

## 17 HTTP agent

### Overview

This item type allows data polling using the HTTP/HTTPS protocol. Trapping is also possible using Zabbix sender or Zabbix sender protocol.

HTTP item check is executed by Zabbix server. However, when hosts are monitored by a Zabbix proxy, HTTP item checks are executed by the proxy.

HTTP item checks do not require any agent running on a host being monitored.

HTTP agent supports both HTTP and HTTPS. Zabbix will optionally follow redirects (see the *Follow redirects* option below). Maximum number of redirects is hard-coded to 10 (using cURL option `CURLOPT_MAXREDIRS`).

See also [known issues](#) for when using HTTPS protocol.

Zabbix server/proxy must be initially configured with cURL (libcurl) support.

### Configuration

To configure an HTTP item:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item*
- Enter parameters of the item in the form

Item Preprocessing

Name: HTTP agent item

Type: HTTP agent

Key: http\_value\_search

URL: http://localhost:9200/\_str/values/\_search

Query fields

Name	Value
scroll	10s

Request type: POST

Timeout: 3s

Request body type: Raw data | JSON data | XML data

Request body: 

```
{  "query": {    "bool": {      "must": [        {          "match": {            "itemid": "28275"          }        }      ]    }  }
```

Headers

Name	Value
name	value

Required status codes: 200

Follow redirects:

Retrieve mode: Body | Headers | Body and headers

Convert to JSON:

HTTP proxy: [protocol://[user[:password]@]proxy.example.com[:port]]

HTTP authentication: None

SSL verify peer:

SSL verify host:

SSL certificate file:

SSL key file:

SSL key password:

Host interface: 127.0.0.1 : 10050

Type of information: Numeric (unsigned)

Units:

Update interval: 30s

Custom intervals

Type	Interval	Period
Flexible   Scheduling	50s	1-7,00:00-24:00

History storage period: 90d

Trend storage period: 365d

Show value: As is

Enable trapping:

Allowed hosts: 104.24.103.152

New application:

Applications: 

- None-
- CPU
- Filesystems
- General
- Memory
- Network interfaces
- OS
- Performance
- Processes
- Security

Populates host inventory field: -None-

Description:

Enabled:

All mandatory input fields are marked with a red asterisk.

The fields that require specific information for HTTP items are:

<i>Type</i>	Select <b>HTTP agent</b> here.
<i>Key</i>	Enter a unique item key.
<i>URL</i>	<p>URL to connect to and retrieve data. For example:  <a href="https://www.google.com">https://www.google.com</a>  <a href="http://www.zabbix.com/download">http://www.zabbix.com/download</a></p> <p>Domain names can be specified in Unicode characters. They are automatically punycode-converted to ASCII when executing the HTTP check.</p> <p>The <i>Parse</i> button can be used to separate optional query fields (like <code>?name=Admin&amp;password=mypassword</code>) from the URL, moving the attributes and values into <i>Query fields</i> for automatic URL-encoding.</p> <p>Limited to 2048 characters.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_URL</a> cURL option.</p>
<i>Query fields</i>	<p>Variables for the URL (see above).</p> <p>Specified as attribute and value pairs.</p> <p>Values are URL-encoded automatically. Values from macros are resolved and then URL-encoded automatically.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_URL</a> cURL option.</p>
<i>Request type</i>	Select request method type: <i>GET</i> , <i>POST</i> , <i>PUT</i> or <i>HEAD</i>
<i>Timeout</i>	<p>Zabbix will not spend more than the set amount of time on processing the URL (maximum is 1 minute). Actually this parameter defines the maximum time for making a connection to the URL and maximum time for performing an HTTP request.</p> <p>Therefore, Zabbix will not spend more than 2 x Timeout seconds on one check.</p> <p>Time suffixes are supported, e.g. 30s, 1m.</p> <p>Supported macros: user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_TIMEOUT</a> cURL option.</p>
<i>Request body type</i>	<p>Select the request body type:</p> <p><b>Raw data</b> - custom HTTP request body, macros are substituted but no encoding is performed</p> <p><b>JSON data</b> - HTTP request body in JSON format. Macros can be used as string, number, true and false; macros used as strings must be enclosed in double quotes. Values from macros are resolved and then escaped automatically. If "Content-Type" is not specified in headers then it will default to "Content-Type: application/json"</p> <p><b>XML data</b> - HTTP request body in XML format. Macros can be used as a text node, attribute or CDATA section. Values from macros are resolved and then escaped automatically in a text node and attribute. If "Content-Type" is not specified in headers then it will default to "Content-Type: application/xml"</p> <p><i>Note that selecting XML data requires libxml2.</i></p>
<i>Request body</i>	<p>Enter the request body.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros.</p>
<i>Headers</i>	<p>Custom HTTP headers that will be sent when performing a request.</p> <p>Specified as attribute and value pairs.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_HTTPHEADER</a> cURL option.</p>

<i>Required status codes</i>	<p>List of expected HTTP status codes. If Zabbix gets a code which is not in the list, the item will become unsupported. If empty, no check is performed.</p> <p>For example: 200,201,210-299</p> <p>Supported macros in the list: user macros, low-level discovery macros.</p> <p>This uses the <a href="#">CURLINFO_RESPONSE_CODE</a> cURL option.</p>
<i>Follow redirects</i>	<p>Mark the checkbox to follow HTTP redirects.</p> <p>This sets the <a href="#">CURLOPT_FOLLOWLOCATION</a> cURL option.</p>
<i>Retrieve mode</i>	<p>Select the part of response that must be retrieved:</p> <p><b>Body</b> - body only</p> <p><b>Headers</b> - headers only</p> <p><b>Body and headers</b> - body and headers</p>
<i>Convert to JSON</i>	<p>Headers are saved as attribute and value pairs under the "header" key.</p> <p>If 'Content-Type: application/json' is encountered then body is saved as an object, otherwise it is stored as string, for example:</p> <pre>{   "header": {     "&lt;key&gt;": "&lt;value&gt;",     "&lt;key2&gt;": "&lt;value&gt;"   },   "body": &lt;body&gt; }</pre>
<i>HTTP proxy</i>	<p>You can specify an HTTP proxy to use, using the format <code>[protocol://][username[:password]@]proxy.mycompany.com[:port]</code>.</p> <p>The optional <code>protocol://</code> prefix may be used to specify alternative proxy protocols (the protocol prefix support was added in cURL 7.21.7). With no protocol specified, the proxy will be treated as an HTTP proxy.</p> <p>By default, 1080 port will be used.</p> <p>If specified, the proxy will overwrite proxy related environment variables like <code>http_proxy</code>, <code>HTTPS_PROXY</code>. If not specified, the proxy will not overwrite proxy-related environment variables. The entered value is passed on "as is", no sanity checking takes place.</p> <p>You may also enter a SOCKS proxy address. If you specify the wrong protocol, the connection will fail and the item will become unsupported.</p> <p><i>Note</i> that only simple authentication is supported with HTTP proxy.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_PROXY</a> cURL option.</p>
<i>HTTP authentication</i>	<p>Authentication type:</p> <p><b>None</b> - no authentication used.</p> <p><b>Basic authentication</b> - basic authentication is used.</p> <p><b>NTLM authentication</b> - NTLM (<a href="#">Windows NT LAN Manager</a>) authentication is used.</p> <p>Selecting an authentication method will provide two additional fields for entering a user name and password, where user macros and low-level discovery macros are supported.</p> <p>This sets the <a href="#">CURLOPT_HTTPAUTH</a> cURL option.</p>
<i>SSL verify peer</i>	<p>Mark the checkbox to verify the SSL certificate of the web server. The server certificate will be automatically taken from system-wide certificate authority (CA) location. You can override the location of CA files using Zabbix server or proxy configuration parameter <code>SSLCALocation</code>.</p> <p>This sets the <a href="#">CURLOPT_SSL_VERIFYPEER</a> cURL option.</p>
<i>SSL verify host</i>	<p>Mark the checkbox to verify that the Common Name field or the Subject Alternate Name field of the web server certificate matches.</p> <p>This sets the <a href="#">CURLOPT_SSL_VERIFYHOST</a> cURL option.</p>

<i>SSL certificate file</i>	Name of the SSL certificate file used for client authentication. The certificate file must be in PEM <sup>1</sup> format. If the certificate file contains also the private key, leave the SSL key file field empty. If the key is encrypted, specify the password in SSL key password field. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLCertLocation. Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros. This sets the <a href="#">CURLOPT_SSLCERT</a> cURL option.
<i>SSL key file</i>	Name of the SSL private key file used for client authentication. The private key file must be in PEM <sup>1</sup> format. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLKeyLocation. Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, user macros, low-level discovery macros. This sets the <a href="#">CURLOPT_SSLKEY</a> cURL option.
<i>SSL key password</i>	SSL private key file password. Supported macros: user macros, low-level discovery macros. This sets the <a href="#">CURLOPT_KEYPASSWD</a> cURL option.
<i>Enable trapping</i>	With this checkbox marked, the item will also function as <a href="#">trapper item</a> and will accept data sent to this item by Zabbix sender or using Zabbix sender protocol.
<i>Allowed hosts</i>	Visible only if <i>Enable trapping</i> checkbox is marked. List of comma delimited IP addresses, optionally in CIDR notation, or hostnames. If specified, incoming connections will be accepted only from the hosts listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address. Note, that "IPv4-compatible IPv6 addresses" (0000::/96 prefix) are supported but deprecated by <a href="#">RFC4291</a> . Example: Server=127.0.0.1, 192.168.1.0/24, 192.168.3.1-255, 192.168.1-10.1-255, ::1,2001:db8::/32, zabbix.domain Spaces and <a href="#">user macros</a> are allowed in this field. Host macros: {HOST.HOST}, {HOST.NAME}, {HOST.IP}, {HOST.DNS}, {HOST.CONN} are allowed in this field.

If the *HTTP proxy* field is left empty, another way for using an HTTP proxy is to set proxy-related environment variables.

For HTTP - set the `http_proxy` environment variable for the Zabbix server user. For example:  
`http_proxy=http://proxy_ip:proxy_port.`

For HTTPS - set the `HTTPS_PROXY` environment variable. For example:  
`HTTPS_PROXY=http://proxy_ip:proxy_port.` More details are available by running a shell command: `# man curl`.

[1] Zabbix supports certificate and private key files in PEM format only. In case you have your certificate and private key data in PKCS #12 format file (usually with extension \*.p12 or \*.pfx) you may generate the PEM file from it using the following commands:

```
openssl pkcs12 -in ssl-cert.p12 -clcerts -nokeys -out ssl-cert.pem
openssl pkcs12 -in ssl-cert.p12 -nocerts -nodes -out ssl-cert.key
```

## Examples

### Example 1

Send simple GET requests to retrieve data from services such as Elasticsearch:

- Create a GET item with URL: localhost:9200/?pretty
- Notice the response:

```
{
  "name" : "YQ2VAY-",
  "cluster_name" : "elasticsearch",
  "cluster_uuid" : "kH4CYqh5QfqgeTsjh2F9zg",
  "version" : {
    "number" : "6.1.3",
    "build_hash" : "af51318",
    "build_date" : "2018-01-26T18:22:55.523Z",
    "build_snapshot" : false,
    "lucene_version" : "7.1.0",
    "minimum_wire_compatibility_version" : "5.6.0",
    "minimum_index_compatibility_version" : "5.0.0"
  },
  "tagline" : "You know, for search"
}
```

- Now extract the version number using a JSONPath preprocessing step: \$.version.number

### Example 2

Send simple POST requests to retrieve data from services such as Elasticsearch:

- Create a POST item with URL:  
[http://localhost:9200/str/values/\\_search?scroll=10s](http://localhost:9200/str/values/_search?scroll=10s)
- Configure the following POST body to obtain the processor load (1 min average per core)

```
{
  "query": {
    "bool": {
      "must": [{
        "match": {
          "itemid": 28275
        }
      }],
      "filter": [{
        "range": {
          "clock": {
            "gt": 1517565836,
            "lte": 1517566137
          }
        }
      ]
    }
  }
}
```

```
    }  
  }  
}
```

- Received:

```
{  
  "_scroll_id":  
  "DnF1ZXJ5VGhlbkZldGNoBQAAAAAAAAAAkFl1RMlZBWS1UU1pxTmdEeGVwQjRBTFEAAAAAAAAAJRZ  
  ZUTJWQVktVFNaCU5nRHhlcEI0QUxRAAAAAAAAAACYWwVEyVkFZLVRTWnFOZ0R4ZXBCNEFMUQAAAAA  
  AAAAnFl1RMlZBWS1UU1pxTmdEeGVwQjRBTFEAAAAAAAAAKBZZUTJWQVktVFNaCU5nRHhlcEI0QUx  
  R",  
  "took": 18,  
  "timed_out": false,  
  "_shards": {  
    "total": 5,  
    "successful": 5,  
    "skipped": 0,  
    "failed": 0  
  },  
  "hits": {  
    "total": 1,  
    "max_score": 1.0,  
    "hits": [{  
      "_index": "dbl",  
      "_type": "values",  
      "_id": "dqX9VWEBV6sEKSMYk6sw",  
      "_score": 1.0,  
      "_source": {  
        "itemid": 28275,  
        "value": "0.138750",  
        "clock": 1517566136,  
        "ns": 25388713,  
        "ttl": 604800  
      }  
    }  
  ]  
}  
}
```

- Now use a JSONPath preprocessing step to get the item value:  
\$.hits.hits[0].\_source.value

### Example 3

Checking if Zabbix API is alive, using [apiinfo.version](#).

- Item configuration:

The screenshot shows the 'Preprocessing' tab of an item configuration in Zabbix. The item is named 'Check Zabbix API version' and is of type 'HTTP agent'. The key is 'check\_zabbix\_api\_apiinfo.version' and the URL is 'http://zabbix-web-apache-mysql/api\_jsonrpc.php'. The request type is 'POST' with a 3s timeout. The request body type is 'JSON data' and the body contains a JSON object: 

```
{ "jsonrpc": "2.0", "method": "apiinfo.version", "params": [], "id": 1 }
```

. A header is set for 'Content-Type' with the value 'application/json-rpc'. The 'Retrieve mode' is set to 'Headers'.

Note the use of the POST method with JSON data, setting request headers and asking to return headers only:

- Item value preprocessing with regular expression to get HTTP code:

The screenshot shows the 'Preprocessing steps' configuration for the item. A single step is added with the name 'Regular expression'. The parameters are set to 'HTTPV1.1 ([0-9]+)' and '\1'.

- Checking the result in *Latest data*:

The screenshot shows the 'Latest data' interface in Zabbix. It features a 'Filter' section with the following elements:

- Host groups:** A search box with the placeholder 'type here to search' and a 'Select' button.
- Hosts:** A search box with the placeholder 'type here to search' and a 'Select' button. Two tags are visible: 'Zabbix server' and 'nginx'.
- Application:** A search box with the placeholder 'type here to search' and a 'Select' button.
- Name:** A text input field containing 'Check Zabbix API'.
- Show items without data:** An unchecked checkbox.
- Show details:** An unchecked checkbox.
- Buttons:** 'Apply' and 'Reset' buttons.

Below the filter section is a table with the following columns: Host, Name, Last check, Last value, and Change.

Host	Name	Last check	Last value	Change
▼ Zabbix server	- other - (1 item)			
<input type="checkbox"/>	Check Zabbix API version	2018-05-16 23:50:34	OK (200)	<a href="#">Graph</a>

#### Example 4

Retrieving weather information by connecting to the Openweathermap public service.

- Configure a master item for bulk data collection in a single JSON:

The screenshot shows the 'Preprocessing' configuration for an item named 'Get weather'. The parent item is 'Template Weather'. The configuration includes the following fields:

- Name:** Get weather
- Type:** HTTP agent
- Key:** get\_weather.http
- URL:** http://api.openweathermap.org/data/2.5/weather

**Query fields:**

Name	Value
units	metric
lat	{SLAT}
lon	{SLON}
APPID	{SWEATHER_APIKEY}
lang	{SWEATHER_LANG}

**Request type:** GET

**Timeout:** 3s

**Request body type:** Raw data, JSON data, XML data

**Request body:** (Empty text area)

Note the usage of macros in query fields. Refer to the [Openweathermap API](#) for how to fill them.

Sample JSON returned in response to HTTP agent:

```
{
  "body": {
    "coord": {
      "lon": 40.01,
      "lat": 56.11
    },
    "weather": [{
      "id": 801,
      "main": "Clouds",
      "description": "few clouds",
      "icon": "02n"
    }],
    "base": "stations",
    "main": {
```

```
    "temp": 15.14,  
    "pressure": 1012.6,  
    "humidity": 66,  
    "temp_min": 15.14,  
    "temp_max": 15.14,  
    "sea_level": 1030.91,  
    "grnd_level": 1012.6  
  },  
  "wind": {  
    "speed": 1.86,  
    "deg": 246.001  
  },  
  "clouds": {  
    "all": 20  
  },  
  "dt": 1526509427,  
  "sys": {  
    "message": 0.0035,  
    "country": "RU",  
    "sunrise": 1526432608,  
    "sunset": 1526491828  
  },  
  "id": 487837,  
  "name": "Stavrovo",  
  "cod": 200  
}  
}
```

The next task is to configure dependent items that extract data from the JSON.

- Configure a sample dependent item for humidity:

The screenshot shows the 'Preprocessing' tab of the Zabbix configuration interface for an item named 'Humidity'. The configuration is as follows:

- Name:** Humidity
- Type:** Dependent item
- Key:** humidity
- Master item:** Template Weather: Get weather
- Type of information:** Numeric (float)

Other weather metrics such as 'Temperature' are added in the same manner.

- Sample dependent item value preprocessing with JSONPath:

Item Preprocessing

Preprocessing steps	Name	Parameters	Action
	JSON Path	\$.body.main.humidity	<a href="#">Remove</a>

[Add](#)

- Check the result of weather data in *Latest data*:

Host	Name	Inter...	History	Trends	Type	Last check	Last value
weather Weather (8 items)							
<input type="checkbox"/>	Get weather <a href="#">get_weather.http</a>	10m	1d		HTTP agent	2018-05-17 01:23:45	{'body': {'coord': {'lon...
<input type="checkbox"/>	Get weather HTTP response code <a href="#">get_weather.http_code</a>		7d	0	Depende...	2018-05-17 01:23:45	OK (200)
<input type="checkbox"/>	Humidity <a href="#">humidity</a>		90d	365d	Depende...	2018-05-17 01:23:45	66 %
<input type="checkbox"/>	Temperature <a href="#">temp</a>		90d	365d	Depende...	2018-05-17 01:23:45	15.14 C

<input type="checkbox"/>	Weather condition id <a href="#">weather.condition.id</a>		7d	0	Depende...	2018-05-17 01:23:45	801
<input type="checkbox"/>	Weather description <a href="#">weather.description</a>		90d		Depende...	2018-05-17 01:23:45	few clouds
<input type="checkbox"/>	Wind speed <a href="#">wind.speed</a>		90d	365d	Depende...	2018-05-17 01:23:45	1.86 m/s

### Example 5

Connecting to Nginx status page and getting its metrics in bulk.

- Configure Nginx following the [official guide](#).
- Configure a master item for bulk data collection:

The screenshot shows the 'Preprocessing' tab of a Zabbix item configuration. The item name is 'Get NGINX status page', its type is 'HTTP agent', and its key is 'get\_nginx'. The URL is 'http://{HOST.CONN}/nginx\_status'. Under 'Query fields', there is a table with 'name' in the 'Name' column and 'value' in the 'Value' column. The 'Request type' is 'GET', the 'Timeout' is '3s', and the 'Request body type' is 'Raw data'. The 'Request body' field is empty.

Sample Nginx stub status output:

```
Active connections: 1 Active connections:  
server accepts handled requests  
52 52 52  
Reading: 0 Writing: 1 Waiting: 0
```

The next task is to configure dependent items that extract data.

- Configure a sample dependent item for requests per second:

The screenshot shows the configuration for a dependent item. The name is 'Client requests per second', the type is 'Dependent item', and the key is 'nginx\_requests\_rps'. The master item is 'Template App Nginx HTTP: Get Nginx stub status'. The 'Type of information' is 'Numeric (unsigned)'.

- Sample dependent item value preprocessing with regular expression:

Item Preprocessing

Preprocessing steps	Name	Parameters
Regular expression		server accepts handled requests's+([0-9]+) ([0-9]+) ([0-9]+)
Change per second		13

[Add](#)

- Check the complete result from stub module in *Latest data*:

Host	Name	Last check	Last value
nginx	<b>Nginx (8 Items)</b>		
<input type="checkbox"/>	Accepted client connections	2018-05-18 17:54:53	568
<input type="checkbox"/>	Active connections	2018-05-18 17:54:53	1
<input type="checkbox"/>	Client requests per second	2018-05-18 17:54:53	0 rps
<input checked="" type="checkbox"/>	Get Nginx stub status	2018-05-18 17:54:53	HTTP/1.1 200 OK Se...
<input type="checkbox"/>	Handled connections per second	2018-05-18 17:54:53	0
<input type="checkbox"/>	Reading	2018-05-18 17:54:53	0
<input type="checkbox"/>	Waiting	2018-05-18 17:54:53	0
<input type="checkbox"/>	Writing	2018-05-18 17:54:53	1
