

22 What's new in Zabbix 3.0.21

Item changes

- A new zone parameter is supported for the **proc.num** Zabbix agent [item](#). It is supported on Solaris only.

Trigger expression constructor

Improvements have been made to the trigger expression constructor:

- String list in the *Function* field has been shortened; it now contains the trigger function choice only (no operator);
- Operators (>, <, =, <>) have been moved to a new drop-down field placed directly before the constant field;
- Missing operators have been added (>= and <=);
- The constant field is now combined with the operator field and named *Result*.
