Zabbix Manual

Welcome to the user manual for Zabbix 3.0 software. These pages are created to help users successfully manage their monitoring tasks with Zabbix, from the simple to the more complex.

Copyright notice

Zabbix documentation is NOT distributed under a GPL license. Use of Zabbix documentation is subject to the following terms:

You may create a printed copy of this documentation solely for your own personal use. Conversion to other formats is allowed as long as the actual content is not altered or edited in any way. You shall not publish or distribute this documentation in any form or on any media, except if you distribute the documentation in a manner similar to how Zabbix disseminates it (that is, electronically for download on a Zabbix web site) or on a USB or similar medium, provided however that the documentation is disseminated together with the software on the same medium. Any other use, such as any dissemination of printed copies or use of this documentation, in whole or in part, in another publication, requires the prior written consent from an authorized representative of Zabbix. Zabbix reserves any and all rights to this documentation not expressly granted above.

1. Introduction

Please use the sidebar to access content in the Introduction section.

1 Manual structure

Structure

The content of this Zabbix 3.0 manual is divided into sections and subsections to provide easy access to particular subjects of interest.

When you navigate to respective sections, make sure that you expand section folders to reveal full content of what is included in subsections and individual pages.

Cross-linking between pages of related content is provided as much as possible to make sure that relevant information is not missed by the users.

Sections

Introduction provides general information about current Zabbix software. Reading this section should equip you with some good reasons to choose Zabbix.

Zabbix concepts explain the terminology used in Zabbix and provides details on Zabbix components.

Installation and **Quickstart** sections should help you to get started with Zabbix. **Zabbix appliance** is an alternative for getting a quick taster of what it is like to use Zabbix.

Configuration is one of the largest and more important sections in this manual. It contains loads of essential advice about how to set up Zabbix to monitor your environment, from setting up hosts to getting essential data to viewing data to configuring notifications and remote commands to be executed in case of problems.

IT services section details how to use Zabbix for a high-level overview of your monitoring environment.

Web monitoring should help you learn how to monitor the availability of web sites.

Virtual machine monitoring presents a how-to for configuring VMware environment monitoring.

Maintenance, **Regular expressions**, **Event acknowledgement** and **XML export/import** are further sections that reveal how to use these various aspects of Zabbix software.

Discovery contains instructions for setting up automatic discovery of network devices, active agents, file systems, network interfaces, etc.

Distributed monitoring deals with the possibilities of using Zabbix in larger and more complex environments.

Encryption helps explaining the possibilities of encrypting communications between Zabbix components.

Web interface contains information specific for using the web interface of Zabbix.

API section presents details of working with Zabbix API.

Detailed lists of technical information are included in **Appendixes**. This is where you will also find a FAQ section.

2 What is Zabbix

Overview

Zabbix was created by Alexei Vladishev, and currently is actively developed and supported by Zabbix SIA.

Zabbix is an enterprise-class open source distributed monitoring solution.

Zabbix is software that monitors numerous parameters of a network and the health and integrity of servers, virtual machines, applications, services, databases, websites, the cloud and more. Zabbix uses a flexible notification mechanism that allows users to configure e-mail based alerts for virtually any event. This allows a fast reaction to server problems. Zabbix offers excellent reporting and data visualisation features based on the stored data. This makes Zabbix ideal for capacity planning.

Zabbix supports both polling and trapping. All Zabbix reports and statistics, as well as configuration parameters, are accessed through a web-based frontend. A web-based frontend ensures that the status of your network and the health of your servers can be assessed from any location. Properly configured, Zabbix can play an important role in monitoring IT infrastructure. This is equally true for small organisations with a few servers and for large companies with a multitude of servers.

Zabbix is free of cost. Zabbix is written and distributed under the GPL General Public License version 2. It means that its source code is freely distributed and available for the general public.

[Commercial support](#) is available and provided by Zabbix Company and its partners around the world.

Learn more about [Zabbix features](#).

Users of Zabbix

Many organisations of different size around the world rely on Zabbix as a primary monitoring platform.

3 Zabbix features

Overview

Zabbix is a highly integrated network monitoring solution, offering a multiplicity of features in a single package.

Data gathering

- availability and performance checks
- support for SNMP (both trapping and polling), IPMI, JMX, VMware monitoring
- custom checks
- gathering desired data at custom intervals
- performed by server/proxy and by agents

Flexible threshold definitions

- you can define very flexible problem thresholds, called triggers, referencing values from the backend database

Highly configurable alerting

- sending notifications can be customized for the escalation schedule, recipient, media type
- notifications can be made meaningful and helpful using macro variables
- automatic actions include remote commands

Real-time graphing

- monitored items are immediately graphed using the built-in graphing functionality

Web monitoring capabilities

- Zabbix can follow a path of simulated mouse clicks on a web site and check for functionality and response time

Extensive visualisation options

- ability to create custom graphs that can combine multiple items into a single view
- network maps
- custom screens and slide shows for a dashboard-style overview
- reports
- high-level (business) view of monitored resources

Historical data storage

- data stored in a database
- configurable history
- built-in housekeeping procedure

Easy configuration

- add monitored devices as hosts
- hosts are picked up for monitoring, once in the database
- apply templates to monitored devices

Use of templates

- grouping checks in templates
- templates can inherit other templates

Network discovery

- automatic discovery of network devices
- agent auto registration
- discovery of file systems, network interfaces and SNMP OIDs

Fast web interface

- a web-based frontend in PHP
- accessible from anywhere
- you can click your way through
- audit log

Zabbix API

- Zabbix API provides programmable interface to Zabbix for mass manipulations, 3rd party software integration and other purposes.

Permissions system

- secure user authentication
- certain users can be limited to certain views

Full featured and easily extensible agent

- deployed on monitoring targets
- can be deployed on both Linux and Windows

Binary daemons

- written in C, for performance and small memory footprint
- easily portable

Ready for complex environments

- remote monitoring made easy by using a Zabbix proxy

4 Zabbix overview

Architecture

Zabbix consists of several major software components, the responsibilities of which are outlined below.

Server

Zabbix server is the central component to which agents report availability and integrity information and statistics. The server is the central repository in which all configuration, statistical and operational data are stored.

Database storage

All configuration information as well as the data gathered by Zabbix is stored in a database.

Web interface

For an easy access to Zabbix from anywhere and from any platform, the web-based interface is provided. The interface is part of Zabbix server, and usually (but not necessarily) runs on the same physical machine as the one running the server.

Note:

Zabbix web interface must run on the same physical machine if SQLite is used.

Proxy

Zabbix proxy can collect performance and availability data on behalf of Zabbix server. A proxy is an optional part of Zabbix deployment; however, it may be very beneficial to distribute the load of a single Zabbix server.

Agent

Zabbix agents are deployed on monitoring targets to actively monitor local resources and applications and report the gathered data to Zabbix server.

Data flow

In addition it is important to take a step back and have a look at the overall data flow within Zabbix. In order to create an item that gathers data you must first create a host. Moving to the other end of the Zabbix spectrum you must first have an item to create a trigger. You must have a trigger to create an action. Thus if you want to receive an alert that your CPU load is too high on *Server X* you must first create a host entry for *Server X* followed by an item for monitoring its CPU, then a trigger which activates if the CPU is too high, followed by an action which sends you an email. While that may seem like a lot of steps, with the use of templating it really isn't. However, due to this design it is possible to create a very flexible setup.

5 What's new in Zabbix 3.0.0**5.1 New web interface** Zabbix 3.0 comes with a completely new frontend design.

Along with visual improvements, there are several other changes for working with the frontend:

- For accessing the second-level menu, top level options (Monitoring, Inventory, Reports, etc) have actually to be clicked (previously a mouseover was enough)
- *Configuration* → *Maps* | *Screens* | *Slide shows* is not available any more. Instead, all configuration options for these entities have been moved to *Monitoring* → *Maps* and *Monitoring* → *Screens*
- *Users* section has been split into *User groups* and *Users*

- *Audit* and *Notifications* sections have been moved out of *Administration* and into *Reports*. Additionally, *Audit* has been split into *Audit* and *Action log* sections.

5.2 Encryption support Network communications between Zabbix components (server, proxies, agents and command-line utilities) can now be encrypted if Zabbix is compiled with mbed TLS (PolarSSL), GnuTLS or OpenSSL library.

Details are specified with new TLS parameters in daemon configuration files for **Zabbix server**, **Zabbix proxy**, **Zabbix agent**, **Zabbix Windows agent** and new commandline options for `zabbix_get` and `zabbix sender`.

RSA certificates or pre-shared key (PSK) can be configured and used for encryption per host and proxy.

For more information, see the **Encryption** section.

5.3 Predictive trigger functions Predictive capabilities are now available via **forecast()** and **timeleft()** trigger functions. These functions analyse item history and return the future value of the item or time in which the item value reaches a threshold respectively. They can be used in calculated items, trigger expressions and notifications to act in advance and avoid potential problems instead of waiting for them to happen and eliminating consequences afterwards. For more information, see:

- **Predictive trigger functions**
- **Supported trigger functions** (entries for 'forecast' and 'timeleft')

5.4 SMTP authentication options Configuring e-mail as a media type for sending notifications has been extended with new SMTP authentication options. It is also possible now to specify the server port other than the hardcoded 25 before.

Media types

Name	<input type="text" value="Email"/>
Type	<input type="text" value="Email"/>
SMTP server	<input type="text" value="mail.company.com"/>
SMTP server port	<input type="text" value="25"/>
SMTP helo	<input type="text" value="company.com"/>
SMTP email	<input type="text" value="zabbix@company.com"/>

Connection security

SSL verify peer ☐

SSL verify host ☐

Authentication

Username

Password

Enabled ☒

See [e-mail configuration](#) for more details.

5.5 Item checking at specific times Item checking so far in Zabbix has centered around the concept of *interval* only. There has been the default update interval and the ability of specifying flexible update intervals. However, checking an item at a specific time and date - that was not previously supported.

In the new version flexible intervals have been supplemented with a new *Scheduling* format where item checking can be defined for specific time points.

Custom intervals	TYPE	INTERVAL	PERIOD
	<input type="button" value="Flexible"/> <input checked="" type="button" value="Scheduling"/>	<input type="text" value="md1wd1h8m59s59"/>	

In the example above item checking will take place at 8:59.59 on the 1st day of the month if it is a Monday.

When configuring an item, both flexible interval and scheduling formats are available under a new option called *Custom intervals*.

5.6 Custom parameter support for alert scripts In previous Zabbix versions three hard-coded parameters were passed to custom alert scripts - *Send to*, *Subject* and *Message*.

Now users can define their own command-line parameters for the script in the media type configuration form:

Name

Type

Script name

Script parameters

PARAMETER	ACTION
<input style="width: 100%;" type="text" value="{ALERT.SENDTO}"/>	Remove
<input style="width: 100%;" type="text" value="{ALERT.SUBJECT}"/>	Remove
<input style="width: 100%;" type="text" value="{ALERT.MESSAGE}"/>	Remove
<input style="width: 100%;" type="text"/>	Remove
Add	

Enabled ☒

Additionally, three new macros are supported in parameter fields - {ALERT.SENDTO}, {ALERT.SUBJECT} and {ALERT.MESSAGE}, resolving to recipient, message subject and message body respectively.

For more details, see:

- [Custom alertscripts](#)
- [Macros supported by location](#)

5.7 Private maps, screens and slide shows All users in Zabbix (including non-admin users) can now create network maps, screens and slide shows. To enable that, the functionality for managing these entities has been moved out of the Configuration menu and into the Monitoring menu. Additionally, the minimum access rights to maps, screens and slide shows (and to adding elements to them) has been lowered from read-write to read permissions.

Maps, screens and slide shows can now be private or public. The public ones can be accessed by all users, while the private ones can be accessed by its owner (creator) and all users the entity has been shared with. There is a new Sharing tab in map/screen/slide show configuration for that purpose.

For more details, see:

- [Managing maps](#)
- [Managing screens](#)
- [Configuring a network map](#)
- [Configuring a screen](#)
- [Configuring a slide show](#)

5.8 Exporting and importing value maps Support for exporting the configured value mappings together with exported hosts and templates has been implemented.

When importing value mappings, the rules provide options to create new and update existing value mappings from XML.

Value mappings can also be imported/exported separately.

5.8.1 Usage in items column

When viewing configured value mappings, there is a useful new column displaying whether the value mapping is used in any items.

Value mapping		
Value mapping		Create value map
<input type="checkbox"/> NAME ▾	VALUE MAP	USED IN ITEMS
<input type="checkbox"/> Zabbix agent ping status	1 ⇒ Up	Yes

5.9 Dependencies between trigger prototypes While defining trigger **dependencies** has been a Zabbix feature for a long time, doing the same for trigger prototypes (defined in low-level discovery) was previously not possible.

Following a popular request, ability to define dependencies has now been implemented for trigger prototypes as well. To define dependencies you go to the *Dependencies* tab in the trigger prototype form (similarly as for real triggers).

Trigger prototype
Dependencies

Dependencies

NAME
Zabbix server: Zabbix agent on {HOST.NAME} is unreachable for 5 minutes
Add Add prototype

A trigger prototype may depend on another trigger prototype from the same low-level discovery (LLD) rule or on a regular trigger.

A trigger prototype may not depend on a trigger prototype from a different LLD rule or on a trigger created from trigger prototype. Host trigger prototype cannot depend on a trigger from a template.

5.9.1 Performance improvements

The processing of trigger prototypes has been optimized by reducing the number of SQL statements. As a result, the process of creating triggers takes only half of the time as before.

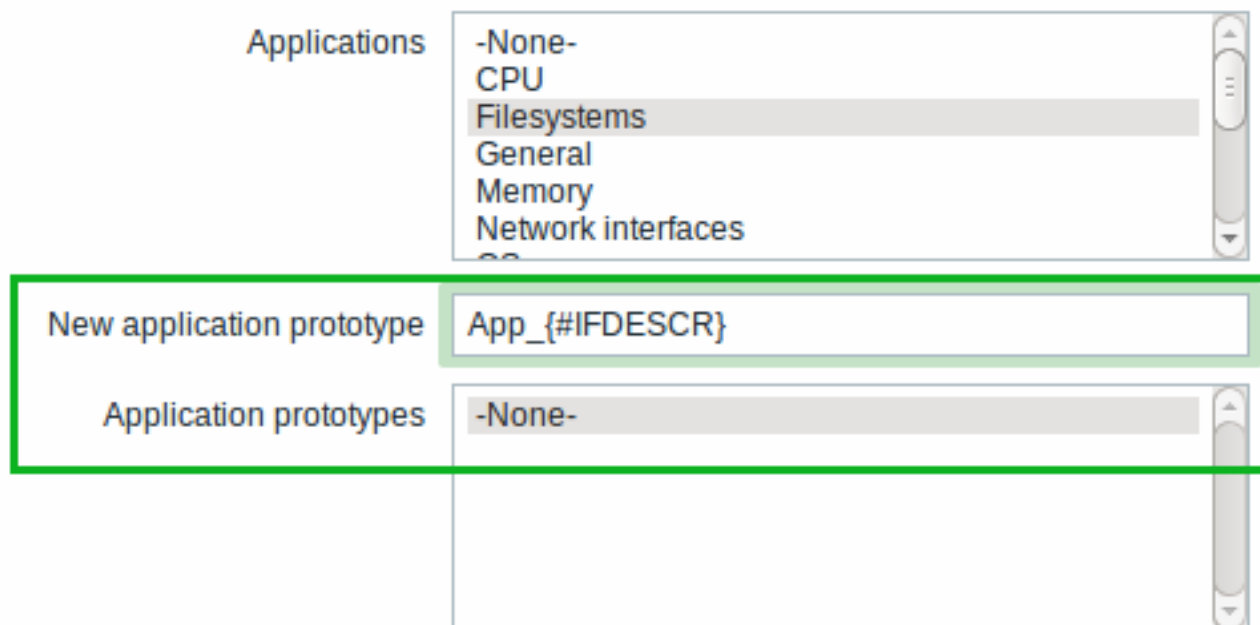

5.10 Multiple OID support in SNMP discovery SNMP discovery has been improved to support discovery of multiple OIDs. The discovery SNMP OID now is specified by using the following format:

```
discovery[{#MACRO1}, oid1, {#MACRO2}, oid2, ...]
```

The discovered OIDs are grouped by their indexes to produce entities with {#MACRO1}, {#MACRO2} ... macros set to corresponding OID values and {#SNMPINDEX} macro set to corresponding OID index.

For more information, see [low level discovery](#) documentation.

5.11 Linking to applications based on discovery values To help with logical grouping of items created from item prototypes by low-level discovery (LLD), it is now possible to assign the discovered items to applications that are based on the values of LLD macros.

In addition to the options for linking to regular applications, a new option for creating *application prototypes* has been added to item prototype definition. Discovered items are linked to the applications created based on application prototypes.

5.12 Graph improvements 5.12.1 Better zoom

In previous versions the shortest period you could zoom into was one hour. Now this limit has been lowered significantly to one minute.

Predefined options in the time period selector now include such periods as 5 minutes, 15 minutes and 30 minutes.

5.12.2 Graphing log items

Log items (**log**, **logrt**, and **eventlog**) and item prototypes can now be saved with any **type of information** (not only "Log"), in line with the possibilities offered by the optional output parameter. It means that log items could also be saved with type of information set to integer ("Numeric (unsigned)"), and thus be graphed.

5.12.3 Miscellaneous

- ISO date format of **yyyy-mm-dd hh:mm:ss** used

Several improvements focus on better readability of labels in graphs, especially large graphs showing data for several years:

- A change of year is clearly displayed on the X axis, with year always highlighted in red
- New time divisions used:

- * 1 month as main interval and 15 days as sub-interval
 - * 1 year as main interval and 1/3/4/6 month(s) as sub-intervals
 - * 5 years as main interval and 1 year as sub-interval
 - * 10 years as main interval and 2 years as sub-interval
 - * 15 years as main interval and 3 years as sub-interval
 - * 20 years as main interval and 5 years as sub-interval
 - * 30 years as main interval and 10 years as sub-interval
 - * 40 years as main interval and 20 years as sub-interval
 - * 60 years as main interval and 30 years as sub-interval
 - * 80 years as main interval and 40 years as sub-interval
- * Overall, the density of intervals displayed on X axis labels has been decreased by 8%

5.13 Resolution of user macros made transparent In previous Zabbix versions there was no easy way to determine what a user macro might resolve to, keeping in mind that user macros could be defined on host, template and global level.

The task could get even more complicated if macros in several levels of linked templates were used or in ambiguous cases when the same macro was defined in several same-level templates.

To make the resolution of macros transparent, there is now a new option in host and template configuration forms with macro resolution details. To see it you go to the Macros tab and select the *Inherited and host macros* option. That is where all defined user macros are displayed with the value they resolve to as well as their origin.

MACRO	EFFECTIVE VALUE	TEMPLATE VALUE	GLOBAL VALUE
{HOST_MACRO}	⇒ snktdjrnslcdc334		
{NESTED_TEMPLATE_MACRO}	⇒ 53689	⇐ Template2: "53689"	
{SNMP_COMMUNITY}	⇒ public		⇐ "public"
{TEMPLATE_MACRO}	⇒ 25865	⇐ Template1: "25864"	

For convenience, links to respective templates and global macro configuration are provided. It is also possible to edit a template/global macro on the host level, effectively creating a copy of the macro on the host.

5.14 Automated selection of host inventory mode In previous Zabbix versions all hosts were created with disabled host inventory by default and the only way to change that was through the properties of each individual host. The new Zabbix version comes with two new automated ways of selecting host inventory mode.

First, a *Default host inventory mode* option is added in *Administration* → *General* → *Other*. This options allows to customise which inventory option is selected by default for new hosts.

Other configuration parameters

Refresh unsupported items (in sec)	<input type="text" value="600"/>
Group for discovered hosts	<input type="text" value="Discovered hosts"/>
Default host inventory mode	<input type="button" value="Disabled"/> <input type="button" value="Manual"/> <input type="button" value="Automatic"/>
User group for database down message	<input type="text" value="Zabbix admin"/>
Log unmatched SNMP traps	<input checked="" type="checkbox"/>
<input type="button" value="Update"/>	

There is also a new action operation for host discovery/auto registration, in which you may choose between manual and automatic inventory modes for discovered hosts.

Actions

Action Conditions Operations

Action operations

DETAILS

Set host inventory mode: Automatic

Operation details

Operation type

Set host inventory mode

Inventory mode

Manual

Automatic

This operation overrides the *Administration* → *General* setting mentioned above.

5.15 Bulk acknowledgement made more flexible In previous Zabbix versions, when bulk acknowledging problems, all unacknowledged events for the problem would be acknowledged. That imposed certain limitations, for example, you could not add a second acknowledgement message as all events were deemed acknowledged.

In Zabbix 3.0 you have more flexible options when using bulk acknowledgement. You may choose to acknowledge only the selected event, or all problems events as well, or all events for the problem. It is also possible to add several messages in bulk acknowledgement mode now.

Alarm acknowledgements

Message

History

TIME	USER	MESSAGE
2015-09-01 11:59:16	Admin (Zabbix Administrator)	fixed2
2015-09-01 11:58:55	Admin (Zabbix Administrator)	fixed1

Acknowledge

☐ Only selected event

☒ Selected and all unacknowledged PROBLEM events 1 event

☐ Selected and all unacknowledged events 1 event

Acknowledge

Cancel

Another improvement sees increased performance for bulk acknowledgement of a large number of events - with events in hundreds of thousands or more, bulk acknowledgement should take place within several minutes at most.

5.16 VMware monitoring improvements A new simple check to monitor VMware virtual machine CPU ready state was added. For more information see [VMware monitoring item keys](#).

5.17 Context support in user macros An optional context can be specified in user macros - `{${MACRO}:context}`. This allows to override the default macro value by a context specific one. If there are no values defined for the specified macro context then macro will resolve to its default value (the one defined for the same macro without context).

For more information, see [user macros](#) documentation.

5.18 Running Zabbix daemons in foreground Zabbix daemons now accept an `-f` (`--foreground`) command line option to run in foreground. To redirect Zabbix logs to standard output when running in foreground set `LogType` configuration parameter to `console`.

5.19 Frontend improvements 5.19.1 Dropping IE8 support

Support for Microsoft Internet Explorer 8 will not be provided anymore.

5.19.2 Showing trigger description in Dashboard

Trigger description is now displayed in the popup when clicking on *Issue* in the *Last 20 issues* widget. This popup already displayed trigger events in previous versions. Now the description field is added, above trigger events.

Last 20 issues

HOST	ISSUE	LAST CHANGE	AGE	INFO
Zabbix server	Lack of free swap space on Zabbix server	2015-08-11 23:29:28	2m 11d 11h	

Status of Zabbix

PARAMETER	TIME	STATUS	DURATION	AGE	ACK
Zabbix server is running	2015-08-11 23:29:28	PROBLEM	2m 11d 11h	2m 11d 11h	Yes 4

It probably means that the system requires more physical memory.

http://www.forensicswiki.org/wiki/Physical_memory

Displaying trigger description is very useful in cases when it can provide clues to resolving the problem. The description field has a maximum size and will be scrollable if the text is larger than the field. URLs within the description are clickable. Moreover, trigger URLs, if available are also displayed.

Trigger description is also displayed in *Host issues* and *Host group issues* screen elements.

5.19.3 Filtering options

Filtering options across several frontend sections have been improved further.

Dashboard filtering by trigger name

When using the Dashboard filter, it is now possible to enter a string limiting the number of triggers displayed in the *System status*, *Host status* and *Last 20 issues* widgets.

Dashboard

Dashboard filter **Enabled**

Host groups **Selected** ▼

Show selected groups **Select**

Hide selected groups **Select**

Filter Reset

HOST	TRIGGER	SEVERITY	NUMBER OF STATUS CHANGES
New host	Disk I/O is overloaded on New host	Warning	6
Zabbix server	Zabbix discoverer processes more than 75% busy	Average	6

While previously it was only possible to filter here by some predefined time period, now you may filter by host group, host, trigger severity, predefined time period and custom time period.

5.19.4 Mass editing buttons instead of dropdown

Options for mass-editing of entities in lists are now displayed as buttons. The previous option of a dropdown selection and then having to click on *Go* has been removed. It is expected that reinstating buttons will make it much quicker and easier to use these operations.

Previous version:

Export selected
Go (0)

Export selected

[Discovery \(0\)](#)
[Web \(0\)](#)

	DISCOVERY	WEB
Zabbix 3.0:	Discovery	Web

5.19.6 User agent options in web monitoring

In web scenario definition it is now possible to select a 'Zabbix' user agent. That may be useful for filtering out requests coming from Zabbix in web server access log files. The 'Zabbix' agent now is the default choice for the frontend and API, unless specified otherwise.

Scenario
Steps
Authentication

Name

Application

New application

Update interval (in sec)

Attempts

Agent

HTTP proxy

Note that when selecting the 'other' option for user agent now, an additional field is opened allowing to enter the string.

Scenario	Steps	Authentication
Name	<input type="text"/>	
Application	<input type="text"/>	
New application	<input type="text"/>	
Update interval (in sec)	<input type="text" value="180"/>	
Attempts	<input type="text" value="1"/>	
Agent	<input type="text" value="other ..."/>	
User agent string	<input type="text" value="Lynx/2.8.4rel.1 libwww-FM/2.14"/>	
HTTP proxy	<input type="text" value="http://[user[:password]@]proxy.example.com[:port]"/>	

Additionally, the user agent list now contains updated browser versions.

5.19.7 Updated translations

- Czech
- English (United States)
- French
- Italian
- Japanese
- Korean
- Polish
- Portuguese (Brazil)
- Russian
- Slovak
- Ukrainian

These languages are available in Zabbix frontend. Other languages are disabled and are not available to be selected as their translation level has dropped below 75%.

5.19.8 XML import/export

It is now possible to import/export the Clock screen element with a "Host time" option.

5.19.9 Value mapping improvements

Value mapping setting "Host status" in *Administration* → *General* → *Value mapping* has been updated and renamed to "Host availability". This value now supports 3 host states by default:

- *0 not available
- *1 available
- *2 unknown

and matches the value of **internal check** item `zabbix[host,<type>,available]`.

5.19.10 Miscellaneous improvements

- Value mappings can now also be cloned similarly to other frontend entities.
- Switching inventory mode in the host mass update form will no longer refresh the whole form.
- Translation of the byte unit prefixes - K for kilobytes, M for megabytes, etc. - has been removed because the "bytes" unit was not translated.

- Spaces, tabulation and multiple lines can now be used in IP ranges in network discovery and action conditions (e.g., "192.168.0.0/24, 192.168.1.0/24").
- The Dashboard *Last 20 issues* widget as well as "Host issues" and "Host group issues" screen elements now display all hosts from trigger expression.
- A table header has been added to the **user media** listing. Entries from the list can be deleted using the *Remove* link, rather than having to mark check-boxes and then click on *Delete selected*. Check-boxes have been removed.

5.20 Daemon improvements 5.20.1 Forced housekeeper execution

An additional runtime control **option** (*housekeeper_execute*) has been added to Zabbix server and Zabbix proxy to support manual housekeeping procedure execution. In this case the period of outdated history deleted in one housekeeping cycle will be 4 times the period since the last housekeeping cycle, but not less than 4 hours and not greater than 4 days.

The automatic housekeeping procedures can now be disabled by setting the configuration file *HousekeepingFrequency* parameter to zero.

5.20.2 Configuration parameters

Default configuration **files** have been changed to improve security and usability.

- *DBUser* has been changed to **zabbix** for proxy and server
- Default value for *MaxHousekeeperDelete* has been increased from 500 to 5000 for server
- *LogSlowQueries* has been increased from 0 to 3000 for proxy and server
- *Timeout* has been increased from 3 to 4 seconds for proxy and server
- Default value for *MaxLinesPerSecond* has been decreased from 100 to 20 for agent
- Prohibited characters have been listed for *UnsafeUserParameters*
- It is possible to disable automatic housekeeping by setting *HousekeepingFrequency* to 0
- It is possible now to set *DebugLevel*=5 in server, proxy and agent configuration files. Previously it could be done using runtime control options only.
- A new **LogType** configuration parameter has been added for server, proxy, agent and Windows agent. This parameter accepts the following values:
 - *file* (default) - write log messages to file configured by the *LogFile* parameter
 - *system* - write log messages to syslog (Unix-like systems) or eventlog (Windows)
 - *console* - write log messages to standard output (valid only when running in foreground mode)
 - See also important **upgrade notes**
- *HistoryIndexCacheSize* parameter has been added for server and proxy
- Several new parameters have been added that are related to **encryption** support

5.20.3 Performance improvements

The process of trigger expression evaluation has been improved dramatically by using a hashing mechanism. Also configuration cache locking during that process has been reduced multiple times.

The *nodata()* function calculation has been improved to limit the database requests to the range specified in *nodata()* function.

When an active proxy connects to Zabbix server, the server identifies this proxy using information from server configuration cache (in earlier versions directly from database). This improves performance and reduces database load. On the other hand, changing active proxy settings via frontend or API now does not have an instant effect. It has to wait until server configuration cache is updated from the database (can be enforced from commandline).

The number of configuration cache locks done by pollers has been reduced. This should give slight performance improvement in peak situations.

Networking performance: in outgoing TCP connections Zabbix now combines header, data size and data (at least initial part) in one TCP packet.

5.20.4 Value cache improvements

Value cache now also tracks the item daily range and once per day updates the active range with daily range. This will cause unused values to be eventually removed if the item request range was reduced.

When working in low memory mode value cache will attempt to switch back to normal operational mode once per day. The current operational mode can be checked with `zabbix[vcache,cache,mode]` key. See the **internal check** documentation.

5.20.5 Zabbix agent crash log on Windows platforms

Zabbix agent will now log crash information on Windows similar to the one generated by agents on Unix-like platforms. However to obtain the full stack trace the program database file (*zabbix_agentd.pdb*) must be located in the same directory as Zabbix agent binary (*zabbix_agentd.exe*). Currently this file is not included in official Zabbix distributions, but can be found in build output directory after building Zabbix agent on Windows platform.

5.20.6 TCP connection timeout on Windows platforms

The configured timeout option is now properly applied when establishing TCP connections on Windows platform. This affects the following Zabbix agent keys:

- net.tcp.port
- net.tcp.service
- net.tcp.service.perf
- web.page.get
- web.page.perf
- web.page.regexp

5.20.7 Support for IPv6 addresses in Java gateway

IPv6 addresses like 2001:db8::6c09 can now be used in JMX interfaces.

5.20.8 Proxy configuration size increase

Server will include "lastlogsize" and "mtime" with every item sent to proxy. Despite these fields being used only for log file monitoring they will be currently sent with all items.

5.20.9 Logging IP addresses of incoming/outgoing connections between Zabbix server and Zabbix proxy

The messages printed to the log files will now contain IP addresses of incoming/outgoing connections between Zabbix server and Zabbix proxy. Please see the [upgrade notes](#) for details.

5.20.10 Database recovery message on DebugLevel=2

If a database query fails the following message will be printed to the log file: `database is down: reconnecting in 10 seconds`. When the database goes up `database connection re-established` will be printed. There were no such messages on `DebugLevel=2` previously.

5.20.11 Host availability improvements

Previously the host availability status in the frontend depended upon whether the last item check had been successful or not. In the absence of any new checks, the last known status would be displayed indefinitely. In the new version, displaying host availability has been made much more accurate.

Zabbix server will set the host availability icon to gray (unknown status) for the corresponding agents (Zabbix, SNMP, IMP, JMX) if:

- there are no enabled items on the corresponding interface - they were removed or disabled (Zabbix agent active checks, as before, do not influence host availability in any way),
- host is set to be monitored by proxy, a different proxy or by server if it was monitored by proxy,
- host is monitored by a proxy that appears to be offline (no updates received from the proxy during the maximum heartbeat interval - 1 hour),
- host is disabled.

5.20.12 Support for multiple escalators

Zabbix now supports multiple escalator processes. The number of escalator processes can be configured with the `StartEscalators` configuration file [parameter](#) (1 being the default value).

5.20.13 Printing defaults with --help option

Zabbix programs will now print default values (configuration file, port) when executed with the `--help` option.

5.20.14 Dropping Inetd Zabbix agent

The Inetd version of Zabbix agent (`zabbix_agent`) has been dropped as it did not seem to have any users.

5.20.15 History cache improvements

History cache will better handle the processing of a large number of values (100 and more values per item) coming from a low number of items (100 items or less).

Text-based values (character, text, log types) are now stored in history cache and the history text cache has been removed together with internal items used to monitor it.

History index cache has been added to keep index of the history cache. A new `zabbix[wcache,index,<mode>]` internal check was added to monitor history index cache usage. See [Internal checks](#) for details.

5.20.16 Action and action condition caching

Actions and action conditions are now stored in configuration cache, improving action processing performance.

5.21 Item changes/improvements A new **proc.cpu.util** item has been added to monitor process CPU utilisation. This item is supported on Linux and Solaris platforms.

net.udp.service and **net.udp.service.perf** items have been added with the possibility to check NTP service. Before Zabbix 3.0 checking of NTP service was done using **net.tcp.service** and **net.tcp.service.perf** items. Database upgrade patches automatically convert NTP service checks using **net.tcp.service** and **net.tcp.service.perf** to the new item.

New internal checks **zabbix[host,,items]** and **zabbix[host,,items_unsupported]** have been added. They return the number of items (unsupported items) on the target host.

A new **service.discovery** item has been added for the **low-level discovery of Windows services**, while the new **service.info** item will help retrieving information about a service. The **service.info** item should now be used instead of the deprecated **service_state** item.

A new **db.odbc.discovery** item has been introduced to support **low-level discovery using ODBC SQL queries**.

A connection protocol parameter has been added to **net.dns** and **net.dns.record** agent items. The accepted values are 'udp' and 'tcp' (udp being the default).

net.dns and **net.dns.record** items on Windows now bypass the internal DNS resolver cache.

net.tcp.listen on Linux 2.6.14 and upward kernel systems now tries to make use of the kernel's NETLINK interface. When building from source, this code is only compiled if **netlink.h** and **inet_diag.h** headers are found in the include path. The interface relies on the presence and operation of **inet_diag** and **tcp_diag** kernel modules. In the case of these modules not being loaded, the item will fall back on the old method of retrieving sockets by state via reading the **/proc/net/tcp(6)** file(s).

The methodology for reading the **/proc/net/tcp(6)** file(s) has been changed as well. Now the files aren't being read fully anymore, but only as long as entries related to sockets in a LISTEN state are being parsed. This relies on the assumption that sockets in the LISTEN state are listed before any other sockets. This has shown an increase in performance of varying magnitudes, but has never shown a decrease in performance.

proc.mem item now supports a 5th parameter - 'memtype' (only on AIX, FreeBSD, Linux, Solaris).

system.cpu.util now supports types 'guest' and 'guest_nice' on Linux kernels 2.6.24 and 2.6.33 and upwards, respectively.

vfs.fs.discovery item on Windows now returns an additional {#FSDRIVETYPE} macro with possible values of "unknown", "noroot-dir", "removable", "fixed", "remote", "cdrom", "ramdisk". Note, however, that if filtering by {#FSDRIVETYPE}, low-level discovery will ignore entities discovered by older agents which return responses without this macro.

Aggregate items now do not require setting the fourth parameter (timeperiod) if the third parameter (itemfunc) is set to *last*. In such cases, the fourth parameter is ignored, if set.

A check for valid reference has been added for global regular expressions in **snmptrap**, **log**, **logrt** and **eventlog** items. If entered reference is not valid, due to misspelling or missing referenced global regular expression, the item will become unsupported and appropriate error message will be displayed.

Log file monitoring (**log**, **logrt** and **eventlog**) was improved by sending actual log file meta information in specific cases and keeping it on Zabbix server side. Log file meta information includes "lastlogsize", "mtime" and "state". Now you can safely restart Zabbix agent or remove Zabbix proxy database while monitoring a log file without getting double alerts.

vm.memory.size[available] item on AIX now returns the sum of free and cached memory. Before Zabbix 3.0 only the free memory size was returned.

vm.memory.size[available] item on Linux now reads MemAvailable (the system's native estimate) from **/proc/meminfo** on Linux kernels 3.14 and above. Before Zabbix 3.0 it was always the sum of free, buffers, and cached memories.

Items **proc.mem** and **proc.num** now return 0 if the specified user does not exist. Before Zabbix 3.0 these items became not supported.

vfs.fs.inode item on CephFS will become not supported instead of returning invalid numbers if second parameter is other than empty or *total*.

vfs.fs.size used to return huge values when the disk space available to normal users was exhausted. The "df" command shows negative value in this case. Now, 0 is returned. This behaviour was noticed on FreeBSD platform.

net.if.in, **net.if.out** and **net.if.total** items on Windows get values from 64-bit counters if available. 64-bit interface statistics counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters as before.

system.uname item on Windows gets values from WMI Win32_OperatingSystem and Win32_Processor classes instead of volatile Windows APIs and undocumented registry keys.

5.22 Function improvements `forecast()` and `timeleft()` [predictive functions](#) have been added.

A `percentile()` trigger [function](#) has been added, which returns the P-th percentile of a series of values. It can be used in calculated items, trigger expressions and notifications.

A check for valid reference has been added for global regular expressions in `logeventid()`, `regexp()` and `iregexp()` trigger functions. If entered reference is not valid, due to misspelling or missing referenced global regular expression, the trigger will switch to unknown state and appropriate error message will be displayed.

5.23 Macro improvements Low-level discovery macros can be used in item prototype *IPMI sensor* and *Units* fields.

Host-level macros such as {HOST.HOST}, {HOST.NAME}, {HOST.IP}, {HOST.DNS}, {HOST.CONN} and {HOST.PORT} along with user macros {\$MACRO} are now available in the trigger URL.

5.24 Commandline utility improvements `zabbix_get` exit code now is 0 (success) or 1 (error). In earlier versions it was 0 (success or error - cannot distinguish between them) or 141 (SIGPIPE).

5.25 API improvements 5.25.1 Returning permissions with `usergroup.get`

Returning user group permissions for host groups is now supported with the `usergroup.get` method. Setting permissions was already allowed with the `usergroup.create` and `usergroup.update` methods. Now it is also possible to retrieve rights using a new "selectRights" parameter.

Both permission level and host group ID can be returned. Super admin users can select any user group and get their rights, while admin level users can select their own user group and get rights to host groups that are either "read" or "read-write".

5.25.2 Value mapping

A [value map](#) API has been implemented. It comes with the standard [get](#), [create](#), [update](#) and [delete](#) methods.

5.25.3 Trends

A [trend](#) API has been implemented. It comes with the standard [get](#) method.

5.26 Miscellaneous improvements 5.26.1 Value map changes

A new "HTTP response status code" value map has been added.

- [Template changes](#)

6 What's new in Zabbix 3.0.1

This minor version does not have any functional changes.

7 What's new in Zabbix 3.0.2

1 Frontend improvements 1.1 Updated translations

- Czech
- English (United States)
- French
- Italian
- Japanese
- Korean
- Polish
- Portuguese (Brazil)
- Russian
- Slovak
- Ukrainian

2 Daemon improvements

- VMware items have been changed to become unsupported if no VMware collector processes are started.

8 What's new in Zabbix 3.0.3

1 Frontend improvements 1.1 Global script results

The global script result window has regained a header with the script name. Information about the executed command is now displayed as well.

	Ping
<pre>PING 192.168.3.252 (192.168.3.252) 56(84) bytes of data. 64 bytes from 192.168.3.252: icmp_seq=1 ttl=64 time=0.106 ms 64 bytes from 192.168.3.252: icmp_seq=2 ttl=64 time=0.132 ms 64 bytes from 192.168.3.252: icmp_seq=3 ttl=64 time=0.121 ms --- 192.168.3.252 ping statistics --- 3 packets transmitted, 3 received, 0% packet loss, time 1999ms rtt min/avg/max/mdev = 0.106/0.119/0.132/0.016 ms</pre>	<pre>/bin/ping -c 3 192.168.3.252 PING 192.168.3.252 (192.168.3.252) 56(84) bytes of data. 64 bytes from 192.168.3.252: icmp_seq=1 ttl=64 time=0.152 ms 64 bytes from 192.168.3.252: icmp_seq=2 ttl=64 time=0.218 ms 64 bytes from 192.168.3.252: icmp_seq=3 ttl=64 time=0.191 ms --- 192.168.3.252 ping statistics --- 3 packets transmitted, 3 received, 0% packet loss, time 2005ms rtt min/avg/max/mdev = 0.152/0.187/0.218/0.027 ms</pre>
Script result in 3.0.0	Script result in 3.0.3

1.2 Updated translations

- Chinese (China)
- English (United States)
- French
- Italian
- Japanese
- Korean
- Polish
- Portuguese (Brazil)
- Russian
- Slovak
- Spanish
- Ukrainian

Chinese (China) translation has been enabled to be displayed by default.

2 Daemon improvements

- Instead of switching trigger to unknown state if there are no data in period the `sum`, `str`, `regexp` and `iregexp` functions will return 0.
- If an `"icmppingsec"` item would return a value less than 0.0001 seconds, the value will be set to 0.0001 seconds.

3 Miscellaneous improvements Fixed issues with mysql user parameter configuration script `mysql.size` parameter. It contained a complex bash expression and was failing if the default shell was not bash (CVE-2016-4338).

9 What's new in Zabbix 3.0.4

1 Frontend improvements 1.1 Updated translations

- Chinese (China)
- Czech
- French
- German
- Italian
- Japanese

- Polish
- Portuguese (Brazil)
- Russian
- Slovak

2 SNMP monitoring

- Ability to monitor SNMP devices returning OIDs in decreasing or mixed order has been added ([ZBX-6370](#)).

3 Daemon improvements

- It is now possible to execute remote commands via SSH and Telnet using another interface than the Zabbix agent one ([ZBX-10907](#)). Previously only the agent interface could be used. The available interface to use will be selected in the following order:
 - Zabbix agent default interface
 - SNMP default interface
 - JMX default interface
 - IPMI default interface

10 What’s new in Zabbix 3.0.5

1 Frontend improvements

- Many frontend fields have been made much wider by default:

Expression

{Template IPMI Intel SR1630:bb_3.3v_stby.last(0)}<2.982 or {Template IPMI Intel SR1630:bb_3.3v_stby.last(0)}>3.625

Add

Expression constructor

Expression

{Template IPMI Intel SR1630:bb_3.3v_stby.last(0)}<2.982 or {Template IPMI Intel SR1630:bb_3.3v_stby.last(0)}>3.625

Add

Expression constructor

Before Zabbix 3.0.5

In Zabbix 3.0.5

- Dashboard widgets now take more of the available space when placed in just a single or two columns. They also align to the left, if placed in one column.

Dashboard

Status of Zabbix

Parameter	Value	Details
Zabbix server is running	Yes	localhost:10051
Number of hosts (enabled/disabled/templates)	55	10 / 1 / 44
Number of items (enabled/disabled/not supported)	364	352 / 3 / 9
Number of triggers (enabled/disabled [problem/ok])	95	92 / 3 [7 / 85]
Number of users (online)	3	1
Required server performance, new values per second	4.8	

Updated: 07:45:13

Last 20 issues

Host	Issue	Last change	Age	Info	Ack	Actions
Zabbix server 1	Zabbix unreachable poller processes more than 75% busy	2016-10-04 07:45:08	5s		No	
Zabbix server 1	Zabbix poller processes more than 75% busy	2016-10-04 07:45:02	11s		No	
Zabbix server 1	Trap trigger	2016-09-26 08:48:07	7d 22h 57m		No	
New host	Zabbix agent on New host is unreachable for 5 minutes	2016-09-13 09:24:30	20d 22h 20m		No	
New host	CPU load too high on 'New host' for 3 minutes	2016-09-12 19:00:49	21d 12h 44m		No	
Zabbix server 1	Lack of free swap space on Zabbix server 1	2016-06-21 10:18:54	3m 14d 21h		Yes 1	
New host	Free disk space is less than 20% on volume /	2016-04-05 11:18:08	6m 1d 20h		No	

7 of 7 issues are shown Updated: 07:45:13

System status

Host group	Disaster	High	Average	Warning	Information	Not classified
Clouds	0	0	0	0	0	0
Database servers	0	0	0	0	0	0
Discovered hosts	0	0	2	2	0	0

Previously in these cases large areas to the left/right would be unused, while information in the widget would get cramped.

- XML import now correctly converts SNMP low-level discovery rules to multiple OID support.

1.1 Updated translations

- Chinese (China)
- French
- German
- Korean
- Persian

2 Daemon improvements 2.1 ODBC monitoring

Now there is no answer size limitation for ODBC requests ([ZBX-8489](#)).

2.2 VMware monitoring optimisations

The VMware data processing and storage was changed, resulting in less time VMware cache is locked and also reducing the size of cached data.

11 What's new in Zabbix 3.0.6

1 Frontend improvements

- {HOST.*} macros used in web scenario configuration are now correctly resolved in several frontend locations, including *Monitoring* → *Web*, *Monitoring* → *Latest data*, simple graphs, etc.
- {HOST.*} macros in item key parameters are now also resolved for items without interfaces, resolving to either Zabbix agent, SNMP, JMX or IPMI interface of the host.
- User macros are now resolved on allowed hosts even if the macros are defined on a template that the user does not have permissions to.

1.1 Updated translations

- English (United States)
- Persian

- Russian
- Spanish
- Ukrainian

2 Daemon improvements

- Active agent auto-registration events are not generated any more if there is no action for auto registration.
- OpenSSL 1.1.0 support, it brings some new ciphersuites for PSK, enabling Perfect Forward Secrecy. See differences between OpenSSL 1.0.2c and 1.1.0 [Ciphersuites](#).
- Item creation/update by low-level discovery now returns errors in case macro resolving cannot be fully accomplished (instead of making such items that will inevitably fail on later stages). A corresponding error message will be displayed in *Configuration → Hosts → Discovery*.

3 Item changes 3.1 VMware monitoring

A new `vmware.hv.sensor.health.state` key has been added to monitor VMware hypervisor health state rollup sensor. The `vmware.hv.status` key was reverted back to its original implementation and now uses the hypervisor overall status property.

A new `vmware.hv.datastore.size` key has been added to monitor VMware datastore capacity and free space.

3.2 Chassis information

Changed `system.hw.chassis` key to read the DMI table from `sysfs`, if `sysfs` access fails then try reading directly from memory.

3.3 Windows monitoring

A new `vm.vmemory.size` key has been added to monitor virtual memory statistics on Windows.

4 Trigger functions

- Support for suffixed values has been added to the `threshold` parameter of the **`timeleft()`** trigger function.
- **`forecast()`** now supports negative values in the `time` parameter.

12 What's new in Zabbix 3.0.7

1 Frontend improvements 1.1 Updated translations

- Czech
- English (United States)
- French
- Italian
- Japanese
- Korean
- Portuguese (Brazil)
- Russian
- Ukrainian

2 Daemon improvements

- Previously inactive IPMI hosts were deleted only from IPMI poller processes. Now the inactive hosts are deleted also from unreachable poller processes.

13 What's new in Zabbix 3.0.8

1 Item count retrieval limit changes for queue requests `QUEUE_DETAIL_ITEM_COUNT` [definition parameter](#) now may be edited to retrieve more than default 500 values.

Format of the counter displayed in *Detail* view of *Administration → Queue* has been enhanced by exposing the overall number of queued items regardless of the parameter settings. Position and appearance of the counter has also been changed to be consistent with counters on the other pages.

Total: 24	Before Zabbix 3.0.8
Total: 500 (Truncated)	
Displaying 24 of 24 found	In Zabbix 3.0.8
Displaying 500 of 623 found	

2 Frontend improvements 2.1 Updated translations

- Czech
- French
- Japanese
- Polish
- Portuguese (Brazil)

3 Daemon improvements

- Database inserts on Oracle have been reworked to use dynamic binding. This should improve the bulk insert speed, especially in high latency environments.
- The rounding of numbers has been made more accurate when calculating CPU statistics.

14 What's new in Zabbix 3.0.9

Frontend improvements

- In Windows event log history events with a zero "Event ID" now have their "Event ID" displayed as "0".

15 What's new in Zabbix 3.0.10

1 Frontend improvements 1.1 Updated translations

- Chinese (China)
- Czech
- English (United States)
- Japanese
- Korean
- Polish
- Portuguese (Brazil)
- Romanian
- Russian
- Ukrainian
- Vietnamese

1.2 Miscellaneous

- Warning messages about errors are no longer displayed in the Status of Zabbix dashboard widget;
- If LDAP module is not installed or not enabled the LDAP configuration form is hidden in *Administration* → *Authentication* and a corresponding error message is displayed.

2 Daemon improvements Cache locking time during configuration synchronization has been reduced.

16 What's new in Zabbix 3.0.11

Frontend improvements

- A new `ZBX_URI_VALID_SCHEMES` **constant** has been added which defines the allowed URI schemes.

Updated translations

- Czech
- English (United States)
- French
- Italian
- Japanese
- Korean
- Russian
- Turkish

Enabled Turkish translation to be displayed by default.

Processing low-level discovery (LLD)

LLD rule processing has been modified so multiple values for the same LLD rule are not processed simultaneously. For more details, see the **upgrade notes**.

17 What's new in Zabbix 3.0.12

Frontend improvements

- Permissions are now correctly applied when revealing personal information from resolving `{ESC.HISTORY}`, `{EVENT.ACK.HISTORY}` macros. Non-super Admin users can only see personal details (such as user name, e-mail address) about themselves and other users who belong to their group. When displaying users that are from another group personal details are hidden, even though message text is viewable.

Daemon improvements

- On Unix-like systems Zabbix server, proxy and agent now follow changes in the `/etc/resolv.conf` file without restart.

18 What's new in Zabbix 3.0.13

Checking if macros in LLD rule filter receive value

It is now checked if all low-level discovery macros used in the low-level discovery rule filter actually receive a value. If JSON data do not contain a value for the corresponding macro, then an error message is displayed in the Info column for the discovery rule:

Cannot accurately apply filter: no value received for macro "`{#MACRO.NAME}`".

Item changes

- **system.cpu.num** agent item on AIX now returns a value based on the logical processors attached to an AIX LPAR and not the physical ones.

19 What's new in Zabbix 3.0.14

Configurable URI validation

URI validation, introduced in **Zabbix 3.0.11**, now can be turned off/on in the new `VALIDATE_URI_SCHEMES` frontend **constant**.

Item changes

- **vmware.eventlog** items that previously were always taking only the 10 latest events will now browse up to 1000 (this is a VMware limitation) events in search of events that have not yet been processed. This means there is less chance to miss events when they are generated at a higher rate. Zabbix can also catch up after some downtime.
- From now on, Zabbix internal item **zabbix[java,,ping]** will not become not supported if java gateway is misconfigured or java gateway is unreachable.

20 What's new in Zabbix 3.0.15

Item changes

- Previously in **log[]**, **logrt[]** items in the *skip* mode in case a log file did not initially exist and only appeared at a later time it was "skipped", i. e. older data in the log file were ignored. From now on, a log file which appears later is processed from the start

Daemon improvements

- Command line arguments that exceed 2KB are now supported in proc.num and proc.mem checks on AIX platform

21 What's new in Zabbix 3.0.16

1 Frontend improvements 1.1 Updated translations

- Chinese (China)
- Czech
- English (United States)
- Japanese
- Korean
- Russian
- Turkish
- Ukrainian

22 What's new in Zabbix 3.0.17

This minor version does not have any functional changes.

23 What's new in Zabbix 3.0.18

This minor version does not have any functional changes.

24 What's new in Zabbix 3.0.19

1 Frontend improvements 1.1 Updated translations

- English (United States)
- Japanese
- Korean

25 What's new in Zabbix 3.0.20

This minor version does not have any functional changes.

26 What's new in Zabbix 3.0.21

Item changes

- A new **zone** parameter is supported for the **proc.num** Zabbix agent **item**. It is supported on Solaris only.

Trigger expression constructor

Improvements have been made to the trigger expression constructor:

- String list in the *Function* field has been shortened; it now contains the trigger function choice only (no operator);
- Operators (>, <, =, <>) have been moved to a new drop-down field placed directly before the constant field;
- Missing operators have been added (>= and <=);
- The constant field is now combined with the operator field and named *Result*.

Condition

* Item

Function

Last of (T)

Time shift

* Result

27 What's new in Zabbix 3.0.22

Item changes

- **system.cpu.num** agent item on AIX now returns the current number of online logical processors and not the number of logical processors attached to an AIX LPAR.

28 What's new in Zabbix 3.0.23

Item improvements

The following items that were previously supported only on AIX LPAR of type "Shared", now are also supported on "Dedicated":

- **system.stat[cpu,ec]** (with "Dedicated" always returns 100 (percent))
- **system.stat[cpu,pc]**
- **system.stat[ent]**

See **system.stat[]** in **agent items** for more details.

Daemon improvements

- Support of OpenSSL 1.1.1 has been added.

29 What's new in Zabbix 3.0.24

License update for linking with OpenSSL

Exception has been added to the license giving permission that the code of Zabbix is linked with the OpenSSL project OpenSSL library (see README file in Zabbix source code).

Daemon improvements

- Daemons and commandline utilities when showing version information (with '-V' option) now also display the crypto library version.

Frontend improvements

- Cookie names and values are now properly URI-encoded.

30 What's new in Zabbix 3.0.25

This minor version does not have any functional changes.

31 What's new in Zabbix 3.0.26

This minor version does not have any functional changes.

32 What's new in Zabbix 3.0.27

This minor version does not have any functional changes.

33 What's new in Zabbix 3.0.28

Daemons

Windows agent compilation revision

Generating a Windows file properties revision number has been added for agent compilation on MS Windows. It follows a {b}-{t}-{nn} format where:

- {b} - source (1 - feature or release, 2 - tag)
- {t} - type (1 - alpha, 2 - beta, 3 - release candidate, 4 - release)
- {nn} - sequence number for the 'type'

For example:

Tag	Branch	Version	Result
3.0.28		Zabbix 3.0.28	3.0.28.2400
	release/3.0	Zabbix 3.0.28rc3	3.0.28.1303
	feature/ZBX-16074	Zabbix 3.0.28rc1	3.0.28.1301

34 What's new in Zabbix 3.0.29

This minor version does not have any functional changes.

35 What's new in Zabbix 3.0.30

This minor version does not have any functional changes.

36 What's new in Zabbix 3.0.31

This minor version does not have any functional changes.

37 What's new in Zabbix 3.0.32

Enhanced URL widget security

The URL dashboard widget and the URL screen element now put retrieved URL content into the sandbox. By default, all sandbox restrictions are enabled. It is possible to modify `sandbox` attribute settings in the `defines.inc.php` file, however turning sandboxing off is not recommended for security reasons. To learn more about the sandbox attribute, please see the [sandbox](#) section of the `iframe` HTML element description.

2. Zabbix concepts

Please use the sidebar to access content in the Zabbix concepts section.

1 Zabbix definitions

Overview

In this section you can learn the meaning of some terms commonly used in Zabbix.

Definitions

host

- a networked device that you want to monitor, with IP/DNS.

host group

- a logical grouping of hosts; it may contain hosts and templates. Hosts and templates within a host group are not in any way linked to each other. Host groups are used when assigning access rights to hosts for different user groups.

item

- a particular piece of data that you want to receive off of a host, a metric of data.

trigger

- a logical expression that defines a problem threshold and is used to "evaluate" data received in items

When received data are above the threshold, triggers go from 'Ok' into a 'Problem' state. When received data are below the threshold, triggers stay in/return to an 'Ok' state.

event

- a single occurrence of something that deserves attention such as a trigger changing state or a discovery/agent auto-registration taking place

action

- a predefined means of reacting to an event.

An action consists of operations (e.g. sending a notification) and conditions (when the operation is carried out)

escalation

- a custom scenario for executing operations within an action; a sequence of sending notifications/executing remote commands

media

- a means of delivering notifications; delivery channel

notification

- a message about some event sent to a user via the chosen media channel

remote command

- a pre-defined command that is automatically executed on a monitored host upon some condition

template

- a set of entities (items, triggers, graphs, screens, applications, low-level discovery rules, web scenarios) ready to be applied to one or several hosts

The job of templates is to speed up the deployment of monitoring tasks on a host; also to make it easier to apply mass changes to monitoring tasks. Templates are linked directly to individual hosts.

application

- a grouping of items in a logical group

web scenario

- one or several HTTP requests to check the availability of a web site

frontend

- the web interface provided with Zabbix

dashboard

- section of the web interface displaying summaries and visualisations of important information in visual blocks.

Zabbix API

- Zabbix API allows you to use the JSON RPC protocol to create, update and fetch Zabbix objects (like hosts, items, graphs and others) or perform any other custom tasks

Zabbix server

- a central process of Zabbix software that performs monitoring, interacts with Zabbix proxies and agents, calculates triggers, sends notifications; a central repository of data

Zabbix agent

- a process deployed on monitoring targets to actively monitor local resources and applications

Zabbix proxy

- a process that may collect data on behalf of Zabbix server, taking some processing load off of the server

encryption

- support of encrypted communications between Zabbix components (server, proxy, agent, zabbix_sender and zabbix_get utilities) using Transport Layer Security (TLS) protocol.

network discovery

- automated discovery of network devices.

low-level discovery

- automated discovery of low-level entities on a particular device (e.g. file systems, network interfaces, etc).

low-level discovery rule

- set of definitions for automated discovery of low-level entities on a device.

item prototype

- a metric with certain parameters as variables, ready for low-level discovery. After low-level discovery the variables are automatically substituted with the real discovered parameters and the metric automatically starts gathering data.

trigger prototype

- a trigger with certain parameters as variables, ready for low-level discovery. After low-level discovery the variables are automatically substituted with the real discovered parameters and the trigger automatically starts evaluating data.

Prototypes of some other Zabbix entities are also in use in low-level discovery - graph prototypes, host prototypes, host group prototypes, application prototypes.

agent auto-registration

- automated process whereby a Zabbix agent itself is registered as a host and started to monitor.

2 Server

Overview

Zabbix server is the central process of Zabbix software.

The server performs the polling and trapping of data, it calculates triggers, sends notifications to users. It is the central component to which Zabbix agents and proxies report data on availability and integrity of systems. The server can itself remotely check networked services (such as web servers and mail servers) using simple service checks.

The server is the central repository in which all configuration, statistical and operational data is stored, and it is the entity in Zabbix that will actively alert administrators when problems arise in any of the monitored systems.

The functioning of a basic Zabbix server is broken into three distinct components; they are: Zabbix server, web frontend and database storage.

All of the configuration information for Zabbix is stored in the database, which both the server and the web frontend interact with. For example, when you create a new item using the web frontend (or API) it is added to the items table in the database. Then, about once a minute Zabbix server will query the items table for a list of the items which are active that is then stored in a cache within the Zabbix server. This is why it can take up to two minutes for any changes made in Zabbix frontend to show up in the latest data section.

Server process

If installed as package

Zabbix server runs as a daemon process. The server can be started by executing:

```
shell> service zabbix-server start
```

This will work on most of GNU/Linux systems. On other systems you may need to run:

```
shell> /etc/init.d/zabbix-server start
```

Similarly, for stopping/restarting/viewing status, use the following commands:

```
shell> service zabbix-server stop
shell> service zabbix-server restart
shell> service zabbix-server status
```

Start up manually

If the above does not work you have to start it manually. Find the path to the zabbix_server binary and execute:

```
shell> zabbix_server
```

You can use the following command line parameters with Zabbix server:

-c --config <file>	absolute path to the configuration file (default is /usr/local/etc/zabbix_
-f --foreground	run Zabbix server in foreground
-R --runtime-control <option>	perform administrative functions
-h --help	give this help
-V --version	display version number

Note:

Runtime control is not supported on OpenBSD and NetBSD.

Examples of running Zabbix server with command line parameters:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf
shell> zabbix_server --help
shell> zabbix_server -V
```

Runtime control

Runtime control options:

Option	Description	Target
config_cache_reload	Reload configuration cache. Ignored if cache is being currently loaded.	

Option	Description	Target
housekeeper_execute	Start the housekeeping procedure. Ignored if the housekeeping procedure is currently in progress.	
log_level_increase[=<target>]	Increase log level, affects all processes if target is not specified.	pid - Process identifier (1 to 65535) process type - All processes of specified type (e.g., poller) process type,N - Process type and number (e.g., poller,3)
log_level_decrease[=<target>]	Decrease log level, affects all processes if target is not specified.	

Allowed range of PIDs for changing the log level of a single Zabbix process is from 1 to 65535. On systems with PIDs>65535, a <process type,N> target can be used as a workaround for changing the log level of a single process (e.g."history syncer,6").

Example of using runtime control to reload the server configuration cache:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf -R config_cache_reload
```

Example of using runtime control to trigger execution of housekeeper:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf -R housekeeper_execute
```

Examples of using runtime control to change log level:

Increase log level of all processes:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_increase
```

Increase log level of second poller process:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_increase=poller,2
```

Increase log level of process with PID 1234:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_increase=1234
```

Decrease log level of all http poller processes:

```
shell> zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_decrease="http poller"
```

Process user

Zabbix server is designed to run as a non-root user. It will run as whatever non-root user it is started as. So you can run server as any non-root user without any issues.

If you will try to run it as 'root', it will switch to a hardcoded 'zabbix' user, which must be **present** on your system. You can only run server as 'root' if you modify the 'AllowRoot' parameter in the server configuration file accordingly.

If Zabbix server and **agent** are run on the same machine it is recommended to use a different user for running the server than for running the agent. Otherwise, if both are run as the same user, the agent can access the server configuration file and any Admin level user in Zabbix can quite easily retrieve, for example, the database password.

Configuration file

See the **configuration file** options for details on configuring zabbix_server.

Start-up scripts

The scripts are used to automatically start/stop Zabbix processes during system's start-up/shutdown. The scripts are located under directory misc/init.d.

Supported platforms

Due to the security requirements and mission-critical nature of server operation, UNIX is the only operating system that can consistently deliver the necessary performance, fault tolerance and resilience. Zabbix operates on market leading versions.

Zabbix server is tested on the following platforms:

- Linux
- Solaris
- AIX
- HP-UX
- Mac OS X

- FreeBSD
- OpenBSD
- NetBSD
- SCO Open Server
- Tru64/OSF1

Note:

Zabbix may work on other Unix-like operating systems as well.

Locale

Note that the server requires a UTF-8 locale so that some textual items can be interpreted correctly. Most modern Unix-like systems have a UTF-8 locale as default, however, there are some systems where that may need to be set specifically.

3 Agent

Overview

Zabbix agent is deployed on a monitoring target to actively monitor local resources and applications (hard drives, memory, processor statistics etc).

The agent gathers operational information locally and reports data to Zabbix server for further processing. In case of failures (such as a hard disk running full or a crashed service process), Zabbix server can actively alert the administrators of the particular machine that reported the failure.

Zabbix agents are extremely efficient because of use of native system calls for gathering statistical information.

Passive and active checks

Zabbix agents can perform passive and active checks.

In a **passive check** the agent responds to a data request. Zabbix server (or proxy) asks for data, for example, CPU load, and Zabbix agent sends back the result.

Active checks require more complex processing. The agent must first retrieve a list of items from Zabbix server for independent processing. Then it will periodically send new values to the server.

Whether to perform passive or active checks is configured by selecting the respective monitoring **item type**. Zabbix agent processes items of type 'Zabbix agent' or 'Zabbix agent (active)'.

Supported platforms

Zabbix agent is supported for:

- Linux
- IBM AIX
- FreeBSD
- NetBSD
- OpenBSD
- HP-UX
- Mac OS X
- Solaris: 9, 10, 11
- Windows: all desktop and server versions since 2000

Agent on UNIX-like systems

Zabbix agent on UNIX-like systems is run on the host being monitored.

Installation

See the **package installation** section for instructions on how to install Zabbix agent as package.

Alternatively see instructions for **manual installation** if you do not want to use packages.

Attention:

In general, 32bit Zabbix agents will work on 64bit systems, but may fail in some cases.

If installed as package

Zabbix agent runs as a daemon process. The agent can be started by executing:

```
shell> service zabbix-agent start
```

This will work on most of GNU/Linux systems. On other systems you may need to run:

```
shell> /etc/init.d/zabbix-agent start
```

Similarly, for stopping/restarting/viewing status of Zabbix agent, use the following commands:

```
shell> service zabbix-agent stop
shell> service zabbix-agent restart
shell> service zabbix-agent status
```

Start up manually

If the above does not work you have to start it manually. Find the path to the zabbix_agentd binary and execute:

```
shell> zabbix_agentd
```

Agent on Windows systems

Zabbix agent on Windows runs as a Windows service.

Preparation

Zabbix agent is distributed as a zip archive. After you download the archive you need to unpack it. Choose any folder to store Zabbix agent and the configuration file, e. g.

C:\zabbix

Copy bin\zabbix_agentd.exe and conf\zabbix_agentd.conf files to c:\zabbix.

Edit the c:\zabbix\zabbix_agentd.conf file to your needs, making sure to specify a correct "Hostname" parameter.

Installation

After this is done use the following command to install Zabbix agent as Windows service:

```
C:\> c:\zabbix\zabbix_agentd.exe -c c:\zabbix\zabbix_agentd.conf -i
```

Now you should be able to configure "Zabbix agent" service normally as any other Windows service.

See [more details](#) on installing and running Zabbix agent on Windows.

Other agent options

It is possible to run multiple instances of the agent on a host. A single instance can use the default configuration file or a configuration file specified in the command line. In case of multiple instances each agent instance must have its own configuration file (one of the instances can use the default configuration file).

The following command line parameters can be used with Zabbix agent:

Parameter	Description
UNIX and Windows agent	
-c --config <config-file>	Absolute path to the configuration file. You may use this option to specify a configuration file that is not the default one. On UNIX, default is /usr/local/etc/zabbix_agentd.conf or as set by compile-time variables --sysconfdir or --prefix On Windows, default is c:\zabbix_agentd.conf
-p --print	Print known items and exit. Note: To return user parameter results as well, you must specify the configuration file (if it is not in the default location).
-t --test <item key>	Test specified item and exit. Note: To return user parameter results as well, you must specify the configuration file (if it is not in the default location).
-h --help	Display help information
-V --version	Display version number
UNIX agent only	
-R --runtime-control <option>	Perform administrative functions. See runtime control .
Windows agent only	

Parameter	Description
-m --multiple-agents	Use multiple agent instances (with -i,-d,-s,-x functions). To distinguish service names of instances, each service name will include the Hostname value from the specified configuration file.
Windows agent only (functions)	
-i --install	Install Zabbix Windows agent as service
-d --uninstall	Uninstall Zabbix Windows agent service
-s --start	Start Zabbix Windows agent service
-x --stop	Stop Zabbix Windows agent service

Specific **examples** of using command line parameters:

- printing all built-in agent items with values
- testing a user parameter with "mysql.ping" key defined in the specified configuration file
- installing a "Zabbix Agent" service for Windows using the default path to configuration file c:\zabbix_agentd.conf
- installing a "Zabbix Agent [Hostname]" service for Windows using the configuration file zabbix_agentd.conf located in the same folder as agent executable and make the service name unique by extending it by Hostname value from the config file

```
shell> zabbix_agentd --print
shell> zabbix_agentd -t "mysql.ping" -c /etc/zabbix/zabbix_agentd.conf
shell> zabbix_agentd.exe -i
shell> zabbix_agentd.exe -i -m -c zabbix_agentd.conf
```

Runtime control

With runtime control options you may change the log level of agent processes.

Option	Description	Target
log_level_increase[=<target>]	Increase log level. If target is not specified, all processes are affected.	Target can be specified as: pid - process identifier (1 to 65535) process type - all processes of specified type (e.g., listener) process type,N - process type and number (e.g., listener,3)
log_level_decrease[=<target>]	Decrease log level. If target is not specified, all processes are affected.	

Note that the usable range of PIDs for changing the log level of a single agent process is 1 to 65535. On systems with PIDs>65535, a <process type,N> target can be used as a workaround for changing the log level of a single process. Examples:

- increasing log level of all processes
- increasing log level of the third listener process
- increasing log level of process with PID 1234
- decreasing log level of all active check processes

```
shell> zabbix_agentd -R log_level_increase
shell> zabbix_agentd -R log_level_increase=listener,3
shell> zabbix_agentd -R log_level_increase=1234
shell> zabbix_agentd -R log_level_decrease="active checks"
```

Note:

Runtime control is not supported on OpenBSD, NetBSD and Windows.

Process user

Zabbix agent on UNIX is designed to run as a non-root user. It will run as whatever non-root user it is started as. So you can run agent as any non-root user without any issues.

If you will try to run it as 'root', it will switch to a hardcoded 'zabbix' user, which must be present on your system. You can only run agent as 'root' if you modify the 'AllowRoot' parameter in the agent configuration file accordingly.

Configuration file

For details on configuring Zabbix agent see the configuration file options for [zabbix_agentd](#) or [Windows agent](#).

Locale

Note that the agent requires a UTF-8 locale so that some textual agent items can return the expected content. Most modern Unix-like systems have a UTF-8 locale as default, however, there are some systems where that may need to be set specifically.

Exit code

Before version 2.2 Zabbix agent returned 0 in case of successful exit and 255 in case of failure. Starting from version 2.2 and higher Zabbix agent returns 0 in case of successful exit and 1 in case of failure.

4 Proxy

Overview

Zabbix proxy is a process that may collect monitoring data from one or more monitored devices and send the information to the Zabbix server, essentially working on behalf of the server. All collected data is buffered locally and then transferred to the Zabbix server the proxy belongs to.

Deploying a proxy is optional, but may be very beneficial to distribute the load of a single Zabbix server. If only proxies collect data, processing on the server becomes less CPU and disk I/O hungry.

A Zabbix proxy is the ideal solution for centralized monitoring of remote locations, branches and networks with no local administrators.

Zabbix proxy requires a separate database.

Attention:

Note that databases supported with Zabbix proxy are SQLite, MySQL and PostgreSQL. Using Oracle or IBM DB2 is at your own risk and may contain some limitations as, for example, in [return values](#) of low-level discovery rules.

Attention:

'Increment offset' parameter in the *database configuration* should remain at the default value "1". If increment offset has been manually changed, it may slow down performance of Zabbix proxy (the proxy will detect missing record numbers and wait for the uncommitted data).

See also: [Using proxies in a distributed environment](#)

Proxy process

If installed as package

Zabbix proxy runs as a daemon process. The proxy can be started by executing:

```
shell> service zabbix-proxy start
```

This will work on most of GNU/Linux systems. On other systems you may need to run:

```
shell> /etc/init.d/zabbix-proxy start
```

Similarly, for stopping/restarting/viewing status of Zabbix proxy, use the following commands:

```
shell> service zabbix-proxy stop
shell> service zabbix-proxy restart
shell> service zabbix-proxy status
```

Start up manually

If the above does not work you have to start it manually. Find the path to the `zabbix_proxy` binary and execute:

```
shell> zabbix_proxy
```

You can use the following command line parameters with Zabbix proxy:

<code>-c --config <file></code>	absolute path to the configuration file
<code>-f --foreground</code>	run Zabbix proxy in foreground
<code>-R --runtime-control <option></code>	perform administrative functions
<code>-h --help</code>	give this help
<code>-V --version</code>	display version number

Note:

Runtime control is not supported on OpenBSD and NetBSD.

Examples of running Zabbix proxy with command line parameters:

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf
shell> zabbix_proxy --help
shell> zabbix_proxy -V
```

Runtime control

Runtime control options:

Option	Description	Target
config_cache_reload	Reload configuration cache. Ignored if cache is being currently loaded. Active Zabbix proxy will connect to the Zabbix server and request configuration data.	
housekeeper_execute	Start the housekeeping procedure. Ignored if the housekeeping procedure is currently in progress.	
log_level_increase[=<target>]	Increase log level, affects all processes if target is not specified.	pid - Process identifier (1 to 65535) process type - All processes of specified type (e.g., poller) process type,N - Process type and number (e.g., poller,3)
log_level_decrease[=<target>]	Decrease log level, affects all processes if target is not specified.	

Allowed range of PIDs for changing the log level of a single Zabbix process is from 1 to 65535. On systems with PIDs>65535, a <process type,N> target can be used as a workaround for changing the log level of a single process.

Example of using runtime control to reload the proxy configuration cache:

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R config_cache_reload
```

Example of using runtime control to trigger execution of housekeeper

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R housekeeper_execute
```

Examples of using runtime control to change log level:

Increase log level of all processes:

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_increase
```

Increase log level of second poller process:

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_increase=poller,2
```

Increase log level of process with PID 1234:

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_increase=1234
```

Decrease log level of all http poller processes:

```
shell> zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_decrease="http poller"
```

Process user

Zabbix proxy is designed to run as a non-root user. It will run as whatever non-root user it is started as. So you can run proxy as any non-root user without any issues.

If you will try to run it as 'root', it will switch to a hardcoded 'zabbix' user, which must be present on your system. You can only run proxy as 'root' if you modify the 'AllowRoot' parameter in the proxy configuration file accordingly.

Configuration file

See the [configuration file](#) options for details on configuring zabbix_proxy.

Supported platforms

Zabbix proxy runs on the same list of **server#supported platforms** as Zabbix server.

Locale

Note that the proxy requires a UTF-8 locale so that some textual items can be interpreted correctly. Most modern Unix-like systems have a UTF-8 locale as default, however, there are some systems where that may need to be set specifically.

5 Java gateway

Overview

Native support for monitoring JMX applications exists in the form of a Zabbix daemon called "Zabbix Java gateway", available since Zabbix 2.0. Zabbix Java gateway is a daemon written in Java. To find out the value of a particular JMX counter on a host, Zabbix server queries Zabbix Java gateway, which uses the **JMX management API** to query the application of interest remotely. The application does not need any additional software installed, it just has to be started with `-Dcom.sun.management.jmxremote` option on the command line.

Java gateway accepts incoming connection from Zabbix server or proxy and can only be used as a "passive proxy". As opposed to Zabbix proxy, it may also be used from Zabbix proxy (Zabbix proxies cannot be chained). Access to each Java gateway is configured directly in Zabbix server or proxy configuration file, thus only one Java gateway may be configured per Zabbix server or Zabbix proxy. If a host will have items of type **JMX agent** and items of other type, only the **JMX agent** items will be passed to Java gateway for retrieval.

When an item has to be updated over Java gateway, Zabbix server or proxy will connect to the Java gateway and request the value, which Java gateway in turn retrieves and passes back to the server or proxy. As such, Java gateway does not cache any values.

Zabbix server or proxy has a specific type of processes that connect to Java gateway, controlled by the option **StartJavaPollers**. Internally, Java gateway starts multiple threads, controlled by the **START_POLLERS** option. On the server side, if a connection takes more than **Timeout** seconds, it will be terminated, but Java gateway might still be busy retrieving value from the JMX counter. To solve this, there is the **TIMEOUT** option in Java gateway that allows to set timeout for JMX network operations.

Zabbix server or proxy will try to pool requests to a single JMX target together as much as possible (affected by item intervals) and send them to the Java Gateway in a single connection for better performance.

It is suggested to have **StartJavaPollers** less than or equal to **START_POLLERS**, otherwise there might be situations when no threads are available in the Java gateway to service incoming requests; in such a case Java gateway uses `ThreadPoolExecutor.CallerRunsPolicy`, meaning that the main thread will service the incoming request and temporarily will not accept any new requests.

Sections below describe how to get and run Zabbix Java gateway, how to configure Zabbix server (or Zabbix proxy) to use Zabbix Java gateway for JMX monitoring, and how to configure Zabbix items in Zabbix GUI that correspond to particular JMX counters.

1 Getting Java gateway

There are two ways to get Java gateway. One is to download Java gateway package from Zabbix website and the other is to compile Java gateway from source.

1.1 Downloading from Zabbix website

Zabbix Java gateway packages (RHEL, Debian, Ubuntu) are available for download at <http://www.zabbix.com/download.php>.

1.2 Compiling from source

In order to compile Java gateway, you first run `./configure` script with `--enable-java` option. It is advisable that you specify `--prefix` option to request installation path other than the default `/usr/local`, because installing Java gateway will create a whole directory tree, not just a single executable.

```
$ ./configure --enable-java --prefix=$PREFIX
```

To compile and package Java gateway into a JAR file, run `make`. Note that for this step you will need `javac` and `jar` executables in your path.

```
$ make
```

Now you have `zabbix-java-gateway-$VERSION.jar` file in `src/zabbix_java/bin`. If you are comfortable with running Java gateway from `src/zabbix_java` in the distribution directory, then you can proceed to instructions for configuring and running Java gateway. Otherwise, make sure you have enough privileges and run `make install`.

```
$ make install
```

2 Overview of files in Java gateway distribution

Regardless of how you obtained Java gateway, you should have ended up with a collection of shell scripts, JAR and configuration files under \$PREFIX/sbin/zabbix_java. The role of these files is summarized below.

bin/zabbix-java-gateway-\$VERSION.jar

Java gateway JAR file itself.

lib/logback-core-0.9.27.jar
lib/logback-classic-0.9.27.jar
lib/slf4j-api-1.6.1.jar
lib/android-json-4.3_r3.1.jar

Dependencies of Java gateway: [Logback](#), [SLF4J](#), and [Android JSON](#) library.

lib/logback.xml
lib/logback-console.xml

Configuration files for Logback.

shutdown.sh
startup.sh

Convenience scripts for starting and stopping Java gateway.

settings.sh

Configuration file that is sourced by startup and shutdown scripts above.

3 Configuring and running Java gateway

By default, Java gateway listens on port 10052. If you plan on running Java gateway on a different port, you can specify that in settings.sh script. See the description of [Java gateway configuration file](#) for how to specify this and other options.

Warning:

Port 10052 is not [IANA registered](#).

Once you are comfortable with the settings, you can start Java gateway by running the startup script:

```
$ ./startup.sh
```

Likewise, once you no longer need Java gateway, run the shutdown script to stop it:

```
$ ./shutdown.sh
```

Note that unlike server or proxy, Java gateway is lightweight and does not need a database.

4 Configuring server for use with Java gateway

Now that Java gateway is running, you have to tell Zabbix server where to find Zabbix Java gateway. This is done by specifying JavaGateway and JavaGatewayPort parameters in [server configuration file](#). If the host on which JMX application is running is monitored by Zabbix proxy, then you specify the connection parameters in [proxy configuration file](#) instead.

```
JavaGateway=192.168.3.14  
JavaGatewayPort=10052
```

By default, server does not start any processes related to JMX monitoring. If you wish to use it, however, you have to specify the number of pre-forked instances of Java pollers. You do this in the same way you specify regular pollers and trappers.

```
StartJavaPollers=5
```

Do not forget to restart server or proxy, once you are done with configuring them.

5 Debugging Java gateway

In case there are any problems with Java gateway or an error message that you see about an item in the frontend is not descriptive enough, you might wish to take a look at Java gateway log file.

By default, Java gateway logs its activities into /tmp/zabbix_java.log file with log level "info". Sometimes that information is not enough and there is a need for information at log level "debug". In order to increase logging level, modify file lib/logback.xml and change the level attribute of <root> tag to "debug":

```
<root level="debug">  
  <appender-ref ref="FILE" />  
</root>
```

Note that unlike Zabbix server or Zabbix proxy, there is no need to restart Zabbix Java gateway after changing logback.xml file - changes in logback.xml will be picked up automatically. When you are done with debugging, you can return the logging level to "info".

If you wish to log to a different file or a completely different medium like database, adjust logback.xml file to meet your needs. See [Logback Manual](#) for more details.

Sometimes for debugging purposes it is useful to start Java gateway as a console application rather than a daemon. To do that, comment out PID_FILE variable in settings.sh. If PID_FILE is omitted, startup.sh script starts Java gateway as a console application and makes Logback use lib/logback-console.xml file instead, which not only logs to console, but has logging level "debug" enabled as well.

Finally, note that since Java gateway uses SLF4J for logging, you can replace Logback with the framework of your choice by placing an appropriate JAR file in lib directory. See [SLF4J Manual](#) for more details.

6 Sender

Overview

Zabbix sender is a command line utility that may be used to send performance data to Zabbix server for processing.

The utility is usually used in long running user scripts for periodical sending of availability and performance data.

For sending results directly to Zabbix server or proxy, a **trapper item** type must be configured.

Running Zabbix sender

An example of running Zabbix UNIX sender:

```
shell> cd bin
shell> ./zabbix_sender -z zabbix -s "Linux DB3" -k db.connections -o 43
```

where:

- z - Zabbix server host (IP address can be used as well)
- s - technical name of monitored host (as registered in Zabbix frontend)
- k - item key
- o - value to send

Attention:

Options that contain whitespaces, must be quoted using double quotes.

Zabbix sender can be used to send multiple values from an input file. See the [Zabbix sender manpage](#) for more information.

Zabbix sender accepts strings in UTF-8 encoding (for both UNIX-like systems and Windows) without byte order mark (BOM) first in the file.

Zabbix sender on Windows can be run similarly:

```
zabbix_sender.exe [options]
```

Since Zabbix 1.8.4, zabbix_sender realtime sending scenarios have been improved to gather multiple values passed to it in close succession and send them to the server in a single connection. A value that is not further apart from the previous value than 0.2 seconds can be put in the same stack, but maximum pooling time still is 1 second.

Note:

Zabbix sender will terminate if invalid (not following *parameter=value* notation) parameter entry is present in the specified configuration file.

7 Get

Overview

Zabbix get is a command line utility which can be used to communicate with Zabbix agent and retrieve required information from the agent.

The utility is usually used for the troubleshooting of Zabbix agents.

Running Zabbix get

An example of running Zabbix get under UNIX to get the processor load value from the agent:

```
shell> cd bin
shell> ./zabbix_get -s 127.0.0.1 -p 10050 -k system.cpu.load[all,avg1]
```

Another example of running Zabbix get for capturing a string from a website:

```
shell> cd bin
shell> ./zabbix_get -s 192.168.1.1 -p 10050 -k "web.page.regex[www.zabbix.com,,,\"USA: ([a-zA-Z0-9.-]+)\"]"
```

Note that the item key here contains a space so quotes are used to mark the item key to the shell. The quotes are not part of the item key; they will be trimmed by the shell and will not be passed to Zabbix agent.

Zabbix get accepts the following command line parameters:

-s --host <host name or IP>	Specify host name or IP address of a host.
-p --port <port number>	Specify port number of agent running on the host. Default is 10050.
-I --source-address <IP address>	Specify source IP address.
-k --key <item key>	Specify key of item to retrieve value of.
-h --help	Give this help.
-V --version	Display version number.

See also [Zabbix get manpage](#) for more information.

Zabbix get on Windows can be run similarly:

```
zabbix_get.exe [options]
```

3. Installation

Please use the sidebar to access content in the Installation section.

1 Getting Zabbix

Overview

There are four ways of getting Zabbix:

- Install it from the [distribution packages](#)
- Download the latest source archive and [compile it yourself](#)
- Install it from the [containers](#)
- Download the [virtual appliance](#)

To download the latest distribution packages, pre-compiled sources or the virtual appliance, go to the [Zabbix download page](#), where direct links to latest versions are provided.

Getting Zabbix source code

There are several ways of getting Zabbix source code:

- You can [download](#) the released stable versions from the official Zabbix website
- You can [download](#) nightly builds from the official Zabbix website developer page
- You can get the latest development version from the Git source code repository system:
 - The primary location of the full repository is at <https://git.zabbix.com/scm/zbx/zabbix.git>
 - Master and supported releases are also mirrored to Github at <https://github.com/zabbix/zabbix>

A Git client must be installed to clone the repository. The official commandline Git client package is commonly called **git** in distributions. To install, for example, on Debian/Ubuntu, run:

```
sudo apt-get update
sudo apt-get install git
```

To grab all Zabbix source, change to the directory you want to place the code in and execute:

```
git clone https://git.zabbix.com/scm/zbx/zabbix.git
```

2 Requirements

Hardware

Memory

Zabbix requires both physical and disk memory. 128 MB of physical memory and 256 MB of free disk space could be a good starting point. However, the amount of required disk memory obviously depends on the number of hosts and parameters that are being monitored. If you're planning to keep a long history of monitored parameters, you should be thinking of at least a couple of gigabytes to have enough space to store the history in the database. Each Zabbix daemon process requires several connections to a database server. Amount of memory allocated for the connection depends on configuration of the database engine.

Note:

The more physical memory you have, the faster the database (and therefore Zabbix) works!

CPU

Zabbix and especially Zabbix database may require significant CPU resources depending on number of monitored parameters and chosen database engine.

Other hardware

A serial communication port and a serial GSM modem are required for using SMS notification support in Zabbix. USB-to-serial converter will also work.

Examples of hardware configuration

The table provides several examples of hardware configurations:

Name	Platform	CPU/Memory	Database	Monitored hosts
<i>Small</i>	CentOS	Virtual Appliance	MySQL InnoDB	100
<i>Medium</i>	CentOS	2 CPU cores/2GB	MySQL InnoDB	500
<i>Large</i>	RedHat Enterprise Linux	4 CPU cores/8GB	RAID10 MySQL InnoDB or PostgreSQL	>1000
<i>Very large</i>	RedHat Enterprise Linux	8 CPU cores/16GB	Fast RAID10 MySQL InnoDB or PostgreSQL	>10000

Note:

Actual configuration depends on the number of active items and refresh rates very much (see [database size](#) section of this page for details). It is highly recommended to run the database on a separate box for large installations.

Supported platforms

Due to security requirements and mission-critical nature of monitoring server, UNIX is the only operating system that can consistently deliver the necessary performance, fault tolerance and resilience. Zabbix operates on market leading versions.

Zabbix is tested on the following platforms:

- Linux
- IBM AIX
- FreeBSD
- NetBSD
- OpenBSD
- HP-UX
- Mac OS X
- Solaris
- Windows: all desktop and server versions since 2000 (Zabbix agent only)

Note:

Zabbix may work on other Unix-like operating systems as well.

Attention:

Zabbix disables core dumps on UNIX platforms if compiled with encryption and does not start if system (e.g. SELinux policy) does not allow disabling of core dumps.

Software

Zabbix is built around a modern Apache web server, leading database engines, and PHP scripting language.

Database management system

Software	Version	Comments
<i>MySQL</i>	5.0.3 - 5.7.x	Required if MySQL is used as Zabbix backend database. InnoDB engine is required. MariaDB also works with Zabbix. Note that MySQL 8.0 is not supported in Zabbix pre-4.0 versions. We recommend using the MariaDB Connector/C library for building server/proxy regardless of whether you use a MySQL or MariaDB database server.
<i>Oracle</i>	10g or later	Required if Oracle is used as Zabbix backend database.
<i>PostgreSQL</i>	8.1 or later	Required if PostgreSQL is used as Zabbix backend database. It is suggested to use at least PostgreSQL 8.3, which introduced much better VACUUM performance .
<i>SQLite</i>	3.3.5 or later	Required if SQLite is used as Zabbix backend database.
<i>IBM DB2</i>	9.7 or later	Required if IBM DB2 is used as Zabbix backend database.

Attention:

IBM DB2 support is experimental!

Attention:

While SQLite3 can be used with Zabbix proxies without any problems, using SQLite3 with Zabbix server is not recommended. Since Zabbix 2.4.0, simultaneous database access with server and frontend may even lead to database corruption!

Frontend

The following software is required to run Zabbix frontend:

Software	Version	Comments
<i>Apache</i>	1.3.12 or later	
<i>PHP</i>	5.4.0 or later	PHP v7 is not supported yet.
PHP extensions: <i>gd</i>	2.0 or later	PHP GD extension must support PNG images (<code>--with-png-dir</code>), JPEG (<code>--with-jpeg-dir</code>) images and FreeType 2 (<code>--with-freetype-dir</code>).
<i>bcmath</i>		php-bcmath (<code>--enable-bcmath</code>)
<i>ctype</i>		php-ctype (<code>--enable-ctype</code>)
<i>libXML</i>	2.6.15 or later	php-xml or php5-dom, if provided as a separate package by the distributor.
<i>xmlreader</i>		php-xmlreader, if provided as a separate package by the distributor.

Software	Version	Comments
<i>xmlwriter</i>		php-xmlwriter, if provided as a separate package by the distributor.
<i>session</i>		php-session, if provided as a separate package by the distributor.
<i>sockets</i>		php-net-socket (<i>--enable-sockets</i>). Required for user script support.
<i>mbstring</i>		php-mbstring (<i>--enable-mbstring</i>)
<i>gettext</i>		php-gettext (<i>--with-gettext</i>). Required for translations to work.
<i>ldap</i>		php-ldap. Required only if LDAP authentication is used in the frontend.
<i>ibm_db2</i>		Required if IBM DB2 is used as Zabbix backend database.
<i>mysqli</i>		Required if MySQL is used as Zabbix backend database.
<i>oci8</i>		Required if Oracle is used as Zabbix backend database.
<i>pgsql</i>		Required if PostgreSQL is used as Zabbix backend database.
<i>sqlite3</i>		Required if SQLite is used as Zabbix backend database.

Note:

Zabbix may work on previous versions of Apache, MySQL, Oracle, and PostgreSQL as well.

Attention:

For other fonts than the default DejaVu, PHP function [imagerotate](#) might be required. If it is missing, these fonts might be rendered incorrectly when a graph is displayed. This function is only available if PHP is compiled with bundled GD, which is not the case in Debian and other distributions.

Web browser on client side

Cookies and Java Script must be enabled.

Latest versions of Google Chrome, Mozilla Firefox, Microsoft Internet Explorer and Opera are supported. Other browsers (Apple Safari, Konqueror) may work with Zabbix as well.

Warning:

Starting with Zabbix 3.0.13, the same origin policy for IFrames is implemented, which means that Zabbix cannot be placed in frames on a different domain.

Still, pages placed into a Zabbix frame will have access to Zabbix frontend (through JavaScript) if the page that is placed in the frame and Zabbix frontend are on the same domain. A page like <http://secure-zabbix.com/cms/page.html>, if placed into screens on <http://secure-zabbix.com/zabbix/>, will have full JS access to Zabbix.

Server

Requirement	Description
<i>OpenIPMI</i>	Required for IPMI support.
<i>libssh2</i>	Required for SSH support. Version 1.0 or higher.
<i>fping</i>	Required for ICMP ping items .
<i>libcurl</i>	Required for web monitoring, VMware monitoring and SMTP authentication. For SMTP authentication, version 7.20.0 or higher is required.
<i>libiksemel</i>	Required for Jabber support.
<i>libxml2</i>	Required for VMware monitoring.
<i>net-snmp</i>	Required for SNMP support.
<i>GnuTLS, OpenSSL, LibreSSL or mbedTLS</i>	Required when using encryption .

Requirement	Description
<i>GnuTLS, OpenSSL, LibreSSL or mbedTLS</i>	Required when using encryption .

Java gateway

If you obtained Zabbix from the source repository or an archive, then the necessary dependencies are already included in the source tree.

If you obtained Zabbix from your distribution's package, then the necessary dependencies are already provided by the packaging system.

In both cases above, the software is ready to be used and no additional downloads are necessary.

If, however, you wish to provide your versions of these dependencies (for instance, if you are preparing a package for some Linux distribution), below is the list of library versions that Java gateway is known to work with. Zabbix may work with other versions of these libraries, too.

The following table lists JAR files that are currently bundled with Java gateway in the original code:

Library	License	Website	Comments
<i>logback-core-0.9.27.jar</i>	EPL 1.0, LGPL 2.1	http://logback.qos.ch/	Tested with 0.9.27, 1.0.13, and 1.1.1.
<i>logback-classic-0.9.27.jar</i>	EPL 1.0, LGPL 2.1	http://logback.qos.ch/	Tested with 0.9.27, 1.0.13, and 1.1.1.
<i>slf4j-api-1.6.1.jar</i>	MIT License	http://www.slf4j.org/	Tested with 1.6.1, 1.6.6, and 1.7.6.
<i>android-json-4.3_r3.1.jar</i>	Apache License 2.0	https://android.googlesource.com/platform/libcore/+/_master/json	Tested with 2.3.3_r1.1 and 4.3_r3.1. See <code>src/zabbix_java/lib/README</code> for instructions on creating a JAR file.

Java gateway compiles and runs with Java 1.6 and above. It is recommended that those who provide a precompiled version of the gateway for others use Java 1.6 for compilation, so that it runs on all versions of Java up to the latest one.

Database size

Zabbix configuration data require a fixed amount of disk space and do not grow much.

Zabbix database size mainly depends on these variables, which define the amount of stored historical data:

- Number of processed values per second

This is the average number of new values Zabbix server receives every second. For example, if we have 3000 items for monitoring with refresh rate of 60 seconds, the number of values per second is calculated as $3000/60 = 50$.

It means that 50 new values are added to Zabbix database every second.

- Housekeeper settings for history

Zabbix keeps values for a fixed period of time, normally several weeks or months. Each new value requires a certain amount of disk space for data and index.

So, if we would like to keep 30 days of history and we receive 50 values per second, total number of values will be around $(30 \times 24 \times 3600) \times 50 = 129.600.000$, or about 130M of values.

Depending on the database engine used, type of received values (floats, integers, strings, log files, etc), the disk space for keeping a single value may vary from 40 bytes to hundreds of bytes. Normally it is around 90 bytes per value for numeric items. In our case, it means that 130M of values will require $130M \times 90 \text{ bytes} = 10.9GB$ of disk space.

Note:

The size of text/log item values is impossible to predict exactly, but you may expect around 500 bytes per value.

- Housekeeper setting for trends

Zabbix keeps a 1-hour max/min/avg/count set of values for each item in the table **trends**. The data is used for trending and long period graphs. The one hour period can not be customised.

Zabbix database, depending on database type, requires about 90 bytes per each total. Suppose we would like to keep trend data for 5 years. Values for 3000 items will require $3000 * 24 * 365 * 90 = 2.2\text{GB}$ per year, or **11GB** for 5 years.

- Housekeeper settings for events

Each Zabbix event requires approximately 170 bytes of disk space. It is hard to estimate the number of events generated by Zabbix daily. In the worst case scenario, we may assume that Zabbix generates one event per second.

It means that if we want to keep 3 years of events, this would require $3 * 365 * 24 * 3600 * 170 = 15\text{GB}$

The table contains formulas that can be used to calculate the disk space required for Zabbix system:

Parameter	Formula for required disk space (in bytes)
<i>Zabbix configuration</i>	Fixed size. Normally 10MB or less.
<i>History</i>	$\text{days} * (\text{items} / \text{refresh rate}) * 24 * 3600 * \text{bytes}$ items : number of items days : number of days to keep history refresh rate : average refresh rate of items bytes : number of bytes required to keep single value, depends on database engine, normally ~90 bytes.
<i>Trends</i>	$\text{days} * (\text{items} / 3600) * 24 * 3600 * \text{bytes}$ items : number of items days : number of days to keep history bytes : number of bytes required to keep single trend, depends on database engine, normally ~90 bytes.
<i>Events</i>	$\text{days} * \text{events} * 24 * 3600 * \text{bytes}$ events : number of event per second. One (1) event per second in worst case scenario. days : number of days to keep history bytes : number of bytes required to keep single trend, depends on database engine, normally ~170 bytes.

Note:

Average values such as ~90 bytes for numeric items, ~170 bytes for events have been gathered from real-life statistics using a MySQL backend database.

So, the total required disk space can be calculated as:

Configuration + History + Trends + Events

The disk space will NOT be used immediately after Zabbix installation. Database size will grow then it will stop growing at some point, which depends on housekeeper settings.

Time synchronisation

It is very important to have precise system time on server with Zabbix running. [ntpd](#) is the most popular daemon that synchronizes the host's time with the time of other machines. It's strongly recommended to maintain synchronised system time on all systems Zabbix components are running on.

If the time is not synchronised Zabbix will convert timestamps of the gathered data into Zabbix server time by taking client/server timestamps after establishing data connection and adjusting the received item value timestamps by the client-server time difference. To keep it simple and avoid possible complications the connection latency is ignored. Because of that the connection latency is added to the timestamps of data acquired from active connections (active agent, active proxy, sender) and subtracted from the timestamps of data acquired from passive connections (passive proxy). All other checks are done in server time and their timestamps are not adjusted.

Best practices for secure Zabbix setup

Overview

This section contains best practices that should be observed in order to set up Zabbix in a secure way.

The practices contained here are not required for the functioning of Zabbix. They are recommended for better security of the system.

Principle of least privilege

The principle of least privilege should be used at all times for Zabbix. This principle means that user accounts (in Zabbix frontend) or process user (for Zabbix server/proxy or agent) have only those privileges that are essential to perform intended functions. In other words, user accounts at all times should run with as few privileges as possible.

Attention:

Giving extra permissions to 'zabbix' user will allow it to access configuration files and execute operations that can compromise the overall security of infrastructure.

When implementing the least privilege principle for user accounts, Zabbix **frontend user types** should be taken into account. It is important to understand that while a "Zabbix Admin" user type has less privileges than "Zabbix Super Admin" user type, it has administrative permissions that allow managing configuration and execute custom scripts.

Note:

Some information is available even for non-privileged users. For example, while *Administration* → *Scripts* is not available for non-Super Admins, scripts themselves are available for retrieval by using Zabbix API. Limiting script permissions and not adding sensitive information (like access credentials, etc) should be used to avoid exposure of sensitive information available in global scripts.

Secure user for Zabbix agent

In the default configuration, Zabbix server and Zabbix agent processes share one 'zabbix' user. If you wish to make sure that the agent cannot access sensitive details in server configuration (e.g. database login information), the agent should be run as a different user:

1. Create a secure user
2. Specify this user in the agent **configuration file** ('User' parameter)
3. Restart the agent with administrator privileges. Privileges will be dropped to the specified user.

UTF-8 encoding

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings.

Setting up SSL for Zabbix frontend

On RHEL/CentOS, install mod_ssl package:

```
yum install mod_ssl
```

Create directory for SSL keys:

```
mkdir -p /etc/httpd/ssl/private
chmod 700 /etc/httpd/ssl/private
```

Create SSL certificate:

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout /etc/httpd/ssl/private/apache-selfsigned.key -
```

Fill out the prompts appropriately. The most important line is the one that requests the Common Name. You need to enter the domain name that you want to be associated with your server. You can enter the public IP address instead if you do not have a domain name. We will use *example.com* in this article.

Country Name (2 letter code) [XX]:

State or Province Name (full name) []:

Locality Name (eg, city) [Default City]:

Organization Name (eg, company) [Default Company Ltd]:

Organizational Unit Name (eg, section) []:

Common Name (eg, your name or your server's hostname) []:example.com

Email Address []:

Edit Apache SSL configuration:

```
/etc/httpd/conf.d/ssl.conf
```

```
DocumentRoot "/usr/share/zabbix"
```

```
ServerName example.com:443
```

```
SSLCertificateFile /etc/httpd/ssl/apache-selfsigned.crt
```

```
SSLCertificateKeyFile /etc/httpd/ssl/private/apache-selfsigned.key
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Enabling Zabbix on root directory of URL

Add a virtual host to Apache configuration and set permanent redirect for document root to Zabbix SSL URL. Do not forget to replace *example.com* with the actual name of the server.

```
/etc/httpd/conf/httpd.conf
```

#Add lines

```
<VirtualHost *:*>
    ServerName example.com
    Redirect permanent / https://example.com
</VirtualHost>
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Enabling HTTP Strict Transport Security (HSTS) on the web server

[HSTS](#) is enforced by Zabbix frontend in versions 3.0.13 - 3.0.24.

For all other versions, to protect Zabbix frontend against protocol downgrade attacks, we recommend to enable [HSTS](#) policy on the web server.

For example, to enable HSTS policy for your Zabbix frontend in Apache configuration:

```
/etc/httpd/conf/httpd.conf
```

add the following directive to your virtual host's configuration:

```
<VirtualHost *:443>
    Header set Strict-Transport-Security "max-age=31536000"
</VirtualHost>
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Enabling Content Security Policy (CSP) on the web server

To protect Zabbix frontend against Cross Site Scripting (XSS), data injection, and some other attacks of a similar type, we recommend enabling Content Security Policy on the web server. To do so, you need to configure the web server to return the [Content-Security-Policy](#) HTTP header.

To enable CSP for your Zabbix frontend in Apache configuration, edit:

```
/etc/httpd/conf/httpd.conf
```

For example, if it is planned that all content will come from the site's origin (excluding subdomains), you can add the following directive to your virtual host's configuration:

```
<VirtualHost *:*>
    Header set Content-Security-Policy "default-src 'self';"
</VirtualHost>
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Disabling web server information exposure

It is recommended to disable all web server signatures as part of the web server hardening process. The web server is exposing software signature by default:

▼ **Response Headers** [view source](#)

Cache-Control: no-store, no-cache, must-revalidate
Connection: Keep-Alive
Content-Encoding: gzip
Content-Length: 1160
Content-Type: text/html; charset=UTF-8
Keep-Alive: timeout=5, max=100
Pragma: no-cache
Server: Apache/2.4.18 (Ubuntu)

The signature can be disabled by adding two lines to the Apache (used as an example) configuration file:

```
ServerSignature Off  
ServerTokens Prod
```

PHP signature (X-Powered-By HTTP header) can be disabled by changing the php.ini configuration file (signature is disabled by default):

```
expose_php = Off
```

Web server restart is required for configuration file changes to be applied.

Additional security level can be achieved by using the mod_security (package libapache2-mod-security2) with Apache. mod_security allows to remove server signature instead of only removing version from server signature. Signature can be altered to any value by changing "SecServerSignature" to any desired value after installing mod_security.

Please refer to documentation of your web server to find help on how to remove/change software signatures.

Disabling default web server error pages

It is recommended to disable default error pages to avoid information exposure. Web server is using built-in error pages by default:

Not Found

The requested URL /custom-text was not found on this server.

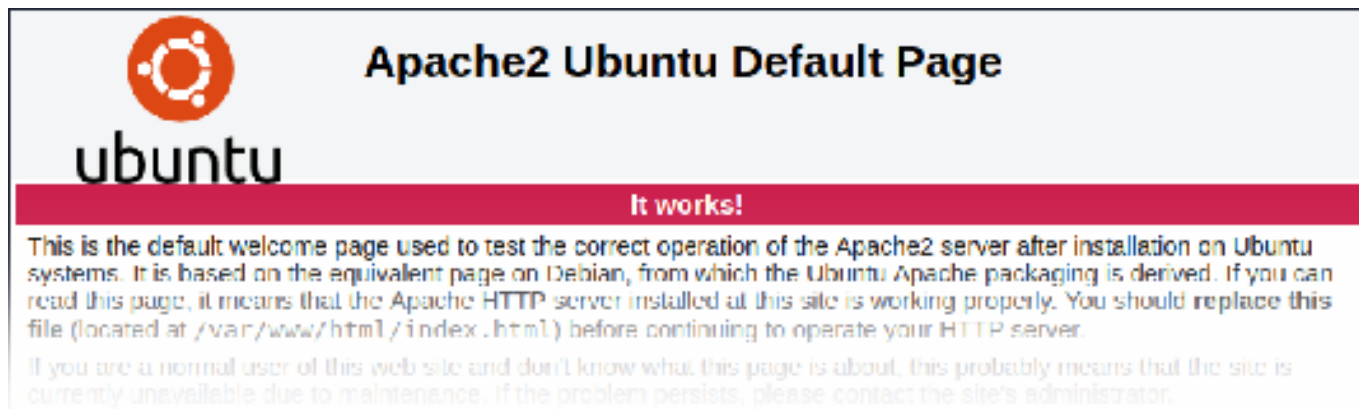

Apache/2.4.18 (Ubuntu) Server at localhost Port 80

Default error pages should be replaced/removed as part of the web server hardening process. The "ErrorDocument" directive can be used to define a custom error page/text for Apache web server (used as an example).

Please refer to documentation of your web server to find help on how to replace/remove default error pages.

Removing web server test page

It is recommended to remove the web server test page to avoid information exposure. By default, web server webroot contains a test page called index.html (Apache2 on Ubuntu is used as an example):

The test page should be removed or should be made unavailable as part of the web server hardening process.

Displaying URL content in the sandbox

Since version 3.0.32, some Zabbix frontend elements (for example, the **URL screen element**) are preconfigured to sandbox content retrieved from the URL. It is recommended to keep all sandboxing restrictions enabled to ensure protection against XSS attacks.

Zabbix Windows agent with OpenSSL

Zabbix Windows agent compiled with OpenSSL will try to reach the SSL configuration file in c:\openssl-64bit. The "openssl-64bit" directory on disk C: can be created by non-privileged users.

So for security hardening, it is required to create this directory manually and revoke write access from non-admin users.

Please note that the directory names will be different on 32-bit and 64-bit versions of Windows.

3 Installation from sources

You can get the very latest version of Zabbix by compiling it from the sources.

A step-by-step tutorial for installing Zabbix from the sources is provided here.

1 Installing Zabbix daemons

1 Download the source archive

Go to the [Zabbix download page](#) and download the source archive. Once downloaded, extract the sources, by running:

```
$ tar -zxvf zabbix-3.0.0.tar.gz
```

Note:

Enter the correct Zabbix version in the command. It must match the name of the downloaded archive.

2 Create user account

For all of the Zabbix daemon processes, an unprivileged user is required. If a Zabbix daemon is started from an unprivileged user account, it will run as that user.

However, if a daemon is started from a 'root' account, it will switch to a 'zabbix' user account, which must be present. To create such a user account (in its own group, "zabbix"),

on a RedHat-based system, run:

```
groupadd --system zabbix
useradd --system -g zabbix -d /usr/lib/zabbix -s /sbin/nologin -c "Zabbix Monitoring System" zabbix
```

on a Debian-based system, run:

```
addgroup --system --quiet zabbix
adduser --quiet --system --disabled-login --ingroup zabbix --home /var/lib/zabbix --no-create-home zabbix
```

Attention:

Zabbix processes do not need a home directory, which is why we do not recommend creating it. However, if you are using some functionality that requires it (e. g. store MySQL credentials in `$HOME/.my.cnf`) you are free to create it using the following commands.

On RedHat-based systems, run:

```
mkdir -m u=rwx,g=rwx,o=-p /usr/lib/zabbix
chown zabbix:zabbix /usr/lib/zabbix
```

On Debian-based systems, run:

```
mkdir -m u=rwx,g=rwx,o=-p /var/lib/zabbix
chown zabbix:zabbix /var/lib/zabbix
```

A separate user account is not required for Zabbix frontend installation.

If Zabbix **server** and **agent** are run on the same machine it is recommended to use a different user for running the server than for running the agent. Otherwise, if both are run as the same user, the agent can access the server configuration file and any Admin level user in Zabbix can quite easily retrieve, for example, the database password.

Attention:

Running Zabbix as `root`, `bin`, or any other account with special rights is a security risk.

3 Create Zabbix database

For Zabbix **server** and **proxy** daemons, as well as Zabbix frontend, a database is required. It is not needed to run Zabbix **agent**.

SQL **scripts are provided** for creating database schema and inserting the dataset. Zabbix proxy database needs only the schema while Zabbix server database requires also the dataset on top of the schema.

Having created a Zabbix database, proceed to the following steps of compiling Zabbix.

4 Configure the sources

When configuring the sources for a Zabbix server or proxy, you must specify the database type to be used. Only one database type can be compiled with a server or proxy process at a time.

To see all of the supported configuration options, inside the extracted Zabbix source directory run:

```
./configure --help
```

To configure the sources for a Zabbix server and agent, you may run something like:

```
./configure --enable-server --enable-agent --with-mysql --enable-ipv6 --with-net-snmp --with-libcurl --with-
```

Note:

--with-libcurl configuration option with cURL 7.20.0 or higher is required for SMTP authentication, supported since Zabbix 3.0.0.

--with-libcurl and --with-libxml2 configuration options are required for virtual machine monitoring, supported since Zabbix 2.2.0.

To configure the sources for a Zabbix server (with PostgreSQL etc.), you may run:

```
./configure --enable-server --with-postgresql --with-net-snmp
```

To configure the sources for a Zabbix proxy (with SQLite etc.), you may run:

```
./configure --prefix=/usr --enable-proxy --with-net-snmp --with-sqlite3 --with-ssh2
```

To configure the sources for a Zabbix agent, you may run:

```
./configure --enable-agent
```

You may use the `--enable-static` flag to statically link libraries. If you plan to distribute compiled binaries among different servers, you must use this flag to make these binaries work without required libraries. Note that `--enable-static` does not work in [Solaris](#).

Attention:

Using `--enable-static` option is not recommended when building server.// //

In order to build the server statically you must have a static version of every external library needed. There is no strict check for that in configure script.

Note:

Command-line utilities `zabbix_get` and `zabbix_sender` are compiled if `--enable-agent` option is used.

Note:

Add optional path to the MySQL configuration file `--with-mysql=/<path_to_the_file>/mysql_config` to select the desired MySQL client library when there is a need to use one that is not located in the default location. It is useful when there are several versions of MySQL installed or MariaDB installed alongside MySQL on the same system.

Note:

Use `--with-ibm-db2` flag to specify location of the CLI API.

Use `--with-oracle` flag to specify location of the OCI API.

For encryption support see [Compiling Zabbix with encryption support](#)

5 Make and install everything

Note:

If installing from git, it is required to run first:

```
$ make dbschema
```

```
make install
```

This step should be run as a user with sufficient permissions (commonly 'root', or by using `sudo`).

Running `make install` will by default install the daemon binaries (`zabbix_server`, `zabbix_agentd`, `zabbix_proxy`) in `/usr/local/sbin` and the client binaries (`zabbix_get`, `zabbix_sender`) in `/usr/local/bin`.

Note:

To specify a different location than `/usr/local`, use a `--prefix` key in the previous step of configuring sources, for example `--prefix=/home/zabbix`. In this case daemon binaries will be installed under `<prefix>/sbin`, while utilities under `<prefix>/bin`. Man pages will be installed under `<prefix>/share`.

6 Review and edit configuration files

- edit the Zabbix agent configuration file **`/usr/local/etc/zabbix_agentd.conf`**

You need to configure this file for every host with `zabbix_agentd` installed.

You must specify the Zabbix server **IP address** in the file. Connections from other hosts will be denied.

- edit the Zabbix server configuration file **`/usr/local/etc/zabbix_server.conf`**

You must specify the database name, user and password (if using any).

Note:

With SQLite the full path to database file must be specified; DB user and password are not required.

The rest of the parameters will suit you with their defaults if you have a small installation (up to ten monitored hosts). You should change the default parameters if you want to maximize the performance of Zabbix server (or proxy) though. See the [performance tuning](#) section for more details.

- if you have installed a Zabbix proxy, edit the proxy configuration file **`/usr/local/etc/zabbix_proxy.conf`**

You must specify the server IP address and proxy hostname (must be known to the server), as well as the database name, user and password (if using any).

Note:

With SQLite the full path to database file must be specified; DB user and password are not required.

7 Start up the daemons

Run `zabbix_server` on the server side.

```
shell> zabbix_server
```

Note:

Make sure that your system allows allocation of 36MB (or a bit more) of shared memory, otherwise the server may not start and you will see "Cannot allocate shared memory for <type of cache>." in the server log file. This may happen on FreeBSD, Solaris 8.

See the **"See also"** section at the bottom of this page to find out how to configure shared memory.

Run zabbix_agentd on all the monitored machines.

```
shell> zabbix_agentd
```

Note:

Make sure that your system allows allocation of 2MB of shared memory, otherwise the agent may not start and you will see "Cannot allocate shared memory for collector." in the agent log file. This may happen on Solaris 8.

If you have installed Zabbix proxy, run zabbix_proxy.

```
shell> zabbix_proxy
```

2 Installing Zabbix web interface

Copying PHP files

Zabbix frontend is written in PHP, so to run it a PHP supported webserver is needed. Installation is done by simply copying the PHP files from frontends/php to the webserver HTML documents directory.

Common locations of HTML documents directories for Apache web servers include:

- /usr/local/apache2/htdocs (default directory when installing Apache from source)
- /srv/www/htdocs (OpenSUSE, SLES)
- /var/www/html (Fedora, RHEL, CentOS)
- /var/www (Debian, Ubuntu)

It is suggested to use a subdirectory instead of the HTML root. To create a subdirectory and copy Zabbix frontend files into it, execute the following commands, replacing the actual directory:

```
mkdir <htdocs>/zabbix
cd frontends/php
cp -a . <htdocs>/zabbix
```

If installing from git and planning to use any other language than English, you must generate translation files. To do so, run:

```
locale/make_mo.sh
```

msgfmt utility from gettext package is required.

Note:

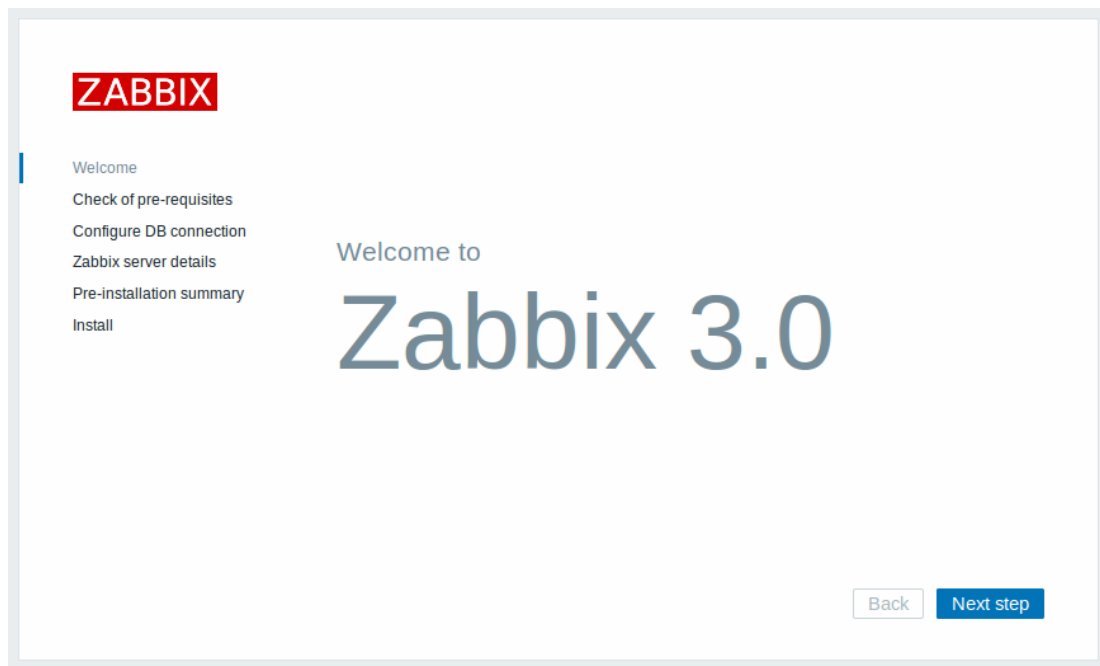

Additionally, to use any other language than English, its locale should be installed on the web server. See the **"See also"** section in the "User profile" page to find out how to install it if required.

Installing frontend

Step 1

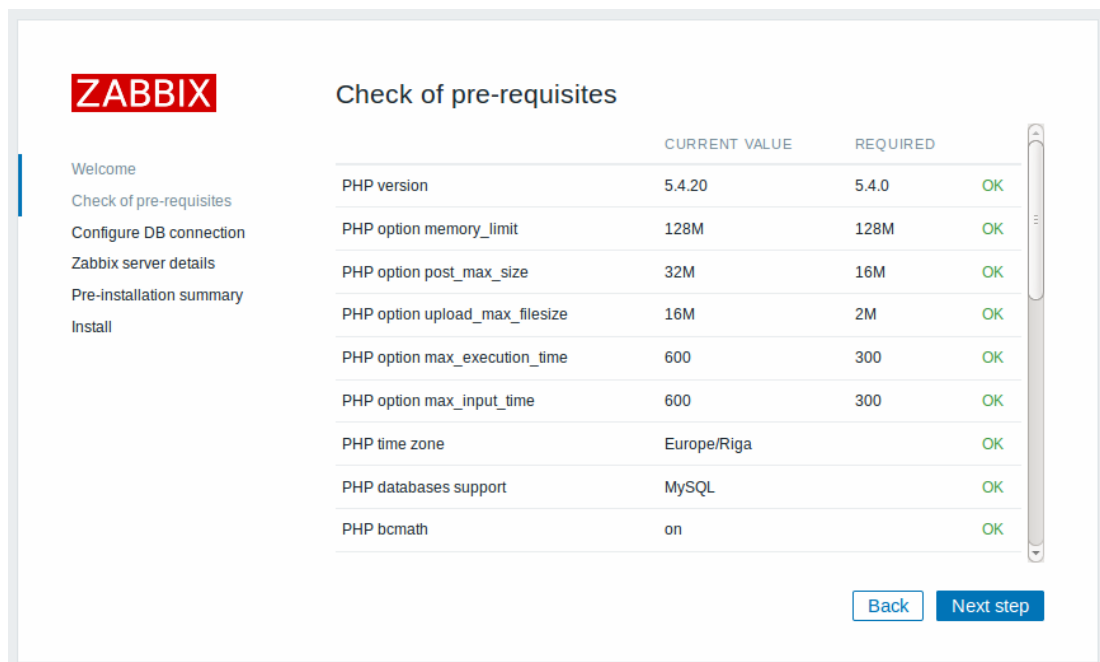

In your browser, open Zabbix URL: `http://<server_ip_or_name>/zabbix`

You should see the first screen of the frontend installation wizard.

Step 2

Make sure that all software prerequisites are met.

Pre-requisite	Minimum value	Description
<i>PHP version</i>	5.4.0	
<i>PHP memory_limit option</i>	128MB	In php.ini: memory_limit = 128M
<i>PHP post_max_size option</i>	16MB	In php.ini: post_max_size = 16M
<i>PHP upload_max_filesize option</i>	2MB	In php.ini: upload_max_filesize = 2M
<i>PHP max_execution_time option</i>	300 seconds (values 0 and -1 are allowed)	In php.ini: max_execution_time = 300
<i>PHP max_input_time option</i>	300 seconds (values 0 and -1 are allowed)	In php.ini: max_input_time = 300
<i>PHP session.auto_start option</i>	must be disabled	In php.ini: session.auto_start = 0

Pre-requisite	Minimum value	Description
<i>Database support</i>	One of: IBM DB2, MySQL, Oracle, PostgreSQL, SQLite	One of the following modules must be installed: ibm_db2, mysql, oci8, pgsql, sqlite3
<i>bcmath</i>		php-bcmath
<i>mbstring</i>		php-mbstring
<i>PHP mbstring.func_overload option</i>	must be disabled	In php.ini: mbstring.func_overload = 0
<i>PHP always_populate_raw_post_data option</i>	must be disabled	Required only for PHP versions 5.6.0 or newer. In php.ini: always_populate_raw_post_data = -1
<i>sockets</i>		php-net-socket. Required for user script support.
<i>gd</i>	2.0 or higher	php-gd. PHP GD extension must support PNG images (<i>--with-png-dir</i>), JPEG (<i>--with-jpeg-dir</i>) images and FreeType 2 (<i>--with-freetype-dir</i>).
<i>libxml</i>	2.6.15	php-xml or php5-dom
<i>xmlwriter</i>		php-xmlwriter
<i>xmlreader</i>		php-xmlreader
<i>ctype</i>		php-ctype
<i>session</i>		php-session
<i>gettext</i>		php-gettext Since Zabbix 2.2.1, the PHP gettext extension is not a mandatory requirement for installing Zabbix. If gettext is not installed, the frontend will work as usual, however, the translations will not be available.

Optional pre-requisites may also be present in the list. A failed optional prerequisite is displayed in orange and has a *Warning* status. With a failed optional pre-requisite, the setup may continue.

Attention:

If there is a need to change the Apache user or user group, permissions to the session folder must be verified. Otherwise Zabbix setup may be unable to continue.

Step 3

Enter details for connecting to the database. Zabbix database must already be created.

ZABBIX

Welcome

Check of pre-requisites

Configure DB connection

Zabbix server details

Pre-installation summary

Install

Configure DB connection

Please create database manually, and set the configuration parameters for connection to this database. Press "Next step" button when done.

Database typeMySQL

Database hostlocalhost

Database port00 - use default port

Database namezabbix

Userzabbix

Password*****

BackNext step

Step 4

Enter Zabbix server details.

ZABBIX

Welcome

Check of pre-requisites

Configure DB connection

Zabbix server details

Pre-installation summary

Install

Zabbix server details

Please enter the host name or host IP address and port number of the Zabbix server, as well as the name of the installation (optional).

Hostlocalhost

Port10051

Name

BackNext step

Entering a name for Zabbix server is optional, however, if submitted, it will be displayed in the menu bar and page titles.

Step 5

Review a summary of settings.

- Welcome
- Check of pre-requisites
- Configure DB connection
- Zabbix server details
- Pre-installation summary
- Install

Pre-installation summary

Please check configuration parameters. If all is correct, press "Next step" button, or "Back" button to change configuration parameters.

Database type	MySQL
Database server	localhost
Database port	default
Database name	zabbix
Database user	zabbix
Database password	*****
Zabbix server	localhost
Zabbix server port	10051
Zabbix server name	

Back
Next step

Step 6

Download the configuration file and place it under conf/ in the webserver HTML documents subdirectory where you copied Zabbix PHP files to.

- Welcome
- Check of pre-requisites
- Configure DB connection
- Zabbix server details
- Pre-installation summary
- Install

Install

Details
Cannot create the configuration file.

Unable to create the configuration file.

Alternatively, you can install it manually:

- Download the configuration file
- Save it as "/usr/share/zabbix/conf/zabbix.conf.php"

Back
Finish

Opening zabbix.conf.php

You have chosen to open:

zabbix.conf.php

which is: PHP script (418 bytes)

from: http://192.168.3.194

What should Firefox do with this file?

☐ Open with gedit (default)

☒ Save File

☐ Do this automatically for files like this from now on.

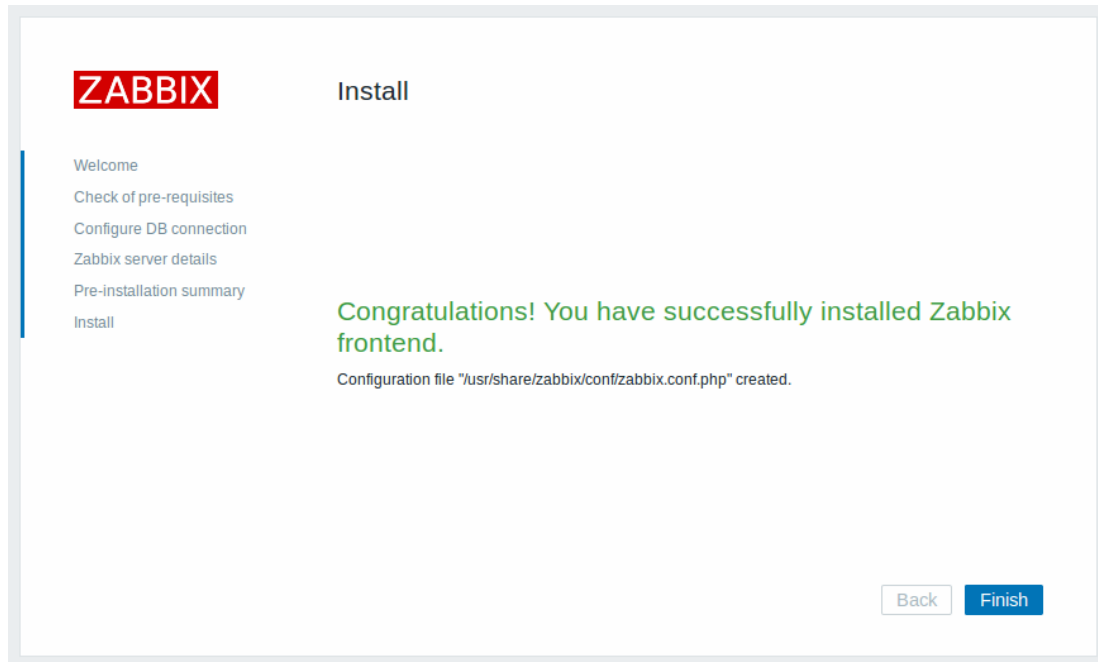

Cancel
OK

Note:

Providing the webserver user has write access to conf/ directory the configuration file would be saved automatically and it would be possible to proceed to the next step right away.

Step 7

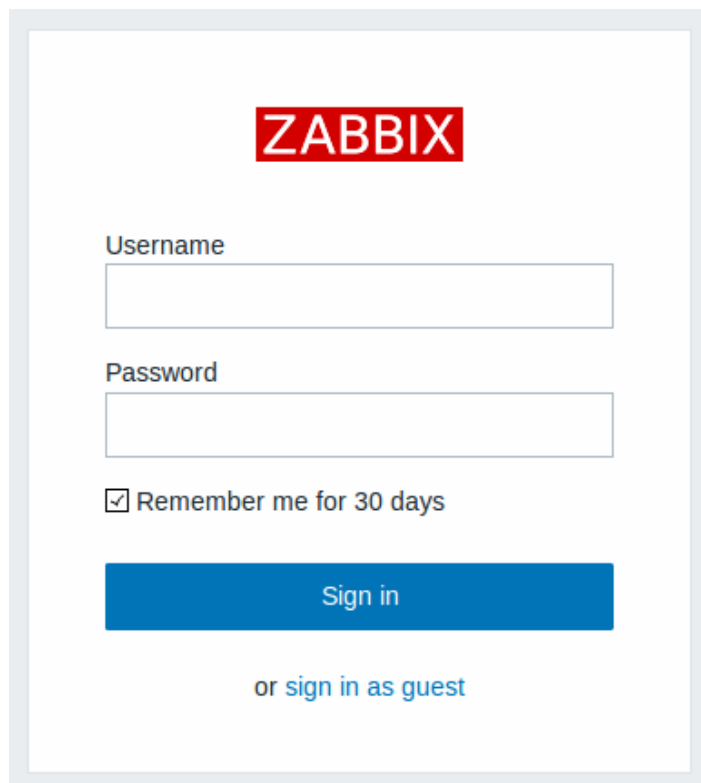

Finish the installation.

The screenshot shows the Zabbix installation completion screen. On the left is a sidebar with the ZABBIX logo and a list of steps: Welcome, Check of pre-requisites, Configure DB connection, Zabbix server details, Pre-installation summary, and Install (which is highlighted). The main area has the title 'Install' and a large green message: 'Congratulations! You have successfully installed Zabbix frontend.' Below this, it says 'Configuration file "/usr/share/zabbix/conf/zabbix.conf.php" created.' At the bottom right are 'Back' and 'Finish' buttons.

Step 8

Zabbix frontend is ready! The default user name is **Admin**, password **zabbix**.

The screenshot shows the Zabbix login page. It features the ZABBIX logo at the top. Below it are input fields for 'Username' and 'Password'. There is a checkbox labeled 'Remember me for 30 days' which is checked. A large blue 'Sign in' button is positioned below the password field. At the bottom, there is a link that says 'or sign in as guest'.

Proceed to [getting started with Zabbix](#).

1. [How to configure shared memory for Zabbix daemons](#)

Building Windows agent binaries with/without TLS

Overview

This section demonstrates how to build Windows agent binaries from sources with or without TLS.

Compiling OpenSSL

The following steps will help you to compile OpenSSL from sources on MS Windows 10 (64-bit).

1. For compiling OpenSSL you will need on Windows machine:
 1. C compiler (e.g. VS 2017 RC),
 2. NASM (<https://www.nasm.us/>),
 3. Perl (e.g. Strawberry Perl from <http://strawberryperl.com/>),
 4. Perl module Text::Template (cpan Text::Template).
2. Get OpenSSL sources from <https://www.openssl.org/>. OpenSSL 1.1.1 is used here.
3. Unpack OpenSSL sources, for example, in E:\openssl-1.1.1.
4. Open a commandline window e.g. the x64 Native Tools Command Prompt for VS 2017 RC.
5. Go to the OpenSSL source directory, e.g. E:\openssl-1.1.1.
 1. Verify that NASM can be found: e:\openssl-1.1.1> nasm --version
NASM version 2.13.01 compiled on May 1 2017
6. Configure OpenSSL, for example: e:\openssl-1.1.1> perl E:\openssl-1.1.1\Configure VC-WIN64A no-shared no-capieng no-srp no-gost no-dgram no-dtls1-method no-dtls1_2-method --api=1.1.0 --prefix=C:\OpenSSL --openssldir=C:\OpenSSL-Win64-111-static
 - Note the option 'no-shared': if 'no-shared' is used then the OpenSSL static libraries libcrypto.lib and libssl.lib will be 'self-sufficient' and resulting Zabbix binaries will include OpenSSL in themselves, no need for external OpenSSL DLLs. Advantage: Zabbix binaries can be copied to other Windows machines without OpenSSL libraries. Disadvantage: when a new OpenSSL bugfix version is released, Zabbix agent needs to be recompiled and reinstalled.
 - If 'no-shared' is not used, then the static libraries libcrypto.lib and libssl.lib will be using OpenSSL DLLs at runtime. Advantage: when a new OpenSSL bugfix version is released, probably you can upgrade only OpenSSL DLLs, without recompiling Zabbix agent. Disadvantage: copying Zabbix agent to another machine requires copying OpenSSL DLLs, too.
7. Compile OpenSSL, run tests, install: e:\openssl-1.1.1> nmake e:\openssl-1.1.1> nmake test ... All tests successful. Files=152, Tests=1152, 501 wallclock secs (0.67 usr + 0.61 sys = 1.28 CPU) Result: PASS e:\openssl-1.1.1> nmake install_sw 'install_sw' installs only software components (i.e. libraries, header files, but no documentation). If you want everything, use "nmake install".

Compiling Zabbix with OpenSSL

The following steps will help you to compile Zabbix from sources on MS Windows 10 (64-bit). When compiling Zabbix with/without TLS support the only significant difference is in step 4.

Support for OpenSSL 1.1.1 was added in 3.0.23, some additional fixes - in 3.0.24rc1.

1. On a Linux machine check out the source from git: \$ git clone https://git.zabbix.com/scm/zbx/zabbix.git
\$ cd zabbix \$ git checkout 3.0.31 -b 3.0.31 # replace 3.0.31 with the latest release available \$./bootstrap.sh \$./configure --enable-agent --enable-ipv6 --prefix=`pwd` \$ make dbschema \$ make dist
2. Copy and unpack the archive, e.g. zabbix-3.0.24.tar.gz, on a Windows machine.
3. Let's assume that sources are in e:\zabbix-3.0.24. Open a commandline window e.g. the x64 Native Tools Command Prompt for VS 2017 RC. Go to e:\3.0.24\build\win32\project.
4. Compile zabbix_get, zabbix_sender and zabbix_agent.
 - without TLS: E:\zabbix-3.0.24\build\win32\project> nmake /K
 - with TLS: E:\zabbix-3.0.24\build\win32\project> nmake /K -f Makefile_get TLS=openssl TLSINCDIR="C:\OpenSSL-Win64-111-static\include" TLSLIBDIR="C:\OpenSSL-Win64-111-static\lib" E:\zabbix-3.0.24\build\win32\project> nmake /K -f Makefile_sender TLS=openssl TLSINCDIR="C:\OpenSSL-Win64-111-static\include" TLSLIBDIR="C:\OpenSSL-Win64-111-static\lib" E:\zabbix-3.0.24\build\win32\project> nmake /K -f Makefile_agent TLS=openssl TLSINCDIR="C:\OpenSSL-Win64-111-static\include" TLSLIBDIR="C:\OpenSSL-Win64-111-static\lib"
5. New binaries are located in e:\zabbix-3.0.24\bin\win64. Since OpenSSL was compiled with 'no-shared' option, Zabbix binaries contain OpenSSL within themselves and can be copied to other machines that do not have OpenSSL.

Compiling Zabbix with LibreSSL

The process is similar to compiling with OpenSSL, but you need to make small changes in files located in the build\win32\project directory:

* In 'Makefile_tls' delete 'DHAVE_OPENSSL_WITH_PSK'. i.e. find <code>

```
CFLAGS = $(CFLAGS) /DHAVE_OPENSSL /DHAVE_OPENSSL_WITH_PSK</code>and replace it with CFLAGS = $(CFLAGS) /DHAVE_OPENSSL
```

```
* In 'Makefile_common.inc' add '/NODEFAULTLIB:LIBCMT' i.e. find <code>
```

```
/MANIFESTUAC:"level='asInvoker' uiAccess='false'" /DYNAMICBASE:NO /PDB:$(TARGETDIR)\$(TARGETNAME).pdb</code>and replace it with /MANIFESTUAC:"level='asInvoker' uiAccess='false'" /DYNAMICBASE:NO /PDB:$(TARGETDIR)\$(TARGETNAME).pdb /NODEFAULTLIB:LIBCMT
```

4 Installation from packages

Zabbix SIA provides official RPM and DEB packages for:

- [Red Hat Enterprise Linux](#)
- [Debian](#)
- [Ubuntu LTS](#)
- [SUSE Linux Enterprise Server](#)

Package files are available at repo.zabbix.com. Yum and apt repositories are also available on the server. A step-by-step tutorial for installing Zabbix from packages is provided in sub-pages of this section.

Note, that though some OS distributions (in particular, Debian-based distributions) provide their own Zabbix packages, these packages are not supported by Zabbix. Zabbix packages provided by 3rd parties can be out of date and may lack the latest features and bug fixes. It is recommended to use only official packages from repo.zabbix.com. If you have previously used unofficial Zabbix packages, follow this procedure to switch to the official packages:

1. Always uninstall the old packages first.
2. Check for residual files that may have been left after deinstallation.
3. Install official packages following [installation instructions](#) provided by Zabbix.

Never do a direct update, as this may result in a broken installation.

1 Repository installation

For Red Hat Enterprise Linux / CentOS

Supported versions

- RHEL 7
- Oracle Linux 7
- CentOS 7

Some packages (agent, proxy, etc.) are available for RHEL 5 and RHEL 6 (in https://repo.zabbix.com/zabbix/3.0/rhel/5/x86_64/ and https://repo.zabbix.com/zabbix/3.0/rhel/6/x86_64/ directories respectively).

Installing repository configuration package

Install the repository configuration package. This package contains yum (software package manager) configuration files.

```
# rpm -Uvh https://repo.zabbix.com/zabbix/3.0/rhel/7/x86_64/zabbix-release-3.0-1.el7.noarch.rpm
```

Now you are ready to install Zabbix [server with MySQL](#) or [server with PostgreSQL](#), [agent](#) and [proxy](#).

For Debian

Supported versions

- Debian 10 (codename: buster)
- Debian 9 (codename: stretch)
- Debian 8 (codename: jessie)
- Debian 7 (codename: wheezy)

Installing repository configuration package

Install the repository configuration package, which contains apt (software package manager) configuration files. Shell commands for **Debian 10** (buster):

```
# wget https://repo.zabbix.com/zabbix/3.0/debian/pool/main/z/zabbix-release/zabbix-release_3.0-2+buster_all.deb
# dpkg -i zabbix-release_3.0-2+buster_all.deb
```

For Debian 9 change 'buster' to 'stretch'. For Debian 8 change 'buster' to 'jessie'. For Debian 7 change 'buster' to 'wheezy'.

Before running `apt-get update`, you should create/edit the `/etc/apt/preferences` file with the following content (Otherwise 3.0 packages from Zabbix repo will be overridden with 4.0 from Debian repo.):

```
Package: zabbix-*
Pin: origin repo.zabbix.com
Pin-Priority: 900
```

```
# apt-get update
```

Now you are ready to install Zabbix [server with MySQL](#) or [server with PostgreSQL](#), [agent](#) and [proxy](#).

For Ubuntu

Supported versions

- * Ubuntu 18.04 LTS (codename: bionic)
- * Ubuntu 16.04 LTS (codename: xenial)
- * Ubuntu 14.04 LTS (codename: trusty)

Installing repository configuration package

Install the repository configuration package, which contains apt (software package manager) configuration files. Shell commands for **Ubuntu 18.04 LTS** (bionic):

```
# wget https://repo.zabbix.com/zabbix/3.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_3.0-2+bionic_all.deb
# dpkg -i zabbix-release_3.0-2+bionic_all.deb
# apt-get update
```

- For Ubuntu 16.04 LTS change 'bionic' to 'xenial'.
- For Ubuntu 14.04 LTS change 'bionic' to 'trusty'.

Now you are ready to install Zabbix [server with MySQL](#) or [server with PostgreSQL](#), [agent](#) and [proxy](#).

2 Server installation with MySQL database

Attention:

It is a good practice to have the [innodb_file_per_table](#) option enabled on MySQL. Check this setting before proceeding.

Red Hat Enterprise Linux / CentOS

Installing packages

Here is an example for Zabbix server and web frontend installation with MySQL database:

```
# yum install zabbix-server-mysql zabbix-web-mysql
```

Attention:

In order to install `zabbix-web-mysql` on RHEL 7 you need to enable `rhel-7-server-optional-rpms` repository.

Creating initial database

Create Zabbix database and user on MySQL by the following commands, where `<root_password>` shall be replaced with the actual root password (e.g., `shell> mysql -uroot -p12345`) and `<password>` with new password for zabbix user on the database (including apostrophes: `...identified by '67890'`):

```
shell> mysql -uroot -p<root_password>
mysql> create database zabbix character set utf8 collate utf8_bin;
mysql> grant all privileges on zabbix.* to zabbix@localhost identified by '<password>';
mysql> quit;
```

Note that UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings.

Now import initial schema and data. Make sure to insert correct version for 3.0.*. You will be prompted to enter your newly created password.

```
# zcat /usr/share/doc/zabbix-server-mysql-3.0.*/create.sql.gz | mysql -uzabbix -p zabbix
```

In order to check the version you have in your package, use the following command:

```
# rpm -q zabbix-server-mysql
```

Database configuration for Zabbix server

Edit server host, name, user and password in `zabbix_server.conf` as follows, where `DBPassword` is the password you've set creating initial database:

```
# vi /etc/zabbix/zabbix_server.conf
DBHost=localhost
DBName=zabbix
DBUser=zabbix
DBPassword=<password>
```

Starting Zabbix server process

It's time to start Zabbix server process and make it start at system boot:

```
# systemctl start zabbix-server
# systemctl enable zabbix-server
```

PHP configuration for Zabbix frontend

Apache configuration file for Zabbix frontend is located in `/etc/httpd/conf.d/zabbix.conf`. Some PHP settings are already configured. But it's necessary to uncomment the `"date.timezone"` setting and [set the right timezone](#) for you.

```
php_value max_execution_time 300
php_value memory_limit 128M
php_value post_max_size 16M
php_value upload_max_filesize 2M
php_value max_input_time 300
php_value always_populate_raw_post_data -1
# php_value date.timezone Europe/Riga
```

SELinux configuration

Having SELinux status enabled in enforcing mode, you need to execute the following command to enable successful connection of Zabbix frontend to the server:

```
# setsebool -P httpd_can_connect_zabbix on
```

As frontend and SELinux configuration is done, you need to restart Apache web server:

```
# systemctl start httpd
```

Installing frontend

Now you are ready to proceed with [frontend installation steps](#) which will allow you to access your newly installed Zabbix.

Note:

Zabbix official repository provides `fping`, `iksemel`, `libssh2` packages for RHEL as well. These packages are located in the [non-supported](#) directory.

Debian / Ubuntu

Installing packages

Here is an example for Zabbix server and web frontend installation with MySQL database:

```
# apt-get install zabbix-server-mysql zabbix-frontend-php
```

Creating initial database

Create Zabbix database and user on MySQL by the following commands, where `<root_password>` shall be replaced with the actual root password (e.g., `shell> mysql -uroot -p12345`) and `<password>` with new password for zabbix user on the database (including apostrophes: `...identified by '67890'`);

```
shell> mysql -uroot -p<root_password>
mysql> create database zabbix character set utf8 collate utf8_bin;
mysql> grant all privileges on zabbix.* to zabbix@localhost identified by '<password>';
mysql> quit;
```

Then import initial schema and data. You will be prompted to enter your newly created password.

```
# zcat /usr/share/doc/zabbix-server-mysql/create.sql.gz | mysql -uzabbix -p zabbix
```

Database configuration for Zabbix server

Edit server host, name, user and password in `zabbix_server.conf` as follows, where `DBPassword` is the password you've set creating initial database:

```
# vi /etc/zabbix/zabbix_server.conf
DBHost=localhost
DBName=zabbix
DBUser=zabbix
DBPassword=<password>
```

Starting Zabbix server process

Now you may start Zabbix server process and make it start at system boot

```
# service zabbix-server start
# update-rc.d zabbix-server enable
```

PHP configuration for Zabbix frontend

Apache configuration file for Zabbix frontend is located in `/etc/zabbix/apache.conf`. Some PHP settings are already configured. But it's necessary to uncomment the "date.timezone" setting and [set the right timezone](#) for you.

```
php_value max_execution_time 300
php_value memory_limit 128M
php_value post_max_size 16M
php_value upload_max_filesize 2M
php_value max_input_time 300
php_value always_populate_raw_post_data -1
# php_value date.timezone Europe/Riga
```

After that you need to restart Apache web server:

```
# service apache2 restart
```

If you have SELinux status enabled in enforcing mode see [corresponding block](#) for RHEL / CentOS above.

Installing frontend

Now you are ready to proceed with [frontend installation steps](#) which will allow you to access your newly installed Zabbix.

3 Server installation with PostgreSQL database

Red Hat Enterprise Linux / CentOS

Installing packages

Here is an example for Zabbix server and web frontend with PostgreSQL database.

```
# yum install zabbix-server-pgsql zabbix-web-pgsql
```

Creating initial database

You need to have a database user with permissions to create database objects. The following shell command will create a user `zabbix`. Specify a password when prompted and repeat the password (note, you may first be asked for a sudo password):

```
shell> sudo -u postgres createuser --pwprompt zabbix
```

Now we will set up the database `zabbix` (last parameter) with the previously created user as the owner (`-O zabbix`) and import initial schema and data:

```
shell> sudo -u postgres createdb -O zabbix -E Unicode -T template0 zabbix
shell> zcat /usr/share/doc/zabbix-server-pgsql/create.sql.gz | sudo -u zabbix psql zabbix
```

Attention:

The above commands are provided as an example that will work in most GNU/Linux installations. You can use different commands, e. g. `psql -U <username>` depending on how your system/database is configured. If you have troubles setting up the database please consult your database administrator.

Database configuration for Zabbix server

Edit server host, name, user and password in `zabbix_server.conf` as follows, replacing `<username_password>` with actual password of PostgreSQL user:

```
# vi /etc/zabbix/zabbix_server.conf
DBHost=
DBName=zabbix
DBUser=zabbix
DBPassword=<username_password>
```

You might want to keep default setting `DBHost=localhost` (or an IP address), but this would make PostgreSQL use network socket connecting to Zabbix. See **SELinux configuration** block below for instructions.

Starting Zabbix server process

It's time to start Zabbix server process and make it start at system boot:

```
# systemctl start zabbix-server
# systemctl enable zabbix-server
```

PHP configuration for Zabbix frontend

Apache configuration file for Zabbix frontend is located in `/etc/httpd/conf.d/zabbix.conf`. Some PHP settings are already configured. But it's necessary to uncomment the `"date.timezone"` setting and [set the right timezone](#) for you.

```
php_value max_execution_time 300
php_value memory_limit 128M
php_value post_max_size 16M
php_value upload_max_filesize 2M
php_value max_input_time 300
php_value always_populate_raw_post_data -1
# php_value date.timezone Europe/Riga
```

SELinux configuration

Having SELinux status enabled in enforcing mode, you need to execute the following command to enable successful connection of Zabbix frontend to the server:

```
# setsebool -P httpd_can_connect_zabbix on
```

If any parameter such as `"localhost"` or an IP address is set for `DBHost=` in `zabbix_server.conf`, you need to allow connection between Zabbix frontend and the database too:

```
# setsebool -P httpd_can_network_connect_db on
```

As frontend and SELinux configuration is done, you need to restart Apache web server:

```
# systemctl start httpd
```

Installing frontend

Now you are ready to proceed with **frontend installation steps** which will allow you to access your newly installed Zabbix.

Note:

Zabbix official repository provides `fping`, `iksemel`, `libssh2` packages for RHEL as well. These packages are located in the [non-supported](#) directory.

Debian / Ubuntu

Installing packages

Example for Zabbix server and web frontend with PostgreSQL database.

```
# apt-get install zabbix-server-pgsql zabbix-frontend-php
```

Creating initial database

You need to have database `username` user set up with permissions to create database objects. Create Zabbix database on PostgreSQL with the following commands:

```
shell> psql -U <username>
psql> create database zabbix;
psql> \q
```

Then import initial schema and data:

```
# zcat /usr/share/doc/zabbix-server-pgsql/create.sql.gz | psql -U <username> zabbix
```

Database configuration for Zabbix server

Edit server host, name, user and password in `zabbix_server.conf` as follows, replacing `<username_password>` with actual password of PostgreSQL user:

```
# vi /etc/zabbix/zabbix_server.conf
DBHost=
DBName=zabbix
DBUser=zabbix
DBPassword=<username_password>
```

You might want to keep default setting `DBHost=localhost` (or an IP address), but this would make PostgreSQL use network socket instead of UNIX socket connecting to Zabbix. If you also have SELinux enabled in enforcing mode see [SELinux configuration](#) for instructions.

Starting Zabbix server process

Now you may start Zabbix server process and make it start at system boot

```
# service zabbix-server start
# update-rc.d zabbix-server enable
```

PHP configuration for Zabbix frontend

Apache configuration file for Zabbix frontend is located in `/etc/zabbix/apache.conf`. Some PHP settings are already configured. But it's necessary to uncomment the `"date.timezone"` setting and [set the right timezone](#) for you.

```
php_value max_execution_time 300
php_value memory_limit 128M
php_value post_max_size 16M
php_value upload_max_filesize 2M
php_value max_input_time 300
php_value always_populate_raw_post_data -1
# php_value date.timezone Europe/Riga
```

As frontend is configured, you need to restart Apache web server:

```
# service apache2 restart
```

Installing frontend

Now you are ready to proceed with [frontend installation steps](#) which will allow you to access your newly installed Zabbix.

4 Agent installation

This page covers installation of Zabbix agent. If needed, you may check additional info about [supported platforms](#) and [permission requirements](#) for the agent.

Red Hat Enterprise Linux / CentOS

To install agent after correct [repository configuration package](#) is installed, run the following command:

```
# yum install zabbix-agent
```

Now agent is ready to be started by:

```
# systemctl start zabbix-agent
```

Debian / Ubuntu

To install agent after correct [repository configuration package](#) is installed, run the following command:

```
# apt-get install zabbix-agent
```

Now agent is ready to be started by:

```
# service zabbix-agent start
```

Precompiled Windows and MacOS agents

Zabbix Windows agent can be installed from Windows MSI installer packages (32-bit or 64-bit) available for [download](#).

Zabbix Mac OS agent can be installed from PKG installer packages available for [download](#). Versions with or without encryption are available.

5 Proxy installation

For this procedure [Zabbix repository](#) provides choice of 3 packages named as follows:

- zabbix-proxy-mysql
- zabbix-proxy-pgsql
- zabbix-proxy-sqlite3

where the last value of the name (after *zabbix-proxy-*) represents database type of the package — MySQL, PostgreSQL and SQLite respectively.

Common configuration

Database configuration for Zabbix proxy

Edit proxy host, name, user and password in `zabbix_proxy.conf`

Warning:

If Zabbix proxy and Zabbix server are installed on the same host, their databases must have unique names! Defaults for both are `zabbix`.

```
# vi /etc/zabbix/zabbix_proxy.conf
DBHost=localhost
DBName=zabbix
DBUser=zabbix
DBPassword=zabbix
```

1 Red Hat Enterprise Linux/CentOS

Installing packages

Install proxy and make sure to insert correct database type value for `<database_type>`:

```
# yum install zabbix-proxy-<database_type>
```

Creating proxy database

Create Zabbix proxy database and its user.

For instructions on doing that, see examples from server installation with [MySQL](#) or [PostgreSQL](#) and mind [peculiarity](#) of the SQLite creation.

Then import initial schema. Make sure to insert correct version for `3.0.X`.

MySQL command:

```
# zcat /usr/share/doc/zabbix-proxy-mysql-3.0.X/schema.sql.gz | mysql -u<username> zabbix
```

PostgreSQL command:

```
# zcat /usr/share/doc/zabbix-proxy-pgsql-3.0.X/schema.sql.gz | psql -U <username> zabbix
```

SQLite command:

```
# zcat /usr/share/doc/zabbix-proxy-sqlite3-3.0.X/schema.sql.gz | sqlite3 zabbix.db
```

In order to check the version you have in your package, use the following command:

```
# rpm -q zabbix-proxy-<database_type>
```

Starting Zabbix proxy process

After database is installed and `zabbix_proxy.conf` file is [configured](#), you may start Zabbix proxy process.

```
# systemctl start zabbix-proxy
```

2 Debian/Ubuntu

Installing packages

Install proxy and make sure to insert correct database type value for <database_type>:

```
# apt-get install zabbix-proxy-<database_type>
```

Creating proxy database

Create Zabbix proxy database and its user.

For instructions on doing that, see examples from server installation with **MySQL** or **PostgreSQL** and mind **peculiarity** of the SQLite creation.

Then import initial schema.

MySQL command:

```
# zcat /usr/share/doc/zabbix-proxy-mysql/schema.sql.gz | mysql -u<username> zabbix
```

PostgreSQL command:

```
# zcat /usr/share/doc/zabbix-proxy-pgsql/schema.sql.gz | psql -U <username> zabbix
```

SQLite command:

```
# zcat /usr/share/doc/zabbix-proxy-sqlite3/schema.sql.gz | sqlite3 zabbix.db
```

Starting Zabbix proxy process

After database is installed and zabbix_proxy.conf file is **configured**, you may start Zabbix proxy process.

```
# service zabbix-proxy start
```

5 Installation from containers

Docker Zabbix provides **Docker** images for each Zabbix component as portable and self-sufficient containers to speed up deployment and update procedure.

Zabbix components come with MySQL and PostgreSQL database support, Apache2 and Nginx web server support. These images are separated into different images.

Docker base images

Zabbix components are provided on Ubuntu, Alpine Linux and CentOS base images:

Image	Version
alpine	3.11
ubuntu	18.04 (bionic)
centos	7

All images are configured to rebuild latest images if base images are updated.

Attention:

Zabbix Docker Appliance image is decommissioned since 3.0.30 and will not be available for newer releases. Please use a separate Docker image for each component instead of the all-in-one solution.

Docker file sources

Everyone can follow Docker file changes using the Zabbix [official repository](#) on [github.com](#). You can fork the project or make your own images based on official Docker files.

Structure

All Zabbix components are available in the following Docker repositories:

- Zabbix agent - [zabbix/zabbix-agent](#)
- Zabbix server
 - Zabbix server with MySQL database support - [zabbix/zabbix-server-mysql](#)

- Zabbix server with PostgreSQL database support - [zabbix/zabbix-server-pgsql](#)
- Zabbix web-interface
 - Zabbix web-interface based on Apache2 web server with MySQL database support - [zabbix/zabbix-web-apache-mysql](#)
 - Zabbix web-interface based on Apache2 web server with PostgreSQL database support - [zabbix/zabbix-web-apache-pgsql](#)
 - Zabbix web-interface based on Nginx web server with MySQL database support - [zabbix/zabbix-web-nginx-mysql](#)
 - Zabbix web-interface based on Nginx web server with PostgreSQL database support - [zabbix/zabbix-web-nginx-pgsql](#)
- Zabbix proxy
 - Zabbix proxy with SQLite3 database support - [zabbix/zabbix-proxy-sqlite3](#)
 - Zabbix proxy with MySQL database support - [zabbix/zabbix-proxy-mysql](#)
- Zabbix Java Gateway - [zabbix/zabbix-java-gateway](#)

Additionally there is SNMP trap support. It is provided as additional repository ([zabbix/zabbix-snmptraps](#)) based on Alpine Linux, CentOS 7 and Ubuntu 18.04. It could be linked with Zabbix server and Zabbix proxy.

Versions

Each repository of Zabbix components contains the following tags:

- latest - latest stable version of a Zabbix component based on Alpine Linux image
- alpine-latest - latest stable version of a Zabbix component based on Alpine Linux image
- ubuntu-latest - latest stable version of a Zabbix component based on Ubuntu image
- alpine-3.0-latest - latest minor version of a Zabbix 3.0 component based on Alpine Linux image
- ubuntu-3.0-latest - latest minor version of a Zabbix 3.0 component based on Ubuntu image
- alpine-3.0.* - different minor versions of a Zabbix 3.0 component based on Alpine Linux image, where * is the minor version of Zabbix component
- ubuntu-3.0.* - different minor versions of a Zabbix 3.0 component based on Ubuntu image, where * is the minor version of Zabbix component

Usage

Environment variables

All Zabbix component images provide environment variables to control configuration. These environment variables are listed in each component repository. These environment variables are options from Zabbix configuration files, but with different naming method. For example, ZBX_LOGSLOWQUERIES is equal to LogSlowQueries from Zabbix server and Zabbix proxy configuration files.

Attention:

Some of configuration options are not allowed to change. For example, PIDFile and LogType.

Some of components have specific environment variables, which do not exist in official Zabbix configuration files:

Variable	Components	Description
DB_SERVER_HOST	Server	This variable is IP or DNS name of MySQL or PostgreSQL server. By default, value is mysql-server or postgres-server for MySQL or PostgreSQL respectively
	Proxy	
	Web interface	
DB_SERVER_PORT	Server	This variable is port of MySQL or PostgreSQL server. By default, value is '3306' or '5432' respectively.
	Proxy	
	Web interface	
MYSQL_USER	Server	MySQL database user. By default, value is 'zabbix'.
	Proxy	
	Web-interface	
MYSQL_PASSWORD	Server	MySQL database password. By default, value is 'zabbix'.
	Proxy	
	Web interface	
MYSQL_DATABASE	Server	Zabbix database name. By default, value is 'zabbix' for Zabbix server and 'zabbix_proxy' for Zabbix proxy.
	Proxy	
	Web interface	
POSTGRES_USER	Server	PostgreSQL database user. By default, value is 'zabbix'.
	Web interface	

POSTGRES_PASSWORD	Server	PostgreSQL database password.
	Web interface	By default, value is 'zabbix'.
POSTGRES_DB	Server	Zabbix database name.
	Web interface	By default, value is 'zabbix' for Zabbix server and 'zabbix_proxy' for Zabbix proxy.
PHP_TZ	Web-interface	Timezone in PHP format. Full list of supported timezones are available on php.net .
		By default, value is 'Europe/Riga'.
ZBX_SERVER_NAME	Web interface	Visible Zabbix installation name in right top corner of the web interface.
		By default, value is 'Zabbix Docker'
ZBX_JAVAGATEWAY_ENABLE	Server	Enables communication with Zabbix Java gateway to collect Java related checks.
	Proxy	By default, value is "false"
ZBX_ENABLE_SNMP_TRAPS	Server	Enables SNMP trap feature. It requires zabbix-snmptraps instance and shared volume
	Proxy	<code>/var/lib/zabbix/snmptraps</code> to Zabbix server or Zabbix proxy.

Volumes

The images allow to use some mount points. These mount points are different and depend on Zabbix component type:

Volume	Description
Zabbix agent	
<code>/etc/zabbix/zabbix_agentd.d</code>	The volume allows to include <code>*.conf</code> files and extend Zabbix agent using the <code>UserParameter</code> feature
<code>/var/lib/zabbix/modules</code>	The volume allows to load additional modules and extend Zabbix agent using the <code>LoadModule</code> feature
<code>/var/lib/zabbix/enc</code>	The volume is used to store TLS-related files. These file names are specified using <code>ZBX_TLSCAFILE</code> , <code>ZBX_TLSCRLFILE</code> , <code>ZBX_TLSKEY_FILE</code> and <code>ZBX_TLSPSKFILE</code> environment variables
Zabbix server	
<code>/usr/lib/zabbix/alertscripts</code>	The volume is used for custom alert scripts. It is the <code>AlertScriptsPath</code> parameter in <code>zabbix_server.conf</code>
<code>/usr/lib/zabbix/externalscripts</code>	The volume is used by <code>external checks</code> . It is the <code>ExternalScripts</code> parameter in <code>zabbix_server.conf</code>
<code>/var/lib/zabbix/modules</code>	The volume allows to load additional modules and extend Zabbix server using the <code>LoadModule</code> feature
<code>/var/lib/zabbix/enc</code>	The volume is used to store TLS related files. These file names are specified using <code>ZBX_TLSCAFILE</code> , <code>ZBX_TLSCRLFILE</code> , <code>ZBX_TLSKEY_FILE</code> and <code>ZBX_TLSPSKFILE</code> environment variables
<code>/var/lib/zabbix/ssl/certs</code>	The volume is used as location of SSL client certificate files for client authentication. It is the <code>SSLCertLocation</code> parameter in <code>zabbix_server.conf</code>
<code>/var/lib/zabbix/ssl/keys</code>	The volume is used as location of SSL private key files for client authentication. It is the <code>SSLKeyLocation</code> parameter in <code>zabbix_server.conf</code>
<code>/var/lib/zabbix/ssl/ssl_ca</code>	The volume is used as location of certificate authority (CA) files for SSL server certificate verification. It is the <code>SSLCALocation</code> parameter in <code>zabbix_server.conf</code>

<i>/var/lib/zabbix/snmptraps</i>	The volume is used as location of snmptraps.log file. It could be shared by zabbix-snmptraps container and inherited using the volumes_from Docker option while creating a new instance of Zabbix server. SNMP trap processing feature could be enabled by using shared volume and switching the ZBX_ENABLE_SNMP_TRAPS environment variable to 'true'
<i>/var/lib/zabbix/mibs</i>	The volume allows to add new MIB files. It does not support subdirectories, all MIBs must be placed in /var/lib/zabbix/mibs
Zabbix proxy	
<i>/usr/lib/zabbix/externalscripts</i>	The volume is used by external checks. It is the ExternalScripts parameter in zabbix_proxy.conf
<i>/var/lib/zabbix/modules</i>	The volume allows to load additional modules and extend Zabbix server using the LoadModule feature
<i>/var/lib/zabbix/enc</i>	The volume is used to store TLS related files. These file names are specified using ZBX_TLSCAFILE, ZBX_TLSCRLFILE, ZBX_TLSKEY_FILE and ZBX_TLSPSKFILE environment variables
<i>/var/lib/zabbix/ssl/certs</i>	The volume is used as location of SSL client certificate files for client authentication. It is the SSLCertLocation parameter in zabbix_proxy.conf
<i>/var/lib/zabbix/ssl/keys</i>	The volume is used as location of SSL private key files for client authentication. It is the SSLKeyLocation parameter in zabbix_proxy.conf
<i>/var/lib/zabbix/ssl/ssl_ca</i>	The volume is used as location of certificate authority (CA) files for SSL server certificate verification. It is the SSLCALocation parameter in zabbix_proxy.conf
<i>/var/lib/zabbix/snmptraps</i>	The volume is used as location of snmptraps.log file. It could be shared by the zabbix-snmptraps container and inherited using the volumes_from Docker option while creating a new instance of Zabbix server. SNMP trap processing feature could be enabled by using shared volume and switching the ZBX_ENABLE_SNMP_TRAPS environment variable to 'true'
<i>/var/lib/zabbix/mibs</i>	The volume allows to add new MIB files. It does not support subdirectories, all MIBs must be placed in /var/lib/zabbix/mibs
Zabbix web interface based on Apache2 web server	
<i>/etc/ssl/apache2</i>	The volume allows to enable HTTPS for Zabbix web interface. The volume must contain the two ssl.crt and ssl.key files prepared for Apache2 SSL connections
Zabbix web interface based on Nginx web server	
<i>/etc/ssl/nginx</i>	The volume allows to enable HTTPS for Zabbix web interface. The volume must contain the two ssl.crt, ssl.key files and dhparam.pem prepared for Nginx SSL connections
Zabbix snmptraps	
<i>/var/lib/zabbix/snmptraps</i>	The volume contains the snmptraps.log log file named with received SNMP traps
<i>/var/lib/zabbix/mibs</i>	The volume allows to add new MIB files. It does not support subdirectories, all MIBs must be placed in /var/lib/zabbix/mibs

For additional information use Zabbix official repositories in Docker Hub.

Usage examples

** Example 1 **

The example demonstrates how to run Zabbix server with MySQL database support, Zabbix web interface based on the Nginx web server and Zabbix Java gateway.

1. Create network dedicated for Zabbix component containers:

```
# docker network create --subnet 172.20.0.0/16 --ip-range 172.20.240.0/20 zabbix-net
```

2. Start empty MySQL server instance

```
# docker run --name mysql-server -t \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
--network=zabbix-net \
--restart unless-stopped \
-d mysql:5.7 \
--character-set-server=utf8 --collation-server=utf8_bin
```

3. Start Zabbix Java gateway instance

```
# docker run --name zabbix-java-gateway -t \
--network=zabbix-net \
--restart unless-stopped \
-d zabbix/zabbix-java-gateway:alpine-3.0-latest
```

4. Start Zabbix server instance and link the instance with created MySQL server instance

```
# docker run --name zabbix-server-mysql -t \
-e DB_SERVER_HOST="mysql-server" \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
-e ZBX_JAVAGATEWAY="zabbix-java-gateway" \
--network=zabbix-net \
-p 10051:10051 \
--restart unless-stopped \
-d zabbix/zabbix-server-mysql:alpine-3.0-latest
```

Note:

Zabbix server instance exposes 10051/TCP port (Zabbix trapper) to host machine.

5. Start Zabbix web interface and link the instance with created MySQL server and Zabbix server instances

```
# docker run --name zabbix-web-nginx-mysql -t \
-e ZBX_SERVER_HOST="zabbix-server-mysql" \
-e DB_SERVER_HOST="mysql-server" \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
--network=zabbix-net \
-p 80:8080 \
--restart unless-stopped \
-d zabbix/zabbix-web-nginx-mysql:alpine-3.0-latest
```

Note:

Zabbix web interface instance exposes 80/TCP port (HTTP) to host machine.

**** Example 2 ****

The example demonstrates how to run Zabbix server with PostgreSQL database support, Zabbix web interface based on the Nginx web server and SNMP trap feature.

1. Create network dedicated for Zabbix component containers:

```
# docker network create --subnet 172.20.0.0/16 --ip-range 172.20.240.0/20 zabbix-net
```

2. Start empty PostgreSQL server instance

```
# docker run --name postgres-server -t \
-e POSTGRES_USER="zabbix" \
-e POSTGRES_PASSWORD="zabbix_pwd" \
-e POSTGRES_DB="zabbix" \
--network=zabbix-net \
```

```
--restart unless-stopped \  
-d postgres:latest
```

3. Start Zabbix snmptraps instance

```
# docker run --name zabbix-snmptraps -t \  
-v /zbx_instance/snmptraps:/var/lib/zabbix/snmptraps:rw \  
-v /var/lib/zabbix/mibs:/usr/share/snmp/mibs:ro \  
--network=zabbix-net \  
-p 162:1162/udp \  
--restart unless-stopped \  
-d zabbix/zabbix-snmptraps:alpine-3.0-latest
```

Note:

Zabbix snmptrap instance exposes the 162/UDP port (SNMP traps) to host machine.

4. Start Zabbix server instance and link the instance with created PostgreSQL server instance

```
# docker run --name zabbix-server-pgsql -t \  
-e DB_SERVER_HOST="postgres-server" \  
-e POSTGRES_USER="zabbix" \  
-e POSTGRES_PASSWORD="zabbix_pwd" \  
-e POSTGRES_DB="zabbix" \  
-e ZBX_ENABLE_SNMP_TRAPS="true" \  
--network=zabbix-net \  
-p 10051:10051 \  
--volumes-from zabbix-snmptraps \  
--restart unless-stopped \  
-d zabbix/zabbix-server-pgsql:alpine-3.0-latest
```

Note:

Zabbix server instance exposes the 10051/TCP port (Zabbix trapper) to host machine.

5. Start Zabbix web interface and link the instance with created PostgreSQL server and Zabbix server instances

```
# docker run --name zabbix-web-nginx-pgsql -t \  
-e ZBX_SERVER_HOST="zabbix-server-pgsql" \  
-e DB_SERVER_HOST="postgres-server" \  
-e POSTGRES_USER="zabbix" \  
-e POSTGRES_PASSWORD="zabbix_pwd" \  
-e POSTGRES_DB="zabbix" \  
--network=zabbix-net \  
-p 443:8443 \  
-p 80:8080 \  
-v /etc/ssl/nginx:/etc/ssl/nginx:ro \  
--restart unless-stopped \  
-d zabbix/zabbix-web-nginx-pgsql:alpine-3.0-latest
```

Note:

Zabbix web interface instance exposes the 443/TCP port (HTTPS) to host machine.
Directory `/etc/ssl/nginx` must contain certificate with required name.

Docker Compose Zabbix provides compose files also for defining and running multi-container Zabbix components in Docker. These compose files are available in Zabbix docker official repository on github.com: <https://github.com/zabbix/zabbix-docker>. These compose files are added as examples, they are overloaded. For example, they contain proxies with MySQL and SQLite3 support.

There are a few different versions of compose files:

File name	Description
<code>docker-compose_v3_alpine_mysql_latest.yaml</code>	The compose file runs the latest version of Zabbix 3.0 components on Alpine Linux with MySQL database support.

<code>docker-compose_v3_alpine_mysql_local.yaml</code>	The compose file locally builds the latest version of Zabbix 3.0 and runs Zabbix components on Alpine Linux with MySQL database support.
<code>docker-compose_v3_alpine_pgsql_latest.yaml</code>	The compose file runs the latest version of Zabbix 3.0 components on Alpine Linux with PostgreSQL database support.
<code>docker-compose_v3_alpine_pgsql_local.yaml</code>	The compose file locally builds the latest version of Zabbix 3.0 and runs Zabbix components on Alpine Linux with PostgreSQL database support.
<code>docker-compose_v3_centos_mysql_latest.yaml</code>	The compose file runs the latest version of Zabbix 3.0 components on CentOS 7 with MySQL database support.
<code>docker-compose_v3_centos_mysql_local.yaml</code>	The compose file locally builds the latest version of Zabbix 3.0 and runs Zabbix components on CentOS 7 with MySQL database support.
<code>docker-compose_v3_centos_pgsql_latest.yaml</code>	The compose file runs the latest version of Zabbix 3.0 components on CentOS 7 with PostgreSQL database support.
<code>docker-compose_v3_centos_pgsql_local.yaml</code>	The compose file locally builds the latest version of Zabbix 3.0 and runs Zabbix components on CentOS 7 with PostgreSQL database support.
<code>docker-compose_v3_ubuntu_mysql_latest.yaml</code>	The compose file runs the latest version of Zabbix 3.0 components on Ubuntu 18.04 with MySQL database support.
<code>docker-compose_v3_ubuntu_mysql_local.yaml</code>	The compose file locally builds the latest version of Zabbix 3.0 and runs Zabbix components on Ubuntu 18.04 with MySQL database support.
<code>docker-compose_v3_ubuntu_pgsql_latest.yaml</code>	The compose file runs the latest version of Zabbix 3.0 components on Ubuntu 18.04 with PostgreSQL database support.
<code>docker-compose_v3_ubuntu_pgsql_local.yaml</code>	The compose file locally builds the latest version of Zabbix 3.0 and runs Zabbix components on Ubuntu 18.04 with PostgreSQL database support.

Attention:

Available Docker compose files support version 3 of Docker Compose.

Storage

Compose files are configured to support local storage on a host machine. Docker Compose will create a `zbx_env` directory in the folder with the compose file when you run Zabbix components using the compose file. The directory will contain the same structure as described above in the **Volumes** section and directory for database storage.

There are also volumes in read-only mode for `/etc/localtime` and `/etc/timezone` files.

Environment files

In the same directory with compose files on github.com you can find files with default environment variables for each component in compose file. These environment files are named like `.env_<type of component>`.

Examples

**** Example 1 ****

```
# git checkout 3.0
# docker-compose -f ./docker-compose_v3_alpine_mysql_latest.yaml up -d
```

The command will download latest Zabbix 3.0 images for each Zabbix component and run them in detach mode.

Attention:

Do not forget to download `.env_<type of component>` files from github.com official Zabbix repository with compose files.

**** Example 2 ****

```
# git checkout 3.0
# docker-compose -f ./docker-compose_v3_ubuntu_mysql_local.yaml up -d
```

The command will download base image Ubuntu 18.04 (bionic), then build Zabbix 3.0 components locally and run them in detach mode.

6 Upgrade procedure using sources

Overview

This section provides the steps required for a successful upgrade to Zabbix 3.0.

Direct upgrade to Zabbix 3.0 is possible from Zabbix 2.4.x, 2.2.x and 2.0.x. For upgrading from earlier versions consult Zabbix documentation for 2.0 and earlier.

While upgrading Zabbix agents is not mandatory (but recommended), Zabbix server and proxies must be of the **same major version**. Therefore, in a server-proxy setup, Zabbix server and all proxies have to be stopped and upgraded.

To minimize downtime and data loss during the upgrade, it is recommended to stop and upgrade Zabbix server and then stop, upgrade and start Zabbix proxies one after another. When all proxies are upgraded, start Zabbix server. During the Zabbix server downtime, running proxies will keep collecting and storing data and will pass the data to Zabbix server when the server is up and running. Any notifications for problems during Zabbix server downtime will be generated only after the upgraded server is started.

Attention:

It is known to be possible to start the upgraded server and have older, yet unupgraded proxies report data to a newer server (the proxies can't refresh their configuration though). This approach, however, is not recommended and not supported by Zabbix and choosing it is entirely at your own risk.

Note that with SQLite database on proxies, history data from proxies before the upgrade will be lost, because SQLite database upgrade is not supported and the SQLite database file has to be manually removed. When proxy is started for the first time and the SQLite database file is missing, proxy creates it automatically.

Before the upgrade from 2.4.x to 3.0:

- read the [upgrade notes for 3.0](#)
- check [requirements for 3.0](#)

If upgrading from earlier versions, read also the upgrade notes for [2.0 → 2.2](#) and [2.2 → 2.4](#).

Note:

It may be handy to run two parallel SSH sessions during the upgrade, executing the upgrade steps in one and monitoring the server/proxy logs in another. For example, run `tail -f zabbix_server.log` or `tail -f zabbix_proxy.log` in the second SSH session showing you the latest log file entries and possible errors in real time. This can be critical for production instances.

Server upgrade process

1 Stop Zabbix server

Stop Zabbix server to make sure that no new data is inserted into database.

2 Back up the existing Zabbix database

This is a very important step. Make sure that you have a backup of your database. It will help if the upgrade procedure fails (lack of disk space, power off, any unexpected problem).

3 Back up configuration files, PHP files and Zabbix binaries

Make a backup copy of Zabbix binaries, configuration files and the PHP file directory.

4 Install new server binaries

Use these [instructions](#) to compile Zabbix server from sources.

5 Review server configuration parameters

The `HistoryTextCacheSize` parameter has been replaced by a new `HistoryIndexCacheSize` server [parameter](#), which must be present for the server to start.

For other recommended changes and new parameters, see the [What's new](#) section.

6 Start new Zabbix binaries

Start new binaries. Check log files to see if the binaries have started successfully.

Zabbix server will automatically upgrade the database. When starting up, Zabbix server reports the current (mandatory and optional) and required database versions. If the current mandatory version is older than the required version, Zabbix server automatically executes the required database upgrade patches. The start and progress level (percentage) of the database upgrade is written to the Zabbix server log file. When the upgrade is completed, a "database upgrade fully completed" message is written to the log file. If any of the upgrade patches fail, Zabbix server will not start. Zabbix server will also not start if the current mandatory database version is newer than the required one. Zabbix server will only start if the current mandatory database version corresponds to the required mandatory version.

```
8673:20161117:104750.259 current database version (mandatory/optional): 03000000/03000000
8673:20161117:104750.259 required mandatory version: 03000000
```

Before you start the server:

- Make sure the database user has enough permissions (create table, drop table, create index, drop index)
- Make sure you have enough free disk space.

7 Install new Zabbix web interface

Warning:

The minimum required PHP version has been **upped** from 5.3.0 to 5.4.0.

Update if needed and then follow the [installation instructions](#).

8 Clear web browser cookies and cache

After the upgrade you may need to clear web browser cookies and web browser cache for the Zabbix web interface to work properly.

Proxy upgrade process

1 Stop Zabbix proxy

Stop Zabbix proxy.

2 Back up configuration files and Zabbix proxy binaries

Make a backup copy of the Zabbix proxy binary and configuration file.

3 Install new proxy binaries

Use these [instructions](#) to compile Zabbix proxy from sources.

4 Review proxy configuration parameters

The *HistoryTextCacheSize* parameter has been replaced by a new *HistoryIndexCacheSize* proxy [parameter](#), which must be present for the proxy to start.

For other recommended changes and new parameters, see the [What's new](#) section.

5 Start new Zabbix proxy

Start the new Zabbix proxy. Check log files to see if the proxy has started successfully.

Zabbix proxy will automatically upgrade the database. Database upgrade takes place similarly as when starting [Zabbix server](#).

Agent upgrade process

Attention:

Upgrading agents is not mandatory. You only need to upgrade agents if it is required to access the new functionality.

1 Stop Zabbix agent

Stop Zabbix agent.

2 Back up configuration files and Zabbix agent binaries

Make a backup copy of the Zabbix agent binary and configuration file.

3 Install new agent binaries

Use these [instructions](#) to compile Zabbix agent from sources.

Alternatively, you may download pre-compiled Zabbix agents from the [Zabbix download page](#).

4 Review agent configuration parameters

There are no mandatory changes in this version to agent **parameters**. For recommended changes and new optional parameters, see the **What's new** section.

5 Start new Zabbix agent

Start the new Zabbix agent. Check log files to see if the agent has started successfully.

Upgrade between minor versions

When upgrading between minor versions of 3.0.x (for example from 3.0.1 to 3.0.3) it is required to execute the same actions for server/proxy/agent as during the upgrade between major versions. The only difference is that when upgrading between minor versions no changes to the database are made.

7 Upgrade procedure using packages

Overview

This section provides the steps required for a successful upgrade using official RPM and DEB packages provided by Zabbix for:

- **Red Hat Enterprise Linux/CentOS**
- **Debian/Ubuntu**

1 Red Hat Enterprise Linux/CentOS

Overview

Make sure to read **general information** about upgrading first.

Upgrade procedure

1 Stop Zabbix processes

Stop Zabbix server to make sure that no new data is inserted into database.

```
# systemctl stop zabbix-server
```

If upgrading the proxy, stop proxy too.

```
# systemctl stop zabbix-proxy
```

2 Back up the existing Zabbix database

This is a very important step. Make sure that you have a backup of your database. It will help if the upgrade procedure fails (lack of disk space, power off, any unexpected problem).

3 Back up configuration files, PHP files and Zabbix binaries

Make a backup copy of Zabbix binaries, configuration files and the PHP file directory.

Configuration files:

```
# mkdir /opt/zabbix-backup/  
# cp /etc/zabbix/zabbix_server.conf /opt/zabbix-backup/  
# cp /etc/httpd/conf.d/zabbix.conf /opt/zabbix-backup/
```

PHP files and Zabbix binaries:

```
# cp -R /usr/share/zabbix/ /opt/zabbix-backup/  
# cp -R /usr/share/doc/zabbix-* /opt/zabbix-backup/
```

4 Update repository configuration package

To proceed with the upgrade your current repository package has to be updated.

```
# rpm -Uvh https://repo.zabbix.com/zabbix/3.0/rhel/7/x86_64/zabbix-release-3.0-1.el7.noarch.rpm
```

5 Upgrade Zabbix components

To upgrade Zabbix components you may run something like:

```
# yum upgrade zabbix-server-mysql zabbix-web-mysql zabbix-agent
```

If using PostgreSQL, substitute `mysql` with `pgsql` in the command. If upgrading the proxy, substitute `server` with `proxy` in the command.

6 Review component configuration parameters

The `HistoryTextCacheSize` parameter has been replaced by a new `HistoryIndexCacheSize` server/proxy **parameter**, which must be present for the server/proxy to start.

For other recommended changes and new parameters, see the **What's new** section.

7 Start Zabbix processes

Start the updated Zabbix components.

```
# systemctl start zabbix-server
# systemctl start zabbix-proxy
# systemctl start zabbix-agent
```

8 Clear web browser cookies and cache

After the upgrade you may need to clear web browser cookies and web browser cache for the Zabbix web interface to work properly.

Upgrade between minor versions

It is possible to upgrade between minor versions of 3.0.x (for example, from 3.0.1 to 3.0.3). Upgrading between minor versions is easy.

To execute Zabbix minor version upgrade it is required to run:

```
$ sudo yum upgrade 'zabbix-*
```

To execute Zabbix server minor version upgrade run:

```
$ sudo yum upgrade 'zabbix-server-*
```

To execute Zabbix agent minor version upgrade run:

```
$ sudo yum upgrade 'zabbix-agent-*
```

Note that you may also use 'update' instead of 'upgrade' in these commands. While 'upgrade' will delete obsolete packages, 'update' will preserve them.

2 Debian/Ubuntu

Overview

Make sure to read **general information** about upgrading first.

Upgrade procedure

1 Stop Zabbix processes

Stop Zabbix server to make sure that no new data is inserted into database.

```
# service zabbix-server stop
```

If upgrading Zabbix proxy, stop proxy too.

```
# service zabbix-proxy stop
```

2 Back up the existing Zabbix database

This is a very important step. Make sure that you have a backup of your database. It will help if the upgrade procedure fails (lack of disk space, power off, any unexpected problem).

3 Back up configuration files, PHP files and Zabbix binaries

Make a backup copy of Zabbix binaries, configuration files and the PHP file directory.

Configuration files:

```
# mkdir /opt/zabbix-backup/
# cp /etc/zabbix/zabbix_server.conf /opt/zabbix-backup/
# cp /etc/apache2/conf-enabled/zabbix.conf /opt/zabbix-backup/
```

PHP files and Zabbix binaries:

```
# cp -R /usr/share/zabbix/ /opt/zabbix-backup/
# cp -R /usr/share/doc/zabbix-* /opt/zabbix-backup/
```

4 Update repository configuration package

To proceed with the update your current repository package has to be uninstalled.

```
# rm -Rf /etc/apt/sources.list.d/zabbix.list
```

Then install the new repository configuration package.

On **Debian 9** run:

```
# wget https://repo.zabbix.com/zabbix/3.0/debian/pool/main/z/zabbix-release/zabbix-release_3.0-2+stretch_all.deb
# dpkg -i zabbix-release_3.0-2+stretch_all.deb
```

On **Debian 8** run:

```
# wget https://repo.zabbix.com/zabbix/3.0/debian/pool/main/z/zabbix-release/zabbix-release_3.0-2+jessie_all.deb
# dpkg -i zabbix-release_3.0-2+jessie_all.deb
```

On **Debian 7** run:

```
# wget https://repo.zabbix.com/zabbix/3.0/debian/pool/main/z/zabbix-release/zabbix-release_3.0-2+wheezy_all.deb
# dpkg -i zabbix-release_3.0-2+wheezy_all.deb
```

On **Ubuntu 18.04** run:

```
# wget https://repo.zabbix.com/zabbix/3.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_3.0-2+bionic_all.deb
# dpkg -i zabbix-release_3.0-2+bionic_all.deb
```

On **Ubuntu 16.04** run:

```
# wget https://repo.zabbix.com/zabbix/3.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_3.0-2+xenial_all.deb
# dpkg -i zabbix-release_3.0-2+xenial_all.deb
```

On **Ubuntu 14.04** run:

```
# wget https://repo.zabbix.com/zabbix/3.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_3.0-2+trusty_all.deb
# dpkg -i zabbix-release_3.0-2+trusty_all.deb
```

Update the repository information.

```
# apt-get update
```

5 Upgrade Zabbix components

To upgrade Zabbix components you may run something like:

```
# apt-get install --only-upgrade zabbix-server-mysql zabbix-frontend-php zabbix-agent
```

If using PostgreSQL, substitute mysql with pgsq in the command. If upgrading the proxy, substitute server with proxy in the command.

6 Review component configuration parameters

The *HistoryTextCacheSize* parameter has been replaced by a new *HistoryIndexCacheSize* server/proxy **parameter**, which must be present for the server/proxy to start.

For other recommended changes and new parameters, see the **What's new** section.

7 Start Zabbix processes

Start the updated Zabbix components.

```
# service zabbix-server start
# service zabbix-proxy start
# service zabbix-agent start
```

8 Clear web browser cookies and cache

After the upgrade you may need to clear web browser cookies and web browser cache for the Zabbix web interface to work properly.

Upgrade between minor versions

It is possible to upgrade minor versions of 3.0.x (for example, from 3.0.1 to 3.0.3). It is easy.

To upgrade Zabbix minor version please run:

```
$ sudo apt install --only-upgrade 'zabbix.*'
```

To upgrade Zabbix server minor version please run:

```
$ sudo apt install --only-upgrade 'zabbix-server.*'
```

To upgrade Zabbix agent minor version please run:

```
$ sudo apt install --only-upgrade 'zabbix-agent.*'
```

8 Known issues

Upgrade with MariaDB 10.2.1 and before

Upgrading Zabbix may fail if database tables were created with MariaDB 10.2.1 and before, because in those versions the default row format is compact. This can be fixed by changing the row format to dynamic (see also [ZBX-17690](#)).

NetBSD 8.0 and newer

Various Zabbix processes may randomly crash on startup on the NetBSD versions 8.X and 9.X. That is due to the too small default stack size (4MB), which must be increased by running:

```
ulimit -s 10240
```

For more information, please see the related problem report: [ZBX-18275](#).

Problems with pressing Enter in configuration forms

Affects Zabbix versions 3.0.0 - 3.0.4. Pressing Enter in a text field of a configuration form is known to result in various problems.

For instance, if you open the configuration form of a host with linked templates, then press Enter in any text field and update the form, template linkage is removed (items from the template remain).

Agent items

- `net.dns[]` Zabbix agent **item** does not support IPv6 addresses in its first parameter.

IPMI checks

IPMI checks will not work with the standard OpenIPMI library package on Debian prior to 9 (stretch) and Ubuntu prior to 16.04 (xenial). To fix that, recompile OpenIPMI library with OpenSSL enabled as discussed in [ZBX-6139](#).

SSH checks

Some Linux distributions like Debian, Ubuntu do not support encrypted private keys (with passphrase) if the libssh2 library is installed from packages. Please see [ZBX-4850](#) for more details.

When using libssh 0.9.x on CentOS 8 with OpenSSH 8 SSH checks may occasionally report "Cannot read data from SSH server". This is caused by a libssh [issue](#) ([more detailed report](#)). The error is expected to have been fixed by a stable libssh 0.9.5 release. See also [ZBX-17756](#) for details.

ODBC checks

- MySQL unixODBC driver should not be used with Zabbix server or Zabbix proxy compiled against MariaDB connector library and vice versa, if possible it is also better to avoid using the same connector as the driver due to an [upstream bug](#). Suggested setup:

PostgreSQL, SQLite or Oracle connector → MariaDB or MySQL unixODBC driver

MariaDB connector → MariaDB unixODBC driver

MySQL connector → MySQL unixODBC driver

Please see [ZBX-7665](#) for more information and available workarounds.

- XML data queried from Microsoft SQL Server may get truncated in various ways on Linux and UNIX systems.
- It has been observed that using ODBC checks on CentOS 8 for monitoring Oracle databases using Oracle Instant Client for Linux 11.2.0.4.0 causes the Zabbix server to crash. The issue can be solved by upgrading Oracle Instant Client to 12.1.0.2.0, 12.2.0.1.0, 18.5.0.0.0 or 19. See also [ZBX-18402](#).

HTTPS checks

Web scenarios using the https protocol and Zabbix agent checks `net.tcp.service[https...]` and `net.tcp.service.perf[https...]` may fail if the target server is configured to disallow TLS v1.0 protocol or below. Please see [ZBX-9879](#) for more information and available workarounds.

Simple checks

There is a bug in **fping** versions earlier than v3.10 that mishandles duplicate echo replay packets. This may cause unexpected results for `icmping`, `icmpingloss`, `icmpingsec` items. It is recommended to use the latest version of **fping**. Please see [ZBX-11726](#) for more details.

SNMP checks

If the OpenBSD operating system is used, a use-after-free bug in the Net-SNMP library up to the 5.7.3 version can cause a crash of Zabbix server if the `SourceIP` parameter is set in the Zabbix server configuration file. As a workaround, please do not set the `SourceIP` parameter. The same problem applies also for Linux, but it does not cause Zabbix server to stop working. A local patch for the `net-snmp` package on OpenBSD was applied and will be released with OpenBSD 6.3.

SNMP data spikes

Spikes in SNMP data have been observed that may be related to certain physical factors like voltage spikes in the mains. See [ZBX-14318](#) more details.

SNMP traps

The `"net-snmp-perl"` package, needed for SNMP traps, has been removed in RHEL/CentOS 8.0-8.2; re-added in RHEL 8.3.

So if you are using RHEL 8.0-8.2, the best solution is to upgrade to RHEL 8.3; if you are using CentOS 8.0-8.2, you may wait for CentOS 8.3 or use a package from EPEL.

Please also see [ZBX-17192](#) for more information.

Web monitoring

Zabbix server leaks memory on CentOS 6, CentOS 7 and possibly other related Linux distributions due to an [upstream bug](#) when `"SSL verify peer"` is enabled in web scenarios. Please see [ZBX-10486](#) for more information and available workarounds.

Alerter process crash in Centos/RHEL 7

Instances of a Zabbix server alerter process crash have been encountered in Centos/RHEL 7. Please see [ZBX-10461](#) for details.

Flipping frontend locales

It has been observed that frontend locales may flip without apparent logic, i. e. some pages (or parts of pages) are displayed in one language while other pages (or parts of pages) in a different language. Typically the problem may appear when there are several users, some of whom use one locale, while others use another.

A known workaround to this is to disable multithreading in PHP and Apache.

The problem is related to how setting the locale works [in PHP](#): locale information is maintained per process, not per thread. So in a multi-thread environment, when there are several projects run by same Apache process, it is possible that the locale gets changed in another thread and that changes how data can be processed in the Zabbix thread.

For more information, please see related problem reports:

- [ZBX-10911](#) (Problem with flipping frontend locales)
- [ZBX-16297](#) (Problem with number processing in graphs using the `bcdiv` function of BC Math functions)

Compatibility issue with PHP 7.0

It has been observed that with PHP 7.0 importing a template with web monitoring triggers may fail due to incorrectly added double quotes to the web monitoring items in the trigger expressions. The issue goes away when upgrading PHP to 7.1.

MariaDB row size error

Prior to MariaDB 10.2.26, 10.3.17, and 10.4.7, MariaDB didn't properly calculate the row sizes while executing DDL, so `"unsafe"` tables could be created, even with `innodb_strict_mode=ON` set. This was fixed by [MDEV-19292](#). As a side effect, tables that could be created in previous versions may get rejected after the latest releases.

Suggested database changes for existing 3.0 installations:

```
shell> mysql -uroot -p<password>
mysql> alter table `host_inventory` modify `name` varchar(128) default '' not null, modify `alias` varchar
```

Suggested database changes for new 3.0 installations:

```
shell> mysql -uroot -p<password>
mysql> set global innodb_strict_mode='OFF';
```

Perform database creation as usual and fix schema after:

```
shell> mysql -uroot -p<password>
mysql> alter table `host_inventory` modify `name` varchar(128) default '' not null, modify `alias` varchar
mysql> set global innodb_strict_mode='ON';
```

Graphs

Changes to Daylight Saving Time (DST) result in irregularities when displaying X axis labels (date duplication, date missing, etc).

Non-ASCII characters are incorrectly saved in MySQL

Affects Zabbix versions 3.0.0, 3.0.1 and 3.0.2 using MySQL database. Issue occurs when Zabbix server or proxy reads, processes and saves back to the database text containing non-ASCII characters (automatic template linking, low-level discovery, notification messages, ...) The issue is transient, it is related to MySQL automatic reconnection behaviour. Fixed in 3.0.3rc1, [ZBX-10540](#) contains patch and more information on the issue.

Log file monitoring

`log[]` and `logrt[]` items repeatedly reread log file from the beginning if file system is 100% full and the log file is being appended (see [ZBX-10884](#) for more information).

Slow MySQL queries

Zabbix server generates slow select queries in case of non-existing values for items. This is caused by a known [issue](#) in MySQL 5.6/5.7 versions. A workaround to this is disabling the `index_condition_pushdown` optimizer in MySQL. For an extended discussion, see [ZBX-10652](#).

API fails decoding valid JSON-RPC request

Affects Zabbix versions 3.0.4, 3.0.5. API fails to decode a valid JSON-RPC request unless a non-requirement `php-json` module is installed. [ZBX-11244](#) contains more information on this issue.

Escalations

Several operations can be assigned to the same step. If these operations have different step duration defined, the shortest one is taken into account and applied to the step. But due to bug there was exception to this rule when step duration is set to 0, it would use default value instead of shortest one. Now there will be no exception and default step duration will only be used if it's shortest, this is equivalent to behavior that frontend shows and user expects. Affects all versions, fixed in 3.0.7rc1, (see [ZBX-11534](#) for more information).

API

The **output** parameter does not work properly with the `history.get` method.

API login

A large number of open user sessions can be created when using custom scripts with the `user.login` **method** without a following `user.logout`.

IPv6 address issue in SNMPv3 traps

Due to a net-snmp bug, IPv6 address may not be correctly displayed when using SNMPv3 in SNMP traps. For more details and a possible workaround, see [ZBX-14541](#).

Zabbix agent checks on Windows

Non-existing DNS entries in a `Server` parameter of Zabbix agent configuration file (`zabbix_agentd.conf`) may increase Zabbix agent response time on Windows. This happens because Windows DNS caching daemon doesn't cache negative responses for IPv4 addresses. However, for IPv6 addresses negative responses are cached, so a possible workaround to this is disabling IPv4 on the host.

Known issues for 3.0.0 - 3.0.17

- Remote commands executed on Zabbix server are displayed with an initial `:` colon in *Reports* → *Action log*.

Known issues for 3.0.0 - 3.0.18

- When `proc.mem`, `proc.num` agent items are invoked from the command line and contain a command line parameter (e.g. using the agent test mode: `zabbix_agentd -t proc.num[, , ,apache2]`), two extra processes are counted, as the agent counts itself twice.

Known issues for 3.0.18

- 3.0.18 version Zabbix servers are not backwards (or forwards) compatible with 3.0.x proxies. Fixed for 3.0.19 Zabbix server.

Known issues for 3.0.0 - 3.0.24

- **Negative problem duration** affects the total result in **SLA calculation** or **Availability report**, making it incorrect. Fixed in 3.0.25.

Known issues starting with 3.0.25

- Failed login attempt message has been changed to display only the first 39 characters of a stored IP address as that's the character limit in the database field. That means that IPv6 IP addresses longer than 39 characters will be shown incompletely.

9 Template changes

This page lists all changes to the stock templates that are shipped with Zabbix. It is suggested to modify these templates in existing installations - depending on the changes, it can be done either by importing the latest version or by performing the change manually.

Template changes in 3.0.0

A new item `vmware.vm.cpu.ready` was added to template *Template Virt VMware Guest*.

Item `net.tcp.service[ntp]` was changed to be `net.udp.service[ntp]` in template *Template App NTP Service*.

History text cache monitoring item `zabbix[wcache,index,pfree]` and the corresponding trigger were removed from *Template App Zabbix Server* template.

History index cache monitoring item `zabbix[wcache,index,pfree]` with a corresponding trigger were added to *Template App Zabbix Server* template.

Template changes in 3.0.6

New items `vmware.hv.datastore.size[{$URL},{HOST.HOST},{#DATASTORE}]`, `vmware.hv.datastore.size[{$URL},{HOST.HOST},{#DATASTORE}]` to monitor VMware datastore capacity were added to template *Template Virt VMware Hypervisor* datastore discovery.

Template changes in 3.0.7

The `vmware.vm.cpu.ready` item unit and description was changed from percentage to milliseconds.

Tomcat template changes in 3.0.25

Template App Apache Tomcat JMX has been updated in the following way:

- support for recent Tomcat versions has been added
- the following macros have been defined: `{$PROTOCOL_HANDLER_HTTP}`, `{$PROTOCOL_HANDLER_HTTPS}`, `{$PROTOCOL_HANDLER_AJP}`

10 Upgrade notes for 3.0.0

These notes are for upgrading from Zabbix 2.4.x to Zabbix 3.0.0. All notes are grouped into:

- **Critical** - the most critical information related to the upgrade process and the changes in Zabbix functionality
- **Informational** - all remaining information describing the changes in Zabbix functionality

It is possible to upgrade to Zabbix 3.0.0 from versions before Zabbix 2.4.0. See the [upgrade procedure](#) section for all relevant information about upgrading from previous Zabbix versions.

Critical Minimum required PHP version

The minimum required PHP version has been upped from 5.3.0 to 5.4.0.

Support for IE8 dropped

Support for Microsoft Internet Explorer 8 is not provided any more.

Case-sensitive MySQL database

A case-sensitive MySQL database is required for proper server work. It is **recommended** to create a case-sensitive MySQL database during new installations. If you created a MySQL database with the utf8 character set previously, in order to support case sensitivity of stored data, you need to convert the charset to `utf8_bin`.

Configuration parameters related to logging

As a new **LogType** configuration parameter has been **added**, it is important to note that previously Zabbix would log to `syslog/eventlog` by default if the `LogFile` parameter was empty. After the upgrade, Zabbix logs to file as default and the agent **will not** start if `LogFile` is not specified. To enable logging to `syslog/eventlog`, `LogType` must be set to *system*.

Upgrade with MariaDB 10.2.1 and before

Upgrading Zabbix may fail if database tables were created with MariaDB 10.2.1 and before, because in those versions the default row format is compact. This can be fixed by changing the row format to dynamic (see also [ZBX-17690](#)).

Informational Item changes

net.dns and **net.dns.record** items on Windows now bypass the internal DNS resolver cache.

net.tcp.listen item on Linux kernels 2.6.14 and above, when detecting NETLINK capabilities, now tries to obtain information on sockets in the LISTEN state from the kernel's NETLINK interface. In case of failing to do that, it falls back on the old method of obtaining this information from the /proc virtual filesystem, which has also been improved. See [What's new in Zabbix 3.0.0](#) for details.

vfs.fs.discovery item on Windows now returns an additional {#FSDRIVETYPE} macro with possible values of "unknown", "noroot-dir", "removable", "fixed", "remote", "cdrom", "ramdisk". Note, however, that if filtering by {#FSDRIVETYPE}, low-level discovery will ignore entities discovered by older agents which return responses without this macro.

SNMP discovery item OID value now accepts a `discovery[{#MACRO1}, oid1, {#MACRO2}, oid2, ...]` format (see [low level discovery](#) for details). The OID values of existing SNMP discovery rules will be converted to the new format (`discovery[{#SNMPVALUE}, <old oid value>]`) during database upgrade.

A check for valid reference has been added for global regular expressions in **snmptrap**, **log**, **logrt** and **eventlog** items. If entered reference is not valid, due to misspelling or missing referenced global regular expression, the item will become unsupported and appropriate error message will be displayed.

An item to monitor VMware virtual machine CPU ready state was added to the default virtual machine monitoring template. If a performance counter based item was used to monitor virtual machine CPU ready state (for example `vmware.vm.perfcounter[{ $URL }, {HOST.HOST}]`), then it can be replaced with the new item (`vmware.vm.cpu.ready[{ $URL }, {HOST.HOST}]`).

vm.memory.size[available] item on AIX now returns the sum of free and cached memory. Before Zabbix 3.0 only the free memory size was returned.

vm.memory.size[available] item on Linux now reads MemAvailable (the system's native estimate) from /proc/meminfo on Linux kernels 3.14 and above. Depending on the system state (like the amount of reclaimable slab), the new value may differ significantly from the old version and may thus cause triggers to change their value. Before Zabbix 3.0 it was always the sum of free, buffers, and cached memories.

Items **proc.mem** and **proc.num** now return 0 if the specified user does not exist. Before Zabbix 3.0 these items became not supported.

Added items **net.udp.service** and **net.udp.service.perf** with the possibility to check NTP service. Before Zabbix 3.0 checking of NTP service was done using **net.tcp.service** and **net.tcp.service.perf** items. Database upgrade patches automatically convert NTP service checks using **net.tcp.service** and **net.tcp.service.perf** to the new item.

service_state[service] item for Windows is now deprecated. The new **service.info[service,state]** item should be used instead and will return the same information.

system.uname item on Windows gets values from WMI Win32_OperatingSystem and Win32_Processor classes instead of volatile Windows APIs and undocumented registry keys. After upgrade the values returned by the item might change.

Validation has been added for the 'clock' and 'ns' field values in trapper items, expecting integer timestamp values.

API changes

Deprecated `exists()` and `getObjects()` methods as well as the `selectHosts` and `expandData` parameters of the several `get()` methods have been removed. See [API changes from 2.4 to 3.0](#) for details.

Daemon changes

Command-line parameter validation has been made more strict. Using the same option several times, mutually exclusive options or parameters which are not option values now is an error. Help option ('-h') does not output a version number anymore.

Default configuration file changes

Default configuration files have been changed. Most changes do not affect existing installations, but a new installation or an automated process that uses those files might have to be adjusted. See [What's new in 3.0](#) for a list of changed parameters.

MaxHousekeeperDelete change will affect existing installations unless this parameter is specified in the configuration file.

Proxy configuration data size

Proxy configuration data size sent from server has been increased. For every item 2 new fields will be sent: "lastlogsize" and "mtime". This will result in 1-2 % increase of proxy configuration data size.

Log files

Log file rotation has been improved. This can result in a situation where the log file, after being rotated, is empty for some time. This could not happen before.

Database recovery message on DebugLevel=2

If database query fails the following message will be printed to log file: `database is down: reconnecting in 10 seconds`. When database goes up `database connection re-established` will be printed. There were no such messages on `DebugLevel=2` previously.

Time to delete lost low level discovery resources

Server will now calculate the time when to delete lost low level discovery resources based on the time when it processes a discovery rule. Previously a discovery item time stamp was used for this purpose. The new logic is meant to save users from situations when the discovery item is sent via Zabbix sender with invalid time stamp. However, if the discovery item is checked via proxy and/or active agent and a delay occurs on its way to the server, this situation results in lost resources being deleted later compared to the old logic.

History cache changes

History text cache and the related internal checks (`zabbix[wcache,text,<mode>]`) were removed - the text data is now also stored in history cache. Depending on setup the `HistoryCacheSize` parameter in configuration file should be increased by the old `HistoryTextCacheSize` value.

History index cache was added to index the data store in history cache. The index cache size is configured by `HistoryIndexCacheSize` configuration file parameter. The history index cache size determines the maximum number of items that can be stored in history cache while the history cache size determines the maximum number of item values that can be stored in history cache.

When history index cache is full Zabbix exits with a corresponding error. In the worst case Zabbix must be able to store values from all items in history cache - so the index cache size must be large enough to index all items on system. The index cache size needs roughly 100 bytes to cache one item.

The history index cache usage can be monitored with internal check `zabbix[wcache,index,<mode>]`. See [Internal checks](#) for details.

Action and action condition caching

Actions and action conditions are now stored in configuration cache. That means changing actions or their conditions does not affect action processing until configuration cache is synchronized.

Dropping Inetd Zabbix agent

The Inetd version of Zabbix agent (`zabbix_agent`) has been dropped as it did not seem to have any users.

Running Windows agent in console mode

Previously the Windows agent defaulted to running in console if no service management command line options were specified. Now to run Windows agent in console the `-f` command line option is required.

Changes in modules

Because of adding support for log file monitoring with any value type, the `AGENT_RESULT` structure has been modified. This means that modules that were using it must be recompiled.

Numbered macro resolution

Server used to resolve `{MACRO<1-9>}` just like the ordinary `{MACRO}` in non-trigger-related locations. Now in such places only `{MACRO}` can be used, `{MACRO<1-9>}` won't be recognised. In trigger-related locations `{MACRO<1-9>}` can still be used to reference items and respective hosts in the order they appear in trigger expression. Resolution of `{{HOST.HOST<1-9>}:key.func()}` in graph names was not affected.

Frontend changes

- *Configuration* → *Maps* | *Screens* | *Slide shows* is not available anymore. Instead, all configuration options for these entities have been moved to *Monitoring* → *Maps* and *Monitoring* → *Screens* (that includes both screens and slide shows) sections.
- Zeroes are not displayed any more in lists for entities with no items. Whereas previously a (0) would be displayed next to the entity in a table column, now nothing is displayed.

- A hardcoded `----[BULK ACKNOWLEDGE]----` string is no longer added to bulk acknowledgement messages by default.
- In IT service configuration, when clicking on a service name to open a popup (displaying options for adding child, editing or deleting service), the service name is no longer displayed in the heading.
- In the fullscreen view of *Monitoring* → *Triggers*, the *Triggers info* screen element is no longer displayed as the top line. Removing the extra element makes it consistent with other fullscreen views and improves performance of the page.

|<|<|<|

- Some field labels have been changed in screen **element** definition to be more intuitive and correct:

Screen element	Field label change
Clock (with 'Host time' selected)	Parameter → Item
Graph	Graph name → Graph
Graph prototype	Graph name → Graph prototype
Map	Parameter → Map
Plain text	Parameter → Item
Screen	Parameter → Screen
Simple graph	Parameter → Item
Simple graph prototype	Parameter → Item prototype

- History screens displaying 11 seconds more data than the selected interval has now been fixed and history screens obey the interval strictly.
- Translation of the byte unit prefixes - K for kilobytes, M for megabytes, etc. - has been removed because the "bytes" unit was not translated.
- Frontend maintenance mode superglobal variable `$_REQUEST['warning_msg']` has been replaced by `$ZBX_GUI_ACCESS_MESSAGE`. See [maintenance mode page](#) for details.
- Popup action menu is closed when user clicks outside of it.
- The global script result window is now displayed without a header (it used to display a *Result of "script name"* string). The header is reinstated in version 3.0.3.
- **Changes in value mapping** allow to preserve these settings for the imported/exported hosts and templates. However, if you want to import host/template with custom "Host status" value map created in previous Zabbix versions you should recreate this setting in *Administration* → *General* → *Value mapping* before importing as this setting was **enhanced and renamed** in Zabbix 3.0.
- User and user group permission form has been redesigned. Permissions are no longer displayed in colour-coded listboxes.
- When copying elements, the copy page (where you choose the copy target) is not showing the element count any more.

Trigger function improvements

A check for valid reference has been added for global regular expressions in **logeventid()**, **regexp()** and **iregexp()** trigger functions. If entered reference is not valid, due to misspelling or missing referenced global regular expression, the trigger will switch to unknown state and appropriate error message will be displayed.

Logging IP addresses of connections between server and proxy

The messages printed to the log files will now contain IP addresses of incoming/outgoing connections between Zabbix server and Zabbix proxy.

The following messages were removed:

```
sending heartbeat message to server failed: <ERROR>
Error while sending data to the server [<ERROR>]
Error while receiving answer from server [<ERROR>]
cannot obtain configuration data from server: <ERROR>
received configuration data from server, datalen <LENGTH>
sending host availability data to server failed: <ERROR>
sending data to server failed: <ERROR>
cannot collect proxy configuration: <ERROR>
sending configuration data to proxy "<PROXY>", datalen <LENGTH>
cannot send proxy configuration, error:"<ERROR>", info:"<INFO>"
host availability data from active proxy on "<IP>" failed: <ERROR>
error while sending host availability data to server: <ERROR>
sending host availability data to server: error:"<ERROR>", info:"<INFO>"
proxy configuration request from active proxy on "<IP>" failed: <ERROR>
cannot collect proxy configuration: <ERROR>
sending configuration data to proxy "<PROXY>", datalen <LENGTH>
cannot send configuration: <ERROR>
invalid proxy configuration data: <ERROR>
autoregistration data from active proxy on "<IP>" failed: <ERROR>
error while sending auto-registration data to server: <ERROR>
sending auto-registration data to server: error:"<ERROR>", info:"<INFO>"
discovery data from active proxy on "<IP>" failed: <ERROR>
error while sending discovery data to server: <ERROR>
sending discovery data to server: error:"<ERROR>", info:"<INFO>"
history data from active proxy on "<IP>" failed: <ERROR>
error while sending history data to server: <ERROR>
sending history data to server: error:"<ERROR>", info:"<INFO>"
heartbeat from active proxy on "<IP>" failed: <ERROR>
misconfiguration error: the proxy is running in the active mode but server sends requests to it as to proxy
received configuration data from server, datalen <LENGTH>
```

The following messages were introduced and correspond to the removed messages above:

```
cannot send heartbeat message to server at "<IP>": <ERROR>
cannot obtain configuration data from server at "<IP>": <ERROR>
received configuration data from server at "<IP>", datalen <LENGTH>
cannot send host availability data to server at "<IP>": <ERROR>
cannot send history data to server at "<IP>": <ERROR>
cannot collect configuration data for proxy "<PROXY>": <ERROR>
sending configuration data to proxy "<PROXY>" at "<IP>", datalen <LENGTH>
cannot send configuration data to proxy "<PROXY>" at "<IP>": <ERROR>
cannot parse host availability data from active proxy at "<IP>": <ERROR>
cannot send host availability data to server at "<IP>": <ERROR>
cannot parse proxy configuration data request from active proxy at "<IP>": <ERROR>
cannot collect configuration data for proxy "<PROXY>" at "<IP>": <ERROR>
sending configuration data to proxy "<PROXY>" at "<IP>", datalen <LENGTH>
cannot send configuration data to proxy "<PROXY>" at "<IP>": <ERROR>
cannot parse proxy configuration data received from server at "<IP>": <ERROR>
cannot parse autoregistration data from active proxy at "<IP>": <ERROR>
cannot send auto-registration data to server at "<IP>": <ERROR>
cannot parse discovery data from active proxy at "<IP>": <ERROR>
cannot send discovery data to server at "<IP>": <ERROR>
cannot parse history data from active proxy at "<IP>": <ERROR>
cannot send history data to server at "<IP>": <ERROR>
cannot parse heartbeat from active proxy at "<IP>": <ERROR>
misconfiguration error: the proxy is running in the active mode but server at "<IP>" sends requests to it
received configuration data from server at "<IP>", datalen <LENGTH>
```

- [Template changes](#)

11 Upgrade notes for 3.0.1

This minor version does not have any upgrade notes.

12 Upgrade notes for 3.0.2

Item value macro resolution

The {ITEM.VALUE} macro was previously resolved like {ITEM.LASTVALUE} when displaying trigger name:

- on a mouse over pop-up in the Dashboard *System status* widget
- on a mouse over pop-up on the *System status* screen element
- in *Monitoring* → *Triggers*

Now the macro will be resolved to the historical (at-the-time-of-event) value of the item in these places.

13 Upgrade notes for 3.0.3

Item changes

- **proc.cpu.util** on *Solaris*: if agent has been compiled on *Solaris* without zone support but is running on a newer *Solaris* version where zones are supported and `<zone>` parameter is default or "current" then the agent will return NOTSUPPORTED (the agent cannot limit results to only current zone). However, `<zone>` parameter value "all" is supported in this case.

Daemon changes

- Instead of switching trigger to unknown state if there are no data in period the `sum`, `str`, `regexp` and `iregexp` functions will return 0.
- If an "icmppingsec" item would return a value less than 0.0001 seconds, the value will be set to 0.0001 seconds.

Frontend changes

- The global script result window has regained a header with the script name. Information about the executed command is now displayed as well.

	Ping
<pre>PING 192.168.3.252 (192.168.3.252) 56(84) bytes of data. 64 bytes from 192.168.3.252: icmp_seq=1 ttl=64 time=0.106 ms 64 bytes from 192.168.3.252: icmp_seq=2 ttl=64 time=0.132 ms 64 bytes from 192.168.3.252: icmp_seq=3 ttl=64 time=0.121 ms --- 192.168.3.252 ping statistics --- 3 packets transmitted, 3 received, 0% packet loss, time 1999ms rtt min/avg/max/mdev = 0.106/0.119/0.132/0.016 ms</pre>	<pre>/bin/ping -c 3 192.168.3.252 PING 192.168.3.252 (192.168.3.252) 56(84) bytes of data. 64 bytes from 192.168.3.252: icmp_seq=1 ttl=64 time=0.152 ms 64 bytes from 192.168.3.252: icmp_seq=2 ttl=64 time=0.218 ms 64 bytes from 192.168.3.252: icmp_seq=3 ttl=64 time=0.191 ms --- 192.168.3.252 ping statistics --- 3 packets transmitted, 3 received, 0% packet loss, time 2005ms rtt min/avg/max/mdev = 0.152/0.187/0.218/0.027 ms</pre>
Script result in 3.0.0	Script result in 3.0.3

14 Upgrade notes for 3.0.4

This minor version does not have any upgrade notes.

15 Upgrade notes for 3.0.5

Frontend changes

- The behavior of "Triggers status" filter in "Monitoring" → "Triggers" and "Monitoring" → "Overview" was changed to always remember its value, even if it is "All". On large installations, if you select "All" and you become stuck with these pages taking a very long time to load because of an overwhelming amount of data to process, you can reset the filter by replacing URL parameters with `?filter_rst=1`.

16 Upgrade notes for 3.0.6

Frontend changes

- The link for adding descriptions to triggers created by low-level discovery has been removed from *Monitoring* → *Triggers*. Such descriptions were later deleted anyway by low-level discovery, if they were not present in the original trigger prototype.

Daemon changes

- Active agent auto-registration events are not generated any more if there is no action for auto registration.

Miscellaneous changes

- Zabbix server and frontend now try to set the MySQL autocommit variable to "autocommit=1" (enable MySQL autocommit mode) at the beginning of each connection to the database. Failing to do so results in failed database connection.

17 Upgrade notes for 3.0.7

Daemon changes

In escalations, several operations can be assigned to the same step. If these operations have different step duration defined, the shortest one is taken into account and applied to the step. But due to bug there was exception to this rule when step duration is set to 0, it would use default value instead of shortest one. Now there will be no exception and default step duration will only be used when it's shortest, this is equivalent to behavior that frontend shows and user expects.

18 Upgrade notes for 3.0.8

Frontend changes

In *Monitoring* → *Web* now only values that fall within the last 24 hours are displayed by default. This limit has been introduced with the aim of improving initial loading times for large pages of web monitoring. It is also possible to change this limitation by changing the value of `ZBX_HISTORY_PERIOD` **constant** in *include/defines.inc.php*.

Trigger dependency improvements

Actions on dependent triggers will not be executed if the state of the trigger that it depends on changes from 'PROBLEM' to 'UNKNOWN'.

Reduced log message severity in web scenarios

Web scenario failed step log messages are now displayed from debug **level 4** (debugging) instead of debug level 3 (warnings).

19 Upgrade notes for 3.0.9

This minor version does not have any upgrade notes.

20 Upgrade notes for 3.0.10

This minor version does not have any upgrade notes.

21 Upgrade notes for 3.0.11

URI validation

A new `ZBX_URI_VALID_SCHEMES` **constant** has been added which defines the URI schemes that are allowed by default (*http, https, ftp, file, mailto, tel, ssh*).

All URLs in the frontend should be checked if they contain an allowed scheme.

Note that starting with **Zabbix 3.0.14**, URI scheme validation can be turned off/on.

Processing low-level discovery (LLD)

LLD rule processing has been modified so multiple values for the same LLD rule are not processed simultaneously.

Previously all values for LLD rules were processed in a context of data gathering process (for example, a trapper). This could cause deadlocks when separate values of a single low-level discovery rule were being processed in more than one data gathering process.

LLD rule locking is implemented in the configuration cache. A new piece of LLD data will be discarded if the previous one hasn't been fully processed yet. To avoid such possible delays with LLD value processing it is recommended, for example, to increase the polling interval for LLD rules or not send LLD JSONs with `zabbix_sender` too frequently. Discarded LLD data is not considered an error. `zabbix_sender` can report a value as "processed" even if the value was discarded. All cases of discarded LLD data are listed in the Zabbix server log file in the following format:

```
<TIMESTAMP> cannot process discovery rule "host:key": another value is being processed
```

SMTP authentication for e-mail

Previously Zabbix would enforce PLAIN as the **authentication** mechanism when using username/password. Now libcurl may decide on its own which mechanism among those supported by the SMTP server to choose. With the parameters Zabbix passes to libcurl it effectively means choosing between PLAIN and LOGIN on most occasions. This is enough to enable Zabbix operation with Office 365 and should be enough for Gmail provided that "less secure apps" are **allowed**.

22 Upgrade notes for 3.0.12

This minor version does not have any upgrade notes.

23 Upgrade notes for 3.0.13

More secure Zabbix setup

Several features have been implemented as part of an effort to "harden" the Zabbix web interface:

- Same origin policy for IFrames. Zabbix now cannot be placed in frames on a different domain. Still, pages placed into a Zabbix frame will have access to Zabbix frontend (through JavaScript) if the page that is placed in the frame and Zabbix frontend are on the same domain. A page like `http://secure-zabbix.com/cms/page.html`, if placed into screens on `http://secure-zabbix.com/zabbix/`, will have full JS access to Zabbix.
- Technical errors (PHP/SQL) are now hidden by default from non-Zabbix Super admin users and from users that are not part of user groups with **debug mode** enabled. This is configurable via the new `ZBX_SHOW_TECHNICAL_ERRORS` **constant**, set to 'false' by default.

Item changes

- **system.cpu.num** agent item on AIX now returns a value based on the logical processors attached to an AIX LPAR and not the physical ones.

24 Upgrade notes for 3.0.14

Configurable URI validation

URI validation, introduced in **Zabbix 3.0.11**, now can be turned off/on in the new `VALIDATE_URI_SCHEMES` frontend **constant**.

Additionally:

- Relative URLs are no longer validated against the URI scheme whitelist i.e. are always considered valid.
- In URLs where macros are supported, delayed validation is used. If the URL after resolving the macros is not valid, then the link will not work.
- URLs with invalid port numbers, like `ftp://user@host:port` are considered as invalid

Item changes

- In **system.cpu.util** agent items `user` and `nice` time no longer include `guest` time and `guest_nice` time (on Linux kernels 2.6.24 and above)
- **vmware.eventlog** items will now browse up to 1000 events (instead of 10) in search of events that have not yet been processed. Consequently, when catching up after some downtime Zabbix may cache up to 1000 events, which will increase the VMware cache usage right after startup. The new algorithm is also less tolerant to multiple **vmware.eventlog** items configured with the same VMware URL.
- From now on, Zabbix internal item **zabbix[java,,ping]** will not become not supported if java gateway is misconfigured or java gateway is unreachable

Note:

If you have some actions configured for internal events to monitor **zabbix[java,,ping]**, please change it to **nodata** trigger to continue monitoring the availability of java gateway.

Security improvements

- From now on `HttpOnly` flag is set for all session cookies.

25 Upgrade notes for 3.0.15

Item changes

- Previously in **log[]**, **logrt[]** items in the *skip* mode in case a log file did not initially exist and only appeared at a later time it was "skipped", i. e. older data in the log file were ignored. From now on, a log file which appears later is processed from the start.

26 Upgrade notes for 3.0.16

This minor version does not have any upgrade notes.

27 Upgrade notes for 3.0.17

Item changes

- `web.page.get[]`, `web.page.perf[]` and `web.page.regex[]` items now turn unsupported if the resource specified in the `host` parameter does not exist or is unavailable. For more details, see Zabbix agent **items**.

Trigger changes

- Trigger expression's behaviour regarding numbers, differing by 0.000001, is now changed. Since logical operators are defined in terms of equality to zero, their result for 0.000001 is affected too:

Expression (Example)	Evaluation result	
	Before	After
<code>1.000001 > 1</code>	1	0
<code>1.000001 <= 1</code>	0	1
<code>0 >= 0.000001</code>	0	1

28 Upgrade notes for 3.0.18

Server issues

Warning:

3.0.18 version Zabbix servers are not backwards compatible with 3.0.x proxies.

29 Upgrade notes for 3.0.19

Server issues

Backward-compatibility issue with 3.0.x proxies, present in Zabbix 3.0.18, has been fixed.

30 Upgrade notes for 3.0.20

Macro changes

The value of **ZBX_HISTORY_PERIOD** now affects how far in the past the value is searched when {ITEM.VALUE} macro in trigger name is resolved.

VMware monitoring

Zabbix will now call "RefreshDatastoreStorageInfo" for vSphere each **VMwareFrequency**.

31 Upgrade notes for 3.0.21

This minor version does not have any upgrade notes.

32 Upgrade notes for 3.0.22

This minor version does not have any upgrade notes.

33 Upgrade notes for 3.0.23

This minor version does not have any upgrade notes.

34 Upgrade notes for 3.0.24

This minor version does not have any upgrade notes.

35 Upgrade notes for 3.0.25

Removing stale agent connections

Previously, if a system had devices with dynamically changing paths or if a device got manually removed, Zabbix agent would not release them and would keep the connection resulting in collector overfilling. Now Zabbix agent will terminate "stale" device connections if the values of corresponding items are not accessed for more than 3 hours. Note that the corresponding items (`vfs.dev.read[]`, `vfs.dev.write[]`), if having the update interval longer than 3 hours, will now always return '0'.

Frontend changes

- Frontend no longer enforces HTTP Strict Transport Security (HSTS) policy, introduced in 3.0.13. To protect Zabbix frontend against protocol downgrade attacks, it is recommended to **enable HSTS policy** on the webserver.

36 Upgrade notes for 3.0.26

This minor version does not have any upgrade notes.

37 Upgrade notes for 3.0.27

This minor version does not have any upgrade notes.

38 Upgrade notes for 3.0.28

This minor version does not have any upgrade notes.

40 Upgrade notes for 3.0.30

Building with libxml2

When building with libxml2, pkg-config is now used instead of xml2-config to detect and use libxml2, as xml2-config is to be removed from libxml2 in the future.

41 Upgrade notes for 3.0.31

Non-root permissions implemented for Docker images

Zabbix Docker images have been updated to implement non-root container best practices. Due to the change:

- All directories have been restricted for the container user, except directories which are required for the container. For example, `/etc/zabbix/` with Zabbix component configuration files.
- Ports 80 and 443 have been changed to 8080 and 8443, because usage of all ports <1024 is restricted for non-privileged users. Zabbix web interface images have been updated to use non-privileged ports 8080, 8443; Zabbix snmptrap images port 1162.
- All Zabbix images are updated to use a non-privileged user. By default, 'zabbix' with UID 1997.

A known issue: Nginx based images do not run under root. Will be fixed soon.

Docker appliance support dropped

Zabbix Docker Appliance image has been decommissioned and will not be available for 3.0.31 and newer releases. Please use a separate Docker image for each component instead of the all-in-one solution.

42 Upgrade notes for 3.0.32

Enhanced URL widget security

The URL dashboard widget and the URL screen element now put retrieved URL content into the sandbox. By default, all sandbox restrictions are enabled. It is possible to modify `sandbox` attribute settings in the `defines.inc.php` file, however turning sandboxing off is not recommended for security reasons. To learn more about the sandbox attribute, please see the [sandbox](#) section of the `iframe` HTML element description.

4. Quickstart

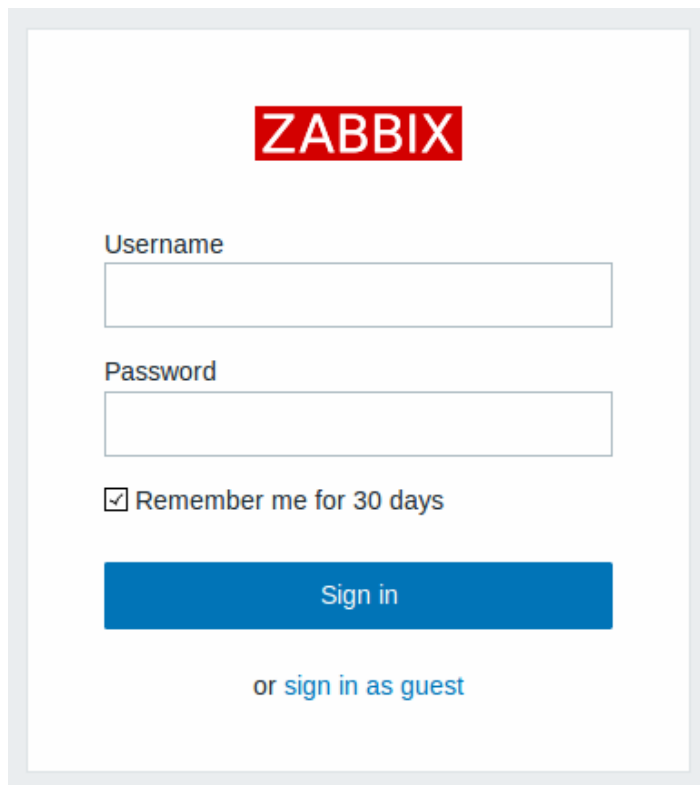

Please use the sidebar to access content in the Quickstart section.

1 Login and configuring user

Overview

In this section you will learn how to log in and set up a system user in Zabbix.

Login

The image shows the Zabbix login interface. At the top, the word "ZABBIX" is displayed in white capital letters on a red rectangular background. Below this, the label "Username" is followed by a text input field. Underneath, the label "Password" is followed by another text input field. Below the password field, there is a checkbox that is checked, followed by the text "Remember me for 30 days". At the bottom of the form is a large blue button with the text "Sign in" in white. Below the button, the text "or sign in as guest" is displayed in a smaller, blue font.

This is the Zabbix "Welcome" screen. Enter the user name **Admin** with password **zabbix** to log in as a **Zabbix superuser**.

When logged in, you will see 'Connected as Admin' in the lower right corner of the page. Access to *Configuration* and *Administration* menus will be granted.

Protection against brute force attacks

In case of five consecutive failed login attempts, Zabbix interface will pause for 30 seconds in order to prevent brute force and dictionary attacks.

The IP address of a failed login attempt will be displayed after a successful login.

Adding user

To view information about users, go to *Administration* → *Users*.

Users									
							User group	All	Create user
<input type="checkbox"/>	Alias	Name	Surname	User type	Groups	Is online?	Login	Frontend access	Debug mode
<input type="checkbox"/>	Admin	Zabbix	Administrator	Zabbix Super Admin	Zabbix administrators	Yes (2015-08-05 17:25:44)	Ok	System default	Disabled
<input type="checkbox"/>	guest			Zabbix User	Guests	Yes (2015-08-05 17:16:38)	Ok	System default	Disabled

To add a new user, click on *Create user*.

In the new user form, make sure to add your user to one of the existing **user groups**, for example 'Zabbix administrators'.

In this pop-up, mark the checkbox next to 'Linux servers', then click *Select*. *Linux servers* should be displayed in the respective box. In the user group properties form, click *Update*.

Attention:

In Zabbix, access rights to hosts are assigned to **user groups**, not individual users.

Done! You may try to log in using the credentials of the new user.

2 New host

Overview

In this section you will learn how to set up a new host.

A host in Zabbix is a networked entity (physical, virtual) that you wish to monitor. The definition of what can be a "host" in Zabbix is quite flexible. It can be a physical server, a network switch, a virtual machine or some application.

Adding host

Information about configured hosts in Zabbix is available in *Configuration* → *Hosts*. There is already one pre-defined host, called 'Zabbix server', but we want to learn adding another.

To add a new host, click on *Create host*. This will present us with a host configuration form.

The bare minimum to enter here is:

Host name

- Enter a host name. Alphanumerics, spaces, dots, dashes and underscores are allowed.

Groups

- Select one or several groups from the right hand side selectbox and click on « to move them to the 'In groups' selectbox.

Note:

All access permissions are assigned to host groups, not individual hosts. That is why a host must belong to at least one group.

IP address

- Enter the IP address of the host. Note that if this is the Zabbix server IP address, it must be specified in the Zabbix agent configuration file 'Server' directive.

Other options will suit us with their defaults for now.

When done, click *Add*. Your new host should be visible in the hostlist.

Note:

If the *ZBX* icon in the *Availability* column is red, there is some error with communication - move your mouse cursor over it to see the error message. If that icon is gray, no status update has happened so far. Check that Zabbix server is running, and try refreshing the page later as well.

3 New item

Overview

In this section you will learn how to set up an item.

Items are the basis of gathering data in Zabbix. Without items, there is no data - because only an item defines a single metric or what data to get off of a host.

Adding item

All items are grouped around hosts. That is why to configure a sample item we go to *Configuration* → *Hosts* and find the 'New host' we have created.

The *Items* link in the row of 'New host' should display a count of '0'. Click on the link, and then click on *Create item*. This will present us with an item definition form.

Items

Show value As is show value mappings

New application

Applications -None-

Populates host inventory field -None-

Description

Enabled ☒

Add

Cancel

For our sample item, the essential information to enter is:

Name

- Enter *CPU Load* as the value. This will be the item name displayed in lists and elsewhere.

Key

- Manually enter *system.cpu.load* as the value. This is a technical name of an item that identifies the type of information that will be gathered. The particular key is just one of **pre-defined keys** that come with Zabbix agent.

Type of information

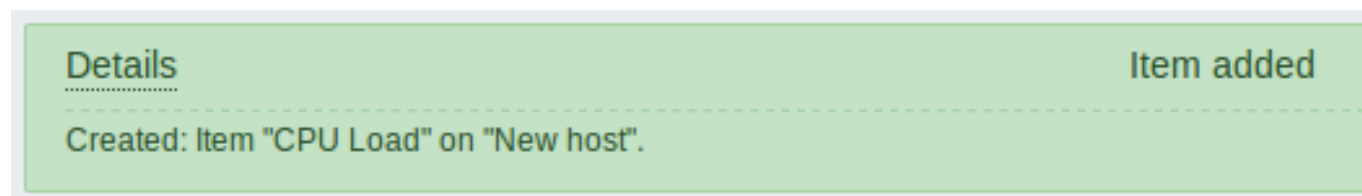

- Select *Numeric (float)* here. This attribute defines the format of expected data.

Note:

You may also want to reduce the amount of days **item history** will be kept, to 7 or 14. This is good practice to relieve the database from keeping lots of historical values.

Other options will suit us with their defaults for now.

When done, click *Add*. The new item should appear in the itemlist. Click on *Details* above the list to view what exactly was done.

Seeing data

With an item defined, you might be curious if it is actually gathering data. For that, go to *Monitoring* → *Latest data*, click on the + before - **other** - and expect your item to be there and displaying data.

▼ <input type="checkbox"/> HOST	NAME ▲	LAST CHECK	LAST VALUE	CHANGE
▼ New host	- other - (1 item)			
<input type="checkbox"/>	CPU Load	2015-08-08 16:00:49	2.24	-0.26 Graph

With that said, first data may take up to 60 seconds to arrive. That, by default, is how often the server reads configuration changes and picks up new items to execute.

If you see no value in the 'Change' column, maybe only one value has been received so far. Wait 30 seconds for another value to arrive.

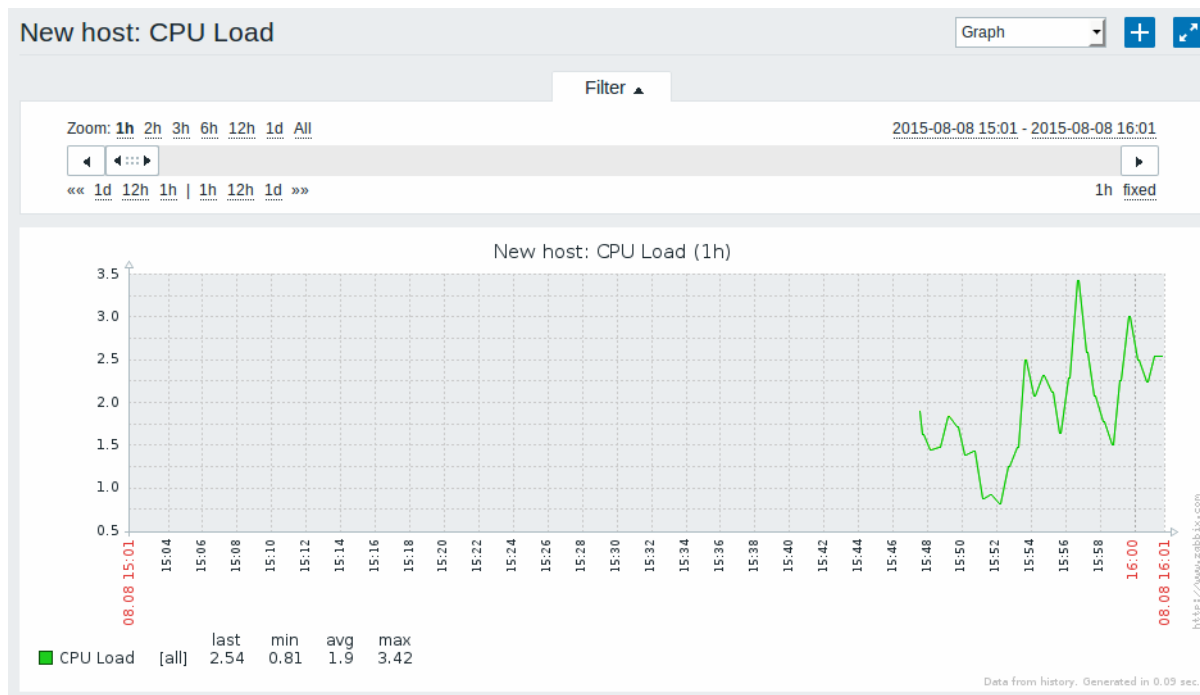

If you do not see information about the item as in the screenshot, make sure that:

- you entered item 'Key' and 'Type of information' fields exactly as in the screenshot
- both agent and server are running
- host status is 'Monitored' and its availability icon is green
- host is selected in the host dropdown, item is active

Graphs

With the item working for a while, it might be time to see something visual. **Simple graphs** are available for any monitored numeric item without any additional configuration. These graphs are generated on runtime.

To view the graph, go to *Monitoring* → *Latest data* and click on the 'Graph' link next to the item.

4 New trigger

Overview

In this section you will learn how to set up a trigger.

Items only collect data. To automatically evaluate incoming data we need to define triggers. A trigger contains an expression that defines a threshold of what is an acceptable level for the data.

If that level is surpassed by the incoming data, a trigger will "fire" or go into a 'Problem' state - letting us know that something has happened that may require attention. If the level is acceptable again, trigger returns to an 'Ok' state.

Adding trigger

To configure a trigger for our item, go to *Configuration* → *Hosts*, find 'New host' and click on *Triggers* next to it and then on *Create trigger*. This presents us with a trigger definition form.

Triggers

All hosts / New host Enabled ZBX SNMP JMX IPMI Applications Items 2 Triggers 1 Graphs

Trigger

Dependencies

Name CPU load too high on 'New host' for 3 minutes

Expression {New host:system.cpu.load.avg(180)}>5

Add

[Expression constructor](#)

Multiple PROBLEM events generation ☐

Description

URL

Severity

Not classified

Information

Warning

Average

High

Enabled ☒

Add

Cancel

For our trigger, the essential information to enter here is:

Name

- Enter *CPU load too high on 'New host' for 3 minutes* as the value. This will be the trigger name displayed in lists and elsewhere.

Expression

- Enter: {New host:system.cpu.load.avg(180)}>2

This is the trigger expression. Make sure that the expression is entered right, down to the last symbol. The item key here (system.cpu.load) is used to refer to the item. This particular expression basically says that the problem threshold is exceeded when the CPU load average value for 3 minutes is over 2. You can learn more about the [syntax of trigger expressions](#).

When done, click *Add*. The new trigger should appear in the trigger list.

Displaying trigger status

With a trigger defined, you might be interested to see its status.

For that, go to *Monitoring* → *Triggers*. After 3 minutes or so (we asked to evaluate a 3-minute average after all) your trigger should appear there, presumably with a green 'OK' flashing in the 'Status' column.

Status of triggers									
					Group	all	Host	all	
Filter ▼									
<input type="checkbox"/>	SEVERITY	STATUS	INFO	LAST CHANGE ▼	AGE	ACK	HOST	NAME	DESCRIPTION
<input type="checkbox"/>	Not classified	OK		2015-08-08 21:08:49	5s	No 1	New host	CPU load too high on 'New host' for 3 minutes	Add

The flashing indicates a recent change of trigger status, one that has taken place in the last 30 minutes.

If a red 'PROBLEM' is flashing there, then obviously the CPU load has exceeded the threshold level you defined in the trigger.

5 Receiving problem notification

Overview

In this section you will learn how to set up alerting in the form of notifications in Zabbix.

With items collecting data and triggers designed to "fire" upon problem situations, it would also be useful to have some alerting mechanism in place that would notify us about important events even when we are not directly looking at Zabbix frontend.

This is what notifications do. E-mail being the most popular delivery method for problem notifications, we will learn how to set up an e-mail notification.

E-mail settings

Initially there are several predefined notification **delivery methods** in Zabbix. **E-mail** is one of those.

To configure e-mail settings, go to *Administration* → *Media types* and click on *Email* in the list of pre-defined media types.

Media types					Create media type
<input type="checkbox"/>	NAME ▲	TYPE	STATUS	USED IN ACTIONS	DETAILS
<input type="checkbox"/>	Email	Email	Enabled		SMTP server: "mail.company.com", SMTP helo: "company.com", SMTP email: "zabbix@company.com"
<input type="checkbox"/>	Jabber	Jabber	Enabled		Jabber identifier: "jabber@company.com"
<input type="checkbox"/>	SMS	SMS	Enabled		GSM modem: "/dev/ttyS0"

This will present us with the e-mail settings definition form.

Media types

Name	<input type="text" value="Email"/>
Type	<input type="text" value="Email"/>
SMTP server	<input type="text" value="mail.company.com"/>
SMTP server port	<input type="text" value="25"/>
SMTP helo	<input type="text" value="company.com"/>
SMTP email	<input type="text" value="zabbix@company.com"/>
Connection security	<input type="radio"/> None <input type="radio"/> STARTTLS <input type="radio"/> SSL/TLS
Authentication	<input type="radio"/> None <input type="radio"/> Normal password
Enabled	<input checked="" type="checkbox"/>
<input type="button" value="Update"/> <input type="button" value="Clone"/> <input type="button" value="Delete"/> <input type="button" value="Cancel"/>	

Set the values of SMTP server, SMTP helo and SMTP e-mail to the appropriate for your environment.

Note:

'SMTP email' will be used as the 'From' address for the notifications sent from Zabbix.

Press *Update* when ready.

Now you have configured 'Email' as a working media type. A media type must be linked to users by defining specific delivery addresses (like we did when [configuring a new user](#)), otherwise it will not be used.

New action

Delivering notifications is one of the things **actions** do in Zabbix. Therefore, to set up a notification, go to *Configuration → Actions* and click on *Create action*.

ActionConditionsOperations

Name

Test action

Default subject

{TRIGGER.STATUS}: {TRIGGER.NAME}

Default message

Trigger: {TRIGGER.NAME}
Trigger status: {TRIGGER.STATUS}
Trigger severity: {TRIGGER.SEVERITY}
Trigger URL: {TRIGGER.URL}

Item values:
1. {ITEM.NAME1} ({HOST.NAME1}:{ITEM.KEY1}):

Recovery message

☐

Enabled

☒

Add

Cancel

In this form, enter a name for the action.

{TRIGGER.STATUS} and {TRIGGER.NAME} macros (or variables), visible in the *Default subject* and *Default message* fields, will be replaced with the actual trigger status and trigger name values.

In the most simple case, if we do not add any more specific **conditions**, the action will be taken upon any trigger change from 'Ok' to 'Problem'.

We still should define what the action should do - and that is done in the *Operations* tab. Click on *New* in there, which opens a new operation form.

Action
Conditions
Operations

Default operation step duration
3600 (minimum 60 seconds)

Action operations	STEPS	DETAILS	START IN	DURATION (SEC)	ACTION
Operation details	Steps	1 - 1			
	Step duration	0 (minimum 60 seconds, 0 - use action default)			
	Operation type	Send message			
	Send to User groups	<div> <div>USER GROUP</div> <div>Add</div> </div>			ACTION
	Send to Users	<div> <div>USER</div> <div>user (New User)</div> <div>Add</div> </div>			ACTION Remove
	Send only to	Email			
	Default message	<input checked="" type="checkbox"/>			
	Conditions	<div> <div>LABEL</div> <div>New</div> </div>			
		Add Cancel			

Add
Cancel

Here, click on *Add* in the *Send to Users* block and select the user ('user') we have defined. Select 'Email' as the value of *Send only to*. When done with this, click on *Add* in the operation detail block.

That is all for a simple action configuration, so click *Add* in the action form.

Receiving notification

Now, with delivering notifications configured it would be fun to actually receive one. To help with that, we might on purpose increase the load on our host - so that our **trigger** "fires" and we receive a problem notification.

Open the console on your host and run:

```
cat /dev/urandom | md5sum
```

You may run one or several of [these processes](#).

Now go to *Monitoring* → *Latest data* and see how the values of 'CPU Load' have increased. Remember, for our trigger to *fire*, the 'CPU Load' value has to go over '2' for 3 minutes running. Once it does:

- in *Monitoring* → *Triggers* you should see the trigger with a flashing 'Problem' status
- you should receive a problem notification in your e-mail

Attention:

If notifications do not work:

- verify once again that both the e-mail settings and the action have been configured properly
- make sure the user you created has at least read permissions on the host which generated the event, as noted in the *Adding user* step. The user, being part of the 'Zabbix administrators' user group must have at least read access to 'Linux servers' host group that our host belongs to.
- Additionally, you can check out the action log by going to *Reports* → *Action log*.

6 New template

Overview

In this section you will learn how to set up a template.

Previously we learned how to set up an item, a trigger and how to get a problem notification for the host.

While all of these steps offer a great deal of flexibility in themselves, it may appear like a lot of steps to take if needed for, say, a thousand hosts. Some automation would be handy.

This is where templates come to help. Templates allow to group useful items, triggers and other entities so that those can be reused again and again by applying to hosts in a single step.

When a template is linked to a host, the host inherits all entities of the template. So, basically a pre-prepared bunch of checks can be applied very quickly.

Adding template

To start working with templates, we must first create one. To do that, in *Configuration → Templates* click on *Create template*. This will present us with a template configuration form.

The screenshot shows the 'Create template' form in the Zabbix web interface. The form is titled 'Templates' and has three tabs: 'Template' (selected), 'Linked templates', and 'Macros'. The 'Template' tab contains the following fields and sections:

- Template name:** A text input field with the value 'New template'.
- Visible name:** An empty text input field.
- Groups:** A section with two lists of groups. The 'In groups' list contains 'Templates'. The 'Other groups' list contains: Database servers, Discovered hosts, Hypervisors, Linux servers, Network devices, UPS devices, Virtual machines, Web servers, Windows servers, and Zabbix servers. There are left and right arrow buttons between the two lists.
- New group:** A text input field with a green border.
- Hosts / templates:** A section with two lists. The 'In' list is empty. The 'Other | group' dropdown is set to 'Templates'. The 'Other | group' list contains: Template1, Template2, Template App FTP Service, Template App HTTP Service, Template App HTTPS Service, Template App IMAP Service, Template App LDAP Service, Template App MySQL, Template App NNTP Service, Template App NTP Service, Template App POP Service, Template App SMTP Service, Template App SSH Service, Template App Telnet Service, Template App Zabbix Agent, Template App Zabbix Proxy, Template App Zabbix Server, Template ICMP Ping, Template IPMI Intel SR1530, and Template IPMI Intel SR1630. There are left and right arrow buttons between the two lists.
- Description:** A large text area for the template description.
- Buttons:** 'Add' and 'Cancel' buttons at the bottom.

The required parameters to enter here are:

Template name

- Enter a template name. Alpha-numericals, spaces and underscores are allowed.

Groups

- Select one or several groups from the right hand side selectbox and click on « to move them to the 'In groups' selectbox. The template must belong to a group.

When done, click *Add*. Your new template should be visible in the list of templates.

As you may see, the template is there, but it holds nothing in it - no items, triggers or other entities.

Adding item to template

To add an item to the template, go to the item list for 'New host'. In *Configuration → Hosts* click on *Items* next to 'New host'.

Then:

- mark the checkbox of the 'CPU Load' item in the list
- click on *Copy* below the list
- select the template to copy item to

- click on *Copy*

If you now go to *Configuration → Templates*, 'New template' should have one new item in it.

We will stop at one item only for now, but similarly you can add any other items, triggers or other entities to the template until it's a fairly complete set of entities for given purpose (monitoring OS, monitoring single application).

Linking template to host

With a template ready, it only remains to add it to a host. For that, go to *Configuration → Hosts*, click on 'New host' to open its property form and go to the **Templates** tab.

There, click on *Select* next to *Link new templates*. In the pop-up window click on the name of template we have created ('New template'). As it appears in the *Link new templates* field, click on *Add*. The template should appear in the *Linked templates* list.

Hosts

All hosts / New host Enabled ZBX SNMP JMX IPMI Applications Items 1 Triggers 1 Graphs D

Host **Templates** IPMI Macros Host inventory

Linked templates

Name	Action
New template	Unlink

Link new templates

Click *Update* in the form to save the changes. The template is now added to the host, with all entities that it holds.

As you may have guessed, this way it can be applied to any other host as well. Any changes to the items, triggers and other entities at the template level will propagate to the hosts the template is linked to.

Linking pre-defined templates to hosts

As you may have noticed, Zabbix comes with a set of predefined templates for various OS, devices and applications. To get started with monitoring very quickly, you may link the appropriate one of them to a host, but beware that these templates need to be fine-tuned for your environment. Some checks may not be needed, and polling intervals may be way too frequent.

More information about [templates](#) is available.

5. Zabbix appliance

Overview As an alternative to setting up manually or reusing an existing server for Zabbix, users may [download](#) a Zabbix appliance or Zabbix appliance installation CD image. Zabbix appliance installation CD could be used for instant deployment of Zabbix server (MySQL), Zabbix server (PostgreSQL), Zabbix proxy (MySQL) and Zabbix proxy (SQLite 3).

Zabbix Appliance virtual machines have prepared Zabbix server with MySQL support. It is built using Zabbix appliance installation CD.

|<|<|<|

|<|<|<|

Zabbix appliance and installation CD versions are based upon the following Ubuntu versions:

Zabbix appliance version	Ubuntu version
3.0.30	14.04.3

Zabbix appliance is available in the following formats:

- vmdk (VMware/Virtualbox)
- OVF (Open Virtualisation Format)
- KVM
- HDD/flash image, USB stick
- Live CD/DVD

- Xen guest
- Microsoft VHD (Azure)
- Microsoft VHD (Hyper-V)

To get started, boot the appliance and point your browser at the IP it has received over DHCP: `http://<host_ip>/zabbix`
It has Zabbix server configured and running on MySQL, as well as frontend available.

The appliance has been built using standard Ubuntu/Debian feature called Preseed files.

1 Changes to Ubuntu configuration There are some changes applied to the base Ubuntu configuration.

1.1 Repositories

Official Zabbix **repository** has been added to `/etc/apt/sources.list`:

```
## Zabbix repository
deb https://repo.zabbix.com/zabbix/3.0/ubuntu trusty main
deb-src https://repo.zabbix.com/zabbix/3.0/ubuntu trusty main
```

1.2 Firewall

The appliance uses iptables firewall with predefined rules:

- Opened SSH port (22 TCP);
- Opened Zabbix agent (10050 TCP) and Zabbix trapper (10051 TCP) ports;
- Opened HTTP (80 TCP) and HTTPS (443 TCP) ports;
- Opened SNMP trap port (162 UDP);
- Opened outgoing connections to DNS port (53 UDP) to 8.8.8.8 and 8.8.4.4;
- Opened outgoing connections to NTP port (123 UDP);
- ICMP packets limited to 5 packets per second;
- All other incoming connections are dropped.

1.3 Additional packages

Various basic utilities have been added that could make working with Zabbix and monitoring in general easier:

- iptables-persistent
- mc
- htop
- snmptrapfmt
- snmp-mibs-downloader

Some of these packages are used by Zabbix, some of them are installed to help users to configure/manage appliance settings.

1.4 Using a static IP address

By default the appliance uses DHCP to obtain the IP address. To specify a static IP address:

- Log in as root user;
- Open file `/etc/network/interfaces` in your favourite editor;
- `iface eth0 inet dhcp → iface eth0 inet static`
- Add the following lines after `iface eth0 inet static`:
 - `address <IP address of the appliance>`
 - `netmask <network mask>`
 - `gateway <your gateway address>`
- Run the commands **`sudo ifdown eth0 && sudo ifup eth0`**.

Note:

For more information about other possible options see the official Ubuntu [documentation](#).

To configure DNS, add nameserver entries in `/etc/resolv.conf`, specifying each nameserver on its own line: **nameserver 192.168.1.2**.

1.5 Changing time zone

By default the appliance uses UTC for the system clock. To change the time zone, copy the appropriate file from `/usr/share/zoneinfo` to `/etc/localtime`, for example:

```
cp /usr/share/zoneinfo/Europe/Riga /etc/localtime
```

1.6 Locale changes

The appliance contains a few locale changes:

- Contains languages: *en_US.UTF-8, ru_RU.UTF-8, ja_JP.UTF-8, cs_CZ.UTF-8, ko_KR.UTF-8, it_IT.UTF-8, pt_BR.UTF-8, sk_SK.UTF-8, uk_UA.UTF-8, fr_FR.UTF-8, pl.UTF-8, zh_CN.UTF-8*;
- Default locale is *en_US.UTF-8*.

These changes are required to support a multilingual Zabbix web-interface.

1.7 Other changes

- Network is configured to use DHCP to obtain IP address;
- Utility **fping** is set to have permissions 4710 and is owned by group **zabbix** - suid and only allowed to be used by zabbix group;
- ntpd configured to synchronise to the public pool servers: *ntp.ubuntu.com*;
- LVM volume is used with ext4 filesystem.
- "*UseDNS no*" is added to SSH server configuration file */etc/ssh/sshd_config* to avoid long SSH connection waits;
- Daemon snmpd is disabled using */etc/default/snmpd* configuration file.

2 Zabbix configuration

Appliance Zabbix setup has the following passwords and other configuration changes:

2.1 Credentials (login:password)

System:

- appliance:zabbix

Attention:

Use "sudo su" command with "appliance" user name password to get root access rights.

Attention:

LiveCD comes without any password and uses the **ubuntu** user to log in into the console.

Database:

- root:<random>
- zabbix:<random>

Note:

Database passwords are randomly generated during the installation process.

Root password is stored to */root/.my.cnf* file, it is not required to input a password under the "root" account.

Zabbix frontend:

- Admin:zabbix

To change the database user password it has to be changed in the following locations:

- MySQL;
- */etc/zabbix/zabbix_server.conf*;
- */etc/zabbix/web/zabbix.conf.php*.

2.2 File locations

- Configuration files are placed in **/etc/zabbix**.
- Zabbix server, proxy and agent logfiles are placed in **/var/log/zabbix**.
- Zabbix frontend is placed in **/usr/share/zabbix**.
- Home directory for user **zabbix** is **/var/lib/zabbix**.

2.3 Changes to Zabbix configuration

- Server name for Zabbix frontend is set to "Zabbix Appliance";
- Frontend timezone is set to Europe/Riga (this can be modified in **/etc/apache2/conf-available/zabbix.conf**);

2.4 Preserving configuration

If you are running a Live CD/DVD version of the appliance or for some other reason cannot have persistent storage, you can create a backup of the whole database, including all configuration and gathered data.

To create the backup, run:

```
sudo mysqldump zabbix | bzip2 -9 > dbdump.bz2
```

Now you can transfer the **dbdump.bz2** file to another machine.

To restore from the backup, transfer it to the appliance and execute:

```
bzcat dbdump.bz2 | sudo mysql zabbix
```

Attention:

Make sure that Zabbix server is stopped while performing the restore.

3 Frontend access Access to frontend by default is allowed from everywhere.

The frontend can be accessed `http://<host>/zabbix`.

This can be customised in `/etc/apache2/conf-available/zabbix.conf`. You have to restart the webserver after modifying this file. To do so, log in using SSH as **root** user and execute:

```
service apache2 restart
```

4 Firewall By default, only the ports listed in changes are open. To open additional ports just modify `"/etc/iptables/rules.v4"` or `"/etc/iptables/rules.v6"` files and reload firewall rules:

```
service iptables-persistent reload
```

5 Monitoring capabilities Zabbix installation is provided with the support for the following:

- SNMP
- IPMI
- Web monitoring
- VMware monitoring
- Jabber notifications
- EZ Texting notifications
- ODBC
- SSH2
- IPv6
- SNMP Traps
- Zabbix Java Gateway

6 SNMP traps Zabbix appliance uses `snmptrapfmt` to handle SNMP traps. It is configured to receive all traps from everywhere.

Authentication is not required. If you would like to enable authentication, you need to change the `/etc/snmp/snmptrapd.conf` file and specify required auth settings.

All traps are stored in the `/var/log/zabbix/snmptrapfmt.log` file. It is rotated by logrotate before reaching 2GB file size.

7 Upgrading The appliance Zabbix packages may be upgraded. To do so, run:

```
sudo apt install --only-upgrade 'zabbix.*'
```

Attention:

For Zabbix 3.0, there will be no new appliances after version 3.0.30.

8 Naming, init and other scripts Appropriate init scripts are provided. To control Zabbix server, use any of these:

```
service zabbix-server status
```

Replace **server** with **agent** for Zabbix agent daemon or with **proxy** for Zabbix proxy daemon.

8.1 Increasing available diskpace

Warning:

Create a backup of all data before attempting any of the steps.

Available diskpace on the appliance might not be sufficient. In that case it is possible to expand the disk. To do so, first expand the block device in your virtualization environment, then follow these steps.

Start `fdisk` to change the partition size. As *root*, execute:

```
fdisk /dev/sda
```

This will start *fdisk* on disk *sda*. Next, switch to sectors by issuing:

```
u
```

Attention:

Don't disable DOS compatibility mode by entering **c**. Proceeding with it disabled will damage the partition.

Then delete the existing partition and create a new one with the desired size. In the majority of cases you will accept the available maximum, which will expand the filesystem to whatever size you made available for the virtual disk. To do so, enter the following sequence in *fdisk* prompt:

```
d
n
p
1
(accept default 63)
(accept default max)
```

If you wish to leave some space for additional partitions (swap etc), you can enter another value for *last sector*. When done, save the changes by issuing:

```
w
```

After partition creation (new disk or extended existing) create physical volume:

```
pvcreate /dev/sdb1
```

Warning:

Partition name */dev/sdb1* is used in the example; in your case disk name and partition number could be different. You can check partition number using *fdisk -l /dev/sdb* command.

Check newly created physical volume:

```
pvdisplay /dev/sdb1
```

Check available physical volumes. There must be 2 volumes *zabbix-vg* and newly created:

```
pvs
```

Extend your existing volume group with the newly created physical volume:

```
vgextend zabbix-vg /dev/sdb1
```

Check "zabbix-vg" volume group:

```
vgdisplay
```

Now extend your logical volume with the free PE space:

```
lvextend -l +100%FREE /dev/mapper/zabbix--vg-root
```

Resize your root volume (can be done on a live sysyem):

```
resize2fs /dev/mapper/zabbix--vg-root
```

Reboot the virtual machine (as the partition we modified is in use currently). That's it, filesystem should be grown to the partition size now. Check *"/dev/mapper/zabbix--vg-root"* volume:

```
df -h
```

9 Format-specific notes 9.1 Xen

Converting image for XenServer

To use Xen images with Citrix Xenserver you have to convert the disk image. To do so:

- Create a virtual disk, which is at least as large as the image
- Find out the UUID for this disk

```
xe vdi-list params=all
```

- If there are lots of disks, they can be filtered by the name parameter *name-label*, as assigned when creating the virtual disk
- Import the image

```
xe vdi-import filename="image.raw" uuid="<UUID>"
```

Instructions from Brian Radford blog.

9.2 VMware

The images in *vmdk* format are usable directly in VMware Player, Server and Workstation products. For use in ESX, ESXi and vSphere they must be converted using [VMware converter](#).

9.3 HDD/flash image (raw)

```
dd if=./zabbix_appliance_3.0.0_x86_64.raw of=/dev/sdc bs=4k conv=fdatasync
```

Replace */dev/sdc* with your Flash/HDD disk device.

10 Known issues

6. Configuration

Please use the sidebar to access content in the Configuration section.

1 Configuring a template

Overview

Configuring a template requires that you first create a template by defining its general parameters and then you add entities (items, triggers, graphs etc.) to it.

Creating a template

To create a template, do the following:

- Go to *Configuration* → *Templates*
- Click on *Create template*
- Edit template attributes

The **Template** tab contains general template attributes.

Template

Linked templates

Macros

Template name

Template OS Linux

Visible name

Groups

In groups

Templates

Other groups

Database servers

Discovered hosts

Hypervisors

Java

Linux servers

Network devices

SNMP hosts

UPS devices

Virtual machines

Web servers

New group

Hosts / templates

In

Other | group

Discovered hosts

New host

Zabbix server

Description

Add

Cancel

Template attributes:

Parameter	Description
<i>Template name</i>	Unique template name.
<i>Visible name</i>	If you set this name, it will be the one visible in lists, maps, etc.
<i>Groups</i>	Host/template groups the template belongs to.
<i>New group</i>	A new group can be created to hold the template.
	Ignored, if empty.
<i>Hosts/Templates</i>	List of hosts/templates the template is applied to.
<i>Description</i>	Enter the template description.

The **Linked templates** tab allows you to link one or more "nested" templates to this template. All entities (items, triggers, graphs etc.) will be inherited from the linked templates.

To link a new template, start typing in the *Link new templates* field until a list of templates corresponding to the entered letter(s) appear. Scroll down to select. When all templates to be linked are selected, click on *Add*.

To unlink a template, use one of the two options in the *Linked templates* block:

- *Unlink* - unlink the template, but preserve its items, triggers and graphs

- *Unlink and clear* - unlink the template and remove all its items, triggers and graphs

The **Macros** tab allows you to define template-level **user macros**. You may also view here macros from linked templates and global macros if you select the *Inherited and template macros* option. That is where all defined user macros for the template are displayed with the value they resolve to as well as their origin.

MACRO	EFFECTIVE VALUE	TEMPLATE VALUE	GLOBAL VALUE
{NESTED_TEMPLATE_MACRO}	53689	Change → Template2: "53689"	
{SNMP_COMMUNITY}	public	Change	← "public"
{TEMPLATE_MACRO}	25864	Remove	

Buttons: Add, Update, Clone, Full clone, Delete, Delete and clear, Cancel

For convenience, links to respective templates and global macro configuration are provided. It is also possible to edit a nested template/global macro on the template level, effectively creating a copy of the macro on the template.

Buttons:

Add	Add the template. The added template should appear in the list.
Update	Update the properties of an existing template.
Clone	Create another template based on the properties of the current template, including the entities (items, triggers, etc) inherited from linked templates.
Full clone	Create another template based on the properties of the current template, including the entities (items, triggers, etc) both inherited from linked templates and directly attached to the current template.
Delete	Delete the template; entities of the template (items, triggers, etc) remain with the linked hosts.
Delete and clear	Delete the template and all its entities from linked hosts.
Cancel	Cancel the editing of template properties.

With a template created, it is time to add some entities to it.

Attention:

Items have to be added to a template first. Triggers and graphs cannot be added without the corresponding item.

Adding items, triggers, graphs

To add items to the template, do the following:

- Go to *Configuration → Hosts (or Templates)*
- Click on *Items* in the row of the required host/template
- Mark the checkboxes of items you want add to the template
- Click on *Copy* below the item list
- Select the template (or group of templates) the items should be copied to and click on *Copy*

All the selected items should be copied to the template.

Adding triggers and graphs is done in similar fashion (from the list of triggers and graphs respectively), again, keeping in mind that they can only be added if the required items are added first.

Adding screens

To add screens to a template in *Configuration → Templates*, do the following:

- Click on *Screens* in the row of the template
- Configure a screen following the usual method of [configuring screens](#)

Attention:

The elements that can be included in a template screen are: simple graph, custom graph, clock, plain text, URL.

Configuring low-level discovery rules

See the [low-level discovery](#) section of the manual.

Adding web scenarios

To add web scenarios to a template in *Configuration → Templates*, do the following:

- Click on *Web* in the row of the template
- Configure a web scenario following the usual method of [configuring web scenarios](#)

2 Linking/unlinking

Overview

Linking is a process whereby templates are applied to hosts, whereas unlinking removes the association with the template from a host.

Attention:

Templates are linked directly to individual hosts and not to host groups. Simply adding a template to a host group will not link it. Host groups are used only for logical grouping of hosts and templates.

Linking a template

To link a template to the host, do the following:

- Go to *Configuration → Hosts*
- Click on the required host and switch to the *Templates* tab
- Click on *Add* next to *Link new templates*
- Select one or several templates in the popup window
- Click on *Add/Update* in the host attributes form

The host will now have all the entities (items, triggers, graphs, etc) of the template.

Attention:

Linking multiple templates to the same host will fail if in those templates there are items with the same item key. And, as triggers and graphs use items, they cannot be linked to a single host from multiple templates either, if using identical item keys.

When entities (items, triggers, graphs etc.) are added from the template:

- previously existing identical entities on the host are updated as entities of the template
- entities from the template are added
- any directly linked entities that, prior to template linkage, existed only on the host remain untouched

In the lists, all entities from the template now are prefixed by the template name, indicating that these belong to the particular template. The template name itself (in grey text) is a link allowing to access the list of those entities on the template level.

If some entity (item, trigger, graph etc.) is not prefixed by the template name, it means that it existed on the host before and was not added by the template.

Entity uniqueness criteria

When adding entities (items, triggers, graphs etc.) from a template it is important to know what of those entities already exist on the host and need to be updated and what entities differ. The uniqueness criteria for deciding upon the sameness/difference are:

- for items - the item key

- for triggers - trigger name and expression
- for custom graphs - graph name and its items
- for applications - application name

Linking templates to several hosts

There are some ways of mass-applying templates (to many hosts at once):

- To link a template to many hosts, in *Configuration* → *Templates*, click on the template, then select hosts from the respective group in the *Other* box, click on « and update the template.

Vice versa, if you select the linked hosts in the *In* box, click on » and update the template, you unlink the template from these hosts (while the hosts will still inherit the items, triggers, graphs etc. from the template).

- To update template linkage of many hosts, in *Configuration* → *Hosts* select some hosts by marking their checkboxes, then click on **Mass update** below the list and then in the *Templates* tab select to link additional templates:

Select *Link templates* and start typing the template name in the auto-complete field until a dropdown appears offering the matching templates. Just scroll down to select the template to link.

The *Replace* option will allow to link a new template while unlinking any template that was linked to the hosts before. The *Clear when unlinking* option will allow to not only unlink any previously linked templates, but also remove all elements inherited from them (items, triggers, etc.).

Note:

Zabbix offers a sizable set of predefined templates. You can use these for reference, but beware of using them unchanged in production as they may contain too many items and poll for data too often. If you feel like using them, finetune them to fit your real needs.

Editing linked entities

If you try to edit an item or trigger that was linked from the template, you may realize that many key options are disabled for editing. This makes sense as the idea of templates is that things are edited in one-touch manner on the template level. However, you still can, for example, enable/disable an item on the individual host and set the update interval, history length and some other parameters.

If you want to edit the entity fully, you have to edit it on the template level (template level shortcut is displayed in the form name), keeping in mind that these changes will affect all hosts that have this template linked to them.

Unlinking a template

To unlink a template from a host, do the following:

- Go to *Configuration* → *Hosts*
- Click on the required host and switch to the *Templates* tab
- Click on *Unlink* or *Unlink and clear* next to the template to unlink
- Click on *Update* in the host attributes form

Choosing the *Unlink* option will simply remove association with the template, while leaving all its entities (items, triggers, graphs etc.) with the host.

Choosing the *Unlink and clear* option will remove both the association with the template and all its entities (items, triggers, graphs etc.).

3 Nesting

Overview

Nesting is a way of one template encompassing one or more other templates.

As it makes sense to separate out on individual templates entities for various services, applications etc. you may end up with quite a few templates all of which may need to be linked to quite a few hosts. To simplify the picture, it is possible to link some templates together, in one "nested" template.

The benefit of nesting is that then you have to link only the one template to the host and the host will inherit all entities of the linked templates automatically.

Configuring a nested template

If you want to link some templates, to begin with you can take an existing template or a new one, then:

- Open the template properties form
- Look for the *Linked templates* tab
- Click on *Select* to select templates in the popup window
- Click on *Add* to list selected templates
- Click on *Add/Update* in the template properties form

Thus, all entities of the template itself, as well as all linked templates' entities (such as items, triggers, graphs etc.) will appear in the template configuration, except for the linked template screens, which will nevertheless be inherited by hosts.

To unlink any of the linked templates, in the same form use the *Unlink* or *Unlink and clear* buttons and click on *Update*.

Choosing the *Unlink* option will simply remove the association with the other template, while not removing all its entities (items, triggers, graphs etc).

Choosing the *Unlink and clear* option will remove both the association with the other template and all its entities (items, triggers, graphs etc).

1 Hosts and host groups

What is a "host"?

Typical Zabbix hosts are the devices you wish to monitor (servers, workstations, switches, etc).

Creating hosts is one of the first monitoring tasks in Zabbix. For example, if you want to monitor some parameters on a server "x", you must first create a host called, say, "Server X" and then you can look to add monitoring items to it.

Hosts are organized into host groups.

Proceed to [creating and configuring a host](#).

1 Configuring a host

Overview

To configure a host in Zabbix frontend, do the following:

- Go to: *Configuration* → *Hosts*
- Click on *Create host* to the right (or on the host name to edit an existing host)
- Enter parameters of the host in the form

You can also use the *Clone* and *Full clone* buttons in the form of an existing host to create a new host. Clicking on *Clone* will retain all host parameters and template linkage (keeping all entities from those templates). *Full clone* will additionally retain directly attached entities (applications, items, triggers, graphs, low-level discovery rules and web scenarios).

Note: When a host is cloned, it will retain all template entities as they are originally on the template. Any changes to those entities made on the existing host level (such as changed item interval, modified regular expression or added prototypes to the low-level discovery rule) will not be cloned to the new host; instead they will be as on the template.

Parameter	Description
<i>Host name</i>	Enter a unique host name. Alphanumerics, spaces, dots, dashes and underscores are allowed. <i>Note:</i> With Zabbix agent running on the host you are configuring, the agent configuration file parameter <i>Hostname</i> must have the same value as the host name entered here. The name in the parameter is needed in the processing of active checks .
<i>Visible name</i>	If you set this name, it will be the one visible in lists, maps, etc. This attribute has UTF-8 support.
<i>Groups</i>	Select host groups the host belongs to. A host must belong to at least one host group.
<i>New host group</i>	A new group can be created and linked to the host. Ignored, if empty.
<i>Interfaces</i>	Several host interface types are supported for a host: <i>Agent</i> , <i>SNMP</i> , <i>JMX</i> and <i>IPMI</i> . To add a new interface, click on <i>Add</i> in the <i>Interfaces</i> block and enter <i>IP/DNS</i> , <i>Connect to</i> and <i>Port</i> info. <i>Note:</i> Interfaces that are used in any items cannot be removed and link <i>Remove</i> is greyed out for them. <i>Use bulk requests</i> option for SNMP interfaces allows to enable/disable bulk processing of SNMP requests per interface.
<i>IP address</i>	Host IP address (optional).
<i>DNS name</i>	Host DNS name (optional).

Parameter	Description
<i>Connect to</i>	Clicking the respective button will tell Zabbix server what to use to retrieve data from agents: IP - Connect to the host IP address (recommended) DNS - Connect to the host DNS name
<i>Port</i>	TCP/UDP port number. Default values are: 10050 for Zabbix agent, 161 for SNMP agent, 12345 for JMX and 623 for IPMI.
<i>Default</i>	Check the radio button to set the default interface.
<i>Description</i>	Enter the host description.
<i>Monitored by proxy</i>	The host can be monitored either by Zabbix server or one of Zabbix proxies: (no proxy) - host is monitored by Zabbix server Proxy name - host is monitored by Zabbix proxy "Proxy name"
<i>Enabled</i>	Mark the checkbox to make the host active, ready to be monitored. If unchecked, the host is not active, thus not monitored.

The **Templates** tab allows you to link **templates** to the host. All entities (items, triggers, graphs and applications) will be inherited from the template.

To link a new template, start typing in the *Link new templates* field until a list of matching templates appear. Scroll down to select. When all templates to be linked are selected, click on *Add*.

To unlink a template, use one of the two options in the *Linked templates* block:

- *Unlink* - unlink the template, but preserve its items, triggers and graphs
- *Unlink and clear* - unlink the template and remove all its items, triggers and graphs

Listed template names are clickable links leading to the template configuration form.

See also **known issues** about template linkage.

The **IPMI** tab contains IPMI management attributes.

Parameter	Description
<i>Authentication algorithm</i>	Select the authentication algorithm.
<i>Privilege level</i>	Select the privilege level.
<i>Username</i>	User name for authentication.
<i>Password</i>	Password for authentication.

The **Macros** tab allows you to define host-level **user macros**. You may also view here template-level and global macros if you select the *Inherited and host macros* option. That is where all defined user macros for the host are displayed with the value they resolve to as well as their origin.

For convenience, links to respective templates and global macro configuration are provided. It is also possible to edit a template/global macro on the host level, effectively creating a copy of the macro on the host.

The **Host inventory** tab allows you to manually enter **inventory** information for the host. You can also select to enable *Automatic* inventory population, or disable inventory population for this host.

The **Encryption** tab allows you to require **encrypted** connections with the host.

Parameter	Description
<i>Connections to host</i>	How Zabbix server or proxy connects to Zabbix agent on a host: no encryption (default), using PSK (pre-shared key) or certificate.
<i>Connections from host</i>	Select what type of connections are allowed from the host (i.e. from Zabbix agent and Zabbix sender). Several connection types can be selected at the same time (useful for testing and switching to other connection type). Default is "No encryption".
<i>Issuer</i>	Allowed issuer of certificate. Certificate is first validated with CA (certificate authority). If it is valid, signed by the CA, then the <i>Issuer</i> field can be used to further restrict allowed CA. This field is intended to be used if your Zabbix installation uses certificates from multiple CAs. If this field is empty then any CA is accepted.
<i>Subject</i>	Allowed subject of certificate. Certificate is first validated with CA. If it is valid, signed by the CA, then the <i>Subject</i> field can be used to allow only one value of <i>Subject</i> string. If this field is empty then any valid certificate signed by the configured CA is accepted.
<i>PSK identity</i>	Pre-shared key identity string. Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.
<i>PSK</i>	Pre-shared key (hex-string). Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library. Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952

Configuring a host group

To configure a host group in Zabbix frontend, do the following:

- Go to: *Configuration* → *Host groups*
- Click on *Create Group* in the upper right corner of the screen
- Enter parameters of the group in the form

Host groups

Group name

Hosts

Template JMX Tomcat
Template OS AIX

Parameter	Description
<i>Group name</i>	Enter a unique host group name.
<i>Hosts</i>	Select hosts, members of the group. A host group may have zero, one or more hosts.

2 Inventory

Overview

You can keep the inventory of networked devices in Zabbix.

There is a special *Inventory* menu in the Zabbix frontend. However, you will not see any data there initially and it is not where you enter data. Building inventory data is done manually when configuring a host or automatically by using some automatic population options.

Building inventory

Manual mode

When **configuring a host**, in the *Host inventory* tab you can enter such details as the type of device, serial number, location, responsible person, etc - data that will populate inventory information.

If a URL is included in host inventory information and it starts with 'http' or 'https', it will result in a clickable link in the *Inventory* section.

Automatic mode

Host inventory can also be populated automatically. For that to work, when configuring a host the inventory mode in the *Host inventory* tab must be set to *Automatic*.

Then you can **configure host items** to populate any host inventory field with their value, indicating the destination field with the respective attribute (called *Item will populate host inventory field*) in item configuration.

Items that are especially useful for automated inventory data collection:

- system.hw.chassis[full|type|vendor|model|serial] - default is [full], root permissions needed
- system.hw.cpu[all|cpunum,full|maxfreq|vendor|model|curfreq] - default is [all,full]
- system.hw.devices[pci|usb] - default is [pci]
- system.hw.macaddr[interface,short|full] - default is [all,full], interface is regexp
- system.sw.arch
- system.sw.os[name|short|full] - default is [name]
- system.sw.packages[package,manager,short|full] - default is [all,all,full], package is regexp

Inventory mode selection

Inventory mode can be selected in the host configuration form.

Inventory mode by default for new hosts is selected based on the *Default host inventory mode* setting in *Administration* → *General* → *Other*.

For hosts added by network discovery or auto registration actions, it is possible to define a *Set host inventory mode* operation selecting manual or automatic mode. This operation overrides the *Default host inventory mode* setting.

Inventory overview

The details of all existing inventory data are available in the *Inventory* menu.

In *Inventory* → *Overview* you can get a host count by various fields of the inventory.

In *Inventory* → *Hosts* you can see all hosts that have inventory information. Clicking on the host name will reveal the inventory details in a form.

The **Overview** tab shows:

Parameter	Description
Host name	Name of the host. Clicking on the name opens a menu with the scripts defined for the host. Host name is displayed with an orange icon, if the host is in maintenance.
Visible name	Visible name of the host (if defined).
Host (Agent, SNMP, JMX, IPMI) interfaces	This block provides details of the interfaces configured for the host.
OS	Operating system inventory field of the host (if defined).
Hardware	Host hardware inventory field (if defined).
Software	Host software inventory field (if defined).
Description	Host description.
Monitoring	Links to monitoring sections with data for this host: <i>Web, Latest data, Triggers, Events, Graphs, Screens</i> .
Configuration	Links to configuration sections for this host: <i>Host, Applications, Items, Triggers, Graphs, Discovery, Web</i> . The amount of configured entities is listed in parenthesis after each link.

The **Details** tab shows all inventory fields that are populated (are not empty).

Inventory macros

There are host inventory macros {INVENTORY.*} available for use in notifications, for example:

"Server in {INVENTORY.LOCATION1} has a problem, responsible person is {INVENTORY.CONTACT1}, phone number {INVENTORY.POC.PRIMARY.PHONE.A1}."

For more details, see the [Macros supported by location](#) page.

3 Mass update

Overview

Sometimes you may want to change some attribute for a number of hosts at once. Instead of opening each individual host for editing, you may use the mass update function for that.

Using mass update

To mass-update some hosts, do the following:

- Mark the checkboxes before the hosts you want to update in the [host list](#)
- Click on *Mass update* below the list

- Navigate to the desired tab of attributes (*Host*, *Templates*, *IPMI* or *Inventory*)
- Mark the checkboxes of any attribute to update and enter a new value for them

Select

Description ☐ Original

Monitored by proxy ☒

(no proxy)

Status ☐ Original

Update

Cancel

Replace host groups will remove the host from any existing host groups and replace those with the one(s) specified in this field.

Add new or existing host groups allows to specify additional host groups from the existing ones or enter completely new host groups for the hosts.

Both these fields are auto-complete - starting to type in them offers a dropdown of matching host groups. If the host group is new, it also appears in the dropdown and it is indicated by *(new)* after the string. Just scroll down to select.

☐ Clear when unlinking

Update

Cancel

To update template linkage in the **Templates** tab, select *Link templates* and start typing the template name in the auto-complete field until a dropdown appears offering the matching templates. Just scroll down to select the template to link.

The *Replace* option will allow to link a new template while unlinking any template that was linked to the hosts before. The *Clear when unlinking* option will allow to not only unlink any previously linked templates, but also remove all elements inherited from them (items, triggers, etc.).

To be able to mass update inventory fields, the *Inventory mode* should be set to 'Manual' or 'Automatic'.

When done with all required changes, click on *Update*. The attributes will be updated accordingly for all the selected hosts.

2 Items

Overview

Items are the ones that gather data from a host.

Once you have configured a host, you need to add some monitoring items to start getting actual data.

An item is an individual metric. One way of quickly adding many items is to attach one of the predefined templates to a host. For optimized system performance though, you may need to fine-tune the templates to have only as many items and as frequent monitoring as is really necessary.

In an individual item you specify what sort of data will be gathered from the host.

For that purpose you use the **item key**. Thus an item with the key name **system.cpu.load** will gather data of the processor load, while an item with the key name **net.if.in** will gather incoming traffic information.

To specify further parameters with the key, you include those in square brackets after the key name. Thus, **system.cpu.load[avg5]** will return processor load average for the last 5 minutes, while **net.if.in[eth0]** will show incoming traffic in the interface eth0.

Note:

For all supported item types and item keys, see individual sections of [item types](#).

Proceed to [creating and configuring an item](#).

1 Creating an item

Overview

To create an item in Zabbix frontend, do the following:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item* in the upper right corner of the screen
- Enter parameters of the item in the form

Item attributes:

Parameter	Description
<i>Name</i>	<p>This is how the item will be named.</p> <p>The following macros can be used:</p> <p>\$1, \$2...\$9 - referring to the first, second... ninth parameter of the item key</p> <p>For example: Free disk space on \$1</p> <p>If the item key is "vfs.fs.size[/,free]", the description will automatically change to "Free disk space on /"</p>
<i>Type</i>	Item type. See individual item type sections.
<i>Key</i>	<p>Item key (up to 256 characters).</p> <p>The supported item keys can be found in individual item type sections.</p> <p>The key must be unique within a single host.</p> <p>If key type is 'Zabbix agent', 'Zabbix agent (active)', 'Simple check' or 'Zabbix aggregate', the key value must be supported by Zabbix agent or Zabbix server.</p> <p>See also: the correct key format.</p>
<i>Host interface</i>	Select the host interface. This field is available when editing an item on the host level.
<i>Type of information</i>	<p>Type of data as stored in the database after performing conversions, if any.</p> <p>Numeric (unsigned) - 64bit unsigned integer</p> <p>Numeric (float) - floating point number</p> <p>Negative values can be stored.</p> <p>Allowed range: -99999999999.9999 to 99999999999.9999.</p> <p>Starting with Zabbix 2.2, receiving values in scientific notation is also supported. E.g. 1e+7, 1e-4.</p> <p>Character - short text data</p> <p>Log - long text data with optional log related properties (timestamp, source, severity, logeventid)</p> <p>Text - long text data</p> <p><i>Limits of text data are described in the table below.</i></p>
<i>Data type</i>	<p>Data type is used for integer items in order to specify the expected data type:</p> <p>Boolean - textual representation translated into either 0 or 1. Thus, 'TRUE' is stored as 1 and 'FALSE' is stored as 0. All values are matched in a case-insensitive way. Currently recognized values are, for:</p> <p><i>TRUE</i> - true, t, yes, y, on, up, running, enabled, available</p> <p><i>FALSE</i> - false, f, no, n, off, down, unused, disabled, unavailable</p> <p>Additionally, any non-zero numeric value is considered to be TRUE and zero is considered to be FALSE.</p> <p>Octal - data in octal format</p> <p>Decimal - data in decimal format</p> <p>Hexadecimal - data in hexadecimal format</p> <p>Zabbix will automatically perform the conversion to numeric. The conversion is done by Zabbix server (even when a host is monitored by Zabbix proxy).</p>

Parameter	Description
<i>Units</i>	<p>If a unit symbol is set, Zabbix will add post processing to the received value and display it with the set unit postfix.</p> <p>By default, if the raw value exceeds 1000, it is divided by 1000 and displayed accordingly. For example, if you set <i>bps</i> and receive a value of 881764, it will be displayed as 881.76 Kbps.</p> <p>The JEDEC memory standard is used for processing B (byte), Bps (bytes per second) units, which are divided by 1024. Thus, if units are set to B or Bps Zabbix will display:</p> <p>1 as 1B/1Bps 1024 as 1KB/1KBps 1536 as 1.5KB/1.5KBps</p> <p>Special processing is used if the following time-related units are used:</p> <p>unixtime - translated to "yyyy.mm.dd hh:mm:ss". To translate correctly, the received value must be a <i>Numeric (unsigned)</i> type of information.</p> <p>uptime - translated to "hh:mm:ss" or "N days, hh:mm:ss" For example, if you receive the value as 881764 (seconds), it will be displayed as "10 days, 04:56:04"</p> <p>s - translated to "yyy mmm ddd hhh mmm sss ms"; parameter is treated as number of seconds. For example, if you receive the value as 881764 (seconds), it will be displayed as "10d 4h 56m"</p> <p>Only 3 upper major units are shown, like "1m 15d 5h" or "2h 4m 46s". If there are no days to display, only two levels are displayed - "1m 5h" (no minutes, seconds or milliseconds are shown). Will be translated to "< 1 ms" if the value is less than 0.001.</p> <p>See also the unit blacklist.</p>
<i>Use custom multiplier</i>	<p>If you enable this option, all received values will be multiplied by the integer or floating-point value set in the value field.</p> <p>Use this option to convert values received in KB, MBps, etc into B, Bps. Otherwise Zabbix cannot correctly set prefixes (K, M, G etc). <i>Note</i> that if the item type of information is <i>Numeric (unsigned)</i>, incoming values with a fractional part will be trimmed (i.e. '0.9' will become '0') before the custom multiplier is applied.</p> <p>Starting with Zabbix 2.2, using scientific notation is also supported. E.g. 1e+70.</p>
<i>Update interval (in sec)</i>	<p>Retrieve a new value for this item every N seconds. Maximum allowed update interval is 86400 seconds (1 day).</p> <p><i>Note:</i> The update interval can only be set to '0' if custom intervals exist with a non-zero value. If set to '0', and a custom interval (flexible or scheduled) exists with a non-zero value, the item will be polled during the custom interval duration.</p> <p><i>Note</i> that the first item poll after the item became active or after update interval change might occur earlier than the configured value.</p>
<i>Custom intervals</i>	<p>You can create custom rules for checking the item:</p> <p>Flexible - create an exception to the <i>Update interval</i> (interval with different frequency)</p> <p>Scheduling - create a custom polling schedule.</p> <p>For detailed information see Custom intervals. Scheduling is supported since Zabbix 3.0.0.</p> <p><i>Note:</i> Not available for Zabbix agent active items.</p>

Parameter	Description
<i>History storage period
(in days)</i>	<p>Number of days to keep detailed history in the database. Older data will be removed by the housekeeper.</p> <p>Starting with Zabbix 2.2, this value can be overridden globally in <i>Administration</i> → <i>General</i> → <i>Housekeeper</i>. If the global setting exists, a warning message is displayed:</p> <p>Keep history (in days) <input type="text" value="14"/> Overridden by global housekeeper settings (7 days)</p> <p>It is recommended to keep the recorded values for the smallest possible number of days to reduce the size of value history in the database. Instead of keeping long history of values, you can keep longer data of trends.</p> <p>If set to "0" no data is stored in the history table for the item. Host inventory data only are updated.</p> <p>See also History and trends.</p>
<i>Trend storage period
(in days)</i>	<p>Keep aggregated (hourly min, max, avg, count) detailed history for N days in the database. Older data will be removed by the housekeeper.</p> <p>Starting with Zabbix 2.2, this value can be overridden globally in <i>Administration</i> → <i>General</i> → <i>Housekeeper</i>. If the global setting exists, a warning message is displayed:</p> <p>Keep trends (in days) <input type="text" value="90"/> Overridden by global housekeeper settings (365 days)</p> <p><i>Note:</i> Keeping trends is not available for non-numeric data - character, log and text.</p> <p>If set to "0" no trends are kept.</p> <p>See also History and trends.</p>
<i>Store value</i>	<p>As is - no pre-processing</p> <p>Delta (speed per second) - evaluate value as $(value_prev_value)/(time_prev_time)$, where</p> <ul style="list-style-type: none"> <i>value</i> - current value <i>value_prev</i> - previously received value <i>time</i> - current timestamp <i>prev_time</i> - timestamp of previous value <p>This setting is extremely useful to get speed per second for a constantly growing value.</p> <p>If current value is smaller than the previous value, Zabbix discards that difference (stores nothing) and waits for another value. This helps to work correctly with, for instance, a wrapping (overflow) of 32-bit SNMP counters.</p> <p><i>Note:</i> As this calculation may produce floating point numbers, it is recommended to set the 'Type of information' to <i>Numeric (float)</i>, even if the incoming raw values are integers. This is especially relevant for small numbers where the decimal part matters. If the floating point values are large and may exceed the 'float' field length in which case the entire value may be lost, it is actually suggested to use <i>Numeric (unsigned)</i> and thus trim only the decimal part.</p> <p>Delta (simple change) - evaluate as $(value_prev_value)$, where</p> <ul style="list-style-type: none"> <i>value</i> - current value <i>value_prev</i> - previously received value <p>This setting can be useful to measure a constantly growing value. If the current value is smaller than the previous value, Zabbix discards that difference (stores nothing) and waits for another value.</p>
<i>Show value</i>	<p>Apply value mapping to this item. Value mapping does not change received values, it is for displaying data only.</p> <p>It works with <i>Numeric(unsigned)</i>, <i>Numeric(float)</i> and <i>Character</i> items.</p> <p>For example, "Windows service states".</p>

Parameter	Description
<i>Log time format</i>	Available for items of type Log only. Supported placeholders: * y : Year (1970-2038) * M : Month (01-12) * d : Day (01-31) * h : Hour (00-23) * m : Minute (00-59) * s : Second (00-59) If left blank the timestamp will not be parsed. For example, consider the following line from the Zabbix agent log file: " 23480:20100328:154718.045 Zabbix agent started. Zabbix 1.8.2 (revision 11211)." It begins with six character positions for PID, followed by date, time, and the rest of the line. Log time format for this line would be "pppppp:yyyyMMdd:hhmmss". Note that "p" and ":" chars are just placeholders and can be anything but "yMdhms".
<i>New application</i>	Enter the name of a new application for the item.
<i>Applications</i>	Link item to one or more existing applications.
<i>Populates host inventory field</i>	You can select a host inventory field that the value of item will populate. This will work if automatic inventory population is enabled for the host.
<i>Description</i>	This field is not available if <i>Type of information</i> is set to 'Log'. Enter an item description.
<i>Enabled</i>	Mark the checkbox to enable the item so it will be processed.

You can also create an item by opening an existing one, pressing the *Clone* button and then saving under a different name.

Note:

Item type specific fields are described on [corresponding pages](#).

Note:

When editing an existing **template** level item on a host level, a number of fields are read-only. You can use the link in the form header and go to the template level and edit them there, keeping in mind that the changes on a template level will change the item for all hosts that the template is linked to.

Note:

If you use a custom multiplier or store value as *Delta (speed per second)* for items with the type of information set to *Numeric (unsigned)* and the resulting calculated value is actually a float number, the calculated value is still accepted as a correct one by trimming the decimal part and storing the value as integer.

Text data limits

Text data limits depend on the database backend. Before storing text values in the database they get truncated to match the database value type limit:

Database	Type of information		
	Character	Log	Text
MySQL	255 characters	65536 bytes	65536 bytes
PostgreSQL	255 characters	65536 characters	65536 characters
Oracle	255 characters	65536 characters	65536 characters
IBM DB2	255 bytes	2048 bytes	2048 bytes

Unit blacklist

By default, specifying a unit for an item will result in a multiplier prefix being added - for example, value 2048 with unit B would be displayed as 2KB. For a pre-defined, hardcoded list of units this is prevented:

- ms
- RPM
- rpm
- %

Note that both lowercase and uppercase **rpm** (*rpm* and *RPM*) strings are blacklisted.

Unsupported items

An item can become unsupported if its value cannot be retrieved for some reason. Such items are still rechecked at a fixed interval, configurable in [Administration section](#).

Unsupported items are reported as having a NOT SUPPORTED state.

1 Item key format

Item key format, including key parameters, must follow syntax rules. The following illustrations depict the supported syntax. Allowed elements and characters at each point can be determined by following the arrows - if some block can be reached through the line, it is allowed, if not - it is not allowed.

To construct a valid item key, one starts with specifying the key name, then there's a choice to either have parameters or not - as depicted by the two lines that could be followed.

Key name

The key name itself has a limited range of allowed characters, which just follow each other. Allowed characters are:

0-9a-zA-Z_-. .

Which means:

- all numbers;
- all lowercase letters;
- all uppercase letters;
- underscore;
- dash;
- dot.

Key parameters

An item key can have multiple parameters that are comma separated.

Each key parameter can be either a quoted string, an unquoted string or an array.

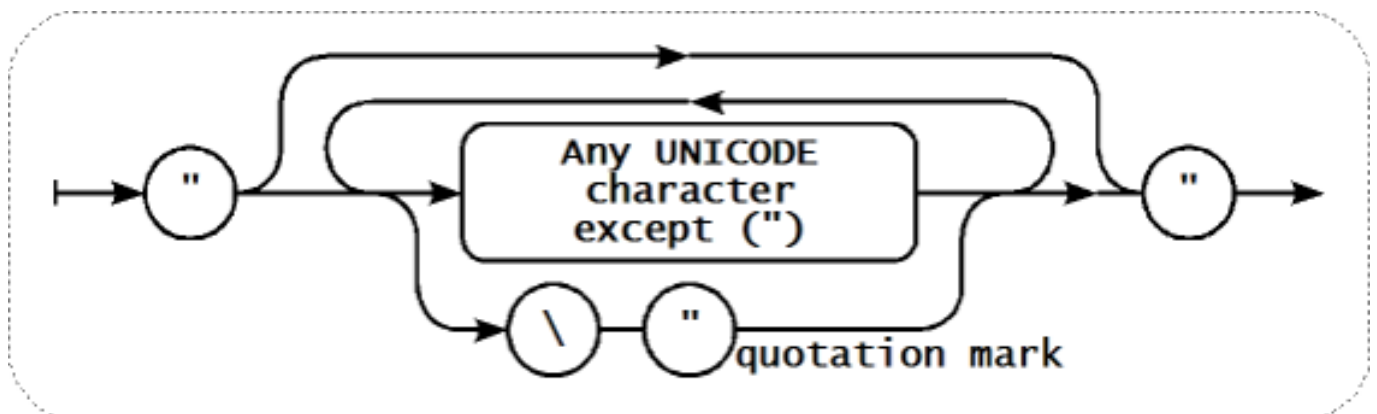

The parameter can also be left empty, thus using the default value. In that case, the appropriate number of commas must be added if any further parameters are specified. For example, item key `icmpping[,,200,,500]` would specify that the interval between individual pings is 200 milliseconds, timeout - 500 milliseconds, and all other parameters are left at their defaults.

Parameter - quoted string

If the key parameter is a quoted string, any Unicode character is allowed.

If the key parameter string contains comma, this parameter has to be quoted.

If the key parameter string contains quotation mark, this parameter has to be quoted and each quotation mark which is a part of the parameter string has to be escaped with a backslash (\) character.

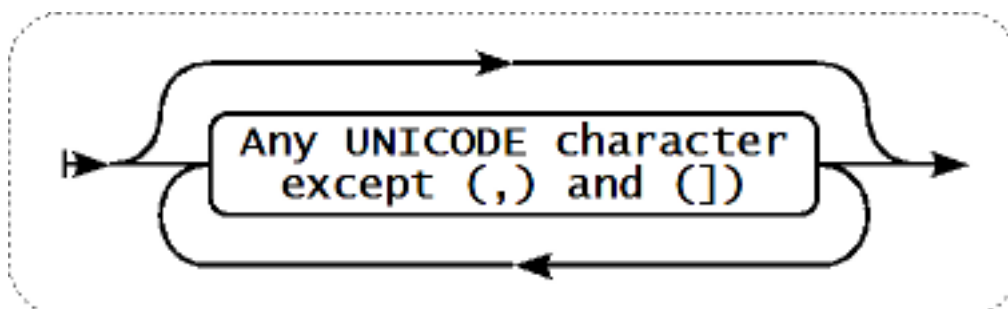

Warning:

To quote item key parameters, use double quotes only. Single quotes are not supported.

Parameter - unquoted string

If the key parameter is an unquoted string, any Unicode character is allowed except comma and right square bracket (]). Unquoted parameter cannot start with left square bracket ([).

Parameter - array

If the key parameter is an array, it is again enclosed in square brackets, where individual parameters come in line with the rules and syntax of specifying multiple parameters.

2 Custom intervals

Overview

It is possible to create custom rules regarding the times when an item is checked. The two methods for that are *Flexible intervals*, which allow to redefine the default update interval, and *Scheduling*, whereby an item check can be executed at a specific time or sequence of times.

Flexible intervals

Flexible intervals allow to redefine the default update interval for specific time periods. A flexible interval is defined with *Interval* and *Period* where:

- *Interval* – the update interval for the specified time period
- *Period* – the time period when the flexible interval is active (see the [time periods](#) for detailed description of the *Period* format)

Up to seven flexible intervals can be defined. If multiple flexible intervals overlap, the smallest *Interval* value is used for the overlapping period. Note that if the smallest value of overlapping flexible intervals is '0', no polling will take place. Outside the flexible intervals the default update interval is used.

Note that if the flexible interval equals the length of the period, the item will be checked exactly once. If the flexible interval is greater than the period, the item might be checked once or it might not be checked at all (thus such configuration is not advisable). If the flexible interval is less than the period, the item will be checked at least once.

If the flexible interval is set to '0', the item is not polled during the flexible interval period and resumes polling according to the default *Update interval* once the period is over. Examples:

Interval	Period	Description
10	1-5,09:00-18:00	Item will be checked every 10 seconds during working hours.
0	1-7,00:00-7:00	Item will not be checked during the night.
0	7-7,00:00-24:00	Item will not be checked on Sundays.
60	1-7,12:00-12:01	Item will be checked at 12:00 every day. Note that this was used as a workaround for scheduled checks and starting with Zabbix 3.0 it is recommended to use scheduling intervals for such checks.

Scheduling intervals

Scheduling intervals are used to check items at specific times. While flexible intervals are designed to redefine the default item update interval, the scheduling intervals are used to specify an independent checking schedule, which is executed in parallel.

A scheduling interval is defined as: `md<filter>wd<filter>h<filter>m<filter>s<filter>` where:

- **md** - month days
- **wd** - week days
- **h** - hours
- **m** - minutes
- **s** - seconds

`<filter>` is used to specify values for its prefix (days, hours, minutes, seconds) and is defined as: `[<from>[-<to>]] [/<step>] [,<filter>]` where:

- `<from>` and `<to>` define the range of matching values (included). If `<to>` is omitted then the filter matches a `<from>` – `<from>` range. If `<from>` is also omitted then the filter matches all possible values.

- `<step>` defines the skips of the number value through the range. By default `<step>` has the value of 1, which means that all values of the defined range are matched.

While the filter definitions are optional, at least one filter must be used. A filter must either have a range or the `<step>` value defined.

An empty filter matches either '0' if no lower-level filter is defined or all possible values otherwise. For example, if the hour filter is omitted then only '0' hour will match, provided minute and seconds filters are omitted too, otherwise an empty hour filter will match all hour values.

Valid `<from>` and `<to>` values for their respective filter prefix are:

Prefix	Description	<code><from></code>	<code><to></code>
md	Month days	1-31	1-31
wd	Week days	1-7	1-7
h	Hours	0-23	0-23
m	Minutes	0-59	0-59
s	Seconds	0-59	0-59

The `<from>` value must be less or equal to `<to>` value. The `<step>` value must be greater or equal to 1 and less or equal to `<to>` - `<from>`.

Single digit month days, hours, minutes and seconds values can be prefixed with 0. For example `md01-31` and `h/02` are valid intervals, but `md01-031` and `wd01-07` are not.

In Zabbix frontend, multiple scheduling intervals are entered in separate rows. In Zabbix API, they are concatenated into a single string with a semicolon ; as a separator.

If a time is matched by several intervals it is executed only once. For example, `wd1h9;h9` will be executed only once on Monday at 9am.

Examples:

Interval	Description
m0-59	execute every minute
h9-17/2	execute every 2 hours starting with 9:00 (9:00, 11:00 ...)
m0,30 or m/30	execute hourly at hh:00 and hh:30
m0,5,10,15,20,25,30,35,40,45,50,55 or m/5	every five minutes
wd1-5h9	every Monday till Friday at 9:00
wd1-5h9-18	every Monday till Friday at 9:00,10:00,...,18:00
h9,10,11 or h9-11	every day at 9:00, 10:00 and 11:00
md1h9m30	every 1st day of each month at 9:30
md1wd1h9m30	every 1st day of each month at 9:30 if it is Monday
h9m/30	execute at 9:00, 9:30
h9m0-59/30	execute at 9:00, 9:30
h9,10m/30	execute at 9:00, 9:30, 10:00, 10:30
h9-10m30	execute at 9:30, 10:30
h9m10-40/30	execute at 9:10, 9:40
h9,10m10-40/30	execute at 9:10, 9:40, 10:10, 10:40
h9-10m10-40/30	execute at 9:10, 9:40, 10:10, 10:40
h9m10-40	execute at 9:10, 9:11, 9:12, ... 9:40
h9m10-40/1	execute at 9:10, 9:11, 9:12, ... 9:40
h9-12,15	execute at 9:00, 10:00, 11:00, 12:00, 15:00
h9-12,15m0	execute at 9:00, 10:00, 11:00, 12:00, 15:00
h9-12,15m0s30	execute at 9:00:30, 10:00:30, 11:00:30, 12:00:30, 15:00:30
h9-12s30	execute at 9:00:30, 9:01:30, 9:02:30 ... 12:58:30, 12:59:30
h9m/30;h10 (API-specific syntax)	every day at 9:00, 9:30, 10:00
h9m/30	every day at 9:00, 9:30, 10:00
h10 (add this as another row in frontend)	

2 Item types

Overview

Item types cover various methods of acquiring data from your system. Each item type comes with its own set of supported item keys and required parameters.

The following items types are currently offered by Zabbix:

- Zabbix agent checks
- SNMP agent checks
- SNMP traps
- IPMI checks
- Simple checks
 - VMware monitoring
- Log file monitoring
- Calculated items
- Zabbix internal checks
- SSH checks
- Telnet checks
- External checks
- Aggregate checks
- Trapper items
- JMX monitoring
- ODBC checks

Details for all item types are included in the subpages of this section. Even though item types offer a lot of options for data gathering, there are further options through [user parameters](#) or [loadable modules](#).

Some checks are performed by Zabbix server alone (as agent-less monitoring) while others require Zabbix agent or even Zabbix Java gateway (with JMX monitoring).

Attention:

If a particular item type requires a particular interface (like an IPMI check needs an IPMI interface on the host) that interface must exist in the host definition.

Multiple interfaces can be set in the host definition: Zabbix agent, SNMP agent, JMX and IPMI. If an item can use more than one interface, it will search the available host interfaces (in the order: Agent→SNMP→JMX→IPMI) for the first appropriate one to be linked with.

All items that return text (character, log, text types of information) can return whitespace only as well (where applicable) setting the return value to an empty string (supported since 2.0).

1 Zabbix agent

Overview

These checks use the communication with Zabbix agent for data gathering.

There are [passive](#) and [active](#) agent checks. When configuring an item, you can select the required type:

- *Zabbix agent* - for passive checks
- *Zabbix agent (active)* - for active checks

Supported item keys

The table provides details on the item keys that you can use with Zabbix agent items.

See also:

- [Items supported by platform](#)
- [Item keys specific for Windows agent](#)
- [Minimum permission level for Windows agent items](#)

** Mandatory and optional parameters **

Parameters without angle brackets are mandatory. Parameters marked with angle brackets < > are optional.

Key	Description	Return value	Parameters	Comments
agent.hostname				

Key			
	Agent host name.	String	Returns the actual value of the agent hostname from a configuration file.
agent.ping	Agent availability check.	Nothing - unavailable 1 - available	Use the nodata() trigger function to check for host unavailability.
agent.version	Version of Zabbix agent.	String	Example of returned value: 1.8.2
kernel.maxfiles	Maximum number of opened files supported by OS.	Integer	
kernel.maxproc	Maximum number of processes supported by OS.	Integer	
log[file,<regex>,<encoding>,<maxlines>,<mode>,<output>]			

Log file monitoring.	Log	file - full path and name of log file regexp - regular expression describing the required pattern encoding - code page identifier maxlines - maximum number of new lines per second the agent will send to Zabbix server or proxy. This parameter overrides the value of 'MaxLinesPerSecond' in zabbix_agentd.conf mode - possible values: <i>all</i> (default), <i>skip</i> - skip processing of older data (affects only newly created items). output - an optional output formatting template. The \0 escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an \N (where N=1...9) escape sequence is replaced with Nth matched group (or an empty string if the N exceeds the number of captured	The item must be configured as an active check . If file is missing or permissions do not allow access, item turns unsupported. If output is left empty - the whole line containing the matched text is returned. Note that all global regular expression types except 'Result is TRUE' always return the whole matched line and the output parameter is ignored. Content extraction using the output parameter takes place on the agent. Examples: => log[/var/log/syslog] => log[/var/log/syslog,error] => log[/home/zabbix/logs/logfile,, <i>Example of using output parameter for extracting a number from log record:</i> log[/app1/app.log,"task run [0-9.]+ sec, processed ([0-9.]+) records, [0-9.]+ errors" ,,,\1]→ will match a log record "2015-11-13 10:08:26 task run 6.08 sec, processed 6080 records,
----------------------	-----	---	---

Key

logrt[file_regexp,<regexp>,<encoding>,<maxlines>,<mode>,<output>]

Log file monitoring with log rotation support.	Log	<p>file_regexp - absolute path to file and regexp describing the file name pattern</p> <p>regexp - regular expression describing the required content pattern</p> <p>encoding - code page identifier</p> <p>maxlines - maximum number of new lines per second the agent will send to Zabbix server or proxy. This parameter overrides the value of 'MaxLinesPerSecond' in <code>zabbix_agentd.conf</code></p> <p>mode - possible values: <i>all</i> (default), <i>skip</i> - skip processing of older data (affects only newly created items).</p> <p>output - an optional output formatting template. The <code>\0</code> escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an <code>\N</code> (where $N=1\dots9$) escape sequence is replaced with Nth matched group (or an</p>	<p>The item must be configured as an active check. Log rotation is based on the last modification time of files.</p> <p>Note that logrt is designed to work with one currently active log file, with several other matching inactive files rotated. If, for example, a directory has many active log files, a separate logrt item should be created for each one. Otherwise if one logrt item picks up too many files it may lead to exhausted memory and a crash of monitoring.</p> <p>If output is left empty - the whole line containing the matched text is returned. Note that all global regular expression types except 'Result is TRUE' always return the whole matched line and the output parameter is ignored.</p> <p>Content extraction using the output parameter takes place on the agent.</p> <p>Examples:</p>
--	-----	---	--

Key

net.dns[<ip>,name,<type>,<timeout>,<count>,<protocol>]

Checks if DNS
service is up.

0 - DNS is down
(server did not
respond or
DNS resolution
failed)

1 - DNS is up

ip - IP address
of DNS server
(leave empty
for the default
DNS server,
ignored on
Windows)
name - DNS
name to query
type - record
type to be
queried
(default is *SOA*)
timeout
(ignored on
Windows) -
timeout for the
request in
seconds
(default is 1
second)
count (ignored
on Windows) -
number of tries
for the request
(default is 2)
protocol - the
protocol used
to perform DNS
queries: *udp*
(default) or *tcp*

Example:
=>

net.dns[8.8.8.8,zabbix.com,M]

The possible
values for
type are:
*ANY, A, NS,
CNAME, MB,
MG, MR, PTR,
MD, MF, MX,
SOA, NULL,
WKS* (except
for Windows),
*HINFO, MINFO,
TXT, SRV*

Internationalized
domain names
are not
supported,
please use
IDNA encoded
names instead.

The protocol
parameter is
supported
since Zabbix
3.0.
SRV record
type is
supported
since Zabbix
agent versions
1.8.6 (Unix)
and 2.0.0
(Windows).

Naming before
Zabbix 2.0 (still
supported):
net.tcp.dns

net.dns.record[<ip>,name,<type>,<timeout>,<count>,<protocol>]

Key	Performs a DNS query.	Character string with the required type of information	ip - IP address of DNS server (leave empty for the default DNS server, ignored on Windows) name - DNS name to query type - record type to be queried (default is <i>SOA</i>) timeout (ignored on Windows) - timeout for the request in seconds (default is 1 second) count (ignored on Windows) - number of tries for the request (default is 2) protocol - the protocol used to perform DNS queries: <i>udp</i> (default) or <i>tcp</i>	Example: => <i>net.dns.record[8.8.8.8,zabbix.</i> The possible values for type are: <i>ANY, A, NS,</i> <i>CNAME, MB,</i> <i>MG, MR, PTR,</i> <i>MD, MF, MX,</i> <i>SOA, NULL,</i> <i>WKS</i> (except for Windows), <i>HINFO, MINFO,</i> <i>TXT, SRV</i> Internationalized domain names are not supported, please use IDNA encoded names instead. The protocol parameter is supported since Zabbix 3.0. SRV record type is supported since Zabbix agent versions 1.8.6 (Unix) and 2.0.0 (Windows). Naming before Zabbix 2.0 (still supported): <i>net.tcp.dns.query</i>
<i>net.if.collisions[if]</i>	Number of out-of-window collisions.	Integer	if - network interface name	
<i>net.if.discovery</i>				

Key

	List of network interfaces. Used for low-level discovery.	JSON object	Supported since Zabbix agent version 2.0. On FreeBSD, OpenBSD and NetBSD supported since Zabbix agent version 2.2. Some Windows versions (for example, Server 2008) might require the latest updates installed to support non-ASCII characters in interface names.
net.if.in[if,<mode>]			

Key	Incoming traffic statistics on network interface.	Integer	if - network interface name (Unix); network interface full description or IPv4 address (Windows) mode - possible values: <i>bytes</i> - number of bytes (default) <i>packets</i> - number of packets <i>errors</i> - number of errors <i>dropped</i> - number of dropped packets	On Windows, the item gets values from 64-bit counters if available. 64-bit interface statistic counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters. Multi-byte interface names on Windows are supported since Zabbix agent version 1.8.6. Examples: => net.if.in[eth0,errors] => net.if.in[eth0] You may obtain network interface descriptions on Windows with net.if.discovery or net.if.list items. You may use this key with a <i>Delta (speed per second)</i> store value in order to get bytes per second statistics.
net.if.out[if,<mode>]				

Key	Description	Value	Unit	Notes
<code>net.if.total[if,<mode>]</code>	Outgoing traffic statistics on network interface.	Integer		<p>if - network interface name (Unix); network interface full description or IPv4 address (Windows)</p> <p>mode - possible values:</p> <p><i>bytes</i> - number of bytes (default)</p> <p><i>packets</i> - number of packets</p> <p><i>errors</i> - number of errors</p> <p><i>dropped</i> - number of dropped packets</p> <p>On Windows, the item gets values from 64-bit counters if available. 64-bit interface statistic counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters.</p> <p>Multi-byte interface names on Windows are supported since Zabbix agent 1.8.6 version.</p> <p>Examples:</p> <pre>=> net.if.out[eth0,errors] => net.if.out[eth0]</pre> <p>You may obtain network interface descriptions on Windows with <code>net.if.discovery</code> or <code>net.if.list</code> items.</p> <p>You may use this key with a <i>Delta (speed per second)</i> store value in order to get bytes per second statistics.</p>

	Sum of incoming and outgoing traffic statistics on network interface.	Integer	if - network interface name (Unix); network interface full description or IPv4 address (Windows) mode - possible values: <i>bytes</i> - number of bytes (default) <i>packets</i> - number of packets <i>errors</i> - number of errors <i>dropped</i> - number of dropped packets	<p>On Windows, the item gets values from 64-bit counters if available. 64-bit interface statistic counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters.</p> <p>Examples: => net.if.total[eth0,errors] => net.if.total[eth0]</p> <p>You may obtain network interface descriptions on Windows with net.if.discovery or net.if.list items.</p> <p>You may use this key with a <i>Delta (speed per second)</i> store value in order to get bytes per second statistics.</p> <p>Note that dropped packets are supported only if both net.if.in and net.if.out work for dropped packets on your platform.</p>
net.tcp.listen[port]				

Key

	Checks if this TCP port is in LISTEN state.	0 - it is not in LISTEN state 1 - it is in LISTEN state	port - TCP port number	<p>Example: => net.tcp.listen[80]</p> <p>On Linux supported since Zabbix agent version 1.8.4</p> <p>Since Zabbix 3.0.0, on Linux kernels 2.6.14 and above, information about listening TCP sockets is obtained from the kernel's NETLINK interface, if possible. Otherwise, the information is retrieved from /proc/net/tcp and /proc/net/tcp6 files.</p>
net.tcp.port[<ip>,<port>]	Checks if it is possible to make TCP connection to specified port.	0 - cannot connect 1 - can connect	<p>ip - IP or DNS name (default is 127.0.0.1)</p> <p>port - port number</p>	<p>Example: => net.tcp.port[,80] → can be used to test availability of web server running on port 80.</p> <p>For simple TCP performance testing use net.tcp.service.perf[tcp,<ip>],</p> <p>Note that these checks may result in additional messages in system daemon logfiles (SMTP and SSH sessions being logged usually).</p> <p>Old naming: check_port[*]</p>
net.tcp.service[service,<ip>,<port>]				

Checks if service is running and accepting TCP connections.

0 - service is down
1 - service is running

service - either of: *ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet* (see [details](#))
ip - IP address (default is 127.0.0.1)
port - port number (by default standard service port number is used)

Example:
=> `net.tcp.service[ftp,,45]`
→ can be used to test the availability of FTP server on TCP port 45.

Note that these checks may result in additional messages in system daemon logfiles (SMTP and SSH sessions being logged usually).

Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use `net.tcp.port` for checks like these.

Checking of LDAP and HTTPS by Windows agent is currently not supported.

Note that the telnet check looks for a login prompt (': ' at the end).

See also [known issues](#) of checking HTTPS service.

https and *telnet* services are supported since Zabbix 2.0.

Old naming:
`check_service[*]`

Key

net.tcp.service.perf[service,<ip>,<port>]

Checks
performance of
TCP service.

0 - service is
down

seconds - the
number of
seconds spent
while
connecting to
the service

service -
either of:
ssh, ldap,
smtp, ftp, http,
pop, nntp,
imap, tcp,
https, telnet
(see [details](#))
ip - IP address
(default is
127.0.0.1)
port - port
number (by
default
standard
service port
number is
used)

Example:
=>
net.tcp.service.perf[ssh]
→ can be used
to test the
speed of initial
response from
SSH server.

Checking of
encrypted
protocols (like
IMAP on port
993 or POP on
port 995) is
currently not
supported. As
a workaround,
please use
net.tcp.service.perf[tcp,<ip>,
for checks like
these.

Checking of
LDAP and
HTTPS by
Windows agent
is currently not
supported.

Note that the
telnet check
looks for a
login prompt
(':' at the end).

See also [known
issues](#) of
checking
HTTPS service.

https and
telnet services
are supported
since Zabbix
2.0.

Old naming:
check_service_perf[]*

net.udp.listen[port]

Checks if this
UDP port is in
LISTEN state.

0 - it is not in
LISTEN state

1 - it is in
LISTEN state

port - UDP port
number

Example:
=>
net.udp.listen[68]

On Linux
supported
since Zabbix
agent version
1.8.4

net.udp.service[service,<ip>,<port>]

Key

	Checks if service is running and responding to UDP requests.	0 - service is down 1 - service is running	service - <i>ntp</i> (see details) ip - IP address (default is 127.0.0.1) port - port number (by default standard service port number is used)	Example: => net.udp.service[ntp,45] → can be used to test the availability of NTP service on UDP port 45. This item is supported since Zabbix 3.0.0, but <i>ntp</i> service was available for net.tcp.service[] item in prior versions.
net.udp.service.perf[service,<ip>,<port>]	Checks performance of UDP service.	0 - service is down seconds - the number of seconds spent waiting for response from the service	service - <i>ntp</i> (see details) ip - IP address (default is 127.0.0.1) port - port number (by default standard service port number is used)	Example: => net.udp.service.perf[ntp] → can be used to test response time from NTP service. This item is supported since Zabbix 3.0.0, but <i>ntp</i> service was available for net.tcp.service[] item in prior versions.
proc.cpu.util[<name>,<user>,<type>,<cmdline>,<mode>,<zone>]				

Process CPU
utilisation
percentage.

Float

name -
process name
(default is *all
processes*)
user - user
name (default
is *all users*)
type - CPU
utilisation type:
total (default),
user, *system*
cmdline - filter
by command
line (it is a
regular
expression)
mode - data
gathering
mode: *avg1*
(default), *avg5*,
avg15
zone - target
zone: *current*
(default), *all*.
This parameter
is supported
only on Solaris
platform.

Examples:

=>
proc.cpu.util[,root]

→ CPU
utilisation of all
processes
running under
the "root" user

=>
proc.cpu.util[zabbix_server,za]

→ CPU
utilisation of all
zabbix_server
processes
running under
the zabbix user

The returned
value is based
on single CPU
core utilisation
percentage.
For example
CPU utilisation
of a process
fully using two
cores is 200%.

The process
CPU utilisation
data is
gathered by a
collector which
supports the
maximum of
1024 unique
(by name, user
and command
line) queries.
Queries not
accessed
during the last
24 hours are
removed from
the collector.

Note that when
setting the
zone
parameter to
current (or
default) in case
the agent has
been compiled
on a Solaris
without zone
support, but
running on a
newer Solaris
where zones
are supported,
then the agent
since Zabbix
3.0.3 will
return NOTSUP-

Key

proc.mem[<name>,<user>,<mode>,<cmdline>,<memtype>]

Memory used by process in bytes.	Integer - with mode as <i>max</i> , <i>min</i> , <i>sum</i> Float - with mode as <i>avg</i>	name - process name (default is <i>all processes</i>) user - user name (default is <i>all users</i>) mode - possible values: <i>avg</i> , <i>max</i> , <i>min</i> , <i>sum</i> (default) cmdline - filter by command line (it is a regular expression) memtype - type of memory used by process	Examples: => proc.mem[,root] → memory used by all processes running under the "root" user => proc.mem[zabbix_server,zabbix_server] → memory used by all zabbix_server processes running under the zabbix user => proc.mem[,oracle,max,oracle2] → memory used by the most memory-hungry process running under oracle having oracleZABBIX in its command line <i>Note:</i> When several processes use shared memory, the sum of memory used by processes may result in large, unrealistic values. See <i>notes</i> on selecting processes with name and cmdline parameters (Linux-specific). When this item is invoked from the command line and contains a command line parameter (e.g. using the agent test mode: zabbix_agentd -t proc.mem[, , ,apache2]), one extra process will be
----------------------------------	--	--	---

Key

proc.num[<name>,<user>,<state>,<cmdline>,<zone>]

The number of
processes.

Integer

name -
process name
(default is *all
processes*)
user - user
name (default
is *all users*)
state -
possible
values: *all*
(default), *run*,
sleep, *zomb*
cmdline - filter
by command
line (it is a
regular
expression)
zone - target
zone: *current*
(default), *all*.
This parameter
is supported on
Solaris only.

Examples:
=>
proc.num[,mysql]
→ number of
processes
running under
the mysql user
=>
proc.num[apache2,www-
data] →
number of
apache2
processes
running under
the www-data
user
=>
proc.num[,oracle,sleep,oracle:
→ number of
processes in
sleep state
running under
oracle having
oracleZABBIX
in its command
line

See [notes](#) on
selecting
processes with
name and
cmdline
parameters
(Linux-
specific).

When this item
is invoked from
the command
line and
contains a
command line
parameter
(e.g. using the
agent test
mode:
zabbix_agentd
-t
proc.num[, , ,apache2]),
one extra
process will be
counted, as the
agent will
count itself.

On Windows,
only the **name**
and **user**
parameters are
supported.

The **zone**
parameter is
supported on
Solaris since

Key

sensor[device,sensor,<mode>]

Hardware
sensor reading.

Float

device -
device name
sensor -
sensor name
mode -
possible
values:
avg, max, min
(if this
parameter is
omitted, device
and sensor are
treated
verbatim).

Reads
/proc/sys/dev/sensors
on Linux 2.4.

Example:
=> sen-
sor[w83781d-
i2c-0-
2d,temp1]

Prior to Zabbix
1.8.4, the
sensor[temp1]
format was
used.
Reads
/sys/class/hwmon
on Linux 2.6+.

See a more
detailed
description of
sensor item on
Linux.
Reads the
hw.sensors MIB
on OpenBSD.

Examples:
=> sen-
sor[cpu0,temp0]
→ temperature
of one CPU
=>
sensor["cpu[0-
2]\$",temp,avg]
→ average
temperature of
the first three
CPU's

Supported on
OpenBSD since
Zabbix 1.8.4.

system.boottime

System boot
time.

Integer (Unix
timestamp)

system.cpu.discovery

List of detected
CPUs/CPU
cores. Used for
low-level
discovery.

JSON object

Supported on
all platforms
since 2.4.0.

system.cpu.intr

Device
interrupts.

Integer

system.cpu.load[<cpu>,<mode>]

Key				
	CPU load.	Float	cpu - possible values: <i>all</i> (default), <i>percpu</i> (total load divided by online CPU count) mode - possible values: <i>avg1</i> (one-minute average, default), <i>avg5</i> , <i>avg15</i>	Example: => sys-tem.cpu.load[,avg5] <i>percpu</i> is supported since Zabbix 2.0.0. Old naming: sys-tem.cpu.loadX
system.cpu.num[<type>]	Number of CPUs.	Integer	type - possible values: <i>online</i> (default), <i>max</i>	Example: => sys-tem.cpu.num
system.cpu.switches	Count of context switches.	Integer		Old naming: sys-tem[switches]
system.cpu.util[<cpu>,<type>,<mode>]				

Key				
	CPU utilisation percentage.	Float	<p>cpu - <CPU number> or <i>all</i> (default)</p> <p>type - possible values: <i>idle, nice, user</i> (default), <i>system</i> (default for Windows), <i>iowait, interrupt, softirq, steal, guest</i> (on Linux kernels 2.6.24 and above), <i>guest_nice</i> (on Linux kernels 2.6.33 and above). Parameters <i>user</i> and <i>nice</i> time no longer include <i>guest</i> time and <i>guest_nice</i> time since Zabbix 3.0.14. See also platform-specific details for this parameter.</p> <p>mode - possible values: <i>avg1</i> (one-minute average, default), <i>avg5, avg15</i></p>	<p>Example: => sys-tem.cpu.util[0,user,avg5]</p> <p>Old naming: sys-tem.cpu.idleX, sys-tem.cpu.niceX, sys-tem.cpu.systemX, sys-tem.cpu.userX</p>
system.hostname[<type>]				

	System host name.	String	type (Windows only, must not be used on other systems) - possible values: <i>netbios</i> (default) or <i>host</i>	<p>The value is acquired by either <code>GetComputerName()</code> (for netbios) or <code>gethostname()</code> (for host) functions on Windows and by "hostname" command on other systems.</p> <p>Examples of returned values: <i>on Linux:</i> => <code>sys-tem.hostname</code> → <code>linux-w7x1</code> => <code>sys-tem.hostname</code> → <code>www.zabbix.com</code> <i>on Windows:</i> => <code>sys-tem.hostname</code> → <code>WIN-SERV2008-I6</code> => <code>sys-tem.hostname[host]</code> → <code>Win-Serv2008-I6LonG</code></p> <p>The type parameter for this item is supported since Zabbix 1.8.6.</p> <p>See also a more detailed description.</p>
system.hw.chassis[<info>]				

Key	Chassis information.	String	info - one of full (default), model, serial, type or vendor	<p>Example: system.hw.chassis[full] Hewlett-Packard HP Pro 3010 Small Form Factor PC CZXXXXXXXXX Desktop]</p> <p>This key depends on the availability of the SMBIOS table. Will try to read the DMI table from sysfs, if sysfs access fails then try reading directly from memory.</p> <p>Root permissions are required because the value is acquired by reading from sysfs or memory.</p> <p>Supported since Zabbix agent version 2.0.</p>
system.hw.cpu[<cpu>,<info>]				

Key				
	CPU information.	String or integer	cpu - <CPU number> or <i>all</i> (default) info - possible values: <i>full</i> (default), <i>curfreq</i> , <i>maxfreq</i> , <i>model</i> or <i>vendor</i>	<p>Example: => sys-tem.hw.cpu[0,vendor] → AuthenticAMD</p> <p>Gathers info from /proc/cpuinfo and /sys/devices/system/cpu/cpu</p> <p>If a CPU number and <i>curfreq</i> or <i>maxfreq</i> is specified, a numeric value is returned (Hz).</p> <p>Supported since Zabbix agent version 2.0.</p>
system.hw.devices[<type>]	Listing of PCI or USB devices.	Text	type - <i>pci</i> (default) or <i>usb</i>	<p>Example: => sys-tem.hw.devices[pci] → 00:00.0 Host bridge: Advanced Micro Devices [AMD] RS780 Host Bridge [...]</p> <p>Returns the output of either <i>lspci</i> or <i>lsusb</i> utility (executed without any parameters)</p> <p>Supported since Zabbix agent version 2.0.</p>
system.hw.macaddr[<interface>,<format>]				

	Listing of MAC addresses.	String	interface - <i>all</i> (default) or a regular expression format - <i>full</i> (default) or <i>short</i>	Lists MAC addresses of the interfaces whose name matches the given interface regexp (<i>all</i> lists for all interfaces). Example: => sys-tem.hw.macaddr["eth0\$",full] → [eth0] 00:11:22:33:44:55 If <i>format</i> is specified as <i>short</i> , interface names and identical MAC addresses are not listed. Supported since Zabbix agent version 2.0.
system.localtime[<type>]	System time.	Integer - with type as <i>utc</i> String - with type as <i>local</i>	type - possible values: <i>utc</i> - (default) the time since the Epoch (00:00:00 UTC, January 1, 1970), measured in seconds. <i>local</i> - the time in the 'yyyy-mm-dd,hh:mm:ss.nnn' format	Parameters for this item are supported since Zabbix agent version 2.0. Example: => sys-tem.localtime[local] → create an item using this key and then use into use into display host time in the Clock screen element .
system.run[command,<mode>]				

Run specified command on the host.	Text result of the command	command - command for execution mode - possible values: <i>wait</i> - wait end of execution (default), <i>nowait</i> - do not wait	Up to 512KB of data can be returned, including trailing whitespace that is truncated. To be processed correctly, the output of the command must be text. Example: => system.run[ls -l /] → detailed file list of root directory. <i>Note:</i> To enable this functionality, agent configuration file must contain EnableRemoteCommands=1 option. <i>Note:</i> The return value of the item is standard output together with standard error produced by command. <i>Note:</i> Empty result is allowed starting with Zabbix 2.4.0. See also: Command execution.
------------------------------------	----------------------------	---	---

system.stat[resource,<type>]

System
statistics.

Integer or float

ent - number
of processor
units this
partition is
entitled to

			Comments
			<p>This item is supported on AIX only, since Zabbix 1.8.1.</p> <p>The following items are supported only on AIX LPAR of type "Shared":</p> <p>=> sys-tem.stat[cpu,app]</p> <p>=> sys-tem.stat[cpu,ec]</p> <p>(also on "Dedicated" since Zabbix 3.0.23; always returns 100 (percent))</p> <p>=> sys-tem.stat[cpu,lbusy]</p> <p>=> sys-tem.stat[cpu,pc]</p> <p>(also on "Dedicated" since Zabbix 3.0.23)</p> <p>=> sys-tem.stat[ent]</p> <p>(also on "Dedicated" since Zabbix 3.0.23)</p>
system.sw.arch	Software architecture information.	String	<p>Example:</p> <p>=> system.sw.arch → i686</p> <p>Info is acquired from uname() function.</p> <p>Supported since Zabbix agent version 2.0.</p>
system.sw.os[<info>]			

Key				
	Operating system information.	String	info - possible values: <i>full</i> (default), <i>short</i> or <i>name</i>	<p>Example: => sys-tem.sw.os[short]→ Ubuntu 2.6.35-28.50-generic 2.6.35.11</p> <p>Info is acquired from (note that not all files are present in all distributions): /proc/version (<i>full</i>) /proc/version_signature (<i>short</i>) /etc/issue.net (<i>name</i>)</p> <p>Supported since Zabbix agent version 2.0.</p>
system.sw.packages[<package>,<manager>,<format>]				

Listing of installed packages.	Text	<p>package - <i>all</i> (default) or a regular expression</p> <p>manager - <i>all</i> (default) or a package manager</p> <p>format - <i>full</i> (default) or <i>short</i></p>	<p>Lists (alphabetically) installed packages whose name matches the given package regexp (<i>all</i> lists them all).</p> <p>Example:</p> <pre>=> system.sw.packages[mini,dpkg,sl -> python-minimal, python2.6-minimal, ubuntu-minimal</pre> <p>Supported package managers (executed command):</p> <pre>dpkg (dpkg --get-selections) pkgtool (ls /var/log/packages) rpm (rpm -qa) pacman (pacman -Q)</pre> <p>If <i>format</i> is specified as <i>full</i>, packages are grouped by package managers (each manager on a separate line beginning with its name in square brackets).</p> <p>If <i>format</i> is specified as <i>short</i>, packages are not grouped and are listed on a single line.</p> <p>Supported since Zabbix agent version 2.0.</p>
system.swap.in[<device>,<type>]			

	Swap in (from device into memory) statistics.	Integer	device - device used for swapping (default is <i>all</i>) type - possible values: <i>count</i> (number of swapins), <i>sectors</i> (sectors swapped in), <i>pages</i> (pages swapped in). See also platform-specific details for this parameter.	Example: => sys-tem.swap.in[,pages] The source of this information is: /proc/swaps, /proc/partitions, /proc/stat (Linux 2.4) /proc/swaps, /proc/diskstats, /proc/vmstat (Linux 2.6)
system.swap.out[<device>,<type>]	Swap out (from memory onto device) statistics.	Integer	device - device used for swapping (default is <i>all</i>) type - possible values: <i>count</i> (number of swapouts), <i>sectors</i> (sectors swapped out), <i>pages</i> (pages swapped out). See also platform-specific details for this parameter.	Example: => sys-tem.swap.out[,pages] The source of this information is: /proc/swaps, /proc/partitions, /proc/stat (Linux 2.4) /proc/swaps, /proc/diskstats, /proc/vmstat (Linux 2.6)
system.swap.size[<device>,<type>]				

	Swap space size in bytes or in percentage from total.	Integer - for bytes Float - for percentage	device - device used for swapping (default is <i>all</i>) type - possible values: <i>free</i> (free swap space, default), <i>pfree</i> (free swap space, in percent), <i>pusd</i> (used swap space, in percent), <i>total</i> (total swap space), <i>used</i> (used swap space) See also platform-specific details for this parameter.	Example: => <code>sys-tem.swap.size[,pfree]</code> → free swap space percentage If <i>device</i> is not specified Zabbix agent will only take into account swap devices (files), physical memory will be ignored. For example, on Solaris systems <code>swap -s</code> command includes a portion of physical memory and swap devices (unlike <code>swap -l</code>). Note that this key might report incorrect swap space size/percentage on virtualized (VMware ESXi, VirtualBox) Windows platforms. In this case you may use the <code>perf_counter[\700(_Total</code> key to obtain correct swap space percentage. Old naming: <code>sys-tem.swap.free</code> , <code>sys-tem.swap.total</code>
system.uname				

Identification of the system.	String	Example of returned value (Unix): FreeBSD localhost 4.2-RELEASE FreeBSD 4.2-RELEASE #0: Mon Nov i386
		Example of returned value (Windows): Windows ZABBIX-WIN 6.0.6001 Microsoft® Windows Server® 2008 Standard Service Pack 1 x86
		On Unix since Zabbix 2.2.0 the value for this item is obtained with uname() system call. Previously it was obtained by invoking "uname -a". The value of this item might differ from the output of "uname -a" and does not include additional information that "uname -a" prints based on other sources.
		On Windows since Zabbix 3.0 the value for this item is obtained from Win32_OperatingSystem and Win32_Processor WMI classes. Previously it was obtained from volatile Windows APIs and undocumented registry keys.

system.uptime	System uptime in seconds.	Integer		In item configuration , use s or uptime units to get readable values.
system.users.num	Number of users logged in.	Integer		who command is used on the agent side to obtain the value.
vfs.dev.read[<device>,<type>,<mode>]	Disk read statistics.	<p>Integer - with type in <i>sectors, operations, bytes</i></p> <p>Float - with type in <i>sps, ops, bps</i></p> <p><i>Note:</i> Since 3.0.25, if using an update interval of three hours or more², will always return '0'</p>	<p>device - disk device (default is <i>all</i>³)</p> <p>type - possible values: <i>sectors, operations, bytes, sps, ops, bps</i></p> <p>Note that 'type' parameter support and defaults depend on the platform. See platform-specific details. <i>sps, ops, bps</i> stand for: sectors, operations, bytes per second, respectively.</p> <p>mode - possible values: <i>avg1</i> (one-minute average, default), <i>avg5</i>, <i>avg15</i>. This parameter is supported only with type in: <i>sps, ops, bps</i>.</p>	<p>You may use relative device names (for example, <i>sda</i>) as well as an optional <i>/dev/</i> prefix (for example, <i>/dev/sda</i>).</p> <p>LVM logical volumes are supported.</p> <p>Default values of 'type' parameter for different OSes: AIX - operations FreeBSD - <i>bps</i> Linux - <i>sps</i> OpenBSD - operations Solaris - bytes</p> <p>Example: => <code>vfs.dev.read[,operations]</code></p> <p><i>sps, ops</i> and <i>bps</i> on supported platforms used to be limited to 8 devices (7 individual and one <i>all</i>). Since Zabbix 2.0.1 this limit is 1024 devices (1023 individual and one for <i>all</i>).</p> <p>Old naming: <i>io[*]</i></p>

vfs.dev.write[<device>,<type>,<mode>]

Disk write statistics.

Integer - with type in *sectors, operations, bytes*

Float - with type in *sps, ops, bps*

Note: Since 3.0.25, if using an update interval of three hours or more², will always return '0'

device - disk device (default is *all*³)

type - possible values: *sectors, operations, bytes, sps, ops, bps*

Note that

'type' parameter support and defaults depend on the platform. See **platform-specific** details. *sps, ops, bps*

stand for: *sectors, operations, bytes per second, respectively.*

mode -

possible values: *avg1* (one-minute average, default), *avg5*, *avg15*.

This parameter is supported only with type in: *sps, ops, bps*.

You may use relative device names (for example, *sda*) as well as an optional */dev/* prefix (for example, */dev/sda*).

LVM logical volumes are supported.

Default values of 'type' parameter for different OSes: AIX - *operations* FreeBSD - *bps* Linux - *sps* OpenBSD - *operations* Solaris - *bytes*

Example: =>

`vfs.dev.write[,operations]`

sps, ops and *bps* on supported platforms used to be limited to 8 devices (7 individual and one *all*). Since Zabbix 2.0.1 this limit is 1024 (1023 individual and one for *all*).

Old naming: *io[*]*

vfs.file.cksum[file]

Key				
	File checksum, calculated by the UNIX cksum algorithm.	Integer	file - full path to file	<p>Example: => vfs.file.cksum[/etc/passwd]</p> <p>Example of returned value: 1938292000</p> <p>Old naming: <i>cksum</i></p> <p>The file size limit depends on large file support.</p>
vfs.file.contents[file,<encoding>]	Retrieving contents of a file.	Text	file - full path to file encoding - code page identifier	<p>Returns an empty string if the file is empty or contains LF/CR characters only.</p> <p>Example: => vfs.file.contents[/etc/passwd]</p> <p>This item is limited to files no larger than 64 Kbytes.</p> <p>Supported since Zabbix agent version 2.0.</p>
vfs.file.exists[file]	Checks if file exists.	<p>0 - not found</p> <p>1 - regular file or a link (symbolic or hard) to regular file exists</p>	file - full path to file	<p>Example: => vfs.file.exists[/tmp/application]</p> <p>The return value depends on what S_ISREG POSIX macro returns.</p> <p>The file size limit depends on large file support.</p>
vfs.file.md5sum[file]				

Key				
	MD5 checksum of file.	Character string (MD5 hash of the file)	file - full path to file	Example: => vfs.file.md5sum[/usr/local/etc/ Example of returned value: b5052dec b577e0ff d622d6d The file size limit (64 MB) for this item was removed in version 1.8.6. The file size limit depends on large file support .
vfs.file.regexp[file,regexp,<encoding>,<start line>,<end line>,<output>]				

Key	Find string in a file.	The line containing the matched string, or as specified by the optional output parameter	file - full path to file regexp - GNU regular expression encoding - code page identifier start line - the number of first line to search (first line of file by default). end line - the number of last line to search (last line of file by default). output - an optional output formatting template. The \0 escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an \N (where N=1...9) escape sequence is replaced with Nth matched group (or an empty string if the N exceeds the number of captured groups).	Only the first matching line is returned. An empty string is returned if no line matched the expression. Content extraction using the output parameter takes place on the agent. The start line, end line and output parameters are supported from version 2.2. Examples: => vfs.file.regexp[/etc/passwd,zabbix] => vfs.file.regexp[/path/to/some/file/9]+)\$",,3,5,\1] => vfs.file.regexp[/etc/passwd,"^9]+)"",,\1] → getting the ID of user <i>zabbix</i>
-----	------------------------	--	--	---

vfs.file.regmatch[file,regexp,<encoding>,<start line>,<end line>]

Key

	Find string in a file.	0 - match not found 1 - found	file - full path to file regexp - GNU regular expression encoding - code page identifier start line - the number of first line to search (first line of file by default). end line - the number of last line to search (last line of file by default).	The start line and end line parameters are supported from version 2.2. Example: => vfs.file.regmatch[/var/log/app.
vfs.file.size[file]	File size (in bytes).	Integer	file - full path to file	The file must have read permissions for user <i>zabbix</i> . Example: => vfs.file.size[/var/log/syslog] The file size limit depends on large file support .
vfs.file.time[file,<mode>]	File time information.	Integer (Unix timestamp)	file - full path to the file mode - possible values: <i>modify</i> (default) - last time of modifying file content, <i>access</i> - last time of reading file, <i>change</i> - last time of changing file properties	Example: => vfs.file.time[/etc/passwd,modi The file size limit depends on large file support .
vfs.fs.discovery	List of mounted filesystems. Used for low-level discovery.	JSON object		Supported since Zabbix agent version 2.0. {#FSDRIVETYPE} macro is supported on Windows since Zabbix agent version 3.0.

Key

vfs.fs.inode[fs,<mode>]

Number or
percentage of
inodes.

Integer - for
number

Float - for
percentage

fs - filesystem
mode -
possible
values:
total (default),
free, *used*,
//pfree // (free,
percentage),
pused (used,
percentage)

Example:
=>
vfs.fs.inode[/,pfree]

Old naming:
vfs.fs.inode.free[*],
vfs.fs.inode.pfree[*],
vfs.fs.inode.total[*]

vfs.fs.size[fs,<mode>]

Disk space in
bytes or in
percentage
from total.

Integer - for
bytes

Float - for
percentage

fs - filesystem
mode -
possible
values:
total (default),
free, *used*,
pfree (free,
percentage),
pused (used,
percentage)

In case of a
mounted
volume, disk
space for local
file system is
returned.

Example:
=>
vfs.fs.size[/tmp,free]

Reserved
space of a file
system is
taken into
account and
not included
when using the
free mode.

Old naming:
vfs.fs.free[*],
vfs.fs.total[*],
vfs.fs.used[*],
vfs.fs.pfree[*],
vfs.fs.pused[*]

vm.memory.size[<mode>]

	Memory size in bytes or in percentage from total.	Integer - for bytes Float - for percentage	mode - possible values: <i>total</i> (default), <i>active</i> , <i>anon</i> , <i>buffers</i> , <i>cached</i> , <i>exec</i> , <i>file</i> , <i>free</i> , <i>inactive</i> , <i>pinned</i> , <i>shared</i> , <i>wired</i> , <i>used</i> , <i>pusd</i> (used, percentage), <i>available</i> , <i>pavailable</i> (available, percentage) See also platform-specific support and additional details for this parameter.	This item accepts three categories of parameters: 1) <i>total</i> - total amount of memory; 2) platform-specific memory types: <i>active</i> , <i>anon</i> , <i>buffers</i> , <i>cached</i> , <i>exec</i> , <i>file</i> , <i>free</i> , <i>inactive</i> , <i>pinned</i> , <i>shared</i> , <i>wired</i> ; 3) user-level estimates on how much memory is used and available: <i>used</i> , <i>pusd</i> , <i>available</i> , <i>pavailable</i> .
web.page.get[host,<path>,<port>]	Get content of web page.	Web page source as text (including headers)	host - hostname path - path to HTML document (default is /) port - port number (default is 80)	This item turns unsupported if the resource specified in host does not exist or is unavailable. <i>Note</i> that before version 3.0.17 it would return an empty string on fail. Example: => web.page.get[www.zabbix.com]
web.page.perf[host,<path>,<port>]	Loading time of full web page (in seconds).	Float	host - hostname path - path to HTML document (default is /) port - port number (default is 80)	This item turns unsupported if the resource specified in host does not exist or is unavailable. <i>Note</i> that before version 3.0.17 it would return '0' on fail. Example: => web.page.perf[www.zabbix.com]

Key

web.page.regexp[host,<path>,<port>,regexp,<length>,<output>]

Find string on a web page.

The matched string, or as specified by the optional output parameter

host - hostname
path - path to HTML document (default is /)
port - port number (default is 80)
regexp - GNU regular expression
length - maximum number of characters to return
output - an optional output formatting template. The **\0** escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an **\N** (where N=1...9) escape sequence is replaced with Nth matched group (or an empty string if the N exceeds the number of captured groups).

This item turns unsupported if the resource specified in host does not exist or is unavailable. *Note* that before version 3.0.17 it would return an empty string if no match was found or on fail.
Content extraction using the output parameter takes place on the agent.

The output parameter is supported from version 2.2.

Example:
=>

web.page.regexp[www.zabbix

Footnotes

¹A Linux-specific note. Zabbix agent must have read-only access to filesystem */proc*. Kernel patches from www.grsecurity.org limit access rights of non-privileged users.

² `vfs.dev.read[]`, `vfs.dev.write[]`: Starting with Zabbix 3.0.25 Zabbix agent will terminate "stale" device connections if the item values are not accessed for more than 3 hours. This may happen if a system has devices with dynamically changing paths or if a device gets manually removed. Note also that these items, if using an update interval of 3 hours or more, will always return '0'.

³ `vfs.dev.read[]`, `vfs.dev.write[]`: If default *all* is used for the first parameter then the key will return summary statistics, including all block devices like *sda*, *sdb* and their partitions (*sda1*, *sda2*, *sdb3*...) and multiple devices (MD raid) based on those block devices/partitions and logical volumes (LVM) based on those block devices/partitions. In such cases returned values should be considered only as relative value (dynamic in time) but not as absolute values.

Available encodings

The `encoding` parameter is used to specify encoding for processing corresponding item checks, so that data acquired will not be corrupted. For a list of supported encodings (code page identifiers), please consult respective documentation, such as documentation for [libiconv](#) (GNU Project) or Microsoft Windows SDK documentation for "Code Page Identifiers".

If empty `encoding` is passed, then UTF-8 (default locale for newer Unix/Linux distributions, see your system's settings) or ANSI with system-specific extension (Windows) is used by default.

Troubleshooting agent items

- If used with the passive agent, *Timeout* value in server configuration may need to be higher than *Timeout* in the agent configuration file. Otherwise the item may not get any value because the server request to agent timed out first.

Windows-specific item keys

Item keys

The table provides details on the item keys that you can use with Zabbix Windows agent only.

See also: [Minimum permission level for Windows agent items](#)

Key				
	Description	Return value	Parameters	Comments
eventlog[name,<regexp>,<severity>,<source>,<eventid>,<maxlines>,<mode>]				

Event log monitoring.	Log		
		name - name of event log regex - regular expression describing the required pattern severity - regular expression describing severity This parameter accepts the following values: <i>"Information", "Warning", "Error", "Critical", "Verbose"</i> (since Zabbix 2.2.0 running on Windows Vista or newer) source - regular expression describing source identifier (regular expression is supported since Zabbix 2.2.0) eventid - regular expression describing the event identifier(s) maxlines - maximum number of new lines per second the agent will send to Zabbix server or proxy. This parameter overrides the value of 'MaxLinesPerSecond' in zabbix_agentd.win.console mode - possible values: <i>all</i> (default), <i>skip</i> - skip processing of	The item must be configured as an active check . Examples: => event-log[Application] => event-log[Security,"Failure Audit" ,"^(529 680)\$] => event-log[System,"Warning Error"] => event-log[System,"",^1\$] => event-log[System,"",@TWOSHORT] - here a custom regular expression named TWOSHORT is referenced (defined as a <i>Result is TRUE</i> type, the expression itself being <i>^1\$\ ^70\$</i>). <i>Note</i> that the agent is unable to send in events from the "Forwarded events" log. The mode parameter is supported since Zabbix 2.0.0. "Windows Eventing 6.0" is supported since Zabbix 2.2.0. <i>Note</i> that selecting a non-Log type of information for this item will lead to the loss of local timestamp, as well as log severity and source information. See also additional information on

Key

net.if.list

Network
interface list
(includes
interface type,
status, IPv4
address,
description).

Text

Supported
since Zabbix
agent version
1.8.1.
Multi-byte
interface
names
supported
since Zabbix
agent version
1.8.6. Disabled
interfaces are
not listed.

Note that en-
abling/disabling
some
components
may change
their ordering
in the Windows
interface
name.

Some Windows
versions (for
example,
Server 2008)
might require
the latest
updates
installed to
support
non-ASCII
characters in
interface
names.

perf_counter[counter,<interval>]

	Value of any Windows performance counter.	Integer, float, string or text (depending on the request)	counter - path to the counter interval - last N seconds for storing the average value. The <code>interval</code> must be between 1 and 900 seconds (included) and the default value is 1.	Performance Monitor can be used to obtain list of available counters. Until version 1.6 this parameter will return correct value only for counters that require just one sample (like <code>\System\Threads</code>). It will not work as expected for counters that require more than one sample - like CPU utilisation. Since 1.6, <code>interval</code> is used, so the check returns an average value for last "interval" seconds every time. See also: Windows performance counters .
<code>proc_info[process,<attribute>,<type>]</code>				

Various information about specific process(es).	Float	<p>process - process name</p> <p>attribute - requested process attribute</p> <p>type - representation type (meaningful when more than one process with the same name exists)</p>	<p>The following attributes are supported:</p> <p><i>vmsize</i> (default) - size of process virtual memory in Kbytes</p> <p><i>wkset</i> - size of process working set (amount of physical memory used by process) in Kbytes</p> <p><i>pf</i> - number of page faults</p> <p><i>ktime</i> - process kernel time in milliseconds</p> <p><i>utime</i> - process user time in milliseconds</p> <p><i>io_read_b</i> - number of bytes read by process during I/O operations</p> <p><i>io_read_op</i> - number of read operation performed by process</p> <p><i>io_write_b</i> - number of bytes written by process during I/O operations</p> <p><i>io_write_op</i> - number of write operation performed by process</p> <p><i>io_other_b</i> - number of bytes transferred by process during operations other than read and write operations</p> <p><i>io_other_op</i> - number of I/O operations performed by process, other than read and write operations</p> <p><i>gdiobj</i> - number of GDI objects used</p>
---	-------	---	--

service.discovery

List of Windows services. Used for **low-level discovery**.

JSON object

Supported since Zabbix agent version 3.0.

service.info[service,<param>]

Information about a service.

Integer - with param as *state, startup*

String - with param as *displayname, path, user*

Text - with param as *description*

Specifically for *state*:

0 - running,
1 - paused,
2 - start pending,
3 - pause pending,
4 - continue pending,
5 - stop pending,
6 - stopped,
7 - unknown,
255 - no such service

Specifically for *startup*:

0 - automatic,
1 - automatic delayed,
2 - manual,
3 - disabled,
4 - unknown

service - a real service name or its display name as seen in MMC Services snap-in
param - *state* (default), *displayname, path, user, startup* or *description*

Examples:
=> service.info[SNMPTRAP]
- state of the SNMPTRAP service
=> service.info[SNMP Trap]
- state of the same service, but with display name specified
=> service.info[EventLog,startup]
- startup type of the EventLog service

Items service.info[service,state] and service.info[service] will return the same information.

Note that only with param as *state* this item returns a value for non-existing services (255).

This item is supported since Zabbix 3.0.0. It should be used instead of the deprecated service_state[service] item.

services[<type>,<state>,<exclude>]

	Listing of services.	0 - if empty Text - list of services separated by a newline	type - <i>all</i> (default), <i>automatic</i> , <i>manual</i> or <i>disabled</i> state - <i>all</i> (default), <i>stopped</i> , <i>started</i> , <i>start_pending</i> , <i>stop_pending</i> , <i>running</i> , <i>continue_pending</i> , <i>pause_pending</i> or <i>paused</i> exclude - services to exclude from the result. Excluded services should be listed in double quotes, separated by comma, without spaces.	Examples: => <i>services[,started]</i> - list of started services => <i>services[automatic, stopped]</i> - list of stopped services, that should be run => <i>services[automatic, stopped, "service1,service2,service3"]</i> - list of stopped services, that should be run, excluding services with names <i>service1</i> , <i>service2</i> and <i>service3</i> The <i>exclude</i> parameter is supported since Zabbix 1.8.1.
wmi.get[<namespace>,<query>]	Execute WMI query and return the first selected object.	Integer, float, string or text (depending on the request)	namespace - WMI namespace query - WMI query returning a single object	Example: => <i>wmi.get[root\cimv2,select status from Win32_DiskDrive where Name like '%PHYSICALDRIVE0%']</i> - returns the status of the first physical disk. This key is supported since Zabbix 2.2.0.
vm.memory.size[<type>]				

Key				
	Virtual memory size in bytes or in percentage from total.	Integer - for bytes Float - for percentage	type - possible values: <i>available</i> (available virtual memory), <i>pavailable</i> (available virtual memory, in percent), <i>used</i> (used virtual memory, in percent), <i>total</i> (total virtual memory, default), <i>used</i> (used virtual memory)	Example: => vm.vmemory.size[pavailable] → available virtual memory, in percentage Monitoring of virtual memory statistics is based on: * Total virtual memory on Windows (total physical + page file size); * The maximum amount of memory Zabbix agent can commit; * The current committed memory limit for the system or Zabbix agent, whichever is smaller. This key is supported since Zabbix 3.0.7.

Monitoring Windows services

This tutorial provides step-by-step instructions for setting up the monitoring of Windows services. It is assumed that Zabbix server and agent are configured and operational.

Step 1

Get the service name.

You can get that name by going to MMC Services snap-in and bringing up the properties of the service. In the General tab you should see a field called 'Service name'. The value that follows is the name you will use when setting up an item for monitoring.

For example, if you wanted to monitor the "workstation" service then your service might be: **lanmanworkstation**.

Step 2

Configure an item for monitoring the service.

The item `service.info[service,<param>]` retrieves the information about a particular service. Depending on the information you need, specify the *param* option which accepts the following values: *displayname*, *state*, *path*, *user*, *startup* or *description*. The default value is *state* if *param* is not specified (`service.info[service]`).

The type of return value depends on chosen *param*: integer for *state* and *startup*; character string for *displayname*, *path* and *user*; text for *description*.

Example:

- **Key:** `service.info[lanmanworkstation]`
- **Type of information:** Numeric (unsigned)

- *Show value*: select the *Windows service state* value mapping

Two value maps are available *Windows service state* and *Windows service startup type* to map a numerical value to a text representation in the Frontend.

Discovery of Windows services

Low-level discovery provides a way to automatically create items, triggers, and graphs for different entities on a computer. Zabbix can automatically start monitoring Windows services on your machine, without the need to know the exact name of a service or create items for each service manually. A filter can be used to generate real items, triggers, and graphs only for services of interest.

2 SNMP agent

Overview

You may want to use SNMP monitoring on devices such as printers, network switches, routers or UPS that usually are SNMP-enabled and on which it would be impractical to attempt setting up complete operating systems and Zabbix agents.

To be able to retrieve data provided by SNMP agents on these devices, Zabbix server must be **initially configured** with SNMP support.

SNMP checks are performed over the UDP protocol only.

Zabbix server and proxy daemons query SNMP devices for multiple values in a single request. This affects all kinds of SNMP items (regular SNMP items, SNMP items with dynamic indexes, and SNMP low-level discovery) and should make SNMP processing much more efficient. See the **bulk processing** section for technical details on how it works internally. Bulk requests can also be disabled for devices that cannot handle them properly using the "Use bulk requests" setting for each interface.

Zabbix server and proxy daemons log lines similar to the following if they receive an incorrect SNMP response:

SNMP response from host "gateway" does not contain all of the requested variable bindings

While they do not cover all the problematic cases, they are useful for identifying individual SNMP devices for which bulk requests should be disabled.

Zabbix server/proxy will always retry at least one time after an unsuccessful query attempt: either through the SNMP library's retrying mechanism or through the **internal bulk processing mechanism**.

Warning:

If monitoring SNMPv3 devices, make sure that msgAuthoritativeEngineID (also known as snmpEngineID or "Engine ID") is never shared by two devices. According to [RFC 2571](#) (section 3.1.1.1) it must be unique for each device.

Configuring SNMP monitoring

To start monitoring a device through SNMP, the following steps have to be performed:

Step 1

Create a host for the device with an SNMP interface.

Enter the IP address/DNS name and port number. You can use one of the provided SNMP templates (*Template SNMP Device* and others) that will automatically add a set of items. However, the template may not be compatible with the host. Click on *Add* to save the host.

Step 2

Find out the SNMP string (or OID) of the item you want to monitor.

To get a list of SNMP strings, use the **snmpwalk** command (part of [net-snmp](#) software which you should have installed as part of the Zabbix installation) or equivalent tool:

```
shell> snmpwalk -v 2c -c public <host IP> .
```

As '2c' here stands for SNMP version, you may also substitute it with '1', to indicate SNMP Version 1 on the device.

This should give you a list of SNMP strings and their last value. If it doesn't then it is possible that the SNMP 'community' is different from the standard 'public' in which case you will need to find out what it is.

You can then go through the list until you find the string you want to monitor, e.g. if you wanted to monitor the bytes coming in to your switch on port 3 you would use the IF-MIB::ifInOctets.3 string from this line:

```
IF-MIB::ifInOctets.3 = Counter32: 3409739121
```

You may now use the **snmpget** command to find out the numeric OID for 'IF-MIB::ifInOctets.3':

```
shell> snmpget -v 2c -c public -On 10.62.1.22 IF-MIB::ifInOctets.3
```

Note that the last number in the string is the port number you are looking to monitor. See also: [Dynamic indexes](#).

This should give you something like the following:

.1.3.6.1.2.1.2.2.1.10.3 = Counter32: 3472126941

Again, the last number in the OID is the port number.

Note:

3COM seem to use port numbers in the hundreds, e.g. port 1 = port 101, port 3 = port 103, but Cisco use regular numbers, e.g. port 3 = 3.

Note:

Some of the most used SNMP OIDs are [translated automatically to a numeric representation](#) by Zabbix.

In the last example above value type is "Counter32", which internally corresponds to ASN_COUNTER type. The full list of supported types is ASN_COUNTER, ASN_COUNTER64, ASN_INTEGER, ASN_UNSIGNED64, ASN_INTEGER64, ASN_FLOAT, ASN_DOUBLE, ASN_TIMETICKS, ASN_GAUGE, ASN_IPADDRESS, ASN_OCTET_STR and ASN_OBJECT_ID (since 2.2.8, 2.4.3). These types roughly correspond to "Counter32", "Counter64", "UInteger32", "INTEGER", "Float", "Double", "Timeticks", "Gauge32", "IpAddress", "OCTET STRING", "OBJECT IDENTIFIER" in **snmpget** output, but might also be shown as "STRING", "Hex-STRING", "OID" and other, depending on the presence of a display hint.

Step 3

Create an item for monitoring.

So, now go back to Zabbix and click on *Items* for the SNMP host you created earlier. Depending on whether you used a template or not when creating your host, you will have either a list of SNMP items associated with your host or just an empty list. We will work on the assumption that you are going to create the item yourself using the information you have just gathered using **snmpwalk** and **snmpget**, so click on *Create item*. In the new item form, enter the item 'Name'. Make sure the 'Host interface' field has your switch/router in it and change the 'Type' field to "SNMPv* agent". Enter the community (usually public) and enter the textual or numeric OID that you retrieved earlier into the 'SNMP OID' field, for example: .1.3.6.1.2.1.2.2.1.10.3

Enter the SNMP 'Port' as 161 and the 'Key' as something meaningful, e.g. SNMP-InOctets-Bps. Choose a custom multiplier if you want one and enter an 'Update interval' and 'History storage period' if you want them to be different from the default. Set the 'Type of information' to *Numeric (float)* and the 'Store value' to *Delta (speed per second)* (important, otherwise you will get cumulative values from the SNMP device instead of the latest change).

Items

[All hosts](#) / [Zabbix server](#)

Enabled

ZBX

SNMP

JMX

IPMI

[Applications](#) 13

[Items](#) 83

[Triggers](#) 44

Name	<input type="text" value="SNMP: InOctets (Bps)"/>		
Type	<input type="text" value="SNMPv3 agent"/>		
Key	<input type="text" value="SNMP-InOctets-Bps"/>	<input type="button" value="Select"/>	
Host interface	<input type="text" value="127.0.0.1 : 161"/>		
SNMP OID	<input type="text" value=".1.3.6.1.2.1.2.2.1.10.3"/>		
Context name	<input type="text"/>		
Security name	<input type="text"/>		
Security level	<input type="text" value="authPriv"/>		
Authentication protocol	<input checked="" type="radio"/> MD5 <input type="radio"/> SHA		
Authentication passphrase	<input type="text"/>		
Privacy protocol	<input checked="" type="radio"/> DES <input type="radio"/> AES		
Privacy passphrase	<input type="text"/>		
Port	<input type="text" value="161"/>		
Type of information	<input type="text" value="Numeric (float)"/>		
Units	<input type="text"/>		
Use custom multiplier	<input type="checkbox"/>	<input type="text" value="1"/>	
Update interval (in sec)	<input type="text" value="30"/>		
Flexible intervals	Interval	Period	Action
	No flexible intervals defined.		
New flexible interval	Interval (in sec)	<input type="text" value="50"/>	Period <input type="text" value="1-7,00:00-24:00"/>
History storage period (in days)	<input type="text" value="7"/>		
Trend storage period (in days)	<input type="text" value="365"/>		
Store value	<input type="text" value="Delta (speed per second)"/>		

Now save the item and go to *Monitoring* → *Latest data* for your SNMP data!

Take note of specific options available for SNMPv3 items:

Parameter	Description
<i>Context name</i>	Enter context name to identify item on SNMP subnet. <i>Context name</i> is supported for SNMPv3 items since Zabbix 2.2. User macros are resolved in this field.
<i>Security name</i>	Enter security name. User macros are resolved in this field.
<i>Security level</i>	Select security level: noAuthNoPriv - no authentication nor privacy protocols are used AuthNoPriv - authentication protocol is used, privacy protocol is not AuthPriv - both authentication and privacy protocols are used
<i>Authentication protocol</i>	Select authentication protocol - <i>MD5</i> or <i>SHA</i> .
<i>Authentication passphrase</i>	Enter authentication passphrase. User macros are resolved in this field.
<i>Privacy protocol</i>	Select privacy protocol - <i>DES</i> or <i>AES</i> .
<i>Privacy passphrase</i>	Enter privacy passphrase. User macros are resolved in this field.

Warning:

Server/proxy restart is required for changes in *Authentication protocol*, *Authentication passphrase*, *Privacy protocol* or *Privacy passphrase* to take effect, if the *Security name* is not changed at the same time. In cases, where *Security name* is also changed, all parameters will be updated immediately.

Example 1

General example:

Parameter	Description
Community	public
OID	1.2.3.45.6.7.8.0 (or .1.2.3.45.6.7.8.0)
Key	<Unique string to be used as reference to triggers> For example, "my_param".

Note that OID can be given in either numeric or string form. However, in some cases, string OID must be converted to numeric representation. Utility `snmpget` may be used for this purpose:

```
shell> snmpget -On localhost public enterprises.ucdavis.memory.memTotalSwap.0
```

Monitoring of SNMP parameters is possible if `--with-net-snmp` flag was specified while configuring Zabbix sources.

Example 2

Monitoring of uptime:

Parameter	Description
Community	public
Oid	MIB::sysUpTime.0
Key	router.uptime
Value type	Float
Units	uptime
Multiplier	0.01

Internal workings of bulk processing

Starting from 2.2.3 Zabbix server and proxy query SNMP devices for multiple values in a single request. This affects several types of SNMP items:

- regular SNMP items;
- **SNMP items with dynamic indexes;**
- **SNMP low-level discovery rules.**

All SNMP items on a single interface with identical parameters are scheduled to be queried at the same time. The first two types of items are taken by pollers in batches of at most 128 items, whereas low-level discovery rules are processed individually, as before.

On the lower level, there are two kinds of operations performed for querying values: getting multiple specified objects and walking an OID tree.

For "getting", a GetRequest-PDU is used with at most 128 variable bindings. For "walking", a GetNextRequest-PDU is used for SNMPv1 and GetBulkRequest with "max-repetitions" field of at most 128 is used for SNMPv2 and SNMPv3.

Thus, the benefits of bulk processing for each SNMP item type are outlined below:

- regular SNMP items benefit from "getting" improvements;
- SNMP items with dynamic indexes benefit from both "getting" and "walking" improvements: "getting" is used for index verification and "walking" for building the cache;
- SNMP low-level discovery rules benefit from "walking" improvements.

However, there is a technical issue that not all devices are capable of returning 128 values per request. Some always return a proper response, but others either respond with a "tooBig(1)" error or do not respond at all once the potential response is over a certain limit.

In order to find an optimal number of objects to query for a given device, Zabbix uses the following strategy. It starts cautiously with querying 1 value in a request. If that is successful, it queries 2 values in a request. If that is successful again, it queries 3 values in a request and continues similarly by multiplying the number of queried objects by 1.5, resulting in the following sequence of request sizes: 1, 2, 3, 4, 6, 9, 13, 19, 28, 42, 63, 94, 128.

However, once a device refuses to give a proper response (for example, for 42 variables), Zabbix does two things.

First, for the current item batch it halves the number of objects in a single request and queries 21 variables. If the device is alive, then the query should work in the vast majority of cases, because 28 variables were known to work and 21 is significantly less than that. However, if that still fails, then Zabbix falls back to querying values one by one. If it still fails at this point, then the device is definitely not responding and request size is not an issue.

The second thing Zabbix does for subsequent item batches is it starts with the last successful number of variables (28 in our example) and continues incrementing request sizes by 1 until the limit is hit. For example, assuming the largest response size is 32 variables, the subsequent requests will be of sizes 29, 30, 31, 32, and 33. The last request will fail and Zabbix will never issue a request of size 33 again. From that point on, Zabbix will query at most 32 variables for this device.

If large queries fail with this number of variables, it can mean one of two things. The exact criteria that a device uses for limiting response size cannot be known, but we try to approximate that using the number of variables. So the first possibility is that this number of variables is around the device's actual response size limit in the general case: sometimes response is less than the limit, sometimes it is greater than that. The second possibility is that a UDP packet in either direction simply got lost. For these reasons, if Zabbix gets a failed query, it reduces the maximum number of variables to try to get deeper into the device's comfortable range, but (starting from 2.2.8) only up to two times.

In the example above, if a query with 32 variables happens to fail, Zabbix will reduce the count to 31. If that happens to fail, too, Zabbix will reduce the count to 30. However, Zabbix will not reduce the count below 30, because it will assume that further failures are due to UDP packets getting lost, rather than the device's limit.

If, however, a device cannot handle bulk requests properly for other reasons and the heuristic described above does not work, since Zabbix 2.4 there is a "Use bulk requests" setting for each interface that allows to disable bulk requests for that device.

1 Dynamic indexes

Overview

While you may find the required index number (for example, of a network interface) among the SNMP OIDs, sometimes you may not completely rely on the index number always staying the same.

Index numbers may be dynamic - they may change over time and your item may stop working as a consequence.

To avoid this scenario, it is possible to define an OID which takes into account the possibility of an index number changing.

For example, if you need to retrieve the index value to append to **ifInOctets** that corresponds to the **GigabitEthernet0/1** interface on a Cisco device, use the following OID:

```
ifInOctets["index","ifDescr","GigabitEthernet0/1"]
```

The syntax

A special syntax for OID is used:

<OID of data>["index","<base OID of index>","<string to search for>"]

Parameter	Description
OID of data	Main OID to use for data retrieval on the item.
index	Method of processing. Currently one method is supported: index - search for index and append it to the data OID
base OID of index	This OID will be looked up to get the index value corresponding to the string.
string to search for	The string to use for an exact match with a value when doing lookup. Case sensitive.

Example

Getting memory usage of *apache* process.

If using this OID syntax:

```
HOST-RESOURCES-MIB::hrSWRunPerfMem["index", "HOST-RESOURCES-MIB::hrSWRunPath", "/usr/sbin/apache2"]
```

the index number will be looked up here:

```
...
HOST-RESOURCES-MIB::hrSWRunPath.5376 = STRING: "/sbin/getty"
HOST-RESOURCES-MIB::hrSWRunPath.5377 = STRING: "/sbin/getty"
HOST-RESOURCES-MIB::hrSWRunPath.5388 = STRING: "/usr/sbin/apache2"
HOST-RESOURCES-MIB::hrSWRunPath.5389 = STRING: "/sbin/sshd"
...
```

Now we have the index, 5388. The index will be appended to the data OID in order to receive the value we are interested in:

```
HOST-RESOURCES-MIB::hrSWRunPerfMem.5388 = INTEGER: 31468 KBytes
```

Index lookup caching

When a dynamic index item is requested, Zabbix retrieves and caches whole SNMP table under base OID for index, even if a match would be found sooner. This is done in case another item would refer to the same base OID later - Zabbix would look up index in the cache, instead of querying the monitored host again. Note that each poller process uses separate cache.

In all subsequent value retrieval operations only the found index is verified. If it has not changed, value is requested. If it has changed, cache is rebuilt - each poller that encounters a changed index walks the index SNMP table again.

2 Special OIDs

Some of the most used SNMP OIDs are translated automatically to a numeric representation by Zabbix. For example, **ifIndex** is translated to **1.3.6.1.2.1.2.2.1.1**, **ifIndex.0** is translated to **1.3.6.1.2.1.2.2.1.1.0**.

The table contains list of the special OIDs.

Special OID	Identifier	Description
ifIndex	1.3.6.1.2.1.2.2.1.1	A unique value for each interface.
ifDescr	1.3.6.1.2.1.2.2.1.2	A textual string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the hardware interface.
ifType	1.3.6.1.2.1.2.2.1.3	The type of interface, distinguished according to the physical/link protocol(s) immediately 'below' the network layer in the protocol stack.
ifMtu	1.3.6.1.2.1.2.2.1.4	The size of the largest datagram which can be sent / received on the interface, specified in octets.
ifSpeed	1.3.6.1.2.1.2.2.1.5	An estimate of the interface's current bandwidth in bits per second.

Special OID	Identifier	Description
ifPhysAddress	1.3.6.1.2.1.2.2.1.6	The interface's address at the protocol layer immediately 'below' the network layer in the protocol stack.
ifAdminStatus	1.3.6.1.2.1.2.2.1.7	The current administrative state of the interface.
ifOperStatus	1.3.6.1.2.1.2.2.1.8	The current operational state of the interface.
ifInOctets	1.3.6.1.2.1.2.2.1.10	The total number of octets received on the interface, including framing characters.
ifInUcastPkts	1.3.6.1.2.1.2.2.1.11	The number of subnetwork-unicast packets delivered to a higher-layer protocol.
ifInNUcastPkts	1.3.6.1.2.1.2.2.1.12	The number of non-unicast (i.e., subnetwork- broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol.
ifInDiscards	1.3.6.1.2.1.2.2.1.13	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
ifInErrors	1.3.6.1.2.1.2.2.1.14	The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.
ifInUnknownProtos	1.3.6.1.2.1.2.2.1.15	The number of packets received via the interface which were discarded because of an unknown or unsupported protocol.
ifOutOctets	1.3.6.1.2.1.2.2.1.16	The total number of octets transmitted out of the interface, including framing characters.
ifOutUcastPkts	1.3.6.1.2.1.2.2.1.17	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
ifOutNUcastPkts	1.3.6.1.2.1.2.2.1.18	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
ifOutDiscards	1.3.6.1.2.1.2.2.1.19	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
ifOutErrors	1.3.6.1.2.1.2.2.1.20	The number of outbound packets that could not be transmitted because of errors.
ifOutQLen	1.3.6.1.2.1.2.2.1.21	The length of the output packet queue (in packets).

3 SNMP traps

Overview

Receiving SNMP traps is the opposite to querying SNMP-enabled devices.

In this case the information is sent from a SNMP-enabled device and is collected or "trapped" by Zabbix.

Usually traps are sent upon some condition change and the agent connects to the server on port 162 (as opposed to port 161 on the agent side that is used for queries). Using traps may detect some short problems that occur amidst the query interval and may be missed by the query data.

Receiving SNMP traps in Zabbix is designed to work with **snmptrapd** and one of the built-in mechanisms for passing the traps to Zabbix - either a perl script or SNMPPTT.

The workflow of receiving a trap:

1. **snmptrapd** receives a trap
2. snmptrapd passes the trap to SNMPPTT or calls Perl trap receiver
3. SNMPPTT or Perl trap receiver parses, formats and writes the trap to a file
4. Zabbix SNMP trapper reads and parses the trap file
5. For each trap Zabbix finds all "SNMP trapper" items with host interfaces matching the received trap address. Note that only the selected "IP" or "DNS" in host interface is used during the matching.
6. For each found item, the trap is compared to regexp in "snmptrap[regexp]". The trap is set as the value of **all** matched items. If no matching item is found and there is an "snmptrap.fallback" item, the trap is set as the value of that.
7. If the trap was not set as the value of any item, Zabbix by default logs the unmatched trap. (This is configured by "Log unmatched SNMP traps" in Administration → General → Other.)

1 Configuring SNMP traps

Configuring the following fields in the frontend is specific for this item type:

- Your host must have an SNMP interface

In *Configuration → Hosts*, in the **Host interface** field set an SNMP interface with the correct IP or DNS address. The address from each received trap is compared to the IP and DNS addresses of all SNMP interfaces to find the corresponding hosts.

- Configure the item

In the **Key** field use one of the SNMP trap keys:

Key		
Description	Return value	Comments
snmptrap[regexp] Catches all SNMP traps that match the regular expression specified in regexp . If regexp is unspecified, catches any trap.	SNMP trap	This item can be set only for SNMP interfaces. This item is supported since Zabbix 2.0.0 . <i>Note:</i> Starting with Zabbix 2.0.5, user macros and global regular expressions are supported in the parameter of this item key.
snmptrap.fallback Catches all SNMP traps that were not caught by any of the snmptrap[] items for that interface.	SNMP trap	This item can be set only for SNMP interfaces. This item is supported since Zabbix 2.0.0 .

Note:

Multi-line regexp matching is not supported at this time.

Set the **Type of information** to be 'Log' for the timestamps to be parsed. Note that other formats such as 'Numeric' are also acceptable but might require a custom trap handler.

Note:

For SNMP trap monitoring to work, it must first be correctly set up.

2 Setting up SNMP trap monitoring

Configuring Zabbix server/proxy

To read the traps, Zabbix server or proxy must be configured to start the SNMP trapper process and point to the trap file that is being written by SNMPTT or a perl trap receiver. To do that, edit the configuration file (`zabbix_server.conf` or `zabbix_proxy.conf`):

1. `StartSNMPTrapper=1`
2. `SNMPTrapperFile=[TRAP FILE]`

Warning:

If systemd parameter `PrivateTmp` is used, this file is unlikely to work in `/tmp`.

Configuring SNMPTT

At first, `snmptrapd` should be configured to use SNMPTT.

Note:

For the best performance, SNMPTT should be configured as a daemon using `snmpthandler-embedded` to pass the traps to it. See instructions for configuring SNMPTT in its homepage:

<http://snmptt.sourceforge.net/docs/snmptt.shtml>

When SNMPTT is configured to receive the traps, configure `snmptt.ini`:

1. enable the use of the Perl module from the NET-SNMP package:
`net_snmp_perl_enable = 1`
2. log traps to the trap file which will be read by Zabbix:
`log_enable = 1`
`log_file = [TRAP FILE]`
3. set the date-time format:
`date_time_format = %H:%M:%S %Y/%m/%d = [DATE TIME FORMAT]`

Warning:

The "net-snmp-perl" package has been removed in RHEL/CentOS 8.0-8.2; re-added in RHEL 8.3. For more information, see the [known issues](#).

Now format the traps for Zabbix to recognise them (edit `snmptt.conf`):

1. Each FORMAT statement should start with "ZBXTRAP [address]", where [address] will be compared to IP and DNS addresses of SNMP interfaces on Zabbix. E.g.:
`EVENT coldStart .1.3.6.1.6.3.1.1.5.1 "Status Events" Normal`
`FORMAT ZBXTRAP $aA Device reinitialized (coldStart)`
2. See more about SNMP trap format below.

Attention:

Do not use unknown traps - Zabbix will not be able to recognise them. Unknown traps can be handled by defining a general event in `snmptt.conf`:

`EVENT general .* "General event" Normal`

Configuring Perl trap receiver

Requirements: Perl, Net-SNMP compiled with `--enable-embedded-perl` (done by default since Net-SNMP 5.4)

Perl trap receiver (look for `misc/snmptrap/zabbix_trap_receiver.pl`) can be used to pass traps to Zabbix server directly from `snmptrapd`. To configure it:

- add the perl script to `snmptrapd` configuration file (`snmptrapd.conf`), e.g.:
`perl do "[FULL PATH TO PERL RECEIVER SCRIPT]";`
- configure the receiver, e.g:
`$SNMPTrapperFile = '[TRAP FILE]';`
`$DateTimeFormat = '[DATE TIME FORMAT]';`

Note:

If script name is not quoted, snmptrapd will refuse to start up with messages, similar to these:

Regexp modifiers "/1" and "/a" are mutually exclusive at (eval 2) line 1, at end of line
 Regexp modifier "/1" may not appear twice at (eval 2) line 1, at end of line

Warning:

net-snmp agent does not support AES256 with SNMPv3/USM.

SNMP trap format

All customised perl trap receivers and SNMPTT trap configuration must format the trap in the following way: **[timestamp] [the trap, part 1] ZBXTRAP [address] [the trap, part 2]**, where

- [timestamp] - timestamp used for log items
- ZBXTRAP - header that indicates that a new trap starts in this line
- [address] - IP address used to find the host for this trap

Note that "ZBXTRAP" and "[address]" will be cut out from the message during processing. If the trap is formatted otherwise, Zabbix might parse the traps unexpectedly.

Example trap:

11:30:15 2011/07/27 .1.3.6.1.6.3.1.1.5.3 Normal "Status Events" localhost - ZBXTRAP 192.168.1.1 Link down on interface 2.
 Admin state: 1. Operational state: 2

This will result in the following trap for SNMP interface with IP=192.168.1.1:

11:30:15 2011/07/27 .1.3.6.1.6.3.1.1.5.3 Normal "Status Events" localhost - Link down on interface 2. Admin state: 1.

3 System requirements

Log rotation

Zabbix does not provide any log rotation system - that should be handled by the user. The log rotation should first rename the old file and only later delete it so that no traps are lost:

1. Zabbix opens the trap file at the last known location and goes to step 3
2. Zabbix checks if the currently opened file has been rotated by comparing the inode number to the define trap file's inode number. If there is no opened file, Zabbix resets the last location and goes to step 1.
3. Zabbix reads the data from the currently opened file and sets the new location.
4. The new data are parsed. If this was the rotated file, the file is closed and goes back to step 2.
5. If there was no new data, Zabbix sleeps for 1 second and goes back to step 2.

Attention:

The maximum log file size supported by Zabbix is 2 gigabytes. The log file must be rotated before reaching this limit.

File system

Because of the trap file implementation, Zabbix needs the file system to support inodes to differentiate files (the information is acquired by a stat() call).

4 Setup example

This example uses snmptrapd + SNMPTT to pass traps to Zabbix server. Setup:

1. **zabbix_server.conf** - configure Zabbix to start SNMP trapper and set the trap file:
 StartSNMPTrapper=1
 SNMPTrapperFile=/tmp/my_zabbix_traps.tmp
2. **snmptrapd.conf** - add SNMPTT as the trap handler:
 traphandle default snmptt
3. **snmptt.ini** -
 enable the use of the Perl module from the NET-SNMP package:
 net_snmp_perl_enable = 1
 configure output file and time format:
 log_file = /tmp/my_zabbix_traps.tmp
 date_time_format = %H:%M:%S %Y/%m/%d
4. **snmptt.conf** - define a default trap format:
 EVENT general .* "General event" Normal
 FORMAT ZBXTRAP \$aA \$ar

5. Create an SNMP item TEST:
Host's SNMP interface IP: 127.0.0.1
Key: snmptrap["General"]
Log time format: hh:mm:ss yyyy/MM/dd

This results in:

1. Command used to send a trap:
`snmptrap -v 1 -c public 127.0.0.1 '.1.3.6.1.6.3.1.1.5.3' '0.0.0.0' 6 33 '55' .1.3.6.1.6.3.1.1.5.3 s "teststring000"`
2. The received trap:
`15:48:18 2011/07/26 .1.3.6.1.6.3.1.1.5.3.0.33 Normal "General event" localhost - ZBXTRAP 127.0.0.1 127.0.0.1`
3. Value for item TEST:
`15:48:18 2011/07/26 .1.3.6.1.6.3.1.1.5.3.0.33 Normal "General event" localhost - 127.0.0.1`

Note:

This simple example uses SNMPPTT as **traphandle**. For better performance on production systems, use embedded Perl to pass traps from snmptrapd to SNMPPTT or directly to Zabbix.

4 IPMI checks

Overview

You can monitor the health and availability of Intelligent Platform Management Interface (IPMI) devices in Zabbix. To perform IPMI checks Zabbix server must be initially **configured** with IPMI support.

IPMI is a standardized interface for remote "lights-out" or "out-of-band" management of computer systems. It allows to monitor hardware status directly from the so-called "out-of-band" management cards, independently from the operating system or whether the machine is powered on at all.

Zabbix IPMI monitoring works only for devices having IPMI support (HP iLO, DELL DRAC, IBM RSA, Sun SSP, etc).

See also **known issues** for IPMI checks.

Configuration

Host configuration

A host must be configured to process IPMI checks. An IPMI interface must be added, with the respective IP and port numbers, and IPMI authentication parameters must be defined.

See the **configuration of hosts** for more details.

Server configuration

By default, the Zabbix server is not configured to start any IPMI pollers, thus any added IPMI items won't work. To change this, open the Zabbix server configuration file (**zabbix_server.conf**) as root and look for the following line:

```
# StartIPMIPollers=0
```

Uncomment it and set poller count to, say, 3, so that it reads:

```
StartIPMIPollers=3
```

Save the file and restart `zabbix_server` afterwards.

Item configuration

When **configuring an item** on a host level:

- For *Host interface* select the IPMI IP and port
- Select 'IPMI agent' as the *Type*
- Specify the *IPMI sensor* (for example 'FAN MOD 1A RPM' on Dell Poweredge)
- Enter an item **key** that is unique within the host (say, `ipmi.fan.rpm`)
- Select the respective type of information ('Numeric (float)' in this case, for discrete sensors - 'Numeric (unsigned)'), units (most likely 'rpm') and any other required item attributes

Timeout and session termination

IPMI message timeouts and retry counts are defined in OpenIPMI library. Due to the current design of OpenIPMI, it is not possible to make these values configurable in Zabbix, neither on interface nor item level.

IPMI session inactivity timeout for LAN is 60 +/-3 seconds. Currently it is not possible to implement periodic sending of Activate Session command with OpenIPMI. If there are no IPMI item checks from Zabbix to a particular BMC for more than the session timeout configured in BMC then the next IPMI check after the timeout expires will time out due to individual message timeouts, retries or receive error. After that a new session is opened and a full rescan of the BMC is initiated. If you want to avoid unnecessary rescans of the BMC it is advised to set the IPMI item polling interval below the IPMI session inactivity timeout configured in BMC.

Notes on IPMI discrete sensors

To find sensors on a host start Zabbix server with **DebugLevel=4** enabled. Wait a few minutes and find sensor discovery records in Zabbix server logfile:

```
$ grep 'Added sensor' zabbix_server.log
8358:20130318:111122.170 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:7 id:'CATERR' reading_type:
8358:20130318:111122.170 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:15 id:'CPU Therm Trip' read

8358:20130318:111122.174 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:14 id:'BB +1.05V PCH' readi
```

To decode IPMI sensor types and states, get a copy of IPMI 2.0 specifications at <http://www.intel.com/content/www/us/en/servers/ipmi/ipmi-specifications.html> (At the time of writing the newest document was <http://www.intel.com/content/dam/www/public/us/en/documents/product-briefs/second-gen-interface-spec-v2.pdf>)

The first parameter to start with is "reading_type". Use "Table 42-1, Event/Reading Type Code Ranges" from the specifications to decode "reading_type" code. Most of the sensors in our example have "reading_type:0x1" which means "threshold" sensor. "Table 42-3, Sensor Type Codes" shows that "type:0x1" means temperature sensor, "type:0x2" - voltage sensor, "type:0x4" - Fan etc. Threshold sensors sometimes are called "analog" sensors as they measure continuous parameters like temperature, voltage, revolutions per minute.

Another example - a sensor with "reading_type:0x3". "Table 42-1, Event/Reading Type Code Ranges" says that reading type codes 02h-0Ch mean "Generic Discrete" sensor. Discrete sensors have up to 15 possible states (in other words - up to 15 meaningful bits). For example, for sensor 'CATERR' with "type:0x7" the "Table 42-3, Sensor Type Codes" shows that this type means "Processor" and the meaning of individual bits is: 00h (the least significant bit) - IERR, 01h - Thermal Trip etc.

There are few sensors with "reading_type:0x6f" in our example. For these sensors the "Table 42-1, Event/Reading Type Code Ranges" advises to use "Table 42-3, Sensor Type Codes" for decoding meanings of bits. For example, sensor 'Power Unit Stat' has type "type:0x9" which means "Power Unit". Offset 00h means "PowerOff/Power Down". In other words if the least significant bit is 1, then server is powered off. To test this bit a function **band** with mask 1 can be used. The trigger expression could be like

```
{www.zabbix.com:Power Unit Stat.band(#1,1)}=1
```

to warn about a server power off.

Notes on discrete sensor names in OpenIPMI-2.0.16, 2.0.17, 2.0.18 and 2.0.19

Names of discrete sensors in OpenIPMI-2.0.16, 2.0.17 and 2.0.18 often have an additional "0" (or some other digit or letter) appended at the end. For example, while ipmitool and OpenIPMI-2.0.19 display sensor names as "PhysicalSecurity" or "CATERR", in OpenIPMI-2.0.16, 2.0.17 and 2.0.18 the names are "PhysicalSecurity0" or "CATERR0", respectively.

When configuring an IPMI item with Zabbix server using OpenIPMI-2.0.16, 2.0.17 and 2.0.18, use these names ending with "0" in the *IPMI sensor* field of IPMI agent items. When your Zabbix server is upgraded to a new Linux distribution, which uses OpenIPMI-

2.0.19 (or later), items with these IPMI discrete sensors will become "NOT SUPPORTED". You have to change their *IPMI sensor* names (remove the '0' in the end) and wait for some time before they turn "Enabled" again.

Notes on threshold and discrete sensor simultaneous availability

Some IPMI agents provide both a threshold sensor and a discrete sensor under the same name. In Zabbix versions prior to 2.2.8 and 2.4.3, the first provided sensor was chosen. Since versions 2.2.8 and 2.4.3, preference is always given to the threshold sensor.

Notes on connection termination

If IPMI checks are not performed (by any reason: all host IPMI items disabled/notsupported, host disabled/deleted, host in maintenance etc.) the IPMI connection will be terminated from Zabbix server or proxy in 3 to 4 hours depending on the time when Zabbix server/proxy was started.

5 Simple checks

1 Overview

Simple checks are normally used for remote agent-less checks of services.

Note that Zabbix agent is not needed for simple checks. Zabbix server/proxy is responsible for the processing of simple checks (making external connections, etc).

Examples of using simple checks:

```
net.tcp.service[ftp,,155]
net.tcp.service[http]
net.tcp.service.perf[http,,8080]
net.udp.service.perf[ntp]
```

Note:

User name and *Password* fields in simple check item configuration are used for VMware monitoring items; ignored otherwise.

2 Supported simple checks

List of supported simple checks:

See also:

- [VMware monitoring item keys](#)

Key				
	Description	Return value	Parameters	Comments
icmpping[<target>,<packets>,<interval>,<size>,<timeout>]	Host accessibility by ICMP ping.	0 - ICMP ping fails 1 - ICMP ping successful	target - host IP or DNS name packets - number of packets interval - time between successive packets in milliseconds size - packet size in bytes timeout - timeout in milliseconds	Example: => icmpping[,4] → if at least one packet of the four is returned, the item will return 1. See also: table of default values .
icmppingloss[<target>,<packets>,<interval>,<size>,<timeout>]				

	Percentage of lost packets.	Float.	target - host IP or DNS name packets - number of packets interval - time between successive packets in milliseconds size - packet size in bytes timeout - timeout in milliseconds	See also: table of default values .
icmppingsec[<target>,<packets>,<interval>,<size>,<timeout>,<mode>]	ICMP ping response time (in seconds).	Float.	target - host IP or DNS name packets - number of packets interval - time between successive packets in milliseconds size - packet size in bytes timeout - timeout in milliseconds mode - possible values: <i>min</i> , <i>max</i> , <i>avg</i> (default)	If host is not available (timeout reached), the item will return 0. If the return value is less than 0.0001 seconds, the value will be set to 0.0001 seconds. See also: table of default values .
net.tcp.service[service,<ip>,<port>]				

Checks if service is running and accepting TCP connections.	0 - service is down 1 - service is running	service - possible values: <i>ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet</i> (see details) ip - IP address or DNS name (by default host IP/DNS is used) port - port number (by default standard service port number is used).	Example: => net.tcp.service[ftp,,45] → can be used to test the availability of FTP server on TCP port 45. Note that with <i>tcp</i> service indicating the port is mandatory. These checks may result in additional messages in system daemon logfiles (SMTP and SSH sessions being logged usually). Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use net.tcp.service[tcp,<ip>,<port>] for checks like these. <i>https</i> and <i>telnet</i> services are supported since Zabbix 2.0.
---	---	--	--

net.tcp.service.perf[service,<ip>,<port>]

	Checks performance of TCP service.	Float. 0.000000 - service is down seconds - the number of seconds spent while connecting to the service	service - possible values: <i>ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet</i> (see details) ip - IP address or DNS name (by default, host IP/DNS is used) port - port number (by default standard service port number is used).	Example: => net.tcp.service.perf[ssh] → can be used to test the speed of initial response from SSH server. Note that with <i>tcp</i> service indicating the port is mandatory. Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use net.tcp.service.perf[tcp,<ip>], for checks like these. <i>https</i> and <i>telnet</i> services are supported since Zabbix 2.0. Called tcp_perf before Zabbix 2.0.
net.udp.service[service,<ip>,<port>]	Checks if service is running and responding to UDP requests.	0 - service is down 1 - service is running	service - possible values: <i>ntp</i> (see details) ip - IP address or DNS name (by default host IP/DNS is used) port - port number (by default standard service port number is used).	Example: => net.udp.service[ntp,45] → can be used to test the availability of NTP service on UDP port 45. This item is supported since Zabbix 3.0, but <i>ntp</i> service was available for net.tcp.service[] item in prior versions.
net.udp.service.perf[service,<ip>,<port>]				

Key				
	Checks performance of UDP service.	Float. 0.000000 - service is down seconds - the number of seconds spent waiting for response from the service	service - possible values: <i>ntp</i> (see details) ip - IP address or DNS name (by default, host IP/DNS is used) port - port number (by default standard service port number is used).	Example: => net.udp.service.perf[ntp] → can be used to test response time from NTP service. This item is supported since Zabbix 3.0, but <i>ntp</i> service was available for net.tcp.service[] item in prior versions.

Timeout processing

Zabbix will not process a simple check longer than the Timeout seconds defined in the Zabbix server/proxy configuration file.

3 ICMP pings

Zabbix uses external utility **fping** for processing of ICMP pings.

The utility is not part of Zabbix distribution and has to be additionally installed. If the utility is missing, has wrong permissions or its location does not match the location set in the Zabbix server/proxy configuration file ('FpingLocation' parameter), ICMP pings (**icmpping**, **icmppingloss**, **icmppingsec**) will not be processed.

See also: [known issues](#)

fping must be executable by the user Zabbix daemons run as and setuid root. Run these commands as user **root** in order to set up correct permissions:

```
shell> chown root:zabbix /usr/sbin/fping
shell> chmod 4710 /usr/sbin/fping
```

After performing the two commands above check ownership of the **fping** executable. In some cases the ownership can be reset by executing the chmod command.

Also check, if user zabbix belongs to group zabbix by running:

```
shell> groups zabbix
```

and if it's not add by issuing:

```
shell> usermod -a -G zabbix zabbix
```

Defaults, limits and description of values for ICMP check parameters:

Parameter	Unit	Description	Fping's flag	Defaults set by	Allowed limits by Zabbix
-----------	------	-------------	--------------	-----------------	--------------------------

Warning:

Warning: fping defaults can differ depending on platform and version - if in doubt, check fping documentation.

Zabbix writes IP addresses to be checked by any of three *icmpping** keys to a temporary file, which is then passed to **fping**. If items have different key parameters, only ones with identical key parameters are written to a single file.

All IP addresses written to the single file will be checked by fping in parallel, so Zabbix icmp pinger process will spend fixed amount of time disregarding the number of IP addresses in the file.

1 VMware monitoring item keys

Item keys

The table provides details on the simple checks that can be used to monitor **VMware environments**.

Key	Description	Return value	Parameters	Comments
vmware.cluster.discovery[<url>]	Discovery of VMware clusters.	JSON object	url - VMware service URL	
vmware.cluster.status[<url>, <name>]	VMware cluster status.	Integer: 0 - gray; 1 - green; 2 - yellow; 3 - red	url - VMware service URL name - VMware cluster name	
vmware.eventlog[<url>]	VMware event log.	Log	url - VMware service URL	
vmware.fullname[<url>]	VMware service full name.	String	url - VMware service URL	
vmware.hv.cluster.name[<url>,<uuid>]	VMware hypervisor cluster name.	String	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.cpu.usage[<url>,<uuid>]	VMware hypervisor processor usage (Hz).	Integer	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.datastore.discovery[<url>,<uuid>]	Discovery of VMware hypervisor datastores.	JSON object	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.datastore.read[<url>,<uuid>,<datastore>,<mode>]	Average amount of time for a read operation from the datastore (milliseconds).	Integer ²	url - VMware service URL uuid - VMware hypervisor host name datastore - datastore name mode - latency (default)	
vmware.hv.datastore.size[<url>,<uuid>,<datastore>,<mode>]				

Key				
	VMware datastore space in bytes or in percentage from total.	Integer - for bytes Float - for percentage	url - VMware service URL uuid - VMware hypervisor host name datastore - datastore name mode - possible values: total (default), free, pfree (free, percentage), uncommitted	Available since Zabbix version 3.0.6
vmware.hv.datastore.write[<url>,<uuid>,<datastore>,<mode>]	Average amount of time for a write operation to the datastore (milliseconds).	Integer ²	url - VMware service URL uuid - VMware hypervisor host name datastore - datastore name mode - latency (default)	
vmware.hv.discovery[<url>]	Discovery of VMware hypervisors.	JSON object	url - VMware service URL	
vmware.hv.fullname[<url>,<uuid>]	VMware hypervisor name.	String	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.hw.cpu.freq[<url>,<uuid>]	VMware hypervisor processor frequency (Hz).	Integer	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.hw.cpu.model[<url>,<uuid>]	VMware hypervisor processor model.	String	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.hw.cpu.num[<url>,<uuid>]	Number of processor cores on VMware hypervisor.	Integer	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.hw.cpu.threads[<url>,<uuid>]	Number of processor threads on VMware hypervisor.	Integer	url - VMware service URL uuid - VMware hypervisor host name	

Key

vmware.hv.hw.memory[<url>,<uuid>]	VMware hypervisor total memory size (bytes).	Integer	url - VMware service URL uuid - VMware hypervisor host name
vmware.hv.hw.model[<url>,<uuid>]	VMware hypervisor model.	String	url - VMware service URL uuid - VMware hypervisor host name
vmware.hv.hw.uuid[<url>,<uuid>]	VMware hypervisor BIOS UUID.	String	url - VMware service URL uuid - VMware hypervisor host name
vmware.hv.hw.vendor[<url>,<uuid>]	VMware hypervisor vendor name.	String	url - VMware service URL uuid - VMware hypervisor host name
vmware.hv.memory.size.ballooned[<url>,<uuid>]	VMware hypervisor ballooned memory size (bytes).	Integer	url - VMware service URL uuid - VMware hypervisor host name
vmware.hv.memory.used[<url>,<uuid>]	VMware hypervisor used memory size (bytes).	Integer	url - VMware service URL uuid - VMware hypervisor host name
vmware.hv.network.in[<url>,<uuid>,<mode>]	VMware hypervisor network input statistics (bytes per second).	Integer ²	url - VMware service URL uuid - VMware hypervisor host name mode - bps (default)
vmware.hv.network.out[<url>,<uuid>,<mode>]	VMware hypervisor network output statistics (bytes per second).	Integer ²	url - VMware service URL uuid - VMware hypervisor host name mode - bps (default)
vmware.hv.perfcounter[<url>,<uuid>,<path>,<instance>]			

Key

	VMware hypervisor performance counter value.	Integer ²	url - VMware service URL uuid - VMware hypervisor host name path - performance counter path ¹ instance - performance counter instance. Use empty instance for aggregate values (default)	Available since Zabbix versions 2.2.9, 2.4.4
vmware.hv.sensor.health.state[<url>,<uuid>]	VMware hypervisor health state rollup sensor.	Integer: 0 - gray; 1 - green; 2 - yellow; 3 - red	url - VMware service URL uuid - VMware hypervisor host name	Available since Zabbix 3.0.6
vmware.hv.status[<url>,<uuid>]	VMware hypervisor status.	Integer: 0 - gray; 1 - green; 2 - yellow; 3 - red	url - VMware service URL uuid - VMware hypervisor host name	Uses health state rollup sensor before Zabbix 3.0.6 and host system overall status property since Zabbix 3.0.6
vmware.hv.uptime[<url>,<uuid>]	VMware hypervisor uptime (seconds).	Integer	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.version[<url>,<uuid>]	VMware hypervisor version.	String	url - VMware service URL uuid - VMware hypervisor host name	
vmware.hv.vm.num[<url>,<uuid>]	Number of virtual machines on VMware hypervisor.	Integer	url - VMware service URL uuid - VMware hypervisor host name	
vmware.version[<url>]	VMware service version.	String	url - VMware service URL	
vmware.vm.cluster.name[<url>,<uuid>]	VMware virtual machine name.	String	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.cpu.num[<url>,<uuid>]				

	Number of processors on VMware virtual machine.	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.cpu.ready[<url>,<uuid>]	Time (in milliseconds) that the virtual machine was ready, but could not get scheduled to run on the physical CPU. CPU ready time is dependent on the number of virtual machines on the host and their CPU loads (%).	Integer ²	url - VMware service URL uuid - VMware virtual machine host name	Available since Zabbix version 3.0.0
vmware.vm.cpu.usage[<url>,<uuid>]	VMware virtual machine processor usage (Hz).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.discovery[<url>]	Discovery of VMware virtual machines.	JSON object	url - VMware service URL	
vmware.vm.hv.name[<url>,<uuid>]	VMware virtual machine hypervisor name.	String	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.memory.size[<url>,<uuid>]	VMware virtual machine total memory size (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.memory.size.ballooned[<url>,<uuid>]	VMware virtual machine ballooned memory size (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.memory.size.compressed[<url>,<uuid>]	VMware virtual machine compressed memory size (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.memory.size.private[<url>,<uuid>]				

Key

vmware.vm.memory.size.shared[<url>,<uuid>]	VMware virtual machine private memory size (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name
vmware.vm.memory.size.swapped[<url>,<uuid>]	VMware virtual machine shared memory size (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name
vmware.vm.memory.size.usage.guest[<url>,<uuid>]	VMware virtual machine swapped memory size (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name
vmware.vm.memory.size.usage.host[<url>,<uuid>]	VMware virtual machine guest memory usage (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name
vmware.vm.net.if.discovery[<url>,<uuid>]	VMware virtual machine host memory usage (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name
vmware.vm.net.if.in[<url>,<uuid>,<instance>,<mode>]	Discovery of VMware virtual machine network interfaces.	JSON object	url - VMware service URL uuid - VMware virtual machine host name
vmware.vm.net.if.out[<url>,<uuid>,<instance>,<mode>]	VMware virtual machine network interface input statistics (bytes/packets per second).	Integer ²	url - VMware service URL uuid - VMware virtual machine host name instance - network interface instance mode - bps (default)/pps - bytes/packets per second

	VMware virtual machine network interface output statistics (bytes/packets per second).	Integer ²	url - VMware service URL uuid - VMware virtual machine host name instance - network interface instance mode - bps (default)/pps - bytes/packets per second	
vmware.vm.perfcounter[<url>,<uuid>,<path>,<instance>]	VMware virtual machine performance counter value.	Integer ²	url - VMware service URL uuid - VMware virtual machine host name path - performance counter path ¹ instance - performance counter instance. Use empty instance for aggregate values (default)	Available since Zabbix versions 2.2.9, 2.4.4
vmware.vm.powerstate[<url>,<uuid>]	VMware virtual machine power state.	Integer: 0 - poweredOff; 1 - poweredOn; 2 - suspended	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.storage.committed[<url>,<uuid>]	VMware virtual machine committed storage space (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.storage.uncommitted[<url>,<uuid>]	VMware virtual machine uncommitted storage space (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.storage.unshared[<url>,<uuid>]	VMware virtual machine unshared storage space (bytes).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.uptime[<url>,<uuid>]	VMware virtual machine uptime (seconds).	Integer	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.vfs.dev.discovery[<url>,<uuid>]				

Key

	Discovery of VMware virtual machine disk devices.	JSON object	url - VMware service URL uuid - VMware virtual machine host name	
vmware.vm.vfs.dev.read[<url>,<uuid>,<instance>,<mode>]	VMware virtual machine disk device read statistics (bytes/operations per second).	Integer ²	url - VMware service URL uuid - VMware virtual machine host name instance - disk device instance mode - bps (default)/ops - bytes/operations per second	
vmware.vm.vfs.dev.write[<url>,<uuid>,<instance>,<mode>]	VMware virtual machine disk device write statistics (bytes/operations per second).	Integer ²	url - VMware service URL uuid - VMware virtual machine host name instance - disk device instance mode - bps (default)/ops - bytes/operations per second	
vmware.vm.vfs.fs.discovery[<url>,<uuid>]	Discovery of VMware virtual machine file systems.	JSON object	url - VMware service URL uuid - VMware virtual machine host name	VMware Tools must be installed on the guest virtual machine.
vmware.vm.vfs.fs.size[<url>,<uuid>,<fsname>,<mode>]	VMware virtual machine file system statistics (bytes/percentages).	Integer	url - VMware service URL uuid - VMware virtual machine host name fsname - file system name mode - to-tal/free/used/pfree/pused	VMware Tools must be installed on the guest virtual machine.

Footnotes

¹ The VMware performance counter path has the group/counter[rollup] format where:

- group - the performance counter group, for example *cpu*
- counter - the performance counter name, for example *usagemhz*
- rollup - the performance counter rollup type, for example *average*

So the above example would give the following counter path: *cpu/usagemhz[average]*

The performance counter group descriptions, counter names and rollup types can be found in [VMware documentation](#).

² The value of these items is obtained from VMware performance counters and the VMwarePerfFrequency **parameter** is used to refresh their data in Zabbix VMware cache:

- vmware.hv.datastore.read

- vmware.hv.datastore.write
- vmware.hv.network.in
- vmware.hv.network.out
- vmware.hv.perfcounter
- vmware.vm.cpu.ready
- vmware.vm.net.if.in
- vmware.vm.net.if.out
- vmware.vm.perfcounter
- vmware.vm.vfs.dev.read
- vmware.vm.vfs.dev.write

More info

See [Virtual machine monitoring](#) for detailed information how to configure Zabbix to monitor VMware environments.

6 Log file monitoring

Overview

Zabbix can be used for centralized monitoring and analysis of log files with/without log rotation support.

Notifications can be used to warn users when a log file contains certain strings or string patterns.

To monitor a log file you must have:

- Zabbix agent running on the host
- log monitoring item set up

Attention:

The size limit of a monitored log file depends on [large file support](#).

Configuration

Verify agent parameters

Make sure that in the [agent configuration file](#):

- 'Hostname' parameter matches the host name in the frontend
- Servers in the 'ServerActive' parameter are specified for the processing of active checks

Item configuration

Configure a log monitoring [item](#):

Name	<input type="text" value="Log item"/>		
Type	<input type="text" value="Zabbix agent (active)"/>		
Key	<input type="text" value="log[/var/log/syslog.error]"/>	<input type="button" value="Select"/>	
Type of information	<input type="text" value="Log"/>		
Update interval (in sec)	<input type="text" value="10"/>		
History storage period (in days)	<input type="text" value="7"/>		
Log time format	<input type="text" value="ppppddphh:mm:ss"/>		

Specifically for log monitoring items you enter:

Type

Select **Zabbix agent (active)** here.

Key	<p>Use one of the following item keys: log[] or logrt[]</p> <p>These two item keys allow to monitor logs and filter log entries by the content regexp, if present.</p> <p>For example: <code>log[/var/log/syslog,error]</code>. Make sure that the file has read permissions for the 'zabbix' user otherwise the item status will be set to 'unsupported'.</p> <p>See supported Zabbix agent item key section for details on using these item keys and their parameters.</p>
Type of information	<p>Select Log here.</p> <p>If optionally using the output parameter, you may select the appropriate type of information other than Log.</p> <p>Note that choosing a non-Log type of information will lead to the loss of local timestamp.</p>
Update interval (in sec)	<p>The parameter defines how often Zabbix agent will check for any changes in the log file. Setting it to 1 second will make sure that you get new records as soon as possible.</p>
Log time format	<p>In this field you may optionally specify the pattern for parsing the log line timestamp.</p> <p>If left blank the timestamp will not be parsed.</p> <p>Supported placeholders:</p> <ul style="list-style-type: none"> * y: Year (0001-9999) * M: Month (01-12) * d: Day (01-31) * h: Hour (00-23) * m: Minute (00-59) * s: Second (00-59) <p>For example, consider the following line from the Zabbix agent log file:</p> <p>" 23480:20100328:154718.045 Zabbix agent started. Zabbix 1.8.2 (revision 11211)."</p> <p>It begins with six character positions for PID, followed by date, time, and the rest of the line.</p> <p>Log time format for this line would be "pppppp:yyyyMMdd:hhmmss".</p> <p>Note that "p" and ":" chars are just placeholders and can be anything but "yMdhms".</p>

Important notes

- The server and agent keep the trace of a monitored log's size and last modification time (for logrt) in two counters. Additionally:
 - * The agent also internally uses inode numbers (on UNIX/GNU/Linux), file indexes (on Microsoft Windows)
 - * On UNIX/GNU/Linux systems it is assumed that the file systems where log files are stored report inode
 - * On Microsoft Windows Zabbix agent determines the file system type the log files reside on and uses:
 - * On NTFS file systems 64-bit file indexes.
 - * On ReFS file systems (only from Microsoft Windows Server 2012) 128-bit file IDs.
 - * On file systems where file indexes change (e.g. FAT32, exFAT) a fall-back algorithm is used to ta
 - * The inode numbers, file indexes and MD5 sums are internally collected by Zabbix agent. They are not t
 - * Do not modify the last modification time of log files with 'touch' utility, do not copy a log file wi
 - * If there are several matching log files for 'logrt[]' item and Zabbix agent is following the most r
- * The agent starts reading the log file from the point it stopped the previous time.
- * The number of bytes already analyzed (the size counter) and last modification time (the time counter) ar
- * Whenever the log file becomes smaller than the log size counter known by the agent, the counter is reset
- * If there are several matching files with the same last modification time in the directory, then the agen
- * Zabbix agent processes new records of a log file once per //Update interval// seconds.
- * Zabbix agent does not send more than ****maxlines**** of a log file per second. The limit prevents overloadi
- * To find the required string Zabbix will process 4 times more new lines than set in MaxLinesPerSecond. Th
- * Additionally, log values are always limited to 50% of the agent send buffer size, even if there are no n
- * In the absence of log items all agent buffer size is used for non-log values. When log values come in th
- * For log file records longer than 256kB, only the first 256kB are matched against the regular expression
- * Special note for "\" path separators: if file_format is "file.log", then there should not be a "file" d
- * Regular expressions for 'logrt' are supported in filename only, directory regular expression matching

- * On UNIX platforms a `'logrt[]'` item becomes NOTSUPPORTED if a directory where the log files are expected does not exist.
- * On Microsoft Windows, if a directory does not exist the item will not become NOTSUPPORTED (for example, `logrt[C:\Program Files\Zabbix Agent\zabbix_agentd.log]`).
- * An absence of log files for `'logrt[]'` item does not make it NOTSUPPORTED. Errors of reading log files are reported in the Zabbix agent log file.
- * Zabbix agent log file can be helpful to find out why a `'log[]'` or `'logrt[]'` item became NOTSUPPORTED.

Extracting matching part of regular expression

Sometimes we may want to extract only the interesting value from a target file instead of returning the whole line when a regular expression match is found.

Since Zabbix 2.2.0, log items have the ability to extract desired values from matched lines. This is accomplished by the additional **output** parameter in `log` and `logrt` items.

`output` allows to indicate the subgroup of the match that we may be interested in.

So, for example

```
log[/path/to/the/file,"large result buffer allocation.*Entries: ([0-9]+)",,,\1]
```

should allow returning the entry count as found in the content of:

```
Fr Feb 07 2014 11:07:36.6690 */ Thread Id 1400 (GLEWF) large result
buffer allocation - /Length: 437136/Entries: 5948/Client Ver: >=10/RPC
ID: 41726453/User: AUser/Form: CFG:ServiceLevelAgreement
```

The reason why Zabbix will return only the number is because `output` here is defined by `\1` referring to the first and only subgroup of interest: **([0-9]+)**

And, with the ability to extract and return a number, the value can be used to define triggers.

7 Calculated items

1 Overview

With calculated items you can create calculations on the basis of other items.

Thus, calculated items are a way of creating virtual data sources. The values will be periodically calculated based on an arithmetical expression. All calculations are done by the Zabbix server - nothing related to calculated items is performed on Zabbix agents or proxies.

The resulting data will be stored in the Zabbix database as for any other item - this means storing both history and trend values for fast graph generation. Calculated items may be used in trigger expressions, referenced by macros or other entities same as any other item type.

To use calculated items, choose the item type **Calculated**.

2 Configurable fields

The **key** is a unique item identifier (per host). You can create any key name using supported symbols.

Calculation definition should be entered in the **Formula** field. There is virtually no connection between the formula and the key. The key parameters are not used in formula in any way.

The correct syntax of a simple formula is:

```
func(<key>|<hostname:key>,<parameter1>,<parameter2>,...)
```

Where:

ARGUMENT	DEFINITION
func	One of the functions supported in trigger expressions: last, min, max, avg, count, etc
key	The key of another item whose data you want to use. It may be defined as key or hostname:key . <i>Note:</i> Putting the whole key in double quotes ("...") is strongly recommended to avoid incorrect parsing because of spaces or commas within the key. If there are also quoted parameters within the key, those double quotes must be escaped by using the backslash (\). See Example 5 below.
parameter(s)	Function parameter(s), if required.

Note:

All items that are referenced from the calculated item formula must exist and be collecting data. Also, if you change the item key of a referenced item, you have to manually update any formulas using that key.

Attention:

User **macros** in the formula will be expanded if used to reference a function parameter or a constant. User macros will NOT be expanded if referencing a function, host name, item key, item key parameter or operator.

A more complex formula may use a combination of functions, operators and brackets. You can use all functions and **operators** supported in trigger expressions. Note that the syntax is slightly different, however logic and operator precedence are exactly the same.

Unlike trigger expressions, Zabbix processes calculated items according to the item update interval, not upon receiving a new value.

Note:

If the calculation result is a float value it will be trimmed to an integer if the calculated item type of information is *Numeric (unsigned)*.

A calculated item may become unsupported in several cases:

1. referenced item(s) not found
2. no data to calculate a function
3. division by zero
4. incorrect syntax used

Support for calculated items was introduced in Zabbix 1.8.1.

3 Usage examples

Example 1

Calculating percentage of free disk space on '/'.

Use of function **last**:

```
100*last("vfs.fs.size[/,free]"/last("vfs.fs.size[/,total])
```

Zabbix will take the latest values for free and total disk spaces and calculate percentage according to the given formula.

Example 2

Calculating a 10-minute average of the number of values processed by Zabbix.

Use of function **avg**:

```
avg("Zabbix Server:zabbix[wcache,values]",600)
```

Note that extensive use of calculated items with long time periods may affect performance of Zabbix server.

Example 3

Calculating total bandwidth on eth0.

Sum of two functions:

```
last("net.if.in[eth0,bytes]")+last("net.if.out[eth0,bytes]")
```

Example 4

Calculating percentage of incoming traffic.

More complex expression:

```
100*last("net.if.in[eth0,bytes]"/(last("net.if.in[eth0,bytes]")+last("net.if.out[eth0,bytes]"))
```

Example 5

Using aggregated items correctly within a calculated item.

Take note of how double quotes are escaped within the quoted key:

```
last("grpsum[\"video\", \"net.if.out[eth0,bytes]\", \"last\"]") / last("grpsum[\"video\", \"nginx_stat.sh[act
```

8 Internal checks

1 Overview

Internal checks allow to monitor the internal processes of Zabbix. In other words, you can monitor what goes on with Zabbix server or Zabbix proxy.

Internal checks are calculated:

- on Zabbix server - if the host is monitored by server
- on Zabbix proxy - if the host is monitored by proxy

Internal checks are processed by server or proxy regardless of host maintenance status (since Zabbix 2.4.0).

To use this item, choose the **Zabbix internal** item type.

Note:

Internal checks are processed by Zabbix pollers.

2 Supported checks

- Parameters without angle brackets are constants - for example, 'host' and 'available' in `zabbix[host,<type>,available]`. Use them in the item key *as is*.
- Values for items and item parameters that are "not supported on proxy" can only be gathered if the host is monitored by server. And vice versa, values "not supported on server" can only be gathered if the host is monitored by proxy.

Key			
▲	Description	Return value	Comments
zabbix[boottime]	Startup time of Zabbix server or Zabbix proxy process in seconds.	Integer.	
zabbix[history]	Number of values stored in table HISTORY	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! <i>(not supported on proxy)</i>
zabbix[history_log]	Number of values stored in table HISTORY_LOG	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! This item is supported starting with Zabbix 1.8.3 . <i>(not supported on proxy)</i>
zabbix[history_str]			

Key			
	Number of values stored in table HISTORY_STR	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! <i>(not supported on proxy)</i>
zabbix[history_text]	Number of values stored in table HISTORY_TEXT	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! This item is supported starting with Zabbix 1.8.3. <i>(not supported on proxy)</i>
zabbix[history_uint]	Number of values stored in table HISTORY_UINT	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! This item is supported starting with Zabbix 1.8.3. <i>(not supported on proxy)</i>
zabbix[host,,items]	Number of enabled items (supported and not supported) on the host.	Integer.	This item is supported starting with Zabbix 3.0.0.
zabbix[host,,items_unsupported]	Number of enabled unsupported items on the host.	Integer.	This item is supported starting with Zabbix 3.0.0.
zabbix[host,,maintenance]			

	Returns current maintenance status of a host.	0 - host in normal state, 1 - host in maintenance with data collection, 2 - host in maintenance without data collection.	This item is always processed by Zabbix server regardless of host location (on server or proxy). The proxy will not receive this item with configuration data. The second parameter must be empty and is reserved for future use. This item is supported starting with Zabbix 2.4.0 .
zabbix[host,<type>,available]	Returns availability of a particular type of checks on the host. The value of this item corresponds to availability icons in the host list.	0 - not available, 1 - available, 2 - unknown.	Valid types are: agent , snmp , ipmi , jmx . The item value is calculated according to configuration parameters regarding host unreachability/unavailability . This item is supported starting with Zabbix 2.0.0 .
zabbix[hosts]	Number of monitored hosts	Integer.	This item is supported starting with Zabbix 2.2.0 .
zabbix[items]			

Key			
	Number of enabled items (supported and not supported)	Integer.	
zabbix[items_unsupported]			
	Number of not supported items	Integer.	
zabbix[java,,<param>]			
	Returns information associated with Zabbix Java gateway.	If <param> is ping , "1" is returned. Can be used to check Java gateway availability using nodata() trigger function.	Valid values for <param> are: <i>ping</i> , <i>version</i> Second parameter must be empty and is reserved for future use.
		If <param> is version , version of Java gateway is returned. Example: "2.0.0".	This item is supported starting with Zabbix 2.0.0 .
zabbix[process,<type>,<mode>,<state>]			

Time a particular Zabbix process or a group of processes (identified by <type> and <mode>) spent in <state> in percentage. It is calculated for the last minute only.

If <mode> is Zabbix process number that is not running (for example, with 5 pollers running <mode> is specified to be 6), such an item will turn into unsupported state. Minimum and maximum refers to the usage percentage for a single process. So if in a group of 3 pollers usage percentages per process were 2, 18 and 66, min would return 2 and max would return 66. Processes report what they are doing in shared memory and the self-monitoring process summarizes that data

Percentage of time. Float.

The following process types are currently supported:
alerter - process for sending notifications (*not supported on proxy*)
configuration syncer - process for managing in-memory cache of configuration data
data sender - proxy data sender (*not supported on server*)
db watchdog - sender of a warning message in case DB is not available (*not supported on proxy*)
discoverer - process for discovery of devices
escalator - process for escalation of actions (*not supported on proxy*)
heartbeat sender - proxy heartbeat sender (*not supported on server*)
history syncer - history DB writer
housekeeper - process for removal of old historical data
http poller - web

Key			
zabbix[proxy,<name>,<param>]	Access to Zabbix proxy related information.	Integer.	<p><name> - proxy name</p> <p>List of supported parameters (<param>):</p> <p>lastaccess - timestamp of last heart beat message received from proxy</p> <p>Example: => zabbix[proxy,"Germany",lastaccess]</p> <p>fuzzytime() trigger function can be used to check availability of proxies. Starting with Zabbix 2.4.0 this item is always processed by Zabbix server regardless of host location (on server or proxy).</p>
zabbix[proxy_history]	Number of values in proxy history table waiting to be sent to the server	Integer.	<p>This item is supported starting with Zabbix 2.2.0. (not supported on server)</p>
zabbix[queue,<from>,<to>]			

Key			
	Number of monitored items in the queue which are delayed at least by <from> seconds but less than by <to> seconds.	Integer.	<from> - default: 6 seconds <to> - default: infinity Time-unit symbols (s,m,h,d,w) are supported for these parameters. Parameters from and to are supported starting with Zabbix 1.8.3.
zabbix[rccache,<cache>,<mode>]	Availability statistics of Zabbix configuration cache.	Integer (for size); float (for percentage).	Cache: buffer Mode: total - total size of buffer free - size of free buffer pfree - percentage of free buffer used - size of used buffer
zabbix[requiredperformance]	Required performance of the Zabbix server or Zabbix proxy, in new values per second expected.	Float.	Approximately correlates with "Required server performance, new values per second" in <i>Reports</i> → Status of Zabbix . This item is supported starting with Zabbix 1.6.2.
zabbix[trends]	Number of values stored in table TRENDS	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! (<i>not supported on proxy</i>)

Key

zabbix[trends_uint]	Number of values stored in table TRENDS_UINT	Integer.	Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! This item is supported starting with Zabbix 1.8.3. <i>(not supported on proxy)</i>
zabbix[triggers]	Number of enabled triggers in Zabbix database, with all items enabled on enabled hosts.	Integer.	<i>(not supported on proxy)</i>
zabbix[uptime]	Uptime of Zabbix server or Zabbix proxy process in seconds.	Integer.	
zabbix[vcache,buffer,<mode>]	Availability statistics of Zabbix value cache.	Integer (for size); float (for percentage).	Mode: total - total size of buffer free - size of free buffer pfree - percentage of free buffer used - size of used buffer pused - percentage of used buffer This item is supported starting with Zabbix 2.2.0. <i>(not supported on proxy)</i>
zabbix[vcache,cache,<parameter>]			

Effectiveness
statistics of
Zabbix value
cache.

Integer.

With the
mode
parameter:
0 - normal
mode,
1 - low
memory
mode

Parameter:
requests -
total number
of requests
hits -
number of
cache hits
(history
values taken
from the
cache)
misses -
number of
cache
misses
(history
values taken
from the
database)
mode -
value cache
operating
mode
This item is
supported
starting with
Zabbix
2.2.0 and
the **mode**
parameter
starting with
Zabbix
3.0.0.
(*not
supported
on proxy*)

Once the
low memory
mode has
been
switched on,
the value
cache will
remain in
this state for
24 hours,
even if the
problem that
triggered
this mode is
resolved
sooner.

You may use
this key with
a *Delta*
(*speed per
second*)
store value
in order to
get values
per second
statistics.

Key

zabbix[vmware,buffer,<mode>]

Availability statistics of Zabbix vmware cache.

Integer (for size); float (for percentage).

Mode:
total - total size of buffer
free - size of free buffer
pfree - percentage of free buffer
used - size of used buffer
pused - percentage of used buffer

This item is supported starting with Zabbix **2.2.0**.

zabbix[wcache,<cache>,<mode>]

Statistics and availability of Zabbix write cache.

Cache
values

Mode
all
(*default*)

Total number of values processed by Zabbix server or Zabbix proxy, except unsupported items.

Integer.

Specifying <cache> is mandatory.

Counter. You may use this key with a *Delta (speed per second)* store value in order to get values per second statistics. Counter.

float

Number of processed float values.

Integer.

Counter.

uint

Number of processed unsigned integer values.

Integer.

Counter.

str

Number of processed character/string values.

Integer.

Counter.

log

Number of processed log values.

Integer.

Counter.

text

Number of processed text values.

Integer.

Counter.

	not supported	Number of times item processing resulted in item becoming unsupported or keeping that state.	Integer.	Counter. <i>Not supported</i> mode is supported starting with Zabbix 1.8.6 .
history	pfree (default)	Percentage of free history buffer.	Float.	History cache is used to store item values. A low number indicates performance problems on the database side.
	free	Size of free history buffer.	Integer.	
	total	Total size of history buffer.	Integer.	
	used	Size of used history buffer.	Integer.	
index	pfree (default)	Percentage of free history index buffer.	Float.	History index cache is used to index values stored in history cache. <i>Index</i> cache is supported starting with Zabbix 3.0.0 .
	free	Size of free history index buffer.	Integer.	
	total	Total size of history index buffer.	Integer.	
	used	Size of used history index buffer.	Integer.	

Key					
	trend	pfree (default)	Percentage of free trend cache.	Float.	Trend cache stores aggregate for the current hour for all items that receive data. (not supported on proxy)
		free	Size of free trend buffer.	Integer.	(not supported on proxy)
		total	Total size of trend buffer.	Integer.	(not supported on proxy)
		used	Size of used trend buffer.	Integer.	(not supported on proxy)

9 SSH checks

1 Overview

SSH checks are performed as agent-less monitoring. Zabbix agent is not needed for SSH checks.

To perform SSH checks Zabbix server must be **initially configured** with SSH2 support.

Attention:

The minimum supported libssh2 library version is 1.0.0.

2 Configuration

2.1 Passphrase authentication

SSH checks provide two authentication methods, a user/password pair and key-file based.

If you do not intend to use keys, no additional configuration is required, besides linking libssh2 to Zabbix, if you're building from source.

2.2 Key file authentication

To use key based authentication for SSH items, certain changes to the server configuration are required.

Open the Zabbix server configuration file (**zabbix_server.conf**) as root and look for the following line:

```
# SSHKeyLocation=
```

Uncomment it and set full path to a folder where public and private keys will be located:

```
SSHKeyLocation=/home/zabbix/.ssh
```

Save the file and restart zabbix_server afterwards.

/home/zabbix here is the home directory for the *zabbix* user account and *.ssh* is a directory where by default public and private keys will be generated by a **ssh-keygen** command inside the home directory.

Usually installation packages of zabbix-server from different OS distributions create the *zabbix* user account with a home directory in not very well-known places (as for system accounts). For example, for CentOS it's */var/lib/zabbix*, for Debian it's */var/run/zabbix*.

Before starting to generate the keys, an approach to reallocate the home directory to a better known place (intuitively expected) could be considered. This will correspond with the *SSHKeyLocation* Zabbix server configuration parameter mentioned above.

These steps can be skipped if *zabbix* account has been added manually according to the **installation section** because in this case most likely the home directory is already located at */home/zabbix*.

To change the setting for the *zabbix* user account all working processes which are using it have to be stopped:

Now it's possible to check the SSH login using the default private key (*/home/zabbix/.ssh/id_rsa*) for *zabbix* user account:

```
# sudo -u zabbix ssh root@10.10.10.10
```

If the login is successful, then the configuration part in the shell is finished and remote SSH session can be closed.

2.4 Item configuration

Actual command(s) to be executed must be placed in the **Executed script** field in the item configuration. Multiple commands can be executed one after another by placing them on a new line. In this case returned values also will be formatted as multi lined.

Name

SSH test check (without passphrase)

Type

SSH agent

Key

ssh.run[clear]

Host interface

192.168.3.239 : 10050

Authentication method

Public key

User name

root

Public key file

id_rsa.pub

Private key file

id_rsa

Key passphrase

Executed script

service mysql-server status

Type of information

Text

Update interval (in sec)

60

The fields that require specific information for SSH items are:

Parameter	Description	Comments
Type	Select SSH agent here.	

Parameter	Description	Comments
Key	Unique (per host) item key in format ssh.run[<unique short description>,<ip>,<port>,<encoding>]	<unique short description> is required and should be unique for all SSH items per host Default port is 22, not the port specified in the interface to which this item is assigned
Authentication method	One of the "Password" or "Public key"	
User name	User name to authenticate on remote host. Required	
Public key file	File name of public key if <i>Authentication method</i> is "Public key". Required	Example: <i>id_rsa.pub</i> - default public key file name generated by a command ssh-keygen
Private key file	File name of private key if <i>Authentication method</i> is "Public key". Required	Example: <i>id_rsa</i> - default private key file name
Password or Key passphrase	Password to authenticate or Passphrase if it was used for the private key	Leave the <i>Key passphrase</i> field empty if passphrase was not used See also known issues regarding passphrase usage
Executed script	Executed shell command(s) using SSH remote session	Examples: <i>date +%s</i> <i>service mysql-server status</i> <i>ps auxww grep httpd wc -l</i>

Attention:

libssh2 library may truncate executable scripts to ~32kB.

10 Telnet checks

1 Overview

Telnet checks are performed as agent-less monitoring. Zabbix agent is not needed for Telnet checks.

2 Configurable fields

Actual command(s) to be executed must be placed in the **Executed script** field in the item configuration.

Multiple commands can be executed one after another by placing them on a new line. In this case returned value also will be formatted as multi lined.

Supported characters that the shell prompt can end with:

- \$
- #
- .
- %

Note:

A telnet prompt line which ended with one of these characters will be removed from the returned value, but only for the first command in the commands list, i.e. only at a start of the telnet session.

Key	Description	Comments
telnet.run[<unique short description>,<ip>,<port>,<encoding>]	Run a command on a remote device using telnet connection	

Attention:

If a telnet check returns a value with non-ASCII characters and in non-UTF8 encoding then the *<encoding>* parameter of the key should be properly specified. See [encoding of returned values](#) page for more details.

11 External checks

1 Overview

External check is a check executed by Zabbix server by running a shell script or a binary. However, when hosts are monitored by a Zabbix proxy, the external checks are executed by the proxy.

External checks do not require any agent running on a host being monitored.

The syntax of the item key is:

```
script[<parameter1>,<parameter2>,...]
```

Where:

ARGUMENT	DEFINITION
script	Name of a shell script or a binary.
parameter(s)	Optional command line parameters.

If you don't want to pass any parameters to the script you may use:

```
script[] or
script
```

Zabbix server will look in the directory defined as the location for external scripts (parameter 'ExternalScripts' in [Zabbix server configuration file](#)) and execute the command. The command will be executed as the user Zabbix server runs as, so any access permissions or environment variables should be handled in a wrapper script, if necessary, and permissions on the command should allow that user to execute it. Only commands in the specified directory are available for execution.

Warning:

Do not overuse external checks! As each script requires starting a fork process by Zabbix server, running many scripts can decrease Zabbix performance a lot.

2 Usage example

Executing the script **check_oracle.sh** with the first parameters "-h". The second parameter will be replaced by IP address or DNS name, depending on the selection in the host properties.

```
check_oracle.sh["-h","{HOST.CONN}"]
```

Assuming host is configured to use IP address, Zabbix will execute:

```
check_oracle.sh "-h" "192.168.1.4"
```

3 External check result

The return value of the check is standard output together with standard error (the full output with trimmed trailing whitespace is returned since Zabbix 2.0).

Attention:

A text (character, log or text type of information) item will not become unsupported in case of standard error output.

In case the requested script is not found or Zabbix server has no permissions to execute it, item will become unsupported and corresponding error message will be set. In case of a timeout, the item will be marked as unsupported as well, an according error message will be displayed and the forked process for the script will be killed.

12 Aggregate checks

Overview

In aggregate checks Zabbix server collects aggregate information from items by doing direct database queries.

Aggregate checks do not require any agent running on the host being monitored.

Syntax

The syntax of the aggregate item key is:

```
groupfunc["host group","item key",itemfunc,timeperiod]
```

Supported group functions (groupfunc) are:

Group function	Description
<i>grpavg</i>	Average value
<i>grpmax</i>	Maximum value
<i>grpmin</i>	Minimum value
<i>grpsum</i>	Sum of values

Multiple host groups may be included by inserting a comma-delimited array.

All items that are referenced from the aggregate item key must exist and be collecting data. Only enabled items on enabled hosts are included in the calculations.

Attention:

The key of the aggregate item must be updated manually, if the item key of a referenced item is changed.

Supported item functions (itemfunc) are:

Item function	Description
<i>avg</i>	Average value
<i>count</i>	Number of values
<i>last</i>	Last value
<i>max</i>	Maximum value
<i>min</i>	Minimum value
<i>sum</i>	Sum of values

The **timeperiod** parameter specifies a time period of latest collected values. **Supported unit symbols** can be used in this parameter for convenience, for example '5m' (minutes) instead of '300' (seconds) or '1d' (day) instead of '86400' (seconds).

Warning:

An amount of values (prefixed with #) is not supported in the timeperiod.

Timeperiod is ignored by the server if the third parameter (item function) is *last* and can thus be omitted:

```
groupfunc["host group","item key",last]
```

Note:

If the aggregate results in a float value it will be trimmed to an integer if the aggregated item type of information is *Numeric (unsigned)*.

An aggregate item may become unsupported in several cases:

- none of the referenced items is found (which may happen if the item key is incorrect, none of the items exists or all included groups are incorrect)
- no data to calculate a function

Usage examples

Examples of keys for aggregate checks:

Example 1

Total disk space of host group 'MySQL Servers'.

```
grpsum["MySQL Servers","vfs.fs.size[/,total]",last]
```

Example 2

Average processor load of host group 'MySQL Servers'.

```
grpavg["MySQL Servers","system.cpu.load[,avg1]",last]
```

Example 3

5-minute average of the number of queries per second for host group 'MySQL Servers'.

```
grpavg["MySQL Servers",mysql.qps,avg,5m]
```

Example 4

Average CPU load on all hosts in multiple host groups.

```
grpavg[["Servers A","Servers B","Servers C"],system.cpu.load,last]
```

13 Trapper items

Overview

Trapper items accept incoming data instead of querying for it.

It is useful for any data you might want to "push" into Zabbix.

To use a trapper item you must:

- have a trapper item set up in Zabbix
- send in the data into Zabbix

Configuration

Item configuration

To configure a trapper item:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item*
- Enter parameters of the item in the form

The screenshot shows the Zabbix item configuration form. The fields are as follows:

- Name:** Trapper item
- Type:** Zabbix trapper (selected from a dropdown)
- Key:** trap (with a **Select** button to the right)
- Type of information:** Text (selected from a dropdown)
- History storage period (in days):** 7
- Allowed hosts:** (empty text field)

The fields that require specific information for trapper items are:

Type

Key

Type of information

Select **Zabbix trapper** here.

Enter a key that will be used to recognize the item when sending in data.

Select the type of information that will correspond the format of data that will be sent in.

Allowed hosts

If specified, the trapper will accept incoming data only from this comma-delimited list of hosts.
Hosts are identified by IP address/DNS name. For example:
Single IP: 192.168.1.33
List of IP addresses: 192.168.56.5, 192.168.56.6, 192.168.56.7
Single DNS name: testzabbix.zabbix.com
List of DNS names: testzabbix, testzabbix.zabbix.com, testzabbix1.zabbix.com
Spaces and **user macros** are allowed in this field since Zabbix 2.2.0.

Note:

You may have to wait up to 60 seconds after saving the item until the server picks up the changes from a configuration cache update, before you can send in values.

Sending in data

In the simplest of cases, we may use **zabbix_sender** utility to send in some 'test value':

```
zabbix_sender -z <server IP address> -p 10051 -s "New host" -k trap -o "test value"
```

To send in the value we use these keys:

- z - to specify Zabbix server IP address
- p - to specify Zabbix server port number (10051 by default)
- s - to specify the host (make sure to use the 'technical' **host name** here, instead of the 'visible' name)
- k - to specify the key of the item we just defined
- o - to specify the actual value to send

Attention:

Zabbix trapper process does not expand macros used in the item key in attempt to check corresponding item key existence for targeted host.

Display

This is the result in *Monitoring* → *Latest data*:

▼ <input type="checkbox"/> HOST	NAME ▼	LAST CHECK	LAST VALUE	CHANGE
▼ New host	- other - (2 items)			
<input type="checkbox"/>	Trapper item	2015-08-11 18:50:53	test value	History

Note that if a single numeric value is sent in, the data graph will show a horizontal line to the left and to the right of the time point of the value.

Timestamps

If values are sent using **zabbix_sender** from a file with timestamps, then these timestamps will be adjusted to match server time. For instance, if an item's timestamp is "10:30:50", the current time on **zabbix_sender**'s machine is "10:40:03", and the current time on Zabbix server's machine is "10:40:05", then the item's value will be stored in the database with a timestamp of "10:30:52".

Similarly, if a value is first sent to Zabbix proxy, which later sends it to Zabbix server, the timestamp will be first adjusted to match Zabbix proxy time, and then it will be adjusted to match Zabbix server time.

14 JMX monitoring

1 Overview

JMX monitoring can be used to monitor JMX counters of a Java application.

JMX monitoring has native support in Zabbix in the form of a Zabbix daemon called "Zabbix Java gateway", introduced since Zabbix 2.0.

To retrieve the value of a particular JMX counter on a host, Zabbix server queries the Zabbix **Java gateway**, which in turn uses the [JMX management API](#) to query the application of interest remotely.

For more details and setup see the [Zabbix Java gateway](#) section.

Warning:

Communication between Java gateway and the monitored JMX application should not be firewalled.

2 Enabling remote JMX monitoring for Java application

A Java application does not need any additional software installed, but it needs to be started with the command-line options specified below to have support for remote JMX monitoring.

As a bare minimum, if you just wish to get started by monitoring a simple Java application on a local host with no security enforced, start it with these options:

```
java \
-Dcom.sun.management.jmxremote \
-Dcom.sun.management.jmxremote.port=12345 \
-Dcom.sun.management.jmxremote.authenticate=false \
-Dcom.sun.management.jmxremote.ssl=false \
-jar /usr/share/doc/openjdk-6-jre-headless/demo/jfc/Notepad/Notepad.jar
```

This makes Java listen for incoming JMX connections on port 12345, from local host only, and tells it not to require authentication or SSL.

If you want to allow connections on another interface, set the `-Djava.rmi.server.hostname` parameter to the IP of that interface.

If you wish to be more stringent about security, there are many other Java options available to you. For instance, the next example starts the application with a more versatile set of options and opens it to a wider network, not just local host.

```
java \
-Djava.rmi.server.hostname=192.168.3.14 \
-Dcom.sun.management.jmxremote \
-Dcom.sun.management.jmxremote.port=12345 \
-Dcom.sun.management.jmxremote.authenticate=true \
-Dcom.sun.management.jmxremote.password.file=/etc/java-6-openjdk/management/jmxremote.password \
-Dcom.sun.management.jmxremote.access.file=/etc/java-6-openjdk/management/jmxremote.access \
-Dcom.sun.management.jmxremote.ssl=true \
-Djavax.net.ssl.keyStore=$YOUR_KEY_STORE \
-Djavax.net.ssl.keyStorePassword=$YOUR_KEY_STORE_PASSWORD \
-Djavax.net.ssl.trustStore=$YOUR_TRUST_STORE \
-Djavax.net.ssl.trustStorePassword=$YOUR_TRUST_STORE_PASSWORD \
-Dcom.sun.management.jmxremote.ssl.need.client.auth=true \
-jar /usr/share/doc/openjdk-6-jre-headless/demo/jfc/Notepad/Notepad.jar
```

Most (if not all) of these settings can be specified in `/etc/java-6-openjdk/management/management.properties` (or wherever that file is on your system).

Note that if you wish to use SSL, you have to modify `startup.sh` script by adding `-Djavax.net.ssl.*` options to Java gateway, so that it knows where to find key and trust stores.

See [Monitoring and Management Using JMX](#) for a detailed description.

3 Configuring JMX interfaces and items in Zabbix GUI

With Java gateway running, server knowing where to find it and a Java application started with support for remote JMX monitoring, it is time to configure the interfaces and items in Zabbix GUI.

Configuring JMX interface

You begin by creating a JMX-type interface on the host of interest:

Hosts

Host Templates IPMI Macros Host inventory

Host name

Visible name

Groups

In groups

Java

Other groups

Database servers

Discovered hosts

Hypervisors

Linux servers

Network devices

Templates

UPS devices

Virtual machines

Web servers

Windows servers

New group

Agent interfaces

IP addressDNS nameConnect toPortDefault

[Add](#)

SNMP interfaces

[Add](#)

JMX interfaces

...

192.168.3.194

IPDNS

12345

Remove

[Add](#)

IPMI interfaces

[Add](#)

Description

Monitored by proxy

(no proxy)

Enabled

☒

Adding JMX agent item

For each JMX counter you are interested in you add an item of type **JMX agent** attached to that interface. If you have configured authentication on your Java application, then you also specify username and password.

The key in the screenshot below says `jmx["java.lang:type=Memory", "HeapMemoryUsage.used"]`. The key consists of 2 parameters:

- object name - which represents the object name of an MBean
- attribute name - an MBean attribute name with optional composite data field names separated by dots

See below for more detail on JMX item keys.

Name

Type

Key

Host interface

User name

Password

Type of information

Data type

Units

Use custom multiplier ☐

Update interval (in sec)

Flexible intervals

Interval	Period	Action
No flexible intervals defined.		

New flexible interval Interval (in sec) Period [Add](#)

History storage period (in days)

Trend storage period (in days)

Store value

Show value [show value mappings](#)

New application

Applications

Populates host inventory field

Description

Enabled ☒

If you wish to monitor a Boolean counter that is either "true" or "false", then you specify type of information as "Numeric (unsigned)" and data type as "Boolean". Server will store Boolean values as 1 or 0, respectively.

JMX item keys in more detail

Simple attributes

An MBean object name is nothing but a string which you define in your Java application. An attribute name, on the other hand, can be more complex. In case an attribute returns primitive data type (an integer, a string etc.) there is nothing to worry about, the key will look like this:

```
jmx[com.example:Type=Hello,weight]
```

In this example an object name is "com.example:Type=Hello", attribute name is "weight" and probably the returned value type should be "Numeric (float)".

Attributes returning composite data

It becomes more complicated when your attribute returns composite data. For example: your attribute name is "apple" and it returns a hash representing its parameters, like "weight", "color" etc. Your key may look like this:

```
jmx[com.example:Type=Hello,apple.weight]
```

This is how an attribute name and a hash key are separated, by using a dot symbol. Same way, if an attribute returns nested composite data the parts are separated by a dot:

```
jmx[com.example:Type=Hello,fruits.apple.weight]
```

Problem with dots

So far so good. But what if an attribute name or a hash key contains dot symbol? Here is an example:

```
jmx[com.example:Type=Hello,all.fruits.apple.weight]
```

That's a problem. How to tell Zabbix that attribute name is "all.fruits", not just "all"? How to distinguish a dot that is part of the name from the dot that separates an attribute name and hash keys?

Before **2.0.4** Zabbix Java gateway was unable to handle such situations and users were left with UNSUPPORTED items. Since 2.0.4 this is possible, all you need to do is to escape the dots that are part of the name with a backslash:

```
jmx[com.example:Type=Hello,all\.fruits.apple.weight]
```

Same way, if your hash key contains a dot you escape it:

```
jmx[com.example:Type=Hello,all\.fruits.apple.total\.weight]
```

Other issues

A backslash character should be escaped as well:

```
jmx[com.example:type=Hello,c:\\documents]
```

If the object name or attribute name contains spaces or commas double-quote it:

```
jmx["com.example:Type=Hello","fruits.apple.total weight"]
```

This is actually all there is to it. Happy JMX monitoring!

15 ODBC monitoring

1 Overview

ODBC monitoring corresponds to the *Database monitor* item type in the Zabbix frontend.

ODBC is a C programming language middle-ware API for accessing database management systems (DBMS). The ODBC concept was developed by Microsoft and later ported to other platforms.

Zabbix may query any database, which is supported by ODBC. To do that, Zabbix does not directly connect to the databases, but uses the ODBC interface and drivers set up in ODBC. This function allows for more efficient monitoring of different databases for multiple purposes - for example, checking specific database queues, usage statistics and so on. Zabbix supports unixODBC, which is one of the most commonly used open source ODBC API implementations.

Attention:

See also the [known issues](#) for ODBC checks.

2 Installing unixODBC

The suggested way of installing unixODBC is to use the Linux operating system default package repositories. In the most popular Linux distributions unixODBC is included in the package repository by default. If it's not available, it can be obtained at the unixODBC homepage: <http://www.unixodbc.org/download.html>.

Installing unixODBC on RedHat/Fedora based systems using the *yum* package manager:

```
shell> yum -y install unixODBC unixODBC-devel
```

Installing unixODBC on SUSE based systems using the *zypper* package manager:

```
# zypper in unixODBC-devel
```

Note:

The unixODBC-devel package is needed to compile Zabbix with unixODBC support.

3 Installing unixODBC drivers

A unixODBC database driver should be installed for the database, which will be monitored. unixODBC has a list of supported databases and drivers: <http://www.unixodbc.org/drivers.html>. In some Linux distributions database drivers are included in package repositories. Installing MySQL database driver on RedHat/Fedora based systems using the *yum* package manager:

```
shell> yum install mysql-connector-odbc
```

Installing MySQL database driver on SUSE based systems using the *zypper* package manager:

```
zypper in MySQL-connector-odbc
```

4 Configuring unixODBC

ODBC configuration is done by editing the **odbcinst.ini** and **odbc.ini** files. To verify the configuration file location, type:

```
shell> odbcinst -j
```

odbcinst.ini is used to list the installed ODBC database drivers:

```
[mysql]
Description = ODBC for MySQL
Driver       = /usr/lib/libmyodbc5.so
```

Parameter details:

Attribute	Description
<i>mysql</i>	Database driver name.
<i>Description</i>	Database driver description.
<i>Driver</i>	Database driver library location.

odbc.ini is used to define data sources:

```
[test]
Description = MySQL test database
Driver       = mysql
Server       = 127.0.0.1
User         = root
Password     =
Port         = 3306
Database     = zabbix
```

Parameter details:

Attribute	Description
<i>test</i>	Data source name (DSN).
<i>Description</i>	Data source description.
<i>Driver</i>	Database driver name - as specified in odbcinst.ini
<i>Server</i>	Database server IP/DNS.

Attribute	Description
<i>User</i>	Database user for connection.
<i>Password</i>	Database user password.
<i>Port</i>	Database connection port.
<i>Database</i>	Database name.

To verify if ODBC connection is working successfully, a connection to database should be tested. That can be done with the **isql** utility (included in the unixODBC package):

```
shell> isql test
+-----+
| Connected!                                |
|                                           |
| sql-statement                            |
| help [tablename]                         |
| quit                                     |
|                                           |
+-----+
SQL>
```

5 Compiling Zabbix with ODBC support

To enable ODBC support, Zabbix should be compiled with the following flag:

```
--with-unixodbc[=ARG] use odbc driver against unixODBC package
```

Note:

See more about Zabbix installation from the [source code](#).

6 Item configuration in Zabbix frontend

Configure a database monitoring **item**:

The screenshot shows the 'Add item' configuration form in the Zabbix frontend. The fields are filled as follows:

- Name:** MySQL host count
- Type:** Database monitor (selected from a dropdown)
- Key:** db.odbc.select[mysql-simple-check,test] (with a 'Select' button next to it)
- User name:** zabbix
- Password:** (empty field)
- SQL query:** select count(*) from hosts
- Type of information:** Numeric (unsigned) (selected from a dropdown)

Specifically for database monitoring items you must enter:

Type

Select Database monitor here.

Key	Enter
	db.odbc.select [unique_description,data_source_name] The unique description will serve to identify the item in triggers etc. The data source name (DSN) must be set as specified in <code>odbc.ini</code> .
User name	Enter the database user name (optional if user is specified in <code>odbc.ini</code>)
Password	Enter the database user password (optional if password is specified in <code>odbc.ini</code>)
SQL query	Enter the SQL query
Type of information	It is important to know what type of information will be returned by the query, so that it is selected correctly here. With an incorrect <i>type of information</i> the item will turn unsupported.

7 Important notes

- Zabbix does not limit the query execution time. It is up to the user to choose queries that can be executed in a reasonable amount of time.
- The **Timeout** parameter value from Zabbix server is used as the ODBC login timeout (note that depending on ODBC drivers the login timeout setting might be ignored).
- The query must return one value only.
- If a query returns more than one column, only the first column is read.
- If a query returns more than one line, only the first line is read.
- The SQL command must return a result set like any query with `select ...`. The query syntax will depend on the RDBMS which will process them. The syntax of request to a storage procedure must be started with `call` keyword.

8 Error messages

Starting from Zabbix 2.0.8 the ODBC error messages are structured into fields to provide more detailed information. Example:

```
Cannot execute ODBC query: [SQL_ERROR]: [42601] [7] [ERROR: syntax error at or near ";"; Error while executing
-----
|                               |         |  ~- Native error code           ~- error message.
|                               |         |  ~-SQLState
|                               |         |  ~- Zabbix message  ~- ODBC return code
```

Note that the error message length is limited to 2048 bytes, so the message can be truncated. If there is more than one ODBC diagnostic record Zabbix tries to concatenate them as far as the length limit allows.

3 History and trends

Overview

History and trends are the two ways of storing collected data in Zabbix.

Whereas history keeps each collected value, trends keep averaged information on hourly basis and therefore are less resource-hungry.

Keeping history

You can set for how many days history will be kept:

- in the item properties **form**
- when mass-updating items
- when **setting up** housekeeper tasks

Any older data will be removed by the housekeeper.

The general strong advice is to keep history for the smallest possible number of days and that way not to overload the database with lots of historical values.

Instead of keeping a long history, you can keep longer data of trends. For example, you could keep history for 14 days and trends for 5 years.

You can get a good idea of how much space is required by history versus trends data by referring to the [database sizing page](#).

While keeping shorter history, you will still be able to review older data in graphs, as graphs will use trend values for displaying older data.

Attention:

If history is set to '0', the item will update only inventory. No trigger functions will be evaluated.

Keeping trends

Trends is a built-in historical data reduction mechanism which stores minimum, maximum, average and the total number of values per every hour for numeric data types.

You can set for how many days trends will be kept:

- in the item properties **form**
- when mass-updating items
- when setting up Housekeeper tasks

Trends usually can be kept for much longer than history. Any older data will be removed by the housekeeper.

Zabbix server accumulates trend data in runtime in the trend cache, as the data flows in. Server flushes trends into the database (where frontend can find them) in these situations:

- a new hour has started and server receives a new value for the item;
- a new hour is about to end in less than 5 minutes (no new values)
- server stops

To see trends on a graph you need to wait at least to the beginning of the next hour (if item is updated frequently) and at most to the end of the next hour (if item is updated rarely), which is 2 hours maximum.

When server flushes trend cache and there are already trends in the database for this hour (for example, server has been restarted mid-hour), server needs to use update statements instead of simple inserts. Therefore on a bigger installation if restart is needed it is desirable to stop server in the end of one hour and start in the beginning of the next hour to avoid trend data overlap.

History tables do not participate in trend generation in any way.

Attention:

If trends are set to '0', Zabbix server does not calculate or store trends at all.

Note:

The trends are calculated and stored with the same data type as the original values. As a result the average value calculations of unsigned data type values are rounded and the less the value interval is the less precise the result will be. For example if item has values 0 and 1, the average value will be 0, not 0.5.

Also restarting server might result in the precision loss of unsigned data type average value calculations for the current hour.

4 User parameters

Overview

Sometimes you may want to run an agent check that does not come predefined with Zabbix. This is where user parameters come to help.

You may write a command that retrieves the data you need and include it in the user parameter in the **agent configuration file** ('UserParameter' configuration parameter).

A user parameter has the following syntax:

```
UserParameter=<key>,<command>
```

As you can see, a user parameter also contains a key. The key will be necessary when configuring an item. Enter a key of your choice that will be easy to reference (it must be unique within a host). Restart the agent.

Then, when **configuring an item**, enter the key to reference the command from the user parameter you want executed.

User parameters are commands executed by Zabbix agent. Up to 512KB of data can be returned. Note, however, that the text value that can be eventually stored in database is limited to 64KB on MySQL (see info on other databases in the **table**).

/bin/sh is used as a command line interpreter under UNIX operating systems. User parameters obey the agent check timeout; if timeout is reached the forked user parameter process is terminated.

See also:

- [Step-by-step tutorial](#) on making use of user parameters
- [Command execution](#)

Examples of simple user parameters

A simple command:

```
UserParameter=ping,echo 1
```

The agent will always return '1' for an item with 'ping' key.

A more complex example:

```
UserParameter=mysql.ping,mysqladmin -uroot ping | grep -c alive
```

The agent will return '1', if MySQL server is alive, '0' - otherwise.

Flexible user parameters

Flexible user parameters accept parameters with the key. This way a flexible user parameter can be the basis for creating several items.

Flexible user parameters have the following syntax:

```
UserParameter=key[*],command
```

Parameter	Description
Key	Unique item key. The [*] defines that this key accepts parameters within the brackets.
Command	Parameters are given when configuring the item. Command to be executed to evaluate value of the key. <i>For flexible user parameters only:</i> You may use positional references \$1...\$9 in the command to refer to the respective parameter in the item key. Zabbix parses the parameters enclosed in [] of the item key and substitutes \$1,...,\$9 in the command accordingly. \$0 will be substituted by the original command (prior to expansion of \$0,...,\$9) to be run. Positional references are interpreted regardless of whether they are enclosed between double (") or single (') quotes. To use positional references unaltered, specify a double dollar sign - for example, awk '{print \$\$2}'. In this case \$\$2 will actually turn into \$2 when executing the command.

Attention:

Positional references with the \$ sign are searched for and replaced by Zabbix agent only for flexible user parameters. For simple user parameters, such reference processing is skipped and, therefore, any \$ sign quoting is not necessary.

Attention:

Certain symbols are not allowed in user parameters by default. See [UnsafeUserParameters](#) documentation for a full list.

Example 1

Something very simple:

```
UserParameter=ping[*],echo $1
```

We may define unlimited number of items for monitoring all having format ping[something].

- ping[0] - will always return '0'
- ping[aaa] - will always return 'aaa'

Example 2

Let's add more sense!

```
UserParameter=mysql.ping[*],mysqladmin -u$1 -p$2 ping | grep -c alive
```

This parameter can be used for monitoring availability of MySQL database. We can pass user name and password:

```
mysql.ping[zabbix,our_password]
```

Example 3

How many lines matching a regular expression in a file?

```
UserParameter=wc[*],grep -c "$2" $1
```

This parameter can be used to calculate number of lines in a file.

```
wc[/etc/passwd,root]
```

```
wc[/etc/services,zabbix]
```

Command result

The return value of the command is standard output together with standard error.

Attention:

A text (character, log or text type of information) item will not become unsupported in case of standard error output.

User parameters that return text (character, log, text type of information) can return whitespace. In case of invalid result item will become unsupported.

1 Extending Zabbix agents

This tutorial provides step-by-step instructions on how to extend the functionality of Zabbix agent with the use of a **user parameter**.

Step 1

Write a script or command line to retrieve required parameter.

For example, we may write the following command in order to get total number of queries executed by a MySQL server:

```
mysqladmin -uroot status | cut -f4 -d":" | cut -f1 -d"S"
```

When executed, the command returns total number of SQL queries.

Step 2

Add the command to zabbix_agentd.conf:

```
UserParameter=mysql.questions,mysqladmin -uroot status | cut -f4 -d":" | cut -f1 -d"S"
```

mysql.questions is a unique identifier. It can be any valid key identifier, for example, *queries*.

Test this parameter by using Zabbix agent with "-t" flag (if running under root, however, note that the agent may have different permissions when launched as a daemon):

```
zabbix_agentd -t mysql.questions
```

Step 3

Restart Zabbix agent.

Agent will reload configuration file.

Test this parameter by using **zabbix_get** utility.

Step 4

Add new item with Key=mysql.questions to the monitored host. Type of the item must be either Zabbix Agent or Zabbix Agent (active).

Be aware that type of returned values must be set correctly on Zabbix server. Otherwise Zabbix won't accept them.

5 Loadable modules

1 Overview

Loadable modules offer a performance-minded option for extending Zabbix functionality.

There already are ways of extending Zabbix functionality by way of:

- **user parameters** (agent metrics)

- **external checks** (agent-less monitoring)
- `system.run[]` Zabbix **agent item**.

They work very well, but have one major drawback, namely `fork()`. Zabbix has to fork a new process every time it handles a user metric, which is not good for performance. It is not a big deal normally, however it could be a serious issue when monitoring embedded systems, having a large number of monitored parameters or heavy scripts with complex logic or long startup time.

Support of loadable modules offers ways for extending Zabbix agent, server and proxy without sacrificing performance.

A loadable module is basically a shared library used by Zabbix daemon and loaded on startup. The library should contain certain functions, so that a Zabbix process may detect that the file is indeed a module it can load and work with.

Loadable modules have a number of benefits. Great performance and ability to implement any logic are very important, but perhaps the most important advantage is the ability to develop, use and share Zabbix modules. It contributes to trouble-free maintenance and helps to deliver new functionality easier and independently of the Zabbix core code base.

Module licensing and distribution in binary form is governed by the GPL license (modules are linking with Zabbix in runtime and are using Zabbix headers; currently the whole Zabbix code is licensed under GPL license). Binary compatibility is not guaranteed by Zabbix.

Module API stability is guaranteed during one Zabbix LTS (Long Term Support) [release](#) cycle. Stability of Zabbix API is not guaranteed (technically it is possible to call Zabbix internal functions from a module, but there is no guarantee that such modules will work).

2 Module API

In order for a shared library to be treated as a Zabbix module, it should implement and export several functions. There are currently five functions in the Zabbix module API, two of which are mandatory and the other three are optional.

2.1 Mandatory interface

The two mandatory functions are **`zbx_module_api_version()`** and **`zbx_module_init()`**:

```
int zbx_module_api_version(void);
```

This function should return the API version implemented by this module. Currently, there is only one version, `ZBX_MODULE_API_VERSION_ONE` (defined to 1), so this function should return this constant.

```
int zbx_module_init(void);
```

This function should perform the necessary initialization for the module (if any). If successful, it should return `ZBX_MODULE_OK`. Otherwise, it should return `ZBX_MODULE_FAIL`.

These two functions are mandatory in a sense that if any of them is absent from module API or any of them returns an unacceptable result when called for any module in the list of modules to load Zabbix will not start.

2.2 Optional interface

The three optional functions are **`zbx_module_item_list()`**, **`zbx_module_item_timeout()`**, **`zbx_module_uninit()`**:

```
ZBX_METRIC *zbx_module_item_list(void);
```

This function should return a list of items supported by the module. Zabbix reads the list of supported items only once on startup. New items cannot be added during the operation. Each item is defined in a `ZBX_METRIC` structure, see the section below for details. The list is terminated by a `ZBX_METRIC` structure with "key" field of `NULL`. If this function is absent from the module API, Zabbix will unload the module and proceed with loading other modules.

```
void zbx_module_item_timeout(int timeout);
```

This function is used by Zabbix to specify the timeout settings in Zabbix configuration file that the module should obey. Here, the "timeout" parameter is in seconds.

```
int zbx_module_uninit(void);
```

This function should perform the necessary uninitialization (if any) like freeing allocated resources, closing file descriptors, etc.

All functions are called once on Zabbix startup when the module is loaded, with the exception of `zbx_module_uninit()`, which is called once on Zabbix shutdown when the module is unloaded.

2.3 Defining items

Each item is defined in a `ZBX_METRIC` structure:

```
typedef struct
{
    char *key;
```

```

    unsigned    flags;
    int         (*function)();
    char        *test_param;
}
ZBX_METRIC;

```

Here, **key** is the item key (e.g., "dummy.random"), **flags** is either CF_HAVEPARAMS or 0 (depending on whether the item accepts parameters or not), **function** is a C function that implements the item (e.g., "zbx_module_dummy_random"), and **test_param** is the parameter list to be used when Zabbix agent is started with the "-p" flag (e.g., "1,1000", can be NULL). An example definition may look like this:

```

static ZBX_METRIC keys[] =
{
    { "dummy.random", CF_HAVEPARAMS, zbx_module_dummy_random, "1,1000" },
    { NULL }
}

```

Each function that implements an item should accept two pointer parameters, the first one of type AGENT_REQUEST and the second one of type AGENT_RESULT:

```

int zbx_module_dummy_random(AGENT_REQUEST *request, AGENT_RESULT *result)
{
    ...

    SET_UI64_RESULT(result, from + rand() % (to - from + 1));

    return SYSINFO_RET_OK;
}

```

These functions should return SYSINFO_RET_OK, if the item value was successfully obtained. Otherwise, they should return SYSINFO_RET_FAIL. See example "dummy" module below for details on how to obtain information from AGENT_REQUEST and how to set information in AGENT_RESULT.

2.4 Building modules

Modules are currently meant to be built inside Zabbix source tree, because the module API depends on some data structures that are defined in Zabbix headers.

The most important header for loadable modules is **include/module.h**, which defines these data structures. Another useful header is **include/sysinc.h**, which performs the inclusion of the necessary system headers, which itself helps include/module.h to work properly.

In order for include/module.h and include/sysinc.h to be included, the **./configure** command (without arguments) should first be run in the root of Zabbix source tree. This will create **include/config.h** file, which include/sysinc.h relies upon. (If you obtained Zabbix source code as a Subversion repository checkout, the ./configure script does not exist yet and the **./bootstrap.sh** command should first be run to generate it.)

With this information in mind, everything is ready for the module to be built. The module should include **sysinc.h** and **module.h**, and the build script should make sure that these two files are in the include path. See example "dummy" module below for details.

Another useful header is **include/log.h**, which defines **zabbix_log()** function, which can be used for logging and debugging purposes.

3 Configuration parameters

Zabbix agent, server and proxy support two **parameters** to deal with modules:

- LoadModulePath – full path to the location of loadable modules
- LoadModule – module(s) to load at startup. The modules must be located in a directory specified by LoadModulePath. It is allowed to include multiple LoadModule parameters.

For example, to extend Zabbix agent we could add the following parameters:

```

LoadModulePath=/usr/local/lib/zabbix/agent/
LoadModule=mariadb.so
LoadModule=apache.so
LoadModule=kernel.so
LoadModule=dummy.so

```

Upon agent startup it will load the mariadb.so, apache.so, kernel.so and dummy.so modules from the /usr/local/lib/zabbix/agent directory. It will fail if a module is missing, in case of bad permissions or if a shared library is not a Zabbix module.

4 Frontend configuration

Loadable modules are supported by Zabbix agent, server and proxy. Therefore, item type in Zabbix frontend depends on where the module is loaded. If the module is loaded into the agent, then the item type should be "Zabbix agent" or "Zabbix agent (active)". If the module is loaded into server or proxy, then the item type should be "Simple check".

5 Dummy module

Zabbix includes a sample module written in C language. The module is located under src/modules/dummy:

```
alex@alex:~trunk/src/modules/dummy$ ls -l
-rw-rw-r-- 1 alex alex 9019 Apr 24 17:54 dummy.c
-rw-rw-r-- 1 alex alex 67 Apr 24 17:54 Makefile
-rw-rw-r-- 1 alex alex 245 Apr 24 17:54 README
```

The module is well documented, it can be used as a template for your own modules.

After ./configure has been run in the root of Zabbix source tree as described above, just run **make** in order to build **dummy.so**.

*
*****/
int zbx_module_dummy_random(AGENT_REQUEST *request, AGENT_RESULT *result)
{
    char *param1, *param2;
    int from, to;

    if (request+nparam != 2)
    {
        /* set optional error message */
        SET_MSG_RESULT(result, strdup("Invalid number of parameters"));
        return SYSINFO_RET_FAIL;
    }

    param1 = get_rparam(request, 0);
    param2 = get_rparam(request, 1);

    /* there is no strict validation of parameters for simplicity sake */
    from = atoi(param1);
    to = atoi(param2);

    if (from > to)
    {
        SET_MSG_RESULT(result, strdup("Incorrect range given"));
        return SYSINFO_RET_FAIL;
    }

    SET_UI64_RESULT(result, from + rand() % (to - from + 1));

    return SYSINFO_RET_OK;
}

/*****
*
* Function: zbx_module_init
*
* Purpose: the function is called on agent startup
*          It should be used to call any initialization routines
*
* Return value: ZBX_MODULE_OK - success
*               ZBX_MODULE_FAIL - module initialization failed
*
* Comment: the module won't be loaded in case of ZBX_MODULE_FAIL
*
*****/

```

```

*****/
int    zbx_module_init()
{
    /* initialization for dummy.random */
    srand(time(NULL));

    return ZBX_MODULE_OK;
}

/*****
 *
 * Function: zbx_module_uninit
 *
 * Purpose: the function is called on agent shutdown
 *          It should be used to cleanup used resources if there are any
 *
 * Return value: ZBX_MODULE_OK - success
 *              ZBX_MODULE_FAIL - function failed
 *
 *****/
int    zbx_module_uninit()
{
    return ZBX_MODULE_OK;
}

```

The module exports three new items:

- `dummy.ping` - always returns '1'
- `dummy.echo[param1]` - returns the first parameter as it is, for example, `dummy.echo[ABC]` will return ABC
- `dummy.random[param1, param2]` - returns a random number within the range of param1-param2, for example, `dummy.random[1,1000000]`

6 Limitations

Support of loadable modules is implemented for the Unix platform only. It means that it does not work for Windows agents.

In some cases a module may need to read module-related configuration parameters from `zabbix_agentd.conf`. It is not supported currently. If you need your module to use some configuration parameters you should probably implement parsing of a module-specific configuration file.

6 Windows performance counters

Overview

You can effectively monitor Windows performance counters using the `perf_counter[]` key.

For example:

```
perf_counter["\Processor(0)\Interrupts/sec"]
```

or

```
perf_counter["\Processor(0)\Interrupts/sec", 10]
```

For more information on using this key, see [Windows-specific item keys](#).

In order to get a full list of performance counters available for monitoring, you may run:

```
typeperf -qx
```

Numeric representation

As the naming of performance counters may differ on different Windows servers, depending on local settings, it introduces a certain problem when creating a template for monitoring several Windows machines having different locales.

At the same time every performance counter can also be referred to by its numeric form, which is unique and exactly the same regardless of language settings, so you might use the numeric representation instead of strings.

To find out the numeric equivalents, run **regedit**, then find `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib\00`

The registry entry contains information like this:

```

1
1847
2
System
4
Memory
6
% Processor Time
10
File Read Operations/sec
12
File Write Operations/sec
14
File Control Operations/sec
16
File Read Bytes/sec
18
File Write Bytes/sec
....

```

Here you can find the corresponding numbers for each string part of the performance counter, like in '\System\% Processor Time':

```

System → 2
% Processor Time → 6

```

Then you can use these numbers to represent the path in numbers:

```
\2\6
```

Performance counter parameters

You can deploy some PerfCounter parameters for the monitoring of Windows performance counters.

For example, you can add these to the Zabbix agent configuration file:

```

PerfCounter=UserPerfCounter1,"\Memory\Page Reads/sec",30
or
PerfCounter=UserPerfCounter2,"4\24",30

```

With such parameters in place, you can then simply use *UserPerfCounter1* or *UserPerfCounter2* as the keys for creating the respective items.

Remember to restart Zabbix agent after making changes to the configuration file.

Troubleshooting

Sometimes Zabbix agent cannot retrieve performance counter values in Windows 2000-based systems, because the pdh.dll file is outdated. It shows up as failure messages in Zabbix agent and server log files. In this case pdh.dll should be updated to a newer 5.0.2195.2668 version.

7 Mass update

Overview

Sometimes you may want to change some attribute for a number of items at once. Instead of opening each individual item for editing, you may use the mass update function for that.

Using mass update

To mass-update some items, do the following:

- Mark the checkboxes of the items to update in the list
- Click on *Mass update* below the list
- Mark the checkboxes of the attributes to update
- Enter new values for the attributes and click on *Update*

Update

Cancel

Replace applications will remove the item from any existing applications and replace those with the one(s) specified in this field.

Add new or existing applications allows to specify additional applications from the existing ones or enter completely new applications for the items.

Both these fields are auto-complete - starting to type in them offers a dropdown of matching applications. If the application is new, it also appears in the dropdown and it is indicated by *(new)* after the string. Just scroll down to select.

8 Value mapping

Overview

For a more "human" representation of received values, you can use value maps that contain the mapping between numeric values and string representations.

Value mappings can be used in both the Zabbix frontend and notifications sent by email/SMS/jabber etc.

For example, an item which has value '0' or '1' can use value mapping to represent the values in a human-readable form:

- '0' => 'Not Available'
- '1' => 'Available'

Or, a backup related value map could be:

- 'F' → 'Full'
- 'D' → 'Differential'
- 'I' → 'Incremental'

Thus, when **configuring items** you can use a value map to "humanize" the way an item value will be displayed. To do that, you refer to the name of a previously defined value map in the *Show value* field.

Note:

Value mapping can be used with items having *Numeric (unsigned)*, *Numeric (float)* and *Character* type of information.

Value mappings, starting with Zabbix 3.0, can be exported/imported, either separately, or with the respective template or host.

Configuration

To define a value map:

- Go to: *Administration* → *General*
- Select *Value mapping* from the dropdown
- Click on *Create value map* (or on the name of an existing map)

Value mapping

Name

Mappings

VALUE		MAPPED TO	ACTION
<input type="text" value="0"/>	⇒	<input type="text" value="Running"/>	Remove
<input type="text" value="1"/>	⇒	<input type="text" value="Paused"/>	Remove
<input type="text" value="2"/>	⇒	<input type="text" value="Start pending"/>	Remove
<input type="text" value="3"/>	⇒	<input type="text" value="Pause pending"/>	Remove
<input type="text" value="4"/>	⇒	<input type="text" value="Continue pending"/>	Remove
<input type="text" value="5"/>	⇒	<input type="text" value="Stop pending"/>	Remove
<input type="text" value="6"/>	⇒	<input type="text" value="Stopped"/>	Remove
<input type="text" value="7"/>	⇒	<input type="text" value="Unknown"/>	Remove
<input type="text" value="255"/>	⇒	<input type="text" value="No such service"/>	Remove
Add			

Parameters of a value map:

Parameter	Description
<i>Name</i>	Unique name of a set of value mappings.
<i>Mappings</i>	Individual mappings - pairs of numeric values and their string representations.

To add a new individual mapping, click on *Add*.

How this works

For example, one of the predefined agent items 'Ping to the server (TCP)' uses an existing value map called 'Service state' to display its values.

Name

Service state

Mappings

VALUE		MAPPED TO	ACTION
0	⇒	Down	Remove
1	⇒	Up	Remove
Add			

Update

Clone

Delete

Cancel

In the item **configuration form** you can see a reference to this value map in the *Show value* field:

Show value

Service state

show value mappings

So in *Monitoring → Latest data* the mapping is put to use to display 'Up' (with the raw value in parentheses).

NAME	LAST CHECK	LAST VALUE
Zabbix agent (1 item)		
Agent ping	2015-08-11 22:01:07	Up (1)

In the *Latest data* section displayed values are shortened to 20 symbols. If value mapping is used, this shortening is not applied to the mapped value, but only to the raw value separately (displayed in parenthesis).

Note:

A value being displayed in a human-readable form is also easier to understand when receiving notifications.

Without a predefined value map you would only get this:

NAME	LAST CHECK	LAST VALUE
Zabbix agent (1 item)		
Agent ping	2015-08-11 22:09:21	1

So in this case you would either have to guess what the '1' stands for or do a search of documentation to find out.

9 Applications

Overview

Applications are used to group items in logical groups.

For example, the *MySQL Server* application can hold all items related to the MySQL server: availability of MySQL, disk space, processor load, transactions per second, number of slow queries, etc.

Applications are also used for grouping web scenarios.

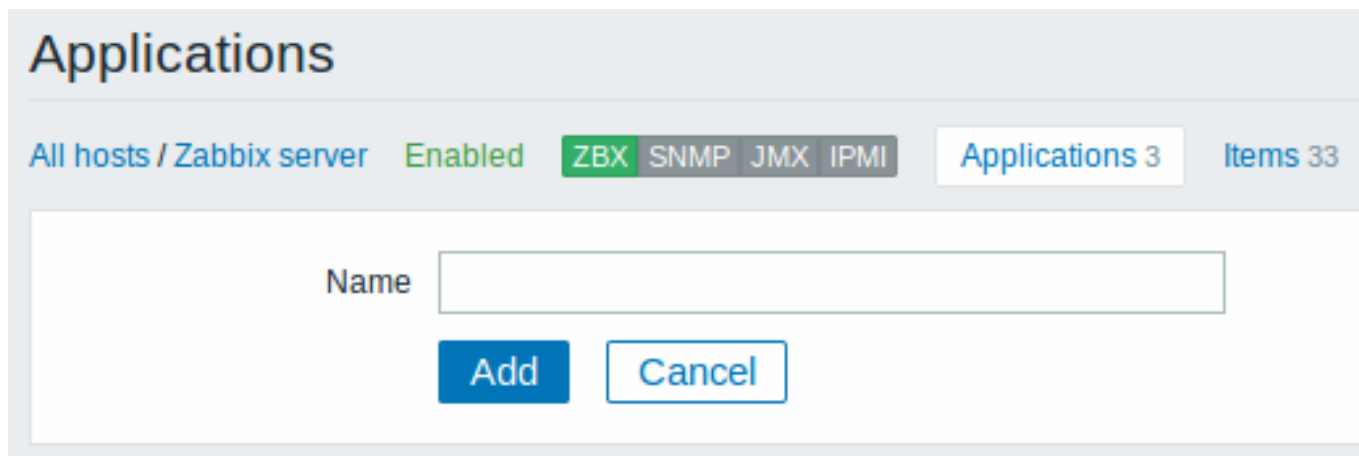

If you are using applications, then in *Monitoring → Latest data* you will see items and web scenarios grouped under their respective applications.

Configuration

To work with applications you must first create them and then link items or web scenarios to them.

To create an application, do the following:

- Go to *Configuration* → *Hosts* or *Templates*
- Click on *Applications* next to the required host or template
- Click on *Create application*
- Enter the application name and click on *Add* to save it

You can also create a new application directly in the item properties form.

Items are linked to applications in the item properties form. Select one or more applications the item will belong to.

Web scenarios are linked to applications in the web scenario definition form. Select the application the scenario will belong to.

10 Queue

Overview

The queue displays items that are waiting for a refresh. The queue is just a **logical** representation of data. There is no IPC queue or any other queue mechanism in Zabbix.

Items monitored by proxies are also included in the queue - they will be counted as queued for the proxy history data update period.

Only items with scheduled refresh times are displayed in the queue. This means that the following item types are excluded from the queue:

- log, logrt and event log active Zabbix agent items
- SNMP trap items
- trapper items
- web monitoring items

Statistics shown by the queue is a good indicator of the performance of Zabbix server.

The queue is retrieved directly from Zabbix server using JSON protocol. The information is available only if Zabbix server is running.

Reading the queue

To read the queue, go to *Administration* → *Queue*. *Overview* should be selected in the dropdown to the right.

Queue of items to be updated						
	Overview					
ITEMS	5 SECONDS	10 SECONDS	30 SECONDS	1 MINUTE	5 MINUTES	MORE THAN 10 MINUTES
Zabbix agent	0	0	0	0	0	0
Zabbix agent (active)	0	0	0	0	0	0
Simple check	0	0	0	0	0	0
SNMPv1 agent	0	0	0	0	0	0
SNMPv2 agent	0	0	0	0	0	0
SNMPv3 agent	0	0	0	0	0	0
Zabbix internal	1	0	5	0	0	0
Zabbix aggregate	0	0	0	0	0	0
External check	0	0	0	0	0	0
Database monitor	0	0	0	0	0	0
IPMI agent	0	0	0	0	0	0
SSH agent	0	0	0	0	0	0
TELNET agent	0	0	0	0	0	0
JMX agent	0	0	0	0	0	0
Calculated	0	0	0	0	0	0

The picture here is generally "green" so we may assume that the server is doing fine.

The queue shows one item waiting for 5 seconds and five for 30 seconds. Nice, it would be great to know what items these are.

To do just that, select *Details* in the dropdown in the upper right corner. Now you can see a list of those delayed items.

SCHEDULED CHECK	DELAYED BY	HOST	NAME
2015-08-11 22:43:51	12s	Remote proxy: Zabbix server	Zabbix history write cache, % free
2015-08-11 22:43:52	11s	Remote proxy: Zabbix server	Zabbix text write cache, % free
2015-08-11 22:43:53	10s	Remote proxy: Zabbix server	Zabbix trend write cache, % free
2015-08-11 22:43:54	9s	Remote proxy: Zabbix server	Values processed by Zabbix server per second

With these details provided it may be possible to find out why these items might be delayed.

With one or two delayed items there perhaps is no cause for alarm. They might get updated in a second. However, if you see a bunch of items getting delayed for too long, there might be a more serious problem.

ITEMS	5 SECONDS	10 SECONDS	30 SECONDS	1 MINUTE	5 MINUTES	MORE THAN 10 MINUTES
Zabbix agent	0	13	7	0	0	0
Zabbix agent (active)	0	0	0	0	0	0
Simple check	0	0	0	0	0	0
SNMPv1 agent	0	0	0	0	0	0
SNMPv2 agent	0	0	0	0	0	0
SNMPv3 agent	0	0	0	0	0	0
Zabbix internal	5	1	9	0	0	0

Is the agent down?

Queue item

A special internal item **zabbix[queue,<from>,<to>]** can be used to monitor the health of the queue in Zabbix. It will return the number of items delayed by the set amount of time. For more information see [Internal items](#).

11 Value cache

Overview

To make the calculation of trigger expressions, calculated/aggregate items and some macros much faster, since Zabbix 2.2 a value cache option is supported by the Zabbix server.

This in-memory cache can be used for accessing historical data, instead of making direct SQL calls to the database. If historical values are not present in the cache, the missing values are requested from the database and the cache updated accordingly.

To enable the value cache functionality, an optional **ValueCacheSize** parameter is supported by the Zabbix server [configuration](#) file.

Two internal items are supported for monitoring the value cache: **zabbix[vcache,buffer,<mode>]** and **zabbix[vcache,cache,<parameter>]**. See more details with [internal items](#).

3 Triggers

Overview

Triggers are logical expressions that "evaluate" data gathered by items and represent the current system state.

While items are used to gather system data, it is highly impractical to follow these data all the time waiting for a condition that is alarming or deserves attention. The job of "evaluating" data can be left to trigger expressions.

Trigger expressions allow to define a threshold of what state of data is "acceptable". Therefore, should the incoming data surpass the acceptable state, a trigger is "fired" - or changes status to PROBLEM.

A trigger may have the following status:

VALUE	DESCRIPTION
OK	This is a normal trigger state. Called FALSE in older Zabbix versions.
PROBLEM	Normally means that something happened. For example, the processor load is too high. Called TRUE in older Zabbix versions.

Trigger status (the expression) is recalculated every time Zabbix server receives a new value that is part of the expression.

Triggers are evaluated based on [history](#) data only; trend data are never considered.

If time-based functions (**nodata()**, **date()**, **dayofmonth()**, **dayofweek()**, **time()**, **now()**) are used in the expression, the trigger is recalculated every 30 seconds by a Zabbix *timer* process. If both time-based and non-time-based functions are used in an expression, it is recalculated when a new value is received **and** every 30 seconds.

You can [build trigger expressions](#) with different degrees of complexity.

1 Configuring a trigger

Overview

To configure a trigger, do the following:

- Go to: *Configuration* → *Hosts*
- Click on *Triggers* in the row of the host
- Click on *Create trigger* to the right (or on the trigger name to edit an existing trigger)
- Enter parameters of the trigger in the form

Configuration

The **Trigger** tab contains all the essential trigger attributes.

Trigger

Dependencies

Name

Disk I/O is overloaded on {HOST.NAME}

Expression

{Zabbix server:system.cpu.util[,iowait].avg(5m)}>20

Add

Expression constructor

Multiple PROBLEM events generation

☐

Description

OS spends significant time waiting for I/O (input/output) operations. It could be indicator of performance issues with storage system.

URL

Severity

Parameter	Description
<i>Name</i>	<p>Trigger name.</p> <p>The name may contain the supported macros: {HOST.HOST}, {HOST.NAME}, {HOST.CONN}, {HOST.DNS}, {HOST.IP}, {ITEM.VALUE}, {ITEM.LASTVALUE} and {\$MACRO}.</p> <p>\$1, \$2...\$9 macros can be used to refer to the first, second...ninth constant of the expression.</p> <p><i>Note:</i> \$1-\$9 macros will resolve correctly if referring to constants in relatively simple, straightforward expressions. For example, the name "Processor load above \$1 on {HOST.NAME}" will automatically change to "Processor load above 5 on New host" if the expression is {New host:system.cpu.load[percpu,avg1].last()}>5</p>
<i>Expression</i>	Logical expression used for calculating the trigger state.
<i>Multiple PROBLEM events generation</i>	By checking this option you can set that an event is generated upon every 'Problem' evaluation of the trigger.
<i>Description</i>	<p>Text field used to provide more information about this trigger. May contain instructions for fixing specific problem, contact detail of responsible staff, etc.</p> <p><i>Starting with Zabbix 2.2</i>, the description may contain the same set of macros as trigger name.</p>

Parameter	Description
URL	If not empty, the URL entered here is available as a link when clicking on the trigger name in <i>Monitoring</i> → <i>Triggers</i> . Macros may be used in the trigger URL field - {TRIGGER.ID}, several {HOST.*} macros (since Zabbix 3.0.0) and user macros (since Zabbix 3.0.0).
Severity	Set the required trigger severity by clicking the buttons.
Enabled	Unchecking this box will disable the trigger if required. Problems of a disabled trigger are no longer displayed in the frontend, but are not deleted.

The **Dependencies** tab contains all the dependencies of the trigger.

Click on *Add* to add a new dependency.

Note:

You can also configure a trigger by opening an existing one, pressing the *Clone* button and then saving under a different name.

Testing expressions

It is possible to test the configured trigger expression as to what the expression result would be depending on the received value.

To test the expression, click on *Expression constructor* under the expression field.

Trigger

Dependencies

Name

Processor load is too high on {HOST.NAME}

Expression

{Template OS Linux:system.cpu.load[percpu,avg1].avg(5m)}>5

Add

Expression constructor

In the Expression constructor, all individual expressions are listed. To open the testing window, click on *Test* below the expression list.

Target	Expression	Action	Info
<input checked="" type="checkbox"/>	A {Template OS Linux:system.cpu.load[percpu,avg1].avg(5m)}>5	Remove	
	Test		

In the testing window you can enter sample values ("6" in this example) and then see the expression result, by clicking on the *Test* button.

Test

Test data

Expression Variable Elements

Result type

Value

{Template OS Linux:system.cpu.load[percpu,avg1].avg(5m)} Numeric (float) 6

Result

Expression

Result

A {Template OS Linux:system.cpu.load[percpu,avg1].avg(5m)}>5 TRUE

A TRUE

Test

Close

The result of the individual expressions as well as the whole expression can be seen.

"TRUE" result means the specified expression is correct. In that case current value exceeds the warning value and a Problem has occurred.

"FALSE" result means the specified expression is incorrect. Warning value hasn't been exceeded, respectively, Problem has not occurred.

2 Trigger expression

Overview

The expressions used in triggers are very flexible. You can use them to create complex logical tests regarding monitored statistics.

A simple useful expression might look like:

```
{<server>:<key>.<function>(<parameter>)}<operator><constant>
```

Functions

Trigger functions allow to reference the collected values, current time and other factors.

A complete list of **supported functions** is available.

All functions return numeric values only. String comparison is not supported. If you want string comparison, upgrade to Zabbix 5.0.

Function parameters

Most of numeric functions accept the number of seconds as a parameter.

You may use the prefix **#** to specify that a parameter has a different meaning:

FUNCTION CALL	MEANING
sum(600)	Sum of all values in no more than the latest 600 seconds
sum(#5)	Sum of all values in no more than the last 5 values

The function **last** uses a different meaning for values when prefixed with the hash mark - it makes it choose the n-th previous value, so given the values 3, 7, 2, 6, 5 (from most recent to least recent), **last(#2)** would return 7 and **last(#5)** would return 5.

Several functions support an additional, second `time_shift` parameter. This parameter allows to reference data from a period of time in the past. For example, **avg(1h,1d)** will return the average value for an hour one day ago.

You can use the supported **unit symbols** in trigger expressions, for example '5m' (minutes) instead of '300' seconds or '1d' (day) instead of '86400' seconds. '1K' will stand for '1024' bytes.

Numbers with a '+' sign are not supported.

Operators

The following operators are supported for triggers **(in descending priority of execution)**:

PRIORITY	OPERATOR	DEFINITION
1	-	Unary minus
2	not	Logical NOT
3	*** Multiplication / **	Division
4	+	Arithmetical plus
	-	Arithmetical minus
5	<	Less than. The operator is defined as: $A < B \Leftrightarrow (A < B - 0.000001)$ since Zabbix 3.0.17 $A < B \Leftrightarrow (A \leq B - 0.000001)$ before Zabbix 3.0.17
	<=	Less than or equal to. The operator is defined as: $A \leq B \Leftrightarrow (A \leq B + 0.000001)$ since Zabbix 3.0.17 $A \leq B \Leftrightarrow (A < B + 0.000001)$ before Zabbix 3.0.17

PRIORITY	OPERATOR	DEFINITION
6	>	More than. The operator is defined as: $A > B \Leftrightarrow (A > B + 0.000001)$ since Zabbix 3.0.17 $A > B \Leftrightarrow (A \geq B + 0.000001)$ before Zabbix 3.0.17
	>=	More than or equal to. The operator is defined as: $A \geq B \Leftrightarrow (A \geq B - 0.000001)$ since Zabbix 3.0.17 $A \geq B \Leftrightarrow (A > B - 0.000001)$ before Zabbix 3.0.17
	=	Is equal. The operator is defined as: $A = B \Leftrightarrow (A \geq B - 0.000001)$ and $(A \leq B + 0.000001)$ since Zabbix 3.0.17 $A = B \Leftrightarrow (A > B - 0.000001)$ and $(A < B + 0.000001)$ before Zabbix 3.0.17
	<>	Not equal. The operator is defined as: $A < > B \Leftrightarrow (A < B - 0.000001)$ or $(A > B + 0.000001)$ since Zabbix 3.0.17 $A < > B \Leftrightarrow (A \leq B - 0.000001)$ or $(A \geq B + 0.000001)$ before Zabbix 3.0.17
7	and	Logical AND
8	or	Logical OR

not, **and** and **or** operators are case-sensitive and must be in lowercase. They also must be surrounded by spaces or parentheses.

All operators, except unary - and **not**, have left-to-right associativity. Unary - and **not** are non-associative (meaning **-(-1)** and **not (not 1)** should be used instead of **--1** and **not not 1**).

Evaluation result:

- <, <=, >, >=, =, <> operators shall yield '1' in the trigger expression if the specified relation is true and '0' if it is false;
- **and** shall yield '1' if both of its operands compare unequal to '0'; otherwise, it yields '0';
- **or** shall yield '1' if either of its operands compare unequal to '0'; otherwise, it yields '0';
- The result of the logical negation operator **not** is '0' if the value of its operand compares unequal to '0'; '1' if the value of its operand compares equal to '0'.

Value caching

Values required for trigger evaluation are cached by Zabbix server. Because of this trigger evaluation causes a higher database load for some time after the server restarts. The value cache is not cleared when item history values are removed (either manually or by housekeeper), so the server will use the cached values until they are older than the time periods defined in trigger functions or server is restarted.

Examples of triggers

Example 1

Processor load is too high on www.zabbix.com

```
{www.zabbix.com:system.cpu.load[all,avg1].last()}>5
```

'www.zabbix.com:system.cpu.load[all,avg1]' gives a short name of the monitored parameter. It specifies that the server is 'www.zabbix.com' and the key being monitored is 'system.cpu.load[all,avg1]'. By using the function 'last()', we are referring to the most recent value. Finally, '>5' means that the trigger is in the PROBLEM state whenever the most recent processor load measurement from www.zabbix.com is greater than 5.

Example 2

www.zabbix.com is overloaded

```
{www.zabbix.com:system.cpu.load[all,avg1].last()}>5 or {www.zabbix.com:system.cpu.load[all,avg1].min(10m)}>2
```

The expression is true when either the current processor load is more than 5 or the processor load was more than 2 during last 10 minutes.

Example 3

/etc/passwd has been changed

Use of function diff:

```
{www.zabbix.com:vfs.file.cksum[/etc/passwd].diff()}=1
```

The expression is true when the previous value of checksum of /etc/passwd differs from the most recent one.

Similar expressions could be useful to monitor changes in important files, such as /etc/passwd, /etc/inetd.conf, /kernel, etc.

Example 4

Someone is downloading a large file from the Internet

Use of function min:

```
{www.zabbix.com:net.if.in[eth0,bytes].min(5m)}>100K
```

The expression is true when number of received bytes on eth0 is more than 100 KB within last 5 minutes.

Example 5

Both nodes of clustered SMTP server are down

Note use of two different hosts in one expression:

```
{smtp1.zabbix.com:net.tcp.service[smtp].last()}=0 and {smtp2.zabbix.com:net.tcp.service[smtp].last()}=0
```

The expression is true when both SMTP servers are down on both smtp1.zabbix.com and smtp2.zabbix.com.

Example 6

Zabbix agent needs to be upgraded

Use of function str():

```
{zabbix.zabbix.com:agent.version.str("beta8")}=1
```

The expression is true if Zabbix agent has version beta8 (presumably 1.0beta8).

Example 7

Server is unreachable

```
{zabbix.zabbix.com:icmpping.count(30m,0)}>5
```

The expression is true if host "zabbix.zabbix.com" is unreachable more than 5 times in the last 30 minutes.

Example 8

No heartbeats within last 3 minutes

Use of function nodata():

```
{zabbix.zabbix.com:tick.nodata(3m)}=1
```

To make use of this trigger, 'tick' must be defined as a Zabbix **trapper** item. The host should periodically send data for this item using zabbix_sender. If no data is received within 180 seconds, the trigger value becomes PROBLEM.

Note that 'nodata' can be used for any item type.

Example 9

CPU activity at night time

Use of function time():

```
{zabbix:system.cpu.load[all,avg1].min(5m)}>2 and {zabbix:system.cpu.load[all,avg1].time()}>000000 and {zabbix:system.cpu.load[all,avg1].time()}<060000
```

The trigger may change its status to true, only at night (00:00-06:00) time.

Example 10

Check if client local time is in sync with Zabbix server time

Use of function fuzzytime():

```
{MySQL_DB:system.localtime.fuzzytime(10)}=0
```

The trigger will change to the problem state in case when local time on server MySQL_DB and Zabbix server differs by more than 10 seconds.

Example 11

Comparing average load today with average load of the same time yesterday (using a second `time_shift` parameter).

```
{server:system.cpu.load.avg(1h)}/{server:system.cpu.load.avg(1h,1d)}>2
```

This expression will fire if the average load of the last hour tops the average load of the same hour yesterday more than two times.

Example 12

Using the value of another item to get a trigger threshold:

```
{Template PfSense:hrStorageFree[{#SNMPVALUE}].last()}<{Template PfSense:hrStorageSize[{#SNMPVALUE}].last()}
```

The trigger will fire if the free storage drops below 10 percent.

Example 13

Using **evaluation result** to get the number of triggers over a threshold:

```
({server1:system.cpu.load[all,avg1].last()}>5) + ({server2:system.cpu.load[all,avg1].last()}>5) + ({server3:system.cpu.load[all,avg1].last()}>5)
```

The trigger will fire if at least two of the triggers in the expression are over 5.

Hysteresis

Sometimes a trigger must have different conditions for different states. For example, we would like to define a trigger which would become PROBLEM when server room temperature is higher than 20C while it should stay in the state until temperature will not become lower than 15C.

In order to do this, we define the following trigger:

Example 1

Temperature in server room is too high

```
({TRIGGER.VALUE}=0 and {server:temp.last()}>20) or  
({TRIGGER.VALUE}=1 and {server:temp.last()}>15)
```

Note the use of a macro `{TRIGGER.VALUE}`. The macro returns current trigger value.

Example 2

Free disk space is too low

Problem: it is less than 10GB for last 5 minutes

Recovery: it is more than 40GB for last 10 minutes

```
({TRIGGER.VALUE}=0 and {server:vfs.fs.size[/,free].max(5m)}<10G) or  
({TRIGGER.VALUE}=1 and {server:vfs.fs.size[/,free].min(10m)}<40G)
```

Note use of `{TRIGGER.VALUE}` macro. The macro returns current trigger value.

3 Trigger dependencies

Overview

Sometimes the availability of one host depends on another. A server that is behind some router will become unreachable if the router goes down. With triggers configured for both, you might get notifications about two hosts down - while only the router was the guilty party.

This is where some dependency between hosts might be useful. With dependency set notifications of the dependants could be withheld and only the notification for the root problem sent.

While Zabbix does not support dependencies between hosts directly, they may be defined with another, more flexible method - trigger dependencies. A trigger may have one or more triggers it depends on.

So in our simple example we open the server trigger configuration form and set that it depends on the respective trigger of the router. With such dependency the server trigger will not change state as long as the trigger it depends on is in 'PROBLEM' state - and thus no dependant actions will be taken and no notifications sent.

If both the server and the router are down and dependency is there, Zabbix will not execute actions for the dependent trigger.

Actions on dependent triggers will not be executed if the trigger they depend on:

- changes its state from 'PROBLEM' to 'UNKNOWN'
- is closed with the help of time- based functions
- is resolved by a value of an item not involved in dependent trigger
- is disabled, has disabled item or disabled item host

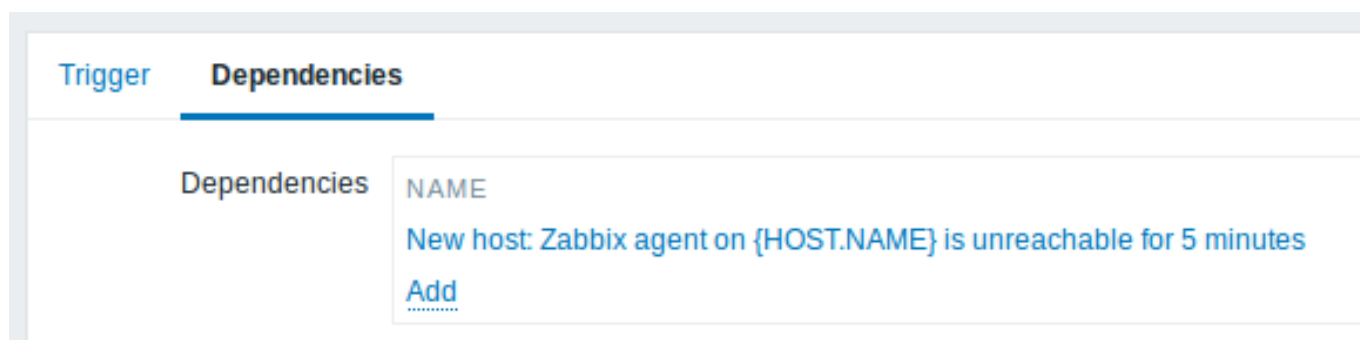

Note that "secondary" (dependent) trigger in the above-mentioned cases will not be immediately updated.

Also:

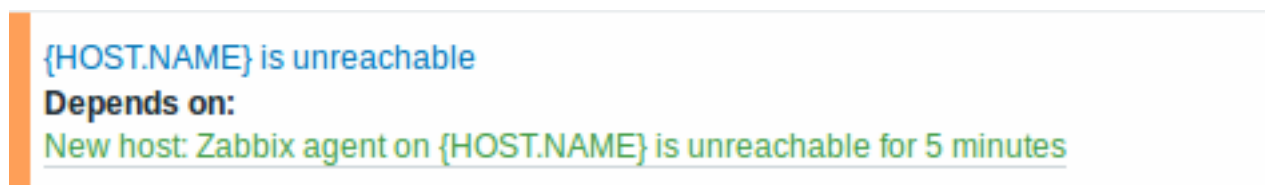

- Trigger dependency may be added from any host trigger to any other host trigger, as long as it wouldn't result in a circular dependency.
- Trigger dependency may be added from a template to a template. If a trigger from template A depends on a trigger from template B, template A may only be linked to a host (or another template) together with template B, but template B may be linked to a host (or another template) alone.
- Trigger dependency may be added from template trigger to a host trigger. In this case, linking such a template to a host will create a host trigger that depends on the same trigger template trigger was depending on. This allows to, for example, have a template where some triggers depend on router (host) triggers. All hosts linked to this template will depend on that specific router.
- Trigger dependency from a host trigger to a template trigger may not be added.
- Trigger dependency may be added from a trigger prototype to another trigger prototype (within the same low-level discovery rule) or a real trigger. A trigger prototype may not depend on a trigger prototype from a different LLD rule or on a trigger created from trigger prototype. Host trigger prototype cannot depend on a trigger from a template.

Configuration

To define a dependency, open the Dependencies tab in a trigger **configuration form**. Click on *Add* in the 'Dependencies' block and select one or more triggers that our trigger will depend on.

Click *Update*. Now the trigger has an indication of its dependency in the list.

Example of several dependencies

For example, a Host is behind a Router2 and the Router2 is behind a Router1.

Zabbix – Router1 – Router2 – Host

If Router1 is down, then obviously Host and Router2 are also unreachable yet we don't want to receive three notifications about Host, Router1 and Router2 all being down.

So in this case we define two dependencies:

```
'Host is down' trigger depends on 'Router2 is down' trigger
'Router2 is down' trigger depends on 'Router1 is down' trigger
```

Before changing the status of the 'Host is down' trigger, Zabbix will check for corresponding trigger dependencies. If found, and one of those triggers is in 'Problem' state, then the trigger status will not be changed and thus actions will not be executed and notifications will not be sent.

Zabbix performs this check recursively. If Router1 or Router2 is unreachable, the Host trigger won't be updated.

4 Trigger severity

Trigger severity defines how important a trigger is. Zabbix supports the following trigger severities:

SEVERITY	DEFINITION	COLOUR
Not classified	Unknown severity.	Grey
Information	For information purposes.	Light blue
Warning	Be warned.	Yellow
Average	Average problem.	Orange
High	Something important has happened.	Light red
Disaster	Disaster. Financial losses, etc.	Red

The severities are used for:

- visual representation of triggers. Different colours for different severities.
- audio in global alarms. Different audio for different severities.
- user media. Different media (notification channel) for different severities. For example, SMS - high severity, email - other.
- limiting actions by conditions against trigger severities

It is possible to [customise trigger severity names and colours](#).

5 Customising trigger severities

Trigger severity names and colours for severity related GUI elements can be configured in *Administration* → *General* → *Trigger severities*. Colours are shared among all GUI themes.

Translating customised severity names

Attention:

If Zabbix frontend translations are used, custom severity names will override translated names by default.

Default trigger severity names are available for translation in all locales. If a severity name is changed, custom name is used in all locales and additional manual translation is needed.

Custom severity name translation procedure:

- set required custom severity name, for example 'Important'
- edit `<frontend_dir>/locale/<required_locale>/LC_MESSAGES/frontend.po`
- add 2 lines:

```
msgid "Important"
msgstr "<translation string>"
```

and save file.

- create .mo files as described in `<frontend_dir>/locale/README`

Here **msgid** should match the new custom severity name and **msgstr** should be the translation for it in the specific language.

This procedure should be performed after each severity name change.

6 Unit symbols

Overview

Having to use some large numbers, for example '86400' to represent the number of seconds in one day, is both difficult and error-prone. This is why you can use some appropriate unit symbols (or suffixes) to simplify Zabbix trigger expressions and item keys.

Instead of '86400' you can simply enter '1d'. Suffixes function as multipliers.

Time and memory size suffixes

Time and memory size suffixes are supported in:

- trigger [expression](#) constants and function parameters.
- constants of [calculated item](#) formulas

For time you can use:

- **s** - seconds (when used, works the same as the raw value)
- **m** - minutes
- **h** - hours
- **d** - days
- **w** - weeks

Time suffixes are also supported in parameters of the **zabbix[queue,<from>,<to>]** [internal item](#) and the last parameter of [aggregate checks](#).

For memory size you can use:

- **K** - kilobyte
- **M** - megabyte
- **G** - gigabyte
- **T** - terabyte

Other uses

Unit symbols are also used for a human-readable representation of data in the frontend.

In both Zabbix server and frontend these symbols are supported:

- **K** - kilo
- **M** - mega
- **G** - giga
- **T** - tera

When item values in B, Bps are displayed in the frontend, base 2 is applied (1K = 1024). Otherwise a base of 10 is used (1K = 1000).

Additionally the frontend also supports the display of:

- **P** - peta
- **E** - exa
- **Z** - zetta
- **Y** - yotta

Usage examples

By using some appropriate suffixes you can write trigger expressions that are easier to understand and maintain, for example these expressions:

```
{host:zabbix[proxy,zabbix_proxy,lastaccess]}>120
{host:system.uptime[]}.last()}<86400
{host:system.cpu.load.avg(600)}<10
{host:vm.memory.size[available]}.last()}<20971520
```

could be changed to:

```
{host:zabbix[proxy,zabbix_proxy,lastaccess]}>2m
{host:system.uptime.last()}<1d
{host:system.cpu.load.avg(10m)}<10
{host:vm.memory.size[available]}.last()}<20M
```

7 Mass update

Overview

With mass update you may change some attribute for a number of triggers at once, saving you the need to open each individual trigger for editing.

Using mass update

To mass-update some triggers, do the following:

- Mark the checkboxes of the triggers to update in the list
- Click on *Mass update* below the list
- Mark the checkboxes of the attributes to update
- Specify new values for the attributes and click on *Update*

8 Predictive trigger functions

Overview

Sometimes there are signs of the upcoming problem. These signs can be spotted so that actions may be taken in advance to prevent or at least minimize the impact of the problem.

Zabbix has tools to predict the future behaviour of the monitored system based on historic data. These tools are realized through predictive trigger functions.

Functions

Two things one needs to know is how to define a problem state and how much time is needed to take action. Then there are two ways to set up a trigger signalling about a potential unwanted situation. First: trigger must fire when the system after "time to act" is expected to be in problem state. Second: trigger must fire when the system is going to reach the problem state in less than "time to act". Corresponding trigger functions to use are **forecast** and **timeleft**. Note that underlying statistical analysis is basically identical for both functions. You may set up a trigger whichever way you prefer with similar results.

Parameters

Both functions use almost the same set of parameters. Use the list of [supported functions](#) for reference.

Time interval

First of all you should specify the historic period Zabbix should analyse to come up with prediction. You do it in a familiar way by means of `sec` or `#num` parameter and optional `time_shift` like you do it with **avg**, **count**, **delta**, **max**, **min** and **sum** functions.

Forecasting horizon

(**forecast** only)

Parameter `time` specifies how far in the future Zabbix should extrapolate dependencies it finds in historic data. No matter if you use `time_shift` or not, `time` is always counted starting from the current moment.

Threshold to reach

(**timeleft** only)

Parameter `threshold` specifies a value the analysed item has to reach, no difference if from above or from below. Once we have determined $f(t)$ (see below) we should solve equation $f(t) = \text{threshold}$ and return the root which is closer to now and to the right from now or 9999999999.9999 if there is no such root.

Note:

When item values approach the threshold and then cross it, **timeleft** assumes that intersection is already in the past and therefore switches to the next intersection with `threshold` level, if any. Best practice should be to use predictions as a complement to ordinary problem diagnostics, not as a substitution.^a

^aAccording to [specification](#) these are voltages on chip pins and generally speaking may need scaling.

Fit functions

Default `fit` is the *linear* function. But if your monitored system is more complicated you have more options to choose from.

fit	$x = f(t)$
<i>linear</i>	$x = a + b \cdot t$
<i>polynomialN</i> ¹	$x = a_0 + a_1 \cdot t + a_2 \cdot t^2 + \dots + a_n \cdot t^n$
<i>exponential</i>	$x = a \cdot \exp(b \cdot t)$
<i>logarithmic</i>	$x = a + b \cdot \log(t)$
<i>power</i>	$x = a \cdot t^b$

Modes

(forecast only)

Every time a trigger function is evaluated it gets data from the specified history period and fits a specified function to the data. So, if the data is slightly different the fitted function will be slightly different. If we simply calculate the value of the fitted function at a specified time in the future you will know nothing about how the analysed item is expected to behave between now and that moment in the future. For some *fit* options (like *polynomial*) a simple value from the future may be misleading.

mode	forecast result
<i>value</i>	$f(\text{now} + \text{time})$
<i>max</i>	$\max_{\text{now} \leq t \leq \text{now} + \text{time}} f(t)$
<i>min</i>	$\min_{\text{now} \leq t \leq \text{now} + \text{time}} f(t)$
<i>delta</i>	$\text{max} - \text{min}$
<i>avg</i>	average of $f(t)$ ($\text{now} \leq t \leq \text{now} + \text{time}$) according to definition

Details

To avoid calculations with huge numbers we consider the timestamp of the first value in specified period plus 1 ns as a new zero-time (current epoch time is of order 10^9 , epoch squared is 10^{18} , double precision is about 10^{-16}). 1 ns is added to provide all positive time values for *logarithmic* and *power* fits which involve calculating $\log(t)$. Time shift does not affect *linear*, *polynomial*, *exponential* (apart from easier and more precise calculations) but changes the shape of *logarithmic* and *power* functions.

Potential errors

Functions return -1 in such situations:

- specified evaluation period contains no data;
- result of mathematical operation is not defined²;
- numerical complications (unfortunately, for some sets of input data range and precision of double-precision floating-point format become insufficient)³.

Note:

No warnings or errors are flagged if chosen fit poorly describes provided data or there is just too few data for accurate prediction.

Examples and dealing with errors

To get a warning when you are about to run out of free disk space on your host you may use a trigger expression like this:

```
{host:vfs.fs.size[/,free].timeleft(1h,,0)}<1h
```

However, error code -1 may come into play and put your trigger in a problem state. Generally it's good because you get a warning that your predictions don't work correctly and you should look at them more thoroughly to find out why. But sometimes it's bad because -1 can simply mean that there was no data about the host free disk space obtained in the last hour. If you are getting too many false positive alerts consider using more complicated trigger expression⁴:

```
{host:vfs.fs.size[/,free].timeleft(1h,,0)}<1h and {host:vfs.fs.size[/,free].timeleft(1h,,0)}<>-1
```

¹Polynomial degree can be from 1 to 6, *polynomial1* is equivalent to *linear*. However, use higher degree polynomials with caution. If the evaluation period contains less points than needed to determine polynomial coefficients, polynomial degree will be lowered (e.g *polynomial5* is requested, but there are only 4 points, therefore *polynomial3* will be fitted).

²For example fitting *exponential* or *power* functions involves calculating $\log()$ of item values. If data contains zeros or negative numbers you will get an error since $\log()$ is defined for positive values only.

³For *linear*, *exponential*, *logarithmic* and *power* fits all necessary calculations can be written explicitly. For *polynomial* only *value* can be calculated without any additional steps. Calculating *avg* involves computing polynomial antiderivative (analytically). Computing *max*, *min* and *delta* involves computing polynomial derivative (analytically) and finding its roots (numerically). Solving $f(t) = 0$ involves finding polynomial roots (numerically).

⁴But in this case -1 can cause your trigger to recover from the problem state. To be fully protected use: `{host:vfs.fs.size[/,free].timeleft(1h,,0)}<1h and ({TRIGGER.VALUE}=0 and {host:vfs.fs.size[/,free].timeleft(1h,,0)}<>-1 or {TRIGGER.VALUE}=1)`

Situation is a bit more difficult with **forecast**. First of all, -1 may or may not put the trigger in a problem state depending on whether you have expression like `{host:item.forecast(...)}<...` or like `{host:item.forecast(...)}>...`

Furthermore, -1 may be a valid forecast if it's normal for the item value to be negative. But probability of this situation in the real world situation is negligible (see **how** operator = works). So add `...` or `{host:item.forecast(...)}=-1` or `...` and `{host:item.forecast(...)}<>-1` if you want or don't want to treat -1 as a problem respectively.

4 Events

Overview

There are several types of events generated in Zabbix:

- trigger events - whenever a trigger changes its status (*OK*→*PROBLEM*→*OK*)
- discovery events - when hosts or services are detected
- auto registration events - when active agents are auto-registered by server
- internal events - when an item/low-level discovery rule becomes unsupported or a trigger goes into an unknown state

Note:

Internal events are supported starting with Zabbix 2.2 version.

Events are time-stamped and can be the basis of actions such as sending notification e-mail etc.

To view details of events in the frontend, go to *Monitoring | Events*. There you can click on the event date and time to view details of an event.

More information is available on [each event source](#).

1 Event sources

1.1 Trigger events

Change of trigger status is the most frequent and most important source of events.

Each time the trigger changes its state, an event is generated. The event contains details of the trigger state's change - when did it happen and what the new state is.

1.2 Discovery events

Zabbix periodically scans the IP ranges defined in network discovery rules. Frequency of the check is configurable for each rule individually. Once a host or a service is discovered, a discovery event (or several events) are generated.

Zabbix generates the following events:

Event	When generated
Service Up	Every time Zabbix detects active service.
Service Down	Every time Zabbix cannot detect service.
Host Up	If at least one of the services is UP for the IP.
Host Down	If all services are not responding.
Service Discovered	If the service is back after downtime or discovered for the first time.
Service Lost	If the service is lost after being up.
Host Discovered	If host is back after downtime or discovered for the first time.
Host Lost	If host is lost after being up.

1.3 Active agent auto-discovery events

Active agent auto-registration creates events in Zabbix.

If configured, active agent auto-registration can happen when a previously unknown active agent asks for checks. The server adds a new auto-registered host, using the received IP address and port of the agent.

For more information, see the [active agent auto-registration](#) page.

1.4 Internal events

Internal events happen when:

- an item changes state from 'normal' to 'unsupported'
- an item changes state from 'unsupported' to 'normal'
- a low-level discovery rule changes state from 'normal' to 'unsupported'
- a low-level discovery rule changes state from 'unsupported' to 'normal'
- a trigger changes state from 'normal' to 'unknown'
- a trigger changes state from 'unknown' to 'normal'

Internal events are supported since Zabbix 2.2. The aim of introducing internal events is to allow users to be notified when any internal event takes place, for example, an item becomes unsupported and stops gathering data.

5 Visualisation

1 Graphs

Overview

With lots of data flowing into Zabbix, it becomes much easier for the users if they can look at a visual representation of what is going on rather than only numbers.

This is where graphs come in. Graphs allow to grasp the data flow at a glance, correlate problems, discover when something started or make a presentation of when something might turn into a problem.

Zabbix provides users with:

- built-in **simple graphs** of one item data
- the possibility to create more complex **customised graphs**
- access to a comparison of several items quickly in **ad-hoc graphs**

1 Simple graphs

Overview

Simple graphs are provided for the visualization of data gathered by items.

No configuration effort is required on the user part to view simple graphs. They are freely made available by Zabbix.

Just go to *Monitoring* → *Latest data* and click on the Graph link for the respective item and a graph will be displayed.

Time period selector

Take note of the time period selector above the graph. It allows you to select the desired time period easily.

The slider within the selector can be dragged back and forth, as well as resized, effectively changing the time period displayed. Links on the left hand side allow to choose some often-used predefined periods (above the slider area) and move them back and forth in time (below the slider area). The dates on the right hand side actually work as links, popping up a calendar and allowing to set a specific start/end time.

The **fixed/dynamic** link in the lower right hand corner has the following effects:

- controls whether the time period is kept constant when you change the start/end time in the calendar popup.
- when *fixed*, time moving controls (« 1m 7d 1d 12h 1h 5m | 5m 1h 12h 1d 7d 1m ») will move the slider, while not changing its size, whereas when *dynamic*, the control used will enlarge the slider in the respective direction.
- when *fixed*, pressing the larger < and > buttons will move the slider, while not changing its size, whereas when *dynamic*, < and > will enlarge the slider in the respective direction. The slider will move by the amount of its size, so, for example, if it is one month, it will move by a month; whereas the slider will enlarge by 1 day.

Another way of controlling the displayed time is to highlight an area in the graph with the left mouse button. The graph will zoom into the highlighted area once you release the left mouse button.

Note:

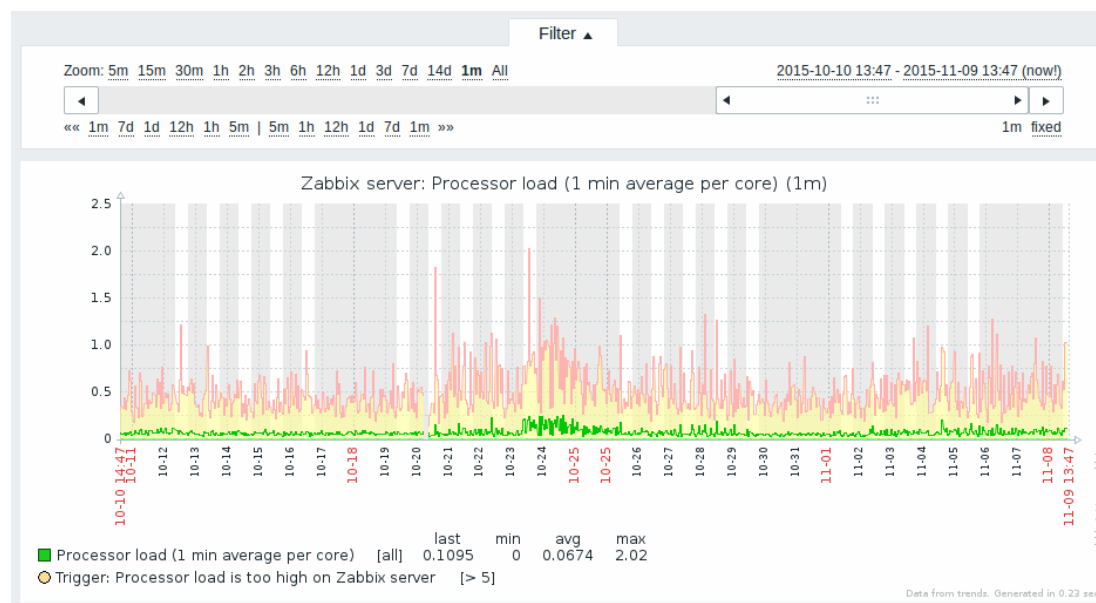

Simple graphs are provided for all numeric items. For textual items, a link to History is available in *Monitoring* → *Latest data*.

Recent data vs longer periods

For very recent data a **single** line is drawn connecting each received value. The single line is drawn as long as there is at least one horizontal pixel available for one value.

For data that show a longer period **three lines** are drawn - a dark green one shows the average, while a light pink and a light green line shows the maximum and minimum values at that point in time. The space between the highs and the lows is filled with yellow background.

Working time (working days) is displayed in graphs as a white background, while non-working time is displayed in grey (with the *Original blue* default frontend theme).

Working time is always displayed in simple graphs, whereas displaying it in **custom graphs** is a user preference.

Working time is not displayed if the graph shows more than 3 months.

Generating from history/trends

Graphs can be drawn based on either item **history** or **trends**. A grey caption at the bottom right of a graph indicates where the data come from.

Several factors influence whether history of trends is used:

- longevity of item history. For example, item history can be kept for 14 days. In that case, any data older than the fourteen days will be coming from trends.
- data congestion in the graph. If the amount of seconds to display in a horizontal graph pixel exceeds 3600/16, trend data are displayed (even if item history is still available for the same period).

- if trends are disabled, item history is used for graph building - if available for that period. This is supported starting with Zabbix 2.2.1 (before, disabled trends would mean an empty graph for the period even if item history was available).

Absence of data

For items with a regular update interval, nothing is displayed in the graph if item data are not collected.

However, for trapper items and items with a scheduled update interval (and regular update interval set to 0), a straight line is drawn leading up to the first collected value and from the last collected value to the end of graph; the line is on the level of the first/last value respectively.

Switching to raw values

A dropdown on the upper right allows to switch from the simple graph to the *Values/500 latest values* listings. This can be useful for viewing the numeric values making up the graph.

The values represented here are raw, i.e. no units or postprocessing of values is used. Value mapping, however, is applied.

Known issues

See [known issues](#) for graphs.

2 Custom graphs

Overview

Custom graphs, as the name suggests, offer customisation capabilities.

While simple graphs are good for viewing data of a single item, they do not offer configuration capabilities.

Thus, if you want to change graph style or the way lines are displayed or compare several items, for example incoming and outgoing traffic in a single graph, you need a custom graph.

Custom graphs are configured manually.

They can be created for a host or several hosts or for a single template.

Configuring custom graphs

To create a custom graph, do the following:

- Go to *Configuration* → *Hosts (or Templates)*
- Click on *Graphs* in the row next to the desired host or template
- In the Graphs screen click on *Create graph*
- Edit graph attributes

Graph attributes:

Parameter	Description
<i>Name</i>	<p>Unique graph name.</p> <p>Starting with Zabbix 2.2, item values can be referenced in the name by using simple macros with the standard <code>{host:key.func(param)}</code> syntax. Only avg, last, max and min as functions with seconds as parameter are supported within this macro. <code>{HOST.HOST<1-9>}</code> macros are supported for the use within this macro, referencing the first, second, third, etc. host in the graph, for example <code>{{HOST.HOST1}:key.func(param)}</code>.</p>
<i>Width</i>	Graph width in pixels (for preview and pie/exploded graphs only).
<i>Height</i>	Graph height in pixels.
<i>Graph type</i>	<p>Graph type:</p> <p>Normal - normal graph, values displayed as lines</p> <p>Stacked - stacked graph, filled areas displayed</p> <p>Pie - pie graph</p> <p>Exploded - "exploded" pie graph, portions displayed as "cut out" of the pie</p>
<i>Show legend</i>	Checking this box will set to display the graph legend.
<i>Show working time</i>	<p>If selected, non-working hours will be shown with gray background.</p> <p>Not available for pie and exploded pie graphs.</p>
<i>Show triggers</i>	<p>If selected, simple triggers will be displayed as lines with black dashes over trigger severity color. Not available for pie and exploded pie graphs.</p>
<i>Percentile line (left)</i>	<p>Display percentile for left Y axis. If, for example, 95% percentile is set, then the percentile line will be at the level where 95 per cent of the values fall under. Displayed as a bright green line. Only available for normal graphs.</p>
<i>Percentile line (right)</i>	<p>Display percentile for right Y axis. If, for example, 95% percentile is set, then the percentile line will be at the level where 95 per cent of the values fall under. Displayed as a bright red line. Only available for normal graphs.</p>

Parameter	Description
<i>Y axis MIN value</i>	Minimum value of Y axis: Calculated - Y axis minimum value will be automatically calculated Fixed - fixed minimum value for Y axis. Not available for pie and exploded pie graphs. Item - last value of the selected item will be the minimum value
<i>Y axis MAX value</i>	Maximum value of Y axis: Calculated - Y axis maximum value will be automatically calculated Fixed - fixed maximum value for Y axis. Not available for pie and exploded pie graphs. Item - last value of the selected item will be the maximum value
<i>3D view</i>	Enable 3D style. For pie and exploded pie graphs only.
<i>Items</i>	Items, data of which are to be displayed in this graph.

Configuring graph items

To add items, data of which are to be displayed in the graph, click on *Add* in the *Items* block, select items and then set attributes for the way item data will be displayed.

Item display attributes:

Parameter	Description
<i>Sort order (0→100)</i>	Draw order. 0 will be processed first. Can be used to draw lines or regions behind (or in front of) another. You can drag and drop items by the arrow in the beginning of line to set the sort order or which item is displayed in front of the other.
<i>Name</i>	Name of item, data of which will be displayed.
<i>Type</i>	Type (only available for pie and exploded pie graphs): Simple - value of the item is represented proportionally on the pie Graph sum - value of the item represents the whole pie Note that colouring of the "graph sum" item will only be visible to the extent that it is not taken up by "proportional" items.
<i>Function</i>	What values will be displayed when more than one value exists for an item: all - all (minimum, average and maximum) min - minimum only avg - average only max - maximum only
<i>Draw style</i>	Draw style (only available for normal graphs; for stacked graphs filled region is always used): Line - draw lines Filled region - draw filled region Bold line - draw bold lines Dot - draw dots Dashed line - draw dashed line
<i>Y axis side</i>	Which Y axis side the element is assigned to.
<i>Colour</i>	RGB colour in HEX notation.

Graph preview

In the *Preview* tab, a preview of the graph is displayed so you can immediately see what you are creating.

Note that the preview will not show any data for template items.

In this example, pay attention to the dashed bold line displaying the trigger level and the trigger information displayed in the legend.

Note:

3 triggers is the hard-coded limit for the number of triggers displayed in the legend.
If graph height is set as less than 120 pixels, no trigger will be displayed in the legend.

3 Ad-hoc graphs

Overview

While a **simple graph** is great for accessing data of one item and **custom graphs** offer customisation options, none of the two allow to quickly create a comparison graph for multiple items with little effort and no maintenance.

To address this issue, since Zabbix 2.4 it is possible to create ad-hoc graphs for several items in a very quick way.

Configuration

To create an ad-hoc graph, do the following:

- Go to *Monitoring* → *Latest data*
- Use filter to display items that you want
- Mark checkboxes of the items you want to graph
- Click on *Display stacked graph* or *Display graph* buttons

Latest data ↗

Filter ▲

Host groups Discovered hosts x
type here to search

<input checked="" type="checkbox"/>		Processor load (5 min average per core)	2015-08-20 10:31:15	0.07	-0.01	Graph
▼	New host	CPU (1 item)				
<input checked="" type="checkbox"/>		Processor load (5 min average per core)	2015-08-20 10:30:43	0.67	+0.07	Graph

0 selected Display stacked graph Display graph

Your graph is created instantly:

Note that to avoid displaying too many lines in the graph, only the average value for each item is displayed (min/max value lines

are not displayed). Triggers and trigger information is not displayed in the graph.

In the created graph window you have the time period selector available and the possibility to switch from the "normal" line graph to a stacked one (and back).

2 Network maps

Overview

If you have a network to look after, you may want to have an overview of your infrastructure somewhere. For that purpose you can create maps in Zabbix - of networks and of anything you like.

All users can create network maps. The maps can be public (available to all users) or private (available to selected users).

Proceed to [configuring a network map](#).

1 Configuring a network map

Overview

Configuring a map in Zabbix requires that you first create a map by defining its general parameters and then you start filling the actual map with elements and their links.

You can populate the map with elements that are a host, a host group, a trigger, an image or another map.

Icons are used to represent map elements. You can define the information that will be displayed with the icons and set that recent problems are displayed in a special way. You can link the icons and define information to be displayed on the links.

You can add custom URLs to be accessible by clicking on the icons. Thus you may link a host icon to host properties or a map icon to another map.

Maps are managed in *Monitoring* → *Maps*, where they can be configured, managed and viewed. In the monitoring view you can click on the icons and take advantage of the links to some scripts and URLs.

All users in Zabbix (including non-admin users) can create network maps. Maps have an owner - the user who created them.

Maps can be made public or private. Public maps are visible to all users, however, they must have at least read permissions to all map elements to see it. To add an element to the map the user must also have at least read permission to it.

Private maps are visible only to their owner. Private maps can be shared by the owner to other users and user groups. Regular (non-Super admin) users can only share with the groups and users they are member of. Private maps will be visible to their owner and the users the map is shared with as long as they have read permissions to all map elements. Admin level users, as long as they have read permissions to all map elements, can see and edit private maps regardless of being the owner or belonging to the shared user list.

Creating a map

To create a map, do the following:

- Go to *Monitoring* → *Maps*
- Go to the view with all maps
- Click on *Create map*

The **Map** tab contains general map attributes:

General map attributes:

Parameter	Description
<i>Owner</i>	Name of map owner.
<i>Name</i>	Unique map name.
<i>Width</i>	Map width in pixels.
<i>Height</i>	Map height in pixels.
<i>Background image</i>	Use background image: No image - no background image (white background) Image - selected image to be used as a background image. No scaling is performed. You may use a geographical map or any other image to enhance your map.
<i>Automatic icon mapping</i>	You can set to use an automatic icon mapping, configured in <i>Administration</i> → <i>General</i> → <i>Icon mapping</i> . Icon mapping allows to map certain icons against certain host inventory fields.
<i>Icon highlighting</i>	If you check this box, icons will receive highlighting. Elements with an active trigger will receive a round background, in the same colour as the highest severity trigger. Moreover, a thick green line will be displayed around the circle, if all problems are acknowledged. Elements with "disabled" or "in maintenance" status will get a square background, gray and orange respectively. See also: Viewing maps

Parameter	Description
<i>Mark elements on trigger status change</i>	A recent change of trigger status (recent problem or resolution) will be highlighted with markers (inward-pointing red triangles) on the three sides of the element icon that are free of the label. Markers are displayed for 30 minutes.
<i>Expand single problem</i>	If a map element (host, host group or another map) has one single problem, this option controls whether the problem (trigger) name is displayed, or problem count. If marked, problem name is used.
<i>Advanced labels</i>	If you check this box you will be able to define separate label types for separate element types.
<i>Icon label type</i>	Label type used for icons: Label - icon label IP address - IP address Element name - element name (for example, host name) Status only - status only (OK or PROBLEM) Nothing - no labels are displayed
<i>Icon label location</i>	Label location in relation to the icon: Bottom - beneath the icon Left - to the left Right - to the right Top - above the icon
<i>Problem display</i>	Display problem count as: All - full problem count will be displayed Separated - unacknowledged problem count will be displayed separated as a number of the total problem count Unacknowledged only - only the unacknowledged problem count will be displayed
<i>Minimum trigger severity</i>	Problems below the selected minimum severity level will not be displayed in the map. For example, with <i>Warning</i> selected, changes with <i>Information</i> and <i>Not classified</i> level triggers will not be reflected in the map.
<i>URLs</i>	This parameter is supported starting with Zabbix 2.2. URLs for each element type can be defined (with a label). These will be displayed as links when a user clicks on the element in the map viewing mode. Macros that can be used in map URLs: {MAP.ID}, {HOSTGROUP.ID}, {HOST.ID}, {TRIGGER.ID}

The **Sharing** tab contains the map type as well as sharing options (user groups, users) for private maps:

Parameter	Description
Type	Select map type: Private - map is visible only to selected user groups and users Public - map is visible to all
List of user group shares	Select user groups that the map is accessible to.
List of user shares	You may allow read-only or read-write access. Select users that the map is accessible to. You may allow read-only or read-write access.

When you click on *Add* to save this map, you have created an empty map with a name, dimensions and certain preferences. Now you need to add some elements. For that, click on *Constructor* in the map list to open the editable area.

Adding elements

To add an element, click on *Add* next to *Icon*. The new element will appear at the top left corner of the map. Drag and drop it wherever you like.

Note that with the *Grid* option "On", elements will always align to the grid (you can pick various grid sizes from the dropdown, also hide/show the grid). If you want to put elements anywhere without alignment, turn the option to "Off". (Random elements can later again be aligned to the grid with the *Align icons* button.)

Now that you have some elements in place, you may want to start differentiating them by giving names etc. By clicking on the element, a form is displayed and you can set the element type, give a name, choose a different icon etc.

Map element attributes:

Parameter	Description
<i>Type</i>	Type of the element: Host - icon representing status of all triggers of the selected host Map - icon representing status of all elements of a map Trigger - icon representing status of a single trigger Host group - icon representing status of all triggers of all hosts belonging to the selected group Image - an icon, not linked to any resource
<i>Label</i>	Icon label, any string. Macros and multi-line strings can be used in labels.

Parameter	Description
<i>Label location</i>	Label location in relation to the icon: Default - map's default label location Bottom - beneath the icon Left - to the left Right - to the right Top - above the icon
<i>Host</i>	Enter the host, if the element type is 'Host'. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts. Scroll down to select. Click on 'x' to remove the selected.
<i>Map</i>	Select the map, if the element type is 'Map'.
<i>Trigger</i>	Select the trigger, if the element type is 'Trigger'.
<i>Host group</i>	Enter the host group, if the element type is 'Host group'. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. Scroll down to select. Click on 'x' to remove the selected.
<i>Application</i>	You can select an application, allowing to only display problems of triggers that belong to the given application. This field is available for host and host group element types, and supported since Zabbix 2.4.0 .
<i>Automatic icon selection</i>	In this case an icon mapping will be used to determine which icon to display.
<i>Icons</i>	You can choose to display different icons for the element in these cases: default, problem, maintenance, disabled.
<i>Coordinate X</i>	X coordinate of the map element.
<i>Coordinate Y</i>	Y coordinate of the map element.
<i>URLs</i>	Element-specific URLs can be set for the element. These will be displayed as links when a user clicks on the element in the map viewing mode. If the element has its own URLs and there are map level URLs for its type defined, they will be combined in the same menu. Macros that can be used in map element URLs: {MAP.ID}, {HOSTGROUP.ID}, {HOST.ID}, {TRIGGER.ID}

Attention:

Added elements are not automatically saved. If you navigate away from the page, all changes may be lost. Therefore it is a good idea to click on the **Update** button in the top right corner. Once clicked, the changes are saved regardless of what you choose in the following popup.
Selected grid options are also saved with each map.

Selecting elements

To select elements, select one and then hold down *Ctrl* to select the others.

You can also select multiple elements by dragging a rectangle in the editable area and selecting all elements in it (option available since Zabbix 2.0).

Once you select more than one element, the element property form shifts to the mass-update mode so you can change attributes of selected elements in one go. To do so, mark the attribute using the checkbox and enter a new value for it. You may use macros here (such as, say, {HOST.NAME} for the element label).

Type (OK): Bold line

Colour (OK): 00CC00

Link indicators	TRIGGER	TYPE	COLOUR	ACTION
-----------------	---------	------	--------	--------

Link attributes:

Parameter	Description
<i>Label</i>	Label that will be rendered on top of the link. The <code>{host:key.func(param)}</code> macro is supported in this field, but only with <code>avg</code> , <code>last</code> , <code>min</code> and <code>max</code> trigger functions, with seconds as parameter.
<i>Connect to</i> <i>Type (OK)</i>	The element that the link connects to. Default link style: Line - single line Bold line - bold line Dot - dots Dashed line - dashed line
<i>Colour (OK)</i> <i>Link indicators</i>	Default link colour. List of triggers linked to the link. In case a trigger has status <code>PROBLEM</code> , its style is applied to the link.

2 Host group elements

Overview

This section explains how to add a “Host group” type element when configuring a `network map`.

Configuration

Icon: [Add / Remove](#) Shape: [Add / Remove](#) Link: [Add / Remove](#) Expand macros: [Off](#) Grid: [Shown / Off](#) 50x50 [Align icons](#)

Map element

Type:

Show:

Area type:

Area size: Width Height

Placing algorithm:

Label:

Label location:

Host group:

Application:

This table consists of parameters typical for *Host group* element type:

Parameter	Description
Type	Select Type of the element: Host group - icon representing status of all triggers of all hosts belonging to the selected group
Show	Show options: Host group - selecting this option will result as one single icon displaying corresponding information about the certain host group Host group elements - selecting this option will result as multiple icons displaying corresponding information about each single element (host) of the certain host group

Parameter	Description
Area type	<p>This setting is available if “Host group elements” parameter is selected:</p> <p>Fit to map - all host group elements are equally placed within the map</p> <p>Custom size - manual setting of the map area for all the host group elements to be displayed</p>
Area size	<p>This setting is available if “Host group elements” parameter and “Area type” parameter are selected:</p> <p>Width - numeric value to be entered to specify map area width</p> <p>Height - numeric value to be entered to specify map area height</p>
Placing algorithm	<p>Grid - only available option of displaying all the host group elements</p>
Label	<p>Icon label, any string.</p> <p>Macros and multi-line strings can be used in labels.</p> <p>If the type of the map element is “Host group” specifying a certain Macros has impact on the map view displaying corresponding information about each single host. For example, if {HOST.IP} macro is used, edit map view will only display the macro {HOST.IP} itself while map view will include and display each host’s unique IP address</p>

Viewing host group elements

This option is available if “Host group elements” show option is chosen. When selecting “Host group elements” as the *show* option, you will at first see only one icon for the host group. However, when you save the map and then go to the map view, you will see that the map includes all the elements (hosts) of the certain host group:

Map editing view

Map view

Notice how the {HOST.NAME} macro is used. In map editing the macro name is unresolved, while in map view all the unique names of the hosts are displayed.

3 Link indicators

Overview

You can assign some triggers to a **link** between elements in a network map. When these triggers go into a problem state, the link can reflect that.

When you configure a link, you set the default link type and color. When you assign triggers to a link, you can assign different link types and colors with these triggers.

Should any of these triggers go into a problem state, their link style and color will be displayed on the link. So maybe your default link was a green line. Now, with the trigger in problem state, your link may become bold red (if you have defined it so).

Configuration

To assign triggers as link indicators, do the following:

- select a map element
- click on *Edit* in the *Links* section for the appropriate link
- click on *Add* in the *Link indicators* block and select one or more triggers

Map element

Type Host

Label

Label location Default

Host New host x Select

Automatic icon selection ☐

Icons

Default	Server_(96)
Problem	Server_(128)
Maintenance	Server_(24)
Disabled	Default

Coordinates X Y

URLs

NAME	URL
<input type="text"/>	<input type="text"/>

[Add](#)

Apply Remove Close

Links

ELEMENT NAME	LINK INDICATORS
Zabbix server	New host: Zabbix agent on New host is unreachable for 5 minutes

Label

Connect to Zabbix server

Type (OK) Bold line

Colour (OK) 00CC00

Link indicators

TRIGGER	TYPE	COLOUR
New host: Zabbix agent on New host is unreachable for 5 minutes	Line	Red

[Add](#)

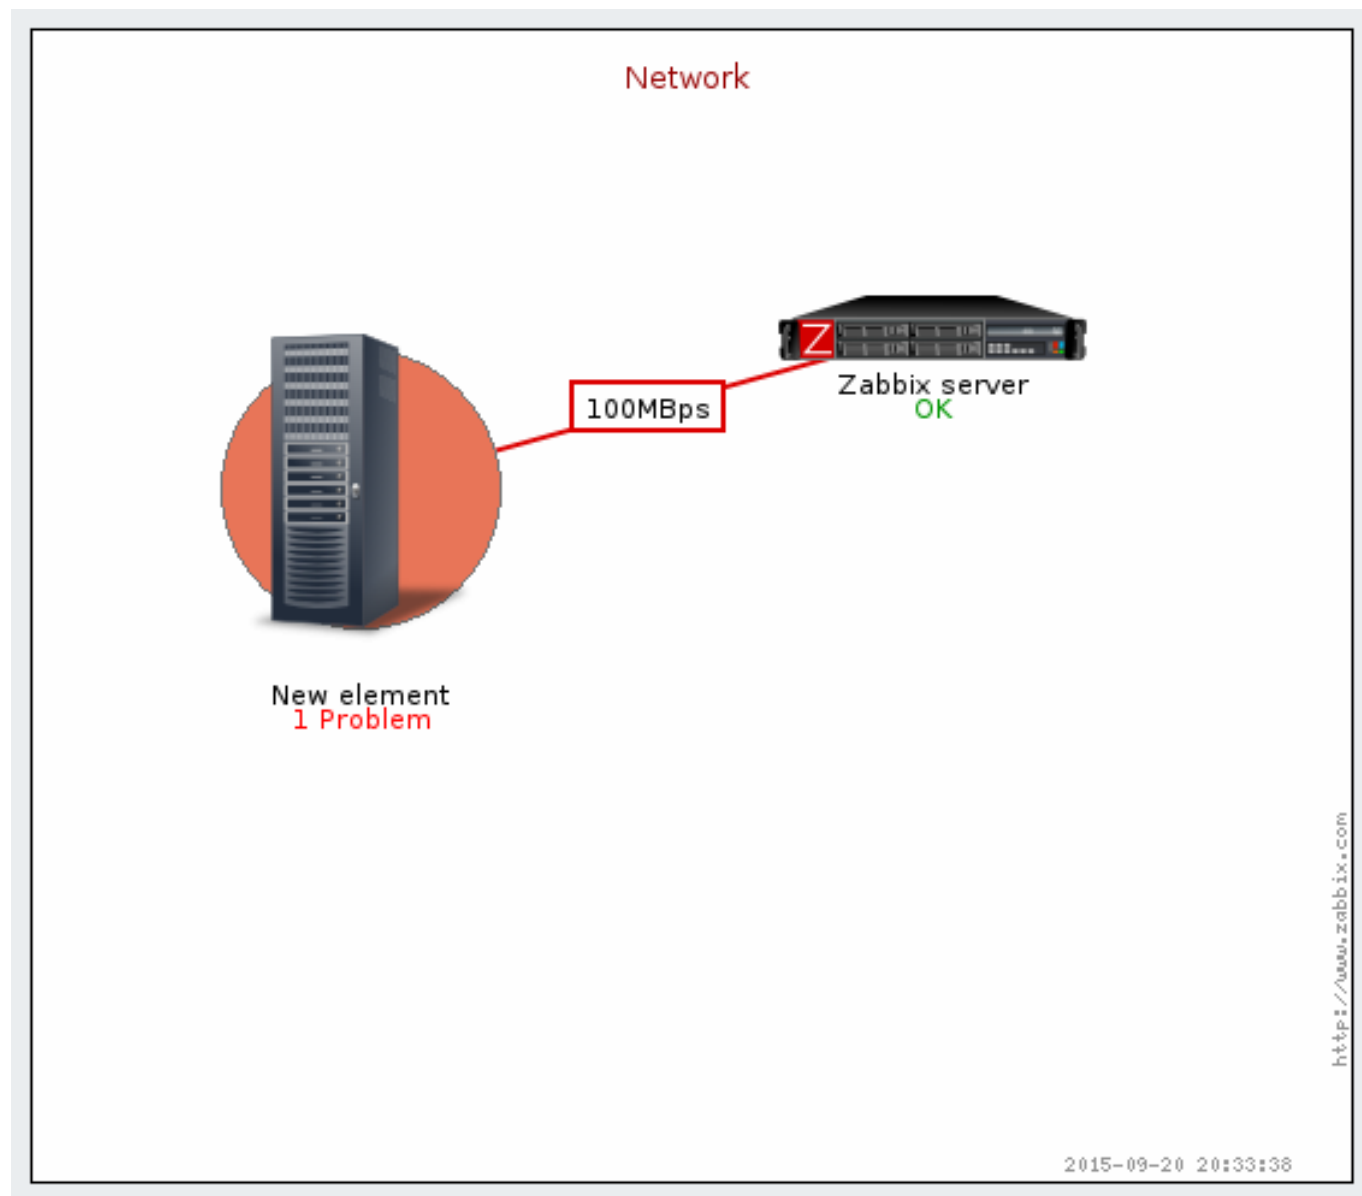

Apply Remove Close

Added triggers can be seen in the *Link indicators* list.

You can set the link type and color for each trigger directly from the list. When done, click on *Apply*, close the form and click on *Update* to save the map changes.

Display

In *Monitoring* → *Maps* the respective color will be displayed on the link if the trigger goes into a problem state.

Note:

If multiple triggers go into a problem state, the one with the highest severity will determine the link style and color. If multiple triggers with the same severity are assigned to the same map link, the one with the lowest ID takes precedence.

3 Screens

Overview

On Zabbix screens you can group information from various sources for a quick overview on a single screen. Building the screens is quite easy and intuitive.

Essentially a screen is a table. You choose how many cells per table and what elements to display in the cells. The following elements can be displayed:

- simple graphs
- simple graph prototypes
- user-defined custom graphs
- custom graph prototypes

- maps
- other screens
- plain text information
- server information (overview)
- host information (overview)
- trigger information (overview)
- host/hostgroup issues (status of triggers)
- system status
- data overview
- clock
- history of events
- history of recent actions
- URL (data taken from another location)

Screens are managed in *Monitoring* → *Screens*, where they can be configured, managed and viewed. They can also be added to the favourites section of *Monitoring* → *Dashboard*.

To configure a screen you must first create it by defining its general properties and then add individual elements in the cells.

All users in Zabbix (including non-admin users) can create screens. Screens have an owner - the user who created them.

Screens can be made public or private. Public screens are visible to all users.

Private screens are visible to their owner. Private screens can be shared by the owner to other users and user groups. Regular (non-Super admin) users can only share with the groups and users they are member of. Private screens will be visible to their owner and the users the screen is shared with as long as they have read permissions to all screen elements. Admin level users, as long as they have read permissions to all screen elements, can see and edit private screens regardless of being the owner or belonging to the shared user list.

Warning:

For both public and private screens a user must have at least read permissions to all screen elements in order to see the screen. To add an element to a screen a user must also have at least read permission to it.

Creating a screen

To create a screen, do the following:

- Go to *Monitoring* → *Screens*
- Go to the view with all screens
- Click on *Create Screen*

The **Screen** tab contains general screen attributes:

The screenshot shows the 'Create Screen' dialog in Zabbix. It has two tabs: 'Screen' (selected) and 'Sharing'. Under the 'Screen' tab, there are four input fields: 'Owner' (with a dropdown menu showing 'Admin (Zabbix Administrator)' and a 'Select' button), 'Name' (text input with 'Zabbix server'), 'Columns' (numeric input with '2'), and 'Rows' (numeric input with '2'). At the bottom, there are two buttons: 'Add' (blue) and 'Cancel' (white with blue border).

Give your screen a unique name and set the number of columns (vertical cells) and rows (horizontal cells).

The **Sharing** tab contains the screen type as well as sharing options (user groups, users) for private screens:

Screen
Sharing

Type
Private
Public

List of user group shares

USER GROUPS
PERMISSIONS
ACTION

Zabbix administrators
Read-only
Read-write
Remove

Add

List of user shares

USERS
PERMISSIONS
ACTION

user (New User)
Read-only
Read-write
Remove

Add

Add
Cancel

Parameter	Description
<i>Owner</i>	Select the screen owner.
<i>Type</i>	Select screen type: Private - screen is visible only to selected user groups and users Public - screen is visible to all
<i>List of user group shares</i>	Select user groups that the screen is accessible to. You may allow read-only or read-write access.
<i>List of user shares</i>	Select users that the screen is accessible to. You may allow read-only or read-write access.

Click on *Add* to save the screen.

Adding elements

To add elements to the screen, click on *Constructor* next to the screen name in the list.

On a new screen you probably only see links named *Change*. Clicking those links opens a form whereby you set what to display in each cell.

On an existing screen you click on the existing elements to open the form whereby you set what to display.

Screen element attributes:

Parameter	Description
<i>Resource</i>	<p>Information displayed in the cell:</p> <p>Action log - history of recent actions</p> <p>Clock - digital or analog clock displaying current server or local time</p> <p>Data overview - latest data for a group of hosts</p> <p>Graph - single custom graph</p> <p>Graph prototype - custom graph from low-level discovery rule</p> <p>History of events - latest events</p> <p>Host group issues - status of triggers filtered by the hostgroup (includes triggers without events, since Zabbix 2.2)</p> <p>Host issues - status of triggers filtered by the host (includes triggers without events, since Zabbix 2.2)</p> <p>Hosts info - high level host related information</p> <p>Map - single map</p> <p>Plain text - plain text data</p> <p>Screen - screen (one screen may contain other screens inside)</p> <p>Server info - server high-level information</p> <p>Simple graph - single simple graph</p> <p>Simple graph prototype - simple graph based on item generated by low-level discovery</p> <p>System status - displays system status (similar to the Dashboard)</p> <p>Triggers info - high level trigger related information</p> <p>Triggers overview - status of triggers for a host group</p> <p>URL - include content from an external resource</p>
<i>Horizontal align</i>	<p>Possible values:</p> <p>Center</p> <p>Left</p> <p>Right</p>
<i>Vertical align</i>	<p>Possible values:</p> <p>Middle</p> <p>Top</p> <p>Bottom</p>
<i>Column span</i>	Extend cell to a number of columns, same way as HTML column spanning works.
<i>Row span</i>	Extend cell to a number of rows, same way as HTML row spanning works.

Take note of the '+' and '-' controls on each side of the table.

Clicking on '+' above the table will add a column. Clicking on '-' beneath the table will remove a column.

Clicking on '+' on the left side of the table will add a row. Clicking on '-' on the right side of the table will remove a row.

Attention:

If graph height is set as less than 120 pixels, no trigger will be displayed in the legend.

Dynamic elements

For some of the elements there is an extra option called *Dynamic item*. Checking this box at first does not seem to change anything.

However, once you go to *Monitoring → Screens*, you may realize that now you have extra dropdowns there for selecting the host. Thus you have a screen where some elements display the same information while others display information depending on the currently selected host.

The benefit of this is that you do not need to create extra screens just because you want to see the same graphs containing data from various hosts.

Dynamic item option is available for several screen elements:

- Graphs (custom graphs)
- Graph prototypes
- Simple graphs
- Simple graph prototypes

- Plain text
- URL

Note:

Clicking on a dynamic graph opens it in full view; although with custom graphs and graph prototypes that is currently supported with the default host only (i.e. with host 'not selected' in the dropdown). When selecting another host in the dropdown, the dynamic graph is created using item data of that host and the resulting graph is not clickable.

Note:

Dynamic URL elements will not be displayed in *Monitoring → Screens*, unless a host is selected. Without a selected host the "No host selected" message will be visible only.

1 Screen elements

Overview

This section lists available **screen** elements and provides details for screen element configuration.

1 Action log

In the action log element you can display details of action operations (notifications, remote commands). It replicates information from *Reports → Audit*.

Attention:

Browsers might not load an HTTP page included in a screen (using URL element), if Zabbix frontend is accessed over HTTPS.

4 Slide shows

Overview

In a slide show you can configure that a number of **screens** are displayed one after another at set intervals.

Sometimes you might want to switch between some configured screens. While that can be done manually, doing that more than once or twice may become very tedious. This is where the slide show function comes to rescue.

All users in Zabbix (including non-admin users) can create slide shows. Slide shows have an owner - the user who created them.

Slide shows can be made public or private. Public slide shows are visible to all users, however, they must have at least read permissions to all slide show elements (screens) to see it. To add a screen to the slide show the user must also have at least read permission to it.

Private slide shows are visible only to their owner. Private slide shows can be shared by the owner to other users and user groups. Regular (non-Super admin) users can only share with the groups and users they are member of. Private slide shows will be visible to their owner and the users the slide show is shared with as long as they have read permissions to all included screens. Admin level users, as long as they have read permissions to all included screens, can see and edit private slide shows regardless of being the owner or belonging to the shared user list.

Configuration

To create a slide show, do the following:

- Go to *Monitoring* → *Screens*
- Select *Slide shows* in the dropdown
- Go to the view with all slide shows
- Click on *Create slide show*

The **Slide** tab contains general slide show attributes:

Owner	Name	Default delay (in seconds)
Admin (Zabbix Administrator) ×	Zabbix administrators	30

Slides	SCREEN	DELAY	ACTION
⋮	1: Zabbix server	default	Remove
⋮	2: Zabbix server2	15	Remove
Add			

[Add](#) [Cancel](#)

Parameter	Description
Owner	Select the slide show owner. Specifying owner is mandatory.
Name	Unique name of the slide show.
Default delay (in seconds)	How long one screen is displayed by default, before rotating to the next, in seconds.
Slides	List of screens to be rotated. Click on <i>Add</i> to select screens. The <i>Up/Down</i> arrow before the screen allows to drag a screen up and down in the sort order of display. If you want to display only, say, a single graph in the slide show, create a screen containing just that one graph.
Screen	Screen name.
Delay	A custom value for how long the screen will be displayed, in seconds. If set to 0, the <i>Default delay</i> value will be used.
Action	Click on <i>Remove</i> to remove a screen from the slide show.

The slide show in this example consists of two screens which will be displayed in the following order:

Zabbix server ⇒ Displayed for 30 seconds ⇒ Zabbix server2 ⇒ Displayed for 15 seconds ⇒ Zabbix server ⇒ Displayed for 30 seconds ⇒ Zabbix server2 ⇒ ...

The **Sharing** tab contains the slide show type as well as sharing options (user groups, users) for private slide shows:

Slide

Sharing

Type

PrivatePublic

List of user group shares

USER GROUPS	PERMISSIONS	ACTION
Linux administrators	Read-onlyRead-write	Remove
Add		

List of user shares

USERS	PERMISSIONS	ACTION
guest	Read-onlyRead-write	Remove
Add		

Add

Cancel

Parameter	Description
Type	Select slide show type: Private - slide show is visible only to selected user groups and users Public - slide show is visible to all
List of user group shares	Select user groups that the slide show is accessible to. You may allow read-only or read-write access.
List of user shares	Select users that the slide show is accessible to. You may allow read-only or read-write access.

Click on *Add* to save the slide show.

Display

Slide shows that are ready can be viewed in *Monitoring* → *Screens*, then choosing *Slide shows* from the dropdown and clicking on the slide show name.

With the Menu option next to the dropdown, you can accelerate or slow down the display by choosing a slide delay multiplier:

REFRESH TIME MULTIPLIER

x0.25

x0.5

✓ x1

x1.5

x2

x3

x4

x5

Attention:

If a delay ends up as being less than 5 seconds (either by having entered a delay less than 5 seconds or by using the slide delay multiplier), a 5-second minimum delay will be used.

6 Templates

Overview

A template is a set of entities that can be conveniently applied to multiple hosts.

The entities may be:

- items
- triggers
- graphs
- applications
- screens (*since Zabbix 2.0*)
- low-level discovery rules (*since Zabbix 2.0*)
- web scenarios (*since Zabbix 2.2*)

As many hosts in real life are identical or fairly similar so it naturally follows that the set of entities (items, triggers, graphs,...) you have created for one host, may be useful for many. Of course, you could copy them to each new host, but that would be a lot of manual work. Instead, with templates you can copy them to one template and then apply the template to as many hosts as needed.

When a template is linked to a host, all entities (items, triggers, graphs,...) of the template are added to the host. Templates are assigned to each individual host directly (and not to a host group).

Templates are often used to group entities for particular services or applications (like Apache, MySQL, PostgreSQL, Postfix...) and then applied to hosts running those services.

Another benefit of using templates is when something has to be changed for all the hosts. Changing something on the template level once will propagate the change to all the linked hosts.

Thus, the use of templates is an excellent way of reducing one's workload and streamlining the Zabbix configuration.

Proceed to [creating and configuring a template](#).

7 Notifications upon events

Overview

Assuming that we have configured some items and triggers and now are getting some events happening as a result of triggers changing state, it is time to consider some actions.

To begin with, we would not want to stare at the triggers or events list all the time. It would be much better to receive notification if something significant (such as a problem) has happened. Also, when problems occur, we would like to see that all the people concerned are informed.

That is why sending notifications is one of the primary actions offered by Zabbix. Who and when should be notified upon a certain event can be defined.

To be able to send and receive notifications from Zabbix you have to:

- [define some media](#)
- [configure an action](#) that sends a message to one of the defined media

Actions consist of *conditions* and *operations*. Basically, when conditions are met, operations are carried out. The two principal operations are sending a message (notification) and executing a remote command.

For discovery and auto-registration created events, some additional operations are available. Those include adding or removing a host, linking a template etc.

1 Media types

Overview

Media are the delivery channels used for sending notifications and alerts in Zabbix.

You can configure several media types:

- E-mail
- SMS
- Jabber
- Ez Texting
- Custom alertscripts

1 E-mail

Overview

To configure e-mail as the delivery channel for messages, you need to configure e-mail as the media type and assign specific addresses to users.

Configuration

To configure e-mail as the media type:

- Go to *Administration*→*Media types*
- Click on *Create media type* (or click on *E-mail* in the list of pre-defined media types).

Media types

Name	<input type="text" value="Email"/>
Type	<input type="text" value="Email"/>
SMTP server	<input type="text" value="mail.company.com"/>
SMTP server port	<input type="text" value="25"/>
SMTP helo	<input type="text" value="company.com"/>
SMTP email	<input type="text" value="Zabbix-info <monitoring.info@company.com>"/>
Connection security	<input type="radio"/> None <input checked="" type="radio"/> STARTTLS <input type="radio"/> SSL/TLS
SSL verify peer	<input type="checkbox"/>
SSL verify host	<input type="checkbox"/>
Authentication	<input type="radio"/> None <input checked="" type="radio"/> Normal password
Username	<input type="text"/>
Password	<input type="password"/>
Enabled	<input checked="" type="checkbox"/>
<input type="button" value="Add"/> <input type="button" value="Cancel"/>	

Media type attributes:

Parameter	Description
<i>Name</i>	Name of the media type.
<i>Type</i>	Select <i>Email</i> as the type.
<i>SMTP server</i>	Set an SMTP server to handle outgoing messages.
<i>SMTP server port</i>	Set the SMTP server port to handle outgoing messages.
	This option is supported <i>starting with Zabbix 3.0</i> .
<i>SMTP helo</i>	Set a correct SMTP helo value, normally a domain name.

Parameter	Description
<i>SMTP email</i>	<p>The address entered here will be used as the From address for the messages sent.</p> <p>Adding a sender display name (like "Zabbix-HQ" in <i>Zabbix-HQ <zabbix@company.com></i> in the screenshot above) with the actual e-mail address is supported since Zabbix 2.2 version.</p> <p>There are some restrictions on display names in Zabbix emails in comparison to what is allowed by RFC 5322, as illustrated by examples:</p> <p>Valid examples:</p> <p><i>zabbix@company.com</i> (only email address, no need to use angle brackets)</p> <p><i>Zabbix HQ <zabbix@company.com></i> (display name and email address in angle brackets)</p> <p><i>ΣΩ-monitoring <zabbix@company.com></i> (UTF-8 characters in display name)</p> <p>Invalid examples:</p> <p><i>Zabbix HQ zabbix@company.com</i> (display name present but no angle brackets around email address)</p> <p><i>"Zabbix\@ <H(comment)Q >" <zabbix@company.com></i> (although valid by RFC 5322, quoted pairs and comments are not supported in Zabbix emails)</p>
<i>Connection security</i>	<p>Select the level of connection security:</p> <p>None - do not use the CURLOPT_USE_SSL option</p> <p>STARTTLS - use the CURLOPT_USE_SSL option with CURLUSESSL_ALL value</p> <p>SSL/TLS - use of CURLOPT_USE_SSL is optional</p> <p>This option is supported <i>starting with Zabbix 3.0</i>.</p>
<i>SSL verify peer</i>	<p>Mark the checkbox to verify the SSL certificate of the SMTP server. The value of "SSLCAlocation" server configuration directive should be put into CURLOPT_CAPATH for certificate validation. This sets cURL option CURLOPT_SSL_VERIFYPEER.</p>
<i>SSL verify host</i>	<p>This option is supported <i>starting with Zabbix 3.0</i>.</p> <p>Mark the checkbox to verify that the <i>Common Name</i> field or the <i>Subject Alternate Name</i> field of the SMTP server certificate matches. This sets cURL option CURLOPT_SSL_VERIFYHOST.</p>
<i>Authentication</i>	<p>This option is supported <i>starting with Zabbix 3.0</i>.</p> <p>Select the level of authentication:</p> <p>None - no cURL options are set (since 3.0.11) Username and password - implies "AUTH=" leaving the choice of authentication mechanism to cURL (until 3.0.11) Normal password - CURLOPT_LOGIN_OPTIONS is set to "AUTH=PLAIN"</p>
<i>Username</i>	<p>This option is supported <i>starting with Zabbix 3.0</i>.</p> <p>User name to use in authentication. This sets the value of CURLOPT_USERNAME.</p>
<i>Password</i>	<p>This option is supported <i>starting with Zabbix 3.0</i>.</p> <p>Password to use in authentication. This sets the value of CURLOPT_PASSWORD.</p>
<i>Enabled</i>	<p>This option is supported <i>starting with Zabbix 3.0</i>.</p> <p>Mark the checkbox to enable the media type.</p>

Attention:

To make SMTP authentication options available, Zabbix server should be compiled with the `--with-libcurl` **compilation** option with cURL 7.20.0 or higher.

User media

To assign a specific address to the user:

- Go to *Administration→Users*

- Open the user properties form
- In Media tab, click on *Add*

Media

Type

Email

Send to

Some User <user@domain.tld>

When active

1-7,00:00-24:00

Use if severity

☒ Not classified

☒ Information

☒ Warning

☒ Average

☒ High

☒ Disaster

Enabled

☒

Add

Cancel

User media attributes:

Parameter	Description
Type	Select <i>Email</i> as the type.
Send to	Specify the e-mail address to send the messages to. Adding a recipient display name (like “Some User” in <i>Some User <user@domain.tld></i> in the screenshot above) with the actual e-mail address is supported since Zabbix 2.2 version. See examples and restrictions on display name and email address in media type attribute SMTP email description.
When active	You can limit the time when messages are sent, for example, the working days only (1-5,09:00-18:00). See the Time period specification page for description of the format.
Use if severity	Mark the checkboxes of trigger severities that you want to receive notifications for. <i>Note</i> that for non-trigger events the default severity (‘Not classified’) is used, so leave it checked if you want to receive notifications for non-trigger events.
Status	Status of the user media. Enabled - is in use. Disabled - is not being used.

2 SMS

Overview

Zabbix supports the sending of SMS messages using a serial GSM modem connected to Zabbix server’s serial port.

Make sure that:

- The speed of the serial device (normally /dev/ttyS0 under Linux) matches that of the GSM modem. Zabbix does not set the speed of the serial link. It uses default settings.
- The 'zabbix' user has read/write access to the serial device. Run the command `ls -l /dev/ttyS0` to see current permissions of the serial device.
- The GSM modem has PIN entered and it preserves it after power reset. Alternatively you may disable PIN on the SIM card. PIN can be entered by issuing command `AT+CPIN="NNNN"` (NNNN is your PIN number, the quotes must be present) in a terminal software, such as Unix minicom or Windows HyperTerminal.

Zabbix has been tested with these GSM modems:

- Siemens MC35
- Teltonika ModemCOM/G10

To configure SMS as the delivery channel for messages, you also need to configure SMS as the media type and enter the respective phone numbers for the users.

Configuration

To configure SMS as the media type:

- Go to *Administration*→*Media types*
- Click on *Create media type* (or click on *SMS* in the list of pre-defined media types).

Media type attributes:

Parameter	Description
<i>Description</i>	Name of the media type.
<i>Type</i>	Select <i>SMS</i> as the type.
<i>GSM modem</i>	Set the serial device name of the GSM modem.

User media

To assign a phone number to the user:

- Go to *Administration*→*Users*
- Open the user properties form
- In Media tab, click on *Add*

User media attributes:

Parameter	Description
<i>Type</i>	Select <i>SMS</i> as the type.
<i>Send to</i>	Specify the phone number to send messages to.
<i>When active</i>	You can limit the time when messages are sent, for example, the working days only (1-5,09:00-18:00). See the Time period specification page for description of the format.
<i>Use if severity</i>	Mark the checkboxes of trigger severities that you want to receive notifications for.
<i>Status</i>	Status of the user media. Enabled - is in use. Disabled - is not being used.

3 Jabber

Overview

Zabbix supports sending Jabber messages.

When sending notifications, Zabbix tries to look up the Jabber SRV record first, and if that fails, it uses an address record for that domain. Among Jabber SRV records, the one with the highest priority and maximum weight is chosen. If it fails, other records are not tried.

To configure Jabber as the delivery channel for messages, you need to configure Jabber as the media type and enter the respective addresses for the users.

Configuration

To configure Jabber as the media type:

- Go to *Administration*→*Media types*
- Click on *Create media type* (or click on *Jabber* in the list of pre-defined media types).

Media type attributes:

Parameter	Description
<i>Description</i>	Name of the media type.
<i>Type</i>	Select <i>Jabber</i> as the type.
<i>Jabber identifier</i>	Enter Jabber identifier.
<i>Password</i>	Enter Jabber password.

User media

To assign a Jabber address to the user:

- Go to *Administration*→*Users*
- Open the user properties form
- In Media tab, click on *Add*

User media attributes:

Parameter	Description
<i>Type</i>	Select <i>Jabber</i> as the type.
<i>Send to</i>	Specify the address to send messages to.
<i>When active</i>	You can limit the time when messages are sent, for example, the working days only (1-5,09:00-18:00). See the Time period specification page for description of the format.
<i>Use if severity</i>	Mark the checkboxes of trigger severities that you want to receive notifications for.
<i>Status</i>	Status of the user media. Enabled - is in use. Disabled - is not being used.

4 Ez Texting

Overview

You can use [Zabbix technological partner](#) Ez Texting for message sending.

To configure Ez Texting as the delivery channel for messages, you need to configure Ez Texting as the media type and assign recipient identification to the users.

Configuration

To configure Ez Texting as the media type:

- Go to *Administration*→*Media types*
- Click on *Create media type*

Media types

Name	<input type="text" value="Ez Texting"/>
Type	<div><div>Ez Texting</div><div>https://app.eztexting.com</div></div>
Username	<input type="text"/>
Password	<input type="password"/>
Message text limit	<div>USA (160 characters)</div>
Enabled	<input checked="" type="checkbox"/>
<div><div>Add</div><div>Cancel</div></div>	

Media type attributes:

Parameter	Description
<i>Description</i>	Name of the media type.
<i>Type</i>	Select <i>Ez Texting</i> as the type.
<i>Username</i>	Enter the Ez Texting username.
<i>Password</i>	Enter the Ez Texting password.
<i>Message text limit</i>	Select the message text limit. USA (160 characters) Canada (136 characters)

User media

To assign Ez Texting recipient identification to the user:

- Go to *Administration*→*Users*
- Open the user properties form
- In Media tab, click on *Add*

User media attributes:

Parameter	Description
<i>Type</i>	Select the Ez Texting media type.
<i>Send to</i>	Specify the recipient to send the messages to.
<i>When active</i>	You can limit the time when messages are sent, for example, the working days only (1-5,09:00-18:00). See the Time period specification page for description of the format.
<i>Use if severity</i>	Mark the checkboxes of trigger severities that you want to receive notifications for.
<i>Status</i>	Status of the user media. Enabled - is in use. Disabled - is not being used.

5 Custom alertscripts

Overview

If you are not satisfied with existing media types for sending alerts there is an alternative way to do that. You can create a script that will handle the notification your way.

Alert scripts are executed on Zabbix server. These scripts are located in the directory defined in the server configuration file **AlertScriptsPath** variable.

Here is an example alert script:

```
#####!/bin/bash

to=$1
subject=$2
body=$3

cat <<EOF | mail -s "$subject" "$to"
$body
EOF
```

Environment variables are not preserved or created for the script, so they should be handled explicitly.

Configuration

To configure custom alertscripts as the media type:

- Go to *Administration→Media types*
- Click on *Create media type*

Name

Script

Type

Script

Script name

notification.sh

Script parameters

PARAMETER	ACTION
{ALERT.SENDTO}	Remove
{ALERT.SUBJECT}	Remove
{ALERT.MESSAGE}	Remove
	Remove
Add	

Enabled

☒

Media type attributes:

Parameter	Description
Name	Enter name of the media type.
Type	Select <i>Script</i> as the type.
Script name	Enter the name of the script.

Parameter	Description
<i>Script parameters</i>	Add command-line parameters to the script. {ALERT.SENDTO}, {ALERT.SUBJECT} and {ALERT.MESSAGE} macros are supported in script parameters. Customizing script parameters is supported since Zabbix 3.0.

User media

To assign custom alertscripts to the user:

- Go to *Administration*→*Users*
- Open the user properties form
- In Media tab, click on *Add*

User media attributes:

Parameter	Description
<i>Type</i>	Select the custom alertscripts media type.
<i>Send to</i>	Specify the recipient to receive the alerts.
<i>When active</i>	You can limit the time when alertscripts are executed, for example, the working days only (1-5,09:00-18:00). See the Time period specification page for description of the format.
<i>Use if severity</i>	Mark the checkboxes of trigger severities that you want to activate the alertscript for.
<i>Status</i>	Status of the user media. Enabled - is in use. Disabled - is not being used.

2 Actions

Overview

If you want some operations taking place as a result of events (for example, notifications sent), you need to configure actions.

Actions can be defined in response to events of all supported types:

- Trigger events - when trigger status changes from *OK* to *PROBLEM* and back
- Discovery events - when network discovery takes place
- Auto registration events - when new active agents auto-register
- Internal events - when items become unsupported or triggers go into an unknown state

Configuring an action

To configure an action, do the following:

- Go to *Configuration* → *Actions*
- From the *Event source* dropdown select the required source
- Click on *Create action*
- Set general action attributes
- Choose the **operation** to carry out, in Operations tab
- Choose the **conditions** upon which the operation is carried out, in Conditions tab

General action attributes:

Actions

Action

Conditions

Operations

Name Report problems to Zabbix administrators

Default subject {TRIGGER.STATUS}: {TRIGGER.NAME}

Default message
Trigger: {TRIGGER.NAME}
Trigger status: {TRIGGER.STATUS}
Trigger severity: {TRIGGER.SEVERITY}
Item value: {ITEM.NAME1} ({HOST.NAME1}:
{ITEM.KEY1}): {ITEM.VALUE1}

Original event ID: {EVENT.ID}

Recovery message ☒

Recovery subject {TRIGGER.STATUS}: {TRIGGER.NAME}

Recovery message
Trigger: {TRIGGER.NAME}
Trigger status: {TRIGGER.STATUS}
Trigger severity: {TRIGGER.SEVERITY}
Item value: {ITEM.NAME1} ({HOST.NAME1}:
{ITEM.KEY1}): {ITEM.VALUE1}

Original event ID: {EVENT.ID}

Enabled ☒

Add

Cancel

Parameter	Description
Name	Unique action name.
Default subject	Default message subject. The subject may contain macros . It is limited to 255 characters.
Default message	Default message. The message may contain macros . It is limited to certain amount of characters depending on the type of database (see Sending message for more information).

Parameter	Description
<i>Recovery message</i>	<p>Mark the checkbox to turn on a <i>Recovery message</i>.</p> <p><i>Recovery message</i> is a special way of getting notified for a resolved problem. If turned on, only a single message with a custom subject/body is sent if trigger value changes to OK.</p> <p><i>Note:</i> To receive a recovery message, "Trigger value=<i>Problem</i>" must be present in action conditions; "Trigger value=<i>OK</i>", however, must not be present. (If "Trigger value=<i>OK</i>" is set, the recovery message will not work; instead you will get a full escalation of defined messages and/or remote commands in the same way as for a problem situation).</p> <p><i>Recovery message</i> will be sent only to those who received any messages regarding the problem before.</p> <p>A recovery message inherits acknowledgement status and history from the problem event (such as when expanding {EVENT.ACK.HISTORY} and {EVENT.ACK.STATUS} macros).</p> <p>If using {EVENT.*} macros in a recovery message, they will refer to the problem event (not the OK event).</p> <p>{EVENT.RECOVERY.*} macros will only expanded in a recovery message and will refer to the recovery/OK event.</p>
<i>Recovery subject</i>	Recovery message subject. It may contain macros. It is limited to 255 characters
<i>Recovery message</i>	Recovery message. It may contain macros. It is limited to certain amount of characters depending on the type of database (see Sending message for more information).
<i>Enabled</i>	Mark the checkbox to enable the action. Otherwise it will be disabled.

1 Operations

Overview

You can define the following operations for all events:

- send a message
- execute a remote command (including IPMI)

Attention:

Zabbix server does not create alerts if access to the host is explicitly "denied" for the user defined as action operation recipient or if the user has no rights defined to the host at all.

For discovery events, there are additional operations available:

- add host
- remove host
- enable host
- disable host
- add to group
- delete from group
- link to template
- unlink from template
- set host inventory mode

The additional operations available for auto-registration events are:

- add host
- disable host
- add to group
- link to template
- set host inventory mode

Configuring an operation

To configure an operation, go to *Operations* tab in the action properties form and click on *New*. Edit the operation step and click on *Add* to add to the list of *Action operations*.

Operation attributes:

Actions

Parameter	Description
Default operation step duration	Duration of one operation step by default (minimum 60 seconds). For example, an hour-long step duration means that if an operation is carried out, an hour will pass before the next step.

Parameter	Description
<i>Action operations</i>	<p>Action operations are displayed, with these details:</p> <p>Steps - escalation step(s) to which the operation is assigned</p> <p>Details - type of operation and its recipient/target.</p> <p>Since Zabbix 2.2, the operation list also displays the media type (e-mail, SMS, Jabber, etc) used in sending a message as well as the name and surname (in parentheses after the alias) of a notification recipient.</p> <p>Start in - how long after an event the operation is performed</p> <p>Duration (sec) - step duration is displayed. <i>Default</i> is displayed if the step uses default duration, and a time is displayed if custom duration is used.</p> <p>Action - links for editing and removing an operation are displayed.</p> <p>To configure a new operation, click on <i>New</i>.</p>
<i>Operation details</i>	<p>This block is used to configure the details of an operation.</p>
<i>Step</i>	<p>Select the step(s) to assign the operation to in an escalation schedule:</p> <p>From - execute starting with this step</p> <p>To - execute until this step (0=infinity, execution will not be limited)</p> <p>Step duration - custom duration for these steps (0=use default step duration).</p> <p>Several operations can be assigned to the same step. If these operations have different step duration defined, the shortest one is taken into account and applied to the step.</p>
<i>Operation type</i>	<p>Two operation types are available for all events:</p> <p>Send message - send message to user</p> <p>Remote command - execute a remote command</p> <p>More operations are available for discovery and auto-registration based events (see above).</p>
<i>Operation type:</i> <i>send mes-</i> <i>sage</i>	
<i>Send to user groups</i>	<p>Click on <i>Add</i> to select user groups to send the message to.</p> <p>The user group must have at least "read" permissions to the host in order to be notified.</p>
<i>Send to users</i>	<p>Click on <i>Add</i> to select users to send the message to.</p> <p>The user must have at least "read" permissions to the host in order to be notified.</p>
<i>Send only to Default mes-</i> <i>sage</i>	<p>Send message to all defined media types or a selected one only.</p>
<i>Subject</i>	<p>If selected, the default message will be used (see general action attributes).</p> <p>Subject of the custom message. The subject may contain macros.</p>

Parameter	Description
<i>Message</i>	The custom message. The message may contain macros.
Operation type: <i>re-mote command</i>	
<i>Target list</i>	<p>Select targets to execute the command on:</p> <p>Current host - command is executed on the host of the trigger that caused the problem event. This option will not work if there are multiple hosts in the trigger.</p> <p>Host - select host(s) to execute the command on.</p> <p>Host group - select host group(s) to execute the command on.</p> <p>A command on a host is executed only once, even if the host matches more than once (e.g. from several host groups; individually and from a host group).</p> <p>The target list is meaningless if a custom script is executed on Zabbix server. Selecting more targets in this case only results in the script being executed on the server more times.</p> <p>Note that for global scripts, the target selection also depends on the <i>Host group</i> setting in global script <i>configuration</i>.</p>
<i>Type</i>	<p>Select the command type:</p> <p>IPMI - execute an <i>IPMI command</i></p> <p>Custom script - execute a custom set of commands</p> <p>SSH - execute an SSH command</p> <p>Telnet - execute a Telnet command</p> <p>Global script - execute one of the global scripts defined in <i>Administration→Scripts</i>.</p>
<i>Execute on</i>	<p>Execute a custom script on Zabbix server or Zabbix agent. To execute scripts on the agent, it must be <i>configured</i> to allow remote commands from the server.</p> <p>This field is available if 'Custom script' is selected as <i>Type</i>.</p>
<i>Commands</i>	<p>Enter the command(s).</p> <p>Supported macros will be resolved based on the trigger expression that caused the event. For example, host macros will resolve to the hosts of the trigger expression (and not of the target list).</p>
<i>Conditions</i>	<p>Condition for performing the operation:</p> <p>Not ack - only when the event is unacknowledged</p> <p>Ack - only when the event is acknowledged.</p>

1 Sending message

Overview

Sending a message is one of the best ways of notifying people about a problem. That is why it is one of the primary actions offered by Zabbix.

Configuration

To be able to send and receive notifications from Zabbix you have to:

- **define the media** to send a message to
- **configure an action operation** that sends a message to one of the defined media

Attention:

Zabbix sends notifications only to those users that have at least 'read' permissions to the host that generated the event. At least one host of a trigger expression must be accessible.

You can configure custom scenarios for sending messages using **escalations**.

To successfully receive and read e-mails from Zabbix, e-mail servers/clients must support standard 'SMTP/MIME e-mail' format since Zabbix sends UTF-8 data (If the subject contains ASCII characters only, it is not UTF-8 encoded.). The subject and the body of the message are base64-encoded to follow 'SMTP/MIME e-mail' format standard.

Message limit after all macros expansion is the same as message limit for **Remote commands**.

Tracking messages

You can view the status of messages sent in *Monitoring* → *Events*.

In the *Actions* column you can see summarized information about actions taken. In there green numbers represent messages sent, red ones - failed messages. *In progress* indicates that an action is initiated. *Failed* informs that no action has executed successfully.

If you click on the event time to view event details, you will also see the *Message actions* block containing details of messages sent (or not sent) due to the event.

In *Reports* → *Action log* you will see details of all actions taken for those events that have an action configured.

2 Remote commands

Overview

With remote commands you can define that a certain pre-defined command is automatically executed on the monitored host upon some condition.

Thus remote commands are a powerful mechanism for smart pro-active monitoring.

In the most obvious uses of the feature you can try to:

- Automatically restart some application (web server, middleware, CRM) if it does not respond
- Use IPMI 'reboot' command to reboot some remote server if it does not answer requests
- Automatically free disk space (removing older files, cleaning /tmp) if running out of disk space
- Migrate a VM from one physical box to another depending on the CPU load
- Add new nodes to a cloud environment upon insufficient CPU (disk, memory, whatever) resources

Configuring an action for remote commands is similar to that for sending a message, the only difference being that Zabbix will execute a command instead of sending a message.

Attention:

Remote commands are not supported to be executed on Zabbix agents monitored by Zabbix proxy, so for commands from Zabbix server to agent a direct connection is required.

Remote command limit after all macros expansion depends on the type of database and character set (non- ASCII characters require more than one byte to be stored):

Database	//Limit in characters //	//Limit in bytes //
MySQL	65535	65535
Oracle Database	2048	4000
PostgreSQL	65535	not limited
IBM DB2	2048	2048
SQLite (only Zabbix proxy)	65535	not limited

See also the **command execution** page.

Remote commands are executed even if the target host is in maintenance.

The following tutorial provides step-by-step instructions on how to set up remote commands.

Configuration

Those remote commands that are executed on Zabbix agent (custom scripts) must be first enabled in the respective `zabbix_agentd.conf`.

Make sure that the **EnableRemoteCommands** parameter is set to **1** and uncommented. Restart agent daemon if changing this parameter.

Attention:

Remote commands do not work with active Zabbix agents.

Then, when configuring a new action in *Configuration→Actions*:

- In the *Operations* tab, select the **Remote command** operation type
- Select the remote command type (IPMI, Custom script, SSH, Telnet, Global script)
- Enter the remote command

For example:

```
sudo /etc/init.d/apache restart
```

In this case, Zabbix will try to restart an Apache process. With this command, make sure that the command is executed on Zabbix agent (click the *Zabbix agent* button against *Execute on*).

Attention:

Note the use of **sudo** - Zabbix user does not have permissions to restart system services by default. See below for hints on how to configure **sudo**.

Note:

Zabbix agent should run on the remote host and accept incoming connections. Zabbix agent executes commands in background.

Attention:

Zabbix does not check if a command has been executed successfully.

Remote commands on Zabbix agent are executed without timeout by the `system.run[,nowait]` key. On Zabbix server remote commands are executed with timeout as set in the `TrapperTimeout` parameter of `zabbix_server.conf` file.

- In the *Conditions* tab, define the appropriate conditions. In this example, set that the action is activated upon any disaster problems with one of Apache applications.

Actions

Action

Conditions

Operations

Type of calculation

And/Or

A and B and C and D

Conditions

LABEL

NAME

A

Maintenance status not in *maintenance*

B

Trigger value = *PROBLEM*

C

Application like *Apache*

D

Trigger severity >= *Disaster*

Access permissions

Make sure that the 'zabbix' user has execute permissions for configured commands. One may be interested in using **sudo** to give access to privileged commands. To configure access, execute as root:

```
# visudo
```

Example lines that could be used in *sudoers* file:

```
# allows 'zabbix' user to run all commands without password.
zabbix ALL=NOPASSWD: ALL
```

```
# allows 'zabbix' user to restart apache without password.
zabbix ALL=NOPASSWD: /etc/init.d/apache restart
```

Note:

On some systems *sudoers* file will prevent non-local users from executing commands. To change this, comment out **requiretty** option in */etc/sudoers*.

Remote commands with multiple interfaces

If the target system has multiple interfaces of the selected type (Zabbix agent or IPMI), remote commands will be executed on the default interface.

Before Zabbix 3.0.4 only the agent interface can be used for SSH and Telnet remote commands. Starting with Zabbix 3.0.4, it is possible to execute remote commands via SSH and Telnet using another interface than the Zabbix agent one. The available interface to use is selected in the following order:

- * Zabbix agent default interface
- * SNMP default interface
- * JMX default interface
- * IPMI default interface

IPMI remote commands

For IPMI remote commands the following syntax should be used:

<command> [<value>]

where

- <command> - one of IPMI commands without spaces
- <value> - 'on', 'off' or any unsigned integer. <value> is an optional parameter.

Examples

Example 1

Restart of Windows on certain condition.

In order to automatically restart Windows upon a problem detected by Zabbix, define the following actions:

PARAMETER	Description
Operation type	'Remote command'
Type	'Custom script'
Command	c:\windows\system32\shutdown.exe -r -f

Example 2

Restart the host by using IPMI control.

PARAMETER	Description
Operation type	'Remote command'
Type	'IPMI'
Command	reset

Example 3

Power off the host by using IPMI control.

PARAMETER	Description
Operation type	'Remote command'
Type	'IPMI'
Command	power off

3 Additional operations

Overview

For discovery events, there are additional operations available:

- add host
- remove host
- enable host
- disable host
- add to group
- delete from group
- link to template
- unlink from template
- set host inventory mode

The additional operations available for auto-registration events are:

- add host
- disable host
- add to group
- link to template
- set host inventory mode

Adding host

Hosts are added during the discovery process, as soon as a host is discovered, rather than at the end of the discovery process.

Note:

As network discovery can take some time due to many unavailable hosts/services having patience and using reasonable IP ranges is advisable.

When adding a host, its name is decided by the standard **gethostbyname** function. If the host can be resolved, resolved name is used. If not, the IP address is used. Besides, if IPv6 address must be used for a host name, then all ":" (colons) are replaced by "_" (underscores), since colons are not allowed in host names.

Attention:

If performing discovery by a proxy, currently hostname lookup still takes place on Zabbix server.

Attention:

If a host already exists in Zabbix configuration with the same name as a newly discovered one, versions of Zabbix prior to 1.8 would add another host with the same name. Zabbix 1.8.1 and later adds **_N** to the hostname, where **N** is increasing number, starting with 2.

4 Using macros in messages

Overview

In message subjects and message text you can use macros for more efficient problem reporting.

A [full list of macros](#) supported by Zabbix is available.

Examples

Examples here illustrate how you can use macros in messages.

Example 1

Message subject:

```
{TRIGGER.NAME}: {TRIGGER.STATUS}
```

When you receive the message, the message subject will be replaced by something like:

```
Processor load is too high on server zabbix.zabbix.com: PROBLEM
```

Example 2

Message:

```
Processor load is: {zabbix.zabbix.com:system.cpu.load[,avg1].last()}
```

When you receive the message, the message will be replaced by something like:

```
Processor load is: 1.45
```

Example 3

Message:

```
Latest value: {{HOST.HOST}}:{{ITEM.KEY}}.last()}
```

```
MAX for 15 minutes: {{HOST.HOST}}:{{ITEM.KEY}}.max(900)}
```

```
MIN for 15 minutes: {{HOST.HOST}}:{{ITEM.KEY}}.min(900)}
```

When you receive the message, the message will be replaced by something like:

```
Latest value: 1.45
```

```
MAX for 15 minutes: 2.33
```

```
MIN for 15 minutes: 1.01
```

Example 4

Message:

```
http://<server_ip_or_name>/zabbix/events.php?triggerid={TRIGGER.ID}&filter_set=1
```

When you receive the message, it will contain a link to all events of the problem trigger.

Example 5

Informing about values from several hosts in a trigger expression.

Message:

Trigger: {TRIGGER.NAME}
Trigger expression: {TRIGGER.EXPRESSION}

1. Item value on {HOST.NAME1}: {ITEM.VALUE1} ({ITEM.NAME1})
2. Item value on {HOST.NAME2}: {ITEM.VALUE2} ({ITEM.NAME2})

When you receive the message, the message will be replaced by something like:

Trigger: Processor load is too high on a local host

Trigger expression: {Myhost:system.cpu.load[percpu,avg1].last()}>5 or {Myotherhost:system.cpu.load[percpu,

1. Item value on Myhost: 0.83 (Processor load (1 min average per core))
2. Item value on Myotherhost: 5.125 (Processor load (1 min average per core))

Example 6

Receiving details of both the problem event and recovery event in a **recovery** message:

Message:

Problem:

Event ID: {EVENT.ID}
Event value: {EVENT.VALUE}
Event status: {EVENT.STATUS}
Event time: {EVENT.TIME}
Event date: {EVENT.DATE}
Event age: {EVENT.AGE}
Event acknowledgement: {EVENT.ACK.STATUS}
Event acknowledgement history: {EVENT.ACK.HISTORY}

Recovery:

Event ID: {EVENT.RECOVERY.ID}
Event value: {EVENT.RECOVERY.VALUE}
Event status: {EVENT.RECOVERY.STATUS}
Event time: {EVENT.RECOVERY.TIME}
Event date: {EVENT.RECOVERY.DATE}

When you receive the message, the macros will be replaced by something like:

Problem:

Event ID: 21874
Event value: 1
Event status: PROBLEM
Event time: 13:04:30
Event date: 2014.01.02
Event age: 5m
Event acknowledgement: Yes
Event acknowledgement history: 2014.01.02 13:05:51 "John Smith (Admin)"
-acknowledged-

Recovery:

Event ID: 21896
Event value: 0
Event status: OK
Event time: 13:10:07
Event date: 2014.01.02

Attention:

Separate notification macros for the original problem event and recovery event are supported since Zabbix 2.2.0.

2 Conditions

Overview

It is possible to define that an action is executed only if the event matches a defined set of conditions. Condition matching is case-sensitive.

Configuration

To set a condition:

- Go to *Conditions* tab in the action properties form
- Select conditions from the *New condition* dropdowns and click on *Add*
- Select the type of calculation (with more than one condition)

Actions

[Action](#) [Conditions](#) [Operations](#)

Type of calculationAnd/OrA and B and (C or D)

Conditions

LABEL	NAME	ACTION
A	Maintenance status not in <i>maintenance</i>	Remove
B	Trigger value = <i>PROBLEM</i>	Remove
C	Host group = <i>Discovered hosts</i>	Remove
D	Host group = <i>Linux servers</i>	Remove

New condition

Host group

=

type here to search

Select

[Add](#)

The following conditions can be set for trigger-based actions:

Condition type	Supported operators	Description
<i>Application</i>	= like not like	Specify an application or an application to exclude. = - event belongs to a trigger of the item that is linked to the specified application. like - event belongs to a trigger of the item that is linked to an application containing the string. not like - event belongs to a trigger of the item that is linked to an application not containing the string.
<i>Host group</i>	= <>	Specify host groups or host groups to exclude. = - event belongs to this host group. <> - event does not belong to this host group.
<i>Template</i>	= <>	Specify templates or templates to exclude. = - event belongs to a trigger inherited from this template. <> - event does not belong to a trigger inherited from this template.

Condition type	Supported operators	Description
<i>Host</i>	= <>	Specify hosts or hosts to exclude. = - event belongs to this host. <> - event does not belong to this host.
<i>Trigger</i>	= <>	Specify triggers or triggers to exclude. = - event is generated by this trigger. <> - event is generated by any other trigger, except this one.
<i>Trigger name</i>	like not like	Specify a string in the trigger name or a string to exclude. like - event is generated by a trigger, containing this string in the name. not like - this string cannot be found in the trigger name. <i>Note:</i> Entered value will be compared to trigger name with all macros expanded.
<i>Trigger severity</i>	= <> >= <=	Specify trigger severity. = - equal to trigger severity <> - not equal to trigger severity >= - more or equal to trigger severity <= - less or equal to trigger severity
<i>Trigger value</i>	=	Specify a trigger value. = - equal to trigger value (OK or PROBLEM)
<i>Time period</i>	in not in	Specify a time period or a time period to exclude. in - event time is within the time period. not in - event time is not within the time period. See Time period specification page for description of the format.
<i>Maintenance status</i>	in not in	Specify a host in maintenance or not in maintenance. in - host is in maintenance mode. not in - host is not in maintenance mode. <i>Note:</i> If several hosts are involved in the trigger expression, the condition matches if at least one of the hosts is/is not in maintenance mode.

Trigger value:

- if a trigger changes status from OK to PROBLEM, trigger value is PROBLEM
- if a trigger changes status from PROBLEM to OK, trigger value is OK

Note:

When a new action for triggers is created, it gets two automatic conditions (both can be removed by the user):

- "Trigger value = *PROBLEM*" - so that notifications are sent for problems only. This means that if you configure an action without any more specific conditions, messages will be received for any problem. Having this condition by default is also important if you want to receive a single **recovery message**.
- "Maintenance status = not in *maintenance*" - so that notifications are not sent for hosts in maintenance.

The following conditions can be set for discovery-based events:

Condition type	Supported operators	Description
<i>Host IP</i>	= <>	Specify an IP address range or a range to exclude for a discovered host. = - host IP is in the range. <> - host IP is not in the range. It may have the following formats: Single IP: 192.168.1.33 Range of IP addresses: 192.168.1-10.1-254 IP mask: 192.168.4.0/24 List: 192.168.1.1-254, 192.168.2.1-100, 192.168.2.200, 192.168.4.0/24 Support for spaces in the list format is provided since Zabbix 3.0.0.
<i>Service type</i>	= <>	Specify a service type of a discovered service or a service type to exclude. = - matches the discovered service. <> - does not match the discovered service. Available service types: SSH, LDAP, SMTP, FTP, HTTP, HTTPS (<i>available since Zabbix 2.2 version</i>), POP, NNTP, IMAP, TCP, Zabbix agent, SNMPv1 agent, SNMPv2 agent, SNMPv3 agent, ICMP ping, telnet (<i>available since Zabbix 2.2 version</i>).
<i>Service port</i>	= <>	Specify a TCP port range of a discovered service or a range to exclude. = - service port is in the range. <> - service port is not in the range.
<i>Discovery rule</i>	= <>	Specify a discovery rule or a discovery rule to exclude. = - using this discovery rule. <> - using any other discovery rule, except this one.

Condition type	Supported operators	Description
<i>Discovery check</i>	= <>	Specify a discovery check or a discovery check to exclude. = - using this discovery check. <> - using any other discovery check, except this one.
<i>Discovery object</i>	=	Specify the discovered object. = - equal to discovered object (a device or a service).
<i>Discovery status</i>	=	Up - matches 'Host Up' and 'Service Up' events Down - matches 'Host Down' and 'Service Down' events Discovered - matches 'Host Discovered' and 'Service Discovered' events Lost - matches 'Host Lost' and 'Service Lost' events
<i>Uptime/Downtime</i>	>= <=	Uptime for 'Host Up' and 'Service Up' events. Downtime for 'Host Down' and 'Service Down' events. >= - is more or equal to. Parameter is given in seconds. <= - is less or equal to. Parameter is given in seconds.
<i>Received value</i>	= <> >= <= like not like	Specify the value received from an agent (Zabbix, SNMP). String comparison. If multiple Zabbix agent or SNMP checks are configured for a rule, received values for all of them are checked (each check generates a new event which is matched against all conditions). = - equal to the value. <> - not equal to the value. >= - more or equal to the value. <= - less or equal to the value. like - contains the substring. Parameter is given as a string. not like - does not contain the substring. Parameter is given as a string.
<i>Proxy</i>	= <>	Specify a proxy or a proxy to exclude. = - using this proxy. <> - using any other proxy except this one.

Note:

Service checks in a discovery rule, which result in discovery events, do not take place simultaneously. Therefore, if **multiple** values are configured for `Service type`, `Service port` or `Received value` conditions in the action, they will be compared to one discovery event at a time, but **not** to several events simultaneously. As a result, actions with multiple values for the same check types may not be executed correctly.

The following conditions can be set for actions based on active agent auto-registration:

Condition type	Supported operators	Description
<i>Host metadata</i>	like not like	Specify host metadata or host metadata to exclude. like - host metadata contains the string. not like - host metadata does not contain the string. Host metadata can be specified in an agent configuration file .
<i>Host name</i>	like not like	Specify a host name or a host name to exclude. like - host name contains the string. not like - host name does not contain the string.
<i>Proxy</i>	= <>	Specify a proxy or a proxy to exclude. = - using this proxy. <> - using any other proxy except this one.

The following conditions can be set for actions based on internal events:

Condition type	Supported operators	Description
<i>Application</i>	= like not like	Specify an application or an application to exclude. = - event belongs to an item that is linked to the specified application. like - event belongs to an item that is linked to an application containing the string. not like - event belongs to an item that is linked to an application not containing the string.

Condition type	Supported operators	Description
<i>Event type</i>	=	<p>Item in "not supported" state - matches events where an item goes from a 'normal' to 'not supported' state</p> <p>Item in "normal" state - matches events where an item goes from a 'not supported' to 'normal' state</p> <p>Low-level discovery rule in "not supported" state - matches events where a low-level discovery rule goes from a 'normal' to 'not supported' state</p> <p>** Low-level discovery rule in "normal" state** - matches events where a low-level discovery rule goes from a 'not supported' to 'normal' state</p> <p>Trigger in "unknown" state - matches events where a trigger goes from a 'normal' to 'unknown' state</p> <p>** Trigger in "normal" state** - matches events where a trigger goes from an 'unknown' to 'normal' state</p>
<i>Host group</i>	= <>	<p>Specify host groups or host groups to exclude.</p> <p>= - event belongs to this host group.</p> <p><> - event does not belong to this host group.</p>
<i>Template</i>	= <>	<p>Specify templates or templates to exclude.</p> <p>= - event belongs to an item/trigger/low-level discovery rule inherited from this template.</p> <p><> - event does not belong to an item/trigger/low-level discovery rule inherited from this template.</p>
<i>Host</i>	= <>	<p>Specify hosts or hosts to exclude.</p> <p>= - event belongs to this host.</p> <p><> - event does not belong to this host.</p>

Type of calculation

The following options of calculating conditions are available:

- **And** - all conditions must be met

Note that using "And" calculation is disallowed between several triggers when they are selected as a Trigger= condition. Actions can only be executed based on the event of one trigger.

- **Or** - enough if one condition is met
- **And/Or** - combination of the two: AND with different condition types and OR with the same condition type, for example:

Host group = Oracle servers
Host group = MySQL servers
Trigger name like 'Database is down'
Trigger name like 'Database is unavailable'

is evaluated as

(Host group = Oracle servers **or** Host group = MySQL servers) **and** (Trigger name like 'Database is down' **or** Trigger name like 'Database is unavailable')

- **Custom expression** - a user-defined calculation formula for evaluating action conditions. It must include all conditions (represented as uppercase letters A, B, C, ...) and may include spaces, tabs, brackets (), **and** (case sensitive), **or** (case sensitive).

While the previous example with **And/Or** would be represented as (A or B) and (C or D), in a custom expression you may as well have multiple other ways of calculation:

(A and B) and (C or D)
(A and B) or (C and D)
((A or B) and C) or D
etc.

Actions disabled due to deleted objects

If a certain object (host, template, trigger, etc) used in an action condition/operation is deleted, the condition/operation is removed and the action is disabled to avoid incorrect execution of the action. The action can be re-enabled by the user.

This behavior takes place when deleting:

- host groups ("host group" condition, "remote command" operation on a specific host group);
- hosts ("host" condition, "remote command" operation on a specific host);
- templates ("template" condition, "link to template" and "unlink from template" operations);
- triggers ("trigger" condition);
- discovery rules (when using "discovery rule" and "discovery check" conditions);
- proxies ("proxy" condition).

Note: If a remote command has many target hosts, and we delete one of them, only this host will be removed from the target list, the operation itself will remain. But, if it's the only host, the operation will be removed, too. The same goes for "link to template" and "unlink from template" operations.

Actions are not disabled when deleting a user or user group used in a "send message" operation.

3 Escalations

Overview

With escalations you can create custom scenarios for sending notifications or executing remote commands.

In practical terms it means that:

- Users can be informed about new problems immediately
- Notifications can be repeated until the problem is resolved
- Sending a notification can be delayed
- Notifications can be escalated to another "higher" user group
- Remote commands can be executed immediately or when a problem is not resolved for a lengthy period
- Recovery messages can be sent

Actions are escalated based on the **escalation step**. Each step has a duration in time.

You can define both the default duration and a custom duration of an individual step. The minimum duration of one escalation step is 60 seconds.

You can start actions, such as sending notifications or executing commands, from any step. Step one is for immediate actions. If you want to delay an action, you can assign it to a later step. For each step, several actions can be defined.

The number of escalation steps is not limited.

Escalations are defined when **configuring an operation**.

Miscellaneous aspects of escalation behaviour

Let's consider what happens in different circumstances if an action contains several escalation steps.

Situation	Behaviour
<i>The host in question goes into maintenance after the initial problem notification is sent</i>	All remaining escalation steps are executed. A maintenance cannot stop operations; maintenance has effect with regard to when actions are started/not started, not operations.
<i>The time period defined in the Time period action condition ends after the initial notification is sent</i>	All remaining escalation steps are executed. The <i>Time period</i> condition cannot stop operations; it has effect with regard to when actions are started/not started, not operations.
<i>A problem starts during maintenance and continues (is not resolved) after maintenance ends</i>	All escalation steps are executed starting from the moment maintenance ends.
<i>A problem starts during a no-data maintenance and continues (is not resolved) after maintenance ends</i>	It must wait for the trigger to fire, before all escalation steps are executed.
<i>Different escalations follow in close succession and overlap</i>	The execution of each new escalation supersedes the previous escalation, but for at least one escalation step that is always executed on the previous escalation. This behavior is relevant in actions upon events that are created with EVERY problem evaluation of the trigger.
<i>During an escalation in progress (like a message being sent), based on any type of event: - the action is disabled - the event is deleted Based on trigger event: - the trigger is disabled or deleted - the host or item is disabled Based on internal event about triggers: - the trigger is disabled or deleted Based on internal event about items/low-level discovery rules: - the item is disabled or deleted - the host is disabled</i>	The message in progress is sent and then one more message on the escalation is sent. The follow-up message will have the cancellation text at the beginning of the message body (NOTE: Escalation cancelled) naming the reason (for example, NOTE: Escalation cancelled: action ' <i><Action name></i> ' disabled). This way the recipient is informed that the escalation is cancelled and no more steps will be executed. This message is sent to the recipients defined in the following escalation step. The reason of cancellation is also logged to the server log file (starting from Debug Level 3=Warning).
<i>During an escalation in progress (like a message being sent) the action is deleted</i>	No more messages are sent. The information is logged to the server log file (starting from Debug Level 3=Warning), for example: escalation cancelled: action id:334 deleted

Escalation examples

Example 1

Sending a repeated notification once every 30 minutes (5 times in total) to a 'MySQL Administrators' group. To configure:

- in Operations tab, set the *Default operation step duration* to '1800' seconds (30 minutes)
- Set the escalation steps to be *From '1' To '5'*
- Select the 'MySQL Administrators' group as recipients of the message

Action	Conditions	Operations
Default operation step duration: 1800 (minimum 60 seconds)		
Action operations		
STEPS	DETAILS	START IN DURATION (SEC)
1 - 5	Send message to user groups: MySQL Administrators via all media	Immediately Default
New		

Notifications will be sent at 0:00, 0:30, 1:00, 1:30, 2:00 hours after the problem starts (unless, of course, the problem is resolved sooner).

If the problem is resolved and a recovery message is configured, it will be sent to those who received at least one problem message within this escalation scenario.

Note:

If the trigger that generated an active escalation is disabled, Zabbix sends an informative message about it to all those that have already received notifications.

Example 2

Sending a delayed notification about a long-standing problem. To configure:

- In Operations tab, set the *Default operation step duration* to '36000' seconds (10 hours)
- Set the escalation steps to be *From '2' To '2'*

Action	Conditions	Operations								
Default operation step duration <input type="text" value="36000"/> (minimum 60 seconds)										
Action operations <table border="1"> <thead> <tr> <th>STEPS</th> <th>DETAILS</th> <th>START IN</th> <th>DURATION (SEC)</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>Send message to users: Dpt_Head (Andrew Interferes) via Email</td> <td>10:00:00</td> <td>Default</td> </tr> </tbody> </table> New			STEPS	DETAILS	START IN	DURATION (SEC)	2	Send message to users: Dpt_Head (Andrew Interferes) via Email	10:00:00	Default
STEPS	DETAILS	START IN	DURATION (SEC)							
2	Send message to users: Dpt_Head (Andrew Interferes) via Email	10:00:00	Default							

A notification will only be sent at Step 2 of the escalation scenario, or 10 hours after the problem starts.

You can customize the message text to something like 'The problem is more than 10 hours old'.

Example 3

Escalating the problem to the Boss.

In the first example above we configured periodical sending of messages to MySQL administrators. In this case, the administrators will get four messages before the problem will be escalated to the Database manager. Note that the manager will get a message only in case the problem is not acknowledged yet, supposedly no one is working on it.

Action	Conditions	Operations														
Default operation step duration <input type="text" value="1800"/> (minimum 60 seconds)																
Action operations <table border="1"> <thead> <tr> <th>STEPS</th> <th>DETAILS</th> <th>START IN</th> <th>DURATION (SEC)</th> </tr> </thead> <tbody> <tr> <td>1 - 0</td> <td>Send message to user groups: MySQL Administrators via Email</td> <td>Immediately</td> <td>Default</td> </tr> <tr> <td>5</td> <td>Send message to user groups: Database manager via Email</td> <td>02:00:00</td> <td>Default</td> </tr> </tbody> </table>			STEPS	DETAILS	START IN	DURATION (SEC)	1 - 0	Send message to user groups: MySQL Administrators via Email	Immediately	Default	5	Send message to user groups: Database manager via Email	02:00:00	Default		
STEPS	DETAILS	START IN	DURATION (SEC)													
1 - 0	Send message to user groups: MySQL Administrators via Email	Immediately	Default													
5	Send message to user groups: Database manager via Email	02:00:00	Default													
Operation details <div> Steps <input type="text" value="5"/> - <input type="text" value="5"/> </div> <div> Step duration <input type="text" value="0"/> (minimum 60 seconds, 0 - use action default) </div> <div> Operation type <input type="text" value="Send message"/> </div> <div> <table border="1"> <thead> <tr> <th>USER GROUP</th> <th>ACTION</th> </tr> </thead> <tbody> <tr> <td>Database manager</td> <td>Remove</td> </tr> </tbody> </table> Add </div> <div> Send to User groups </div> <div> <table border="1"> <thead> <tr> <th>USER</th> <th>ACTION</th> </tr> </thead> <tbody> <tr> <td>Add</td> <td></td> </tr> </tbody> </table> </div> <div> Send to Users </div> <div> Send only to <input type="text" value="Email"/> </div> <div> Default message <input type="checkbox"/> </div> <div> Subject <input type="text" value="Unacknowledged problem"/> </div> <div> Message <div> Trigger: {TRIGGER.NAME} Trigger status: {TRIGGER.STATUS} Trigger severity: {TRIGGER.SEVERITY} Original event ID: {EVENT.ID} Escalation history: {ESC.HISTORY} </div> </div> <div> <table border="1"> <thead> <tr> <th>LABEL</th> <th>NAME</th> <th>ACTION</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>Event acknowledged = Not Ack</td> <td>Remove</td> </tr> </tbody> </table> New </div> <div> Conditions </div> <div> Update Cancel </div>			USER GROUP	ACTION	Database manager	Remove	USER	ACTION	Add		LABEL	NAME	ACTION	A	Event acknowledged = Not Ack	Remove
USER GROUP	ACTION															
Database manager	Remove															
USER	ACTION															
Add																
LABEL	NAME	ACTION														
A	Event acknowledged = Not Ack	Remove														

Note the use of {ESC.HISTORY} macro in the message. The macro will contain information about all previously executed steps on this escalation, such as notifications sent and commands executed.

Example 4

A more complex scenario. After multiple messages to MySQL administrators and escalation to the manager, Zabbix will try to restart the MySQL database. It will happen if the problem exists for 2:30 hours and it hasn't been acknowledged.

If the problem still exists, after another 30 minutes Zabbix will send a message to all guest users.

If this does not help, after another hour Zabbix will reboot server with the MySQL database (second remote command) using IPMI commands.

Action

Conditions

Operations

Default operation step duration

1800 (minimum 60 seconds)

Action operations

STEPS	DETAILS	START IN	DURATION (SEC)
1 - 0	Send message to user groups: MySQL Administrators via Email	Immediately	Default
5	Send message to user groups: Database manager via Email	02:00:00	Default
6	Run remote commands on current host	02:30:00	Default
7	Send message to user groups: Guests via Email	03:00:00	Default
9	Run remote commands on current host	04:00:00	Default
New			

Example 5

An escalation with several operations assigned to one step and custom intervals used. The default operation step duration is 30 minutes.

Action

Conditions

Operations

Default operation step duration

1800

(minimum 60 seconds)

Action operations

STEPS	DETAILS	START IN	DURATION (SEC)
1 - 4	Send message to user groups: MySQL Administrators via Email	Immediately	Default
5 - 6	Send message to user groups: Database manager via Email	02:00:00	3600
5 - 7	Send message to user groups: Zabbix admin via Email	02:00:00	600
11	Send message to user groups: Guests via Email	04:00:00	Default
New			

Notifications will be sent as follows:

- to MySQL administrators at 0:00, 0:30, 1:00, 1:30 after the problem starts
- to Database manager at 2:00 and 2:10 (and not at 3:00; seeing that steps 5 and 6 overlap with the next operation, the shorter custom step duration of 600 seconds in the next operation overrides the longer step duration of 3600 seconds tried to set here)
- to Zabbix administrators at 2:00, 2:10, 2:20 after the problem starts (the custom step duration of 600 seconds working)
- to guest users at 4:00 hours after the problem start (the default step duration of 30 minutes returning between steps 8 and 11)

3 Receiving notification on unsupported items

Overview

Receiving notifications on unsupported items is supported since Zabbix 2.2.

It is part of the concept of internal events in Zabbix, allowing users to be notified on these occasions. Internal events reflect a change of state:

- when items go from 'normal' to 'unsupported' (and back)
- when triggers go from 'normal' to 'unknown' (and back)
- when low-level discovery rules go from 'normal' to 'unsupported' (and back)

This section presents a how-to for **receiving notification** when an item turns unsupported.

Configuration

Overall, the process of setting up the notification should feel familiar to those who have set up alerts in Zabbix before.

Step 1

Configure **some media**, such as e-mail, SMS or Jabber, to use for the notifications. Refer to the corresponding sections of the manual to perform this task.

Attention:

For notifying on internal events the default severity ('Not classified') is used, so leave it checked when configuring **user media** if you want to receive notifications for internal events.

Step 2

Go to *Configuration*→*Actions* and select *Internal* as the event source. Click on *Create action* on the upper right to open an action configuration form.

Step 3

In the **Action** tab enter a name for the action and the subject/content of problem and recovery messages.

Actions

Action

Conditions

Operations

Name

Click on **Add** in the *Operation details* block to actually list the operation in the *Action operations* block.

If you wish to receive more than one notification, set the operation step duration (interval between messages sent) and add another operation.

When finished, click on the **Add** button underneath the form.

And that's it, you're done! Now you can look forward to receiving your first notification from Zabbix if some item turns unsupported.

8 Macros

Overview

Zabbix supports a number of macros which may be used in various situations. Macros are variables, identified by a **{MACRO}** syntax, and resolve to a specific value depending on the context.

Effective use of macros allows to save time and make Zabbix configuration more transparent.

In one of typical uses, a macro may be used in a template. Thus a trigger on a template may be named "Processor load is too high

on {HOST.NAME}”. When the template is applied to the host, such as Zabbix server, the name will resolve to “Processor load is too high on Zabbix server” when the trigger is displayed in the Monitoring section.

Macros may be used in item key parameters. A macro may be used for only a part of the parameter, for example `item.key[server_{HOST.HOST}_local]`. Double-quoting the parameter is not necessary as Zabbix will take care of any ambiguous special symbols, if present in the resolved macro.

See a full list of [supported macros](#) by location.

You can also configure your own [user macros](#).

User macros

Overview

For greater flexibility, Zabbix supports user macros, which can be defined on global, template and host level. These macros have a special syntax: **{`$MACRO`}**. An optional context can be used in user macros, allowing to override default value with context specific one. User macros with context have a similar syntax: **{`$MACRO:context`}**.

The macros can be used in:

- item names
- item key parameters
- trigger names and descriptions
- trigger expression parameters and constants (see examples)
- several other [locations](#)

The following characters are allowed in the macro names: **A-Z** , **0-9** , **_** , **.**

Zabbix resolves macros according to the following precedence:

1. host level macros (checked first)
2. macros defined for first level templates of the host (i.e., templates linked directly to the host), sorted by template ID
3. macros defined for second level templates of the host, sorted by template ID
4. macros defined for third level templates of the host, sorted by template ID
5. ...
6. global macros (checked last)

In other words, if a macro does not exist for a host, Zabbix will try to find it in the host templates of increasing depth. If still not found, a global macro will be used, if exists.

If Zabbix is unable to find a macro, the macro will not be resolved.

Attention:

Macros (including user macros) are left unresolved in the Configuration section (for example, in the trigger list) by design to make complex configuration more transparent.

To define user macros, go to the corresponding locations in the frontend:

- for global macros, visit *Administration* → *General* → *Macros*
- for host and template level macros, open host or template properties and look for the *Macros* tab

Note:

If a user macro is used in items or triggers in a template, it is suggested to add that macro to the template even if it is defined on a global level. That way, exporting the template to XML and importing it in another system will still allow it to work as expected.

Most common use cases of global and host macros:

1. taking advantage of templates with host specific attributes: passwords, port numbers, file names, regular expressions, etc
2. global macros for global one-click configuration changes and fine tuning

Macro context

Macro context is a simple text value. The common use case for macro contexts would be using an [LLD macro value](#) as a user macro context. For example, a trigger prototype could be defined for mounted file system discovery to use a different low space limit depending on the mount points or file system types.

Only low-level discovery macros are supported in macro contexts. Any other macros are ignored and treated as plain text.

Technically, macro context is specified using rules similar to [item key](#) parameters, except macro context is not parsed as several parameters if there is a `,` character:

- Macro context must be quoted with `"` if the context contains a `}` character or starts with a `"` character. Quotes inside quoted context must be escaped with the `\` character. The `\` character itself is not escaped, which means it's impossible to have a quoted context ending with the `\` character - the macro `{${MACRO:"a:\b\c\"}}` is invalid.
- The leading spaces in context are ignored, the trailing spaces are not. For example `{${MACRO:A}}` is the same as `{${MACRO: A}}`, but not `{${MACRO:A }}`.
- All spaces before leading quotes and after trailing quotes are ignored, but all spaces inside quotes are not. Macros `{${MACRO:"A"}}`, `{${MACRO: "A"}}`, `{${MACRO:"A" }}` and `{${MACRO: "A" }}` are the same, but macros `{${MACRO:"A"}}` and `{${MACRO:" A"}}` are not.

The following macros are all equivalent, because they have the same context: `{${MACRO:A}}`, `{${MACRO: A}}` and `{${MACRO:"A"}}`. This is in contrast with item keys, where `key[a]`, `key[a]` and `key["a"]` are the same semantically, but different for uniqueness purposes.

When context macros are processed, Zabbix looks up the macro with its context. If a macro with this context is not defined by host or linked templates, and it is not defined as a global macro with context, then the macro without context is searched for.

Examples

Example 1

Use of host-level macro in the "Status of SSH daemon" item key:

```
net.tcp.service[ssh,{${SSH_PORT}]
```

This item can be assigned to multiple hosts, providing that the value of `{${SSH_PORT}}` is defined on those hosts.

Example 2

Use of host-level macro in the "CPU load is too high" trigger:

```
{ca_001:system.cpu.load[,avg1].last()}>{${MAX_CPULOAD}}
```

Such a trigger would be created on the template, not edited in individual hosts.

Note:

If you want to use amount of values as the function parameter (for example, `max(#3)`), include hash mark in the macro definition like this: `SOME_PERIOD => #3`

Example 3

Use of two macros in the "CPU load is too high" trigger:

```
{ca_001:system.cpu.load[,avg1].min({${CPULOAD_PERIOD}})}>{${MAX_CPULOAD}}
```

Note that a macro can be used as a parameter of trigger function, in this example function `min()`.

Attention:

In trigger expressions user macros will resolve if referencing a parameter or constant. They will NOT resolve if referencing the host, item key, function, operator or another trigger expression.

Example 4

See [usage example](#) for disk space trigger prototype and take limitation clause into consideration.

9 Users and user groups

Overview

All users in Zabbix access the Zabbix application through the web-based frontend. Each user is assigned a unique login name and a password.

All user passwords are encrypted and stored in the Zabbix database. Users cannot use their user id and password to log directly into the UNIX server unless they have also been set up accordingly to UNIX. Communication between the web server and the user browser can be protected using SSL.

With a flexible [user permission schema](#) you can restrict and differentiate access to:

- administrative Zabbix frontend functions
- monitored hosts in hostgroups

1 Configuring a user

Overview

The initial Zabbix installation has two predefined users:

- *Admin* - a Zabbix **superuser** with full permissions;
- *guest* - a special Zabbix **user**. As a guest, you may access monitoring pages in Zabbix without being logged in. Note that by default, 'guest' has no permissions on Zabbix objects.

To configure a new user:

- Go to *Administration* → *Users*
- Click on *Create user* (or on the user name to edit an existing user)
- Edit user attributes in the form

General attributes

The *User* tab contains general user attributes:

Users

User

Media

Permissions

Alias Admin

Name Zabbix

Surname Administrator

Groups Zabbix admin

Add

Delete selected

Password Change password

Language English (en_GB)

Theme System default

Auto-login ☐

Auto-logout (min 90 seconds) ☐ 900

Refresh (in seconds) 30

Rows per page 50

URL (after login)

Update

Delete

Cancel

Parameter

Description

Alias

Unique username, used as the login name.

Name

User first name (optional).

If not empty, visible in acknowledgement information and notification recipient information.

Last name

User last name (optional).

If not empty, visible in acknowledgement information and notification recipient information.

Parameter	Description
<i>Groups</i>	List of all user groups the user belongs to. Adherence to user groups determines what host groups and hosts the user will have access to . Click on <i>Add</i> to add groups. Starting with Zabbix 3.0.12 this field is auto-complete so starting to type the name of a user group will offer a dropdown of matching groups. Scroll down to select. Click on 'x' to remove the selected.
<i>Password</i>	Two fields for entering the user password. With an existing password, contains a <i>Password</i> button, clicking on which opens the password fields.
<i>Language</i>	Language of the Zabbix frontend. The php gettext extension is required for the translations to work.
<i>Theme</i>	Defines how the frontend looks like: System default - use default system settings Blue - standard blue theme Dark - alternative dark theme
<i>Auto-login</i>	Mark this checkbox to make Zabbix remember the user and log the user in automatically for 30 days. Browser cookies are used for this.
<i>Auto-logout</i>	With this checkbox marked the user will be logged out automatically, after the set amount of seconds (minimum 90 seconds). Note that this option will not work: * If the "Show warning if Zabbix server is down" global configuration option is enabled and Zabbix frontend is kept open; * When Monitoring menu pages perform background information refreshes; * If logging in with the <i>Remember me for 30 days</i> option checked.
<i>Refresh (in seconds)</i>	Set the refresh rate used for graphs, screens, plain text data, etc. Can be set to 0 to disable.
<i>Rows per page</i>	You can determine how many rows per page will be displayed in lists.
<i>URL (after login)</i>	You can make Zabbix to transfer you to a specific URL after successful login, for example, the status of triggers page.

User media

The *Media* tab contains a listing of all media defined for the user. Media are used for sending notifications. Click on *Add* to assign media to the user.

See the **Media types** section for details on configuring media types.

Permissions

The *Permissions* tab contains information on:

- the user type (Zabbix User, Zabbix Admin, Zabbix Super Admin). Users cannot change their own type.
- host groups and hosts the user has access to. 'Zabbix User' and 'Zabbix Admin' users do not have access to any host groups and hosts by default. To get access they need to be included in user groups that have access to respective host groups and hosts.

See the **User permissions** page for details.

2 Permissions

Overview

You can differentiate user permissions in Zabbix by defining the respective user type and then by including the unprivileged users in user groups that have access to host group data.

User type

The user type defines the level of access to administrative menus and the default access to host group data.

User type	Description
<i>Zabbix User</i>	The user has access to the Monitoring menu. The user has no access to any resources by default. Any permissions to host groups must be explicitly assigned.
<i>Zabbix Admin</i>	The user has access to the Monitoring and Configuration menus. The user has no access to any host groups by default. Any permissions to host groups must be explicitly given.
<i>Zabbix Super Admin</i>	The user has access to everything: Monitoring, Configuration and Administration menus. The user has a read-write access to all host groups. Permissions cannot be revoked by denying access to specific host groups.

Permissions to host groups

Access to any host data in Zabbix are granted to user groups on host group level only.

That means that an individual user cannot be directly granted access to a host (or host group). It can only be granted access to a host by being part of a user group that is granted access to the host group that contains the host.

3 User groups

Overview

User groups allow to group users both for organizational purposes and for assigning permissions to data. Permissions to monitoring data of host groups are assigned to user groups, not individual users.

It may often make sense to separate what information is available for one group of users and what - for another. This can be accomplished by grouping users and then assigning varied permissions to host groups.

A user can belong to any number of groups.

Configuration

To configure a user group:

- Go to *Administration* → *User groups*
- Click on *Create user group* (or on the group name to edit an existing group)
- Edit group attributes in the form

The *User group* tab contains general group attributes:

User groups

User group

Permissions

Group name

Users

In group

Dpt_Head (Andrew Interferes)

Other groups

All

Admin (Zabbix Administrator)

guest user (New User)

Frontend access

System default

Enabled

☐

Debug mode

☐

Update

Delete

Cancel

Parameter	Description
<i>Group name</i>	Unique group name.
<i>Users</i>	The In group block contains a listing of the members of this group. To add users to the group select them in the <i>Other groups</i> block and click on «.
<i>Frontend access</i>	How the users of the group are authenticated. System default - use default authentication Internal - use Zabbix authentication. Ignored if HTTP authentication is set Disabled - access to Zabbix GUI is forbidden
<i>Enabled</i>	Status of user group and group members. <i>Checked</i> - user group and users are enabled <i>Unchecked</i> - user group and users are disabled
<i>Debug mode</i>	Mark this checkbox to activate debug mode for the users.

The *Permissions* tab allows you to specify user group access to host group (and thereby host) data:

<i>Composing permissions</i>	Click on <i>Add</i> beneath the respective list to specify the host groups that the user group will have access to on the level of: Read-write - read-write access to a host group Read - read-only access to a host group Deny - access to a host group denied
<i>Calculated permissions</i>	Depending on the permissions set above, <i>Calculated permissions</i> will display all host groups and all hosts that the user group has access to on the level of: Read-write - host groups with read-write access Read - host groups with read-only access Deny - host groups with access denied

Host access from several user groups

A user may belong to any number of user groups. These groups may have different access permissions to hosts.

Therefore, it is important to know what hosts an unprivileged user will be able to access as a result. For example, let us consider how access to host **X** (in Hostgroup 1) will be affected in various situations for a user who is in user groups A and B.

- If Group A has only *Read* access to Hostgroup 1, but Group B *Read-write* access to Hostgroup 1, the user will get **Read-write** access to 'X'.

Attention:

“Read-write” permissions have precedence over “Read” permissions starting with Zabbix 2.2.

- In the same scenario as above, if 'X' is simultaneously also in Hostgroup 2 that is **denied** to Group A or B, access to 'X' will be **unavailable**, despite a *Read-write* access to Hostgroup 1.
- If Group A has no permissions defined and Group B has a *Read-write* access to Hostgroup 1, the user will get **Read-write** access to 'X'.
- If Group A has *Deny* access to Hostgroup 1 and Group B has a *Read-write* access to Hostgroup 1, the user will get access to 'X' **denied**.

Other details

- An Admin level user with *Read-write* access to a host will not be able to link/unlink templates, if he has no access to the *Templates* group. With *Read* access to *Templates* group he will be able to link/unlink templates to the host, however, will not see any templates in the template list and will not be able to operate with templates in other places.
- An Admin level user with *Read* access to a host will not see the host in the configuration section host list; however, the host triggers will be accessible in IT service configuration.
- Any non-Zabbix Super Admin user (including 'guest') can see network maps as long as the map is empty or has only images. When hosts, host groups or triggers are added to the map, permissions are respected. The same applies to screens and slideshows as well. The users, regardless of permissions, will see any objects that are not directly or indirectly linked to hosts.
- Zabbix server will not send notifications to users defined as action operation recipients if access to the concerned host is explicitly “denied” or if there are no rights defined to the host.

7. IT services

Overview IT services are intended for those who want to get a high-level (business) view of monitored infrastructure. In many cases, we are not interested in low-level details, like the lack of disk space, high processor load, etc. What we are interested in is the availability of service provided by our IT department. We can also be interested in identifying weak places of IT infrastructure, SLA of various IT services, the structure of existing IT infrastructure, and other information of a higher level.

Zabbix IT services provide answers to all mentioned questions.

IT services is a hierarchy representation of monitored data.

A very simple IT service structure may look like:

```
IT Service
|
|-Workstations
| |
| |-Workstation1
| |
| |-Workstation2
|
|-Servers
```

Each node of the structure has attribute status. The status is calculated and propagated to upper levels according to the selected algorithm. At the lowest level of IT services are triggers. The status of individual nodes is affected by the status of their triggers.

Note:
Note that triggers with a *Not classified* or *Information* severity do not impact SLA calculation.

Configuration To configure IT services, go to: *Configuration* → *IT services*.

On this screen you can build a hierarchy of your monitored infrastructure. The highest-level parent service is 'root'. You can build your hierarchy downward by adding lower-level parent services and then individual nodes to them.

IT services	
SERVICE	ACTION
root	Add child
▼ SLA by service	Add child
Server 1	Add child Delete
Server 2	Add child Delete
Server 3	Add child Delete
Server 4	Add child Delete
Server 5	Add child Delete

Click on *Add child* to add services. To edit an existing service, click on its name. A form is displayed where you can edit the service attributes.

Configuring an IT service

The **Service** tab contains general service attributes:

ServiceDependenciesTime

Name

Server 1

Parent service

SLA by service

Change

Status calculation algorithm

Problem, if at least one child has a problem

Calculate SLA, acceptable SLA (in %)

Hard and soft dependency

Availability of a service may depend on several other services, not just one. The first option is to add all those directly as child services.

However, if some service is already added somewhere else in the services tree, it cannot be simply moved out of there to a child service here. How to create a dependency on it? The answer is "soft" linking. Add the service and mark the *Soft* check box. That way the service can remain in its original location in the tree, yet be depended upon from several other services. Services that are "soft-linked" are displayed in grey in the tree. Additionally, if a service has only "soft" dependencies, it can be deleted directly, without deleting child services first.

The **Time** tab contains the service time specification.

Parameter	Description
<i>Service times</i>	By default, all services are expected to operate 24x7x365. If exceptions needed, add new service times.

Parameter	Description
<i>New service time</i>	<p>Service times:</p> <p>Uptime - service uptime</p> <p>Downtime - service state within this period does not affect SLA.</p> <p>One-time downtime - a single downtime. Service state within this period does not affect SLA.</p> <p>Add the respective hours.</p> <p><i>Note:</i> Service times affect only the service they are configured for. Thus, a parent service will not take into account the service time configured on a child service (unless a corresponding service time is configured on the parent service as well).</p> <p>Service times are taken into account when calculating IT service status and SLA by the frontend. However, information on service availability is being inserted into database continuously, regardless of service times.</p>

Display To monitor IT services, go to *Monitoring → IT services*.

8. Web monitoring

Overview With Zabbix you can check several availability aspects of web sites.

Attention:

To perform web monitoring Zabbix server must be initially **configured** with cURL (libcurl) support.

To activate web monitoring you need to define web scenarios. A web scenario consists of one or several HTTP requests or "steps". The steps are periodically executed by Zabbix server in a pre-defined order. If a host is monitored by proxy, the steps are executed by the proxy.

Since Zabbix 2.2 web scenarios are attached to hosts/templates in the same way as items, triggers, etc. That means that web scenarios can also be created on a template level and then applied to multiple hosts in one move.

The following information is collected in any web scenario:

- average download speed per second for all steps of whole scenario
- number of the step that failed
- last error message

The following information is collected in any web scenario step:

- download speed per second
- response time
- response code

For more details, see **web monitoring items**.

Data collected from executing web scenarios is kept in the database. The data is automatically used for graphs, triggers and notifications.

Zabbix can also check if a retrieved HTML page contains a pre-defined string. It can execute a simulated login and follow a path of simulated mouse clicks on the page.

Zabbix web monitoring supports both HTTP and HTTPS. When running a web scenario, Zabbix will optionally follow redirects (see option *Follow redirects* below). Maximum number of redirects is hard-coded to 10 (using cURL option `CURLOPT_MAXREDIRS`). All cookies are preserved during the execution of a single scenario.

See also **known issues** for web monitoring using HTTPS protocol.

Configuring a web scenario To configure a web scenario:

- Go to: *Configuration → Hosts (or Templates)*
- Click on *Web* in the row of the host/template
- Click on *Create scenario* to the right (or on the scenario name to edit an existing scenario)

- Enter parameters of the scenario in the form

The **Scenario** tab allows you to configure the general parameters of a web scenario.

General parameters:

Parameter	Description
Host	Name of the host/template that the scenario belongs to.

Parameter	Description
<i>Name</i>	Unique scenario name. <i>Starting with Zabbix 2.2</i> , the name may contain supported macros .
<i>Application</i>	Select an application the scenario will belong to. Web scenario items will be grouped under the selected application in <i>Monitoring</i> → <i>Latest data</i> .
<i>New application</i>	Enter the name of a new application for the scenario.
<i>Update interval (in sec)</i>	How often the scenario will be executed, in seconds.
<i>Attempts</i>	The number of attempts for executing web scenario steps. In case of network problems (timeout, no connectivity, etc) Zabbix can repeat executing a step several times. The figure set will equally affect each step of the scenario. Up to 10 attempts can be specified, default value is 1. <i>Note:</i> Zabbix will not repeat a step because of a wrong response code or the mismatch of a required string.
<i>Agent</i>	This parameter is supported starting with <i>Zabbix 2.2</i> . Select a client agent. Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers.
<i>HTTP proxy</i>	User macros can be used in this field, <i>starting with Zabbix 2.2</i> . You can specify an HTTP proxy to use, using the format: <code>http://[username[:password]@]proxy.example.com[:port]</code> By default, 1080 port will be used. If specified, the proxy will overwrite proxy related environment variables like <code>http_proxy</code> , <code>HTTPS_PROXY</code> . If not specified, the proxy will not overwrite proxy related environment variables. The entered value is passed on "as is", no sanity checking takes place. You may also enter a SOCKS proxy address. If you specify the wrong protocol, the connection will fail and the item will become unsupported. With no protocol specified, the proxy will be treated as an HTTP proxy. <i>Note:</i> Only simple authentication is supported with HTTP proxy. User macros can be used in this field.
<i>Variables</i>	This parameter is supported starting with <i>Zabbix 2.2</i> . List of scenario-level variables (macros) that may be used in scenario steps (URL, Post variables). They have the following format: {macro1} =value1 {macro2} =value2 {macro3} =regex:<regular expression> For example: <code>{username}=Alexei</code> <code>{password}=kj3h5kj34bd</code> <code>{hostid}=regex:hostid is ([0-9]+)</code> If the value part starts with <i>regex</i> : then the part after it will be treated as a regular expression that will search the web page and, if found, store the match in the variable. Note that at least one subgroup must be present so that the matched value can be extracted. The macros can then be referenced in the steps as <code>{username}</code> , <code>{password}</code> and <code>{hostid}</code> . Zabbix will automatically replace them with actual values. Having variables that search a webpage for a regular expression match is supported <i>starting with Zabbix 2.2</i> . <code>HOST.*</code> macros and user macros can be used in this field, <i>starting with Zabbix 2.2</i> . <i>Note:</i> Variables are not URL-encoded.

Parameter	Description
<i>Headers</i>	<p>HTTP headers that will be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol, optionally using some additional features supported by the CURLOPT_HTTPHEADER cURL option. For example:</p> <p>Accept-Charset: utf-8 Accept-Language: en-US Content-Type: application/xml; charset=utf-8 HOST.* macros and user macros can be used in this field.</p> <p>Specifying custom headers is supported <i>starting with Zabbix 2.4</i>.</p>
<i>Enabled</i>	The scenario is active if this box is checked, otherwise - disabled.

Note that when editing an existing scenario, two extra buttons are available in the form:

Clone	Create another scenario based on the properties of the existing one.
Clear history and trends	Delete history and trend data for the scenario. This will make the server perform the scenario immediately after deleting the data.

Note:

If *HTTP proxy* field is left empty, another way for using an HTTP proxy is to set proxy related environment variables. For HTTP checks - set the **http_proxy** environment variable for the Zabbix server user. For example, `//http_proxy=http:%%/%%proxy_ip:proxy_port//`. For HTTPS checks - set the **HTTPS_PROXY** environment variable. For example, `//HTTPS_PROXY=http:%%/%%proxy_ip:proxy_port//`. More details are available by running a shell command: `# man curl`.

The **Steps** tab allows you to configure the web scenario steps. To add a web scenario step, click on *Add*.

Configuring steps

Step parameters:

Parameter	Description
Name	Unique step name. Starting with Zabbix 2.2, the name may contain supported macros.

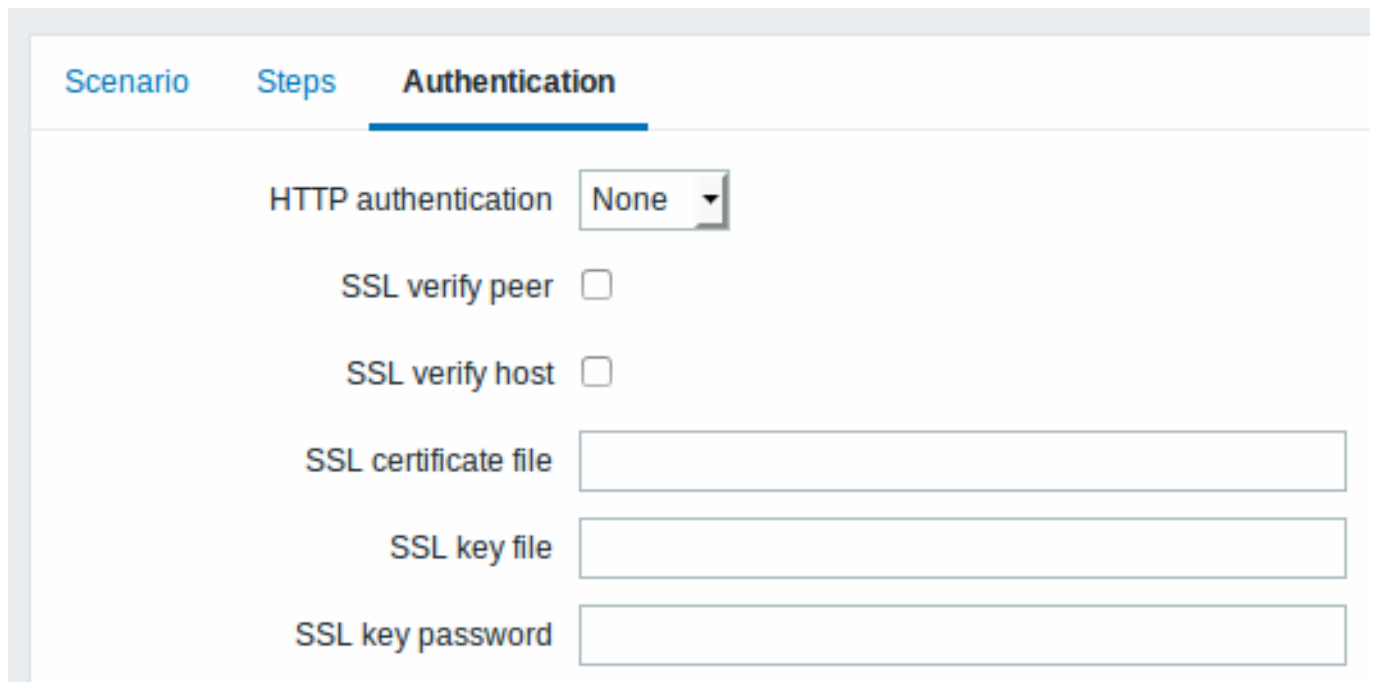

Parameter	Description
<i>URL</i>	<p>URL to connect to and retrieve data. For example: http://www.zabbix.com https://www.google.com GET variables can be passed in the URL parameter. <i>Starting with Zabbix 2.2</i>, this field may contain supported macros. Limited to 2048 characters <i>starting with Zabbix 2.4</i>.</p>
<i>Post</i>	<p>HTTP POST variables, if any. For example: id=2345&userid={user} If {user} is defined as a macro of the web scenario, it will be replaced by its value when the step is executed. The information will be sent as is, variables are not URL-encoded. <i>Starting with Zabbix 2.2</i>, this field may contain supported macros.</p>
<i>Variables</i>	<p>List of step-level variables (macros) that may be used for GET and POST functions. Step-level variables override scenario-level variables or variables from the previous step. However, the value of a step-level variable only affects the step after (and not the current step). They have the following format: {macro}=value {macro}=regex:<regular expression> For more information see variable description on the scenario level. Having step-level variables is supported <i>starting with Zabbix 2.2</i>. <i>Note:</i> Variables are not URL-encoded.</p>
<i>Headers</i>	<p>HTTP headers that will be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol. Headers on the step level will overwrite the headers specified for the scenario. For example, 'User-Agent:' with no data will remove User-Agent set on scenario level. HOST.* macros and user macros can be used in this field. This sets the CURLOPT_HTTPHEADER cURL option. Specifying custom headers is supported <i>starting with Zabbix 2.4</i>.</p>
<i>Follow redirects</i>	<p>Mark the checkbox to follow HTTP redirects. This sets the CURLOPT_FOLLOWLOCATION cURL option. This option is supported <i>starting with Zabbix 2.4</i>.</p>
<i>Retrieve only headers</i>	<p>Mark the checkbox to retrieve only headers from the HTTP response. This sets the CURLOPT_NOBODY cURL option. This option is supported <i>starting with Zabbix 2.4</i>.</p>
<i>Timeout</i>	<p>Zabbix will not spend more than the set amount of seconds on processing the URL. Actually this parameter defines maximum time for making connection to the URL and maximum time for performing an HTTP request. Therefore, Zabbix will not spend more than 2 x Timeout seconds on the step. For example: 15</p>
<i>Required string</i>	<p>Required regular expression pattern. Unless retrieved content (HTML) matches the required pattern the step will fail. If empty, no check on required string is performed. For example: Homepage of Zabbix Welcome.*admin <i>Note:</i> Referencing regular expressions created in the Zabbix frontend is not supported in this field. <i>Starting with Zabbix 2.2</i>, this field may contain supported macros.</p>
<i>Required status codes</i>	<p>List of expected HTTP status codes. If Zabbix gets a code which is not in the list, the step will fail. If empty, no check on required status codes is performed. For example: 200,201,210-299 <i>Starting with Zabbix 2.2</i>, user macros can be used in this field.</p>

Note:

Any changes in web scenario steps will only be saved when the whole scenario is saved.

See also a [real-life example](#) of how web monitoring steps can be configured.

Configuring authentication The **Authentication** tab allows you to configure scenario authentication options.

Authentication parameters:

Parameter	Description
<i>Authentication</i>	Authentication options. None - no authentication used. Basic authentication - basic authentication is used. NTLM authentication - NTLM (Windows NT LAN Manager) authentication is used. Selecting an authentication method will provide two additional fields for entering a user name and password. User macros can be used in user and password fields, <i>starting with Zabbix 2.2</i> .
<i>SSL verify peer</i>	Mark the checkbox to verify the SSL certificate of the web server. The server certificate will be automatically taken from system-wide certificate authority (CA) location. You can override the location of CA files using Zabbix server or proxy configuration parameter SSLCALocation . This sets the CURLOPT_SSL_VERIFYPEER cURL option. This option is supported <i>starting with Zabbix 2.4</i> .
<i>SSL verify host</i>	Mark the checkbox to verify that the <i>Common Name</i> field or the <i>Subject Alternate Name</i> field of the web server certificate matches. This sets the CURLOPT_SSL_VERIFYHOST cURL option. This option is supported <i>starting with Zabbix 2.4</i> .
<i>SSL certificate file</i>	Name of the SSL certificate file used for client authentication. The certificate file must be in PEM ¹ format. If the certificate file contains also the private key, leave the <i>SSL key file</i> field empty. If the key is encrypted, specify the password in <i>SSL key password</i> field. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLCertLocation . <i>HOST.*</i> macros and user macros can be used in this field. This sets the CURLOPT_SSLCERT cURL option. This option is supported <i>starting with Zabbix 2.4</i> .

Parameter	Description
SSL key file	Name of the SSL private key file used for client authentication. The private key file must be in PEM ¹ format. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLKeyLocation . HOST.* macros and user macros can be used in this field. This sets the CURLOPT_SSLKEY cURL option. This option is supported <i>starting with Zabbix 2.4</i> .
SSL key password	SSL private key file password. User macros can be used in this field. This sets the CURLOPT_KEYPASSWD cURL option. This option is supported <i>starting with Zabbix 2.4</i> .

Attention:

[1] Zabbix supports certificate and private key files in PEM format only. In case you have your certificate and private key data in PKCS #12 format file (usually with extension *.p12 or *.pfx) you may generate the PEM file from it using the following commands:

```
openssl pkcs12 -in ssl-cert.p12 -clcerts -nokeys -out ssl-cert.pem
openssl pkcs12 -in ssl-cert.p12 -nocerts -nodes -out ssl-cert.key
```

Note:

Zabbix server picks up changes in certificates without a restart.

Note:

If you have client certificate and private key in a single file just specify it in a "SSL certificate file" field and leave "SSL key file" field empty. The certificate and key must still be in PEM format. Combining certificate and key is easy:

```
cat client.crt client.key > client.pem
```

Display To view detailed data of defined web scenarios, go to *Monitoring* → *Web* or *Latest data*. Click on the scenario name to see more detailed statistics.

1h fixed

An overview of web monitoring scenarios can be viewed in *Monitoring* → *Dashboard*.

Extended monitoring Sometimes it is necessary to log received HTML page content. This is especially useful if some web scenario step fails. Debug level 5 (trace) serves that purpose. This level can be set in **server** and **proxy** configuration files or using a runtime control option (`-R log_level_increase="http poller,N"`, where N is the process number). The following examples demonstrate how extended monitoring can be started provided debug level 4 is already set:

Increase log level of all http pollers:

```
shell> zabbix_server -R log_level_increase="http poller"
```

Increase log level of second http poller:

```
shell> zabbix_server -R log_level_increase="http poller,2"
```

If extended web monitoring is not required it can be stopped using the `-R log_level_decrease` option.

1 Web monitoring items

Overview

Some new items are automatically added for monitoring when web scenarios are created.

Scenario items

As soon as a scenario is created, Zabbix automatically adds the following items for monitoring, linking them to the selected application.

Item	Description
<i>Download speed for scenario</i> <Scenario>	This item will collect information about the download speed (bytes per second) of the whole scenario, i.e. average for all steps. Item key: web.test.in[Scenario,,bps] Type: <i>Numeric(float)</i>
<i>Failed step of scenario</i> <Scenario>	This item will display the number of the step that failed on the scenario. If all steps are executed successfully, 0 is returned. Item key: web.test.fail[Scenario] Type: <i>Numeric(unsigned)</i>
<i>Last error message of scenario</i> <Scenario>	This item returns the last error message text of the scenario. A new value is stored only if the scenario has a failed step. If all steps are ok, no new value is collected. Item key: web.test.error[Scenario] Type: <i>Character</i>

The actual scenario name will be used instead of "Scenario".

Note:

Web monitoring items are added with a 30 day history and a 90 day trend retention period.

Note:

If scenario name starts with a doublequote or contains comma or square bracket, it will be properly quoted in item keys. In other cases no additional quoting will be performed.

These items can be used to create triggers and define notification conditions.

Example 1

To create a "Web scenario failed" trigger, you can define a trigger expression:

```
{host:web.test.fail[Scenario].last()}<>0
```

Make sure to replace 'Scenario' with the real name of your scenario.

Example 2

To create a "Web scenario failed" trigger with a useful problem description in the trigger name, you can define a trigger with name:

Web scenario "Scenario" failed: {ITEM.VALUE}

and trigger expression:

```
{host:web.test.error[Scenario].strlen()}>0 and {host:web.test.fail[Scenario].last()}>0
```

Make sure to replace 'Scenario' with the real name of your scenario.

Example 3

To create a "Web application is slow" trigger, you can define a trigger expression:

```
{host:web.test.in[Scenario,,bps].last()}<10000
```

Make sure to replace 'Scenario' with the real name of your scenario.

Scenario step items

As soon as a step is created, Zabbix automatically adds the following items for monitoring, linking them to the selected application.

Item	Description
<i>Download speed for step</i> <Step> of scenario <Scenario>	This item will collect information about the download speed (bytes per second) of the step. Item key: web.test.in[Scenario,Step,bps] Type: <i>Numeric(float)</i>

Item	Description
<i>Response time for step <Step> of scenario <Scenario></i>	<p>This item will collect information about the response time of the step in seconds. Response time is counted from the beginning of the request until all information has been transferred.</p> <p>Item key: web.test.time[Scenario,Step,resp] Type: <i>Numeric(float)</i></p>
<i>Response code for step <Step> of scenario <Scenario></i>	<p>This item will collect response codes of the step.</p> <p>Item key: web.test.rspcode[Scenario,Step] Type: <i>Numeric(unsigned)</i></p>

Actual scenario and step names will be used instead of "Scenario" and "Step" respectively.

Note:

Web monitoring items are added with a 30 day history and a 90 day trend retention period.

Note:

If scenario name starts with a doublequote or contains comma or square bracket, it will be properly quoted in item keys. In other cases no additional quoting will be performed.

These items can be used to create triggers and define notification conditions. For example, to create a "Zabbix GUI login is too slow" trigger, you can define a trigger expression:

```
{zabbix:web.test.time[ZABBIX GUI,Login,resp].last()}>3
```

2 Real life scenario

Overview

This section presents a step-by-step real-life example of how web monitoring can be used.

Let's use Zabbix Web monitoring to monitor the web interface of Zabbix. We want to know if it is available, provides the right content and how quickly it works. To do that we also must log in with our user name and password.

Scenario

Step 1

Add a new web scenario.

We will add a scenario to monitor the web interface of Zabbix. The scenario will execute a number of steps.

Go to *Configuration* → *Hosts*, pick a host and click on *Web* in the row of that host. Then click on *Create scenario*.

Scenario

Steps

Authentication

Name

Zabbix frontend

Application

New application

Zabbix frontend

Update interval (in sec)

180

Attempts

1

Agent

other ...

User agent string

Lynx/2.8.4rel.1 libwww-FM/2.14

HTTP proxy

http://[user[:password]@]proxy.example.com[:port]

Variables

{user}=Admin

{password}=zabbix

Headers

Enabled

☒

Add

Cancel

In the new scenario form we will name the scenario as *Zabbix frontend* and create a new *Zabbix frontend* application for it. Note that we will also create two macros, {user} and {password}.

Step 2

Define steps for the scenario.

Click on *Add* button in the *Steps* tab to add individual steps.

Web scenario step 1

We start by checking that the first page responds correctly, returns with HTTP response code 200 and contains text "Zabbix SIA".

Name	<input type="text" value="First page"/>
URL	<input type="text" value="http://localhost/zabbix/index.php"/>
Post	<div></div>
Variables	<div></div>
Headers	<div></div>
Follow redirects	<input checked="" type="checkbox"/>
Retrieve only headers	<input type="checkbox"/>
Timeout	<input type="text" value="15"/>
Required string	<input type="text" value="Zabbix SIA"/>
Required status codes	<input type="text" value="200"/>

When done configuring the step, click on *Add*.

Web scenario step 2

We continue by logging in to the Zabbix frontend, and we do so by reusing the macros (variables) we defined on the scenario level, {user} and {password}.

Name	Log in
URL	http://localhost/zabbix/index.php
Post	name={user}&password={password}&enter=Sign in
Variables	{sid}=regex:name="sid" value="([0-9a-z]{16})"
Headers	
Follow redirects	<input checked="" type="checkbox"/>
Retrieve only headers	<input type="checkbox"/>
Timeout	15
Required string	
Required status codes	200

Attention:

Note that Zabbix frontend uses JavaScript redirect when logging in, thus first we must log in, and only in further steps we may check for logged-in features. Additionally, the login step must use full URL to **index.php** file.

All the post variables must be on a single line and concatenated with **&** symbol. Example string for logging into Zabbix frontend:

```
name=Admin&password=zabbix&enter=Sign in
```

If using the macros as in this example, login string becomes:

```
name={user}&password={password}&enter=Sign in
```

Take note also of how we are getting the content of {sid} variable (session ID), which will be required in step 4.

Web scenario step 3

Being logged in, we should now verify the fact. To do so, we check for a string that is only visible when logged in - for example, **Administration**.

Name

URL

Post

Variables

Headers

Follow redirects ☒

Retrieve only headers ☐

Timeout

Required string

Required status codes

Web scenario step 4

Now that we have verified that frontend is accessible and we can log in and retrieve logged-in content, we should also log out - otherwise Zabbix database will become polluted with lots and lots of open session records.

Name

URL

Post

Variables

Headers

Follow redirects ☒

Retrieve only headers ☐

Timeout

Required string

Required status codes

Web scenario step 5

We can also check that we have logged out by looking for the **Username** string.

Name

URL

Post

Variables

Headers

Follow redirects ☒

Retrieve only headers ☐

Timeout

Required string

Required status codes

Complete configuration of steps

A complete configuration of web scenario steps should look like this:

Scenario	Steps	Authentication				
	Steps	NAME	TIMEOUT	URL	REQUIRED	STATUS
	1:	First page	15 sec	http://localhost/zabbix/index.php	Zabbix SIA	200
	2:	Log in	15 sec	http://localhost/zabbix/index.php		200
	3:	Check login	15 sec	http://localhost/zabbix/index.php	Administration	200
	4:	Log out	15 sec	http://localhost/zabbix/index.php?reconnect=1&sid={sid}		200
	5:	Check logout	15 sec	http://localhost/zabbix/index.php	Username	200
	Add					

Step 3

Save the finished web monitoring scenario.

The scenario will appear in *Monitoring → Web*:

Web monitoring					Group	all	Host	all	
HOST	NAME ▲	NUMBER OF STEPS	LAST CHECK	STATUS					
Zabbix server	Zabbix frontend	5	2015-10-09 15:26:56	OK					

Click on the scenario name to see more detailed statistics:

Details of web scenario: Zabbix frontend

STEP	SPEED	RESPONSE TIME	RESPONSE CODE	STATUS
First page	14.63 KBps	198.5ms	200	OK
Log in	22.82 KBps	710ms	200	OK
Check login	56.74 KBps	285.5ms	200	OK
Log out	17.14 KBps	169.5ms	200	OK

9. Virtual machine monitoring

Overview Support of monitoring VMware environments is available in Zabbix starting with version 2.2.0.

Zabbix can use low-level discovery rules to automatically discover VMware hypervisors and virtual machines and create hosts to monitor them, based on pre-defined host prototypes.

The default dataset in Zabbix offers several ready-to-use templates for monitoring VMware vCenter or ESX hypervisor.

The minimum required VMware vCenter or vSphere version is 4.1.

Details The virtual machine monitoring is done in two steps. First, virtual machine data is gathered by *vmware collector* Zabbix processes. Those processes obtain necessary information from VMware web services over the SOAP protocol, pre-process it and store into Zabbix server shared memory. Then, this data is retrieved by pollers using Zabbix simple check **VMware keys**.

Starting with Zabbix version 2.4.4 the collected data is divided into 2 types: VMware configuration data and VMware performance counter data. Both types are collected independently by *vmware collectors*. Because of this it is recommended to enable more collectors than the monitored VMware services. Otherwise retrieval of VMware performance counter statistics might be delayed by the retrieval of VMware configuration data (which takes a while for large installations).

Currently only datastore, network interface and disk device statistics and custom performance counter items are based on the VMware performance counter information.

Configuration For virtual machine monitoring to work, Zabbix should be **compiled** with the `--with-libxml2` and `--with-libcurl` compilation options.

The following configuration file options can be used to tune the Virtual machine monitoring:

- **StartVMwareCollectors** - the number of pre-forked vmware collector instances.
This value depends on the number of VMware services you are going to monitor. For the most cases this should be:
 $servicenum < StartVMwareCollectors < (servicenum * 2)$
where *servicenum* is the number of VMware services. E. g. if you have 1 VMware service to monitor set StartVMwareCollectors to 2, if you have 3 VMware services, set it to 5. Note that in most cases this value should not be less than 2 and should not be 2 times greater than the number of VMware services that you monitor. Also keep in mind that this value also depends on your VMware environment size and *VMwareFrequency* and *VMwarePerfFrequency* configuration parameters (see below).
- **VMwareCacheSize**
- **VMwareFrequency**
- **VMwarePerfFrequency**
- **VMwareTimeout**

For more details, see the configuration file pages for Zabbix **server** and **proxy**.

Discovery Zabbix can use a low-level discovery rule to automatically discover VMware hypervisors and virtual machines.

Discovery rule

☒

Discovery rule key in the above screenshot is `vmware.hv.discovery[{$URL}]`.

Host prototypes Host prototypes can be created with the low-level discovery rule. When virtual machines are discovered, these prototypes become real hosts. Prototypes, before becoming discovered, cannot have their own items and triggers, other than those from the linked templates. Discovered hosts will belong to an existing host and will take the IP of the existing host for the host configuration.

Discovery rules

All templates / Template Virt VMware Applications 3 Items 3 Triggers Graphs Screens

Discovery

<input type="checkbox"/>	NAME ▲	ITEMS	TRIGGERS	GRAPHS	HOSTS

☒

Add

Cancel

Discovered hosts are prefixed with the name of the discovery rule that created them, in the host list. Discovered hosts can be manually deleted. Discovered hosts will also be automatically deleted, based on the *Keep lost resources period (in days)* value of the discovery rule. Most of the configuration options are read-only, except for enabling/disabling the host and host inventory. Discovered hosts cannot have host prototypes of their own.

Ready-to-use templates The default dataset in Zabbix offers several ready-to-use templates for monitoring VMware vCenter or directly ESX hypervisor.

These templates contain pre-configured LLD rules as well as a number of built-in checks for monitoring virtual installations.

Note that *Template Virt VMware* template should be used for VMware vCenter and ESX hypervisor monitoring. The *Template Virt VMware Hypervisor* and *Template Virt VMware Guest* templates are used by discovery and normally should not be manually linked to a host.

Templates

<input type="checkbox"/> TEMPLATES ▾	APPLICATIONS	ITEMS	TRIGGERS	GRAPHS	SCREENS	DISKS
<input type="checkbox"/> Template Virt VMware Hypervisor	Applications 6	Items 19	Triggers	Graphs	Screens	Disks
<input type="checkbox"/> Template Virt VMware Guest	Applications 8	Items 17	Triggers	Graphs	Screens	Disks
<input type="checkbox"/> Template Virt VMware	Applications 3	Items 3	Triggers	Graphs	Screens	Disks

Note:

If your server has been upgraded from a pre-2.2 version and has no such templates, you can import them manually, downloading from the community page with [official templates](#). However, these templates have dependencies from the *VMware VirtualMachinePowerState* and *VMware status* value maps, so it is necessary to create these value maps first (using an [SQL script](#), manually or importing from an XML) before importing the templates.

Host configuration To use VMware simple checks the host must have the following user macros defined:

- **{ \$URL }** - VMware service (vCenter or ESX hypervisor) SDK URL (<https://servername/sdk>)
- **{ \$USERNAME }** - VMware service user name
- **{ \$PASSWORD }** - VMware service { \$USERNAME } user password

Example The following example demonstrates how to quickly setup VMware monitoring on Zabbix:

- compile zabbix server with required options (`--with-libxml2` and `--with-libcurl`)
- set the `StartVMwareCollectors` option in Zabbix server configuration file to 1 or more
- create a new host
- set the host macros required for VMware authentication:

```
{{...:assets:en:manual:vm_monitoring:vm_host_macros.png|}}
```

* Link the host to the VMware service template:

```
{{...:assets:en:manual:vm_monitoring:vm_host_templates.png|}}
```

* Click on the `//Add//` button to save the host

Extended logging The data gathered by VMware collector can be logged for detailed debugging using debug level 5. This level can be set in **server** and **proxy** configuration files or using a runtime control option (`-R log_level_increase="vmware collector,N"`, where N is a process number). The following examples demonstrate how extended logging can be started provided debug level 4 is already set:

Increase log level of all vmware collectors:

```
shell> zabbix_server -R log_level_increase="vmware collector"
```

Increase log level of second vmware collector:

```
shell> zabbix_server -R log_level_increase="vmware collector,2"
```

If extended logging of VMware collector data is not required it can be stopped using the `-R log_level_decrease` option.

Troubleshooting

- In case of unavailable metrics, please make sure if they are not made unavailable or turned off by default in recent VMware vSphere versions or if some limits are not placed on performance-metric database queries. See [ZBX-12094](#) for additional details.
- To fix the `'config.vpxd.stats.maxQueryMetrics' is invalid or exceeds the maximum number of characters permitted` error, check value of the `maxQuerySize` parameter in VMware's `web.xml`, then go to the *advanced vCenter Server settings* and add a `config.vpxd.stats.maxQueryMetrics` parameter with the same value. See this VMware knowledge base [article](#) for details.

Virtual machine discovery key fields

The following table lists fields returned by virtual machine related discovery keys.

Item key		
Description	Field	Retrieved content
vmware.cluster.discovery Performs cluster discovery.	{#CLUSTER.ID} {#CLUSTER.NAME}	Cluster identifier. Cluster name.
vmware.hv.discovery Performs hypervisor discovery.	{#HV.UUID} {#HV.ID} {#HV.NAME} {#CLUSTER.NAME}	Unique hypervisor identifier. Hypervisor identifier (Host-System managed object name). Hypervisor name. Cluster name, might be empty.
vmware.hv.datastore.discovery Performs hypervisor datastore discovery. Note that multiple hypervisors can use the same datastore.	{#DATASTORE.ID}	Datastore name.
vmware.vm.discovery Performs virtual machine discovery.	{#VM.UUID} {#VM.ID} {#VM.NAME} {#HV.NAME} {#CLUSTER.NAME}	Unique virtual machine identifier. Virtual machine identifier (Virtual-Machine managed object name). Virtual machine name. Hypervisor name. Cluster name, might be empty.
vmware.vm.net.if.discovery Performs virtual machine network interface discovery.	{#IFNAME}	Network interface name.

Item key

vmware.vm.vfs.dev.discovery

Performs virtual machine disk device discovery.

{#DISKNAME} Disk

device
name.

vmware.vm.vfs.fs.discovery

Performs virtual machine file system discovery.

{#FSNAME} File

name.

10. Maintenance

Overview You can define maintenance periods for hosts and host groups in Zabbix. There are two maintenance types - with data collection and with no data collection.

During a maintenance "with data collection" triggers are processed as usual and events are created when required. To skip receiving notifications during such maintenance type, actions should be configured by retaining the default action **condition** 'Maintenance status = not in "maintenance"' - then you should not get notifications during maintenance. It's dedicated to skip problem notifications.

If a trigger generated an event during the maintenance period (as set in maintenance configuration), an additional event (the same as last event created during maintenance) will be created at the end of maintenance for the host. This way, if a problem happens during maintenance and is not resolved, a notification may be generated after the maintenance period ends.

To receive a notification during the maintenance you have to remove the default action condition about not taking actions during maintenance.

Note:

If at least one host (used in the trigger expression) is not in maintenance mode, Zabbix will send a problem notification.

Zabbix server must be running during maintenance. Timer processes are responsible for switching host status to/from maintenance at 0 seconds of every minute. A proxy will always collect data regardless of the maintenance type (including "no data" maintenance). The data is later ignored by the server if 'no data collection' is set.

When "no data" maintenance ends, triggers using `nodata()` function will not fire before the next check during the period they are checking.

If a log item is added while a host is in maintenance and the maintenance ends, only new logfile entries since the end of the maintenance will be gathered.

If a timestamped value is sent for a host that is in a "no data" maintenance type (e.g. using **Zabbix sender**) then this value will be dropped however it is possible to send a timestamped value in for an expired maintenance period and it will be accepted.

Attention:

To ensure predictable behaviour of recurring maintenance periods (daily, weekly, monthly), it is required to use a common time zone for all parts of Zabbix.

Configuration To configure a maintenance period:

- Go to: *Configuration* → *Maintenance*
- Click on *Create maintenance period* (or on the name of an existing maintenance period)

The **Maintenance** tab contains general maintenance period attributes:

Maintenance
Periods
Hosts & Groups

Name
Maintenance period

Maintenance type
With data collection

Active since
2015 - 01 - 01 00 : 00

Active till
2016 - 01 - 01 00 : 00

Description

Add
Cancel

Parameter	Description
<i>Name</i>	Name of the maintenance period.
<i>Maintenance type</i>	Two types of maintenance can be set: With data collection - data will be collected by the server during maintenance, triggers will be processed No data collection - data will not be collected by the server during maintenance
<i>Active since</i>	The date and time when executing maintenance periods becomes active. <i>Note:</i> Setting this time alone does not activate a maintenance period; for that go to the <i>Periods</i> tab.
<i>Active till</i>	The date and time when executing maintenance periods stops being active.
<i>Description</i>	Description of maintenance period.

The **Periods** tab allows you to define the exact days and hours when the maintenance takes place. Clicking on *New* opens a flexible *Maintenance period* form where you can define the times - for daily, weekly, monthly or one-time maintenance.

Daily and weekly periods have an *Every day/Every week* parameter, which defaults to 1. Setting it to 2 would make the maintenance take place every two days or every two weeks and so on. The starting day or week is the day or week that *Active since* time falls on.

For example, having *Active since* set to 2013-09-06 12:00 and an hour long daily recurrent period every two days at 23:00 will result in the first maintenance period starting on 2013-09-06 at 23:00, while the second maintenance period will start on 2013-09-08 at 23:00. Or, with the same *Active since* time and an hour long daily recurrent period every two days at 01:00, the first maintenance period will start on 2013-09-08 at 01:00, and the second maintenance period on 2013-09-10 at 01:00.

Attention:

It is possible to set maintenance time and occurrence in **Periods** which partly or fully doesn't match with active period set in **Maintenance**.

Maintenance periods outside active period will not be **represented** in the frontend and will not affect **problem notification** behavior.

The **Hosts & Groups** tab allows you to select the hosts and host groups for maintenance.

Weekly maintenance [Maintenance with data collection]
We break and fix things at this time.

Maintenance details are displayed when the mouse pointer is positioned over the icon.

Note:

The display of hosts in maintenance in the Dashboard can be unset altogether with the dashboard filtering function.

Additionally, hosts in maintenance get an orange background in *Monitoring → Maps* and in *Configuration → Hosts* their status is displayed as 'In maintenance'.

11. Regular expressions

Overview POSIX extended regular expressions are supported in Zabbix.

There are two ways of using regular expressions in Zabbix:

- manually entering a regular expression
- using a global regular expression created in Zabbix

Regular expressions You may manually enter a regular expression in supported places. Note that the expression may not start with @ because that symbol is used in Zabbix for referencing global regular expressions.

Global regular expressions There is an advanced editor for creating and testing complex regular expressions in Zabbix frontend.

Once a regular expression has been created this way, it can be used in several places in the frontend by referring to its name, prefixed with @, for example, @mycustomregexp.

To create a global regular expression:

- Go to: Administration → General
- Select Regular expressions from the dropdown
- Click on New regular expression

The Expressions tab allows to set the regular expression name and add subexpressions.

ExpressionsTest

NameNetwork interfaces for discovery

Expressions

EXPRESSION TYPE	EXPRESSION	DELIMITER	CASE SENSITIVE	ACTION
Result is FALSE	^!o\$		<input checked="" type="checkbox"/>	Remove
Result is FALSE	^Software Loopback Interface		<input checked="" type="checkbox"/>	Remove

Add

AddCancel

Parameter	Description
Name	Set the regular expression name. Any Unicode characters are allowed.
Expressions	Click on Add in the Expressions block to add a new subexpression. <div>Expression type</div> <div>Select expression type:<ul style="list-style-type: none">Character string included - match the substringAny character string included - match any substring from a delimited list. The delimited list includes a comma (,), a dot (.) or a forward slash (/).Character string not included - match any string except the substringResult is TRUE - match the regular expressionResult is FALSE - do not match the regular expression</div> <div>Expression</div> <div>Enter substring/regular expression.</div>
Delimiter	A comma (,), a dot (.) or a forward slash (/) to separate text strings in a regular expression. This parameter is active only when "Any character string included" expression type is selected.
Case sensitive	A checkbox to specify whether a regular expression is sensitive to capitalization of letters.

Since Zabbix 2.4.0, a forward slash (/) in the expression is treated literally, rather than a delimiter. This way it is possible to save expressions containing a slash, whereas previously it would produce an error.

Attention:

A custom regular expression name in Zabbix may contain commas, spaces, etc. In those cases where that may lead to misinterpretation when referencing (for example, a comma in the parameter of an item key) the whole reference may be put in quotes like this: "@My custom regexp for purpose1, purpose2".

Regular expression names must not be quoted in other locations (for example, in LLD rule properties).

Example Use of the following regular expression in LLD to discover databases not taking into consideration a database with a specific name:

`^TESTDATABASE$`

Chosen *Expression type*: "Result is FALSE". Doesn't match name, containing string "TESTDATABASE".

Test string

Test expressions

Result	Expression type	Expression	Result
	Result is FALSE	<code>^TESTDATABASE</code>	FALSE
	Combined result		FALSE

More complex example A custom regular expression may consist of multiple subexpressions, and it can be tested in the **Test** tab by providing a test string.

Expressions Test

Test string

Test expressions

Result	Expression type	Expression	Result
	Result is FALSE	<code>^Software Loopback Interface</code>	TRUE
	Result is FALSE	<code>^(In)?[Ll]oop[Bb]ack[0-9._]*\$</code>	TRUE
	Result is FALSE	<code>^NULL[0-9.]*\$</code>	TRUE
	Result is FALSE	<code>^[Ll]o[0-9.]*\$</code>	FALSE
	Result is FALSE	<code>^[Ss]ystem\$</code>	TRUE
	Result is FALSE	<code>^Nu[0-9.]*\$</code>	TRUE
	Combined result		FALSE

Update Clone Delete Cancel

Results show the status of each subexpression and total custom expression status.

Total custom expression status is defined as *Combined result*. If several sub expressions are defined Zabbix uses AND logical operator to calculate *Combined result*. It means that if at least one Result is False *Combined result* has also False status.

Explanation of global regular expressions

Global regexp	Expression	Description
<i>File systems for discovery</i>	<code>^(btrfs ext2 ext3 ext4 jfs xfs reiser ufs vxfs zfs)\$</code>	Matches "btrfs" or "ext2" or "ext3" or "ext4" or "jfs" or "xfs" or "reiser" or "ufs" or "vxfs" or "zfs"
<i>Network interfaces for discovery</i>	<code>^Software Loopback Interface</code>	Matches strings starting with "Software Loopback Interface"
	<code>^lo\$</code>	Matches "lo"
	<code>^(In)?[Ll]oop[Bb]ack[0-9._]*\$</code>	Matches strings that optionally start with "In", then have "L" or "l", then "oop", then "B" or "b", then "ack", which can be optionally followed by any number of digits, dots or underscores
	<code>^NULL[0-9._]*\$</code>	Matches strings starting with "NULL" optionally followed by any number of digits or dots
	<code>^[Ll]o[0-9._]*\$</code>	Matches strings starting with "Lo" or "lo" and optionally followed by any number of digits or dots
<i>Storage devices for SNMP discovery</i>	<code>^[Ss]ystem\$</code>	Matches "System" or "system"
	<code>^Nu[0-9._]*\$</code>	Matches strings starting with "Nu" optionally followed by any number of digits or dots
<i>Storage devices for SNMP discovery</i>	<code>^(Physical memory Virtual memory Memory buffers Cached memory Swap space)\$</code>	Matches "Physical memory" or "Virtual memory" or "Memory buffers" or "Cached memory" or "Swap space"
<i>Windows service names for discovery</i>	<code>^(MMCSS gupdate SysmonLog clbcatq clbcatq_mon gupdate50727_32 clr_optimization_v2.0.50727_32 clr_optimization_v4.0.30319_32)\$</code>	Matches "MMCSS" or "gupdate" or "SysmonLog" or strings like "clbcatq" or "clbcatq_mon" or "clr_optimization_v2.0.50727_32" and "clr_optimization_v4.0.30319_32" where instead of dots you can put any character except newline.
<i>Windows service startup states for discovery</i>	<code>^(automatic automatic delayed)\$</code>	Matches "automatic" or "automatic delayed".

12. Event acknowledgement

Overview Problem events in Zabbix can be acknowledged by users.

If a user gets notified about of a problem event, they can go to Zabbix frontend, navigate from events to the acknowledgement screen and acknowledge the problem. When acknowledging, they can enter their comment for it, saying that they are working on it or whatever else they may feel like saying about it.

This way, if another system user spots the same problem, they immediately see if it has been acknowledged and the comments so far.

This way the workflow of resolving problems with more than one system user can take place in a more coordinated way.

Acknowledgement status is also used when defining **action operations**. You can define, for example, that a notification is sent to a higher level manager only if an event is not acknowledged for some time.

To acknowledge events, a user must have at least read permission to the corresponding trigger.

Acknowledgement screen The acknowledgement status of problems is displayed in:

- *Monitoring* → *Dashboard* (Last 20 issues and System status widgets)
- *Monitoring* → *Overview* (with triggers selected)
- *Monitoring* → *Triggers*
- *Monitoring* → *Events*

- *Monitoring* → *Event details*
- *Monitoring* → *Screens* (with *Host group issues*, *Host issues*, *System status* and *Triggers overview* elements)

The *Ack* column contains either a 'Yes' or a 'No', indicating an acknowledged or an unacknowledged problem respectively. A 'Yes' may also have a number with it, indicating the number of comments for the problem so far.

Both 'Yes' and 'No' are links. Clicking them will take you to the acknowledgement screen.

Alarm acknowledgements

Message

History

TIME	USER	MESSAGE

Acknowledge

☐ Only selected event
 ☒ Selected and all unacknowledged PROBLEM events 1 event
 ☐ Selected and all unacknowledged events 1 event

Acknowledge

Cancel

To acknowledge a problem, enter your comment (maximum 256 characters) and click on *Acknowledge*. You may choose to acknowledge the selected event, selected event and all unacknowledged problem events or selected event and all unacknowledged events ('Problem' and 'Ok' events).

Any previous comments for the problem are displayed below the message area.

Event acknowledgement in the frontend can be turned on/off in *Administration* → *General*. When turned off, acknowledgement related controls are hidden from view except for the operation condition in action operations. Also, while turning acknowledgement on/off affects the frontend, it remains available via the API.

Display Acknowledgement information is fully displayed in the event details accessible by clicking the time of event in *Monitoring* → *Events*.

Based on acknowledgement information it is possible to configure how the problem count is displayed in the dashboard or maps. To do that, you have to make selections in the *Problem display* option, available in both *map configuration* and the *dashboard filter*. It is possible to display all problem count, unacknowledged problem count as separated from the total or unacknowledged problem count only.

Acknowledgement status is displayed in *Monitoring* → *Triggers*. There, acknowledgement status is also used with the trigger filtering options. You can filter by unacknowledged triggers or triggers with the last event unacknowledged.

13. Configuration export/import

Overview Zabbix export/import functionality makes it possible to exchange various configuration entities between one Zabbix system and another.

Typical use cases for this functionality:

- sharing of templates or network maps - Zabbix users may share their configuration parameters
- integration with third-party tools - the universal XML format makes integration and data import/export possible with third party tools and applications.

What can be exported/imported

Objects that can be exported/imported are:

- host groups (*through Zabbix API only*)
- templates (including all directly attached items, triggers, graphs, screens, discovery rules and template linkage)
- hosts (including all directly attached items, triggers, graphs, discovery rules and template linkage)
- network maps (including all related images; map export/import is supported since *Zabbix 1.8.2*)
- images
- screens
- value maps

Export format

Data can be exported using the Zabbix web frontend or [Zabbix API](#). Supported export formats are:

- XML - in the frontend
- XML or JSON - in Zabbix API

Details about export

- All supported elements are exported in one file.
- Host and template entities (items, triggers, graphs, discovery rules) that are inherited from linked templates are not exported. Any changes made to those entities on a host level (such as changed item interval, modified regular expression or added prototypes to the low-level discovery rule) will be lost when exporting; when importing, all entities from linked templates are re-created as on the original linked template.
- Entities created by low-level discovery and any entities depending on them are not exported. For example, a trigger created for an LLD-rule generated item will not be exported.
- Triggers and graphs that use web items are not exported.

Details about import

- Import stops at the first error.
- When updating existing images during image import, "imagetype" field is ignored, i.e. it is impossible to change image type via import.
- When importing hosts/templates using the "Delete missing" option, host/template macros not present in the imported XML file will be deleted too.
- Empty tags for items, triggers, graphs, host/template applications, discoveryRules, itemPrototypes, triggerPrototypes, graphPrototypes are meaningless i.e. it's the same as if it was missing. Other tags, for example, item applications, are meaningful i.e. empty tag means no applications for item, missing tag means don't update applications.
- Import supports both XML and JSON, the import file must have a correct file extension: .xml for XML and .json for JSON.
- See [compatibility information](#) about supported XML versions.

```
<?xml version="1.0" encoding="UTF-8"?>
<zabbix_export>
  <version>3.0</version>
  <date>2016-04-18T14:07:36Z</date>
</zabbix_export>
```

XML base format

```
<?xml version="1.0" encoding="UTF-8"?>
```

Default header for XML documents.

```
<zabbix_export>
```

Root element for Zabbix XML export.

```
<version>3.0</version>
```

Export version.

```
<date>2016-04-18T14:07:36Z</date>
```

Date when export was created in ISO 8601 long format.

Other tags are dependent on exported objects.

Groups

Frontend can export groups only with hosts or templates. When host or template is exported all groups it belongs to are exported with it automatically.

API allows to export groups independently from hosts or templates.

```
<groups>
  <group>
    <name>Zabbix servers</name>
  </group>
</groups>
```

groups/group

Parameter	Type	Description	Details
name	string	Group name.	

Hosts

Hosts are exported with many related objects and object relations.

Host export contains:

- host data
- host inventory data
- group relations
- template relations
- interfaces
- macros
- applications
- items
- discovery rules with all prototypes
- value maps

When a host is imported and updated, it can only be linked to additional templates and never be unlinked from any.

hosts/host

Parameter	Type	Description	Details
host	<i>string</i>	Host name.	
name	<i>string</i>	Visible host name.	
description	<i>string</i>	Host description.	
status	<i>int</i>	Host status.	
proxy	<i>int</i>	Proxy name.	
ipmi_authtype	<i>int</i>	IPMI authentication type.	
ipmi_privilege	<i>int</i>	IPMI privilege.	
ipmi_username	<i>string</i>	IPMI username.	
ipmi_password	<i>string</i>	IPMI password.	

hosts/host/groups/group

Parameter	Type	Description	Details
name	<i>string</i>	Group name.	

hosts/host/templates/template

Parameter	Type	Description	Details
name	<i>string</i>	Template technical name.	

hosts/host/interfaces/interface

Column name	Type	Description
default	integer	Interface status: 0 - Not default interface 1 - Default interface
type	integer	Interface type: 1 - agent 2 - SNMP 3 - IPMI 4 - JMX
useip	integer	How to connect to the host: 0 - connect to the host using DNS name 1 - connect to the host using IP address
ip	varchar	IP address, can be either IPv4 or IPv6.
dns	varchar	DNS name.
port	varchar	Port number.
interface_ref	varchar	Interface reference name to be used in items.

hosts/host/applications/application

Parameter	Type	Description	Details
name	<i>string</i>	Application name.	

Parameter	Type	Description
type	<i>int</i>	Item type: 0 - Zabbix agent 1 - SNMPv1 2 - Trapper 3 - Simple check 4 - SNMPv2 5 - Internal 6 - SNMPv3 7 - Active check 8 - Aggregate 9 - HTTP test (web monitoring scenario step) 10 - External 11 - Database monitor 12 - IPMI 13 - SSH 14 - telnet 15 - Calculated 16 - JMX 17 - SNMP trap
snmp_community	<i>string</i>	SNMP Community name
snmp_oid	<i>string</i>	SNMP OID
port	<i>int</i>	Item custom port
name	<i>string</i>	Item name
key	<i>string</i>	Item key
delay	<i>int</i>	Check interval
history	<i>int</i>	How long to keep item history (days)
trends	<i>int</i>	How long to keep item trends (days)
status	<i>int</i>	Item status
value_type	<i>int</i>	Value type
trapper_hosts	<i>string</i>	
units	<i>string</i>	Value units
multiplier	<i>int</i>	Value multiplier
delta	<i>int</i>	Store values as delta
snmpv3_securityname	<i>string</i>	SNMPv3 security name
snmpv3_securitylevel	<i>int</i>	SNMPv3 security level
snmpv3_authpassphrase	<i>string</i>	SNMPv3 authentication phrase
snmpv3_privpassphrase	<i>string</i>	SNMPv3 private phrase
formula	<i>string</i>	
delay_flex	<i>string</i>	Flexible delay
params	<i>string</i>	
ipmi_sensor	<i>string</i>	IPMI sensor
data_type	<i>int</i>	
authtype	<i>int</i>	
username	<i>string</i>	
password	<i>string</i>	
publickey	<i>string</i>	
privatekey	<i>string</i>	
interface_ref	<i>varchar</i>	Reference to host interface
description	<i>string</i>	Item description
inventory_link	<i>int</i>	Host inventory field number, that will be updated with the value returned by the item
applications		Item applications
valuemap		Value map assigned to item
logtimefmt	<i>string</i>	Format of the time in log entries. Used only by log items.

Parameter	Type	Description	Details
name	<i>string</i>	Application name.	

hosts/host/items/item/valuemap

Parameter	Type	Description	Details
name	<i>string</i>	Value map name.	

value_maps/value_map

Parameter	Type	Description	Details
name	<i>string</i>	Value map name.	
mappings		Value mappings for value map.	

value_maps/value_map/mappings/mapping

Parameter	Type	Description	Details
value	<i>string</i>	Value mapping original value.	
newvalue	<i>string</i>	Value to which the original value is mapped to.	

14. Discovery

Please use the sidebar to access content in the Discovery section.

1 Network discovery

Overview

Zabbix offers automatic network discovery functionality that is effective and very flexible.

With network discovery properly set up you can:

- speed up Zabbix deployment
- simplify administration
- use Zabbix in rapidly changing environments without excessive administration

Zabbix network discovery is based on the following information:

- IP ranges
- Availability of external services (FTP, SSH, WEB, POP3, IMAP, TCP, etc)
- Information received from Zabbix agent (only unencrypted mode is supported)
- Information received from SNMP agent

It does NOT provide:

- Discovery of network topology

Network discovery basically consists of two phases: discovery and actions.

Discovery

Zabbix periodically scans the IP ranges defined in **network discovery rules**. The frequency of the check is configurable for each rule individually.

Note that one discovery rule will always be processed by a single discoverer process. The IP range will not be split between multiple discoverer processes.

Each rule has a set of service checks defined to be performed for the IP range.

Note:

Discovery checks are processed independently from the other checks. If any checks do not find a service (or fail), other checks will still be processed.

Every check of a service and a host (IP) performed by the network discovery module generates a discovery event.

Event	Check of service result
<i>Service Discovered</i>	The service is 'up' after it was 'down' or when discovered for the first time.
<i>Service Up</i>	The service is 'up', consecutively.
<i>Service Lost</i>	The service is 'down' after it was 'up'.
<i>Service Down</i>	The service is 'down', consecutively.
<i>Host Discovered</i>	At least one service of a host is 'up' after all services of that host were 'down' or a service is discovered which belongs to a not registered host.
<i>Host Up</i>	At least one service of a host is 'up', consecutively.
<i>Host Lost</i>	All services of a host are 'down' after at least one was 'up'.
<i>Host Down</i>	All services of a host are 'down', consecutively.

Actions

Discovery events can be the basis of relevant **actions**, such as:

- Sending notifications
- Adding/removing hosts
- Enabling/disabling hosts
- Adding hosts to a group
- Removing hosts from a group
- Linking hosts to/unlinking from a template
- Executing remote scripts

These actions can be configured with respect to the device type, IP, status, uptime/downtime, etc. For full details on configuring actions for network-discovery based events, see action **operation** and **conditions** pages.

Note:

Linking a discovered host to templates will fail collectively if any of the linkable templates has a unique entity (e.g. item key) that is the same as a unique entity (e.g. item key) already existing on the host or on another of the linkable templates.

Host creation

A host is added if the *Add host* operation is selected. A host is also added, even if the *Add host* operation is missing, if you select operations resulting in actions on a host. Such operations are:

- enable host
- disable host
- add host to a host group
- link template to a host

When adding hosts, a host name is the result of reverse DNS lookup or IP address if reverse lookup fails. Lookup is performed from the Zabbix server or Zabbix proxy, depending on which is doing the discovery. If lookup fails on the proxy, it is not retried on the server. If the host with such a name already exists, the next host would get **_2** appended to the name, then **_3** and so on.

Created hosts are added to the *Discovered hosts* group (by default, configurable in *Administration* → *General* → **Other**). If you wish hosts to be added to another group, add a *Remove from host groups* operation (specifying "Discovered hosts") and also add an *Add to host groups* operation (specifying another host group), because a host must belong to a host group.

If a host already exists with the discovered IP address, a new host is not created. However, if the discovery action contains operations (link template, add to host group, etc), they are performed on the existing host.

Host removal

Hosts discovered by a network discovery rule are removed automatically from *Monitoring* → *Discovery* if a discovered entity is not in the rule's IP range any more. Hosts are removed immediately.

Interface creation when adding hosts

When hosts are added as a result of network discovery, they get interfaces created according to these rules:

- the services detected - for example, if an SNMP check succeeded, an SNMP interface will be created

- if a host responded both to Zabbix agent and SNMP requests, both types of interfaces will be created
- if uniqueness criteria are Zabbix agent or SNMP-returned data, the first interface found for a host will be created as the default one. Other IP addresses will be added as additional interfaces.
- if a host responded to agent checks only, it will be created with an agent interface only. If it would start responding to SNMP later, additional SNMP interfaces would be added.
- if 3 separate hosts were initially created, having been discovered by the "IP" uniqueness criteria, and then the discovery rule is modified so that hosts A, B and C have identical uniqueness criteria result, B and C are created as additional interfaces for A, the first host. The individual hosts B and C remain. In *Monitoring → Discovery* the added interfaces will be displayed in the "Discovered device" column, in black font and indented, but the "Monitored host" column will only display A, the first created host. "Uptime/Downtime" is not measured for IPs that are considered to be additional interfaces.

Configuring a network discovery rule

Overview

To configure a network discovery rule used by Zabbix to discover hosts and services:

- Go to *Configuration → Discovery*
- Click on *Create rule* (or on the rule name to edit an existing one)
- Edit the discovery rule attributes

Rule attributes

Discovery rules

Name	<input type="text" value="Local network"/>
Discovery by proxy	<input type="text" value="No proxy"/>
IP range	<input type="text" value="192.168.0.1-254"/>
Delay (in sec)	<input type="text" value="3600"/>
Checks	<div><div>ICMP ping</div><div>SNMPv2 agent "1.3.6.1.2.1.1.1.0"</div><div>Zabbix agent "system.uname"</div><div>New</div></div> <div><div>Edit</div><div>Remove</div></div> <div><div>Edit</div><div>Remove</div></div> <div><div>Edit</div><div>Remove</div></div>
Device uniqueness criteria	<div><div><input checked="" type="radio"/> IP address</div><div><input type="radio"/> SNMPv2 agent "1.3.6.1.2.1.1.1.0"</div><div><input type="radio"/> Zabbix agent "system.uname"</div></div>
Enabled	<input checked="" type="checkbox"/>
<div><div>Add</div><div>Cancel</div></div>	

Parameter	Description
<i>Name</i>	Unique name of the rule. For example, "Local network".
<i>Discovery by proxy</i>	What performs discovery: no proxy - Zabbix server is doing discovery <proxy name> - this proxy performs discovery

Parameter	Description
<i>IP range</i>	<p>The range of IP addresses for discovery. It may have the following formats:</p> <p>Single IP: 192.168.1.33</p> <p>Range of IP addresses: 192.168.1-10.1-255. The range is limited by the total number of covered addresses (less than 64K).</p> <p>IP mask: 192.168.4.0/24</p> <p>supported IP masks:</p> <p>/16 - /30 for IPv4 addresses</p> <p>/112 - /128 for IPv6 addresses</p> <p>List: 192.168.1.1-255, 192.168.2.1-100, 192.168.2.200, 192.168.4.0/24</p> <p>Since Zabbix 3.0.0 this field supports spaces, tabulation and multiple lines.</p>
<i>Delay (in sec)</i>	<p>This parameter defines how often Zabbix will execute the rule. Delay is measured after the execution of previous discovery instance ends so there is no overlap.</p>
<i>Checks</i>	<p>Zabbix will use this list of checks for discovery.</p> <p>Supported checks: SSH, LDAP, SMTP, FTP, HTTP, HTTPS, POP, NNTP, IMAP, TCP, Telnet, Zabbix agent, SNMPv1 agent, SNMPv2 agent, SNMPv3 agent, ICMP ping.</p> <p>A protocol-based discovery uses the net.tcp.service[] functionality to test each host, except for SNMP which queries an SNMP OID. Zabbix agent is tested by querying an item in unencrypted mode. Please see agent items for more details.</p> <p>The 'Ports' parameter may be one of following:</p> <p>Single port: 22</p> <p>Range of ports: 22-45</p> <p>List: 22-45,55,60-70</p>
<i>Device uniqueness criteria</i>	<p>Uniqueness criteria may be:</p> <p>IP address - no processing of multiple single-IP devices. If a device with the same IP already exists it will be considered already discovered and a new host will not be added.</p> <p>Type of discovery check - either SNMP or Zabbix agent check.</p>
<i>Enabled</i>	<p>With the check-box marked the rule is active and will be executed by Zabbix server.</p> <p>If unmarked, the rule is not active. It won't be executed.</p>

Changing proxy setting

Since Zabbix 2.2.0 the hosts discovered by different proxies are always treated as different hosts. While this allows to perform discovery on matching IP ranges used by different subnets, changing proxy for an already monitored subnet is complicated because the proxy changes must be also applied to all discovered hosts. For example the steps to replace proxy in a discovery rule:

1. disable discovery rule
2. sync proxy configuration
3. replace the proxy in the discovery rule
4. replace the proxy for all hosts discovered by this rule
5. enable discovery rule

A real life scenario

In this example we would like to set up network discovery for the local network having an IP range of 192.168.1.1-192.168.1.254.

In our scenario we want to:

- discover those hosts that have Zabbix agent running
- run discovery every 10 minutes
- add a host to monitoring if the host uptime is more than 1 hour
- remove hosts if the host downtime is more than 24 hours
- add Linux hosts to the "Linux servers" group
- add Windows hosts to the "Windows servers" group
- use *Template OS Linux* for Linux hosts
- use *Template OS Windows* for Windows hosts

Step 1

Defining a network discovery rule for our IP range.

Name	<input type="text" value="Local network"/>
Discovery by proxy	<input type="text" value="No proxy"/>
IP range	<input type="text" value="192.168.1.1-254"/>
Delay (in sec)	<input type="text" value="600"/>
Checks	<div>Zabbix agent "system.uname" Edit Remove</div> <div>New</div>
Device uniqueness criteria	<div><input checked="" type="radio"/> IP address</div> <div><input type="radio"/> Zabbix agent "system.uname"</div>
Enabled	<input checked="" type="checkbox"/>

Zabbix will try to discover hosts in the IP range of 192.168.1.1-192.168.1.254 by connecting to Zabbix agents and getting the value from **system.uname** key. The value received from the agent can be used to apply different actions for different operating systems. For example, link Windows servers to Template OS Windows, Linux servers to Template OS Linux.

The rule will be executed every 10 minutes (600 seconds).

When this rule is added, Zabbix will automatically start the discovery and generating discovery-based events for further processing.

Step 2

Defining an **action** for adding the discovered Linux servers to the respective group/template.

Action

Conditions

Operations

Type of calculation

And/Or

A and B and C and D

Conditions

LABEL	NAME
A	Received value like <i>Linux</i>
B	Discovery status = <i>Up</i>
C	Service type = <i>Zabbix agent</i>
D	Uptime/Downtime >= 3600

New condition

Uptime/Downtime

>=

600

Add

The action will be activated if:

- the "Zabbix agent" service is "up"
- the value of system.uname (the Zabbix agent key we used in rule definition) contains "Linux"
- Uptime is 1 hour (3600 seconds) or more

Action

Conditions

Operations

Action operations

DETAILS

Add to host groups: Linux servers

Link to templates: Template OS Linux

New

The action will execute the following operations:

- add the discovered host to the "Linux servers" group (and also add host if it wasn't added previously)
- link host to the "Template OS Linux" template. Zabbix will automatically start monitoring the host using items and triggers from "Template OS Linux".

Step 3

Defining an action for adding the discovered Windows servers to the respective group/template.

ActionConditionsOperations

Type of calculation

And/Or

A and B and C and D

Conditions

LABEL	NAME
A	Received value like <i>Windows</i>
B	Uptime/Downtime >= 3600
C	Discovery status = <i>Up</i>
D	Service type = <i>Zabbix agent</i>

New condition

Service type

=

FTP

Add

ActionConditionsOperations

Action operations

DETAILS

Add to host groups: Windows servers

Link to templates: Template OS Windows

New

Step 4

Defining an action for removing lost servers.

ActionConditionsOperations

Type of calculation

And/Or

A and B and C

Conditions

LABEL	NAME
A	Uptime/Downtime >= 86400
B	Discovery status = Down
C	Service type = Zabbix agent

New condition

Service type

=

FTP

Add

ActionConditionsOperations

Action operations

DETAILS

Remove host

New

A server will be removed if "Zabbix agent" service is 'down' for more than 24 hours (86400 seconds).

2 Active agent auto-registration

Overview

It is possible to allow active Zabbix agent auto-registration, after which the server can start monitoring them. This way new hosts can be added for monitoring without configuring them manually on the server.

Auto registration can happen when a previously unknown active agent asks for checks.

The feature might be very handy for automatic monitoring of new Cloud nodes. As soon as you have a new node in the Cloud Zabbix will automatically start the collection of performance and availability data of the host.

Active agent auto-registration also supports the monitoring of added hosts with passive checks. When the active agent asks for checks, providing it has the 'ListenIP' or 'ListenPort' configuration parameters defined in the configuration file, these are sent along to the server. (If multiple IP addresses are specified, the first one is sent to the server.)

Server, when adding the new auto-registered host, uses the received IP address and port to configure the agent. If no IP address value is received, the one used for the incoming connection is used. If no port value is received, 10050 is used.

Configuration

Specify server

Make sure you have the Zabbix server identified in the agent **configuration file** - zabbix_agentd.conf

```
ServerActive=10.0.0.1
```

Unless you specifically define a *Hostname* in *zabbix_agentd.conf*, the system hostname of agent location will be used by server for naming the host. The system hostname in Linux can be obtained by running the 'hostname' command.

Restart the agent after making any changes to the configuration file.

Action for active agent auto-registration

When server receives an auto-registration request from an agent it calls an **action**. An action of event source "Auto registration" must be configured for agent auto-registration.

Note:

Setting up **network discovery** is not required to have active agents auto-register.

In the Zabbix frontend, go to *Configuration* → *Actions*, select *Auto registration* as the event source and click on *Create action*:

- In the Action tab, give your action a name
- In the Conditions tab, optionally specify conditions. If you are going to use the "Host metadata" condition, see the next section.
- In the Operations tab, add relevant operations, such as - 'Add host', 'Add to host groups' (for example, *Discovered hosts*), 'Link to templates', etc.

Note:

If the hosts that will be auto-registering are likely to be supported for active monitoring only (such as hosts that are firewalled from your Zabbix server) then you might want to create a specific template like *Template_Linux-active* to link to.

Created hosts are added to the *Discovered hosts* group (by default, configurable in *Administration* → *General* → *Other*).

Using host metadata

When agent is sending an auto-registration request to the server it sends its hostname. In some cases (for example, Amazon cloud nodes) a hostname is not enough for Zabbix server to differentiate discovered hosts. Host metadata can be optionally used to send other information from an agent to the server.

Host metadata is configured in the agent **configuration file** - *zabbix_agentd.conf*. There are 2 ways of specifying host metadata in the configuration file:

```
HostMetadata
HostMetadataItem
```

See the description of the options in the link above.

<note:important>An auto-registration attempt happens every time an active agent sends a request to refresh active checks to the server. The delay between requests is specified in the **RefreshActiveChecks** parameter of the agent. The first request is sent immediately after the agent is restarted. :::

Example 1

Using host metadata to distinguish between Linux and Windows hosts.

Say you would like the hosts to be auto-registered by the Zabbix server. You have active Zabbix agents (see "Configuration" section above) on your network. There are Windows hosts and Linux hosts on your network and you have "Template OS Linux" and "Template OS Windows" templates available in your Zabbix frontend. So at host registration you would like the appropriate Linux/Windows template to be applied to the host being registered. By default only the hostname is sent to the server at auto-registration, which might not be enough. In order to make sure the proper template is applied to the host you should use host metadata.

Agent configuration

The first thing to do is configuring the agents. Add the next line to the agent configuration files:

```
HostMetadataItem=system.uname
```

This way you make sure host metadata will contain "Linux" or "Windows" depending on the host an agent is running on. An example of host metadata in this case:

```
Linux: Linux server3 3.2.0-4-686-pae #1 SMP Debian 3.2.41-2 i686 GNU/Linux
Windows: Windows WIN-OPXGGSTYNHO 6.0.6001 Windows Server 2008 Service Pack 1 Intel IA-32
```

Do not forget to restart the agent after making any changes to the configuration file.

Frontend configuration

Now you need to configure the frontend. Create 2 actions. The first action:

- Name: Linux host autoregistration
- Conditions: Host metadata like *Linux*
- Operations: Link to templates: Template OS Linux

Note:

You can skip an "Add host" operation in this case. Linking to a template requires adding a host first so the server will do that automatically.

The second action:

- Name: Windows host autoregistration
- Conditions: Host metadata like *Windows*
- Operations: Link to templates: Template OS Windows

Example 2

Using host metadata to allow some basic protection against unwanted hosts registering.

Agent configuration

Add the next line to the agent configuration file:

```
HostMetadata=Linux 21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
```

where "Linux" is a platform, and the rest of the string is some hard-to-guess secret text.

Do not forget to restart the agent after making any changes to the configuration file.

Frontend configuration

Create an action in the frontend, using the above mentioned hard-to-guess secret code to disallow unwanted hosts:

- Name: Auto registration action Linux
- Conditions:
 - * Type of calculation: AND
 - * Condition (A): Host metadata like `//Linux//`
 - * Condition (B): Host metadata like `//21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae`
- * Operations:
 - * Send message to users: Admin via all media
 - * Add to host groups: Linux servers
 - * Link to templates: Template OS Linux

Please note that this method alone does not provide strong protection because data are transmitted in plain text.

3 Low-level discovery

Overview

Low-level discovery provides a way to automatically create items, triggers, and graphs for different entities on a computer. For instance, Zabbix can automatically start monitoring file systems or network interfaces on your machine, without the need to create items for each file system or network interface manually. Additionally it is possible to configure Zabbix to remove unneeded entities automatically based on actual results of periodically performed discovery.

In Zabbix, six types of discovery items are supported out of the box:

- discovery of file systems;
- discovery of network interfaces;
- discovery of CPUs and CPU cores;
- discovery of SNMP OIDs;
- discovery using ODBC SQL queries;
- discovery of Windows services.

A user can define their own types of discovery, provided they follow a particular JSON protocol.

The general architecture of the discovery process is as follows.

First, a user creates a discovery rule in "Configuration" → "Templates" → "Discovery" column. A discovery rule consists of (1) an item that discovers the necessary entities (for instance, file systems or network interfaces) and (2) prototypes of items, triggers, and graphs that should be created based on the value of that item.

An item that discovers the necessary entities is like a regular item seen elsewhere: the server asks a Zabbix agent (or whatever the type of the item is set to) for a value of that item, the agent responds with a textual value. The difference is that the value the agent responds with should contain a list of discovered entities in a specific JSON format. While the details of this format are only important for implementers of custom discovery checks, it is necessary to know that the returned value contains a list of macro → value pairs. For instance, item "net.if.discovery" might return two pairs: "{#IFNAME}" → "lo" and "{#IFNAME}" → "eth0".

Note:

Low-level discovery items "vfs.fs.discovery" and "net.if.discovery" are supported since Zabbix agent version 2.0.
 Discovery item "system.cpu.discovery" is supported since Zabbix agent version 2.4.
 Discovery of SNMP OIDs is supported since Zabbix server and proxy version 2.0.
 Discovery using ODBC SQL queries is supported since Zabbix server and proxy version 3.0.

These macros are used in names, keys and other prototype fields where they are then substituted with the received values for creating real items, triggers, graphs or even hosts for each discovered entity. See the full list of [options](#) for using LLD macros.

When the server receives a value for a discovery item, it looks at the macro → value pairs and for each pair generates real items, triggers, and graphs, based on their prototypes. In the example with "net.if.discovery" above, the server would generate one set of items, triggers, and graphs for the loopback interface "lo", and another set for interface "eth0".

See also: [Discovered entities](#)

The following sections illustrate the process described above in detail and serve as a how-to for performing all types of discovery mentioned above. See [Creating custom LLD rules](#) for a description of the JSON format for discovery items and an example of how to implement your own file system discoverer as a Perl script.

Data limits for return values

There is no limit for low-level discovery rule JSON data if it is received directly by Zabbix server, because return values are processed without being stored in a database. There's also no limit for custom low-level discovery rules, however, if it is intended to acquire custom LLD data using a user parameter, then user parameter return value limit applies (512 KB).

If data has to go through Zabbix proxy it has to store this data in database so [database limits](#) apply, for example, 2048 bytes on a Zabbix proxy run with IBM DB2 database.

3.1 Discovery of file systems

To configure the discovery of file systems, do the following:

- Go to: *Configuration* → *Templates* or *Hosts*
- Click on *Discovery* in the row of an appropriate template/host

Templates						
<input type="checkbox"/>	TEMPLATES ▲	APPLICATIONS	ITEMS	TRIGGERS	GRAPHS	SCREENS DISCOVERY
<input type="checkbox"/>	Template1	Applications	Items	Triggers	Graphs	Screens Discovery

- Click on *Create discovery rule* in the upper right corner of the screen
- Fill in the form with the following details

The **Discovery rule** tab contains general discovery rule attributes:

Discovery rules

Description

Enabled ☒

[Add](#)

[Cancel](#)

Parameter	Description
<i>Name</i>	Name of discovery rule.
<i>Type</i>	The type of check to perform discovery; should be <i>Zabbix agent</i> or <i>Zabbix agent (active)</i> for file system discovery.
<i>Key</i>	An item with "vfs.fs.discovery" key is built into the Zabbix agent on many platforms (see supported item key list for details), and will return a JSON with the list of file systems present on the computer and their types.

Parameter	Description
<i>Update interval (in sec)</i>	This field specifies how often Zabbix performs discovery. In the beginning, when you are just setting up file system discovery, you might wish to set it to a small interval, but once you know it works you can set it to 30 minutes or more, because file systems usually do not change very often. <i>Note:</i> The update interval can only be set to '0' if custom intervals exist with a non-zero value. If set to '0', and a custom interval (flexible or scheduled) exists with a non-zero value, the item will be polled during the custom interval duration.
<i>Custom intervals</i>	You can create custom rules for checking the item: Flexible - create an exception to the <i>Update interval</i> (interval with different frequency) Scheduling - create a custom polling schedule. For detailed information see Custom intervals . Scheduling is supported since Zabbix 3.0.0.
<i>Keep lost resources period (in days)</i>	This field allows you to specify for how many days the discovered entity will be retained (won't be deleted) once its discovery status becomes "Not discovered anymore" (max 3650 days). <i>Note:</i> If set to "0", entities will be deleted immediately. Using "0" is not recommended, since just wrongly editing the filter may end up in the entity being deleted with all the historical data.
<i>Description</i>	Enter a description.
<i>Enabled</i>	If checked, the rule will be processed.

The **Filters** tab contains discovery rule filter definitions:

The screenshot shows the 'Filters' tab of a Zabbix discovery rule configuration. At the top, there are two tabs: 'Discovery rule' and 'Filters', with 'Filters' being the active tab. Below the tabs, the 'Type of calculation' is set to 'And/Or', and a preview shows 'A or (B and C) ...'. Underneath, there are two filter rules defined:

- Filter A:** LabelMacro is '{#FSTYPE}', and it matches the regular expression '@File systems for discover'.
- Filter B:** LabelMacro is '{#MACRO}', and it matches the regular expression 'regular expression'.

Below the filter rules, there is an 'Add' button. At the bottom of the configuration area, there are 'Add' and 'Cancel' buttons.

Parameter	Description
<i>Type of calculation</i>	The following options for calculating filters are available: And - all filters must be passed; Or - enough if one filter is passed; And/Or - uses <i>And</i> with different macro names and <i>Or</i> with the same macro name; Custom expression - offers the possibility to define a custom calculation of filters. The formula must include all filters in the list. Limited to 255 symbols.

Parameter	Description
<i>Filters</i>	<p>A filter can be used to generate real items, triggers, and graphs only for certain file systems. It expects a POSIX Extended Regular Expression. For instance, if you are only interested in C:, D:, and E: file systems, you could put {#FSNAME} into "Macro" and "^C ^D ^E" regular expression into "Regular expression" text fields. Filtering is also possible by file system types using {#FSTYPE} macro (e.g. "^ext ^reiserfs") and by drive types (supported only by Windows agent) using {#FSDRIVETYPE} macro (e.g., "fixed").</p> <p>You can enter a regular expression or reference a global regular expression in "Regular expression" field.</p> <p>In order to test a regular expression you can use "grep -E", for example:</p> <pre>for f in ext2 nfs reiserfs smbfs; do echo \$f \ grep -E '^ext'</pre> <p>macro on Windows is supported since Zabbix 3.0.0.</p> <p>Defining several filters is supported since Zabbix 2.4.0.</p> <p>Note that if some macro from the filter is missing in the response, the found entity will be ignored.</p>

Attention:

Zabbix database in MySQL must be created as case-sensitive if file system names that differ only by case are to be discovered correctly.

Attention:

The mistake or typo in regex used in LLD rule may cause deleting thousands of configuration elements, historical values and events for many hosts. For example, incorrect "File systems for discovery" regular expression may cause deleting thousands of items, triggers, historical values and events.

Note:

Discovery rule history is not preserved.

Once a rule is created, go to the items for that rule and press "Create prototype" to create an item prototype. Note how macro {#FSNAME} is used where a file system name is required. When the discovery rule is processed, this macro will be substituted with the discovered file system.

New application prototype

Application prototypes

- None-

Description

Note:

If an item prototype is created with a *Disabled* status, it will be added to a discovered entity, but in a disabled state.

Application prototype is an option that is specific in item prototype properties. In application prototypes you can use low-level discovery macros that, after discovery, will be substituted with real values to create applications that are specific for the discovered entity. See also [application discovery notes](#) for more specific information.

We can create several item prototypes for each file system metric we are interested in:

Item prototypes		
All templates / Template OS Linux Discovery list / Mounted filesystem discovery Item prototypes		
<input type="checkbox"/> NAME ▲	KEY	INTERVAL
<input type="checkbox"/> Free disk space on {#FSNAME}	vfs.fs.size[{#FSNAME},free]	1m
<input type="checkbox"/> Free disk space on {#FSNAME} (percentage)	vfs.fs.size[{#FSNAME},pfree]	1m
<input type="checkbox"/> Free inodes on {#FSNAME} (percentage)	vfs.fs.inode[{#FSNAME},pfree]	1m
<input type="checkbox"/> Total disk space on {#FSNAME}	vfs.fs.size[{#FSNAME},total]	1h
<input type="checkbox"/> Used disk space on {#FSNAME}	vfs.fs.size[{#FSNAME},used]	1m

Then, we create trigger prototypes in a similar way:

Trigger prototype
Dependencies

Name
Free disk space is less than 20% on volume {#FSNAME}

Expression
{Template OS
Linux:vfs.fs.size[{#FSNAME},pfree].last(0)}<20
Add

Enabled
☒

When real triggers are created from the prototypes, there may be a need to be flexible as to what constant ('20' in our example) is used for comparison in the expression. See how [user macros with context](#) can be useful to accomplish such flexibility.

You can define [dependencies](#) between trigger prototypes as well (supported since Zabbix 3.0). To do that, go to the *Dependencies* tab. A trigger prototype may depend on another trigger prototype from the same low-level discovery (LLD) rule or on a regular trigger. A trigger prototype may not depend on a trigger prototype from a different LLD rule or on a trigger created from trigger prototype. Host trigger prototype cannot depend on a trigger from a template.

3.1.1 Discovered entities

The screenshots below illustrate how discovered items, triggers, and graphs look like in the host's configuration. Discovered entities are prefixed with an orange link to a discovery rule they come from.

Items

All hosts / Zabbix server Enabled ZBX SNMP JMX IPMI Applications 13 Items 83 Triggers 44

<input type="checkbox"/>	WIZARD	NAME	TRIGGERS
<input type="checkbox"/>		Mounted filesystem discovery : Free disk space on /	
<input type="checkbox"/>		Mounted filesystem discovery : Free disk space on / (percentage)	Triggers 1
<input type="checkbox"/>		Mounted filesystem discovery : Total disk space on /	
<input type="checkbox"/>		Template OS Linux : Host name	Triggers 1
<input type="checkbox"/>		Network interface discovery : Incoming network traffic on enp0s3	

Note that discovered entities will not be created in case there are already existing entities with the same uniqueness criteria, for example, an item with the same key or graph with the same name. An error message is displayed in this case in the frontend that the low-level discovery rule could not create certain entities. The discovery rule itself, however, will not turn unsupported because some entity could not be created and had to be skipped. The discovery rule will go on creating/updating other entities.

Items (similarly, triggers and graphs) created by a low-level discovery rule cannot be manually deleted. However, they will be deleted automatically if a discovered entity (file system, interface, etc) stops being discovered (or does not pass the filter anymore). In this case the items, triggers and graphs will be deleted after the days defined in the *Keep lost resources period* field pass.

When discovered entities become 'Not discovered anymore', a lifetime indicator is displayed in the item list. Move your mouse pointer over it and a message will be displayed indicating how many days are left until the item is deleted.

1m	7d	1y	Zabbix agent	Enabled	
The item is not discovered anymore and will be deleted in 29d 23h 44m (on 2015-08-31 at 23:27).					

If entities were marked for deletion, but were not deleted at the expected time (disabled discovery rule or item host), they will be deleted the next time the discovery rule is processed.

Entities containing other entities, which are marked for deletion, will not update if changed on the discovery rule level. For example, LLD-based triggers will not update if they contain items that are marked for deletion.

Triggers

<input type="checkbox"/>	Mounted filesystem discovery: Disk space usage /

3.2 Discovery of network interfaces

Discovery of network interfaces is done in exactly the same way as discovery of file systems, except that you use the discovery rule key "net.if.discovery" instead of "vfs.fs.discovery" and use macro `{#IFNAME}` instead of `{#FSNAME}` in filter and item/trigger/graph prototypes.

Examples of item prototypes that you might wish to create based on "net.if.discovery": "net.if.in[{#IFNAME},bytes]", "net.if.out[{#IFNAME},bytes]".

See above for more information about the filter.

3.3 Discovery of CPUs and CPU cores

Discovery of CPUs and CPU cores is done in a similar fashion as network interface discovery with the exception being that the discovery rule key is "system.cpu.discovery". This discovery key returns two macros - `{#CPU.NUMBER}` and `{#CPU.STATUS}` identifying the CPU order number and status respectively. To note, a clear distinction cannot be made between actual, physical processors, cores and hyperthreads. `{#CPU.STATUS}` on Linux, UNIX and BSD systems returns the status of the processor, which can be either "online" or "offline". On Windows systems, this same macro may represent a third value - "unknown" - which indicates that a processor has been detected, but no information has been collected for it yet.

CPU discovery relies on the agent's collector process to remain consistent with the data provided by the collector and save resources on obtaining the data. This has the effect of this item key not working with the test (-t) command line flag of the agent binary, which will return a NOT_SUPPORTED status and an accompanying message indicating that the collector process has not been started.

Item prototypes that can be created based on CPU discovery include, for example, "system.cpu.util[{#CPU.NUMBER}, <type>, <mode>]" or "system.hw.cpu[{#CPU.NUMBER}, <info>]".

3.4 Discovery of SNMP OIDs

In this example, we will perform SNMP discovery on a switch. First, go to "Configuration" → "Templates".

Templates

<input type="checkbox"/>	TEMPLATES ▼	APPLICATIONS	ITEMS	TRIGGERS	GRAPHS	SCREENS	DISCOVERY
<input type="checkbox"/>	Template SNMP Interfaces	Applications 1	Items 1	Triggers	Graphs	Screens	Discovery 1

To edit discovery rules for a template, click on the link in the "Discovery" column.

Then, press "Create rule" and fill the form with the details in the screenshot below.

Unlike file system and network interface discovery, the item does not necessarily have to have "snmp.discovery" key - item type of SNMP agent is sufficient.

The OIDs to discover are defined in SNMP OID field in the following format: `discovery[{#MACRO1}, oid1, {#MACRO2}, oid2, ...,]`

where `{#MACRO1}`, `{#MACRO2}` ... are valid lld macro names and `oid1`, `oid2`... are OIDs capable of generating meaningful values for these macros. A built-in macro `{#SNMPINDEX}` containing index of the discovered OID is applied to discovered entities. The discovered entities are grouped by `{#SNMPINDEX}` macro value.

To understand what we mean, let us perform few snmpwalks on our switch:

```
$ snmpwalk -v 2c -c public 192.168.1.1 IF-MIB::ifDescr
IF-MIB::ifDescr.1 = STRING: WAN
IF-MIB::ifDescr.2 = STRING: LAN1
IF-MIB::ifDescr.3 = STRING: LAN2
```

```
$ snmpwalk -v 2c -c public 192.168.1.1 IF-MIB::ifPhysAddress
IF-MIB::ifPhysAddress.1 = STRING: 8:0:27:90:7a:75
IF-MIB::ifPhysAddress.2 = STRING: 8:0:27:90:7a:76
IF-MIB::ifPhysAddress.3 = STRING: 8:0:27:2b:af:9e
```

And set SNMP OID to: `discovery[{#IFDESCR}, ifDescr, {#IFPHYSADDRESS}, ifPhysAddress]`

Now this rule will discover entities with `{#IFDESCR}` macros set to **WAN**, **LAN1** and **LAN2**, `{#IFPHYSADDRESS}` macros set to **8:0:27:90:7a:75**, **8:0:27:90:7a:76**, and **8:0:27:2b:af:9e**, `{#SNMPINDEX}` macros set to the discovered OIDs indexes **1**, **2** and **3**:

```
{
  "data": [
    {
      "{#SNMPINDEX}": "1",
      "{#IFDESCR}": "WAN",
      "{#IFPHYSADDRESS}": "8:0:27:90:7a:75"
    },
    {
      "{#SNMPINDEX}": "2",
      "{#IFDESCR}": "LAN1",
      "{#IFPHYSADDRESS}": "8:0:27:90:7a:76"
    },
    {
      "{#SNMPINDEX}": "3",
      "{#IFDESCR}": "LAN2",
      "{#IFPHYSADDRESS}": "8:0:27:2b:af:9e"
    }
  ]
}
```

If an entity does not have the specified OID, then the corresponding macro will be omitted for this entity. For example if we have the following data:

```
ifDescr.1 "Interface #1"
ifDescr.2 "Interface #2"
ifDescr.4 "Interface #4"
```

```
ifAlias.1 "eth0"
ifAlias.2 "eth1"
ifAlias.3 "eth2"
ifAlias.5 "eth4"
```

Then in this case SNMP discovery `discovery[{#IFDESCR}, ifDescr, {#IFALIAS}, ifAlias]` will return the following structure:

```
{
  "data": [
    {
      "{#SNMPINDEX}": 1,
      "{#IFDESCR}": "Interface #1",
      "{#IFALIAS}": "eth0"
    },
    {
      "{#SNMPINDEX}": 2,
      "{#IFDESCR}": "Interface #2",
      "{#IFALIAS}": "eth1"
    },
    {
      "{#SNMPINDEX}": 3,

```

```

    "{#IFALIAS}": "eth2"
  },
  {
    "{#SNMPINDEX}": 4,
    "{#IFDESCR}": "Interface #4"
  },
  {
    "{#SNMPINDEX}": 5,
    "{#IFALIAS}": "eth4"
  }
]
}

```

<input type="checkbox"/>	Network interfaces : Traffic on interface 4	900	200

3.5 Discovery using ODBC SQL queries

This type of discovery is done using SQL queries, whose results get automatically transformed into a JSON object suitable for low-level discovery. SQL queries are performed using items of type "Database monitor". Therefore, most of the instructions on [ODBC monitoring](#) page apply in order to get a working "Database monitor" discovery rule, the only difference being that

"db.odbc.discovery[<description>,<dsn>]" key should be used instead of "db.odbc.select[<description>,<dsn>]".

As a practical example to illustrate how the SQL query is transformed into JSON, let us consider low-level discovery of Zabbix proxies by performing an ODBC query on Zabbix database. This is useful for automatic creation of "zabbix[proxy,<name>,lastaccess]" **internal items** to monitor which proxies are alive.

Let us start with discovery rule configuration:

Discovery rule

Filters

Name

Proxy discovery

Type

Database monitor

Key

db.odbc.discovery[proxies,{SDSN}]

User name

Password

SQL query

SELECT h1.host, COUNT(h2.host) AS count FROM hosts h1 LEFT JOIN hosts h2 ON h1.hostid = h2.proxy_hostid WHERE h1.status IN (5, 6) GROUP BY h1.host;

Update interval (in sec)

3600

Custom intervals

TYPE	INTERVAL	PERIOD
Flexible	Scheduling	50
Add		

Keep lost resources period (in days)

30

Description

Enabled

☒

Add

Cancel

Here, the following direct query on Zabbix database is used to select all Zabbix proxies, together with the number of hosts they are monitoring. The number of hosts can be used, for instance, to filter out empty proxies:

```
mysql> SELECT h1.host, COUNT(h2.host) AS count FROM hosts h1 LEFT JOIN hosts h2 ON h1.hostid = h2.proxy_ho
+-----+-----+
| host   | count |
+-----+-----+
| Japan 1 |     5 |
| Japan 2 |    12 |
| Latvia  |     3 |
+-----+-----+
3 rows in set (0.01 sec)
```

By the internal workings of "db.odbc.discovery[]" item, the result of this query gets automatically transformed into the following JSON:

```
{
  "data": [
    {
      "{#HOST}": "Japan 1",
      "{#COUNT}": "5"
    },
    {
      "{#HOST}": "Japan 2",
      "{#COUNT}": "12"
    },
    {
      "{#HOST}": "Latvia",
      "{#COUNT}": "3"
    }
  ]
}
```

It can be seen that column names become macro names and selected rows become the values of these macros.

Note:

If it is not obvious how a column name would be transformed into a macro name, it is suggested to use column aliases like "COUNT(h2.host) AS count" in the example above.

In case a column name cannot be converted into a valid macro name, the discovery rule becomes not supported, with the error message detailing the offending column number. If additional help is desired, the obtained column names are provided under DebugLevel=4 in Zabbix server log file:

```
$ grep db.odbc.discovery /tmp/zabbix_server.log
...
23876:20150114:153410.856 In db_odbc_discovery() query:'SELECT h1.host, COUNT(h2.host) FROM hosts h1 I
23876:20150114:153410.860 db_odbc_discovery() column[1]:'host'
23876:20150114:153410.860 db_odbc_discovery() column[2]:'COUNT(h2.host) '
23876:20150114:153410.860 End of db_odbc_discovery():NOTSUPPORTED
23876:20150114:153410.860 Item [Zabbix server:db.odbc.discovery[proxies,{ $DSN}]] error: Cannot convert
```

Now that we understand how a SQL query is transformed into a JSON object, we can use {#HOST} macro in item prototypes:

Name

Type

Key

Type of information

Data type

Units

Use custom multiplier ☐

Update interval (in sec)

Custom intervals

TYPE	INTERVAL	PERIOD
Flexible	Scheduling	50
Add		

History storage period (in days)

Trend storage period (in days)

Store value

Show value [show value mappings](#)

Once discovery is performed, an item will be created for each proxy:

Items			
All hosts / Zabbix server Enabled ZBX SNMP JMX IPMI Applications Items 3 Triggers 3 Graphs			
Filter			
WIZARD	NAME	TRIGGERS	KEY
<input type="checkbox"/>	Proxy discovery: Last access time of proxy Japan 1	Triggers 1	zabbix[proxy,Japan 1,lastaccess]
<input type="checkbox"/>	Proxy discovery: Last access time of proxy Japan 2	Triggers 1	zabbix[proxy,Japan 2,lastaccess]
<input type="checkbox"/>	Proxy discovery: Last access time of proxy Latvia	Triggers 1	zabbix[proxy,Latvia,lastaccess]

3.6 Discovery of Windows services

Windows service discovery is done in the same way as discovery of file systems. The key to use in the discovery rule is "service.discovery" and the following macros are supported for use in the filter and item/trigger/graph prototypes:

{#SERVICE.NAME}
 {#SERVICE.DISPLAYNAME}

```

{#SERVICE.DESRIPTION}
{#SERVICE.STATE}
{#SERVICE.STATENAME}
{#SERVICE.PATH}
{#SERVICE.USER}
{#SERVICE.STARTUP}
{#SERVICE.STARTUPNAME}

```

Based on Windows service discovery you may create an item prototype like "service.info[{#SERVICE.NAME},<param>]", where *param* accepts the following values: *state*, *displayname*, *path*, *user*, *startup* or *description*. For example, to acquire the display name of a service you should use a "service.info[{#SERVICE.NAME},displayname]" item. If *param* value is not specified ("service.info[{#SERVICE.NAME}]"), the default parameter *state* is used.

{#SERVICE.STATE} and {#SERVICE.STATENAME} macros return the same content, however, {#SERVICE.STATE} returns a numerical value (0-7), while {#SERVICE.STATENAME} returns text (*running*, *paused*, *start pending*, *pause pending*, *continue pending*, *stop pending*, *stopped* or *unknown*). The same applies to {#SERVICE.STARTUP} and {#SERVICE.STARTUPNAME}, where one returns a numerical value (0-4) while the other - text (*automatic*, *automatic delayed*, *manual*, *disabled*, *unknown*).

3.7 Creating custom LLD rules

It is also possible to create a completely custom LLD rule, discovering any type of entities - for example, databases on a database server.

To do so, a custom item should be created that returns JSON, specifying found objects and optionally - some properties of them. The amount of macros per entity is not limited - while the built-in discovery rules return either one or two macros (for example, two for filesystem discovery), it is possible to return more.

The required JSON format is best illustrated with an example. Suppose we are running an old Zabbix 1.8 agent (one that does not support "vfs.fs.discovery"), but we still need to discover file systems. Here is a simple Perl script for Linux that discovers mounted file systems and outputs JSON, which includes both file system name and type. One way to use it would be as a UserParameter with key "vfs.fs.discovery_perl":

```

###!/usr/bin/perl

$first = 1;

print "{\n";
print "\t\"data\": [\n\n";

for (`cat /proc/mounts`)
{
    ($fsname, $fstype) = m/\S+ (\S+) (\S+)/;

    print "\t,\n" if not $first;
    $first = 0;

    print "\t{\n";
    print "\t\t\"{#FSNAME}\" : \"$fsname\",\n";
    print "\t\t\"{#FSTYPE}\" : \"$fstype\",\n";
    print "\t}\n";
}

print "\n\t]\n";
print "}\n";

```

Attention:

Allowed symbols for LLD macro names are **0-9** , **A-Z** , **_** , **.**

Lowercase letters are not supported in the names.

An example of its output (reformatted for clarity) is shown below. JSON for custom discovery checks has to follow the same format.

```

{
  "data": [

    { "{#FSNAME}": "/",           "{#FSTYPE}": "rootfs" },
    { "{#FSNAME}": "/sys",       "{#FSTYPE}": "sysfs"   },

```

```

{ "#{FSNAME}":"/proc",           "#{FSTYPE}":"proc"      },
{ "#{FSNAME}":"/dev",           "#{FSTYPE}":"devtmpfs"  },
{ "#{FSNAME}":"/dev/pts",       "#{FSTYPE}":"devpts"    },
{ "#{FSNAME}":"/lib/init/rw",   "#{FSTYPE}":"tmpfs"     },
{ "#{FSNAME}":"/dev/shm",       "#{FSTYPE}":"tmpfs"     },
{ "#{FSNAME}":"/home",         "#{FSTYPE}":"ext3"      },
{ "#{FSNAME}":"/tmp",           "#{FSTYPE}":"ext3"      },
{ "#{FSNAME}":"/usr",           "#{FSTYPE}":"ext3"      },
{ "#{FSNAME}":"/var",           "#{FSTYPE}":"ext3"      },
{ "#{FSNAME}":"/sys/fs/fuse/connections", "#{FSTYPE}":"fusectl"  }

]
}

```

Then, in the discovery rule's "Filter" field, we could specify "#{FSTYPE}" as a macro and "rootfs|ext3" as a regular expression.

Note:

You don't have to use macro names FSNAME/FSTYPE with custom LLD rules, you are free to use whatever names you like.

Note that, if using a user parameter, the return value is limited to 512 KB. For more details, see [data limits for LLD return values](#).

3.8 Using LLD macros in user macro contexts

User macros **with context** can be used to accomplish more flexible thresholds in trigger expressions. Different thresholds may be defined on user macro level and then used in trigger constants depending on the discovered context. Discovered context appears when the **low-level discovery macros** used in the macros are resolved to real values.

To illustrate we can use data from the example above and assume that the following file systems will be discovered: /, /home, /tmp, /usr, /var.

We may define a free-disk-space trigger prototype for a host, where the threshold is expressed by a user macro with context:

```
{host:vfs.fs.size[#{FSNAME},pfree].last()}<{$LOW_SPACE_LIMIT:"#{FSNAME}"}
```

Then add user macros:

- {\$LOW_SPACE_LIMIT} **10**
- {\$LOW_SPACE_LIMIT:/home} **20**
- {\$LOW_SPACE_LIMIT:/tmp} **50**

Now, once the file systems are discovered, events will be generated if /, /usr and /var filesystems have less than **10%** of free disk space, the /home filesystem - less than **20%** of free disk space or the /tmp filesystem - less than **50%** of free disk space.

Attention:

LLD macros are not supported inside of user macro contexts in **trigger function parameters**.

Notes on low-level discovery

Application discovery

Application prototypes support LLD macros.

One application prototype can be used by several item prototypes of the same discovery rule.

If created application prototype is not used by any item prototype it gets removed from 'Application prototypes' list automatically.

Like other discovered entities applications follow the lifetime defined in discovery rule ('keep lost resources period' setting) - they are removed after not being discovered for the specified number of days.

If an application is not discovered anymore all discovered items are automatically removed from it, even if the application itself is not yet removed because of the 'lost resources period' setting.

Application prototypes defined by one discovery rule can't discover the same application. In this situation only the first prototype discovery will succeed, the rest will report appropriate LLD error. Only application prototypes defined in different discovery rules can result in discovering the same application.

15. Distributed monitoring

Overview Zabbix provides an effective and reliable way of monitoring a distributed IT infrastructure using Zabbix proxies. Proxies can be used to collect data locally on behalf of a centralized Zabbix server and then report the data to the server.

Proxy features

When making a choice of using/not using a proxy, several considerations must be taken into account.

	Proxy
Lightweight	Yes
GUI	No
Works independently	Yes
Easy maintenance	Yes
Automatic DB creation ¹	Yes
Local administration	No
Ready for embedded hardware	Yes
One way TCP connections	Yes
Centralised configuration	Yes
Generates notifications	No

Note:
[1] Automatic DB creation feature only works with SQLite. Other databases require a manual setup.

1 Proxies

Overview

A Zabbix proxy can collect performance and availability data on behalf of the Zabbix server. This way, a proxy can take on itself some of the load of collecting data and offload the Zabbix server.

Also, using a proxy is the easiest way of implementing centralized and distributed monitoring, when all agents and proxies report to one Zabbix server and all data is collected centrally.

A Zabbix proxy can be used to:

- Monitor remote locations
- Monitor locations having unreliable communications
- Offload the Zabbix server when monitoring thousands of devices
- Simplify the maintenance of distributed monitoring

The proxy requires only one TCP connection to the Zabbix server. This way it is easier to get around a firewall as you only need to configure one firewall rule.

Attention:

Zabbix proxy must use a separate database. Pointing it to the Zabbix server database will break the configuration.

All data collected by the proxy is stored locally before transmitting it over to the server. This way no data is lost due to any temporary communication problems with the server. The *ProxyLocalBuffer* and *ProxyOfflineBuffer* parameters in the **proxy configuration file** control for how long the data are kept locally.

Attention:

It may happen that a proxy, which receives the latest configuration changes directly from Zabbix server database, has a more up-to-date configuration than Zabbix server whose configuration may not be updated as fast due to the value of **CacheUpdateFrequency**. As a result, proxy may start gathering data and send them to Zabbix server that ignores these data.

Zabbix proxy is a data collector. It does not calculate triggers, process events or send alerts. For an overview of what proxy functionality is, review the following table:

Function	Supported by proxy
Items	
<i>Zabbix agent checks</i>	Yes
<i>Zabbix agent checks (active)</i>	Yes ¹
<i>Simple checks</i>	Yes
<i>Trapper items</i>	Yes
<i>SNMP checks</i>	Yes
<i>SNMP traps</i>	Yes
<i>IPMI checks</i>	Yes
<i>JMX checks</i>	Yes
<i>Log file monitoring</i>	Yes
<i>Internal checks</i>	Yes
<i>SSH checks</i>	Yes
<i>Telnet checks</i>	Yes
<i>External checks</i>	Yes
Built-in web monitoring	Yes
Network discovery	Yes
Low-level discovery	Yes
Calculating triggers	<i>No</i>
Processing events	<i>No</i>
Sending alerts	<i>No</i>
Remote commands	<i>No</i>

Note:

[1] To make sure that an agent asks the proxy (and not the server) for active checks, the proxy must be listed in the **ServerActive** parameter in the agent configuration file.

Configuration

Once you have **installed** and **configured** a proxy, it is time to configure it in the Zabbix frontend.

Adding proxies

To configure a proxy in Zabbix frontend:

- Go to: *Administration* → *Proxies*
- Click on *Create proxy*

Proxy

Encryption

Proxy name

Remote proxy

Proxy mode

Active

Hosts

Proxy hosts

Other hosts

Me

procurve.zabbix.lan
Zabbix server

Description

Add

Cancel

Parameter	Description
<i>Proxy name</i>	Enter the proxy name. It must be the same name as in the <i>Hostname</i> parameter in the proxy configuration file.
<i>Proxy mode</i>	Select the proxy mode. Active - the proxy will connect to the Zabbix server and request configuration data Passive - Zabbix server connects to the proxy <i>Note</i> that without encrypted communications (sensitive) proxy configuration data may become available to parties having access to the Zabbix server trapper port when using an active proxy. This is possible because anyone may pretend to be an active proxy and request configuration data if authentication does not take place.
<i>Hosts</i>	Add hosts to be monitored by the proxy.
<i>Description</i>	Enter the proxy description.

The **Encryption** tab allows you to require encrypted connections with the proxy.

Parameter	Description
<i>Connections to proxy</i>	How the server connects to the passive proxy: no encryption (default), using PSK (pre-shared key) or certificate.
<i>Connections from proxy</i>	Select what type of connections are allowed from the active proxy. Several connection types can be selected at the same time (useful for testing and switching to other connection type). Default is "No encryption".

Parameter	Description
<i>Issuer</i>	Allowed issuer of certificate. Certificate is first validated with CA (certificate authority). If it is valid, signed by the CA, then the <i>Issuer</i> field can be used to further restrict allowed CA. This field is optional, intended to use if your Zabbix installation uses certificates from multiple CAs.
<i>Subject</i>	Allowed subject of certificate. Certificate is first validated with CA. If it is valid, signed by the CA, then the <i>Subject</i> field can be used to allow only one value of <i>Subject</i> string. If this field is empty then any valid certificate signed by the configured CA is accepted.
<i>PSK identity</i>	Pre-shared key identity string. Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.
<i>PSK</i>	Pre-shared key (hex-string). Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library. Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952

Host configuration

You can specify that an individual host should be monitored by a proxy in the [host configuration](#) form, using the *Monitored by proxy* field.

Host [mass update](#) is another way of specifying that hosts should be monitored by a proxy.

16. Encryption

Overview Zabbix supports encrypted communications between Zabbix server, Zabbix proxy, Zabbix agent, `zabbix_sender` and `zabbix_get` utilities using Transport Layer Security (TLS) protocol v.1.2. Encryption is supported starting with Zabbix 3.0. Certificate-based and pre-shared key-based encryption is supported.

Encryption is optional and configurable for individual components (e.g. some proxies and agents can be configured to use certificate-based encryption with the server, while others can use pre-shared key-based encryption, and yet others continue with unencrypted communications as before).

Server (proxy) can use different encryption configurations for different hosts.

Zabbix daemon programs use one listening port for encrypted and unencrypted incoming connections. Adding an encryption does not require opening new ports on firewalls.

Limitations

- Private keys are stored in plain text in files readable by Zabbix components during startup.
- Pre-shared keys are entered in Zabbix frontend and stored in Zabbix database in plain text.
- Built-in encryption does not protect communications:
 - * between web server running Zabbix frontend and user web browser,
 - * between Zabbix frontend and Zabbix server,
 - * between Zabbix server (proxy) and Zabbix database.
- * Currently each encrypted connection opens with a full TLS handshake, no session caching and tickets are
- * Adding encryption increases time of checks and actions, depending on network latency.\\ For example, if
- * Encryption is not supported by `[/manual/discovery/network_discovery|network discovery]`. Zabbix agent c

Compiling Zabbix with encryption support To support encryption Zabbix must be compiled and linked with one of four crypto libraries:

- *GnuTLS* (from version 3.1.18)
- *OpenSSL* (versions 1.0.1, 1.0.2, 1.1.0). *OpenSSL* 1.1.1 is supported from Zabbix version 3.0.23.
- *LibreSSL* (tested with versions 2.7.4, 2.8.2) is supported from Zabbix version 3.0.26. *LibreSSL* 2.6.x is not supported. *LibreSSL* is supported as a compatible replacement of *OpenSSL*, the new `tls_*` *LibreSSL*-specific API functions are not used. Zabbix components compiled with *LibreSSL* will not be able to use PSK, only certificates can be used.
- *mbed TLS* (formerly *PolarSSL*)(version 1.3.9 and later 1.3.x). *mbed TLS* 2.x is not currently supported, it is not a drop-in replacement for 1.3 branch, Zabbix will not compile with *mbed TLS* 2.x.

The library is selected by specifying an option to "configure" script:

- `--with-gnutls [=DIR]`
- `--with-openssl [=DIR]` (also used for *LibreSSL*)
- `--with-mbedtls [=DIR]`

For example, to configure the sources for server and agent with *OpenSSL* you may use something like:

```
./configure --enable-server --enable-agent --with-mysql --enable-ipv6 --with-net-snmp --with-libcurl --with-libxml2 --with-openssl
```

Different Zabbix components may be compiled with different crypto libraries (e.g. a server with *OpenSSL*, an agent with *GnuTLS*).

In our tests *OpenSSL* was the fastest, followed by *GnuTLS*.

Attention:

If you plan to use pre-shared keys (PSK) consider using *GnuTLS*, newer *OpenSSL* (from 1.1.0) or *mbed TLS* libraries in Zabbix components using PSKs. These libraries support PSK ciphersuites with [Perfect Forward Secrecy](#). Older *OpenSSL* libraries (versions 1.0.1, 1.0.2c) do support PSKs but available PSK ciphersuites do not provide Perfect Forward Secrecy.

Connection encryption management Connections in Zabbix can use:

- no encryption (default)
- **RSA certificate-based encryption**
- **PSK-based encryption**

There are two important parameters used to specify encryption for connections between Zabbix components:

- `TLSCConnect`
- `TLSAccept`

`TLSCConnect` specifies what encryption to use for outgoing connections and can take one of 3 values (unencrypted, PSK, certificate). `TLSCConnect` is used in configuration files for Zabbix proxy (in active mode, specifies only connections to server) and Zabbix agentd (for active checks). In Zabbix frontend the `TLSCConnect` equivalent is *Connections to host* field in *Configuration→Hosts→<some host>→Encryption* tab and *Connections to proxy* field in *Administration→Proxies→<some proxy>→Encryption* tab. If the configured encryption type for connection fails, no other encryption types will be tried.

`TLSAccept` specifies what types of connections are allowed for incoming connections. Connection types are: unencrypted, PSK, certificate. One or more values can be specified. `TLSAccept` is used in configuration files for Zabbix proxy (in passive mode, specifies only connections from server) and Zabbix agentd (for passive checks). In Zabbix frontend the `TLSAccept` equivalent is *Connections from host* field in *Configuration→Hosts→<some host>→Encryption* tab and *Connections from proxy* field in *Administration→Proxies→<some proxy>→Encryption* tab.

Normally you configure only one type of encryption for incoming encryptions. But you may want to switch encryption type, e.g. from unencrypted to certificate-based with minimum downtime and rollback possibility.

To achieve this you can set `TLSAccept=unencrypted,cert` in agentd configuration file and restart Zabbix agent.

Then you can test connection with `zabbix_get` to the agent using certificate. If it works, you can reconfigure encryption for that agent in Zabbix frontend in *Configuration→Hosts→<some host>→Encryption* tab by setting *Connections to host* to "Certificate". When server configuration cache gets updated (and proxy configuration is updated if the host is monitored by proxy) then connections to that agent will be encrypted.

If everything works as expected you can set `TLSAccept=cert` in agent configuration file and restart Zabbix agent.

Now the agent will be accepting only encrypted certificate-based connections. Unencrypted and PSK-based connections will be rejected.

In a similar way it works on server and proxy. If in Zabbix frontend in host configuration *Connections from host* is set to "Certificate" then only certificate-based encrypted connections will be accepted from agent (active checks) and `zabbix_sender` (trapper items).

Most likely you will configure incoming and outgoing connections to use the same encryption type or no encryption at all. But technically it is possible to configure it asymmetrically, e.g. certificate-based encryption for incoming and PSK-based for outgoing connections.

For overview, encryption configuration for each host is displayed in Zabbix frontend *Configuration→Hosts* on the right side, in column *AGENT ENCRYPTION*. Configuration display examples:

Example	Connections TO host	Allowed connections FROM host	Rejected connections FROM host
NONE	Unencrypted	Unencrypted	Encrypted certificate and PSK-based
	Encrypted, certificate-based	Encrypted certificate-based	Unencrypted and PSK-based
	Encrypted, PSK-based	Encrypted PSK-based	Unencrypted and certificate-based
	Encrypted, PSK-based	Unencrypted and PSK-based encrypted	Certificate-based
	Encrypted, certificate-based	Unencrypted, PSK or certificate-based encrypted	-

Attention:

Default is unencrypted connections. Encryption must be configured for each host and proxy individually.

zabbix_get and zabbix_sender with encryption See man-pages [zabbix_get](#) and [zabbix_sender](#) for using them with encryption.

Ciphersuites Ciphersuites are configured internally during Zabbix startup and depend on crypto library, currently they are not user-configurable.

Configured ciphersuites by library type in order from higher to lower priority:

Library	Certificate ciphersuites	PSK ciphersuites
<i>mbed TLS (PolarSSL) 1.3.9</i>	TLS-ECDHE-RSA-WITH-AES-128-GCM-SHA256 TLS-ECDHE-RSA-WITH-AES-128-CBC-SHA256 TLS-ECDHE-RSA-WITH-AES-128-CBC-SHA TLS-RSA-WITH-AES-128-GCM-SHA256 TLS-RSA-WITH-AES-128-CBC-SHA256 TLS-RSA-WITH-AES-128-CBC-SHA	TLS-ECDHE-PSK-WITH-AES-128-CBC-SHA256 TLS-ECDHE-PSK-WITH-AES-128-CBC-SHA TLS-PSK-WITH-AES-128-GCM-SHA256 TLS-PSK-WITH-AES-128-CBC-SHA256 TLS-PSK-WITH-AES-128-CBC-SHA

1 Using certificates

Overview

Zabbix can use RSA certificates in PEM format, signed by a public or in-house certificate authority (CA). Certificate verification is done against a pre-configured CA certificate. Optionally certificate revocation lists (CRL) can be used. Each Zabbix component can have only one certificate configured.

For more information how to set up and operate internal CA, how to generate certificate requests and sign them, how to revoke certificates you can find numerous online how-tos, for example, [OpenSSL PKI Tutorial v1.1](#).

Carefully consider and test your certificate extensions - see [Limitations on using X.509 v3 certificate extensions](#).

Certificate configuration parameters

Parameter	Mandatory	Description
<i>TLSCAFile</i>	*	Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification. In case of certificate chain with several members they must be ordered: lower level CA certificates first followed by certificates of higher level CA(s). Certificates from multiple CA(s) can be included in a single file.
<i>TLSCRLFile</i>		Full pathname of a file containing Certificate Revocation Lists. See notes in Certificate Revocation Lists (CRL) .
<i>TLSCertFile</i>	*	Full pathname of a file containing certificate (certificate chain). In case of certificate chain with several members they must be ordered: server, proxy, or agent certificate first, followed by lower level CA certificates then certificates of higher level CA(s).
<i>TLSKeyFile</i>	*	Full pathname of a file containing private key. Set access rights to this file - it must be readable only by Zabbix user.
<i>TLSServerCertIssuer</i>		Allowed server certificate issuer.

Parameter	Mandatory	Description
<i>TLSServerCertSubject</i>		Allowed server certificate subject.

Configuring certificate on Zabbix server

1. In order to verify peer certificates, Zabbix server must have access to file with their top-level self-signed root CA certificates. For example, if we expect certificates from two independent root CAs, we can put their certificates into file `/home/zabbix/zabbix_ca_file` like this:

Certificate:

Data:

Version: 3 (0x2)

Serial Number: 1 (0x1)

Signature Algorithm: sha1WithRSAEncryption

Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA

...

Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA

Subject Public Key Info:

Public Key Algorithm: rsaEncryption

Public-Key: (2048 bit)

...

X509v3 extensions:

X509v3 Key Usage: critical

Certificate Sign, CRL Sign

X509v3 Basic Constraints: critical

CA:TRUE

...

-----BEGIN CERTIFICATE-----

MIID2jCCAsKgAwIBAgIBATANBgkqhkiG9w0BAQUFADB+MRMwEQYKCZImiZPyLGGQ

....

9wEzdN8uTrqoyU78gi12npLj08LegRKjb5hFTVm0

-----END CERTIFICATE-----

Certificate:

Data:

Version: 3 (0x2)

Serial Number: 1 (0x1)

Signature Algorithm: sha1WithRSAEncryption

Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root2 CA

...

Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root2 CA

Subject Public Key Info:

Public Key Algorithm: rsaEncryption

Public-Key: (2048 bit)

....

X509v3 extensions:

X509v3 Key Usage: critical

Certificate Sign, CRL Sign

X509v3 Basic Constraints: critical

CA:TRUE

....

-----BEGIN CERTIFICATE-----

...

vdGNYoSfvu41GQAR5Vj5FnRJRzv5XQ0Z3B6894GY1zY=

-----END CERTIFICATE-----

2. Put Zabbix server certificate chain into file, for example, `/home/zabbix/zabbix_server.crt`:

Certificate:

Data:

Version: 3 (0x2)

Serial Number: 1 (0x1)

Signature Algorithm: sha1WithRSAEncryption

Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA

```

...
Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Zabbix server
Subject Public Key Info:
    Public Key Algorithm: rsaEncryption
    Public-Key: (2048 bit)
...
X509v3 extensions:
    X509v3 Key Usage: critical
        Digital Signature, Key Encipherment
    X509v3 Basic Constraints:
        CA:FALSE
...
-----BEGIN CERTIFICATE-----
MIIECDCCAvCgAwIBAgIBATANBgkqhkiG9w0BAQUFADCBgTETMBEGCgmSJomT8ixk
...
h02u1GHIy46GI+xfR3LsPwFKlkTaaLaL/6aaoQ==
-----END CERTIFICATE-----
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 2 (0x2)
    Signature Algorithm: sha1WithRSAEncryption
    Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
    ...
    Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
    Subject Public Key Info:
        Public Key Algorithm: rsaEncryption
        Public-Key: (2048 bit)
    ...
    X509v3 extensions:
        X509v3 Key Usage: critical
            Certificate Sign, CRL Sign
        X509v3 Basic Constraints: critical
            CA:TRUE, pathlen:0
    ...
-----BEGIN CERTIFICATE-----
MIID4TCCAsmgAwIBAgIBAJANBgkqhkiG9w0BAQUFADB+MRMwEQYKCZImiZPyLGGQB
...
dyCeWnvL7u5sd6ffo8iRny0QzbHKmQt/wUtcVIvWXdmIFJMOHw==
-----END CERTIFICATE-----

```

Here the first is Zabbix server certificate, followed by intermediate CA certificate.

3. Put Zabbix server private key into file, for example, /home/zabbix/zabbix_server.key:

```

-----BEGIN PRIVATE KEY-----
MIIEWwAIBADANBgkqhkiG9w0BAQEFAASCBKowggSmAgEAAoIBAQC9tIXIJoVnNXDl
...
IJLkhbybBYEf47MLhffWa7XvZTY=
-----END PRIVATE KEY-----

```

4. Edit TLS parameters in Zabbix server configuration file like this:

```

TLSCAFile=/home/zabbix/zabbix_ca_file
TLSCertFile=/home/zabbix/zabbix_server.crt
TLSKeyFile=/home/zabbix/zabbix_server.key

```

Configuring certificate-based encryption for Zabbix proxy

1. Prepare files with top-level CA certificates, proxy certificate (chain) and private key as described in [Configuring certificate on Zabbix server](#). Edit parameters TLSCAFile, TLSCertFile, TLSKeyFile in proxy configuration accordingly.

2. For active proxy edit TLSConnect parameter:

```

TLSConnect=cert

```

For passive proxy edit TLSAccept parameter:

TLSAccept=cert

3. Now you have a minimal certificate-based proxy configuration. You may prefer to improve proxy security by setting TLSServerCertIssuer and TLSServerCertSubject parameters (see [Restricting allowed certificate Issuer and Subject](#)).

4. In final proxy configuration file TLS parameters may look like:

```
TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSCertFile=/home/zabbix/zabbix_proxy.crt
TLSKeyFile=/home/zabbix/zabbix_proxy.key
```

5. Configure encryption for this proxy in Zabbix frontend:

- Go to: *Administration* → *Proxies*
- Select proxy and click on **Encryption** tab

In examples below Issuer and Subject fields are filled in - see [Restricting allowed certificate Issuer and Subject](#) why and how to use these fields.

For active proxy

The screenshot shows the 'Encryption' tab in the Zabbix frontend for an active proxy. The 'Connections to proxy' section has three buttons: 'No encryption', 'PSK', and 'Certificate', with 'Certificate' being the active selection. The 'Connections from proxy' section has three checkboxes: 'No encryption' (unchecked), 'PSK' (unchecked), and 'Certificate' (checked). The 'Issuer' field contains the text 'CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com'. The 'Subject' field contains the text 'CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com'. At the bottom, there are four buttons: 'Update', 'Clone', 'Delete', and 'Cancel'.

For passive proxy

The screenshot shows the 'Encryption' tab in the Zabbix frontend for a passive proxy. The 'Connections to proxy' section has three buttons: 'No encryption', 'PSK', and 'Certificate', with 'Certificate' being the active selection. The 'Connections from proxy' section has three checkboxes: 'No encryption' (checked), 'PSK' (unchecked), and 'Certificate' (unchecked). The 'Issuer' field contains the text 'CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com'. The 'Subject' field contains the text 'CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com'. At the bottom, there are four buttons: 'Update', 'Clone', 'Delete', and 'Cancel'.

Configuring certificate-based encryption for Zabbix agent

1. Prepare files with top-level CA certificates, agent certificate (chain) and private key as described in [Configuring certificate on Zabbix server](#). Edit parameters `TLSCAFile`, `TLSCertFile`, `TLSKeyFile` in agent configuration accordingly.

2. For active checks edit `TLSConnect` parameter:

```
TLSConnect=cert
```

For passive checks edit `TLSAccept` parameter:

```
TLSAccept=cert
```

3. Now you have a minimal certificate-based agent configuration. You may prefer to improve agent security by setting `TLSServerCertIssuer` and `TLSServerCertSubject` parameters. (see [Restricting allowed certificate Issuer and Subject](#)).

4. In final agent configuration file TLS parameters may look like:

```
TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSCertFile=/home/zabbix/zabbix_agentd.crt
TLSKeyFile=/home/zabbix/zabbix_agentd.key
```

(Example assumes that host is monitored via proxy, hence proxy certificate Subject.)

5. Configure encryption for this agent in Zabbix frontend:

- Go to: *Configuration* → *Hosts*
- Select host and click on **Encryption** tab

In example below Issuer and Subject fields are filled in - see [Restricting allowed certificate Issuer and Subject](#) why and how to use these fields.

The screenshot shows the 'Encryption' tab in the Zabbix frontend. At the top, there are tabs for 'Host', 'Templates', 'IPMI', 'Macros', 'Host inventory', and 'Encryption'. Below the tabs, there are three sections: 'Connections to host' with buttons for 'No encryption', 'PSK', and 'Certificate' (which is selected); 'Connections from host' with checkboxes for 'No encryption', 'PSK', and 'Certificate' (which is checked); and 'Issuer' and 'Subject' text input fields. The 'Issuer' field contains 'CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com' and the 'Subject' field contains 'CN=www01,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com'. At the bottom, there are five buttons: 'Update', 'Clone', 'Full clone', 'Delete', and 'Cancel'.

Restricting allowed certificate Issuer and Subject

When two Zabbix components (e.g. server and agent) establish a TLS connection they both check each others certificates. If a peer certificate is signed by a trusted CA (with pre-configured top-level certificate in `TLSCAFile`), is valid, has not expired and passes some other checks then communication can proceed. Certificate issuer and subject are not checked in this simplest case.

Here is a risk - anybody with a valid certificate signed by a trusted CA can impersonate anybody else (e.g. a host certificate can be used to impersonate server). This may be acceptable in small environments where certificates are signed by a dedicated in-house CA and risk of impersonating is low.

In case of several pre-configured trusted CAs use `Issuer` field to specify which CA should be required in a certificate for a given Zabbix component.

If your top-level CA is issuing other certificates which should not be accepted by Zabbix or you want to reduce risk of impersonating you can restrict allowed certificate by specifying its `Subject` string.

For example, you can write in Zabbix proxy configuration file:

```
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

With these settings, an active proxy will not talk to Zabbix server with different Issuer or Subject string in certificate, a passive proxy will not accept requests from such server. Note that restricting Issuer and Subject can be used in command-line utilities "zabbix_get" and "zabbix_sender", too.

A few notes about Issuer or Subject string matching:

1. Issuer and Subject strings are checked independently. Both are optional.
 2. UTF-8 characters are allowed.
 3. Unspecified string means any string is accepted.
 4. Strings are compared "as-is", they must be exactly the same to match.
 5. Wildcards and regexp's are not supported in matching.
 6. Only some requirements from [RFC 4514 Lightweight Directory Access Protocol \(LDAP\): String Representation of Distinguished Names](http://tools.ietf.org/html/rfc4514) are implemented:
 - escape characters '"' (U+0022), '+' U+002B, ',' U+002C, ';' U+003B, '<' U+003C, '>' U+003E, '\\' U+005C
 - escape characters space (' ' U+0020) or number sign ('#' U+0023) at the beginning of string.
 - escape character space (' ' U+0020) at the end of string.
- Match fails if a null character (U+0000) is encountered ([<http://tools.ietf.org/html/rfc4514>|RFC 4514])
- Requirements of [<http://tools.ietf.org/html/rfc4517>| RFC 4517 Lightweight Directory Access Protocol (LDAP)]

Order of fields in Issuer and Subject strings and formatting are important! Zabbix follows [RFC 4514](http://tools.ietf.org/html/rfc4514) recommendation and uses the reverse order of fields.

The reverse order can be illustrated by example:

```
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

Note that it starts with low level (CN), proceeds to mid-level (OU, O) and ends with top-level (DC) fields.

OpenSSL by default shows certificate Issuer and Subject fields in "normal" order, depending on additional options used:

```
$ openssl x509 -noout -in /home/zabbix/zabbix_proxy.crt -issuer -subject
issuer= /DC=com/DC=zabbix/O=Zabbix SIA/OU=Development group/CN=Signing CA
subject= /DC=com/DC=zabbix/O=Zabbix SIA/OU=Development group/CN=Zabbix proxy
```

```
$ openssl x509 -noout -text -in /home/zabbix/zabbix_proxy.crt
Certificate:
```

```
...
    Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
...
    Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Zabbix proxy
```

Here Issuer and Subject strings start with top-level (DC) and end with low-level (CN) field, spaces and field separators depend on options used. None of these values will match in Zabbix Issuer and Subject fields!

Attention:

To get proper Issuer and Subject strings usable in Zabbix invoke OpenSSL with special options
-nameopt esc_2253,esc_ctrl,utf8,dump_nostr,dump_unknown,dump_der,sep_comma_plus,dn_rev,sname:

```
$ openssl x509 -noout -issuer -subject \
    -nameopt esc_2253,esc_ctrl,utf8,dump_nostr,dump_unknown,dump_der,sep_comma_plus,dn_rev,sname \
    -in /home/zabbix/zabbix_proxy.crt
issuer= CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
subject= CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

Now string fields are in reverse order, fields are comma-separated, can be used in Zabbix configuration files and frontend.

Limitations on using X.509 v3 certificate extensions

- **Subject Alternative Name (*subjectAltName*)** extension.
Alternative subject names from *subjectAltName* extension (like IP address, e-mail address) are not supported by Zabbix. Only value of "Subject" field can be checked in Zabbix (see [Restricting allowed certificate Issuer and Subject](#)).
If certificate uses the *subjectAltName* extension then result depends on particular combination of crypto toolkits Zabbix components are compiled with (it may or may not work, Zabbix may refuse to accept such certificates from peers).

- **Extended Key Usage** extension.
If used then generally both *clientAuth* (TLS WWW client authentication) and *serverAuth* (TLS WWW server authentication) are necessary.
For example, in passive checks Zabbix agent acts in a TLS server role, so *serverAuth* must be set in agent certificate. For active checks agent certificate needs *clientAuth* to be set.
GnuTLS issues a warning in case of key usage violation but allows communication to proceed.
- **Name Constraints** extension.
Not all crypto toolkits support it. This extension may prevent Zabbix from loading CA certificates where this section is marked as *critical* (depends on particular crypto toolkit).

Certificate Revocation Lists (CRL)

If a certificate is compromised CA can revoke it by including in CRL. CRLs can be configured in server, proxy and agent configuration file using parameter `TLSCRLFile`. For example:

```
TLSCRLFile=/home/zabbix/zabbix_crl_file
```

where `zabbix_crl_file` may contain CRLs from several CAs and look like:

```
-----BEGIN X509 CRL-----
MIIB/DCB5QIBATANBgkqhkiG9w0BAQUFADCBgTETMBEGCgmSJomT8ixkARkWA2Nv
...
treZeUPjb7LSmZ3K2hpbZN7So0ZcAoHQ3GWd9npuctg=
-----END X509 CRL-----
-----BEGIN X509 CRL-----
MIIB+TCB4gIBATANBgkqhkiG9w0BAQUFADB/MRMwEQYKCZImiZPyLQGDBGYDY29t
...
CAEebS2CND3ShBedZ8YSi15906JvaDP611R51Ns=
-----END X509 CRL-----
```

CRL file is loaded only on Zabbix start. CRL update requires restart.

Attention:

If Zabbix component is compiled with *OpenSSL* and CRLs are used then each top and intermediate level CA in certificate chains must have a corresponding CRL (it can be empty) in `TLSCRLFile`.

Limitations on using CRL extensions

- **Authority Key Identifier** extension.
CRLs for CAs with identical names may not work in case of *mbedTLS* (*PolarSSL*), even with "Authority Key Identifier" extension.

2 Using pre-shared keys

Overview

Each pre-shared key (PSK) in Zabbix actually is a pair of:

- non-secret PSK identity string,
- secret PSK string value.

PSK identity string is a non-empty UTF-8 string. For example, "PSK ID 001 Zabbix agentd". It is a unique name by which this specific PSK is referred to by Zabbix components. Do not put sensitive information in PSK identity string - it is transmitted over the network unencrypted.

PSK value is a hard to guess string of hexadecimal digits, for example, "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327b".

Size limits

There are size limits for PSK identity and value in Zabbix, in some cases a crypto library can have lower limit:

Component	PSK identity max size	PSK value min size	PSK value max size
<i>Zabbix</i>	128 UTF-8 characters	128-bit (16-byte PSK, entered as 32 hexadecimal digits)	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)
<i>GnuTLS</i>	128 bytes (may include UTF-8 characters)	-	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)

Component	PSK identity max size	PSK value min size	PSK value max size
<i>mbed TLS</i> (<i>PolarSSL</i>)	128 UTF-8 characters	-	256-bit (default limit) (32-byte PSK, entered as 64 hexadecimal digits)
<i>OpenSSL 1.0.x, 1.1.0</i>	127 bytes (may include UTF-8 characters)	-	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)
<i>OpenSSL 1.1.1</i>	127 bytes (may include UTF-8 characters)	-	512-bit (64-byte PSK, entered as 128 hexadecimal digits)
<i>OpenSSL 1.1.1a and later</i>	127 bytes (may include UTF-8 characters)	-	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)

Attention:

Zabbix frontend allows configuring up to 128-character long PSK identity string and 2048-bit long PSK regardless of crypto libraries used.

If some Zabbix components support lower limits, it is the user's responsibility to configure PSK identity and value with allowed length for these components.

Exceeding length limits results in communication failures between Zabbix components.

Before Zabbix server connects to agent using PSK, the server looks up the PSK identity and PSK value configured for that agent in database (actually in configuration cache). Upon receiving a connection the agent uses PSK identity and PSK value from its configuration file. If both parties have the same PSK identity string and PSK value the connection may succeed.

Attention:

Each PSK identity must be paired with only one value. It is the user's responsibility to ensure that there are no two PSKs with the same identity string but different values. Failing to do so may lead to unpredictable disruptions of communication between Zabbix components using PSKs with this PSK identity string.

Generating PSK

For example, a 256-bit (32 bytes) PSK can be generated using the following commands:

- with *OpenSSL*:

```
$ openssl rand -hex 32
af8ced32dfe8714e548694e2d29e1a14ba6fa13f216cb35c19d0feb1084b0429
```

- with *GnuTLS*:

```
$ psktool -u psk_identity -p database.psk -s 32
Generating a random key for user 'psk_identity'
Key stored to database.psk
```

```
$ cat database.psk
psk_identity:9b8eafedfaae00cece62e85d5f4792c7d9c9bcc851b23216a1d300311cc4f7cb
```

Note that "psktool" above generates a database file with a PSK identity and its associated PSK. Zabbix expects just a PSK in the PSK file, so the identity string and colon (':') should be removed from the file.

Configuring PSK for server-agent communication (example)

On the agent host, write the PSK value into a file, for example, /home/zabbix/zabbix_agentd.psk. The file must contain PSK in the first text string, for example:

```
1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952
```

Set access rights to PSK file - it must be readable only by Zabbix user.

Edit TLS parameters in agent configuration file `zabbix_agentd.conf`, for example, set:

```
TLSConnect=psk
TLSAccept=psk
TLSPSKFile=/home/zabbix/zabbix_agentd.psk
TLSPSKIdentity=PSK 001
```

The agent will connect to server (active checks) and accept from server and zabbix_get only connections using PSK. PSK identity will be "PSK 001".

Restart the agent. Now you can test the connection using zabbix_get, for example:

```
$ zabbix_get -s 127.0.0.1 -k "system.cpu.load[all,avg1]" --tls-connect=psk \
--tls-psk-identity="PSK 001" --tls-psk-file=/home/zabbix/zabbix_agentd.psk
```

(To minimize downtime see how to change connection type in [Connection encryption management](#)).

Configure PSK encryption for this agent in Zabbix frontend:

- Go to: *Configuration* → *Hosts*
- Select host and click on **Encryption** tab

Example:

The screenshot shows the 'Encryption' tab in the Zabbix frontend. At the top, there are tabs for 'Host', 'Templates', 'IPMI', 'Macros', 'Host inventory', and 'Encryption'. The 'Encryption' tab is selected. Below the tabs, there are three buttons: 'No encryption', 'PSK' (which is highlighted), and 'Certificate'. Under 'Connections from host', there are three checkboxes: 'No encryption' (unchecked), 'PSK' (checked), and 'Certificate' (unchecked). Below these, there is a text input field for 'PSK identity' containing 'PSK 001'. Below that is a text input field for 'PSK' containing a long alphanumeric string: '1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c547319495'. At the bottom, there are five buttons: 'Update', 'Clone', 'Full clone', 'Delete', and 'Cancel'.

When configuration cache is synchronized with database the new connections will use PSK. Check server and agent logfiles for error messages.

Configuring PSK for server - active proxy communication (example)

On the proxy, write the PSK value into a file, for example, /home/zabbix/zabbix_proxy.psk. The file must contain PSK in the first text string, for example:

```
e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9
```

Set access rights to PSK file - it must be readable only by Zabbix user.

Edit TLS parameters in proxy configuration file zabbix_proxy.conf, for example, set:

```
TLSCConnect=psk
TLSPSKFile=/home/zabbix/zabbix_proxy.psk
TLSPSKIdentity=PSK 002
```

The proxy will connect to server using PSK. PSK identity will be "PSK 002".

(To minimize downtime see how to change connection type in [Connection encryption management](#)).

Configure PSK for this proxy in Zabbix frontend. Go to *Administration* → *Proxies*, select the proxy, go to "Encryption" tab. In "Connections from proxy" mark PSK. Paste into "PSK identity" field "PSK 002" and "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9" into "PSK" field. Click "Update".

Restart proxy. It will start using PSK-based encrypted connections to server. Check server and proxy logfiles for error messages.

For a passive proxy the procedure is very similar. The only difference - set `TLSCAccept=psk` in proxy configuration file and set "Connections to proxy" in Zabbix frontend to PSK.

3 Troubleshooting

General recommendations

- Start with understanding which component acts as a TLS client and which one acts as a TLS server in problem case. Zabbix server, proxies and agents, depending on interaction between them, all can work as TLS servers and clients. For example, Zabbix server connecting to agent for a passive check, acts as a TLS client. The agent is in role of TLS server. Zabbix agent, requesting a list of active checks from proxy, acts as a TLS client. The proxy is in role of TLS server. `zabbix_get` and `zabbix_sender` utilities always act as TLS clients.
- Zabbix uses mutual authentication. Each side verifies its peer and may refuse connection. For example, Zabbix server connecting to agent can close connection immediately if agent's certificate is invalid. And vice versa - Zabbix agent accepting a connection from server can close connection if server is not trusted by agent.
- Examine logfiles in both sides - in TLS client and TLS server. The side which refuses connection may log a precise reason why it was refused. Other side often reports rather general error (e.g. "Connection closed by peer", "connection was non-properly terminated").
- Sometimes misconfigured encryption results in confusing error messages in no way pointing to real cause. In subsections below we try to provide a (far from exhaustive) collection of messages and possible causes which could help in troubleshooting. Please note that different crypto toolkits (OpenSSL, GnuTLS, mbed TLS (PolarSSL)) often produce different error messages in same problem situations. Sometimes error messages depend even on particular combination of crypto toolkits on both sides.

1 Connection type or permission problems

Server is configured to connect with PSK to agent but agent accepts only unencrypted connections

In server or proxy log (with *mbed TLS (PolarSSL)* 1.3.11)

Get value from agent failed: `ssl_handshake(): SSL - The connection indicated an EOF`

In server or proxy log (with *GnuTLS* 3.3.16)

Get value from agent failed: `zbx_tls_connect(): gnutls_handshake() failed: \n-110 The TLS connection was non-properly terminated.`

In server or proxy log (with *OpenSSL* 1.0.2c)

Get value from agent failed: `TCP connection successful, cannot establish TLS to [[127.0.0.1]:10050]: \nConnection closed by peer. Check allowed connection types and access rights`

One side connects with certificate but other side accepts only PSK or vice versa

In any log (with *mbed TLS (PolarSSL)*):

failed to accept an incoming connection: from 127.0.0.1: `ssl_handshake():\nSSL - The server has no ciphersuites in common with the client`

In any log (with *GnuTLS*):

failed to accept an incoming connection: from 127.0.0.1: `zbx_tls_accept(): gnutls_handshake() failed:\n-21 Could not negotiate a supported cipher suite.`

In any log (with *OpenSSL* 1.0.2c):

failed to accept an incoming connection: from 127.0.0.1: `TLS handshake returned error code 1:\nfile .\ssl\s3_srvr.c line 1411: error:1408A0C1:SSL routines:ssl3_get_client_hello:no shared cipher:\nTLS write fatal alert "handshake failure"`

Attempting to use Zabbix sender compiled with TLS support to send data to Zabbix server/proxy compiled without TLS

In connecting-side log:

Linux:

```
...In zbx_tls_init_child()
...OpenSSL library (version OpenSSL 1.1.1 11 Sep 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK test sender"
...End of zbx_tls_connect():FAIL error:'connection closed by peer'
...send value error: TCP successful, cannot establish TLS to [[localhost]:10051]: connection closed by peer
```

Windows:

```

...OpenSSL library (version OpenSSL 1.1.1a 20 Nov 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK test sender"
...zbx_psk_client_cb() requested PSK identity "PSK test sender"
...End of zbx_tls_connect():FAIL error:'SSL_connect() I/O error: [0x00000000] The operation completed successfully'
...send value error: TCP successful, cannot establish TLS to [[192.168.1.2]:10051]: SSL_connect() I/O error: [0] Success

In accepting-side log:

...failed to accept an incoming connection: from 127.0.0.1: support for TLS was not compiled in
One side connects with PSK but other side uses LibreSSL or has been compiled without encryption support
LibreSSL does not support PSK.

In connecting-side log:

...TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() I/O error: [0] Success

In accepting-side log:

...failed to accept an incoming connection: from 192.168.1.2: support for PSK was not compiled in

In Zabbix frontend:

Get value from agent failed: TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() I/O error: [0] Success
One side connects with PSK but other side uses OpenSSL with PSK support disabled

In connecting-side log:

...TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() set result code to SSL_ERROR_SSL

In accepting-side log:

...failed to accept an incoming connection: from 192.168.1.2: TLS handshake set result code to 1: file ssl

```

2 Certificate problems

OpenSSL used with CRLs and for some CA in the certificate chain its CRL is not included in TLSCRLFile

In TLS server log in case of *MBED TLS (PolarSSL)* and *OpenSSL* peers:

```

failed to accept an incoming connection: from 127.0.0.1: TLS handshake with 127.0.0.1 returned error code
file s3_srvr.c line 3251: error:14089086: SSL routines:ssl3_get_client_certificate:certificate verify failed:
TLS write fatal alert "unknown CA"

```

In TLS server log in case of *GnuTLS* peer:

```

failed to accept an incoming connection: from 127.0.0.1: TLS handshake with 127.0.0.1 returned error code
file rsa_pk1.c line 103: error:0407006A: rsa routines:RSA_padding_check_PKCS1_type_1:\
block type is not 01 file rsa_eay.c line 705: error:04067072: rsa routines:RSA_EAY_PUBLIC_DECRYPT:padding

```

CRL expired or expires during server operation

OpenSSL, in server log:

- before expiration:

```

cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004]:
SSL_connect() returned SSL_ERROR_SSL: file s3_clnt.c line 1253: error:14090086:
SSL routines:ssl3_get_server_certificate:certificate verify failed:\
TLS write fatal alert "certificate revoked"

```

- after expiration:

```

cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004]:
SSL_connect() returned SSL_ERROR_SSL: file s3_clnt.c line 1253: error:14090086:
SSL routines:ssl3_get_server_certificate:certificate verify failed:\
TLS write fatal alert "certificate expired"

```

The point here is that with valid CRL a revoked certificate is reported as "certificate revoked". When CRL expires the error message changes to "certificate expired" which is quite misleading.

GnuTLS, in server log:

- before and after expiration the same:

cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004
invalid peer certificate: The certificate is NOT trusted. The certificate chain is revoked.

MBED TLS (PolarSSL), in server log:

- before expiration:

cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004
invalid peer certificate: revoked

- after expiration:

cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004
invalid peer certificate: revoked, CRL expired

Self-signed certificate, unknown CA

OpenSSL, in log:

```
error:'self signed certificate: SSL_connect() set result code to SSL_ERROR_SSL: file ../ssl/statem/statem_
line 1924: error:1416F086:SSL routines:tls_process_server_certificate:certificate verify failed:\
TLS write fatal alert "unknown CA"'
```

This was observed when server certificate by mistake had the same Issuer and Subject string, although it was signed by CA. Issuer and Subject are equal in top-level CA certificate, but they cannot be equal in server certificate. (The same applies to proxy and agent certificates.)

3 PSK problems

PSK contains an odd number of hex-digits

Proxy or agent does not start, message in the proxy or agent log:

invalid PSK in file "/home/zabbix/zabbix_proxy.psk"

PSK identity string longer than 128 bytes is passed to GnuTLS

In TLS client side log:

gnutls_handshake() failed: -110 The TLS connection was non-properly terminated.

In TLS server side log.

gnutls_handshake() failed: -90 The SRP username supplied is illegal.

PSK longer than 32 bytes is passed to mbed TLS (PolarSSL)

In any Zabbix log:

ssl_set_psk(): SSL - Bad input parameters to function

Same PSK identity but different PSK values used by communicating components (example with OpenSSL)

In connecting-side log:

...[connect] TCP successful, cannot establish TLS to [[xx.xx.xx.xx]:xxx]: SSL_connect() returned SSL_ERROR

In accepting-side log:

...failed to accept an incoming connection: from xx.xx.xx.xx: TLS handshake returned error code 1: file s3

Too long PSK value used with OpenSSL 1.1.1

In connecting-side log:

...OpenSSL library (version OpenSSL 1.1.1 11 Sep 2018) initialized

...

...In zbx_tls_connect(): psk_identity:"PSK 1"

...zbx_psk_client_cb() requested PSK identity "PSK 1"

...End of zbx_tls_connect():FAIL error:'SSL_connect() set result code to SSL_ERROR_SSL: file ssl\statem\ex

In accepting-side log:

...Message from 123.123.123.123 is missing header. Message ignored.

This problem typically arises when upgrading OpenSSL from 1.0.x or 1.1.0 to 1.1.1 and if the PSK value is longer than 512-bit (64-byte PSK, entered as 128 hexadecimal digits).

See also: [Value size limits](#)

17. Web interface

Overview For an easy access to Zabbix from anywhere and from any platform, the web-based interface is provided.

Note:

Trying to access two Zabbix frontend installations on the same host, on different ports, simultaneously will fail. Logging into the second one will terminate the session on the first one and so on.

1 Frontend sections

1 Monitoring

Overview

The Monitoring menu is all about displaying data. Whatever information Zabbix is configured to gather, visualize and act upon, it will be displayed in the various sections of the Monitoring menu.

1 Dashboard

Overview

The *Monitoring* → *Dashboard* section, similar to the dashboard on your car, displays a summary of all the important information.

Favourites

There are some widgets for favourites where you can create quick shortcuts to the most needed graphs, custom graphs, screens, slide shows and maps.

Just click on the Menu button in the widget, select to add, for example, some screen and then select from the configured screens. The selected screens will be displayed as shortcuts in the favourites widget.

Status widgets

A number of status widgets - *Status of Zabbix*, *System status*, *Host status*, *Last 20 issues*, *Web monitoring*, *Discovery status* each display a summary of the respective data.

As you may have noticed from the screenshot, the widgets can be arranged in up to three columns. Additionally, all widgets can be freely moved around. Just grab a widget by its title bar, drag and drop wherever you would like it.

Dashboard filter

Clicking on  in the title bar allows you to access the dashboard filter.

Update

Cancel

By enabling the filter you can limit what hosts and triggers are displayed in the dashboard and define how the problem count is displayed.

Parameter	Description
<i>Dashboard filter</i> <i>Host groups</i>	Click the link to enable/disable the dashboard filter. Select to display host data from: All - all host groups Selected - selected host groups.
<i>Show selected groups</i>	This field is available if <i>Selected</i> is chosen in the <i>Host groups</i> field. Enter host groups to display. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. Host data from these host groups will be displayed in the Dashboard.
<i>Hide selected groups</i>	If no host groups are entered, all host groups will be displayed. This field is available if <i>Selected</i> is chosen in the <i>Host groups</i> field. Enter host groups to hide. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. Host data from these host groups will not be displayed in the Dashboard. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to <i>show</i> Group A and <i>hide</i> Group B at the same time, only data from host 001 will be displayed in the Dashboard.
<i>Hosts</i>	Mark the <i>Show hosts in maintenance</i> option to display data from hosts in maintenance in the Dashboard.
<i>Triggers with severity</i>	Mark the trigger severities to be displayed in the Dashboard.

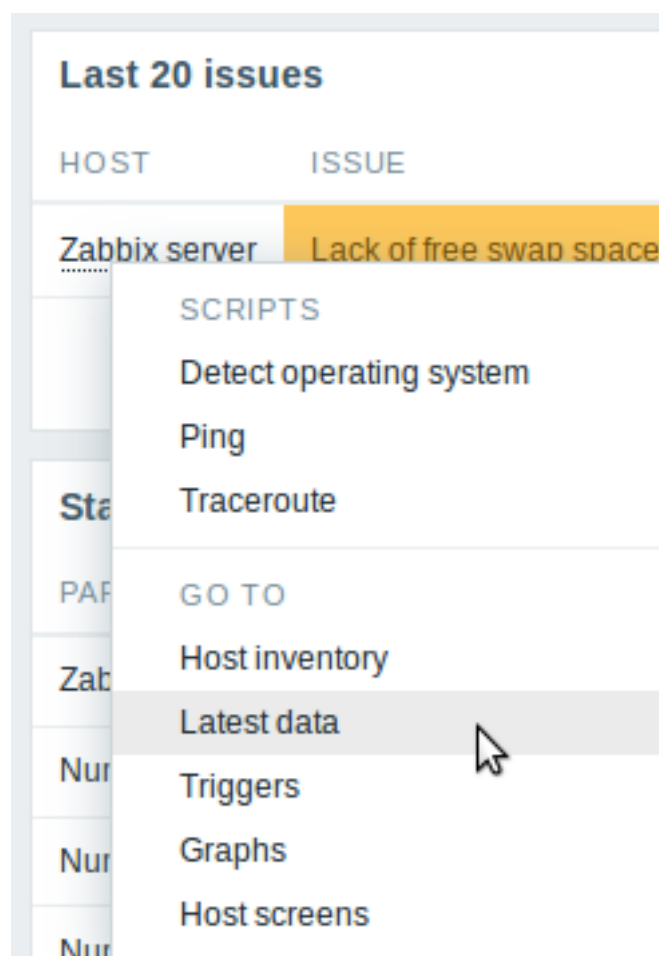

Parameter	Description
<i>Trigger name like</i>	Limit the number of triggers displayed in the <i>System status</i> , <i>Host status</i> and <i>Last 20 issues</i> widgets with this string.
<i>Problem display</i>	Display problem count as: All - full problem count will be displayed Separated - unacknowledged problem count will be displayed separated as a number of the total problem count Unacknowledged only - only the unacknowledged problem count will be displayed.

If dashboard filtering is applied, it is indicated by a green indicator with the filter icon:

Host menu

Clicking on a host in the *Last 20 issues* widget brings up the host menu. It includes links to custom scripts, latest data, triggers, inventory, graphs and screens for the host.

The host menu is accessible by clicking on a host in several other frontend sections:

- Monitoring → **Overview** (on *Hosts*: left)
- Monitoring → **Latest data**
- Monitoring → **Triggers**
- Monitoring → **Events**
- Monitoring → **Events** → Event details
- Monitoring → **Screens** (in *Host issues* and *Host group issues* widgets)
- Monitoring → **Maps**
- Reports → **Triggers top 100**

Trigger event popup

Clicking on *Issue* in the *Last 20 issues* widget brings up the trigger event popup. It includes a list of events and, if defined, the trigger description and a clickable URL.

Last 20 issues

HOST	ISSUE	LAST CHANGE	AGE	INF
Zabbix server	Lack of free swap space on Zabbix server	2015-08-11 23:29:28	2m 11d 11h	

Status of Zabbix

Zabbix server is running	2015-08-11 23:29:28	PROBLEM	2m 11d 11h	2m 11d 11h	Yes 4

It probably means that the system requires more physical memory.

http://www.forensicswiki.org/wiki/Physical_memory

Attention:

Resolved values of {ITEM.VALUE} and {ITEM.LASTVALUE} macros in the trigger description will be truncated to 20 characters.

2 Overview

Overview

The *Monitoring* → *Overview* section offers an overview of trigger states or a comparison of data for various hosts at once.

The following display options are available:

- select all hosts or specific host groups in the *Group* dropdown
- choose what type of information to display (triggers or data) in the *Type* dropdown
- select horizontal or vertical display of information in the *Hosts location* dropdown

Overview of triggers

In the next screenshot Triggers are selected in the *Type* dropdown. As a result, trigger states of two local hosts are displayed, as coloured blocks (the colour depending on the state of the trigger):

3 Web

Overview

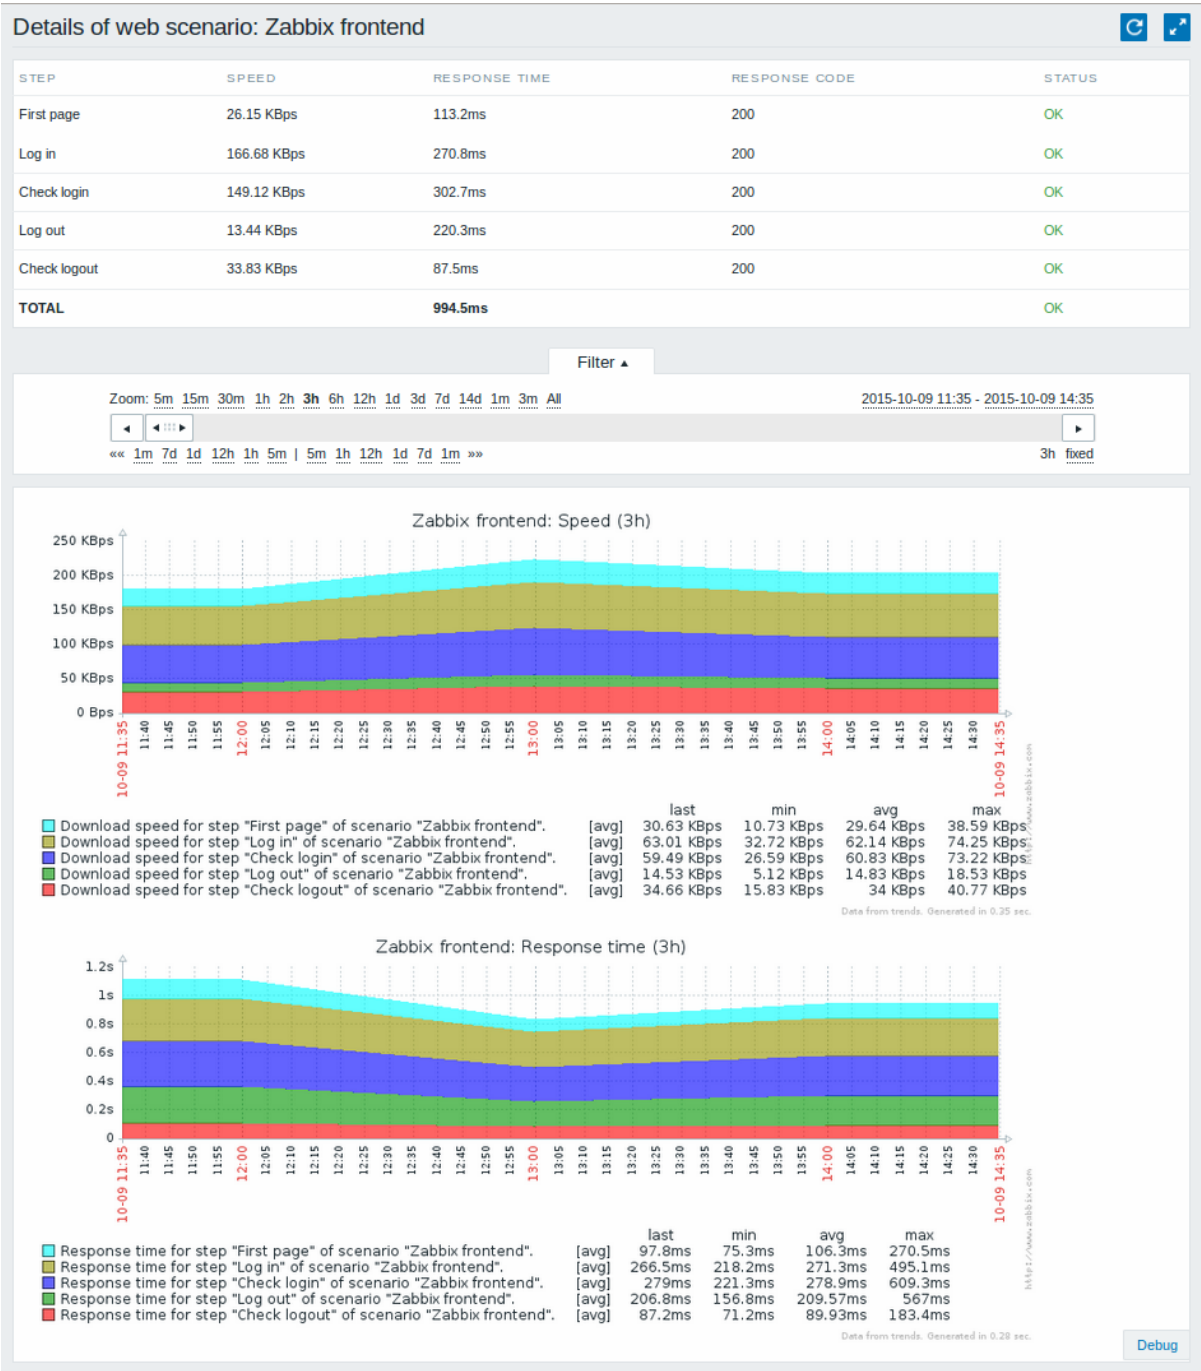

In the *Monitoring* → *Web* section current information about **web scenarios** is displayed.

Web monitoring				
Group all Host all				
HOST	NAME ▲	NUMBER OF STEPS	LAST CHECK	STATUS
Zabbix server	Zabbix frontend	5	2016-01-02 16:45:32	OK
Displaying 1 of 1 found				

Note: The name of a disabled host is displayed in red (in both the host dropdown and the list). Data of disabled hosts is accessible starting with Zabbix 2.2.0.

Starting with Zabbix 3.0.8, only values that fall within the last 24 hours are displayed by default. This limit has been introduced with the aim of improving initial loading times for large pages of web monitoring. It is also possible to change this limitation by changing the value of `ZBX_HISTORY_PERIOD` constant in `include/defines.inc.php`.

The scenario name is link to more detailed statistics about it:

▶ <u>New host</u>	Filesystems (5 Items)			
▶ <u>Zabbix server</u>	General (5 Items)			

In the list displayed, click on  before a host and the relevant application to reveal latest values of that host and application.

You can expand all hosts and all applications, thus revealing all items by clicking on  in the header row.

Note: The name of a disabled host is displayed in red. Data of disabled hosts, including graphs and item value lists, is accessible in *Latest data* since Zabbix 2.2.0.

Items are displayed with their name, last check time, last value, change amount and a link to a simple graph/history of item values.

Only values that fall within the last 24 hours are displayed by default. This limit has been introduced with the aim of improving initial loading times for large pages of latest data. It is also possible to change this limitation by changing the value of `ZBX_HISTORY_PERIOD` **constant** in `include/defines.inc.php`.

Attention:

For items with update frequency of 1 day or more the change amount will never be displayed (with the default setting). Also in this case the last value will not be displayed at all if it was received more than 24 hours ago.

Using filter

You can use the filter to display only the items you are interested in. The *Filter* link is located above the table in the middle. You can use it to filter items by host group, host, application, a string in the item name; you can also select to display items that have no data gathered.

Moreover, *Show details* allows to extend displayable information on the items. Such details as refresh interval, history and trends settings, item type and item errors (fine/unsupported) are displayed. A link to item configuration is also available.

[Display graph](#)

By default, items without data are shown but details are not displayed.

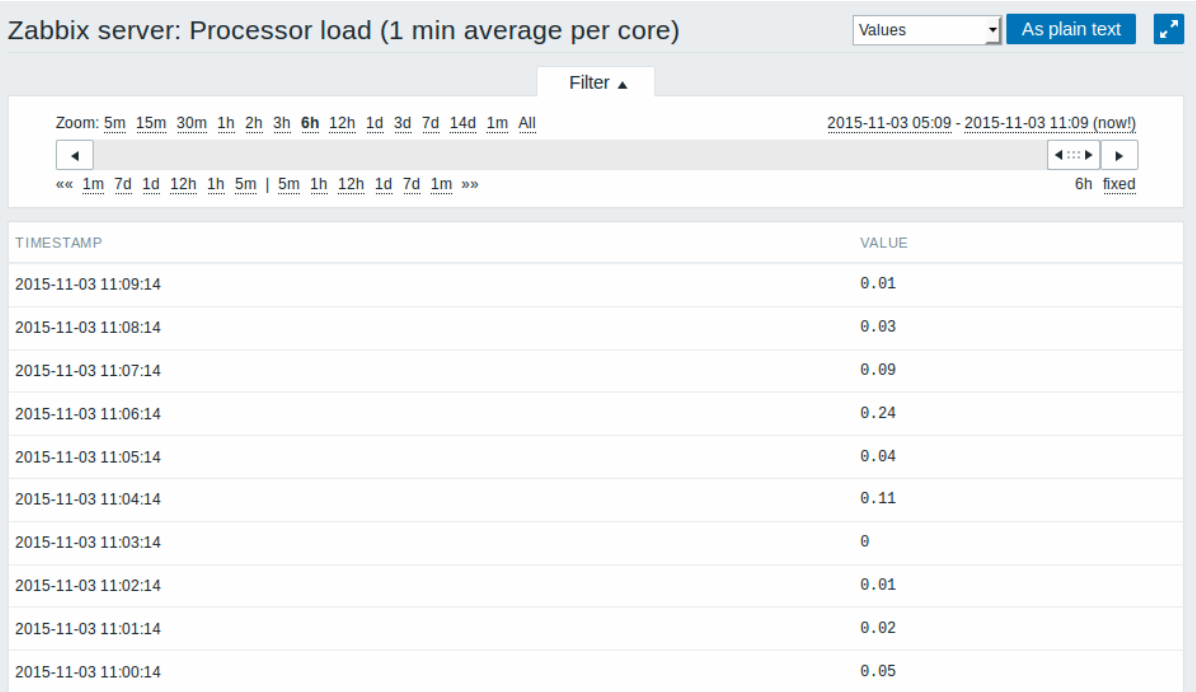

Graphs for comparing items

You may use the checkbox in the second column to select several items and then compare their data in a simple graph or stacked graph. To do that, select items of interest, then click on the required graph button below the table.

Links to value history/simple graph

The last column in the latest value list offers:

- a **History** link (for all textual items) - leading to listings (*Values/500 latest values*) displaying the history of previous item values.
- a **Graph** link (for all numeric items) - leading to a **simple graph**. However, once the graph is displayed, a dropdown on the upper right offers a possibility to switch to *Values/500 latest values* as well.

The values displayed in this list are “raw”, that is, no postprocessing is applied.

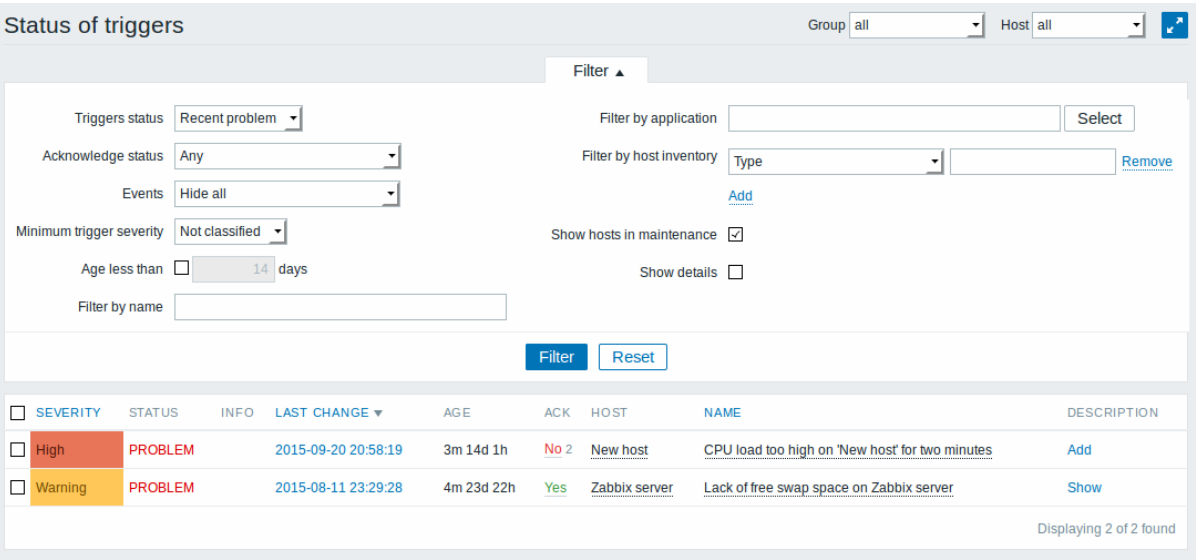

Note:

The total amount of values displayed is defined by the value of *Search/Filter elements limit* parameter, set in **Administration** → **General**.

5 Triggers

Overview

The *Monitoring* → *Triggers* section displays the status of triggers.

Column	Description
Severity	The trigger severity is displayed. The color of the severity is used as cell background for problem triggers. For OK triggers, green background is used.

Column	Description
<i>Status</i>	<p>The trigger status is displayed - OK or PROBLEM.</p> <p>By default, it will be blinking for 30 minutes for triggers that have recently changed their state. Additionally, triggers that have recently changed their state to OK, will be displayed for 30 minutes even if the filter is set to show only problems.</p> <p>Text color and blinking options can be configured in <i>Administration</i> → <i>General</i> → <i>Trigger displaying options</i>.</p>
<i>Info</i>	A grey icon with a question mark indicates that there is some relevant information to be displayed. If you move your mouse pointer over it, the message will be displayed.
<i>Last change</i>	The date and time of last trigger status change is displayed.
<i>Age</i>	The age of last trigger status change is displayed.
<i>Acknowledged</i>	<p>The acknowledgement status of the trigger is displayed:</p> <p>Yes - green text indicating that the trigger is acknowledged. A trigger is considered to be acknowledged if all problem events for it are acknowledged (or if there have been only OK events).</p> <p>No - a red link indicating unacknowledged problem events (and their number in grey text).</p> <p>If you click on the link you will be taken to a bulk acknowledgement screen where all events for this trigger can be acknowledged at once.</p> <p><i>Note:</i> If you wish to acknowledge a single event only, go to <i>Monitoring</i> → <i>Events</i>.</p> <p>No events - if there have been no problem events for the trigger. Displaying this string is supported since Zabbix 2.0.4; prior to that these triggers were displayed as <i>Acknowledged</i>.</p>
<i>Host</i>	<p>The host of the trigger is displayed.</p> <p>It is also a link to the defined custom scripts, latest host data, host inventory overview and host screens.</p>
<i>Name</i>	<p>The name of the trigger is displayed.</p> <p>It is also a link to the trigger event list and the trigger configuration page, as well as to a simple graph of item data. The link list may also contain a custom trigger URL, if one is defined in trigger configuration.</p>
<i>Description</i>	<p>A link to trigger description.</p> <p>The link for adding descriptions to triggers created by low-level discovery has been removed in Zabbix 3.0.6. Such descriptions were later deleted anyway by low-level discovery, if they were not present in the original trigger prototype.</p>

Negative problem duration

It is actually possible in some common situations to have negative problem duration i.e. when the problem resolution time is earlier than problem creation time, e. g.:

- If some host is monitored by proxy and a network error happens, leading to no data received from the proxy for a while, the `item.nodata()` trigger will be fired by the server. When the connection is restored, the server will receive item data from the proxy having a time from the past. Then, the `item.nodata()` problem will be resolved and it will have a negative problem duration;
- When item data that resolve the problem event are sent by Zabbix sender and contain a timestamp earlier than the problem creation time, a negative problem duration will also be displayed.

Note:

Since Zabbix 3.0.25, negative problem duration is not affecting **SLA calculation** or **Availability report** in any way; it neither reduces nor expands problem time. See also: known issues for **3.0.0-3.0.24**.

Using filter

You can use the filter to display only the triggers you are interested in. The filter is located above the table.

By default only triggers in a 'Recent problem' status are displayed - including both problem triggers and triggers that only very recently changed to OK. You may also select to display triggers in 'Problem' status (only problem triggers) or 'Any'.

Note that if you select 'Any' then the amount of data processed on large installations may be overwhelming and the page may take a very long time to load, if ever. You can fix this by replacing URL parameters with `?filter_rst=1` to reset the filter.

Mass editing options

A button below the list offers one mass-editing option:

- *Bulk acknowledge* - acknowledge the selected triggers

To use this option, mark the checkboxes before the respective triggers and click on *Bulk acknowledge*.

6 Events

Overview

The *Monitoring* → *Events* section displays latest **events**.

Details about the event, its source, acknowledgements, actions taken (messages, remote commands) and previous similar events are displayed.

7 Graphs

Overview

In the *Monitoring* → *Graphs* section any **custom graph** that has been configured can be displayed.

To display a graph, select the host group, host and then the graph from the dropdowns to the right.

Note: In the host dropdown, a disabled host is highlighted in red. Graphs for disabled hosts are accessible starting with Zabbix 2.2.0.

Time period selector

The filter section above the graph contains a time period selector. It allows you to select the desired time period easily.

The slider within the selector can be dragged back and forth, as well as resized, effectively changing the time period displayed. Links on the left hand side allow to choose some often-used predefined periods (above the slider area) and move them back and forth in time (below the slider area). The dates on the right hand side actually work as links, popping up a calendar and allowing to set a specific start/end time.

The **fixed/dynamic** link in the lower right hand corner has the following effects:

- controls whether the time period is kept constant when you change the start/end time in the calendar popup.
- when *fixed*, time moving controls (« 1m 7d 1d 12h 1h 5m | 5m 1h 12h 1d 7d 1m ») will move the slider, while not changing its size, whereas when *dynamic*, the control used will enlarge the slider in the respective direction.
- when *fixed*, pressing the larger < and > buttons will move the slider, while not changing its size, whereas when *dynamic*, < and > will enlarge the slider in the respective direction. The slider will move by the amount of its size, so, for example, if it is one month, it will move by a month; whereas the slider will enlarge by 1 day.

Another way of controlling the displayed time is to highlight an area in the graph with the left mouse button. The graph will zoom into the highlighted area once you release the left mouse button.

Controls

Three control buttons are available in the title bar:

-  - add graph to the favourites widget in the **Dashboard**
-  - reset graph display to the original setting of displaying the last hour data
-  - use the full browser window to display the graph

8 Screens

Overview

In the *Monitoring* → *Screens* section you can configure, manage and view Zabbix **screens** and **slide shows**.

When you open this section, you will either see the last screen/slide show you accessed or a listing of all entities you have access to. Screen/slide show listing can be filtered by name.

Since Zabbix 3.0 all screens/slide shows can be either public or private. The public ones are available to all users, while private ones are accessible only to their owner and the users the entity is shared with.

Use the dropdown in the title bar to switch between screens and slide shows.

Displaying 4 of 4 found

Displayed data:

Column	Description
Name	Name of the screen. Click on the name to view the screen.
Dimensions	The number of columns and rows of the screen.
Actions	Two actions are available: Properties - edit general screen properties (name and dimensions) Constructor - access the grid of screen elements for editing

To **create** a new screen, click on the *Create screen* button in the top right-hand corner. To import a screen from an XML file, click on the *Import* button in the top right-hand corner. The user who imports the screen will be set as its owner.

Mass editing options

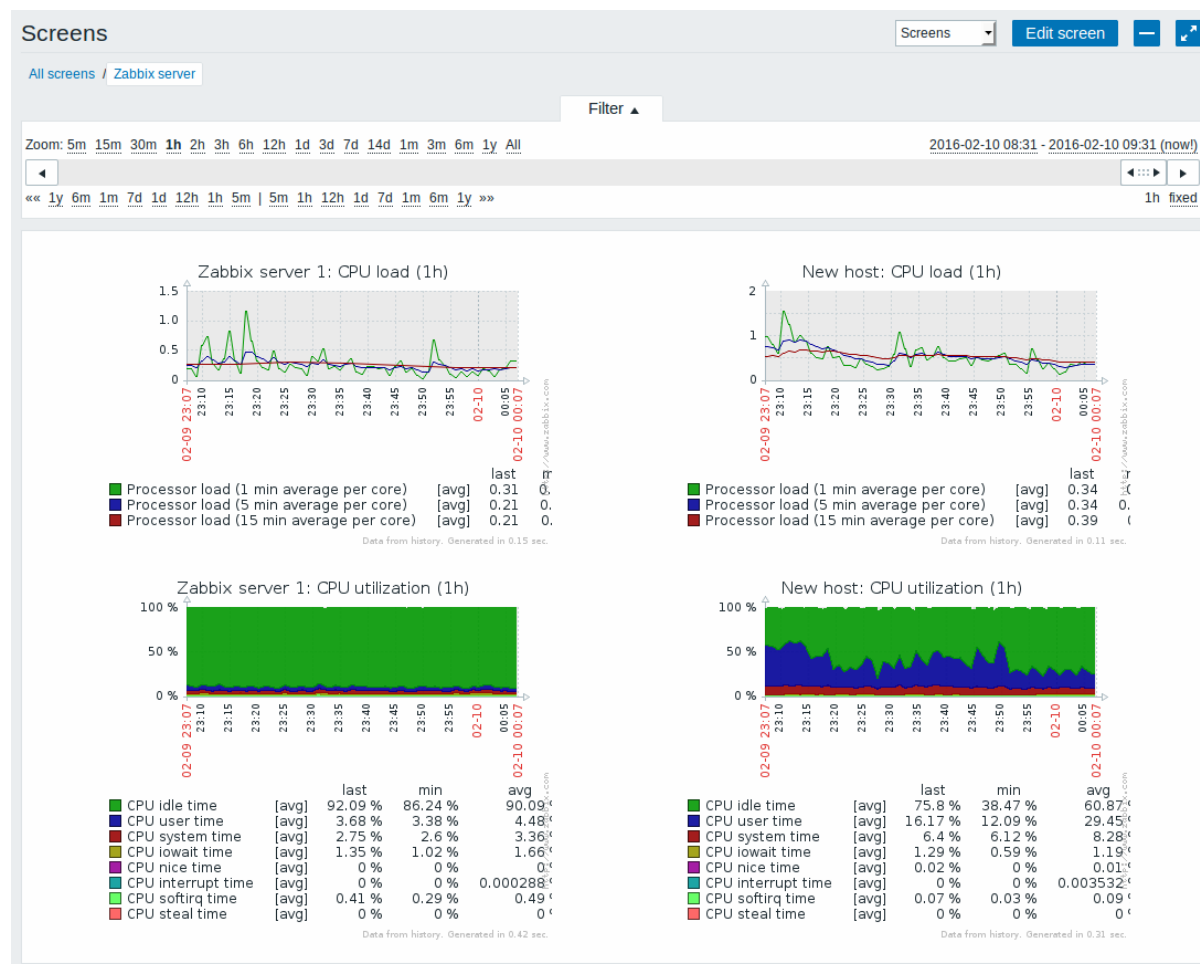

Buttons below the list offer some mass-editing options:

- *Export* - export the screens to an XML file
- *Delete* - delete the screens

To use these options, mark the checkboxes before the respective screens, then click on the required button.

Viewing screens

To view a screen, click on its name in the list of all screens.

Time period selector

The filter section above the screen contains a time period selector. It allows you to select the desired time period easily, affecting the data displayed in graphs etc.

Controls

Three control buttons are available in the title bar:

- **Edit screen** - go to screen constructor to edit the screen
- **+** - add screen to the favourites widget in the **Dashboard**

- - use the full browser window to display the screen

Slide show listing

Use the dropdown in the title bar to switch from screens to slide shows.

<input type="checkbox"/> NAME ▲	DELAY	NUMBER OF SLIDES	ACTIONS
<input type="checkbox"/> Zabbix administrators	30s	2	Properties
<input type="checkbox"/> Zabbix administrators2	30s	4	Properties

Displaying 2 of 2 found

Displayed data:

Column	Description
<i>Name</i>	Name of the slide show. Click on the name to view the slide show.
<i>Delay</i>	The default duration of showing one slide is displayed.
<i>Number of slides</i>	The number of slides in the slide show is displayed.
<i>Actions</i>	One action is available: Properties - edit slide show properties

To **create** a new slide show, click on the *Create slide show* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the slide shows

To use this option, mark the checkboxes before the respective slide shows and click on *Delete*.

Viewing slide shows

To view a slide show, click on its name in the list of all slide shows.

Controls

Four control buttons are available in the title bar:

-  - go to slide show properties
-  - add slide show to the favourites widget in the **Dashboard**
-  - use the full browser window to display the slide show
-  - slow down or speed up a slide show

Referencing a screen

Screens can be referenced by both `elementid` and `screenname` GET parameters. For example,

`http://zabbix/zabbix/screens.php?screenname=Zabbix%20server`

will open the screen with that name (Zabbix server).

If both `elementid` (screen ID) and `screenname` (screen name) are specified, `screenname` has higher priority.

9 Maps

Overview

In the *Monitoring* → *Maps* section you can configure, manage and view **network maps**.

When you open this section, you will either see the last map you accessed or a listing of all maps you have access to. Map listing can be filtered by name.

Since Zabbix 3.0 all maps can be either public or private. Public maps are available to all users, while private maps are accessible only to their owner and the users the map is shared with.

Displaying 3 of 3 found

Displayed data:

Column	Description
Name	Name of the map. Click on the name to view the map.
Width	Map width is displayed.
Height	Map height is displayed.
Actions	Two actions are available: Properties - edit general map properties Constructor - access the grid for adding map elements

To **configure** a new map, click on the *Create map* button in the top right-hand corner. To import a map from an XML file, click on the *Import* button in the top right-hand corner. The user who imports the map will be set as its owner.

Two buttons below the list offer some mass-editing options:

- *Export* - export the maps to an XML file
- *Delete* - delete the maps

To use these options, mark the checkboxes before the respective maps, then click on the required button.

Viewing maps

To view a map, click on its name in the list of all maps.

You can use the dropdown in the map title bar to select the lowest severity level of the problem triggers to display. The severity marked as *default* is the level set in map configuration. If the map contains a submap, navigating to the submap will retain the higher-level map severity.

Icon highlighting

If a map element is in problem status, it is highlighted with a round circle. The fill colour of the circle corresponds to the severity colour of the problem trigger. Only problems on or above the selected severity level will be displayed with the element. If all problems are acknowledged, a thick green border around the circle is displayed.

Additionally, a host in **maintenance** is highlighted with an orange, filled square and a disabled (not-monitored) host is highlighted with a grey, filled square. Highlighting is displayed if the *Icon highlighting* check-box is marked in map **configuration**.

Recent change markers

Inward pointing red triangles around an element indicate a recent trigger status change - one that's happened within the last 30 minutes. These triangles are shown if the *Mark elements on trigger status change* check-box is marked in map **configuration**.

Links

Clicking on a map element opens a menu with some available links.

Controls

Three control buttons are available in the title bar:

-  - go to map constructor to edit the map content
-  - add map to the favourites widget in the **Dashboard**
-  - use the full browser window to display the map

Referencing a network map

Network maps can be referenced by both `sysmapid` and `mapname` GET parameters. For example,

`http://zabbix/zabbix/maps.php?mapname=Local%20network`

will open the map with that name (Local network).

If both `sysmapid` (map ID) and `mapname` (map name) are specified, `mapname` has higher priority.

10 Discovery

Overview

In the *Monitoring* → *Discovery* section results of **network discovery** are shown. Discovered devices are sorted by the discovery rule.

Status of discovery

Discovery rule: all

DISCOVERED DEVICE ▼	MONITORED HOST	UPTIME/DOWNTIME	ICMP PING	SNMPV2 AGENT: 1.3.6.1.2.1.1.1.0
Local network (9 devices)				
192.168.3.9		12 days, 13:46:02	<div></div>	
192.168.3.8		12 days, 13:46:12	<div></div>	
192.168.3.7 (procurve.zabbix.lan)	procurve.zabbix.lan	02:44:55	<div></div>	

If a device is already monitored, the host name will be listed in the *Monitored host* column, and the duration of the device being discovered or lost after previous discovery is shown in the *Uptime/Downtime* column.

After that follow the columns showing the state of individual services for each discovered device. A tooltip for each cell will show individual service uptime or downtime.

Attention:

Only those services that have been found on at least one device will have a column showing their state.

11 IT services

Overview

In the *Monitoring* → *IT services* section the status of **IT services** is displayed.

IT services

Period: This week

SERVICE	STATUS	REASON	PROBLEM TIME	SLA / ACCEPTABLE SLA
root				
▼ SLA by service	OK			
Server 1 - Zabbix agent on Zabbix server is unreachable for 5 minutes	Average	Zabbix agent on Zabbix server is unreachable for 5 minutes	<div>80%100%</div>	0.5402 99.4598 / 99.9000
Server 2	OK			
Server 3	OK			

Only the last 20% of the indicator is displayed.

A list of the existing IT services is displayed along with data of their status and SLA. From the dropdown in the upper right corner you can select a desired period for display.

Displayed data:

Parameter	Description
Service	Service name.
Status	Status of service: OK - no problems (trigger colour and severity) - indicates a problem and its severity
Reason	Indicates the reason of problem (if any).

Parameter	Description
<i>Problem time</i>	Displays SLA bar. Green/red ratio indicates the proportion of availability/problems. The bar displays the last 20% of SLA (from 80% to 100%).
<i>SLA/Acceptable SLA</i>	The bar contains a link to a graph of availability data. Displays current SLA/expected SLA value. If current value is below the acceptable level, it is displayed in red.

You can also click on the service name to access the *IT Services Availability Report*.

IT services availability report: Server 1					Period Daily	Year 2016	
DAY	OK	PROBLEMS	DOWNTIME	SLA	ACCEPTABLE SLA		
2016-01-03	0d 19h 29m	0d 1h 4m		94.7956	99.9000		
2016-01-02	1d 0h 0m			100.0000	99.9000		
2016-01-01	1d 0h 0m			100.0000	99.9000		

Here you can assess IT service availability data over a longer period of time on daily/weekly/monthly/yearly basis.

2 Inventory

Overview

The Inventory menu features sections providing an overview of host inventory data by a chosen parameter as well as the ability to view host inventory details.

1 Overview

Overview

The *Inventory* → *Overview* section provides ways of having an overview of **host inventory** data.

For an overview to be displayed, choose a host group (or all groups) and the inventory field by which to display data. The number of hosts corresponding to each entry of the chosen field will be displayed.

Host inventory overview		Group all	Grouping by Type
TYPE	HOST COUNT ▼		
Zabbix server	1		
Workstation	1		
Switch	1		

The completeness of an overview depends on how much inventory information is maintained with the hosts.

Numbers in the *Host count* column are links; they lead to these hosts being filtered out in the *Host Inventories* table.

The completeness of inventory data depends on how much inventory information is maintained with the host. If no information is maintained, the *Details* tab is disabled.

3 Reports

Overview

The Reports menu features several sections that contain a variety of predefined and user-customizable reports focused on displaying an overview of such parameters as the status of Zabbix, triggers and gathered data.

1 Status of Zabbix

Overview

In *Reports* → *Status of Zabbix* a summary of key system data is displayed.

Status of Zabbix		
PARAMETER	VALUE	DETAILS
Zabbix server is running	Yes	localhost:10051
Number of hosts (enabled/disabled/templates)	45	3 / 0 / 42
Number of items (enabled/disabled/not supported)	113	106 / 2 / 5
Number of triggers (enabled/disabled [problem/ok])	60	60 / 0 [2 / 58]
Number of users (online)	3	2
Required server performance, new values per second	1.55	

This report is also displayed as a widget in the [Dashboard](#).

Displayed data

Parameter	Value	Details
<i>Zabbix server is running</i>	Status of Zabbix server: Yes - server is running No - server is not running <i>Note:</i> To make sure the web frontend knows that the server is running there must be at least one trapper process started on the server (StartTrappers parameter in <code>zabbix_server.conf</code> file>0).	Location and port of Zabbix server.
<i>Number of hosts</i>	Total number of hosts configured is displayed. Templates are counted as a type of host too.	Number of monitored hosts/not monitored hosts/templates.
<i>Number of items</i>	Total number of items is displayed. Only items assigned to enabled hosts are counted.	Number of monitored/disabled/unsupported items.
<i>Number of triggers</i>	Total number of triggers is displayed. Only triggers assigned to enabled hosts and depending on enabled items are counted.	Number of enabled/disabled triggers. [Triggers in problem/ok state.]
<i>Number of users</i>	Total number of users configured is displayed.	Number of users online.

Parameter	Value	Details
<i>Required server performance, new values per second</i>	The expected number of new values processed by Zabbix server per second is displayed.	<p><i>Required server performance</i> is an estimate and can be useful as a guideline. For precise numbers of values processed, use the <code>zabbix[wcache,values,all]</code> internal item.</p> <p>Enabled items from monitored hosts are included in the calculation. Log items are counted as one value per item update interval. Regular interval values are counted; flexible and scheduling interval values are not. The calculation is not adjusted during a "nodata" maintenance period. Trapper items are not counted.</p>

2 Availability report

Overview

In *Reports* → *Availability report* you can see what proportion of time each trigger has been in problem/ok state. The percentage of time for each state is displayed.

Thus it is easy to determine the availability situation of various elements on your system.

Availability report

Mode By host

New host	Free disk space on New host	Warning	1
New host	Free disk space on New host	Warning	1
Zabbix server 1	Free disk space on Zabbix server 1	Warning	1

**** Using filter ****

You may use the filter to display triggers by host group, host, trigger severity, predefined time period or a custom time period.

Both host and trigger column entries are links that offer some useful options:

- for host - links to user-defined scripts, latest data, inventory, graphs and screens for the host
- for trigger - links to latest events, the trigger configuration form and a simple graph

4 Audit

Overview

In the *Reports* → *Audit* section users can view records of changes made in the frontend.

Audit log

In this screen the audit log of various changes made in the frontend can be seen. You can use the filter, located below the *Audit log* bar, to narrow down the records by user, activity type, affected resource and the time period.

Displayed data:

484

Column	Description
<i>Time</i>	Timestamp of the operation.
<i>Action</i>	Name of the action causing operations is displayed. Action name is displayed since Zabbix 2.4.0.
<i>Type</i>	Operation type is displayed - <i>Email</i> or <i>Command</i> .
<i>Recipient(s)</i>	User alias, name and surname (in parenthesis) and e-mail address of the notification recipient is displayed. User alias, name and surname are displayed since Zabbix 2.4.0.
<i>Message</i>	The content of the message/remote command is displayed. A remote command is separated from the target host with a colon symbol: <host>: <command>. If the remote command is executed on Zabbix server, then the information has the following format: Zabbix server:<command> See also: known issues for 3.0.0 - 3.0.17.
<i>Status</i>	Operation status is displayed: <i>In progress</i> - action is in progress For actions in progress the number of retries left is displayed - the remaining number of times the server will try to send the notification. <i>Sent</i> - notification has been sent <i>Executed</i> - command has been executed <i>Not sent</i> - action has not been completed.
<i>Info</i>	Error information (if any) regarding the action execution is displayed.

6 Notifications

Overview

In the *Reports* → *Notifications* section a report on the number of notifications sent to each user is displayed.

From the dropdowns in the top right-hand corner you can choose the media type (or all), period (data for each day/week/month/year) and year for the notifications sent.

Notifications			
	Media type	all	Period
		Daily	Year
		2016	
DAY	ADMIN (ZABBIX ADMINISTRATOR)	GUEST	USER (NEW USER)
2016-01-01			
2016-01-02	6 (6/0/0/0)		
2016-01-03	2 (2/0/0/0)		
2016-01-04	10 (10/0/0/0)		
2016-01-05	24 (24/0/0/0)		
2016-01-06	10 (10/0/0/0)		
2016-01-07	6 (6/0/0/0)		
2016-01-08	4 (4/0/0/0)		

Each column displays totals per one system user.

4 Configuration

Overview

The Configuration menu contains sections for setting up major Zabbix functions, such as hosts and host groups, data gathering, data thresholds, sending problem notifications, creating data visualisation and others.

1 Host groups

Overview

In the *Configuration* → *Host groups* section users can configure and maintain host groups. A host group can contain both templates and hosts.

A listing of existing host groups with their details is displayed.

Host groups				Create host group
<input type="checkbox"/> NAME ▼	HOSTS	TEMPLATES	MEMBERS	INFO
<input type="checkbox"/> Zabbix servers	Hosts 1	Templates	Zabbix server	
<input type="checkbox"/> Windows servers	Hosts	Templates		
<input type="checkbox"/> Web servers	Hosts	Templates		
<input type="checkbox"/> Virtual machines	Hosts	Templates		
<input type="checkbox"/> UPS devices	Hosts	Templates		
<input type="checkbox"/> Templates	Hosts	Templates 42	New template, Template1, Template2, Template App FTP Service, Template App HTTP Service, Template App HTTPS Service, Template App IMAP Service, Template App LDAP Service, Template App MySQL, Template App NNTP Service, Template App NTP Service, Template App POP Service, Template App SMTP Service, Template App SSH Service, Template App Telnet Service, Template App Zabbix Agent, Template App Zabbix Proxy, Template App Zabbix Server, Template ICMP Ping, Template IPMI Intel SR1530, Template IPMI Intel SR1630, Template JMX Generic, Template JMX Tomcat, Template OS AIX, Template OS FreeBSD, Template OS HP-UX, Template OS Linux, Template OS Mac OS X, Template OS OpenBSD, Template OS Solaris, Template OS Windows, Template SNMP Device, Template SNMP Disks, Template SNMP Generic, Template SNMP Interfaces, Template SNMP Interfaces_Orig, Template SNMP OS Linux, Template SNMP OS Windows, Template SNMP Processors, Template Virt VMware, Template Virt VMware Guest, Template Virt VMware Hypervisor	
<input type="checkbox"/> SNMP hosts	Hosts 1	Templates	procurve.zabbix.lan	

Displayed data:

Column	Description
Name	Name of the host group. Clicking on the group name opens the host group configuration form .
Hosts	Number of hosts in the group (displayed in grey). Clicking on "Hosts" will, in the whole listing of hosts, filter out those that belong to the group.
Templates	Number of templates in the group (displayed in grey). Clicking on "Templates" will, in the whole listing of templates, filter out those that belong to the group.
Members	Names of group members. Template names are displayed in grey, monitored host names in blue and non-monitored host names in red. Clicking on a name will open the template/host configuration form.
Info	Error information (if any) regarding the host group is displayed.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable hosts* - change the status of all hosts in the group to "Monitored"
- *Disable hosts* - change the status of all hosts in the group to "Not monitored"
- *Delete* - delete the host groups

To use these options, mark the checkboxes before the respective host groups, then click on the required button.

2 Templates

Overview

In the *Configuration* → *Templates* section users can configure and maintain templates.

A listing of existing templates with their details is displayed.

Templates									
		Group		all		Create template		Import	
<input type="checkbox"/> TEMPLATES ▼	APPLICATIONS	ITEMS	TRIGGERS	GRAPHS	SCREENS	DISCOVERY	WEB	LINKED TEMPLATES	LINKED TO
<input type="checkbox"/> Template Virt VMWare Hypervisor	Applications 6	Items 19	Triggers	Graphs	Screens	Discovery 1	Web		
<input type="checkbox"/> Template Virt VMWare Guest	Applications 8	Items 17	Triggers	Graphs	Screens	Discovery 3	Web		
<input type="checkbox"/> Template Virt VMWare	Applications 3	Items 3	Triggers	Graphs	Screens	Discovery 3	Web		
<input type="checkbox"/> Template SNMP Processors	Applications 1	Items	Triggers	Graphs	Screens	Discovery 1	Web		Template SNMP OS Linux, Template SNMP OS Windows
<input type="checkbox"/> Template SNMP OS Windows	Applications 4	Items 6	Triggers	Graphs	Screens	Discovery 3	Web	Template SNMP Disks, Template SNMP Generic, Template SNMP Interfaces_Orig, Template SNMP Processors	
<input type="checkbox"/> Template SNMP OS Linux	Applications 4	Items 6	Triggers	Graphs	Screens	Discovery 3	Web	Template SNMP Disks, Template SNMP Generic, Template SNMP Interfaces_Orig, Template SNMP Processors	
<input type="checkbox"/> Template SNMP Interfaces_Orig	Applications 1	Items 1	Triggers	Graphs	Screens	Discovery 1	Web		Template SNMP Device, Template SNMP OS Linux, Template SNMP OS Windows
<input type="checkbox"/> Template SNMP Interfaces	Applications 1	Items 1	Triggers	Graphs	Screens	Discovery 1	Web		procurve.zabbix.ian

From the dropdown to the right in the title bar you can choose whether to display all templates or only those belonging to a group.

Displayed data:

Column	Description
<i>Templates</i>	Name of the template. Clicking on the template name opens the template configuration form .
<i>Entities (Applications, Items, Triggers, Graphs, Screens, Discovery, Web)</i>	Number of the respective entities in the template (displayed in grey). Clicking on the entity name will, in the whole listing of that entity, filter out those that belong to the template.
<i>Linked templates</i>	Templates that are linked to the template, in a nested setup where the template will inherit all entities of the linked templates.
<i>Linked to</i>	The hosts and templates that the template is linked to.

To configure a new template, click on the *Create template* button in the top right-hand corner. To import a template from an XML file, click on the *Import* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Export* - export the template to an XML file
- *Delete* - delete the template while leaving its linked entities (items, triggers etc.) with the hosts
- *Delete and clear* - delete the template and its linked entities from the hosts

To use these options, mark the checkboxes before the respective templates, then click on the required button.

3 Hosts

Overview

In the *Configuration → Hosts* section users can configure and maintain hosts.

A listing of existing hosts with their details is displayed.

From the dropdown to the right in the *Hosts* bar you can choose whether to display all hosts or only those belonging to one particular group.

Hosts										
							Group	all	Create host	Import
Filter										
<input type="checkbox"/>	NAME	APPLICATIONS	ITEMS	TRIGGERS	GRAPHS	DISCOVERY	WEB	INTERFACE	TEMPLATES	STATUS
<input type="checkbox"/>	Zabbix server	Applications 12	Items 71	Triggers 44	Graphs 12	Discovery 2	Web 1	192.168.3.194:10050	Template1 (Template2), Template App Zabbix Server, Template OS Linux (Template App Zabbix Agent)	Enabled ZBX SNMP JMX IPMI NONE
<input type="checkbox"/>	procurve.zabbix.lan	Applications 1	Items 1	Triggers	Graphs	Discovery 1	Web	192.168.3.7:161	Template SNMP Interfaces	Enabled ZBX SNMP JMX IPMI NONE
<input type="checkbox"/>	New host	Applications 10	Items 42	Triggers 18	Graphs 9	Discovery 2	Web	192.168.3.31:32050	Template OS Linux (Template App Zabbix Agent)	Enabled ZBX SNMP JMX IPMI NONE

Displayed data:

Column	Description
Name	Name of the host. Clicking on the host name opens the host configuration form .
Elements (Applications, Items, Triggers, Graphs, Discovery, Web)	Clicking on the element name will display items, triggers etc. of the host. The number of the respective elements is displayed in gray.
Interface	The main interface of the host is displayed.
Templates	The templates linked to the host are displayed. If other templates are contained in the linked template, those are displayed in parentheses, separated by a comma. Clicking on a template name will open its configuration form.
Status	Host status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.
Availability	Availability of the host is displayed. Four icons each represent a supported interface (Zabbix agent, SNMP, IPMI, JMX). The current status of the interface is displayed by the respective colour: Green - available Red - not available (upon mouseover, details of why the interface cannot be reached are displayed) Gray - unknown or not configured
Agent encryption	Note that active Zabbix agent items do not affect host availability. Encryption status for connections to the host is displayed: None - no encryption PSK - using pre-shared key Cert - using certificate
Info	Error information (if any) regarding the host is displayed.

To configure a new host, click on the *Create host* button in the top right-hand corner. To import a host from an XML file, click on the *Import* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change host status to *Monitored*
- *Disable* - change host status to *Not monitored*
- *Export* - export the hosts to an XML file
- *Mass update* - **update several properties** for a number of hosts at once
- *Delete* - delete the hosts

To use these options, mark the checkboxes before the respective hosts, then click on the required button.

Filter

As the list may contain very many hosts, it may be needed to filter out the ones you really need.

The *Filter* link is available above the list of hosts. If you click on it, a filter becomes available where you can filter hosts by name, DNS, IP or port number.

Filter ▲

Name like

Port like

Filter

Reset

Reading host availability

Host availability icons reflect the current host interface status on Zabbix server. Therefore, in the frontend:

- If you disable a host, availability icons will not immediately turn gray (unknown status), because the server has to synchronize the configuration changes first;
- If you enable a host, availability icons will not immediately turn green (available), because the server has to synchronize the configuration changes and start polling the host first.

Unknown host status

Zabbix server sets the host availability icon to gray (unknown status) for the corresponding agent interface (Zabbix, SNMP, IPMI, JMX) if:

- there are no enabled items on the interface (they were removed or disabled);
- there are only active Zabbix agent items;
- there are no pollers for that type of the interface (e.g. StartPollers=0);
- host is disabled;
- host is set to be monitored by proxy, a different proxy or by server if it was monitored by proxy;
- host is monitored by a proxy that appears to be offline (no updates received from the proxy during the maximum heartbeat interval - 1 hour).

Setting host availability to unknown is done after server configuration cache synchronization. Restoring host availability (available/unavailable) on hosts monitored by proxies is done after proxy configuration cache synchronization.

See also more details about host [unreachability](#).

1 Applications

Overview

The application list for a template can be accessed from *Configuration → Templates* and then clicking on Applications for the respective template.

The application list for a host can be accessed from *Configuration → Hosts* and then clicking on Applications for the respective host.

A list of existing applications is displayed.

Applications		Group	all	Host	Zabbix server	Create application
All hosts / Zabbix server		Enabled	ZBX	SNMP	JMX	IPMI
		Applications 12	Items 71	Triggers 44	Graphs 12	Discovery rules 2

Template OS Linux: Processes	Items 2					
Template OS Linux: Security	Items 2					
Template App Zabbix Agent: Zabbix agent	Items 3					
Zabbix frontend	Items					
Template App Zabbix Server: Zabbix server	Items 30					

Displayed data:

Column	Description
<i>Application</i>	Name of the application, displayed as a blue link for directly created applications. Clicking on the application name link opens the application configuration form . If the host application belongs to a template, the template name is displayed before the application name, as a grey link. Clicking on the template link will open the application list on the template level.
<i>Items</i>	Click on Items to view the items contained in the application. The number of items is displayed in grey.
<i>Info</i>	Error information (if any) regarding the application is displayed.

To configure a new application, click on the *Create application* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change application status to *Enabled*
- *Disable* - change application status to *Disabled*
- *Delete* - delete the applications

To use these options, mark the checkboxes before the respective applications, then click on the required button.

2 Items

Overview

The item list for a template can be accessed from *Configuration → Templates* and then clicking on Items for the respective template.

The item list for a host can be accessed from *Configuration → Hosts* and then clicking on Items for the respective host.

A list of existing items is displayed.

Displayed data:

Column	Description
<i>Wizard</i>	The wizard icon is a link to a wizard for creating a trigger based on the item.

Column	Description
<i>Name</i>	Name of the item, mostly displayed as a blue link except for items created from item prototypes. Clicking on the item name link opens the item configuration form . If the host item belongs to a template, the template name is displayed before the item name, as a grey link. Clicking on the template link will open the item list on the template level. If the item has been created from an item prototype, its name is preceded by the low level discovery rule name, in orange. Clicking on the discovery rule name will open the item prototype list.
<i>Triggers</i>	Moving the mouse over Triggers will display an info box displaying the triggers associated with the item. The number of the triggers is displayed in grey.
<i>Key</i>	Item key is displayed.
<i>Interval</i>	Frequency of the check is displayed.
<i>History</i>	How many days item data history will be kept is displayed.
<i>Trends</i>	How many days item trends history will be kept is displayed.
<i>Type</i>	Item type is displayed (Zabbix agent, SNMP agent, simple check, etc).
<i>Applications</i>	Item applications are displayed.
<i>Status</i>	Item status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Not supported</i> . By clicking on the status you can change it - from Enabled to Disabled (and back); from Not supported to Disabled (and back).
<i>Info</i>	If everything is fine, no icon is displayed in this column. If there are errors, a red square icon with a cross is displayed. Move the mouse over the icon and you will see a tooltip with the error description.

To configure a new item, click on the *Create item* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change item status to *Enabled*
- *Disable* - change item status to *Disabled*
- *Clear history* - delete history and trend data for items
- *Copy* - copy the items to other hosts or templates
- *Mass update* - **update several properties** for a number of items at once
- *Delete* - delete the items

To use these options, mark the checkboxes before the respective items, then click on the required button.

Filter

As the list may contain very many items, it may be needed to filter out the ones you really need.

The *Filter* link is available above the list. If you click on it, a filter becomes available where you can filter items by several properties.

Displayed data:

Column	Description
Severity	Severity of the trigger is displayed by both name and cell background colour.
Name	Name of the trigger, mostly displayed as a blue link except for triggers created from trigger prototypes. Clicking on the trigger name link opens the trigger configuration form . If the host trigger belongs to a template, the template name is displayed before the trigger name, as a grey link. Clicking on the template link will open the trigger list on the template level. If the trigger has been created from a trigger prototype, its name is preceded by the low level discovery rule name, in orange. Clicking on the discovery rule name will open the trigger prototype list.
Expression	Trigger expression is displayed. The host-item part of the expression is displayed as a link, leading to the item configuration form.
Status	Trigger status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Unknown</i> . By clicking on the status you can change it - from Enabled to Disabled (and back); from Unknown to Disabled (and back). Problems of a disabled trigger are no longer displayed in the frontend, but are not deleted.
Info	If everything is fine, no icon is displayed in this column. If there are errors, a red square icon with a cross is displayed. Move the mouse over the icon and you will see a tooltip with the error description.

To configure a new trigger, click on the *Create trigger* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change trigger status to *Enabled*
- *Disable* - change trigger status to *Disabled*
- *Copy* - copy the triggers to other hosts or templates
- *Mass update* - update several properties for a number of triggers at once
- *Delete* - delete the triggers

To use these options, mark the checkboxes before the respective triggers, then click on the required button.

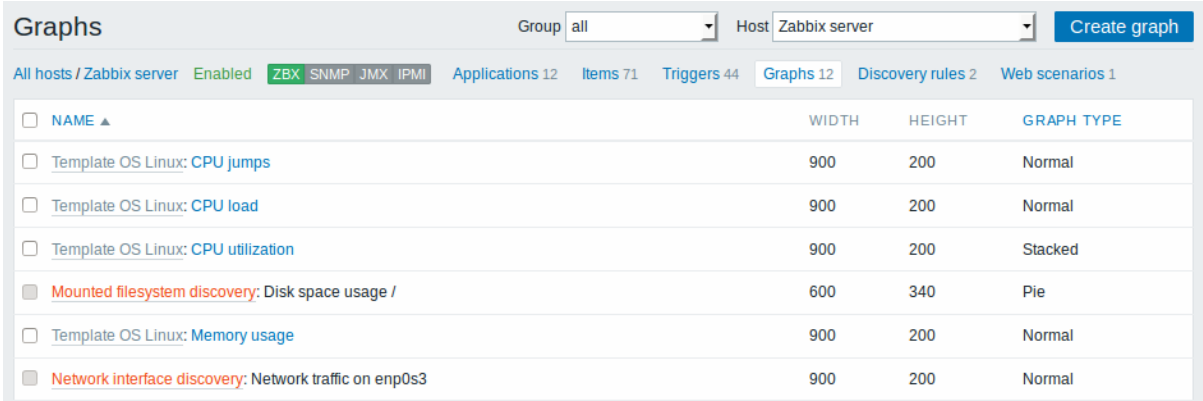

4 Graphs

Overview

The custom graph list for a template can be accessed from *Configuration → Templates* and then clicking on Graphs for the respective template.

The custom graph list for a host can be accessed from *Configuration → Hosts* and then clicking on Graphs for the respective host.

A list of existing graphs is displayed.

Displayed data:

Column	Description
Name	Name of the custom graph, mostly displayed as a blue link except for graphs created from graph prototypes. Clicking on the graph name link opens the graph configuration form . If the host graph belongs to a template, the template name is displayed before the graph name, as a grey link. Clicking on the template link will open the graph list on the template level. If the graph has been created from a graph prototype, its name is preceded by the low level discovery rule name, in orange. Clicking on the discovery rule name will open the graph prototype list.
Width	Graph width is displayed.
Height	Graph height is displayed.
Graph type	Graph type is displayed - <i>Normal</i> , <i>Stacked</i> , <i>Pie</i> or <i>Exploded</i> .

To configure a new graph, click on the *Create graph* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click on the required button.

5 Discovery rules

Overview

The list of low-level discovery rules for a template can be accessed from *Configuration → Templates* and then clicking on Discovery for the respective template.

The list of low-level discovery rules for a host can be accessed from *Configuration → Hosts* and then clicking on Discovery for the respective host.

A list of existing low-level discovery rules is displayed.

Discovery rules										Create discovery rule
All hosts / Zabbix server Enabled ZBX SNMP JMX IPMI Applications 12 Items 71 Triggers 44 Graphs 12 Discovery rules 2 Web scenarios 1										
<input type="checkbox"/> NAME ▲	ITEMS	TRIGGERS	GRAPHS	HOSTS	KEY	INTERVAL	TYPE	STATUS	INFO	
<input type="checkbox"/> Template OS Linux: Mounted filesystem discovery	Item prototypes 5	Trigger prototypes 2	Graph prototypes 1	Host prototypes	vfs.fs.discovery	1h	Zabbix agent	Enabled		
<input type="checkbox"/> Template OS Linux: Network interface discovery	Item prototypes 2	Trigger prototypes	Graph prototypes 1	Host prototypes	net.if.discovery	1h	Zabbix agent	Enabled		

Displayed data:

Column	Description
<i>Name</i>	Name of the rule, displayed as a blue link. Clicking on the rule name opens the low-level discovery rule configuration form . If the discovery rule belongs to a template, the template name is displayed before the rule name, as a grey link. Clicking on the template link will open the rule list on the template level.
<i>Items</i>	A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in grey.
<i>Triggers</i>	A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in grey.
<i>Graphs</i>	A link to the list of graph prototypes displayed. The number of existing graph prototypes is displayed in grey.
<i>Hosts</i>	A link to the list of host prototypes displayed. The number of existing host prototypes is displayed in grey.
<i>Key</i>	The item key used for discovery is displayed.
<i>Interval</i>	The frequency of performing discovery is displayed.
<i>Type</i>	The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).
<i>Status</i>	Discovery rule status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Not supported</i> . By clicking on the status you can change it - from Enabled to Disabled (and back); from Not supported to Disabled (and back).
<i>Info</i>	If everything is fine, no icon is displayed in this column. If there are errors, a red square icon with a cross is displayed. Move the mouse over the icon and you will see a tooltip with the error description.

To configure a new low-level discovery rule, click on the *Create discovery rule* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the low-level discovery rule status to *Enabled*
- *Disable* - change the low-level discovery rule status to *Disabled*
- *Delete* - delete the low-level discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

6 Web scenarios

Overview

The web scenario list for a template can be accessed from *Configuration* → *Templates* and then clicking on Web for the respective template.

The web scenario list for a host can be accessed from *Configuration* → *Hosts* and then clicking on Web for the respective host.

A list of existing web scenarios is displayed. From the dropdown to the right in the *Scenarios* bar you can choose whether to display all web scenarios or only those belonging to one particular group and host. Additionally you can choose to hide disabled scenarios (or show them again) by clicking on the respective link.

Web monitoring Group: Host: [Create web scenario](#)

All hosts / Zabbix server **Enabled** [ZBX](#) [SNMP](#) [JMX](#) [IPMI](#) Applications 12 Items 71 Triggers 44 Graphs 12 Discovery rules 2 Web scenarios 1

<input type="checkbox"/> NAME ▲	NUMBER OF STEPS	UPDATE INTERVAL	ATTEMPTS	AUTHENTICATION	HTTP PROXY	APPLICATION	STATUS	INFO
<input type="checkbox"/> Zabbix frontend	5	3m	1	None	No	Zabbix frontend	Enabled	

Displayed data:

Column	Description
<i>Name</i>	Name of the web scenario. Clicking on the web scenario name opens the web scenario configuration form .
<i>Number of steps</i>	The number of steps contained in the scenario.
<i>Update interval</i>	How often the scenario is performed.
<i>Attempts</i>	How many attempts for executing web scenario steps are performed.
<i>Authentication</i>	Authentication method is displayed - Basic, NTLM or None.
<i>HTTP proxy</i>	Displays HTTP proxy or 'No' if not used.
<i>Application</i>	Web scenario application is displayed.
<i>Status</i>	Web scenario status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.
<i>Info</i>	If everything is fine, no icon is displayed in this column. If there are errors, a red square icon with a cross is displayed. Move the mouse over the icon and you will see a tooltip with the error description.

To configure a new web scenario, click on the *Create web scenario* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the scenario status to *Enabled*
- *Disable* - change the scenario status to *Disabled*
- *Clear history* - clear history and trend data for the scenarios
- *Delete* - delete the web scenarios

To use these options, mark the checkboxes before the respective web scenarios, then click on the required button.

4 Maintenance

Overview

In the *Configuration* → *Maintenance* section users can configure and maintain maintenance periods for hosts.

A listing of existing maintenance periods with their details is displayed.

From the dropdown to the right in the *Maintenance periods* bar you can choose whether to display all maintenance periods or only those belonging to one particular group.

Maintenance periods Group: [Create maintenance period](#)

<input type="checkbox"/> NAME ▲	TYPE	ACTIVE SINCE	ACTIVE TILL	STATE	DESCRIPTION
<input type="checkbox"/> Weekly maintenance	With data collection	2015-01-01 00:00	2016-01-01 00:00	Active	We break and fix things at this time.

Displayed data:

Column	Description
<i>Name</i>	Name of the maintenance period. Clicking on the maintenance period name opens the maintenance period configuration form .
<i>Type</i>	The type of maintenance is displayed: <i>With data collection</i> or <i>No data collection</i>
<i>Active since</i>	The date and time when executing maintenance periods becomes active.
<i>Active till</i>	The date and time when executing maintenance periods stops being active.

Column	Description
<i>State</i>	The state of the maintenance period: Approaching - will become active soon Active - is active Expired - is not active any more
<i>Description</i>	Description of the maintenance period is displayed.

Name, *Type*, *Active since* and *Active till* are sortable columns that can be sorted in ascending/descending order. To sort, click on the column name.

To configure a new maintenance period, click on the *Create maintenance period* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the maintenance periods

To use this option, mark the checkboxes before the respective maintenance periods and click on *Delete*.

5 Actions

Overview

In the *Configuration* → *Actions* section users can configure and maintain actions.

A listing of existing actions with their details is displayed. The actions displayed are actions assigned to the selected event source (triggers, discovery, auto-registration).

To view actions assigned to a different event source, change the source from the dropdown to the right in the *Actions* bar.

For users without Super-admin rights actions are displayed according to permission settings. That means in some cases a user without Super-admin rights isn't able to view the complete action list because of certain permission restrictions. An action is displayed to the user without Super-admin rights if the following conditions are fulfilled:

- The user has read-write access to host groups, hosts, templates and triggers in action conditions
- The user has read-write access to host groups, hosts and templates in action operations
- The user has read access to user groups and users in action operations

Actions			
Event source			Triggers
Create action			
<input type="checkbox"/> NAME ▲	CONDITIONS	OPERATIONS	STATUS
<input type="checkbox"/> Report problems to Zabbix administrators	Maintenance status not in <i>maintenance</i> Trigger value = <i>PROBLEM</i> Host group = <i>Zabbix servers</i>	Send message to user groups: Zabbix administrators via Email Send message to users: user (New User) via all media Run remote commands on current host	Enabled

Displayed data:

Column	Description
<i>Name</i>	Name of the action. Clicking on the action name opens the action configuration form .
<i>Conditions</i>	Action conditions are displayed.
<i>Operations</i>	Action operations are displayed. Since Zabbix 2.2, the operation list also displays the media type (e-mail, SMS, Jabber, etc) used for notification as well as the name and surname (in parentheses after the alias) of a notification recipient.
<i>Status</i>	Action status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it. See the Escalations section for more details as to what happens if an action is disabled during an escalation in progress.

To configure a new action, click on the *Create action* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the action status to *Enabled*
- *Disable* - change the action status to *Disabled*
- *Delete* - delete the actions

To use these options, mark the checkboxes before the respective actions, then click on the required button.

6 Discovery

Overview

In the *Configuration* → *Discovery* section users can configure and maintain discovery rules.

A listing of existing discovery rules with their details is displayed.

Discovery rules					Create discovery rule
<input type="checkbox"/> NAME ▲	IP RANGE	DELAY	CHECKS	STATUS	
<input type="checkbox"/> Local network	192.168.3.1-9	1h	ICMP ping, SNMPv2 agent, Zabbix agent	Enabled	

Displayed data:

Column	Description
<i>Name</i>	Name of the discovery rule. Clicking on the discovery rule name opens the discovery rule <i>configuration form</i> .
<i>IP range</i>	The range of IP addresses to use for network scanning is displayed.
<i>Delay</i>	The frequency of performing discovery displayed.
<i>Checks</i>	The types of checks used for discovery are displayed.
<i>Status</i>	Action status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.

To configure a new discovery rule, click on the *Create discovery rule* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the discovery rule status to *Enabled*
- *Disable* - change the discovery rule status to *Disabled*
- *Delete* - delete the discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

7 IT services

Overview

In the *Configuration* → *IT services* section users can configure and maintain an IT services hierarchy.

When you first open this section it only contains a *root* entry.

You can use it as a starting point of building the hierarchy of monitored infrastructure. Click on *Add child* to add services and then other services below the ones you have added.

IT services			
SERVICE	ACTION	STATUS CALCULATION	TRIGGER
root	Add child		
▼ SLA by service	Add child	Problem, if all children have problems	
Server 1	Add child Delete	Problem, if at least one child has a problem	
Server 2	Add child Delete	Problem, if at least one child has a problem	
Server 3	Add child Delete	Problem, if at least one child has a problem	
Server 4	Add child Delete	Problem, if at least one child has a problem	
Server 5	Add child Delete	Problem, if at least one child has a problem	

For details on adding services, see the [IT services](#) section.

5 Administration

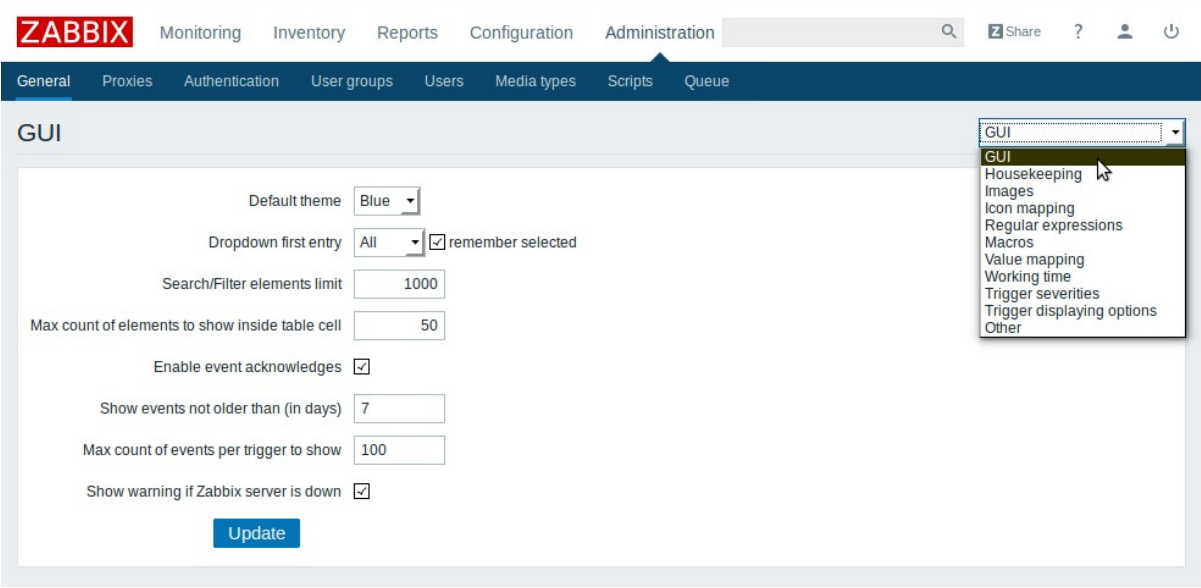

Overview

The Administration menu is for administrative functions of Zabbix. This menu is available to users of [Super Administrators](#) type only.

1 General

Overview

The *Administration* → *General* section contains a number of screens for setting frontend-related defaults and customizing Zabbix. The dropdown to the right allows you to switch between different configuration screens.

1 GUI

This screen provides customization of several frontend-related defaults.

Default theme

Blue

Dropdown first entry

All

☒ remember selected

Search/Filter elements limit

1000

Max count of elements to show inside table cell

50

Enable event acknowledges

☒

Show events not older than (in days)

7

Max count of events per trigger to show

100

Show warning if Zabbix server is down

☒

Update

Configuration parameters:

Parameter	Description
<i>Default theme</i>	Default theme for users who have not set a specific one in their profiles.
<i>Dropdown first entry</i>	Whether first entry in element selection dropdowns should be <i>All</i> or <i>None</i> . With <i>remember selected</i> checked, the last selected element in the dropdown will be remembered (instead of the default) when navigating to another page.
<i>Search/Filter elements limit</i>	Maximum amount of elements (rows) that will be displayed in a web-interface list, like, for example, in <i>Monitoring → Events</i> or <i>Configuration → Hosts</i> . <i>Note:</i> If set to, for example, '50', only the first 50 elements will be displayed in all affected frontend lists. If some list contains more than fifty elements, the indication of that will be the '+' sign in "Displaying 1 to 50 of 50+ found". Also, if filtering is used and still there are more than 50 matches, only the first 50 will be displayed.
<i>Max count of elements to show inside table cell</i>	For entries that are displayed in a single table cell, no more than configured here will be shown.
<i>Enable event acknowledges</i>	This parameter defines if event acknowledgments are activated in Zabbix interface.
<i>Show events not older than (in days)</i>	This parameter defines for how many days events are displayed in Status of Triggers screen. Default is 7 days.
<i>Max count of events per trigger to show</i>	Maximum number of event to show for each trigger in Status of Triggers screen. Default is 100.
<i>Show warning if Zabbix server is down</i>	This parameter enables a warning message to be displayed in the browser window if Zabbix server cannot be reached (may be down). The message remains visible even if the user scrolls down the page. If the mouse is moved over it, the message is temporarily hidden to reveal the contents below. This parameter is supported since Zabbix 2.0.1.

2 Housekeeper

The housekeeper is a periodical process, executed by Zabbix server. The process removes outdated information and information deleted by user.

Events and alerts

Enable internal housekeeping ☒

Trigger data storage period (in days)

Internal data storage period (in days)

Network discovery data storage period (in days)

Data storage period (in days)

History

Enable internal housekeeping ☒

Override item history period ☐

Data storage period (in days)

Trends

Enable internal housekeeping ☒

Override item trend period ☐

Data storage period (in days)

Update

Reset defaults

In this section housekeeping tasks can be enabled or disabled on a per-task basis separately for: events and alerts/IT services/audit/user sessions/history/trends. If housekeeping is enabled, it is possible to set for how many days data records will be kept before being removed by the housekeeper.

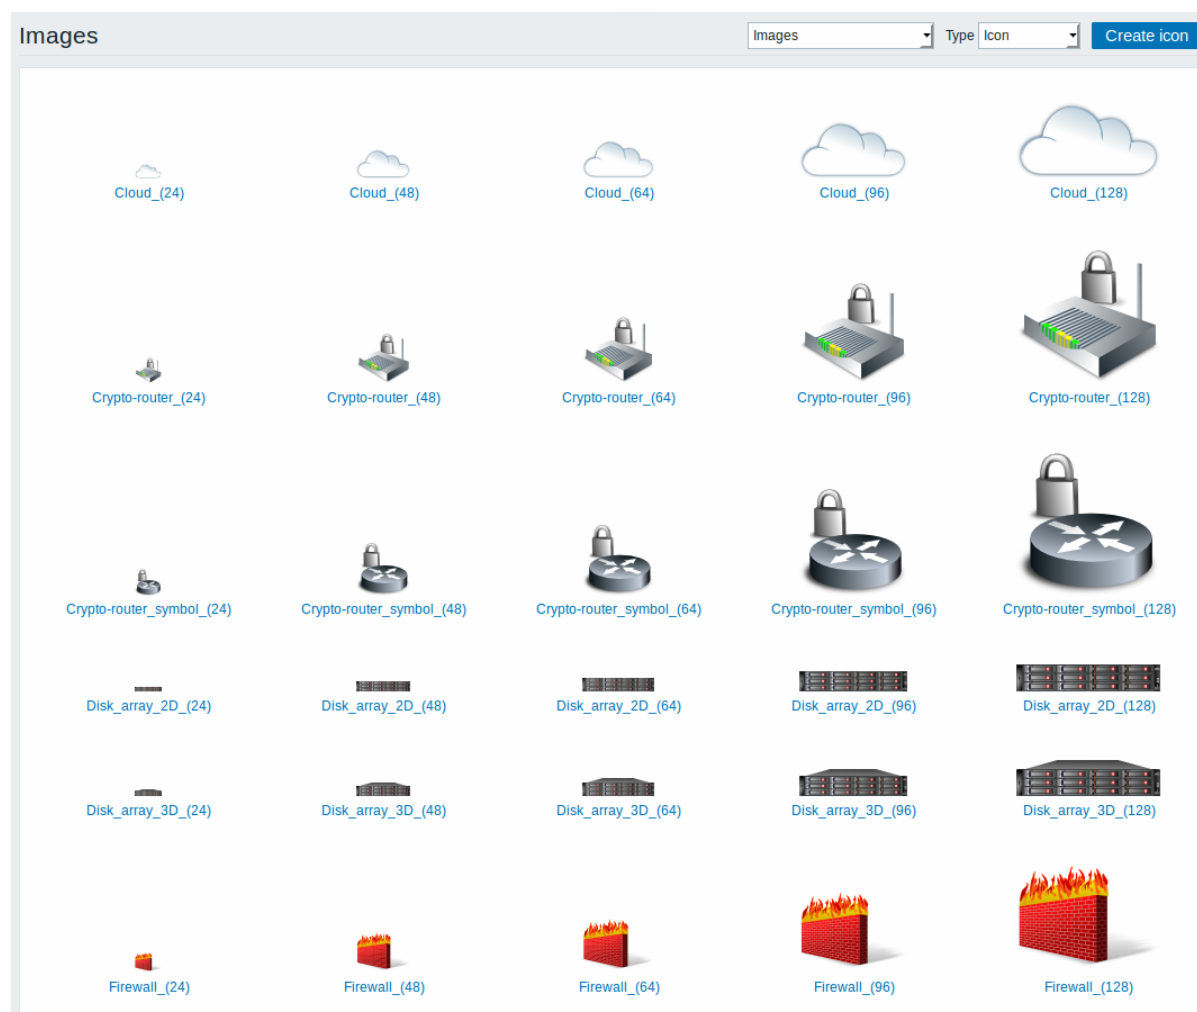

For history and trends an additional option is available: *Override item history period* and *Override item trends period*. This option allows to globally set for how many days item history/trends will be kept, in this case overriding the values set for individual items in *Keep history/Keep trends* fields in **item configuration**.

It is possible to override the history/trend storage period even if internal housekeeping is disabled. Thus, when using an external housekeeper, the history storage period could be set using the history *Data storage period* field.

Reset defaults button allows to revert any changes made.

3 Images

The Images section displays all the images available in Zabbix. Images are stored in the database.

The *Type* dropdown allows you to switch between icon and background images:

- Icons are used to display **network map** elements
- Backgrounds are used as background images of network maps

Adding image

You can add your own image by clicking on the *Create icon* or *Create background* button in the top right corner.

Name

Upload

Browse...

No file selected.

Add

Cancel

Image attributes:

Parameter	Description
<i>Name</i>	Unique name of an image.
<i>Upload</i>	Select the file (PNG, JPEG) from a local system to be uploaded to Zabbix.

Note:

Maximum size of the upload file is limited by value of ZBX_MAX_IMAGE_SIZE that is 1024x1024 bytes or 1 MB.

The upload of an image may fail if the image size is close to 1 MB and the `max_allowed_packet` MySQL configuration parameter is at a default of 1MB. In this case, increase the [max_allowed_packet](#) parameter.

4 Icon mapping

This section allows to create the mapping of certain hosts with certain icons. Host inventory field information is used to create the mapping.

The mappings can then be used in [network map configuration](#) to assign appropriate icons to matching hosts automatically.

To create a new icon map, click on *Create icon map* in the top right corner.

Name

Host type

Mappings

	INVENTORY FIELD	EXPRESSION	ICON	ACTION
1:	Type	server	Server_(96)	Remove
2:	Type	router	Router_(96)	Remove
3:	Type	workstation	Workstation_(96)	Remove
Add				
	Default		Cloud_(24)	

Add

Cancel

Configuration parameters:

Parameter	Description
<i>Name</i>	Unique name of icon map.
<i>Mappings</i>	A list of mappings. The order of mappings determines which one will have priority. You can move mappings up and down the list with drag-and-drop.
<i>Inventory field</i>	Host inventory field that will be looked into to seek a match.
<i>Expression</i>	Regular expression describing the match.
<i>Icon</i>	Icon to use if a match for the expression is found.
<i>Default</i>	Default icon to use.

5 Regular expressions

This section allows to create custom regular expressions that can be used in several places in the frontend. See [Regular expressions](#) section for details.

6 Macros

This section allows to define system-wide macros.

MACRO

VALUE

{ \$SNMP_COMMUNITY }

⇒

public

{ \$MACRO }

⇒

value

Add

Update

See [User macros](#) section for more details.

7 Value mapping

This section allows to manage value maps that are useful for human-readable representation of incoming data in Zabbix frontend.

Value mapping

Value mapping

Create value map

Import

NAME	VALUE MAP	USED IN ITEMS
<input type="checkbox"/> Zabbix agent ping status	1 ⇒ Up	
<input type="checkbox"/> Windows service state	0 ⇒ Running 1 ⇒ Paused 2 ⇒ Start pending 3 ⇒ Pause pending 4 ⇒ Continue pending 5 ⇒ Stop pending 6 ⇒ Stopped 7 ⇒ Unknown 255 ⇒ No such service	
<input type="checkbox"/> VMware VirtualMachinePowerState	0 ⇒ poweredOff 1 ⇒ poweredOn 2 ⇒ suspended	Yes
<input type="checkbox"/> VMware status	0 ⇒ gray 1 ⇒ green 2 ⇒ yellow 3 ⇒ red	Yes
<input type="checkbox"/> SNMP interface status (ifOperStatus)	1 ⇒ up 2 ⇒ down 3 ⇒ testing 4 ⇒ unknown 5 ⇒ dormant 6 ⇒ notPresent 7 ⇒ lowerLayerDown	Yes

See [Value mapping](#) section for more details.

8 Working time

Working time is system-wide parameter, which defines working time. Working time is displayed as a white background in graphs, while non-working time is displayed in grey.

Working time

1-5,09:00-18:00;

Update

See [Time period specification](#) page for description of the time format.

9 Trigger severities

This section allows to customize [trigger severity](#) names and colors.

Not classified >Custom name< 97AAB3

Information Information 7499FF

Warning Warning FFC859

Average Average FFA059

High High

Disaster Disaster

Info Custom severity names affect all locales and require manual update

Update Reset defaults

You can enter new names and color codes or click on the color to select another from the provided palette.

See [Customising trigger severities](#) page for more information.

10 Trigger displaying options

This section allows to customize how trigger status is displayed in the frontend.

Unacknowledged PROBLEM events DC0000 ☒ blinking

Acknowledged PROBLEM events DC0000 ☒ blinking

Unacknowledged OK events 00AA00 ☒ blinking

Acknowledged OK events 00AA00 ☒ blinking

Display OK triggers for 1800 seconds

On status change triggers blink for 1800 seconds

Update Reset defaults

The colors for acknowledged/unacknowledged events can be customized and blinking enabled or disabled. Also the time period for displaying OK triggers and for blinking upon trigger status change can be customized.

11 Other parameters

This section allows to configure several other frontend parameters.

Refresh unsupported items (in sec)

600

Group for discovered hosts

Discovered hosts

Default host inventory mode

Disabled

Manual

Automatic

User group for database down message

Zabbix administrators

Log unmatched SNMP traps

☒

Update

Parameter	Description
<i>Refresh unsupported items (in sec)</i>	<p>Some items may become unsupported due to errors in user parameters or because of an item not being supported by agent. Zabbix can be configured to periodically make unsupported items active.</p> <p>Zabbix will activate unsupported item every N seconds set here. If set to 0, the automatic activation will be disabled. Note that the first attempt to reactivate the unsupported item may occur earlier than the value configured here.</p> <p>The configured value also applies to how often Zabbix proxies reactivate unsupported items.</p>
<i>Group for discovered hosts</i>	<p>Hosts discovered by network discovery and agent auto-registration will be automatically placed in the host group, selected here.</p>

Parameter	Description	
<i>Default host inventory mode</i>	Default mode for host inventory. It will be followed whenever a new host or host prototype is created by server or frontend, unless overridden during host discovery/auto registration by the <i>//Set host inventory mode operation</i> . User group for database down message//	User group for sending alarm message or 'None'. Availability of Zabbix server depends on availability of back-end database. It cannot work without a database. Database watchdog, a special Zabbix server process, will alarm selected users in case of disaster. If the database is down, the watchdog will send notifications

Parameter	Description
<i>Log unmatched SNMP traps</i>	Log SNMP trap if no corresponding SNMP interfaces have been found.

2 Proxies

Overview

In the *Administration* → *Proxies* section proxies for **distributed monitoring** can be configured in the Zabbix frontend.

Proxies

A listing of existing proxies with their details is displayed.

Proxies Create proxy							
<input type="checkbox"/> NAME ▲	MODE	ENCRYPTION	LAST SEEN (AGE)	HOST COUNT	ITEM COUNT	REQUIRED PERFORMANCE (VPS)	HOSTS
<input type="checkbox"/> Remote proxy	Active	NONE	Never	2	129	1.67	Host 1, Host 2

Displayed data:

Column	Description
<i>Name</i>	Name of the proxy. Clicking on the proxy name opens the proxy configuration form .
<i>Mode</i>	Proxy mode is displayed - <i>Active</i> or <i>Passive</i> .
<i>Encryption</i>	Encryption status for connections from the proxy is displayed: None - no encryption PSK - using pre-shared key Cert - using certificate
<i>Last seen (age)</i>	The time when the proxy was last seen by the server is displayed.
<i>Host count</i>	The number of hosts monitored by the proxy is displayed.
<i>Item count</i>	The number of items monitored by the proxy is displayed.
<i>Required performance (vps)</i>	Required proxy performance is displayed (the number of values that need to be collected per second).
<i>Hosts</i>	All hosts monitored by the proxy are listed. Clicking on the host name opens the host configuration form.

To configure a new proxy, click on the *Create proxy* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable hosts* - change the status of hosts monitored by the proxy to *Monitored*
- *Disable hosts* - change the status of hosts monitored by the proxy to *Not monitored*
- *Delete* - delete the proxies

To use these options, mark the checkboxes before the respective proxies, then click on the required button.

3 Authentication

Overview

In *Administration* → *Authentication* the user authentication method to Zabbix can be changed. The available methods are internal, LDAP and HTTP authentication.

Authentication

Default authentication

Internal

LDAP

HTTP

Update

By default, internal Zabbix authentication is used. To change, click on the button with the method name and press *Update*.

Internal

Internal Zabbix authentication is used.

LDAP

External LDAP authentication can be used to check user names and passwords. Note that a user must exist in Zabbix as well, however its Zabbix password will not be used.

Zabbix LDAP authentication works at least with Microsoft Active Directory and OpenLDAP.

Default authentication

Internal

LDAP

HTTP

LDAP host

Port

389

Base DN

Search attribute

Bind DN

Bind password

Test authentication [must be a valid LDAP user]

Login

Admin

User password

Update

Test

Configuration parameters:

Parameter	Description
LDAP host	Name of LDAP server. For example: ldap://ldap.zabbix.com For secure LDAP server use ldaps protocol. ldaps://ldap.zabbix.com With OpenLDAP 2.x.x and later, a full LDAP URI of the form ldap://hostname:port or ldaps://hostname:port may be used.

Parameter	Description
<i>Port</i>	Port of LDAP server. Default is 389. For secure LDAP connection port number is normally 636. Not used when using full LDAP URIs.
<i>Base DN</i>	Base path to search accounts: ou=Users,ou=system (for OpenLDAP), DC=company,DC=com (for Microsoft Active Directory)
<i>Search attribute</i>	LDAP account attribute used for search: uid (for OpenLDAP), sAMAccountName (for Microsoft Active Directory)
<i>Bind DN</i>	LDAP account for binding and searching over the LDAP server, examples: uid=ldap_search,ou=system (for OpenLDAP), CN=ldap_search,OU=user_group,DC=company,DC=com (for Microsoft Active Directory)
<i>Bind password</i>	Required, anonymous binding is not supported. LDAP password of the account for binding and searching over the LDAP server.
<i>Test authentication</i>	Header of a section for testing
<i>Login</i>	Name of a test user (which is currently logged in the Zabbix frontend). This user name must exist in the LDAP server. Zabbix will not activate LDAP authentication if it is unable to authenticate the test user.
<i>User password</i>	LDAP password of the test user.

Warning:

In case of trouble with certificates, to make a secure LDAP connection (ldaps) work you may need to add a `TLS_REQCERT allow` line to the `/etc/openldap/ldap.conf` configuration file. It may decrease the security of connection to the LDAP catalog.

Note:

It is recommended to create a separate LDAP account (*Bind DN*) to perform binding and searching over the LDAP server with minimal privileges in the LDAP instead of using real user accounts (used for logging in the Zabbix frontend). Such an approach provides more security and does not require changing the *Bind password* when the user changes his own password in the LDAP server.
In the table above it's *ldap_search* account name.

Note:

Some user groups can still be authenticated by Zabbix. These groups must have **frontend access** set to Internal.

HTTP

Apache-based (HTTP) authentication can be used to check user names and passwords. Note that a user must exist in Zabbix as well, however its Zabbix password will not be used.

Attention:

Be careful! Make sure that Apache authentication is configured and works properly before switching it on.

Note:

In case of Apache authentication all users (even with **frontend access** set to Internal) will be authenticated by Apache, not by Zabbix!

4 User groups

Overview

In the *Administration* → *User groups* section user groups of the system are maintained.

User groups

A listing of existing user groups with their details is displayed.

User groups						Create user group
<input type="checkbox"/> NAME ▼	#	MEMBERS	FRONTEND ACCESS	DEBUG MODE	STATUS	
<input type="checkbox"/> Zabbix administrators	Users 1	Admin (Zabbix Administrator)	System default	Disabled	Enabled	
<input type="checkbox"/> Windows administrators	Users		System default	Disabled	Enabled	
<input type="checkbox"/> Security specialists	Users 1	user (New User)	System default	Disabled	Enabled	
<input type="checkbox"/> No access to the frontend	Users		Disabled	Disabled	Enabled	
<input type="checkbox"/> Network administrators	Users		System default	Disabled	Enabled	
<input type="checkbox"/> MySQL Administrators	Users		System default	Disabled	Enabled	
<input type="checkbox"/> Linux administrators	Users		System default	Disabled	Enabled	
<input type="checkbox"/> IT management	Users		System default	Disabled	Enabled	
<input type="checkbox"/> Helpdesk	Users		System default	Disabled	Enabled	
<input type="checkbox"/> Guests	Users 1	guest	System default	Disabled	Enabled	
<input type="checkbox"/> Enabled debug mode	Users		System default	Enabled	Enabled	
<input type="checkbox"/> Disabled	Users		System default	Disabled	Disabled	
<input type="checkbox"/> Database manager	Users		System default	Disabled	Enabled	

Displayed data:

Column	Description
Name	Name of the user group. Clicking on the user group name opens the user group configuration form .
#	The number of users in the group. Clicking on <i>Users</i> will display the respective users filtered out in the user list.
Members	Aliases of individual users in the user group (with name and surname in parentheses). Clicking on the alias will open the user configuration form. Users from disabled groups are displayed in red.
Frontend access	Frontend access level is displayed: System default - Zabbix, LDAP or HTTP authentication; depending on the chosen authentication method Internal - the user is authenticated by Zabbix regardless of system settings Disabled - frontend access for this user is disabled. By clicking on the current level you can change it.
Debug mode	Debug mode status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.
Status	User group status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.

To configure a new user group, click on the *Create user group* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the user group status to *Enabled*
- *Disable* - change the user group status to *Disabled*
- *Enable debug mode* - enable debug mode for the user groups
- *Disable debug mode* - disable debug mode for the user groups
- *Delete* - delete the user groups

To use these options, mark the checkboxes before the respective user groups, then click on the required button.

5 Users

Overview

In the *Administration* → *Users* section users of the system are maintained.

Users

A listing of existing users with their details is displayed.

Users										
								User group	All	Create user
<input type="checkbox"/>	ALIAS ▲	NAME	SURNAME	USER TYPE	GROUPS	IS ONLINE?	LOGIN	FRONTEND ACCESS	DEBUG MODE	STATUS
<input type="checkbox"/>	Admin	Zabbix	Administrator	Zabbix Super Admin	Zabbix administrators	Yes (2015-12-09 11:42:07)	Ok	System default	Enabled	Enabled
<input type="checkbox"/>	guest			Zabbix User	Guests	Yes (2015-12-09 11:41:15)	Ok	System default	Disabled	Enabled
<input type="checkbox"/>	user	New	User	Zabbix Admin	Security specialists	No (2015-12-09 07:55:42)	Ok	System default	Disabled	Enabled

From the dropdown to the right in the *Users* bar you can choose whether to display all users or those belonging to one particular group.

Displayed data:

Column	Description
<i>Alias</i>	Alias of the user, used for logging into Zabbix. Clicking on the alias opens the user configuration form .
<i>Name</i>	First name of the user.
<i>Surname</i>	Second name of the user.
<i>User type</i>	User type is displayed - <i>Zabbix Super Admin</i> , <i>Zabbix Admin</i> or <i>Zabbix User</i> .
<i>Groups</i>	Groups that the user is member of are listed. Clicking on the user group name opens the user group configuration form. Disabled groups are displayed in red.
<i>Is online?</i>	The on-line status of the user is displayed - <i>Yes</i> or <i>No</i> . The time of last user activity is displayed in parentheses.
<i>Login</i>	The login status of the user is displayed - <i>Ok</i> or <i>Blocked</i> . A user can become temporarily blocked upon more than five unsuccessful login attempts. By clicking on <i>Blocked</i> you can unblock the user.
<i>Frontend access</i>	Frontend access level is displayed - <i>System default</i> , <i>Internal</i> or <i>Disabled</i> , depending on the one set for the whole user group.
<i>Debug mode</i>	Debug mode status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the whole user group.
<i>Status</i>	User status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the whole user group.

To configure a new user, click on the *Create user* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Unblock* - re-enable system access to blocked users
- *Delete* - delete the users

To use these options, mark the check-boxes before the respective users, then click on the required button.

6 Media types

Overview

In the *Administration* → *Media types* section users can configure and maintain media type information.

Media type information contains general instructions for using a medium as delivery channel for notifications. Specific details, such as the individual e-mail addresses to send a notification to are kept with individual users.

A listing of existing media types with their details is displayed.

Media types					Create media type
<input type="checkbox"/>	NAME ▲	TYPE	STATUS	USED IN ACTIONS	DETAILS
<input type="checkbox"/>	Email	Email	Enabled	Report problems to Zabbix administrators	SMTP server: "mail.company.com", SMTP helo: "company.com", SMTP email: "monitoring.info@company.com"
<input type="checkbox"/>	Jabber	Jabber	Enabled		Jabber identifier: "jabber@company.com"
<input type="checkbox"/>	Script	Script	Enabled		Script name: "script.sh"
<input type="checkbox"/>	SMS	SMS	Enabled		GSM modem: "/dev/ttyS0"

Displayed data:

Column	Description
Name	Name of the media type. Clicking on the name opens the media type configuration form .
Type	Type of the media (e-mail, SMS, etc) is displayed.
Status	Media type status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.
Used in actions	All actions where the media type is used directly (selected in the <i>Send only to</i> dropdown) are displayed. Clicking on the action name opens the action configuration form.
Details	Detailed information of the media type is displayed.

To configure a new media type, click on the *Create media type* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the media type status to *Enabled*
- *Disable* - change the media type status to *Disabled*
- *Delete* - delete the media types

To use these options, mark the checkboxes before the respective media types, then click on the required button.

7 Scripts

Overview

In the *Administration* → *Scripts* section user-defined global scripts can be configured and maintained.

These scripts, depending on the set user permissions, then become available for execution by clicking on the host in various frontend locations (*Dashboard*, *Latest data*, *Status of triggers*, *Events*, *Maps*) and can also be run as an action operation. The scripts are executed on the Zabbix server or agent.

A listing of existing scripts with their details is displayed.

Scripts							Create script
<input type="checkbox"/>	NAME ▲	TYPE	EXECUTE ON	COMMANDS	USER GROUP	HOST GROUP	HOST ACCESS
<input type="checkbox"/>	Detect operating system	Script	Server	sudo /usr/bin/nmap -O {HOST.CONN}	Zabbix administrators	All	Read
<input type="checkbox"/>	Ping	Script	Server	/bin/ping -c 3 {HOST.CONN}	All	All	Read
<input type="checkbox"/>	Traceroute	Script	Server	/usr/bin/traceroute {HOST.CONN}	All	All	Read
							Displaying 3 of 3 found

Displayed data:

Column	Description
Name	Name of the script. Clicking on the script name opens the script configuration form .
Type	Script type is displayed - <i>Script</i> or <i>IPMI</i> command.
Execute on	It is displayed whether the script will be executed on Zabbix server or agent.

Column	Description
<i>Commands</i>	All commands to be executed within the script are displayed.
<i>User group</i>	The user group that the script is available to is displayed (or <i>All</i> for all user groups).
<i>Host group</i>	The host group that the script is available for is displayed (or <i>All</i> for all host groups).
<i>Host access</i>	The permission level for the host group is displayed - <i>Read</i> or <i>Write</i> . Only users with the required permission level will have access to executing the script.

To configure a new script, click on the *Create script* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the scripts

To use this option, mark the checkboxes before the respective scripts and click on *Delete*.

Script attributes:

Parameter	Description
<i>Name</i>	<p>Unique name of the script.</p> <p>Since Zabbix 2.2 the name can be prefixed with the desired path, for example, <code>Default/</code>, putting the script into the respective directory. When accessing scripts through the menu in monitoring sections, they will be organized according to the given directories. A script cannot have the same name as an existing directory (and vice versa). A script name must be unique within its directory. Unescaped script names are validated for uniqueness, i.e. "Ping" and "\Ping" cannot be added in the same folder. A single backslash escapes any symbol directly after it. For example, characters <code>'/'</code> and <code>'\'</code> can be escaped by backslash, i.e. <code>\/</code> or <code>\\</code>.</p>
<i>Type</i>	<p>Select script type - Script or IPMI command.</p> <p>A special dropdown selection for scripts containing IPMI commands is available since Zabbix 2.0 version (previously a special syntax of <i>IPMI <command></i> had to be used in the command field).</p>
<i>Execute on</i>	<p>Click the respective button to execute the script on Zabbix server or agent.</p> <p>The option to execute scripts on Zabbix agent is available since Zabbix 2.0 version (providing remote commands are enabled in the <code>EnableRemoteCommands</code> parameter in Zabbix agent configuration file).</p>
<i>Commands</i>	<p>Enter full path to the commands to be executed within the script.</p> <p>The following macros are supported in the commands: <code>{HOST.CONN}</code>, <code>{HOST.IP}</code>, <code>{HOST.DNS}</code>, <code>{HOST.HOST}</code>, <code>{HOST.NAME}</code>. If a macro may resolve to a value with spaces (for example, host name), don't forget to quote as needed.</p> <p>Since Zabbix 2.2, user macros are supported in script commands.</p>
<i>Description</i>	Enter a description for the script.
<i>User group</i>	Select the user group that the script will be available to (or <i>All</i> for all user groups).
<i>Host group</i>	Select the host group that the script will be available for (or <i>All</i> for all host groups).
<i>Required host permissions</i>	Select the permission level for the host group - <i>Read</i> or <i>Write</i> . Only users with the required permission level will have access to executing the script.
<i>Enable confirmation</i>	Mark the checkbox to display a confirmation message before executing the script. This feature might be especially useful with potentially dangerous operations (like a reboot script) or ones that might take a long time.
<i>Confirmation text</i>	<p>Enter a custom confirmation text for the confirmation popup enabled with the checkbox above (for example, <i>Remote system will be rebooted. Are you sure?</i>). To see how the text will look like, click on <i>Test confirmation</i> next to the field.</p> <p>Since Zabbix 2.2, the confirmation text will expand host name macros - <code>{HOST.HOST}</code>, <code>{HOST.NAME}</code>, host connection macros - <code>{HOST.IP}</code>, <code>{HOST.DNS}</code>, <code>{HOST.CONN}</code> and user macros. <i>Note:</i> The macros will not be expanded when testing the confirmation message.</p>

Script result

The script result will be displayed in a pop-up window that will appear after the script is run.

Note: The return value of the script is standard output together with standard error.

See example of a script and the result window below:

```
uname
uname --non-existing-flag
/tmp/non_existing_script.sh
```

Uname

```
uname
uname --non-existing-flag
/tmp/non_existing_script.sh

Linux
uname: unrecognized option '--non-existing-flag'
Try 'uname --help' for more information.
sh: 3: /tmp/non_existing_script.sh: not found
```

8 Queue

Overview

In the *Administration* → *Queue* section items that are waiting to be updated are displayed.

Ideally, when you open this section it should all be “green” meaning no items in the queue. If all items are updated without delay, there are none waiting. However, due to lacking server performance, connection problems or problems with agents, some items may get delayed and the information is displayed in this section. For more details, see the [Queue](#) section.

Note:

Queue is available only if Zabbix server is running.

From the dropdown in the upper right corner you can select:

- queue overview by item type
- queue overview by proxy
- list of delayed items

Overview by item type

In this screen it is easy to locate if the problem is related to one or several item types.

Queue of items to be updated						
Overview						
ITEMS	5 SECONDS	10 SECONDS	30 SECONDS	1 MINUTE	5 MINUTES	MORE THAN 10 MINUTES
Zabbix agent	0	0	0	0	0	0
Zabbix agent (active)	0	0	0	0	0	0
Simple check	0	0	0	0	0	0
SNMPv1 agent	0	0	0	0	0	0
SNMPv2 agent	0	0	0	0	0	0
SNMPv3 agent	0	0	0	0	0	0
Zabbix internal	4	14	1	0	0	0
Zabbix aggregate	0	0	0	0	0	0

Each line contains an item type. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

Overview by proxy

In this screen it is easy to locate if the problem is related to one of the proxies or the server.

Queue of items to be updated							Overview by proxy ▾
PROXY	5 SECONDS	10 SECONDS	30 SECONDS	1 MINUTE	5 MINUTES	MORE THAN 10 MINUTES	
Remote proxy	0	13	15	0	0	0	
Server	0	0	0	0	0	0	
Total: 2							

Each line contains a proxy, with the server last in the list. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

List of waiting items

In this screen, each waiting item is listed.

Queue of items to be updated				Details ▾
SCHEDULED CHECK	DELAYED BY	HOST	NAME	
2016-01-04 17:28:39	36s	Zabbix server 1	Zabbix busy discoverer processes, in %	
2016-01-04 17:28:40	35s	Zabbix server 1	Zabbix busy escalator processes, in %	
2016-01-04 17:28:41	34s	Zabbix server 1	Zabbix busy history syncer processes, in %	
2016-01-04 17:28:42	33s	Zabbix server 1	Zabbix busy housekeeper processes, in %	
2016-01-04 17:28:43	32s	Zabbix server 1	Zabbix busy http poller processes, in %	
2016-01-04 17:28:44	31s	Zabbix server 1	Zabbix busy icmp pinger processes, in %	

In the host column, hosts monitored by proxy are prefixed with the proxy name (since Zabbix 2.4.0).

Displayed data:

Column	Description
<i>Next check</i>	The time when the check was due is displayed.
<i>Delayed by</i>	The length of the delay is displayed.
<i>Host</i>	Host of the item is displayed.
<i>Name</i>	Name of the waiting item is displayed.

Possible error messages

You may encounter a situation when no data is displayed and the following error message appears:

Details

Cannot display item queue.

Permission denied.

Error message in this case is the following:

Cannot display item queue. Permission denied

This happens when PHP configuration parameters \$ZBX_SERVER_PORT or \$ZBX_SERVER in zabbix.conf.php point to existing Zabbix server which uses different database.

2 User profile

Overview

In the user profile you can customize some Zabbix frontend features, such as the interface language, color theme, number of rows displayed in the lists etc. The changes made here will apply for the user only.

To access the user profile configuration form, click on the  user profile link in the upper right corner of Zabbix window.

Configuration

The **User** tab allows you to set various user preferences.

UserMediaMessaging

Password

Change password

Auto-login

☐

Auto-logout (min 90 seconds)

☐900

Refresh (in seconds)

30

Rows per page

50

URL (after login)

Update

Cancel

Parameter	Description
Password	Click on the link to display two fields for entering a new password.
Language	Select the interface language of your choice. The php gettext extension is required for the translations to work.
Theme	Select a color theme specifically for your profile.
Auto-login	Mark this checkbox to make Zabbix remember you and log you in automatically for 30 days. Browser cookies are used for this.
Auto-logout	With this checkbox marked you will be logged out automatically, after the set amount of seconds (minimum 90 seconds). Note that this option will not work: * When Monitoring menu pages perform background information refreshes. In case pages refreshing data in a specific time interval (dashboards, graphs, screens, latest data, etc.) are left open session lifetime is extended, respectively disabling auto-logout feature; * If logging in with the <i>Remember me for 30 days</i> option checked.
Refresh (in seconds)	Auto-logout can accept 0, meaning that Auto-logout becomes disabled after profile settings update.
Rows per page	You can set how often the information in the pages will be refreshed on the Monitoring menu, except for Dashboard, which uses its own refresh parameters for every widget.
URL (after login)	You can set how many rows will be displayed per page in the lists. Fewer rows (and fewer records to display) mean faster loading times. You can set a specific URL to be displayed after the login. Instead of the default <i>Monitoring → Dashboard</i> it can be, for example, the URL of <i>Monitoring → Triggers</i> .

Note:

If some language is not available for selection in the user profile it means that a locale for it is not installed on the web server. See the [link](#) at the bottom of this page to find out how to install them.

The **Media** tab allows you to specify the **media** details for the user, such as the types, the addresses to use and when to use them to deliver notifications.

The screenshot shows the 'Media' tab selected in a configuration interface. At the top, there are three tabs: 'User', 'Media', and 'Messaging'. Below the tabs, the 'Media' section contains a table with the following columns: TYPE, SEND TO, WHEN ACTIVE, USE IF SEVERITY, and STATUS. There are two rows of data: one for 'Email' and one for 'Jabber', both using 'user@company.com' as the contact address and 'NIWAHD' as the severity level. Both are marked as 'Enabled'. Below the table is an 'Add' link. At the bottom of the section are 'Update' and 'Cancel' buttons.

TYPE	SEND TO	WHEN ACTIVE	USE IF SEVERITY	STATUS
Email	user@company.com	1-5,09:00-18:00	NIWAHD	Enabled
Jabber	user@company.com	1-7,00:00-24:00	NIWAHD	Enabled

[Add](#)

[Update](#) [Cancel](#)

Note:

Only **admin level** users (Admin and Super Admin) can change their own media details.

The **Messaging** tab allows you to set **global notifications**.

See also

1. [How to install additional locales to be able to select unavailable languages in the user profile](#)

1 Global notifications**Overview**

Global notifications are a way of displaying issues that are currently happening right on the screen you're at in Zabbix frontend.

Without global notifications, working in some other location than *Status of triggers* or *Dashboard* pages would not show any information regarding issues that are currently happening. Global notifications will display this information regardless of where you are.

Global notifications involve both showing a message and **playing a sound**.

Attention:

The auto play of sounds may be disabled in recent browser versions by default. In this case, you need to change this setting manually.

Configuration

Global notifications can be enabled per user in the *Messaging* tab of **profile configuration**.

Update

Cancel

Parameter	Description
<i>Frontend messaging</i>	Mark the checkbox to enable global notifications.
<i>Message timeout</i>	You can set for how long the message will be displayed. By default, messages will stay on screen for 60 seconds.
<i>Play sound</i>	You can set how long the sound will be played. Once - sound is played once and fully. 10 seconds - sound is repeated for 10 seconds. Message timeout - sound is repeated while the message is visible.
<i>Trigger severity</i>	You can set the trigger severities that global notifications and sounds will be activated for. You can also select the sounds appropriate for various severities. If no severity is marked then no messages will be displayed at all. Also, recovery messages will only be displayed for those severities that are marked. So if you mark <i>Recovery</i> and <i>Disaster</i> , global notifications will be displayed for the problems and the recoveries of disaster severity triggers.

Global messages displayed

As the messages arrive, they are displayed in a floating section on the right hand side. This section can be repositioned freely by dragging the section header.

521

For this section, several controls are available:

-  **Snooze** button silences currently active alarm sound;
-  **Mute/Unmute** button switches between playing and not playing the alarm sounds.

2 Sound in browsers

Overview

For the sounds to be played in Zabbix frontend, *Frontend messaging* must be enabled in the user profile *Messaging* tab, with all trigger severities checked, and sounds should also be enabled in the global notification pop-up window.

The sounds of Zabbix frontend have been successfully tested in the following web browser versions and no additional configuration was required:

- Firefox 3.5.16 on Linux
- Opera 11.01 on Linux
- Google Chrome 9.0 on Windows
- Firefox 3.5.16 on Windows
- IE7 browser on Windows
- Opera v11.01 on Windows
- Chrome v9.0 on Windows
- Safari v5.0 on Windows, but this browser requires *Quick Time Player* to be installed

Additional requirements

Firefox v 3.5.16

For playing wav files in the Firefox browser you can use one of the following applications:

- Windows Media Player
- Quick Time plug-in.

Then, in *Tools* → *Options* → *Applications*, in "Wave sound (audio/wav)" set Windows Media Player to play these files.

Safari 5.0

Quick Time Player is required.

Microsoft Internet Explorer

To play sounds in MSIE7 and MSIE8:

- In *Tools* → *Internet Options* → *Advanced* enable *Play sounds in webpages*
- In *Tools* → *Manage Add-ons...* enable **Windows Media Player**
- In the Windows Media Player, in *Tools*→*Options*→*File Types* enable *Windows audio file (wav)*

In the Windows Media Player, in *Tools*→*Options* tab, "File Types" is only available if the user is a member of "Power Users" or "Administrators" group, i.e. a regular user does not have access to this tab and does not see it.

An additional thing - if IE does not have some *.wav file in the local cache directory (%userprofile%\Local Settings\Temporary Internet Files) the sound will not play the first time.

Known not to work

Browsers where the sound did not work:

- Opera 10.11 on Linux.

3 Global search

It is possible to search Zabbix frontend for hosts, host groups and templates.

The search input box is located in the upper right corner. The search can be started by pressing *Enter* or clicking on the search icon.

If there is a host that starts with the entered string, a dropdown will appear, listing all such hosts.

Properties searched

Hosts can be searched by the following properties:

- Host name
- Visible name
- IP address
- DNS name

Host groups can be searched by name.

Templates can be searched by name or visible name. If you search by a name that is different from the visible name (of a template/host), in the search results it is displayed below the visible name in parentheses.

Search results

Search results consist of three separate blocks for hosts, host groups and templates.

It is possible to collapse/expand each individual block. The entry count is displayed at the bottom of each block, for example, *Displaying 13 of 13 found*. Total entries displayed within one block are limited to 100.

Each entry provides links to monitoring and configuration data. See [links available](#).

For all configuration data (such as items, triggers, graphs) the amount of entities found is displayed by a number next to the entity name, in grey. **Note** that if there are zero entities, no number is displayed.

Enabled hosts are displayed in blue, disabled hosts in red.

4 Frontend maintenance mode

Overview

Zabbix web frontend can be temporarily disabled in order to prohibit access to it. This can be useful for protecting the Zabbix database from any changes initiated by users, thus protecting the integrity of database.

Zabbix database can be stopped and maintenance tasks can be performed while Zabbix frontend is in maintenance mode.

Users from defined IP addresses will be able to work with the frontend normally during maintenance mode.

Configuration

In order to enable maintenance mode, the `maintenance.inc.php` file (located in `/conf` of the Zabbix HTML document directory on the webserver) must be modified to uncomment the following lines:

```
// Maintenance mode.
define('ZBX_DENY_GUI_ACCESS', 1);

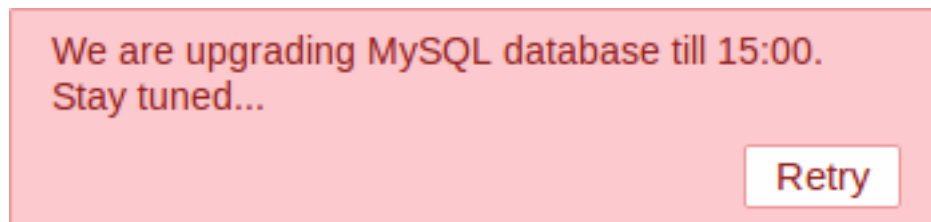

// Array of IP addresses, which are allowed to connect to frontend (optional).
$ZBX_GUI_ACCESS_IP_RANGE = array('127.0.0.1');

// Message shown on warning screen (optional).
$ZBX_GUI_ACCESS_MESSAGE = 'We are upgrading MySQL database till 15:00. Stay tuned...';
```

Parameter	Details
ZBX_DENY_GUI_ACCESS	Enable maintenance mode: 1 - maintenance mode is enabled, disabled otherwise
ZBX_GUI_ACCESS_IP_RANGE	Array of IP addresses, which are allowed to connect to frontend (optional). For example: <code>array('192.168.1.1', '192.168.1.2')</code>
ZBX_GUI_ACCESS_MESSAGE	A message you can enter to inform users about the maintenance (optional).

Display

The following screen will be displayed when trying to access the Zabbix frontend while in maintenance mode. The screen is refreshed every 30 seconds in order to return to a normal state without user intervention when the maintenance is over.

IP addresses defined in `ZBX_GUI_ACCESS_IP_RANGE` will be able to access the frontend as always.

5 Page parameters

Overview

Most Zabbix web interface pages support various HTTP GET parameters that control what will be displayed. They may be passed by specifying `parameter=value` pairs after the URL, separated from the URL by a question mark (?) and from each other by ampersands (&).

Status of triggers

Accessed as *Monitoring* → *Triggers*, page name `tr_status.php`.

Attention:

To set the filter, parameter `filter_set=1` must be passed. Fields that are not specified will be reset to default values.

Generic parameters

- `groupid`
- `hostid`
- `fullscreen`

Page specific parameters

- `show_triggers` - filter option **Triggers status**, 1 - Recent problem, 2 - Any, 3 - Problem
- `show_events` - filter option **Events**, 1 - Hide all, 2 - Show all, 3 - Show unacknowledged
- `ack_status` - filter option **Acknowledge status**, 1 - Any, 2 - With unacknowledged events, 3 - With last event unacknowledged
- `show_severity` - filter option **Min severity**, 0-5 - corresponding severity
- `show_details` - filter option **Show details**, 0 - do not show, 1 - show
- `status_change_days` - filter option **Age less than**, in days
- `status_change` - filter option **Age less than**, 0 - disabled, 1 - enabled (**status_change_days** will be used)
- `txt_select` - filter option **Filter by name**, freeform string
- `application` - filter option **Application**, freeform string
- `show_maintenance` - filter option **Show hosts in maintenance**, 0 - do not show hosts in maintenance, 1 - show hosts in maintenance

Inventory filter

Since Zabbix 2.4.0, triggers can also be filtered by inventory. Here the syntax is a bit more complicated. Inventory fields and their values are added as zero-based index entries, for example:

```
inventory[0][field]=type_full
inventory[0][value]=Virtual machine
inventory[1][field]=os_full
inventory[1][value]=Linux
```

These must be URL-encoded, though. The passed values would look like:

```
inventory%5B0%5D%5Bfield%5D=type_full
inventory%5B0%5D%5Bvalue%5D=Virtual machine
inventory%5B1%5D%5Bfield%5D=os_full
inventory%5B1%5D%5Bvalue%5D=Linux
```

Inventory field codes can be found in the [Zabbix API host object documentation](#).

Trigger events

Access to events of a specific trigger, which may be useful for notifications is to use a URL like:

```
http://<server_ip_or_name>/zabbix/events.php?triggerid={TRIGGER.ID}&filter_set=1
```

6 Definitions

Overview

While many things in the frontend can be configured using the frontend itself, some customisations are currently only possible by editing a definitions file.

This file is `defines.inc.php` located in `/include` of the Zabbix HTML document directory.

Parameters

Parameters in this file that could be of interest to users:

- `ZBX_LOGIN_ATTEMPTS`

Number of unsuccessful login attempts that is allowed to an existing system user before a login block is applied (see `ZBX_LOGIN_BLOCK`). By default 5 attempts. Once the set number of login attempts is tried unsuccessfully, each additional unsuccessful attempt results in a login block. Used with **internal** authentication only.

- `ZBX_LOGIN_BLOCK`

Number of seconds for blocking a user from accessing Zabbix frontend after a number of unsuccessful login attempts (see ZBX_LOGIN_ATTEMPTS). By default 30 seconds. Used with **internal** authentication only.

- ZBX_PERIOD_DEFAULT

Default graph period, in seconds. One hour by default.

- ZBX_MIN_PERIOD

Minimum graph period, in seconds. One minute by default.

- ZBX_MAX_PERIOD

Maximum graph period, in seconds. Two years by default since 1.6.7, one year before that.

- ZBX_HISTORY_PERIOD

The maximum period to display history data in *Latest data*, *Overview* pages and *Data overview* screen element in seconds. By default set to 86400 seconds (24 hours). Unlimited period, if set to 0 seconds.

This constant value also affects how far in the past the value is searched when {ITEM.VALUE} macro in trigger name is resolved (since Zabbix 3.0.20).

- GRAPH_YAXIS_SIDE_DEFAULT

Default location of Y axis in simple graphs and default value for drop down box when adding items to custom graphs. Possible values: 0 - left, 1 - right.

Default: 0

- DEFAULT_LATEST_ISSUES_CNT

Controls how many issues are shown in the dashboard's *Last n issues* widget. By default 20 issues are shown.

- SCREEN_REFRESH_TIMEOUT (available since 2.0.4)

Used in screens and defines the timeout seconds for a screen element update. When the defined number of seconds after launching an update pass and the screen element has still not been updated, the screen element will be darkened.

Default: 30

- SCREEN_REFRESH_RESPONSIVENESS (available since 2.0.4)

Used in screens and defines the number of seconds after which query skipping will be switched off. Otherwise, if a screen element is in update status all queries on update are skipped until a response is received. With this parameter in use, another update query might be sent after N seconds without having to wait for the response to the first one.

Default: 10

- QUEUE_DETAIL_ITEM_COUNT

Defines retrieval limit of the total queued items. In Zabbix 3.0.8 may be set higher than default value.

Default: 500

- VALIDATE_URI_SCHEMES (available since 3.0.14)

Validate a URI against the scheme whitelist defined in ZBX_URI_VALID_SCHEMES.

Default: true

- ZBX_URI_VALID_SCHEMES (available since 3.0.11)

A comma-separated list of allowed schemes.

Default: http,https,ftp,file,mailto,tel,ssh

- ZBX_SHOW_TECHNICAL_ERRORS (available since 3.0.13)

Show technical errors (PHP/SQL) to non-Zabbix Super admin users and to users that are not part of user groups with **debug mode** enabled.

Default: false

7 Creating your own theme

Overview

By default, Zabbix provides a number of predefined themes. You may follow the step-by-step procedure provided here in order to create your own. Feel free to share the result of your work with Zabbix community if you created something nice.

Step 1

To define your own theme you'll need to create a CSS file and save it in the *styles/* folder (for example, *custom-theme.css*). You can either copy the files from a different theme and create your theme based on it or start from scratch.

Step 2

Add your theme to the list of themes returned by the `Z::getThemes()` method. You can do this by overriding the `ZBase::getThemes()` method in the `Z` class. This can be done by adding the following code before the closing brace in *include/classes/core/Z.php*:

```
public static function getThemes() {
    return array_merge(parent::getThemes(), array(
        'custom-theme' => _('Custom theme')
    ));
}
```

Attention:

Note that the name you specify within the first pair of quotes must match the name of the theme file without extension.

To add multiple themes, just list them under the first theme, for example:

```
public static function getThemes() {
    return array_merge(parent::getThemes(), array(
        'custom-theme' => _('Custom theme'),
        'anothertheme' => _('Another theme'),
        'onemoretheme' => _('One more theme')
    ));
}
```

Note that every theme except the last one must have a trailing comma.

Note:

To change graph colours, the entry must be added in the *graph_theme* database table.

Step 3

Activate the new theme.

In Zabbix frontend, you may either set this theme to be the default one or change your theme in the user profile.

Enjoy the new look and feel!

8 Debug mode

Overview

Debug mode may be used to diagnose performance problems with frontend pages.

Configuration

Debug mode can be activated for individual users who belong to a user group:

- when configuring a **user group**;
- when viewing configured **user groups**.

When *Debug mode* is enabled for a user group, its users will see a *Debug* button in the lower right corner of the browser window:

Clicking on the *Debug* button opens a new window below the page contents which contains the SQL statistics of the page, along with a list of API calls and individual SQL statements:

```
***** Script profiler *****
Total time: 0.249825
Total SQL time: 0.139814
SQL count: 143 (selects: 117 | executes: 26)
Peak memory usage: 6M
Memory limit: 128M

1. hostgroup.get [latest.php:124]

Parameters:          Result:
Array               Array
(
    [output] => Array (
        [0] => groupid
    )
)
(
    [4] => Array (
        [groupid] => 4
    )
)
```

In case of performance problems with the page, this window may be used to search for the root cause of the problem.

Warning:

Enabled *Debug mode* negatively affects frontend performance.

18. API

Overview Zabbix API allows you to programmatically retrieve and modify the configuration of Zabbix and provides access to historical data. It is widely used to:

- Create new applications to work with Zabbix;
- Integrate Zabbix with third party software;
- Automate routine tasks.

The Zabbix API is a web based API and is shipped as part of the web frontend. It uses the JSON-RPC 2.0 protocol which means two things:

- The API consists of a set of separate methods;
- Requests and responses between the clients and the API are encoded using the JSON format.

More info about the protocol and JSON can be found in the [JSON-RPC 2.0 specification](#) and the [JSON format homepage](#).

Structure The API consists of a number of methods that are nominally grouped into separate APIs. Each of the methods performs one specific task. For example, the `host.create` method belongs to the `host` API and is used to create new hosts. Historically, APIs are sometimes referred to as "classes".

Note:

Most APIs contain at least four methods: `get`, `create`, `update` and `delete` for retrieving, creating, updating and deleting data respectfully, but some of the APIs may provide a totally different set of methods.

Performing requests Once you've set up the frontend, you can use remote HTTP requests to call the API. To do that you need to send HTTP POST requests to the `api_jsonrpc.php` file located in the frontend directory. For example, if your Zabbix frontend is installed under `http://company.com/zabbix`, the HTTP request to call the `apiinfo.version` method may look like this:

```
POST http://company.com/zabbix/api_jsonrpc.php HTTP/1.1
Content-Type: application/json-rpc
```

```
{"jsonrpc": "2.0", "method": "apiinfo.version", "id": 1, "auth": null, "params": {}}
```

The request must have the Content-Type header set to one of these values: application/json-rpc, application/json or application/jsonrequest.

Note:

You can use any HTTP client or a JSON-RPC testing tool to perform API requests manually, but for developing applications we suggest you use one of the [community maintained libraries](#).

Example workflow The following section will walk you through some usage examples in more detail.

Authentication Before you can access any data inside of Zabbix you'll need to log in and obtain an authentication token. This can be done using the `user.login` method. Let us suppose that you want to log in as a standard Zabbix Admin user. Then your JSON request will look like this:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "user": "Admin",
    "password": "zabbix"
  },
  "id": 1,
  "auth": null
}
```

Let's take a closer look at the request object. It has the following properties:

- `jsonrpc` - the version of the JSON-RPC protocol used by the API; the Zabbix API implements JSON-RPC version 2.0;
- `method` - the API method being called;
- `params` - parameters that will be passed to the API method;
- `id` - an arbitrary identifier of the request;
- `auth` - a user authentication token; since we don't have one yet, it's set to `null`.

If you provided the credentials correctly, the response returned by the API will contain the user authentication token:

```
{
  "jsonrpc": "2.0",
  "result": "0424bd59b807674191e7d77572075f33",
  "id": 1
}
```

The response object in turn contains the following properties:

- `jsonrpc` - again, the version of the JSON-RPC protocol;
- `result` - the data returned by the method;
- `id` - identifier of the corresponding request.

Retrieving hosts We now have a valid user authentication token that can be used to access the data in Zabbix. For example, let's use the `host.get` method to retrieve the IDs, host names and interfaces of all configured **hosts**:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": [
      "hostid",
      "host"
    ],
    "selectInterfaces": [
      "interfaceid",
      "ip"
    ]
  },
  "id": 2,
}
```

```
    "auth": "0424bd59b807674191e7d77572075f33"
  }
```

Attention:

Note that the `auth` property is now set to the authentication token we've obtained by calling `user.login`.

The response object will contain the requested data about the hosts:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "host": "Zabbix server",
      "interfaces": [
        {
          "interfaceid": "1",
          "ip": "127.0.0.1"
        }
      ]
    }
  ],
  "id": 2
}
```

Note:

For performance reasons we recommend to always list the object properties you want to retrieve and avoid retrieving everything.

Creating a new item Let's create a new `item` on "Zabbix server" using the data we've obtained from the previous `host.get` request. This can be done by using the `item.create` method:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Free disk space on $1",
    "key_": "vfs.fs.size[/home/joe/,free]",
    "hostid": "10084",
    "type": 0,
    "value_type": 3,
    "interfaceid": "1",
    "delay": 30
  },
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 3
}
```

A successful response will contain the ID of the newly created item, which can be used to reference the item in the following requests:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "24759"
    ]
  },
  "id": 3
}
```

Note:

The `item.create` method as well as other create methods can also accept arrays of objects and create multiple items with one API call.

Creating multiple triggers So if create methods accept arrays, we can add multiple **triggers** like so:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.create",
  "params": [
    {
      "description": "Processor load is too high on {HOST.NAME}",
      "expression": "{Linux server:system.cpu.load[percpu,avg1].last()}>5",
    },
    {
      "description": "Too many processes on {HOST.NAME}",
      "expression": "{Linux server:proc.num[].avg(5m)}>300",
    }
  ],
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 4
}
```

A successful response will contain the IDs of the newly created triggers:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "17369",
      "17370"
    ]
  },
  "id": 4
}
```

Updating an item Enable an item, that is, set its status to "0":

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "10092",
    "status": 0
  },
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 5
}
```

A successful response will contain the ID of the updated item:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10092"
    ]
  },
  "id": 5
}
```

Note:

The `item.update` method as well as other update methods can also accept arrays of objects and update multiple items with one API call.

Updating multiple triggers Enable multiple triggers, that is, set their status to 0:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": [
    {
      "triggerid": "13938",
      "status": 0
    },
    {
      "triggerid": "13939",
      "status": 0
    }
  ],
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 6
}
```

A successful response will contain the IDs of the updated triggers:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938",
      "13939"
    ]
  },
  "id": 6
}
```

Note:

This is the preferred method of updating. Some API methods like `host.massupdate` allow to write more simple code, but it's not recommended to use those methods, since they will be removed in the future releases.

Error handling Up to that point everything we've tried has worked fine. But what happens if we try to make an incorrect call to the API? Let's try to create another host by calling `host.create` but omitting the mandatory `groups` parameter.

```
{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "Linux server",
    "interfaces": [
      {
        "type": 1,
        "main": 1,
        "useip": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050"
      }
    ]
  },
  "id": 7,
  "auth": "0424bd59b807674191e7d77572075f33"
}
```

The response will then contain an error message:

```
{
  "jsonrpc": "2.0",
  "error": {
    "code": -32602,
  }
}
```

```

    "message": "Invalid params.",
    "data": "No groups for host \"Linux server\"."
  },
  "id": 7
}

```

If an error occurred, instead of the `result` property, the response object will contain an `error` property with the following data:

- `code` - an error code;
- `message` - a short error summary;
- `data` - a more detailed error message.

Errors can occur in different cases, such as, using incorrect input values, a session timeout or trying to access unexisting objects. Your application should be able to gracefully handle these kinds of errors.

API versions To simplify API versioning, since Zabbix 2.0.4, the version of the API matches the version of Zabbix itself. You can use the `apiinfo.version` method to find out the version of the API you're working with. This can be useful for adjusting your application to use version-specific features.

We guarantee feature backward compatibility inside of a major version. When making backward incompatible changes between major releases, we usually leave the old features as deprecated in the next release, and only remove them in the release after that. Occasionally, we may remove features between major releases without providing any backward compatibility. It is important that you never rely on any deprecated features and migrate to newer alternatives as soon as possible.

Note:

You can follow all of the changes made to the API in the [API changelog](#).

Further reading You now know enough to start working with the Zabbix API, but don't stop here. For further reading we suggest you have a look at the [list of available APIs](#).

Method reference

This section provides an overview of the functions provided by the Zabbix API and will help you find your way around the available classes and methods.

Monitoring The Zabbix API allows you to access history and other data gathered during monitoring.

History

Retrieve historical values gathered by Zabbix monitoring processes for presentation or further processing.

[History API](#)

Events

Retrieve events generated by triggers, network discovery and other Zabbix systems for more flexible situation management or third-party tool integration.

[Event API](#)

Service monitoring

Retrieve detailed service layer availability information about any IT service.

[IT service SLA calculation](#)

Configuration The Zabbix API allows you to manage the configuration of your monitoring system.

Hosts and host groups

Manage host groups, hosts and everything related to them, including host interfaces, host macros and maintenance periods.

[Host API](#) | [Host group API](#) | [Host interface API](#) | [User macro API](#) | [Maintenance API](#)

Items and applications

Define items to monitor. Create or remove applications and assign items to them.

[Item API](#) | [Application API](#)

Triggers

Configure triggers to notify you about problems in your system. Manage trigger dependencies.

[Trigger API](#)

Graphs

Edit graphs or separate graph items for better presentation of the gathered data.

[Graph API](#) | [Graph item API](#)

Templates

Manage templates and link them to hosts or other templates.

[Template API](#)

Export and import

Export and import Zabbix configuration data for configuration backups, migration or large-scale configuration updates.

[Configuration API](#)

Low-level discovery

Configure low-level discovery rules as well as item, trigger and graph prototypes to monitor dynamic entities.

[LLD rule API](#) | [Item prototype API](#) | [Trigger protototype API](#) | [Graph prototype API](#) | [Host prototype API](#)

Screens

Edit global and template-level screens or each screen item individually.

[Screen API](#) | [Screen item API](#) | [Template screen API](#) | [Template screen item API](#)

Actions and alerts

Define actions and operations to notify users about certain events or automatically execute remote commands. Gain access to information about generated alerts and their receivers.

[Action API](#) | [Alert API](#)

IT services

Manage IT services for service-level monitoring and retrieve detailed SLA information about any service.

[IT service API](#)

Maps

Configure maps to create detailed dynamic representations of your IT infrastructure.

[Map API](#)

Web monitoring

Configure web scenarios to monitor your web applications and services.

[Web scenario API](#)

Network discovery

Manage network-level discovery rules to automatically find and monitor new hosts. Gain full access to information about discovered services and hosts.

[Discovery rule API](#) | [Discovery check API](#) | [Discovery host API](#) | [Discovery service API](#)

Administration With the Zabbix API you can change administration settings of your monitoring system.

Users

Add users that will have access to Zabbix, assign them to user groups and grant permissions. Configure media types and the ways users will receive alerts.

[User API](#) | [User group API](#) | [Media type API](#) | [Media API](#)

General

Change certain global configuration options.

[Icon map API](#) | [Image API](#) | [User macro API](#) | [Value map API](#)

Proxies

Manage the proxies used in your distributed monitoring setup.

[Proxy API](#)

Scripts

Configure and execute scripts to help you with your daily tasks.

[Script API](#)

API information Retrieve the version of the Zabbix API so that your application could use version-specific features.

[API info API](#)

Action

This class is designed to work with actions.

Object references:

- [Action](#)
- [Action condition](#)
- [Action operation](#)

Available methods:

- [action.create](#) - create new actions
- [action.delete](#) - delete actions
- [action.get](#) - retrieve actions
- [action.update](#) - update actions

> Action object

The following objects are directly related to the `action` API.

Action

The action object has the following properties.

Property	Type	Description
actionid	string	(readonly) ID of the action.
esc_period (required)	integer	Default operation step duration. Must be greater than 60 seconds.

Note that escalations are supported only for trigger and internal actions. In trigger actions, escalations are not supported in problem recovery and update operations.

Property	Type	Description
eventsourcesource (required)	integer	(<i>constant</i>) Type of events that the action will handle. Refer to the event "source" property for a list of supported event types.
name (required)	string	Name of the action.
def_longdata	string	Problem message text.
def_shortdata	string	Problem message subject.
r_longdata	string	Recovery message text.
r_shortdata	string	Recovery message subject.
recovery_msg	integer	Whether recovery messages are enabled. Possible values: 0 - (<i>default</i>) disabled; 1 - enabled.
status	integer	Whether the action is enabled or disabled. Possible values: 0 - (<i>default</i>) enabled; 1 - disabled.

Action operation

The action operation object defines an operation that will be performed when an action is executed. It has the following properties.

Property	Type	Description
operationid	string	(<i>readonly</i>) ID of the action operation.

Property	Type	Description
operationtype (required)	integer	<p>Type of operation.</p> <p>Possible values: 0 - send message; 1 - remote command; 2 - add host; 3 - remove host; 4 - add to host group; 5 - remove from host group; 6 - link to template; 7 - unlink from template; 8 - enable host; 9 - disable host; 10 - set host inventory mode.</p> <p>Note that only types '0' and '1' are supported for trigger actions, only '0' is supported for internal actions. All types are supported for discovery and autoregistration actions.</p>
actionid	string	<p>ID of the action that the operation belongs to.</p>
esc_period	integer	<p>Duration of an escalation step in seconds. Must be greater than 60 seconds. If set to 0, the default action escalation period will be used.</p> <p>Default: 0.</p> <p>Note that escalations are supported only for trigger and internal actions. In trigger actions, escalations are not supported in problem recovery and update operations.</p>

Property	Type	Description
esc_step_from	integer	<p>Step to start escalation from.</p> <p>Default: 1.</p> <p>Note that escalations are supported only for trigger and internal actions. In trigger actions, escalations are not supported in problem recovery and update operations.</p>
esc_step_to	integer	<p>Step to end escalation at.</p> <p>Default: 1.</p> <p>Note that escalations are supported only for trigger and internal actions. In trigger actions, escalations are not supported in problem recovery and update operations.</p>
evaltype	integer	<p>Operation condition evaluation method.</p> <p>Possible values: 0 - (default) AND / OR; 1 - AND; 2 - OR.</p>
opcommand	object	<p>Object containing the data about the command run by the operation.</p> <p>The operation command object is described in detail below.</p> <p>Required for remote command operations.</p>

Property	Type	Description
opcommand_grparray		<p>Host groups to run remote commands on.</p> <p>Each object has the following properties:</p> <ul style="list-style-type: none"> opcommand_grpid - (<i>string, readonly</i>) ID of the object; operationid - (<i>string</i>) ID of the operation; groupid - (<i>string</i>) ID of the host group. <p>Required for remote command operations if opcommand_hst is not set.</p>
opcommand_hstarray		<p>Host to run remote commands on.</p> <p>Each object has the following properties:</p> <ul style="list-style-type: none"> opcommand_hstid - (<i>string, readonly</i>) ID of the object; operationid - (<i>string</i>) ID of the operation; hostid - (<i>string</i>) ID of the host; if set to 0 the command will be run on the current host. <p>Required for remote command operations if opcommand_grp is not set.</p>
opconditions	array	<p>Operation conditions used for trigger actions.</p> <p>The operation condition object is described in detail below.</p>

Property	Type	Description
opgroup	array	<p>Host groups to add hosts to.</p> <p>Each object has the following properties: operationid - <i>(string)</i> ID of the operation; groupid - <i>(string)</i> ID of the host group.</p> <p>Required for "add to host group" and "remove from host group" operations.</p>
opmessage	object	<p>Object containing the data about the message sent by the operation.</p> <p>The operation message object is described in detail below.</p>
opmessage_grparray		<p>Required for message operations. User groups to send messages to.</p> <p>Each object has the following properties: operationid - <i>(string)</i> ID of the operation; usrgrp - <i>(string)</i> ID of the user group.</p> <p>Required for message operations if opmessage_usr is not set.</p>

Property	Type	Description
opmessage_usr	array	<p>Users to send messages to.</p> <p>Each object has the following properties: operationid - (string) ID of the operation; userid - (string) ID of the user.</p> <p>Required for message operations if opmessage_grp is not set.</p>
optemplate	array	<p>Templates to link the hosts to.</p> <p>Each object has the following properties: operationid - (string) ID of the operation; templateid - (string) ID of the template.</p> <p>Required for "link to template" and "unlink from template" operations.</p>
opinventory	object	<p>Inventory mode set host to.</p> <p>Object has the following properties: operationid - (string) ID of the operation; inventory_mode - (string) Inventory mode.</p> <p>Required for "Set host inventory mode" operations.</p>

Action operation command

The operation command object contains data about the command that will be run by the operation.

Property	Type	Description
operationid	string	(readonly) ID of the operation.

Property	Type	Description
command (required)	string	Command to run.
type (required)	integer	Type of operation command. Possible values: 0 - custom script; 1 - IPMI; 2 - SSH; 3 - Telnet; 4 - global script.
authtype	integer	Authentication method used for SSH commands. Possible values: 0 - password; 1 - public key.
execute_on	integer	Required for SSH commands. Target on which the custom script operation command will be executed. Possible values: 0 - Zabbix agent; 1 - Zabbix server.
password	string	Required for custom script commands. Password used for SSH commands with password authentication and Telnet commands.
port	string	Port number used for SSH and Telnet commands.
privatekey	string	Name of the private key file used for SSH commands with public key authentication.
		Required for SSH commands with public key authentication.

Property	Type	Description
publickey	string	Name of the public key file used for SSH commands with public key authentication.
scriptid	string	Required for SSH commands with public key authentication. ID of the script used for global script commands.
username	string	Required for global script commands. User name used for authentication.
		Required for SSH and Telnet commands.

Action operation message

The operation message object contains data about the message that will be sent by the operation.

Property	Type	Description
operationid	string	(<i>readonly</i>) ID of the action operation.
default_msg	integer	Whether to use the default action message text and subject. Possible values: 0 - (<i>default</i>) use the data from the operation; 1 - use the data from the action.
mediatypeid	string	ID of the media type that will be used to send the message.
message	string	Operation message text.
subject	string	Operation message subject.

Action operation condition

The action operation condition object defines a condition that must be met to perform the current operation. It has the following properties.

Property	Type	Description
opconditionid	string	(readonly) ID of the action operation condition
conditiontype (required)	integer	Type of condition. Possible values: 14 - event acknowledged.
value (required)	string	Value to compare with.
operationid	string	(readonly) ID of the operation.
operator	integer	Condition operator. Possible values: 0 - (default) =.

The following operators and values are supported for each operation condition type.

Condition	Condition name	Supported operators	Expected value
14	Event acknowledged	=	Whether the event is acknowledged. Possible values: 0 - not acknowledged; 1 - acknowledged.

Action filter

The action filter object defines a set of conditions that must be met to perform the configured action operations. It has the following properties.

Property	Type	Description
conditions (required)	array	Set of filter conditions to use for filtering results.
evaltype (required)	integer	Filter condition evaluation method. Possible values: 0 - and/or; 1 - and; 2 - or; 3 - custom expression.

Property	Type	Description
eval_formula	string	(readonly) Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its formulaid. The value of eval_formula is equal to the value of formula for filters with a custom expression.
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its formulaid. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Required for custom expression filters.

Action filter condition

The action filter condition object defines a specific condition that must be checked before running the action operations.

Property	Type	Description
conditionid	string	(readonly) ID of the action condition.

Property	Type	Description
conditiontype (required)	integer	<p>Type of condition.</p> <p>Possible values for trigger actions:</p> <p>0 - host group; 1 - host; 2 - trigger; 3 - trigger name; 4 - trigger severity; 5 - trigger value; 6 - time period; 13 - host template; 15 - application; 16 - maintenance status.</p> <p>Possible values for discovery actions:</p> <p>7 - host IP; 8 - discovered service type; 9 - discovered service port; 10 - discovery status; 11 - uptime or downtime duration; 12 - received value; 18 - discovery rule; 19 - discovery check; 20 - proxy; 21 - discovery object.</p> <p>Possible values for auto-registration actions:</p> <p>20 - proxy; 22 - host name; 24 - host metadata.</p> <p>Possible values for internal actions:</p> <p>0 - host group; 1 - host; 13 - host template; 15 - application; 23 - event type.</p> <p>Value to compare with.</p>
value (required)	string	

Property	Type	Description
actionid	string	(readonly) ID of the action that the condition belongs to.
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.
operator	integer	Condition operator. Possible values: 0 - (default) =; 1 - <>; 2 - like; 3 - not like; 4 - in; 5 - >=; 6 - <=; 7 - not in.

Note:

To better understand how to use filters with various types of expressions, see examples on the [action.get](#) and [action.create](#) method pages.

The following operators and values are supported for each condition type.

Condition	Condition name	Supported operators	Expected value
0	Host group	=, <>	Host group ID.
1	Host	=, <>	Host ID.
2	Trigger	=, <>	Trigger ID.
3	Trigger name	like, not like	Trigger name.
4	Trigger severity	=, <>, >=, <=	Trigger severity. Refer to the trigger "severity" property for a list of supported trigger severities.
5	Trigger value	=	Trigger value. Refer to the trigger "value" property for a list of supported trigger values.
6	Time period	in, not in	Time when the event was triggered as a time period .

Condition	Condition name	Supported operators	Expected value
7	Host IP	=, <>	One or several IP ranges to check separated by commas. Refer to the network discovery configuration section for more information on supported formats of IP ranges.
8	Discovered service type	=, <>	Type of discovered service. The type of service matches the type of the discovery check used to detect the service. Refer to the discovery check "type" property for a list of supported types.
9	Discovered service port	=, <>	One or several port ranges separated by commas.
10	Discovery status	=	Status of a discovered object. Possible values: 0 - host or service up; 1 - host or service down; 2 - host or service discovered; 3 - host or service lost.
11	Uptime or downtime duration	>=, <=	Time indicating how long has the discovered object been in the current status in seconds.
12	Received values	=, <>, >=, <=, like, not like	Value returned when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check.
13	Host template	=, <>	Linked template ID.
15	Application	=, like, not like	Name of the application.
16	Maintenance status	in, not in	No value required: using the "in" operator means that the host must be in maintenance, "not in" - not in maintenance.
18	Discovery rule	=, <>	ID of the discovery rule.
19	Discovery check	=, <>	ID of the discovery check.
20	Proxy	=, <>	ID of the proxy.
21	Discovery object	=	Type of object that triggered the discovery event. Possible values: 1 - discovered host; 2 - discovered service.
22	Host name	like, not like	Host name.

Condition	Condition name	Supported operators	Expected value
23	Event type	=	Specific internal event. Possible values: 0 - item in "not supported" state; 1 - item in "normal" state; 2 - LLD rule in "not supported" state; 3 - LLD rule in "normal" state; 4 - trigger in "unknown" state; 5 - trigger in "normal" state.
24	Host metadata	like, not like	Metadata of the auto-registered host.

action.create

Description

object action.create(object/array actions)

This method allows to create new actions.

Parameters

(object/array) Actions to create.

Additionally to the **standard action properties**, the method accepts the following parameters.

Parameter	Type	Description
operations (required)	array	Action operations to create for the action.
filter	object	Action filter object for the action.

Return values

(object) Returns an object containing the IDs of the created actions under the `actionids` property. The order of the returned IDs matches the order of the passed actions.

Examples

Create a trigger action

Create an action that will be run when a trigger from host "30045" that has the word "memory" in its name goes into problem state. The action must first send a message to all users in user group "7". If the event is not resolved in 4 minutes, it will run script "3" on all hosts in group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Trigger action",
    "eventsources": 0,
    "status": 0,
    "esc_period": 120,
    "def_shortdata": "{TRIGGER.NAME}: {TRIGGER.STATUS}",
    "def_longdata": "{TRIGGER.NAME}: {TRIGGER.STATUS}\r\nLast value: {ITEM.LASTVALUE}\r\n\r\n{TRIGGER.",
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
```

```

        "conditiontype": 1,
        "operator": 0,
        "value": "10084"
    },
    {
        "conditiontype": 3,
        "operator": 2,
        "value": "memory"
    }
]
},
"operations": [
    {
        "operationtype": 0,
        "esc_period": 0,
        "esc_step_from": 1,
        "esc_step_to": 2,
        "evaltype": 0,
        "opmessage_grp": [
            {
                "usrgrp": "7"
            }
        ],
        "opmessage": {
            "default_msg": 1,
            "mediatypeid": "1"
        }
    },
    {
        "operationtype": 1,
        "esc_step_from": 3,
        "esc_step_to": 4,
        "evaltype": 0,
        "opconditions": [
            {
                "conditiontype": 14,
                "operator": 0,
                "value": "0"
            }
        ],
        "opcommand_grp": [
            {
                "groupid": "2"
            }
        ],
        "opcommand": {
            "type": 4,
            "scriptid": "3"
        }
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            "17"
        ]
    }
}

```

```

    ]
  },
  "id": 1
}

```

Create a discovery action

Create an action that will link discovered hosts to template "30085".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Discovery action",
    "eventsources": 1,
    "status": 0,
    "esc_period": 0,
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
          "conditiontype": 21,
          "value": "1"
        },
        {
          "conditiontype": 10,
          "value": "2"
        }
      ]
    },
    "operations": [
      {
        "esc_step_from": 1,
        "esc_period": 0,
        "optemplate": [
          {
            "templateid": "10091"
          }
        ],
        "operationtype": 6,
        "esc_step_to": 1
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "18"
    ]
  },
  "id": 1
}

```

Using a custom expression filter

Create a trigger action that will use a custom filter condition. The action must send a message for each trigger with severity higher or equal to "Warning" for hosts "10084" and "10106". The formula IDs "A", "B" and "C" have been chosen arbitrarily.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Trigger action",
    "eventsources": 0,
    "status": 0,
    "esc_period": 120,
    "def_shortcode": "{TRIGGER.NAME}: {TRIGGER.STATUS}",
    "def_longdata": "{TRIGGER.NAME}: {TRIGGER.STATUS}\r\nLast value: {ITEM.LASTVALUE}\r\n\r\n{TRIGGER.",
    "filter": {
      "evaltype": 3,
      "formula": "A and (B or C)",
      "conditions": [
        {
          "conditiontype": 4,
          "operator": 5,
          "value": "2",
          "formulaid": "A"
        },
        {
          "conditiontype": 1,
          "operator": 0,
          "value": "10084",
          "formulaid": "B"
        },
        {
          "conditiontype": 1,
          "operator": 0,
          "value": "10106",
          "formulaid": "C"
        }
      ]
    },
    "operations": [
      {
        "operationtype": 0,
        "esc_period": 0,
        "esc_step_from": 1,
        "esc_step_to": 2,
        "evaltype": 0,
        "opmessage_grp": [
          {
            "usrgrp": "7"
          }
        ],
        "opmessage": {
          "default_msg": 1,
          "mediatypeid": "1"
        }
      }
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
  }
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
```

```

        "actionids": [
            "18"
        ],
        "id": 1
    }
}

```

action.delete

Description

object action.delete(array actionIds)

This method allows to delete actions.

Parameters

(array) IDs of the actions to delete.

Return values

(object) Returns an object containing the IDs of the deleted actions under the actionids property.

Examples

Delete multiple actions

Delete two actions.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "action.delete",
    "params": [
        "17",
        "18"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            "17",
            "18"
        ]
    },
    "id": 1
}

```

CAction::delete() in *frontends/php/include/classes/api/services/CAction.php*.

action.get

Description

integer/array action.get(object parameters)

The method allows to retrieve actions according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
actionids	string/array	Return only actions with the given IDs.
groupids	string/array	Return only actions that use the given host groups in action conditions.
hostids	string/array	Return only actions that use the given hosts in action conditions.
triggerids	string/array	Return only actions that use the given triggers in action conditions.
mediatypeids	string/array	Return only actions that use the given media types to send messages.
usrgrpids	string/array	Return only actions that are configured to send messages to the given user groups.
userids	string/array	Return only actions that are configured to send messages to the given users.
scriptids	string/array	Return only actions that are configured to run the given scripts.
selectFilter	query	Returns the action filter in the filter property.
selectOperations	query	Return action operations in the operations property.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
		Possible values are: actionid, name and status.
countOutput	flag	These parameters being common for all get methods are described in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve discovery actions

Retrieve all configured discovery actions together with action conditions and operations. The filter uses the "and" evaluation type, so the formula property is empty and eval_formula is generated automatically.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.get",
  "params": {
    "output": "extend",
    "selectOperations": "extend",
    "selectFilter": "extend",
    "filter": {
      "eventsources": 1
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "actionid": "2",
      "name": "Auto discovery. Linux servers.",

```

```

CAction::get() in *frontends/php/include/classes/api/services/CAction.php*.

action.update

Description

object action.update(object/array actions)

This method allows to update existing actions.

Parameters

(object/array) Action properties to be updated.

The `actionid` property must be defined for each action, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard action properties](#), the method accepts the following parameters.

Parameter	Type	Description
filter	object	Action filter object to replace the current filter.
operations	array	Action operations to replace existing operations.

Return values

(object) Returns an object containing the IDs of the updated actions under the `actionids` property.

Examples

Disable action

Disable action, that is, set its status to "1".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "action.update",
  "params": {
    "actionid": "2",
    "status": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [

```

```

    ],
    "id": 1
}

```

Alert

This class is designed to work with alerts.

Object references:

- [Alert](#)

Available methods:

- [alert.get](#) - retrieve alerts

> Alert object

The following objects are directly related to the alert API.

Alert

Note:

Alerts are created by the Zabbix server and cannot be modified via the API.

The alert object contains information about whether certain action operations have been executed successfully. It has the following properties.

Property	Type	Description
alertid	string	ID of the alert.
actionid	string	ID of the action that generated the alert.
alerttype	integer	Alert type. Possible values: 0 - message; 1 - remote command.
clock	timestamp	Time when the alert was generated.
error	string	Error text if there are problems sending a message or running a command.
esc_step	integer	Action escalation step during which the alert was generated.

Property	Type	Description
eventid	string	ID of the event that triggered the action.
mediatypeid	string	ID of the media type that was used to send the message.
message	text	Message text. Used for message alerts.
retries	integer	Number of times Zabbix tried to send the message.
sendto	string	Address, user name or other identifier of the recipient. Used for message alerts.
status	integer	Status indicating whether the action operation has been executed successfully. Possible values for message alerts: 0 - message not sent; 1 - message sent; 2 - failed after a number of retries. Possible values for command alerts: 1 - command run; 2 - tried to run the command on the Zabbix agent but it was unavailable.
subject	string	Message subject. Used for message alerts.
userid	string	ID of the user that the message was sent to.

alert.get

Description

`integer/array alert.get(object parameters)`

The method allows to retrieve alerts according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
alertids	string/array	Return only alerts with the given IDs.
actionids	string/array	Return only alerts generated by the given actions.
eventids	string/array	Return only alerts generated by the given events.
groupids	string/array	Return only alerts generated by objects from the given host groups.
hostids	string/array	Return only alerts generated by objects from the given hosts.
mediatypeids	string/array	Return only message alerts that used the given media types.
objectids	string/array	Return only alerts generated by the given objects.
userids	string/array	Return only message alerts that were sent to the given users.
eventobject	integer	Return only alerts generated by events related to objects of the given type. Refer to the event "object" property for a list of supported object types.
eventsource	integer	Default: 0 - trigger. Return only alerts generated by events of the given type. Refer to the event "source" property for a list of supported event types. Default: 0 - trigger events.

Parameter	Type	Description
time_from	timestamp	Return only alerts that have been generated after the given time.
time_till	timestamp	
selectHosts	query	Return only alerts that have been generated before the given time.
selectMediatypes	query	Return the hosts that triggered the action operation in the <code>hosts</code> property.
selectUsers	query	Return the media type that was used for the message alert as an array in the <code>mediatypes</code> property.
sortfield	string/array	Return the user that the message was addressed to as an array in the <code>users</code> property. Sort the result by the given properties.
countOutput	flag	Possible values are: <code>alertid</code> , <code>clock</code> , <code>eventid</code> and <code>status</code> . These parameters being common for all <code>get</code> methods are described in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve alerts by action ID

Retrieve all alerts generated by action "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "alert.get",
  "params": {
    "output": "extend",
    "actionids": "3"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "alertid": "1",
      "actionid": "3",
      "eventid": "21243",
      "userid": "1",

API info

This class is designed to retrieve meta information about the API.

Available methods:

- [apiinfo.version](#) - retrieving the version of the Zabbix API

apiinfo.version

Description

`string apiinfo.version(array)`

This method allows to retrieve the version of the Zabbix API.

Parameters

Attention:

This method is available to unauthenticated users and must be called without the `auth` parameter in the JSON-RPC request.

(array) The method accepts an empty array.

Return values

(string) Returns the version of the Zabbix API.

Note:

Starting from Zabbix 2.0.4 the version of the API matches the version of Zabbix.

Examples

Retrieving the version of the API

Retrieve the version of the Zabbix API.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "apiinfo.version",
  "params": [],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "3.0.0",
  "id": 1
}
```

`CAPIInfo::version()` in *frontends/php/include/classes/api/services/CAPIInfo.php*.

Application

This class is designed to work with applications.

Object references:

- [Application](#)

Available methods:

- [application.create](#) - creating new applications
- [application.delete](#) - deleting applications
- [application.get](#) - retrieving application
- [application.massadd](#) - updating application
- [application.update](#) - adding items to applications

> Application object

The following objects are directly related to the `application` API.

Application

The application object has the following properties.

Property	Type	Description
applicationid	string	(readonly) ID of the application.
hostid (required)	string	ID of the host that the application belongs to.
name (required)	string	Cannot be updated. Name of the application
flags	integer	(readonly) Origin of the application.
templateids	array	Possible values: 0 - a plain application; 4 - a discovered application. (readonly) IDs of the parent template applications.

application.create

Description

object application.create(object/array applications)

This method allows to create new applications.

Parameters

(object/array) Applications to create.

The method accepts applications with the **standard application properties**.

Return values

(object) Returns an object containing the IDs of the created applications under the applicationids property. The order of the returned IDs matches the order of the passed applications.

Examples

Creating an application

Create an application to store SNMP items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "application.create",
  "params": {
    "name": "SNMP Items",
    "hostid": "10050"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "applicationids": [
```

```

        "356"
    ]
},
    "id": 1
}

```

Source

CApplication::create() in *frontends/php/include/classes/api/services/CApplication.php*.

application.delete

Description

object application.delete(array applicationIds)

This method allows to delete applications.

Parameters

(array) IDs of the applications to delete.

Return values

(object) Returns an object containing the IDs of the deleted applications under the applicationids property.

Examples

Deleting multiple applications

Delete two applications.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "application.delete",
    "params": [
        "356",
        "358"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "applicationids": [
            "356",
            "358"
        ]
    },
    "id": 1
}

```

CApplication::delete() in *frontends/php/include/classes/api/services/CApplication.php*.

application.get

Description

integer/array application.get(object parameters)

The method allows to retrieve applications according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
applicationids	string/array	Return only applications with the given IDs.
groupids	string/array	Return only applications that belong to hosts from the given host groups.
hostids	string/array	Return only applications that belong to the given hosts.
inherited	boolean	If set to true return only applications inherited from a template.
itemids	string/array	Return only applications that contain the given items.
templated	boolean	If set to true return only applications that belong to templates.
templateids	string/array	Return only applications that belong to the given templates.
selectHost	query	Return the host that the application belongs to in the host property.
selectItems	query	Return the items contained in the application in the items property.
selectDiscoveryRule	query	Return the LLD rule that created the application in the discoveryRule property.
selectApplicationDiscovery	query	Return the application discovery object in the applicationDiscovery property.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
		Possible values are: applicationid and name.
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving applications from a host

Retrieve all applications from a host sorted by name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "application.get",
  "params": {
    "output": "extend",
    "hostids": "10001",
    "sortfield": "name"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "applicationid": "13",
      "hostid": "10001",
      "name": "CPU",
      "templateids": []
    }
  ]
}
```

```

    },
    {
        "applicationid": "5",
        "hostid": "10001",
        "name": "Filesystems",
        "templateids": []
    },
    {
        "applicationid": "21",
        "hostid": "10001",
        "name": "General",
        "templateids": []
    },
    {
        "applicationid": "15",
        "hostid": "10001",
        "name": "Memory",
        "templateids": []
    },
],
"id": 1
}

```

application.massadd

Description

object application.massadd(object parameters)

This method allows to simultaneously add multiple items to the given applications.

Parameters

(object) Parameters containing the IDs of the applications to update and the items to add to the applications.

The method accepts the following parameters.

Parameter	Type	Description
applications (required)	array/object	Applications to be updated. The applications must have the <code>applicationid</code> property defined.
items	array/object	Items to add to the given applications. The items must have the <code>itemid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated applications under the `applicationids` property.

Examples

Adding items to multiple applications

Add the given items to two applications.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "application.massadd",
  "params": {
    "applications": [
      {
        "applicationid": "247"
      },
      {
        "applicationid": "246"
      }
    ],
    "items": [
      {
        "itemid": "22800"
      },
      {
        "itemid": "22801"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "applicationids": [
      "247",
      "246"
    ]
  },
  "id": 1
}
```

CApplication::massAdd() in *frontends/php/include/classes/api/services/CApplication.php*.

application.update

Description

object application.update(object/array applications)

This method allows to update existing applications.

Parameters

(object/array) **Application properties** to be updated.

The applicationid property must be defined for each application, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated applications under the `applicationids` property.

Examples

Changing the name of an application

Change the name of the application to "Processes and performance".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "application.update",
  "params": {
    "applicationid": "13",
    "name": "Processes and performance"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "applicationids": [
      "13"
    ]
  },
  "id": 1
}
```

Configuration

This class is designed to export and import Zabbix configuration data.

Available methods:

- `configuration.export` - exporting the configuration
- `configuration.import` - importing the configuration

configuration.export

Description

`string configuration.export(object parameters)`

This method allows to export configuration data as a serialized string.

Parameters

(object) Parameters defining the objects to be exported and the format to use.

Parameter	Type	Description
format (required)	string	Format in which the data must be exported. Possible values: json - JSON; xml - XML.

Parameter	Type	Description
options (required)	object	<p>Objects to be exported.</p> <p>The options object has the following parameters:</p> <p>groups - (array) IDs of host groups to export;</p> <p>hosts - (array) IDs of hosts to export;</p> <p>images - (array) IDs of images to export;</p> <p>maps - (array) IDs of maps to export.</p> <p>screens - (array) IDs of screens to export;</p> <p>templates - (array) IDs of templates to export;</p> <p>valueMaps - (array) IDs of value maps to export;</p>

Return values

(string) Returns a serialized string containing the requested configuration data.

Examples

Exporting a host

Export the configuration of a host as an XML string.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.export",
  "params": {
    "options": {
      "hosts": [
        "10161"
      ]
    },
    "format": "xml"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```

    "result": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<zabbix_export><version>3.0</version><date>2012
    \"id\": 1
  }

```

Source

CConfiguration::export() in *frontends/php/include/classes/api/services/CConfiguration.php*.

configuration.import

Description

`boolean configuration.import(object parameters)`

This method allows to import configuration data from a serialized string.

Parameters

(object) Parameters containing the data to import and rules how the data should be handled.

Parameter	Type	Description
format (required)	string	Format of the serialized string. Possible values: json - JSON; xml - XML.
source (required)	string	Serialized string containing the configuration data.
rules (required)	object	Rules on how new and existing objects should be imported. The rules parameter is described in detail in the table below.

Note:

If no rules are given, the configuration will not be updated.

The rules object supports the following parameters.

Parameter	Type	Description
applications	object	Rules on how to import applications. Supported parameters: createMissing - (boolean) if set to true, new applications will be created; default: false; updateExisting - (boolean) if set to true, existing applications will be updated; default: false; deleteMissing - (boolean) if set to true, applications not present in the imported data will be deleted from the database; default: false.

Parameter	Type	Description
discoveryRules	object	Rules on how to import LLD rules. Supported parameters: createMissing - (boolean) if set to true, new LLD rules will be created; default: false; updateExisting - (boolean) if set to true, existing LLD rules will be updated; default: false; deleteMissing - (boolean) if set to true, LLD rules not present in the imported data will be deleted from the database; default: false.
graphs	object	Rules on how to import graphs. Supported parameters: createMissing - (boolean) if set to true, new graphs will be created; default: false; updateExisting - (boolean) if set to true, existing graphs will be updated; default: false; deleteMissing - (boolean) if set to true, graphs not present in the imported data will be deleted from the database; default: false.
groups	object	Rules on how to import host groups. Supported parameters: createMissing - (boolean) if set to true, new host groups will be created; default: false.
hosts	object	Rules on how to import hosts. Supported parameters: createMissing - (boolean) if set to true, new hosts will be created; default: false; updateExisting - (boolean) if set to true, existing hosts will be updated; default: false.
images	object	Rules on how to import images. Supported parameters: createMissing - (boolean) if set to true, new images will be created; default: false; updateExisting - (boolean) if set to true, existing images will be updated; default: false.
items	object	Rules on how to import items. Supported parameters: createMissing - (boolean) if set to true, new items will be created; default: false; updateExisting - (boolean) if set to true, existing items will be updated; default: false; deleteMissing - (boolean) if set to true, items not present in the imported data will be deleted from the database; default: false.
maps	object	Rules on how to import maps. Supported parameters: createMissing - (boolean) if set to true, new maps will be created; default: false; updateExisting - (boolean) if set to true, existing maps will be updated; default: false.

Parameter	Type	Description
screens	object	Rules on how to import screens. Supported parameters: createMissing - (boolean) if set to true, new screens will be created; default: false; updateExisting - (boolean) if set to true, existing screens will be updated; default: false.
templateLinkage	object	Rules on how to import template links. Supported parameters: createMissing - (boolean) if set to true, new links between templates and host will be created; default: false.
templates	object	Rules on how to import templates. Supported parameters: createMissing - (boolean) if set to true, new templates will be created; default: false; updateExisting - (boolean) if set to true, existing templates will be updated; default: false.
templateScreens	object	Rules on how to import template screens. Supported parameters: createMissing - (boolean) if set to true, new template screens will be created; default: false; updateExisting - (boolean) if set to true, existing template screens will be updated; default: false;
triggers	object	deleteMissing - (boolean) if set to true, template screens not present in the imported data will be deleted from the database; default: false. Rules on how to import triggers. Supported parameters: createMissing - (boolean) if set to true, new triggers will be created; default: false; updateExisting - (boolean) if set to true, existing triggers will be updated; default: false; deleteMissing - (boolean) if set to true, triggers not present in the imported data will be deleted from the database; default: false.
valueMaps	object	Rules on how to import value maps. Supported parameters: createMissing - (boolean) if set to true, new value maps will be created; default: false; updateExisting - (boolean) if set to true, existing value maps will be updated; default: false.

Return values

(boolean) Returns true if importing has been successful.

Examples

Importing hosts and items

Import the host and items contained in the XML string. If any items in XML are missing, they will be deleted from the database, and everything else will be left unchanged.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.import",
  "params": {
    "format": "xml",
    "rules": {
      "hosts": {
        "createMissing": true,
        "updateExisting": true
      },
      "items": {
        "createMissing": true,
        "updateExisting": true,
        "deleteMissing": true
      }
    },
    "source": "<?xml version='1.0' encoding='UTF-8'?><zabbix_export><version>3.0</version><date>2020-09-08T10:00:00+0000</date><groups><group><name>Zabbix server</name></group></groups><templates><template><name>Zabbix server</name><parent></parent><groups><group><name>Zabbix server</name></group></groups><hosts><host><name>Zabbix server</name><parent></parent><groups><group><name>Zabbix server</name></group></groups></zabbix_export>"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Source

CConfiguration::import() in *frontends/php/include/classes/api/services/CConfiguration.php*.

Discovered host

This class is designed to work with discovered hosts.

Object references:

- [Discovered host](#)

Available methods:

- [dhost.get](#) - retrieve discovered hosts

> Discovered host object

The following objects are directly related to the dhost API.

Discovered host

Note:

Discovered host are created by the Zabbix server and cannot be modified via the API.

The discovered host object contains information about a host discovered by a network discovery rule. It has the following properties.

Property	Type	Description
dhostid	string	ID of the discovered host.

Property	Type	Description
druleid	string	ID of the discovery rule that detected the host.
lastdown	timestamp	Time when the discovered host last went down.
lastup	timestamp	Time when the discovered host last went up.
status	integer	Whether the discovered host is up or down. A host is up if it has at least one active discovered service. Possible values: 0 - host up; 1 - host down.

dhost.get

Description

`integer/array dhost.get(object parameters)`

The method allows to retrieve discovered hosts according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dhostids	string/array	Return only discovered hosts with the given IDs.
druleids	string/array	Return only discovered hosts that have been created by the given discovery rules.
dserviceids	string/array	Return only discovered hosts that are running the given services.
selectDRules	query	Return the discovery rule that detected the host as an array in the <code>drules</code> property.

Parameter	Type	Description
selectDServices	query	Return the discovered services running on the host in the dservices property.
limitSelects	integer	Supports count. Limits the number of records returned by subselects.
sortfield	string/array	Applies to the following subselects: selectDServices - results will be sorted by dserviceid. Sort the result by the given properties.
countOutput	flag	Possible values are: dhostid and druleid. These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve discovered hosts by discovery rule

Retrieve all hosts and the discovered services they are running that have been detected by discovery rule "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dhost.get",
```

```

    "params": {
      "output": "extend",
      "selectDServices": "extend",
      "druleids": "4"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "dservices": [
        {
          "dserviceid": "1",

Discovered service

This class is designed to work with discovered services.

Object references:

- [Discovered service](#)

Available methods:

- `dservice.get` - retrieve discovered services

> Discovered service object

The following objects are directly related to the `dservice` API.

Discovered service

Note:

Discovered services are created by the Zabbix server and cannot be modified via the API.

The discovered service object contains information about a service discovered by a network discovery rule on a host. It has the following properties.

Property	Type	Description
<code>dserviceid</code>	string	ID of the discovered service.
<code>dcheckid</code>	string	ID of the discovery check used to detect the service.
<code>dhostid</code>	string	ID of the discovered host running the service.
<code>dns</code>	string	DNS of the host running the service.
<code>ip</code>	string	IP address of the host running the service.
<code>key_</code>	string	Key used by a Zabbix agent discovery check to locate the service.
<code>lastdown</code>	timestamp	Time when the discovered service last went down.
<code>lastup</code>	timestamp	Time when the discovered service last went up.
<code>port</code>	integer	Service port number.
<code>status</code>	integer	Status of the service. Possible values: 0 - service up; 1 - service down.

Property	Type	Description
type	integer	Type of discovered service. The type of service matches the type of the discovery check used to detect the service.
value	string	Refer to the discovery check "type" property for a list of supported types. Value returned by the service when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check.

dservice.get

Description

`integer/array dservice.get(object parameters)`

The method allows to retrieve discovered services according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dserviceids	string/array	Return only discovered services with the given IDs.
dhostids	string/array	Return only discovered services that belong to the given discovered hosts.
dcheckids	string/array	Return only discovered services that have been detected by the given discovery checks.
druleids	string/array	Return only discovered services that have been detected by the given discovery rules.

Parameter	Type	Description
selectDRules	query	Return the discovery rule that detected the service as an array in the drules property.
selectDHosts	query	Return the discovered host that service belongs to as an array in the dhosts property.
selectHosts	query	Return the hosts with the same IP address and proxy as the service in the hosts property.
limitSelects	integer	Supports count. Limits the number of records returned by subselects.
sortfield	string/array	Applies to the following subselects: selectHosts - result will be sorted by hostid. Sort the result by the given properties.
countOutput	flag	Possible values are: dserviceid, dhostid and ip. These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve services discovered on a host

Retrieve all discovered services detected on discovered host "11".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dservice.get",
  "params": {
    "output": "extend",
    "dhostids": "11"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dserviceid": "12",
      "dhostid": "11",
      "type": "4",
      "key_": "",
      "value": "",
      "port": "80",
      "status": "1",
      "lastup": "0",
      "lastdown": "1348650607",
      "dcheckid": "5",
      "ip": "192.168.1.134",
      "dns": "john.local"
    },
    {
      "dserviceid": "13",
      "dhostid": "11",
      "type": "3",
      "key_": "",
      "value": "",
      "port": "21",
      "status": "1",
      "lastup": "0",
      "lastdown": "1348650610",
      "dcheckid": "6",
      "ip": "192.168.1.134",
      "dns": "john.local"
    }
  ],
  "id": 1
}
```

Discovery check

This class is designed to work with discovery checks.

Object references:

- [Discovery check](#)

Available methods:

- [dcheck.get](#) - retrieve discovery checks

> Discovery check object

The following objects are directly related to the dcheck API.

Discovery check

The discovery check object defines a specific check performed by a network discovery rule. It has the following properties.

Property	Type	Description
dcheckid	string	(readonly) ID of the discovery check.
druleid	string	(readonly) ID of the discovery rule that the check belongs to.
key_	string	The value of this property differs depending on the type of the check: - key to query for Zabbix agent checks, required; - SNMP OID for SNMPv1, SNMPv2 and SNMPv3 checks, required.
ports	string	One or several port ranges to check separated by commas. Used for all checks except for ICMP.
snmp_community	string	Default: 0. SNMP community.
snmpv3_authpassphrase	string	Required for SNMPv1 and SNMPv2 agent checks. Auth passphrase used for SNMPv3 agent checks with security level set to <i>authNoPriv</i> or <i>authPriv</i> .

Property	Type	Description
snmpv3_authprotocol	integer	Authentication protocol used for SNMPv3 agent checks with security level set to <i>authNoPriv</i> or <i>authPriv</i> . Possible values: 0 - (default) MD5; 1 - SHA.
snmpv3_contextname	string	SNMPv3 context name. Used only by SNMPv3 checks.
snmpv3_privpassphrase	string	Priv passphrase used for SNMPv3 agent checks with security level set to <i>authPriv</i> .
snmpv3_privprotocol	integer	Privacy protocol used for SNMPv3 agent checks with security level set to <i>authPriv</i> . Possible values: 0 - (default) DES; 1 - AES.
snmpv3_securitylevel	integer	Security level used for SNMPv3 agent checks. Possible values: 0 - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv.
snmpv3_securityname	string	Security name used for SNMPv3 agent checks.
type (required)	integer	Type of check. Possible values: 0 - SSH; 1 - LDAP; 2 - SMTP; 3 - FTP; 4 - HTTP; 5 - POP; 6 - NNTP; 7 - IMAP; 8 - TCP; 9 - Zabbix agent; 10 - SNMPv1 agent; 11 - SNMPv2 agent; 12 - ICMP ping; 13 - SNMPv3 agent; 14 - HTTPS; 15 - Telnet.

Property	Type	Description
uniq	integer	<p>Whether to use this check as a device uniqueness criteria. Only a single unique check can be configured for a discovery rule. Used for Zabbix agent, SNMPv1, SNMPv2 and SNMPv3 agent checks.</p> <p>Possible values: 0 - <i>(default)</i> do not use this check as a uniqueness criteria; 1 - use this check as a uniqueness criteria.</p>

dcheck.get

Description

`integer/array dcheck.get(object parameters)`

The method allows to retrieve discovery checks according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dcheckids	string/array	Return only discovery checks with the given IDs.
druleids	string/array	Return only discovery checks that belong to the given discovery rules.
dserviceids	string/array	Return only discovery checks that have detected the given discovered services.
sortfield	string/array	Sort the result by the given properties.
		Possible values are: dcheckid and druleid.

Parameter	Type	Description
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve discovery checks for a discovery rule

Retrieve all discovery checks used by discovery rule "6".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dcheck.get",
  "params": {
    "output": "extend",
    "dcheckids": "6"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dcheckid": "6",
      "druleid": "4",
      "type": "3",
      "key_": "",
      "snmp_community": "",
      "ports": "21",
      "snmpv3_securityname": "",
      "snmpv3_securitylevel": "0",
      "snmpv3_authpassphrase": "",
      "snmpv3_privpassphrase": "",
      "uniq": "0",
      "snmpv3_authprotocol": "0",
      "snmpv3_privprotocol": "0"
    }
  ]
}
```

```
],
  "id": 1
}
```

CDCheck::get() in *frontends/php/include/classes/api/services/CDCheck.php*.

Discovery rule

This class is designed to work with network discovery rules.

Note:

This API is meant to work with network discovery rules. For the low-level discovery rules see the [LLD rule API](#).

Object references:

- [Discovery rule](#)

Available methods:

- [drule.create](#) - create new discovery rules
- [drule.delete](#) - delete discovery rules
- [drule.get](#) - retrieve discovery rules
- [drule.isreadable](#) - check if discovery rules are readable
- [drule.iswritable](#) - check if discovery rules are writable
- [drule.update](#) - update discovery rules

> Discovery rule object

The following objects are directly related to the `drule` API.

Discovery rule

The discovery rule object defines a network discovery rule. It has the following properties.

Property	Type	Description
<code>druleid</code>	string	(<i>readonly</i>) ID of the discovery rule.
<code>iprange</code> (required)	string	One or several IP ranges to check separated by commas. Refer to the network discovery configuration section for more information on supported formats of IP ranges.
<code>name</code> (required)	string	Name of the discovery rule.
<code>delay</code>	integer	Execution interval of the discovery rule in seconds. Default: 3600.

Property	Type	Description
nextcheck	timestamp	(readonly) Time when the discovery rule will be executed next.
proxy_hostid	string	ID of the proxy used for discovery.
status	integer	Whether the discovery rule is enabled. Possible values: 0 - (default) enabled; 1 - disabled.

drule.create

Description

object drule.create(object/array discoveryRules)

This method allows to create new discovery rules.

Parameters

(object/array) Discovery rules to create.

Additionally to the **standard discovery rule properties**, the method accepts the following parameters.

Parameter	Type	Description
dchecks (required)	array	Discovery checks to create for the discovery rule.

Return values

(object) Returns an object containing the IDs of the created discovery rules under the druleids property. The order of the returned IDs matches the order of the passed discovery rules.

Examples

Create a discovery rule

Create a discovery rule to find machines running the Zabbix agent in the local network. The rule must use a single Zabbix agent check on port 10050.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.create",
  "params": {
    "name": "Zabbix agent discovery",
    "iprange": "192.168.1.1-255",
    "dchecks": [
      {
        "type": "9",
        "key_": "system.uname",
        "ports": "10050",
        "uniq": "0"
      }
    ]
  },
}
```

```
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "6"
    ]
  },
  "id": 1
}
```

CDRule::create() in *frontends/php/include/classes/api/services/CDRule.php*.

drule.delete

Description

object drule.delete(array discoveryRuleIds)

This method allows to delete discovery rules.

Parameters

(array) IDs of the discovery rules to delete.

Return values

(object) Returns an object containing the IDs of the deleted discovery rules under the `druleids` property.

Examples

Delete multiple discovery rules

Delete two discovery rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.delete",
  "params": [
    "4",
    "6"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "4",
      "6"
    ]
  },
  "id": 1
}
```

CDRule::delete() in *frontends/php/include/classes/api/services/CDRule.php*.

drule.get

Description

integer/array drule.get(object parameters)

The method allows to retrieve discovery rules according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dhostids	string/array	Return only discovery rules that created the given discovered hosts.
druleids	string/array	Return only discovery rules with the given IDs.
dserviceids	string/array	Return only discovery rules that created the given discovered services.
selectDChecks	query	Return discovery checks used by the discovery rule in the dchecks property.
selectDHosts	query	Supports count. Return the discovered hosts that the discovery rule created in the dhosts property.
limitSelects	integer	Supports count. Limits the number of records returned by subselects. Applies to the following subselects: selectDChecks - results will be sorted by dcheckid; selectDHosts - results will be sorted by dhostsid.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>druleid</code> and <code>name</code> . These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all discovery rules

Retrieve all configured discovery rules and the discovery checks they use.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.get",
  "params": {
    "output": "extend",
    "selectDChecks": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "druleid": "2",
      "proxy_hostid": "0",
      "name": "Local network",

CDRule::get() in *frontends/php/include/classes/api/services/CDRule.php*.

drule.isreadable

Description

boolean `drule.isreadable(array discoveryRuleIds)`

This method checks if the given discovery rules are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [drule.get](#) instead.

Parameters

(array) IDs of the discovery rules to check.

Return values

(boolean) Returns true if the given discovery rules are available for reading.

Examples

Check multiple discovery rules

Check if the two discovery rules are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.isreadable",
  "params": [
    "5",
    "8"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",

drule.iswritable

Description

boolean `drule.iswritable(array discoveryRuleIds)`

This method checks if the given discovery rules are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use `drule.get` instead.

Parameters

(array) IDs of the discovery rules to check.

Return values

(boolean) Returns true if the given discovery rules are available for writing.

Examples

Check multiple discovery rules

Check if the two discovery rules are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.iswritable",
  "params": [
    "5",
    "8"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{

drule.update**Description**

`object drule.update(object/array discoveryRules)`

This method allows to update existing discovery rules.

Parameters

(object/array) Discovery rule properties to be updated.

The `druleid` property must be defined for each discovery rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard discovery rule properties**, the method accepts the following parameters.

Parameter	Type	Description
dchecks	array	Discovery checks to replace existing checks.

Return values

(object) Returns an object containing the IDs of the updated discovery rules under the `druleids` property.

Examples

Change the IP range of a discovery rule

Change the IP range of a discovery rule to "192.168.2.1-255".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.update",
  "params": {
    "druleid": "6",
    "iprange": "192.168.2.1-255"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "6"
    ]
  },
  "id": 1
}
```

Event

This class is designed to work with events.

Object references:

- [Event](#)

Available methods:

- [event.get](#) - retrieving events
- [event.acknowledge](#) - acknowledging events

> Event object

The following objects are directly related to the event API.

Event

Note:
Events are created by the Zabbix server and cannot be modified via the API.

The event object has the following properties.

Property	Type	Description
eventid	string	ID of the event.
acknowledged	integer	Whether the event has been acknowledged.

Property	Type	Description
clock	timestamp	Time when the event was created.
ns	integer	Nanoseconds when the event was created.
object	integer	Type of object that is related to the event.
		Possible values for trigger events: 0 - trigger.
		Possible values for discovery events: 1 - discovered host; 2 - discovered service.
		Possible values for auto-registration events: 3 - auto-registered host.
		Possible values for internal events: 0 - trigger; 4 - item; 5 - LLD rule.
objectid	string	ID of the related object.
source	integer	Type of the event.
		Possible values: 0 - event created by a trigger; 1 - event created by a discovery rule; 2 - event created by active agent auto-registration; 3 - internal event.

Property	Type	Description
value	integer	<p>State of the related object.</p> <p>Possible values for trigger events: 0 - OK; 1 - problem.</p> <p>Possible values for discovery events: 0 - host or service up; 1 - host or service down; 2 - host or service discovered; 3 - host or service lost.</p> <p>Possible values for internal events: 0 - "normal" state; 1 - "unknown" or "not supported" state.</p> <p>This parameter is not used for active agent auto-registration events.</p>

event.acknowledge

Description

`object event.acknowledge(object/array parameters)`

This method allows to acknowledge events and add an acknowledgement message. If an event is already acknowledged, a new message will still be added.

Attention:

Only trigger events can be acknowledged.

Parameters

(object/array) Parameters containing the IDs of the events acknowledge and a message.

Parameter	Type	Description
eventids (required)	string/object	IDs of the events to acknowledge.
message	string	Text of the acknowledgement message.

Return values

(object) Returns an object containing the IDs of the acknowledged events under the `eventids` property.

Examples

Acknowledging an event

Acknowledge a single event and leave a message.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.acknowledge",
  "params": {
    "eventids": "20427",
    "message": "Problem resolved."
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "eventids": [
      "20427"
    ]
  },
  "id": 1
}
```

CEvent::acknowledge() in *frontends/php/include/classes/api/services/CEvent.php*.

event.get

Description

integer/array event.get(object parameters)

The method allows to retrieve events according to the given parameters.

Attention:

This method may return events of a deleted entity if these events have not been removed by the housekeeper yet.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
eventids	string/array	Return only events with the given IDs.
groupids	string/array	Return only events created by objects that belong to the given host groups.
hostids	string/array	Return only events created by objects that belong to the given hosts.

Parameter	Type	Description
objectids	string/array	Return only events created by the given objects.
object	integer	Return only events created by objects of the given type. Refer to the event object page for a list of supported object types.
acknowledged	boolean	Default: 0 - trigger. If set to true return only acknowledged events.
eventid_from	string	Return only events with IDs greater or equal to the given ID.
eventid_till	string	Return only events with IDs less or equal to the given ID.
source	integer	Return only events with the given type. Refer to the event object page for a list of supported event types.
time_from	timestamp	Default: 0 - trigger events. Return only events that have been created after or at the given time.
time_till	timestamp	Return only events that have been created before or at the given time.
value	integer/array	Return only events with the given values.
selectHosts	query	Return hosts containing the object that created the event in the <code>hosts</code> property. Supported only for events generated by triggers, items or LLD rules.

Parameter	Type	Description
selectRelatedObject	query	Return the object that created the event in the relatedObject property. The type of object returned depends on the event type.
select_alerts	query	Return alerts generated by the event in the alerts property. Alerts are sorted in reverse chronological order.

Parameter	Type	Description
select_acknowledges	query	<p>Return event's acknowledges in the acknowledges property. Acknowledges are sorted in reverse chronological order.</p> <p>The event acknowledgement object has the following properties:</p> <ul style="list-style-type: none"> acknowledgeid - (string) acknowledgement's ID; userid - (string) ID of the user that acknowledged the event; eventid - (string) ID of the acknowledged event; clock - (timestamp) time when the event was acknowledged; message - (string) text of the acknowledgement message; alias - (string) alias of the user that acknowledged the event; name - (string) name of the user that acknowledged the event; surname - (string) surname of the user that acknowledged the event. <p>Supports count.</p>

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
		Possible values are: eventid, objectid and clock.
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving trigger events

Retrieve the latest events from trigger "13926."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.get",
  "params": {
    "output": "extend",
    "select_acknowledges": "extend",
    "objectids": "13926",
    "sortfield": ["clock", "eventid"],
    "sortorder": "DESC"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "acknowledges": [
        {
```

```

        "acknowledgeid": "1",
        "userid": "1",
        "eventid": "9695",
        "clock": "1350640590",
        "message": "Problem resolved.\n\r----[BULK ACKNOWLEDGE]----",
        "alias": "Admin",
        "name": "Zabbix",
        "surname": "Administrator"
    }
],
    "eventid": "9695",
    "source": "0",
    "object": "0",
    "objectid": "13926",
    "clock": "1347970410",
    "value": "1",
    "acknowledged": "1",
    "ns": "413316245"
},
{
    "acknowledges": [],
    "eventid": "9671",
    "source": "0",
    "object": "0",
    "objectid": "13926",
    "clock": "1347970347",
    "value": "0",
    "acknowledged": "0",
    "ns": "0"
}
],
    "id": 1
}

```

Retrieving events by time period

Retrieve all events that have been created between October 9 and 10, 2012, in reverse chronological order.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "event.get",
    "params": {
        "output": "extend",
        "time_from": "1349797228",
        "time_till": "1350661228",
        "sortfield": ["clock", "eventid"],
        "sortorder": "desc"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "eventid": "20616",
            "source": "0",
            "object": "0",
            "objectid": "14282",

```

```

        "clock": "1350477814",
        "value": "1",
        "acknowledged": "0",
        "ns": "0"
    },
    {
        "eventid": "20617",
        "source": "0",
        "object": "0",
        "objectid": "14283",
        "clock": "1350477814",
        "value": "0",
        "acknowledged": "0",
        "ns": "0"
    },
    {
        "eventid": "20618",
        "source": "0",
        "object": "0",
        "objectid": "14284",
        "clock": "1350477815",
        "value": "1",
        "acknowledged": "0",
        "ns": "0"
    }
],
    "id": 1
}

```

Graph

This class is designed to work with items.

Object references:

- [Graph](#)

Available methods:

- [graph.create](#) - creating new graphs
- [graph.delete](#) - deleting graphs
- [graph.get](#) - retrieving graphs
- [graph.update](#) - updating graphs

> Graph object

The following objects are directly related to the `graph` API.

Graph

The graph object has the following properties.

Property	Type	Description
graphid	string	(<i>readonly</i>) ID of the graph.
height (required)	integer	Height of the graph in pixels.
name (required)	string	Name of the graph
width (required)	integer	Width of the graph in pixels.
flags	integer	(<i>readonly</i>) Origin of the graph. Possible values are: 0 - (<i>default</i>) a plain graph; 4 - a discovered graph.
graphtype	integer	Graph's layout type. Possible values: 0 - (<i>default</i>) normal; 1 - stacked; 2 - pie; 3 - exploded.
percent_left	float	Left percentile.
percent_right	float	Default: 0. Right percentile.
show_3d	integer	Default: 0. Whether to show pie and exploded graphs in 3D. Possible values: 0 - (<i>default</i>) show in 2D; 1 - show in 3D.
show_legend	integer	Whether to show the legend on the graph. Possible values: 0 - hide; 1 - (<i>default</i>) show.
show_work_period	integer	Whether to show the working time on the graph. Possible values: 0 - hide; 1 - (<i>default</i>) show.
show_triggers	integer	Whether to show the trigger line on the graph. Possible values: 0 - hide; 1 - (<i>default</i>) show.

Property	Type	Description
templateid	string	(readonly) ID of the parent template graph.
yaxismax	float	The fixed maximum value for the Y axis.
yaxismin	float	Default: 100. The fixed minimum value for the Y axis.
ymax_itemid	string	Default: 0. ID of the item that is used as the maximum value for the Y axis.
ymax_type	integer	Maximum value calculation method for the Y axis.
ymin_itemid	string	Possible values: 0 - (default) calculated; 1 - fixed; 2 - item. ID of the item that is used as the minimum value for the Y axis.
ymin_type	integer	Minimum value calculation method for the Y axis.
		Possible values: 0 - (default) calculated; 1 - fixed; 2 - item.

graph.create

Description

object graph.create(object/array graphs)

This method allows to create new graphs.

Parameters

(object/array) Graphs to create.

Additionally to the **standard graph properties**, the method accepts the following parameters.

Parameter	Type	Description
gitems (required)	array	Graph items to be created for the graph.

Return values

(object) Returns an object containing the IDs of the created graphs under the `graphids` property. The order of the returned IDs matches the order of the passed graphs.

Examples

Creating a graph

Create a graph with two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.create",
  "params": {
    "name": "MySQL bandwidth",
    "width": 900,
    "height": 200,
    "gitems": [
      {
        "itemid": "22828",
        "color": "00AA00"
      },
      {
        "itemid": "22829",
        "color": "3333FF"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652"
    ]
  },
  "id": 1
}
```

graph.delete

Description

`object graph.delete(array graphIds)`

This method allows to delete graphs.

Parameters

(array) IDs of the graphs to delete.

Return values

(object) Returns an object containing the IDs of the deleted graphs under the `graphids` property.

Examples

Deleting multiple graphs

Delete two graphs.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.delete",
  "params": [
    "652",
    "653"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652",
      "653"
    ]
  },
  "id": 1
}
```

Source

CGraph::delete() in *frontends/php/include/classes/api/services/CGraph.php*.

graph.get

Description

integer/array graph.get(object parameters)

The method allows to retrieve graphs according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
graphids	string/array	Return only graphs with the given IDs.
groupids	string/array	Return only graphs that belong to hosts in the given host groups.
templateids	string/array	Return only graph that belong to the given templates.
hostids	string/array	Return only graphs that belong to the given hosts.
itemids	string/array	Return only graphs that contain the given items.

Parameter	Type	Description
templated	boolean	If set to true return only graphs that belong to templates.
inherited	boolean	If set to true return only graphs inherited from a template.
expandName	flag	Expand macros in the graph name.
selectGroups	query	Return the host groups that the graph belongs to in the groups property.
selectTemplates	query	Return the templates that the graph belongs to in the templates property.
selectHosts	query	Return the hosts that the graph belongs to in the hosts property.
selectItems	query	Return the items used in the graph in the items property.
selectGraphDiscovery	query	Return the graph discovery object in the graphDiscovery property. The graph discovery objects links the graph to a graph prototype from which it was created.
		It has the following properties: graphid - (string) ID of the graph; parent_graphid - (string) ID of the graph prototype from which the graph has been created.
selectGraphItems	query	Return the graph items used in the graph in the gitems property.

Parameter	Type	Description
selectDiscoveryRuleQuery		Return the low-level discovery rule that created the graph in the <code>discoveryRule</code> property.
filter	object	Return only those results that exactly match the given filter. Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against. Supports additional filters: <code>host</code> - technical name of the host that the graph belongs to; <code>hostid</code> - ID of the host that the graph belongs to. Sort the result by the given properties.
sortfield	string/array	Possible values are: <code>graphid</code> , <code>name</code> and <code>graphtype</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary page.
countOutput	flag	
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;

- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving graphs from hosts

Retrieve all graphs from host "10107" and sort them by name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.get",
  "params": {
    "output": "extend",
    "hostids": 10107,
    "sortfield": "name"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "graphid": "612",
      "name": "CPU jumps",
      "width": "900",
      "height": "200",
      "yaxismin": "0.0000",
      "yaxismax": "100.0000",
      "templateid": "439",
      "show_work_period": "1",
      "show_triggers": "1",
      "graphtype": "0",
      "show_legend": "1",
      "show_3d": "0",
      "percent_left": "0.0000",
      "percent_right": "0.0000",
      "ymin_type": "0",
      "ymax_type": "0",
      "ymin_itemid": "0",
      "ymax_itemid": "0",
      "flags": "0"
    },
    {
      "graphid": "613",
      "name": "CPU load",
      "width": "900",
      "height": "200",
      "yaxismin": "0.0000",
      "yaxismax": "100.0000",
      "templateid": "433",
      "show_work_period": "1",
      "show_triggers": "1",
      "graphtype": "0",
      "show_legend": "1",
      "show_3d": "0",
      "percent_left": "0.0000",
      "percent_right": "0.0000",
      "ymin_type": "1",
      "ymax_type": "0",
      "ymin_itemid": "0",

```

```

        "ymax_itemid": "0",
        "flags": "0"
    },
    {
        "graphid": "614",
        "name": "CPU utilization",
        "width": "900",
        "height": "200",
        "yaxismin": "0.0000",
        "yaxismax": "100.0000",
        "templateid": "387",
        "show_work_period": "1",
        "show_triggers": "0",
        "graphtype": "1",
        "show_legend": "1",
        "show_3d": "0",
        "percent_left": "0.0000",
        "percent_right": "0.0000",
        "ymin_type": "1",
        "ymax_type": "1",
        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "flags": "0"
    },
    {
        "graphid": "645",
        "name": "Disk space usage /",
        "width": "600",
        "height": "340",
        "yaxismin": "0.0000",
        "yaxismax": "0.0000",
        "templateid": "0",
        "show_work_period": "0",
        "show_triggers": "0",
        "graphtype": "2",
        "show_legend": "1",
        "show_3d": "1",
        "percent_left": "0.0000",
        "percent_right": "0.0000",
        "ymin_type": "0",
        "ymax_type": "0",
        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "flags": "4"
    }
],
"id": 1
}

```

CGraph::get() in *frontends/php/include/classes/api/services/CGraph.php*.

graph.update

Description

`object graph.update(object/array graphs)`

This method allows to update existing graphs.

Parameters

(object/array) Graph properties to be updated.

The `graphid` property must be defined for each graph, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard graph properties** the method accepts the following parameters.

Parameter	Type	Description
gitems	array	Graph items to replace existing graph items. If a graph item has the <code>gitemid</code> property defined it will be updated, otherwise a new graph item will be created.

Return values

(object) Returns an object containing the IDs of the updated graphs under the `graphids` property.

Examples

Setting the maximum for the Y scale

Set the the maximum of the Y scale to a fixed value of 100.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.update",
  "params": {
    "graphid": "439",
    "ymax_type": 1,
    "yaxismax": 100
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "439"
    ]
  },
  "id": 1
}
```

Source

`CGraph::update()` in `frontends/php/include/classes/api/services/CGraph.php`.

Graph item

This class is designed to work with hosts.

Object references:

- [Graph item](#)

Available methods:

- [graphitem.get](#) - retrieving graph items

> Graph item object

The following objects are directly related to the `graphitem` API.

Graph item

Note:

Graph items can only be modified via the `graph` API.

The graph item object has the following properties.

Property	Type	Description
gitemid	string	(<i>readonly</i>) ID of the graph item.
color (required)	string	Graph item's draw color as a hexadecimal color code.
itemid (required)	string	ID of the item.
calc_fnc	integer	Value of the item that will be displayed. Possible values: 1 - minimum value; 2 - (<i>default</i>) average value; 4 - maximum value; 7 - all values; 9 - last value, used only by pie and exploded graphs.
drawtype	integer	Draw style of the graph item. Possible values: 0 - (<i>default</i>) line; 1 - filled region; 2 - bold line; 3 - dot; 4 - dashed line; 5 - gradient line.
graphid	string	ID of the graph that the graph item belongs to.

Property	Type	Description
sortorder	integer	Position of the item in the graph. Default: starts with 0 and increases by one with each entry.
type	integer	Type of graph item. Possible values: 0 - <i>(default)</i> simple; 2 - graph sum, used only by pie and exploded graphs.
yaxisside	integer	Side of the graph where the graph item's Y scale will be drawn. Possible values: 0 - <i>(default)</i> left side; 1 - right side.

graphitem.get

Description

`integer/array graphitem.get(object parameters)`

The method allows to retrieve graph items according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
gitemids	string/array	Return only graph items with the given IDs.
graphids	string/array	Return only graph items that belong to the given graphs.
itemids	string/array	Return only graph items with the given item IDs.
type	integer	Return only graph items with the given type. Refer to the graph item object page for a list of supported graph item types.

Parameter	Type	Description
selectGraphs	query	Return the graph that the item belongs to as an array in the <code>graphs</code> property. Sort the result by the given properties.
sortfield	string/array	
countOutput	flag	
editable	boolean	
limit	integer	
output	query	Possible values are: <code>gitemid</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary page.
preservekeys	flag	
sortorder	string/array	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving graph items from a graph

Retrieve all graph items used in a graph with additional information about the item and the host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphitem.get",
  "params": {
    "output": "extend",
    "graphids": "387"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "gitemid": "1242",
      "graphid": "387",
      "itemid": "22665",
      "drawtype": "1",
      "sortorder": "1",
      "color": "FF5555",
      "yaxisside": "0",
      "calc_fnc": "2",

```

```

        "type": "0",
        "key_": "system.cpu.util[,steal]",
        "hostid": "10001",
        "flags": "0",
        "host": "Template OS Linux"
    },
    {
        "gitemid": "1243",
        "graphid": "387",

Graph prototype

This class is designed to work with graph prototypes.

Object references:

- [Graph prototype](#)

Available methods:

- [graphprototype.create](#) - creating new graph prototypes
- [graphprototype.delete](#) - deleting graph prototypes
- [graphprototype.get](#) - retrieving graph prototypes
- [graphprototype.update](#) - updating graph prototypes

> Graph prototype object

The following objects are directly related to the graphprototype API.

Graph prototype

The graph prototype object has the following properties.

Property	Type	Description
graphid	string	(readonly) ID of the graph prototype.
height (required)	integer	Height of the graph prototype in pixels.
name (required)	string	Name of the graph prototype.
width (required)	integer	Width of the graph prototype in pixels.
graphtype	integer	Graph prototypes's layout type. Possible values: 0 - (default) normal; 1 - stacked; 2 - pie; 3 - exploded.
percent_left	float	Left percentile.
percent_right	float	Default: 0. Right percentile.
show_3d	integer	Default: 0. Whether to show discovered pie and exploded graphs in 3D.
show_legend	integer	Possible values: 0 - (default) show in 2D; 1 - show in 3D. Whether to show the legend on the discovered graph.
show_work_period	integer	Possible values: 0 - hide; 1 - (default) show. Whether to show the working time on the discovered graph.
show_work_period	integer	Possible values: 0 - hide; 1 - (default) show.

Property	Type	Description
templateid	string	(readonly) ID of the parent template graph prototype.
yaxismax	float	The fixed maximum value for the Y axis.
yaxismin	float	The fixed minimum value for the Y axis.
ymax_itemid	string	ID of the item that is used as the maximum value for the Y axis.
ymin_type	integer	Maximum value calculation method for the Y axis. Possible values: 0 - (default) calculated; 1 - fixed; 2 - item.
ymin_itemid	string	ID of the item that is used as the minimum value for the Y axis.
ymin_type	integer	Minimum value calculation method for the Y axis. Possible values: 0 - (default) calculated; 1 - fixed; 2 - item.

graphprototype.create

Description

object graphprototype.create(object/array graphPrototypes)

This method allows to create new graph prototypes.

Parameters

(object/array) Graph prototypes to create.

Additionally to the **standard graph prototype properties**, the method accepts the following parameters.

Parameter	Type	Description
gitems (required)	array	Graph items to be created for the graph prototypes. Graph items can reference both items and item prototypes, but at least one item prototype must be present.

Return values

(object) Returns an object containing the IDs of the created graph prototypes under the `graphids` property. The order of the returned IDs matches the order of the passed graph prototypes.

Examples

Creating a graph prototype

Create a graph prototype with two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.create",
  "params": {
    "name": "Disk space usage {#FSNAME}",
    "width": 900,
    "height": 200,
    "gitems": [
      {
        "itemid": "22828",
        "color": "00AA00"
      },
      {
        "itemid": "22829",
        "color": "3333FF"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652"
    ]
  },
  "id": 1
}
```

graphprototype.delete

Description

object graphprototype.delete(array graphPrototypeIds)

This method allows to delete graph prototypes.

Parameters

(array) IDs of the graph prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted graph prototypes under the `graphids` property.

Examples

Deleting multiple graph prototypes

Delete two graph prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.delete",
  "params": [
    "652",
    "653"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652",
      "653"
    ]
  },
  "id": 1
}
```

graphprototype.get

Description

integer/array graphprototype.get(object parameters)

The method allows to retrieve graph prototypes according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
discoveryids	string/array	Return only graph prototypes that belong to the given discovery rules.
graphids	string/array	Return only graph prototypes with the given IDs.
groupids	string/array	Return only graph prototypes that belong to hosts in the given host groups.
hostids	string/array	Return only graph prototypes that belong to the given hosts.
inherited	boolean	If set to true return only graph prototypes inherited from a template.
itemids	string/array	Return only graph prototypes that contain the given item prototypes.
templated	boolean	If set to true return only graph prototypes that belong to templates.
templateids	string/array	Return only graph prototypes that belong to the given templates.
selectDiscoveryRule	query	Return the LLD rule that the graph prototype belongs to in the discoveryRule property.
selectGraphItems	query	Return the graph items used in the graph prototype in the gitems property.
selectGroups	query	Return the host groups that the graph prototype belongs to in the groups property.
selectHosts	query	Return the hosts that the graph prototype belongs to in the hosts property.
selectItems	query	Return the items and item prototypes used in the graph prototype in the items property.

Parameter	Type	Description
selectTemplates	query	Return the templates that the graph prototype belongs to in the templates property.
filter	object	Return only those results that exactly match the given filter. Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against. Supports additional filters: host - technical name of the host that the graph prototype belongs to; hostid - ID of the host that the graph prototype belongs to.
sortfield	string/array	Sort the result by the given properties. Possible values are: graphid, name and graphtype.
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving graph prototypes from a LLD rule

Retrieve all graph prototypes from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.get",
  "params": {
    "output": "extend",
    "discoveryids": "27426"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "graphid": "1017",
      "parent_itemid": "27426",
      "name": "Disk space usage {#FSNAME}",
      "width": "600",
      "height": "340",
      "yaxismin": "0.0000",
      "yaxismax": "0.0000",
      "templateid": "442",
      "show_work_period": "0",
      "show_triggers": "0",
      "graphtype": "2",
      "show_legend": "1",
      "show_3d": "1",
      "percent_left": "0.0000",
      "percent_right": "0.0000",
      "ymin_type": "0",
      "ymax_type": "0",
      "ymin_itemid": "0",
      "ymax_itemid": "0"
    }
  ],
  "id": 1
}
```

graphprototype.update

Description

`object graphprototype.update(object/array graphPrototypes)`

This method allows to update existing graph prototypes.

Parameters

(object/array) Graph prototype properties to be updated.

The `graphid` property must be defined for each graph prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard graph prototype properties**, the method accepts the following parameters.

Parameter	Type	Description
<code>gitems</code>	array	Graph items to replace existing graph items. If a graph item has the <code>gitemid</code> property defined it will be updated, otherwise a new graph item will be created.

Return values

(object) Returns an object containing the IDs of the updated graph prototypes under the `graphids` property.

Examples

Changing the size of a graph prototype

Change the size of a graph prototype to 1100 to 400 pixels.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.update",
  "params": {
    "graphid": "439",
    "width": 1100,
    "height": 400
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "439"
    ]
  },
  "id": 1
}
```

History

This class is designed to work with history data.

Object references:

- [History](#)

Available methods:

- [history.get](#) - retrieving history data.

> History object

The following objects are directly related to the `history` API.

Note:

History objects differ depending on the item's type of information. They are created by the Zabbix server and cannot be modified via the API.

Float history

The float history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	float	Received value.

Integer history

The integer history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	integer	Received value.

String history

The string history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	string	Received value.

Text history

The text history object has the following properties.

Property	Type	Description
id	string	ID of the history entry.
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	text	Received value.

Log history

The log history object has the following properties.

Property	Type	Description
id	string	ID of the history entry.
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
logeventid	integer	Windows event log entry ID.
ns	integer	Nanoseconds when the value was received.
severity	integer	Windows event log entry level.
source	string	Windows event log entry source.
timestamp	timestamp	Windows event log entry time.
value	text	Received value.

history.get

Description

`integer/array history.get(object parameters)`

The method allows to retrieve history data according to the given parameters.

See also: [known issues](#)

Attention:

This method may return historical data of a deleted entity if this data has not been removed by the housekeeper yet.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
history	integer	History object types to return. Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text.
hostids	string/array	Default: 3. Return only history from the given hosts.
itemids	string/array	Return only history from the given items.
time_from	timestamp	Return only values that have been received after or at the given time.
time_till	timestamp	Return only values that have been received before or at the given time.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: itemid and clock. These parameters being common for all get methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving item history data

Return 10 latest values received from a numeric(float) item.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "history.get",
  "params": {
    "output": "extend",
    "history": 0,
    "itemids": "23296",
    "sortfield": "clock",
    "sortorder": "DESC",
    "limit": 10
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "23296",
      "clock": "1351090996",

CHistory::get() in *frontends/php/include/classes/api/services/CHistory.php*.

Host

This class is designed to work with hosts.

Object references:

- [Host](#)
- [Host inventory](#)

Available methods:

- [host.create](#) - creating new hosts
- [host.delete](#) - deleting hosts
- [host.get](#) - retrieving hosts
- [host.isreadable](#) - checking if hosts are readable
- [host.iswritable](#) - checking if hosts are writable
- [host.massadd](#) - adding related objects to hosts
- [host.massremove](#) - removing related objects from hosts
- [host.massupdate](#) - replacing or removing related objects from hosts
- [host.update](#) - updating hosts

> Host object

The following objects are directly related to the host API.

Host

The host object has the following properties.

Property	Type	Description
hostid	string	<i>(readonly)</i> ID of the host.
host (required)	string	Technical name of the host.
available	integer	<i>(readonly)</i> Availability of Zabbix agent. Possible values are: 0 - <i>(default)</i> unknown; 1 - available; 2 - unavailable.
description	text	Description of the host.
disable_until	timestamp	<i>(readonly)</i> The next polling time of an unavailable Zabbix agent.
error	string	<i>(readonly)</i> Error text if Zabbix agent is unavailable.
errors_from	timestamp	<i>(readonly)</i> Time when Zabbix agent became unavailable.

Property	Type	Description
flags	integer	<i>(readonly)</i> Origin of the host. Possible values: 0 - a plain host; 4 - a discovered host.
inventory_mode	integer	Host inventory population mode. Possible values are: -1 - disabled; 0 - <i>(default)</i> manual; 1 - automatic.
ipmi_auth_type	integer	IPMI authentication algorithm. Possible values are: -1 - <i>(default)</i> default; 0 - none; 1 - MD2; 2 - MD5 4 - straight; 5 - OEM; 6 - RMCP+.
ipmi_available	integer	<i>(readonly)</i> Availability of IPMI agent. Possible values are: 0 - <i>(default)</i> unknown; 1 - available; 2 - unavailable.
ipmi_disable_until_timestamp		<i>(readonly)</i> The next polling time of an unavailable IPMI agent.
ipmi_error	string	<i>(readonly)</i> Error text if IPMI agent is unavailable.
ipmi_errors_from_timestamp		<i>(readonly)</i> Time when IPMI agent became unavailable.
ipmi_password	string	IPMI password.
ipmi_privilege	integer	IPMI privilege level. Possible values are: 1 - callback; 2 - <i>(default)</i> user; 3 - operator; 4 - admin; 5 - OEM.

Property	Type	Description
ipmi_username	string	IPMI username.
jmx_available	integer	<i>(readonly)</i> Availability of JMX agent. Possible values are: 0 - <i>(default)</i> unknown; 1 - available; 2 - unavailable.
jmx_disable_until	timestamp	<i>(readonly)</i> The next polling time of an unavailable JMX agent.
jmx_error	string	<i>(readonly)</i> Error text if JMX agent is unavailable.
jmx_errors_from	timestamp	<i>(readonly)</i> Time when JMX agent became unavailable.
maintenance_from	timestamp	<i>(readonly)</i> Starting time of the effective maintenance.
maintenance_status	integer	<i>(readonly)</i> Effective maintenance status. Possible values are: 0 - <i>(default)</i> no maintenance; 1 - maintenance in effect.
maintenance_type	integer	<i>(readonly)</i> Effective maintenance type. Possible values are: 0 - <i>(default)</i> maintenance with data collection; 1 - maintenance without data collection.
maintenanceid	string	<i>(readonly)</i> ID of the maintenance that is currently in effect on the host.
name	string	Visible name of the host.
proxy_hostid	string	Default: host property value. ID of the proxy that is used to monitor the host.

Property	Type	Description
snmp_available	integer	(readonly) Availability of SNMP agent. Possible values are: 0 - (default) unknown; 1 - available; 2 - unavailable.
snmp_disable_until	timestamp	(readonly) The next polling time of an unavailable SNMP agent.
snmp_error	string	(readonly) Error text if SNMP agent is unavailable.
snmp_errors_from	timestamp	(readonly) Time when SNMP agent became unavailable.
status	integer	Status and function of the host. Possible values are: 0 - (default) monitored host; 1 - unmonitored host.
tls_connect	integer	Connections to host. Possible values are: 1 - (default) No encryption; 2 - PSK; 4 - certificate.
tls_accept	integer	Connections from host. Possible bitmap values are: 1 - (default) No encryption; 2 - PSK; 4 - certificate.
tls_issuer	string	Certificate issuer.
tls_subject	string	Certificate subject.

Property	Type	Description
tls_psk_identity	string	PSK identity. Required if either <code>tls_connect</code> or <code>tls_accept</code> has PSK enabled. Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.
tls_psk	string	The preshared key, at least 32 hex digits. Required if either <code>tls_connect</code> or <code>tls_accept</code> has PSK enabled.

Host inventory

The host inventory object has the following properties.

Note:

Each property has it's own unique ID number, which is used to associate host inventory fields with items.

ID	Property	Type	Description
4	alias	string	Alias.
11	asset_tag	string	Asset tag.
28	chassis	string	Chassis.
23	contact	string	Contact person.
32	contract_number	string	Contract number.
47	date_hw_decomm	string	HW decommissioning date.
46	date_hw_expiry	string	HW maintenance expiry date.
45	date_hw_install	string	HW installation date.
44	date_hw_purchase	string	HW purchase date.
34	deployment_status	string	Deployment status.
14	hardware	string	Hardware.
15	hardware_full	string	Detailed hardware.
39	host_netmask	string	Host subnet mask.
38	host_networks	string	Host networks.
40	host_router	string	Host router.
30	hw_arch	string	HW architecture.
33	installer_name	string	Installer name.
24	location	string	Location.
25	location_lat	string	Location latitude.
26	location_lon	string	Location longitude.
12	macaddress_a	string	MAC address A.
13	macaddress_b	string	MAC address B.
29	model	string	Model.
3	name	string	Name.
27	notes	string	Notes.
41	oob_ip	string	OOB IP address.
42	oob_netmask	string	OOB host subnet mask.
43	oob_router	string	OOB router.
5	os	string	OS name.
6	os_full	string	Detailed OS name.

ID	Property	Type	Description
7	os_short	string	Short OS name.
61	poc_1_cell	string	Primary POC mobile number.
58	poc_1_email	string	Primary email.
57	poc_1_name	string	Primary POC name.
63	poc_1_notes	string	Primary POC notes.
59	poc_1_phone_a	string	Primary POC phone A.
60	poc_1_phone_b	string	Primary POC phone B.
62	poc_1_screen	string	Primary POC screen name.
68	poc_2_cell	string	Secondary POC mobile number.
65	poc_2_email	string	Secondary POC email.
64	poc_2_name	string	Secondary POC name.
70	poc_2_notes	string	Secondary POC notes.
66	poc_2_phone_a	string	Secondary POC phone A.
67	poc_2_phone_b	string	Secondary POC phone B.
69	poc_2_screen	string	Secondary POC screen name.
8	serialno_a	string	Serial number A.
9	serialno_b	string	Serial number B.
48	site_address_a	string	Site address A.
49	site_address_b	string	Site address B.
50	site_address_c	string	Site address C.
51	site_city	string	Site city.
53	site_country	string	Site country.
56	site_notes	string	Site notes.
55	site_rack	string	Site rack location.
52	site_state	string	Site state.
54	site_zip	string	Site ZIP/postal code.
16	software	string	Software.
18	software_app_a	string	Software application A.
19	software_app_b	string	Software application B.
20	software_app_c	string	Software application C.
21	software_app_d	string	Software application D.
22	software_app_e	string	Software application E.
17	software_full	string	Software details.
10	tag	string	Tag.
1	type	string	Type.
2	type_full	string	Type details.
35	url_a	string	URL A.
36	url_b	string	URL B.
37	url_c	string	URL C.
31	vendor	string	Vendor.

host.create

Description

object host.create(object/array hosts)

This method allows to create new hosts.

Parameters

(object/array) Hosts to create.

Additionally to the **standard host properties**, the method accepts the following parameters.

Parameter	Type	Description
groups (required)	object/array	Host groups to add the host to. The host groups must have the <code>groupid</code> property defined.
interfaces (required)	object/array	Interfaces to be created for the host.
templates	object/array	Templates to be linked to the host. The templates must have the <code>templateid</code> property defined.
macros	object/array	User macros to be created for the host.
inventory	object	Host inventory properties.

Return values

(object) Returns an object containing the IDs of the created hosts under the `hostids` property. The order of the returned IDs matches the order of the passed hosts.

Examples

Creating a host

Create a host called "Linux server" with an IP interface, add it to a group, link a template to it and set the MAC addresses in the host inventory.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "Linux server",
    "interfaces": [
      {
        "type": 1,
        "main": 1,
        "useip": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050"
      }
    ],
    "groups": [
      {
        "groupid": "50"
      }
    ],
    "templates": [
      {
        "templateid": "20045"
      }
    ],
    "macros": [
      {
```

```

        "macro": "{$USER_ID}",
        "value": "123321"
    }
],
"inventory_mode": 0,
"inventory": {
    "macaddress_a": "01234",
    "macaddress_b": "56768"
}
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "107819"
        ]
    },
    "id": 1
}

```

host.delete

Description

`object host.delete(array hosts)`

This method allows to delete hosts.

Parameters

(array) IDs of hosts to delete.

Return values

(object) Returns an object containing the IDs of the deleted hosts under the `hostids` property.

Examples

Deleting multiple hosts

Delete two hosts.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.delete",
    "params": [
        "13",
        "32"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
}

```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "13",
      "32"
    ]
  },
  "id": 1
}
```

host.get

Description

`integer/array host.get(object parameters)`

The method allows to retrieve hosts according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	string/array	Return only hosts that belong to the given groups.
applicationids	string/array	Return only hosts that have the given applications.
dserviceids	string/array	Return only hosts that are related to the given discovered services.
graphids	string/array	Return only hosts that have the given graphs.
hostids	string/array	Return only hosts with the given host IDs.
httpstestids	string/array	Return only hosts that have the given web checks.
interfaceids	string/array	Return only hosts that use the given interfaces.
itemids	string/array	Return only hosts that have the given items.

Parameter	Type	Description
maintenanceids	string/array	Return only hosts that are affected by the given maintenances.
monitored_hosts	flag	Return only monitored hosts.
proxy_hosts	flag	Return only proxies.
proxyids	string/array	Return only hosts that are monitored by the given proxies.
templated_hosts	flag	Return both hosts and templates.
templateids	string/array	Return only hosts that are linked to the given templates.
triggerids	string/array	Return only hosts that have the given triggers.
with_items	flag	Return only hosts that have items.
with_applications	flag	Overrides the with_monitored_items and with_simple_graph_items parameters. Return only hosts that have applications.
with_graphs	flag	Return only hosts that have graphs.
with_httptests	flag	Return only hosts that have web checks.
with_monitored_httptests	flag	Overrides the with_monitored_httptests parameter. Return only hosts that have enabled web checks.
with_monitored_items	flag	Return only hosts that have enabled items.
with_monitored_triggers	flag	Overrides the with_simple_graph_items parameter. Return only hosts that have enabled triggers. All of the items used in the trigger must also be enabled.
with_simple_graph_items	flag	Return only hosts that have items with numeric type of information.

Parameter	Type	Description
with_triggers	flag	Return only hosts that have triggers.
withInventory	flag	Overrides the with_monitored_triggers parameter. Return only hosts that have inventory data.
selectGroups	query	Return a groups property with host groups that the host belongs to.
selectApplications	query	Return an applications property with host applications .
selectDiscoveries	query	Supports count. Return a discoveries property with host low-level discovery rules .
selectDiscoveryRule	query	Supports count. Return a discoveryRule property with the low-level discovery rule that created the host (from host prototype in VMware monitoring).
selectGraphs	query	Return a graphs property with host graphs .
		Supports count.

Parameter	Type	Description
selectHostDiscovery	query	<p>Return a <code>hostDiscovery</code> property with host discovery object data.</p> <p>The host discovery object links a discovered host to a host prototype or a host prototypes to an LLD rule and has the following properties:</p> <ul style="list-style-type: none"> <code>host</code> - <i>(string)</i> host of the host prototype; <code>hostid</code> - <i>(string)</i> ID of the discovered host or host prototype; <code>parent_hostid</code> - <i>(string)</i> ID of the host prototype from which the host has been created; <code>parent_itemid</code> - <i>(string)</i> ID of the LLD rule that created the discovered host; <code>lastcheck</code> - <i>(timestamp)</i> time when the host was last discovered; <code>ts_delete</code> - <i>(timestamp)</i> time when a host that is no longer discovered will be deleted.
selectHttpTests	query	<p>Return an <code>httpTests</code> property with host web scenarios.</p>
selectInterfaces	query	<p>Supports count. Return an <code>interfaces</code> property with host interfaces.</p>
selectInventory	query	<p>Supports count. Return an <code>inventory</code> property with host inventory data.</p>

Parameter	Type	Description
selectItems	query	Return an items property with host items .
selectMacros	query	Supports count. Return a macros property with host macros .
selectParentTemplates	query	Return a parentTemplates property with templates that the host is linked to.
selectScreens	query	Supports count. Return a screens property with host screens .
selectTriggers	query	Supports count. Return a triggers property with host triggers .
filter	object	Supports count. Return only those results that exactly match the given filter. Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against. Allows filtering by interface properties.

Parameter	Type	Description
limitSelects	integer	<p>Limits the number of records returned by subselects.</p> <p>Applies to the following subselects:</p> <ul style="list-style-type: none"> selectParentTemplates - results will be sorted by host; selectInterfaces; selectItems - sorted by name; selectDiscoveries - sorted by name; selectTriggers - sorted by description; selectGraphs - sorted by name; selectApplications - sorted by name; selectScreens - sorted by name.
search	object	<p>Return results that match the given wildcard search.</p> <p>Accepts an array, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.</p> <p>Allows searching by interface properties. Works only with text fields.</p>
searchInventory	object	<p>Return only hosts that have inventory data matching the given wildcard search.</p> <p>This parameter is affected by the same additional parameters as search.</p>

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties. Possible values are: <code>hostid</code> , <code>host</code> , <code>name</code> , <code>status</code> . These parameters being common for all get methods are described in detail in the reference commentary .
countOutput	flag	
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two hosts named "Zabbix server" and "Linux server".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "filter": {
      "host": [
        "Zabbix server",
        "Linux server"
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "maintenances": [],
      "hostid": "10160",
      "proxy_hostid": "0",
      "host": "Zabbix server",
```

```

    "status": "0",
    "disable_until": "0",
    "error": "",
    "available": "0",
    "errors_from": "0",
    "lastaccess": "0",
    "ipmi_authtype": "-1",
    "ipmi_privilege": "2",
    "ipmi_username": "",
    "ipmi_password": "",
    "ipmi_disable_until": "0",
    "ipmi_available": "0",
    "snmp_disable_until": "0",
    "snmp_available": "0",
    "maintenanceid": "0",
    "maintenance_status": "0",
    "maintenance_type": "0",
    "maintenance_from": "0",

    "host": "Linux server",
    "status": "0",
    "disable_until": "0",
    "error": "",
    "available": "0",
    "errors_from": "0",
    "lastaccess": "0",
    "ipmi_authtype": "-1",
    "ipmi_privilege": "2",
    "ipmi_username": "",
    "ipmi_password": "",
    "ipmi_disable_until": "0",
    "ipmi_available": "0",
    "snmp_disable_until": "0",
    "snmp_available": "0",
    "maintenanceid": "0",
    "maintenance_status": "0",
    "maintenance_type": "0",
    "maintenance_from": "0",
    "ipmi_errors_from": "0",
    "snmp_errors_from": "0",
    "ipmi_error": "",
    "snmp_error": "",

```

```

        "jmx_disable_until": "0",
        "jmx_available": "0",
        "jmx_errors_from": "0",
        "jmx_error": "",
        "name": "Linux server",
        "description": "",
        "tls_connect": "1",
        "tls_accept": "1",
        "tls_issuer": "",
        "tls_subject": "",
        "tls_psk_identity": "",
        "tls_psk": ""
    }
],
    "id": 1
}

```

Retrieving host groups

Retrieve names of the groups host "Zabbix server" is member of, but no host details themselves.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectGroups": "extend",
        "filter": {
            "host": [
                "Zabbix server"
            ]
        }
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 2
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10085",
            "groups": [
                {
                    "groupid": "2",
                    "name": "Linux servers",
                    "internal": "0",
                    "flags": "0"
                },
                {
                    "groupid": "4",
                    "name": "Zabbix servers",
                    "internal": "0",
                    "flags": "0"
                }
            ]
        }
    ],
    "id": 2
}

```

Retrieving linked templates

Retrieve the IDs and names of templates linked to host "10084".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid"],
    "selectParentTemplates": [
      "templateid",
      "name"
    ],
    "hostids": "10084"
  },
  "id": 1,
  "auth": "70785d2b494a7302309b48afcdb3a401"
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "parentTemplates": [
        {
          "name": "Template OS Linux",
          "templateid": "10001"
        },
        {
          "name": "Template App Zabbix Server",
          "templateid": "10047"
        }
      ]
    }
  ],
  "id": 1
}
```

Searching by host inventory data

Retrieve hosts that contain "Linux" in the host inventory "OS" field.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": [
      "host"
    ],
    "selectInventory": [
      "os"
    ],
    "searchInventory": {
      "os": "Linux"
    }
  },
  "id": 2,
  "auth": "7f9e00124c75e8f25facd5c093f3e9a0"
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "host": "Zabbix server",
      "inventory": {
        "os": "Linux Ubuntu"
      }
    },
    {
      "hostid": "10107",
      "host": "Linux server",
      "inventory": {
        "os": "Linux Mint"
      }
    }
  ],
  "id": 1
}
```

host.isreadable

Description

`boolean host.isreadable(array hostIds)`

This method checks if the given hosts are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use `host.get` instead.

Parameters

(array) IDs of the hosts to check.

Return values

(boolean) Returns true if the given hosts are available for reading.

Examples

Check multiple hosts

Check if the two hosts are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.isreadable",
  "params": [
    "143",
    "943"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

host.iswritable

Description

boolean `host.iswritable(array hostIds)`

This method checks if the given hosts are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [host.get](#) instead.

Parameters

(array) IDs of the hosts to check.

Return values

(boolean) Returns true if the given hosts are available for writing.

Examples

Check multiple hosts

Check if the two hosts are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.iswritable",
  "params": [
    "143",
    "943"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

host.massadd

Description

`object host.massadd(object parameters)`

This method allows to simultaneously add multiple related objects to all the given hosts.

Parameters

(object) Parameters containing the IDs of the hosts to update and the objects to add to all the hosts.

The method accepts the following parameters.

Parameter	Type	Description
hosts (required)	object/array	Hosts to be updated. The hosts must have the <code>hostid</code> property defined.
groups	object/array	Host groups to add to the given hosts. The host groups must have the <code>groupid</code> property defined.
interfaces	object/array	Host interfaces to be created for the given hosts.
macros	object/array	User macros to be created for the given hosts.
templates	object/array	Templates to link to the given hosts. The templates must have the <code>templateid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Adding macros

Add two new macros to two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massadd",
  "params": {
    "hosts": [
      {
        "hostid": "10160"
      },
      {
        "hostid": "10167"
      }
    ]
  }
}
```

```

    ],
    "macros": [
        {
            "macro": "${TEST1}",
            "value": "MACROTEST1"
        },
        {
            "macro": "${TEST2}",
            "value": "MACROTEST2"
        }
    ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10160",
            "10167"
        ]
    },
    "id": 1
}

```

`CHost::massAdd()` in *frontends/php/include/classes/api/services/CHost.php*.

host.massremove

Description

`object host.massremove(object parameters)`

This method allows to remove related objects from multiple hosts.

Parameters

(object) Parameters containing the IDs of the hosts to update and the objects that should be removed.

Parameter	Type	Description
hostids (required)	string/array	IDs of the hosts to be updated.
groupids	string/array	Host groups to remove the given hosts from.

Parameter	Type	Description
interfaces	object/array	Host interfaces to remove from the given hosts. The host interface object must have the <code>ip</code> , <code>dns</code> and <code>port</code> properties defined.
macros	string/array	User macros to delete from the given hosts.
templateids	string/array	Templates to unlink from the given hosts.
templateids_clear	string/array	Templates to unlink and clear from the given hosts.

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Unlinking templates

Unlink a template from two hosts and delete all of the templated entities.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massremove",
  "params": {
    "hostids": ["69665", "69666"],
    "templateids_clear": "325"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "69665",
      "69666"
    ]
  },
  "id": 1
}
```

`CHost::massRemove()` in *frontends/php/include/classes/api/services/CHost.php*.

host.massupdate

Description

```
object host.massupdate(object parameters)
```

This method allows to simultaneously replace or remove related objects and update properties on multiple hosts.

Parameters

(object) Parameters containing the IDs of the hosts to update and the properties that should be updated.

Additionally to the [standard host properties](#), the method accepts the following parameters.

Parameter	Type	Description
hosts (required)	object/array	Hosts to be updated. The hosts must have the <code>hostid</code> property defined.
groups	object/array	Host groups to replace the current host groups the hosts belong to. The host groups must have the <code>groupid</code> property defined.
interfaces	object/array	Host interfaces to replace the current host interfaces on the given hosts.
inventory	object	Host inventory properties.
inventory_mode	integer	Host inventory mode cannot be updated using the <code>inventory</code> parameter, use <code>inventory_mode</code> instead. Host inventory population mode.
macros	object/array	Refer to the host inventory object page for a list of supported inventory modes. User macros to replace the current user macros on the given hosts.

Parameter	Type	Description
templates	object/array	<p>Templates to replace the currently linked templates on the given hosts.</p> <p>The templates must have the <code>templateid</code> property defined.</p>
templates_clear	object/array	<p>Templates to unlink and clear from the given hosts.</p> <p>The templates must have the <code>templateid</code> property defined.</p>

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Enabling multiple hosts

Enable monitoring of two hosts, i.e., set their status to 0.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massupdate",
  "params": {
    "hosts": [
      {
        "hostid": "69665"
      },
      {
        "hostid": "69666"
      }
    ],
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "69665",
      "69666"
    ]
  },
  "id": 1
}
```

Source

CHost::massUpdate() in *frontends/php/include/classes/api/services/CHost.php*.

host.update

Description

`object host.update(object/array hosts)`

This method allows to update existing hosts.

Parameters

(object/array) Host properties to be updated.

The `hostid` property must be defined for each host, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Note, however, that updating the host technical name will also update the host's visible name (if not given or empty) by the host's technical name value.

Additionally to the [standard host properties](#), the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	<p>Host groups to replace the current host groups the host belongs to.</p> <p>The host groups must have the <code>groupid</code> property defined. All host groups that are not listed in the request will be unlinked.</p>
interfaces	object/array	<p>Host interfaces to replace the current host interfaces.</p> <p>All interfaces that are not listed in the request will be removed.</p>
inventory	object	<p>Host inventory properties.</p>

Parameter	Type	Description
macros	object/array	User macros to replace the current user macros. All macros that are not listed in the request will be removed.
templates	object/array	Templates to replace the currently linked templates. All templates that are not listed in the request will be only unlinked. The templates must have the <code>templateid</code> property defined.
templates_clear	object/array	Templates to unlink and clear from the host. The templates must have the <code>templateid</code> property defined.

Note:

As opposed to the Zabbix frontend, when `name` (visible host name) is the same as `host` (technical host name), updating `host` via API will not automatically update `name`. Both properties need to be updated explicitly.

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Enabling a host

Enable host monitoring, i.e. set its status to 0.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
```

```

        "10126"
    ],
    },
    "id": 1
}

```

Unlinking templates

Unlink and clear two templates from host.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "templates_clear": [
      {
        "templateid": "10124"
      },
      {
        "templateid": "10125"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}

```

Updating host macros

Replace all host macros with two new ones.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "macros": [
      {
        "macro": "${PASS}",
        "value": "password"
      },
      {
        "macro": "${DISC}",
        "value": "sda"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}
```

Updating host inventory

Change inventory mode and add location

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10387",
    "inventory_mode": 0,
    "inventory": {
      "location": "Latvia, Riga"
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10387"
    ]
  },
  "id": 2
}
```

Host group

This class is designed to work with host groups.

Object references:

- [Host group](#)

Available methods:

- **hostgroup.create** - creating new host groups
- **hostgroup.delete** - deleting host groups
- **hostgroup.get** - retrieving host groups
- **hostgroup.isreadable** - checking if host groups are readable
- **hostgroup.iswritable** - checking if host groups are writable
- **hostgroup.massadd** - adding related objects to host groups
- **hostgroup.massremove** - removing related objects from host groups
- **hostgroup.massupdate** - replacing or removing related objects from host groups
- **hostgroup.update** - updating host groups

> Host group object

The following objects are directly related to the `hostgroup` API.

Host group

The host group object has the following properties.

Property	Type	Description
groupid	string	(readonly) ID of the host group.
name (required)	string	Name of the host group.
flags	integer	(readonly) Origin of the host group. Possible values: 0 - a plain host group; 4 - a discovered host group.
internal	integer	(readonly) Whether the group is used internally by the system. An internal group cannot be deleted. Possible values: 0 - (default) not internal; 1 - internal.

hostgroup.create

Description

`object hostgroup.create(object/array hostGroups)`

This method allows to create new host groups.

Parameters

(object/array) Host groups to create. The method accepts host groups with the **standard host group properties**.

Return values

(object) Returns an object containing the IDs of the created host groups under the `groupids` property. The order of the returned IDs matches the order of the passed host groups.

Examples

Creating a host group

Create a host group called "Linux servers".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.create",
  "params": {
    "name": "Linux servers"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107819"
    ]
  },
  "id": 1
}
```

Source

CHostGroup::create() in *frontends/php/include/classes/api/services/CHostGroup.php*.

hostgroup.delete

Description

object hostgroup.delete(array hostGroupIds)

This method allows to delete host groups.

A host group can not be deleted if:

- it contains hosts that belong to this group only;
- it's marked as internal;
- it is used by a host prototype;
- it is used in a global script.

Parameters

(array) IDs of the host groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted host groups under the `groupids` property.

Examples

Deleting multiple host groups

Delete two host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.delete",
  "params": [
    "107824",
    "107825"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107824",
      "107825"
    ]
  },
  "id": 1
}
```

Source

`CHostGroup::delete()` in *frontends/php/include/classes/api/services/CHostGroup.php*.

hostgroup.get

Description

`integer/array hostgroup.get(object parameters)`

The method allows to retrieve host groups according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
graphids	string/array	Return only host groups that contain hosts or templates with the given graphs.
groupids	string/array	Return only host groups with the given host group IDs.
hostids	string/array	Return only host groups that contain the given hosts.
maintenanceids	string/array	Return only host groups that are affected by the given maintenances.
monitored_hosts	flag	Return only host groups that contain monitored hosts.
real_hosts	flag	Return only host groups that contain hosts.
templated_hosts	flag	Return only host groups that contain templates.

Parameter	Type	Description
templateids	string/array	Return only host groups that contain the given templates.
triggerids	string/array	Return only host groups that contain hosts or templates with the given triggers.
with_applications	flag	Return only host groups that contain hosts with applications.
with_graphs	flag	Return only host groups that contain hosts with graphs.
with_hosts_and_templates	flag	Return only host groups that contain hosts <i>or</i> templates.
with_httptests	flag	Return only host groups that contain hosts with web checks.
with_items	flag	Overrides the <code>with_monitored_httptests</code> parameter. Return only host groups that contain hosts or templates with items.
with_monitored_httptests	flag	Overrides the <code>with_monitored_items</code> and <code>with_simple_graph_items</code> parameters. Return only host groups that contain hosts with enabled web checks.
with_monitored_items	flag	Return only host groups that contain hosts or templates with enabled items.
with_monitored_triggers	flag	Overrides the <code>with_simple_graph_items</code> parameter. Return only host groups that contain hosts with enabled triggers. All of the items used in the trigger must also be enabled.

Parameter	Type	Description
with_simple_graphs	flag	Return only host groups that contain hosts with numeric items.
with_triggers	flag	Return only host groups that contain hosts with triggers.
		Overrides the with_monitored_triggers parameter.
selectDiscoveryRule	query	Return the LLD rule that created the host group in the discoveryRule property.
selectGroupDiscovery	query	Return the host group discovery object in the groupDiscovery property.
		The host group discovery object links a discovered host group to a host group prototype and has the following properties:
		groupid - (string) ID of the discovered host group;
		lastcheck - (timestamp) time when the host group was last discovered;
		name - (string) name of the host group prototype;
		parent_group_prototypeid - (string) ID of the host group prototype from which the host group has been created;
		ts_delete - (timestamp) time when a host group that is no longer discovered will be deleted.

Parameter	Type	Description
selectHosts	query	Return the hosts that belong to the host group in the hosts property.
selectTemplates	query	Supports count. Return the templates that belong to the host group in the templates property.
limitSelects	integer	Supports count. Limits the number of records returned by subselects.
sortfield	string/array	Applies to the following subselects: selectHosts - results will be sorted by host; selectTemplates - results will be sorted by host. Sort the result by the given properties.
countOutput	flag	Possible values are: groupid, name. These parameters being common for all get methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two host groups named "Zabbix servers" and "Linux servers".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.get",
  "params": {
    "output": "extend",
    "filter": {
      "name": [
        "Zabbix servers",
        "Linux servers"
      ]
    }
  },
  "auth": "6f38cddc44cfbb6c1bd186f9a220b5a0",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "groupid": "2",
      "name": "Linux servers",
      "internal": "0"
    },
    {
      "groupid": "4",
      "name": "Zabbix servers",
      "internal": "0"
    }
  ],
  "id": 1
}
```

Source

`CHostGroup::get()` in *frontends/php/include/classes/api/services/CHostGroup.php*.

hostgroup.isreadable

Description

`boolean hostgroup.isreadable(array hostGroupIds)`

This method checks if the given host groups are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [hostgroup.get](#) instead.

Parameters

(array) IDs of the host groups to check.

Return values

(boolean) Returns true if the given host groups are available for reading.

Examples

Check multiple host groups

Check if the two host groups are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.isreadable",
  "params": [
    "5",
    "7"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

See also

- [hostgroup.iswritable](#)

Source

`CHostGroup::isReadable()` in *frontends/php/include/classes/api/services/CHostGroup.php*.

hostgroup.iswritable

Description

boolean `hostgroup.iswritable(array hostGroupIds)`

This method checks if the given host groups are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [hostgroup.get](#) instead.

Parameters

(array) IDs of the host groups to check.

Return values

(boolean) Returns true if the given host groups are available for writing.

Examples

Check multiple host groups

Check if the two host groups are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.iswritable",
  "params": [
    "5",
    "7"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

hostgroup.massadd

Description

object hostgroup.massadd(object parameters)

This method allows to simultaneously add multiple related objects to all the given host groups.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects to add to all the host groups.

The method accepts the following parameters.

Parameter	Type	Description
groups (required)	object/array	Host groups to be updated. The host groups must have the groupid property defined.
hosts	object/array	Hosts to add to all host groups. The hosts must have the hostid property defined.
templates	object/array	Templates to add to all host groups. The templates must have the templateid property defined.

Return values

(object) Returns an object containing the IDs of the updated host groups under the **groupids** property.

Examples

Adding hosts to host groups

Add two hosts to host groups with IDs 5 and 6.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massadd",
  "params": {
    "groups": [
      {
        "groupid": "5"
      },
      {
        "groupid": "6"
      }
    ],
    "hosts": [
      {
        "hostid": "30050"
      },
      {
        "hostid": "30001"
      }
    ]
  },
  "auth": "f223adf833b2bf2ff38574a67bba6372",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "5",
      "6"
    ]
  },
  "id": 1
}
```

See also

hostgroup.massremove

Description

`object hostgroup.massremove(object parameters)`

This method allows to remove related objects from multiple host groups.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects that should be removed.

Parameter	Type	Description
groupids (required)	string/array	IDs of the host groups to be updated.
hostids	string/array	Hosts to remove from all host groups.
templateids	string/array	Templates to remove from all host groups.

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Removing hosts from host groups

Remove two hosts from the given host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massremove",
  "params": {
    "groupids": [
      "5",
      "6"
    ],
    "hostids": [
      "30050",
      "30001"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "5",
      "6"
    ]
  },
  "id": 1
}
```

Source

`CHostGroup::massRemove()` in *frontends/php/include/classes/api/services/CHostGroup.php*.

hostgroup.massupdate

Description

`object hostgroup.massupdate(object parameters)`

This method allows to simultaneously replace or remove related objects for multiple host groups.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects that should be updated.

Parameter	Type	Description
groups (required)	object/array	Host groups to be updated. The host groups must have the <code>groupid</code> property defined.

Parameter	Type	Description
hosts	object/array	Hosts to replace the current hosts on the given host groups. The hosts must have the <code>hostid</code> property defined.
templates	object/array	Templates to replace the current templates on the given host groups. The templates must have the <code>templateid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Replacing hosts in a host group

Replace all hosts in the host group with ID.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massupdate",
  "params": {
    "groups": [
      {
        "groupid": "6"
      }
    ],
    "hosts": [
      {
        "hostid": "30050"
      }
    ]
  },
  "auth": "f223adf833b2bf2ff38574a67bba6372",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "6",
    ]
  },
  "id": 1
}
```

hostgroup.update

Description

`object hostgroup.update(object/array hostGroups)`

This method allows to update existing hosts groups.

Parameters

(object/array) [Host group properties](#) to be updated.

The `groupid` property must be defined for each host group, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Renaming a host group

Rename a host group to "Linux hosts."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.update",
  "params": {
    "groupid": "7",
    "name": "Linux hosts"
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "7"
    ]
  },
  "id": 1
}
```

Source

`CHostGroup::update()` in *frontends/php/include/classes/api/services/CHostGroup.php*.

Host interface

This class is designed to work with host interfaces.

Object references:

- [Host interface](#)

Available methods:

- `hostinterface.create` - creating new host interfaces
- `hostinterface.delete` - deleting host interfaces
- `hostinterface.get` - retrieving host interfaces
- `hostinterface.massadd` - adding host interfaces to hosts
- `hostinterface.massremove` - removing host interfaces from hosts
- `hostinterface.replacehostinterfaces` - replacing host interfaces on a host
- `hostinterface.update` - updating host interfaces

> Host interface object

The following objects are directly related to the `hostinterface` API.

Host interface

The host interface object has the following properties.

Attention:

Note that both IP and DNS are required. If you do not want to use DNS, set it to an empty string.

Property	Type	Description
<code>interfaceid</code>	string	(readonly) ID of the interface.
<code>dns</code> (required)	string	DNS name used by the interface. Can be empty if the connection is made via IP.
<code>hostid</code> (required)	string	ID of the host the interface belongs to.
<code>ip</code> (required)	string	IP address used by the interface.
<code>main</code> (required)	integer	Can be empty if the connection is made via DNS. Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host.
<code>port</code> (required)	string	Possible values are: 0 - not default; 1 - default. Port number used by the interface. Can contain user macros.

Property	Type	Description
type (required)	integer	Interface type. Possible values are: 1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX.
useip (required)	integer	Whether the connection should be made via IP. Possible values are: 0 - connect using host DNS name; 1 - connect using host IP address for this host interface.
bulk	integer	Whether to use bulk SNMP requests. Possible values are: 0 - don't use bulk requests; 1 - (default) use bulk requests.

hostinterface.create

Description

`object hostinterface.create(object/array hostInterfaces)`

This method allows to create new host interfaces.

Parameters

(object/array) Host interfaces to create. The method accepts host interfaces with the **standard host interface properties**.

Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property. The order of the returned IDs matches the order of the passed host interfaces.

Examples

Create a new interface

Create a secondary IP agent interface on host "30052."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.create",
  "params": {
    "hostid": "30052",
    "dns": "",
    "ip": "127.0.0.1",
```

```

        "main": 0,
        "port": "10050",
        "type": 1,
        "useip": 1
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "interfaceids": [
            "30062"
        ]
    },
    "id": 1
}

```

hostinterface.delete

Description

object `hostinterface.delete(array hostInterfaceIds)`

This method allows to delete host interfaces.

Parameters

(array) IDs of the host interfaces to delete.

Return values

(object) Returns an object containing the IDs of the deleted host interfaces under the `interfaceids` property.

Examples

Delete a host interface

Delete the host interface with ID 30062.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hostinterface.delete",
    "params": [
        "30062"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "interfaceids": [
            "30062"
        ]
    }
}

```

```

    ],
    },
    "id": 1
}

```

hostinterface.get

Description

`integer/array hostinterface.get(object parameters)`

The method allows to retrieve host interfaces according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
hostids	string/array	Return only host interfaces used by the given hosts.
interfaceids	string/array	Return only host interfaces with the given IDs.
itemids	string/array	Return only host interfaces used by the given items.
triggerids	string/array	Return only host interfaces used by items in the given triggers.
selectItems	query	Return the items that use the interface in the <code>items</code> property.
selectHosts	query	Supports <code>count</code> . Return the host that uses the interface as an array in the <code>hosts</code> property.
limitSelects	integer	Limits the number of records returned by subselects.
		Applies to the following subselects: <code>selectItems</code> .

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: interfaceid, dns, ip. These parameters being common for all get methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
nodeids	string/array	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve host interfaces

Retrieve all data about the interfaces used by host "30057."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.get",
  "params": {
    "output": "extend",
    "hostids": "30057"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "interfaceid": "30050",
      "hostid": "30057",
      "main": "1",
      "type": "1",

```

```

        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "10050",
        "bulk": "1"
    },
    {
        "interfaceid": "30067",
        "hostid": "30057",
        "main": "0",
        "type": "1",
        "useip": "0",
        "ip": "",
        "dns": "localhost",
        "port": "10050",
        "bulk": "1"
    },
    {
        "interfaceid": "30068",
        "hostid": "30057",
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "bulk": "1"
    }
],
"id": 1
}

```

hostinterface.massadd

Description

`object hostinterface.massadd(object parameters)`

This method allows to simultaneously add host interfaces to multiple hosts.

Parameters

(object) Parameters containing the host interfaces to be created on the given hosts.

The method accepts the following parameters.

Parameter	Type	Description
hosts (required)	object/array	Hosts to be updated.
interfaces (required)	object/array	The hosts must have the <code>hostid</code> property defined. Host interfaces to create on the given hosts.

Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property.

Examples

Creating interfaces

Create an interface on two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.massadd",
  "params": {
    "hosts": [
      {
        "hostid": "30050"
      },
      {
        "hostid": "30052"
      }
    ],
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "main": 0,
      "port": "10050",
      "type": 1,
      "useip": 1
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30069",
      "30070"
    ]
  },
  "id": 1
}
```

hostinterface.massremove

Description

object `hostinterface.massremove(object parameters)`

This method allows to remove host interfaces from the given hosts.

Parameters

(object) Parameters containing the IDs of the hosts to be updated and the interfaces to be removed.

Parameter	Type	Description
hostids (required)	string/array	IDs of the hosts to be updated.
interfaces (required)	object/array	Host interfaces to remove from the given hosts. The host interface object must have the ip, dns and port properties defined

Return values

(object) Returns an object containing the IDs of the deleted host interfaces under the `interfaceids` property.

Examples

Removing interfaces

Remove the "127.0.0.1" SNMP interface from two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.massremove",
  "params": {
    "hostids": [
      "30050",
      "30052"
    ],
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "port": "161"
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30069",
      "30070"
    ]
  },
  "id": 1
}
```

hostinterface.replacehostinterfaces

Description

object hostinterface.replacehostinterfaces(object parameters)

This method allows to replace all host interfaces on a given host.

Parameters

(object) Parameters containing the ID of the host to be updated and the new host interfaces.

Parameter	Type	Description
hostid (required)	string	ID of the host to be updated.
interfaces (required)	object/array	Host interfaces to replace the current host interfaces with.

Return values

(object) Returns an object containing the IDs of the created host interfaces under the interfaceids property.

Examples

Replacing host interfaces

Replace all host interfaces with a single agent interface.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.replacehostinterfaces",
  "params": {
    "hostid": "30052",
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "main": 1,
      "port": "10050",
      "type": 1,
      "useip": 1
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30081"
    ]
  },
  "id": 1
}
```

CHostInterface::replaceHostInterfaces() in *frontends/php/include/classes/api/services/CHostInterface.php*.

hostinterface.update

Description

object hostinterface.update(object/array hostInterfaces)

This method allows to update existing host interfaces.

Parameters

(object/array) **Host interface properties** to be updated.

The interfaceid property must be defined for each host interface, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host interfaces under the interfaceids property.

Examples

Changing a host interface port

Change the port of a host interface.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.update",
  "params": {
    "interfaceid": "30048",
    "port": "30050"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30048"
    ]
  },
  "id": 1
}
```

Host prototype

This class is designed to work with host prototypes.

Object references:

- [Host prototype](#)
- [Host prototype inventory](#)
- [Group link](#)
- [Group prototype](#)

Available methods:

- `hostprototype.create` - creating new host prototypes
- `hostprototype.delete` - deleting host prototypes
- `hostprototype.get` - retrieving host prototypes
- `hostprototype.isreadable` - checking if host prototypes are readable
- `hostprototype.iswritable` - checking if host prototypes are writable
- `hostprototype.update` - updating host prototypes

> Host prototype object

The following objects are directly related to the `hostprototype` API.

Host prototype

The host prototype object has the following properties.

Property	Type	Description
hostid	string	(<i>readonly</i>) ID of the host prototype.
host (required)	string	Technical name of the host prototype.
name	string	Visible name of the host prototype.
status	integer	Default: host property value. Status of the host prototype. Possible values are: 0 - (<i>default</i>) monitored host; 1 - unmonitored host.
templateid	string	(<i>readonly</i>) ID of the parent template host prototype.

Host prototype inventory

The host prototype inventory object has the following properties.

Property	Type	Description
inventory_mode	integer	Host prototype inventory population mode. Possible values are: -1 - disabled; 0 - (<i>default</i>) manual; 1 - automatic.

Group link

The group link object links a host prototype with a host group and has the following properties.

Property	Type	Description
group_prototypeid	string	(readonly) ID of the group link.
groupid (required)	string	ID of the host group.
hostid	string	(readonly) ID of the host prototype
templateid	string	(readonly) ID of the parent template group link.

Group prototype

The group prototype object defines a group that will be created for a discovered host and has the following properties.

Property	Type	Description
group_prototypeid	string	(readonly) ID of the group prototype.
name (required)	string	Name of the group prototype.
hostid	string	(readonly) ID of the host prototype
templateid	string	(readonly) ID of the parent template group prototype.

hostprototype.create

Description

object hostprototype.create(object/array hostPrototypes)

This method allows to create new host prototypes.

Parameters

(object/array) Host prototypes to create.

Additionally to the [standard host prototype properties](#), the method accepts the following parameters.

Parameter	Type	Description
groupLinks (required)	array	Group links to be created for the host prototype.
ruleid (required)	string	ID of the LLD rule that the host prototype belongs to.
groupPrototypes	array	Group prototypes to be created for the host prototype.
inventory	object	Host prototype inventory properties.
templates	object/array	Templates to be linked to the host prototype. The templates must have the <code>templateid</code> property defined.

Return values

(object) Returns an object containing the IDs of the created host prototypes under the `hostids` property. The order of the returned IDs matches the order of the passed host prototypes.

Examples

Creating a host prototype

Create a host prototype "{#VM.NAME}" on LLD rule "23542" with a group prototype "{#HV.NAME}". Link it to host group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.create",
  "params": {
    "host": "{#VM.NAME}",
    "ruleid": "23542",
    "groupLinks": [
      {
        "groupid": "2"
      }
    ],
    "groupPrototypes": [
      {
        "name": "{#HV.NAME}"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10103"
    ]
  },
  "id": 1
}
```

See also

Source

CHostPrototype::create() in *frontends/php/include/classes/api/services/CHostPrototype.php*.

hostprototype.delete

Description

object hostprototype.delete(array hostPrototypeIds)

This method allows to delete host prototypes.

Parameters

(array) IDs of the host prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted host prototypes under the `hostids` property.

Examples

Deleting multiple host prototypes

Delete two host prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.delete",
  "params": [
    "10103",
    "10105"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10103",
      "10105"
    ]
  },
  "id": 1
}
```

Source

CHostPrototype::delete() in *frontends/php/include/classes/api/services/CHostPrototype.php*.

hostprototype.get

Description

integer/array hostprototype.get(object parameters)

The method allows to retrieve host prototypes according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
hostids	string/array	Return only host prototypes with the given IDs.
discoveryids	string/array	Return only host prototype that belong to the given LLD rules.
inherited	boolean	If set to true return only items inherited from a template.
selectDiscoveryRule	query	Return the LLD rule that the host prototype belongs to in the discoveryRule property.
selectGroupLinks	query	Return the group links of the host prototype in the groupLinks property.

Parameter	Type	Description
selectGroupPrototypes	query	Return the group prototypes of the host prototype in the groupPrototypes property.
selectInventory	query	Return the host prototype inventory in the inventory property.
selectParentHost	query	Return the host that the host prototype belongs to in the parentHost property.
selectTemplates	query	Return the templates linked to the host prototype in the templates property.
sortfield	string/array	Sort the result by the given properties. Possible values are: <code>hostid</code> , <code>host</code> , <code>name</code> and <code>status</code> .
countOutput	flag	These parameters being common for all <code>get</code> methods are described in detail on the Generic Zabbix API information page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving host prototypes from an LLD rule

Retrieve all host prototypes and their group links and group prototypes from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.get",
  "params": {
    "output": "extend",
    "selectGroupLinks": "extend",
    "selectGroupPrototypes": "extend",
    "discoveryids": "23554"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10092",
      "host": "{#HV.UUID}",
      "status": "0",
      "name": "{#HV.NAME}",
      "templateid": "0",
      "groupLinks": [
        {
          "group_prototypeid": "4",
          "hostid": "10092",
          "groupid": "7",
          "templateid": "0"
        }
      ],
      "groupPrototypes": [
        {
          "group_prototypeid": "7",
          "hostid": "10092",
          "name": "{#CLUSTER.NAME}",
          "templateid": "0"
        }
      ]
    }
  ],
  "id": 1
}
```

Source

`CHostPrototype::get()` in `frontends/php/include/classes/api/services/CHostPrototype.php`.

hostprototype.isreadable

Description

`boolean hostprototype.isreadable(array hostPrototypeIds)`

This method checks if the given host prototypes are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use `hostprototype.get` instead.

Parameters

(array) IDs of the host prototypes to check.

Return values

(boolean) Returns true if the given host prototypes are available for reading.

Examples

Check multiple host prototypes

Check if the two host prototypes are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.isreadable",
  "params": [
    "10092",
    "10093"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

See also

- `hostprototype.iswritable`

Source

`CHostPrototype::isReadable()` in *frontends/php/include/classes/api/services/CHostPrototype.php*.

hostprototype.iswritable**Description**

boolean `hostprototype.iswritable(array hostPrototypeIds)`

This method checks if the given host prototypes are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use `hostprototype.get` instead.

Parameters

(array) IDs of the host prototypes to check.

Return values

(boolean) Returns true if the given host prototypes are available for writing.

Examples

Check multiple host prototypes

Check if the two host prototypes are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.iswritable",
  "params": [
    "10092",
    "10093"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Source

CHostPrototype::isWritable() in *frontends/php/include/classes/api/services/CHostPrototype.php*.

hostprototype.update

Description

object hostprototype.update(object/array hostPrototypes)

This method allows to update existing host prototypes.

Parameters

(object/array) Host prototype properties to be updated.

The `hostid` property must be defined for each host prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard host prototype properties](#), the method accepts the following parameters.

Parameter	Type	Description
groupLinks	array	Group links to replace the current group links on the host prototype.
groupPrototypes	array	Group prototypes to replace the existing group prototypes on the host prototype.
inventory	object	Host prototype inventory properties.

Parameter	Type	Description
templates	object/array	<p>Templates to replace the currently linked templates.</p> <p>The templates must have the <code>templateid</code> property defined.</p>

Return values

(object) Returns an object containing the IDs of the updated host prototypes under the `hostids` property.

Examples

Disabling a host prototype

Disable a host prototype, that is, set its status to 1.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "status": 1
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10092"
    ]
  },
  "id": 1
}
```

Icon map

This class is designed to work with icon maps.

Object references:

- [Icon map](#)
- [Icon mapping](#)

Available methods:

- `iconmap.create` - create new icon maps
- `iconmap.delete` - delete icon maps
- `iconmap.get` - retrieve icon maps
- `iconmap.isreadable` - check if an icon map is readable
- `iconmap.iswritable` - check if an icon map is writable
- `iconmap.update` - update icon maps

> Icon map object

The following objects are directly related to the `iconmap` API.

Icon map

The icon map object has the following properties.

Property	Type	Description
<code>iconmapid</code>	string	(<i>readonly</i>) ID of the icon map.
<code>default_iconid</code> (required)	string	ID of the default icon.
<code>name</code> (required)	string	Name of the icon map.

Icon mapping

The icon mapping object defines a specific icon to be used for hosts with a certain inventory field value. It has the following properties.

Property	Type	Description
<code>iconmappingid</code>	string	(<i>readonly</i>) ID of the icon map.
<code>iconid</code> (required)	string	ID of the icon used by the icon mapping.
<code>expression</code> (required)	string	Expression to match the inventory field against.
<code>inventory_link</code> (required)	integer	ID of the host inventory field.
		Refer to the host inventory object for a list of supported inventory fields.
<code>iconmapid</code>	string	(<i>readonly</i>) ID of the icon map that the icon mapping belongs to.
<code>sortorder</code>	integer	Position of the icon mapping in the icon map.
		Default: 0.

`iconmap.create`

Description

```
object iconmap.create(object/array iconMaps)
```

This method allows to create new icon maps.

Parameters

(object/array) Icon maps to create.

Additionally to the [standard icon map properties](#), the method accepts the following parameters.

Parameter	Type	Description
mappings (required)	array	Icon mappings to be created for the icon map.

Return values

(object) Returns an object containing the IDs of the created icon maps under the `iconmapids` property. The order of the returned IDs matches the order of the passed icon maps.

Examples

Create an icon map

Create an icon map to display hosts of different types.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.create",
  "params": {
    "name": "Type icons",
    "default_iconid": "2",
    "mappings": [

iconmap.delete

Description

object iconmap.delete(array iconMapIds)

This method allows to delete icon maps.

Parameters

(array) IDs of the icon maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted icon maps under the `iconmapids` property.

Examples

Delete multiple icon maps

Delete two icon maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.delete",
  "params": [
    "2",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "2",
      "5"
    ]
  },
  "id": 1
}
```

iconmap.get

Description

integer/array iconmap.get(object parameters)

The method allows to retrieve icon maps according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
iconmapids	string/array	Return only icon maps with the given IDs.

Parameter	Type	Description
sysmapids	string/array	Return only icon maps that are used in the given maps.
selectMappings	query	Return used icon mappings in the mappings property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>iconmapid</code> and <code>name</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve an icon map

Retrieve all data about icon map "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.get",
  "params": {
    "iconmapids": "3",
    "output": "extend",
    "selectMappings": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```

"result": [
  {
    "mappings": [
      {
        "iconmappingid": "3",
        "iconmapid": "3",
        "iconid": "6",
        "inventory_link": "1",
        "expression": "server",
        "sortorder": "0"
      },
      {
        "iconmappingid": "4",
        "iconmapid": "3",
        "iconid": "10",
        "inventory_link": "1",
        "expression": "switch",
        "sortorder": "1"
      }
    ],
    "iconmapid": "3",
    "name": "Host type icons",
    "default_iconid": "2"
  }
],
"id": 1
}

```

iconmap.isreadable

Description

boolean iconmap.isreadable(array iconMapIds)

This method checks if the given icon maps are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [iconmap.get](#) instead.

Parameters

(array) IDs of the icon maps to check.

Return values

(boolean) Returns true if the given icon maps are available for reading.

Examples

Check multiple icon maps

Check if the two icon maps are readable.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "iconmap.isreadable",
  "params": [
    "4", "6"
  ]
}

```

```
],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

iconmap.iswritable

Description

boolean iconmap.iswritable(array iconMapIds)

This method checks if the given icon maps are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [iconmap.get](#) instead.

Parameters

(array) IDs of the icon maps to check.

Return values

(boolean) Returns true if the given icon maps are available for writing.

Examples

Check multiple icon maps

Check if the two icon maps are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.iswritable",
  "params": [
    "4", "6"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

iconmap.update

Description

object iconmap.update(object/array iconMaps)

This method allows to update existing icon maps.

Parameters

(object/array) Icon map properties to be updated.

The `iconmapid` property must be defined for each icon map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard icon map properties](#), the method accepts the following parameters.

Parameter	Type	Description
mappings	array	Icon mappings to replace the existing icon mappings.

Return values

(object) Returns an object containing the IDs of the updated icon maps under the `iconmapids` property.

Examples

Rename icon map

Rename an icon map to "OS icons".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.update",
  "params": {
    "iconmapid": "1",
    "name": "OS icons"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "1"
    ]
  },
  "id": 1
}
```

Image

This class is designed to work with images.

Object references:

- [Image](#)

Available methods:

- [image.create](#) - create new images
- [image.delete](#) - delete images
- [image.get](#) - retrieve images
- [image.update](#) - update images

> Image object

The following objects are directly related to the `image` API.

Image

The image object has the following properties.

Property	Type	Description
<code>imageid</code>	string	(<i>readonly</i>) ID of the image.
<code>name</code> (required)	string	Name of the image.
<code>imagetype</code> (required)	integer	Type of image. Possible values: 1 - icon; 2 - background image.

image.create

Description

`object image.create(object/array images)`

This method allows to create new images.

Parameters

(object/array) Images to create.

Additionally to the [standard image properties](#), the method accepts the following parameters.

Parameter	Type	Description
<code>image</code> (required)	string	Base64 encoded image. The maximum size of the encoded image is 1 MB.

Return values

(object) Returns an object containing the IDs of the created images under the `imageids` property. The order of the returned IDs matches the order of the passed images.

Examples

Create an image

Create a cloud icon.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.create",
  "params": {
    "imagetype": 1,
    "name": "Cloud_(24)",
    "image": "iVBORwOKGgoAAAANSUhEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACmAAAAPgE
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "188"
    ]
  },
  "id": 1
}
```

Source

CImage::create() in *frontends/php/include/classes/api/services/CImage.php*.

image.delete

Description

object image.delete(array imageIds)

This method allows to delete images.

Parameters

(array) IDs of the images to delete.

Return values

(object) Returns an object containing the IDs of the deleted images under the `imageids` property.

Examples

Delete multiple images

Delete two images.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.delete",
  "params": [
    "188",
    "192"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```

    "result": {
        "imageids": [
            "188",
            "192"
        ]
    },
    "id": 1
}

```

image.get

Description

integer/array image.get(object parameters)

The method allows to retrieve images according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
imageids	string/array	Return only images with the given IDs.
sysmapids	string/array	Return images that are used on the given maps.
select_image	flag	Return the Base64 encoded image in the image property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>imageid</code> and <code>name</code> . These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve an image

Retrieve all data for image with ID "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.get",
  "params": {
    "output": "extend",
    "select_image": true,
    "imageids": "2"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "imageid": "2",
      "imagetype": "1",
      "name": "Cloud_(24)",
      "image": "iVBORwOKGgoAAAANSUgEUGAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACMAAA"
    }
  ],

`CImage::get()` in `frontends/php/include/classes/api/services/CImage.php`.

image.update

Description

`object image.update(object/array images)`

This method allows to update existing images.

Parameters

(object/array) Image properties to be updated.

The `imageid` property must be defined for each image, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard image properties**, the method accepts the following parameters.

Parameter	Type	Description
image	string	Base64 encoded image. The maximum size of the encoded image is 1 MB.

Return values

(object) Returns an object containing the IDs of the updated images under the `imageids` property.

Examples

Rename image

Rename image to "Cloud icon".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.update",
  "params": {
    "imageid": "2",
    "name": "Cloud icon"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "2"
    ]
  },
  "id": 1
}

Item

This class is designed to work with items.

Object references:

- [Item](#)

Available methods:

- [item.create](#) - creating new items
- [item.delete](#) - deleting items
- [item.get](#) - retrieving items
- [item.isreadable](#) - checking if items are readable
- [item.iswritable](#) - checking if items are writable
- [item.update](#) - updating items

> Item object

The following objects are directly related to the `item` API.

Item

Note:

Web items cannot be directly created, updated or deleted via the Zabbix API.

The item object has the following properties.

Property	Type	Description
itemid	string	(readonly) ID of the item.
delay (required)	integer	Update interval of the item in seconds.
hostid (required)	string	ID of the host or template that the item belongs to.
interfaceid (required)	string	ID of the item's host interface.
		Not required for template items. Optional for Zabbix agent (active), Zabbix internal, Zabbix trapper, Zabbix aggregate, database monitor and calculated items.
key_ (required)	string	Item key.
name (required)	string	Name of the item.
type (required)	integer	Type of the item.
		Possible values: 0 - Zabbix agent; 1 - SNMPv1 agent; 2 - Zabbix trapper; 3 - simple check; 4 - SNMPv2 agent; 5 - Zabbix internal; 6 - SNMPv3 agent; 7 - Zabbix agent (active); 8 - Zabbix aggregate; 9 - web item; 10 - external check; 11 - database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 15 - calculated; 16 - JMX agent; 17 - SNMP trap.

Property	Type	Description
value_type (required)	integer	Type of information of the item. Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text.
authtype	integer	SSH authentication method. Used only by SSH agent items.
data_type	integer	Possible values: 0 - <i>(default)</i> password; 1 - public key. Data type of the item.
delay_flex	string	Possible values: 0 - <i>(default)</i> decimal; 1 - octal; 2 - hexadecimal; 3 - boolean. Custom intervals that contain flexible intervals and scheduling intervals as serialized strings.
delta	integer	Multiple intervals are separated by a semicolon. Value that will be stored.
description	string	Possible values: 0 - <i>(default)</i> as is; 1 - Delta, speed per second; 2 - Delta, simple change. Description of the item.
error	string	<i>(readonly)</i> Error text if there are problems updating the item.

Property	Type	Description
flags	integer	<p>(readonly) Origin of the item.</p> <p>Possible values: 0 - a plain item; 4 - a discovered item.</p>
formula	integer/float	Custom multiplier.
history	integer	<p>Default: 1. Number of days to keep item's history data.</p>
inventory_link	integer	<p>Default: 90. ID of the host inventory field that is populated by the item.</p> <p>Refer to the host inventory page for a list of supported host inventory fields and their IDs.</p>
ipmi_sensor	string	<p>Default: 0. IPMI sensor. Used only by IPMI items.</p>
lastclock	timestamp	<p>(readonly) Time when the item was last updated.</p> <p>This property will only return a value for the period configured in</p>
lastns	integer	<p>ZBX_HISTORY_PERIOD. (readonly) Nanoseconds when the item was last updated.</p> <p>This property will only return a value for the period configured in</p>
lastvalue	string	<p>ZBX_HISTORY_PERIOD. (readonly) Last value of the item.</p> <p>This property will only return a value for the period configured in</p>
		ZBX_HISTORY_PERIOD .

Property	Type	Description
logtimefmt	string	Format of the time in log entries. Used only by log items.
mtime	timestamp	Time when the monitored log file was last updated. Used only by log items.
multiplier	integer	Whether to use a custom multiplier.
params	string	Additional parameters depending on the type of the item: - executed script for SSH and Telnet items; - SQL query for database monitor items; - formula for calculated items.
password	string	Password for authentication. Used by simple check, SSH, Telnet, database monitor and JMX items.
port	string	Port monitored by the item. Used only by SNMP items.
prevvalue	string	<i>(readonly)</i> Previous value of the item.
privatekey	string	This property will only return a value for the period configured in ZBX_HISTORY_PERIOD . Name of the private key file.
publickey	string	Name of the public key file.
snmp_community	string	SNMP community. Used only by SNMPv1 and SNMPv2 items.
snmp_oid	string	SNMP OID.
snmpv3_authpassphrase	string	SNMPv3 auth passphrase. Used only by SNMPv3 items.

Property	Type	Description
snmpv3_authprotocol	integer	SNMPv3 authentication protocol. Used only by SNMPv3 items. Possible values: 0 - <i>(default)</i> MD5; 1 - SHA.
snmpv3_contextname	string	SNMPv3 context name. Used only by SNMPv3 items.
snmpv3_privpassphrase	string	SNMPv3 priv passphrase. Used only by SNMPv3 items.
snmpv3_privprotocol	integer	SNMPv3 privacy protocol. Used only by SNMPv3 items. Possible values: 0 - <i>(default)</i> DES; 1 - AES.
snmpv3_securitylevel	integer	SNMPv3 security level. Used only by SNMPv3 items. Possible values: 0 - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv.
snmpv3_securityname	string	SNMPv3 security name. Used only by SNMPv3 items.
state	integer	<i>(readonly)</i> State of the item. Possible values: 0 - <i>(default)</i> normal; 1 - not supported.
status	integer	Status of the item. Possible values: 0 - <i>(default)</i> enabled item; 1 - disabled item.
templateid	string	<i>(readonly)</i> ID of the parent template item. <i>Hint:</i> Use the <code>hostid</code> property to specify the template that the item belongs to.
trapper_hosts	string	Allowed hosts. Used only by trapper items.

Property	Type	Description
trends	integer	Number of days to keep item's trends data.
units	string	Default: 365. Value units.
username	string	Username for authentication. Used by simple check, SSH, Telnet, database monitor and JMX items.
valuemapid	string	Required by SSH and Telnet items. ID of the associated value map.

item.create

Description

object item.create(object/array items)

This method allows to create new items.

Note:

Web items cannot be created via the Zabbix API.

Parameters

(object/array) Items to create.

Additionally to the **standard item properties**, the method accepts the following parameters.

Parameter	Type	Description
applications	array	IDs of the applications to add the item to.

Return values

(object) Returns an object containing the IDs of the created items under the `itemids` property. The order of the returned IDs matches the order of the passed items.

Examples

Creating an item

Create a numeric Zabbix agent item to monitor free disk space on host with ID "30074" and add it to two applications.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Free disk space on $1",
    "key_": "vfs.fs.size[/home/joe/,free]",
    "hostid": "30074",
    "type": 0,
    "value_type": 3,
    "interfaceid": "30084",
  }
}
```

```

        "applications": [
            "609",
            "610"
        ],
        "delay": 30
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "24758"
        ]
    },
    "id": 1
}

```

Creating a host inventory item

Create a Zabbix agent item to populate the host's "OS" inventory field.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "name": "uname",
        "key_": "system.uname",
        "hostid": "30021",
        "type": 0,
        "interfaceid": "30007",
        "value_type": 1,
        "delay": 10,
        "inventory_link": 5
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "24759"
        ]
    },
    "id": 1
}

```

Source

CItem::create() in *frontends/php/include/classes/api/services/CItem.php*.

item.delete

Description

object item.delete(array itemIds)

This method allows to delete items.

Note:

Web items cannot be deleted via the Zabbix API.

Parameters

(array) IDs of the items to delete.

Return values

(object) Returns an object containing the IDs of the deleted items under the `itemids` property.

Examples

Deleting multiple items

Delete two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.delete",
  "params": [
    "22982",
    "22986"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22982",
      "22986"
    ]
  },
  "id": 1
}
```

item.get

Description

`integer/array item.get(object parameters)`

The method allows to retrieve items according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
itemids	string/array	Return only items with the given IDs.

Parameter	Type	Description
groupids	string/array	Return only items that belong to the hosts from the given groups.
templateids	string/array	Return only items that belong to the given templates.
hostids	string/array	Return only items that belong to the given hosts.
proxyids	string/array	Return only items that are monitored by the given proxies.
interfaceids	string/array	Return only items that use the given host interfaces.
graphids	string/array	Return only items that are used in the given graphs.
triggerids	string/array	Return only items that are used in the given triggers.
applicationids	string/array	Return only items that belong to the given applications.
webitems	flag	Include web items in the result.
inherited	boolean	If set to true return only items inherited from a template.
templated	boolean	If set to true return only items that belong to templates.
monitored	boolean	If set to true return only enabled items that belong to monitored hosts.
group	string	Return only items that belong to a group with the given name.
host	string	Return only items that belong to a host with the given name.
application	string	Return only items that belong to an application with the given name.
with_triggers	boolean	If set to true return only items that are used in triggers.

Parameter	Type	Description
selectHosts	query	Returns the host that the item belongs to as an array in the hosts property.
selectInterfaces	query	Returns the host interface used by the item as an array in the interfaces property.
selectTriggers	query	Return triggers that the item is used in in the triggers property.
selectGraphs	query	Supports count. Return graphs that contain the item in the graphs property.
selectApplications	query	Supports count. Return the applications that the item belongs to in the applications property.
selectDiscoveryRule	query	Return the LLD rule that created the item in the discoveryRule property.

Parameter	Type	Description
selectItemDiscovery	query	<p>Return the item discovery object in the itemDiscovery property. The item discovery object links the item to an item prototype from which it was created.</p> <p>It has the following properties:</p> <ul style="list-style-type: none"> itemdiscoveryid - (string) ID of the item discovery; itemid - (string) ID of the discovered item; parent_itemid - (string) ID of the item prototype from which the item has been created; key_ - (string) key of the item prototype; lastcheck - (timestamp) time when the item was last discovered; ts_delete - (timestamp) time when an item that is no longer discovered will be deleted.

Parameter	Type	Description
filter	object	<p>Return only those results that exactly match the given filter.</p> <p>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.</p> <p>Supports additional filters: host - technical name of the host that the item belongs to. Limits the number of records returned by subselects.</p>
limitSelects	integer	<p>Applies to the following subselects: selectGraphs - results will be sorted by name; selectTriggers - results will be sorted by description. Sort the result by the given properties.</p>
sortfield	string/array	<p>Possible values are: itemid, name, key_, delay, history, trends, type and status. These parameters being common for all get methods are described in detail in the reference commentary page.</p>
countOutput	flag	
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	

Parameter	Type	Description
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Finding items by key

Retrieve all items from host with ID "10084" that have the word "system" in the key and sort them by name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.get",
  "params": {
    "output": "extend",
    "hostids": "10084",
    "search": {
      "key_": "system"
    },
    "sortfield": "name"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "23298",
      "type": "0",
      "snmp_community": "",

CItem::get() in *frontends/php/include/classes/api/services/CItem.php*.

item.isreadable

Description

boolean item.isreadable(array itemIds)

This method checks if the given items are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [item.get](#) instead.

Parameters

(array) IDs of the items to check.

Return values

(boolean) Returns true if the given items are available for reading.

Examples

Check multiple items

Check if the two items are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "item.isreadable",
    "params": [
        "23298",
        "23323"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
}

```

```
    "id": 1
}
```

item.iswritable

Description

`boolean item.iswritable(array itemIds)`

This method checks if the given items are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [item.get](#) instead.

Parameters

(array) IDs of the items to check.

Return values

(boolean) Returns true if the given items are available for writing.

Examples

Check multiple items

Check if the two items are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.iswritable",
  "params": [
    "23298",
    "23323"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

item.update

Description

`object item.update(object/array items)`

This method allows to update existing items.

Note:

Web items cannot be updated via the Zabbix API.

Parameters

(object/array) Item properties to be updated.

The `itemid` property must be defined for each item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard item properties**, the method accepts the following parameters.

Parameter	Type	Description
applications	array	IDs of the applications to replace the current applications.

Return values

(object) Returns an object containing the IDs of the updated items under the `itemids` property.

Examples

Enabling an item

Enable an item, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "10092",
    "status": 0
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10092"
    ]
  },
  "id": 1
}
```

Item prototype

This class is designed to work with item prototypes.

Object references:

- **Item prototype**

Available methods:

- `itemprototype.create` - creating new item prototypes
- `itemprototype.delete` - deleting item prototypes
- `itemprototype.get` - retrieving item prototypes
- `itemprototype.isreadable` - checking if item prototypes are readable
- `itemprototype.iswritable` - checking if item prototypes are writable
- `itemprototype.update` - updating item prototypes

> Item prototype object

The following objects are directly related to the `itemprototype` API.

Item prototype

The item prototype object has the following properties.

Property	Type	Description
<code>itemid</code>	string	(<i>readonly</i>) ID of the item prototype.
delay (required)	integer	Update interval of the item prototype in seconds.
hostid (required)	string	ID of the host that the item prototype belongs to.
interfaceid (required)	string	ID of the item prototype's host interface. Used only for host item prototypes.
key_ (required)	string	Optional for Zabbix agent (active), Zabbix internal, Zabbix trapper, Zabbix aggregate, database monitor and calculated item prototypes. Item prototype key.
name (required)	string	Name of the item prototype.

Property	Type	Description
type (required)	integer	<p>Type of the item prototype.</p> <p>Possible values: 0 - Zabbix agent; 1 - SNMPv1 agent; 2 - Zabbix trapper; 3 - simple check; 4 - SNMPv2 agent; 5 - Zabbix internal; 6 - SNMPv3 agent; 7 - Zabbix agent (active); 8 - Zabbix aggregate; 10 - external check; 11 - database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 15 - calculated; 16 - JMX agent; 17 - SNMP trap.</p>
value_type (required)	integer	<p>Type of information of the item prototype.</p> <p>Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text.</p>
authtype	integer	<p>SSH authentication method. Used only by SSH agent item prototypes.</p> <p>Possible values: 0 - (<i>default</i>) password; 1 - public key.</p>
data_type	integer	<p>Data type of the item prototype.</p> <p>Possible values: 0 - (<i>default</i>) decimal; 1 - octal; 2 - hexadecimal; 3 - boolean.</p>

Property	Type	Description
delay_flex	string	Custom intervals that contain flexible intervals and scheduling intervals as serialized strings.
delta	integer	Multiple intervals are separated by a semicolon. Value that will be stored.
description	string	Possible values: 0 - <i>(default)</i> as is; 1 - Delta, speed per second; 2 - Delta, simple change. Description of the item prototype.
formula	integer/float	Custom multiplier.
history	integer	Default: 1. Number of days to keep item prototype's history data.
ipmi_sensor	string	Default: 90. IPMI sensor. Used only by IPMI item prototypes.
logtimefmt	string	Format of the time in log entries. Used only by log item prototypes.
multiplier	integer	Whether to use a custom multiplier.
params	string	Additional parameters depending on the type of the item prototype: - executed script for SSH and Telnet item prototypes; - SQL query for database monitor item prototypes; - formula for calculated item prototypes.
password	string	Password for authentication. Used by simple check, SSH, Telnet, database monitor and JMX item prototypes.

Property	Type	Description
port	string	Port monitored by the item prototype. Used only by SNMP items prototype.
privatekey	string	Name of the private key file.
publickey	string	Name of the public key file.
snmp_community	string	SNMP community.
snmp_oid	string	Used only by SNMPv1 and SNMPv2 item prototypes. SNMP OID.
snmpv3_authpassphrase	string	SNMPv3 auth passphrase. Used only by SNMPv3 item prototypes.
snmpv3_authprotocol	integer	SNMPv3 authentication protocol. Used only by SNMPv3 items.
snmpv3_contextname	string	Possible values: 0 - (default) MD5; 1 - SHA. SNMPv3 context name. Used only by SNMPv3 item prototypes.
snmpv3_privpassphrase	string	SNMPv3 priv passphrase. Used only by SNMPv3 item prototypes.
snmpv3_privprotocol	integer	SNMPv3 privacy protocol. Used only by SNMPv3 items.
snmpv3_securitylevel	integer	Possible values: 0 - (default) DES; 1 - AES. SNMPv3 security level. Used only by SNMPv3 item prototypes.
snmpv3_securityname	string	Possible values: 0 - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv. SNMPv3 security name. Used only by SNMPv3 item prototypes.

Property	Type	Description
status	integer	Status of the item prototype. Possible values: 0 - <i>(default)</i> enabled item prototype; 1 - disabled item prototype; 3 - unsupported item prototype. (readonly) ID of the parent template item prototype.
templateid	string	Allowed hosts. Used only by trapper item prototypes.
trapper_hosts	string	Number of days to keep item prototype's trends data.
trends	integer	Default: 365. Value units.
units	string	Username for authentication. Used by simple check, SSH, Telnet, database monitor and JMX item prototypes.
username	string	Required by SSH and Telnet item prototypes.
valuemapid	string	ID of the associated value map.

itemprototype.create

Description

`object itemprototype.create(object/array itemPrototypes)`

This method allows to create new item prototypes.

Parameters

(object/array) Item prototype to create.

Additionally to the [standard item prototype properties](#), the method accepts the following parameters.

Parameter	Type	Description
ruleid (required)	string	ID of the LLD rule that the item belongs to.

Parameter	Type	Description
applications	array	IDs of applications to be assigned to the discovered items.
applicationPrototypes	array	Names of application prototypes to be assigned to the item prototype.

Return values

(object) Returns an object containing the IDs of the created item prototypes under the `itemids` property. The order of the returned IDs matches the order of the passed item prototypes.

Examples

Creating an item prototype

Create an item prototype to monitor free disc space on a discovered file system. Discovered items should be numeric Zabbix agent items updated every 30 seconds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "name": "Free disk space on $1",
    "key_": "vfs.fs.size[{#FSNAME},free]",
    "hostid": "10197",
    "ruleid": "27665",
    "type": 0,
    "value_type": 3,
    "interfaceid": "112",
    "delay": 30
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27666"
    ]
  },
  "id": 1
}
```

Source

`CItemPrototype::create()` in *frontends/php/include/classes/api/services/CItemPrototype.php*.

itemprototype.delete

Description

object `itemprototype.delete(array itemPrototypeIds)`

This method allows to delete item prototypes.

Parameters

(array) IDs of the item prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted item prototypes under the `prototypeids` property.

Examples

Deleting multiple item prototypes

Delete two item prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.delete",
  "params": [
    "27352",
    "27356"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "prototypeids": [
      "27352",
      "27356"
    ]
  },
  "id": 1
}
```

Source

`CItemPrototype::delete()` in *frontends/php/include/classes/api/services/CItemPrototype.php*.

itemprototype.get

Description

`integer/array itemprototype.get(object parameters)`

The method allows to retrieve item prototypes according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
discoveryids	string/array	Return only item prototypes that belong to the given LLD rules.
graphids	string/array	Return only item prototypes that are used in the given graph prototypes.
hostids	string/array	Return only item prototypes that belong to the given hosts.

Parameter	Type	Description
inherited	boolean	If set to true return only item prototypes inherited from a template.
itemids	string/array	Return only item prototypes with the given IDs.
monitored	boolean	If set to true return only enabled item prototypes that belong to monitored hosts.
templated	boolean	If set to true return only item prototypes that belong to templates.
templateids	string/array	Return only item prototypes that belong to the given templates.
triggerids	string/array	Return only item prototypes that are used in the given trigger prototypes.
selectApplications query		Return applications that the item prototype belongs to in the applications property.
selectApplicationPrototypes query		Return application prototypes linked to item prototype in applicationPrototypes property.
selectDiscoveryRule query		Return the low-level discovery rule that the item prototype belongs to in the discoveryRule property.
selectGraphs query	query	Return graph prototypes that the item prototype is used in in the graphs property.
		Supports count.

Parameter	Type	Description
selectHosts	query	Returns the host that the item prototype belongs to as an array in the hosts property.
selectTriggers	query	Return trigger prototypes that the item prototype is used in in the triggers property.
filter	object	<p>Supports count. Return only those results that exactly match the given filter.</p> <p>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.</p>
limitSelects	integer	<p>Supports additional filters: host - technical name of the host that the item prototype belongs to.</p> <p>Limits the number of records returned by subselects.</p>
sortfield	string/array	<p>Applies to the following subselects: selectGraphs - results will be sorted by name; selectTriggers - results will be sorted by description. Sort the result by the given properties.</p> <p>Possible values are: itemid, name, key_, delay, type and status.</p>

Parameter	Type	Description
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving item prototypes from an LLD rule

Retrieve all item prototypes from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.get",
  "params": {
    "output": "extend",
    "discoveryids": "27426"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

CItemPrototype::get() in *frontends/php/include/classes/api/services/CItemPrototype.php*.

itemprototype.isreadable

Description

boolean itemprototype.isreadable(array itemPrototypeIds)

This method checks if the given item prototypes are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [itemprototype.get](#) instead.

Parameters

(array) IDs of the item prototypes to check.

Return values

(boolean) Returns true if the given item prototypes are available for reading.

Examples

Check multiple item prototypes

Check if the two item prototypes are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "itemprototype.isreadable",
    "params": [
        "27352",
        "27356"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}

```

itemprototype.iswritable

Description

boolean itemprototype.iswritable(array itemPrototypeIds)

This method checks if the given item prototypes are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [itemprototype.get](#) instead.

Parameters

(array) IDs of the item prototypes to check.

Return values

(boolean) Returns true if the given item prototypes are available for writing.

Examples

Check multiple item prototypes

Check if the two item prototypes are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.iswritable",
  "params": [
    "27352",
    "27356"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

itemprototype.update

Description

object itemprototype.update(object/array itemPrototypes)

This method allows to update existing item prototypes.

Parameters

(object/array) Item prototype properties to be updated.

The itemid property must be defined for each item prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard item prototype properties**, the method accepts the following parameters.

Parameter	Type	Description
applications	array	IDs of the applications to replace the current applications.
applicationPrototypes	array	Names of the application prototypes to replace the current application prototypes.

Return values

(object) Returns an object containing the IDs of the updated item prototypes under the `itemids` property.

Examples

Changing the interface of an item prototype

Change the host interface that will be used by discovered items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "27428",
    "interfaceid": "132"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27428"
    ]
  },
  "id": 1
}
```

IT service

This class is designed to work with IT services.

Object references:

- **IT service**
- **Service time**
- **Service dependency**
- **Service alarm**

Available methods:

- **service.adddependencies** - adding dependencies between IT services
- **service.addtimes** - adding service times
- **service.create** - creating new IT services
- **service.delete** - deleting IT services
- **service.deletedependencies** - deleting dependencies between IT services
- **service.deletetimes** - deleting service times
- **service.get** - retrieving IT services
- **service.getsla** - retrieving availability information about IT services
- **service.isreadable** - checking if IT services are readable
- **service.iswritable** - checking if IT services are writable
- **service.update** - updating IT services

> IT Service object

The following objects are directly related to the `service` API.

IT Service

The IT service object has the following properties.

Property	Type	Description
serviceid	string	(readonly) ID of the IT service.
algorithm (required)	integer	Algorithm used to calculate the state of the IT service. Possible values: 0 - do not calculate; 1 - problem, if at least one child has a problem; 2 - problem, if all children have problems.
name (required)	string	Name of the IT service.
showsla (required)	integer	Whether SLA should be calculated. Possible values: 0 - do not calculate; 1 - calculate.
sortorder (required)	integer	Position of the IT service used for sorting.
goodsla	float	Minimum acceptable SLA value. If the SLA drops lower, the IT service is considered to be in problem state. Default: 99.9.

Property	Type	Description
status	integer	<p><i>(readonly)</i> Whether the IT service is in OK or problem state.</p> <p>If the IT service is in problem state, status is equal either to:</p> <ul style="list-style-type: none"> - the priority of the linked trigger if it is set to 2, "Warning" or higher (priorities 0, "Not classified" and 1, "Information" are ignored); - the highest status of a child IT service in problem state. <p>If the IT service is in OK state, status is equal to 0.</p>
triggerid	string	<p>Trigger associated with the IT service. Can only be set for IT services that don't have children.</p> <p>Default: 0</p>

Service time

The service time object defines periods, when an IT service is scheduled to be up or down. It has the following properties.

Property	Type	Description
timeid	string	<i>(readonly)</i> ID of the service time.
serviceid (required)	string	<p>ID of the IT service.</p> <p>Cannot be updated.</p>

Property	Type	Description
ts_from (required)	integer	Time when the service time comes into effect. For onetime downtimes ts_from must be set as a Unix timestamp, for other types - as a specific time in a week, in seconds, for example, 90000 for Mon, 1:00 AM.
ts_to (required)	integer	Time when the service time ends. For onetime uptimes ts_to must be set as a Unix timestamp, for other types - as a specific time in a week, in seconds, for example, 90000 for Mon, 1:00 AM.
type (required)	integer	Service time type. Possible values: 0 - planned uptime, repeated every week; 1 - planned downtime, repeated every week; 2 - one-time downtime.
note	string	Additional information about the service time.

Service dependency

The service dependency object represents a dependency between IT services. It has the following properties.

Property	Type	Description
linkid	string	(<i>readonly</i>) ID of the service dependency.

Property	Type	Description
servicedownid (required)	string	ID of the IT service, that a service depends on, that is, the child service. An IT service can have multiple children.
serviceupid (required)	string	ID of the IT service, that is dependent on a service, that is, the parent service. An IT service can have multiple parents forming a directed graph.
soft (required)	integer	Type of dependency between IT services. Possible values: 0 - hard dependency; 1 - soft dependency. An IT service can have only one hard-dependent parent. This attribute has no effect on status or SLA calculation and is only used to create a core IT service tree. Additional parents can be added as soft dependencies forming a graph. An IT service can not be deleted if it has hard-dependent children.

Service alarm

Note:

Service alarms cannot be directly created, updated or deleted via the Zabbix API.

The service alarm objects represents an IT service's state change. It has the following properties.

Property	Type	Description
servicealarmid	string	ID of the service alarm.
serviceid	string	ID of the IT service.
clock	timestamp	Time when the IT service state change has happened.
value	integer	Status of the IT service.
		Refer the the IT service status property for a list of possible values.

service.adddependencies

Description

object service.adddependencies(object/array serviceDependencies)

This method allows to create dependencies between IT services.

Parameters

(object/array) Service dependencies to create.

Each service dependency has the following parameters.

Parameter	Type	Description
serviceid	string	ID of the IT service that depends on a service, that is, the parent service.
dependsOnServiceid	string	ID of the IT service that a service depends on, that is, the child service.
soft	string	Type of dependency.
		Refer to the service dependency object page for more information on dependency types.

Return values

(object) Returns an object containing the IDs of the affected parent IT services under the serviceids property.

Examples

Creating a hard dependency

Make IT service "2" a hard-dependent child of service "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.adddependencies",
  "params": {
    "serviceid": "3",
    "dependsOnServiceid": "2",
    "soft": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "3"
    ]
  },
  "id": 1
}
```

- [service.update](#)

Source

CService::addDependencies() in *frontends/php/include/classes/api/services/CService.php*.

service.addtimes

Description

object service.addtimes(object/array serviceTimes)

This method allows to create new service times.

Parameters

(object/array) Service times to create.

The method accepts service times with the [standard service time properties](#).

Return values

(object) Returns an object containing the IDs of the affected IT services under the `serviceids` property.

Examples

Adding a scheduled downtime

Add a downtime for IT service "4" scheduled weekly from Monday 22:00 till Tuesday 10:00.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.addtimes",
  "params": {
    "serviceid": "4",
    "type": 1,
    "ts_from": 165600,
    "ts_to": 201600
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "4"
    ]
  },
  "id": 1
}
```

See also

- [service.update](#)

Source

CService::addTimes() in *frontends/php/include/classes/api/services/CService.php*.

service.create

Description

`object service.create(object/array itServices)`

This method allows to create new IT services.

Parameters

(object/array) IT services to create.

Additionally to the [standard IT service properties](#), the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Service dependencies. Each service dependency has the following parameters: <ul style="list-style-type: none">- dependsOnServiceid - <i>(string)</i> ID of an IT service the service depends on, that is, the child IT service.- soft - <i>(integer)</i> type of service dependency; refer to the service dependency object page for more information on dependency types. ID of a hard-linked parent IT service.
parentid	string	

Parameter	Type	Description
times	array	Service times to be created for the IT service.

Return values

(object) Returns an object containing the IDs of the created IT services under the `serviceids` property. The order of the returned IDs matches the order of the passed IT services.

Examples

Creating an IT service

Create an IT service that will be switched to problem state, if at least one child has a problem. SLA calculation will be on and the minimum acceptable SLA is 99.99%.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.create",
  "params": {
    "name": "Server 1",
    "algorithm": 1,
    "showsla": 1,
    "goodsla": 99.99,
    "sortorder": 1
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

CService::create() in *frontends/php/include/classes/api/services/CService.php*.

service.delete

Description

object `service.delete(array itServiceIds)`

This method allows to delete IT services.

IT services with hard-dependent child services cannot be deleted.

Parameters

(array) IDs of the IT services to delete.

Return values

(object) Returns an object containing the IDs of the deleted IT services under the `serviceids` property.

Examples

Deleting multiple IT services

Delete two IT services.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.delete",
  "params": [
    "4",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "4",
      "5"
    ]
  },
  "id": 1
}
```

Source

CService::delete() in *frontends/php/include/classes/api/services/CService.php*.

service.deletedependencies

Description

object service.deletedependencies(string/array serviceIds)

This method allows to delete all dependencies from IT services.

Parameters

(string/array) IDs of the IT services to delete all dependencies from.

Return values

(object) Returns an object containing the IDs of the affected IT services under the `serviceids` property.

Examples

Deleting dependencies from an IT service

Delete all dependencies from IT service "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.deletedependencies",
  "params": [
    "2"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
```

```

        "serviceids": [
            "2"
        ]
    },
    "id": 1
}

```

service.deletetimes

Description

object service.deletetimes(string/array serviceIds)

This method allows to delete all service times from IT services.

Parameters

(string/array) IDs of the IT services to delete all service times from.

Return values

(object) Returns an object containing the IDs of the affected IT services under the `serviceids` property.

Examples

Deleting service times from an IT service

Delete all service times from IT service "2".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "service.deletetimes",
    "params": [
        "2"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "serviceids": [
            "2"
        ]
    },
    "id": 1
}

```

- [service.update](#)

Source

CService::delete() in *frontends/php/include/classes/api/services/CService.php*.

service.get

Description

integer/array service.get(object parameters)

The method allows to retrieve IT services according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
serviceids	string/array	Return only IT services with the given IDs.
parentids	string/array	Return only IT services with the given hard-dependent parent IT services.
childids	string/array	Return only IT services that are hard-dependent on the given child IT services.
selectParent	query	Return a parent property with the hard-dependent parent service.
selectDependencies	query	Return a dependencies property with child service dependencies.
selectParentDependencies	query	Return a parent-Dependencies property with parent service dependencies.
selectTimes	query	Return a times property with service times.
selectAlarms	query	Return an alarms property with service alarms.
selectTrigger	query	Return a trigger property with the associated trigger.
sortfield	string/array	Sort the result by the given properties.
		Possible values are: name and sortorder .

Parameter	Type	Description
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving all IT services

Retrieve all data about all IT services and their dependencies.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.get",
  "params": {
    "output": "extend",
    "selectDependencies": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "serviceid": "2",
      "name": "Server 1",
      "status": "0",

    }
],
    "id": 1
}

```

Source

CService::get() in *frontends/php/include/classes/api/services/CService.php*.

service.getsla

Description

object service.getsla(object parameters)

This method allows to calculate availability information about IT services.

Parameters

(object) Parameters containing the IDs of the IT services and time intervals to calculate SLA.

Parameter	Type	Description
serviceids	string/array	IDs of IT services to return availability information for.

Parameter	Type	Description
intervals	array	<p>Time intervals to return service layer availability information about.</p> <p>Each time interval must have the following parameters:</p> <ul style="list-style-type: none"> - from - <i>(timestamp)</i> interval start time; - to - <i>(timestamp)</i> interval end time.

Return values

(object) Returns the following availability information about each IT service under the corresponding service ID.

Property	Type	Description
status	integer	<p>Current status of the IT service.</p> <p>Refer to the IT service object page for more information on service statuses.</p>
problems	array	<p>Triggers that are currently in problem state and are linked either to the IT service or one of its descendants.</p>

Property	Type	Description
sla	array	<p>SLA data about each time period.</p> <p>Each SLA object has the following properties:</p> <ul style="list-style-type: none"> - from - <i>(timestamp)</i> interval start time; - to - <i>(timestamp)</i> interval end time; - sla - <i>(float)</i> SLA for the given time interval; - okTime - <i>(integer)</i> time the service was in OK state, in seconds; - problemTime - <i>(integer)</i> time the service was in problem state, in seconds; - downtimeTime - <i>(integer)</i> time the service was in scheduled downtime, in seconds.

Examples

Retrieving availability information for an IT service

Retrieve availability information about a service during a week.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.getsla",
  "params": {
    "serviceids": "2",
    "intervals": [
      {
        "from": 1352452201,
        "to": 1353057001
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "2": {
      "status": "3",
      "problems": {
```

```

        "13904": {
            "triggerid": "13904",

service.isreadable

Description

boolean service.isreadable(array serviceIds)

This method checks if the given IT services are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [service.get](#) instead.

Parameters

(array) IDs of the IT services to check.

Return values

(boolean) Returns true if the given IT services are available for reading.

Examples

Check multiple IT services

Check if the two IT services are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.isreadable",
  "params": [
    "3", "4"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```

service.iswritable

Description

`boolean service.iswritable(array serviceIds)`

This method checks if the given IT services are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [service.get](#) instead.

Parameters

(array) IDs of the IT services to check.

Return values

(boolean) Returns true if the given IT services are available for writing.

Examples

Check multiple IT services

Check if the two IT services are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.iswritable",
  "params": [
    "3", "4"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

service.update

Description

`object service.update(object/array itServices)`

This method allows to update existing IT services.

Parameters

(object/array) IT service properties to be updated.

The `serviceid` property must be defined for each IT service, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard IT service properties](#), the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Service dependencies to replace the current service dependencies. Each service dependency has the following parameters: - - <code>dependsOnServiceid</code> - <i>(string)</i> ID of an IT service the service depends on, that is, the child IT service. - <code>soft</code> - <i>(integer)</i> type of service dependency; refer to the service dependency object page for more information on dependency types.
parentid	string	ID of a hard-linked parent IT service.
times	array	Service times to replace the current service times.

Return values

(object) Returns an object containing the IDs of the updated IT services under the `serviceids` property.

Examples

Setting the parent of an IT service

Make IT service "3" the hard-linked parent of service "5".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "serviceid": "5",
    "parentid": "3"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "5"
    ]
  },
  "id": 1
}
```

LLD rule

This class is designed to work with low level discovery rules.

Object references:

- [LLD rule](#)

Available methods:

- [discoveryrule.copy](#) - copying LLD rules
- [discoveryrule.create](#) - creating new LLD rules
- [discoveryrule.delete](#) - deleting LLD rules
- [discoveryrule.get](#) - retrieving LLD rules
- [discoveryrule.isreadable](#) - checking if LLD rules are readable
- [discoveryrule.iswritable](#) - checking if LLD rules are writable
- [discoveryrule.update](#) - updating LLD rules

> LLD rule object

The following objects are directly related to the `discoveryrule` API.

LLD rule

The low-level discovery rule object has the following properties.

Property	Type	Description
itemid	string	<i>(readonly)</i> ID of the LLD rule.
delay (required)	integer	Update interval of the LLD rule in seconds.
hostid (required)	string	ID of the host that the LLD rule belongs to.
interfaceid (required)	string	ID of the LLD rule's host interface. Used only for host LLD rules.
key_ (required)	string	Optional for Zabbix agent (active), Zabbix internal, Zabbix trapper and database monitor LLD rules. LLD rule key.
name (required)	string	Name of the LLD rule.
type (required)	integer	Type of the LLD rule. Possible values: 0 - Zabbix agent; 1 - SNMPv1 agent; 2 - Zabbix trapper; 3 - simple check; 4 - SNMPv2 agent; 5 - Zabbix internal; 6 - SNMPv3 agent; 7 - Zabbix agent (active); 10 - external check; 11 - database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 16 - JMX agent.
authtype	integer	SSH authentication method. Used only by SSH agent LLD rules. Possible values: 0 - <i>(default)</i> password; 1 - public key.
delay_flex	string	Custom intervals that contain flexible intervals and scheduling intervals as serialized strings.
description	string	Multiple intervals are separated by a semicolon.
error	string	Description of the LLD rule. <i>(readonly)</i> Error text if there are problems updating the LLD rule.
ipmi_sensor	string	IPMI sensor. Used only by IPMI LLD rules.
lifetime	integer	Time period after which items that are no longer discovered will be deleted, in days.
params	string	Default: 30. Additional parameters depending on the type of the LLD rule: - executed script for SSH and Telnet LLD rules; - SQL query for database monitor LLD rules; - formula for calculated LLD rules.
password	string	Password for authentication. Used by simple check, SSH, Telnet, database monitor and JMX LLD rules.
port	string	Port used by the LLD rule. Used only by SNMP LLD rules.
privatekey	string	Name of the private key file.
publickey	string	Name of the public key file.
snmp_community	string	SNMP community.

Required for SNMPv1 and SNMPv2 LLD rules.

Property	Type	Description
snmp_oid	string	SNMP OID.
snmpv3_authpassphrase	string	SNMPv3 auth passphrase. Used only by SNMPv3 LLD rules.
snmpv3_authprotocol	integer	SNMPv3 authentication protocol. Used only by SNMPv3 LLD rules. Possible values: 0 - <i>(default)</i> MD5; 1 - SHA.
snmpv3_contextname	string	SNMPv3 context name. Used only by SNMPv3 checks.
snmpv3_privpassphrase	string	SNMPv3 priv passphrase. Used only by SNMPv3 LLD rules.
snmpv3_privprotocol	integer	SNMPv3 privacy protocol. Used only by SNMPv3 LLD rules. Possible values: 0 - <i>(default)</i> DES; 1 - AES.
snmpv3_securitylevel	integer	SNMPv3 security level. Used only by SNMPv3 LLD rules. Possible values: 0 - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv.
snmpv3_securityname	string	SNMPv3 security name. Used only by SNMPv3 LLD rules.
state	integer	<i>(readonly)</i> State of the LLD rule. Possible values: 0 - <i>(default)</i> normal; 1 - not supported.
status	integer	Status of the LLD rule. Possible values: 0 - <i>(default)</i> enabled LLD rule; 1 - disabled LLD rule.
templateid	string	<i>(readonly)</i> ID of the parent template LLD rule.
trapper_hosts	string	Allowed hosts. Used only by trapper LLD rules.
username	string	Username for authentication. Used by simple check, SSH, Telnet, database monitor and JMX LLD rules. Required by SSH and Telnet LLD rules.

LLD rule filter

The LLD rule filter object defines a set of conditions that can be used to filter discovered objects. It has the following properties:

Property	Type	Description
conditions (required)	array	Set of filter conditions to use for filtering results.
evaltype (required)	integer	Filter condition evaluation method. Possible values: 0 - and/or; 1 - and; 2 - or; 3 - custom expression.

Property	Type	Description
eval_formula	string	(readonly) Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its formulaid. The value of eval_formula is equal to the value of formula for filters with a custom expression.
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its formulaid. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted.
		Required for custom expression filters.

LLD rule filter condition

The LLD rule filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

Property	Type	Description
macro (required)	string	LLD macro to perform the check on.
value (required)	string	Value to compare with.
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.
operator	integer	Condition operator. Possible values: 8 - (default) matches regular expression.

Note:

To better understand how to use filters with various types of expressions, see examples on the [discoveryrule.get](#) and [discoveryrule.create](#) method pages.

discoveryrule.copy

Description

object `discoveryrule.copy(object parameters)`

This method allows to copy LLD rules with all of the prototypes to the given hosts.

Parameters

(object) Parameters defining the LLD rules to copy and the target hosts.

Parameter	Type	Description
discoveryids	array	IDs of the LLD rules to be copied.
hostids	array	IDs of the hosts to copy the LLD rules to.

Return values

(boolean) Returns true if the copying was successful.

Examples

Copy an LLD rule to multiple hosts

Copy an LLD rule to two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.copy",
  "params": {
    "discoveryids": [
      "27426"
    ],
    "hostids": [
      "10196",
      "10197"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Source

CDiscoveryrule::copy() in *frontends/php/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.create

Description

object discoveryrule.create(object/array lldRules)

This method allows to create new LLD rules.

Parameters

(object/array) LLD rules to create.

Additionally to the **standard LLD rule properties**, the method accepts the following parameters.

Parameter	Type	Description
filter	object	LLD rule filter object for the LLD rule.

Return values

(object) Returns an object containing the IDs of the created LLD rules under the `itemids` property. The order of the returned IDs matches the order of the passed LLD rules.

Examples

Creating an LLD rule

Create a Zabbix agent LLD rule to discover mounted file systems. Discovered items will be updated every 30 seconds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Mounted filesystem discovery",
    "key_": "vfs.fs.discovery",
  },
}
```

```

        "hostid": "10197",
        "type": "0",
        "interfaceid": "112",
        "delay": 30
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27665"
        ]
    },
    "id": 1
}

```

Using a filter

Create an LLD rule with a set of conditions to filter the results by. The conditions will be grouped together using the logical "and" operator.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Filtered LLD rule",
        "key_": "lld",
        "hostid": "10116",
        "type": "0",
        "interfaceid": "13",
        "delay": 30,
        "filter": {
            "evaltype": 1,
            "conditions": [
                {
                    "macro": "{#MACRO1}",
                    "value": "@regex1"
                },
                {
                    "macro": "{#MACRO2}",
                    "value": "@regex2"
                },
                {
                    "macro": "{#MACRO3}",
                    "value": "@regex3"
                }
            ]
        }
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [

```

```

    "27665"
  ]
},
"id": 1
}

```

Using a custom expression filter

Create an LLD rule with a filter that will use a custom expression to evaluate the conditions. The LLD rule must only discover objects the "{#MACRO1}" macro value of which matches both regular expression "regex1" and "regex2", and the value of "{#MACRO2}" matches either "regex3" or "regex4". The formula IDs "A", "B", "C" and "D" have been chosen arbitrarily.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Filtered LLD rule",
    "key_": "lld",
    "hostid": "10116",
    "type": "0",
    "interfaceid": "13",
    "delay": 30,
    "filter": {
      "evaltype": 3,
      "formula": "(A and B) and (C or D)",
      "conditions": [
        {
          "macro": "{#MACRO1}",
          "value": "@regex1",
          "formulaid": "A"
        },
        {
          "macro": "{#MACRO1}",
          "value": "@regex2",
          "formulaid": "B"
        },
        {
          "macro": "{#MACRO2}",
          "value": "@regex3",
          "formulaid": "C"
        },
        {
          "macro": "{#MACRO2}",
          "value": "@regex4",
          "formulaid": "D"
        }
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}

```

```
}
```

Source

CDiscoveryRule::create() in *frontends/php/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.delete

Description

`object discoveryrule.delete(array lldRuleIds)`

This method allows to delete LLD rules.

Parameters

(array) IDs of the LLD rules to delete.

Return values

(object) Returns an object containing the IDs of the deleted LLD rules under the `itemids` property.

Examples

Deleting multiple LLD rules

Delete two LLD rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.delete",
  "params": [
    "27665",
    "27668"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "ruleids": [
      "27665",
      "27668"
    ]
  },
  "id": 1
}
```

Source

CDiscoveryRule::delete() in *frontends/php/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.get

Description

`integer/array discoveryrule.get(object parameters)`

The method allows to retrieve LLD rules according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
itemids	string/array	Return only LLD rules with the given IDs.
hostids	string/array	Return only LLD rules that belong to the given hosts.
inherited	boolean	If set to <code>true</code> return only LLD rules inherited from a template.
interfaceids	string/array	Return only LLD rules use the given host interfaces.
monitored	boolean	If set to <code>true</code> return only enabled LLD rules that belong to monitored hosts.
templated	boolean	If set to <code>true</code> return only LLD rules that belong to templates.
templateids	string/array	Return only LLD rules that belong to the given templates.
selectFilter	query	Returns the filter used by the LLD rule in the <code>filter</code> property.
selectGraphs	query	Returns graph prototypes that belong to the LLD rule in the <code>graphs</code> property.
selectHostPrototypes	query	Supports count. Returns host prototypes that belong to the LLD rule in the <code>hostPrototypes</code> property.
selectHosts	query	Supports count. Returns the host that the LLD rule belongs to as an array in the <code>hosts</code> property.
selectItems	query	Returns item prototypes that belong to the LLD rule in the <code>items</code> property.
selectTriggers	query	Supports count. Returns trigger prototypes that belong to the LLD rule in the <code>triggers</code> property.
filter	object	Supports count. Return only those results that exactly match the given filter.
		Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.
limitSelects	integer	Supports additional filters: <code>host</code> - technical name of the host that the LLD rule belongs to. Limits the number of records returned by subselects.
sortfield	string/array	Applies to the following subselects: <code>selectItems</code> ; <code>selectGraphs</code> ; <code>selectTriggers</code> . Sort the result by the given properties.
countOutput	flag	Possible values are: <code>itemid</code> , <code>name</code> , <code>key_</code> , <code>delay</code> , <code>type</code> and <code>status</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	

Parameter	Type	Description
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving discovery rules from a host

Retrieve all discovery rules from host "10202".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.get",
  "params": {
    "output": "extend",
    "hostids": "10202"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "27425",
      "type": "0",
      "snmp_community": "",
      "snmp_oid": "",
      "hostid": "10202",
      "name": "Network interface discovery",
      "key_": "net.if.discovery",
      "delay": "3600",
      "state": "0",
      "status": "0",
      "trapper_hosts": "",
      "snmpv3_securityname": "",
      "snmpv3_securitylevel": "0",
      "snmpv3_authpassphrase": "",
      "snmpv3_privpassphrase": "",
      "error": "",
      "templateid": "22444",
      "delay_flex": "",
      "params": "",
      "ipmi_sensor": "",
      "authtype": "0",
      "username": "",
      "password": "",
      "publickey": "",
      "privatekey": "",
      "interfaceid": "119",
      "port": "",
    }
  ]
}
```

```

        "description": "Discovery of network interfaces as defined in global regular expression \\"Netw
        "lifetime": "30",
        "snmpv3_authprotocol": "0",
        "snmpv3_privprotocol": "0"
    },
    {
        "itemid": "27426",
        "type": "0",
        "snmp_community": "",
        "snmp_oid": "",
        "hostid": "10202",
        "name": "Mounted filesystem discovery",
        "key_": "vfs.fs.discovery",
        "delay": "3600",
        "state": "0",
        "status": "0",
        "trapper_hosts": "",
        "snmpv3_securityname": "",
        "snmpv3_securitylevel": "0",
        "snmpv3_authpassphrase": "",
        "snmpv3_privpassphrase": "",
        "error": "",
        "templateid": "22450",
        "delay_flex": "",
        "params": "",

        "authtype": "0",
        "username": "",
        "password": "",
        "publickey": "",
        "privatekey": "",
        "interfaceid": "119",
        "port": "",
        "description": "Discovery of file systems of different types as defined in global regular expr
        "lifetime": "30",
        "snmpv3_authprotocol": "0",
        "snmpv3_privprotocol": "0"
    }
],
    "id": 2
}

```

Retrieving filter conditions

Retrieve the name of the LLD rule "24681" and its filter conditions. The filter uses the "and" evaluation type, so the formula property is empty and eval_formula is generated automatically.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "output": [
            "name"
        ],
        "selectFilter": "extend",
        "itemids": ["24681"]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "24681",
      "name": "Filtered LLD rule",
      "filter": {
        "evaltype": "1",
        "formula": "",
        "conditions": [
          {
            "macro": "{#MACRO1}",
            "value": "@regex1",
            "operator": "8",
            "formulaid": "A"
          },
          {
            "macro": "{#MACRO2}",
            "value": "@regex2",
            "operator": "8",
            "formulaid": "B"
          },
          {
            "macro": "{#MACRO3}",
            "value": "@regex3",
            "operator": "8",
            "formulaid": "C"
          }
        ],
        "eval_formula": "A and B and C"
      }
    }
  ],
  "id": 1
}

```

CDiscoveryRule::get() in *frontends/php/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.isreadable

Description

boolean discoveryrule.isreadable(array lldRuleIds)

This method checks if the given LLD rules are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [discoveryrule.get](#) instead.

Parameters

(array) IDs of the LLD rules to check.

Return values

(boolean) Returns true if the given LLD rules are available for reading.

Examples

Check multiple LLD rules

Check if the two LLD rules are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.isreadable",
  "params": [
    "27425",
    "27429"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

discoveryrule.iswritable

Description

boolean discoveryrule.iswritable(array lldRuleIds)

This method checks if the given LLD rules are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [discoveryrule.get](#) instead.

Parameters

(array) IDs of the LLD rules to check.

Return values

(boolean) Returns true if the given LLD rules are available for writing.

Examples

Check multiple LLD rules

Check if the two LLD rules are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.iswritable",
  "params": [
    "27425",
    "27429"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

discoveryrule.update

Description

object discoveryrule.update(object/array lldRules)

This method allows to update existing LLD rules.

Parameters

(object/array) LLD rule properties to be updated.

The `itemid` property must be defined for each LLD rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard LLD rule properties](#), the method accepts the following parameters.

Parameter	Type	Description
filter	object	LLD rule filter object to replace the current filter.

Return values

(object) Returns an object containing the IDs of the updated LLD rules under the `itemids` property.

Examples

Adding a filter to an LLD rule

Add a filter so that the contents of the `{#FSTYPE}` macro would match the *@File systems for discovery* regexp.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "22450",
    "filter": {
      "evaltype": 1,
      "conditions": [
        {
          "macro": "{#FSTYPE}",
          "value": "@File systems for discovery"
        }
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22450"
    ]
  },
  "id": 1
}
```

Maintenance

This class is designed to work with maintenances.

Object references:

- [Maintenance](#)
- [Time period](#)

Available methods:

- [maintenance.create](#) - creating new maintenances
- [maintenance.delete](#) - deleting maintenances
- [maintenance.get](#) - retrieving maintenances
- [maintenance.update](#) - updating maintenances

> Maintenance object

The following objects are directly related to the `maintenance` API.

Maintenance

The maintenance object has the following properties.

Property	Type	Description
<code>maintenanceid</code>	string	(<i>readonly</i>) ID of the maintenance.
<code>name</code> (required)	string	Name of the maintenance.
<code>active_since</code> (required)	timestamp	Time when the maintenance becomes active.
<code>active_till</code> (required)	timestamp	Time when the maintenance stops being active.
<code>description</code>	string	Description of the maintenance.
<code>maintenance_type</code>	integer	Type of maintenance. Possible values: 0 - (<i>default</i>) with data collection; 1 - without data collection.

Time period

The time period object is used to define periods when the maintenance must come into effect. It has the following properties.

Property	Type	Description
timeperiodid	string	(readonly) ID of the maintenance.
day	integer	Day of the month when the maintenance must come into effect.
dayofweek	integer	Required only for monthly time periods. Days of the week when the maintenance must come into effect.
		Days are stored in binary form with each bit representing the corresponding day. For example, 4 equals 100 in binary and means, that maintenance will be enabled on Wednesday.
every	integer	Used for weekly and monthly time periods. Required only for weekly time periods. For daily and weekly periods every defines day or week intervals at which the maintenance must come into effect.
		For monthly periods every defines the week of the month when the maintenance must come into effect. Possible values: 1 - first week; 2 - second week; 3 - third week; 4 - fourth week; 5 - last week.

Property	Type	Description
month	integer	<p>Months when the maintenance must come into effect.</p> <p>Months are stored in binary form with each bit representing the corresponding month. For example, 5 equals 101 in binary and means, that maintenance will be enabled in January and March.</p>
period	integer	<p>Required only for monthly time periods.</p> <p>Duration of the maintenance period in seconds.</p>
start_date	timestamp	<p>Default: 3600.</p> <p>Date when the maintenance period must come into effect.</p>
start_time	integer	<p>Required only for one time periods.</p> <p>Default: current date.</p> <p>Time of day when the maintenance starts in seconds.</p>
timeperiod_type	integer	<p>Required for daily, weekly and monthly periods.</p> <p>Type of time period.</p> <p>Possible values: 0 - (default) one time only; 2 - daily; 3 - weekly; 4 - monthly.</p>

maintenance.create

Description

`object maintenance.create(object/array maintenances)`

This method allows to create new maintenances.

Parameters

(object/array) Maintenances to create.

Additionally to the **standard maintenance properties**, the method accepts the following parameters.

Parameter	Type	Description
groupids (required)	array	IDs of the host groups that will undergo maintenance.
hostids (required)	array	IDs of the hosts that will undergo maintenance.
timeperiods (required)	array	Maintenance time periods.

Attention:

At least one host or host group must be defined for each maintenance.

Return values

(object) Returns an object containing the IDs of the created maintenances under the `maintenanceids` property. The order of the returned IDs matches the order of the passed maintenances.

Examples

Creating a maintenance

Create a maintenance with data collection for host group "2". It must be active from 22.01.2013 till 22.01.2014, come in effect each Sunday at 18:00 and last for one hour.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.create",
  "params": {
    "name": "Sunday maintenance",
    "active_since": 1358844540,
    "active_till": 1390466940,
    "groupids": [
      "2"
    ],
    "timeperiods": [
      {
        "timeperiod_type": 3,
        "every": 1,
        "dayofweek": 64,
        "start_time": 64800,
        "period": 3600
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "maintenanceids": [
```

```

        "3"
    ],
    },
    "id": 1
}

```

maintenance.delete

Description

object maintenance.delete(array maintenanceIds)

This method allows to delete maintenances.

Parameters

(array) IDs of the maintenances to delete.

Return values

(object) Returns an object containing the IDs of the deleted maintenances under the `maintenanceids` property.

Examples

Deleting multiple maintenances

Delete two maintenances.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "maintenance.delete",
    "params": [
        "3",
        "1"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "maintenanceids": [
            "3",
            "1"
        ]
    },
    "id": 1
}

```

CMaintenance::delete() in *frontends/php/include/classes/api/services/CMaintenance.php*.

maintenance.get

Description

integer/array maintenance.get(object parameters)

The method allows to retrieve maintenances according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	string/array	Return only maintenances that are assigned to the given host groups.
hostids	string/array	Return only maintenances that are assigned to the given hosts.
maintenanceids	string/array	Return only maintenances with the given IDs.
selectGroups	query	Return host groups assigned to the maintenance in the groups property.
selectHosts	query	Return hosts assigned to the maintenance in the hosts property.
selectTimeperiods	query	Return the maintenance's time periods in the timeperiods property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>maintenanceid</code> , <code>name</code> and <code>maintenance_type</code> . These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	

Parameter	Type	Description
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving maintenances

Retrieve all configured maintenances, and the data about the assigned host groups, hosts and defined time periods.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.get",
  "params": {
    "output": "extend",
    "selectGroups": "extend",
    "selectTimeperiods": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "maintenanceid": "3",
      "name": "Sunday maintenance",
      "maintenance_type": "0",
      "description": "",
      "active_since": "1358844540",
      "active_till": "1390466940",
      "groups": [
        {
          "groupid": "4",
          "name": "Zabbix servers",
          "internal": "0"
        }
      ],
      "timeperiods": [
        {
          "timeperiodid": "4",
          "timeperiod_type": "3",
          "every": "1",
          "month": "0",
          "dayofweek": "1",
          "day": "0",
          "start_time": "64800",
          "period": "3600",
          "start_date": "2147483647"
        }
      ]
    }
  ],
  "id": 1
}
```

```
    "id": 1
}
```

CMaintenance::get() in *frontends/php/include/classes/api/services/CMaintenance.php*.

maintenance.update

Description

`object maintenance.update(object/array maintenances)`

This method allows to update existing maintenances.

Parameters

(object/array) Maintenance properties to be updated.

The `maintenanceid` property must be defined for each maintenance, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard maintenance properties](#), the method accepts the following parameters.

Parameter	Type	Description
groupids	array	IDs of the host groups to replace the current groups.
hostids	array	IDs of the hosts to replace the current hosts.
timeperiods	array	Maintenance time periods to replace the current periods.

Attention:

At least one host or host group must be defined for each maintenance.

Return values

(object) Returns an object containing the IDs of the updated maintenances under the `maintenanceids` property.

Examples

Assigning different hosts

Replace the hosts currently assigned to maintenance "3" with two different ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.update",
  "params": {
    "maintenanceid": "3",
    "hostids": [
      "10085",
      "10084"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "maintenanceids": [
      "3"
    ]
  },
  "id": 1
}
```

Map

This class is designed to work with maps.

Object references:

- [Map](#)
- [Map element](#)
- [Map link](#)
- [Map URL](#)
- [Map user](#)
- [Map user group](#)

Available methods:

- [map.create](#) - create new maps
- [map.delete](#) - delete maps
- [map.get](#) - retrieve maps
- [map.isreadable](#) - check if maps are readable
- [map.iswritable](#) - check if maps are writable
- [map.update](#) - update maps

> Map object

The following objects are directly related to the map API.

Map

The map object has the following properties.

Property	Type	Description
sysmapid	string	<i>(readonly)</i> ID of the map.
height (required)	integer	Height of the map in pixels.
name (required)	string	Name of the map.
width (required)	integer	Width of the map in pixels.
backgroundid	string	ID of the image used as the background for the map.

Property	Type	Description
expand_macros	integer	Whether to expand macros in labels when configuring the map. Possible values: 0 - <i>(default)</i> do not expand macros; 1 - expand macros.
expandproblem	integer	Whether the the problem trigger will be displayed for elements with a single problem. Possible values: 0 - always display the number of problems; 1 - <i>(default)</i> display the problem trigger if there's only one problem.
grid_align	integer	Whether to enable grid aligning. Possible values: 0 - disable grid aligning; 1 - <i>(default)</i> enable grid aligning.
grid_show	integer	Whether to show the grid on the map. Possible values: 0 - do not show the grid; 1 - <i>(default)</i> show the grid.
grid_size	integer	Size of the map grid in pixels. Supported values: 20, 40, 50, 75 and 100. Default: 50.

Property	Type	Description
highlight	integer	Whether icon highlighting is enabled. Possible values: 0 - highlighting disabled; 1 - <i>(default)</i> highlighting enabled.
iconmapid	string	ID of the icon map used on the map.
label_format	integer	Whether to enable advanced labels. Possible values: 0 - <i>(default)</i> disable advanced labels; 1 - enable advanced labels.
label_location	integer	Location of the map element label. Possible values: 0 - <i>(default)</i> bottom; 1 - left; 2 - right; 3 - top.
label_string_host	string	Custom label for host elements. Required for maps with custom host label type.
label_string_host_group	string	Custom label for host group elements. Required for maps with custom host group label type.
label_string_image	string	Custom label for image elements. Required for maps with custom image label type.
label_string_map	string	Custom label for map elements. Required for maps with custom map label type.

Property	Type	Description
label_string_trigger	string	Custom label for trigger elements.
label_type	integer	<p>Required for maps with custom trigger label type. Map element label type.</p> <p>Possible values: 0 - label; 1 - IP address; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing.</p>
label_type_host	integer	<p>Label type for host elements.</p> <p>Possible values: 0 - label; 1 - IP address; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing;</p>
label_type_hostgroup	integer	<p>5 - custom. Label type for host group elements.</p> <p>Possible values: 0 - label; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing; 5 - custom.</p>
label_type_image	integer	<p>Label type for host group elements.</p> <p>Possible values: 0 - label; 2 - <i>(default)</i> element name; 4 - nothing; 5 - custom.</p>
label_type_map	integer	<p>Label type for map elements.</p> <p>Possible values: 0 - label; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing; 5 - custom.</p>

Property	Type	Description
label_type_trigger	integer	Label type for trigger elements. Possible values: 0 - label; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing; 5 - custom.
mark_elements	integer	Whether to highlight map elements that have recently changed their status. Possible values: 0 - <i>(default)</i> do not highlight elements; 1 - highlight elements.
severity_min	integer	Minimum severity of the triggers that will be displayed on the map. Refer to the trigger " <i>severity</i> " property for a list of supported trigger severities.
show_unack	integer	How problems should be displayed. Possible values: 0 - <i>(default)</i> display the count of all problems; 1 - display only the count of unacknowledged problems; 2 - display the count of acknowledged and unacknowledged problems separately.
userid	string	Map owner user ID.

Property	Type	Description
private	integer	Type of map sharing. Possible values: 0 - public map; 1 - <i>(default)</i> private map.

Map element

The map element object defines an object displayed on a map. It has the following properties.

Property	Type	Description
selementid	string	<i>(readonly)</i> ID of the map element.
elementid (required)	string	ID of the object that the map element represents.
elementtype (required)	integer	Required for host, host group, trigger and map type elements. Type of map element. Possible values: 0 - host; 1 - map; 2 - trigger; 3 - host group; 4 - image.
iconid_off (required)	string	ID of the image used to display the element in default state.
areatype	integer	How separate host group hosts should be displayed. Possible values: 0 - <i>(default)</i> the host group element will take up the whole map; 1 - the host group element will have a fixed size.
application	string	Name of the application to display problems from. Used only for host and host group map elements.

Property	Type	Description
elementsubtype	integer	How a host group element should be displayed on a map. Possible values: 0 - <i>(default)</i> display the host group as a single element; 1 - display each host in the group separately. Height of the fixed size host group element in pixels.
height	integer	Height of the fixed size host group element in pixels.
iconid_disabled	string	Default: 200. ID of the image used to display disabled map elements. Unused for image elements.
iconid_maintenance	string	ID of the image used to display map elements in maintenance. Unused for image elements.
iconid_on	string	ID of the image used to display map elements with problems. Unused for image elements.
label	string	Label of the element.
label_location	integer	Location of the map element label. Possible values: -1 - <i>(default)</i> default location; 0 - bottom; 1 - left; 2 - right; 3 - top.
sysmapid	string	<i>(readonly)</i> ID of the map that the element belongs to.
urls	array	Map element URLs. The map element URL object is described in detail below .

Property	Type	Description
use_iconmap	integer	Whether icon mapping must be used for host elements.
viewtype	integer	Possible values: 0 - do not use icon mapping; 1 - <i>(default)</i> use icon mapping. Host group element placing algorithm.
width	integer	Possible values: 0 - <i>(default)</i> grid. Width of the fixed size host group element in pixels.
x	integer	Default: 200. X-coordinates of the element in pixels.
y	integer	Default: 0. Y-coordinates of the element in pixels.
		Default: 0.

Map element URL

The map element URL object defines a clickable link that will be available for a specific map element. It has the following properties:

Property	Type	Description
sysmapelementurlid	string	<i>(readonly)</i> ID of the map element URL.
name (required)	string	Link caption.
url (required)	string	Link URL.
selementid	string	ID of the map element that the URL belongs to.

Map link

The map link object defines a link between two map elements. It has the following properties.

Property	Type	Description
linkid	string	<i>(readonly)</i> ID of the map link.
selementid1 (required)	string	ID of the first map element linked on one end.
selementid2 (required)	string	ID of the first map element linked on the other end.

Property	Type	Description
color	string	Line color as a hexadecimal color code.
drawtype	integer	Default: 000000. Link line draw style.
label	string	Possible values: 0 - <i>(default)</i> line; 2 - bold line; 3 - dotted line; 4 - dashed line. Link label.
linktriggers	array	Map link triggers to use as link status indicators.
sysmapid	string	The map link trigger object is described in detail below . ID of the map the link belongs to.

Map link trigger

The map link trigger object defines a map link status indicator based on the state of a trigger. It has the following properties:

Property	Type	Description
linktriggerid	string	<i>(readonly)</i> ID of the map link trigger.
triggerid (required)	string	ID of the trigger used as a link indicator.
color	string	Indicator color as a hexadecimal color code.
drawtype	integer	Default: DD0000. Indicator draw style.
linkid	string	Possible values: 0 - <i>(default)</i> line; 2 - bold line; 3 - dotted line; 4 - dashed line. ID of the map link that the link trigger belongs to.

Map URL

The map URL object defines a clickable link that will be available for all elements of a specific type on the map. It has the following properties:

Property	Type	Description
sysmapurlid	string	(<i>readonly</i>) ID of the map URL.
name (required)	string	Link caption.
url (required)	string	Link URL.
elementtype	integer	Type of map element for which the URL will be available.
		Refer to the map element "type" property for a list of supported types.
sysmapid	string	Default: 0. ID of the map that the URL belongs to.

Map user

List of map permissions based on users. It has the following properties:

Property	Type	Description
sysmapuserid	string	(<i>readonly</i>) ID of the map user.
userid (required)	string	User ID.
permission (required)	integer	Type of permission level.
		Possible values: 2 - read only; 3 - read-write;

Map user group

List of map permissions based on user groups. It has the following properties:

Property	Type	Description
sysmapusrgrpids	string	(<i>readonly</i>) ID of the map user group.
usrgpid (required)	string	User group ID.
permission (required)	integer	Type of permission level.
		Possible values: 2 - read only; 3 - read-write;

map.create

Description

`object map.create(object/array maps)`

This method allows to create new maps.

Parameters

(object/array) Maps to create.

Additionally to the [standard map properties](#), the method accepts the following parameters.

Parameter	Type	Description
links	array	Map links to be created on the map.
selements	array	Map elements to be created on the map.
urls	array	Map URLs to be created on the map.
users	array	Map user shares to be created on the map.
userGroups	array	Map user group shares to be created on the map.

Note:

To create map links you'll need to set a map elements `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. [See example](#).

Return values

(object) Returns an object containing the IDs of the created maps under the `sysmapids` property. The order of the returned IDs matches the order of the passed maps.

Examples

Create an empty map

Create a map with no elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map",
    "width": 600,
    "height": 600
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "8"
    ]
  },
  "id": 1
}
```

Create a host map

Create a map with two host elements and a link between them. Note the use of temporary `"selementid1"` and `"selementid2"` values in the map link object to refer to map elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
```

```

"params": {
  "name": "Host map",
  "width": 600,
  "height": 600,
  "selements": [
    {
      "elementid": "1033",
      "selementid": "1",
      "elementtype": 0,
      "iconid_off": "2"
    },
    {
      "elementid": "1037",
      "selementid": "2",
      "elementtype": 0,
      "iconid_off": "2"
    }
  ],
  "links": [
    {
      "selementid1": "1",
      "selementid2": "2"
    }
  ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 1
}

```

Map sharing

Create a map with two types of sharing (user and user group).

Request:

```

{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {

map.delete

Description

object map.delete(array mapIds)

This method allows to delete maps.

Parameters

(array) IDs of the maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted maps under the sysmapids property.

Examples

Delete multiple maps

Delete two maps.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "map.delete",
  "params": [
    "12",
    "34"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [

```

```

        "12",
        "34"
    ]
},
"id": 1
}

```

CMap::delete() in *frontends/php/include/classes/api/services/CMap.php*.

map.get

Description

integer/array map.get(object parameters)

The method allows to retrieve maps according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
sysmapids	string/array	Return only maps with the given IDs.
userids	string/array	Return only maps that belong to the given user IDs.
expandUrls	flag	Adds global map URLs to the corresponding map elements and expands macros in all map element URLs.
selectIconMap	query	Returns the icon map used on the map in the iconmap property.
selectLinks	query	Returns map links between elements in the links property.
selectSelements	query	Returns the map elements from the map in the selements property.
selectUrls	query	Returns the map URLs in the urls property.
selectUsers	query	Returns users that the map is shared with in users property.

Parameter	Type	Description
selectUserGroups	query	Returns user groups that the map is shared with in userGroups property.
sortfield	string/array	Sort the result by the given properties. Possible values are: name, width and height.
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve a map

Retrieve all data about map "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.get",
  "params": {
    "output": "extend",
    "selectSelements": "extend",
    "selectLinks": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
    "sysmapids": "3"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "selements": [
        {
          "selementid": "10",

CMap::get() in *frontends/php/include/classes/api/services/CMap.php*.

map.isreadable

Description

`boolean map.isreadable(array sysmapIds)`

This method checks if the given maps are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use `map.get` instead.

Parameters

(array) IDs of the maps to check.

Return values

(boolean) Returns `true` if the given maps are available for reading.

Examples

Check multiple maps

Check if the two maps are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.isreadable",
  "params": [
    "32", "6"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

map.iswritable

Description

`boolean map.iswritable(array sysmapIds)`

This method checks if the given maps are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use `map.get` instead.

Parameters

(array) IDs of the maps to check.

Return values

(boolean) Returns `true` if the given maps are available for writing.

Examples

Check multiple maps

Check if the two maps are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.iswritable",
  "params": [
    "32", "7"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

map.update

Description

object map.update(object/array maps)

This method allows to update existing maps.

Parameters

(object/array) Map properties to be updated.

The `mapid` property must be defined for each map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard map properties](#), the method accepts the following parameters.

Parameter	Type	Description
links	array	Map links to replace the existing links.
selements	array	Map elements to replace the existing elements.
urls	array	Map URLs to replace the existing URLs.
users	array	Map user shares to replace the existing elements.
userGroups	array	Map user group shares to replace the existing elements.

Note:

To create map links between new map elements you'll need to set an elements `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. [See example for map.create](#).

Return values

(object) Returns an object containing the IDs of the updated maps under the `sysmapids` property.

Examples

Resize a map

Change the size of the map to 1200x1200 pixels.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.update",
  "params": {
    "sysmapid": "8",
    "width": 1200,
    "height": 1200
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "8"
    ]
  },
  "id": 1
}
```

Change map owner

Available only for admins and super admins.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.update",
  "params": {
    "sysmapid": "9",
    "userid": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 2
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 2
}
```

Media

This class is designed to work with media.

Object references:

- [Media](#)

Available methods:

- [usermedia.get](#) - retrieving media

Methods to configure media via the user API:

- [user.addmedia](#) - creating media
- [user.updatemedia](#) - updating media
- [user.deletemedia](#) - deleting media

> Media object

The following objects are directly related to the `usermedia` API.

Media

Note:

Media are created, updated and deleted via the [user API](#).

The media object defines how a media type should be used for a user. It has the following properties.

Property	Type	Description
mediaid	string	<i>(readonly)</i> ID of the media.
active (required)	integer	Whether the media is enabled. Possible values: 0 - enabled; 1 - disabled.
mediatypeid (required)	string	ID of the media type used by the media.
period (required)	string	Time when the notifications can be sent as a time period .
sendto (required)	string	Address, user name or other identifier of the recipient.
severity (required)	integer	Trigger severities to send notifications about. Severities are stored in binary form with each bit representing the corresponding severity. For example, 12 equals 1100 in binary and means, that notifications will be sent from triggers with severities warning and average. Refer to the trigger object page for a list of supported trigger severities.
userid (required)	string	ID of the user that uses the media.

usermedia.get

Description

`integer/array usermedia.get(object parameters)`

The method allows to retrieve media according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
mediaids	string/array	Return only media with the given IDs.
usrgrpids	string/array	Return only media that are used by users in the given user groups.
userids	string/array	Return only media that are used by the given users.
mediatypeids	string/array	Return only media that use the given media types.
sortfield	string/array	Sort the result by the given properties.
		Possible values are: mediaid, userid and mediatypeid.
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving media by user

Retrieve all media for the given user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermedia.get",
  "params": {
    "output": "extend",
    "userids": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "mediaid": "8",
      "userid": "1",
      "mediatypeid": "3",
      "sendto": "+3711231233",
      "active": "0",
      "severity": "48",

```

```

        "period": "1-5,09:00-18:00"
    },
    {
        "mediaid": "9",
        "userid": "1",
        "mediatypeid": "1",
        "sendto": "john@company.com",
        "active": "0",
        "severity": "63",
        "period": "1-7,00:00-24:00"
    }
],
"id": 1
}

```

Source

CUserMedia::get() in *frontends/php/include/classes/api/services/CUserMedia.php*.

Media type

This class is designed to work with media types.

Object references:

- [Media type](#)

Available methods:

- [mediatype.create](#) - creating new media types
- [mediatype.delete](#) - deleting media types
- [mediatype.get](#) - retrieving media types
- [mediatype.update](#) - updating media types

> Media type object

The following objects are directly related to the mediatype API.

Media type

The media type object has the following properties.

Property	Type	Description
mediatypeid	string	(readonly) ID of the media type.
description (required)	string	Name of the media type.
type (required)	integer	Transport used by the media type.
		Possible values: 0 - email; 1 - script; 2 - SMS; 3 - Jabber; 100 - Ez Texting.

Property	Type	Description
exec_path	string	<p>For script media types <code>exec_path</code> contains the name of the executed script.</p> <p>For Ez Texting <code>exec_path</code> contains the message text limit. Possible text limit values: 0 - USA (160 characters); 1 - Canada (136 characters).</p>
gsm_modem	string	<p>Required for script and Ez Texting media types. Serial device name of the GSM modem.</p>
passwd	string	<p>Required for SMS media types. Authentication password.</p>
smtp_email	string	<p>Required for Jabber and Ez Texting media types. Email address from which notifications will be sent.</p>
smtp_helo	string	<p>Required for email media types. SMTP HELO.</p>
smtp_server	string	<p>Required for email media types. SMTP server.</p>
status	integer	<p>Required for email media types. Whether the media type is enabled.</p> <p>Possible values: 0 - (<i>default</i>) enabled; 1 - disabled.</p>

Property	Type	Description
username	string	Username or Jabber identifier.
exec_params	string	Required for Jabber and Ez Texting media types. Script parameters.
smtp_port	integer	Each parameter ends with a new line feed. SMTP server port to connect to.
smtp_security	integer	SMTP connection security level to use.
smtp_verify_host	integer	Possible values: 0 - None; 1 - STARTTLS; 2 - SSL/TLS. SSL verify host for SMTP.
smtp_verify_peer	integer	Possible values: 0 - No; 1 - Yes. SSL verify peer for SMTP.
smtp_authentication	integer	Possible values: 0 - No; 1 - Yes. SMTP authentication method to use.
		Possible values: 0 - None; 1 - Normal password.

mediatype.create

Description

object mediatype.create(object/array mediaTypes)

This method allows to create new media types.

Parameters

(object/array) Media types to create.

The method accepts media types with the **standard media type properties**.

Return values

(object) Returns an object containing the IDs of the created media types under the `mediatypeids` property. The order of the returned IDs matches the order of the passed media types.

Examples

Creating a media type

Create a new e-mail media type.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "description": "E-mail",
    "type": 0,
    "smtp_server": "rootmail@company.com",
    "smtp_helo": "company.com",
    "smtp_email": "zabbix@company.com"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "7"
    ]
  },
  "id": 1
}
```

Source

CMediaType::create() in *frontends/php/include/classes/api/services/CMediaType.php*.

mediatype.delete

Description

object mediatype.delete(array mediaTypeIds)

This method allows to delete media types.

Parameters

(array) IDs of the media types to delete.

Return values

(object) Returns an object containing the IDs of the deleted media types under the `mediatypeids` property.

Examples

Deleting multiple media types

Delete two media types.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.delete",
  "params": [
    "3",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "3",
      "5"
    ]
  },
  "id": 1
}
```

Source

CMediaType::delete() in *frontends/php/include/classes/api/services/CMediaType.php*.

mediatype.get

Description

integer/array mediatype.get(object parameters)

The method allows to retrieve media types according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
mediatypeids	string/array	Return only media types with the given IDs.
mediaids	string/array	Return only media types used by the given media.
userids	string/array	Return only media types used by the given users.
selectUsers	query	Return the users that use the media type in the users property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: mediatypeid. These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	

Parameter	Type	Description
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving media types

Retrieve all configured media types.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "mediatypeid": "1",
      "type": "0",
      "description": "Email",

CMediaType::get() in *frontends/php/include/classes/api/services/CMediaType.php*.

mediatype.update

Description

object mediatype.update(object/array mediaTypes)

This method allows to update existing media types.

Parameters

(object/array) **Media type properties** to be updated.

The `mediatypeid` property must be defined for each media type, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated media types under the `mediatypeids` property.

Examples

Enabling a media type

Enable a media type, that is, set its status to 0.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.update",
  "params": {
    "mediatypeid": "6",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "6"
    ]
  },
  "id": 1
}
```

Proxy

This class is designed to work with proxies.

Object references:

- [Proxy](#)
- [Proxy interface](#)

Available methods:

- [proxy.create](#) - create new proxies
- [proxy.delete](#) - delete proxies
- [proxy.get](#) - retrieve proxies
- [proxy.isreadable](#) - check if a proxy is readable
- [proxy.iswritable](#) - check if a proxy is writable
- [proxy.update](#) - update proxies

> Proxy object

The following objects are directly related to the proxy API.

Proxy

The proxy object has the following properties.

Property	Type	Description
proxyid	string	(readonly) ID of the proxy.
host (required)	string	Name of the proxy.
status (required)	integer	Type of proxy. Possible values: 5 - active proxy; 6 - passive proxy.

Property	Type	Description
description	text	Description of the proxy.
lastaccess	timestamp	(readonly) Time when the proxy last connected to the server.
tls_connect	integer	Connections to proxy. Possible values are: 1 - (default) No encryption; 2 - PSK; 4 - certificate.
tls_accept	integer	Connections from proxy. Possible bitmap values are: 1 - (default) No encryption; 2 - PSK; 4 - certificate.
tls_issuer	string	Certificate issuer.
tls_subject	string	Certificate subject.
tls_psk_identity	string	PSK identity. Required if either tls_connect or tls_accept has PSK enabled. Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.
tls_psk	string	The preshared key, at least 32 hex digits. Required if either tls_connect or tls_accept has PSK enabled.

Proxy interface

The proxy interface object defines the interface used to connect to a passive proxy. It has the following properties.

Property	Type	Description
interfaceid	string	(readonly) ID of the interface.

Property	Type	Description
dns (required)	string	DNS name to connect to.
ip (required)	string	Can be empty if connections are made via IP address. IP address to connect to.
port (required)	string	Can be empty if connections are made via DNS names. Port number to connect to.
useip (required)	integer	Whether the connection should be made via IP address. Possible values are: 0 - connect using DNS name; 1 - connect using IP address.
hostid	string	<i>(readonly)</i> ID of the proxy the interface belongs to.

proxy.create

Description

object proxy.create(object/array proxies)

This method allows to create new proxies.

Parameters

(object/array) Proxies to create.

Additionally to the **standard proxy properties**, the method accepts the following parameters.

Parameter	Type	Description
hosts	array	Hosts to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy. The hosts must have the hostid property defined.

Parameter	Type	Description
interface	object	Host interface to be created for the passive proxy.
interfaces (deprecated)	array	Required for passive proxies. Host interface to be created for the passive proxy passed as an array.

Return values

(object) Returns an object containing the IDs of the created proxies under the `proxyids` property. The order of the returned IDs matches the order of the passed proxies.

Examples

Create an active proxy

Create an action proxy "Active proxy" and assign a host to be monitored by it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "host": "Active proxy",
    "status": "5",
    "hosts": [
      {
        "hostid": "10279"
      }
    ]
  },
  "auth": "ab9638041ec6922cb14b07982b268f47",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10280"
    ]
  },
  "id": 1
}
```

Create a passive proxy

Create a passive proxy "Passive proxy" and assign two hosts to be monitored by it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "host": "Passive proxy",
    "status": "6",
    "interface": {
```

```

        "ip": "127.0.0.1",
        "dns": "",
        "useip": "1",
        "port": "10051"
    },
    "hosts": [
        {
            "hostid": "10192"
        },
        {
            "hostid": "10139"
        }
    ]
},
"auth": "ab9638041ec6922cb14b07982b268f47",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10284"
        ]
    },
    "id": 1
}

```

proxy.delete

Description

object proxy.delete(array proxies)

This method allows to delete proxies.

Parameters

(array) IDs of proxies to delete.

Return values

(object) Returns an object containing the IDs of the deleted proxies under the proxyids property.

Examples

Delete multiple proxies

Delete two proxies.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "proxy.delete",
    "params": [
        "10286",
        "10285"
    ],

```

```

    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10286",
      "10285"
    ]
  },
  "id": 1
}

```

proxy.get

Description

integer/array proxy.get(object parameters)

The method allows to retrieve proxies according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
proxyids	string/array	Return only proxies with the given IDs.
selectHosts	query	Return hosts monitored by the proxy in the hosts property.
selectInterface	query	Return the proxy interface used by a passive proxy in the interface property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>hostid</code> , <code>host</code> and <code>status</code> . These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	

Parameter	Type	Description
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve all proxies

Retrieve all configured proxies and their interfaces.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.get",
  "params": {
    "output": "extend",
    "selectInterface": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "host": "Active proxy",
      "status": "5",
      "lastaccess": "0",
      "description": "",
      "tls_connect": "1",
      "tls_accept": "1",
      "tls_issuer": "",
      "tls_subject": "",
      "tls_psk_identity": "",
      "tls_psk": "",
      "proxyid": "30091",
      "interface": []
    },
    {
      "host": "Passive proxy",
      "status": "6",
      "lastaccess": "0",
      "description": "",
      "tls_connect": "1",
      "tls_accept": "1",
      "tls_issuer": "",
      "tls_subject": "",
      "tls_psk_identity": "",
      "tls_psk": "",
      "proxyid": "30091",
      "interface": []
    }
  ]
}
```

```

        "proxyid": "30092",
        "interface": {
            "interfaceid": "30109",
            "hostid": "30092",
            "useip": "1",
            "ip": "127.0.0.1",
            "dns": "",
            "port": "10051"
        }
    ],
    "id": 1
}

```

proxy.isreadable

Description

boolean proxy.isreadable(array proxyIds)

This method checks if the given proxies are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [proxy.get](#) instead.

Parameters

(array) IDs of the proxies to check.

Return values

(boolean) Returns true if the given proxies are available for reading.

Examples

Check multiple proxies

Check if the two proxies are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "proxy.isreadable",
    "params": [
        "30091",
        "30092"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}

```

CProxy::isReadable() in *frontends/php/include/classes/api/services/CProxy.php*.

proxy.iswritable

Description

boolean proxy.iswritable(array proxyIds)

This method checks if the given proxies are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [proxy.get](#) instead.

Parameters

(array) IDs of the proxies to check.

Return values

(boolean) Returns true if the given proxies are available for writing.

Examples

Check multiple proxies

Check if the two proxies are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.iswritable",
  "params": [
    "30091",
    "30092"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

proxy.update

Description

object proxy.update(object/array proxies)

This method allows to update existing proxies.

Parameters

(object/array) Proxy properties to be updated.

The `proxyid` property must be defined for each proxy, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard proxy properties**, the method accepts the following parameters.

Parameter	Type	Description
hosts	array	Hosts to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy.
interface	object	The hosts must have the <code>hostid</code> property defined. Host interface to replace the existing interface for the passive proxy.
interfaces (deprecated)	array	Host interface to be created for the passive proxy passed as an array.

Return values

(object) Returns an object containing the IDs of the updated proxies under the `proxyids` property.

Examples

Change hosts monitored by a proxy

Update the proxy to monitor the two given hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.update",
  "params": {
    "proxyid": "10293",
    "hosts": [
      "10294",
      "10295"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10293"
    ]
  },
}
```

```
    "id": 1
}
```

Change proxy status

Change the proxy to an active proxy and rename it to "Active proxy".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.update",
  "params": {
    "proxyid": "10293",
    "host": "Active proxy",
    "status": "5"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10293"
    ]
  },
  "id": 1
}
```

Screen

This class is designed to work with screen.

Object references:

- [Screen](#)
- [Screen user](#)
- [Screen user group](#)

Available methods:

- [screen.create](#) - creating new screen
- [screen.delete](#) - deleting screens
- [screen.get](#) - retrieving screens
- [screen.update](#) - updating screens

> Screen object

The following objects are directly related to the screen API.

Screen

The screen object has the following properties.

Property	Type	Description
screenid	string	(readonly) ID of the screen.
name (required)	string	Name of the screen.
hsize	integer	Width of the screen.
vsiz	integer	Default: 1 Height of the screen.
userid	string	Default: 1 Screen owner user ID.
private	integer	Type of screen sharing. Possible values: 0 - public screen; 1 - (default) private screen.

Screen user

List of screen permissions based on users. It has the following properties:

Property	Type	Description
screenuserid	string	(readonly) ID of the screen user.
userid (required)	string	User ID.
permission (required)	integer	Type of permission level. Possible values: 2 - read only; 3 - read-write;

Screen user group

List of screen permissions based on user groups. It has the following properties:

Property	Type	Description
screenusrgrp	string	(readonly) ID of the screen user group.
usrgrp (required)	string	User group ID.
permission (required)	integer	Type of permission level. Possible values: 2 - read only; 3 - read-write;

screen.create

Description

`object screen.create(object/array screens)`

This method allows to create new screens.

Parameters

(object/array) Screens to create.

Additionally to the [standard screen properties](#), the method accepts the following parameters.

Parameter	Type	Description
screenitems	array	Screen items to be created for the screen.
users	array	Screen user shares to be created on the screen.
userGroups	array	Screen user group shares to be created on the screen.

Return values

(object) Returns an object containing the IDs of the created screens under the `screenids` property. The order of the returned IDs matches the order of the passed screens.

Examples

Creating a screen

Create a screen named "Graphs" with 2 rows and 3 columns and add a graph to the upper-left cell.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screen.create",
  "params": {
    "name": "Graphs",
    "hsize": 3,
    "vsize": 2,
    "screenitems": [
      {
        "resourcetype": 0,
        "resourceid": "612",
        "rowspan": 0,
        "colspan": 0,
        "x": 0,
        "y": 0
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "26"
    ]
  },
  "id": 1
}
```

Screen sharing

Create a screen with two types of sharing (user and user group).

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screen.create",
  "params": {
    "name": "Screen sharing",
    "hsize": 3,
    "vsize": 2,
    "users": [
      {
        "userid": "4",
        "permission": "3"
      }
    ],
    "userGroups": [
      {
        "usrgrpId": "7",
        "permission": "2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "83"
    ]
  },
  "id": 1
}
```

screen.delete

Description

object screen.delete(array screenIds)

This method allows to delete screens.

Parameters

(array) IDs of the screens to delete.

Return values

(object) Returns an object containing the IDs of the deleted screens under the screenids property.

Examples

Deleting multiple screens

Delete two screens.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screen.delete",
  "params": [
    "25",
    "26"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "25",
      "26"
    ]
  },
  "id": 1
}
```

screen.get

Description

integer/array screen.get(object parameters)

The method allows to retrieve screens according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
screenids	string/array	Return only screens with the given IDs.
userids	string/array	Return only screens that belong to the given user IDs.
screenitemids	string/array	Return only screens that contain the given screen items.
selectUsers	query	Returns users that the screen is shared with in users property.
selectUserGroups	query	Returns user groups that the screen is shared with in userGroups property.

Parameter	Type	Description
selectScreenItemsquery		Return the screen items that are used in the screen.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>screenid</code> and <code>name</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving a screen by ID

Retrieve all data about screen "26" and its screen items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screen.get",
  "params": {
    "output": "extend",
    "selectScreenItems": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
    "screenids": "26"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
```

```

{
    "screenitems": [
        {
            "screenitemid": "67",
            "screenid": "26",
            "resourcetype": "0",
            "resourceid": "612",
            "width": "320",
            "height": "200",
            "x": "0",
            "y": "0",
            "colspan": "0",
            "rowspan": "0",
            "elements": "25",
            "valign": "0",
            "halign": "0",
            "style": "0",
            "url": "",
            "dynamic": "0",
            "sort_triggers": "0"
        }
    ],
    "users": [
        {
            "sysmapuserid": "1",
            "userid": "2",
            "permission": "2"
        }
    ],
    "userGroups": [
        {
            "screenusrgrpid": "1",
            "usrgrpid": "7",
            "permission": "3"
        }
    ],
    "screenid": "26",
    "name": "CPU Graphs",
    "hsize": "3",

screen.update

Description

object screen.update(object/array screens)

This method allows to update existing screens.

Parameters

(object/array) Screen properties to be updated.

The `screenid` property must be defined for each screen, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard screen properties**, the method accepts the following parameters.

Parameter	Type	Description
screenitems	array	Screen items to replace existing screen items. Screen items are updated by coordinates, so each screen item must have the x and y properties defined.
users	array	Screen user shares to replace the existing elements.
userGroups	array	Screen user group shares to replace the existing elements.

Return values

(object) Returns an object containing the IDs of the updated screens under the `screenids` property.

Examples

Renaming a screen

Rename a screen to "CPU Graphs".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screen.update",
  "params": {
    "screenid": "26",
    "name": "CPU Graphs"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "26"
    ]
  },
  "id": 1
}
```

Change screen owner

Available only for admins and super admins.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screen.update",
  "params": {
    "screenid": "83",
    "userid": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 2
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "83"
    ]
  },
  "id": 2
}
```

Screen item

This class is designed to work with screen items.

Object references:

- [Screen item](#)

Available methods:

- [screenitem.create](#) - creating new screen items
- [screenitem.delete](#) - deleting screen items
- [screenitem.get](#) - retrieving screen items
- [screenitem.isreadable](#) - checking if screen items are readable
- [screenitem.iswritable](#) - checking if screen items are writable
- [screenitem.update](#) - updating screen items
- [screenitem.updatebyposition](#) - updating screen items in a specific screen cell

> Screen item object

The following objects are directly related to the `screenitem` API.

Screen item

The screen item object defines an element displayed on a screen. It has the following properties.

Property	Type	Description
screenitemid	string	(readonly) ID of the screen item.
resourcetype (required)	integer	Type of screen item. Possible values: 0 - graph; 1 - simple graph; 2 - map; 3 - plain text; 4 - hosts info; 5 - triggers info; 6 - server info; 7 - clock; 8 - screen; 9 - triggers overview 10 - data overview; 11 - URL; 12 - history of actions; 13 - history of events; 14 - latest host group issues; 15 - system status; 16 - latest host issues; 19 - simple graph prototype; 20 - graph prototype.
screenid (required)	string	ID of the screen that the item belongs to.
application	string	Application or part of application name by which data in screen item can be filtered. Applies to resource types: "Data overview" and "Triggers overview".
colspan	integer	Number of columns the screen item will span across.
dynamic	integer	Default: 1. Whether the screen item is dynamic. Possible values: 0 - (default) not dynamic; 1 - dynamic.

Property	Type	Description
elements	integer	Number of lines to display on the screen item.
halign	integer	<p>Default: 25. Specifies how the screen item must be aligned horizontally in the cell.</p> <p>Possible values: 0 - (<i>default</i>) center; 1 - left; 2 - right.</p>
height	integer	Height of the screen item in pixels.
max_columns	integer	<p>Default: 200. Specifies the maximum amount of columns a graph prototype or simple graph prototype screen element can have.</p>
resourceid	string	<p>Default: 3. ID of the object displayed on the screen item. Depending on the type of a screen item, the <code>resourceid</code> property can reference different objects.</p> <p>Required for data overview, graph, map, plain text, screen, simple graph and trigger overview screen items. Unused by local and server time clocks, history of actions, history of events, hosts info, server info, system status and URL screen items.</p>

Property	Type	Description
rowspan	integer	Number or rows the screen item will span across.
sort_triggers	integer	<p>Default: 1. Order in which actions or triggers must be sorted.</p> <p>Possible values for history of actions screen elements: 3 - time, ascending; 4 - time, descending; 5 - type, ascending; 6 - type, descending; 7 - status, ascending; 8 - status, descending; 9 - retries left, ascending; 10 - retries left, descending; 11 - recipient, ascending; 12 - recipient, descending.</p> <p>Possible values for latest host group issues and latest host issues screen items: 0 - <i>(default)</i> last change, descending; 1 - severity, descending; 2 - host, ascending.</p>

Property	Type	Description
style	integer	<p>Screen item display option.</p> <p>Possible values for data overview and triggers overview screen items: 0 - <i>(default)</i> display hosts on the left side; 1 - display hosts on the top.</p> <p>Possible values for hosts info and triggers info screen elements: 0 - <i>(default)</i> horizontal layout; 1 - vertical layout.</p> <p>Possible values for clock screen items: 0 - <i>(default)</i> local time; 1 - server time; 2 - host time.</p> <p>Possible values for plain text screen items: 0 - <i>(default)</i> display values as plain text; 1 - display values as HTML.</p>
url	string	<p>URL of the webpage to be displayed in the screen item.</p> <p>Used by URL screen items.</p>
valign	integer	<p>Specifies how the screen item must be aligned vertically in the cell.</p> <p>Possible values: 0 - <i>(default)</i> middle; 1 - top; 2 - bottom.</p>
width	integer	<p>Width of the screen item in pixels.</p> <p>Default: 320.</p>

Property	Type	Description
x	integer	X-coordinates of the screen item on the screen, from left to right.
y	integer	Default: 0. Y-coordinates of the screen item on the screen, from top to bottom.
		Default: 0.

screenitem.create

Description

object screenitem.create(object/array screenItems)

This method allows to create new screen items.

Parameters

(object/array) Screen items to create.

The method accepts screen items with the **standard screen item properties**.

Return values

(object) Returns an object containing the IDs of the created screen items under the screenitemids property. The order of the returned IDs matches the order of the passed screen items.

Examples

Creating a screen item

Create a screen item displaying a graph in the left-upper cell of the screen.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screenitem.create",
  "params": {
    "screenid": 16,
    "resourcetype": 0,
    "resourceid": 612,
    "x": 0,
    "y": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenitemids": [
      "65"
    ]
  },
  "id": 1
}
```

screenitem.delete

Description

object screenitem.delete(array screenItemIds)

This method allows to delete screen items.

Parameters

(array) IDs of the screen items to delete.

Return values

(object) Returns an object containing the IDs of the deleted screen items under the `screenitemids` property.

Examples

Deleting multiple screen items

Delete two screen items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screenitem.delete",
  "params": [
    "65",
    "63"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenitemids": [
      "65",
      "63"
    ]
  },
  "id": 1
}
```

screenitem.get

Description

integer/array screenitem.get(object parameters)

The method allows to retrieve screen items according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
screenitemids	string/array	Return only screen items with the given IDs.
screenids	string/array	Return only screen items that belong to the given screen.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: screenitemid and screenid. These parameters being common for all get methods are described in detail in the reference commentary page .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving screen items from screen

Retrieve all screen items from the given screen.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screenitem.get",
  "params": {
    "output": "extend",
    "screenids": "3"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "screenitemid": "20",
      "screenid": "3",
      "resourcetype": "0",

],
    "id": 1
}

```

Source

CScreenItem::get() in *frontends/php/include/classes/api/services/CScreenItem.php*.

screenitem.isreadable

Description

boolean screenitem.isreadable(array screenItemIds)

This method checks if the given screen items are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use **screenitem.get** instead.

Parameters

(array) IDs of the screen items to check.

Return values

(boolean) Returns true if the given screen items are available for reading.

Examples

Check multiple screen items

Check if the two screen items are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "screenitem.isreadable",
    "params": [
        "20",
        "21"
    ]
}

```

```
],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

screenitem.iswritable

Description

`boolean screenitem.iswritable(array screenItemIds)`

This method checks if the given screen items are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [screenitem.get](#) instead.

Parameters

(array) IDs of the screen items to check.

Return values

(boolean) Returns true if the given screen items are available for writing.

Examples

Check multiple screen items

Check if the two screen items are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screenitem.iswritable",
  "params": [
    "20",
    "21"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

screenitem.update

Description

object screenitem.update(object/array screenItems)

This method allows to update existing screen items.

Parameters

(object/array) **Screen item properties** to be updated.

The screenitemid property must be defined for each screen item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated screen items under the screenitemids property.

Examples

Setting the size of the screen item

Set the width of the screen item to 500px and height to 300px.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screenitem.update",
  "params": {
    "screenitemid": "20",
    "width": 500,
    "height": 300
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenitemids": [
      "20"
    ]
  },
  "id": 1
}
```

See also

- **screenitem.updatebyposition**

Source

CScreenItem::update() in *frontends/php/include/classes/api/services/CScreenItem.php*.

screenitem.updatebyposition

Description

object screenitem.updatebyposition(array screenItems)

This method allows to update screen items in the given screen cells. If a cell is empty, a new screen item will be created.

Parameters

(array) **Screen item properties** to be updated.

The x, y and screenid properties must be defined for each screen item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated and created screen items under the **screenitemids** property.

Examples

Changing a screen items resource ID

Change the resource ID for the screen element located in the upper-left cell of the screen.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "screenitem.updatebyposition",
  "params": [
    {
      "screenid": "16",
      "x": 0,
      "y": 0,
      "resourceid": "644"
    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenitemids": [
      "66"
    ]
  },
  "id": 1
}
```

Script

This class is designed to work with scripts.

Object references:

- **Script**

Available methods:

- **script.create** - create new scripts
- **script.delete** - delete scripts
- **script.execute** - run scripts
- **script.get** - retrieve scripts
- **script.getscriptsbyhosts** - retrieve scripts for hosts
- **script.update** - update scripts

> Script object

The following objects are directly related to the `script` API.

Script

The script object has the following properties.

Property	Type	Description
scriptid	string	(<i>readonly</i>) ID of the script.
command (required)	string	Command to run.
name (required)	string	Name of the script.
confirmation	string	Confirmation pop up text. The pop up will appear when trying to run the script from the Zabbix frontend.
description	string	Description of the script.
execute_on	integer	Where to run the script. Possible values: 0 - run on Zabbix agent; 1 - (<i>default</i>) run on Zabbix server.
groupid	string	ID of the host group that the script can be run on. If set to 0, the script will be available on all host groups.
host_access	integer	Default: 0. Host permissions needed to run the script. Possible values: 2 - (<i>default</i>) read; 3 - write.
type	integer	Script type. Possible values: 0 - (<i>default</i>) script; 1 - IPMI.

Property	Type	Description
usrgrpId	string	ID of the user group that will be allowed to run the script. If set to 0, the script will be available for all user groups.
		Default: 0.

script.create

Description

object script.create(object/array scripts)

This method allows to create new scripts.

Parameters

(object/array) Scripts to create.

The method accepts scripts with the **standard script properties**.

Return values

(object) Returns an object containing the IDs of the created scripts under the `scriptids` property. The order of the returned IDs matches the order of the passed scripts.

Examples

Create a script

Create a script that will reboot a server. The script will require write access to the host and will display a configuration message before running in the frontend.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "Reboot server",
    "command": "reboot server 1",
    "host_access": 3,
    "confirmation": "Are you sure you would like to reboot the server?"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "3"
    ]
  },
  "id": 1
}
```

Source

CScript::create() in *frontends/php/include/classes/api/services/CScript.php*.

script.delete

Description

object script.delete(array scriptIds)

This method allows to delete scripts.

Parameters

(array) IDs of the scripts to delete.

Return values

(object) Returns an object containing the IDs of the deleted scripts under the `scriptids` property.

Examples

Delete multiple scripts

Delete two scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.delete",
  "params": [
    "3",
    "4"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "3",
      "4"
    ]
  },
  "id": 1
}
```

Source

CScript::delete() in *frontends/php/include/classes/api/services/CScript.php*.

script.execute

Description

object script.execute(object parameters)

This method allows to run a script on a host.

Parameters

(object) Parameters containing the ID of the script to run and the ID of the host.

Parameter	Type	Description
hostid (required)	string	ID of the host to run the script on.
scriptid (required)	string	ID of the script to run.

Return values

(object) Returns the result of script execution.

Property	Type	Description
response	string	Whether the script was run successfully. Possible values: success or failed.
value	string	Script output.

Examples

Run a script

Run a "ping" script on a host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.execute",
  "params": {
    "scriptid": "1",
    "hostid": "30079"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "value": "PING 127.0.0.1 (127.0.0.1) 56(84) bytes of data.\n64 bytes from 127.0.0.1: icmp_req=1 tt"
  },
  "id": 1
}
```

Source

CScript::execute() in *frontends/php/include/classes/api/services/CScript.php*.

script.get

Description

integer/array script.get(object parameters)

The method allows to retrieve scripts according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	string/array	Return only scripts that can be run on the given host groups.
hostids	string/array	Return only scripts that can be run on the given hosts.
scriptids	string/array	Return only scripts with the given IDs.
usrgrpids	string/array	Return only scripts that can be run by users in the given user groups.
selectGroups	query	Return host groups that the script can be run on in the groups property.
selectHosts	query	Return hosts that the script can be run on in the hosts property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>scriptid</code> and <code>name</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all scripts

Retrieve all configured scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "scriptid": "1",

CScript::get() in *frontends/php/include/classes/api/services/CScript.php*.

script.getscriptsbyhosts

Description

object script.getscriptsbyhosts(array hostIds)

This method allows to retrieve scripts available on the given hosts.

Parameters

(string/array) IDs of hosts to return scripts for.

Return values

(object) Returns an object with host IDs as properties and arrays of available scripts as values.

Note:

The method will automatically expand macros in the confirmation text.

Examples

Retrieve scripts by host IDs

Retrieve all scripts available on hosts "30079" and "30073".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.getscriptsbyhosts",
  "params": [
    "30079",
    "30073"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "30079": [
      {
        "scriptid": "3",
        "name": "Detect operating system",
        "command": "sudo /usr/bin/nmap -O {HOST.CONN} 2>&1",

CScript::getScriptsByHosts() in *frontends/php/include/classes/api/services/CScript.php*.

script.update

Description

object script.update(object/array scripts)

This method allows to update existing scripts.

Parameters

(object/array) **Script properties** to be updated.

The scriptid property must be defined for each script, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated scripts under the scriptids property.

Examples

Change script command

Change the command of the script to `"/bin/ping -c 10 {HOST.CONN} 2>&1"`.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.update",
  "params": {
    "scriptid": "1",
    "command": "/bin/ping -c 10 {HOST.CONN} 2>&1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "1"
    ]
  },
  "id": 1
}
```

CScript::update() in *frontends/php/include/classes/api/services/CScript.php*.

Template

This class is designed to work with templates.

Object references:

- **Template**

Available methods:

- **template.create** - creating new templates
- **template.delete** - deleting templates
- **template.get** - retrieving templates

- `template.isreadable` - checking if templates are readable
- `template.iswritable` - checking if templates are writable
- `template.massadd` - adding related objects to templates
- `template.massremove` - removing related objects from templates
- `template.massupdate` - replacing or removing related objects from templates
- `template.update` - updating templates

> Template object

The following objects are directly related to the `template` API.

Template

The template object has the following properties.

Property	Type	Description
<code>templateid</code>	string	(readonly) ID of the template.
host (required)	string	Technical name of the template.
<code>description</code>	text	Description of the template.
<code>name</code>	string	Visible name of the template.
		Default: <code>host</code> property value.

`template.create`

Description

`object template.create(object/array templates)`

This method allows to create new templates.

Parameters

(object/array) Templates to create.

Additionally to the [standard template properties](#), the method accepts the following parameters.

Parameter	Type	Description
groups (required)	object/array	Host groups to add the template to. The host groups must have the <code>groupid</code> property defined.
<code>templates</code>	object/array	Templates to be linked to the template. The templates must have the <code>templateid</code> property defined.
<code>macros</code>	object/array	User macros to be created for the template.

Parameter	Type	Description
hosts	object/array	Hosts to link the template to. The hosts must have the <code>hostid</code> property defined.

Return values

(object) Returns an object containing the IDs of the created templates under the `templateids` property. The order of the returned IDs matches the order of the passed templates.

Examples

Creating a template

Create a template and link it to two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.create",
  "params": {
    "host": "Linux template",
    "groups": {
      "groupid": 1
    },
    "hosts": [
      {
        "hostid": "10084"
      },
      {
        "hostid": "10090"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

Source

CTemplate::create() in *frontends/php/include/classes/api/services/CTemplate.php*.

template.delete

Description

object `template.delete(array templateIds)`

This method allows to delete templates.

Parameters

(array) IDs of the templates to delete.

Return values

(object) Returns an object containing the IDs of the deleted templates under the `templateids` property.

Examples

Deleting multiple templates

Delete two templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.delete",
  "params": [
    "13",
    "32"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "13",
      "32"
    ]
  },
  "id": 1
}
```

Source

CTemplate::delete() in *frontends/php/include/classes/api/services/CTemplate.php*.

template.get

Description

integer/array `template.get(object parameters)`

The method allows to retrieve templates according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
templateids	string/array	Return only templates with the given template IDs.
groupids	string/array	Return only templates that belong to the given host groups.
parentTemplateids	string/array	Return only templates that are children of the given templates.

Parameter	Type	Description
hostids	string/array	Return only templates that are linked to the given hosts.
graphids	string/array	Return only templates that contain the given graphs.
itemids	string/array	Return only templates that contain the given items.
triggerids	string/array	Return only templates that contain the given triggers.
with_items	flag	Return only templates that have items.
with_triggers	flag	Return only templates that have triggers.
with_graphs	flag	Return only templates that have graphs.
with_httptests	flag	Return only templates that have web scenarios.
selectGroups	query	Return the host groups that the template belongs to in the groups property.
selectHosts	query	Return the hosts that are linked to the template in the hosts property.
selectTemplates	query	Supports count. Return the child templates in the templates property.
selectParentTemplates	query	Supports count. Return the parent templates in the parentTemplates property.
selectHttpTests	query	Supports count. Return the web scenarios from the template in the httpTests property.
		Supports count.

Parameter	Type	Description
selectItems	query	Return items from the template in the <code>items</code> property.
selectDiscoveries	query	Supports count. Return low-level discoveries from the template in the <code>discoveries</code> property.
selectTriggers	query	Supports count. Return triggers from the template in the <code>triggers</code> property.
selectGraphs	query	Supports count. Return graphs from the template in the <code>graphs</code> property.
selectApplications	query	Supports count. Return applications from the template in the <code>applications</code> property.
selectMacros	query	Supports count. Return the macros from the template in the <code>macros</code> property..
selectScreens	query	Return screens from the template in the <code>screens</code> property.
		Supports count.

Parameter	Type	Description
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: selectTemplates - results will be sorted by name; selectHosts - sorted by host; selectParentTemplates - sorted by host; selectItems - sorted by name; selectDiscoveries - sorted by name; selectTriggers - sorted by description; selectGraphs - sorted by name; selectApplications - sorted by name; selectScreens - sorted by name. Sort the result by the given properties. Possible values are: hostid, host, name, status.
sortfield	string/array	These parameters being common for all get methods are described in detail in the reference commentary .
countOutput	flag	
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving templates by name

Retrieve all data about two templates named "Template OS Linux" and "Template OS Windows".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.get",
  "params": {
    "output": "extend",
    "filter": {
      "host": [
        "Template OS Linux",
        "Template OS Windows"
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "proxy_hostid": "0",
      "host": "Template OS Linux",
      "status": "3",

CTemplate::get() in *frontends/php/include/classes/api/services/CTemplate.php*.

template.isreadable

Description

boolean `template.isreadable(array templateIds)`

This method checks if the given templates are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use `template.get` instead.

Parameters

(array) IDs of the templates to check.

Return values

(boolean) Returns true if the given templates are available for reading.

Examples

Check multiple templates

Check if the two templates are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.isreadable",
  "params": [
    "10001",
    "10081"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

- `template.iswritable`

Source

CTemplate::isReadable() in *frontends/php/include/classes/api/services/CTemplate.php*.

template.iswritable**Description**

boolean `template.iswritable(array templateIds)`

This method checks if the given templates are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use `template.get` instead.

Parameters

(array) IDs of the templates to check.

Return values

(boolean) Returns true if the given templates are available for writing.

Examples

Check multiple templates

Check if the two templates are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.iswritable",
  "params": [
    "10001",
    "10081"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

template.massadd

Description

object template.massadd(object parameters)

This method allows to simultaneously add multiple related objects to the given templates.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects to add to the templates.

The method accepts the following parameters.

Parameter	Type	Description
templates (required)	object/array	<p>Templates to be updated.</p> <p>The templates must have the <code>templateid</code> property defined.</p>
groups	object/array	<p>Host groups to add the given templates to.</p> <p>The host groups must have the <code>groupid</code> property defined.</p>
hosts	object/array	<p>Hosts and templates to link the given templates to.</p> <p>The hosts must have the <code>hostid</code> property defined.</p>

Parameter	Type	Description
macros	object/array	User macros to be created for the given templates.
templates_link	object/array	Templates to link to the given templates. The templates must have the <code>templateid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Adding templates to a group

Add two templates to the host group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massadd",
  "params": {
    "templates": [
      {
        "templateid": "10085"
      },
      {
        "templateid": "10086"
      }
    ],
    "groups": [
      {
        "groupid": "2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}
```

Linking a template to hosts

Link template "10073" to two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massadd",
  "params": {
    "templates": [
      {
        "templateid": "10073"
      }
    ],
    "hosts": [
      {
        "hostid": "10106"
      },
      {
        "hostid": "10104"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10073"
    ]
  },
  "id": 1
}
```

template.massremove

Description

object `template.massremove(object parameters)`

This method allows to remove related objects from multiple templates.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects that should be removed.

Parameter	Type	Description
templateids (required)	string/array	IDs of the templates to be updated.
groupids	string/array	Host groups to remove the given templates from.

Parameter	Type	Description
hostids	string/array	Hosts or templates to unlink the given templates from (downstream).
macros	string/array	User macros to delete from the given templates.
templateids_clear	string/array	Templates to unlink and clear from the given templates (upstream).
templateids_link	string/array	Templates to unlink from the given templates (upstream).

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Removing templates from a group

Remove two templates from group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massremove",
  "params": {
    "templateids": [
      "10085",
      "10086"
    ],
    "groupids": "2"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}
```

Unlinking templates from a host

Unlink template "10085" from two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massremove",
```

```

    "params": {
      "templateids": "10085",
      "hostids": [
        "10106",
        "10104"
      ]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085"
    ]
  },
  "id": 1
}

```

template.massupdate

Description

object template.massupdate(object parameters)

This method allows to simultaneously replace or remove related objects and update properties on multiple templates.

Parameters

(object) Parameters containing the IDs of the templates to update and the properties that should be updated.

Additionally to the [standard template properties](#), the method accepts the following parameters.

Parameter	Type	Description
templates (required)	object/array	<p>Templates to be updated.</p> <p>The templates must have the <code>templateid</code> property defined.</p>
groups	object/array	<p>Host groups to replace the current host groups the templates belong to.</p> <p>The host groups must have the <code>groupid</code> property defined.</p>

Parameter	Type	Description
hosts	object/array	Hosts and templates to replace the ones the templates are currently linked to.
macros	object/array	Both hosts and templates must use the <code>hostid</code> property to pass an ID. User macros to replace the current user macros on the given templates.
templates_clear	object/array	Templates to unlink and clear from the given templates.
templates_link	object/array	The templates must have the <code>templateid</code> property defined. Templates to replace the currently linked templates. The templates must have the <code>templateid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Replacing host groups

Unlink and clear template "10091" from the given templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massupdate",
  "params": {
    "templates": [
      {
        "templateid": "10085"
      },
      {
        "templateid": "10086"
      }
    ],
    "templates_clear": [
      {
        "templateid": "10091"
      }
    ]
  }
}
```

```

    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}

```

template.update

Description

object template.update(object/array templates)

This method allows to update existing templates.

Parameters

(object/array) Template properties to be updated.

The `templateid` property must be defined for each template, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Additionally to the [standard template properties](#), the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to replace the current host groups the templates belong to. The host groups must have the <code>groupid</code> property defined.

Parameter	Type	Description
hosts	object/array	Hosts and templates to replace the ones the templates are currently linked to. Both hosts and templates must use the <code>hostid</code> property to pass an ID.
macros	object/array	User macros to replace the current user macros on the given templates.
templates	object/array	Templates to replace the currently linked templates. Templates that are not passed are only unlinked.
templates_clear	object/array	The templates must have the <code>templateid</code> property defined. Templates to unlink and clear from the given templates. The templates must have the <code>templateid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Renaming a template

Rename the template to "Template OS Linux".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "name": "Template OS Linux"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

Template screen

This class is designed to work with template screens.

Object references:

- [Template screen](#)

Available methods:

- [templatescreen.copy](#) - copy template screens
- [templatescreen.create](#) - create new template screens
- [templatescreen.delete](#) - delete template screens
- [templatescreen.get](#) - retrieve template screens
- [templatescreen.isreadable](#) - check if template screens are readable
- [templatescreen.iswritable](#) - check if template screens are writable
- [templatescreen.update](#) - update template screens

> Template screen object

The following objects are directly related to the `templatescreen` API.

Template screen

The template screen object has the following properties.

Property	Type	Description
screenid	string	(<i>readonly</i>) ID of the template screen.
name (required)	string	Name of the template screen.
templateid (required)	string	ID of the template that the screen belongs to.
hsize	integer	Width of the template screen.
vsize	integer	Default: 1 Height of the template screen.
		Default: 1

templatescreen.copy

Description

`object templatescreen.copy(object parameters)`

This method allows to copy template screens to the given templates.

Parameters

(object) Parameters defining the template screens to copy and the target templates.

Parameter	Type	Description
screenIds (required)	string/array	IDs of template screens to copy.
templateIds (required)	string/array	IDs of templates to copy the screens to.

Return values

(boolean) Returns true if the copying was successful.

Examples

Copy a template screen

Copy template screen "25" to template "30085".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreen.copy",
  "params": {
    "screenIds": "25",
    "templateIds": "30085"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Source

CTemplateScreen::copy() in *frontends/php/include/classes/api/services/CTemplateScreen.php*.

templatescreen.create

Description

`object templatescreen.create(object/array templateScreens)`

This method allows to create new template screens.

Parameters

(object/array) Template screens to create.

Additionally to the **standard template screen properties**, the method accepts the following parameters.

Parameter	Type	Description
screenitems	array	Template screen items to create on the screen.

Return values

(object) Returns an object containing the IDs of the created template screens under the `screenids` property. The order of the returned IDs matches the order of the passed template screens.

Examples

Create a template screen

Create a template screen named “Graphs” with 2 rows and 3 columns and add a graph to the upper-left cell.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreen.create",
  "params": {
    "name": "Graphs",
    "templateid": "10047",
    "hsize": 3,
    "vsize": 2,
    "screenitems": [
      {
        "resourcetype": 0,
        "resourceid": "410",
        "x": 0,
        "y": 0
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "45"
    ]
  },
  "id": 1
}
```

See also

Source

`CTemplateScreen::create()` in `frontends/php/include/classes/api/services/CTemplateScreen.php`.

templatescreen.delete

Description

object `templatescreen.delete(array templateScreenIds)`

This method allows to delete template screens.

Parameters

(array) IDs of the template screens to delete.

Return values

(object) Returns an object containing the IDs of the deleted template screens under the `screenids` property.

Examples

Delete multiple template screens

Delete two template screens.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreen.delete",
  "params": [
    "45",
    "46"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "45",
      "46"
    ]
  },
  "id": 1
}
```

Source

CTemplateScreen::delete() in *frontends/php/include/classes/api/services/CTemplateScreen.php*.

templatescreen.get

Description

integer/array templatescreen.get(object parameters)

The method allows to retrieve template screens according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
hostids	string/array	Return only template screens that belong to the given hosts.
screenids	string/array	Return only template screens with the given IDs.
screenitemids	string/array	Return only template screens that contain the given screen items.
templateids	string/array	Return only template screens that belong to the given templates.
noInheritance	flag	Do not return inherited template screens.

Parameter	Type	Description
selectScreenItemsquery		Return the screen items that are used in the template screen in the screenitems property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>screenid</code> and <code>name</code> . These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve screens from template

Retrieve all screens from template "10001" and all of the screen items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreen.get",
  "params": {
    "output": "extend",
    "selectScreenItems": "extend",
    "templateids": "10001"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
```

```

{
  "screenid": "3",
  "name": "System performance",
  "hsize": "2",
  "vsize": "2",
  "templateid": "10001",
  "screenitems": [
    {
      "screenitemid": "20",
      "screenid": "3",

      "width": "500",
      "height": "148",
      "x": "1",
      "y": "0",
      "colspan": "1",
      "rowspan": "1",
      "elements": "0",
      "valign": "1",
      "halign": "0",
      "style": "0",
      "url": ""
    },
    {
      "screenitemid": "23",
      "screenid": "3",
      "resourcetype": "1",

```

```

        "resourceid": "22181",
        "width": "500",
        "height": "184",
        "x": "1",
        "y": "1",
        "colspan": "1",
        "rowspan": "1",
        "elements": "0",
        "valign": "1",
        "halign": "0",
        "style": "0",
        "url": ""
    }
]
},
"id": 1
}

```

templatescreen.isreadable

Description

boolean templatescreen.isreadable(array templateScreenIds)

This method checks if the given template screens are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [templatescreen.get](#) instead.

Parameters

(array) IDs of the template screens to check.

Return values

(boolean) Returns true if the given template screens are available for reading.

Examples

Check multiple template screens

Check if the two template screens are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "templatescreen.isreadable",
    "params": [
        "3",
        "5"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",

```

```
"result": true,
"id": 1
}
```

templatescreen.iswritable

Description

boolean templatescreen.iswritable(array templateScreenIds)

This method checks if the given template screens are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [templatescreen.get](#) instead.

Parameters

(array) IDs of the template screens to check.

Return values

(boolean) Returns true if the given template screens are available for writing.

Examples

Check multiple template screens

Check if the two template screens are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreen.iswritable",
  "params": [
    "3",
    "5"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

templatescreen.update

Description

object templatescreen.update(object/array templateScreens)

This method allows to update existing template screens.

Parameters

(object/array) Template screen properties to be updated.

The `screenid` property must be defined for each template screen, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard template screen properties](#), the method accepts the following parameters.

Parameter	Type	Description
screenitems	array	Screen items to replace existing screen items. Screen items are updated by coordinates, so each screen item must have the x and y properties defined.

Return values

(object) Returns an object containing the IDs of the updated template screens under the `screenids` property.

Examples

Rename a template screen

Rename the template screen to "Performance graphs".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreen.update",
  "params": {
    "screenid": "3",
    "name": "Performance graphs"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "screenids": [
      "3"
    ]
  },
  "id": 1
}
```

Template screen item

This class is designed to work with template screen items.

Object references:

- **Template screen item**

Available methods:

- **templatescreenitem.get** - retrieve template screen items

> **Template screen item object**

The following objects are directly related to the `templatescreenitem` API.

Template screen item

The template screen item object defines an element displayed on a template screen. It has the following properties.

Property	Type	Description
<code>screenitemid</code>	string	(readonly) ID of the template screen item.
<code>resourceid</code> (required)	string	ID of the object from the parent template displayed on the template screen item. Depending on the type of screen item, the <code>resourceid</code> property can reference different objects. Unused by clock and URL template screen items. <i>Note: the <code>resourceid</code> property always references an object used in the parent template object, even if the screen item itself is inherited on a host or template.</i>
<code>resourcetype</code> (required)	integer	Type of template screen item. Possible values: 0 - graph; 1 - simple graph; 3 - plain text; 7 - clock; 11 - URL; 19 - simple graph prototype; 20 - graph prototype.
<code>screenid</code> (required)	string	ID of the template screen that the item belongs to.

Property	Type	Description
colspan	integer	Number of columns the template screen item will span across.
elements	integer	Default: 1. Number of lines to display on the template screen item.
halign	integer	Default: 25. Specifies how the template screen item must be aligned horizontally in the cell.
height	integer	Possible values: 0 - (<i>default</i>) center; 1 - left; 2 - right. Height of the template screen item in pixels.
max_columns	integer	Default: 200. Specifies the maximum amount of columns a graph prototype or simple graph prototype screen element can have.
rowspan	integer	Default: 3. Number of rows the template screen item will span across.
		Default: 1.

Property	Type	Description
style	integer	<p>Template screen item display option.</p> <p>Possible values for clock screen items: 0 - (<i>default</i>) local time; 1 - server time; 2 - host time.</p> <p>Possible values for plain text screen items: 0 - (<i>default</i>) display values as plain text; 1 - display values as HTML.</p>
url	string	<p>URL of the webpage to be displayed in the template screen item. Used by URL template screen items.</p>
valign	integer	<p>Specifies how the template screen item must be aligned vertically in the cell.</p> <p>Possible values: 0 - (<i>default</i>) middle; 1 - top; 2 - bottom.</p>
width	integer	<p>Width of the template screen item in pixels.</p>
x	integer	<p>Default: 320. X-coordinates of the template screen item on the screen, from left to right.</p>
y	integer	<p>Default: 0. Y-coordinates of the template screen item on the screen, from top to bottom.</p> <p>Default: 0.</p>

templatescreenitem.get

Description

`integer/array templatescreenitem.get(object parameters)`

The method allows to retrieve template screen items according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
screenids	string/array	Return only template screen items that belong to the given template screens.
screenitemids	string/array	Return only template screen items with the given IDs.
hostids	string/array	Returns an additional <code>real_resourceid</code> property for each template screen item, that belongs to a screen from the given hosts or templates. The <code>real_resourceid</code> property contains the ID of object displayed on the screen.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: <code>screenitemid</code> and <code>screenid</code> . These parameters being common for all <code>get</code> methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve template screen items for screen

Return all template screen items from template screen "15".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatescreenitem.get",
  "params": {
    "output": "extend",
    "screenids": "15"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "screenitemid": "42",
      "screenid": "15",
      "resourcetype": "0",
      "resourceid": "454",
      "width": "500",
      "height": "200",
      "x": "0",
      "y": "0",
      "colspan": "1",
      "rowspan": "1",
      "elements": "0",
      "valign": "1",
      "halign": "0",
      "style": "0",
      "url": "",
      "max_columns": "3"
    },
    {
      "screenitemid": "43",
      "screenid": "15",
      "resourcetype": "0",
      "resourceid": "455",
      "width": "500",
      "height": "270",
      "x": "1",
      "y": "0",
      "colspan": "1",
      "rowspan": "1",
      "elements": "0",
      "valign": "1",
      "halign": "0",
      "style": "0",
      "url": "",
      "max_columns": "3"
    }
  ],
  "id": 1
}
```

```
}
```

Source

CTemplateScreenItem::get() in *frontends/php/include/classes/api/services/CTemplateScreenItem.php*.

Trend

This class is designed to work with trend data.

Object references:

- **Trend**

Available methods:

- **trend.get** - retrieving trends

> Trend object

The following objects are directly related to the **trend** API.

Note:

Trend objects differ depending on the item's type of information. They are created by the Zabbix server and cannot be modified via the API.

Float trend

The float trend object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
num	integer	Number of values within this hour.
value_min	float	Hourly minimum value.
value_avg	float	Hourly average value.
value_max	float	Hourly maximum value.

Integer trend

The integer trend object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	string	ID of the related item.
num	integer	Number of values within this hour.
value_min	integer	Hourly minimum value.
value_avg	integer	Hourly average value.
value_max	integer	Hourly maximum value.

trend.get

Description

```
integer/array trend.get(object parameters)
```

The method allows to retrieve trend data according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
itemids	string/array	Return only trends with the given item IDs.
time_from	timestamp	Return only values that have been collected after or at the given time.
time_till	timestamp	Return only values that have been collected before or at the given time.
countOutput	flag	Count the number of retrieved objects.
limit	integer	Limit the amount of retrieved objects.
output	query	Set fields to output.

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving item trend data

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trend.get",
  "params": {
    "output": [
      "itemid",
      "clock",
      "num",
      "value_min",
      "value_avg",
      "value_max",
    ],
    "itemids": [
      "23715"
    ],
    "limit": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
```

```

        "itemid": "23715",
        "clock": "1446199200",
        "num": "60",
        "value_min": "0.1650",
        "value_avg": "0.2168",
        "value_max": "0.3500",
    }
],
    "id": 1
}

```

CTrend::get() in *frontends/php/include/classes/api/services/CTrend.php*.

Trigger

This class is designed to work with triggers.

Object references:

- [Trigger](#)

Available methods:

- [trigger.adddependencies](#) - adding new trigger dependencies
- [trigger.create](#) - creating new triggers
- [trigger.delete](#) - deleting triggers
- [trigger.deletedependencies](#) - deleting trigger dependencies
- [trigger.get](#) - retrieving triggers
- [trigger.isreadable](#) - checking if triggers are readable
- [trigger.iswritable](#) - checking if triggers are writable
- [trigger.update](#) - updating triggers

> Trigger object

The following objects are directly related to the `trigger` API.

Trigger

The trigger object has the following properties.

Property	Type	Description
triggerid	string	<i>(readonly)</i> ID of the trigger.
description (required)	string	Name of the trigger.
expression (required)	string	Reduced trigger expression.
comments	string	Additional description of the trigger.
error	string	<i>(readonly)</i> Error text if there have been any problems when updating the state of the trigger.

Property	Type	Description
flags	integer	<p>(readonly) Origin of the trigger.</p> <p>Possible values are: 0 - (default) a plain trigger; 4 - a discovered trigger.</p>
lastchange	timestamp	(readonly) Time when the trigger last changed its state.
priority	integer	<p>Severity of the trigger.</p> <p>Possible values are: 0 - (default) not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.</p>
state	integer	<p>(readonly) State of the trigger.</p> <p>Possible values: 0 - (default) trigger state is up to date; 1 - current trigger state is unknown.</p>
status	integer	<p>Whether the trigger is enabled or disabled.</p> <p>Possible values are: 0 - (default) enabled; 1 - disabled.</p>
templateid	string	(readonly) ID of the parent template trigger.
type	integer	<p>Whether the trigger can generate multiple problem events.</p> <p>Possible values are: 0 - (default) do not generate multiple events; 1 - generate multiple events.</p>
url	string	URL associated with the trigger.

Property	Type	Description
value	integer	<i>(readonly)</i> Whether the trigger is in OK or problem state. Possible values are: 0 - <i>(default)</i> OK; 1 - problem.

trigger.adddependencies

Description

object trigger.adddependencies(object/array triggerDependencies)

This method allows to create new trigger dependencies.

Parameters

(object/array) Trigger dependencies to create.

Each trigger dependency has the following parameters:

Parameter	Type	Description
triggerid (required)	string	ID of the dependent trigger.
dependsOnTriggerid (required)	string	ID of the trigger that the trigger depends on.

Return values

(object) Returns an object containing the IDs of the dependent triggers under the `triggerids` property.

Examples

Add a trigger dependency

Make trigger "14092" dependent on trigger "13565."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.adddependencies",
  "params": {
    "triggerid": "14092",
    "dependsOnTriggerid": "13565"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "14092"
    ]
  },
}
```

```
    "id": 1
}
```

- [trigger.update](#)

Source

CTrigger::addDependencies() in *frontends/php/include/classes/api/services/CTrigger.php*.

trigger.create

Description

object trigger.create(object/array triggers)

This method allows to create new triggers.

Parameters

(object/array) Triggers to create.

Additionally to the [standard trigger properties](#) the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Triggers that the trigger is dependent on. The triggers must have the <code>triggerid</code> property defined.

Attention:

The trigger expression has to be given in its expanded form.

Return values

(object) Returns an object containing the IDs of the created triggers under the `triggerids` property. The order of the returned IDs matches the order of the passed triggers.

Examples

Creating a trigger

Create a trigger with a single trigger dependency.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.create",
  "params": {
    "description": "Processor load is too high on {HOST.NAME}",
    "expression": "{Linux server:system.cpu.load[percpu,avg1].last()}>5",
    "dependencies": [
      {
        "triggerid": "14062"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "14102"
    ]
  },
  "id": 1
}
```

Source

CTrigger::create() in *frontends/php/include/classes/api/services/CTrigger.php*.

trigger.delete

Description

object trigger.delete(array triggerIds)

This method allows to delete triggers.

Parameters

(array) IDs of the triggers to delete.

Return values

(object) Returns an object containing the IDs of the deleted triggers under the `triggerids` property.

Examples

Delete multiple triggers

Delete two triggers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.delete",
  "params": [
    "12002",
    "12003"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "12002",
      "12003"
    ]
  },
  "id": 1
}
```

Source

CTrigger::delete() in *frontends/php/include/classes/api/services/CTrigger.php*.

trigger.deletedependencies

Description

`object trigger.deleteDependencies(string/array triggers)`

This method allows to delete all trigger dependencies from the given triggers.

Parameters

(string/array) Triggers to delete the trigger dependencies from.

Return values

(object) Returns an object containing the IDs of the affected triggers under the `triggerids` property.

Examples

Deleting dependencies from multiple triggers

Delete all dependencies from two triggers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.deleteDependencies",
  "params": [
    {
      "triggerid": "14544"
    },
    {
      "triggerid": "14545"
    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "14544",
      "14545"
    ]
  },
  "id": 1
}
```

trigger.get

Description

`integer/array trigger.get(object parameters)`

The method allows to retrieve triggers according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
triggerids	string/array	Return only triggers with the given IDs.
groupids	string/array	Return only triggers that belong to hosts from the given host groups.
templateids	string/array	Return only triggers that belong to the given templates.
hostids	string/array	Return only triggers that belong to the given hosts.
itemids	string/array	Return only triggers that contain the given items.
applicationids	string/array	Return only triggers that contain items from the given applications.
functions	string/array	Return only triggers that use the given functions.
		Refer to the supported trigger functions page for a list of supported functions.
group	string	Return only triggers that belong to hosts from the host group with the given name.
host	string	Return only triggers that belong to host with the given name.
inherited	boolean	If set to <code>true</code> return only triggers inherited from a template.
templated	boolean	If set to <code>true</code> return only triggers that belong to templates.
monitored	flag	Return only enabled triggers that belong to monitored hosts and contain only enabled items.

Parameter	Type	Description
active	flag	Return only enabled triggers that belong to monitored hosts.
maintenance	boolean	If set to true return only enabled triggers that belong to hosts in maintenance.
withUnacknowledgedEvents	flag	Return only triggers that have unacknowledged events.
withAcknowledgedEvents	flag	Return only triggers with all events acknowledged.
withLastEventUnacknowledged	flag	Return only triggers with the last event unacknowledged.
skipDependent	flag	Skip triggers in a problem state that are dependent on other triggers. Note that the other triggers are ignored if disabled, have disabled items or disabled item hosts.
lastChangeSince	timestamp	Return only triggers that have changed their state after the given time.
lastChangeTill	timestamp	Return only triggers that have changed their state before the given time.
only_true	flag	Return only triggers that have recently been in a problem state.
min_severity	integer	Return only triggers with severity greater or equal than the given severity.
expandComment	flag	Expand macros in the trigger description.
expandDescription	flag	Expand macros in the name of the trigger.

Parameter	Type	Description
expandExpression flag		Expand functions and macros in the trigger expression.
selectGroups	query	Return the host groups that the trigger belongs to in the groups property.
selectHosts	query	Return the hosts that the trigger belongs to in the hosts property.
selectItems	query	Return items contained by the trigger in the items property.
selectFunctions	query	Return functions used in the trigger in the functions property.
		The function objects represents the functions used in the trigger expression and has the following properties: functionid - (string) ID of the function; itemid - (string) ID of the item used in the function; function - (string) name of the function; parameter - (string) parameter passed to the function.
selectDependencies	query	Return triggers that the trigger depends on in the dependencies property.
selectDiscoveryRule	query	Return the low-level discovery rule that created the trigger.
selectLastEvent	query	Return the last significant trigger event in the lastEvent property.

Parameter	Type	Description
filter	object	<p>Return only those results that exactly match the given filter.</p> <p>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.</p> <p>Supports additional filters: host - technical name of the host that the trigger belongs to; hostid - ID of the host that the trigger belongs to.</p>
limitSelects	integer	<p>Limits the number of records returned by subselects.</p> <p>Applies to the following subselects: selectHosts - results will be sorted by host. Sort the result by the given properties.</p>
sortfield	string/array	<p>Possible values are: triggerid, description, status, priority, lastchange and hostname.</p>
countOutput	flag	<p>These parameters being common for all get methods are described in detail in the reference commentary page.</p>
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	

Parameter	Type	Description
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving data by trigger ID

Retrieve all data and the functions used in trigger "14062".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.get",
  "params": {
    "triggerids": "14062",
    "output": "extend",
    "selectFunctions": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "functions": [
        {
          "functionid": "13513",
          "itemid": "24350",
          "function": "diff",
          "parameter": "0"
        }
      ],
      "triggerid": "14062",
      "expression": "{13513}>0",
      "description": "/etc/passwd has been changed on {HOST.NAME}",
      "url": "",
      "status": "0",
      "value": "0",
      "priority": "2",
      "lastchange": "0",
      "comments": "",
      "error": "",
      "templateid": "10016",
      "type": "0",
      "state": "0",
      "flags": "0"
    }
  ],
  "id": 1
}
```

Retrieving triggers in problem state

Retrieve the ID, name and severity of all triggers in problem state and sort them by severity in descending order.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.get",
  "params": {
    "output": [
      "triggerid",
      "description",
      "priority"
    ],
    "filter": {
      "value": 1
    },
    "sortfield": "priority",
    "sortorder": "DESC"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "triggerid": "13907",
      "description": "Zabbix self-monitoring processes < 100% busy",
      "priority": "4"
    },
    {
      "triggerid": "13824",
      "description": "Zabbix discoverer processes more than 75% busy",
      "priority": "3"
    }
  ],
  "id": 1
}
```

trigger.isreadable

Description

boolean trigger.isreadable(array triggerIds)

This method checks if the given triggers are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [trigger.get](#) instead.

Parameters

(array) IDs of the triggers to check.

Return values

(boolean) Returns true if the given triggers are available for reading.

Examples

Check multiple triggers

Check if the two triggers are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.isreadable",
  "params": [
    "13938",
    "14062"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

trigger.iswritable

Description

boolean trigger.iswritable(array triggerIds)

This method checks if the given triggers are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [trigger.get](#) instead.

Parameters

(array) IDs of the triggers to check.

Return values

(boolean) Returns true if the given triggers are available for writing.

Examples

Check multiple triggers

Check if the two triggers are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.iswritable",
  "params": [
    "13938",
    "14062"
  ],
}
```

```

    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}

```

CTrigger::isWritable() in *frontends/php/include/classes/api/services/CTrigger.php*.

trigger.update

Description

object trigger.update(object/array triggers)

This method allows to update existing triggers.

Parameters

(object/array) Trigger properties to be updated.

The triggerid property must be defined for each trigger, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard trigger properties](#) the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Triggers that the trigger is dependent on.
		The triggers must have the triggerid property defined.

Attention:

The trigger expression has to be given in its expanded form.

Return values

(object) Returns an object containing the IDs of the updated triggers under the triggerids property.

Examples

Enabling a trigger

Enable a trigger, that is, set its status to 0.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "trigger.update",
    "params": {
        "triggerid": "13938",
        "status": 0
    }
}

```

```

    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}

```

Trigger prototype

This class is designed to work with trigger prototypes.

Object references:

- [Trigger prototype](#)

Available methods:

- [triggerprototype.create](#) - creating new trigger prototypes
- [triggerprototype.delete](#) - deleting trigger prototypes
- [triggerprototype.get](#) - retrieving trigger prototypes
- [triggerprototype.update](#) - updating trigger prototypes

> Trigger prototype object

The following objects are directly related to the triggerprototype API.

Trigger

The trigger prototype object has the following properties.

Property	Type	Description
triggerid	string	(readonly) ID of the trigger prototype.
description (required)	string	Name of the trigger prototype.
expression (required)	string	Reduced trigger expression.
comments	string	Additional comments to the trigger prototype.

Property	Type	Description
priority	integer	Severity of the trigger prototype. Possible values: 0 - <i>(default)</i> not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.
status	integer	Whether the trigger prototype is enabled or disabled. Possible values: 0 - <i>(default)</i> enabled; 1 - disabled.
templateid	string	<i>(readonly)</i> ID of the parent template trigger prototype.
type	integer	Whether the trigger prototype can generate multiple problem events. Possible values: 0 - <i>(default)</i> do not generate multiple events; 1 - generate multiple events.
url	string	URL associated with the trigger prototype.

triggerprototype.create

Description

object triggerprototype.create(object/array triggerPrototypes)

This method allows to create new trigger prototypes.

Parameters

(object/array) Trigger prototypes to create.

In addition to the **standard trigger prototype properties** this method accepts the following parameters:

Parameter	Type	Description
dependencies	array	Triggers and trigger prototypes that the trigger prototype is dependent on. The triggers must have the triggerid property defined.

Attention:

The trigger expression has to be given in its expanded form and must contain at least one item prototype.

Return values

(object) Returns an object containing the IDs of the created trigger prototypes under the `triggerids` property. The order of the returned IDs matches the order of the passed trigger prototypes.

Examples

Creating a trigger prototype

Create a trigger prototype to detect when a file system has less than 20% free disk space.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.create",
  "params": {
    "description": "Free disk space is less than 20% on volume {#FSNAME}",
    "expression": "{Zabbix server:vfs.fs.size[{#FSNAME},pfree].last()}<20"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "15331"
    ]
  },
  "id": 1
}
```

Source

`CTriggerPrototype::create()` in *frontends/php/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.delete

Description

object `triggerprototype.delete(array triggerPrototypeIds)`

This method allows to delete trigger prototypes.

Parameters

(array) IDs of the trigger prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted trigger prototypes under the `triggerids` property.

Examples

Deleting multiple trigger prototypes

Delete two trigger prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.delete",
  "params": [
    "12002",
    "12003"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "12002",
      "12003"
    ]
  },
  "id": 1
}
```

Source

`CTriggerPrototype::delete()` in *frontends/php/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.get

Description

`integer/array triggerprototype.get(object parameters)`

The method allows to retrieve trigger prototypes according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
active	flag	Return only enabled trigger prototypes that belong to monitored hosts.
applicationids	string/array	Return only trigger prototypes that contain items from the given applications.
discoveryids	string/array	Return only trigger prototypes that belong to the given LLD rules.

Parameter	Type	Description
functions	string/array	Return only triggers that use the given functions.
group	string	Refer to the supported trigger functions page for a list of supported functions. Return only trigger prototypes that belong to hosts from the host groups with the given name.
groupids	string/array	Return only trigger prototypes that belong to hosts from the given host groups.
host	string	Return only trigger prototypes that belong to hosts with the given name.
hostids	string/array	Return only trigger prototypes that belong to the given hosts.
inherited	boolean	If set to true return only trigger prototypes inherited from a template.
maintenance	boolean	If set to true return only enabled trigger prototypes that belong to hosts in maintenance.
min_severity	integer	Return only trigger prototypes with severity greater or equal than the given severity.
monitored	flag	Return only enabled trigger prototypes that belong to monitored hosts and contain only enabled items.
templated	boolean	If set to true return only trigger prototypes that belong to templates.

Parameter	Type	Description
templateids	string/array	Return only trigger prototypes that belong to the given templates.
triggerids	string/array	Return only trigger prototypes with the given IDs.
expandExpression flag		Expand functions and macros in the trigger expression.
selectDependencies	query	Return trigger prototypes and triggers that the trigger prototype depends on in the dependencies property.
selectDiscoveryRule	query	Return the LLD rule that the trigger prototype belongs to.
selectFunctions	query	Return functions used in the trigger prototype in the functions property. The function objects represents the functions used in the trigger expression and has the following properties: functionid - (string) ID of the function; itemid - (string) ID of the item used in the function; function - (string) name of the function; parameter - (string) parameter passed to the function.
selectGroups	query	Return the host groups that the trigger prototype belongs to in the groups property.

Parameter	Type	Description
selectHosts	query	Return the hosts that the trigger prototype belongs to in the hosts property.
selectItems	query	Return items and item prototypes used the trigger prototype in the items property.
filter	object	Return only those results that exactly match the given filter. Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against. Supports additional filters: host - technical name of the host that the trigger prototype belongs to; hostid - ID of the host that the trigger prototype belongs to.
limitSelects	integer	Limits the number of records returned by subselects.
sortfield	string/array	Applies to the following subselects: selectHosts - results will be sorted by host. Sort the result by the given properties.
countOutput	flag	Possible values are: triggerid, description, status and priority. These parameters being common for all get methods are described in detail in the reference commentary .

Parameter	Type	Description
editable	boolean	
excludeSearch	flag	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve trigger prototypes from an LLD rule

Retrieve all trigger prototypes and their functions from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.get",
  "params": {
    "output": "extend",
    "selectFunctions": "extend",
    "discoveryids": "22450"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "functions": [
        {
          "functionid": "12598",
          "itemid": "22454",
          "function": "last",
          "parameter": "0"
        }
      ],
      "triggerid": "13272",
      "expression": "{12598}<20",

triggerprototype.update

Description

object triggerprototype.update(object/array triggerPrototypes)

This method allows to update existing trigger prototypes.

Parameters

(object/array) [Trigger prototype properties](#) to be updated.

The triggerid property must be defined for each trigger prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

In addition to the [standard trigger prototype properties](#) this method accepts the following parameters:

Parameter	Type	Description
dependencies	array	Triggers and trigger prototypes that the trigger prototype is dependent on.
		The triggers must have the triggerid property defined.

Attention:

The trigger expression has to be given in its expanded form and must contain at least one item prototype.

Return values

(object) Returns an object containing the IDs of the updated trigger prototypes under the `triggerids` property.

Examples

Enabling a trigger prototype

Enable a trigger prototype, that is, set its status to 0.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.update",
  "params": {
    "triggerid": "13938",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

Source

`CTriggerPrototype::update()` in *frontends/php/include/classes/api/services/CTriggerPrototype.php*.

User

This class is designed to work with users.

Object references:

- [User](#)

Available methods:

- [user.addmedia](#) - adding media to users
- [user.create](#) - creating new users
- [user.delete](#) - deleting users
- [user.deletemedia](#) - deleting media from users
- [user.get](#) - retrieving users
- [user.isreadable](#) - checking if users are readable
- [user.iswritable](#) - checking if users are writable
- [user.login](#) - logging in to the API
- [user.logout](#) - logging out of the API
- [user.update](#) - updating users
- [user.updatemedia](#) - updating user media
- [user.updateprofile](#) - updating the currently logged in user

> User object

The following objects are directly related to the user API.

User

The user object has the following properties.

Property	Type	Description
userid	string	(readonly) ID of the user.
alias (required)	string	User alias.
attempt_clock	timestamp	(readonly) Time of the last unsuccessful login attempt.
attempt_failed	integer	(readonly) Recent failed login attempt count.
attempt_ip	string	(readonly) IP address from where the last unsuccessful login attempt came from.
autologin	integer	Whether to enable auto-login. Possible values: 0 - (default) auto-login disabled; 1 - auto-login enabled.
autologout	integer	User session life time in seconds. If set to 0, the session will never expire.
lang	string	Default: 900. Language code of the user's language.
name	string	Default: en_GB. Name of the user.
refresh	integer	Automatic refresh period in seconds.
rows_per_page	integer	Default: 30. Amount of object rows to show per page.
surname	string	Default: 50. Surname of the user.
theme	string	User's theme. Possible values: default - (default) system default; blue-theme - Blue; dark-theme - Dark.

Property	Type	Description
type	integer	Type of the user. Possible values: 1 - (default) Zabbix user; 2 - Zabbix admin; 3 - Zabbix super admin.
url	string	URL of the page to redirect the user to after logging in.

user.addmedia

Description

object user.addmedia(object parameters)

This method allows to add new media to multiple users.

Parameters

(object) Parameters defining the media to create and the users to add them to.

Parameter	Type	Description
medias (required)	object/array	Media to create for the given users. The media <code>userid</code> property must not be defined.
users (required)	object/array	Users to add the media to. The users must have the <code>userid</code> property defined.

Return values

(object) Returns an object containing the IDs of the created media under the `mediaids` property.

Examples

Adding a media to multiple users

Create a common e-mail media for two users. The media must send notifications about all alerts at any time.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.addmedia",
  "params": {
    "users": [
      {
        "userid": "1"
      },
      {
        "userid": "2"
      }
    ]
  }
}
```

```

    }
  ],
  "medias": {
    "mediatypeid": "1",
    "sendto": "support@company.com",
    "active": 0,
    "severity": 63,
    "period": "1-7,00:00-24:00"
  }
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "mediaids": [
      "12",
      "13"
    ]
  },
  "id": 1
}

```

Source

CUser::addMedia() in *frontends/php/include/classes/api/services/CUser.php*.

user.checkAuthentication

Description

object `user.checkAuthentication`

This method checks and prolongs user session.

Parameters

The method accepts the following parameters.

Parameter	Type	Description
sessionid	string	User session id.

Attention:

Calling **user.checkAuthentication** method prolongs user session by default.

Return values

(object) Returns an object containing information about user.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.checkAuthentication",
  "params": {
    "sessionid": "8C8447FF6F61D134CEAC740CCA1BC90D"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userid": "1",
    "alias": "Admin",
    "name": "Zabbix",
    "surname": "Administrator",
    "url": "",
    "autologin": "1",
    "autologout": "0",
    "lang": "ru_RU",
    "refresh": "0",
    "type": "3",
    "theme": "default",
    "attempt_failed": "0",
    "attempt_ip": "127.0.0.1",
    "attempt_clock": "1355919038",
    "rows_per_page": "50",
    "debug_mode": true,
    "userip": "127.0.0.1",
    "sessionid": "8C8447FF6F61D134CEAC740CCA1BC90D",
    "gui_access": "0"
  },
  "id": 1
}
```

Note:

Response is similar to **User.login** call response with "userData" parameter set to true (the difference is that user data is retrieved by session id and not by username / password).

Source

CUser::checkAuthentication() in *frontends/php/include/classes/api/services/CUser.php*.

user.create

Description

object user.create(object/array users)

This method allows to create new users.

Parameters

(object/array) Users to create.

Additionally to the **standard user properties**, the method accepts the following parameters.

Parameter	Type	Description
passwd (required)	string	User's password.

Parameter	Type	Description
usrgrps (required)	array	User groups to add the user to. The user groups must have the usrgrpid property defined.
user_medias	array	Media to create for the user. The media userid property must not be defined.

Return values

(object) Returns an object containing the IDs of the created users under the **userids** property. The order of the returned IDs matches the order of the passed users.

Examples

Creating a user

Create a new user, add him to a user group and create a new media for him.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.create",
  "params": {
    "alias": "John",
    "passwd": "Doe123",
    "usrgrps": [
      {
        "usrgrpid": "7"
      }
    ],
    "user_medias": [
      {
        "mediatypeid": "1",
        "sendto": "support@company.com",
        "active": 0,
        "severity": 63,
        "period": "1-7,00:00-24:00"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "12"
    ]
  },
  "id": 1
}
```

user.delete

Description

object user.delete(array users)

This method allows to delete users.

Parameters

(array) IDs of users to delete.

Return values

(object) Returns an object containing the IDs of the deleted users under the `userids` property.

Examples

Deleting multiple users

Delete two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.delete",
  "params": [
    "1",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "5"
    ]
  },
  "id": 1
}
```

Source

CUser::delete() in *frontends/php/include/classes/api/services/CUser.php*.

user.deletemedia

Description

object user.deletemedia(string/array mediaIds)

This method allows to delete media.

Parameters

(string/array) IDs of the media to delete.

Return values

(object) Returns an object containing the IDs of the deleted media under the `mediaids` property.

Examples

Deleting multiple media

Delete two media.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.deletemedia",
  "params": [
    "11",
    "13"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediaids": [
      "11",
      "13"
    ]
  },
  "id": 1
}
```

`CUser::deleteMedia()` in *frontends/php/include/classes/api/services/CUser.php*.

user.get

Description

integer/array `user.get(object parameters)`

The method allows to retrieve users according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
mediaids	string/array	Return only users that use the given media.
mediatypeids	string/array	Return only users that use the given media types.
userids	string/array	Return only users with the given IDs.

Parameter	Type	Description
usrgrpids	string/array	Return only users that belong to the given user groups.
getAccess	flag	<p>Adds additional information about user permissions.</p> <p>Adds the following properties for each user:</p> <p>gui_access - <i>(integer)</i> user's frontend authentication method. Refer to the gui_access property of the user group object for a list of possible values.</p> <p>debug_mode - <i>(integer)</i> indicates whether debug is enabled for the user. Possible values: 0 - debug disabled, 1 - debug enabled.</p> <p>users_status - <i>(integer)</i> indicates whether the user is disabled. Possible values: 0 - user enabled, 1 - user disabled.</p>
selectMedias	query	Return media used by the user in the medias property.
selectMediatypes	query	Return media types used by the user in the mediatypes property.
selectUsrgrps	query	Return user groups that the user belongs to in the usrgrps property.
sortfield	string/array	<p>Sort the result by the given properties.</p> <p>Possible values are: userid and alias.</p>

Parameter	Type	Description
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving users

Retrieve all of the configured users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "1",
      "alias": "Admin",
      "name": "Zabbix",
      "surname": "Administrator",
      "url": "",
      "autologin": "1",
      "autologout": "0",
      "lang": "ru_RU",
      "refresh": "0",
      "type": "3",
      "theme": "default",
      "attempt_failed": "0",
      "attempt_ip": "",
      "attempt_clock": "0",
      "rows_per_page": "50"
    }
  ]
}
```

```

    },
    {
        "userid": "2",
        "alias": "guest",
        "name": "Default2",
        "surname": "User",
        "url": "",
        "autologin": "0",
        "autologout": "900",
        "lang": "en_GB",
        "refresh": "30",
        "type": "1",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "",
        "attempt_clock": "0",
        "rows_per_page": "50"
    }
],
    "id": 1
}

```

CUser::get() in *frontends/php/include/classes/api/services/CUser.php*.

user.isreadable

Description

boolean user.isreadable(array userIds)

This method checks if the given users are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [user.get](#) instead.

Parameters

(array) IDs of the users to check.

Return values

(boolean) Returns true if the given users are available for reading.

Examples

Check multiple users

Check if the two users are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "user.isreadable",
    "params": [
        "4",
        "6"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
}

```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Source

CUser::isReadable() in *frontends/php/include/classes/api/services/CUser.php*.

user.iswritable

Description

boolean user.iswritable(array userIds)

This method checks if the given users are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [user.get](#) instead.

Parameters

(array) IDs of the users to check.

Return values

(boolean) Returns true if the given users are available for writing.

Examples

Check multiple users

Check if the two users are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.iswritable",
  "params": [
    "4",
    "6"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

CUser::isWritable() in *frontends/php/include/classes/api/services/CUser.php*.

user.login

Description

string/object user.login(object parameters)

This method allows to log in to the API and generate an authentication token.

Warning:

When using this method, you also need to do **user.logout** to prevent the generation of a large number of open session records.

Parameters

Attention:

This method is available to unauthenticated users and must be called without the `auth` parameter in the JSON-RPC request.

(object) Parameters containing the user name and password.

The method accepts the following parameters.

Parameter	Type	Description
password (required)	string	User password. Unused for HTTP authentication.
user (required)	string	User name.
userData	flag	Return information about the authenticated user.

Attention:

When using HTTP authentication, the user name in the API request must match the one used in the `Authorization` header. The password will not be validated and can be omitted.

Return values

(string/object) If the `userData` parameter is used, returns an object containing information about the authenticated user.

Additionally to the **standard user properties**, the following information is returned:

Property	Type	Description
debug_mode	boolean	Whether debug mode is enabled for the user.
gui_access	integer	User's authentication method to the frontend. Refer to the <code>gui_access</code> property of the user group object for a list of possible values.
sessionid	string	Authentication token, which must be used in the following API requests.

Property	Type	Description
userip	string	IP address of the user.

Note:

If a user has been successfully authenticated after one or more failed attempts, the method will return the current values for the `attempt_clock`, `attempt_failed` and `attempt_ip` properties and then reset them.

If the `userData` parameter is not used, the method returns an authentication token.

Note:

The generated authentication token should be remembered and used in the `auth` parameter of the following JSON-RPC requests. It is also required when using HTTP authentication.

Examples

Authenticating a user

Authenticate a user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "user": "Admin",
    "password": "zabbix"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "0424bd59b807674191e7d77572075f33",
  "id": 1
}
```

Requesting authenticated user's information

Authenticate and return additional information about the user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "user": "Admin",
    "password": "zabbix",
    "userData": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userid": "1",
    "alias": "Admin",
    "name": "Zabbix",
    "surname": "Administrator",
  },
  "id": 1
}
```

```

        "url": "",
        "autologin": "1",
        "autologout": "0",
        "lang": "ru_RU",
        "refresh": "0",
        "type": "3",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "127.0.0.1",
        "attempt_clock": "1355919038",
        "rows_per_page": "50",
        "debug_mode": true,
        "userip": "127.0.0.1",
        "sessionid": "5b56eee8be445e98f0bd42b435736e42",
        "gui_access": "0"
    },
    "id": 1
}

```

- [user.logout](#)

Source

CUser::login() in *frontends/php/include/classes/api/services/CUser.php*.

user.logout

Description

string/object user.logout(array)

This method allows to log out of the API and invalidates the current authentication token.

Parameters

(array) The method accepts an empty array.

Return values

(boolean) Returns true if the user has been logged out successfully.

Examples

Logging out

Log out from the API.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "user.logout",
    "params": [],
    "id": 1,
    "auth": "16a46baf181ef9602e1687f3110abf8a"
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}

```

- [user.login](#)

Source

CUser::login() in *frontends/php/include/classes/api/services/CUser.php*.

user.update

Description

`object user.update(object/array users)`

This method allows to update existing users.

Parameters

(object/array) User properties to be updated.

The `userid` property must be defined for each user, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user properties](#), the method accepts the following parameters.

Parameter	Type	Description
passwd	string	User's password.
usrgrps	array	User groups to replace existing user groups. The user groups must have the <code>usrgrpid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated users under the `userids` property.

Examples

Renaming a user

Rename a user to John Doe.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.update",
  "params": {
    "userid": "1",
    "name": "John",
    "surname": "Doe"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1"
    ]

user.updatemedia

Description

`object user.updatemedia(object parameters)`

This method allows to update media for multiple users.

Parameters

(object) Parameters defining the media and users to be updated.

Parameter	Type	Description
medias (required)	object/array	Media to replace existing media. If a media has the <code>mediaid</code> property defined it will be updated, otherwise a new media will be created.
users (required)	object/array	Users to update. The users must have the <code>userid</code> property defined.

Return values

(object) Returns an object containing the IDs of the updated users under the `userids` property.

Examples

Replacing media for multiple users

Replace all media used by the two users with a common e-mail media. The media must send notifications about all alerts at any time.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.updatemedia",
  "params": {
    "users": [
      {
        "userid": "1"
      },
      {
        "userid": "2"
      }
    ],
    "medias": {
      "mediatypeid": "1",
      "sendto": "support@company.com",
      "active": 0,
      "severity": 63,
      "period": "1-7,00:00-24:00"
    }
  }
},
```

```

    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "2"
    ]
  },
  "id": 1
}

```

user.updateprofile

Description

`object user.updateprofile(object parameters)`

This method allows to update the currently logged in user.

Parameters

(object/array) User properties to be updated.

The `userid` property must not be defined. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user properties](#), the method accepts the following parameters.

Parameter	Type	Description
passwd	string	User's password.
usrgrps	array	User groups to replace existing user groups.
		The user groups must have the <code>usrgrpid</code> property defined.

Return values

(object) Returns an object containing the ID of the updated user under the `userids` property.

Examples

Renaming the current user

Rename the current user to John Doe.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.updateprofile",
  "params": {
    "name": "John",
    "lastname": "Doe"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1"
    ]
  },
  "id": 1
}
```

User group

This class is designed to work with user groups.

Object references:

- [User group](#)

Available methods:

- [usergroup.create](#) - creating new user groups
- [usergroup.delete](#) - deleting user groups
- [usergroup.get](#) - retrieving user groups
- [usergroup.isreadable](#) - checking if user groups are readable
- [usergroup.iswritable](#) - checking if user groups are writable
- [usergroup.massadd](#) - adding permissions and users to user groups
- [usergroup.massupdate](#) - simultaneously updating multiple user groups
- [usergroup.update](#) - updating user groups

> User group object

The following objects are directly related to the usergroup API.

User group

The user group object has the following properties.

Property	Type	Description
usrgrpId	string	(readonly) ID of the user group.
name (required)	string	Name of the user group.

Property	Type	Description
debug_mode	integer	Whether debug mode is enabled or disabled. Possible values are: 0 - (default) disabled; 1 - enabled.
gui_access	integer	Frontend authentication method of the users in the group. Possible values: 0 - (default) use the system default authentication method; 1 - use internal authentication; 2 - disable access to the frontend.
users_status	integer	Whether the user group is enabled or disabled. Possible values are: 0 - (default) enabled; 1 - disabled.

Permission

The permission object has the following properties.

Property	Type	Description
id (required)	string	ID of the host group to add permission to.
permission (required)	integer	Access level to the host group. Possible values: 0 - access denied; 2 - read-only access; 3 - read-write access.

usergroup.create

Description

`object usergroup.create(object/array userGroups)`

This method allows to create new user groups.

Parameters

(object/array) User groups to create.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

Parameter	Type	Description
rights	object/array	Permissions to assign to the group
userids	string/array	IDs of users to add to the user group.

Return values

(object) Returns an object containing the IDs of the created user groups under the `usrgrpids` property. The order of the returned IDs matches the order of the passed user groups.

Examples

Creating a user group

Create a user group, which denies access to host group "2", and add a user to it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.create",
  "params": {
    "name": "Operation managers",
    "rights": {
      "permission": 0,
      "id": "2"
    },
    "userids": "12"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "20"
    ]
  },
  "id": 1
}
```

Source

`CUserGroup::create()` in `frontends/php/include/classes/api/services/CUserGroup.php`.

usergroup.delete

Description

object `usergroup.delete(array userGroupIds)`

This method allows to delete user groups.

Parameters

(array) IDs of the user groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted user groups under the `usrgrpids` property.

Examples

Deleting multiple user groups

Delete two user groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.delete",
  "params": [
    "20",
    "21"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "20",
      "21"
    ]
  },
  "id": 1
}
```

Source

`CUserGroup::delete()` in *frontends/php/include/classes/api/services/CUserGroup.php*.

usergroup.get

Description

`integer/array usergroup.get(object parameters)`

The method allows to retrieve user groups according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
status	integer	Return only user groups with the given status. Refer to the user group page for a list of supported statuses.
userids	string/array	Return only user groups that contain the given users.

Parameter	Type	Description
usrgrpids	string/array	Return only user groups with the given IDs.
with_gui_access	integer	Return only user groups with the given frontend authentication method.
		Refer to the user group page for a list of supported methods.
selectUsers	query	Return the users from the user group in the users property.
selectRights	query	Return user group rights in the rights property.
		It has the following properties: permission - (integer) access level to the host group; id - (string) ID of the host group.
		Refer to the user group page for a list of access levels to host groups.
limitSelects	integer	Limits the number of records returned by subselects.
sortfield	string/array	Sort the result by the given properties.
		Possible values are: usrgrpId, name.
countOutput	flag	These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	

Parameter	Type	Description
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving enabled user groups

Retrieve all enabled user groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.get",
  "params": {
    "output": "extend",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "usrgrpid": "7",
      "name": "Zabbix administrators",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "1"
    },
    {
      "usrgrpid": "8",
      "name": "Guests",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "0"
    },
    {
      "usrgrpid": "11",
      "name": "Enabled debug mode",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "1"
    },
    {
      "usrgrpid": "12",
      "name": "No access to the frontend",
      "gui_access": "2",
      "users_status": "0",
      "debug_mode": "0"
    }
  ],
  {
```

```

        "usrgrp_id": "14",
        "name": "Read only",
        "gui_access": "0",
        "users_status": "0",
        "debug_mode": "0"
    },
    {
        "usrgrp_id": "18",
        "name": "Deny",
        "gui_access": "0",
        "users_status": "0",
        "debug_mode": "0"
    }
],
"id": 1
}

```

usergroup.isreadable

Description

boolean usergroup.isreadable(array userGroupIds)

This method checks if the given user groups are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [usergroup.get](#) instead.

Parameters

(array) IDs of the user groups to check.

Return values

(boolean) Returns true if the given user groups are available for reading.

Examples

Check multiple user groups

Check if the two user groups are readable.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "usergroup.isreadable",
    "params": [
        "21",
        "22"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
}

```

```
    "id": 1
}
```

usergroup.iswritable

Description

`boolean usergroup.iswritable(array userGroupIds)`

This method checks if the given user groups are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [usergroup.get](#) instead.

Parameters

(array) IDs of the user groups to check.

Return values

(boolean) Returns true if the given user groups are available for writing.

Examples

Check multiple user groups

Check if the two user groups are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.iswritable",
  "params": [
    "21",
    "22"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

usergroup.massadd

Description

`object usergroup.massadd(object parameters)`

This method allows to simultaneously add permissions and users to multiple user groups.

Parameters

(object) Parameters containing the IDs of the user groups to update and the permissions and users to add.

The method accepts the following parameters.

Parameter	Type	Description
usrgrpids (required)	string/array	IDs of user groups to update.
rights	object/array	Permissions to assign to the user groups.
userids	string/array	IDs of the users to add to the user groups.

Return values

(object) Returns an object containing the IDs of the updated user groups under the `usrgrpids` property.

Examples

Denying access to host group

Deny two user groups access to host group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.massadd",
  "params": {
    "usrgrpids": [
      "17",
      "19"
    ],
    "rights": {
      "permission": 0,
      "id": "2"
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "17",
      "19"
    ]
  },
  "id": 1
}
```

- [usergroup.update](#)

Source

`CUserGroup::massAdd()` in *frontends/php/include/classes/api/services/CUserGroup.php*.

usergroup.massupdate

Description

object usergroup.massupdate(object parameters)

This method allows to simultaneously update properties, users or permissions for multiple user groups.

Parameters

(object) Parameters containing the IDs of the user groups to update and the properties that should be updated.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

Parameter	Type	Description
usrgrpids (required)	string/array	IDs of user groups to update.
rights	string/array	Permissions to replace the current permissions assigned to the user group.
userids	object/array	IDs of the users to replace the users in the group.

Return values

(object) Returns an object containing the IDs of the updated user groups under the `usrgrpids` property.

Examples

Changing permissions for a user group

Update the permissions for two user groups to only allow read-write access to two host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.massupdate",
  "params": {
    "usrgrpids": [
      "17",
      "19"
    ],
    "rights": [
      {
        "permission": 3,
        "id": "2"
      },
      {
        "permission": 3,
        "id": "3"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
```

```

        "usrgrpids": [
            "17",
            "19"
        ]
    },
    "id": 1
}

```

Source

CUserGroup::massUpdate() in *frontends/php/include/classes/api/services/CUserGroup.php*.

usergroup.update

Description

`object usergroup.update(object/array userGroups)`

This method allows to update existing user groups.

Parameters

(object/array) User group properties to be updated.

The `usrgrpid` property must be defined for each user group, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

Parameter	Type	Description
rights	object/array	Permissions to replace the current permissions assigned to the user group.
userids	string/array	IDs of the users to replace the users in the group.

Return values

(object) Returns an object containing the IDs of the updated user groups under the `usrgrpids` property.

Examples

Disabling a user group

Disable a user group.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "usergroup.update",
    "params": {
        "usrgrpid": "17",
        "users_status": "1"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```
{

User macro

This class is designed to work with host and global macros.

Object references:

- [Global macro](#)
- [Host macro](#)

Available methods:

- [usermacro.create](#) - creating new host macros
- [usermacro.createglobal](#) - creating new global macros
- [usermacro.delete](#) - deleting host macros
- [usermacro.deleteglobal](#) - deleting global macros
- [usermacro.get](#) - retrieving host and global macros
- [usermacro.update](#) - updating host macros
- [usermacro.updateglobal](#) - updating global macros

> User macro object

The following objects are directly related to the `usermacro` API.

Global macro

The global macro object has the following properties.

Property	Type	Description
<code>globalmacroid</code>	string	(<i>readonly</i>) ID of the global macro.
macro (required)	string	Macro string.
value (required)	string	Value of the macro.

Host macro

The host macro object defines a macro available on a host or template. It has the following properties.

Property	Type	Description
<code>hostmacroid</code>	string	(<i>readonly</i>) ID of the host macro.
hostid (required)	string	ID of the host that the macro belongs to.

Property	Type	Description
macro (required)	string	Macro string.
value (required)	string	Value of the macro.

usermacro.create

Description

object usermacro.create(object/array hostMacros)

This method allows to create new host macros.

Parameters

(object/array) Host macros to create.

The method accepts host macros with the **standard host macro properties**.

Return values

(object) Returns an object containing the IDs of the created host macros under the `hostmacroids` property. The order of the returned IDs matches the order of the passed host macros.

Examples

Creating a host macro

Creat a host macro "{ \$SNMP_COMMUNITY}" with the value "public" on host "10198".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.create",
  "params": {
    "hostid": "10198",
    "macro": "{ $SNMP_COMMUNITY}",
    "value": "public"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "11"
    ]
  },
  "id": 1
}
```

Source

CUserMacro::create() in *frontends/php/include/classes/api/services/CUserMacro.php*.

usermacro.createglobal

Description

object usermacro.createglobal(object/array globalMacros)

This method allows to create new global macros.

Parameters

(object/array) Global macros to create.

The method accepts global macros with the **standard global macro properties**.

Return values

(object) Returns an object containing the IDs of the created global macros under the `globalmacroids` property. The order of the returned IDs matches the order of the passed global macros.

Examples

Creating a global macro

Create a global macro "{\$SNMP_COMMUNITY}" with value "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.createglobal",
  "params": {
    "macro": "{$SNMP_COMMUNITY}",
    "value": "public"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "globalmacroids": [
      "6"
    ]
  },
  "id": 1
}
```

Source

`CUserMacro::createGlobal()` in *frontends/php/include/classes/api/services/CUserMacro.php*.

usermacro.delete

Description

object `usermacro.delete(array hostMacroIds)`

This method allows to delete host macros.

Parameters

(array) IDs of the host macros to delete.

Return values

(object) Returns an object containing the IDs of the deleted host macros under the `hostmacroids` property.

Examples

Deleting multiple host macros

Delete two host macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.delete",
  "params": [
    "32",

```

```

        "11"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostmacroids": [
            "32",
            "11"
        ]
    },
    "id": 1
}

```

Source

CUserMacro::delete() in *frontends/php/include/classes/api/services/CUserMacro.php*.

usermacro.deleteglobal

Description

object usermacro.deleteglobal(array globalMacroIds)

This method allows to delete global macros.

Parameters

(string/array) IDs of the global macros to delete.

Return values

(object) Returns an object containing the IDs of the deleted global macros under the `globalmacroids` property.

Examples

Deleting multiple global macros

Delete two global macros.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "usermacro.deleteglobal",
    "params": [
        "32",
        "11"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "globalmacroids": [
            "32",
            "11"
        ]
    },
    "id": 1
}

```

Source

usermacro.get

Description

integer/array usermacro.get(object parameters)

The method allows to retrieve host and global macros according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
globalmacro	flag	Return global macros instead of host macros.
globalmacroids	string/array	Return only global macros with the given IDs.
groupids	string/array	Return only host macros that belong to hosts or templates from the given host groups.
hostids	string/array	Return only macros that belong to the given hosts or templates.
hostmacroids	string/array	Return only host macros with the given IDs.
selectGroups	query	Return host groups that the host macro belongs to in the groups property.
selectHosts	query	Used only when retrieving host macros. Return hosts that the host macro belongs to in the hosts property.
		Used only when retrieving host macros.

Parameter	Type	Description
selectTemplates	query	Return templates that the host macro belongs to in the templates property.
sortfield	string/array	Used only when retrieving host macros. Sort the result by the given properties.
countOutput	flag	Possible value: macro. These parameters being common for all get methods are described in detail in the reference commentary page.
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving host macros for a host

Retrieve all host macros defined for host "10198".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.get",
  "params": {
    "output": "extend",
    "hostids": "10198"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostmacroid": "9",
      "hostid": "10198",
      "macro": "{$INTERFACE}",
      "value": "eth0"
    },
    {
      "hostmacroid": "11",
      "hostid": "10198",
      "macro": "{$SNMP_COMMUNITY}",
      "value": "public"
    }
  ],
  "id": 1
}
```

Retrieving global macros

Retrieve all global macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.get",
  "params": {
    "output": "extend",
    "globalmacro": true
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "globalmacroid": "6",
      "macro": "{$SNMP_COMMUNITY}",
      "value": "public"
    }
  ],
  "id": 1
}
```

usermacro.update

Description

object usermacro.update(object/array hostMacros)

This method allows to update existing host macros.

Parameters

(object/array) **Host macro properties** to be updated.

The hostmacroid property must be defined for each host macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host macros under the `hostmacroids` property.

Examples

Changing the value of a host macro

Change the value of a host macro to "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.update",
  "params": {
    "hostmacroid": "1",
    "value": "public"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

`CUserMacro::update()` in *frontends/php/include/classes/api/services/CUserMacro.php*.

usermacro.updateglobal

Description

object `usermacro.updateglobal(object/array globalMacros)`

This method allows to update existing global macros.

Parameters

(object/array) **Global macro properties** to be updated.

The `globalmacroid` property must be defined for each global macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated global macros under the `globalmacroids` property.

Examples

Changing the value of a global macro

Change the value of a global macro to "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.updateglobal",
  "params": {
    "globalmacroid": "1",
    "value": "public"
  },
}
```

```

    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "globalmacroids": [
      "1"
    ]
  },
  "id": 1
}

```

Value map

This class is designed to work with value maps.

Object references:

- [Value map](#)

Available methods:

- [valuemap.create](#) - creating new value maps
- [valuemap.delete](#) - deleting value maps
- [valuemap.get](#) - retrieving value maps
- [valuemap.update](#) - updating value maps

> Value map object

The following objects are directly related to the `valuemap` API.

Value map

The value map object has the following properties.

Property	Type	Description
<code>valuemapid</code>	string	(readonly) ID of the value map.
name (required)	string	Name of the value map.
mappings (required)	array	Value mappings for current value map. The mapping object is described in detail below .

Value mappings

The value mappings object defines value mappings of the value map. It has the following properties.

Property	Type	Description
value (required)	string	Original value.

Property	Type	Description
newvalue (required)	string	Value to which the original value is mapped to.

valuemap.create

Description

object `valuemap.create(object/array valuemaps)`

This method allows to create new value maps.

Parameters

(object/array) Value maps to create.

The method accepts value maps with with the [standard value map properties](#).

Return values

(object) Returns an object containing the IDs of the created value maps the `valuemapids` property. The order of the returned IDs matches the order of the passed value maps.

Examples

Creating a value map

Create one value map with two mappings.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.create",
  "params": {
    "name": "Service state",
    "mappings": [
      {
        "value": "0",
        "newvalue": "Down"
      },
      {
        "value": "1",
        "newvalue": "Up"
      }
    ]
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

CValueMap::create() in *frontends/php/include/classes/api/services/CValueMap.php*.

valuemap.delete

Description

object valuemap.delete(array valuemaps)

This method allows to delete value maps.

Parameters

(array) IDs of the value maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted value maps under the valuemaps property.

Examples

Deleting multiple value maps

Delete two value maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.delete",
  "params": [
    "1",
    "2"
  ],
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemaps": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

CValueMap::delete() in *frontends/php/include/classes/api/services/CValueMap.php*.

valuemap.get

Description

integer/array valuemap.get(object parameters)

The method allows to retrieve value maps according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
valuemaps	string/array	Return only value maps with the given IDs.

Parameter	Type	Description
selectMappings	query	Return the value mappings for current value map in the mappings property.
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: valuemapid, name. These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving value maps

Retrieve all configured value maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.get",
  "params": {
    "output": "extend"
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "valuemapid": "4",
```

```

        "name": "APC Battery Replacement Status"
    },
    {
        "valuemapid": "5",
        "name": "APC Battery Status"
    },
    {
        "valuemapid": "7",
        "name": "Dell Open Manage System Status"
    }
],
"id": 1
}

```

Retrieve one value map with its mappings.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "valuemap.get",
    "params": {
        "output": "extend",
        "selectMappings": "extend",
        "valuemapids": ["4"]
    },
    "auth": "57562fd409b3b3b9a4d916d45207bbcb",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "valuemapid": "4",
            "name": "APC Battery Replacement Status",
            "mappings": [
                {
                    "value": "1",
                    "newvalue": "unknown"
                },
                {
                    "value": "2",
                    "newvalue": "notInstalled"
                },
                {
                    "value": "3",
                    "newvalue": "ok"
                },
                {
                    "value": "4",
                    "newvalue": "failed"
                },
                {
                    "value": "5",
                    "newvalue": "highTemperature"
                },
                {
                    "value": "6",
                    "newvalue": "replaceImmediately"
                },
                {
                    "value": "7",

```

```

        "newvalue": "lowCapacity"
    }
    ]
}
],
"id": 1
}

```

CValueMap::get() in *frontends/php/include/classes/api/services/CValueMap.php*.

valuemap.update

Description

object valuemap.update(object/array valuemaps)

This method allows to update existing value maps.

Parameters

(object/array) **Value map properties** to be updated.

The valuemapid property must be defined for each value map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated value maps under the valuemaps property.

Examples

Changing value map name

Change value map name to "Device status".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "valuemap.update",
  "params": {
    "valuemapid": "2",
    "name": "Device status"
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "valuemaps": [
      "2"
    ]
  },
  "id": 1
}

```

Changing mappings for one value map.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "valuemap.update",
  "params": {
    "valuemapid": "2",

```

```

        "mappings": [
            {
                "value": "0",
                "newvalue": "Online"
            },
            {
                "value": "1",
                "newvalue": "Offline"
            }
        ]
    },
    "auth": "57562fd409b3b3b9a4d916d45207bbcb",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "valuemapids": [
            "2"
        ]
    },
    "id": 1
}

```

CValueMap::update() in *frontends/php/include/classes/api/services/CValueMap.php*.

Web scenario

This class is designed to work with web scenarios.

Object references:

- [Web scenario](#)
- [Scenario step](#)

Available methods:

- [httptest.create](#) - creating new web scenarios
- [httptest.delete](#) - deleting web scenarios
- [httptest.get](#) - retrieving web scenarios
- [httptest.isreadable](#) - checking if web scenarios are readable
- [httptest.iswritable](#) - checking if web scenarios are writable
- [httptest.update](#) - updating web scenarios

> Web scenario object

The following objects are directly related to the webcheck API.

Web scenario

The web scenario object has the following properties.

Property	Type	Description
httptestid	string	(<i>readonly</i>) ID of the web scenario.
hostid (required)	string	ID of the host that the web scenario belongs to.
name (required)	string	Name of the web scenario.

Property	Type	Description
agent	string	User agent string that will be used by the web scenario.
applicationid	string	Default: Zabbix ID of the application that the web scenario belongs to.
authentication	integer	Authentication method that will be used by the web scenario. Possible values: 0 - (default) none; 1 - basic HTTP authentication; 2 - NTLM authentication.
delay	integer	Execution interval of the web scenario in seconds.
headers	string	Default: 60. HTTP headers that will be sent when performing a request.
http_password	string	Password used for authentication.
http_proxy	string	Required for web scenarios with basic HTTP or NTLM authentication. Proxy that will be used by the web scenario given as <i>http://[username[:password]]@[proxy.example.com][:port]</i> .
http_user	string	User name used for authentication.
nextcheck	timestamp	Required for web scenarios with basic HTTP or NTLM authentication. (readonly) Time of the next web scenario execution.
retries	integer	Number of times a web scenario will try to execute each step before failing.
ssl_cert_file	string	Default: 1. Name of the SSL certificate file used for client authentication (must be in PEM format).
ssl_key_file	string	Name of the SSL private key file used for client authentication (must be in PEM format).
ssl_key_password	string	SSL private key password.
status	integer	Whether the web scenario is enabled.
templateid	string	Possible values are: 0 - (default) enabled; 1 - disabled. (readonly) ID of the parent template web scenario.
variables	string	Web scenario variables.
verify_host	integer	Whether to verify that the host name specified in the SSL certificate matches the one used in the scenario.
verify_peer	integer	Possible values are: 0 - (default) skip host verification; 1 - verify host. Whether to verify the SSL certificate of the web server.
		Possible values are: 0 - (default) skip peer verification; 1 - verify peer.

Scenario step

The scenario step object defines a specific web scenario check. It has the following properties.

Property	Type	Description
httpstepid	string	(<i>readonly</i>) ID of the scenario step.
name (required)	string	Name of the scenario step.
no (required)	integer	Sequence number of the step in a web scenario.
url (required)	string	URL to be checked.
follow_redirects	integer	Whether to follow HTTP redirects. Possible values are: 0 - don't follow redirects; 1 - (<i>default</i>) follow redirects.
headers	string	HTTP headers that will be sent when performing a request. Scenario step headers will overwrite headers specified for the web scenario.
httptestid	string	(<i>readonly</i>) ID of the web scenario that the step belongs to.
posts	string	HTTP POST variables as a string.
required	string	Text that must be present in the response.
retrieve_mode	integer	Part of the HTTP response that the scenario step must retrieve. Possible values are: 0 - (<i>default</i>) only body; 1 - only headers.
status_codes	string	Ranges of required HTTP status codes separated by commas.
timeout	integer	Request timeout in seconds.
variables	string	Default: 15. Scenario step variables.

httptest.create

Description

object httptest.create(object/array webScenarios)

This method allows to create new web scenarios.

Note:

Creating a web scenario will automatically create a set of **web monitoring items**.

Parameters

(object/array) Web scenarios to create.

Additionally to the **standard web scenario properties**, the method accepts the following parameters.

Parameter	Type	Description
steps (required)	array	Web scenario steps.

Return values

(object) Returns an object containing the IDs of the created web scenarios under the httptestids property. The order of the returned IDs matches the order of the passed web scenarios.

Examples

Creating a web scenario

Create a web scenario to monitor the company home page. The scenario will have two steps, to check the home page and the "About" page and make sure they return the HTTP status code 200.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.create",
  "params": {
    "name": "Homepage check",
    "hostid": "10085",
    "steps": [
      {
        "name": "Homepage",
        "url": "http://example.com",
        "status_codes": 200,
        "no": 1
      },
      {
        "name": "Homepage / About",
        "url": "http://example.com/about",
        "status_codes": 200,
        "no": 2
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "5"
    ]
  },
  "id": 1
}
```

- [Scenario step](#)

Source

CHttpTest::create() in *frontends/php/include/classes/api/services/CHttpTest.php*.

httptest.delete

Description

object httptest.delete(array webScenarioIds)

This method allows to delete web scenarios.

Parameters

(array) IDs of the web scenarios to delete.

Return values

(object) Returns an object containing the IDs of the deleted web scenarios under the `httptestids` property.

Examples

Deleting multiple web scenarios

Delete two web scenarios.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.delete",
  "params": [
    "2",
    "3"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "2",
      "3"
    ]
  },
  "id": 1
}
```

httptest.get

Description

integer/array httptest.get(object parameters)

The method allows to retrieve web scenarios according to the given parameters.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
applicationids	string/array	Return only web scenarios that belong to the given applications.
groupids	string/array	Return only web scenarios that belong to the given host groups.
hostids	string/array	Return only web scenarios that belong to the given hosts.
httptestids	string/array	Return only web scenarios with the given IDs.
inherited	boolean	If set to <code>true</code> return only web scenarios inherited from a template.
monitored	boolean	If set to <code>true</code> return only enabled web scenarios that belong to monitored hosts.
templated	boolean	If set to <code>true</code> return only web scenarios that belong to templates.
templateids	string/array	Return only web scenarios that belong to the given templates.
expandName	flag	Expand macros in the name of the web scenario.
expandStepName	flag	Expand macros in the names of scenario steps.
selectHosts	query	Return the host that the web scenario belongs to as an array in the <code>hosts</code> property.
selectSteps	query	Return web scenario steps in the <code>steps</code> property.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties.
countOutput	flag	Possible values are: httpstestid and name. These parameters being common for all get methods are described in detail in the reference commentary .
editable	boolean	
excludeSearch	flag	
filter	object	
limit	integer	
output	query	
preservekeys	flag	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	flag	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving a web scenario

Retrieve all data about web scenario "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httpstest.get",
  "params": {
    "output": "extend",
    "selectSteps": "extend",
    "httpstestids": "9"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "httpstestid": "9",
      "name": "Homepage check",
      "applicationid": "0",
      "nextcheck": "0",
      "delay": "60",
      "status": "0",
      "variables": "",
      "agent": "Zabbix",
      "authentication": "0",
      "http_user": "",
      "http_password": "",

httptest.isreadable

Description

boolean `httptest.isreadable(array webScenarioIds)`

This method checks if the given web scenarios are available for reading.

Warning:

This method is deprecated and will be removed in the future. Please use [httptest.get](#) instead.

Parameters

(array) IDs of the web scenarios to check.

Return values

(boolean) Returns true if the given web scenarios are available for reading.

Examples

Check multiple web scenarios

Check if the two web scenarios are readable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.isreadable",
  "params": [
    "3",
    "5"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

CHttpTest::isReadable() in *frontends/php/include/classes/api/services/CHttpTest.php*.

httptest.iswritable

Description

boolean httptest.iswritable(array webScenarioIds)

This method checks if the given web scenarios are available for writing.

Warning:

This method is deprecated and will be removed in the future. Please use [httptest.get](#) instead.

Parameters

(array) IDs of the web scenarios to check.

Return values

(boolean) Returns true if the given web scenarios are available for writing.

Examples

Check multiple web scenarios

Check if the two web scenarios are writable.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.iswritable",
  "params": [
    "3",

```

```

        "5"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}

```

httptest.update

Description

object httptest.update(object/array webScenarios)

This method allows to update existing web scenarios.

Parameters

(object/array) Web scenario properties to be updated.

The httptestid property must be defined for each web scenario, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard web scenario properties](#), the method accepts the following parameters.

Parameter	Type	Description
steps	array	Scenario steps to replace existing steps.

Return values

(object) Returns an object containing the IDs of the updated web scenarios under the httptestid property.

Examples

Enabling a web scenario

Enable a web scenario, that is, set its status to "0".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "httptest.update",
    "params": {
        "httptestid": "5",
        "status": 0
    },
    "auth": "700ca65537074ec963db7efabda78259",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {

```

```

        "httptestids": [
            "5"
        ]
    },
    "id": 1
}

```

Appendix 1. Reference commentary

Notation Data types

The Zabbix API supports the following data types as input:

Type	Description
bool	A boolean value, accepts either <code>true</code> or <code>false</code> .
flag	The value is considered to be <code>true</code> if it is passed and not equal to <code>null</code> and <code>false</code> otherwise.
integer	A whole number.
float	A floating point number.
string	A text string.
text	A longer text string.
timestamp	A Unix timestamp.
array	An ordered sequence of values, that is, a plain array.
object	An associative array.
query	A value which defines, what data should be returned.
	Can be defined as an array of property names to return only specific properties, or as one of the predefined values: <code>extend</code> - returns all object properties; <code>count</code> - returns the number of retrieved records, supported only by certain subselects.

Attention:

Zabbix API always returns values as strings or arrays only.

Property labels

Some of the objects properties are marked with short labels to describe their behavior. The following labels are used:

- *readonly* - the value of the property is set automatically and cannot be defined or changed by the client;
- *constant* - the value of the property can be set when creating an object, but cannot be changed after.

Removing referenced object via API Reserved ID value "0" can be used to remove referenced objects. For example, to remove a referenced proxy from a host, `proxy_hostid` should be set to 0 ("`proxy_hostid`": "0").

Common "get" method parameters The following parameters are supported by all `get` methods:

Parameter	Type	Description
<code>countOutput</code>	flag	Return the number of records in the result instead of the actual data.

Parameter	Type	Description
editable	boolean	If set to true return only objects that the user has write permissions to.
excludeSearch	flag	Default: false. Return results that do not match the criteria given in the search parameter.
filter	object	Return only those results that exactly match the given filter. Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.
limit	integer	Doesn't work for text fields. Limit the number of records returned.
output	query	Object properties to be returned.
preservekeys	flag	Default: extend. Use IDs as keys in the resulting array.
search	object	Return results that match the given wildcard search (case-insensitive). Accepts an array, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.
searchByAny	boolean	Works only for string and text fields. If set to true return results that match any of the criteria given in the filter or search parameter instead of all of them.
searchWildcardsEnabled	boolean	Default: false. If set to true enables the use of "*" as a wildcard character in the search parameter.
sortfield	string/array	Default: false. Sort the result by the given properties. Refer to a specific API get method description for a list of properties that can be used for sorting. Macros are not expanded before sorting. If no value is specified, data will be returned unsorted.

Parameter	Type	Description
sortorder	string/array	Order of sorting. If an array is passed, each value will be matched to the corresponding property given in the sortfield parameter.
startSearch	flag	<p>Possible values are: ASC - <i>(default)</i> ascending; DESC - descending.</p> <p>The search parameter will compare the beginning of fields, that is, perform a LIKE "...%" search instead.</p> <p>Ignored if searchWildcardsEnabled is set to true.</p>

Examples User permission check

Does the user have permission to write to hosts whose names begin with "MySQL" or "Linux" ?

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "countOutput": true,
    "search": {
      "host": ["MySQL", "Linux"]
    },
    "editable": true,
    "startSearch": true,
    "searchByAny": true
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "0",
  "id": 1
}
```

Note:

Zero result means no hosts with read/write permissions.

Mismatch counting

Count the number of hosts whose names do not contain the substring "ubuntu"

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "countOutput": true,
    "search": {
      "host": "ubuntu"
    }
  }
}
```

```

    },
    "excludeSearch": true
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": "44",
  "id": 1
}

```

Searching for hosts using wildcards

Find hosts whose name contains word "server" and have interface ports "10050" or "10071". Sort the result by host name in descending order and limit it to 5 hosts.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "host"],
    "selectInterfaces": ["port"],
    "filter": {
      "port": ["10050", "10071"]
    },
    "search": {
      "host": "*server*"
    },
    "searchWildcardsEnabled": true,
    "searchByAny": true,
    "sortfield": "host",
    "sortorder": "DESC",
    "limit": 5
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "50003",
      "host": "WebServer-Tomcat02",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "50005",
      "host": "WebServer-Tomcat01",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    }
  ]
}

```

```

    },
    {
      "hostid": "50004",
      "host": "WebServer-Nginx",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "99032",
      "host": "MySQL server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    },
    {
      "hostid": "99061",
      "host": "Linux server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    }
  ],
  "id": 1
}

```

Searching for hosts using wildcards with "preservekeys"

If you add the parameter "preservekeys" to the previous request, the result is returned as an associative array, where the keys are the id of the objects.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "host"],
    "selectInterfaces": ["port"],
    "filter": {
      "port": ["10050", "10071"]
    },
    "search": {
      "host": "*server*"
    },
    "searchWildcardsEnabled": true,
    "searchByAny": true,
    "sortfield": "host",
    "sortorder": "DESC",
    "limit": 5,
    "preservekeys": true
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "50003": {
      "hostid": "50003",
      "host": "WebServer-Tomcat02",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "50005": {
      "hostid": "50005",
      "host": "WebServer-Tomcat01",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "50004": {
      "hostid": "50004",
      "host": "WebServer-Nginx",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "99032": {
      "hostid": "99032",
      "host": "MySQL server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    },
    "99061": {
      "hostid": "99061",
      "host": "Linux server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    }
  },
  "id": 1
}

```

Appendix 2. Changes from 2.4 to 3.0

Backward incompatible changes General

[ZBXNEXT-2724](#) dropped support of all deprecated exists methods

[ZBXNEXT-2724](#) dropped support of all deprecated getObjects methods

application

[ZBXNEXT-2724](#) application.get: removed the deprecated expandData parameter
[ZBXNEXT-2724](#) application.get: removed the deprecated selectHosts parameter

graphitem

[ZBXNEXT-2724](#) graphitem.get: removed the deprecated expandData parameter

httptest

[ZBXNEXT-1821](#) httptest.create: made the hostid parameter required regardless of applicationid existence

host

[ZBXNEXT-1263](#) added host encryption support for communications between Zabbix components and encryption fields validation

proxy

[ZBXNEXT-1263](#) added proxy encryption support for communications between Zabbix components and encryption fields validation

trigger

[ZBXNEXT-2724](#) trigger.get: removed the deprecated expandData parameter

triggerprototype

[ZBXNEXT-2724](#) triggerprototype.get: removed the deprecated expandData parameter

Other changes and bug fixes General

Changes:

All of the isreadable and iswritable methods have been deprecated

action

Bug fixes:

[ZBX-9888](#) added validation in action condition formula to prohibit comparison of several triggers with AND operator

application

Changes:

[ZBXNEXT-1241](#) added new operation type OPERATION_TYPE_HOST_INVENTORY (10) that changes the Inventory mode host property

[ZBXNEXT-1219](#) application.get: added a new selectDiscoveryRule option that returns the LLD rule that created the application in the discoveryRule property

[ZBXNEXT-1219](#) application.get: added a new selectApplicationDiscovery option that returns the application discovery object in the applicationDiscovery property

configuration

Changes:

[ZBXNEXT-1679](#) implemented value map import and export

[ZBX-7654](#) configuration.import: implemented import conversion

discoveryrule

Changes:

[ZBXNEXT-2128](#) added support of scheduling interval syntax in the delay_flex property

graph

Bug fixes:

[ZBX-8660](#) graph.delete: added validation so that discovered graphs cannot be deleted

[ZBX-10182](#) graph.update: disallowed updating of templated host graphs

httptest

Changes:

[ZBXNEXT-1821](#) httptest.create: added default user agent string 'Zabbix', if the agent parameter is not set

host

Bug fixes:

[ZBXNEXT-1219](#) fixed incorrect deletion of inherited applications that are still linked to other items when performing template unlinking

[ZBX-8660](#) host.update: added validation so that only 'status', 'inventory', 'description' can be updated for discovered hosts

item

Changes:

[ZBX-9414](#) changed default value for trends to zero for non-numeric item types

[ZBXNEXT-2128](#) added support of scheduling interval syntax in delay_flex property

Bug fixes:

[ZBX-7821](#) removed restriction to have log type information when having a key "log", "logrt" and "eventlog"

[ZBX-8660](#) item.delete: added validation so that discovered items cannot be deleted

[ZBX-8660](#) item.update: added validation so that only 'status' can be updated for discovered items

[ZBX-8904](#) item.get: fixed the selectInterfaces option retrieving all host interfaces

itemprototype

Changes:

[ZBX-9414](#) changed default value for "trends" to zero for non-numeric item prototype types

[ZBXNEXT-1219](#) itemprototype.create: added a new applicationPrototypes option and name property to link new application prototypes to current item prototype

[ZBXNEXT-1219](#) itemprototype.get: added a new selectApplicationPrototypes option to retrieve a list of application prototypes

[ZBXNEXT-1219](#) itemprototype.update: added a new applicationPrototypes option and name property to replace application prototypes in current item prototype

[ZBXNEXT-2128](#) added support of scheduling interval syntax in the delay_flex property

Bug fixes:

[ZBX-7821](#) removed restriction to have log type information when having a key "log", "logrt" and "eventlog"

map

Changes:

[ZBXNEXT-3007](#) implemented support of public and private maps with ability to share them with other users and user groups

Bug fixes:

[ZBX-7654](#) map: added check for label_format key existence

mediatype

Changes:

[ZBXNEXT-2163](#) added a new exec_params string property that supports script parameters. Each parameter must end with new line feed.

screen

Changes:

[ZBXNEXT-3073](#) implemented support of public and private screens with ability to share them with other users and user groups

template

Bug fixes:

[ZBXNEXT-1219](#) fixed incorrect deletion of inherited applications that are still linked to other items when performing template unlinking

trend

Changes:

[ZBXNEXT-1193](#) implemented trend API.

trigger

Bug fixes:

[ZBX-8660](#) trigger.delete: added validation so that discovered triggers cannot be deleted

[ZBX-8660](#) trigger.update: added validation so that only 'status' can be updated for discovered triggers

user

Changes:

[ZBXNEXT-3082](#) user.delete: added validation that user cannot be deleted if he is a slide show owner

[ZBXNEXT-3073](#) user.delete: added validation that user cannot be deleted if he is a screen owner

[ZBXNEXT-3007](#) user.get: added possibility to select other users from group that user belongs to

[ZBXNEXT-3007](#) user.delete: added validation that user cannot be deleted if he is a map owner and added audit log.

Bug fixes:

[ZBX-7202](#) user.delete: fixed action disabling when deleting user

usergroup

Changes:

[ZBXNEXT-3007](#) usergroup.get: added the possibility of selecting the user group that user belongs to

[ZBXNEXT-2581](#) usergroup.get: added a new `selectRights` option to retrieve group rights

Bug fixes:

[ZBX-7202](#) usergroup.delete: fixed action disabling when deleting user group

valuemap

Changes:

[ZBXNEXT-1424](#) implemented value map API.

Zabbix API changes in 3.0

3.0.24 dservice

Bug fixes:

[ZBX-14833](#) dservice.get: fixed "selectHosts" option to return correct hosts that are monitored by current proxy or server

3.0.16 maintenance

Bug fixes:

[ZBX-6167](#) maintenance.update: fixed partial updating

3.0.15 maintenance

Bug fixes:

[ZBX-12991](#) maintenance.create: removed default values for "active_since" and "active_till" fields

3.0.14 alert

Bug fixes:

[ZBX-12655](#) alert.get: fixed method to return only personal alerts and alerts sent to users within the same user group.

3.0.12 host

Bug fixes:

[ZBX-10754](#) host.update, host.massupdate: fixed inheritance of template properties in web scenarios.

template

Bug fixes:

[ZBX-10754](#) template.update, template.massupdate: fixed inheritance of template properties in web scenarios.

3.0.11 map

Bug fixes:

[ZBX-12768](#) map.create, map.update: added url field validation of map and map elements. Valid URI scheme list is defined in [ZBX_URI_VALID_SCHEMES](#).

screen item

Bug fixes:

[ZBX-12768](#) screenitem.create, screenitem.update: added url field validation. Valid URI scheme list is defined in [ZBX_URI_VALID_SCHEMES](#).

trigger

Bug fixes:

[ZBX-12768](#) trigger.create, trigger.update: added url field validation. Valid URI scheme list is defined in [ZBX_URI_VALID_SCHEMES](#).

trigger prototype

Bug fixes:

[ZBX-12768](#) triggerprototype.create, triggerprototype.update: added url field validation. Valid URI scheme list is defined in [ZBX_URI_VALID_SCHEMES](#).

user

Bug fixes:

[ZBX-12768](#) user.create, user.update: added url field validation. Valid URI scheme list is defined in [ZBX_URI_VALID_SCHEMES](#).

3.0.6 General

Bug fixes:

[ZBX-11244](#) fixed decoding a valid JSON-RPC request when PHP is compiled without JSON library

httptest

Bug fixes:

[ZBX-11191](#) httptest.update: fixed web scenarios not properly updating step items when giving only applicationid and steps with httpstepid properties

[ZBX-11191](#) httptest.update: fixed updating templated web scenario steps by prohibiting to directly change the step name or giving different amount of steps than in template

[ZBX-11191](#) httptest.update: added mandatory field check in step validation

[ZBX-10842](#) httptest.update: fixed SQL error when updating httptest with applicationid and without httpstepid parameters

[ZBX-10842](#) httptest.update: prevented disappearing of step items when updating httptest without applicationid, httpstepid parameters

[ZBX-10842](#) httptest.update: fixed connecting web scenario applicationid to created steps when updating

usergroup

Bug fixes:

[ZBX-11121](#) usergroup.update, usergroup.massupdate, usergroup.delete: disallowed leaving a user without linked user groups

3.0.5 host

Bug fixes:

[ZBX-11151](#) implemented a dynamic default sort order for graph items; now the default sort order increases by one with each entry of a graph item

[ZBX-11020](#) host.create: made both "inventory" and "inventory_mode" optional

3.0.4 General

Bug fixes:

[ZBX-10880](#) fixed support of sending several Request objects at the same time to JSON-RPC

hostprototype

Bug fixes:

[ZBX-9455](#) hostprototype.create, hostprototype.update: fixed length limit for host prototype name

==== 3.0.3 ====

configuration

Bug fixes:

[ZBX-10752](#) configuration.export: fixed array formatting in exported JSON

[ZBX-10607](#) configuration.import: fixed validation of import in JSON format

[ZBX-10693](#) configuration.import: fixed importing template and/or host with trigger prototype dependency

host

Bug fixes:

[ZBX-10587](#) host.create: fixed inventory mode not being inherited for host prototypes when linking a template to this host

item

Bug fixes:

[ZBX-10755](#) item.delete: fixed possible SQL errors when deleting items which are used in Y axis MIN/MAX parameters

template

Bug fixes:

[ZBX-10587](#) template.create: fixed inventory mode not being inherited for host prototypes when linking this template to another template or host

3.0.2 General

Bug fixes:

[ZBX-9700](#) fixed API receiving requests without parameters and now showing a proper error message

hostgroup

Bug fixes:

[ZBX-9162](#) hostgroup.get: performance improvements under MySQL

httptest

Bug fixes:

[ZBX-10316](#) removed faulty web scenario step name validation

item

Bug fixes:

[ZBX-10262](#) item.update: fixed "delta" field being modified for templated items

maintenance

Bug fixes:

[ZBX-4842](#) maintenance.create, maintenance.update, maintenance.delete: added auditlog

[ZBX-10563](#) maintenance.create, maintenance.update: improved validation to disallow saving maintenance without timeperiods

screen

Bug fixes:

[ZBX-10517](#) screen.update: fixed unexpected errors if changing the position of screen elements between screen cells

[ZBX-10517](#) screen.create, screen.update: added validation of vsize and hsize parameters

[ZBX-10369](#) screen.update: fixed unexpected deleting of screen items when updating both screen size and screen items

triggerprototype

Bug fixes:

[ZBX-10155](#) triggerprototype.create, triggerprototype.update: prohibited creation of a trigger prototype without item prototypes in the expression

19. Appendixes

Please use the sidebar to access content in the Appendixes section.

1 Frequently asked questions / Troubleshooting

Frequently asked questions or FAQ.

1. Q: Can I flush/clear the queue (as depicted in *Administration* → *Queue*)?
A: No.
2. Q: How do I migrate from one database to another?
A: Dump data only (for MySQL, use flag -t or --no-create-info), create the new database using schema files from Zabbix and import the data.
3. Q: I would like to replace all spaces with underscores in my item keys because they worked in older versions but space is not a valid symbol for an item key in 3.0 (or any other reason to mass-modify item keys). How should I do it and what should I beware of?
A: You may use a database query to replace all occurrences of spaces in item keys with underscores:
`update items set key_=replace(key_,' ','_');`
Triggers will be able to use these items without any additional modifications, but you might have to change any item references in these locations:
 - * Notifications (actions)
 - * Map element and link labels
 - * Calculated item formulas
4. Q: My graphs have dots instead of lines or empty areas. Why so?
A: Data is missing. This can happen for a variety of reasons - performance problems on Zabbix database, Zabbix server, network, monitored devices...
5. Q: Zabbix daemons fail to start up with a message *Listener failed with error: socket() for [[:10050] failed with error 22: Invalid argument*.
A: This error arises at attempt to run Zabbix agent compiled on version 2.6.27 or above on a platform with a kernel 2.6.26 and lower. Note that static linking will not help in this case because it is the socket() system call that does not support SOCK_CLOEXEC flag on earlier kernels. [ZBX-3395](#)
6. Q: I try to set up a flexible user parameter (one that accepts parameters) with a command that uses a positional parameter like \$1, but it doesn't work (uses item parameter instead). How to solve this?
A: Use a double dollar sign like **\$\$1**
7. Q: All dropdowns have a scrollbar and look ugly in Opera 11. Why so?
A: It's a known bug in Opera 11.00 and 11.01; see [Zabbix issue tracker](#) for more information.
8. Q: How can I change graph background colour in a custom theme?
A: See graph_theme table in the database and [theming guide](#).
9. Q: With DebugLevel 4 I'm seeing messages "Trapper got [] len 0" in server/proxy log - what's that?
A: Most likely that is frontend, connecting and checking whether server is still running.
10. Q: My system had the time set in the future and now no data is coming in. How could this be solved?
A: Clear values of database fields hosts.disable_until*, drules.nextcheck, httptest.nextcheck and restart the server/proxy.
11. Q: Text item values in frontend (when using {ITEM.VALUE} macro and in other cases) are cut/trimmed to 20 symbols. Is that normal?
A: Yes, there is a hardcoded limit in include/items.inc.php currently.

2 Installation

1 Database creation scripts

Overview

A Zabbix database must be created during the installation of Zabbix server or proxy.

This section provides scripts for creating a Zabbix database. A separate schema script is provided for each supported database.

Note:

schema.sql, images.sql and data.sql files are located in the *database* subdirectory of Zabbix sources. If Zabbix was installed from distribution packages, refer to the distribution documentation.

Attention:

For a Zabbix proxy database, **only** schema.sql should be imported (no images.sql nor data.sql)

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings.

Scripts

MySQL

Character set utf8 and utf8_bin collation is required for Zabbix server to work properly with MySQL database.

```
shell> mysql -uroot -p<password>
mysql> create database zabbix character set utf8 collate utf8_bin;
mysql> create user 'zabbix'@'localhost' identified by '<password>';
mysql> grant all privileges on zabbix.* to 'zabbix'@'localhost';
mysql> quit;
```

Warning:

If you are installing from Zabbix packages, stop here and continue with instructions for **package installation** to import the data into the database.

Warning:

Zabbix server prior to 4.4 cannot work correctly with newer MariaDB versions out of the box. See **Known issues** for required database modifications.

If you are installing Zabbix from sources, proceed to import the data into the database:

```
shell> cd database/mysql
shell> mysql -uzabbix -p<password> zabbix < schema.sql
# stop here if you are creating database for Zabbix proxy
shell> mysql -uzabbix -p<password> zabbix < images.sql
shell> mysql -uzabbix -p<password> zabbix < data.sql
```

PostgreSQL

Please refer to **this section** if you are installing Zabbix from packages.

You need to have database user with permissions to create database objects. The following shell command will create user zabbix. Specify password when prompted and repeat password (note, you may first be asked for sudo password):

```
shell> sudo -u postgres createuser --pwprompt zabbix
```

Now we will set up the database zabbix (last parameter) with the previously created user as the owner (-O zabbix) and import initial schema and data (assuming you are in the root directory of Zabbix sources):

```
shell> sudo -u postgres createdb -O zabbix -E Unicode -T template0 zabbix
shell> cd database/postgresql
shell> cat schema.sql | sudo -u zabbix psql zabbix
```

Stop here if you are creating database for Zabbix proxy.

```
shell> cat images.sql | sudo -u zabbix psql zabbix
shell> cat data.sql | sudo -u zabbix psql zabbix
```

Attention:

The above commands are provided as an example that will work in most of GNU/Linux installations. You can use different commands, e. g. "psql -U <username>" depending on how your system/database are configured. If you have troubles setting up the database please consult your Database administrator.

Oracle

We assume that a *zabbix* database user with *password* password exists and has permissions to create database objects in ORCL service located on the *host* Oracle database server with a *user* shell user having write access to /tmp directory. Zabbix requires a Unicode database character set and a UTF8 national character set. Check current settings:

```
sqlplus> select parameter,value from v$nls_parameters where parameter='NLS_CHARACTERSET' or parameter='NLS
```

If you are creating a database for Zabbix server you need to have images on a predefined location on Oracle host. Copy all images from misc/images/png_modern to /tmp/zabbix_images directory on Oracle host:

```
shell> cd /path/to/zabbix-sources
shell> ssh user@host "mkdir /tmp/zabbix_images"
shell> scp -r misc/images/png_modern user@host:/tmp/zabbix_images/
```

Now prepare the database:

```
shell> cd database/oracle
shell> sqlplus zabbix/password@host/ORCL
sqlplus> @schema.sql
# stop here if you are creating database for Zabbix proxy
sqlplus> @images.sql
sqlplus> @data.sql
```

Note:

Please set the initialization parameter CURSOR_SHARING=FORCE for best performance.

After executing the images.sql script the /tmp/zabbix_images temporary directory can be removed.

IBM DB2

```
shell> db2 "create database zabbix using codeset utf-8 territory us pagesize 32768"
shell> cd database/ibm_db2
shell> db2batch -d zabbix -f schema.sql
# stop here if you are creating database for Zabbix proxy
shell> db2batch -d zabbix -f images.sql
shell> db2batch -d zabbix -f data.sql
```

Note:

It is important to set UTF-8 locale for Zabbix server, Zabbix proxy and web server running Zabbix frontend. Otherwise text information from Zabbix will be interpreted by IBM DB2 server as non-UTF-8 and will be additionally converted on the way from Zabbix to the database and back. The database will store corrupted non-ASCII characters.

Zabbix frontend uses OFFSET and LIMIT clauses in SQL queries. For this to work, IBM DB2 server must have DB2_COMPATIBILITY_VECTOR variable be set to 3. Run the following command before starting the database server:

```
shell> db2set DB2_COMPATIBILITY_VECTOR=3
```

SQLite

```
shell> cd database/sqlite3
shell> sqlite3 /var/lib/sqlite/zabbix.db < schema.sql
# stop here if you are creating database for Zabbix proxy
shell> sqlite3 /var/lib/sqlite/zabbix.db < images.sql
shell> sqlite3 /var/lib/sqlite/zabbix.db < data.sql
```

Note:

If using SQLite with Zabbix proxy, database will be automatically created if it does not exist.

Return to the [installation section](#).

2 Zabbix agent on Microsoft Windows

Configuring agent

Zabbix agent runs as a Windows service.

You can run a single instance of Zabbix agent or multiple instances of the agent on a Microsoft Windows host. A single instance can use the default configuration file C:\zabbix_agentd.conf or a configuration file specified in the command line. In case of

multiple instances each agent instance must have its own configuration file (one of the instances can use the default configuration file).

An example configuration file is available in Zabbix source archive as `conf/zabbix_agentd.win.conf`.

See the [configuration file](#) options for details on configuring Zabbix Windows agent.

Warning:

Zabbix agent for Windows does not support non-standard Windows configurations where CPUs are distributed non-uniformly across NUMA nodes. If logical CPUs are distributed non-uniformly, then CPU performance metrics may not be available for some CPUs. For example, if there are 72 logical CPUs with 2 NUMA nodes, both nodes must have 36 CPUs each.

Hostname parameter

To perform [active checks](#) on a host Zabbix agent needs to have the hostname defined. Moreover, the hostname value set on the agent side should exactly match the **"Host name"** configured for the host in the frontend.

The hostname value on the agent side can be defined by either the **Hostname** or **Hostnameltem** parameter in the agent [configuration file](#) - or the default values are used if any of these parameters are not specified.

The default value for **Hostnameltem** parameter is the value returned by the `"system.hostname"` agent key and for Windows platform it returns the NetBIOS host name.

The default value for **Hostname** is the value returned by the **Hostnameltem** parameter. So, in effect, if both these parameters are unspecified the actual hostname will be the host NetBIOS name; Zabbix agent will use NetBIOS host name to retrieve the list of active checks from Zabbix server and send results to it.

Attention:

The **system.hostname** key always returns the NetBIOS host name which is limited to 15 symbols and in UPPERCASE only - regardless of the length and lowercase/uppercase characters in the real host name.

Starting from Zabbix agent 1.8.6 version for Windows the `"system.hostname"` key supports an optional parameter - *type* of the name. The default value of this parameter is `"netbios"` (for backward compatibility) and the other possible value is `"host"`.

Attention:

The **system.hostname[host]** key always returns the full, real (case sensitive) Windows host name.

So, to simplify the configuration of `zabbix_agentd.conf` file and make it unified, two different approaches could be used.

1. leave **Hostname** or **Hostnameltem** parameters undefined and Zabbix agent will use NetBIOS host name as the hostname;
2. leave **Hostname** parameter undefined and define **Hostnameltem** like this:

Hostnameltem=system.hostname[host]

and Zabbix agent will use the full, real (case sensitive) Windows host name as the hostname.

Host name is also used as part of Windows service name which is used for installing, starting, stopping and uninstalling the Windows service. For example, if Zabbix agent configuration file specifies `Hostname=Windows_db_server`, then the agent will be installed as a Windows service `"Zabbix Agent [Windows_db_server]"`. Therefore, to have a different Windows service name for each Zabbix agent instance, each instance must use a different host name.

Installing agent as Windows service

To install a single instance of Zabbix agent with the default configuration file `c:\zabbix_agentd.conf`:

```
zabbix_agentd.exe --install
```

Attention:

On a 64-bit system, a 64-bit Zabbix agent version is required for all checks related to running 64-bit processes to work correctly.

If you wish to use a configuration file other than `c:\zabbix_agentd.conf`, you should use the following command for service installation:

```
zabbix_agentd.exe --config <your_configuration_file> --install
```

A full path to the configuration file should be specified.

Multiple instances of Zabbix agent can be installed as services like this:

```
zabbix_agentd.exe --config <configuration_file_for_instance_1> --install --multiple-agents
zabbix_agentd.exe --config <configuration_file_for_instance_2> --install --multiple-agents
...
zabbix_agentd.exe --config <configuration_file_for_instance_N> --install --multiple-agents
```

The installed service should now be visible in Control Panel.

Starting agent

To start the agent service, you can use Control Panel or do it from command line.

To start a single instance of Zabbix agent with the default configuration file:

```
zabbix_agentd.exe --start
```

To start a single instance of Zabbix agent with another configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --start
```

To start one of multiple instances of Zabbix agent:

```
zabbix_agentd.exe --config <configuration_file_for_this_instance> --start --multiple-agents
```

Stopping agent

To stop the agent service, you can use Control Panel or do it from command line.

To stop a single instance of Zabbix agent started with the default configuration file:

```
zabbix_agentd.exe --stop
```

To stop a single instance of Zabbix agent started with another configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --stop
```

To stop one of multiple instances of Zabbix agent:

```
zabbix_agentd.exe --config <configuration_file_for_this_instance> --stop --multiple-agents
```

Uninstalling agent Windows service

To uninstall a single instance of Zabbix agent using the default configuration file:

```
zabbix_agentd.exe --uninstall
```

To uninstall a single instance of Zabbix agent using a non-default configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --uninstall
```

To uninstall multiple instances of Zabbix agent from Windows services:

```
zabbix_agentd.exe --config <configuration_file_for_instance_1> --uninstall --multiple-agents
zabbix_agentd.exe --config <configuration_file_for_instance_2> --uninstall --multiple-agents
...
zabbix_agentd.exe --config <configuration_file_for_instance_N> --uninstall --multiple-agents
```

3 Daemon configuration

1 Zabbix server

Overview

This section lists parameters supported in a Zabbix server configuration file (zabbix_server.conf). Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported in the beginning of the line.

Parameters

Parameter	Mandatory	Range	Default	Description
AlertScriptsPath	no		/usr/local/share/zabbix/alertscripts	Location of custom alert scripts (depends on compile-time installation variable <i>datadir</i>).
AllowRoot	no		0	Allow the server to run as 'root'. If disabled and the server is started by 'root', the server will try to switch to the 'zabbix' user instead. Has no effect if started under a regular user. 0 - do not allow 1 - allow This parameter is supported since Zabbix 2.2.0.
CacheSize	no	128K-8G	8M	Size of configuration cache, in bytes. Shared memory size for storing host, item and trigger data. Upper limit used to be 2GB before Zabbix 2.2.3.
CacheUpdateFrequency	no	1-3600	60	How often Zabbix will perform update of configuration cache, in seconds. See also runtime control options.
DBHost	no		localhost	Database host name. In case of MySQL localhost or empty string results in using a socket. In case of PostgreSQL only empty string results in attempt to use socket.
DBName	yes			Database name or path to database file for SQLite3 (multi-process architecture of Zabbix does not allow to use in-memory database , e.g. <code>:memory:</code> , <code>file::memory:?cache=shared</code> or <code>file:memdb1?mode=memory&cache=shared</code>).
DBPassword	no			Database password. Ignored for SQLite. Comment this line if no password is used.
DBPort	no	1024-65535	3306	Database port when not using local socket. Ignored for SQLite.
DBSchema	no			Schema name. Used for IBM DB2 and PostgreSQL.
DBSocket	no		/tmp/mysql.sock	Path to MySQL socket.
DBUser	no			Database user. Ignored for SQLite.

Parameter	Mandatory	Range	Default	Description
DebugLevel	no	0-5	3	Specifies debug level: 0 - basic information about starting and stopping of Zabbix processes 1 - critical information 2 - error information 3 - warnings 4 - for debugging (produces lots of information) 5 - extended debugging (produces even more information) See also runtime control options.
ExternalScripts	no		/usr/local/share/zabbix/externalscripts	Location of external scripts (depends on compile-time installation variable <i>datadir</i>).
Fping6Location	no		/usr/sbin/fping6	Location of fping6. Make sure that fping6 binary has root ownership and SUID flag set. Make empty ("Fping6Location=") if your fping utility is capable to process IPv6 addresses.
FpingLocation	no		/usr/sbin/fping	Location of fping. Make sure that fping binary has root ownership and SUID flag set!
HistoryCacheSize	no	128K-2G	16M	Size of history cache, in bytes. Shared memory size for storing history data.
HistoryIndexCacheSize	no	128K-2G	4M	Size of history index cache, in bytes. Shared memory size for indexing history data stored in history cache. The index cache size needs roughly 100 bytes to cache one item. This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
HousekeepingFrequency	no	0-24	1	<p>How often Zabbix will perform housekeeping procedure (in hours). Housekeeping is removing outdated information from the database.</p> <p><i>Note:</i> To prevent housekeeper from being overloaded (for example, when history and trend periods are greatly reduced), no more than 4 times HousekeepingFrequency hours of outdated information are deleted in one housekeeping cycle, for each item. Thus, if HousekeepingFrequency is 1, no more than 4 hours of outdated information (starting from the oldest entry) will be deleted per cycle.</p> <p><i>Note:</i> To lower load on server startup housekeeping is postponed for 30 minutes after server start. Thus, if HousekeepingFrequency is 1, the very first housekeeping procedure after server start will run after 30 minutes, and will repeat with one hour delay thereafter. This postponing behavior is in place since Zabbix 2.4.0. Since Zabbix 3.0.0 it is possible to disable automatic housekeeping by setting HousekeepingFrequency to 0. In this case the housekeeping procedure can only be started by <i>housekeeper_execute</i> runtime control option and the period of outdated information deleted in one housekeeping cycle is 4 times the period since the last housekeeping cycle, but not less than 4 hours and not greater than 4 days.</p> <p>See also runtime control options.</p>

Parameter	Mandatory	Range	Default	Description
Include	no			<p>You may include individual files or all files in a directory in the configuration file.</p> <p>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example: <code>/absolute/path/to/config/files/*. Pattern matching is supported since Zabbix 2.4.0. See special notes about limitations.</code></p>
JavaGateway	no			<p>IP address (or hostname) of Zabbix Java gateway. Only required if Java pollers are started.</p> <p>This parameter is supported since Zabbix 2.0.0.</p>
JavaGatewayPort	no	1024-32767	10052	<p>Port that Zabbix Java gateway listens on.</p> <p>This parameter is supported since Zabbix 2.0.0.</p>
ListenIP	no		0.0.0.0	<p>List of comma delimited IP addresses that the trapper should listen on.</p> <p>Trapper will listen on all network interfaces if this parameter is missing.</p> <p>Multiple IP addresses are supported since Zabbix 1.8.3.</p>
ListenPort	no	1024-32767	10051	<p>Listen port for trapper.</p>
LoadModule	no			<p>Module to load at server startup. Modules are used to extend functionality of the server.</p> <p>Format: LoadModule=<module.so> The modules must be located in directory specified by LoadModulePath.</p> <p>It is allowed to include multiple LoadModule parameters.</p>
LoadModulePath	no			<p>Full path to location of server modules.</p> <p>Default depends on compilation options.</p>
LogFile	yes, if LogType is set to <i>file</i> , otherwise no			<p>Name of log file.</p>
LogFileSize	no	0-1024	1	<p>Maximum size of log file in MB.</p> <p>0 - disable automatic log rotation.</p> <p><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.</p>

Parameter	Mandatory	Range	Default	Description
LogType	no		file	Log output type: <i>file</i> - write log to file specified by LogFile parameter, <i>system</i> - write log to syslog, <i>console</i> - write log to standard output. This parameter is supported since Zabbix 3.0.0.
LogSlowQueries	no	0-3600000	0	How long a database query may take before being logged (in milliseconds). 0 - don't log slow queries. This option becomes enabled starting with DebugLevel=3. This parameter is supported since Zabbix 1.8.2.
MaxHousekeeperDelete	no	0-1000000	5000	No more than 'MaxHousekeeperDelete' rows (corresponding to [tablename], [field], [value]) will be deleted per one task in one housekeeping cycle. If set to 0 then no limit is used at all. In this case you must know what you are doing, so as not to overload the database! ¹ This parameter is supported since Zabbix 1.8.2 and applies only to deleting history and trends of already deleted items.
PidFile	no		/tmp/zabbix_server.pid	Name of PID file.
ProxyConfigFrequency	no	1-604800	3600	How often Zabbix server sends configuration data to a Zabbix proxy in seconds. Used only for proxies in a passive mode. This parameter is supported since Zabbix 1.8.3.
ProxyDataFrequency	no	1-3600	1	How often Zabbix server requests history data from a Zabbix proxy in seconds. Used only for proxies in a passive mode. This parameter is supported since Zabbix 1.8.3.
SenderFrequency	no	5-3600	30	How often Zabbix will try to send unsent alerts (in seconds).
SNMPTrapperFile	no		/tmp/zabbix_traps.tmp	Temporary file used for passing data from SNMP trap daemon to the server. Must be the same as in zabbix_trap_receiver.pl or SNMPTT configuration file. This parameter is supported since Zabbix 2.0.0.

Parameter	Mandatory	Range	Default	Description
SourceIP	no			Source IP address for: - outgoing connections to Zabbix proxy and Zabbix agent; - agentless connections (VMware, SSH, JMX, SNMP, Telnet and simple checks); - sending notification emails (connections to SMTP server)
SSHKeyLocation	no			Location of public and private keys for SSH checks and actions
SSLCertLocation	no			Location of SSL client certificate files for client authentication. This parameter is used in web monitoring only and is supported since Zabbix 2.4.
SSLKeyLocation	no			Location of SSL private key files for client authentication. This parameter is used in web monitoring only and is supported since Zabbix 2.4.
SSLCALocation	no			Override the location of certificate authority (CA) files for SSL server certificate verification. If not set, system-wide directory will be used. Note that the value of this parameter will be set as libcurl option CURLOPT_CAPATH. For libcurl versions before 7.42.0, this only has effect if libcurl was compiled to use OpenSSL. For more information see cURL web page . This parameter is used in web monitoring since Zabbix 2.4.0 and in SMTP authentication since Zabbix 3.0.0.
StartDBSyncers	no	1-100	4	Number of pre-forked instances of DB Syncers. The upper limit used to be 64 before version 1.8.5. This parameter is supported since Zabbix 1.8.3.
StartDiscoverers	no	0-250	1	Number of pre-forked instances of discoverers. The upper limit used to be 255 before version 1.8.5.
StartEscalators	no	1-100	1	Number of pre-forked instances of escalators. This parameter is supported since Zabbix 3.0.0.
StartHTTPOllers	no	0-1000	1	Number of pre-forked instances of HTTP pollers. The upper limit used to be 255 before version 1.8.5.

Parameter	Mandatory	Range	Default	Description
StartIPMIPollers	no	0-1000	0	Number of pre-forked instances of IPMI pollers. The upper limit used to be 255 before version 1.8.5.
StartJavaPollers	no	0-1000	0	Number of pre-forked instances of Java pollers. This parameter is supported since Zabbix 2.0.0.
StartPingers	no	0-1000	1	Number of pre-forked instances of ICMP pingers. The upper limit used to be 255 before version 1.8.5.
StartPollersUnreachable	no	0-1000	1	Number of pre-forked instances of pollers for unreachable hosts (including IPMI and Java). Since Zabbix 2.4.0, at least one poller for unreachable hosts must be running if regular, IPMI or Java pollers are started. The upper limit used to be 255 before version 1.8.5. This option is missing in version 1.8.3.
StartPollers	no	0-1000	5	Number of pre-forked instances of pollers. <i>Note</i> that a non-zero value is required for internal, aggregated and calculated items to work.
StartProxyPollers	no	0-250	1	Number of pre-forked instances of pollers for passive proxies. The upper limit used to be 255 before version 1.8.5. This parameter is supported since Zabbix 1.8.3.
StartSNMPTrapper	no	0-1	0	If set to 1, SNMP trapper process will be started. This parameter is supported since Zabbix 2.0.0.
StartTimers	no	1-1000	1	Number of pre-forked instances of timers. Timers process time-based trigger functions and maintenance periods. Only the first timer process handles the maintenance periods. This parameter is supported since Zabbix 2.2.0.

Parameter	Mandatory	Range	Default	Description
StartTrappers	no	0-1000	5	Number of pre-forked instances of trappers. Trappers accept incoming connections from Zabbix sender, active agents and active proxies. At least one trapper process must be running to display server availability and view queue in the frontend. The upper limit used to be 255 before version 1.8.5.
StartVMwareCollectors	no	0-250	0	Number of pre-forked vmware collector instances. This parameter is supported since Zabbix 2.2.0.
Timeout	no	1-30	3	Specifies how long we wait for agent, SNMP device or external check (in seconds).
TLSCAFile	no			Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSCertFile	no			Full pathname of a file containing the server certificate or certificate chain, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSCRLFile	no			Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSKeyFile	no			Full pathname of a file containing the server private key, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TmpDir	no		/tmp	Temporary directory.
TrapperTimeout	no	1-300	300	Specifies how many seconds trapper may spend processing new data.
TrendCacheSize	no	128K-2G	4M	Size of trend cache, in bytes. Shared memory size for storing trends data.
UnavailableDelay	no	1-3600	60	How often host is checked for availability during the unavailability period, in seconds.

Parameter	Mandatory	Range	Default	Description
UnreachableDelay	no	1-3600	15	How often host is checked for availability during the unreachability period, in seconds.
UnreachablePeriod	no	1-3600	45	After how many seconds of unreachability treat a host as unavailable.
User	no		zabbix	Drop privileges to a specific, existing user on the system. Only has effect if run as 'root' and AllowRoot is disabled. This parameter is supported since Zabbix 2.4.0.
ValueCacheSize	no	0,128K-64G	8M	Size of history value cache, in bytes. Shared memory size for caching item history data requests. Setting to 0 disables value cache (not recommended). When value cache runs out of the shared memory a warning message is written to the server log every 5 minutes. This parameter is supported since Zabbix 2.2.0.
VMwareCacheSize	no	256K-2G	8M	Shared memory size for storing VMware data. A VMware internal check <code>zabbix[vmware,buffer,...]</code> can be used to monitor the VMware cache usage (see Internal checks). Note that shared memory is not allocated if there are no vmware collector instances configured to start. This parameter is supported since Zabbix 2.2.0.
VMwareFrequency	no	10-86400	60	Delay in seconds between data gathering from a single VMware service. This delay should be set to the least update interval of any VMware monitoring item. This parameter is supported since Zabbix 2.2.0.
VMwarePerfFrequency	no	10-86400	60	Delay in seconds between performance counter statistics retrieval from a single VMware service. This delay should be set to the least update interval of any VMware monitoring item that uses VMware performance counters. This parameter is supported since Zabbix 2.2.9, 2.4.4

Parameter	Mandatory	Range	Default	Description
VMwareTimeout	no	1-300	10	The maximum number of seconds vmware collector will wait for a response from VMware service (vCenter or ESX hypervisor). This parameter is supported since Zabbix 2.2.9, 2.4.4

Footnotes

¹ When a lot of items are deleted it increases the load to the database, because the housekeeper will need to remove all the history data that these items had. For example, if we only have to remove 1 item prototype, but this prototype is linked to 50 hosts and for every host the prototype is expanded to 100 real items, 5000 items in total have to be removed (1*50*100). If 500 is set for MaxHousekeeperDelete (MaxHousekeeperDelete=500), the housekeeper process will have to remove up to 2500000 values (5000*500) for the deleted items from history and trends tables in one cycle.

2 Zabbix proxy

Overview

This section lists parameters supported in a Zabbix proxy configuration file (zabbix_proxy.conf). Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with “#” are only supported in the beginning of the line.

Parameters

Parameter	Mandatory	Range	Default	Description
AllowRoot	no		0	Allow the proxy to run as 'root'. If disabled and the proxy is started by 'root', the proxy will try to switch to the 'zabbix' user instead. Has no effect if started under a regular user. 0 - do not allow 1 - allow This parameter is supported since Zabbix 2.2.0.
CacheSize	no	128K-8G	8M	Size of configuration cache, in bytes. Shared memory size, for storing hosts and items data. Upper limit used to be 2GB before Zabbix 2.2.3.
ConfigFrequency	no	1-604800	3600	How often proxy retrieves configuration data from Zabbix server in seconds. Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).
DBHost	no		localhost	Database host name. In case of MySQL localhost or empty string results in using a socket. In case of PostgreSQL only empty string results in attempt to use socket.

Parameter	Mandatory	Range	Default	Description
DBName	yes			Database name or path to database file for SQLite3 (multi-process architecture of Zabbix does not allow to use in-memory database , e.g. <code>:memory:</code> , <code>file::memory:?cache=shared</code> or <code>file:memdb1?mode=memory&cache=sha</code>)
DBPassword	no			Warning: Do not attempt to use the same database Zabbix server is using. Database password. Ignored for SQLite. Comment this line if no password is used.
DBSchema	no			Schema name. Used for IBM DB2 and PostgreSQL.
DBSocket	no		3306	Path to MySQL socket. Database port when not using local socket. Ignored for SQLite.
DBUser				Database user. Ignored for SQLite.
DataSenderFrequency	no	1-3600	1	Proxy will send collected data to the server every N seconds. Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).
DebugLevel	no	0-5	3	Specifies debug level: 0 - basic information about starting and stopping of Zabbix processes 1 - critical information 2 - error information 3 - warnings 4 - for debugging (produces lots of information) 5 - extended debugging (produces even more information)
ExternalScripts	no		/usr/local/share/zabbix/externalscripts	Location of external scripts (depends on compile-time installation variable <i>datadir</i>).
Fping6Location	no		/usr/sbin/fping6	Location of fping6. Make sure that fping6 binary has root ownership and SUID flag set. Make empty ("Fping6Location=") if your fping utility is capable to process IPv6 addresses.
FpingLocation	no		/usr/sbin/fping	Location of fping. Make sure that fping binary has root ownership and SUID flag set!

Parameter	Mandatory	Range	Default	Description
HeartbeatFrequency	no	0-3600	60	Frequency of heartbeat messages in seconds. Used for monitoring availability of proxy on server side. 0 - heartbeat messages disabled. Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).
HistoryCacheSize	no	128K-2G	16M	Size of history cache, in bytes. Shared memory size for storing history data.
HistoryIndexCacheSize	no	128K-2G	4M	Size of history index cache, in bytes. Shared memory size for indexing history data stored in history cache. The index cache size needs roughly 100 bytes to cache one item.
Hostname	no		Set by HostnameItem	This parameter is supported since Zabbix 3.0.0. Unique, case sensitive Proxy name. Make sure the proxy name is known to the server! Allowed characters: alphanumeric, '.', '_', '-' and '-'. Maximum length: 64
HostnameItem	no		system.hostname	Item used for setting Hostname if it is undefined (this will be run on the proxy similarly as on an agent). Does not support UserParameters, performance counters or aliases, but does support system.run[]. Ignored if Hostname is set. This parameter is supported since Zabbix 1.8.6.

Parameter	Mandatory	Range	Default	Description
HousekeepingFrequency	no	0-24	1	<p>How often Zabbix will perform housekeeping procedure (in hours). Housekeeping is removing outdated information from the database.</p> <p><i>Note:</i> To prevent housekeeper from being overloaded (for example, when configuration parameters ProxyLocalBuffer or ProxyOfflineBuffer are greatly reduced), no more than 4 times HousekeepingFrequency hours of outdated information are deleted in one housekeeping cycle. Thus, if HousekeepingFrequency is 1, no more than 4 hours of outdated information (starting from the oldest entry) will be deleted per cycle.</p> <p><i>Note:</i> To lower load on proxy startup housekeeping is postponed for 30 minutes after proxy start. Thus, if HousekeepingFrequency is 1, the very first housekeeping procedure after proxy start will run after 30 minutes, and will repeat every hour thereafter. This postponing behavior is in place since Zabbix 2.4.0.</p> <p>Since Zabbix 3.0.0 it is possible to disable automatic housekeeping by setting HousekeepingFrequency to 0. In this case the housekeeping procedure can only be started by <i>housekeeper_execute</i> runtime control option and the period of outdated information deleted in one housekeeping cycle is 4 times the period since the last housekeeping cycle, but not less than 4 hours and not greater than 4 days.</p>

Parameter	Mandatory	Range	Default	Description
Include	no			<p>You may include individual files or all files in a directory in the configuration file.</p> <p>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example: <code>/absolute/path/to/config/files/*. Pattern matching is supported since Zabbix 2.4.0. See special notes about limitations.</code></p>
JavaGateway	no			<p>IP address (or hostname) of Zabbix Java gateway. Only required if Java pollers are started.</p> <p>This parameter is supported since Zabbix 2.0.0.</p>
JavaGatewayPort	no	1024-32767	10052	<p>Port that Zabbix Java gateway listens on.</p> <p>This parameter is supported since Zabbix 2.0.0.</p>
ListenIP	no		0.0.0.0	<p>List of comma delimited IP addresses that the trapper should listen on.</p> <p>Trapper will listen on all network interfaces if this parameter is missing.</p> <p>Multiple IP addresses are supported since Zabbix 1.8.3.</p>
ListenPort	no	1024-32767	10051	<p>Listen port for trapper.</p>
LoadModule	no			<p>Module to load at proxy startup. Modules are used to extend functionality of the proxy.</p> <p>Format: LoadModule=<module.so> The modules must be located in directory specified by LoadModulePath.</p> <p>It is allowed to include multiple LoadModule parameters.</p>
LoadModulePath	no			<p>Full path to location of proxy modules.</p> <p>Default depends on compilation options.</p>
LogFile	yes, if LogType is set to <i>file</i> , otherwise no			<p>Name of log file.</p>
LogFileSize	no	0-1024	1	<p>Maximum size of log file in MB.</p> <p>0 - disable automatic log rotation.</p> <p><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.</p>

Parameter	Mandatory	Range	Default	Description
LogType	no		file	Log output type: <i>file</i> - write log to file specified by LogFile parameter, <i>system</i> - write log to syslog, <i>console</i> - write log to standard output. This parameter is supported since Zabbix 3.0.0.
LogSlowQueries	no	0-3600000	0	How long a database query may take before being logged (in milliseconds). 0 - don't log slow queries. This option becomes enabled starting with DebugLevel=3. This parameter is supported since Zabbix 1.8.2.
PidFile	no		/tmp/zabbix_proxy.pid	Name of PID file.
ProxyLocalBuffer	no	0-720	0	Proxy will keep data locally for N hours, even if the data have already been synced with the server. This parameter may be used if local data will be used by third party applications.
ProxyMode	no	0-1	0	Proxy operating mode. 0 - proxy in the active mode 1 - proxy in the passive mode This parameter is supported since Zabbix 1.8.3. <i>Note</i> that (sensitive) proxy configuration data may become available to parties having access to the Zabbix server trapper port when using an active proxy. This is possible because anyone may pretend to be an active proxy and request configuration data; authentication does not take place.
ProxyOfflineBuffer	no	1-720	1	Proxy will keep data for N hours in case of no connectivity with Zabbix server. Older data will be lost.
ServerPort	no	1024-32767	10051	Port of Zabbix trapper on Zabbix server. Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).
Server	yes			IP address (or hostname) of Zabbix server. Active proxy will get configuration data from the server. Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).

Parameter	Mandatory	Range	Default	Description
SNMPTrapperFile	no		/tmp/zabbix_traps.tmp	Temporary file used for passing data from SNMP trap daemon to the proxy. Must be the same as in zabbix_trap_receiver.pl or SNMPTT configuration file. This parameter is supported since Zabbix 2.0.0.
SourceIP	no			Source IP address for: - outgoing connections to Zabbix server; - agentless connections (VMware, SSH, JMX, SNMP, Telnet and simple checks)
SSHKeyLocation	no			Location of public and private keys for SSH checks and actions
SSLCertLocation	no			Location of SSL client certificate files for client authentication. This parameter is used in web monitoring only and is supported since Zabbix 2.4.0.
SSLKeyLocation	no			Location of SSL private key files for client authentication. This parameter is used in web monitoring only and is supported since Zabbix 2.4.0.
SSLCALocation	no			Location of certificate authority (CA) files for SSL server certificate verification. Note that the value of this parameter will be set as libcurl option CURLOPT_CAPATH. For libcurl versions before 7.42.0, this only has effect if libcurl was compiled to use OpenSSL. For more information see cURL web page . This parameter is used in web monitoring since Zabbix 2.4.0 and in SMTP authentication since Zabbix 3.0.0.
StartDBSyncers	no	1-100	4	Number of pre-forked instances of DB Syncers. The upper limit used to be 64 before version 1.8.5. This parameter is supported since Zabbix 1.8.3.
StartDiscoverers	no	0-250	1	Number of pre-forked instances of discoverers. The upper limit used to be 255 before version 1.8.5.
StartHTTPOllers	no	0-1000	1	Number of pre-forked instances of HTTP pollers.
StartIPMIPollers	no	0-1000	0	Number of pre-forked instances of IPMI pollers. The upper limit used to be 255 before version 1.8.5.

Parameter	Mandatory	Range	Default	Description
StartJavaPollers	no	0-1000	0	Number of pre-forked instances of Java pollers. This parameter is supported since Zabbix 2.0.0.
StartPingers	no	0-1000	1	Number of pre-forked instances of ICMP pingers. The upper limit used to be 255 before version 1.8.5.
StartPollersUnreachable	no	0-1000	1	Number of pre-forked instances of pollers for unreachable hosts (including IPMI and Java). Since Zabbix 2.4.0, at least one poller for unreachable hosts must be running if regular, IPMI or Java pollers are started. The upper limit used to be 255 before version 1.8.5. This option is missing in version 1.8.3.
StartPollers	no	0-1000	5	Number of pre-forked instances of pollers. The upper limit used to be 255 before version 1.8.5.
StartSNMPTrapper	no	0-1	0	If set to 1, SNMP trapper process will be started. This parameter is supported since Zabbix 2.0.0.
StartTrappers	no	0-1000	5	Number of pre-forked instances of trappers. Trappers accept incoming connections from Zabbix sender and active agents. The upper limit used to be 255 before version 1.8.5.
StartVMwareCollectors	no	0-250	0	Number of pre-forked vmware collector instances. This parameter is supported since Zabbix 2.2.0.
Timeout	no	1-30	3	Specifies how long we wait for agent, SNMP device or external check (in seconds).
TLSAccept	yes for passive proxy, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no			What incoming connections to accept from Zabbix server. Used for a passive proxy, ignored on an active proxy. Multiple values can be specified, separated by comma: <i>unencrypted</i> - accept connections without encryption (default) <i>psk</i> - accept connections with TLS and a pre-shared key (PSK) <i>cert</i> - accept connections with TLS and a certificate This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
TLSCAFile	no			Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSCertFile	no			Full pathname of a file containing the proxy certificate or certificate chain, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSConnect	yes for active proxy, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no			How the proxy should connect to Zabbix server. Used for an active proxy, ignored on a passive proxy. Only one value can be specified: <i>unencrypted</i> - connect without encryption (default) <i>psk</i> - connect using TLS and a pre-shared key (PSK) <i>cert</i> - connect using TLS and a certificate This parameter is supported since Zabbix 3.0.0.
TLSCRLFile	no			Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSKeyFile	no			Full pathname of a file containing the proxy private key, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSPSKFile	no			Full pathname of a file containing the proxy pre-shared key. used for encrypted communications with Zabbix server. This parameter is supported since Zabbix 3.0.0.
TLSPSKIdentity	no			Pre-shared key identity string, used for encrypted communications with Zabbix server. This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
TLSServerCertIssuer	no			Allowed server certificate issuer. This parameter is supported since Zabbix 3.0.0.
TLSServerCertSubject	no			Allowed server certificate subject. This parameter is supported since Zabbix 3.0.0.
TmpDir	no		/tmp	Temporary directory.
TrapperTimeout	no	1-300	300	Specifies how many seconds trapper may spend processing new data.
User	no		zabbix	Drop privileges to a specific, existing user on the system. Only has effect if run as 'root' and AllowRoot is disabled. This parameter is supported since Zabbix 2.4.0.
UnavailableDelay	no	1-3600	60	How often host is checked for availability during the unavailability period, in seconds.
UnreachableDelay	no	1-3600	15	How often host is checked for availability during the unreachability period, in seconds.
UnreachablePeriod	no	1-3600	45	After how many seconds of unreachability treat a host as unavailable.
VMwareCacheSize	no	256K-2G	8M	Shared memory size for storing VMware data. A VMware internal check <code>zabbix[vmware,buffer,...]</code> can be used to monitor the VMware cache usage (see Internal checks). Note that shared memory is not allocated if there are no vmware collector instances configured to start. This parameter is supported since Zabbix 2.2.0.
VMwareFrequency	no	10-86400	60	Delay in seconds between data gathering from a single VMware service. This delay should be set to the least update interval of any VMware monitoring item. This parameter is supported since Zabbix 2.2.0.
VMwarePerfFrequency	no	10-86400	60	Delay in seconds between performance counter statistics retrieval from a single VMware service. This delay should be set to the least update interval of any VMware monitoring item that uses VMware performance counters. This parameter is supported since Zabbix 2.2.9, 2.4.4

Parameter	Mandatory	Range	Default	Description
VMwareTimeout	no	1-300	10	The maximum number of seconds vmware collector will wait for a response from VMware service (vCenter or ESX hypervisor). This parameter is supported since Zabbix 2.2.9, 2.4.4

3 Zabbix agent (UNIX)

Overview

This section lists parameters supported in a Zabbix agent configuration file (zabbix_agentd.conf). Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with “#” are only supported in the beginning of the line.

Parameters

Parameter	Mandatory	Range	Default	Description
Alias	no			Sets an alias for an item key. It can be used to substitute long and complex item key with a smaller and simpler one. Multiple <i>Alias</i> parameters may be present. Multiple parameters with the same <i>Alias</i> key are not allowed. Different <i>Alias</i> keys may reference the same item key. For example, to retrieve the ID of user 'zabbix': Alias=zabbix.userid:vfs.file.regexp[/etc/passwd/9]+)"/",,"\\1] Now shorthand key zabbix.userid may be used to retrieve data. Aliases can be used in <i>HostMetadataItem</i> but not in <i>HostnameItem</i> parameters.
AllowRoot	no		0	Allow the agent to run as 'root'. If disabled and the agent is started by 'root', the agent will try to switch to user 'zabbix' instead. Has no effect if started under a regular user. 0 - do not allow 1 - allow
BufferSend	no	1-3600	5	Do not keep data longer than N seconds in buffer.
BufferSize	no	2-65535	100	Maximum number of values in a memory buffer. The agent will send all collected data to Zabbix server or proxy if the buffer is full.

Parameter	Mandatory	Range	Default	Description
DebugLevel	no	0-5	3	Specifies debug level: 0 - basic information about starting and stopping of Zabbix processes 1 - critical information 2 - error information 3 - warnings 4 - for debugging (produces lots of information) 5 - extended debugging (produces even more information)
EnableRemoteCommands	no		0	Whether remote commands from Zabbix server are allowed. 0 - not allowed 1 - allowed
HostMetadata	no	0-255 characters		Optional parameter that defines host metadata. Host metadata is used only at host auto-registration process (active agent). If not defined, the value will be acquired from HostMetadataItem. An agent will issue an error and not start if the specified value is over the limit or a non-UTF-8 string. This option is supported in version 2.2.0 and higher.
HostMetadataItem	no			Optional parameter that defines a <i>Zabbix agent</i> item used for getting host metadata. This option is only used when HostMetadata is not defined. Supports UserParameters and aliases. Supports <i>system.run[]</i> regardless of <i>EnableRemoteCommands</i> value. HostMetadataItem value is retrieved on each auto-registration attempt and is used only at host auto-registration process (active agent). During an auto-registration request an agent will log a warning message if the value returned by the specified item is over the limit of 255 characters. The value returned by the item must be a UTF-8 string otherwise it will be ignored. This option is supported in version 2.2.0 and higher.

Parameter	Mandatory	Range	Default	Description
Hostname	no		Set by Hostnameltem	Unique, case sensitive hostname. Required for active checks and must match hostname as configured on the server. Allowed characters: alphanumeric, '.', '-', '_' and '~'. Maximum length: 64
Hostnameltem	no		system.hostname	Optional parameter that defines a <i>Zabbix agent</i> item used for getting host name. This option is only used when Hostname is not defined. Does not support UserParameters or aliases, but does support <i>system.run[]</i> regardless of <i>EnableRemoteCommands</i> value. This option is supported in version 1.8.6 and higher.
Include	no			You may include individual files or all files in a directory in the configuration file. To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example: <code>/absolute/path/to/config/files/*.</code> Pattern matching is supported since Zabbix 2.4.0. See special notes about limitations.
ListenIP	no		0.0.0.0	List of comma delimited IP addresses that the agent should listen on. Multiple IP addresses are supported in version 1.8.3 and higher.
ListenPort	no	1024-32767	10050	Agent will listen on this port for connections from the server.
LoadModule	no			Module to load at agent startup. Modules are used to extend functionality of the agent. Format: LoadModule=<module.so> The modules must be located in directory specified by LoadModulePath. It is allowed to include multiple LoadModule parameters.
LoadModulePath	no			Full path to location of agent modules. Default depends on compilation options.

Parameter	Mandatory	Range	Default	Description
LogFile	yes, if LogType is set to <i>file</i> , otherwise no			Name of log file.
LogFileSize	no	0-1024	1	Maximum size of log file in MB. 0 - disable automatic log rotation. <i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.
LogType	no		file	Log output type: <i>file</i> - write log to file specified by LogFile parameter, <i>system</i> - write log to syslog, <i>console</i> - write log to standard output. This parameter is supported since Zabbix 3.0.0.
LogRemoteCommands	no		0	Enable logging of executed shell commands as warnings. 0 - disabled 1 - enabled
MaxLinesPerSecond	no	1-1000	20	Maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'eventlog' active checks. The provided value will be overridden by the parameter 'maxlines', provided in 'log' or 'eventlog' item key. <i>Note:</i> Zabbix will process 4 times more new lines than set in <i>MaxLinesPerSecond</i> to seek the required string in log items.
PidFile	no		/tmp/zabbix_agentd.pid	Name of PID file.
RefreshActiveChecks	no	60-3600	120	How often list of active checks is refreshed, in seconds. <i>Note</i> that after failing to refresh active checks the next refresh will be attempted after 60 seconds.
Server	yes, if StartAgents is not explicitly set to 0			List of comma delimited IP addresses (or hostnames) of Zabbix servers and Zabbix proxies. Spaces are allowed. Incoming connections will be accepted only from the hosts listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally.

Parameter	Mandatory	Range	Default	Description
ServerActive	no			IP:port (or hostname:port) of Zabbix server or Zabbix proxy for active checks. Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed. If port is not specified, default port is used. IPv6 addresses must be enclosed in square brackets if port for that host is specified. If port is not specified, square brackets for IPv6 addresses are optional. If this parameter is not specified, active checks are disabled.
SourceIP	no			Source IP address for: - outgoing connections to Zabbix server or Zabbix proxy; - making connections while executing some items (web.page.get, net.tcp.port, etc.)
StartAgents	no	0-100	3	Number of pre-forked instances of zabbix_agentd that process passive checks. If set to 0, disables passive checks and the agent will not listen on any TCP port. The upper limit used to be 16 before version 1.8.5.
Timeout	no	1-30	3	Spend no more than Timeout seconds on processing
TLSAccept	yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no			What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma: <i>unencrypted</i> - accept connections without encryption (default) <i>psk</i> - accept connections with TLS and a pre-shared key (PSK) <i>cert</i> - accept connections with TLS and a certificate This parameter is supported since Zabbix 3.0.0.
TLSCAFile	no			Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
TLSCertFile	no			Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSConnect	yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no			How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified: <i>unencrypted</i> - connect without encryption (default) <i>psk</i> - connect using TLS and a pre-shared key (PSK) <i>cert</i> - connect using TLS and a certificate This parameter is supported since Zabbix 3.0.0.
TLSCRLFile	no			Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSKeyFile	no			Full pathname of a file containing the agent private key used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSPSKFile	no			Full pathname of a file containing the agent pre-shared key used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSPSKIdentity	no			Pre-shared key identity string, used for encrypted communications with Zabbix server. This parameter is supported since Zabbix 3.0.0.
TLSServerCertIssuer	no			Allowed server (proxy) certificate issuer. This parameter is supported since Zabbix 3.0.0.
TLSServerCertSubject	no			Allowed server (proxy) certificate subject. This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
UnsafeUserParameters	no	0,1	0	Allow all characters to be passed in arguments to user-defined parameters. Supported since Zabbix 1.8.2. The following characters are not allowed: \ ' " ' * ? [] { } ~ \$! & ; () > # @ Additionally, newline characters are not allowed.
User	no		zabbix	Drop privileges to a specific, existing user on the system. Only has effect if run as 'root' and AllowRoot is disabled. This parameter is supported since Zabbix 2.4.0.
UserParameter	no			User-defined parameter to monitor. There can be several user-defined parameters. Format: UserParameter=<key>,<shell command> Note that shell command must not return empty string or EOL only. Example: UserParameter=system.test,who wc -l

4 Zabbix agent (Windows)

Overview

This section lists parameters supported in a Zabbix agent (Windows) configuration file (zabbix_agent.conf). Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported in the beginning of the line.

Parameters

Parameter	Mandatory	Range	Default	Description
Alias	no			<p>Sets an alias for an item key. It can be used to substitute long and complex item key with a smaller and simpler one.</p> <p>Multiple <i>Alias</i> parameters may be present. Multiple parameters with the same <i>Alias</i> key are not allowed. Different <i>Alias</i> keys may reference the same item key. For example, to retrieve paging file usage in percents from the server:</p> <p>Alias=pg_usage:perf_counter[\Paging File(_Total)\% Usage]</p> <p>Now shorthand key pg_usage may be used to retrieve data. Aliases can be used in <i>HostMetadataItem</i> but not in <i>HostnameItem</i> or <i>PerfCounter</i> parameters.</p>
BufferSend	no	1-3600	5	Do not keep data longer than N seconds in buffer.
BufferSize	no	2-65535	100	Maximum number of values in a memory buffer. The agent will send all collected data to Zabbix server or proxy if the buffer is full.
DebugLevel	no	0-5	3	<p>Specifies debug level:</p> <p>0 - basic information about starting and stopping of Zabbix processes</p> <p>1 - critical information</p> <p>2 - error information</p> <p>3 - warnings</p> <p>4 - for debugging (produces lots of information)</p> <p>5 - extended debugging (produces even more information)</p>
EnableRemoteCommands	no		0	<p>Whether remote commands from Zabbix server are allowed.</p> <p>0 - not allowed</p> <p>1 - allowed</p>
HostMetadata	no	0-255 characters		<p>Optional parameter that defines host metadata. Host metadata is used only at host auto-registration process (active agent).</p> <p>If not defined, the value will be acquired from <i>HostMetadataItem</i>.</p> <p>An agent will issue an error and not start if the specified value is over the limit or a non-UTF-8 string.</p> <p>This option is supported in version 2.2.0 and higher.</p>

Parameter	Mandatory	Range	Default	Description
HostMetadataltem	no			<p>Optional parameter that defines a <i>Zabbix agent</i> item used for getting host metadata. This option is only used when HostMetadata is not defined.</p> <p>Supports UserParameters, performance counters and aliases. Supports <i>system.run[]</i> regardless of <i>EnableRemoteCommands</i> value.</p> <p>HostMetadataltem value is retrieved on each auto-registration attempt and is used only at host auto-registration process (active agent).</p> <p>During an auto-registration request an agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.</p> <p>The value returned by the item must be a UTF-8 string otherwise it will be ignored.</p> <p>This option is supported in version 2.2.0 and higher.</p>
Hostname	no		Set by HostnameItem	<p>Unique, case sensitive hostname.</p> <p>Required for active checks and must match hostname as configured on the server.</p> <p>Allowed characters: alphanumeric, '.', '-', '_' and '-'. Maximum length: 64</p>
HostnameItem	no		system.hostname	<p>Optional parameter that defines a <i>Zabbix agent</i> item used for getting host name. This option is only used when Hostname is not defined.</p> <p>Does not support UserParameters, performance counters or aliases, but does support <i>system.run[]</i> regardless of <i>EnableRemoteCommands</i> value.</p> <p>This option is supported in version 1.8.6 and higher.</p> <p>See also a more detailed description.</p>

Parameter	Mandatory	Range	Default	Description
Include	no			<p>You may include individual files or all files in a directory in the configuration file.</p> <p>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example: <code>/absolute/path/to/config/files/*. Pattern matching is supported since Zabbix 2.4.0. See special notes about limitations.</code></p>
ListenIP	no		0.0.0.0	<p>List of comma-delimited IP addresses that the agent should listen on.</p> <p>Multiple IP addresses are supported since Zabbix 1.8.3.</p>
ListenPort	no	1024-32767	10050	<p>Agent will listen on this port for connections from the server.</p>
LogFile	yes, if LogType is set to <i>file</i> , otherwise no		C:\zabbix_agentd.log	Name of the agent log file.
LogFileSize	no	0-1024	1	<p>Maximum size of log file in MB.</p> <p>0 - disable automatic log rotation.</p> <p><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.</p>
LogType	no		file	<p>Log output type:</p> <p><i>file</i> - write log to file specified by LogFile parameter,</p> <p><i>system</i> - write log Windows Event Log,</p> <p><i>console</i> - write log to standard output.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>
LogRemoteCommands	no		0	<p>Enable logging of executed shell commands as warnings.</p> <p>0 - disabled</p> <p>1 - enabled</p>
MaxLinesPerSecond	no	1-1000	20	<p>Maximum number of new lines the agent will send per second to Zabbix server or proxy processing 'log', 'logrt' and 'eventlog' active checks.</p> <p>The provided value will be overridden by the parameter 'maxlines', provided in 'log', 'logrt' or 'eventlog' item keys.</p>

Parameter	Mandatory	Range	Default	Description
PerfCounter	no			<p>Syntax: <parameter_name>,"<perf_counter_path>",<period></p> <p>Defines new parameter <parameter_name> which is an average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds).</p> <p>For example, if you wish to receive average number of processor interrupts per second for last minute, you can define new parameter "interrupts" as following:</p> <p>PerfCounter = interrupts,"\\Processor(0)\\Interrupts/sec",60</p> <p>Please note double quotes around performance counter path.</p> <p>The parameter name (interrupts) is to be used as the item key when creating an item.</p> <p>Samples for calculating average value will be taken every second.</p> <p>You may run "typeperf -qx" to get list of all performance counters available in Windows.</p>
RefreshActiveChecks	no	60-3600	120	<p>How often list of active checks is refreshed, in seconds.</p> <p>Note that after failing to refresh active checks the next refresh will be attempted after 60 seconds.</p>
Server	yes, if StartAgents is not explicitly set to 0			<p>List of comma delimited IP addresses (or hostnames) of Zabbix servers. Spaces are allowed.</p> <p>Incoming connections will be accepted only from the hosts listed here.</p> <p>If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally.</p>

Parameter	Mandatory	Range	Default	Description
ServerActive	no	(*)		IP:port (or hostname:port) of Zabbix server or Zabbix proxy for active checks. Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed. If port is not specified, default port is used. IPv6 addresses must be enclosed in square brackets if port for that host is specified. If port is not specified, square brackets for IPv6 addresses are optional. If this parameter is not specified, active checks are disabled.
SourceIP	no			Source IP address for: - outgoing connections to Zabbix server or Zabbix proxy; - making connections while executing some items (web.page.get, net.tcp.port, etc.)
StartAgents	no	0-63 (*)	3	Number of pre-forked instances of zabbix_agentd that process passive checks. If set to 0, disables passive checks and the agent will not listen on any TCP port. The upper limit used to be 16 before version 1.8.5.
Timeout	no	1-30	3	Spend no more than Timeout seconds on processing
TLSAccept	yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no			What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma: <i>unencrypted</i> - accept connections without encryption (default) <i>psk</i> - accept connections with TLS and a pre-shared key (PSK) <i>cert</i> - accept connections with TLS and a certificate This parameter is supported since Zabbix 3.0.0.
TLSCAFile	no			Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
TLSCertFile	no			Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSConnect	yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no			How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified: <i>unencrypted</i> - connect without encryption (default) <i>psk</i> - connect using TLS and a pre-shared key (PSK) <i>cert</i> - connect using TLS and a certificate This parameter is supported since Zabbix 3.0.0.
TLSCRLFile	no			Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSKeyFile	no			Full pathname of a file containing the agent private key used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSPSKFile	no			Full pathname of a file containing the agent pre-shared key used for encrypted communications with Zabbix components. This parameter is supported since Zabbix 3.0.0.
TLSPSKIdentity	no			Pre-shared key identity string, used for encrypted communications with Zabbix server. This parameter is supported since Zabbix 3.0.0.
TLSServerCertIssuer	no			Allowed server (proxy) certificate issuer. This parameter is supported since Zabbix 3.0.0.
TLSServerCertSubject	no			Allowed server (proxy) certificate subject. This parameter is supported since Zabbix 3.0.0.

Parameter	Mandatory	Range	Default	Description
UnsafeUserParameters	no	0-1	0	Allow all characters to be passed in arguments to user-defined parameters. 0 - do not allow 1 - allow The following characters are not allowed: \\ ' " * ? [] { } ~ \$! & ; () > # @ Additionally, newline characters are not allowed.
UserParameter	no			User-defined parameter to monitor. There can be several user-defined parameters. Format: UserParameter=<key>,<shell command> Note that shell command must not return empty string or EOL only. Example: UserParameter=system.test,echo 1

Note:

(*) The number of active servers listed in ServerActive plus the number of pre-forked instances for passive checks specified in StartAgents must be less than 64.

5 Zabbix Java gateway

If you use `startup.sh` and `shutdown.sh` scripts for starting **Zabbix Java gateway**, then you can specify the necessary configuration parameters in file `settings.sh`. The startup and shutdown scripts source the settings file and take care of converting shell variables (listed in the first column) to Java properties (listed in the second column).

If you start Zabbix Java gateway manually by running `java` directly, then you specify the corresponding Java properties on the command line.

Variable	Property	Mandatory	Range	Default	Description
LISTEN_IP	zabbix.listenIP	no		0.0.0.0	IP address to listen on.
LISTEN_PORT	zabbix.listenPort	no	1024-32767	10052	Port to listen on.
PID_FILE	zabbix.pidFile	no		/tmp/zabbix_java.pid	Name of PID file. If omitted, Zabbix Java Gateway is started as a console application.
START_POLLERS	zabbix.startPollers	no	1-1000	5	Number of worker threads to start.
TIMEOUT	zabbix.timeout	no	1-30	3	How long to wait for network operations. This parameter is supported since Zabbix 2.0.15, 2.2.10 and 2.4.5.

Warning:

Port 10052 is not [IANA registered](#).

									11

Note:

See also a description of [vm.memory.size parameters](#).

Footnotes

¹ net.if.in, net.if.out and net.if.total items do not provide statistics of loopback interfaces (e.g. lo0).

² These values for these items are not supported for loopback interfaces on Solaris systems up to and including Solaris 10 6/06 as byte, error and utilisation statistics are not stored and/or reported by the kernel. However, if you're monitoring a Solaris system via net-snmp, values may be returned as net-snmp carries legacy code from the cmu-snmp dated as old as 1997 that, upon failing to read byte values from the interface statistics returns the packet counter (which does exist on loopback interfaces) multiplied by an arbitrary value of 308. This makes the assumption that the average length of a packet is 308 octets, which is a very rough estimation as the MTU limit on Solaris systems for loopback interfaces is 8892 bytes.

These values should not be assumed to be correct or even closely accurate. They are guestimates. The Zabbix agent does not do any guess work, but net-snmp will return a value for these fields.

³ The command line on Solaris, obtained from /proc/pid/psinfo, is limited to 80 bytes and contains the command line as it was when the process was started.

2 vm.memory.size parameters

Overview

This section provides more details and platform-specific information on the parameters of the `vm.memory.size[<mode>]` [agent item](#).

Parameters

The following parameters are possible for this item:

- **active** - memory currently in use or very recently used, and so it is in RAM
- **anon** - memory not associated with a file (cannot be re-read from it)
- **available** - available memory, calculated differently depending on the platform (see the table below)
- **buffers** - cache for things like file system metadata
- **cached** - cache for various things
- **exec** - executable code, typically from a (program) file
- **file** - cache for contents of recently accessed files
- **free** - memory that is readily available to any entity requesting memory
- **inactive** - memory that is marked as not used
- **pavailable** - inactive + cached + free memory as percentage of 'total'
- **pinned** - same as 'wired'
- **pusd** - active + wired memory as percentage of 'total'
- **shared** - memory that may be simultaneously accessed by multiple processes
- **total** - total physical memory available
- **used** - used memory, calculated differently depending on the platform (see the table below)
- **wired** - memory that is marked to always stay in RAM. It is never moved to disk.

Platform-specific calculation of **available** and **used**:

Platform	"available"	"used"
AIX	free + cached	real memory in use
FreeBSD	inactive + cached + free	active + wired + cached
HP UX	free	total - free
Linux<3.14	free + buffers + cached	total - free
Linux 3.14+ (also backported to 3.10 on RHEL 7)	/proc/meminfo, see "MemAvailable" in Linux kernel documentation for details. Note that free + buffers + cached is no longer equal to 'available' due to not all the page cache can be freed and low watermark being used in calculation.	total - free

Platform	"available"	"used"
NetBSD	inactive + execpages + file + free	total - free
OpenBSD	inactive + free + cached	active + wired
OSX	inactive + free	active + wired
Solaris	free	total - free
Win32	free	total - free

Attention:

The sum of *vm.memory.size[used]* and *vm.memory.size[available]* does not necessarily equal total. For instance, on FreeBSD:

- * Active, inactive, wired, cached memories are considered used, because they store some useful information.
- * At the same time inactive, cached, free memories are considered available, because these kinds of memories can be given instantly to processes that request more memory.

So inactive memory is both used and available simultaneously. Because of this, the *vm.memory.size[used]* item is designed for informational purposes only, while *vm.memory.size[available]* is designed to be used in triggers.

See the ["See also"](#) section at the bottom of this page to find more detailed information about memory calculation in different OS.

Platform-specific notes

- on Linux **shared** works only on kernel 2.4

1. [Detailed information about memory calculation in different OS](#)

3 Passive and active agent checks

Overview

This section provides details on passive and active checks performed by **Zabbix agent**.

Zabbix uses a JSON based communication protocol for communicating with Zabbix agent.

Passive checks

A passive check is a simple data request. Zabbix server or proxy asks for some data (for example, CPU load) and Zabbix agent sends back the result to the server.

Server request

For definition of header and data length please refer to [protocol details](#).

```
<item key>\n
```

Agent response

```
<DATA>[\0<ERROR>]
```

Above, the part in square brackets is optional and is only sent for not supported items.

For example, for supported items:

1. Server opens a TCP connection
2. Server sends **agent.ping\n**
3. Agent reads the request and responds with **<HEADER><DATALEN>1**
4. Server processes data to get the value, '1' in our case
5. TCP connection is closed

For not supported items:

1. Server opens a TCP connection
2. Server sends **vfs.fs.size[/nono]\n**
3. Agent reads the request and responds with **<HEADER><DATALEN>ZBX_NOTSUPPORTED\0Cannot obtain filesystem information: [2] No such file or directory**
4. Server processes data, changes item state to not supported with the specified error message
5. TCP connection is closed

Active checks

Active checks require more complex processing. The agent must first retrieve from the server(s) a list of items for independent processing.

The servers to get the active checks from are listed in the 'ServerActive' parameter of the agent **configuration file**. The frequency of asking for these checks is set by the 'RefreshActiveChecks' parameter in the same configuration file. However, if refreshing active checks fails, it is retried after hardcoded 60 seconds.

The agent then periodically sends the new values to the server(s).

Getting the list of items

Agent request

```
{
  "request": "active checks",
  "host": "<hostname>"
}
```

Server response

```
{
  "response": "success",
  "data": [
    {
      "key": "log[/home/zabbix/logs/zabbix_agentd.log]",
      "delay": 30,
      "lastlogsize": 0,
      "mtime": 0
    },
    {
      "key": "agent.version",
      "delay": 600,
      "lastlogsize": 0,
      "mtime": 0
    },
    {
      "key": "vfs.fs.size[/nono]",
      "delay": 600,
      "lastlogsize": 0,
      "mtime": 0
    }
  ]
}
```

The server must respond with success. For each returned item, all properties **key**, **delay**, **lastlogsize** and **mtime** must exist, regardless of whether item is a log item or not.

For example:

1. Agent opens a TCP connection
2. Agent asks for the list of checks
3. Server responds with a list of items (item key, delay)
4. Agent parses the response
5. TCP connection is closed
6. Agent starts periodical collection of data

Attention:

Note that (sensitive) configuration data may become available to parties having access to the Zabbix server trapper port when using an active check. This is possible because anyone may pretend to be an active agent and request item configuration data; authentication does not take place unless you use **encryption** options.

Sending in collected data

Agent sends

```
{
  "request": "agent data",
```

```

"data": [
  {
    "host": "<hostname>",
    "key": "agent.version",
    "value": "2.4.0",
    "clock": 1400675595,
    "ns": 76808644
  },
  {
    "host": "<hostname>",
    "key": "log[/home/zabbix/logs/zabbix_agentd.log]",
    "lastlogsize": 112,
    "value": " 19845:20140621:141708.521 Starting Zabbix Agent [<hostname>]. Zabbix 2.4.0 (revision
    "clock": 1400675595,
    "ns": 77053975
  },
  {
    "host": "<hostname>",
    "key": "vfs.fs.size[/nono]",
    "state": 1,
    "value": "Cannot obtain filesystem information: [2] No such file or directory",
    "clock": 1400675595,
    "ns": 78154128
  }
],
"clock": 1400675595,
"ns": 78211329
}

```

Server response

```

{
  "response": "success",
  "info": "processed: 3; failed: 0; total: 3; seconds spent: 0.003534"
}

```

Attention:

If sending of some values fails on the server (for example, because host or item has been disabled or deleted), agent will not retry sending of those values.

For example:

1. Agent opens a TCP connection
2. Agent sends a list of values
3. Server processes the data and sends the status back
4. TCP connection is closed

Note how in the example above the not supported status for `vfs.fs.size[/nono]` is indicated by the "state" value of 1 and the error message in "value" property.

Attention:

Error message will be trimmed to 2048 symbols on server side.

Older XML protocol

Note:

Zabbix will take up to 16 MB of XML Base64-encoded data, but a single decoded value should be no longer than 64 KB otherwise it will be truncated to 64 KB while decoding.

See also

1. [More details on Zabbix agent protocol](#)

4 Trapper items

Overview

Zabbix server uses a JSON- based communication protocol for receiving data from Zabbix sender with the help of **trapper item**.

For definition of header and data length please refer to **protocol details** section.

Zabbix sender request

```
{
  "request": "sender data",
  "data": [
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value"
    }
  ]
}
```

Zabbix server response

```
{
  "response": "success",
  "info": "processed: 1; failed: 0; total: 1; seconds spent: 0.060753"
}
```

Alternatively Zabbix sender can send request with a timestamp

```
{
  "request": "sender data",
  "data": [
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value",
      "clock": 1516710794
    },
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value",
      "clock": 1516710795
    }
  ],
  "clock": 1516712029,
  "ns": 873386094
}
```

Zabbix server response

```
{
  "response": "success",
  "info": "processed: 2; failed: 0; total: 2; seconds spent: 0.060904"
}
```

5 Minimum permission level for Windows agent items

Overview

When monitoring systems using an agent, a good practice is to obtain metrics from the host on which the agent is installed. To use the principle of least privilege, it is necessary to determine what metrics are obtained from the agent.

The table in this document allows you to select the minimum rights for guaranteed correct operation of Zabbix agent.

If a different user is selected for the agent to work, rather than 'LocalSystem', then for the operation of agent as a Windows service, the new user must have the rights "Log on as a service" from "Local Policy→User Rights Assignment" and the right to create, write

and delete the Zabbix agent log file.

Note:

When working with the rights of an agent based on the "minimum technically acceptable" group, prior provision of rights to objects for monitoring is required.

Common agent items supported on Windows

Item key	User group	
	Recommended	Minimum technically acceptable (functionality is limited)
agent.hostname	Guests	Guests
agent.ping	Guests	Guests
agent.version	Guests	Guests
log	Administrators	Guests
logrt	Administrators	Guests
net.dns	Guests	Guests
net.dns.record	Guests	Guests
net.if.discovery	Guests	Guests
net.if.in	Guests	Guests
net.if.out	Guests	Guests
net.if.total	Guests	Guests
net.tcp.listen	Guests	Guests
net.tcp.port	Guests	Guests
net.tcp.service	Guests	Guests
net.tcp.service.perf	Guests	Guests
net.udp.service	Guests	Guests
net.udp.service.perf	Guests	Guests
proc.num	Administrators	Guests
system.cpu.discovery	Performance Monitor Users	Performance Monitor Users
system.cpu.load	Performance Monitor Users	Performance Monitor Users
system.cpu.num	Guests	Guests
system.cpu.util	Performance Monitor Users	Performance Monitor Users
system.hostname	Guests	Guests
system.localtime	Guests	Guests
system.run	Administrators	Guests
system.sw.arch	Guests	Guests
system.swap.size	Guests	Guests
system.uname	Guests	Guests
system.uptime	Performance Monitor Users	Performance Monitor Users
vfs.file.cksum	Administrators	Guests
vfs.file.contents	Administrators	Guests
vfs.file.exists	Administrators	Guests
vfs.file.md5sum	Administrators	Guests
vfs.file.regexp	Administrators	Guests
vfs.file.regmatch	Administrators	Guests
vfs.file.size	Administrators	Guests
vfs.file.time	Administrators	Guests
vfs.fs.discovery	Administrators	Guests
vfs.fs.size	Administrators	Guests
vm.memory.size	Guests	Guests
web.page.get	Guests	Guests
web.page.perf	Guests	Guests
web.page.regexp	Guests	Guests
zabbix.stats	Guests	Guests

Windows-specific item keys

Item key	User group	
	Recommended	Minimum technically acceptable (functionality is limited)
eventlog	Event Log Readers	Guests
net.if.list	Guests	Guests

Item key	User group	
perf_counter	Performance Monitor Users	Performance Monitor Users
proc_info	Administrators	Guests
service.discovery	Guests	Guests
service.info	Guests	Guests
services	Guests	Guests
wmi.get	Administrators	Guests
vm.vmemory.size	Guests	Guests

6 Encoding of returned values

Zabbix server expects every returned text value in the UTF8 encoding. This is related to any type of checks: zabbix agent, ssh, telnet, etc.

Different monitored systems/devices and checks can return non-ASCII characters in the value. For such cases, almost all possible zabbix keys contain an additional item key parameter - **<encoding>**. This key parameter is optional but it should be specified if the returned value is not in the UTF8 encoding and it contains non-ASCII characters. Otherwise the result can be unexpected and unpredictable.

A description of behavior with different database back-ends in such cases follows.

MySQL

If a value contains a non-ASCII character in non UTF8 encoding - this character and the following will be discarded when the database stores this value. No warning messages will be written to the *zabbix_server.log*.

Relevant for at least MySQL version 5.1.61

PostgreSQL

If a value contains a non-ASCII character in non UTF8 encoding - this will lead to a failed SQL query (PGRES_FATAL_ERROR:ERROR invalid byte sequence for encoding) and data will not be stored. An appropriate warning message will be written to the *zabbix_server.log*.

Relevant for at least PostgreSQL version 9.1.3

7 Large file support

Large file support, often abbreviated to LFS, is the term applied to the ability to work with files larger than 2 GB on 32-bit operating systems. Since Zabbix 2.0 support for large files has been added. This change affects at least **log file monitoring** and all **vfs.file.* items**. Large file support depends on the capabilities of a system at Zabbix compilation time, but is completely disabled on a 32-bit Solaris due to its incompatibility with procfs and swapctl.

8 Sensor

Each sensor chip gets its own directory in the sysfs /sys/devices tree. To find all sensor chips, it is easier to follow the device symlinks from /sys/class/hwmon/hwmon*, where * is a real number (0,1,2,...).

The sensor readings are located either in /sys/class/hwmon/hwmon*/ directory for virtual devices, or in /sys/class/hwmon/hwmon*/device directory for non-virtual devices. A file, called name, located inside hwmon* or hwmon*/device directories contains the name of the chip, which corresponds to the name of the kernel driver used by the sensor chip.

There is only one sensor reading value per file. The common scheme for naming the files that contain sensor readings inside any of the directories mentioned above is: <type><number>_<item>, where

- **type** - for sensor chips is "in" (voltage), "temp" (temperature), "fan" (fan), etc.,
- **item** - "input" (measured value), "max" (high threshold), "min" (low threshold), etc.,
- **number** - always used for elements that can be present more than once (usually starts from 1, except for voltages which start from 0). If files do not refer to a specific element they have a simple name with no number.

The information regarding sensors available on the host can be acquired using **sensor-detect** and **sensors** tools (lm-sensors package: <http://lm-sensors.org/>). **Sensors-detect** helps to determine which modules are necessary for available sensors. When modules are loaded the **sensors** program can be used to show the readings of all sensor chips. The labeling of sensor readings, used by this program, can be different from the common naming scheme (<type><number>_<item>):

- if there is a file called <type><number>_label, then the label inside this file will be used instead of <type><number><item> name;

- if there is no <type><number>_label file, then the program searches inside the /etc/sensors.conf (could be also /etc/sensors3.conf, or different) for the name substitution.

This labeling allows user to determine what kind of hardware is used. If there is neither <type><number>_label file nor label inside the configuration file the type of hardware can be determined by the name attribute (hwmon*/device/name). The actual names of sensors, which zabbix_agent accepts, can be obtained by running **sensors** program with -u parameter (**sensors -u**).

In **sensor** program the available sensors are separated by the bus type (ISA adapter, PCI adapter, SPI adapter, Virtual device, ACPI interface, HID adapter).

On Linux 2.4:

(Sensor readings are obtained from /proc/sys/dev/sensors directory)

- **device** - device name (if <mode> is used, it is a regular expression);
- **sensor** - sensor name (if <mode> is used, it is a regular expression);
- **mode** - possible values: avg, max, min (if this parameter is omitted, device and sensor are treated verbatim).

Example key: sensor[w83781d-i2c-0-2d,temp1]

Prior to Zabbix 1.8.4, the sensor[temp1] format was used.

On Linux 2.6+:

(Sensor readings are obtained from /sys/class/hwmon directory)

- **device** - device name (non regular expression). The device name could be the actual name of the device (e.g 0000:00:18.3) or the name acquired using sensors program (e.g. k8temp-pci-00c3). It is up to the user to choose which name to use;
- **sensor** - sensor name (non regular expression);
- **mode** - possible values: avg, max, min (if this parameter is omitted, device and sensor are treated verbatim).

Example key:

sensor[k8temp-pci-00c3,temp,max] or sensor[0000:00:18.3,temp1]

sensor[sm5c47b397-isa-0880,in,avg] or sensor[sm5c47b397.2176,in1]

Obtaining sensor names

Sensor labels, as printed by the *sensors* command, cannot always be used directly because the naming of labels may be different for each sensor chip vendor. For example, *sensors* output might contain the following lines:

```
$ sensors
in0:          +2.24 V  (min =  +0.00 V, max =  +3.32 V)
Vcore:        +1.15 V  (min =  +0.00 V, max =  +2.99 V)
+3.3V:        +3.30 V  (min =  +2.97 V, max =  +3.63 V)
+12V:         +13.00 V  (min =  +0.00 V, max = +15.94 V)
M/B Temp:     +30.0°C  (low  = -127.0°C, high = +127.0°C)
```

Out of these, only one label may be used directly:

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in0]
2.240000
```

Attempting to use other labels (like *Vcore* or *+12V*) will not work.

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,Vcore]
ZBX_NOTSUPPORTED
```

To find out the actual sensor name, which can be used by Zabbix to retrieve the sensor readings, run *sensors -u*. In the output, the following may be observed:

```
$ sensors -u
...
Vcore:
  in1_input: 1.15
  in1_min: 0.00
  in1_max: 2.99
  in1_alarm: 0.00
...
+12V:
  in4_input: 13.00
  in4_min: 0.00
  in4_max: 15.94
```

```
in4_alarm: 0.00
...
```

So *Vcore* should be queried as *in1*, and *+12V* should be queried as *in4*.⁵

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in1]
1.301000
```

Not only voltage (in), but also current (curr), temperature (temp) and fan speed (fan) readings can be retrieved by Zabbix.

9 Notes on memtype parameter in proc.mem items

Overview

The **memtype** parameter is supported on Linux, AIX, FreeBSD, and Solaris platforms.

Three common values of 'memtype' are supported on all of these platforms: **pmem**, **rss** and **vsiz**. Additionally, platform-specific 'memtype' values are supported on some platforms.

AIX

See values supported for 'memtype' parameter on AIX in the table.

Supported value	Description	Source in proctentry64 structure	Tries to be compatible with
vsiz ((- default value))	Virtual memory size	pi_size	
pmem	Percentage of real memory	pi_prm	ps -o pmem
rss	Resident set size	pi_trss + pi_drss	ps -o rssize
size	Size of process (code + data)	pi_dvm	"ps gv" SIZE column
dsiz	Data size	pi_dsiz	"ps gv" TSIZ column
tsiz	Text (code) size	pi_tsiz	
sdsiz	Data size from shared library	pi_sdsiz	
drss	Data resident set size	pi_drss	
trss	Text resident set size	pi_trss	

FreeBSD

See values supported for 'memtype' parameter on FreeBSD in the table.

Supported value	Description	Source in kinfo_proc structure	Tries to be compatible with
vsiz	Virtual memory size	kp_eproc.e_vm.vm_map.size or ki_size	ps -o vsz
pmem	Percentage of real memory	calculated from rss	ps -o pmem
rss	Resident set size	kp_eproc.e_vm.vm_rssize or ki_rssize	ps -o rss
size ((- default value))	Size of process (code + data + stack)	tsiz + dsiz + ssiz	
tsiz	Text (code) size	kp_eproc.e_vm.vm_tsiz or ki_tsiz	ps -o tsiz
dsiz	Data size	kp_eproc.e_vm.vm_dsiz or ki_dsiz	ps -o dsiz
ssiz	Stack size	kp_eproc.e_vm.vm_ssiz or ki_ssiz	ps -o ssiz

Linux

See values supported for 'memtype' parameter on Linux in the table.

⁵ According to [specification](#) these are voltages on chip pins and generally speaking may need scaling.

Supported value	Description	Source in /proc/<pid>/status file
vsize ((- default value))	Virtual memory size	VmSize
pmem	Percentage of real memory	(VmRSS/total_memory) * 100
rss	Resident set size	VmRSS
data	Size of data segment	VmData
exe	Size of code segment	VmExe
hwm	Peak resident set size	VmHWM
lck	Size of locked memory	VmLck
lib	Size of shared libraries	VmLib
peak	Peak virtual memory size	VmPeak
pin	Size of pinned pages	VmPin
pte	Size of page table entries	VmPTE
size	Size of process code + data + stack segments	VmExe + VmData + VmStk
stk	Size of stack segment	VmStk
swap	Size of swap space used	VmSwap

Notes for Linux:

1. Not all 'memtype' values are supported by older Linux kernels. For example, Linux 2.4 kernels do not support `hwm`, `pin`, `peak`, `pte` and `swap` values.
2. We have noticed that self-monitoring of the Zabbix agent active check process with `proc.mem[...,...,...,data]` shows a value that is 4 kB larger than reported by `VmData` line in the agent's `/proc/<pid>/status` file. At the time of self-measurement the agent's data segment increases by 4 kB and then returns to the previous size.

Solaris

See values supported for 'memtype' parameter on Solaris in the table.

Supported value	Description	Source in psinfo structure	Tries to be compatible with
vsize ((- default value))	Size of process image	pr_size	ps -o vsz
pmem	Percentage of real memory	pr_pctmem	ps -o pmem
rss	Resident set size It may be underestimated - see rss description in "man ps".	pr_rssize	ps -o rss

10 Notes on selecting processes in proc.mem and proc.num items

Processes modifying their commandline

Some programs use modifying their commandline as a method for displaying their current activity. A user can see the activity by running `ps` and `top` commands. Examples of such programs include *PostgreSQL*, *Sendmail*, *Zabbix*.

Let's see an example from Linux. Let's assume we want to monitor a number of Zabbix agent processes.

`ps` command shows processes of interest as

```
$ ps -fu zabbix
UID          PID  PPID  C  STIME TTY          TIME CMD
...
zabbix      6318     1   0  12:01 ?        00:00:00 sbin/zabbix_agentd -c /home/zabbix/ZBXNEXT-1078/zabbix_age
zabbix      6319   6318   0  12:01 ?        00:00:01 sbin/zabbix_agentd: collector [idle 1 sec]
zabbix      6320   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: listener #1 [waiting for connection]
zabbix      6321   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: listener #2 [waiting for connection]
zabbix      6322   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: listener #3 [waiting for connection]
zabbix      6323   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: active checks #1 [idle 1 sec]
...
```

Selecting processes by name and user does the job:

When checking the next process, the agent takes `zabbix_agentd_30: collector [idle 1 sec]` from the `cmdline` file and it does not meet our name parameter `zabbix_agentd_30`. So, only the main process which does not modify its commandline, gets counted. Other agent processes modify their command line and are ignored.

This example shows that the name parameter cannot be used in `proc.mem[]` and `proc.num[]` for selecting processes in this case.

Using `cmdline` parameter with a proper regular expression produces a correct result:

```
$ zabbix_get -s localhost -k 'proc.num[,zabbix,,zabbix_agentd_30[:]]'
6
```

Be careful when using `proc.mem[]` and `proc.num[]` items for monitoring programs which modify their commandlines.

Before putting name and `cmdline` parameters into `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

Linux kernel threads

Threads cannot be selected with `cmdline` parameter in `proc.mem[]` and `proc.num[]` items

Let's take as an example one of kernel threads:

```
$ ps -ef | grep kthreadd
root          2      0  0 09:33 ?                00:00:00 [kthreadd]
```

It can be selected with process name parameter:

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd,root]'
1
```

But selection by process `cmdline` parameter does not work:

```
$ zabbix_get -s localhost -k 'proc.num[,root,,kthreadd]'
0
```

The reason is that Zabbix agent takes the regular expression specified in `cmdline` parameter and applies it to contents of process `/proc/<pid>/cmdline`. For kernel threads their `/proc/<pid>/cmdline` files are empty. So, `cmdline` parameter never matches.

Counting of threads in `proc.mem[]` and `proc.num[]` items

Linux kernel threads are counted by `proc.num[]` item but do not report memory in `proc.mem[]` item. For example:

```
$ ps -ef | grep kthreadd
root          2      0  0 09:51 ?                00:00:00 [kthreadd]
```

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd]'
1
```

```
$ zabbix_get -s localhost -k 'proc.mem[kthreadd]'
ZBX_NOTSUPPORTED: Cannot get amount of "VmSize" memory.
```

But what happens if there is a user process with the same name as a kernel thread ? Then it could look like this:

```
$ ps -ef | grep kthreadd
root          2      0  0 09:51 ?                00:00:00 [kthreadd]
zabbix      9611  6133  0 17:58 pts/1          00:00:00 ./kthreadd
```

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd]'
2
```

```
$ zabbix_get -s localhost -k 'proc.mem[kthreadd]'
4157440
```

`proc.num[]` counted both the kernel thread and the user process. `proc.mem[]` reports memory for the user process only and counts the kernel thread memory as if it was 0. This is different from the case above when `ZBX_NOTSUPPORTED` was reported.

Be careful when using `proc.mem[]` and `proc.num[]` items if the program name happens to match one of the thread.

Before putting parameters into `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

11 Implementation details of net.tcp.service and net.udp.service checks

Implementation of net.tcp.service and net.udp.service checks is detailed on this page for various services specified in the service parameter.

Item net.tcp.service parameters

ftp

Creates a TCP connection and expects the first 4 characters of the response to be "220 ", then sends "QUIT\r\n". Default port 21 is used if not specified.

http

Creates a TCP connection without expecting and sending anything. Default port 80 is used if not specified.

https

Uses (and only works with) libcurl, does not verify the authenticity of the certificate, does not verify the host name in the SSL certificate, only fetches the response header (HEAD request). Default port 443 is used if not specified.

imap

Creates a TCP connection and expects the first 4 characters of the response to be "* OK", then sends "a1 LOGOUT\r\n". Default port 143 is used if not specified.

ldap

Opens a connection to an LDAP server and performs an LDAP search operation with filter set to (objectClass=*). Expects successful retrieval of the first attribute of the first entry. Default port 389 is used if not specified.

nntp

Creates a TCP connection and expects the first 3 characters of the response to be "200" or "201", then sends "QUIT\r\n". Default port 119 is used if not specified.

pop

Creates a TCP connection and expects the first 3 characters of the response to be "+OK", then sends "QUIT\r\n". Default port 110 is used if not specified.

smtp

Creates a TCP connection and expects the first 3 characters of the response to be "220", followed by a space, the line ending or a dash. The lines containing a dash belong to a multi-line response and the response will be re-read until a line without the dash is received. Then sends "QUIT\r\n". Default port 25 is used if not specified.

ssh

Creates a TCP connection. If the connection has been established, both sides exchange an identification string (SSH-major.minor-XXXX), where major and minor are protocol versions and XXXX is a string. Zabbix checks if the string matching the specification is found and then sends back the string "SSH-major.minor-zabbix_agent\r\n" or "0\r\n" on mismatch. Default port 22 is used if not specified.

tcp

Creates a TCP connection without expecting and sending anything. Unlike the other checks requires the port parameter to be specified.

telnet

Creates a TCP connection and expects a login prompt (':' at the end). Default port 23 is used if not specified.

Item net.udp.service parameters

ntp

Sends an SNTP packet over UDP and validates the response according to [RFC 4330, section 5](#). Default port 123 is used if not specified.

12 Unreachable/unavailable host settings

Overview

Several configuration **parameters** define how Zabbix server should behave when an agent check (Zabbix, SNMP, IPMI, JMX) fails and a host becomes unreachable.

Unreachable host

A host is treated as unreachable after a failed check (network error, timeout) by Zabbix, SNMP, IPMI or JMX agents. Note that Zabbix agent active checks do not influence host availability in any way.

From that moment **UnreachableDelay** defines how often a host is rechecked using one of the items (including LLD rules) in this unreachability situation and such rechecks will be performed already by unreachable pollers. By default it is 15 seconds before the next check.

In the Zabbix server log unreachability is indicated by messages like these:

Zabbix agent item "system.cpu.load[percpu,avg1]" on host "New host" failed: first network error, wait for
Zabbix agent item "system.cpu.load[percpu,avg15]" on host "New host" failed: another network error, wait f

Note that the exact item that failed is indicated and the item type (Zabbix agent).

Note:
The *Timeout* parameter will also affect how early a host is rechecked during unreachability. If the Timeout is 20 seconds and UnreachableDelay 30 seconds, the next check will be in 50 seconds after the first attempt.

The **UnreachablePeriod** parameter defines how long the unreachability period is in total. By default UnreachablePeriod is 45 seconds. UnreachablePeriod should be several times bigger than UnreachableDelay, so that a host is rechecked more than once before a host becomes unavailable.

If the unreachable host reappears, the monitoring returns to normal automatically:

resuming Zabbix agent checks on host "New host": connection restored

Unavailable host

After the UnreachablePeriod ends and the host has not reappeared, the host is treated as unavailable.

In the server log it is indicated by messages like these:

temporarily disabling Zabbix agent checks on host "New host": host unavailable

and in the **frontend** the host availability icon for the respective interface goes from green (or gray) to red (note that on mouseover a tooltip with the error description is displayed):

The **UnavailableDelay** parameter defines how often a host is checked during host unavailability.

By default it is 60 seconds (so in this case "temporarily disabling", from the log message above, will mean disabling checks for one minute).

When the connection to the host is restored, the monitoring returns to normal automatically, too:

enabling Zabbix agent checks on host "New host": host became available

6 Triggers

1 Supported trigger functions

All functions supported in **trigger expressions** are listed here.

FUNCTION	Description	Parameters	Comments
----------	-------------	------------	----------

FUNCTION

abschange

The amount of absolute difference between last and previous values.

Supported value types: float, int, str, text, log

For example:
(previous value;last value=abschange)
1;5=4
3;1=2
0;-
2.5=2.5

For strings returns:
0 - values are equal
1 - values differ

avg (sec|#num,<time_shift>)

Average value of an item within the defined evaluation period.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time	Supported value types: float, int Examples: => avg(#5) → average value for the five latest values => avg(1h) → average value for an hour => avg(1h,1d) → average value for an hour one day ago. The <code>time_shift</code> parameter is supported since Zabbix 1.8.2. It is useful when there is a need to compare the current average value with the average value <code>time_shift</code> seconds back.
band (<sec #num>,mask,<time_shift>)		

Value of "bitwise AND" of an item value and mask.	sec (ignored, equals #1) or #num (optional) - the Nth most recent value mask (manda- tory) - 64-bit unsigned integer (0 - 18446744073709551615) time_shift (optional) - evalua- tion point is moved the number of seconds back in time	Supported value types: int Take note that #num works differently here than with many other functions (see last()). Although the com- parison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by compar- ing to 4, not 100. Examples: => band(,12)=8 or band(,12)=4 → 3rd or 4th bit set, but not both at the same time => band(,20)=16 → 3rd bit not set and 5th bit set. This function is supported since Zabbix 2.2.0.
--	---	---

FUNCTION

change

The amount of difference between last and previous values.

Supported value types: float, int, str, text, log

For example:
(previous value;last value=change)
1;5=+4
3;1=-2
0;-2.5=-2.5

For strings returns:
0 - values are equal
1 - values differ

count (sec|#num,<pattern>,<operator>,<time_shift>)

Number of values within the defined evaluation period.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values (preceded by a hash mark) pattern (optional) - required pattern operator (optional)	Supported value types: float, integer, string, text, log Float items match with the precision of 0.000001.
	Supported operators: as two <i>eq</i> - equal <i>ne</i> - not equal <i>gt</i> - greater <i>ge</i> - greater or equal <i>lt</i> - less <i>le</i> - less or equal <i>like</i> - matches if contains pattern (case-sensitive) <i>band</i> - bitwise AND (supported since Zabbix 2.2.0).	With <i>band</i> as third parameter, the second parameter can be specified as two numbers, separated by '/': number_to_compare_with count() calculates "bitwise AND" from the value and the <i>mask</i> and compares the result to <i>number_to_compare_with</i> . If the result of "bitwise AND" is equal to <i>number_to_compare_with</i> , the value is counted.
	Note that: <i>eq</i> (default), <i>ne</i> , <i>gt</i> , <i>ge</i> , <i>lt</i> , <i>le</i> , <i>band</i> are supported for integer items <i>eq</i> (default), <i>ne</i> , <i>gt</i> , <i>ge</i> , <i>lt</i> , <i>le</i> are supported for float	If <i>number_to_compare_with</i> and <i>mask</i> are equal, only the <i>mask</i> need be specified (without '/'). Examples: => count(10m)

FUNCTION			
date		Current date in YYYYM-MDD format.	Supported value types: <i>any</i> Example of returned value: 20150731
dayofmonth		Day of month in range of 1 to 31.	Supported value types: <i>any</i> This function is supported since Zabbix 1.8.5.
dayofweek		Day of week in range of 1 to 7 (Mon - 1, Sun - 7).	Supported value types: <i>any</i>
delta (sec #num,<time_shift>)		Difference between the maximum and minimum values within the defined evaluation period ('max()' minus 'min()').	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values specified (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time Supported value types: float, int The time_shift parameter is supported since Zabbix 1.8.2.
diff			

FUNCTION		
	Checking if last and previous values differ.	Supported value types: float, int, str, text, log Returns: 1 - last and previous values differ 0 - otherwise
forecast (sec #num,<time_shift>,time,<fit>,<mode>)		

Future value, max, min, delta or avg of the item.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values specified (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time time - forecasting horizon in seconds fit (optional) - function used to fit historical data Supported fits: <i>linear</i> - linear function <i>polynomialN</i> - polynomial of degree N (1 ≤ N ≤ 6) <i>exponential</i> - exponential function <i>logarithmic</i> - logarithmic function <i>power</i> - power function Note that: <i>linear</i> is default, <i>polynomial1</i> is	Supported value types: float, int If value to return is larger than 999999999999.9999 or less than -999999999999.9999, return value is cropped to 999999999999.9999 or -999999999999.9999 correspondingly. Becomes not supported only if misused in expression (wrong item type, invalid parameters), otherwise returns -1 in case of errors. Examples: => forecast(#10,,1h) → forecast of item value after one hour based on last 10 values => forecast(1h,,30m) → forecast of item value after 30 minutes based on last hour data => forecast(1h,1d,12h) → forecast
---	--	--

FUNCTION

fuzzytime (sec)

Checking how much an item value (as times-tamp) differs from the Zabbix server time.

sec - seconds

Supported value types: float, int

Returns:
1 - difference between item value (as times-tamp) and Zabbix server times-tamp is less than or equal to T seconds
0 - otherwise

Usually used with the 'system.localtime' item to check that local time is in sync with the local time of Zabbix server. Can be used also with `vfs.file.time[/path/file,mode]` key to check that file didn't get updates for long time.

Example:
=> `fuzzytime(60)=0`
→ detect a problem if time difference is over 60 seconds

iregexp (<pattern>,<sec|#num>)

FUNCTION			
		This function is a non case-sensitive analogue of <code>regexp()</code> .	see <code>regexp()</code> Supported value types: str, log, text
last (<sec #num>,<time_shift>)			

The most recent value.	sec (ignored, equals #1) or #num (optional) - the Nth most recent value time_shift (optional) - evaluation point is moved the number of seconds back in time	Supported value types: float, int, str, text, log Take note that #num works differently here than with many other functions. For example: last() is always equal to last(#1) last(#3) - third most recent value (<i>not</i> three latest values) Zabbix does not guarantee exact order of values if more than two values exist within one second in history. The #num parameter is supported since Zabbix 1.6.2. The time_shift parameter is supported since Zabbix 1.8.2.
------------------------	--	--

logeventid (<pattern>)

FUNCTION

	Checking if event ID of the last log entry matches a regular expression.	pattern (optional) - regular expression describing the required pattern, POSIX extended style.	Supported value types: log Returns: 0 - does not match 1 - matches This function is supported since Zabbix 1.8.5.
logseverity	Log severity of the last log entry.		Supported value types: log Returns: 0 - default severity N - severity (integer, useful for Windows event logs: 1 - Information, 2 - Warning, 4 - Error, 7 - Failure Audit, 8 - Success Audit, 9 - Critical, 10 - Verbose). Zabbix takes log severity from Information field of Windows event log.
logsource (<pattern>)			

FUNCTION

	Checking if log source of the last log entry matches parameter.	pattern (optional) - required string	Supported value types: log Returns: 0 - does not match 1 - matches Normally used for Windows event logs. For example, log-source("VMware Server").
max (sec #num,<time_shift>)	Highest value of an item within the defined evaluation period.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time	Supported value types: float, int The time_shift parameter is supported since Zabbix 1.8.2.
min (sec #num,<time_shift>)			

FUNCTION

	Lowest value of an item within the defined evaluation period.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time	Supported value types: float, int The time_shift parameter is supported since Zabbix 1.8.2.
nodata (sec)			

FUNCTION

Checking for no data received.	sec - eval- uation period in seconds. The period should not be less than 30 seconds. nodata(0) is disal- lowed since Zabbix 3.0.6.	Supported value types: <i>any</i> Returns: 1 - if no data received during the defined period of time 0 - otherwise Note that this function will display an error if, within the period of the 1st pa- rameter: - there's no data and Zabbix server was restarted - there's no data and main- tenance was com- pleted - there's no data and the item was added or re- enabled Errors are displayed in the <i>Info</i> column in trigger <i>configura- tion</i> .
---	---	--

now

FUNCTION

percentile (sec|#num,<time_shift>,percentage)

Number of seconds since the Epoch (00:00:00 UTC, January 1, 1970).

Supported value types: *any*

P-th percentile of a period, where P (percentage) is specified by the third parameter.

sec or **#num** - maximum evaluation period¹ in seconds or in latest collected values (preceded by a hash mark)

time_shift (optional) - evaluation point is moved the number of seconds back in time

percentage - a floating-point number between 0 and 100 (inclusive) with up to 4 digits after the decimal point

Supported value types: float, int

This function is supported since Zabbix 3.0.0.

prev

Previous value.

Supported value types: float, int, str, text, log

regexp (<pattern>,<sec|#num>)

Returns the same as last(#2).

FUNCTION

Checking if the latest (most recent) value matches regular expres-	pattern (optional) - regular expres- sion, POSIX extended style. sec or #num (optional) - maximum evalua- tion period ¹ in seconds or in latest collected values (preceded by a hash mark). In this case, more than one value may be pro- cessed.	Supported value types: str, text, log Returns: 1 - found 0 - otherwise If more than one value is pro- cessed, '1' is returned if there is at least one matching value. This function is case-sensitive.
str (<pattern>,<sec #num>)		

Finding a string in the latest (most recent) value.	pattern (optional) - required string sec or #num (optional) - maximum evaluation period ¹ in seconds or in latest collected values (preceded by a hash mark). In this case, more than one value may be processed.	Supported value types: str, text, log Returns: 1 - found 0 - otherwise If more than one value is processed, '1' is returned if there is at least one matching value. This function is case-sensitive. <i>Tip:</i> You may use the 'count' function with the <i>like</i> operator to count string values that match a pattern.
---	--	---

strlen (<sec|#num>,<time_shift>)

FUNCTION

	Length of the latest (most recent) value in characters (not bytes).	sec (ignored, equals #1) or #num (optional) - the Nth most recent value time_shift (optional) - evaluation point is moved the number of seconds back in time	Supported value types: str, text, log Take note that #num works differently here than with many other functions. Examples: => strlen()(is equal to strlen(#1)) → length of the latest value => strlen(#3) → length of the third most recent value => strlen(,1d) → length of the most recent value one day ago. This function is supported since Zabbix 1.8.4.
sum	(sec #num,<time_shift>)		

FUNCTION

	Sum of collected values within the defined evaluation period.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time	Supported value types: float, int The function is evaluated starting with the first received value. The time_shift parameter is supported since Zabbix 1.8.2.
time	Current time in HHMMSS format.		Supported value types: <i>any</i> Example of returned value: 123055
timeleft	(sec #num,<time_shift>,threshold,<fit>)		

Time in seconds needed for an item to reach a specified threshold.	sec or #num - maximum evaluation period ¹ in seconds or in latest collected values specified (preceded by a hash mark) time_shift (optional) - evaluation point is moved the number of seconds back in time threshold - value to reach fit (optional) - see forecast()	Supported value types: float, int If value to return is larger than 999999999999.9999, return value is cropped to 999999999999.9999. Returns 999999999999.9999 if threshold cannot be reached. Becomes not supported only if misused in expression (wrong item type, invalid parameters), otherwise returns -1 in case of errors. Examples: => timeleft(#10,,0) → time until item value reaches zero based on last 10 values => timeleft(1h,,100) → time until item value reaches 100 based on last hour data => timeleft(1h,1d,0) → time until item value
--	--	---

Warning:

Important notes:

- 1) All functions return numeric values only. Comparison to strings is not supported.
- 2) Some of the functions cannot be used for non-numeric values!
- 3) String arguments should be double quoted. Otherwise, they might get misinterpreted.
- 4) For all trigger functions **sec** and **time_shift** must be an integer with an optional **time unit suffix** and has absolutely nothing to do with the item's data type.

Footnotes

- ¹ The function is evaluated starting with the first received value (unless the `time_shift` parameter is used).

7 Macros**1 Supported macros**

Overview

The table contains a complete list of macros supported by Zabbix.

Note:

To see all macros supported in a location (for example, in "map URL"), you may paste the location name into the search box at the bottom of your browser window (accessible by pressing CTRL+F) and do a search for *next*.

Macro	Supported in	Description
{ACTION.ID}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	<i>Numeric ID of the triggered action.</i> Supported since 2.2.0.
{ACTION.NAME}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	<i>Name of the triggered action.</i> Supported since 2.2.0.
{ALERT.MESSAGE}	→ Alert script parameters	<i>'Default message' value from action configuration.</i> Supported since 3.0.0.
{ALERT.SENDTO}	→ Alert script parameters	<i>'Send to' value from user media configuration.</i> Supported since 3.0.0.
{ALERT.SUBJECT}	→ Alert script parameters	<i>'Default subject' value from action configuration.</i> Supported since 3.0.0.
{DATE}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	<i>Current date in yyyy.mm.dd. format.</i>
{DISCOVERY.DEVICE.IPADDRESS}	→ Discovery notifications and commands	<i>IP address of the discovered device.</i> Available always, does not depend on host being added.
{DISCOVERY.DEVICE.DNS}	→ Discovery notifications and commands	<i>DNS name of the discovered device.</i> Available always, does not depend on host being added.
{DISCOVERY.DEVICE.STATUS}	→ Discovery notifications and commands	<i>Status of the discovered device: can be either UP or DOWN.</i>

Macro	Supported in	Description
{DISCOVERY.DEVICE.UPTIME}	→ Discovery notifications and commands	Time since the last change of discovery status for a particular device. For example: 1h 29m. For devices with status DOWN, this is the period of their downtime.
{DISCOVERY.RULE.NAME}	→ Discovery notifications and commands	Name of the discovery rule that discovered the presence or absence of the device or service.
{DISCOVERY.SERVICE.NAME}	→ Discovery notifications and commands	Name of the service that was discovered. For example: HTTP.
{DISCOVERY.SERVICE.PORT}	→ Discovery notifications and commands	Port of the service that was discovered. For example: 80.
{DISCOVERY.SERVICE.STATUS}	→ Discovery notifications and commands	Status of the discovered <i>service://</i> can be either UP or DOWN. {DISCOVERY.SERVICE.UPTIME} → Discovery notifications and commands Time since the last change of discovery status for a particular service. For example: 1h 29m. For services with status DOWN, this is the period of their downtime. {ESC.HISTORY} → Trigger-based notifications and commands → Internal notifications Escalation history. Log of previously sent messages. Shows previously sent notifications, on which escalation step they were sent and their status (sent//, in progress or failed).
{EVENT.ACK.HISTORY}	→ Trigger-based notifications and commands	Log of acknowledgements on the problem.
{EVENT.ACK.STATUS}	→ Trigger-based notifications and commands	Acknowledgement status of the event (Yes/No).
{EVENT.AGE}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	Age of the event that triggered an action. Useful in escalated messages.
{EVENT.DATE}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	Date of the event that triggered an action.
{EVENT.ID}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	Numeric ID of the event that triggered an action.
{EVENT.RECOVERY.DATE}	→ Recovery messages	Date of the recovery event. Supported since 2.2.0.
{EVENT.RECOVERY.ID}	→ Recovery messages	Numeric ID of the recovery event. Supported since 2.2.0.
{EVENT.RECOVERY.STATUS}	→ Recovery messages	Verbal value of the recovery event. Supported since 2.2.0.
{EVENT.RECOVERY.TIME}	→ Recovery messages	Time of the recovery event. Supported since 2.2.0.
{EVENT.RECOVERY.VALUE}	→ Recovery messages	Numeric value of the recovery event. Supported since 2.2.0.
{EVENT.STATUS}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	Verbal value of the event that triggered an action. Supported since 2.2.0.
{EVENT.TIME}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	Time of the event that triggered an action.

Macro	Supported in	Description
{EVENT.VALUE}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications 	<i>Numeric value of the event that triggered an action (1 for problem, 0 for recovering).</i> Supported since 2.2.0.
{HOST.CONN<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications → Global scripts (including confirmation text) → Icon labels in maps¹ → Item key parameters² → Host interface IP/DNS → Database monitoring additional parameters⁵ → SSH and Telnet scripts⁵ → Web monitoring⁶ → Low-level discovery rule filter regular expressions⁸ → URL field of dynamic URL screen element⁸ → Trigger names and descriptions → Trigger URLs¹⁰ 	<i>Host IP address or DNS name, depending on host settings³.</i> Supported in trigger names since 2.0.0.
{HOST.DESCRPTION<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications → Icon labels in maps¹ 	<i>Host description.</i> Supported since 2.4.0.
{HOST.DNS<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications → Global scripts (including confirmation text) → Icon labels in maps¹ → Item key parameters² → Host interface IP/DNS → Database monitoring additional parameters⁵ → SSH and Telnet scripts⁵ → Web monitoring⁶ → Low-level discovery rule filter regular expressions⁸ → URL field of dynamic URL screen element⁸ → Trigger names and descriptions → Trigger URLs¹⁰ 	<i>Host DNS name³.</i> Supported in trigger names since 2.0.0.
{HOST.HOST<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Autoregistration notifications and commands → Internal notifications → Global scripts (including confirmation text) → Item key parameters → Icon labels in maps¹ → Host interface IP/DNS → Database monitoring additional parameters⁵ → SSH and Telnet scripts⁵ → Web monitoring⁶ → Low-level discovery rule filter regular expressions⁸ → URL field of dynamic URL screen element⁸ → Trigger names and descriptions → Trigger URLs¹⁰ 	<i>Host name.</i> {HOSTNAME<1-9>} is deprecated.
{HOST.ID<1-9>}	<ul style="list-style-type: none"> → Map URLs → URL field of dynamic URL screen element⁸ → Trigger URLs¹⁰ 	<i>Host ID.</i>

Macro	Supported in	Description
{HOST.IP<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Autoregistration notifications and commands → Internal notifications → Global scripts (including confirmation text) → Icon labels in maps¹ → Item key parameters² → Host interface IP/DNS → Database monitoring additional parameters⁵ → SSH and Telnet scripts⁵ → Web monitoring⁶ → Low-level discovery rule filter regular expressions⁸ → URL field of dynamic URL screen element⁸ → Trigger names and descriptions → Trigger URLs¹⁰ 	<p><i>Host IP address</i>³.</p> <p>Supported since 2.0.0. {IPADDRESS<1-9>} is deprecated.</p>
{HOST.METADATA}	<ul style="list-style-type: none"> → Autoregistration notifications and commands 	<p><i>Host metadata.</i></p> <p>Used only for active agent autoregistration. Supported since 2.2.0.</p>
{HOST.NAME<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications → Global scripts (including confirmation text) → Icon labels in maps¹ → Item key parameters → Host interface IP/DNS → Database monitoring additional parameters⁵ → SSH and Telnet scripts⁵ → Web monitoring⁶ → Low-level discovery rule filter regular expressions⁸ → URL field of dynamic URL screen element⁸ → Trigger names and descriptions → Trigger URLs¹⁰ 	<p><i>Visible host name.</i></p> <p>Supported since 2.0.0.</p>
{HOST.PORT<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Autoregistration notifications and commands → Internal notifications → Trigger names and descriptions → Trigger URLs¹⁰ 	<p><i>Host (agent) port</i>³.</p> <p>Supported in autoregistration since 2.0.0. Supported in trigger names, trigger descriptions, internal and trigger-based notifications since 2.2.2.</p>
{HOSTGROUP.ID}	<ul style="list-style-type: none"> → Map URLs 	<p><i>Host group ID.</i></p>
{INVENTORY.ALIAS<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Alias field in host inventory.</i></p>
{INVENTORY.ASSET.TAG<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Asset tag field in host inventory.</i></p>
{INVENTORY.CHASSIS<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Chassis field in host inventory.</i></p>
{INVENTORY.CONTACT<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Contact field in host inventory.</i></p> <p>{PROFILE.CONTACT<1-9>} is deprecated.</p>
{INVENTORY.CONTRACT.NUMBER<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Contract number field in host inventory.</i></p>
{INVENTORY.DEPLOYMENT.STATUS<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Deployment status field in host inventory.</i></p>
{INVENTORY.HARDWARE<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Hardware field in host inventory.</i></p> <p>{PROFILE.HARDWARE<1-9>} is deprecated.</p>
{INVENTORY.HARDWARE.FULL<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Hardware (Full details) field in host inventory.</i></p>
{INVENTORY.HOST.NETMASK<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Host subnet mask field in host inventory.</i></p>
{INVENTORY.HOST.NETWORKS<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Host networks field in host inventory.</i></p>
{INVENTORY.HOST.ROUTER<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Host router field in host inventory.</i></p>
{INVENTORY.HW.ARCH<1-9>}	<ul style="list-style-type: none"> → Trigger-based notifications and commands → Internal notifications 	<p><i>Hardware architecture field in host inventory.</i></p>

Macro	Supported in	Description
{INVENTORY.HW.DATE.DECOMMISSION<1-9>} → Internal notifications	CDMA-based notifications and commands	Date hardware decommissioned field in host inventory.
{INVENTORY.HW.DATE.EXPIRATION<1-9>} → Internal notifications	CDMA-based notifications and commands	Date hardware maintenance expires field in host inventory.
{INVENTORY.HW.DATE.INSTALLATION<1-9>} → Internal notifications	CDMA-based notifications and commands	Date hardware installed field in host inventory.
{INVENTORY.HW.DATE.PURCHASE<1-9>} → Internal notifications	CDMA-based notifications and commands	Date hardware purchased field in host inventory.
{INVENTORY.INSTALLER.NAME<1-9>} → Internal notifications	CDMA-based notifications and commands	Installer name field in host inventory.
{INVENTORY.LOCATION<1-9>} → Internal notifications	CDMA-based notifications and commands	Location field in host inventory. {PROFILE.LOCATION<1-9>} is deprecated.
{INVENTORY.LOCATION.LATITUDE<1-9>} → Internal notifications	CDMA-based notifications and commands	Location latitude field in host inventory.
{INVENTORY.LOCATION.LONGITUDE<1-9>} → Internal notifications	CDMA-based notifications and commands	Location longitude field in host inventory.
{INVENTORY.MACADDRESSA<1-9>} → Internal notifications	CDMA-based notifications and commands	MAC address A field in host inventory. {PROFILE.MACADDRESS<1-9>} is deprecated.
{INVENTORY.MACADDRESSB<1-9>} → Internal notifications	CDMA-based notifications and commands	MAC address B field in host inventory.
{INVENTORY.MODEL<1-9>} → Internal notifications	CDMA-based notifications and commands	Model field in host inventory.
{INVENTORY.NAME<1-9>} → Internal notifications	CDMA-based notifications and commands	Name field in host inventory. {PROFILE.NAME<1-9>} is deprecated.
{INVENTORY.NOTES<1-9>} → Internal notifications	CDMA-based notifications and commands	Notes field in host inventory. {PROFILE.NOTES<1-9>} is deprecated.
{INVENTORY.OOB.IP<1-9>} → Internal notifications	CDMA-based notifications and commands	OOB IP address field in host inventory.
{INVENTORY.OOB.NETMASK<1-9>} → Internal notifications	CDMA-based notifications and commands	OOB subnet mask field in host inventory.
{INVENTORY.OOB.ROUTER<1-9>} → Internal notifications	CDMA-based notifications and commands	OOB router field in host inventory.
{INVENTORY.OS<1-9>} → Internal notifications	CDMA-based notifications and commands	OS field in host inventory. {PROFILE.OS<1-9>} is deprecated.
{INVENTORY.OS.FULL<1-9>} → Internal notifications	CDMA-based notifications and commands	OS (Full details) field in host inventory.
{INVENTORY.OS.SHORT<1-9>} → Internal notifications	CDMA-based notifications and commands	OS (Short) field in host inventory.
{INVENTORY.POC.PRIMARY.CELL<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC cell field in host inventory.
{INVENTORY.POC.PRIMARY.EMAIL<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC email field in host inventory.
{INVENTORY.POC.PRIMARY.NAME<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC name field in host inventory.
{INVENTORY.POC.PRIMARY.NOTES<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC notes field in host inventory.
{INVENTORY.POC.PRIMARY.PHONEA<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC phone A field in host inventory.
{INVENTORY.POC.PRIMARY.PHONEB<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC phone B field in host inventory.
{INVENTORY.POC.PRIMARY.SCREENNAME<1-9>} → Internal notifications	CDMA-based notifications and commands	Primary POC screen name field in host inventory.
{INVENTORY.POC.SECONDARY.CELL<1-9>} → Internal notifications	CDMA-based notifications and commands	Secondary POC cell field in host inventory.
{INVENTORY.POC.SECONDARY.EMAIL<1-9>} → Internal notifications	CDMA-based notifications and commands	Secondary POC email field in host inventory.
{INVENTORY.POC.SECONDARY.NAME<1-9>} → Internal notifications	CDMA-based notifications and commands	Secondary POC name field in host inventory.
{INVENTORY.POC.SECONDARY.NOTES<1-9>} → Internal notifications	CDMA-based notifications and commands	Secondary POC notes field in host inventory.

Macro	Supported in	Description
{INVENTORY.POC.SECONDARYPHONE.A<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Secondary POC phone A field in host inventory.
{INVENTORY.POC.SECONDARYPHONE.B<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Secondary POC phone B field in host inventory.
{INVENTORY.POC.SECONDARYSCREEN<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Secondary POC screen name field in host inventory.
{INVENTORY.SERIALNO.A<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Serial number A field in host inventory. {PROFILE.SERIALNO<1-9>} is deprecated.
{INVENTORY.SERIALNO.B<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Serial number B field in host inventory.
{INVENTORY.SITE.ADDRESS.A<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site address A field in host inventory.
{INVENTORY.SITE.ADDRESS.B<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site address B field in host inventory.
{INVENTORY.SITE.ADDRESS.C<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site address C field in host inventory.
{INVENTORY.SITE.CITY<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site city field in host inventory.
{INVENTORY.SITE.COUNTRY<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site country field in host inventory.
{INVENTORY.SITE.NOTES<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site notes field in host inventory.
{INVENTORY.SITE.RACK<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site rack location field in host inventory.
{INVENTORY.SITE.STATE<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site state/province field in host inventory.
{INVENTORY.SITE.ZIP<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Site ZIP/postal field in host inventory.
{INVENTORY.SOFTWARE<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software field in host inventory. {PROFILE.SOFTWARE<1-9>} is deprecated.
{INVENTORY.SOFTWARE.APPLICATION.A<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software application A field in host inventory.
{INVENTORY.SOFTWARE.APPLICATION.B<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software application B field in host inventory.
{INVENTORY.SOFTWARE.APPLICATION.C<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software application C field in host inventory.
{INVENTORY.SOFTWARE.APPLICATION.D<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software application D field in host inventory.
{INVENTORY.SOFTWARE.APPLICATION.E<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software application E field in host inventory.
{INVENTORY.SOFTWARE.FULL<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Software (Full details) field in host inventory.
{INVENTORY.TAG<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Tag field in host inventory. {PROFILE.TAG<1-9>} is deprecated.
{INVENTORY.TYPE<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Type field in host inventory. {PROFILE.DEVICETYPE<1-9>} is deprecated.
{INVENTORY.TYPE.FULL<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Type (Full details) field in host inventory.
{INVENTORY.URL.A<1-9>}	→ Trigger-based notifications and commands → Internal notifications	URL A field in host inventory.
{INVENTORY.URL.B<1-9>}	→ Trigger-based notifications and commands → Internal notifications	URL B field in host inventory.
{INVENTORY.URL.C<1-9>}	→ Trigger-based notifications and commands → Internal notifications	URL C field in host inventory.
{INVENTORY.VENDOR<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Vendor field in host inventory.
{ITEM.DESCRPTION<1-9>}	→ Trigger-based notifications and commands → Internal notifications	Description of the Nth item in the trigger expression that caused a notification. Supported since 2.0.0.

Macro	Supported in	Description
{ITEM.ID<1-9>}	→ Trigger-based notifications and commands → Internal notifications	<i>Numeric ID of the Nth item in the trigger expression that caused a notification.</i> Supported since 1.8.12.
{ITEM.KEY<1-9>}	→ Trigger-based notifications and commands → Internal notifications	<i>Key of the Nth item in the trigger expression that caused a notification.</i> Supported since 2.0.0. {TRIGGER.KEY} is deprecated.
{ITEM.KEY.ORIG<1-9>}	→ Trigger-based notifications and commands → Internal notifications	<i>Original key (with macros not expanded) of the Nth item in the trigger expression that caused a notification.</i> Supported since 2.0.6.
{ITEM.LASTVALUE<1-9>}	→ Trigger-based notifications and commands → Trigger names and descriptions	<i>The latest value of the Nth item in the trigger expression that caused a notification.</i> It will resolve to *UNKNOWN* in the frontend if the latest history value has been collected more than the ZBX_HISTORY_PERIOD time ago (defined in defines.inc.php). Supported since 1.4.3. It is alias to {HOST.HOST}:{ITEM.KEY}.last().
{ITEM.LOG.AGE<1-9>}	→ Trigger-based notifications and commands	<i>Age of the log item event.</i>
{ITEM.LOG.DATE<1-9>}	→ Trigger-based notifications and commands	<i>Date of the log item event.</i>
{ITEM.LOG.EVENTID<1-9>}	→ Trigger-based notifications and commands	<i>ID of the event in the event log.</i> For Windows event log monitoring only.
{ITEM.LOG.NSEVERITY<1-9>}	→ Trigger-based notifications and commands	<i>Numeric severity of the event in the event log.</i> For Windows event log monitoring only.
{ITEM.LOG.SEVERITY<1-9>}	→ Trigger-based notifications and commands	<i>Verbal severity of the event in the event log.</i> For Windows event log monitoring only.
{ITEM.LOG.SOURCE<1-9>}	→ Trigger-based notifications and commands	<i>Source of the event in the event log.</i> For Windows event log monitoring only.
{ITEM.LOG.TIME<1-9>}	→ Trigger-based notifications and commands	<i>Time of the log item event.</i>
{ITEM.NAME<1-9>}	→ Trigger-based notifications and commands → Internal notifications	<i>Name of the Nth item in the trigger expression that caused a notification.</i>
{ITEM.NAME.ORIG<1-9>}	→ Trigger-based notifications and commands → Internal notifications	<i>Original name (with macros not expanded) of the Nth item in the trigger expression that caused a notification.</i> Supported since 2.0.6.
{ITEM.STATE<1-9>}	→ Item-based internal notifications	<i>The latest state of the Nth item in the trigger expression that caused a notification.</i> Possible values: Not supported and Normal . Supported since 2.2.0.
{ITEM.VALUE<1-9>}	→ Trigger-based notifications and commands → Trigger names and descriptions	Resolved to either: 1) the historical (at-the-time-of-event) value of the Nth item in the trigger expression, if used in the context of trigger status change, for example, when displaying events or sending notifications. 2) the latest value of the Nth item in the trigger expression, if used without the context of trigger status change, for example, when displaying a list of triggers in a pop-up selection window. In this case works the same as {ITEM.LASTVALUE} In the first case it will resolve to *UNKNOWN* if the history value has already been deleted or has never been stored. In the second case, and in the frontend only, it will resolve to *UNKNOWN* if the latest history value has been collected more than the ZBX_HISTORY_PERIOD time ago (defined in defines.inc.php). Supported since 1.4.3.

Macro	Supported in	Description
{LLDRULE.DESCRPTION}	→ LLD-rule based internal notifications	<i>Description of the low-level discovery rule which caused a notification.</i> Supported since 2.2.0.
{LLDRULE.ID}	→ LLD-rule based internal notifications	<i>Numeric ID of the low-level discovery rule which caused a notification.</i> Supported since 2.2.0.
{LLDRULE.KEY}	→ LLD-rule based internal notifications	<i>Key of the low-level discovery rule which caused a notification.</i> Supported since 2.2.0.
{LLDRULE.KEY.ORIG}	→ LLD-rule based internal notifications	<i>Original key (with macros not expanded) of the low-level discovery rule which caused a notification.</i> Supported since 2.2.0.
{LLDRULE.NAME}	→ LLD-rule based internal notifications	<i>Name of the low-level discovery rule which caused a notification.</i> Supported since 2.2.0.
{LLDRULE.NAME.ORIG}	→ LLD-rule based internal notifications	<i>Original name (with macros not expanded) of the low-level discovery rule which caused a notification.</i> Supported since 2.2.0.
{LLDRULE.STATE}	→ LLD-rule based internal notifications	<i>The latest state of the low-level discovery rule.</i> Possible values: Not supported and Normal . Supported since 2.2.0.
{MAP.ID}	→ Map URLs	<i>Network map ID.</i>
{PROXY.DESCRPTION<1-9>}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	<i>Description of the proxy.</i> Resolves to either: 1) proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use indexed macros here. 2) proxy, which executed discovery (in discovery notifications). Use {PROXY.DESCRPTION} here, without indexing. 3) proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.DESCRPTION} here, without indexing. Supported since 2.4.0.
{PROXY.NAME<1-9>}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	<i>Name of the proxy.</i> Resolves to either: 1) proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use indexed macros here. 2) proxy, which executed discovery (in discovery notifications). Use {PROXY.NAME} here, without indexing. 3) proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.NAME} here, without indexing. Supported since 1.8.4.
{TIME}	→ Trigger-based notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications	<i>Current time in hh:mm:ss.</i>
{TRIGGER.DESCRPTION}	→ Trigger-based notifications and commands → Trigger-based internal notifications	<i>Trigger description.</i> Supported since 2.0.4. Starting with 2.2.0, all macros supported in a trigger description will be expanded if {TRIGGER.DESCRPTION} is used in notification text. {TRIGGER.COMMENT} is deprecated.
{TRIGGER.EVENTS.ACK}	→ Trigger-based notifications and commands → Icon labels in maps ¹	<i>Number of acknowledged events for a map element in maps, or for the trigger which generated current event in notifications.</i> Supported since 1.8.3.

Macro	Supported in	Description
{TRIGGER.EVENTS.PROBLEM.OK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of acknowledged PROBLEM events for all triggers disregarding their state. Supported since 1.8.3.
{TRIGGER.EVENTS.PROBLEM.UNACK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of unacknowledged PROBLEM events for all triggers disregarding their state. Supported since 1.8.3.
{TRIGGER.EVENTS.UNACK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of unacknowledged events for a map element in maps, or for the trigger which generated current event in notifications. Supported in map element labels since 1.8.3.
{TRIGGER.HOSTGROUP.NAME}	Trigger-based notifications and commands → Trigger-based internal notifications	A sorted (by SQL query), comma-space separated list of host groups in which the trigger is defined. Supported since 2.0.6.
{TRIGGER.PROBLEM.EVENTS.PROBLEM.ACK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of acknowledged PROBLEM events for triggers in PROBLEM state. Supported since 1.8.3.
{TRIGGER.PROBLEM.EVENTS.PROBLEM.UNACK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of unacknowledged PROBLEM events for triggers in PROBLEM state. Supported since 1.8.3.
{TRIGGER.EXPRESSION}	Trigger-based notifications and commands → Trigger-based internal notifications	Trigger expression. Supported since 1.8.12.
{TRIGGER.ID}	Trigger-based notifications and commands → Trigger-based internal notifications → Map URLs → Trigger URLs	Numeric trigger ID which triggered this action. Supported in trigger URLs since Zabbix 1.8.8.
{TRIGGER.NAME}	Trigger-based notifications and commands → Trigger-based internal notifications	Name of the trigger.
{TRIGGER.NAME.ORIG}	Trigger-based notifications and commands → Trigger-based internal notifications	Original name (with macros not expanded) of the trigger. Supported since 2.0.6.
{TRIGGER.NSEVERITY}	Trigger-based notifications and commands → Trigger-based internal notifications	Numerical trigger severity. Possible values: 0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster. Supported starting from Zabbix 1.6.2.
{TRIGGER.SEVERITY}	Trigger-based notifications and commands → Trigger-based internal notifications	Trigger severity name. Can be defined in Administration → General → Trigger severities.
{TRIGGER.STATE}	Trigger-based internal notifications	The latest state of the trigger. Possible values: Unknown and Normal . Supported since 2.2.0.
{TRIGGER.STATUS}	Trigger-based notifications and commands	Current trigger value. Can be either PROBLEM or OK. {STATUS} is deprecated.
{TRIGGER.TEMPLATE.NAME}	Trigger-based notifications and commands → Trigger-based internal notifications	A sorted (by SQL query), comma-space separated list of templates in which the trigger is defined, or *UNKNOWN* if the trigger is defined in a host. Supported since 2.0.6.
{TRIGGER.URL}	Trigger-based notifications and commands → Trigger-based internal notifications	Trigger URL.
{TRIGGER.VALUE}	Trigger-based notifications and commands → Trigger expressions	Current trigger numeric value: 0 - trigger is in OK state, 1 - trigger is in PROBLEM state.
{TRIGGERS.UNACK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of unacknowledged triggers for a map element, disregarding trigger state. A trigger is considered to be unacknowledged if at least one of its PROBLEM events is unacknowledged.
{TRIGGERS.PROBLEM.UNACK}	Trigger-based notifications and commands → Icon labels in maps ¹	Number of unacknowledged PROBLEM triggers for a map element. A trigger is considered to be unacknowledged if at least one of its PROBLEM events is unacknowledged. Supported since 1.8.3.

Macro	Supported in	Description
{TRIGGERS.ACK}	→ Icon labels in maps ¹	<i>Number of acknowledged triggers for a map element, disregarding trigger state.</i> A trigger is considered to be acknowledged if all of its PROBLEM events are acknowledged. Supported since 1.8.3.
{TRIGGERS.PROBLEM.ACK}	→ Icon labels in maps ¹	<i>Number of acknowledged PROBLEM triggers for a map element.</i> A trigger is considered to be acknowledged if all of its PROBLEM events are acknowledged. Supported since 1.8.3.
{host:key.func(param)}	→ Trigger-based notifications and commands → Icon labels and link labels in maps ^{1 4} → Graph names ⁷ → Trigger expressions ⁹	<i>Simple macros, as used in building trigger expressions.</i>
{\$MACRO}	→ See: Additional support for user macros	<i>User-definable macros.</i> Supported in item and trigger names since 1.8.4. Supported in global script commands and confirmation texts since Zabbix 2.2.0.

Footnotes

¹ Macros for map labels are supported since 1.8.

² The {HOST.*} macros supported in item key parameters will resolve to the interface that is selected for the item. When used in items without interfaces they will resolve to either the Zabbix agent, SNMP, JMX or IPMI interface of the host in this order of priority, since Zabbix 3.0.6. In Zabbix 3.0.0-3.0.5 they will not resolve when used in items without interfaces e.g. "Zabbix agent (active)", "Calculated" etc.

³ In remote commands, global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface, however, if it is not present, the main SNMP interface will be used. If SNMP is also not present, the main JMX interface will be used. If JMX is not present either, the main IPMI interface will be used.

⁴ Only the **avg**, **last**, **max** and **min** functions, with seconds as parameter are supported in this macro in map labels.

⁵ Supported since 2.0.3.

⁶ Supported since Zabbix 2.2.0. {HOST.*} macros are supported in web scenario *Name*, *Variables*, *Headers*, *SSL certificate file* and *SSL key file* fields and in scenario step *Name*, *URL*, *Post*, *Headers* and *Required string* fields.

⁷ Supported since Zabbix 2.2.0. Only the **avg**, **last**, **max** and **min** functions, with seconds as parameter are supported within this macro in graph names. The {HOST.HOST<1-9>} macro can be used as host within the macro. For example:

```
* %#{Cisco switch:ifAlias[#{SNMPINDEX}].last()}%
* %#{HOST.HOST}:ifAlias[#{SNMPINDEX}].last()}%
```

⁸ Supported since 2.4.0.

⁹ While supported to build trigger expressions, simple macros may not be used inside each other.

¹⁰ Supported since 3.0.0.

Indexed macros

The indexed macro syntax of {MACRO<1-9>} is limited to the context of **trigger expressions**. It can be used to reference hosts in the order in which they appear in the expression. Macros like {HOST.IP1}, {HOST.IP2}, {HOST.IP3} will resolve to the IP of the first, second and third host in the trigger expression (providing the trigger expression contains those hosts).

Additionally the {HOST.HOST<1-9>} macro is also supported within the {host:key.func(param)} macro in **graph names**. For example, {HOST.HOST2:key.func()} in the graph name will refer to the host of the second item in the graph.

Warning:

Use macros **without** index (i. e. {HOST.HOST}, {HOST.IP}, etc) in all other contexts.

Additional support for user macros

In addition to the locations listed, **user-definable** macros since Zabbix 2.0 are supported in numerous other locations:

- Hosts
 - Interface IP/DNS
 - Interface port
- Passive proxy
 - Interface port
- Items and item prototypes
 - Name (since Zabbix 1.8.4)
 - Key parameters
 - SNMPv3 context name
 - SNMPv3 security name
 - SNMPv3 auth pass
 - SNMPv3 priv pass
 - SNMPv1/v2 community
 - SNMP OID
 - SNMP port
 - SSH username
 - SSH public key
 - SSH private key
 - SSH password
 - SSH script (since Zabbix 2.0.3)
 - Telnet username
 - Telnet password
 - Telnet script (since Zabbix 2.0.3)
 - Calculated item **formula**
 - Trapper item "Allowed hosts" field (since Zabbix 2.2)
 - Database monitoring additional parameters (since Zabbix 2.0.3)
- Discovery
 - * SNMPv3 context name
 - * SNMPv3 security name
 - * SNMPv3 auth pass
 - * SNMPv3 priv pass
 - * SNMPv1/v2 community
 - * SNMP OID
- Low-level discovery rule
 - * Name (since Zabbix 1.8.4)
 - * Key parameters
 - * SNMPv3 context name
 - * SNMPv3 security name
 - * SNMPv3 auth pass
 - * SNMPv3 priv pass
 - * SNMPv1/v2 community
 - * SNMP OID
 - * SNMP port
 - * SSH username
 - * SSH public key
 - * SSH private key
 - * SSH password
 - * SSH script (since Zabbix 2.0.3)
 - * Telnet username
 - * Telnet password
 - * Telnet script (since Zabbix 2.0.3)
 - * Trapper item "Allowed hosts" field (since Zabbix 2.2)
 - * Database monitoring additional parameters (since Zabbix 2.0.3)
 - * Filter regular expressions (since Zabbix 2.4)
- * Web scenario (since Zabbix 2.2.0)
 - * Name
 - * Agent
 - * HTTP proxy
 - * Variables

- * Headers
- * Step name
- * Step URL
- * Step post variables
- * Step headers
- * Required string
- * Required status codes
- * Authentication (user and password)
- * SSL certificate file
- * SSL key file
- * SSL key password
- Triggers
 - * Name (since Zabbix 1.8.4)
 - * Expression (only in constants and function parameters)
 - * Description
 - * URLs (since Zabbix 3.0)
- Trigger-based notifications and commands (since Zabbix 2.4)
- Trigger-based internal notifications (since Zabbix 2.4)
- Global scripts (including confirmation text) (since Zabbix 2.2.0)
- URL field of dynamic URL screen element (since Zabbix 2.4)

Macros used in low-level discovery

There is a type of macro used within the **low-level discovery** function - **{#MACRO}**. It is a macro that is used in an LLD rule and returns real values of file system names, network interfaces and SNMP OIDs.

These macros can be used for creating item, trigger and graph *prototypes*. Then, when discovering real file systems, network interfaces etc., these macros are substituted with real values and are the basis for creating real items, triggers and graphs.

These macros are also used in creating host and host group **prototypes** in virtual machine discovery.

LLD macros can be used:

- for item prototypes in
 - names
 - key parameters
 - units
 - SNMP OIDs
 - IPMI sensor fields
 - calculated item formulas
 - SSH and Telnet scripts
 - database monitoring SQL queries
 - descriptions (supported since 2.2.0)
- for trigger prototypes in
 - names
 - expressions (insofar as when referencing an item key prototype and as standalone constants)
 - URLs (supported since 3.0.0)
 - descriptions (supported since 2.2.0)
- for graph prototypes in
 - names
- for host prototypes (supported since 2.2.0) in
 - names
 - visible names
 - host group prototype names
 - (see the **full list**)

In all those places LLD macros can be used inside user macro context.

Some low-level discovery macros come "pre-packaged" with the LLD function in Zabbix - {#FSNAME}, {#FSTYPE}, {#IFNAME}, {#SNMPINDEX}, {#SNMPVALUE}. However, adhering to these names is not compulsory when creating a **custom** low-level discovery rule. Then you may use any other LLD macro name and refer to that name.

8 Setting time periods

1 Format

To set a time period, the following format has to be used:

`d-d, hh:mm-hh:mm`

You can specify more than one time period using a semicolon (;) separator:

`d-d, hh:mm-hh:mm; d-d, hh:mm-hh:mm . . .`

2 Description

Symbol	Description
d	Day of the week: 1 - Monday, 2 - Tuesday ,... , 7 - Sunday
hh	Hours: 00-24
mm	Minutes: 00-59

3 Default

Empty time period specification equals 01-07,00:00-24:00, which is the default value.

Attention:

The upper limit of a time period is not included. Thus, if you specify 09:00-18:00 the last second included in the time period is 17:59:59. This is true starting from version 1.8.7, for everything, while **Working time** has always worked this way.

4 Examples

Working hours. Monday - Friday from 9:00 till 18:00:

`1-5,09:00-18:00`

Working hours plus weekend. Monday - Friday from 9:00 till 18:00 and Saturday, Sunday from 10:00 till 16:00:

`1-5,09:00-18:00;6-7,10:00-16:00`

9 Command execution

Zabbix uses common functionality to execute user parameters, remote commands, `system.run[]` items without the "nowait" flag, scripts (alert, external and global) and some internal commands.

The command/script is executed similarly on both Unix and Windows platforms:

1. Zabbix (the parent process) creates a pipe for communication
2. Zabbix sets the pipe as the output for the to-be-created child process
3. Zabbix creates the child process (runs the command/script)
4. A new process group (in Unix) or a job (in Windows) is created for the child process
5. Zabbix reads from the pipe until timeout occurs or no one is writing to the other end (ALL handles/file descriptors have been closed). Note that the child process can create more processes and exit before they exit or close the handle/file descriptor.
6. If the timeout has not been reached, Zabbix waits until the initial child process exits or timeout occurs
7. At this point it is assumed that everything is done and the whole process tree (i.e. the process group or the job) is terminated

Attention:

Steps 5-7 do not refer to remote commands as they are executed with a "nowait" flag.

Attention:

Zabbix assumes that a command/script has done processing when the initial child process has exited AND no other process is still keeping the output handle/file descriptor open. When processing is done, ALL created processes are terminated.

All double quotes and backslashes in the command are escaped with backslashes and the command is enclosed in double quotes.

Read more about **user parameters**, **remote commands**, **alert scripts**.

10 Recipes for monitoring

General

Monitoring server availability

At least three methods (or combination of all methods) may be used in order to monitor availability of a server.

- ICMP ping ("icmpping" key)
- "zabbix[host,agent,available]" item
- trigger function nodata() for monitoring the availability of hosts that use active checks only

Sending alerts via WinPopUps

WinPopUps maybe very useful if you're running Windows OS and want to get quick notification from Zabbix. It could be good addition for email-based alert messages. Details about enabling of WinPopUps can be found at <http://www.zabbix.com/forum/showthread.php?t=2147>.

Monitoring specific applications

AS/400

IBM AS/400 platform can be monitored using SNMP. More information is available at <http://publib-b.boulder.ibm.com/Redbooks.nsf/RedbookAbstracts/sg244504.html?Open>.

MySQL

Several user parameters can be used for the monitoring of MySQL in the agent configuration file: /usr/local/etc/zabbix_agentd.conf

```
### Set of parameters for monitoring MySQL server (v3.23.42 and later)
### Change -u and add -p if required
#UserParameter=mysql.ping,mysqladmin -uroot ping|grep alive|wc -l
#UserParameter=mysql.uptime,mysqladmin -uroot status|cut -f2 -d":"|cut -f2 -d" "
#UserParameter=mysql.threads,mysqladmin -uroot status|cut -f3 -d":"|cut -f2 -d" "
#UserParameter=mysql.questions,mysqladmin -uroot status|cut -f4 -d":"|cut -f2 -d" "
#UserParameter=mysql.slowqueries,mysqladmin -uroot status|cut -f5 -d":"|cut -f2 -d" "
#UserParameter=mysql.qps,mysqladmin -uroot status|cut -f9 -d":"|cut -f2 -d" "
#UserParameter=mysql.version,mysql -V
```

- *mysql.ping*

Check whether MySQL is alive.

Result: 0 - not started 1 - alive

- *mysql.uptime*

Number of seconds MySQL is running.

- *mysql.threads*

Number of MySQL threads.

- *mysql.questions*

Number of processed queries.

- *mysql.slowqueries*

Number of slow queries.

- *mysql.qps*

Queries per second.

- *mysql.version*

Version of MySQL. For example: mysql Ver 14.14 Distrib 5.1.53, for pc-linux-gnu (i686)

For additional information see also the userparameter_mysql.conf file in conf/zabbix_agentd directory.

Mikrotik routers

Use SNMP agent provided by Mikrotik. See <http://www.mikrotik.com> for more information.

Windows

Use Zabbix Windows agent included (pre-compiled) into Zabbix distribution.

Tuxedo

Tuxedo command line utilities `tadmin` and `qadmin` can be used in definition of a `UserParameter` in order to return per server/service/queue performance counters and availability of Tuxedo resources.

Informix

Standard Informix utility **onstat** can be used for monitoring of virtually every aspect of Informix database. Also, Zabbix can retrieve information provided by Informix SNMP agent.

HP OpenView

Zabbix can be configured to send messages to OpenView server. The following steps must be performed:

Step 1

Define new media.

The media will execute a script which will send required information to OpenView.

Step 2

Define new user.

The user has to be linked with the media.

Step 3

Configure actions.

Configure actions to send all (or selected) trigger status changes to the user.

Step 4

Write media script.

The script will have the following logic. If trigger is ON, then execute OpenView command `opcmsg -id application=<application> msg_grp=<msg_grp> object=<object> msg_text=<text>`. The command will return unique message ID which has to be stored somewhere, preferably in a new table of ZABBIX database. If trigger is OFF then `opcmack <message id>` has to be executed with message ID retrieved from the database.

Refer to OpenView official documentation for more details about `opcmsg` and `opcmack`. The media script is not given here.

11 Performance tuning

Attention:

This is a work in progress.

Overview

It is very important to have Zabbix system properly tuned for maximum performance.

Hardware

General advice on hardware:

- Use fastest processor available
- SCSI or SAS is better than IDE (performance of IDE disks may be significantly improved by using utility `hdparm`) and SATA
- 15K RPM is better than 10K RPM which is better than 7200 RPM
- Use fast RAID storage
- Use fast Ethernet adapter
- Having more memory is always better

Operating system

- Use latest (stable!) version of OS
- Exclude unnecessary functionality from kernel
- Tune kernel parameters

Zabbix configuration parameters

Many parameters may be tuned to get optimal performance.

zabbix_server

StartPollers

General rule - keep value of this parameter as low as possible. Every additional instance of zabbix_server adds known overhead, in the same time, parallelism is increased. Optimal number of instances is achieved when queue, on average, contains minimum number of parameters (ideally, 0 at any given moment). This value can be monitored by using internal check zabbix[queue].

Note:

See the **"See also"** section at the bottom of this page to find out how to configure optimal count of zabbix processes.

DebugLevel

Optimal value is 3.

DBSocket

MySQL only. It is recommended to use DBSocket for connection to the database. That is the fastest and the most secure way.

Database engine

This is probably the most important part of Zabbix tuning. Zabbix heavily depends on the availability and performance of database engine.

- use fastest database engine, i.e. MySQL or PostgreSQL
- use stable release of a database engine
- rebuild MySQL or PostgreSQL from sources to get maximum performance
- follow performance tuning instructions taken from MySQL or PostgreSQL documentation
- for MySQL, use InnoDB table structure
- ZABBIX works at least 1.5 times faster (comparing to MyISAM) if InnoDB is used. This is because of increased parallelism. However, InnoDB requires more CPU power.
- tuning the database server for the best performance is highly recommended.
- keep database tables on different hard disks
- 'history', 'history_str', 'items', 'functions', 'triggers', and 'trends' are most heavily used tables.
- for large installations keeping MySQL temporary files in tmpfs is:
 - MySQL >= 5.5: not recommended ([MySQL bug #58421](#))
 - MySQL < 5.5: recommended

GUI debugging

Problems related to the frontend performance may be diagnosed using the frontend **debug mode**.

General advice

- monitor required parameters only
- tune 'Update interval' for all items. Keeping a small update interval may be good for nice graphs, however, this may overload Zabbix
- tune parameters for default templates
- tune housekeeping parameters
- do not monitor parameters which return the same information.
- avoid the use of triggers with long period given as function argument. For example, max(3600) will be calculated significantly slower than max(60).

Viewing Zabbix process performance with "ps" and "top"

Since Zabbix 2.2 processes change their commandlines to display current activity and meaningful statistics, like:

UID	PID	PPID	C	STIME	TTY	TIME	CMD
zabbix22	4584	1	0	14:55	?	00:00:00	zabbix_server -c /home/zabbix22/zabbix_server.conf
zabbix22	4587	4584	0	14:55	?	00:00:00	zabbix_server: configuration syncer [syncd configuration in 0.000000s]
zabbix22	4588	4584	0	14:55	?	00:00:00	zabbix_server: db watchdog [syncd alerts config in 0.018748s]
zabbix22	4608	4584	0	14:55	?	00:00:00	zabbix_server: timer #1 [processed 3 triggers, 0 events in 0.000000s]
zabbix22	4609	4584	0	14:55	?	00:00:00	zabbix_server: timer #2 [processed 2 triggers, 0 events in 0.000000s]
zabbix22	4637	4584	0	14:55	?	00:00:01	zabbix_server: history syncer #4 [syncd 35 items in 0.166198s]
zabbix22	4657	4584	0	14:55	?	00:00:00	zabbix_server: vmware collector #1 [updated 0, removed 0 VMwar
zabbix22	4670	1	0	14:55	?	00:00:00	zabbix_proxy -c /home/zabbix22/zabbix_proxy.conf
zabbix22	4673	4670	0	14:55	?	00:00:00	zabbix_proxy: configuration syncer [syncd config 15251 bytes

```

zabbix22 4674 4670 0 14:55 ? 00:00:00 zabbix_proxy: heartbeat sender [sending heartbeat message succ
zabbix22 4688 4670 0 14:55 ? 00:00:00 zabbix_proxy: icmp pinger #1 [got 1 values in 1.811128 sec, id
zabbix22 4690 4670 0 14:55 ? 00:00:00 zabbix_proxy: housekeeper [deleted 9870 records in 0.233491 se
zabbix22 4701 4670 0 14:55 ? 00:00:08 zabbix_proxy: http poller #2 [got 1 values in 0.024105 sec, id
zabbix22 4707 4670 0 14:55 ? 00:00:00 zabbix_proxy: history syncer #4 [synced 22 items in 0.008565 s
zabbix22 4738 1 0 14:55 ? 00:00:00 zabbix_agentd -c /home/zabbix22/zabbix_agentd.conf
zabbix22 4739 4738 0 14:55 ? 00:00:00 zabbix_agentd: collector [idle 1 sec]
zabbix22 4740 4738 0 14:55 ? 00:00:00 zabbix_agentd: listener #1 [waiting for connection]
zabbix22 4741 4738 0 14:55 ? 00:00:00 zabbix_agentd: listener #2 [processing request]

```

The main process is an exception. Instead of current activity the original commandline is shown. This helps to distinguish processes on systems with multiple Zabbix instances.

This feature is not implemented for Microsoft Windows.

If logging level is set to **DebugLevel=4** these activity and statistics messages are also written into log file.

Linux

On Linux systems `ps` command can be used together with `watch` command for observing how Zabbix is doing. For example, to run `ps` command 5 times per second to see process activities:

```
watch -n 0.2 ps -fu zabbix
```

To show only Zabbix proxy and agent processes:

```
watch -tn 0.2 'ps -f -C zabbix_proxy -C zabbix_agentd'
```

To show only history syncer processes:

```
watch -tn 0.2 'ps -fc zabbix_server | grep history'
```

The `ps` command produces a wide output (approximately 190 columns) as some activity messages are long. If your terminal has less than 190 columns of text you can try

```
watch -tn 0.2 'ps -o cmd -C zabbix_server -C zabbix_proxy -C zabbix_agentd'
```

to display only commandlines without UID, PID, start time etc.

`top` command also can be used for observing Zabbix performance. Pressing 'c' key in `top` shows processes with their commandlines. In our tests on Linux `top` and `atop` correctly displayed changing activities of Zabbix processes, but `htop` was not displaying changing activities.

BSD systems

If `watch` command is not installed, a similar effect can be achieved with

```
while [ 1 ]; do ps x; sleep 0.2; clear; done
```

AIX, HP-UX

If `watch` command is not available, one can try

```
while [ 1 ]; do ps -fu zabbix; sleep 1; clear; done
```

Solaris

By default the `ps` command does not show changing activities. One option is to use `/usr/ucb/ps` instead. If `watch` command is not installed, a periodically updated list of processes can be shown with

```
while [ 1 ]; do /usr/ucb/ps gxww; sleep 1; clear; done
```

On Solaris 11:

- `/usr/ucb/ps` is not installed by default. You may need to install `ucb` package, e.g. `pkg install compatibility/ucb`,
- if Zabbix daemon has been started by privileged user its activities are not shown to non-privileged user.
- the `sleep` command accepts not only whole seconds but also fractions of second (e.g. `sleep 0.2`).

See also

1. [How to configure optimal count of zabbix processes](#)

12 Version compatibility

Supported agents

Zabbix agents from previous Zabbix versions are compatible with Zabbix 3.0. However, you may need to review the configuration of older agents as some parameters have changed, for example, parameters related to **logging** for versions before 3.0.

To take full advantage of new and improved items, improved performance and reduced memory usage, use the latest 3.0 agent.

Note that Zabbix agent newer than 3.0 cannot be used with Zabbix server 3.0.

Supported Zabbix proxies

Both Zabbix 3.0 proxies and Zabbix 3.0 server are supported to work only with Zabbix 3.0 server and Zabbix 3.0 proxies respectively.

Supported XML files

XML files, exported with 1.8, 2.0, 2.2 and 2.4 are supported for import in Zabbix 3.0.

Attention:

In Zabbix 1.8 XML export format, trigger dependencies are stored by name only. If there are several triggers with the same name (for example, having different severities and expressions) that have a dependency defined between them, it is not possible to import them. Such dependencies must be manually removed from the XML file and re-added after import.

13 Database error handling

If Zabbix detects that the backend database is not accessible, it will send a notification message and continue the attempts to connect to the database. For some database engines, specific error codes are recognised.

MySQL

- CR_CONN_HOST_ERROR
- CR_SERVER_GONE_ERROR
- CR_CONNECTION_ERROR
- CR_SERVER_LOST
- CR_UNKNOWN_HOST
- ER_SERVER_SHUTDOWN
- ER_ACCESS_DENIED_ERROR
- ER_ILLEGAL_GRANT_FOR_TABLE
- ER_TABLEACCESS_DENIED_ERROR
- ER_UNKNOWN_ERROR

14 Zabbix sender dynamic link library for Windows

In a Windows environment applications can send data to Zabbix server/proxy directly by using the Zabbix sender dynamic link library (zabbix_sender.dll) instead of having to launch an external process (zabbix_sender.exe).

The dynamic link library with the development files is located in bin\winXX\dev folders. To use it, include the zabbix_sender.h header file and link with the zabbix_sender.lib library. An example file with Zabbix sender API usage can be found in build\win32\examples\zabbix_sender folder.

The following functionality is provided by the Zabbix sender dynamic link library:

```
int zabbix_sender_send_values(const char *address, unsigned short port, const char *source, const zabbix_
char **result);{.c}
```

The following data structures are used by the Zabbix sender dynamic link library:

```
typedef struct
{
    /* host name, must match the name of target host in Zabbix */
    char    *host;
    /* the item key */
    char    *key;
    /* the item value */
    char    *value;
}
zabbix_sender_value_t;

typedef struct
{
    /* number of total values processed */
    int total;
    /* number of failed values */
    int failed;
    /* time in seconds the server spent processing the sent values */
    double  time_spent;
}
zabbix_sender_info_t;
```

15 Other issues

Login and systemd

We recommend creating a *zabbix* user as system user, that is, without ability to log in. Some users ignore this recommendation and use the same account to log in (e. g. using SSH) to host running Zabbix. This might crash Zabbix daemon on log out. In this case you will get something like the following in Zabbix server log:

```
zabbix_server [27730]: [file:'selfmon.c',line:375] lock failed: [22] Invalid argument
zabbix_server [27716]: [file:'dbconfig.c',line:5266] lock failed: [22] Invalid argument
zabbix_server [27706]: [file:'log.c',line:238] lock failed: [22] Invalid argument
```

and in Zabbix agent log:

```
zabbix_agentd [27796]: [file:'log.c',line:238] lock failed: [22] Invalid argument
```

This happens because of default systemd setting `RemoveIPC=yes` configured in `/etc/systemd/logind.conf`. When you log out of the system the semaphores created by Zabbix previously are removed which causes the crash.

A quote from systemd documentation:

`RemoveIPC=`

Controls whether System V and POSIX IPC objects belonging to the user shall be removed when the user fully logs out. Takes a boolean argument. If enabled, the user may not consume IPC resources after the last of the user's sessions terminated. This covers System V semaphores, shared memory and message queues, as well as POSIX shared memory and message queues. Note that IPC objects of the root user and other system users are excluded from the effect of this setting. Defaults to "yes".

There are 2 solutions to this problem:

1. (recommended) Stop using *zabbix* account for anything else than Zabbix processes, create a dedicated account for other things.
2. (not recommended) Set `RemoveIPC=no` in `/etc/systemd/logind.conf` and reboot the system.

Zabbix manpages

These are Zabbix manpages for Zabbix processes.

zabbix_agentd

Section: Maintenance Commands (8)

Updated: 2018-10-11

[Index Return to Main Contents](#)

NAME

zabbix_agentd - Zabbix agent daemon

SYNOPSIS

```
zabbix_agentd [-c config-file]  
zabbix_agentd [-c config-file] -p  
zabbix_agentd [-c config-file] -t item-key  
zabbix_agentd [-c config-file] -R runtime-option  
zabbix_agentd -h  
zabbix_agentd -V
```

DESCRIPTION

zabbix_agentd is a daemon for monitoring of various server parameters.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one. Absolute path should be specified.

-f, --foreground

Run Zabbix agent in foreground.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options

log_level_increase[=*target*]

Increase log level, affects all processes if target is not specified

log_level_decrease[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

process-type

All processes of specified type (e.g., listener)

process-type,N

Process type and number (e.g., listener,3)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

-p, --print

Print known items and exit. For each item either generic defaults are used, or specific defaults for testing are supplied. These defaults are listed in square brackets as item key parameters. Returned values are enclosed in square brackets and prefixed with the type of the returned value, separated by a pipe character. For user parameters type is always **t**, as the agent can not determine all possible return values. Items, displayed as working, are not guaranteed to work from the Zabbix server or `zabbix_get` when querying a running agent daemon as permissions or environment may be different. Returned value types are:

d

Number with a decimal part.

m

Not supported. This could be caused by querying an item that only works in the active mode like a log monitoring item or an item that requires multiple collected values. Permission issues or incorrect user parameters could also result in the not supported state.

s

Text. Maximum length not limited.

t

Text. Same as **s**.

u

Unsigned integer.

-t, --test *item-key*

Test single item and exit. See **--print** for output description.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_agentd.conf

Default location of Zabbix agent configuration file (if not modified during compile time).

NAME

zabbix_get - Zabbix get utility

SYNOPSIS

zabbix_get -s *host-name-or-IP* [-**p** *port-number*] [-**I** *IP-address*] -**k** *item-key*

zabbix_get -s *host-name-or-IP* [-**p** *port-number*] [-**I** *IP-address*] --**tls-connect** **cert** --**tls-ca-file** *CA-file* [--**tls-crl-file** *CRL-file*] [--**tls-agent-cert-issuer** *cert-issuer*] [--**tls-agent-cert-subject** *cert-subject*] --**tls-cert-file** *cert-file* --**tls-key-file** *key-file* -**k** *item-key*

zabbix_get -s *host-name-or-IP* [-**p** *port-number*] [-**I** *IP-address*] --**tls-connect** **psk** --**tls-psk-identity** *PSK-identity* --**tls-psk-file** *PSK-file* -**k** *item-key*

zabbix_get -h

zabbix_get -V

DESCRIPTION

zabbix_get is a command line utility for getting data from Zabbix agent.

OPTIONS

-s, --host *host-name-or-IP*

Specify host name or IP address of a host.

-p, --port *port-number*

Specify port number of agent running on the host. Default is 10050.

-I, --source-address *IP-address*

Specify source IP address.

-k, --key *item-key*

Specify key of item to retrieve value for.

--tls-connect *value*

How to connect to agent. Values:

unencrypted

connect without encryption (default)

psk

connect using TLS and a pre-shared key

cert

connect using TLS and a certificate

--tls-ca-file *CA-file*

Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

--tls-crl-file *CRL-file*

Full pathname of a file containing revoked certificates.

--tls-agent-cert-issuer *cert-issuer*

Allowed agent certificate issuer.

--tls-agent-cert-subject *cert-subject*

Allowed agent certificate subject.

--tls-cert-file *cert-file*

Full pathname of a file containing the certificate or certificate chain.

--tls-key-file *key-file*

Full pathname of a file containing the private key.

--tls-psk-identity *PSK-identity*

PSK-identity string.

--tls-psk-file *PSK-file*

Full pathname of a file containing the pre-shared key.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

EXAMPLES

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]"
```

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]" --tls-connect cert --tls-ca-file /home/zabbix/zabbix_ca_file  
--tls-agent-cert-issuer "CN=Signing CA,OU=IT operations,O=Example Corp,DC=example,DC=com" --tls-agent-cert-  
subject "CN=server1,OU=IT operations,O=Example Corp,DC=example,DC=com" --tls-cert-file /home/zabbix/zabbix_get.crt  
--tls-key-file /home/zabbix/zabbix_get.key
```

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]" --tls-connect psk --tls-psk-identity "PSK ID Zabbix  
agentd" --tls-psk-file /home/zabbix/zabbix_agentd.psk
```

NAME

zabbix_proxy - Zabbix proxy daemon

SYNOPSIS

zabbix_proxy [-c *config-file*]
zabbix_proxy [-c *config-file*] -R *runtime-option*
zabbix_proxy -h
zabbix_proxy -V

DESCRIPTION

zabbix_proxy is a daemon that collects monitoring data from devices and sends it to Zabbix server.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one. Absolute path should be specified.

-f, --foreground

Run Zabbix proxy in foreground.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options

config_cache_reload

Reload configuration cache. Ignored if cache is being currently loaded. Active Zabbix proxy will connect to the Zabbix server and request configuration data. Default configuration file (unless -c option is specified) will be used to find PID file and signal will be sent to process, listed in PID file.

housekeeper_execute

Execute the housekeeper. Ignored if housekeeper is being currently executed.

log_level_increase[=*target*]

Increase log level, affects all processes if target is not specified

log_level_decrease[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

process-type

All processes of specified type (e.g., poller)

process-type,N

Process type and number (e.g., poller,3)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_proxy.conf

Default location of Zabbix proxy configuration file (if not modified during compile time).

NAME

zabbix_sender - Zabbix sender utility

SYNOPSIS

zabbix_sender [-v] -z server [-p port] [-I IP-address] -s host -k key -o value

zabbix_sender [-v] -z server [-p port] [-I IP-address] [-s host] [-T] [-r] -i input-file

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-s host] -k key -o value

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-s host] [-T] [-r] -i input-file

zabbix_sender [-v] -z server [-p port] [-I IP-address] -s host --tls-connect cert --tls-ca-file CA-file [--tls-crl-file CRL-file] [--tls-server-cert-issuer cert-issuer] [--tls-server-cert-subject cert-subject] --tls-cert-file cert-file --tls-key-file key-file -k key -o value

zabbix_sender [-v] -z server [-p port] [-I IP-address] [-s host] --tls-connect cert --tls-ca-file CA-file [--tls-crl-file CRL-file] [--tls-server-cert-issuer cert-issuer] [--tls-server-cert-subject cert-subject] --tls-cert-file cert-file --tls-key-file key-file [-T] [-r] -i input-file

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-s host] --tls-connect cert --tls-ca-file CA-file [--tls-crl-file CRL-file] [--tls-server-cert-issuer cert-issuer] [--tls-server-cert-subject cert-subject] --tls-cert-file cert-file --tls-key-file key-file -k key -o value

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-s host] --tls-connect cert --tls-ca-file CA-file [--tls-crl-file CRL-file] [--tls-server-cert-issuer cert-issuer] [--tls-server-cert-subject cert-subject] --tls-cert-file cert-file --tls-key-file key-file [-T] [-r] -i input-file

zabbix_sender [-v] -z server [-p port] [-I IP-address] -s host --tls-connect psk --tls-psk-identity PSK-identity --tls-psk-file PSK-file -k key -o value

zabbix_sender [-v] -z server [-p port] [-I IP-address] [-s host] --tls-connect psk --tls-psk-identity PSK-identity --tls-psk-file PSK-file [-T] [-r] -i input-file

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-s host] --tls-connect psk --tls-psk-identity PSK-identity --tls-psk-file PSK-file -k key -o value

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-s host] --tls-connect psk --tls-psk-identity PSK-identity

--tls-psk-file *PSK-file* [-T] [-r] -i *input-file*

zabbix_sender -h

zabbix_sender -V

DESCRIPTION

zabbix_sender is a command line utility for sending monitoring data to Zabbix server or proxy. On the Zabbix server an item of type **Zabbix trapper** should be created with corresponding key. Note that incoming values will only be accepted from hosts specified in **Allowed hosts** field for this item.

OPTIONS

-c, --config *config-file*

Use *config-file*. **Zabbix sender** reads server details from the agentd configuration file. By default **Zabbix sender** does not read any configuration file. Absolute path should be specified. Only parameters **Hostname**, **ServerActive**, **SourceIP**, **TLSCConnect**, **TLSCAFile**, **TLSCRLFile**, **TLSServerCertIssuer**, **TLSServerCertSubject**, **TLSCertFile**, **TLSKeyFile**, **TLSPSKIdentity** and **TLSPSKFile** are supported. First entry from the **ServerActive** parameter is used.

-z, --zabbix-server *server*

Hostname or IP address of Zabbix server. If a host is monitored by a proxy, proxy hostname or IP address should be used instead. When used together with **--config**, overrides the first entry of **ServerActive** parameter specified in agentd configuration file.

-p, --port *port*

Specify port number of Zabbix server trapper running on the server. Default is 10051. When used together with **--config**, overrides the port of first entry of **ServerActive** parameter specified in agentd configuration file.

-I, --source-address *IP-address*

Specify source IP address. When used together with **--config**, overrides **SourceIP** parameter specified in agentd configuration file.

-s, --host *host*

Specify host name the item belongs to (as registered in Zabbix frontend). Host IP address and DNS name will not work. When used together with **--config**, overrides **Hostname** parameter specified in agentd configuration file.

-k, --key *key*

Specify item key to send value to.

-o, --value *value*

Specify item value.

-i, --input-file *input-file*

Load values from input file. Specify - as **<input-file>** to read values from standard input. Each line of file contains whitespace delimited: **<hostname> <key> <value>**. Each value must be specified on its own line. Each line must contain 3 whitespace delimited entries: **<hostname> <key> <value>**, where "hostname" is the name of monitored host as registered in Zabbix frontend, "key" is target item key and "value" - the value to send. Specify - as **<hostname>** to use hostname from agent configuration file or from **--host** argument.

An example of a line of an input file:

"Linux DB3" db.connections 43

The value type must be correctly set in item configuration of Zabbix frontend. Zabbix sender will send up to 250 values in one connection. Contents of the input file must be in the UTF-8 encoding. All values from the input file are sent in a sequential order top-down. Entries must be formatted using the following rules:

- Quoted and non-quoted entries are supported.
- Double-quote is the quoting character.
- Entries with whitespace must be quoted.
- Double-quote and backslash characters inside quoted entry must be escaped with a backslash.
- Escaping is not supported in non-quoted entries.
- Linefeed escape sequences (\n) are supported in quoted strings.

-

Linefeed escape sequences are trimmed from the end of an entry.

-T, --with-timestamps

This option can be only used with **--input-file** option.

Each line of the input file must contain 4 whitespace delimited entries: **<hostname> <key> <timestamp> <value>**. Timestamp should be specified in Unix timestamp format. If target item has triggers referencing it, all timestamps must be in an increasing order, otherwise event calculation will not be correct.

An example of a line of the input file:

"Linux DB3" db.connections 1429533600 43

For more details please see option **--input-file**.

If a timestamped value is sent for a host that is in a "no data" maintenance type then this value will be dropped however it is possible to send a timestamped value in for an expired maintenance period and it will be accepted.

-r, --real-time

Send values one by one as soon as they are received. This can be used when reading from standard input.

--tls-connect *value*

How to connect to server or proxy. Values:

unencrypted

connect without encryption (default)

psk

connect using TLS and a pre-shared key

cert

connect using TLS and a certificate

--tls-ca-file *CA-file*

Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

--tls-crl-file *CRL-file*

Full pathname of a file containing revoked certificates.

--tls-server-cert-issuer *cert-issuer*

Allowed server certificate issuer.

--tls-server-cert-subject *cert-subject*

Allowed server certificate subject.

--tls-cert-file *cert-file*

Full pathname of a file containing the certificate or certificate chain.

--tls-key-file *key-file*

Full pathname of a file containing the private key.

--tls-psk-identity *PSK-identity*

PSK-identity string.

--tls-psk-file *PSK-file*

Full pathname of a file containing the pre-shared key.

-v, --verbose

Verbose mode, **-vv** for more details.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

EXIT STATUS

The exit status is 0 if the values were sent and all of them were successfully processed by server. If data was sent, but processing of at least one of the values failed, the exit status is 2. If data sending failed, the exit status is 1.

EXAMPLES

zabbix_sender -c /etc/zabbix/zabbix_agentd.conf -k mysql.queries -o 342.45

Send **342.45** as the value for **mysql.queries** item of monitored host. Use monitored host and Zabbix server defined in agent configuration file.

zabbix_sender -c /etc/zabbix/zabbix_agentd.conf -s "Monitored Host" -k mysql.queries -o 342.45

Send **342.45** as the value for **mysql.queries** item of **Monitored Host** host using Zabbix server defined in agent configuration file.

zabbix_sender -z 192.168.1.113 -i data_values.txt

Send values from file **data_values.txt** to Zabbix server with IP **192.168.1.113**. Host names and keys are defined in the file.

echo "- hw.serial.number 1287872261 SQ4321ASDF" | zabbix_sender -c /usr/local/etc/zabbix_agentd.conf -T -i -

Send a timestamped value from the commandline to Zabbix server, specified in the agent configuration file. Dash in the input data indicates that hostname also should be used from the same configuration file.

echo ""Zabbix server" trapper.item "" | zabbix_sender -z 192.168.1.113 -p 10000 -i -

Send empty value of an item to the Zabbix server with IP address **192.168.1.113** on port **10000** from the commandline. Empty values must be indicated by empty double quotes.

zabbix_sender -z 192.168.1.113 -s "Monitored Host" -k mysql.queries -o 342.45 --tls-connect cert --tls-ca-file /home/zabbix/zabbix_ca_file --tls-cert-file /home/zabbix/zabbix_agentd.crt --tls-key-file /home/zabbix/zabbix_agentd.key

Send **342.45** as the value for **mysql.queries** item in **Monitored Host** host to server with IP **192.168.1.113** using TLS with certificate.

zabbix_sender -z 192.168.1.113 -s "Monitored Host" -k mysql.queries -o 342.45 --tls-connect psk --tls-psk-identity "PSK ID Zabbix agentd" --tls-psk-file /home/zabbix/zabbix_agentd.psk

Send **342.45** as the value for **mysql.queries** item in **Monitored Host** host to server with IP **192.168.1.113** using TLS with pre-shared key (PSK).

NAME

zabbix_server - Zabbix server daemon

SYNOPSIS

zabbix_server [-c *config-file*]

zabbix_server [-c *config-file*] -R *runtime-option*

zabbix_server -h

zabbix_server -V

DESCRIPTION

zabbix_server is the core daemon of Zabbix software.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one. Absolute path should be specified.

-f, --foreground

Run Zabbix server in foreground.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options

config_cache_reload

Reload configuration cache. Ignored if cache is being currently loaded. Default configuration file (unless **-c** option is specified) will be used to find PID file and signal will be sent to process, listed in PID file.

housekeeper_execute

Execute the housekeeper. Ignored if housekeeper is being currently executed.

log_level_increase[=*target*]

Increase log level, affects all processes if target is not specified

log_level_decrease[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

process-type

All processes of specified type (e.g., poller)

process-type,N

Process type and number (e.g., poller,3)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_server.conf

Default location of Zabbix server configuration file (if not modified during compile time).
