| <i>Tag display priority</i>     | Enter tag display priority for a problem, as a comma-separated list of tags (for example: <i>Services, Applications, Application</i> ). Tag names only should be used, no values. The tags of this list will always be displayed first, overriding the natural ordering by alphabet.  |
| <i>Show operational data</i>    | Select the mode for displaying <b>operational data</b> :<br><b>None</b> - no operational data is displayed<br><b>Separately</b> - operational data is displayed in a separate column<br><b>With problem name</b> - append operational data to the problem name, using parentheses for the operational data  |
| <i>Show suppressed problems</i> | Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.   |
| <i>Show unacknowledged only</i> | Mark the checkbox to display unacknowledged problems only.  |
| <i>Sort entries by</i>          | Sort entries by:<br><b>Time</b> (descending or ascending)<br><b>Severity</b> (descending or ascending)<br><b>Problem name</b> (descending or ascending)<br><b>Host</b> (descending or ascending).   |
| <i>Show timeline</i>            | Mark the checkbox to display a visual timeline.   |
| <i>Show lines</i>               | Specify the number of problem lines to display.   |

## 18 Problems by severity

### Overview

In this widget, you can display problems by severity. You can limit what hosts and triggers are displayed in the widget and define how the problem count is displayed.

### Configuration

To configure, select *Problems by severity* as type:

Add widget

TypeProblems by severityShow header

NameProblems by severity

Refresh intervalDefault (1 minute)

AddCancel

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                            |   |
|----------------------------|---|
| <i>Host groups</i>         | Enter host groups to display in the widget. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups.<br>Specifying a parent host group implicitly selects all nested host groups.<br>Host data from these host groups will be displayed in the widget. If no host groups are entered, all host groups will be displayed.   |
| <i>Exclude host groups</i> | Enter host groups to hide from the widget. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups.<br>Specifying a parent host group implicitly selects all nested host groups.<br>Host data from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to <i>show</i> Group A and <i>exclude</i> Group B at the same time, only data from host 001 will be displayed in the Dashboard. |
| <i>Hosts</i>               | Enter hosts to display in the widget. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts.<br>If no hosts are entered, all hosts will be displayed.  |
| <i>Problem</i>             | You can limit the number of problem hosts displayed by the problem name. If you enter a string here, only those hosts with problems whose name contains the entered string will be displayed.<br>Macros are not expanded.   |
| <i>Severity</i>            | Mark problem severities to filter problems to be displayed in the widget.<br>If no severities are marked, all problems will be displayed.   |

|                                     |   |
|-------------------------------------|---|
| <i>Tags</i>                         | <p>Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p><b>Exists</b> - include the specified tag names</p> <p><b>Equals</b> - include the specified tag names and values (case-sensitive)</p> <p><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p><b>Does not exist</b> - exclude the specified tag names</p> <p><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)</p> <p><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p>There are two calculation types for conditions:</p> <p><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition</p> <p><b>Or</b> - enough if one condition is met</p> |
| <i>Show</i>                         | <p>Select the show option:</p> <p><b>Host groups</b> - display problems per host group</p> <p><b>Totals</b> - display a problem total for all selected host groups in colored blocks corresponding to the problem severity.</p>   |
| <i>Layout</i>                       | <p>Select the layout option:</p> <p><b>Horizontal</b> - colored blocks of totals will be displayed horizontally</p> <p><b>Vertical</b> - colored blocks of totals will be displayed vertically</p> <p>This field is available for editing if 'Totals' is selected as the <i>Show</i> option.</p>  |
| <i>Show operational data</i>        | <p>Display operational data (see description of <i>Operational data</i> in <i>Monitoring &gt; Problems</i>) as:</p> <p><b>None</b> - operational data will not be displayed</p> <p><b>Separately</b> - operational data will be displayed as a separate line</p> <p><b>With problem name</b> - operational data will be displayed together with the problem name.</p>   |
| <i>Show suppressed problems</i>     | <p>Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.</p>  |
| <i>Hide groups without problems</i> | <p>Mark the <i>Hide groups without problems</i> option to hide data from host groups without problems in the widget.</p>  |
| <i>Problem display</i>              | <p>Display problem count as:</p> <p><b>All</b> - full problem count will be displayed</p> <p><b>Separated</b> - unacknowledged problem count will be displayed separated as a number of the total problem count</p> <p><b>Unacknowledged only</b> - only the unacknowledged problem count will be displayed.</p>  |
| <i>Show timeline</i>                | <p>Mark the checkbox to display a visual timeline.</p>  |

## 19 SLA report

### Overview

This widget is useful for displaying *SLA reports*. Functionally it is similar to the *Services -> SLA report* section.

### Configuration

To configure, select *SLA report* as type:

### Edit widget

Common column parameters:

|                   |  |
|-------------------|--|
| <i>Name</i>       | Name of the column.  |
| <i>Data</i>       | Data type to display in the column:<br><b>Item value</b> - value of the specified item<br><b>Host name</b> - host name of the item specified in the <i>Item value</i> column<br><b>Text</b> - static text string                                     |
| <i>Base color</i> | Background color of the column; fill color if <i>Item value</i> data is displayed as bar/indicators.<br>For <i>Item value</i> data the default color can be overridden by custom color, if the item value is over one of the specified "Thresholds". |

Specific parameters for item value columns:

|                             |   |
|-----------------------------|---|
| <i>Item</i>                 | Select the item.<br>Selecting non-numeric items is supported since Zabbix 6.0.4.  |
| <i>Time shift</i>           | Specify time shift if required.<br>You may use <b>time suffixes</b> in this field. Negative values are allowed.   |
| <i>Aggregation function</i> | Specify which aggregation function to use:<br><b>min</b> - display the smallest value<br><b>max</b> - display the largest value<br><b>avg</b> - display the average value<br><b>sum</b> - display the sum of values<br><b>count</b> - display the count of values<br><b>first</b> - display the first value<br><b>last</b> - display the last value<br><b>none</b> - display all values (no aggregation)<br>Aggregation allows to display an aggregated value for the chosen interval (5 minutes, an hour, a day), instead of all values. |
| <i>Aggregation interval</i> | Note that only numeric items can be displayed in this column if this setting is not "none".<br>Specify the interval for aggregating values. You may use <b>time suffixes</b> in this field. A numeric value without a suffix will be regarded as seconds.   |
| <i>Display</i>              | This field will not be displayed if <i>Aggregation function</i> is "none".<br>Define how the value should be displayed:<br><b>As is</b> - as regular text<br><b>Bar</b> - as solid, color-filled bar<br><b>Indicators</b> - as segmented, color-filled bar<br>Note that only numeric items can be displayed in this column if this setting is not "as is".  |

|                   |   |
|-------------------|---|
| <i>History</i>    | Take data from history or trends:<br><b>Auto</b> - automatic selection<br><b>History</b> - take history data<br><b>Trends</b> - take trend data   |
| <i>Min</i>        | This setting applies only to numeric data. Non-numeric data will always be taken from history.<br>Minimum value for bar/indicators.   |
| <i>Max</i>        | Maximum value for bar/indicators.   |
| <i>Thresholds</i> | Specify threshold values when the background/fill color should change. The list will be sorted in ascending order when saved.<br>Note that only numeric items can be displayed in this column if thresholds are used. |

Specific parameters for text columns:

|             |   |
|-------------|---|
| <i>Text</i> | Enter the string to display. May contain host and inventory <b>macros</b> . |
|-------------|---|

## 22 Trigger overview

### Overview

In the trigger overview widget, you can display the trigger states for a group of hosts.

- The trigger states are displayed as colored blocks (the color of the blocks for PROBLEM triggers depends on the problem severity color, which can be adjusted in the **problem update** screen). Note that recent trigger state changes (within the last 2 minutes) will be displayed as blinking blocks.
- Gray up and down arrows indicate triggers that have dependencies. On mouseover, dependency details are revealed.
- A checkbox icon indicates acknowledged problems. All problems or resolved problems of the trigger must be acknowledged for this icon to be displayed.

Clicking on a trigger block provides context-dependent links to problem events of the trigger, the problem acknowledgment screen, trigger configuration, trigger URL or a simple graph/latest values list.

Note that 50 records are displayed by default (configurable in *Administration* → *General* → **GUI**, using the *Max number of columns and rows in overview tables* option). If more records exist than are configured to display, a message is displayed at the bottom of the table, asking to provide more specific filtering criteria. There is no pagination. Note that this limit is applied first, before any further filtering of data, for example, by tags.

### Configuration

To configure, select *Trigger overview* as type:

**Note:**

In cases when a user does not have permission to access certain widget elements, that element's name will appear as *Inaccessible* during the widget's configuration. This results in *Inaccessible Item*, *Inaccessible Host*, *Inaccessible Group*, *Inaccessible Map*, and *Inaccessible Graph* appearing instead of the "real" name of the element.

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                                  |   |
|----------------------------------|---|
| <i>Host groups</i>               | Enter host groups to display in the widget. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups.<br>Specifying a parent host group implicitly selects all nested host groups.<br>Host data from these host groups will be displayed in the widget. If no host groups are entered, all host groups will be displayed.   |
| <i>Exclude host groups</i>       | Enter host groups to hide from the widget. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups.<br>Specifying a parent host group implicitly selects all nested host groups.<br>Host data from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to <i>show</i> Group A and <i>exclude</i> Group B at the same time, only data from host 001 will be displayed in the Dashboard.   |
| <i>Hosts</i>                     | Enter hosts to display in the widget. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts.<br>If no hosts are entered, all hosts will be displayed.  |
| <i>Tags</i>                      | Specify tags to limit the number of web scenarios displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met |
| <i>Show hosts in maintenance</i> | Include hosts that are in maintenance in the statistics.  |

#### Web monitoring widget

Once you have completed the configuration, you might like to see the widget with the data it displays. To do it, go to *Monitoring* → *Dashboards*, click on the name of a dashboard where you created the widget.

In this example, you can see the widget named "Zabbix frontend" displaying the status of the web monitoring for three host groups: "Internal network," "Linux servers," and "Web servers."

### Zabbix frontend

| Host group ▲     | Ok | Failed | Unknown |
|------------------|----|--------|---------|
| Internal network | 1  |        |         |
| Linux servers    |    | 1      |         |
| Web servers      |    |        | 1       |

A web monitoring widget displays the following information:

- a name of a widget; below it, there are four columns:
  - *Host group* - displays a list of host groups that contain hosts having web scenarios configured;
  - *Ok* - displays a number of web scenarios (in green color) when two conditions are observed:
    - \* Zabbix has collected the latest data for a web scenario(s);
    - \* all steps that were configured in a **web scenario** are in "Ok" *Status*.

- **Failed** - displays a number of web scenarios (in red color), which have some failed steps:
  - \* click on the host name, and it will open a new window; the *Status* column provides detailed information (in red color) on the step where Zabbix failed to collect the data; and also,
  - \* gives a hint for the parameter that has to be corrected in the **configuration form**.

Web monitoring

| Host                   | Name          | Number of steps | Last check | Status   | Tags |
|------------------------|---------------|-----------------|------------|--|------|
| Internal documentation | Internal Wiki | 2               | 38s        | Step "Configuration page" [2 of 2] failed: required pattern "winter" was not found on http://localhost/index.php |      |

Displaying 1 of 1 found

- **Unknown** - displays a number of web scenarios (in grey color) for which Zabbix has neither collected data, nor has an information about the failed steps.

Web monitoring

| Host        | Name        | Number of steps | Last check | Status | Tags |
|-------------|-------------|-----------------|------------|--------|------|
| Zabbix site | Zabbix site | 1               |            |        |      |

Displaying 1 of 1 found

## Viewing the status and data

Clickable links in the widget allow to easily navigate and quickly acquire a full information on each web scenario. Thus, to view:

- the **Status** of a web scenario, click on the name of a host group.
- more detailed statistics, click on the scenario name. In this example it is "Zabbix frontend".
- the details in the case of **Failed** status, click on a host group name; in the window that opens, click on a web scenario name in the *Name* column; it will open more detailed information on the configured steps for which Zabbix failed to collect the data.

Details of web scenario: Internal Wiki

| Step               | Speed      | Response time   | Response code | Status   |
|--------------------|------------|-----------------|---------------|--|
| First page         | 95.94 KBps | 256.75ms        | 200           | OK   |
| Configuration page | 40.46 KBps | 33.5ms          | 200           | Error: required pattern "winter" was not found on http://localhost/index.php |
| <b>TOTAL</b>       |            | <b>290.25ms</b> |               | Error: required pattern "winter" was not found on http://localhost/index.php |

Now, you can return to the **web scenario configuration form** and correct your settings.

To view the details in the case of **Unknown** status, you can repeat the same steps as explained for **Failed**.

### Attention:

At the first monitoring instance, a web scenario is always displayed in **Unknown** state, which is switched to **Failed** or **Ok** state right after the first check. In the case when a host is monitored by the proxy, the status change occurs in accordance with the data collection frequency configured on the proxy.

## 2 Problems

### Overview

In **Monitoring** → **Problems** you can see what problems you currently have. Problems are those triggers that are in the "Problem" state.

Problems

| Column | Description                      |
|--------|----------------------------------|
| Time   | Problem start time is displayed. |

| Column           | Description  |
|------------------|--|
| Severity         | <p>Problem severity is displayed.</p> <p>Problem severity is originally based on the severity of the underlying problem trigger, however, after the event has happened it can be updated using the <i>Update problem</i> screen. Color of the problem severity is used as cell background during problem time.</p>   |
| Recovery time    | Problem resolution time is displayed.  |
| Status           | <p>Problem status is displayed:</p> <p><b>Problem</b> - unresolved problem</p> <p><b>Resolved</b> - recently resolved problem. You can hide recently resolved problems using the filter.</p> <p>New and recently resolved problems blink for 2 minutes. Resolved problems are displayed for 5 minutes in total. Both of these values are configurable in <i>Administration</i> → <i>General</i> → <i>Trigger displaying options</i>.</p>   |
| Info             | <p>A green information icon is displayed if a problem is closed by global correlation or manually when updating the problem. Rolling a mouse over the icon will display more details:</p>  <p>The following icon is displayed if a suppressed problem is being shown (see <i>Show suppressed problems</i> option in the filter). Rolling a mouse over the icon will display more details:</p>   |
| Host             | Problem host is displayed.   |
| Problem          | <p>Problem name is displayed.</p> <p>Problem name is based on the name of the underlying problem trigger.</p> <p>Macros in the trigger name are resolved at the time of the problem happening and the resolved values do not update any more.</p> <p><i>Note</i> that it is possible to append the problem name with <b>operational data</b> showing some latest item values.</p> <p>Clicking on the problem name brings up the <b>event menu</b>.</p> <p>Hovering on the  icon after the problem name will bring up the trigger description (for those problems that have it).</p> |
| Operational data | <p><b>Operational data</b> are displayed containing latest item values.</p> <p>Operational data can be a combination of text and item value macros if configured on a trigger level. If no operational data is configured on a trigger level, the latest values of all items from the expression are displayed.</p>  |
| Duration         | <p>This column is only displayed if <i>Separately</i> is selected for <i>Show operational data</i> in the filter.</p> <p>Problem duration is displayed.</p> <p>See also: <b>Negative problem duration</b></p>  |
| Ack              | <p>The acknowledgment status of the problem is displayed:</p> <p><b>Yes</b> - green text indicating that the problem is acknowledged. A problem is considered to be acknowledged if all events for it are acknowledged.</p> <p><b>No</b> - a red link indicating unacknowledged events.</p> <p>If you click on the link you will be taken to the <b>problem update</b> screen where various actions can be taken on the problem, including commenting and acknowledging the problem.</p>   |

| Column  | Description  |
|---------|--|
| Actions | <p>History of activities about the problem is displayed using symbolic icons:</p> <ul style="list-style-type: none"> <li> - comments have been made. The number of comments is also displayed.</li> <li> - problem severity has been increased (e.g. Information → Warning)</li> <li> - problem severity has been decreased (e.g. Warning → Information)</li> <li> - problem severity has been changed, but returned to the original level (e.g. Warning → Information → Warning)</li> <li> - actions have been taken. The number of actions is also displayed.</li> <li> - actions have been taken, at least one is in progress. The number of actions is also displayed.</li> <li> - actions have been taken, at least one has failed. The number of actions is also displayed.</li> </ul> <p>When rolling the mouse over the icons, popups with details about the activity are displayed. See <a href="#">viewing details</a> to learn more about icons used in the popup for actions taken.</p> |
| Tags    | <p>Tags are displayed (if any).</p> <p>In addition, tags from an external ticketing system may also be displayed (see the <i>Process tags</i> option when configuring <a href="#">webhooks</a>).</p>   |

## Operational data of problems

It is possible to display operational data for current problems, i.e. the latest item values as opposed to the item values at the time of the problem.

Operational data display can be configured in the filter of *Monitoring → Problems* or in the configuration of the respective **dashboard widget**, by selecting one of the three options:

- *None* - no operational data is displayed
- *Separately* - operational data is displayed in a separate column

| Time     | <input type="checkbox"/> Severity | Recovery time | Status  | Info | Host ▲        | Problem  | Operational data     | Duration  |
|----------|-----------------------------------|---------------|---------|------|---------------|--|----------------------|-----------|
| 09:28:35 | <input type="checkbox"/> Average  |               | PROBLEM |      | Zabbix server | Zabbix discoverer processes more than 75% busy | Current value: 100 % | 3h 32m 8s |

- *With problem name* - operational data is appended to the problem name and in parentheses. Operational data are appended to the problem name only if the *Operational data* field is non-empty in the trigger configuration.

| Time     | <input type="checkbox"/> Severity | Recovery time | Status  | Info | Host ▲        | Problem   | Duration   |
|----------|-----------------------------------|---------------|---------|------|---------------|---|------------|
| 09:28:35 | <input type="checkbox"/> Average  |               | PROBLEM |      | Zabbix server | Zabbix discoverer processes more than 75% busy (Current value: 100 %) | 3h 29m 34s |

The content of operational data can be configured with each **trigger**, in the *Operational data* field. This field accepts an arbitrary string with macros, most importantly, the `{ITEM.LASTVALUE<1-9>}` macro.

`{ITEM.LASTVALUE<1-9>}` in this field will always resolve to the latest values of items in the trigger expression. `{ITEM.VALUE<1-9>}` in this field will resolve to the item values at the moment of trigger status change (i.e. change into problem, change into OK, being closed manually by a user or being closed by correlation).

Note that closing the problem manually does not produce a new value so the resolved value of `{ITEM.LASTVALUE<1-9>}` or `{ITEM.VALUE<1-9>}` will still show the value from the problem time.

`{ITEM.LASTVALUE<1-9>}` or `{ITEM.VALUE<1-9>}` will resolve to *\*UNKNOWN\** if the latest history value has been collected more than the *Max history display period* time ago (see [Administration → General](#)).

## Negative problem duration

It is actually possible in some common situations to have negative problem duration i.e. when the problem resolution time is earlier than problem creation time, e. g.:

- If some host is monitored by proxy and a network error happens, leading to no data received from the proxy for a while, the `nodata(/host/key)` trigger will be fired by the server. When the connection is restored, the server will receive item data

from the proxy having a time from the past. Then, the nodata(/host/key) problem will be resolved and it will have a negative problem duration;

- When item data that resolve the problem event are sent by Zabbix sender and contain a timestamp earlier than the problem creation time, a negative problem duration will also be displayed.

**Note:**

Negative problem duration is not affecting **SLA calculation** or **Availability report** of a particular trigger in any way; it neither reduces nor expands problem time.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Mass update* - update the selected problems by navigating to the **problem update** screen

To use this option, mark the checkboxes before the respective problems, then click on the *Mass update* button.

Buttons

The button to the right offers the following option:

Export to CSV

Export content from all pages to a CSV file.

View mode buttons, being common for all sections, are described on the **Monitoring** page.

Using filter

You can use the filter to display only the problems you are interested in. For better search performance, data is searched with macros unresolved.

The filter is located above the table. Favorite filter settings can be saved as tabs and then quickly accessed by clicking on the **tabs** above the filter.

| Parameter      | Description   |
|----------------|---|
| Show           | Filter by problem status:<br><b>Recent problems</b> - unresolved and recently resolved problems are displayed (default)<br><b>Problems</b> - unresolved problems are displayed<br><b>History</b> - history of all events is displayed |
| Host groups    | Filter by one or more host groups.<br>Specifying a parent host group implicitly selects all nested host groups.   |
| Hosts          | Filter by one or more hosts.  |
| Triggers       | Filter by one or more triggers.   |
| Problem        | Filter by problem name.   |
| Severity       | Filter by trigger (problem) severity.   |
| Age less than  | Filter by how old the problem is.   |
| Host inventory | Filter by inventory type and value.   |

| Parameter                       | Description   |
|---------------------------------|---|
| <i>Tags</i>                     | <p>Filter by <b>event tag</b> name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p><b>Exists</b> - include the specified tag names</p> <p><b>Equals</b> - include the specified tag names and values (case-sensitive)</p> <p><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p><b>Does not exist</b> - exclude the specified tag names</p> <p><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)</p> <p><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p>There are two calculation types for conditions:</p> <p><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition</p> <p><b>Or</b> - enough if one condition is met</p> <p>When filtered, the tags specified here will be displayed first with the problem, unless overridden by the <i>Tag display priority</i> (see below) list.</p> |
| <i>Show tags</i>                | <p>Select the number of displayed tags:</p> <p><b>None</b> - no <i>Tags</i> column in <i>Monitoring → Problems</i></p> <p><b>1</b> - <i>Tags</i> column contains one tag</p> <p><b>2</b> - <i>Tags</i> column contains two tags</p> <p><b>3</b> - <i>Tags</i> column contains three tags</p> <p>To see all tags for the problem roll your mouse over the three dots icon.</p>   |
| <i>Tag name</i>                 | <p>Select tag name display mode:</p> <p><b>Full</b> - tag names and values are displayed in full</p> <p><b>Shortened</b> - tag names are shortened to 3 symbols; tag values are displayed in full</p> <p><b>None</b> - only tag values are displayed; no names</p>  |
| <i>Tag display priority</i>     | <p>Enter tag display priority for a problem, as a comma-separated list of tags (for example: <i>Services, Applications, Application</i>). Tag names only should be used, no values. The tags of this list will always be displayed first, overriding the natural ordering by alphabet.</p>  |
| <i>Show operational data</i>    | <p>Select the mode for displaying <b>operational data</b>:</p> <p><b>None</b> - no operational data is displayed</p> <p><b>Separately</b> - operational data is displayed in a separate column</p> <p><b>With problem name</b> - append operational data to the problem name, using parentheses for the operational data</p>  |
| <i>Show suppressed problems</i> | <p>Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.</p>  |
| <i>Compact view</i>             | <p>Mark the checkbox to enable compact view.</p>  |
| <i>Show details</i>             | <p>Mark the checkbox to display underlying trigger expressions of the problems. Disabled if <i>Compact view</i> checkbox is marked.</p>   |
| <i>Show unacknowledged only</i> | <p>Mark the checkbox to display unacknowledged problems only.</p>   |
| <i>Show timeline</i>            | <p>Mark the checkbox to display the visual timeline and grouping. Disabled if <i>Compact view</i> checkbox is marked.</p>   |
| <i>Highlight whole row</i>      | <p>Mark the checkbox to highlight the full line for unresolved problems. The problem severity color is used for highlighting.</p> <p>Enabled only if the <i>Compact view</i> checkbox is marked in the standard blue and dark themes.</p> <p><i>Highlight whole row</i> is not available in the high-contrast themes.</p>   |

#### Tabs for favorite filters

Frequently used sets of filter parameters can be saved in tabs.

To save a new set of filter parameters, open the main tab, and configure the filter settings, then press the *Save as* button. In a new popup window, define *Filter properties*.

## Filter properties

\* Name

Show number of records ☒

Set custom time period ☒

From

To

Delete

Save

Cancel

| Parameter                     | Description  |
|-------------------------------|--|
| <i>Name</i>                   | The name of the filter to display in the tab list.   |
| <i>Show number of records</i> | Check, if you want the number of problems to be displayed next to the tab name.  |
| <i>Set custom time period</i> | Check to set specific default time period for this filter set. If set, you will only be able to change the time period for this tab by updating filter settings. For tabs without a custom time period, the time range can be changed by pressing the time selector button in the top right corner (button name depends on selected time interval: This week, Last 30 minutes, Yesterday, etc.). This option is available only for filters in <i>Monitoring→Problems</i> . |
| <i>From/To</i>                | <b>Time period</b> start and end in absolute (Y-m-d H:i:s) or relative time syntax (now-1d). Available, if <i>Set custom time period</i> is checked.   |

When saved, the filter is created as a named filter tab and immediately activated.

To edit the filter properties of an existing filter, press the gear symbol next to the active tab name.

### Notes:

- To hide the filter area, click on the name of the current tab. Click on the active tab name again to open the filter area again.
- Keyboard navigation is supported: use arrows to switch between tabs, press *Enter* to open.
- The left/right buttons above the filter may be used to switch between saved filters. Alternatively, the downward pointing button opens a drop-down menu with all saved filters and you can click on the one you need.
- Filter tabs can be re-arranged by dragging and dropping.
- If the settings of a saved filter have been changed (but not saved), a green dot is displayed after the filter name. To update the filter according to the new settings, click on the *Update* button, which is displayed instead of the *Save as* button.
- Current filter settings are remembered in the user profile. When the user opens the page again, the filter settings will have stayed the same.

### Note:

To share filters, copy and send to others a URL of an active filter. After opening this URL, other users will be able to save this set of parameters as a permanent filter in their Zabbix account.

See also: [Page parameters](#).

### Filter buttons

Apply

Apply specified filtering criteria (without saving).

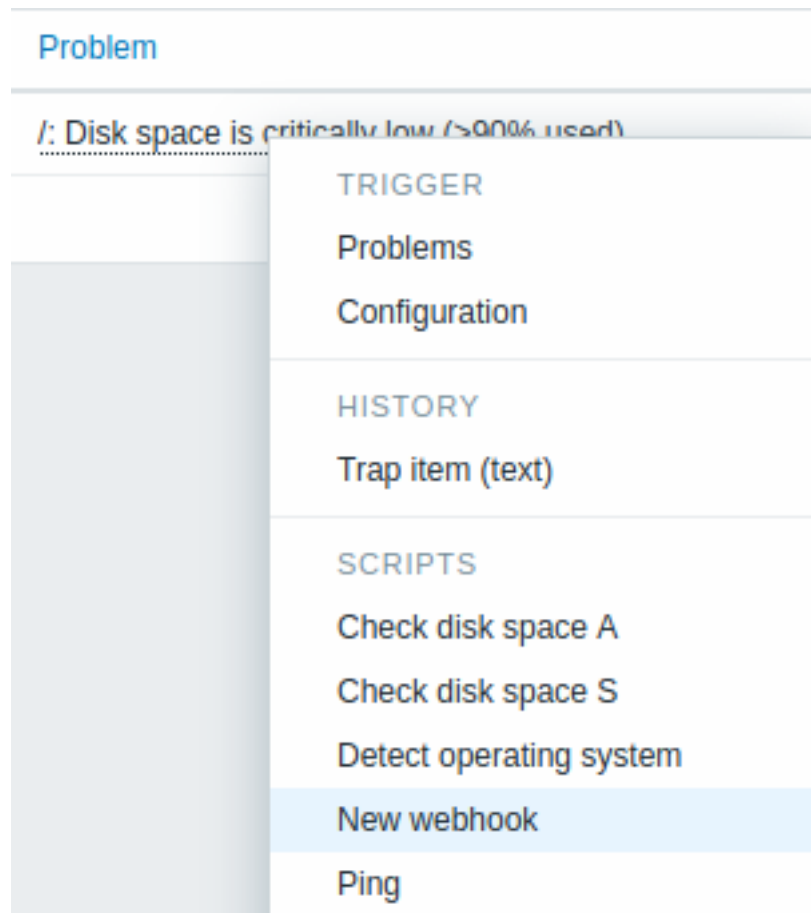

Reset

Reset current filter and return to saved parameters of the current tab. On the main tab, this will clear the filter.

|         |  |
|---------|--|
| Save as | Save current filter parameters in a new tab. Only available on the main tab.               |
| Update  | Replace tab parameters with currently specified parameters. Not available on the main tab. |

## Event menu

Clicking on the problem name brings up the event menu:

The event menu allows to:

- filter the problems of the trigger
- access the trigger configuration
- access a simple graph/item history of the underlying item(s)
- access an external ticket of the problem (if configured, see the *Include event menu entry* option when configuring **webhooks**)
- execute global **scripts** (these scripts need to have their scope defined as 'Manual event action'). This feature may be handy for running scripts used for managing problem tickets in external systems.

## Viewing details

The times for problem start and recovery in *Monitoring* → *Problems* are links. Clicking on them opens more details of the event.

## Event details

| Trigger details     |   | Actions                  |                     |                              |            |   |

| Time                | 2019-10-15 16:12:35                           | 2019-10-15 14:58:05      | 2019-10-15 15:08:35 | RESOLVED                     | 1h 21m 59s | 10m 30s   |
| Acknowledged        | Yes   | 2019-10-15 14:50:35      | 2019-10-15 14:54:35 | RESOLVED                     | 1h 29m 29s | 4m  |
| Tags                | Service: Operations                           | 2019-10-15 13:14:05      | 2019-10-15 13:25:35 | RESOLVED                     | 3h 5m 59s  | 11m 30s   |
| Description         |   | 2019-10-15 13:02:05      | 2019-10-15 13:08:35 | RESOLVED                     | 3h 17m 59s | 6m 30s  |

Note how the problem severity differs for the trigger and the problem event - for the problem event it has been updated using the [Update problem screen](#).

In the action list, the following icons are used to denote the activity type:

-  - problem event generated
-  - message has been sent
-  - problem event acknowledged
-  - problem event unacknowledged
-  - a comment has been added
-  - problem severity has been increased (e.g. Information → Warning)
-  - problem severity has been decreased (e.g. Warning → Information)
-  - problem severity has been changed, but returned to the original level (e.g. Warning → Information → Warning)
-  - a remote command has been executed
-  - problem event has recovered
-  - the problem has been closed manually

## 3 Hosts

### Overview

The *Monitoring* → *Hosts* section displays a full list of monitored hosts with detailed information about host interface, availability, tags, current problems, status (enabled/disabled), and links to easily navigate to the host's latest data, problem history, graphs, dashboards and web scenarios.

### Hosts

| <div> <a href="#">Servers</a> <a href="#">Datacenters</a> <a href="#">Customer</a> <a href="#">MySQL</a> </div> <div>Create host</div> |                 |              |        |         |                                 |                          |                           |                              |                     |

| Column              | Description  |
|---------------------|--|
| <i>Name</i>         | The visible host name. Clicking on the name brings up the <b>host menu</b> .<br><br>An orange wrench icon  after the name indicates that this host is in maintenance.<br>Click on the column header to sort hosts by name in ascending or descending order.   |
| <i>Interface</i>    | The main interface of the host is displayed.   |
| <i>Availability</i> | Host <b>availability</b> per configured interface.<br>Icons represent only those interface types (Zabbix agent, SNMP, IPMI, JMX) that are configured. If you position the mouse on the icon, a popup list of all interfaces of this type appears with each interface details, status and errors.<br>The column is empty for hosts with no interfaces.<br>The current status of all interfaces of one type is displayed by the respective icon color:<br><b>Green</b> - all interfaces available<br><b>Yellow</b> - at least one interface available and at least one unavailable; others can have any value including 'unknown'<br><b>Red</b> - no interfaces available<br><b>Gray</b> - at least one interface unknown (none unavailable)<br>Note that active Zabbix agent items do not affect host availability. |
| <i>Tags</i>         | <b>Tags</b> of the host and all linked templates, with macros unresolved.  |
| <i>Status</i>       | Host status - <i>Enabled</i> or <i>Disabled</i> .<br>Click on the column header to sort hosts by status in ascending or descending order.  |
| <i>Latest data</i>  | Clicking on the link will open the <i>Monitoring - Latest data</i> page with all the latest data collected from the host.<br><br>The number of items with latest data is displayed in gray (displayed since Zabbix 6.0.5).   |
| <i>Problems</i>     | The number of open host problems sorted by severity. The color of the square indicates problem severity. The number on the square means the number of problems for the given severity.<br>Clicking on the icon will open <i>Monitoring - Problems</i> page for the current host.<br>If a host has no problems, a link to the Problems section for this host is displayed as text.<br>Use the filter to select whether suppressed problems should be included (not included by default).  |
| <i>Graphs</i>       | Clicking on the link will display graphs configured for the host. The number of graphs is displayed in gray.<br><br>If a host has no graphs, the link is disabled (gray text) and no number is displayed.  |
| <i>Dashboards</i>   | Clicking on the link will display dashboards configured for the host. The number of dashboards is displayed in gray.<br><br>If a host has no dashboards, the link is disabled (gray text) and no number is displayed.  |
| <i>Web</i>          | Clicking on the link will display web scenarios configured for the host. The number of web scenarios is displayed in gray.<br><br>If a host has no web scenarios, the link is disabled (gray text) and no number is displayed.   |

## Buttons

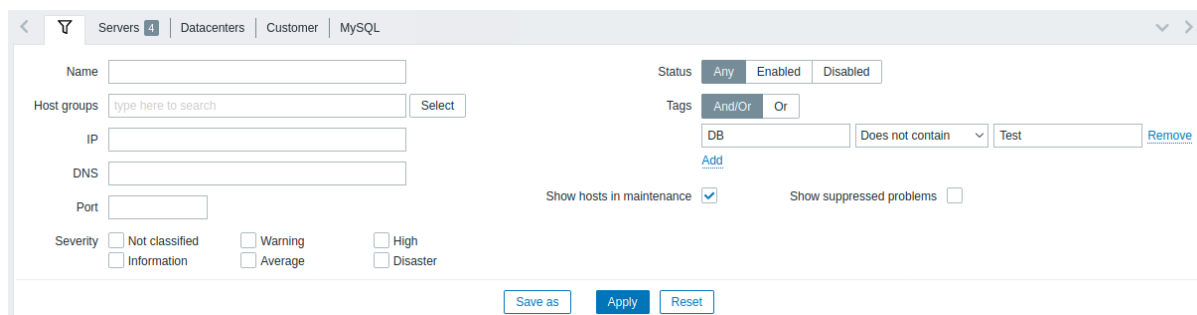

*Create host* allows to create a **new host**. This button is available for Admin and Super Admin users only.

View mode buttons being common for all sections are described on the **Monitoring** page.

## Using filter

You can use the filter to display only the hosts you are interested in. For better search performance, data is searched with macros unresolved.

The filter is located above the table. It is possible to filter hosts by name, host group, IP or DNS, interface port, tags, problem severity, status (enabled/disabled/any); you can also select whether to display suppressed problems and hosts that are currently in maintenance.

The screenshot shows the Zabbix host filter interface. It includes a search bar for Name, Host groups, IP, and DNS. There are checkboxes for Status (Any, Enabled, Disabled), Tags (And/Or, Or), and Severity (Not classified, Warning, High, Information, Average, Disaster). There are also checkboxes for 'Show hosts in maintenance' and 'Show suppressed problems'. At the bottom, there are buttons for 'Save as', 'Apply', and 'Reset'.

| Parameter                        | Description  |
|----------------------------------|--|
| <i>Name</i>                      | Filter by visible host name.   |
| <i>Host groups</i>               | Filter by one or more host groups.<br>Specifying a parent host group implicitly selects all nested host groups.  |
| <i>IP</i>                        | Filter by IP address.  |
| <i>DNS</i>                       | Filter by DNS name.  |
| <i>Port</i>                      | Filter by port number.   |
| <i>Severity</i>                  | Filter by problem severity. By default problems of all severities are displayed. Problems are displayed if not suppressed.   |
| <i>Status</i>                    | Filter by host status.   |
| <i>Tags</i>                      | Filter by host tag name and value. Hosts can be filtered by host-level tags as well as tags from all linked templates, including parent templates.<br>It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met |
| <i>Show hosts in maintenance</i> | Mark the checkbox to display hosts that are in maintenance (displayed by default).   |
| <i>Show suppressed problems</i>  | Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.  |

### Saving filter

Favorite filter settings can be saved as tabs and then quickly accessed by clicking on the respective tab above the filter.

See more details about [saving filters](#).

### 1 Graphs

#### Overview

Host graphs can be accessed from *Monitoring* → *Hosts* by clicking on Graphs for the respective host.

Any [custom graph](#) that has been configured for the host can be displayed, as well as any [simple graph](#).

Graphs are sorted by:

- graph name (custom graphs)
- item name (simple graphs)

Graphs for disabled hosts are also accessible.

Time period selector

Take note of the time period selector above the graph. It allows selecting often required periods with one mouse click.

See also: [Time period selector](#)

Using filter

To view a specific graph, select it in the filter. The filter allows to specify the host, the graph name and the *Show* option (all/host graphs/simple graphs).

If no host is selected in the filter, no graphs are displayed.

Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related graphs. Graphs are related by common entity - tag name or value. When a tag name/value is clicked, it is highlighted with a gray background, and graphs are immediately filtered (no need to click *Apply* in the main filter). Clicking another tag name/value adds it to the filtered results. Clicking the tag name/value again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration* -> *General* -> *GUI*).

Unlike the main filter, the subfilter is updated together with each table refresh request to always get up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable. Vertical lists (such as tags with their values) are limited to 20 entries. If there are more, a three-dot icon is displayed; it is not clickable.

A number next to each clickable entity indicates the number of graphs it has in the results of the main filter.

Once one entity is selected, the numbers with other available entities are displayed with a plus sign indicating how many graphs may be added to the current selection.

## Buttons

View mode buttons, being common for all sections, are described on the [Monitoring](#) page.

## 2 Web scenarios

### Overview

Host **web scenario** information can be accessed from *Monitoring → Hosts* by clicking on Web for the respective host.

≡ Web monitoring ⌵

| Host     | Name ▲          | Number of steps | Last check | Status | Tags                       |
|----------|-----------------|-----------------|------------|--------|----------------------------|
| New host | Zabbix frontend | 5               | 46s        | OK     | Application: Zabbix fro... |

Displaying 1 of 1 found

Data of disabled hosts is also accessible. The name of a disabled host is listed in red.

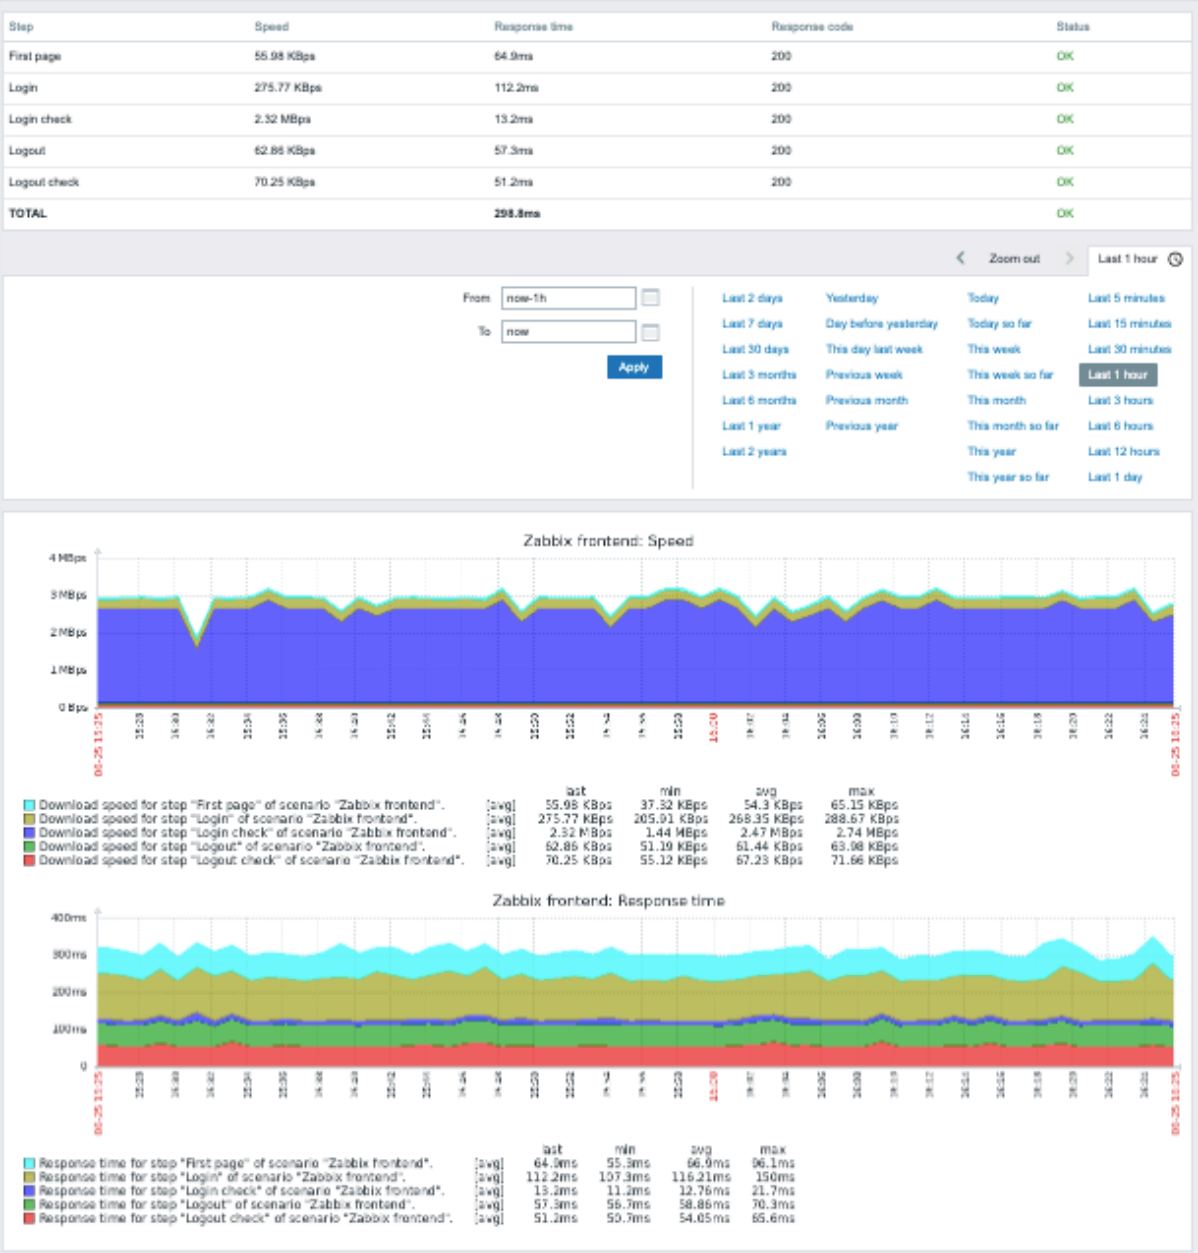

The maximum number of scenarios displayed per page depends on the *Rows per page* user profile **setting**.

By default, only values that fall within the last 24 hours are displayed. This limit has been introduced with the aim of improving initial loading times for large pages of latest data. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration→General* menu section.

The scenario name is link to more detailed statistics about it:

Details of web scenario: Zabbix frontend

Using filter

The page shows a list of all web scenarios of the selected host. To view web scenarios for another host or host group without returning to the *Monitoring* → *Hosts* page, select that host or group in the filter. You may also filter scenarios based on tags.

Buttons

View mode buttons being common for all sections are described on the *Monitoring* page.

4 Latest data

Overview

In this section you can view the latest values gathered by items.

Graphs are also available for the item values.

0 selected

Display stacked graph

Display graph

Execute now

Displaying 2 of 2 found

This section contains:

- the **filter** (collapsed by default)
- the **subfilter** (never collapsed)
- the item list

Items are displayed with their name, time since the last check, **last value**, change amount, tags, and a link to a simple graph/history of item values.

Clicking on the item name opens the item menu with links to available graphs and the item configuration.

Values in the *Last value* column are displayed with unit conversion and value mapping applied. To view raw data, hover over the value.

Tags in the item list are clickable. If you click on a tag, this tag becomes enabled in the **subfilter**. The item list now displays the items corresponding to this tag and any other previously selected tags in the subfilter. Note that once the items have been filtered in this way, tags in the list are no longer clickable. Further modification based on tags (e.g. remove, add another filter) must be done in the subfilter.

If an item has errors, for example, has become unsupported, an information icon will be displayed in the *Info* column . Hover over the icon for details.

An icon with a question mark  is displayed next to the item name for all items that have a description. Hover over this icon to see a tooltip with the item description.

If a host to which the item belongs is in maintenance, an orange wrench icon  is displayed after the host's name.

**Note:** The name of a disabled host is displayed in red. Data of disabled hosts, including graphs and item value lists, is also accessible in *Latest data*.

By default, only values that fall within the last 24 hours are displayed. This limit has been introduced with the aim of improving initial loading times for large pages of the latest data. This time period can be extended by changing the value of the *Max history display period* parameter in *Administration* → *General*.

**Attention:**

For items with an update frequency of 1 day or more the change amount will never be displayed (with the default setting). Also in this case the last value will not be displayed at all if it was received more than 24 hours ago.

Buttons

View mode buttons being common for all sections are described on the **Monitoring** page.

Using filter

You can use the filter to display only the items you are interested in. For better search performance, data is searched with macros unresolved.

The filter icon  is located above the table and the subfilter. Click on it to expand the filter.

The screenshot shows the Zabbix web interface for the 'Memory' tab. The top navigation bar includes 'Memory', 'CPU', 'Server', and 'Web checks'. The main filter area has sections for 'Host groups' (with a search box and 'Select' button), 'Hosts' (with a dropdown showing 'Zabbix server' and a 'Select' button), and 'Name' (with a search box). The 'Tags' section has a dropdown for 'And/Or' (set to 'And/Or'), a search box for 'tag', a dropdown for 'Contains', a search box for 'value', and a 'Remove' button. Below this is an 'Add' button. The 'Show tags' section has a dropdown for 'None', '1', '2', '3' (set to '3'), and a 'Tag name' dropdown for 'Full', 'Shortened', 'None' (set to 'Full'). The 'Tag display priority' section has a search box for 'comma-separated list'. The 'Show details' section has a checked checkbox. Below these are buttons for 'Update', 'Apply', and 'Reset'. A 'Subfilter affects only filtered data' message is shown. The 'TAGS' section shows 'Application 6'. The 'TAG VALUES' section shows 'App: 1 +1 2 +1 3 +1 5 +2' and a list of application items with their counts: 'Application: CPU +17 Disk sda +6 Disk sdb +6 Disk sdc +6 Filesystem / +5 General +9 Interface enp4s0 +9 Interface ppp0 +8 Interface wlp3s0 +8 Interface wwx001e101f0000 +8 Inventory +3 Memory 6 Monitoring agent +3 Security +1 Status +2 Web checks +9 Zabbix raw items +7 Zabbix server +44'. The 'DATA' section shows 'With data 130 Without data 33'.

The filter allows to narrow the list by host group, host, item name, tag and other settings. Specifying a parent host group in the filter implicitly selects all nested host groups. See *Monitoring -> Problems* for details on filtering by tags.

*Show details* allows to extend the information displayed for the items. Such details as the refresh interval, history and trends settings, item type, and item errors (fine/unsupported) are displayed.

### Saving filter

Favorite filter settings can be saved as tabs and then quickly accessed by clicking on the respective tab above the filter.

See more details about *saving filters*.

### Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - host, tag name or value, item state, or data status. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If there are 20 hosts each having 100 items (so 2000 records in total), only half of the hosts will be visible in the subfilter. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration -> General -> GUI*).

Unlike the main filter, the subfilter is updated together with each table refresh request to always get up-to-date information of available filtering options and their counter numbers.

For each entity group (e.g. tags, hosts) up to 10 rows of entities are displayed. If there are more entities, this list can be expanded to a maximum of 1000 entries (the value of `SUBFILTER_VALUES_PER_GROUP` in *frontend definitions*) by clicking on a three-dot icon displayed at the end. Once expanded to the maximum, the list cannot be collapsed. (Note that a non-expandable maximum of 100 is the limit before Zabbix 6.0.5.)

In the list of *Tag values* up to 10 rows of tag names are displayed. If there are more tag names with values, this list can be expanded to a maximum of 200 tag names by clicking on a three-dot icon displayed at the bottom. Once expanded to the maximum, the list cannot be collapsed. (Note that a non-expandable maximum of 20 rows is the limit before Zabbix 6.0.5.)

For each tag name up to 10 rows of values are displayed (expandable to 1000 entries (the value of `SUBFILTER_VALUES_PER_GROUP` in *frontend definitions*)).

The host options in the subfilter are available only if no hosts or more than one host is selected in the main filter.

By default, items with and without data are displayed in the item list. If only one host is selected in the main filter, the subfilter offers the option to filter only items with data, only without data, or both for this host.

A number next to each clickable entity indicates the number of items it has in the results of the main filter. Entities without items are not displayed, unless they were selected in the subfilter before.

Once one entity is selected, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection.

### Graphs

#### Ad-hoc graphs for comparing items

You may use the checkbox in the first column to select several items and then compare their data in a simple or stacked **ad-hoc graph**. To do that, select items of interest, then click on the required graph button below the table.

### Links to value history/simple graph

The last column in the latest value list offers:

- a **History** link (for all textual items) - leading to listings (*Values/500 latest values*) displaying the history of previous item values.
- a **Graph** link (for all numeric items) - leading to a **simple graph**. However, once the graph is displayed, a dropdown on the upper right offers a possibility to switch to *Values/500 latest values* as well.

The values displayed in this list are "raw", that is, no postprocessing is applied.

#### Note:

The total amount of values displayed is defined by the value of *Limit for search and filter results* parameter, set in **Administration → General**.

## 5 Maps

### Overview

In the *Monitoring → Maps* section you can configure, manage and view **network maps**.

When you open this section, you will either see the last map you accessed or a listing of all maps you have access to.

All maps can be either public or private. Public maps are available to all users, while private maps are accessible only to their owner and the users the map is shared with.

### Map listing

The screenshot shows the 'Maps' section in Zabbix. At the top, there are buttons for 'Create map' and 'Import'. Below is a table listing maps. The table has columns: 'Name', 'Width', 'Height', and 'Actions'. There are two maps listed: 'Local network' and 'Local network2'. At the bottom, there's a status bar showing '0 selected' and buttons for 'Export' and 'Delete'.

| Name           | Width | Height | Actions                |
|----------------|-------|--------|------------------------|
| Local network  | 600   | 400    | Properties Constructor |
| Local network2 | 680   | 200    | Properties Constructor |

Displaying 2 of 2 found

Displayed data:

| Column  | Description   |
|---------|---|
| Name    | Name of the map. Click on the name to <b>view</b> the map.  |
| Width   | Map width is displayed.   |
| Height  | Map height is displayed.  |
| Actions | Two actions are available:<br><b>Properties</b> - edit general map <b>properties</b><br><b>Constructor</b> - access the grid for adding <b>map elements</b> |

To **configure** a new map, click on the *Create map* button in the top right-hand corner. To import a map from a YAML, XML, or JSON file, click on the *Import* button in the top right-hand corner. The user who imports the map will be set as its owner.

Two buttons below the list offer some mass-editing options:

- *Export* - export the maps to a YAML, XML, or JSON file
- *Delete* - delete the maps

To use these options, mark the checkboxes before the respective maps, then click on the required button.

Using filter

You can use the filter to display only the maps you are interested in. For better search performance, data is searched with macros unresolved.

Viewing maps

To view a map, click on its name in the list of all maps.

You can use the drop-down in the map title bar to select the lowest severity level of the problem triggers to display. The severity marked as *default* is the level set in the map configuration. If the map contains a sub-map, navigating to the sub-map will retain the higher-level map severity (except if it is *Not classified*, in this case, it will not be passed to the sub-map).

Icon highlighting

If a map element is in problem status, it is highlighted with a round circle. The fill color of the circle corresponds to the severity color of the problem. Only problems on or above the selected severity level will be displayed with the element. If all problems are acknowledged, a thick green border around the circle is displayed.

Additionally:

- a host in **maintenance** is highlighted with an orange, filled square. Note that maintenance highlighting has priority over the problem severity highlighting (since Zabbix 6.0.5, only if the map element is host).
- a disabled (not-monitored) host is highlighted with a gray, filled square.

Highlighting is displayed if the *Icon highlighting* check-box is marked in map **configuration**.

Recent change markers

Inward pointing red triangles around an element indicate a recent trigger status change - one that's happened within the last 30 minutes. These triangles are shown if the *Mark elements on trigger status change* check-box is marked in map **configuration**.

Links

Clicking on a map element opens a menu with some available links.

Buttons

Buttons to the right offer the following options:

## Edit map

Go to map constructor to edit the map content.

Add map to the favorites widget in the **Dashboard**.

The map is in the favorites widget in the **Dashboard**. Click to remove map from the favorites widget.

View mode buttons being common for all sections are described on the **Monitoring** page.

### Readable summary in maps

A hidden "aria-label" property is available allowing map information to be read with a screen reader. Both general map description and individual element description is available, in the following format:

- for map description: <Map name>, <\* of \* items in problem state>, <\* problems in total>.
- for describing one element with one problem: <Element type>, Status <Element status>, <Element name>, <Problem description>.
- for describing one element with multiple problems: <Element type>, Status <Element status>, <Element name>, <\* problems>.
- for describing one element without problems: <Element type>, Status <Element status>, <Element name>.

For example, this description is available:

'Local network, 1 of 6 elements in problem state, 1 problem in total. Host, Status problem, My host, Free disk space is less than 20% on volume /

for the following map:

### Referencing a network map

Network maps can be referenced by both sysmapid and mapname GET parameters. For example,

`http://zabbix/zabbix/zabbix.php?action=map.view&mapname=Local%20network`

will open the map with that name (Local network).

If both sysmapid (map ID) and mapname (map name) are specified, mapname has higher priority.

6 Discovery

Overview

In the *Monitoring* → *Discovery* section results of **network discovery** are shown. Discovered devices are sorted by the discovery rule.

Status of discovery

Discovery rule

type here to search

Select

Apply

Reset

Filter

| Discovered device                     | Monitored host   | Uptime/Downtime  | SNMPv2 agent iso.3.6.1.2.1.1.0 |
|---------------------------------------|--|------------------|--------------------------------|
| Local network (14 devices)            |  |                  |                                |
| 192.168.3.114 (radix-ilo.zabbix.lan)  | Integrated Lights-Out 4 2.61 Jul 27 2018   |                  | 1d 2h 47m                      |

If a device is already monitored, the host name will be listed in the *Monitored host* column, and the duration of the device being discovered or lost after previous discovery is shown in the *Uptime/Downtime* column.

After that follow the columns showing the state of individual services for each discovered device (red cells show services that are down). Service uptime or downtime is included within the cell.

**Attention:**  
Only those services that have been found on at least one device will have a column showing their state.

Buttons

View mode buttons being common for all sections are described on the **Monitoring** page.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

With nothing selected in the filter, all enabled discovery rules are displayed. To select a specific discovery rule for display, start typing its name in the filter. All matching enabled discovery rules will be listed for selection. More than one discovery rule can be selected.

2 Services

Overview

The Services menu is for the **service monitoring** functions of Zabbix.

1 Services

Overview

In this section you can see a high-level status of whole services that have been configured in Zabbix, based on your infrastructure.

A service may be a hierarchy consisting of several levels of other services, called "child" services, which are attributes to the overall status of the service (see also an overview of the **service monitoring** functionality.)

The main categories of service status are *OK* or *Problem*, where the *Problem* status is expressed by the corresponding problem severity name and color.

While the view mode allows to monitor services with their status and other details, you can also **configure** the service hierarchy in this section (add/edit services, child services) by switching to the edit mode.

To switch from the view to the edit mode (and back) click on the respective button in the upper right corner:

-  - view services
-  - add/edit services, and child services

Note that access to editing depends on **user role** settings.

## Viewing services

A list of the existing services is displayed.

Displayed data:

| Parameter         | Description   |
|-------------------|---|
| <i>Name</i>       | Service name.<br>The service name is a link to <b>service details</b> .   |
| <i>Status</i>     | The number after the name indicates how many <b>child services</b> the service has.<br>Service status:<br><b>OK</b> - no problems<br><b>&lt;problem color and severity&gt;</b> - indicates a problem and its severity. In case of multiple problems, the color and severity of the most critical problem are displayed.                               |
| <i>Root cause</i> | Underlying problems that directly or indirectly affect the service status are listed.<br>The same problems are listed as returned by the {SERVICE.ROOTCAUSE} <b>macro</b> .<br>Click on the problem name to see more details about it in <i>Monitoring</i> → <i>Problems</i> .<br>Problems that do not affect the service status are not in the list. |
| <i>Created at</i> | The time when the service was created is displayed.   |
| <i>Tags</i>       | <b>Tags</b> of the service are displayed. Tags are used to identify a service in service <b>actions</b> and <b>SLAs</b> .   |

## Buttons

View mode buttons being common for all sections are described on the **Monitoring** page.

## Using filter

You can use the filter to display only the services you are interested in.

## Editing services

Click on the *Edit* button to access the edit mode. When in edit mode, the listing is complemented with checkboxes before the entries and also these additional options:

-  - add a child service to this service
-  - edit this service
-  - delete this service

Displaying 3 of 3 found

To **configure** a new service, click on the *Create service* button in the top right-hand corner.

## Service details

To access service details, click on the service name. To return to the list of all services, click on *All services*.

Service details include the info box and the list of child services.

| Name        | Reporting period   | SLO  | SLI | Uptime | Downtime   | Error budget | Created at | Tags                    |
|-------------|--------------------|------|-----|--------|------------|--------------|------------|-------------------------|
| Connections | 2022-01-09 - 01-15 | 100% | 0   | 0      | 4d 10h 48m | -4d 10h 48m  | 2000-01-01 | SLA: 2 Type: Connection |
| Servers     |                    |      |     |        |            |              | 2000-01-01 | SLA: 4 Type: CPU        |

To access the info box, click on the *Info* tab. The info box contains the following entries:

- Names of parent services (if any)
- Current status of this service
- Current SLA(s) of this service, in the format `SLA name:service level indicator`. 'SLA name' is also a link to the SLA report for this service. If you position the mouse on the info box next to the service-level indicator (SLI), a pop-up info list is displayed with SLI details. The service-level indicator displays the current service level, in percentage.
- Service tags

The info box also contains a link to the [service configuration](#).

To use the filter for child services, click on the *Filter* tab.

When in edit mode, the child service listing is complemented with additional editing options:

- add a child service to this service
- edit this service
- delete this service

## 2 Service actions

### Overview

In the *Services* → *Service actions* section users can [configure](#) and maintain service actions.

Configured actions are displayed in the list with respect to the user role permissions (see *Access to services* in [user roles](#)). Users will only see actions for services their user role grants access to.

Displayed data, filter and available mass editing options are the same as for other types of [actions](#).

## 3 SLA

### Overview

This section allows to view and [configure](#) SLAs.

#### SLAs

| Name  | SLO   | Effective date | Reporting period | Timezone                        | Schedule | SLA report | Status  |
|-------|-------|----------------|------------------|---------------------------------|----------|------------|---------|
| SLA:1 | 99.9% | 2022-01-01     | Weekly           | System default: (UTC+00:00) UTC | Custom   | SLA report | Enabled |
| SLA:2 | 100%  | 2000-01-01     | Weekly           | System default: (UTC+00:00) UTC | Custom   | SLA report | Enabled |
| SLA:3 | 100%  | 2000-01-01     | Weekly           | System default: (UTC+00:00) UTC | 24x7     | SLA report | Enabled |
| SLA:4 | 99.9% | 2000-01-01     | Weekly           | System default: (UTC+00:00) UTC | 24x7     | SLA report | Enabled |
| SLA:5 | 95%   | 2000-01-01     | Weekly           | System default: (UTC+00:00) UTC | 24x7     | SLA report | Enabled |

A list of the configured SLAs is displayed. *Note* that only the SLAs related to services accessible to the user will be displayed (as read-only, unless *Manage SLA* is enabled for the user role).

Displayed data:

| Parameter               | Description  |
|-------------------------|--|
| <i>Name</i>             | The SLA name is displayed.<br>The name is a link to <b>SLA configuration</b> .                           |
| <i>SLO</i>              | The service level objective (SLO) is displayed.  |
| <i>Effective date</i>   | The date of starting SLA calculation is displayed.   |
| <i>Reporting period</i> | The period used in the SLA report is displayed - <i>daily, weekly, monthly, quarterly, or annually</i> . |
| <i>Time zone</i>        | The SLA time zone is displayed.  |
| <i>Schedule</i>         | The SLA schedule is displayed - 24x7 or custom.  |
| <i>SLA report</i>       | Click on the link to see the SLA report for this SLA.  |
| <i>Status</i>           | The SLA status is displayed - enabled or disabled.   |

#### 4 SLA report

## Overview

This section allows to view **SLA** reports, based on the criteria selected in the filter.

SLA reports can also be displayed as a **dashboard widget**.

## Report

The filter allows to select the report based on the SLA name as well as the service name. It is also possible to limit the displayed period.

| 2021-03 | 100% | 100     | 1m 1d       | 0           | 0            |                    |
| 2021-02 | 100% | 100     | 28d         | 0           | 0            |                    |

Note that **negative problem duration** does not affect SLA calculation or reporting.

3 Inventory

Overview

The Inventory menu features sections providing an overview of host inventory data by a chosen parameter as well as the ability to view host inventory details.

1 Overview

Overview

The *Inventory* → *Overview* section provides ways of having an overview of **host inventory** data.

For an overview to be displayed, choose host groups (or none) and the inventory field by which to display data. The number of hosts corresponding to each entry of the chosen field will be displayed.

≡ Host inventory overview

Filter

Host groups

type here to search

Select

Cancel

The completeness of inventory data depends on how much inventory information is maintained with the host. If no information is maintained, the *Details* tab is disabled.

4 Reports

Overview

The Reports menu features several sections that contain a variety of predefined and user-customizable reports focused on displaying an overview of such parameters as system information, triggers and gathered data.

1 System information

Overview

In Reports → System information, a summary of key Zabbix server and system data is displayed. System data is collected using *internal items*.

Note that in a high availability setup, it is possible to redirect the system information source (server instance). To do this, edit the *zabbix.conf.php* file - uncomment and set \$ZBX\_SERVER or both \$ZBX\_SERVER and \$ZBX\_SERVER\_PORT to a server other than the one shown active. Note that when setting \$ZBX\_SERVER only, a default value (10051) for \$ZBX\_SERVER\_PORT will be used.

With the high availability setup enabled, a separate block is displayed below the system stats with details of high availability nodes. This block is visible to Zabbix *Super Admin* users only.

*System information* is also available as a dashboard **widget**.

## System stats

### System information

| Parameter  | Value   | Details                   |
|--|---------|---------------------------|
| Zabbix server is running                           | Yes     | 192.168.8.103:10051       |
| Number of hosts (enabled/disabled)                 | 5       | 4 / 1                     |
| Number of templates                                | 140     |                           |
| Number of items (enabled/disabled/not supported)   | 199     | 155 / 29 / 15             |
| Number of triggers (enabled/disabled [problem/ok]) | 89      | 87 / 2 [8 / 79]           |
| Number of users (online)                           | 3       | 1                         |
| Required server performance, new values per second | 1.96    |                           |
| High availability cluster                          | Enabled | Fail-over delay: 1 minute |

| Name  | Address             | Last access | Status  |
|-------|---------------------|-------------|---------|
| base  | 192.168.8.103:10051 | 2s          | Active  |
| base2 | localhost:10051     | 5m 11s      | Stopped |

## Displayed data:

| Parameter   | Value   | Details   |
|---|---|---|
| <i>Zabbix server is running</i>                           | Status of Zabbix server:<br><b>Yes</b> - server is running<br><b>No</b> - server is not running<br><i>Note:</i> To display the rest of the information the web, frontend needs the server to be running and there must be at least one trapper process started on the server (StartTrappers parameter in <code>zabbix_server.conf</code> file > 0). | Location and port of Zabbix server.   |
| <i>Number of hosts</i>                                    | Total number of hosts configured is displayed.  | Number of monitored hosts/not monitored hosts.  |
| <i>Number of templates</i>                                | Total number of templates is displayed.   |   |
| <i>Number of items</i>                                    | Total number of items is displayed.   | Number of monitored/disabled/unsupported host-level items.<br>Items on disabled hosts are counted as disabled.  |
| <i>Number of triggers</i>                                 | Total number of triggers is displayed.  | Number of enabled/disabled host-level triggers; split of the enabled triggers according to "Problem"/"OK" states.<br><br>Triggers listed under the "OK" state include triggers with the status "Unknown".<br>Triggers dependent on disabled items or assigned to disabled hosts are counted as disabled.  |
| <i>Number of users</i>                                    | Total number of users configured is displayed.  | Number of users online.   |
| <i>Required server performance, new values per second</i> | The expected number of new values processed by Zabbix server per second is displayed.   | <i>Required server performance</i> is an estimate and can be useful as a guideline. For precise numbers of values processed, use the <code>zabbix[ocache,values,all]</code> <b>internal item</b> .<br><br>Enabled items from monitored hosts are included in the calculation. Log items are counted as one value per item update interval. Regular interval values are counted; flexible and scheduling interval values are not. The calculation is not adjusted during a "nodata" maintenance period. Trapper items are not counted. |
| <i>Database history tables upgraded</i>                   | Database upgrade status:<br><b>No</b> - database history tables have not been upgraded  | This field is displayed if database upgrade to extended range for numeric (float) values has not been completed. See <a href="#">instructions for enabling an extended range of numeric (float) values</a> .  |

| Parameter                 | Value   | Details                                      |
|---------------------------|---|--|
| High availability cluster | Status of <b>high availability cluster</b> for Zabbix server:<br><b>disabled</b> - standalone server<br><b>enabled</b> - at least one high availability node exists | If enabled, the failover delay is displayed. |

System information will also display an error message in the following conditions:

- The database used does not have the required character set or collation (UTF-8).
- The version of the database is below or above the **supported range** (available only to users with the *Super admin role* type).
- **Housekeeping** for **TimescaleDB** is incorrectly configured (history or trend tables contain compressed chunks, but *Override item history period* or *Override item trend period* options are disabled).

#### High availability nodes

If **high availability cluster** is enabled, then another block of data is displayed with the status of each high availability node.

| Name        | Address            | Last access             | Status      |
|-------------|--------------------|-------------------------|-------------|
| node-active | 192.168.1.13:10051 | 12s                     | Active      |
| node6       | 192.168.1.10:10053 | 1h 2m 40s               | Unavailable |
| node7       | 192.168.1.11:10053 | 3m 40s                  | Unavailable |
| node4       | 192.168.1.8:10052  | 1h 34m 29s              | Stopped     |
| node5       | 192.168.1.9:10053  | 1h 9m 51s               | Stopped     |

| Column             | Description  |
|--------------------|--|
| <i>Name</i>        | Node name, as defined in server configuration.   |
| <i>Address</i>     | Node IP address and port.  |
| <i>Last access</i> | Time of node last access.  |
| <i>Status</i>      | Hovering over the cell shows the timestamp of last access in long format.<br>Node status:<br><b>Active</b> - node is up and working<br><b>Unavailable</b> - node hasn't been seen for more than failover delay (you may want to find out why)<br><b>Stopped</b> - node has been stopped or couldn't start (you may want to start it or delete it)<br><b>Standby</b> - node is up and waiting |

## 2 Scheduled reports

### Overview

In *Reports* → *Scheduled reports*, users with sufficient permissions can configure scheduled generation of PDF versions of the dashboards, which will be sent by email to specified recipients.

#### Scheduled reports

[Create report](#)

Show All Created by me

Status Any Enabled Disabled Expired

[Filter](#)

[Apply](#) [Reset](#)

| <input type="checkbox"/> Name              | Owner                        | Repeats | Period       | Last sent | Status  | Info |
|--|------------------------------|---------|--------------|-----------|---------|------|
| <input type="checkbox"/> Global view daily | Admin (Zabbix Administrator) | Daily   | Previous day | Never     | Enabled |      |

Displaying 1 of 1 found

The opening screen displays information about scheduled reports, which can be filtered out for easy navigation - see **Using filter** section below.

Displayed data:

| Column           | Description   |
|------------------|---|
| <i>Name</i>      | Name of the report. Clicking it opens the report <b>configuration form</b> .  |
| <i>Owner</i>     | User who created the report.  |
| <i>Repeats</i>   | Report generation frequency (daily/weekly/monthly/yearly).  |
| <i>Period</i>    | Period for which the report is prepared.  |
| <i>Last sent</i> | The date and time when the latest report has been sent.   |
| <i>Status</i>    | Current status of the report (enabled/disabled/expired). Users with sufficient permissions can change the status by clicking it - from "Enabled" to "Disabled" (and back); from "Expired" to "Disabled" (and back). For users with insufficient rights, the status is not clickable.  |
| <i>Info</i>      | Displays informative icons:<br>A red icon indicates that report generation has failed; hovering over it will display a tooltip with the error information.<br>A yellow icon indicates that a report was generated, but sending to some (or all) recipients has failed or that a report is expired; hovering over it will display a tooltip with additional information. |

Using filter

You may use the filter to narrow down the list of reports. For better search performance, data is searched with macros unresolved.

The following filtering options are available:

- *Name* - partial name match is allowed
- *Show* - created by current user or all reports
- *Status* - select between "Any" (show all reports), "Enabled", "Disabled", or "Expired"

The filter is located below the *Scheduled reports* section name. It can be opened and collapsed by clicking the *Filter* tab in the upper right corner.

Mass update

Sometimes you may want to delete or change the status of a number of reports at once. Instead of opening each individual report for editing, you may use the mass update function for that.

To mass-update some reports, do the following:

- Mark the checkboxes of the reports to update in the list
- Click the required button below the list to make the changes (*Enable*, *Disable*, or *Delete*)

### 3 Availability report

Overview

In *Reports* → *Availability report* you can see what proportion of time each trigger has been in problem/ok state. The percentage of time for each state is displayed.

Thus it is easy to determine the availability situation of various elements on your system.

≡ Availability report Mode By host ▾

The name of the trigger is a link to the latest events of that trigger.

### Using filter

The filter can help narrow down the number of hosts and/or triggers displayed. For better search performance, data is searched with macros unresolved.

The filter is located below the *Availability report* section name. It can be opened and collapsed by clicking on the *Filter* tab on the right.

### Filtering by trigger template

In the *by trigger template* mode results can be filtered by one or several parameters listed below.

| Parameter               | Description   |
|-------------------------|---|
| <i>Template group</i>   | Select all hosts with triggers from templates belonging to that group. Any host group that includes at least one template can be selected.  |
| <i>Template</i>         | Select hosts with triggers from the chosen template and all nested templates. Only triggers inherited from the selected template will be displayed. If a nested template has additional own triggers, those triggers will not be displayed. |
| <i>Template trigger</i> | Select hosts with chosen trigger. Other triggers of the selected hosts will not be displayed.   |
| <i>Host group</i>       | Select hosts belonging to the group.  |

### Filtering by host

In the *by host* mode results can be filtered by a host or by the host group. Specifying a parent host group implicitly selects all nested host groups.

### Time period selector

The **time period selector** allows to select often required periods with one mouse click. The time period selector can be opened by clicking on the time period tab next to the filter.

Clicking on *Show* in the Graph column displays a bar graph where availability information is displayed in bar format each bar representing a past week of the current year.

The green part of a bar stands for OK time and red for problem time.

## 4 Triggers top 100

### Overview

In *Reports* → *Triggers top 100* you can see the triggers that have changed their state most often within the period of evaluation, sorted by the number of status changes.

| <a href="#">Zabbix server</a> | <a href="#">Zabbix server has just been restarted</a>                      | Information | 19                       |
| <a href="#">Zabbix server</a> | <a href="#">Lack of free swap space on Zabbix server</a>                   | Warning     | 16                       |
| <a href="#">New host</a>      | <a href="#">Lack of free swap space on New host</a>                        | Warning     | 12                       |
| <a href="#">New host</a>      | <a href="#">Zabbix agent on New host is unreachable for 5 minutes</a>      | Average     | 8                        |
| <a href="#">Zabbix server</a> | <a href="#">Zabbix agent on Zabbix server is unreachable for 5 minutes</a> | Average     | 8                        |
| <a href="#">New host</a>      | <a href="#">/etc/passwd has been changed on New host</a>                   | Warning     | 4                        |

Both host and trigger column entries are links that offer some useful options:

- for host - links to user-defined scripts, latest data, inventory, graphs, and dashboards for the host
- for trigger - links to latest events, the trigger configuration form, and a simple graph

### Using filter

You may use the filter to display triggers by host group, host, or trigger severity. Specifying a parent host group implicitly selects all nested host groups. For better search performance, data is searched with macros unresolved.

The filter is located below the *100 busiest triggers* bar. It can be opened and collapsed by clicking on the *Filter* tab on the right.

### Time period selector

The **time period selector** allows to select often required periods with one mouse click. The time period selector can be opened by clicking on the time period tab next to the filter.

5 Audit

Overview

In the *Reports* → *Audit* section, the records of user and system activity can be viewed.

**Note:**

For audit records to be collected and displayed, the *Enable audit logging* checkbox has to be marked in the *Administration* → *General* → *Audit log* section. Without this setting enabled, the history of activities will not be recorded in the database and will not be shown in the audit log.

Audit log

| Time                | User  | IP        | Resource | ID | Action       | Recordset ID              | Details  |
|---------------------|-------|-----------|----------|----|--------------|---------------------------|--|
| 2022-05-30 12:07:34 | Admin | 127.0.0.1 | User     | 4  | Update       | cl3sicbqq0000z8ep87xz41zs | Description: Database manager<br>user.lang: default => en_GB |
| 2022-05-30 12:07:13 | Admin | 127.0.0.1 | User     | 1  | Login        | cl3sibvqn0000z8ep40q8w1k  |  |
| 2022-05-30 12:07:13 | guest | 127.0.0.1 | User     | 2  | Failed login | cl3sibvqn0000z8ep40q8w1k  |  |
| 2022-05-30 12:07:12 | guest | 127.0.0.1 | User     | 2  | Failed login | cl3sibvem0000z8epv1m1xizi |  |

Audit log displays the following data:

| Column       | Description   |
|--------------|---|
| Time         | Timestamp of the audit record.  |
| User         | User who performed the activity.  |
| IP           | IP from which the activity was initiated.   |
| Resource     | Type of the affected resource ( <i>API token</i> , <i>Action</i> , <i>Authentication</i> , <i>Autoregistration</i> , etc.).   |
| ID           | ID of the affected resource.<br>Clicking on the hyperlink will result in filtering audit log records by this resource ID.   |
| Action       | Type of the activity ( <i>Add</i> , <i>Delete</i> , <i>Execute</i> , <i>Failed login</i> , <i>History clear</i> , <i>Login</i> , <i>Logout</i> , <i>Update</i> ).   |
| Recordset ID | Shared ID for all audit log records created as a result of the same operation. For example, when linking a template to a host, a separate audit log record is created for each inherited template entity (item, trigger, etc.) - all these records will have the same <i>Recordset ID</i> .<br>Clicking on the hyperlink will result in filtering audit log records by this <i>Recordset ID</i> . |
| Details      | Description of the resource and detailed information about the performed activity. If a record contains more than two rows, an additional link <i>Details</i> will be displayed. Click on this link to view the full list of changes.   |

Using filter

The filter is located below the *Audit log* bar. It can be opened and collapsed by clicking on the *Filter* tab in the upper right corner.

Displayed data:

| Column       | Description  |
|--------------|--|
| Time         | Timestamp of the operation.  |
| Action       | Name of the action causing operations is displayed.  |
| Type         | Operation type is displayed.   |
| Recipient(s) | Username, name, surname (in parentheses) and e-mail address of the notification recipient is displayed.  |
| Message      | The content of the message, remote command or global script name is displayed.<br>A remote command is separated from the target host with a colon symbol: <host>:<command>.<br>If the remote command is executed on Zabbix server, then the information has the following format: Zabbix server:<command>  |
| Status       | Operation status is displayed:<br>In progress - action is in progress<br>For actions in progress the number of retries left is displayed - the remaining number of times the server will try to send the notification.<br>Sent - notification has been sent<br>Executed - command has been executed<br>Not sent - action has not been completed. |
| Info         | Error information (if any) regarding the action execution is displayed.  |

Using filter

You may use the filter to narrow down the records by the message recipient(s). For better search performance, data is searched with macros unresolved.

The filter is located below the Action log bar. It can be opened and collapsed by clicking on the Filter tab on the right.

Time period selector

The time period selector allows to select often required periods with one mouse click. The time period selector can be opened by clicking on the time period tab next to the filter.

7 Notifications

Overview

In the Reports → Notifications section a report on the number of notifications sent to each user is displayed.

From the dropdowns in the top right-hand corner you can choose the media type (or all), period (data for each day/week/month/year) and year for the notifications sent.

| Month    | Admin (Zabbix Administrator) | Database manager | guest | user (New User) |
|----------|------------------------------|------------------|-------|-----------------|
| January  |                              |                  |       |                 |
| February |                              |                  |       |                 |
| March    |                              |                  |       |                 |
| April    | 48                           |                  |       |                 |
| May      | 568                          |                  |       |                 |

Each column displays totals per one system user.

## 5 Configuration

### Overview

The Configuration menu contains sections for setting up major Zabbix functions, such as hosts and host groups, data gathering, data thresholds, sending problem notifications, creating data visualization and others.

### 1 Items

### Overview

The item list for a template can be accessed from *Configuration* → *Templates* by clicking on *Items* for the respective template.

A list of existing items is displayed.

| All templates / Template OS Linux by Zabbix agent... |   |            |                 |          |         |        |                       |         |                           | Items 41 | Triggers 14 | Graphs 8 | Dashboards 1 | Discovery rules 3 | Web scenarios | Filter |  |

| <input type="checkbox"/>                             | ... Template Module Linux generic by Zabbix agent active: Number of running processes             |            | proc.num[,run]  | 1m       | 7d      | 365d   | Zabbix agent (active) | Enabled | Application: General      |          |             |          |              |                   |               |        |  |

Displayed data:

| Column           | Description   |
|------------------|---|
| <i>Item menu</i> | Click on the three-dot icon to open the menu for this specific item with these options:<br><b>Create trigger</b> - create a trigger based on this item<br><b>Triggers</b> - click to see a list with links to already-configured trigger of this item<br><b>Create dependent item</b> - create a dependent item for this item<br><b>Create dependent discovery rule</b> - create a dependent discovery rule for this item |
| <i>Template</i>  | Template the item belongs to.<br>This column is displayed only if multiple templates are selected in the filter.  |
| <i>Name</i>      | Name of the item displayed as a blue link to item details.<br>Clicking on the item name link opens the item <b>configuration form</b> .<br>If the item is inherited from another template, the template name is displayed before the item name, as a gray link. Clicking on the template link will open the item list on that template level.   |
| <i>Triggers</i>  | Moving the mouse over Triggers will display an infobox displaying the triggers associated with the item.<br>The number of the triggers is displayed in gray.  |
| <i>Key</i>       | Item key is displayed.  |
| <i>Interval</i>  | Frequency of the check is displayed.  |

| Column         | Description  |
|----------------|--|
| <i>History</i> | How many days item data history will be kept is displayed.   |
| <i>Trends</i>  | How many days item trends history will be kept is displayed.   |
| <i>Type</i>    | Item type is displayed (Zabbix agent, SNMP agent, simple check, etc).  |
| <i>Status</i>  | Item status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it - from Enabled to Disabled (and back).                              |
| <i>Tags</i>    | Item tags are displayed.<br>Up to three tags (name:value pairs) can be displayed. If there are more tags, a "... " link is displayed that allows to see all tags on mouseover. |

To configure a new item, click on the *Create item* button at the top right corner.

## Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change item status to *Enabled*.
- *Disable* - change item status to *Disabled*.
- *Copy* - copy the items to other hosts or templates.
- *Mass update* - **update several properties** for a number of items at once.
- *Delete* - delete the items.

To use these options, mark the checkboxes before the respective items, then click on the required button.

## Using filter

The item list may contain a lot of items. By using the filter, you can filter out some of them to quickly locate the items you're looking for. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter                  | Description   |
|----------------------------|---|
| <i>Template groups</i>     | Filter by one or more template groups.<br>Only template groups that contain at least one template can be selected.<br>Specifying a parent template group implicitly selects all nested template groups. |
| <i>Templates</i>           | Filter by one or more templates.  |
| <i>Name</i>                | Filter by item name.  |
| <i>Key</i>                 | Filter by item key.   |
| <i>Value mapping</i>       | Filter by the value map used.   |
| <i>Type</i>                | This parameter is not displayed if the <i>Templates</i> option is empty.  |
| <i>Type of information</i> | Filter by item type (Zabbix agent, SNMP agent, etc.).<br>Filter by type of information (Numeric unsigned, float, etc.).   |

| Parameter              | Description   |
|------------------------|---|
| <i>History</i>         | Filter by how long item history is kept.  |
| <i>Trends</i>          | Filter by how long item trends are kept.  |
| <i>Update interval</i> | Filter by item update interval.   |
| <i>Tags</i>            | Specify tags to limit the number of items displayed. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met |
| <i>Status</i>          | Filter by item status - <i>Enabled</i> or <i>Disabled</i> .   |
| <i>Triggers</i>        | Filter items with (or without) triggers.  |
| <i>Inherited</i>       | Filter items inherited (or not inherited) from linked templates.  |

## Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - tag, item type, item update interval, etc. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilter affects only filtered data

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration* -> *General* -> *GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

2 Triggers

## Overview

The trigger list for a template can be accessed from *Configuration* → *Templates* by clicking on *Triggers* for the respective template.

Triggers Create trigger

All templates / Linux OS agent Items 42 Triggers 14 Graphs 8 Dashboards 1 Discovery rules 3 Web scenarios Filter

| <input type="checkbox"/> | Severity    | Name  | Operational data                                   | Expression  | Status  | Tags |

Displayed data:

| Column           | Description  |
|------------------|--|
| Severity         | Severity of the trigger is displayed by both name and cell background color.   |
| Template         | Template the trigger belongs to.<br>This column is displayed only if multiple templates are selected in the filter.  |
| Name             | Name of the trigger displayed as a blue link to trigger details.<br>Clicking on the trigger name link opens the trigger <b>configuration form</b> .<br>If the trigger is inherited from another template, the template name is displayed before the trigger name, as a gray link. Clicking on the template link will open the trigger list on that template level. |
| Operational data | Operational data definition of the trigger, containing arbitrary strings and macros that will resolve dynamically in <i>Monitoring</i> → <i>Problems</i> .   |
| Expression       | Trigger expression is displayed. The template-item part of the expression is displayed as a link, leading to the item configuration form.  |
| Status           | Trigger status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it - from Enabled to Disabled (and back).   |
| Tags             | If a trigger contains tags, tag name and value are displayed in this column.   |

To configure a new trigger, click on the *Create trigger* button at the top right corner.

### Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change trigger status to *Enabled*
- *Disable* - change trigger status to *Disabled*
- *Copy* - copy the triggers to other hosts or templates
- *Mass update* - update several properties for a number of triggers at once
- *Delete* - delete the triggers

To use these options, mark the checkboxes before the respective triggers, then click on the required button.

### Using filter

You can use the filter to display only the triggers you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

### 3 Graphs

#### Overview

The custom graph list for a template can be accessed from *Configuration* → *Templates* by clicking on *Graphs* for the respective template.

A list of existing graphs is displayed.

Graphs

Create graph

| All templates / Template App Zabbix Server Applications 1 Items 46 Triggers 34 Graphs 6 Dashboards 1 Discovery rules Web scenarios |       |        |            | Filter |
|--|-------|--------|------------|--------|
| <input type="checkbox"/> Name  | Width | Height | Graph type |        |
| <input type="checkbox"/> Value cache effectiveness   | 900   | 200    | Stacked    |        |
| <input type="checkbox"/> Zabbix cache usage, % used  | 900   | 200    | Normal     |        |

Displayed data:

| Column            | Description  |
|-------------------|--|
| <i>Template</i>   | Template the graph belongs to.<br>This column is displayed only if multiple templates are selected in the filter.  |
| <i>Name</i>       | Name of the custom graph, displayed as a blue link to graph details.<br>Clicking on the graph name link opens the graph <b>configuration form</b> .<br>If the graph is inherited from another template, the template name is displayed before the graph name, as a gray link. Clicking on the template link will open the graph list on that template level. |
| <i>Width</i>      | Graph width is displayed.  |
| <i>Height</i>     | Graph height is displayed.   |
| <i>Graph type</i> | Graph type is displayed - <i>Normal</i> , <i>Stacked</i> , <i>Pie</i> or <i>Exploded</i> .   |

To configure a new graph, click on the *Create graph* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click on the required button.

Using filter

You can filter graphs by host group and template. For better search performance, data is searched with macros unresolved.

#### 4 Discovery rules

##### Overview

The list of low-level discovery rules for a template can be accessed from *Configuration* → *Templates* by clicking on *Discovery* for the respective template.

A list of existing low-level discovery rules is displayed. It is also possible to see all discovery rules independently of the template, or all discovery rules of a specific host group by changing the filter settings.

Discovery rules

Create discovery rule

Displayed data:

| Column          | Description   |
|-----------------|---|
| <i>Template</i> | The template discovery rule belongs to.   |
| <i>Name</i>     | Name of the rule, displayed as a blue link.<br>Clicking on the rule name opens the low-level discovery rule <b>configuration form</b> .<br>If the discovery rule is inherited from another template, the template name is displayed before the rule name, as a gray link. Clicking on the template link will open the discovery rule list on that template level. |
| <i>Items</i>    | A link to the list of item prototypes is displayed.   |
| <i>Triggers</i> | The number of existing item prototypes is displayed in gray.<br>A link to the list of trigger prototypes is displayed.<br>The number of existing trigger prototypes is displayed in gray.   |

| Column          | Description   |
|-----------------|---|
| <i>Graphs</i>   | A link to the list of graph prototypes displayed.<br>The number of existing graph prototypes is displayed in gray.  |
| <i>Hosts</i>    | A link to the list of host prototypes displayed.<br>The number of existing host prototypes is displayed in gray.  |
| <i>Key</i>      | The item key used for discovery is displayed.   |
| <i>Interval</i> | The frequency of performing discovery is displayed.   |
| <i>Type</i>     | The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).  |
| <i>Status</i>   | Discovery rule status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it - from Enabled to Disabled (and back). |

To configure a new low-level discovery rule, click on the *Create discovery rule* button at the top right corner.

#### Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the low-level discovery rule status to *Enabled*
- *Disable* - change the low-level discovery rule status to *Disabled*
- *Delete* - delete the low-level discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

#### Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria such as template, discovery rule name, item key, item type, etc.

| Parameter                         | Description   |
|-----------------------------------|---|
| <i>Template groups</i>            | Filter by one or more template groups.<br>Only template groups that contain at least one template can be selected.<br>Specifying a parent template group implicitly selects all nested template groups. |
| <i>Templates</i>                  | Filter by one or more templates.  |
| <i>Name</i>                       | Filter by discovery rule name.  |
| <i>Key</i>                        | Filter by discovery item key.   |
| <i>Type</i>                       | Filter by discovery item type.  |
| <i>Update interval</i>            | Filter by update interval.  |
| <i>Keep lost resources period</i> | Not available for Zabbix trapper and dependent items.   |
| <i>Status</i>                     | Filter by discovery rule status (All/Enabled/Disabled).   |

## 1 Item prototypes

### Overview

In this section the configured item prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, item prototypes will become the basis of creating real host **items** during low-level discovery.

Displayed data:

| Column         | Description  |
|----------------|--|
| Name           | <p>Name of the item prototype, displayed as a blue link.</p> <p>Clicking on the name opens the item prototype <b>configuration form</b>.</p> <p>If the item prototype belongs to a linked template, the template name is displayed before the item name, as a gray link. Clicking on the template link will open the item prototype list on the linked template level.</p> |
| Key            | Key of the item prototype is displayed.  |
| Interval       | Frequency of the check is displayed.   |
| History        | How many days to keep item data history is displayed.  |
| Trends         | How many days to keep item trends history is displayed.  |
| Type           | Type of the item prototype is displayed (Zabbix agent, SNMP agent, simple check, etc).   |
| Create enabled | <p>Create the item based on this prototype as:</p> <p><b>Yes</b> - enabled</p> <p><b>No</b> - disabled. You can switch between 'Yes' and 'No' by clicking on them.</p>   |
| Discover       | <p>Discover the item based on this prototype:</p> <p><b>Yes</b> - discover</p> <p><b>No</b> - do not discover. You can switch between 'Yes' and 'No' by clicking on them.</p>  |
| Tags           | Tags of the item prototype is displayed.   |

To configure a new item prototype, click on the *Create item prototype* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these items as *Enabled*
- *Create disabled* - create these items as *Disabled*
- *Mass update* - mass update these item prototypes
- *Delete* - delete these item prototypes

To use these options, mark the checkboxes before the respective item prototypes, then click on the required button.

2 Trigger prototypes

Overview

In this section the configured trigger prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, trigger prototypes will become the basis of creating real host **triggers** during low-level discovery.

| <input type="checkbox"/> | Severity | Name ▲  | Operational data   | Expression  | Create enabled      | Discover            | Tags |

| 0 selected  |                 |                 |          |          |                |            |         | Enable Disable Delete      |

Displayed data:

| Column                 | Description   |
|------------------------|---|
| <i>Name</i>            | Name of the web scenario. Clicking on the web scenario name opens the web scenario <b>configuration form</b> .<br>If the web scenario is inherited from another template, the template name is displayed before the web scenario name, as a gray link. Clicking on the template link will open the web scenarios list on that template level. |
| <i>Number of steps</i> | The number of steps the scenario contains.  |
| <i>Update interval</i> | How often the scenario is performed.  |
| <i>Attempts</i>        | How many attempts for executing web scenario steps are performed.   |
| <i>Authentication</i>  | Authentication method is displayed - Basic, NTLM or None.   |
| <i>HTTP proxy</i>      | Displays HTTP proxy or 'No' if not used.  |
| <i>Status</i>          | Web scenario status is displayed - <i>Enabled</i> or <i>Disabled</i> .<br>By clicking on the status you can change it.  |
| <i>Tags</i>            | Web scenario tags are displayed.<br>Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows to see all tags on mouseover.   |

To configure a new web scenario, click on the *Create web scenario* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the scenario status to *Enabled*
- *Disable* - change the scenario status to *Disabled*
- *Delete* - delete the web scenarios

To use these options, mark the checkboxes before the respective web scenarios, then click on the required button.

Using filter

You can use the filter to display only the scenarios you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of web scenarios. If you click on it, a filter becomes available where you can filter scenarios by host group, template, status and tags.

| <i>Availability</i>     | <p>An orange wrench icon  before the host status indicates that this host is in maintenance. Maintenance details are displayed when the mouse pointer is positioned over the icon.</p> <p>Host <b>availability</b> per configured interface is displayed.</p> <p>Icons represent only those interface types (Zabbix agent, SNMP, IPMI, JMX) that are configured. If you position the mouse on the icon, a popup list of all interfaces of this type appears with each interface details, status and errors.</p> <p>The column is empty for hosts with no interfaces.</p> <p>The current status of all interfaces of one type is displayed by the respective icon color:</p> <p><b>Green</b> - all interfaces available</p> <p><b>Yellow</b> - at least one interface available and at least one unavailable; others can have any value including 'unknown'</p> <p><b>Red</b> - no interfaces available</p> <p><b>Gray</b> - at least one interface unknown (none unavailable)</p> <p>Note that active Zabbix agent items do not affect host availability.</p> |
| <i>Agent encryption</i> | <p>Encryption status for connections to the host is displayed:</p> <p><b>None</b> - no encryption</p> <p><b>PSK</b> - using pre-shared key</p> <p><b>Cert</b> - using certificate</p>  |
| <i>Info</i>             | Error information (if any) regarding the host is displayed.  |
| <i>Tags</i>             | <b>Tags</b> of the host, with macros unresolved.   |

To configure a new host, click on the *Create host* button in the top right-hand corner. To import a host from a YAML, XML, or JSON file, click on the *Import* button in the top right-hand corner.

#### Mass editing options

Buttons below the list offer some mass-editing options:

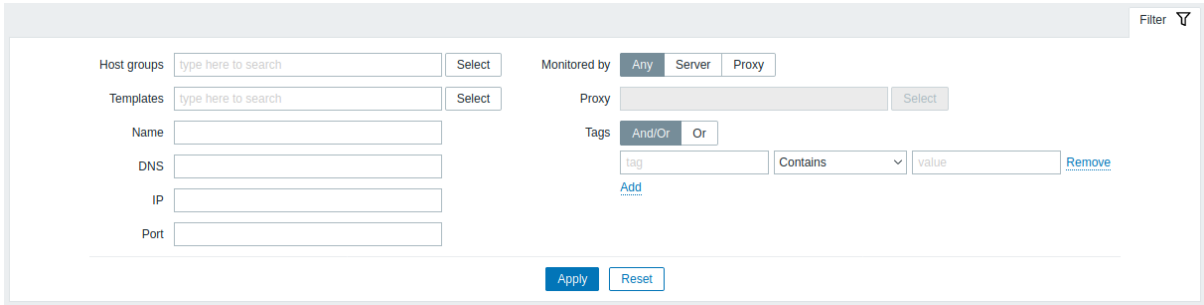

- *Enable* - change host status to *Monitored*
- *Disable* - change host status to *Not monitored*
- *Export* - export the hosts to a YAML, XML or JSON file
- *Mass update* - **update several properties** for a number of hosts at once
- *Delete* - delete the hosts

To use these options, mark the checkboxes before the respective hosts, then click on the required button.

#### Using filter

You can use the filter to display only the hosts you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of hosts. If you click on it, a filter becomes available where you can filter hosts by host group, linked templates, name, DNS, IP, port number, if they are monitored by server or by proxy, proxy name and tags.

| Parameter          | Description   |
|--------------------|---|
| <i>Host groups</i> | Filter by one or more host groups.<br>Specifying a parent host group implicitly selects all nested host groups. |
| <i>Templates</i>   | Filter by linked templates.   |
| <i>Name</i>        | Filter by visible host name.  |
| <i>DNS</i>         | Filter by DNS name.   |
| <i>IP</i>          | Filter by IP address.   |

| Parameter           | Description   |
|---------------------|---|
| <i>Port</i>         | Filter by port number.  |
| <i>Monitored by</i> | Filter hosts that are monitored by server only, proxy only or both.   |
| <i>Proxy</i>        | Filter hosts that are monitored by the proxy specified here.  |
| <i>Tags</i>         | <p>Filter by host tag name and value.</p> <p>It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p><b>Exists</b> - include the specified tag names</p> <p><b>Equals</b> - include the specified tag names and values (case-sensitive)</p> <p><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p><b>Does not exist</b> - exclude the specified tag names</p> <p><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)</p> <p><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p>There are two calculation types for conditions:</p> <p><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition</p> <p><b>Or</b> - enough if one condition is met</p> |

## Reading host availability

Host availability icons reflect the current host interface status on Zabbix server. Therefore, in the frontend:

- If you disable a host, availability icons will not immediately turn gray (unknown status), because the server has to synchronize the configuration changes first;
- If you enable a host, availability icons will not immediately turn green (available), because the server has to synchronize the configuration changes and start polling the host first.

## Unknown interface status

Zabbix server determines an unknown status for the corresponding agent interface (Zabbix, SNMP, IPMI, JMX) if:

- there are no enabled items on the interface (they were removed or disabled);
- there are only active Zabbix agent items;
- there are no pollers for that type of the interface (e.g. StartPollers=0);
- host is disabled;
- host is set to be monitored by proxy, a different proxy or by server if it was monitored by proxy;
- host is monitored by a proxy that appears to be offline (no updates received from the proxy during the maximum heartbeat interval - 1 hour).

Setting interface availability to unknown is done after server configuration cache synchronization. Restoring interface availability (available/unavailable) on hosts monitored by proxies is done after proxy configuration cache synchronization.

See also more details about host interface [unreachability](#).

## 1 Items

## Overview

The item list for a host can be accessed from *Configuration* → *Hosts* by clicking on *Items* for the respective host.

A list of existing items is displayed.

| <i>Item menu</i> | <p>Click on the three-dot icon to open the menu for the specific item with these options:</p> <p><b>Latest data</b> - see latest data of the item</p> <p><b>Create trigger</b> - create a trigger based on this item</p> <p><b>Triggers</b> - click to see a list with links to already-configured trigger of this item</p> <p><b>Create dependent item</b> - create a dependent item for this item</p> <p><b>Create dependent discovery rule</b> - create a dependent discovery rule for this item</p>   |
| <i>Host</i>      | Host of the item.   |
| <i>Name</i>      | <p>This column is displayed only if multiple hosts are selected in the filter.</p> <p>Name of the item displayed as a blue link to item details.</p> <p>Clicking on the item name link opens the item <b>configuration form</b>.</p> <p>If the host item belongs to a template, the template name is displayed before the item name as a gray link. Clicking on the template link will open the item list on the template level.</p> <p>If the item has been created from an item prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking on the discovery rule name will open the item prototype list.</p> |
| <i>Triggers</i>  | <p>Moving the mouse over Triggers will display an infobox displaying the triggers associated with the item.</p> <p>The number of the triggers is displayed in gray.</p>   |
| <i>Key</i>       | Item key is displayed.  |
| <i>Interval</i>  | <p>Frequency of the check is displayed.</p> <p><i>Note</i> that passive items can also be checked immediately by pushing the <i>Execute now</i> button.</p>   |
| <i>History</i>   | How many days item data history will be kept is displayed.  |
| <i>Trends</i>    | How many days item trends history will be kept is displayed.  |
| <i>Type</i>      | Item type is displayed (Zabbix agent, SNMP agent, simple check, etc).   |
| <i>Status</i>    | Item status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Not supported</i> . You can change the status by clicking on it - from Enabled to Disabled (and back); from Not supported to Disabled (and back).   |
| <i>Tags</i>      | <p>Item tags are displayed.</p> <p>Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows to see all tags on mouseover.</p>  |
| <i>Info</i>      | If the item is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.  |

To configure a new item, click on the *Create item* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change item status to *Enabled*
- *Disable* - change item status to *Disabled*
- *Execute now* - execute a check for new item values immediately. Supported for **passive** checks only (see **more details**). Note that when checking for values immediately, configuration cache is not updated, thus the values will not reflect very recent changes to item configuration.
- *Clear history and trends* - delete history and trend data for items.
- *Copy* - copy the items to other hosts or templates.
- *Mass update* - **update several properties** for a number of items at once.

- *Delete* - delete the items.

To use these options, mark the checkboxes before the respective items, then click on the required button.

## Using filter

You can use the filter to display only the items you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| <i>Status</i>    | Filter by item status - <i>Enabled</i> or <i>Disabled</i> .   |
| <i>Triggers</i>  | Filter items with (or without) triggers.  |
| <i>Inherited</i> | Filter items inherited (or not inherited) from a template.  |
| <i>Discovery</i> | Filter items discovered (or not discovered) by low-level discovery.   |

## Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - tag, item type, item state, item update interval, etc. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration -> General -> GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable. A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

## 2 Triggers

### Overview

The trigger list for a host can be accessed from *Configuration* → *Hosts* by clicking on *Triggers* for the respective host.

Triggers

Create trigger

Displayed data:

| Column           | Description   |
|------------------|---|
| Severity         | Severity of the trigger is displayed by both name and cell background color.  |
| Value            | Trigger value is displayed:<br><b>OK</b> - the trigger is in the OK state<br><b>PROBLEM</b> - the trigger is in the Problem state   |
| Host             | Host of the trigger.<br>This column is displayed only if multiple hosts are selected in the filter.   |
| Name             | Name of the trigger, displayed as a blue link to trigger details.<br>Clicking on the trigger name link opens the trigger <b>configuration form</b> .<br>If the host trigger belongs to a template, the template name is displayed before the trigger name, as a gray link. Clicking on the template link will open the trigger list on the template level.<br>If the trigger has been created from a trigger prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking on the discovery rule name will open the trigger prototype list. |
| Operational data | Operational data definition of the trigger, containing arbitrary strings and macros that will resolve dynamically in <i>Monitoring</i> → <i>Problems</i> .  |
| Expression       | Trigger expression is displayed. The host-item part of the expression is displayed as a link, leading to the item configuration form.   |
| Status           | Trigger status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Unknown</i> . By clicking on the status you can change it - from Enabled to Disabled (and back); from Unknown to Disabled (and back).<br>Problems of a disabled trigger are no longer displayed in the frontend, but are not deleted.  |
| Info             | If everything is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.  |
| Tags             | If a trigger contains tags, tag name and value are displayed in this column.  |

To configure a new trigger, click on the *Create trigger* button at the top right corner.

### Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change trigger status to *Enabled*.
- *Disable* - change trigger status to *Disabled*.
- *Copy* - copy the triggers to other hosts or templates.
- *Mass update* - update several properties for a number of triggers at once.
- *Delete* - delete the triggers.

To use these options, mark the checkboxes before the respective triggers, then click on the required button.

### Using filter

You can use the filter to display only the triggers you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter                | Description  |
|--------------------------|--|
| <i>Host groups</i>       | Filter by one or more host groups.<br>Specifying a parent host group implicitly selects all nested host groups.<br>Host groups containing templates only cannot be selected.   |
| <i>Hosts</i>             | Filter by one or more hosts.<br>If host groups are already selected above, host selection is limited to those groups.  |
| <i>Name</i>              | Filter by trigger name.  |
| <i>Severity</i>          | Select to filter by one or several trigger severities.   |
| <i>State</i>             | Filter by trigger state.   |
| <i>Status</i>            | Filter by trigger status.  |
| <i>Value</i>             | Filter by trigger value.   |
| <i>Tags</i>              | Filter by trigger tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met<br>Macros and <b>macro functions</b> are supported both in tag name and tag value fields. |
| <i>Inherited</i>         | Filter triggers inherited (or not inherited) from a template.  |
| <i>Discovered</i>        | Filter triggers discovered (or not discovered) by low-level discovery.   |
| <i>With dependencies</i> | Filter triggers with (or without) dependencies.  |

## 3 Graphs

### Overview

The custom graph list for a host can be accessed from *Configuration* → *Hosts* by clicking on *Graphs* for the respective host.

A list of existing graphs is displayed.

| All hosts / Zabbix server Enabled ZBX SNMP IPMI JMX Items 151 Triggers 68 Graphs 30 Discovery rules 3 Web scenarios 1 |       |        |            |      | Filter |

#### Displayed data:

| Column            | Description   |
|-------------------|---|
| <b>Name</b>       | <p>Name of the custom graph, displayed as a blue link to graph details. Clicking on the graph name link opens the graph <b>configuration form</b>.</p> <p>If the host graph belongs to a template, the template name is displayed before the graph name, as a gray link. Clicking on the template link will open the graph list on the template level.</p> <p>If the graph has been created from a graph prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking on the discovery rule name will open the graph prototype list.</p> |
| <b>Width</b>      | Graph width is displayed.   |
| <b>Height</b>     | Graph height is displayed.  |
| <b>Graph type</b> | Graph type is displayed - <i>Normal</i> , <i>Stacked</i> , <i>Pie</i> or <i>Exploded</i> .  |
| <b>Info</b>       | If the graph is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.   |

To configure a new graph, click on the *Create graph* button at the top right corner.

#### Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click on the required button.

#### Using filter

You can filter graphs by host group and host. For better search performance, data is searched with macros unresolved.

#### 4 Discovery rules

##### Overview

The list of low-level discovery rules for a host can be accessed from *Configuration* → *Hosts* by clicking on *Discovery* for the respective host.

A list of existing low-level discovery rules is displayed. It is also possible to see all discovery rules independently of the host, or all discovery rules of a specific host group by changing the filter settings.

Displayed data:

| Column          | Description   |
|-----------------|---|
| <i>Host</i>     | The visible host name is displayed.<br>In the absence of a visible host name, the technical host name is displayed.   |
| <i>Name</i>     | Name of the rule, displayed as a blue link.<br>Clicking on the rule name opens the low-level discovery rule <b>configuration form</b> .<br>If the discovery rule belongs to a template, the template name is displayed before the rule name, as a gray link. Clicking on the template link will open the rule list on the template level. |
| <i>Items</i>    | A link to the list of item prototypes is displayed.<br>The number of existing item prototypes is displayed in gray.   |
| <i>Triggers</i> | A link to the list of trigger prototypes is displayed.<br>The number of existing trigger prototypes is displayed in gray.   |
| <i>Graphs</i>   | A link to the list of graph prototypes is displayed.<br>The number of existing graph prototypes is displayed in gray.   |
| <i>Hosts</i>    | A link to the list of host prototypes is displayed.<br>The number of existing host prototypes is displayed in gray.   |
| <i>Key</i>      | The item key used for discovery is displayed.   |
| <i>Interval</i> | The frequency of performing discovery is displayed.<br><i>Note</i> that discovery can also be performed immediately by pushing the <i>Execute now</i> button below the list.  |
| <i>Type</i>     | The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).  |
| <i>Status</i>   | Discovery rule status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Not supported</i> . By clicking on the status you can change it - from Enabled to Disabled (and back); from Not supported to Disabled (and back).   |
| <i>Info</i>     | If everything is fine, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.   |

To configure a new low-level discovery rule, click on the *Create discovery rule* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the low-level discovery rule status to *Enabled*.
- *Disable* - change the low-level discovery rule status to *Disabled*.
- *Execute now* - perform discovery based on the discovery rules immediately. See **more details**. Note that when performing discovery immediately, the configuration cache is not updated, thus the result will not reflect very recent changes to discovery rule configuration.
- *Delete* - delete the low-level discovery rules.

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of discovery rules. If you click on it, a filter becomes available where you can filter discovery rules by host group, host, name, item key, item type, and other parameters.

4 Host prototypes

Overview

In this section the host prototypes of a low-level discovery rule on the host are displayed. Host prototypes are the basis of real **hosts** that are created during low-level discovery.

Displayed data:

| Column         | Description  |
|----------------|--|
| Name           | Name of the host prototype, displayed as a blue link.<br>Clicking on the name opens the host prototype configuration form.<br>If the host prototype belongs to a linked template, the template name is displayed before the host name, as a gray link. Clicking on the template link will open the host prototype list on the linked template level. |
| Templates      | Templates of the host prototype are displayed.   |
| Create enabled | Create the host based on this prototype as:<br><b>Yes</b> - enabled<br><b>No</b> - disabled. You can switch between 'Yes' and 'No' by clicking on them.  |
| Discover       | Discover the host based on this prototype:<br><b>Yes</b> - discover<br><b>No</b> - do not discover. You can switch between 'Yes' and 'No' by clicking on them.   |
| Tags           | Tags of the host prototype are displayed.  |

To configure a new host prototype, click on the *Create host prototype* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these hosts as *Enabled*
- *Create disabled* - create these hosts as *Disabled*
- *Delete* - delete these host prototypes

To use these options, mark the checkboxes before the respective host prototypes, then click on the required button.

5 Web scenarios

Overview

The **web scenario** list for a host can be accessed from *Configuration* → *Hosts* by clicking on *Web* for the respective host.

A list of existing web scenarios is displayed.

Displayed data:

| Column                 | Description  |
|------------------------|--|
| <i>Name</i>            | Name of the web scenario. Clicking on the web scenario name opens the web scenario <b>configuration form</b> .<br>If the host web scenario belongs to a template, the template name is displayed before the web scenario name as a gray link. Clicking on the template link will open the web scenario list on the template level. |
| <i>Number of steps</i> | The number of steps the scenario contains.   |
| <i>Update interval</i> | How often the scenario is performed.   |
| <i>Attempts</i>        | How many attempts for executing web scenario steps are performed.  |
| <i>Authentication</i>  | Authentication method is displayed - Basic, NTLM, or None.   |
| <i>HTTP proxy</i>      | Displays HTTP proxy or 'No' if not used.   |
| <i>Status</i>          | Web scenario status is displayed - <i>Enabled</i> or <i>Disabled</i> .<br>By clicking on the status you can change it.   |
| <i>Tags</i>            | Web scenario tags are displayed.<br>Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows to see all tags on mouseover.  |
| <i>Info</i>            | If everything is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.   |

To configure a new web scenario, click on the *Create web scenario* button at the top right corner.

#### Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the scenario status to *Enabled*
- *Disable* - change the scenario status to *Disabled*
- *Clear history and trends* - clear history and trend data for the scenarios
- *Delete* - delete the web scenarios

To use these options, mark the checkboxes before the respective web scenarios, then click on the required button.

#### Using filter

You can use the filter to display only the scenarios you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of web scenarios. If you click on it, a filter becomes available where you can filter scenarios by host group, host, status and tags.

## 4 Maintenance

### Overview

In the *Configuration* → *Maintenance* section users can configure and maintain maintenance periods for hosts.

A listing of existing maintenance periods with their details is displayed.

Maintenance periods

Create maintenance period

| <input type="checkbox"/> | Name ▲         | Type                 | Active since     | Active till      | State  | Description                           |
|--------------------------|----------------|----------------------|------------------|------------------|--------|---------------------------------------|
| <input type="checkbox"/> | Server regular | With data collection | 2020-04-17 00:00 | 2021-04-18 00:00 | Active | We break and fix things at this time. |

0 selected
Delete

Displayed data:

| Column              | Description  |
|---------------------|--|
| <i>Name</i>         | Name of the maintenance period. Clicking on the maintenance period name opens the maintenance period <b>configuration form</b> .   |
| <i>Type</i>         | The type of maintenance is displayed: <i>With data collection</i> or <i>No data collection</i>   |
| <i>Active since</i> | The date and time when executing maintenance periods becomes active.<br>Note: This time does not activate a maintenance period; maintenance periods need to be set separately. |
| <i>Active till</i>  | The date and time when executing maintenance periods stops being active.   |
| <i>State</i>        | The state of the maintenance period:<br><b>Approaching</b> - will become active soon<br><b>Active</b> - is active<br><b>Expired</b> - is not active any more                   |
| <i>Description</i>  | Description of the maintenance period is displayed.  |

To configure a new maintenance period, click on the *Create maintenance period* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the maintenance periods

To use this option, mark the checkboxes before the respective maintenance periods and click on *Delete*.

Using filter

You can use the filter to display only the maintenance periods you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of maintenance periods. If you click on it, a filter becomes available where you can filter maintenance periods by host group, name and state.

## 5 Actions

Overview

In the *Configuration* → *Actions* section users can configure and maintain actions.

The actions displayed are actions assigned to the selected event source (trigger, discovery, autoregistration, internal actions).

To switch to a different event source, click on *Actions* in the *Configuration* menu section. It is also possible to switch between sources by using the title dropdown in the top left corner.

### Note:

Actions for services are maintained in a similar way in *Services* → *Service actions*.

For users without Super admin rights actions are displayed according to permission settings. That means in some cases a user without Super admin rights isn't able to view the complete action list because of certain permission restrictions. An action is displayed to the user without Super admin rights if the following conditions are fulfilled:

- The user has read-write access to host groups, hosts, templates, and triggers in action conditions
- The user has read-write access to host groups, hosts, and templates in action operations, recovery operations, and update operations
- The user has read access to user groups and users in action operations, recovery operations, and update operations

| <input type="checkbox"/> Name ▲                                   | Conditions | Operations   | Status  |
|---|------------|--|---------|
| <input type="checkbox"/> Report problems to Zabbix administrators |            | Send message to user groups: Zabbix administrators via Email<br>Send message to user groups: Managers via SMS<br>Run remote commands on current host | Enabled |

Displayed data:

| Column            | Description  |
|-------------------|--|
| <i>Name</i>       | Name of the action. Clicking on the action name opens the action <b>configuration form</b> .   |
| <i>Conditions</i> | Action conditions are displayed.   |
| <i>Operations</i> | Action operations are displayed.<br>Since Zabbix 2.2, the operation list also displays the media type (e-mail, SMS or script) used for notification as well as the name and surname (in parentheses after the username) of a notification recipient.<br>Action operation can both be a <b>notification</b> or a <b>remote command</b> depending on the selected type of operation. |
| <i>Status</i>     | Action status is displayed - <i>Enabled</i> or <i>Disabled</i> .<br>By clicking on the status you can change it.<br>See the <b>Escalations</b> section for more details as to what happens if an action is disabled during an escalation in progress.  |

To configure a new action, click on the *Create action* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the action status to *Enabled*
- *Disable* - change the action status to *Disabled*
- *Delete* - delete the actions

To use these options, mark the checkboxes before the respective actions, then click on the required button.

Using filter

You can use the filter to display only the actions you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of actions. If you click on it, a filter becomes available where you can filter actions by name and status.

## 6 Event correlation

Overview

In the *Configuration* → *Event correlation* section users can configure and maintain global correlation rules for Zabbix events.

| <input type="checkbox"/> Name ▲          | Conditions   | Operations       | Status  |
|--|--|------------------|---------|
| <input type="checkbox"/> Close old event | Value of new event tag <i>Application</i> equals <i>ABC</i><br>Value of new event tag <i>State</i> equals <i>Up</i><br>Value of old event tag <i>Application</i> equals <i>ABC</i><br>Value of old event tag <i>Application</i> equals value of new event tag <i>Application</i> | Close old events | Enabled |

0 selected
 Enable
 Disable
 Delete

Displaying 1 of 1 found

Displayed data:

| Column            | Description  |
|-------------------|--|
| <i>Name</i>       | Name of the correlation rule. Clicking on the correlation rule name opens the rule <b>configuration form</b> .             |
| <i>Conditions</i> | Correlation rule conditions are displayed.   |
| <i>Operations</i> | Correlation rule operations are displayed.   |
| <i>Status</i>     | Correlation rule status is displayed - <i>Enabled</i> or <i>Disabled</i> .<br>By clicking on the status you can change it. |

To configure a new correlation rule, click on the *Create correlation* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

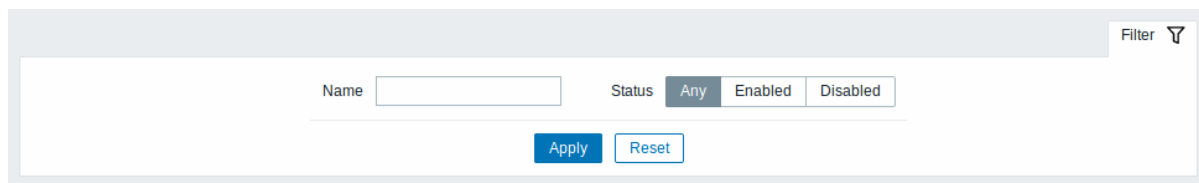

- *Enable* - change the correlation rule status to *Enabled*
- *Disable* - change the correlation rule status to *Disabled*
- *Delete* - delete the correlation rules

To use these options, mark the checkboxes before the respective correlation rules, then click on the required button.

Using filter

You can use the filter to display only the correlation rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of correlation rules. If you click on it, a filter becomes available where you can filter correlation rules by name and status.

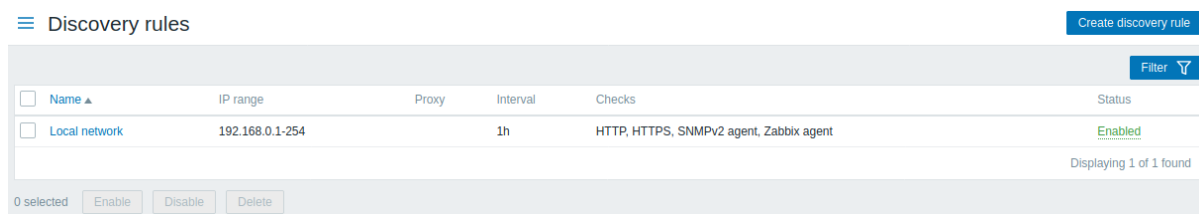

## 7 Discovery

Overview

In the *Configuration* → *Discovery* section users can configure and maintain discovery rules.

A listing of existing discovery rules with their details is displayed.

| Discovery rules          |               |                 |       |          |   | Create discovery rule   |
|--------------------------|---------------|-----------------|-------|----------|---|-------------------------|
| <input type="checkbox"/> | Name ▲        | IP range        | Proxy | Interval | Checks                                  | Status                  |
| <input type="checkbox"/> | Local network | 192.168.0.1-254 |       | 1h       | HTTP, HTTPS, SNMPv2 agent, Zabbix agent | Enabled                 |
|                          |               |                 |       |          |   | Displaying 1 of 1 found |
| 0 selected               |               |                 |       |          |   | Enable Disable Delete   |

Displayed data:

| Column          | Description  |
|-----------------|--|
| <i>Name</i>     | Name of the discovery rule. Clicking on the discovery rule name opens the discovery rule <b>configuration form</b> . |
| <i>IP range</i> | The range of IP addresses to use for network scanning is displayed.  |
| <i>Proxy</i>    | The proxy name is displayed, if discovery is performed by the proxy.   |
| <i>Interval</i> | The frequency of performing discovery displayed.   |
| <i>Checks</i>   | The types of checks used for discovery are displayed.  |
| <i>Status</i>   | Action status is displayed - <i>Enabled</i> or <i>Disabled</i> .<br>By clicking on the status you can change it.     |

To configure a new discovery rule, click on the *Create discovery rule* button in the top right-hand corner.

## Mass editing options

Buttons below the list offer some mass-editing options:

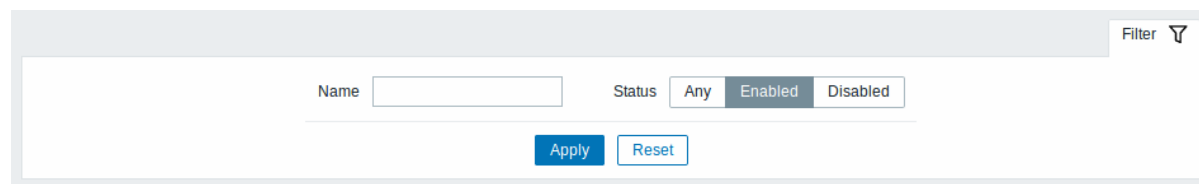

- *Enable* - change the discovery rule status to *Enabled*
- *Disable* - change the discovery rule status to *Disabled*
- *Delete* - delete the discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

## Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of discovery rules. If you click on it, a filter becomes available where you can filter discovery rules by name and status.

The screenshot shows a filter interface for discovery rules. At the top right, there is a 'Filter' link with a funnel icon. Below this, there is a search bar labeled 'Name' with an empty text input field. To the right of the search bar is a 'Status' section with three buttons: 'Any', 'Enabled' (which is highlighted with a dark background), and 'Disabled'. At the bottom of the filter section, there are two buttons: 'Apply' (in blue) and 'Reset' (in white with a blue border).

## 6 Administration

### Overview

The Administration menu is for administrative functions of Zabbix. This menu is available to users of **Super Administrators** type only.

### 1 General

#### Overview

The *Administration* → *General* section contains a number of subsections for setting frontend-related defaults and customizing Zabbix.

The list of available subsections appears upon pressing on *General* in the *Administration* menu section. It is also possible to switch between subsections by using the title dropdown in the top left corner.

#### 1 GUI

This section provides customization of several frontend-related defaults.

Default language

English (en\_US) ▾

Default time zone

(UTC-08:00) America/Los\_Angeles ▾

Default theme

Blue ▾

\* Limit for search and filter results

1000

\* Max number of columns and rows in overview tables

50

\* Max count of elements to show inside table cell

20

Show warning if Zabbix server is down

☒

\* Working time

{WORKING\_HOURS}

Show technical errors

☐

\* Max history display period

24h

\* Time filter default period

1h

\* Max period for time selector

2y

Configuration parameters:

| Parameter   | Description  |
|---|--|
| <i>Default language</i>   | Default language for users who have not specified a language in their profiles and guest users. For more information, see <a href="#">Installation of additional frontend languages</a> .  |
| <i>Default time zone</i>  | Default <b>time zone</b> for users who have not specified a time zone in their profiles and guest users.   |
| <i>Default theme</i>  | Default theme for users who have not specified a theme in their profiles and guest users.  |
| <i>Limit for search and filter results</i>                        | Maximum amount of elements (rows) that will be displayed in a web-interface list, for example, in <i>Configuration &gt; Hosts</i> .<br>Note: If set to, for example, '50', only the first 50 elements will be displayed in all affected frontend lists. If some list contains more than fifty elements, the indication of that will be the '+' sign in <i>"Displaying 1 to 50 of 50+ found"</i> . Also, if filtering is used and still there are more than 50 matches, only the first 50 will be displayed.<br>Note that increasing the value of this parameter may lead to decreased performance and increased memory consumption on the web server side. |
| <i>Max number of columns&lt;br&gt;and rows in overview tables</i> | Maximum number of columns and rows to display in Data overview and Trigger overview dashboard widgets. The same limit applies to both columns and rows. If more rows and/or columns than shown exist, the system will display a warning at the bottom of the table: "Not all results are displayed. Please provide more specific search criteria."   |
| <i>Max count of elements&lt;br&gt;to show inside table cell</i>   | For entries that are displayed in a single table cell, no more than configured here will be shown.   |
| <i>Show warning if Zabbix server is down</i>                      | This parameter enables a warning message to be displayed in a browser window if the Zabbix server cannot be reached (possibly down). The message remains visible even if the user scrolls down the page. When hovered over, the message is temporarily hidden to reveal the contents underneath it.  |
| <i>Working time</i>   | This parameter is supported since Zabbix 2.0.1.<br>This system-wide parameter defines working hours. In graphs, working time is displayed as a white background and non-working time is displayed as gray.<br>See <a href="#">Time period specification</a> page for description of the time format.<br><a href="#">User macros</a> are supported (since Zabbix 3.4.0).  |

| Parameter                           | Description   |
|-------------------------------------|---|
| <i>Show technical errors</i>        | If checked, all registered users will be able to see technical errors (PHP/SQL). If unchecked, the information is only available to <b>Zabbix Super Admins</b> and users belonging to the user groups with enabled <b>debug mode</b> .  |
| <i>Max history display period</i>   | Maximum time period for which to display historical data in <i>Monitoring &gt; Latest data</i> , host <b>web scenario</b> information in <i>Monitoring &gt; Hosts</i> , and in the <i>Data overview</i> dashboard widget.<br>Allowed range: 24 hours (default) - 1 week. <b>Time suffixes</b> , e.g. 1w (one week), 36h (36 hours), are supported.                                |
| <i>Time filter default period</i>   | Time period to be used in graphs and dashboards by default. Allowed range: 1 minute - 10 years (default: 1 hour).<br><b>Time suffixes</b> , e.g. 10m (ten minutes), 5w (five weeks), are supported.<br>Note: when a user changes the time period while viewing a graph, this time period is stored as user preference, replacing the global default or a previous user selection. |
| <i>Max period for time selector</i> | Maximum available time period for graphs and dashboards. Users will not be able to visualize older data. Allowed range: 1 year - 10 years (default: 2 years).<br><b>Time suffixes</b> , e.g. 1y (one year), 365w (365 weeks), are supported.  |

## 2 Autoregistration

In this section, you can configure the encryption level for active agent autoregistration.

Parameters marked with an asterisk are mandatory.

Configuration parameters:

| Parameter               | Description  |
|-------------------------|--|
| <i>Encryption level</i> | Select one or both options for encryption level:<br><b>No encryption</b> - unencrypted connections are allowed<br><b>PSK</b> - TLS encrypted connections with a pre-shared key are allowed   |
| <i>PSK identity</i>     | Enter the pre-shared key identity string.<br>This field is only available if 'PSK' is selected as <i>Encryption level</i> .<br>Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.   |
| <i>PSK</i>              | Enter the pre-shared key (an even number of hexadecimal characters).<br>Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library.<br>Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952<br>This field is only available if 'PSK' is selected as <i>Encryption level</i> . |

365d

Update

Reset defaults

In this section housekeeping tasks can be enabled or disabled on a per-task basis separately for: events and alerts/IT services/user sessions/history/trends. Audit housekeeping settings are available in a separate [menu section](#).

If housekeeping is enabled, it is possible to set for how many days data records will be kept before being removed by the housekeeper.

Deleting an item/trigger will also delete problems generated by that item/trigger.

Also, an event will only be deleted by the housekeeper if it is not associated with a problem in any way. This means that if an event is either a problem or recovery event, it will not be deleted until the related problem record is removed. The housekeeper will delete problems first and events after, to avoid potential problems with stale events or problem records.

For history and trends an additional option is available: *Override item history period* and *Override item trend period*. This option allows to globally set for how many days item history/trends will be kept (1 hour to 25 years; or "0"), in this case overriding the values set for individual items in *History storage period/Trend storage period* fields in **item configuration**. Note that the storage period will not be overridden for items that have configuration option *Do not keep history* and/or *Do not keep trends* enabled.

It is possible to override the history/trend storage period even if internal housekeeping is disabled. Thus, when using an external housekeeper, the history storage period could be set using the history *Data storage period* field.

**Attention:**

If using TimescaleDB, in order to take full advantage of TimescaleDB automatic partitioning of history and trends tables, *Override item history period* and *Override item trend period* options must be enabled as well as *Enable internal housekeeping* option for history and trends. Otherwise, data kept in these tables will still be stored in partitions, however, the housekeeper will not drop outdated partitions, and warnings about incorrect configuration will be displayed. When dropping of outdated partitions is enabled, Zabbix server and frontend will no longer keep track of deleted items, and history for deleted items will be cleared when an outdated partition is deleted.

**Time suffixes** are supported in the period fields, e.g. 1d (one day), 1w (one week). The minimum is 1 day (1 hour for history), the maximum - 25 years.

*Reset defaults* button allows to revert any changes made.

4 Audit log

This section allows configuring audit log settings.

Enable audit logging ☒

Enable internal housekeeping ☒

\* Data storage period

365d

Update

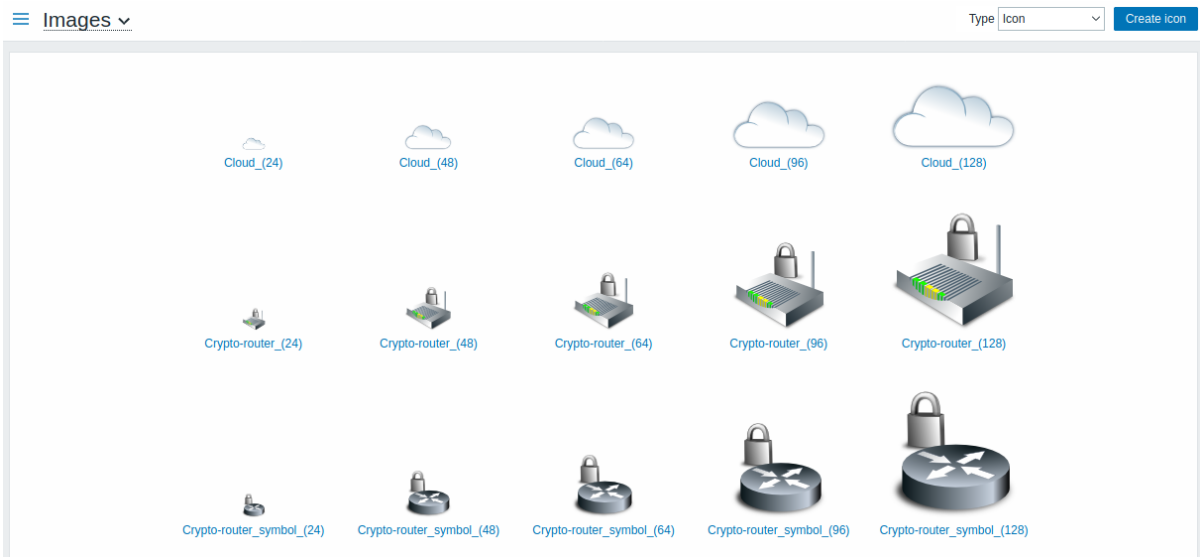

Reset defaults

The following parameters are available:

| Parameter                    | Description   |
|------------------------------|---|
| Enable audit logging         | Enable/disable audit logging. Marked by default.  |
| Enable internal housekeeping | Enable/disable internal housekeeping for audit. Marked by default.  |
| Data storage period          | Amount of days audit records should be kept for before being removed by the housekeeper. Mandatory if housekeeping is enabled. Default: 365 days. |

5 Images

The Images section displays all the images available in Zabbix. Images are stored in the database.

The *Type* dropdown allows you to switch between icon and background images:

- Icons are used to display **network map** elements
- Backgrounds are used as background images of network maps

### Adding image

You can add your own image by clicking on the *Create icon* or *Create background* button in the top right corner.

\* Name

\* Upload

Add

Cancel

Image attributes:

| Parameter     | Description   |
|---------------|---|
| <i>Name</i>   | Unique name of an image.  |
| <i>Upload</i> | Select the file (PNG, JPEG, GIF) from a local system to be uploaded to Zabbix.<br>Note that it may be possible to upload other formats that will be converted to PNG during upload.<br>GD library is used for image processing, therefore formats that are supported depend on the library version used (2.0.28 or higher is required by Zabbix). |

Note:

Maximum size of the upload file is limited by the value of ZBX\_MAX\_IMAGE\_SIZE that is 1024x1024 bytes or 1 MB.  
  
The upload of an image may fail if the image size is close to 1 MB and the max\_allowed\_packet MySQL configuration parameter is at a default of 1MB. In this case, increase the max\_allowed\_packet parameter.

### 6 Icon mapping

This section allows creating the mapping of certain hosts with certain icons. Host inventory field information is used to create the mapping.

The mappings can then be used in **network map configuration** to assign appropriate icons to matching hosts automatically.

To create a new icon map, click on *Create icon map* in the top right corner.

\* Name

\* Mappings

|                     | Inventory field | Expression  | Icon             | Action                 |
|---------------------|-----------------|-------------|------------------|------------------------|
| 1:                  | Type            | server      | Server_(96)      | <a href="#">Remove</a> |
| 2:                  | Type            | router      | Router_(96)      | <a href="#">Remove</a> |
| 3:                  | Type            | workstation | Workstation_(96) | <a href="#">Remove</a> |
| <a href="#">Add</a> |                 |             |                  |                        |
| Default             |                 |             | Cloud_(24)       |                        |

Configuration parameters:

| Parameter              | Description   |
|------------------------|---|
| <i>Name</i>            | Unique name of icon map.  |
| <i>Mappings</i>        | A list of mappings. The order of mappings determines which one will have priority. You can move mappings up and down the list with drag-and-drop. |
| <i>Inventory field</i> | Host inventory field that will be looked into to seek a match.  |
| <i>Expression</i>      | Regular expression describing the match.  |
| <i>Icon</i>            | Icon to use if a match for the expression is found.   |
| <i>Default</i>         | Default icon to use.  |

## 7 Regular expressions

This section allows creating custom regular expressions that can be used in several places in the frontend. See [Regular expressions](#) section for details.

## 8 Macros

This section allows to define system-wide [user macros](#) as name-value pairs. Note that macro values can be kept as plain text, secret text or Vault secret. Adding a description is also supported.

| Macro  | Value   |  | Description  |
|--|---|--|--|
| <input data-bbox="215 1240 635 1279" type="text" value="{MYSQL_PASSWORD}"/>  | <input data-bbox="651 1240 1086 1279" type="password" value="*****"/>               |  | <input data-bbox="1173 1240 1278 1279" type="text" value="description"/> |

## 9 Trigger displaying options

This section allows customizing how trigger status is displayed in the frontend and [trigger severity](#) names and colors.

Use custom event status colors ☒

\* Unacknowledged PROBLEM events  ☒ blinking

\* Acknowledged PROBLEM events  ☒ blinking

\* Unacknowledged RESOLVED events  ☒ blinking

\* Acknowledged RESOLVED events  ☒ blinking

\* Display OK triggers for

\* On status change triggers blink for

\* Not classified

\* Information

\* Warning

\* Average

\* High

\* Disaster

| Parameter   | Description   |
|---|---|
| <i>Use custom event status colors</i>   | Checking this parameter turns on the customization of colors for acknowledged/unacknowledged problems.  |
| <i>Unacknowledged PROBLEM events, Acknowledged PROBLEM events, Unacknowledged RESOLVED events, Acknowledged RESOLVED events</i> | Enter new color code or click on the color to select a new one from the provided palette. If <i>blinking</i> checkbox is marked, triggers will blink for some time upon the status change to become more visible.   |
| <i>Display OK triggers for</i>  | Time period for displaying OK triggers. Allowed range: 0 - 24 hours. <b>Time suffixes</b> , e.g. 5m, 2h, 1d, are supported.   |
| <i>On status change triggers blink for</i>  | Length of trigger blinking. Allowed range: 0 - 24 hours. <b>Time suffixes</b> , e.g. 5m, 2h, 1d, are supported.   |
| <i>Not classified, Information, Warning, Average, High, Disaster</i>  | Custom severity names and/or colors to display instead of system default. Enter new color code or click on the color to select a new one from the provided palette.<br><br>Note that custom severity names entered here will be used in all locales. If you need to translate them to other languages for certain users, see <a href="#">Customizing trigger severities</a> page. |

This section allows selecting geographical map tile service provider and configuring service provider settings for the Geomap **dashboard widget**. To provide visualization using the geographical maps, Zabbix uses open-source JavaScript interactive maps library Leaflet. Please note that Zabbix has no control over the quality of images provided by third-party tile providers, including the predefined tile providers.

\* Tile provider

\* Tile URL

\* Max zoom level

| Parameter        | Description   |
|------------------|---|
| Tile provider    | Select one of the available tile service providers or select <i>Other</i> to add another tile provider or self-hosted tiles (see <a href="#">Using a custom tile service provider</a> ).  |
| Tile URL         | The URL template for loading and displaying the tile layer on geographical maps. This field is editable only if <i>Tile provider</i> is set to <i>Other</i> .<br><br>The following placeholders are supported:<br>{s} represents one of the available subdomains;<br>{z} represents zoom level parameter in the URL;<br>{x} and {y} represent tile coordinates;<br>{r} can be used to add "@2x" to the URL to load retina tiles.<br><br>Example: https://{s}.example.com/{z}/{x}/{y}{r}.png |
| Attribution text | Tile provider attribution text to be displayed in a small text box on the map. This field is visible only if <i>Tile provider</i> is set to <i>Other</i> .  |
| Max zoom level   | Maximum zoom level of the map. This field is editable only if <i>Tile provider</i> is set to <i>Other</i> .   |

## Using a custom tile service provider

The Geomap widget is capable to load raster tile images from a custom self-hosted or a third-party tile provider service. To use a custom third-party tile provider service or a self-hosted tile folder or server, select *Other* in the *Tile provider* field and specify the custom URL in the *Tile URL* field using proper placeholders.

## 11 Modules

This section allows to administer custom **frontend modules**.

| <input type="checkbox"/> | Name ▲         | Version | Author     | Description                      | Status  |
|--------------------------|----------------|---------|------------|----------------------------------|---------|
| <input type="checkbox"/> | Example module | 1.0     | John Smith | Short description of the module. | Enabled |

0 selected

Displaying 1 of 1 found

Click on *Scan directory* to register/unregister any custom modules. Registered modules will appear in the list, along with their details. Unregistered modules will be removed from the list.

You may filter modules by name or status (enabled/disabled). Click on the module status in the list to enable/disable a module. You may also mass enable/disable modules by selecting them in the list and then clicking on the *Enable/Disable* buttons below the list.

## 12 API tokens

This section allows to create and manage API tokens.

| <input type="checkbox"/> | Name ▲  | User                         | Expires at          | Created at          | Created by user              | Last accessed at | Status  |
|--------------------------|---------|------------------------------|---------------------|---------------------|------------------------------|------------------|---------|
| <input type="checkbox"/> | Token   | Admin (Zabbix Administrator) | 2022-01-26 00:00:00 | 2021-01-22 15:51:02 | Admin (Zabbix Administrator) | Never            | Enabled |
| <input type="checkbox"/> | Token 2 | new_user                     | 2021-01-26 00:00:00 | 2021-01-22 16:13:03 | Admin (Zabbix Administrator) | Never            | Enabled |
| <input type="checkbox"/> | Token 3 | guest1                       | Never               | 2021-01-22 16:08:49 | Admin (Zabbix Administrator) | Never            | Enabled |

To create a new token, press *Create API token* button at the top right corner, then fill out the required fields in the token configuration screen:

\* Name

Token 1

Set expiration date and time

☒

\* Expires at

2022-01-28 00:00:00

Enabled

☒

Add

Cancel

| Parameter                    | Description   |
|------------------------------|---|
| Name                         | Token's visible name.   |
| User                         | User the token should be assigned to. To quickly select a user, start typing the username, first or last name, then select the required user from the auto-complete list. Alternatively, you can press the Select button and select a user from the full user list. A token can be assigned only to one user. |
| Description                  | Optional token description.   |
| Set expiration date and time | Unmark this checkbox if a token should not have an expiry date.   |
| Expiry date                  | Click on the calendar icon to select token expiry date or enter the date manually in a format YYYY-MM-DD hh:mm:ss   |
| Enabled                      | Unmark this checkbox if you need to create a token in a disabled state.   |

### Warning:

Click on the token name to edit the name, description, expiry date settings, or token status. Note that it is not possible to change to which user the token is assigned. Press *Update* button to save changes. If a token has been lost or exposed, you may press *Regenerate* button to generate new token value. A confirmation dialog box will appear, asking you to confirm this operation since after proceeding the previously generated token will become invalid.

| Parameter                                   | Description   |
|---|---|
| <i>Frontend URL</i>                         | URL to Zabbix web interface. This parameter is used by Zabbix web service for communication with frontend and should be specified to enable scheduled reports.  |
| <i>Group for discovered hosts</i>           | Hosts discovered by <b>network discovery</b> and <b>agent autoregistration</b> will be automatically placed in the host group, selected here.   |
| <i>Default host inventory mode</i>          | Default <b>mode</b> for host inventory. It will be followed whenever a new host or host prototype is created by server or frontend unless overridden during host discovery/autoregistration by the <i>Set host inventory mode</i> operation.  |
| <i>User group for database down message</i> | User group for sending alarm message or 'None'.<br>Zabbix server depends on the availability of the backend database. It cannot work without a database. If the database is down, selected users can be notified by Zabbix. Notifications will be sent to the user group set here using all configured user media entries. Zabbix server will not stop; it will wait until the database is back again to continue processing.<br>Notification consists of the following content:<br>[MySQL PostgreSQL Oracle] database <DB Name> [on <DB Host>:<DB Port>] is not available: <error message depending on the type of DBMS (database)><br><DB Host> is not added to the message if it is defined as an empty value and <DB Port> is not added if it is the default value ("0"). The alert manager (a special Zabbix server process) tries to establish a new connection to the database every 10 seconds. If the database is still down the alert manager repeats sending alerts, but not more often than every 15 minutes. |
| <i>Log unmatched SNMP traps</i>             | Log <b>SNMP trap</b> if no corresponding SNMP interfaces have been found.   |

## Authorization

| Parameter                      | Description  |
|--------------------------------|--|
| <i>Login attempts</i>          | Number of unsuccessful login attempts before the possibility to log in gets blocked.                 |
| <i>Login blocking interval</i> | Period of time for which logging in will be prohibited when <i>Login attempts</i> limit is exceeded. |

## Security

| Parameter                              | Description  |
|--|--|
| <i>Validate URI schemes</i>            | Unmark this checkbox to disable URI scheme validation (enabled by default).<br>If marked, you can specify a comma-separated list of allowed URI schemes (default: http,https,ftp,file,mailto,tel,ssh). Applies to all fields in the frontend where URIs are used (for example, map element URLs).  |
| <i>Use X-Frame-Options HTTP header</i> | Unmark this checkbox to disable the HTTP X-Frame-options header (not recommended).<br>If marked, you can specify the value of the HTTP X-Frame-options header. Supported values:<br><b>SAMEORIGIN</b> (default) or <b>'self'</b> (must be single-quoted) - the page can only be displayed in a frame on the same origin as the page itself;<br><b>DENY</b> or <b>'none'</b> (must be single-quoted) - the page cannot be displayed in a frame, regardless of the site attempting to do so;<br><b>a string of space-separated hostnames</b> ; adding <b>'self'</b> (must be single-quoted) to the list allows the page to be displayed in a frame on the same origin as the page itself.<br>Note that using <b>'self'</b> or <b>'none'</b> without single quotes will result in them being regarded as hostnames. |
| <i>Use iframe sandboxing</i>           | Unmark this checkbox to disable putting the retrieved URL content into sandbox (not recommended).<br>If marked, you can specify the iframe sandboxing exceptions; unspecified restrictions will still be applied. If this field is empty, all sandbox attribute restrictions apply.<br>For more information, see the description of the <a href="#">sandbox</a> attribute.   |

## Communication with Zabbix server

| Parameter  | Description   |
|--|---|
| <i>Network timeout</i>                           | How many seconds to wait before closing an idle socket (if a connection to Zabbix server has been established earlier, but frontend can not finish read/send data operation during this time, the connection will be dropped). Allowed range: 1 - 300s (default: 3s). |
| <i>Connection timeout</i>                        | How many seconds to wait before stopping an attempt to connect to Zabbix server. Allowed range: 1 - 30s (default: 3s).  |
| <i>Network timeout for media type test</i>       | How many seconds to wait for a response when testing a media type. Allowed range: 1 - 300s (default: 65s).  |
| <i>Network timeout for script execution</i>      | How many seconds to wait for a response when executing a script. Allowed range: 1 - 300s (default: 60s).  |
| <i>Network timeout for item test</i>             | How many seconds to wait for returned data when testing an item. Allowed range: 1 - 300s (default: 60s).  |
| <i>Network timeout for scheduled report test</i> | How many seconds to wait for returned data when testing a scheduled report. Allowed range: 1 - 300s (default: 60s).   |

## 2 Proxies

### Overview

In the *Administration* → *Proxies* section proxies for **distributed monitoring** can be configured in the Zabbix frontend.

### Proxies

A listing of existing proxies with their details is displayed.

| <input type="checkbox"/> Name         | Mode   | Encryption | Compression | Last seen (age) | Host count | Item count | Required performance (vps) | Hosts    |
|---------------------------------------|--------|------------|-------------|-----------------|------------|------------|----------------------------|----------|
| <input type="checkbox"/> Remote proxy | Active | NONE       | ON          | 21h 15m 15s     |            |            |                            | New host |
| <input type="checkbox"/> New proxy    | Active | NONE       | OFF         | Never           |            |            |                            |          |

Displaying 2 of 2 found

Displayed data:

| Column                            | Description   |
|-----------------------------------|---|
| <i>Name</i>                       | Name of the proxy. Clicking on the proxy name opens the proxy <b>configuration form</b> .   |
| <i>Mode</i>                       | Proxy mode is displayed - <i>Active</i> or <i>Passive</i> .   |
| <i>Encryption</i>                 | Encryption status for connections from the proxy is displayed:<br><b>None</b> - no encryption<br><b>PSK</b> - using pre-shared key<br><b>Cert</b> - using certificate |
| <i>Compression</i>                | Compression status for connections from the proxy is displayed:<br><b>On</b> - compression is enabled<br><b>Off</b> - compression is disabled                         |
| <i>Last seen (age)</i>            | The time when the proxy was last seen by the server is displayed.   |
| <i>Host count</i>                 | The number of enabled hosts assigned to the proxy is displayed.   |
| <i>Item count</i>                 | The number of enabled items on enabled hosts assigned to the proxy is displayed.  |
| <i>Required performance (vps)</i> | Required proxy performance is displayed (the number of values that need to be collected per second).  |
| <i>Hosts</i>                      | All hosts monitored by the proxy are listed. Clicking on the host name opens the host configuration form.   |

To configure a new proxy, click on the *Create proxy* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable hosts* - change the status of hosts monitored by the proxy to *Monitored*
- *Disable hosts* - change the status of hosts monitored by the proxy to *Not monitored*
- *Delete* - delete the proxies

To use these options, mark the checkboxes before the respective proxies, then click on the required button.

Using filter

You can use the filter to display only the proxies you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of proxies. If you click on it, a filter becomes available where you can filter proxies by name and mode.

### 3 Authentication

#### Overview

The *Administration* → *Authentication* section allows to specify the global user authentication method to Zabbix and internal password requirements. The available methods are internal, HTTP, LDAP, and SAML authentication.

#### Default authentication

By default, Zabbix uses internal Zabbix authentication for all users. It is possible to change the default method to **LDAP** system-wide or enable LDAP authentication only for specific user groups.

To set LDAP as default authentication method for all users, navigate to the *LDAP* tab and configure authentication parameters, then return to the *Authentication* tab and switch *Default authentication* selector to LDAP.

Note that the authentication method can be fine-tuned on the **user group** level. Even if LDAP authentication is set globally, some user groups can still be authenticated by Zabbix. These groups must have **frontend access** set to Internal. Vice versa, if internal authentication is used globally, LDAP authentication details can be specified and used for specific user groups whose **frontend access** is set to LDAP. If a user is included into at least one user group with LDAP authentication, this user will not be able to use internal authentication method.

**HTTP** and **SAML 2.0** authentication methods can be used in addition to the default authentication method.

Internal authentication

The *Authentication* tab allows defining custom password complexity requirements for internal Zabbix users.

## Authentication

Authentication

LDAP settings

SAML settings

Default authentication

Internal

LDAP

Password policy

Minimum password length

8

Password must contain ?

☐ an uppercase and a lowercase Latin letter

☐ a digit

☐ a special character

Avoid easy-to-guess passwords ?

☒

Update

The following password policy options can be configured:

| Parameter                      | Description   |
|--------------------------------|---|
| <i>Minimum password length</i> | By default, the minimum password length is set to 8. Supported range: 1-70. Note that passwords longer than 72 characters will be truncated.  |
| <i>Password must contain</i>   | Mark one or several checkboxes to require usage of specified characters in a password:<br>-an uppercase and a lowercase Latin letter<br>-a digit<br>-a special character<br><br>Hover over the question mark to see a hint with the list of characters for each option. |

| Parameter                            | Description   |
|--------------------------------------|---|
| <i>Avoid easy-to-guess passwords</i> | <p>If marked, a password will be checked against the following requirements:</p> <ul style="list-style-type: none"> <li>- must not contain user's name, surname, or username</li> <li>- must not be one of the common or context-specific passwords.</li> </ul> <p>The list of common and context-specific passwords is generated automatically from the list of NCSC "Top 100k passwords", the list of SecLists "Top 1M passwords" and the list of Zabbix context-specific passwords. Internal users will not be allowed to set passwords included in this list as such passwords are considered weak due to their common use.</p> |

Changes in password complexity requirements will not affect existing user passwords, but if an existing user chooses to change a password, the new password will have to meet current requirements. A hint with the list of requirements will be displayed next to the *Password* field in the *user profile* and in the *user configuration form* accessible from the *Administration→Users* menu.

#### HTTP authentication

HTTP or web server-based authentication (for example: Basic Authentication, NTLM/Kerberos) can be used to check user names and passwords. Note that a user must exist in Zabbix as well, however its Zabbix password will not be used.

#### Attention:

Be careful! Make sure that web server authentication is configured and works properly before switching it on.

Authentication
HTTP settings

SAML settings

Enable HTTP authentication ? ☒

Default login form HTTP login form

Remove domain name comp, any

Case-sensitive login ☒

Update

#### Configuration parameters:

| Parameter                         | Description   |
|-----------------------------------|---|
| <i>Enable HTTP authentication</i> | <p>Mark the checkbox to enable HTTP authentication. Hovering the mouse over  will bring up a hint box warning that in the case of web server authentication, all users (even with <b>frontend access</b> set to LDAP/Internal) will be authenticated by the web server, not by Zabbix.</p>   |
| <i>Default login form</i>         | <p>Specify whether to direct non-authenticated users to:</p> <p><b>Zabbix login form</b> - standard Zabbix login page.</p> <p><b>HTTP login form</b> - HTTP login page.</p> <p>It is recommended to enable web-server based authentication for the <code>index_http.php</code> page only. If <i>Default login form</i> is set to 'HTTP login page' the user will be logged in automatically if web server authentication module will set valid user login in the <code>\$_SERVER</code> variable. Supported <code>\$_SERVER</code> keys are <code>PHP_AUTH_USER</code>, <code>REMOTE_USER</code>, <code>AUTH_USER</code>.</p> |
| <i>Remove domain name</i>         | <p>A comma-delimited list of domain names that should be removed from the username. E.g. <code>comp,any</code> - if username is 'Admin@any', 'comp\Admin', user will be logged in as 'Admin'; if username is 'notacompany\Admin', login will be denied.</p>   |
| <i>Case sensitive login</i>       | <p>Unmark the checkbox to disable case-sensitive login for usernames (enabled by default). Disabling case-sensitive login allows, for example, to log in as "admin" even if the Zabbix user is "Admin" or "ADMIN".</p> <p>Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: "Authentication failed: supplied credentials are not unique."</p>  |

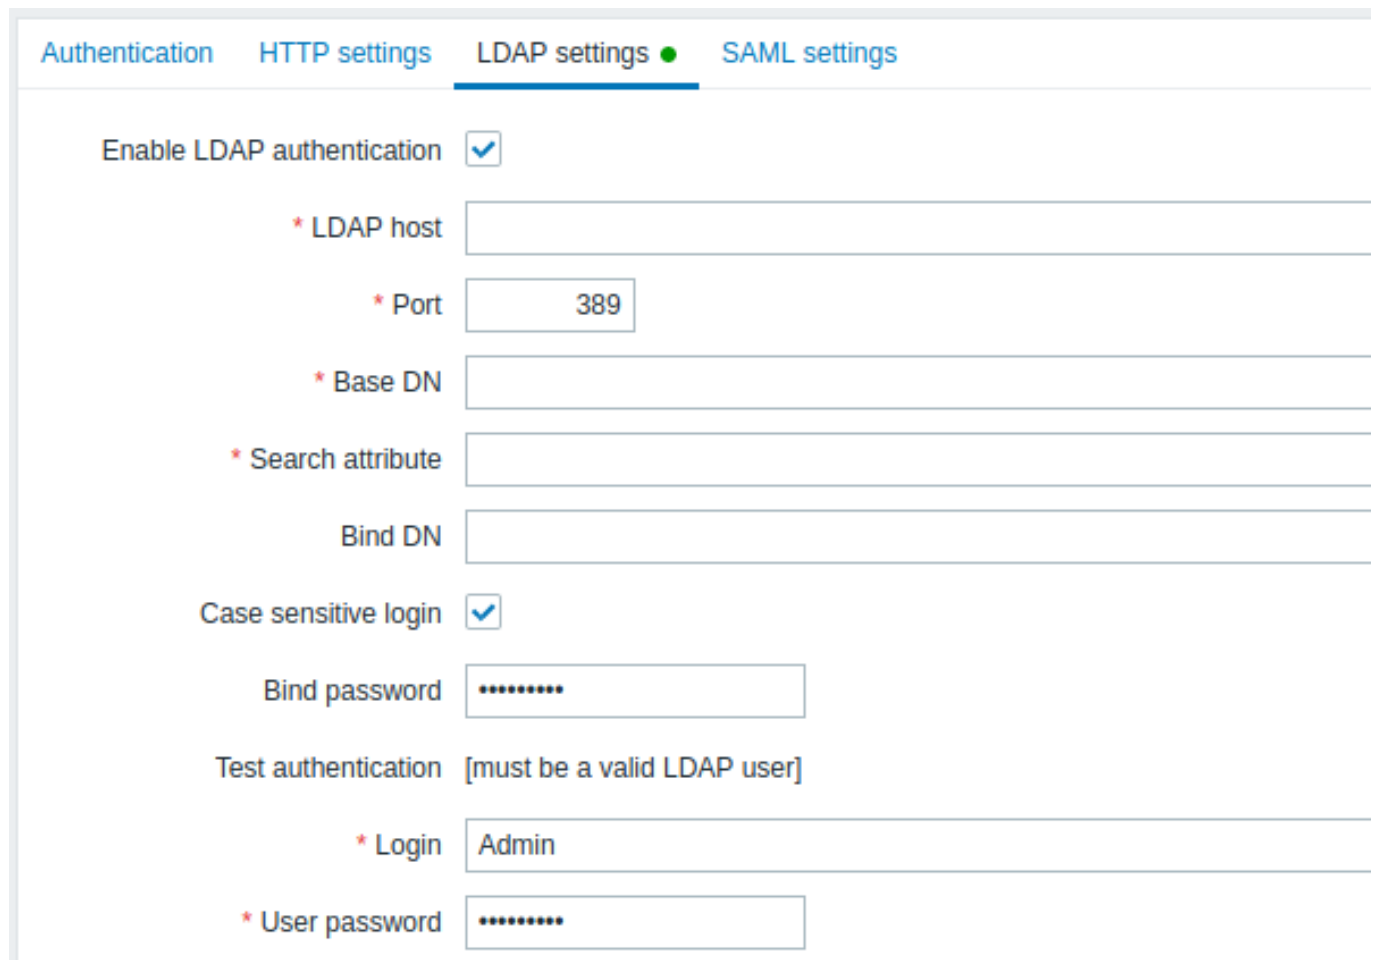

**Note:**

For internal users who are unable to log in using HTTP credentials (with HTTP login form set as default) leading to the 401 error, you may want to add a `ErrorDocument 401 /index.php?form=default` line to basic authentication directives, which will redirect to the regular Zabbix login form.

## LDAP authentication

External LDAP authentication can be used to check user names and passwords. Note that a user must exist in Zabbix as well, however its Zabbix password will not be used.

Zabbix LDAP authentication works at least with Microsoft Active Directory and OpenLDAP.

Configuration parameters:

| Parameter                         | Description   |
|-----------------------------------|---|
| <i>Enable LDAP authentication</i> | Mark the checkbox to enable LDAP authentication.  |
| <i>LDAP host</i>                  | Name of LDAP server. For example: <code>ldap://ldap.zabbix.com</code><br>For secure LDAP server use <i>ldaps</i> protocol.<br><code>ldaps://ldap.zabbix.com</code><br>With OpenLDAP 2.x.x and later, a full LDAP URI of the form <code>ldap://hostname:port</code> or <code>ldaps://hostname:port</code> may be used. |
| <i>Port</i>                       | Port of LDAP server. Default is 389.<br>For secure LDAP connection port number is normally 636.   |
| <i>Base DN</i>                    | Not used when using full LDAP URIs.<br>Base path to search accounts:<br><code>ou=Users,ou=system</code> (for OpenLDAP),<br><code>DC=company,DC=com</code> (for Microsoft Active Directory)  |
| <i>Search attribute</i>           | LDAP account attribute used for search:<br><code>uid</code> (for OpenLDAP),<br><code>sAMAccountName</code> (for Microsoft Active Directory)   |

| Parameter                   | Description   |
|-----------------------------|---|
| <i>Bind DN</i>              | LDAP account for binding and searching over the LDAP server, examples:<br>uid=ldap_search,ou=system (for OpenLDAP),<br>CN=ldap_search,OU=user_group,DC=company,DC=com (for Microsoft Active Directory)<br>Anonymous binding is also supported. Note that anonymous binding potentially opens up domain configuration to unauthorized users (information about users, computers, servers, groups, services, etc.). For security reasons, disable anonymous binds on LDAP hosts and use authenticated access instead. |
| <i>Case sensitive login</i> | Unmark the checkbox to disable case-sensitive login for usernames (enabled by default).<br>Disabling case-sensitive login allows, for example, to log in as "admin" even if the Zabbix user is "Admin" or "ADMIN".<br>Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: "Authentication failed: supplied credentials are not unique."      |
| <i>Bind password</i>        | LDAP password of the account for binding and searching over the LDAP server.  |
| <i>Test authentication</i>  | Header of a section for testing   |
| <i>Login</i>                | Name of a test user (which is currently logged in the Zabbix frontend). This user name must exist in the LDAP server.<br>Zabbix will not activate LDAP authentication if it is unable to authenticate the test user.  |
| <i>User password</i>        | LDAP password of the test user.   |

#### Warning:

In case of trouble with certificates, to make a secure LDAP connection (ldaps) work you may need to add a `TLS_REQCERT allow` line to the `/etc/openldap/ldap.conf` configuration file. It may decrease the security of connection to the LDAP catalog.

#### Note:

It is recommended to create a separate LDAP account (*Bind DN*) to perform binding and searching over the LDAP server with minimal privileges in the LDAP instead of using real user accounts (used for logging in the Zabbix frontend). Such an approach provides more security and does not require changing the *Bind password* when the user changes his own password in the LDAP server.  
In the table above it's *ldap\_search* account name.

## SAML authentication

SAML 2.0 authentication can be used to sign in to Zabbix. Note that a user must exist in Zabbix, however, its Zabbix password will not be used. If authentication is successful, then Zabbix will match a local username with the username attribute returned by SAML.

#### Note:

If SAML authentication is enabled, users will be able to choose between logging in locally or via SAML Single Sign-On.

## Setting up the identity provider

In order to work with Zabbix, a SAML identity provider ([onelogin.com](https://onelogin.com), [auth0.com](https://auth0.com), [okta.com](https://okta.com), etc.) needs to be configured in the following way:

- *Assertion Consumer URL* should be set to `<path_to_zabbix_ui>/index_sso.php?acs`
- *Single Logout URL* should be set to `<path_to_zabbix_ui>/index_sso.php?sls`

`<path_to_zabbix_ui>` examples: `<https://example.com/zabbix/ui>`, `<http://another.example.com/zabbix>`, `<http://><any_public_ip_address>/zabbix`

## Setting up Zabbix

#### Attention:

It is required to install php-openssl if you want to use SAML authentication in the frontend.

To use SAML authentication Zabbix should be configured in the following way:

1. Private key and certificate should be stored in the `ui/conf/certs/`, unless custom paths are provided in `zabbix.conf.php`.

By default, Zabbix will look in the following locations:

- `ui/conf/certs/sp.key` - SP private key file

- ui/conf/certs/sp.crt - SP cert file
- ui/conf/certs/idp.crt - IDP cert file

2. All of the most important settings can be configured in the Zabbix frontend. However, it is possible to specify additional settings in the [configuration file](#).

Configuration parameters, available in the Zabbix frontend:

| Parameter                         | Description  |
|-----------------------------------|--|
| <i>Enable SAML authentication</i> | Mark the checkbox to enable SAML authentication.   |
| <i>IDP entity ID</i>              | The unique identifier of SAML identity provider.   |
| <i>SSO service URL</i>            | The URL users will be redirected to when logging in.   |
| <i>SLO Service URL</i>            | The URL users will be redirected to when logging out. If left empty, the SLO service will not be used.   |
| <i>Username attribute</i>         | SAML attribute to be used as a username when logging into Zabbix.<br>List of supported values is determined by the identity provider.<br><br>Examples:<br>uid<br>userprincipalname<br>samaccountname<br>username<br>userusername<br>urn:oid:0.9.2342.19200300.100.1.1<br>urn:oid:1.3.6.1.4.1.5923.1.1.1.13<br>urn:oid:0.9.2342.19200300.100.1.44 |

| Parameter                   | Description  |
|-----------------------------|--|
| <i>SP entity ID</i>         | The unique identifier of SAML service provider.  |
| <i>SP name ID format</i>    | Request a particular name ID format in the response.<br><br>Examples:<br><code>urn:oasis:names:tc:SAML:2.0:nameid-format:persistent</code><br><code>urn:oasis:names:tc:SAML:2.0:nameid-format:unspecified</code><br><code>urn:oasis:names:tc:SAML:2.0:nameid-format:transient</code>   |
| <i>Sign</i>                 | Mark the checkboxes to select entities for which SAML signature should be enabled:<br><i>Messages</i><br><i>Assertions</i><br><i>AuthN requests</i><br><i>Logout requests</i><br><i>Logout responses</i>   |
| <i>Encrypt</i>              | Mark the checkboxes to select entities for which SAML encryption should be enabled:<br><i>Assertions</i><br><i>Name ID</i>   |
| <i>Case sensitive login</i> | Unmark the checkbox to disable case-sensitive login for usernames (enabled by default).<br>Disabling case-sensitive login allows, for example, to log in as "admin" even if the Zabbix user is "Admin" or "ADMIN".<br>Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: "Authentication failed: supplied credentials are not unique." |

#### Advanced settings

Additional SAML parameters can be configured in the Zabbix frontend configuration file (*zabbix.conf.php*):

- `$SSO['SP_KEY'] = '<path to the SP private key file>';`
- `$SSO['SP_CERT'] = '<path to the SP cert file>';`
- `$SSO['IDP_CERT'] = '<path to the IDP cert file>';`
- `$SSO['SETTINGS']`

#### Note:

Zabbix uses [OneLogin's SAML PHP Toolkit](#) library (version 3.4.1). The structure of `$SSO['SETTINGS']` section should be similar to the structure used by the library. For the description of configuration options, see official library [documentation](#).

Only the following options can be set as part of `$SSO['SETTINGS']`:

- *strict*
- *baseurl*
- *compress*
- *contactPerson*
- *organization*
- *sp* (only options specified in this list)
  - *attributeConsumingService*
  - *x509certNew*
- *idp* (only options specified in this list)
  - *singleLogoutService* (only one option)
    - \* *responseUrl*
  - *certFingerprint*
  - *certFingerprintAlgorithm*
  - *x509certMulti*
- *security* (only options specified in this list)
  - *signMetadata*
  - *wantNameId*
  - *requestedAuthnContext*
  - *requestedAuthnContextComparison*
  - *wantXMLValidation*
  - *relaxDestinationValidation*
  - *destinationStrictlyMatches*
  - *rejectUnsolicitedResponsesWithInResponseTo*
  - *signatureAlgorithm*

- *digestAlgorithm*
- *lowercaseUrlencoding*

All other options will be taken from the database and cannot be overridden. The *debug* option will be ignored.

In addition, if Zabbix UI is behind a proxy or a load balancer, the custom *use\_proxy\_headers* option can be used:

- *false* (default) - ignore the option;
- *true* - use X-Forwarded-\* HTTP headers for building the base URL.

If using a load balancer to connect to Zabbix instance, where the load balancer uses TLS/SSL and Zabbix does not, you must indicate 'baseurl', 'strict' and 'use\_proxy\_headers' parameters as follows:

```
$SSO['SETTINGS'] = [
    'strict' => false,
    'baseurl' => 'https://zabbix.example.com/zabbix/',
    'use_proxy_headers' => true
];
```

#### Configuration example:

```
$SSO['SETTINGS'] = [
    'security' => [
        'signatureAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#rsa-sha384'
        'digestAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#sha384',
        // ...
    ],
    // ...
];
```

#### Frontend configuration with Kerberos/ADFS

The Zabbix frontend configuration file (*zabbix.conf.php*) can be used to configure SSO with Kerberos authentication and ADFS:

```
$SSO['SETTINGS'] = [
    'security' => [
        'requestedAuthnContext' => [
            'urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos',
        ],
        'requestedAuthnContextComparison' => 'exact'
    ]
];
```

In this case, in the SAML configuration *SP name ID* field set:

urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified

## 4 User groups

### Overview

In the *Administration* → *User groups* section user groups of the system are maintained.

### User groups

A listing of existing user groups with their details is displayed.

≡

Displayed data:

| Column                 | Description  |
|------------------------|--|
| <i>Name</i>            | Name of the user group. Clicking on the user group name opens the user group <b>configuration form</b> .   |
| <i>#</i>               | The number of users in the group. Clicking on <i>Users</i> will display the respective users filtered out in the user list.  |
| <i>Members</i>         | Username of individual users in the user group (with name and surname in parentheses). Clicking on the username will open the user configuration form. Users from disabled groups are displayed in red.  |
| <i>Frontend access</i> | Frontend access level is displayed:<br><b>System default</b> - users are authenticated by Zabbix, LDAP or HTTP (depending on the <b>authentication</b> method set globally);<br><b>Internal</b> - users are authenticated by Zabbix; ignored if HTTP authentication is the global default;<br><b>LDAP</b> - users are authenticated by LDAP; ignored if HTTP authentication is the global default;<br><b>Disabled</b> - access to Zabbix frontend is forbidden for this group.<br>By clicking on the current level, you can change it. |
| <i>Debug mode</i>      | <b>Debug mode</b> status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.   |
| <i>Status</i>          | User group status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it.  |

To configure a new user group, click on the *Create user group* button in the top right-hand corner.

#### Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the user group status to *Enabled*
- *Disable* - change the user group status to *Disabled*
- *Enable debug mode* - enable debug mode for the user groups
- *Disable debug mode* - disable debug mode for the user groups
- *Delete* - delete the user groups

To use these options, mark the checkboxes before the respective user groups, then click on the required button.

#### Using filter

You can use the filter to display only the user groups you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of user groups. If you click on it, a filter becomes available where you can filter user groups by name and status.

## 5 User roles

### Overview

In the *Administration* → *User roles* section roles that can be assigned to system users and specific permissions for each role are maintained.

#### Default user roles

By default, Zabbix is configured with four user roles, which have a pre-defined set of permissions:

- Admin role
- Guest role
- Super admin role
- User role

| <input type="checkbox"/> Name ▲           | #       | Users   |
|---|---------|---|
| <input type="checkbox"/> Admin role       | Users 1 | <a href="#">db_manager (Database manager)</a>   |
| <input type="checkbox"/> Guest role       | Users   |   |
| <input type="checkbox"/> Super admin role | Users 2 | <a href="#">Admin (Zabbix Administrator)</a> , <a href="#">ljohnson (Lewis Johnson)</a>   |
| <input type="checkbox"/> User role        | Users 4 | <a href="#">gslone (George Slone)</a> , <a href="#">guest (John Snow)</a> , <a href="#">test_admin</a> , <a href="#">test_guest</a> |

The list of all users assigned the respective role is displayed. The users included in disabled groups are stated in red.

**Note:**

Default *Super admin role* cannot be modified or deleted, because at least one Super admin user with unlimited privileges must exist in Zabbix.

Zabbix users with type Super admins and proper permissions can modify or delete existing roles or create new custom roles.

To create a new role, click on the *Create user role* button at the top right corner. To update an existing role, press on the role name to open the configuration form.

| Default access to new UI elements      | This option specifies how new menu sections will be accessible after a Zabbix upgrade. Existing menu sections of modules remain unaffected.   | Yes | Yes | Yes  | Yes  |
| <b>Access to services</b>              |   |     |     |      |      |
| Read-write access to services          | <p>Select read-write access to services:</p> <p><b>None</b> - no access at all</p> <p><b>All</b> - access to all services is read-write</p> <p><b>Service list</b> - select services for read-write access</p> <p>The read-write access, if granted, takes precedence over the read-only access settings and is dynamically inherited by the child services.</p>                            | All | All | None | None |
| Read-write access to services with tag | <p>Specify tag name and, optionally, value to additionally grant read-write access to services matching the tag.</p> <p>This option is available if 'Service list' is selected in the <i>Read-write access to services</i> parameter.</p> <p>The read-write access, if granted, takes precedence over the read-only access settings and is dynamically inherited by the child services.</p> |     |     |      |      |
| Read-only access to services           | <p>Select read-only access to services:</p> <p><b>None</b> - no access at all</p> <p><b>All</b> - access to all services is read-only</p> <p><b>Service list</b> - select services for read-only access</p> <p>The read-only access does not take precedence over the read-write access and is dynamically inherited by the child services.</p>   |     |     | All  | All  |
| Read-only access to services with tag  | <p>Specify tag name and, optionally, value to additionally grant read-only access to services matching the tag.</p> <p>This option is available if 'Service list' is selected in the <i>Read-only access to services</i> parameter.</p> <p>The read-only access does not take precedence over the read-write access and is dynamically inherited by the child services.</p>                 |     |     |      |      |
| <b>Access to modules</b>               |   |     |     |      |      |
| <Module name>                          | Allow/deny access to a specific module. Only enabled modules are shown in this section. It is not possible to grant or restrict access to a module that is currently disabled.  | Yes | Yes | Yes  | Yes  |
| Default access to new modules          | This option specifies how new modules and widgets will be accessible after a Zabbix upgrade. It also applies to modules and widgets added in the <i>Administration &gt; General &gt; Modules</i> section.   |     |     |      |      |
| <b>Access to API</b>                   |   |     |     |      |      |
| Enabled                                | Enable/disable access to API.   | Yes | Yes | Yes  | No   |

|                               |  |     |     |     |     |  |
|-------------------------------|--|-----|-----|-----|-----|--|
| API methods                   | Select <i>Allow list</i> to allow only specified API methods or <i>Deny list</i> to restrict only specified API methods.   |     |     |     |     |  |
|                               | In the search field, start typing the method name, then select the method from the auto-complete list. You can also press the Select button and select methods from the full list available for this user type. Note that if certain action from the Access to actions block is unchecked, users will not be able to use API methods related to this action. |     |     |     |     |  |
|                               | Wildcards are supported. Examples: <code>dashboard.*</code> (all methods of 'dashboard.' API service) <code>* (any method)</code> , <code>*.export</code> (methods with '.export' name from all API services).   |     |     |     |     |  |
|                               | If no methods have been specified the Allow/Deny list rule will be ignored.  |     |     |     |     |  |
|                               |  |     |     |     |     |  |
| Access to actions             |  |     |     |     |     |  |
| Create and edit dashboards    | Clearing this checkbox will also revoke the rights to use <code>.create</code> , <code>.update</code> and <code>.delete</code> API methods for the corresponding elements.   | Yes | Yes | Yes | No  |  |
| Create and edit maps          |  |     |     |     |     |  |
| Create and edit maintenance   |  |     |     |     | No  |  |
| Add problem comments          | Clearing this checkbox will also revoke the rights to perform corresponding action via event <code>.acknowledge</code> API method.   |     |     | Yes |     |  |
| Change severity               |  |     |     |     |     |  |
| Acknowledge problems          |  |     |     |     |     |  |
| Close problems                |  |     |     |     |     |  |
| Execute scripts               | Clearing this checkbox will also revoke the rights to use the <code>script.execute</code> API method.  |     |     |     |     |  |
| Manage API tokens             | Clearing this checkbox will also revoke the rights to use all <code>token.</code> API methods.   |     |     |     |     |  |
| Manage scheduled reports      | Clearing this checkbox will also revoke the rights to use all <code>report.</code> API methods.  |     |     |     | No  |  |
| Manage SLA                    | Enable/disable the rights to manage <b>SLA</b> .   |     |     |     |     |  |
| Default access to new actions | This option specifies how new actions will be accessible after a Zabbix upgrade.   |     |     |     | Yes |  |

#### Notes:

- Each user may have only one role assigned.
- If an element is restricted, users will not be able to access it even by entering a direct URL to this element into the browser.
- Users of type *User* or *Admin* cannot change their own role settings.
- Users of type *Super admin* can modify settings of their own role (not available for the default *Super admin role*), but not the user type.
- Users of all levels cannot change their own user type.

From the dropdown to the right in the *Users* bar you can choose whether to display all users or those belonging to one particular group.

Displayed data:

| Column                 | Description  |
|------------------------|--|
| <i>Username</i>        | Username for logging into Zabbix. Clicking on the username opens the user <b>configuration form</b> .  |
| <i>Name</i>            | First name of the user.  |
| <i>Last name</i>       | Second name of the user.   |
| <i>User role</i>       | <b>User role</b> is displayed.   |
| <i>Groups</i>          | Groups that the user is a member of are listed. Clicking on the user group name opens the user group configuration form. Disabled groups are displayed in red.   |
| <i>Is online?</i>      | The on-line status of the user is displayed - <i>Yes</i> or <i>No</i> . The time of last user activity is displayed in parentheses.  |
| <i>Login</i>           | The login status of the user is displayed - <i>Ok</i> or <i>Blocked</i> . A user can become temporarily blocked upon exceeding the number of unsuccessful login attempts set in the <b>Administration→General</b> section (five by default). By clicking on <i>Blocked</i> you can unblock the user. |
| <i>Frontend access</i> | Frontend access level is displayed - <i>System default</i> , <i>Internal</i> , <i>LDAP</i> , or <i>Disabled</i> , depending on the one set for the whole user group.   |
| <i>API access</i>      | API access status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the user role.   |
| <i>Debug mode</i>      | Debug mode status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the whole user group.  |
| <i>Status</i>          | User status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the whole user group.  |

To configure a new user, click on the *Create user* button in the top right-hand corner.

## Mass editing options

Buttons below the list offer some mass-editing options:

- *Unblock* - re-enable system access to blocked users
- *Delete* - delete the users

To use these options, mark the check-boxes before the respective users, then click on the required button.

## Using filter

You can use the filter to display only the users you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of users. If you click on it, a filter becomes available where you can filter users by username, name, last name and user role.

7 Media types

Overview

In the *Administration* → *Media types* section users can configure and maintain media type information.

Media type information contains general instructions for using a medium as delivery channel for notifications. Specific details, such as the individual e-mail addresses to send a notification to are kept with individual users.

A listing of existing media types with their details is displayed.

## 8 Scripts

### Overview

In the *Administration* → *Scripts* section user-defined global scripts can be configured and maintained.

Global scripts, depending on the configured scope and also user permissions, are available for execution:

- from the **host menu** in various frontend locations (*Dashboard*, *Problems*, *Latest data*, *Maps*, etc.)
- from the **event menu**
- can be run as an action operation

The scripts are executed on Zabbix agent, Zabbix server (proxy) or Zabbix server only. See also **Command execution**.

Both on Zabbix agent and Zabbix proxy, remote scripts are disabled by default. They can be enabled as follows:

- For remote commands executed on Zabbix agent
  - by adding an `AllowKey=system.run[<command>,*]` parameter for each allowed command in agent configuration, \* stands for wait and nowait mode.
- For remote commands executed on Zabbix proxy
  - **Warning: It is not required to enable remote commands on Zabbix proxy if remote commands are executed on Zabbix agent that is monitored by Zabbix proxy.** If, however, it is required to execute remote commands on Zabbix proxy, set `EnableRemoteCommands` parameter to '1' in the proxy configuration.

A listing of existing scripts with their details is displayed.

Displaying 3 of 3 found

Displayed data:

| Column                 | Description  |
|------------------------|--|
| <i>Name</i>            | Name of the script. Clicking on the script name opens the script <b>configuration form</b> .   |
| <i>Scope</i>           | Scope of the script - action operation, manual host action or manual event action. This setting determines where the script is available.                                    |
| <i>Used in actions</i> | Actions where the script is used are displayed.  |
| <i>Type</i>            | Script type is displayed - <i>Webhook</i> , <i>Script</i> , <i>SSH</i> , <i>Telnet</i> or <i>IPMI</i> command.   |
| <i>Execute on</i>      | It is displayed whether the script will be executed on Zabbix agent, Zabbix server (proxy) or Zabbix server only.  |
| <i>Commands</i>        | All commands to be executed within the script are displayed.<br>Nothing is displayed here for webhooks.  |
| <i>User group</i>      | The user group that the script is available to is displayed (or <i>All</i> for all user groups).   |
| <i>Host group</i>      | The host group that the script is available for is displayed (or <i>All</i> for all host groups).  |
| <i>Host access</i>     | The permission level for the host group is displayed - <i>Read</i> or <i>Write</i> . Only users with the required permission level will have access to executing the script. |

To configure a new script, click on the *Create script* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the scripts

To use this option, mark the checkboxes before the respective scripts and click on *Delete*.

#### Using filter

You can use the filter to display only the scripts you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of scripts. If you click on it, a filter becomes available where you can filter scripts by name and scope.

#### Script attributes:

| Parameter   | Description   |
|-------------|---|
| <i>Name</i> | Unique name of the script.<br>E.g., Clear /tmp filesystem |

| Parameter             | Description   |
|-----------------------|---|
| Scope                 | <p>Scope of the script - action operation, manual host action or manual event action. This setting determines where the script can be used - in remote commands of action operations, from the <b>host menu</b> or from the <b>event menu</b> respectively.</p> <p>Setting the scope to 'Action operation' makes the script available for all users with access to <i>Configuration → Actions</i>.</p> <p>If a script is actually used in an action, its scope cannot be changed away from 'action operation'.</p> <p><b>Macro support</b></p> <p>The scope affects the range of available macros. For example, user-related macros ({USER.*}) are supported in scripts to allow passing information about the user that launched the script. However, they are not supported if the script scope is an action operation, as action operations are executed automatically.</p> <p>To find out which macros are supported, do a search for 'Trigger-based notifications and commands/Trigger-based commands', 'Manual host action scripts' and 'Manual event action scripts' in the <b>supported macro</b> table. Note that if a macro may resolve to a value with spaces (for example, host name), don't forget to quote as needed.</p> |
| Menu path             | <p>The desired menu path to the script. For example, Default or Default/, will display the script in the respective directory. Menus can be nested, e.g., Main menu/Sub menu1/Sub menu2. When accessing scripts through the host/event menu in monitoring sections, they will be organized according to the given directories.</p> <p>This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i>.</p>  |
| Type                  | <p>Click the respective button to select the script type:</p> <p><b>Webhook, Script, SSH, Telnet</b> or <b>IPMI</b> command.</p>  |
| Script type: Webhook  |   |
| Parameters            | <p>Specify the webhook variables as attribute-value pairs.</p> <p>See also: <b>Webhook</b> media configuration.</p> <p>Macros and custom <b>user macros</b> are supported in parameter values. Macro support depends on the scope of the script (see <i>Scope</i> above).</p>   |
| Script                | <p>Enter the JavaScript code in the block that appears when clicking in the parameter field (or on the view/edit button next to it).</p> <p>Macro support depends on the scope of the script (see <i>Scope</i> above).</p> <p>See also: <b>Webhook</b> media configuration, <b>Additional JavaScript objects</b>.</p>   |
| Timeout               | <p>JavaScript execution timeout (1-60s, default 30s).</p> <p>Time suffixes are supported, e.g., 30s, 1m.</p>  |
| Script type: Script   |   |
| Execute on            | <p>Click the respective button to execute the shell script on:</p> <p><b>Zabbix agent</b> - the script will be executed by Zabbix agent (if the system.run item is <b>allowed</b>) on the host</p> <p><b>Zabbix server (proxy)</b> - the script will be executed by Zabbix server or proxy (if enabled by <b>EnableRemoteCommands</b>) - depending on whether the host is monitored by server or proxy</p> <p><b>Zabbix server</b> - the script will be executed by Zabbix server only</p>  |
| Commands              | <p>Enter full path to the commands to be executed within the script.</p> <p>Macro support depends on the scope of the script (see <i>Scope</i> above). Custom <b>user macros</b> are supported.</p>   |
| Script type: SSH      |   |
| Authentication method | Select authentication method - password or public key.  |
| Username              | Enter the username.   |
| Password              | Enter the password.   |
| Public key file       | <p>This field is available if 'Password' is selected as the authentication method.</p> <p>Enter the path to the public key file.</p>  |
| Private key file      | <p>This field is available if 'Public key' is selected as the authentication method.</p> <p>Enter the path to the private key file.</p>   |
| Passphrase            | <p>This field is available if 'Public key' is selected as the authentication method.</p> <p>Enter the passphrase.</p>   |
| Port                  | <p>This field is available if 'Public key' is selected as the authentication method.</p> <p>Enter the port.</p>   |
| Commands              | <p>Enter the commands.</p> <p>Macro support depends on the scope of the script (see <i>Scope</i> above). Custom <b>user macros</b> are supported.</p>   |
| Script type: Telnet   |   |

| Parameter                        | Description  |
|----------------------------------|--|
| <i>Username</i>                  | Enter the username.  |
| <i>Password</i>                  | Enter the password.  |

| <i>Commands</i>                  | Enter the commands.<br>Macro support depends on the scope of the script (see <i>Scope</i> above). Custom <b>user macros</b> are supported.   |
| Script type: IPMI                |  |
| <i>Command</i>                   | Enter the IPMI command.<br>Macro support depends on the scope of the script (see <i>Scope</i> above). Custom <b>user macros</b> are supported.   |
| <i>Description</i>               | Enter a description for the script.  |
| <i>Host group</i>                | Select the host group that the script will be available for (or <i>All</i> for all host groups).<br>It is <b>not recommended</b> to use discovered groups in this field. When discovered groups will be undiscovered and deleted, the script scope will be reset to <i>All</i> .   |
| <i>User group</i>                | Select the user group that the script will be available to (or <i>All</i> for all user groups).<br>This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> .   |
| <i>Required host permissions</i> | Select the permission level for the host group - <i>Read</i> or <i>Write</i> . Only users with the required permission level will have access to executing the script.<br>This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> .  |
| <i>Enable confirmation</i>       | Mark the checkbox to display a confirmation message before executing the script. This feature might be especially useful with potentially dangerous operations (like a reboot script) or ones that might take a long time.<br>This option is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> .   |
| <i>Confirmation text</i>         | Enter a custom confirmation text for the confirmation popup enabled with the checkbox above (for example, <i>Remote system will be rebooted. Are you sure?</i> ). To see how the text will look like, click on <i>Test confirmation</i> next to the field.<br>{HOST.*} and {USER.*} macros are supported. Custom <b>user macros</b> are supported.<br><i>Note:</i> the macros will not be expanded when testing the confirmation message.<br>This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> . |

## Script execution and result

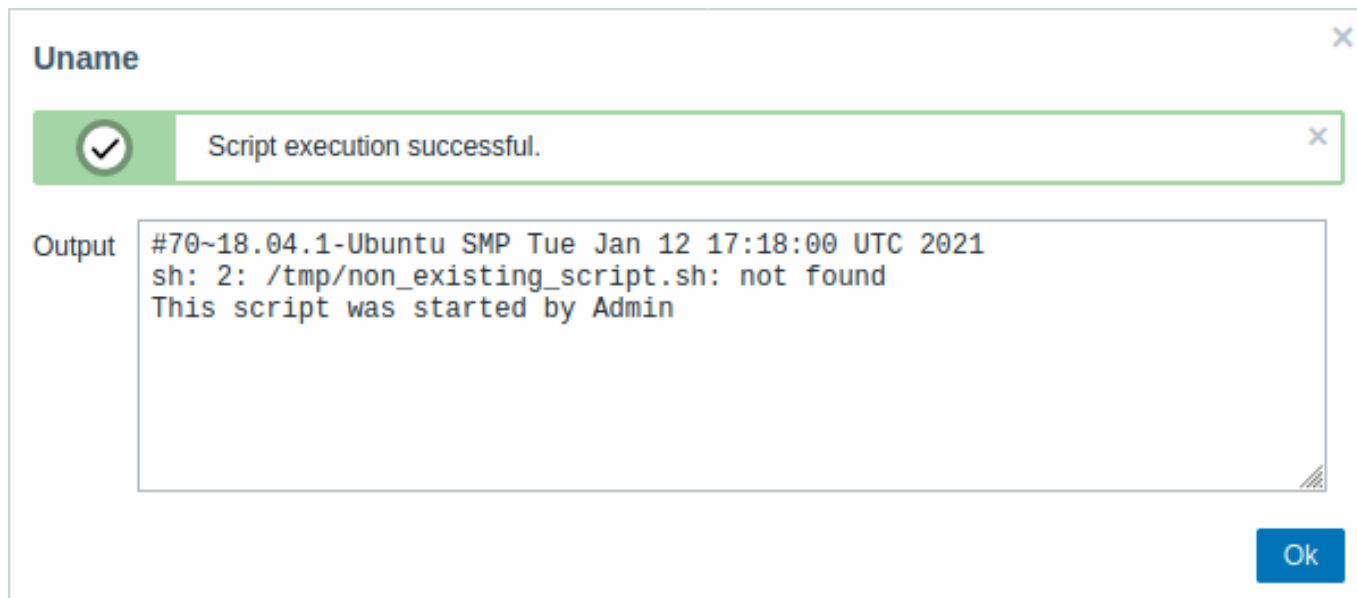

Scripts run by Zabbix server are executed in the order described in the [Command execution](#) page (including exit code checking). The script result will be displayed in a pop-up window that will appear after the script is run.

The return value of the script is a standard output together with a standard error.

The return value is limited to 16MB (including trailing whitespace that is truncated); **database limits** also apply. When data has to pass through Zabbix proxy, it must be stored in the database, thus subjecting it to the same **database limits**.

See an example of a script and the result window below:

```
uname -v
/tmp/non_existing_script.sh
echo "This script was started by {USER.USERNAME}"
```

The script result does not display the script itself.

Script timeout

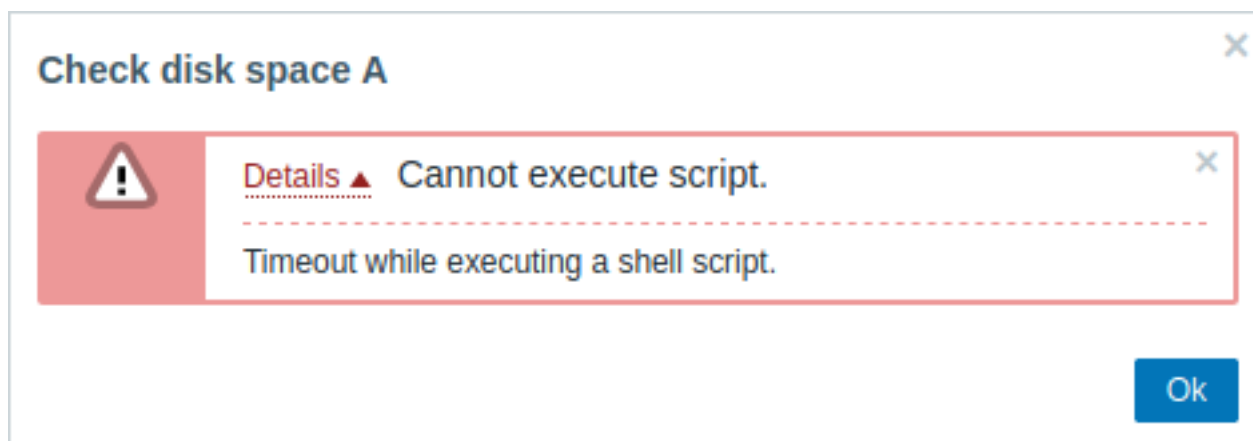

Zabbix agent

You may encounter a situation when a timeout occurs while executing a script.

See an example of a script running on Zabbix agent and the result window below:

```
sleep 5
```

```
df -h
```

The error message, in this case, is the following:

Timeout while executing a shell script.

In order to avoid such a situation, it is advised to optimize the script itself (instead of adjusting Timeout parameter to a corresponding value (in our case, > '5') by modifying the [Zabbix agent configuration](#) and [Zabbix server configuration](#)).

In case the Timeout parameter is changed in [Zabbix agent configuration](#), the following error message will appear:

Get value from agent failed: ZBX\_TCP\_READ() timed out.

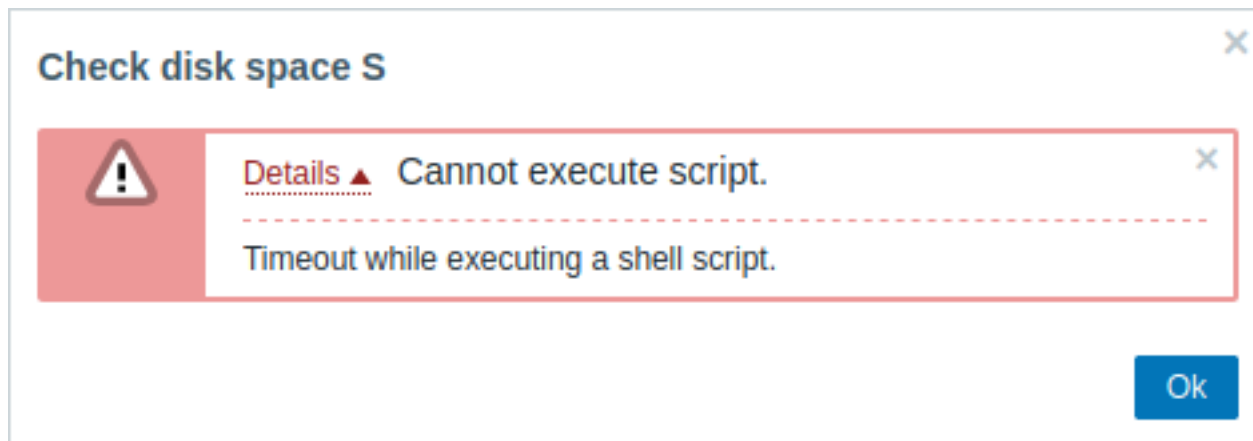

It means that modification was made in [Zabbix agent configuration](#) and it is also required to modify Timeout setting in [Zabbix server configuration](#).

Zabbix server/proxy

See an example of a script running on Zabbix server and the result window below:

```
sleep 11
```

```
df -h
```

It is also advised to optimize the script itself (instead of adjusting TrapperTimeout parameter to a corresponding value (in our case, > '11') by modifying the [Zabbix server configuration](#)).

## 9 Queue

### Overview

In the *Administration* → *Queue* section items that are waiting to be updated are displayed.

Ideally, when you open this section it should all be "green" meaning no items in the queue. If all items are updated without delay, there are none waiting. However, due to lacking server performance, some items may get delayed and the information is displayed in this section. For more details, see the [Queue](#) section.

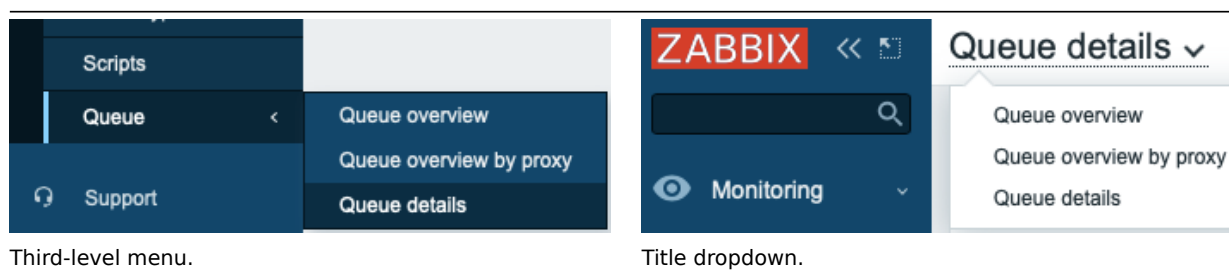

#### Note:

The queue is available only if Zabbix server is running. Items are not counted in the queue if the item interface becomes unavailable due to connection problems or agent not working properly.

The *Administration* → *Queue* section contains the following pages:

- Queue overview — displays queue by item type;
- Queue overview by proxy — displays queue by proxy;
- Queue details — displays a list of delayed items.

The list of available pages appears upon pressing on *Queue* in the *Administration* menu section. It is also possible to switch between pages by using a title dropdown in the top left corner.

### Overview by item type

In this screen it is easy to locate if the problem is related to one or several item types.

### Queue overview

| Items                 | 5 seconds | 10 seconds | 30 seconds | 1 minute | 5 minutes | More than 10 minutes |
|-----------------------|-----------|------------|------------|----------|-----------|----------------------|
| Zabbix agent          | 1         | 11         | 1          | 0        | 0         | 0                    |
| Zabbix agent (active) | 0         | 0          | 0          | 0        | 0         | 0                    |
| Simple check          | 0         | 0          | 0          | 0        | 0         | 0                    |
| SNMPv1 agent          | 0         | 0          | 0          | 0        | 0         | 0                    |
| SNMPv2 agent          | 0         | 0          | 0          | 0        | 0         | 0                    |
| SNMPv3 agent          | 0         | 0          | 0          | 0        | 0         | 0                    |
| Zabbix internal       | 0         | 0          | 0          | 0        | 0         | 0                    |
| Zabbix aggregate      | 0         | 0          | 0          | 0        | 0         | 0                    |
| External check        | 0         | 0          | 0          | 0        | 0         | 0                    |
| Database monitor      | 0         | 0          | 0          | 0        | 0         | 0                    |
| HTTP agent            | 0         | 0          | 0          | 0        | 0         | 0                    |

Each line contains an item type. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

### Overview by proxy

In this screen it is easy to locate if the problem is related to one of the proxies or the server.

### Queue overview by proxy

| Proxy        | 5 seconds | 10 seconds | 30 seconds | 1 minute | 5 minutes | More than 10 minutes |
|--------------|-----------|------------|------------|----------|-----------|----------------------|
| Remote proxy | 0         | 8          | 11         | 0        | 0         | 0                    |
| Server       | 0         | 0          | 0          | 0        | 0         | 0                    |

Total: 2

Each line contains a proxy, with the server last in the list. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

### List of waiting items

In this screen, each waiting item is listed.

### Queue details

| Scheduled check     | Delayed by | Host    | Name               | Proxy        |
|---------------------|------------|---------|--------------------|--------------|
| 2019-09-02 11:46:40 | 58s        | My host | CPU idle time      | Remote proxy |
| 2019-09-02 11:46:41 | 57s        | My host | CPU interrupt time | Remote proxy |
| 2019-09-02 11:46:42 | 56s        | My host | CPU iowait time    | Remote proxy |
| 2019-09-02 11:46:43 | 55s        | My host | CPU nice time      | Remote proxy |
| 2019-09-02 11:46:44 | 54s        | My host | CPU softirq time   | Remote proxy |
| 2019-09-02 11:46:45 | 53s        | My host | CPU steal time     | Remote proxy |
| 2019-09-02 11:46:46 | 52s        | My host | CPU system time    | Remote proxy |

Displayed data:

| Column                 | Description   |
|------------------------|---|
| <i>Scheduled check</i> | The time when the check was due is displayed.                   |
| <i>Delayed by</i>      | The length of the delay is displayed.                           |
| <i>Host</i>            | Host of the item is displayed.                                  |
| <i>Name</i>            | Name of the waiting item is displayed.                          |
| <i>Proxy</i>           | The proxy name is displayed, if the host is monitored by proxy. |

### Possible error messages

You may encounter a situation when no data is displayed and the following error message appears:

Details

Cannot display item queue.

Permission denied.

Error message in this case is the following:

Cannot display item queue. Permission denied

This happens when the PHP configuration parameters in the *zabbix.conf.php* file - `$ZBX_SERVER` or both `$ZBX_SERVER` and `$ZBX_SERVER_PORT` - point to an existing Zabbix server that uses a different database.

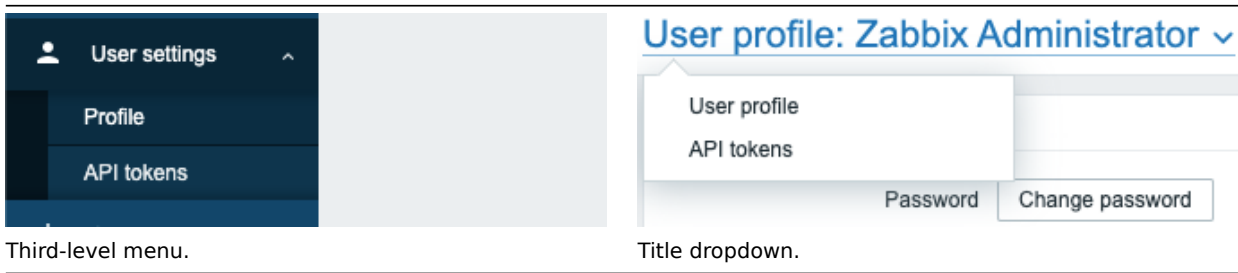

3 User settings

Overview

Depending on user role permissions, the *User settings* section may contain the following pages:

- *User profile* - for customizing certain Zabbix frontend features;
- *API tokens* - for managing API tokens assigned to the current user.

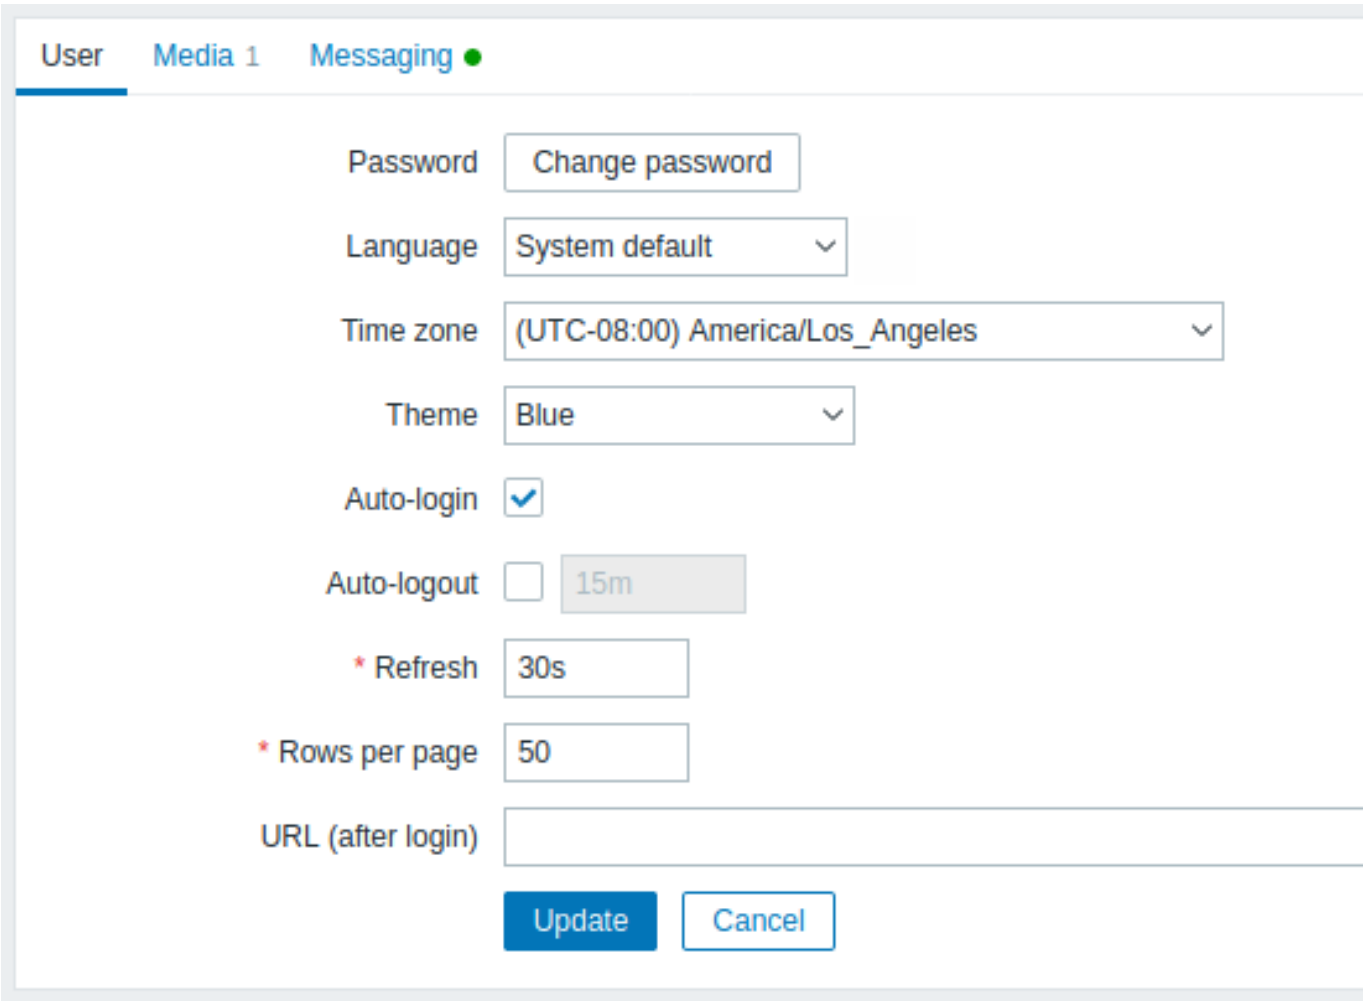

The list of available pages appears upon pressing on the  user icon near the bottom of the Zabbix menu (not available for a guest user). It is also possible to switch between pages by using a title dropdown in the top left corner.

1 User profile

The **User profile** section provides options to set custom interface language, color theme, number of rows displayed in the lists, etc. The changes made here will be applied to the current user only.

The **User** tab allows you to set various user preferences.

The image shows the 'User' tab of the Zabbix user profile settings. It includes fields for 'Password' (with a 'Change password' button), 'Language' (set to 'System default'), 'Time zone' (set to '(UTC-08:00) America/Los\_Angeles'), 'Theme' (set to 'Blue'), 'Auto-login' (checked), 'Auto-logout' (unchecked with a '15m' timer), '\* Refresh' (set to '30s'), '\* Rows per page' (set to '50'), and a 'URL (after login)' field. At the bottom are 'Update' and 'Cancel' buttons.

| Parameter                | Description  |
|--------------------------|--|
| <i>Password</i>          | Click on the link to display two fields for entering a new password.   |
| <i>Language</i>          | Select the interface language of your choice or select <b>System default</b> to use default system settings.<br>For more information, see <a href="#">Installation of additional frontend languages</a> .  |
| <i>Time zone</i>         | Select the time zone to override global <b>time zone</b> on user level or select <b>System default</b> to use global time zone settings.   |
| <i>Theme</i>             | Select a color theme specifically for your profile:<br><b>System default</b> - use default system settings<br><b>Blue</b> - standard blue theme<br><b>Dark</b> - alternative dark theme<br><b>High-contrast light</b> - light theme with high contrast<br><b>High-contrast dark</b> - dark theme with high contrast  |
| <i>Auto-login</i>        | Mark this checkbox to make Zabbix remember you and log you in automatically for 30 days. Browser cookies are used for this.  |
| <i>Auto-logout</i>       | With this checkbox marked you will be logged out automatically, after the set amount of seconds (minimum 90 seconds, maximum 1 day).<br><b>Time suffixes</b> are supported, e.g. 90s, 5m, 2h, 1d.<br>Note that this option will not work:<br>* When Monitoring menu pages perform background information refreshes. In case pages refreshing data in a specific time interval (dashboards, graphs, latest data, etc.) are left open session lifetime is extended, respectively disabling auto-logout feature;<br>* If logging in with the <i>Remember me for 30 days</i> option checked.<br>Auto-logout can accept 0, meaning that Auto-logout becomes disabled after profile settings update. |
| <i>Refresh</i>           | Set how often the information on the <b>Monitoring</b> menu pages will be refreshed (minimum 0 seconds, maximum 1 hour), except for <b>Dashboard</b> , which uses its own refresh parameters for every widget.<br><b>Time suffixes</b> are supported, e.g. 30s, 90s, 1m, 1h.   |
| <i>Rows per page</i>     | You can set how many rows will be displayed per page in the lists. Fewer rows (and fewer records to display) mean faster loading times.  |
| <i>URL (after login)</i> | You can set a specific URL to be displayed after the login. Instead of the default <i>Monitoring</i> → <i>Dashboard</i> it can be, for example, the URL of <i>Monitoring</i> → <i>Triggers</i> .   |

The **Media** tab allows you to specify the **media details** for the user, such as the types, the addresses to use and when to use them to deliver notifications.

User

Media 1

Messaging ●

Media

| Type  | Send to          | When active     | Use if severity |
|-------|------------------|-----------------|-----------------|
| Email | user@company.com | 1-7,00:00-24:00 | N I W A H D     |
| Add   |                  |                 |                 |

**Note:**  
Only **admin level** users (Admin and Super admin) can change their own media details.

The **Messaging** tab allows you to set **global notifications**.

## 2 API tokens

API tokens section allows to view tokens assigned to the user, edit token details and **create new tokens**. This section is only available to a user if *Manage API tokens* action is allowed in the **user role** settings.

API tokens ▾ Create API token

Filter ▾

| <input type="checkbox"/> | Name ▲  | Expires at          | Created at          | Last accessed at | Status  |
|--------------------------|---------|---------------------|---------------------|------------------|---------|
| <input type="checkbox"/> | Token 1 | Never               | 2021-01-22 18:58:11 | Never            | Enabled |
| <input type="checkbox"/> | Token 2 | 2021-01-26 00:00:00 | 2021-01-22 16:13:03 | Never            | Enabled |

Displaying 2 of 2 found

You may filter API tokens by name, expiry date, or status (enabled/disabled). Click on the token status in the list to quickly enable/disable a token. You may also mass enable/disable tokens by selecting them in the list and then clicking on the Enable/Disable buttons below the list.

**Attention:**  
Users cannot view *Auth token* value of the tokens assigned to them in Zabbix. *Auth token* value is displayed only once - immediately after creating a token. If it has been lost, the token has to be regenerated.

1 Global notifications

Overview

Global notifications are a way of displaying issues that are currently happening right on the screen you’re at in Zabbix frontend. Without global notifications, working in some other location than *Problems* or the *Dashboard* would not show any information regarding issues that are currently happening. Global notifications will display this information regardless of where you are.

Global notifications involve both showing a message and **playing a sound**.

**Attention:**  
The auto play of sounds may be disabled in recent browser versions by default. In this case, you need to change this setting manually.

Configuration

Global notifications can be enabled per user in the *Messaging* tab of **profile configuration**.

Update

Cancel

| Parameter                       | Description   |
|---------------------------------|---|
| <i>Frontend messaging</i>       | Mark the checkbox to enable global notifications.   |
| <i>Message timeout</i>          | You can set for how long the message will be displayed. By default, messages will stay on screen for 60 seconds.<br><b>Time suffixes</b> are supported, e.g. 30s, 5m, 2h, 1d.   |
| <i>Play sound</i>               | You can set how long the sound will be played.<br><b>Once</b> - sound is played once and fully.<br><b>10 seconds</b> - sound is repeated for 10 seconds.<br><b>Message timeout</b> - sound is repeated while the message is visible.  |
| <i>Trigger severity</i>         | You can set the trigger severities that global notifications and sounds will be activated for. You can also select the sounds appropriate for various severities.<br>If no severity is marked then no messages will be displayed at all.<br>Also, recovery messages will only be displayed for those severities that are marked. So if you mark <i>Recovery</i> and <i>Disaster</i> , global notifications will be displayed for the problems and the recoveries of disaster severity triggers. |
| <i>Show suppressed problems</i> | Mark the checkbox to display notifications for problems which would otherwise be suppressed (not shown) because of host maintenance.  |

### Global messages displayed

As the messages arrive, they are displayed in a floating section on the right hand side. This section can be repositioned freely by dragging the section header.

For this section, several controls are available:

-  **Snooze** button silences the currently active alarm sound;
-  **Mute/Unmute** button switches between playing and not playing the alarm sounds at all.

## 2 Sound in browsers

### Overview

Sound is used in **global notifications**.

For the sounds to be played in Zabbix frontend, *Frontend messaging* must be enabled in the user profile *Messaging* tab, with all trigger severities checked, and sounds should also be enabled in the global notification pop-up window.

If for some reasons audio cannot be played on the device, the  button in the global notification pop-up window will permanently remain in the "mute" state and the message "Cannot support notification audio for this device." will be displayed upon hovering over the  button.

Sounds, including the default audio clips, are supported in MP3 format only.

The sounds of Zabbix frontend have been successfully tested in recent Firefox/Opera browsers on Linux and in Chrome, Firefox, Microsoft Edge, and Opera browsers on Windows.

**Attention:**

The auto play of sounds may be disabled in recent browser versions by default. In this case, you need to change this setting manually.

## 4 Global search

It is possible to search Zabbix frontend for hosts, host groups and templates.

The search input box is located below the Zabbix logo in the menu. The search can be started by pressing *Enter* or clicking on the

search icon.

If there is a host that contains the entered string in any part of the name, a dropdown will appear, listing all such hosts (with the matching part highlighted in orange). The dropdown will also list a host if that host's visible name is a match to the technical name entered as a search string; the matching host will be listed, but without any highlighting.

### Searchable attributes

Hosts can be searched by the following properties:

- Host name
- Visible name
- IP address
- DNS name

Host groups can be searched by name. Specifying a parent host group implicitly selects all nested host groups.

Templates can be searched by name or visible name. If you search by a name that is different from the visible name (of a template/host), in the search results it is displayed below the visible name in parentheses.

### Search results

Search results consist of three separate blocks for hosts, host groups and templates.

It is possible to collapse/expand each individual block. The entry count is displayed at the bottom of each block, for example, *Displaying 13 of 13 found*. Total entries displayed within one block are limited to 100.

Each entry provides links to monitoring and configuration data. See the [full list](#) of links.

For all configuration data (such as items, triggers, graphs) the amount of entities found is displayed by a number next to the entity name, in gray. **Note** that if there are zero entities, no number is displayed.

Enabled hosts are displayed in blue, disabled hosts in red.

## 5 Frontend maintenance mode

Overview

Zabbix web frontend can be temporarily disabled in order to prohibit access to it. This can be useful for protecting the Zabbix database from any changes initiated by users, thus protecting the integrity of database.

Zabbix database can be stopped and maintenance tasks can be performed while Zabbix frontend is in maintenance mode.

Users from defined IP addresses will be able to work with the frontend normally during maintenance mode.

Configuration

In order to enable maintenance mode, the `maintenance.inc.php` file (located in `/conf` of Zabbix HTML document directory on the web server) must be modified to uncomment the following lines:

```
// Maintenance mode.
define('ZBX_DENY_GUI_ACCESS', 1);

// Array of IP addresses, which are allowed to connect to frontend (optional).
$ZBX_GUI_ACCESS_IP_RANGE = array('127.0.0.1');

// Message shown on warning screen (optional).
$ZBX_GUI_ACCESS_MESSAGE = 'We are upgrading MySQL database till 15:00. Stay tuned...';
```

**Note:**

Mostly the `maintenance.inc.php` file is located in `/conf` of Zabbix HTML document directory on the web server. However, the location of the directory may differ depending on the operating system and a web server it uses.

For example, the location for:

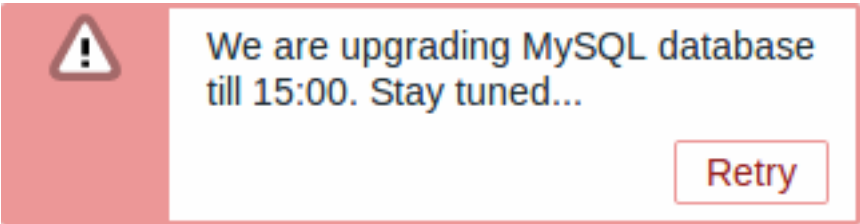

- SUSE and RedHat is `/etc/zabbix/web/maintenance.inc.php`.
- Debian-based systems is `/usr/share/zabbix/conf/`.

See also [Copying PHP files](#).

| Parameter                      | Details   |
|--------------------------------|---|
| <b>ZBX_DENY_GUI_ACCESS</b>     | Enable maintenance mode:<br>1 - maintenance mode is enabled, disabled otherwise   |
| <b>ZBX_GUI_ACCESS_IP_RANGE</b> | Array of IP addresses, which are allowed to connect to frontend (optional).<br>For example:<br><code>array('192.168.1.1', '192.168.1.2')</code> |
| <b>ZBX_GUI_ACCESS_MESSAGE</b>  | Message you can enter to inform users about the maintenance (optional).   |

Display

The following screen will be displayed when trying to access the Zabbix frontend while in maintenance mode. The screen is refreshed every 30 seconds in order to return to a normal state without user intervention when the maintenance is over.

IP addresses defined in `ZBX_GUI_ACCESS_IP_RANGE` will be able to access the frontend as always.

6 Page parameters

Overview

Most Zabbix web interface pages support various HTTP GET parameters that control what will be displayed. They may be passed by specifying `parameter=value` pairs after the URL, separated from the URL by a question mark (?) and from each other by ampersands (&).

Monitoring → Problems

The following parameters are supported:

- `show` - filter option "Show": 1 - recent problems, 2 - all, 3 - in problem state

- `name` - filter option "Problem": freeform string
- `severities` - filter option "Severity": array of selected severities in a format 'severities[\*]=\*' (replace \* with severity level): 0 - not classified, 1 - information, 2 - warning, 3 - average, 4 - high, 5 - disaster
- `inventory` - filter option "Host inventory": array of inventory fields: [field], [value]
- `evaltype` - filter option "Tags", tag filtering strategy: 0 - And/Or, 2 - Or
- `tags` - filter option "Tags": array of defined tags: [tag], [operator], [value]
- `show_tags` - filter option "Show tags": 0 - none, 1 - one, 2 - two, 3 - three
- `tag_name_format` - filter option "Tag name": 0 - full name, 1 - shortened, 2 - none
- `tag_priority` - filter option "Tag display priority": comma-separated string of tag display priority
- `show_suppressed` - filter option "Show suppressed problems": should be 'show\_suppressed=1' to show
- `unacknowledged` - filter option "Show unacknowledged only": should be 'unacknowledged=1' to show
- `compact_view` - filter option "Compact view": should be 'compact\_view=1' to show
- `highlight_row` - filter option "Highlight whole row" (use problem color as background color for every problem row): should be '1' to highlight; can be set only when 'compact\_view' is set
- `filter_name` - filter properties option "Name": freeform string
- `filter_show_counter` - filter properties option "Show number of records": 1 - show, 0 - do not show
- `filter_custom_time` - filter properties option "Set custom time period": 1 - set, 0 - do not set
- `sort` - sort column: clock, host, severity, name
- `sortorder` - sort order or results: DESC - descending, ASC - ascending
- `age_state` - filter option "Age less than": should be 'age\_state=1' to enable 'age'. Is used only when 'show' equals 3.
- `age` - filter option "Age less than": days
- `groupids` - filter option "Host groups": array of host groups IDs
- `hostids` - filter option "Hosts": array of host IDs
- `triggerids` - filter option "Triggers": array of trigger IDs
- `show_timeline` - filter option "Show timeline": should be 'show\_timeline=1' to show
- `details` - filter option "Show details": should be 'details=1' to show
- `from` - date range start, can be 'relative' (e.g.: now-1m). Is used only when 'filter\_custom\_time' equals 1.
- `to` - date range end, can be 'relative' (e.g.: now-1m). Is used only when 'filter\_custom\_time' equals 1.

#### Kiosk mode

The kiosk mode in supported frontend pages can be activated using URL parameters. For example, in dashboards:

- `/zabbix.php?action=dashboard.view&kiosk=1` - activate kiosk mode
- `/zabbix.php?action=dashboard.view&kiosk=0` - activate normal mode

#### Slideshow

It is possible to activate a slideshow in the dashboard:

- `/zabbix.php?action=dashboard.view&slideshow=1` - activate slideshow

## 7 Definitions

### Overview

While many things in the frontend can be configured using the frontend itself, some customisations are currently only possible by editing a definitions file.

This file is `defines.inc.php` located in `/include` of the Zabbix HTML document directory.

### Parameters

Parameters in this file that could be of interest to users:

- `ZBX_MIN_PERIOD`

Minimum graph period, in seconds. One minute by default.

- `GRAPH_YAXIS_SIDE_DEFAULT`

Default location of Y axis in simple graphs and default value for drop down box when adding items to custom graphs. Possible values: 0 - left, 1 - right.

Default: 0

- `ZBX_SESSION_NAME` (available since 4.0.0)

String used as the name of the Zabbix frontend session cookie.

Default: `zbx_sessionid`

- `ZBX_DATA_CACHE_TTL` (available since 5.2.0)

TTL timeout in seconds used to invalidate data cache of **Vault response**. Set 0 to disable Vault response caching.

Default: 60

- `SUBFILTER_VALUES_PER_GROUP` (available since 6.0.5)

Number of subfilter values per group (For example, in the **latest data** subfilter).

Default: 1000

## 8 Creating your own theme

### Overview

By default, Zabbix provides a number of predefined themes. You may follow the step-by-step procedure provided here in order to create your own. Feel free to share the result of your work with Zabbix community if you created something nice.

#### Step 1

To define your own theme you'll need to create a CSS file and save it in the `assets/styles/` folder (for example, *custom-theme.css*). You can either copy the files from a different theme and create your theme based on it or start from scratch.

#### Step 2

Add your theme to the list of themes returned by the `APP::getThemes()` method. You can do this by overriding the `ZBase::getThemes()` method in the `APP` class. This can be done by adding the following code before the closing brace in `include/classes/core/APP.php`:

```
public static function getThemes() {
    return array_merge(parent::getThemes(), [
        'custom-theme' => _('Custom theme')
    ]);
}
```

#### Attention:

Note that the name you specify within the first pair of quotes must match the name of the theme file without extension.

To add multiple themes, just list them under the first theme, for example:

```
public static function getThemes() {
    return array_merge(parent::getThemes(), [
        'custom-theme' => _('Custom theme'),
        'anothertheme' => _('Another theme'),
        'onemoretheme' => _('One more theme')
    ]);
}
```

Note that every theme except the last one must have a trailing comma.

#### Note:

To change graph colors, the entry must be added in the *graph\_theme* database table.

#### Step 3

Activate the new theme.

In Zabbix frontend, you may either set this theme to be the default one or change your theme in the user profile.

Enjoy the new look and feel!

9 Debug mode

Overview

Debug mode may be used to diagnose performance problems with frontend pages.

Configuration

Debug mode can be activated for individual users who belong to a user group:

- when configuring a **user group**;
- when viewing configured **user groups**.

When *Debug mode* is enabled for a user group, its users will see a *Debug* button in the lower right corner of the browser window:

Clicking on the *Debug* button opens a new window below the page contents which contains the SQL statistics of the page, along with a list of API calls and individual SQL statements:

```
***** Script profiler *****
Total time: 0.249825
Total SQL time: 0.139814
SQL count: 143 (selects: 117 | executes: 26)
Peak memory usage: 6M
Memory limit: 128M

1. hostgroup.get [latest.php:124]

Parameters:      Result:
Array            Array
(
  [output] => Array (
    [0] => groupid
  )
  [4] => Array (
    [groupid] => 4
  )
)
```

Hide debug

In case of performance problems with the page, this window may be used to search for the root cause of the problem.

**Warning:**  
Enabled *Debug mode* negatively affects frontend performance.

10 Cookies used by Zabbix

Overview

This page provides a list of cookies used by Zabbix.

| Name            | Description  | Values | Expires/Max-Age                                  | HttpOnly <sup>1</sup> | Secure <sup>2</sup>                          |
|-----------------|--|--------|--|-----------------------|--|
| ZBX_SESSIONNAME | Zabbix frontend session data, stored as JSON encoded by base64 |        | Session (expires when the browsing session ends) | +                     | + (only if HTTPS is enabled on a web server) |

| Name                 | Description   | Values             | Expires/Max-Age   | HttpOnly <sup>1</sup> | Secure <sup>2</sup> |
|----------------------|---|--------------------|---|-----------------------|---------------------|
| tab                  | Active tab number; this cookie is only used on pages with multiple tabs (e.g. <i>Host</i> , <i>Trigger</i> or <i>Action</i> configuration page) and is created, when a user navigates from a primary tab to another tab (such as <i>Tags</i> or <i>Dependencies</i> tab). | Example:<br>1      | Session (expires when the browsing session ends)                                | -                     | -                   |
| browserwarningignore | Whether a warning about using an outdated browser should be ignored.  | yes                | Session (expires when the browsing session ends)                                | -                     | -                   |
| system-message-ok    | A message to show as soon as page is reloaded.  | Plain text message | Session (expires when the browsing session ends) or as soon as page is reloaded | +                     | -                   |
| system-message-error | An error message to show as soon as page is reloaded.   | Plain text message | Session (expires when the browsing session ends) or as soon as page is reloaded | +                     | -                   |

**Note:**

Forcing 'HttpOnly' flag on Zabbix cookies by a webserver directive is not supported.

Footnotes

<sup>1</sup> When HttpOnly is 'true' the cookie will be made accessible only through the HTTP protocol. This means that the cookie won't be accessible by scripting languages, such as JavaScript. This setting can effectively help to reduce identity theft through XSS attacks (although it is not supported by all browsers).

<sup>2</sup> Secure indicates that the cookie should only be transmitted over a secure HTTPS connection from the client. When set to 'true', the cookie will only be set if a secure connection exists.

## 11 Time zones

### Overview

The frontend time zone can be set globally in the frontend and adjusted for individual users.

If *System* is selected, the web server time zone will be used for the frontend (including the value of 'date.timezone' of php.ini, if set), while Zabbix server will use the time zone of the machine it is running on.

#### Note:

Zabbix server will only use the specified global/user time zone when expanding macros in notifications (e.g. {EVENT.TIME} can expand to a different time zone per user) and for the time limit when notifications are sent (see "When active" setting in user [media configuration](#)).

## Configuration

The global time zone:

- can be set manually when [installing](#) the frontend
- can be modified in *Administration* → *General* → *GUI*

User-level time zone:

- can be set when [configuring/updating](#) a user
- can be set by each user in their [user profile](#)

**See also:** Aligning time zones when using [scheduling intervals](#).

## 12 Resetting password

**Overview** This section describes the steps for resetting user passwords in Zabbix.

**Steps** Turn to your Zabbix administrator if you have forgotten your Zabbix password and cannot log in.

A Super administrator user can change passwords for all users in the user [configuration form](#).

If a Super administrator has forgotten their password and cannot log in, the following SQL query must be run to apply the default password to the Super admin user (replace 'Admin' with the appropriate Super admin username):

```
UPDATE users SET passwd = '$2a$10$ZXIvHAEP2ZM.dLXTm6uPHOMVlARXX7cqjbhM6Fn0cANzkCQBWpMrS' WHERE username =
```

After running this query, the user password will be set to *zabbix*. Make sure to change the default password on the first login.

## 19 API

**Overview** Zabbix API allows you to programmatically retrieve and modify the configuration of Zabbix and provides access to historical data. It is widely used to:

- Create new applications to work with Zabbix;
- Integrate Zabbix with third-party software;
- Automate routine tasks.

The Zabbix API is a web based API and is shipped as part of the web frontend. It uses the JSON-RPC 2.0 protocol which means two things:

- The API consists of a set of separate methods;
- Requests and responses between the clients and the API are encoded using the JSON format.

More info about the protocol and JSON can be found in the [JSON-RPC 2.0 specification](#) and the [JSON format homepage](#).

For more information about integrating Zabbix functionality into your Python applications, see the [zabbix\\_utils](#) Python library for Zabbix API.

**Structure** The API consists of a number of methods that are nominally grouped into separate APIs. Each of the methods performs one specific task. For example, the `host.create` method belongs to the `host` API and is used to create new hosts. Historically, APIs are sometimes referred to as "classes".

**Note:**

Most APIs contain at least four methods: `get`, `create`, `update` and `delete` for retrieving, creating, updating and deleting data respectively, but some of the APIs may provide a totally different set of methods.

**Performing requests** Once you've set up the frontend, you can use remote HTTP requests to call the API. To do that you need to send HTTP POST requests to the `api_jsonrpc.php` file located in the frontend directory. For example, if your Zabbix frontend is installed under `http://example.com/zabbix`, the HTTP request to call the `apiinfo.version` method may look like this:

```
POST http://example.com/zabbix/api_jsonrpc.php HTTP/1.1
Content-Type: application/json-rpc
```

```
{
  "jsonrpc": "2.0",
  "method": "apiinfo.version",
  "id": 1,
  "auth": null,
  "params": {}
}
```

The request must have the `Content-Type` header set to one of these values: `application/json-rpc`, `application/json` or `application/jsonrequest`.

**Example workflow** The following section will walk you through some usage examples in more detail.

**Authentication** To access any data in Zabbix, you need to either:

- use an existing **API token** (created in Zabbix frontend or using the **Token API**);
- use an authentication token obtained with the **user.login** method.

For example, if you wanted to obtain a new authentication token by logging in as a standard *Admin* user, then a JSON request would look like this:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "username": "Admin",
    "password": "zabbix"
  },
  "id": 1,
```

```
    "auth": null
}
```

Let's take a closer look at the request object. It has the following properties:

- `jsonrpc` - the version of the JSON-RPC protocol used by the API; the Zabbix API implements JSON-RPC version 2.0;
- `method` - the API method being called;
- `params` - parameters that will be passed to the API method;
- `id` - an arbitrary identifier of the request;
- `auth` - a user authentication token; since we don't have one yet, it's set to `null`.

If you provided the credentials correctly, the response returned by the API will contain the user authentication token:

```
{
  "jsonrpc": "2.0",
  "result": "0424bd59b807674191e7d77572075f33",
  "id": 1
}
```

The response object in turn contains the following properties:

- `jsonrpc` - again, the version of the JSON-RPC protocol;
- `result` - the data returned by the method;
- `id` - identifier of the corresponding request.

**Retrieving hosts** We now have a valid user authentication token that can be used to access the data in Zabbix. For example, let's use the `host.get` method to retrieve the IDs, host names and interfaces of all configured **hosts**:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": [
      "hostid",
      "host"
    ],
    "selectInterfaces": [
      "interfaceid",
      "ip"
    ]
  },
  "id": 2,
  "auth": "0424bd59b807674191e7d77572075f33"
}
```

**Attention:**

Note that the `auth` property is now set to the authentication token we've obtained by calling `user.login`.

The response object will contain the requested data about the hosts:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "host": "Zabbix server",
      "interfaces": [
        {
          "interfaceid": "1",
          "ip": "127.0.0.1"
        }
      ]
    }
  ],
  "id": 2
}
```

**Note:**

For performance reasons we recommend to always list the object properties you want to retrieve and avoid retrieving everything.

**Creating a new item** Let's create a new **item** on "Zabbix server" using the data we've obtained from the previous `host.get` request. This can be done by using the `item.create` method:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Free disk space on /home/joe/",
    "key_": "vfs.fs.size[/home/joe/,free]",
    "hostid": "10084",
    "type": 0,
    "value_type": 3,
    "interfaceid": "1",
    "delay": 30
  },
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 3
}
```

A successful response will contain the ID of the newly created item, which can be used to reference the item in the following requests:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "24759"
    ]
  },
  "id": 3
}
```

**Note:**

The `item.create` method as well as other create methods can also accept arrays of objects and create multiple items with one API call.

**Creating multiple triggers** So if create methods accept arrays, we can add multiple **triggers** like so:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.create",
  "params": [
    {
      "description": "Processor load is too high on {HOST.NAME}",
      "expression": "last(/Linux server/system.cpu.load[percpu,avg1])>5",
    },
    {
      "description": "Too many processes on {HOST.NAME}",
      "expression": "avg(/Linux server/proc.num[],5m)>300",
    }
  ],
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 4
}
```

A successful response will contain the IDs of the newly created triggers:

```
{
  "jsonrpc": "2.0",
```

```

    "result": {
      "triggerids": [
        "17369",
        "17370"
      ]
    },
    "id": 4
  }
}

```

**Updating an item** Enable an item, that is, set its status to "0":

```

{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "10092",
    "status": 0
  },
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 5
}

```

A successful response will contain the ID of the updated item:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10092"
    ]
  },
  "id": 5
}

```

**Note:**

The `item.update` method as well as other update methods can also accept arrays of objects and update multiple items with one API call.

**Updating multiple triggers** Enable multiple triggers, that is, set their status to 0:

```

{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": [
    {
      "triggerid": "13938",
      "status": 0
    },
    {
      "triggerid": "13939",
      "status": 0
    }
  ],
  "auth": "0424bd59b807674191e7d77572075f33",
  "id": 6
}

```

A successful response will contain the IDs of the updated triggers:

```

{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938",

```

```

    "13939"
  ],
  },
  "id": 6
}

```

**Note:**

This is the preferred method of updating. Some API methods like `host.massupdate` allow to write more simple code, but it's not recommended to use those methods, since they will be removed in the future releases.

**Error handling** Up to that point everything we've tried has worked fine. But what happens if we try to make an incorrect call to the API? Let's try to create another host by calling `host.create` but omitting the mandatory `groups` parameter.

```

{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "Linux server",
    "interfaces": [
      {
        "type": 1,
        "main": 1,
        "useip": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050"
      }
    ]
  },
  "id": 7,
  "auth": "0424bd59b807674191e7d77572075f33"
}

```

The response will then contain an error message:

```

{
  "jsonrpc": "2.0",
  "error": {
    "code": -32602,
    "message": "Invalid params.",
    "data": "No groups for host \"Linux server\"."
  },
  "id": 7
}

```

If an error occurred, instead of the `result` property, the response object will contain an `error` property with the following data:

- `code` - an error code;
- `message` - a short error summary;
- `data` - a more detailed error message.

Errors can occur in different cases, such as, using incorrect input values, a session timeout or trying to access unexisting objects. Your application should be able to gracefully handle these kinds of errors.

**API versions** To simplify API versioning, since Zabbix 2.0.4, the version of the API matches the version of Zabbix itself. You can use the `apiinfo.version` method to find out the version of the API you're working with. This can be useful for adjusting your application to use version-specific features.

We guarantee feature backward compatibility inside of a major version. When making backward incompatible changes between major releases, we usually leave the old features as deprecated in the next release, and only remove them in the release after that. Occasionally, we may remove features between major releases without providing any backward compatibility. It is important that you never rely on any deprecated features and migrate to newer alternatives as soon as possible.

**Note:**

You can follow all of the changes made to the API in the [API changelog](#).

**Further reading** You now know enough to start working with the Zabbix API, but don't stop here. For further reading we suggest you have a look at the [list of available APIs](#).

**Method reference**

This section provides an overview of the functions provided by the Zabbix API and will help you find your way around the available classes and methods.

**Monitoring** The Zabbix API allows you to access history and other data gathered during monitoring.

High availability cluster

Retrieve a list of server nodes and their status.

[High availability cluster API](#)

History

Retrieve historical values gathered by Zabbix monitoring processes for presentation or further processing.

[History API](#)

Trends

Retrieve trend values calculated by Zabbix server for presentation or further processing.

[Trend API](#)

Events

Retrieve events generated by triggers, network discovery and other Zabbix systems for more flexible situation management or third-party tool integration.

[Event API](#)

Problems

Retrieve problems according to the given parameters.

[Problem API](#)

Service monitoring

Create a hierarchy representation of monitored IT infrastructure/business services data.

[Service API](#)

Service Level Agreement

Define Service Level Objectives (SLO), retrieve detailed Service Level Indicators (SLI) information about service performance.

[SLA API](#)

Tasks

Interact with Zabbix server task manager, creating tasks and retrieving response.

[Task API](#)

**Configuration** The Zabbix API allows you to manage the configuration of your monitoring system.

Hosts and host groups

Manage host groups, hosts and everything related to them, including host interfaces, host macros and maintenance periods.

[Host API](#) | [Host group API](#) | [Host interface API](#) | [User macro API](#) | [Value map API](#) | [Maintenance API](#)

Items

Define items to monitor.

## Item API

### Triggers

Configure triggers to notify you about problems in your system. Manage trigger dependencies.

## Trigger API

### Graphs

Edit graphs or separate graph items for better presentation of the gathered data.

## Graph API | Graph item API

### Templates

Manage templates and link them to hosts or other templates.

## Template API | Value map API

### Export and import

Export and import Zabbix configuration data for configuration backups, migration or large-scale configuration updates.

## Configuration API

### Low-level discovery

Configure low-level discovery rules as well as item, trigger and graph prototypes to monitor dynamic entities.

## LLD rule API | Item prototype API | Trigger prototype API | Graph prototype API | Host prototype API

### Event correlation

Create custom event correlation rules.

## Correlation API

### Actions and alerts

Define actions and operations to notify users about certain events or automatically execute remote commands. Gain access to information about generated alerts and their receivers.

## Action API | Alert API

### Services

Manage services for service-level monitoring and retrieve detailed SLA information about any service.

## Service API

### Dashboards

Manage dashboards and make scheduled reports based on them.

## Dashboard API | Template dashboard API | Report API

### Maps

Configure maps to create detailed dynamic representations of your IT infrastructure.

## Map API

### Web monitoring

Configure web scenarios to monitor your web applications and services.

## Web scenario API

### Network discovery

Manage network-level discovery rules to automatically find and monitor new hosts. Gain full access to information about discovered services and hosts.

## Discovery rule API | Discovery check API | Discovered host API | Discovered service API

**Administration** With the Zabbix API you can change administration settings of your monitoring system.

#### Users

Add users that will have access to Zabbix, assign them to user groups and grant permissions. Make roles for granular management of user rights. Track configuration changes each user has done. Configure media types and multiple ways users will receive alerts.

[User API](#) | [User group API](#) | [User role API](#) | [Media type API](#) | [Audit log API](#)

## Action

This class is designed to work with actions.

Object references:

- [Action](#)
- [Action condition](#)
- [Action operation](#)

Available methods:

- [action.create](#) - create new actions
- [action.delete](#) - delete actions
- [action.get](#) - retrieve actions
- [action.update](#) - update actions

### > Action object

The following objects are directly related to the `action` API.

#### Action

The action object has the following properties.

| Property                         | Type    | Description  |
|----------------------------------|---------|--|
| actionid                         | string  | ( <i>readonly</i> ) ID of the action.  |
| <b>esc_period</b><br>(required)  | string  | Default operation step duration. Must be at least 60 seconds. Accepts seconds, time unit with suffix and user macro.   |
| <b>eventsource</b><br>(required) | integer | Note that escalations are supported only for trigger, internal and service actions, and only in normal operations.<br>( <i>constant</i> ) Type of events that the action will handle.                            |
| <b>name</b><br>(required)        | string  | Refer to the <b>event "source" property</b> for a list of supported event types.<br>Name of the action.  |
| status                           | integer | Whether the action is enabled or disabled.   |
| pause_suppressed                 | integer | Possible values:<br>0 - ( <i>default</i> ) enabled;<br>1 - disabled.<br>Whether to pause escalation during maintenance periods or not.   |
| notify_if_canceled               | integer | Possible values:<br>0 - Don't pause escalation;<br>1 - ( <i>default</i> ) Pause escalation.<br><br>Note that this parameter is valid for trigger actions only.<br>Whether to notify when escalation is canceled. |
|                                  |         | Possible values:<br>0 - Don't notify when escalation is canceled;<br>1 - ( <i>default</i> ) Notify when escalation is canceled.<br><br>Note that this parameter is valid for trigger actions only.               |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Action operation

The action operation object defines an operation that will be performed when an action is executed. It has the following properties.

| Property                           | Type    | Description   |
|------------------------------------|---------|---|
| operationid                        | string  | ( <i>readonly</i> ) ID of the action operation.   |
| <b>operationtype</b><br>(required) | integer | Type of operation.<br><br>Possible values:<br>0 - send message;<br>1 - global script;<br>2 - add host;<br>3 - remove host;<br>4 - add to host group;<br>5 - remove from host group;<br>6 - link to template;<br>7 - unlink from template;<br>8 - enable host;<br>9 - disable host;<br>10 - set host inventory mode. |
| actionid                           | string  | Note that only types '0' and '1' are supported for trigger and service actions, only '0' is supported for internal actions. All types are supported for discovery and autoregistration actions.<br>( <i>readonly</i> ) ID of the action that the operation belongs to.  |

| Property      | Type    | Description   |
|---------------|---------|---|
| esc_period    | string  | <p>Duration of an escalation step in seconds. Must be greater than 60 seconds. Accepts seconds, time unit with suffix and user macro. If set to 0 or 0s, the default action escalation period will be used.</p> <p>Default: 0s.</p>   |
| esc_step_from | integer | <p>Note that escalations are supported only for trigger, internal and service actions, and only in normal operations.</p> <p>Step to start escalation from.</p> <p>Default: 1.</p>  |
| esc_step_to   | integer | <p>Note that escalations are supported only for trigger, internal and service actions, and only in normal operations.</p> <p>Step to end escalation at.</p> <p>Default: 1.</p>  |
| evaltype      | integer | <p>Note that escalations are supported only for trigger, internal and service actions, and only in normal operations.</p> <p>Operation condition evaluation method.</p> <p>Possible values:<br/> 0 - (default) AND / OR;<br/> 1 - AND;<br/> 2 - OR.</p>   |
| opcommand     | object  | <p>Object containing data on global script run by the operation.</p> <p>Each object has one following property: <code>scriptid</code> - (string) ID of the script.</p>  |
| opcommand_grp | array   | <p>Required for global script operations.</p> <p>Host groups to run global scripts on.</p> <p>Each object has the following properties:<br/> <code>opcommand_grpid</code> - (string, readonly) ID of the object;<br/> <code>operationid</code> - (string, readonly) ID of the operation;<br/> <code>groupid</code> - (string) ID of the host group.</p>   |
| opcommand_hst | array   | <p>Required for global script operations if <code>opcommand_hst</code> is not set.</p> <p>Host to run global scripts on.</p> <p>Each object has the following properties:<br/> <code>opcommand_hstid</code> - (string, readonly) ID of the object;<br/> <code>operationid</code> - (string, readonly) ID of the operation;<br/> <code>hostid</code> - (string) ID of the host; if set to 0 the command will be run on the current host.</p> |
| opconditions  | array   | <p>Required for global script operations if <code>opcommand_grp</code> is not set.</p> <p>Operation conditions used for trigger actions.</p>  |
| opgroup       | array   | <p>The operation condition object is <a href="#">described in detail below</a>.</p> <p>Host groups to add hosts to.</p> <p>Each object has the following properties:<br/> <code>operationid</code> - (string, readonly) ID of the operation;<br/> <code>groupid</code> - (string) ID of the host group.</p> <p>Required for "add to host group" and "remove from host group" operations.</p>  |

| Property      | Type   | Description   |
|---------------|--------|---|
| opmessage     | object | Object containing the data about the message sent by the operation.<br><br>The operation message object is <a href="#">described in detail below</a> .  |
| opmessage_grp | array  | Required for message operations.<br>User groups to send messages to.<br><br>Each object has the following properties:<br>operationid - ( <i>string, readonly</i> ) ID of the operation;<br>usrgrpuid - ( <i>string</i> ) ID of the user group.  |
| opmessage_usr | array  | Required for message operations if opmessage_usr is not set.<br>Users to send messages to.<br><br>Each object has the following properties:<br>operationid - ( <i>string, readonly</i> ) ID of the operation;<br>userid - ( <i>string</i> ) ID of the user.   |
| optemplate    | array  | Required for message operations if opmessage_grp is not set.<br>Templates to link the hosts to.<br><br>Each object has the following properties:<br>operationid - ( <i>string, readonly</i> ) ID of the operation;<br>templateid - ( <i>string</i> ) ID of the template.  |
| opinventory   | object | Required for "link to template" and "unlink from template" operations.<br>Inventory mode set host to.<br><br>Object has the following properties:<br>operationid - ( <i>string, readonly</i> ) ID of the operation;<br>inventory_mode - ( <i>string</i> ) Inventory mode.<br><br>Required for "Set host inventory mode" operations. |

#### Action operation message

The operation message object contains data about the message that will be sent by the operation.

| Property    | Type    | Description   |
|-------------|---------|---|
| default_msg | integer | Whether to use the default action message text and subject.<br><br>Possible values:<br>0 - use the data from the operation;<br>1 - ( <i>default</i> ) use the data from the media type. |
| mediatypeid | string  | ID of the media type that will be used to send the message.   |
| message     | string  | Operation message text.   |
| subject     | string  | Operation message subject.  |

#### Action operation condition

The action operation condition object defines a condition that must be met to perform the current operation. It has the following properties.

| Property                           | Type    | Description  |
|------------------------------------|---------|--|
| opconditionid                      | string  | ( <i>readonly</i> ) ID of the action operation condition               |
| <b>conditiontype</b><br>(required) | integer | Type of condition.<br><br>Possible values:<br>14 - event acknowledged. |

| Property                   | Type    | Description  |
|----------------------------|---------|--|
| <b>value</b><br>(required) | string  | Value to compare with.   |
| operationid                | string  | ( <i>readonly</i> ) ID of the operation.                                 |
| operator                   | integer | Condition operator.<br><br>Possible values:<br>0 - ( <i>default</i> ) =. |

The following operators and values are supported for each operation condition type.

| Condition | Condition name     | Supported operators | Expected value   |
|-----------|--------------------|---------------------|--|
| 14        | Event acknowledged | =                   | Whether the event is acknowledged.<br><br>Possible values:<br>0 - not acknowledged;<br>1 - acknowledged. |

#### Action recovery operation

The action recovery operation object defines an operation that will be performed when a problem is resolved. Recovery operations are possible for trigger, internal and service actions. It has the following properties.

| Property                           | Type    | Description  |
|------------------------------------|---------|--|
| operationid                        | string  | ( <i>readonly</i> ) ID of the action operation.  |
| <b>operationtype</b><br>(required) | integer | Type of operation.<br><br>Possible values for trigger and service actions:<br>0 - send message;<br>1 - global script;<br>11 - notify all involved.<br><br>Possible values for internal actions:<br>0 - send message;<br>11 - notify all involved.  |
| actionid                           | string  | ( <i>readonly</i> ) ID of the action that the recovery operation belongs to.   |
| opcommand                          | object  | Object containing data on global action type script run by the operation.<br><br>Each object has one following property: <i>scriptid</i> - ( <i>string</i> ) ID of the action type script.   |
| opcommand_grp                      | array   | Required for global script operations.<br>Host groups to run global scripts on.<br><br>Each object has the following properties:<br><i>opcommand_grpid</i> - ( <i>string, readonly</i> ) ID of the object;<br><i>operationid</i> - ( <i>string, readonly</i> ) ID of the operation;<br><i>groupid</i> - ( <i>string</i> ) ID of the host group.<br><br>Required for global script operations if <i>opcommand_hst</i> is not set. |

| Property      | Type   | Description   |
|---------------|--------|---|
| opcommand_hst | array  | Host to run global scripts on.<br><br>Each object has the following properties:<br>opcommand_hstid - <i>(string, readonly)</i> ID of the object;<br>operationid - <i>(string, readonly)</i> ID of the operation;<br>hostid - <i>(string)</i> ID of the host; if set to 0 the command will be run on the current host.       |
| opmessage     | object | Required for global script operations if opcommand_grp is not set.<br>Object containing the data about the message sent by the recovery operation.<br><br>The operation message object is <b>described in detail above</b> .  |
| opmessage_grp | array  | Required for message operations.<br>User groups to send messages to.<br><br>Each object has the following properties:<br>operationid - <i>(string, readonly)</i> ID of the operation;<br>usrgrp - <i>(string)</i> ID of the user group.   |
| opmessage_usr | array  | Required for message operations if opmessage_usr is not set.<br>Users to send messages to.<br><br>Each object has the following properties:<br>operationid - <i>(string, readonly)</i> ID of the operation;<br>userid - <i>(string)</i> ID of the user.<br><br>Required for message operations if opmessage_grp is not set. |

#### Action update operation

The action update operation object defines an operation that will be performed when a problem is updated (commented upon, acknowledged, severity changed, or manually closed). Update operations are possible for trigger and service actions. It has the following properties.

| Property                           | Type    | Description   |
|------------------------------------|---------|---|
| operationid                        | string  | <i>(readonly)</i> ID of the action operation.   |
| <b>operationtype</b><br>(required) | integer | Type of operation.<br><br>Possible values for trigger and service actions:<br>0 - send message;<br>1 - global script;<br>12 - notify all involved.  |
| opcommand                          | object  | Object containing data on global action type script run by the operation.<br><br>Each object has one following property: scriptid - <i>(string)</i> ID of the action type script.   |
| opcommand_grp                      | array   | Required for global script operations.<br>Host groups to run global scripts on.<br><br>Each object has the following properties:<br>groupid - <i>(string)</i> ID of the host group.<br><br>Required for global script operations if opcommand_hst is not set. |

| Property      | Type   | Description   |
|---------------|--------|---|
| opcommand_hst | array  | Host to run global scripts on.<br><br>Each object has the following properties:<br>hostid - <i>(string)</i> ID of the host; if set to 0 the command will be run on the current host.  |
| opmessage     | object | Required for global script operations if opcommand_grp is not set. Object containing the data about the message sent by the update operation.   |
| opmessage_grp | array  | The operation message object is <b>described in detail above</b> .<br>User groups to send messages to.<br><br>Each object has the following properties:<br>usrgrp_id - <i>(string)</i> ID of the user group.  |
| opmessage_usr | array  | Required only for send message operations if opmessage_usr is not set.<br>Is ignored for send update message operations.<br>Users to send messages to.<br><br>Each object has the following properties:<br>userid - <i>(string)</i> ID of the user.<br><br>Required only for send message operations if opmessage_grp is not set.<br>Is ignored for send update message operations. |

#### Action filter

The action filter object defines a set of conditions that must be met to perform the configured action operations. It has the following properties.

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>conditions</b><br>(required) | array   | Set of filter conditions to use for filtering results.   |
| <b>evaltype</b><br>(required)   | integer | Filter condition evaluation method.<br><br>Possible values:<br>0 - and/or;<br>1 - and;<br>2 - or;<br>3 - custom expression.  |
| eval_formula                    | string  | <i>(readonly)</i> Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its formulaid. The value of eval_formula is equal to the value of formula for filters with a custom expression.  |
| formula                         | string  | User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its formulaid. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted.<br><br>Required for custom expression filters. |

#### Action filter condition

The action filter condition object defines a specific condition that must be checked before running the action operations.

| Property                           | Type    | Description  |
|------------------------------------|---------|--|
| conditionid                        | string  | ( <i>readonly</i> ) ID of the action condition.  |
| <b>conditiontype</b><br>(required) | integer | Type of condition.<br><br>Possible values for trigger actions:<br>0 - host group;<br>1 - host;<br>2 - trigger;<br>3 - event name;<br>4 - trigger severity;<br>6 - time period;<br>13 - host template;<br>16 - problem is suppressed;<br>25 - event tag;<br>26 - event tag value.<br><br>Possible values for discovery actions:<br>7 - host IP;<br>8 - discovered service type;<br>9 - discovered service port;<br>10 - discovery status;<br>11 - uptime or downtime duration;<br>12 - received value;<br>18 - discovery rule;<br>19 - discovery check;<br>20 - proxy;<br>21 - discovery object.<br><br>Possible values for autoregistration actions:<br>20 - proxy;<br>22 - host name;<br>24 - host metadata.<br><br>Possible values for internal actions:<br>0 - host group;<br>1 - host;<br>13 - host template;<br>23 - event type;<br>25 - event tag;<br>26 - event tag value.<br><br>Possible values for service actions:<br>25 - event tag;<br>26 - event tag value;<br>27 - service;<br>28 - service name. |
| <b>value</b><br>(required)         | string  | Value to compare with.   |
| value2                             | string  | Secondary value to compare with. Required for trigger, internal and service actions when condition type is 26.   |
| actionid                           | string  | ( <i>readonly</i> ) ID of the action that the condition belongs to.  |
| formulaid                          | string  | Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.   |

| Property | Type    | Description  |
|----------|---------|--|
| operator | integer | Condition operator.<br><br>Possible values:<br>0 - (default) equals;<br>1 - does not equal;<br>2 - contains;<br>3 - does not contain;<br>4 - in;<br>5 - is greater than or equals;<br>6 - is less than or equals;<br>7 - not in;<br>8 - matches;<br>9 - does not match;<br>10 - Yes;<br>11 - No. |

**Note:**

To better understand how to use filters with various types of expressions, see examples on the [action.get](#) and [action.create](#) method pages.

The following operators and values are supported for each condition type.

| Condition | Condition name          | Supported operators  | Expected value  |
|-----------|-------------------------|--|---|
| 0         | Host group              | equals,<br>does not equal  | Host group ID.  |
| 1         | Host                    | equals,<br>does not equal  | Host ID.  |
| 2         | Trigger                 | equals,<br>does not equal  | Trigger ID.   |
| 3         | Event name              | contains,<br>does not contain  | Event name.   |
| 4         | Trigger severity        | equals,<br>does not equal,<br>is greater than or<br>equals,<br>is less than or<br>equals | Trigger severity. Refer to the <a href="#">trigger "severity" property</a> for a list of supported trigger severities.  |
| 5         | Trigger value           | equals   | Trigger value. Refer to the <a href="#">trigger "value" property</a> for a list of supported trigger values.  |
| 6         | Time period             | in, not in   | Time when the event was triggered as a <a href="#">time period</a> .  |
| 7         | Host IP                 | equals,<br>does not equal  | One or several IP ranges to check separated by commas.<br>Refer to the <a href="#">network discovery configuration</a> section for more information on supported formats of IP ranges.                          |
| 8         | Discovered service type | equals,<br>does not equal  | Type of discovered service. The type of service matches the type of the discovery check used to detect the service. Refer to the <a href="#">discovery check "type" property</a> for a list of supported types. |
| 9         | Discovered service port | equals,<br>does not equal  | One or several port ranges separated by commas.   |
| 10        | Discovery status        | equals   | Status of a discovered object.<br><br>Possible values:<br>0 - host or service up;<br>1 - host or service down;<br>2 - host or service discovered;<br>3 - host or service lost.                                  |

| Condition | Condition name              | Supported operators  | Expected value  |
|-----------|-----------------------------|--|---|
| 11        | Uptime or downtime duration | is greater than or equals,<br>is less than or equals   | Time indicating how long has the discovered object been in the current status in seconds.   |
| 12        | Received values             | equals,<br>does not equal,<br>is greater than or equals,<br>is less than or equals,<br>contains,<br>does not contain | Value returned when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check.  |
| 13        | Host template               | equals,<br>does not equal  | Linked template ID.   |
| 16        | Problem is suppressed       | Yes, No  | No value required: using the "Yes" operator means that problem must be suppressed, "No" - not suppressed.   |
| 18        | Discovery rule              | equals,<br>does not equal  | ID of the discovery rule.   |
| 19        | Discovery check             | equals,<br>does not equal  | ID of the discovery check.  |
| 20        | Proxy                       | equals,<br>does not equal  | ID of the proxy.  |
| 21        | Discovery object            | equals   | Type of object that triggered the discovery event.<br><br>Possible values:<br>1 - discovered host;<br>2 - discovered service.   |
| 22        | Host name                   | contains,<br>does not contain,<br>matches,<br>does not match   | Host name.<br>Using a regular expression is supported for operators <i>matches</i> and <i>does not match</i> in autoregistration conditions.  |
| 23        | Event type                  | equals   | Specific internal event.<br><br>Possible values:<br>0 - item in "not supported" state;<br>1 - item in "normal" state;<br>2 - LLD rule in "not supported" state;<br>3 - LLD rule in "normal" state;<br>4 - trigger in "unknown" state;<br>5 - trigger in "normal" state. |
| 24        | Host metadata               | contains,<br>does not contain,<br>matches,<br>does not match   | Metadata of the auto-registered host.<br>Using a regular expression is supported for operators <i>matches</i> and <i>does not match</i> .   |
| 25        | Tag                         | equals,<br>does not equal,<br>contains,<br>does not contain  | Event tag.  |
| 26        | Tag value                   | equals,<br>does not equal,<br>contains,<br>does not contain  | Event tag value.  |
| 27        | Service                     | equals,<br>does not equal  | Service ID.   |
| 28        | Service name                | equals,<br>does not equal  | Service name.   |

## action.create

Description

`object action.create(object/array actions)`

This method allows to create new actions.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Actions to create.

Additionally to the [standard action properties](#), the method accepts the following parameters.

| Parameter           | Type   | Description  |
|---------------------|--------|--|
| filter              | object | Action <a href="#">filter</a> object for the action.                 |
| operations          | array  | Action <a href="#">operations</a> to create for the action.          |
| recovery_operations | array  | Action <a href="#">recovery operations</a> to create for the action. |
| update_operations   | array  | Action <a href="#">update operations</a> to create for the action.   |

Return values

(object) Returns an object containing the IDs of the created actions under the `actionids` property. The order of the returned IDs matches the order of the passed actions.

Examples

Create a trigger action

Create a trigger action that will begin once a trigger (with the word "memory" in its name) from host "10084" goes into a PROBLEM state. The action will have 4 configured operations. The first and immediate operation will send a message to all users in user group "7" via media type "1". If the event is not resolved in 30 minutes, the second operation will run [script "5"](#) (script with scope "Action operation") on all hosts in group "2". If the event is resolved, a recovery operation will notify all users who received any messages regarding the problem. If the event is updated, an acknowledge/update operation will notify (with a custom subject and message) all users who received any messages regarding the problem.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Trigger action",
    "eventsources": 0,
    "esc_period": "30m",
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
          "conditiontype": 1,
          "operator": 0,
          "value": "10084"
        },
        {
          "conditiontype": 3,
          "operator": 2,
          "value": "memory"
        }
      ]
    },
    "operations": [
      {
        "operationtype": 0,
        "esc_step_from": 1,
        "esc_step_to": 1,
        "opmessage_grp": [
```

```
}
```

Create a discovery action

Create a discovery action that will link discovered hosts to template "10001".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Discovery action",
    "eventsources": 1,
    "filter": {

          "value": "1"
        },
        {
          "conditiontype": 10,
          "operator": 0,
          "value": "2"
        }
      ]
    },
    "operations": [
      {
        "operationtype": 6,
        "optemplate": [
          {
            "templateid": "10001"
          }
        ]
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "18"
    ]
  },
  "id": 1
}
```

Using a custom expression filter

Create a trigger action that uses a custom expression - "A and (B or C)" - for evaluating action conditions. Once a trigger with a severity higher or equal to "Warning" from host "10084" or host "10106" goes into a PROBLEM state, the action will send a message to all users in user group "7" via media type "1". The formula IDs "A", "B" and "C" have been chosen arbitrarily.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
```

```

"params": {
  "name": "Trigger action",
  "eventsourcesource": 0,
  "esc_period": "15m",
  "filter": {
    "evaltype": 3,
    "formula": "A and (B or C)",
    "conditions": [
      {
        "conditiontype": 4,
        "operator": 5,
        "value": "2",
        "formulaid": "A"
      },
      {
        "conditiontype": 1,
        "operator": 0,
        "value": "10084",
        "formulaid": "B"
      },
      {
        "conditiontype": 1,
        "operator": 0,
        "value": "10106",
        "formulaid": "C"
      }
    ]
  },
  "operations": [
    {
      "operationtype": 0,
      "esc_step_from": 1,
      "esc_step_to": 1,
      "opmessage_grp": [
        {
          "usrgrp": "7"
        }
      ],
      "opmessage": {
        "default_msg": 1,
        "mediatypeid": "1"
      }
    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "18"
    ]
  },
  "id": 1
}

```

Create agent autoregistration rule

Create an autoregistration action that adds a host to host group "2" when the host name contains "SRV" or metadata contains

"AlmaLinux".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Register Linux servers",
    "eventsources": "2",
    "filter": {
      "evaltype": "2",
      "conditions": [
        {
          "conditiontype": "22",
          "operator": "2",
          "value": "SRV"
        },
        {
          "conditiontype": "24",
          "operator": "2",
          "value": "AlmaLinux"
        }
      ]
    },
    "operations": [
      {
        "operationtype": "4",
        "opgroup": [
          {
            "groupid": "2"
          }
        ]
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      19
    ]
  },
  "id": 1
}
```

## **action.delete**

Description

object action.delete(array actionIds)

This method allows to delete actions.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the actions to delete.

Return values

(object) Returns an object containing the IDs of the deleted actions under the `actionids` property.

Examples

Delete multiple actions

Delete two actions.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.delete",
  "params": [
    "17",
    "18"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "17",
      "18"
    ]
  },
  "id": 1
}
```

Source

`Action::delete()` in `ui/include/classes/api/services/CAction.php`.

**action.get**

Description

`integer/array action.get(object parameters)`

The method allows to retrieve actions according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter                | Type         | Description  |
|--------------------------|--------------|--|
| actionids                | string/array | Return only actions with the given IDs.  |
| groupids                 | string/array | Return only actions that use the given host groups in action conditions.           |
| hostids                  | string/array | Return only actions that use the given hosts in action conditions.                 |
| triggerids               | string/array | Return only actions that use the given triggers in action conditions.              |
| mediatypeids             | string/array | Return only actions that use the given media types to send messages.               |
| usrgrpids                | string/array | Return only actions that are configured to send messages to the given user groups. |
| usersids                 | string/array | Return only actions that are configured to send messages to the given users.       |
| scriptids                | string/array | Return only actions that are configured to run the given scripts.                  |
| selectFilter             | query        | Return a <b>filter</b> property with the action condition filter.                  |
| selectOperations         | query        | Return an <b>operations</b> property with action operations.                       |
| selectRecoveryOperations | query        | Return a <b>recovery_operations</b> property with action recovery operations.      |
| selectUpdateOperations   | query        | Return an <b>update_operations</b> property with action update operations.         |
| sortfield                | string/array | Sort the result by the given properties.   |
|                          |              | Possible values are: actionid, name and status.                                    |
|                          |              | These parameters are described in the <b>reference commentary</b> .                |
| countOutput              | boolean      |  |
| excludeSearch            | boolean      |  |
| filter                   | object       |  |
| limit                    | integer      |  |
| output                   | query        |  |
| preservekeys             | boolean      |  |
| search                   | object       |  |
| searchByAny              | boolean      |  |
| searchWildcardsEnabled   | boolean      |  |
| sortorder                | string/array |  |
| startSearch              | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieve trigger actions

Retrieve all configured trigger actions together with action conditions and operations.

Request:

```
{

```

#### Retrieve discovery actions

Retrieve all configured discovery actions together with action conditions and operations. The filter uses the "and" evaluation type, so the formula property is empty and eval\_formula is generated automatically.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "action.get",
    "params": {
        "output": "extend",
        "selectOperations": "extend",
        "selectFilter": "extend",
        "filter": {
            "eventsources": 1
        }
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "actionid": "2",
      "name": "Auto discovery. Linux servers.",
      "eventsources": "1",
      "status": "1",
      "esc_period": "0s",
      "pause_suppressed": "1",
      "filter": {
        "evaltype": "0",
        "formula": "",
        "conditions": [
          {
            "conditiontype": "10",
            "operator": "0",
            "value": "0",
            "value2": "",
            "formulaid": "B"
          },
          {
            "conditiontype": "8",
            "operator": "0",
            "value": "9",
            "value2": "",
            "formulaid": "C"
          },
          {
            "conditiontype": "12",
            "operator": "2",
            "value": "Linux",
            "value2": "",
            "formulaid": "A"
          }
        ],

## action.update

Description

object action.update(object/array actions)

This method allows to update existing actions.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Action properties to be updated.

The `actionid` property must be defined for each action, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard action properties](#), the method accepts the following parameters.

| Parameter           | Type   | Description   |
|---------------------|--------|---|
| filter              | object | Action <a href="#">filter</a> object to replace the current filter.                 |
| operations          | array  | Action <a href="#">operations</a> to replace existing operations.                   |
| recovery_operations | array  | Action <a href="#">recovery operations</a> to replace existing recovery operations. |
| update_operations   | array  | Action <a href="#">update operations</a> to replace existing update operations.     |

Return values

(object) Returns an object containing the IDs of the updated actions under the `actionids` property.

Examples

Disable action

Disable an action, that is, set its status to "1".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "action.update",
    "params": {
        "actionid": "2",
        "status": "1"
    }
}

```

```

    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "2"
    ]
  },
  "id": 1
}

```

## Alert

This class is designed to work with alerts.

Object references:

- [Alert](#)

Available methods:

- [alert.get](#) - retrieve alerts

### > Alert object

The following objects are directly related to the alert API.

Alert

#### Note:

Alerts are created by the Zabbix server and cannot be modified via the API.

The alert object contains information about whether certain action operations have been executed successfully. It has the following properties.

| Property    | Type      | Description  |
|-------------|-----------|--|
| alertid     | string    | ID of the alert.   |
| actionid    | string    | ID of the action that generated the alert.                                 |
| alerttype   | integer   | Alert type.<br><br>Possible values:<br>0 - message;<br>1 - remote command. |
| clock       | timestamp | Time when the alert was generated.   |
| error       | string    | Error text if there are problems sending a message or running a command.   |
| esc_step    | integer   | Action escalation step during which the alert was generated.               |
| eventid     | string    | ID of the event that triggered the action.                                 |
| mediatypeid | string    | ID of the media type that was used to send the message.                    |

| Property      | Type    | Description   |
|---------------|---------|---|
| message       | text    | Message text. Used for message alerts.  |
| retries       | integer | Number of times Zabbix tried to send the message.   |
| sendto        | string  | Address, user name or other identifier of the recipient. Used for message alerts.   |
| status        | integer | Status indicating whether the action operation has been executed successfully.<br><br>Possible values for message alerts:<br>0 - message not sent.<br>1 - message sent.<br>2 - failed after a number of retries.<br>3 - new alert is not yet processed by alert manager.<br><br>Possible values for command alerts:<br>0 - command not run.<br>1 - command run.<br>2 - tried to run the command on the Zabbix agent but it was unavailable. |
| subject       | string  | Message subject. Used for message alerts.   |
| userid        | string  | ID of the user that the message was sent to.  |
| p_eventid     | string  | ID of problem event, which generated the alert.   |
| acknowledgeid | string  | ID of acknowledgment, which generated the alert.  |

## alert.get

### Description

integer/array alert.get(object parameters)

The method allows to retrieve alerts according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type         | Description   |
|--------------|--------------|---|
| alertids     | string/array | Return only alerts with the given IDs.  |
| actionids    | string/array | Return only alerts generated by the given actions.  |
| eventids     | string/array | Return only alerts generated by the given events.   |
| groupids     | string/array | Return only alerts generated by objects from the given host groups.   |
| hostids      | string/array | Return only alerts generated by objects from the given hosts.   |
| mediatypeids | string/array | Return only message alerts that used the given media types.   |
| objectids    | string/array | Return only alerts generated by the given objects   |
| userid       | string/array | Return only message alerts that were sent to the given users.   |
| eventobject  | integer      | Return only alerts generated by events related to objects of the given type.<br><br>See event <a href="#">"object"</a> for a list of supported object types.<br><br>Default: 0 - trigger. |
| eventsources | integer      | Return only alerts generated by events of the given type.<br><br>See event <a href="#">"source"</a> for a list of supported event types.<br><br>Default: 0 - trigger events.              |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| time_from              | timestamp    | Return only alerts that have been generated after the given time.   |
| time_till              | timestamp    | Return only alerts that have been generated before the given time.  |
| selectHosts            | query        | Return a <b>hosts</b> property with data of hosts that triggered the action operation.  |
| selectMediatypes       | query        | Return a <b>mediatypes</b> property with an array of the media types that were used for the message alert.  |
| selectUsers            | query        | Return a <b>users</b> property with an array of the users that the message was addressed to.  |
| sortfield              | string/array | See <b>user.get</b> for restrictions based on user type.<br>Sort the result by the given properties.<br><br>Possible values are: alertid, clock, eventid, mediatypeid, sendto and status. |
| countOutput            | boolean      | These parameters are described in the <b>reference commentary</b> .   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Note:

In Zabbix 6.0.38, *Admin* and *User* type users may retrieve "message" (0) type alert data only about their own user.

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieve alerts by action ID

Retrieve all alerts generated by action "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "alert.get",
  "params": {
    "output": "extend",
    "actionids": "3"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "alertid": "1",
      "actionid": "3",
```

```

        "eventid": "21243",
        "userid": "1",
        "clock": "1362128008",
        "mediatypeid": "1",
        "sendto": "support@company.com",
        "subject": "PROBLEM: Zabbix agent on Linux server is unreachable for 5 minutes: ",
        "message": "Trigger: Zabbix agent on Linux server is unreachable for 5 minutes: \nTrigger stat
        "status": "0",
        "retries": "3",
        "error": "",
        "esc_step": "1",
        "alerttype": "0",
        "p_eventid": "0",
        "acknowledgeid": "0"
    }
],
    "id": 1
}

```

## API info

This class is designed to retrieve meta information about the API.

Available methods:

- [apiinfo.version](#) - retrieving the version of the Zabbix API

### apiinfo.version

Description

`string apiinfo.version(array)`

This method allows to retrieve the version of the Zabbix API.

#### Attention:

This method is only available to unauthenticated users and must be called without the `auth` parameter in the JSON-RPC request.

Parameters

(array) The method accepts an empty array.

Return values

(string) Returns the version of the Zabbix API.

#### Note:

Starting from Zabbix 2.0.4 the version of the API matches the version of Zabbix.

Examples

Retrieving the version of the API

Retrieve the version of the Zabbix API.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "apiinfo.version",
  "params": [],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "4.0.0",
  "id": 1
}
```

## Audit log

This class is designed to work with audit log.

Object references:

- [Audit log object](#)

Available methods:

- [auditlog.get](#) - retrieve audit log records

## > Audit log object

The following objects are directly related to the auditlog API.

Audit log

The audit log object contains information about user actions. It has the following properties.

| Property             | Type      | Description  |
|----------------------|-----------|--|
| auditid              | string    | ( <i>readonly</i> ) ID of audit log entry. Generated using CUID algorithm. |
| userid               | string    | Audit log entry author userid.   |
| username             | string    | Audit log entry author username.   |
| clock                | timestamp | Audit log entry creation timestamp.  |
| ip                   | string    | Audit log entry author IP address.   |
| action               | integer   | Audit log entry action.  |
| Possible values are: |           |  |
| 0 - Add;             |           |  |
| 1 - Update;          |           |  |
| 2 - Delete;          |           |  |
| 4 - Logout;          |           |  |
| 7 - Execute;         |           |  |
| 8 - Login;           |           |  |
| 9 - Failed login;    |           |  |
| 10 - History clear.  |           |  |

| Property     | Type    | Description   |
|--------------|---------|---|
| resourcetype | integer | <p>Audit log entry resource type.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>0 - User;</li> <li>3 - Media type;</li> <li>4 - Host;</li> <li>5 - Action;</li> <li>6 - Graph;</li> <li>11 - User group;</li> <li>13 - Trigger;</li> <li>14 - Host group;</li> <li>15 - Item;</li> <li>16 - Image;</li> <li>17 - Value map;</li> <li>18 - Service;</li> <li>19 - Map;</li> <li>22 - Web scenario;</li> <li>23 - Discovery rule;</li> <li>25 - Script;</li> <li>26 - Proxy;</li> <li>27 - Maintenance;</li> <li>28 - Regular expression;</li> <li>29 - Macro;</li> <li>30 - Template;</li> <li>31 - Trigger prototype;</li> <li>32 - Icon mapping;</li> <li>33 - Dashboard;</li> <li>34 - Event correlation;</li> <li>35 - Graph prototype;</li> <li>36 - Item prototype;</li> <li>37 - Host prototype;</li> <li>38 - Autoregistration;</li> <li>39 - Module;</li> <li>40 - Settings;</li> <li>41 - Housekeeping;</li> <li>42 - Authentication;</li> <li>43 - Template dashboard;</li> <li>44 - User role;</li> <li>45 - API token;</li> <li>46 - Scheduled report;</li> <li>47 - High availability node;</li> <li>48 - SLA.</li> </ul> |
| resourceid   | string  | Audit log entry resource identifier.  |
| resourceName | string  | Audit log entry resource human readable name.   |
| recordsetid  | string  | Audit log entry recordset ID. The audit log records created during the same operation will have the same recordset ID. Generated using CUID algorithm.  |
| details      | text    | <p>Audit log entry details. The details are stored as JSON object where each property name is a path to property or nested object in which change occurred, and each value contain the data about the change of this property in array format.</p> <p>Possible value formats are:</p> <ul style="list-style-type: none"> <li>["add"] - Nested object has been added;</li> <li>["add", "&lt;value&gt;"] - The property of added object contain &lt;value&gt;;</li> <li>["update"] - Nested object has been updated;</li> <li>["update", "&lt;new value&gt;", "&lt;old value&gt;"] - The value of property of updated object was changed from &lt;old value&gt; to &lt;new value&gt;;</li> <li>["delete"] - Nested object has been deleted.</li> </ul>  |

## auditlog.get

### Description

integer/array auditlog.get(object parameters)

The method allows to retrieve audit log records according to the given parameters.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| auditids               | string/array | Return only audit log with the given IDs.  |
| userids                | string/array | Return only audit log that were created by the given users.  |
| time_from              | timestamp    | Returns only audit log entries that have been created after or at the given time.  |
| time_till              | timestamp    | Returns only audit log entries that have been created before or at the given time.   |
| sortfield              | string/array | Sort the result by the given properties.   |
| filter                 | object       | Possible values are: auditid, userid, clock.<br>Return only results that exactly match the given filter.   |
| search                 | object       | Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.<br>Case insensitive sub-string search in content of fields: username, ip, resourcename, details. |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> .   |
| excludeSearch          | boolean      |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

### Examples

#### Retrieve audit log

Retrieve two latest audit log records.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "auditlog.get",
  "params": {
    "output": "extend",
    "sortfield": "clock",
    "sortorder": "DESC",
```

```

        "limit": 2
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "auditid": "cksstgfm0001yhdcc41y20q2",
      "userid": "1",
      "username": "Admin",
      "clock": "1629975715",
      "ip": "127.0.0.1",
      "action": "1",
      "resourcetype": "0",
      "resourceid": "0",
      "resourceName": "Jim",
      "recordsetid": "cksstgfa10000yhdcso67ond1",
      "details": "{\"user.name\": [\"update\", \"Jim\", \"\"], \"user.medias[37]\": [\"add\"], \"user.medias[38]\": [\"add\"]}"
    },
    {
      "auditid": "ckssofl0p0001yhdcqxclsg8r",
      "userid": "1",
      "username": "Admin",
      "clock": "1629967278",
      "ip": "127.0.0.1",
      "action": "0",
      "resourcetype": "0",
      "resourceid": "20",
      "resourceName": "John",
      "recordsetid": "ckssofl0p0000yhdcpxyo1jgo",
      "details": "{\"user.username\": [\"add\", \"John\"], \"user.userid\": [\"add\", \"20\"], \"user.usertype\": [\"add\", \"0\"]}"
    }
  ],
  "id": 1
}

```

Available methods:

- [authentication.get](#) - retrieve authentication
- [authentication.update](#) - update authentication

## > Authentication object

The following objects are directly related to the authentication API.

### Authentication

The authentication object has the following properties.

| Property                | Type    | Description   |
|-------------------------|---------|---|
| authentication_type     | integer | Default authentication.<br><br>Possible values:<br>0 - <i>(default)</i> Internal;<br>1 - LDAP.                  |
| http_auth_enabled       | integer | Enable HTTP authentication.<br><br>Possible values:<br>0 - <i>(default)</i> Disable;<br>1 - Enable.             |
| http_login_form         | integer | Default login form.<br><br>Possible values:<br>0 - <i>(default)</i> Zabbix login form;<br>1 - HTTP login form.  |
| http_strip_domains      | string  | Remove domain name.   |
| http_case_sensitive     | integer | HTTP case-sensitive login.<br><br>Possible values:<br>0 - Off;<br>1 - <i>(default)</i> On.                      |
| ldap_configured         | integer | Enable LDAP authentication.<br><br>Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable.             |
| ldap_host               | string  | LDAP host.  |
| ldap_port               | integer | LDAP port.  |
| ldap_base_dn            | string  | LDAP base DN.   |
| ldap_search_attribute   | string  | LDAP search attribute.  |
| ldap_bind_dn            | string  | LDAP bind DN.   |
| ldap_case_sensitive     | integer | LDAP case-sensitive login.<br><br>Possible values:<br>0 - Off;<br>1 - <i>(default)</i> On.                      |
| ldap_bind_password      | string  | LDAP bind password.   |
| saml_auth_enabled       | integer | Enable SAML authentication.<br><br>Possible values:<br>0 - <i>(default)</i> Disable;<br>1 - Enable.             |
| saml_idp_entityid       | string  | SAML IdP entity ID.   |
| saml_sso_url            | string  | SAML SSO service URL.   |
| saml_slo_url            | string  | SAML SLO service URL.   |
| saml_username_attribute | string  | SAML username attribute.  |
| saml_sp_entityid        | string  | SAML SP entity ID.  |
| saml_nameid_format      | string  | SAML SP name ID format.   |
| saml_sign_messages      | integer | SAML sign messages.<br><br>Possible values:<br>0 - <i>(default)</i> Do not sign messages;<br>1 - Sign messages. |

| Property                   | Type    | Description  |
|----------------------------|---------|--|
| saml_sign_assertions       | integer | SAML sign assertions.<br><br>Possible values:<br>0 - ( <i>default</i> ) Do not sign assertions;<br>1 - Sign assertions.  |
| saml_sign_authn_requests   | integer | SAML sign AuthN requests.<br><br>Possible values:<br>0 - ( <i>default</i> ) Do not sign AuthN requests;<br>1 - Sign AuthN requests.  |
| saml_sign_logout_requests  | integer | SAML sign logout requests.<br><br>Possible values:<br>0 - ( <i>default</i> ) Do not sign logout requests;<br>1 - Sign logout requests.   |
| saml_sign_logout_responses | integer | SAML sign logout responses.<br><br>Possible values:<br>0 - ( <i>default</i> ) Do not sign logout responses;<br>1 - Sign logout responses.  |
| saml_encrypt_nameid        | integer | SAML encrypt name ID.<br><br>Possible values:<br>0 - ( <i>default</i> ) Do not encrypt name ID;<br>1 - Encrypt name ID.  |
| saml_encrypt_assertions    | integer | SAML encrypt assertions.<br><br>Possible values:<br>0 - ( <i>default</i> ) Do not encrypt assertions;<br>1 - Encrypt assertions.   |
| saml_case_sensitive        | integer | SAML case-sensitive login.<br><br>Possible values:<br>0 - Off;<br>1 - ( <i>default</i> ) On.   |
| passwd_min_length          | integer | Password minimal length requirement.<br><br>Possible range of values: 1-70<br>8 - <i>default</i>   |
| passwd_check_rules         | integer | Password checking rules.<br><br>Possible bitmap values are:<br>0 - Check password length;<br>1 - Check if password uses uppercase and lowercase Latin letters;<br>2 - Check if password uses digits;<br>4 - Check if password uses special characters;<br>8 - ( <i>default</i> ) Check if password is not in the list of commonly used passwords and does not contain derivations of word "Zabbix" or user's name, last name, or username.<br><br>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 15 for checking all rules). |

## authentication.get

### Description

`object authentication.get(object parameters)`

The method allows to retrieve authentication object according to the given parameters.

**Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type  | Description   |
|-----------|-------|---|
| output    | query | This parameter is described in the <a href="#">reference commentary</a> . |

**Return values**

(object) Returns authentication object.

**Examples**

Request:

```
{
  "jsonrpc": "2.0",
  "method": "authentication.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "authentication_type": "0",
    "http_auth_enabled": "0",
    "http_login_form": "0",
    "http_strip_domains": "",
    "http_case_sensitive": "1",
    "ldap_configured": "0",
    "ldap_host": "",
    "ldap_port": "389",
    "ldap_base_dn": "",
    "ldap_search_attribute": "",
    "ldap_bind_dn": "",
    "ldap_case_sensitive": "1",
    "ldap_bind_password": "",
    "saml_auth_enabled": "0",
    "saml_idp_entityid": "",
    "saml_sso_url": "",
    "saml_slo_url": "",
    "saml_username_attribute": "",
    "saml_sp_entityid": "",
    "saml_nameid_format": "",
    "saml_sign_messages": "0",
    "saml_sign_assertions": "0",
    "saml_sign_authn_requests": "0",
    "saml_sign_logout_requests": "0",
    "saml_sign_logout_responses": "0",
    "saml_encrypt_nameid": "0",
    "saml_encrypt_assertions": "0",
    "saml_case_sensitive": "0",
    "passwd_min_length": "8",
  }
}
```

```

        "passwd_check_rules": "8"
    },
    "id": 1
}

```

Source

CAuthentication::get() in *ui/include/classes/api/services/CAuthentication.php*.

## authentication.update

Description

`object authentication.update(object authentication)`

This method allows to update existing authentication settings.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Authentication properties to be updated.

Return values

(array) Returns array with the names of updated parameters.

Examples

Request:

```

{
    "jsonrpc": "2.0",
    "method": "authentication.update",
    "params": {
        "http_auth_enabled": 1,
        "http_case_sensitive": 0,
        "http_login_form": 1
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        "http_auth_enabled",
        "http_case_sensitive",
        "http_login_form"
    ],
    "id": 1
}

```

Source

## Autoregistration

This class is designed to work with autoregistration.

Object references:

- [Autoregistration](#)

Available methods:

- [autoregistration.get](#) - retrieve autoregistration
- [autoregistration.update](#) - update autoregistration

## > Autoregistration object

The following objects are directly related to the `autoregistration` API.

Autoregistration

The autoregistration object has the following properties.

| Property                      | Type    | Description  |
|-------------------------------|---------|--|
| <code>tls_accept</code>       | integer | Type of allowed incoming connections for autoregistration.<br><br>Possible values:<br>1 - allow unencrypted connections;<br>2 - allow TLS with PSK.<br>3 - allow both unencrypted and TLS with PSK connections.  |
| <code>tls_psk_identity</code> | string  | (write-only) PSK identity; must be paired with only one PSK (across <a href="#">autoregistration</a> , <a href="#">hosts</a> , and <a href="#">proxies</a> ).<br>Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. |
| <code>tls_psk</code>          | string  | (write-only) Pre-shared key (PSK); must be at least 32 hex digits.   |

## `autoregistration.get`

Description

`object autoregistration.get(object parameters)`

The method allows to retrieve autoregistration object according to the given parameters.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter           | Type  | Description   |
|---------------------|-------|---|
| <code>output</code> | query | This parameter is described in the <a href="#">reference commentary</a> . |

Return values

(object) Returns autoregistration object.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "autoregistration.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

## autoregistration.update

Description

object autoregistration.update(object autoregistration)

This method allows to update existing autoregistration.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Autoregistration properties to be updated.

Return values

(boolean ) Returns boolean true as result on successful update.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "autoregistration.update",
  "params": {
    "tls_accept": "3",
    "tls_psk_identity": "PSK 001",
    "tls_psk": "11111595725ac58dd977beef14b97461a7c1045b9a1c923453302c5473193478"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

## Configuration

This class is designed to export and import Zabbix configuration data.

Available methods:

- [configuration.export](#) - exporting the configuration

- `configuration.import` - importing the configuration
- `configuration.importcompare` - comparing import file with current system elements

## configuration.export

### Description

`string configuration.export(object parameters)`

This method allows to export configuration data as a serialized string.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the objects to be exported and the format to use.

| Parameter                    | Type    | Description   |
|------------------------------|---------|---|
| <b>format</b><br>(required)  | string  | Format in which the data must be exported.<br><br>Possible values:<br>yaml - YAML;<br>xml - XML;<br>json - JSON;<br>raw - unprocessed PHP array.  |
| prettyprint                  | boolean | Make the output more human readable by adding indentation.<br><br>Possible values:<br>true - add indentation;<br>false - (default) do not add indentation.  |
| <b>options</b><br>(required) | object  | Objects to be exported.<br><br>The options object has the following parameters:<br>groups - (array) IDs of host groups to export;<br>hosts - (array) IDs of hosts to export;<br>images - (array) IDs of images to export;<br>maps - (array) IDs of maps to export;<br>mediaTypes - (array) IDs of media types to export;<br>templates - (array) IDs of templates to export. |

### Return values

(string) Returns a serialized string containing the requested configuration data.

### Examples

#### Exporting a template

Export the configuration of template "10571" as an XML string.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.export",
  "params": {
    "options": {
      "templates": [
        "10571"
      ]
    },
    "format": "xml"
  }
}
```

```

    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": "<?xml version='1.0' encoding='UTF-8'?>\n<zabbix_export><version>6.0</version><date>2023-09-14 10:10:10</date><groups><group><name>Zabbix</name></group></groups><templates><template><name>Zabbix</name></template></templates></zabbix_export>\n",
  "id": 1
}

```

Source

CConfiguration::export() in *ui/include/classes/api/services/CConfiguration.php*.

## configuration.import

Description

`boolean configuration.import(object parameters)`

This method allows to import configuration data from a serialized string.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the data to import and rules how the data should be handled.

| Parameter                   | Type   | Description   |
|-----------------------------|--------|---|
| <b>format</b><br>(required) | string | Format of the serialized string.<br><br>Possible values:<br><code>yaml</code> - YAML;<br><code>xml</code> - XML;<br><code>json</code> - JSON. |
| <b>source</b><br>(required) | string | Serialized string containing the configuration data.  |
| <b>rules</b><br>(required)  | object | Rules on how new and existing objects should be imported.<br><br>The <code>rules</code> parameter is described in detail in the table below.  |

### Note:

If no rules are given, the configuration will not be updated.

The `rules` object supports the following parameters.

| Parameter                   | Type   | Description  |
|-----------------------------|--------|--|
| <code>discoveryRules</code> | object | Rules on how to import LLD rules.<br><br>Supported parameters:<br><code>createMissing</code> - (boolean) if set to true, new LLD rules will be created; default: false;<br><code>updateExisting</code> - (boolean) if set to true, existing LLD rules will be updated; default: false;<br><code>deleteMissing</code> - (boolean) if set to true, LLD rules not present in the imported data will be deleted from the database; default: false. |

| Parameter | Type   | Description  |
|-----------|--------|--|
| graphs    | object | <p>Rules on how to import graphs.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new graphs will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing graphs will be updated; default: false;<br/> deleteMissing - (boolean) if set to true, graphs not present in the imported data will be deleted from the database; default: false.</p>                             |
| groups    | object | <p>Rules on how to import host groups.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new host groups will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing host groups will be updated; default: false.</p>  |
| hosts     | object | <p>Rules on how to import hosts.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new hosts will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing hosts will be updated; default: false.</p>  |
| httptests | object | <p>Rules on how to import web scenarios.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new web scenarios will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing web scenarios will be updated; default: false;<br/> deleteMissing - (boolean) if set to true, web scenarios not present in the imported data will be deleted from the database; default: false.</p> |
| images    | object | <p>Rules on how to import images.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new images will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing images will be updated; default: false.</p>   |
| items     | object | <p>Rules on how to import items.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new items will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing items will be updated; default: false;<br/> deleteMissing - (boolean) if set to true, items not present in the imported data will be deleted from the database; default: false.</p>                                 |
| maps      | object | <p>Rules on how to import maps.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new maps will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing maps will be updated; default: false.</p>   |

| Parameter          | Type   | Description   |
|--------------------|--------|---|
| mediaTypes         | object | Rules on how to import media types.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new media types will be created; default: false;<br>updateExisting - (boolean) if set to true, existing media types will be updated; default: false.  |
| templateLinkage    | object | Rules on how to import template links.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, templates that are not linked to the host or template being imported, but are present in the imported data, will be linked; default: false;<br>deleteMissing - (boolean) if set to true, templates that are linked to the host or template being imported, but are not present in the imported data, will be unlinked without removing entities (items, triggers, etc.) inherited from the unlinked templates; default: false. |
| templates          | object | Rules on how to import templates.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new templates will be created; default: false;<br>updateExisting - (boolean) if set to true, existing templates will be updated; default: false.  |
| templateDashboards | object | Rules on how to import template dashboards.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new template dashboards will be created; default: false;<br>updateExisting - (boolean) if set to true, existing template dashboards will be updated; default: false;<br>deleteMissing - (boolean) if set to true, template dashboards not present in the imported data will be deleted from the database; default: false.   |
| triggers           | object | Rules on how to import triggers.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new triggers will be created; default: false;<br>updateExisting - (boolean) if set to true, existing triggers will be updated; default: false;<br>deleteMissing - (boolean) if set to true, triggers not present in the imported data will be deleted from the database; default: false.   |
| valueMaps          | object | Rules on how to import host or template value maps.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new value maps will be created; default: false;<br>updateExisting - (boolean) if set to true, existing value maps will be updated; default: false;<br>deleteMissing - (boolean) if set to true, value maps not present in the imported data will be deleted from the database; default: false.  |

#### Return values

(boolean) Returns true if importing has been successful.

#### Examples

##### Importing a template

Import the template configuration contained in the XML string. If any items or triggers in the XML string are missing, they will be deleted from the database, and everything else will be left unchanged.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.import",
  "params": {
    "format": "xml",
    "rules": {
      "templates": {
        "createMissing": true,
        "updateExisting": true
      },
      "items": {
        "createMissing": true,
        "updateExisting": true,
        "deleteMissing": true
      },
      "triggers": {
        "createMissing": true,
        "updateExisting": true,
        "deleteMissing": true
      },
      "valueMaps": {
        "createMissing": true,
        "updateExisting": false
      }
    },
    "source": "<?xml version='1.0' encoding='UTF-8'?>\n<zabbix_export><version>6.0</version><date>"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

### configuration.importcompare

Description

array configuration.importcompare(object parameters)

This method allows to compare import file with current system elements and shows what will be changed if this import file will be imported.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the possible data to import and rules how the data should be handled.

| Parameter                   | Type   | Description   |
|-----------------------------|--------|---|
| <b>format</b><br>(required) | string | Format of the serialized string.<br><br>Possible values:<br>yaml - YAML;<br>xml - XML;<br>json - JSON.                          |
| <b>source</b><br>(required) | string | Serialized string containing the configuration data.  |
| <b>rules</b><br>(required)  | object | Rules on how new and existing objects should be imported.<br><br>The rules parameter is described in detail in the table below. |

**Note:**

If no rules are given, there will be nothing to update and result will be empty.

**Note:**

Comparison will be done only for host groups and templates. Triggers and graphs will be compared only for imported templates, any other will be considered as "new".

The rules object supports the following parameters.

| Parameter      | Type   | Description   |
|----------------|--------|---|
| discoveryRules | object | Rules on how to import LLD rules.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new LLD rules will be created; default: false;<br>updateExisting - (boolean) if set to true, existing LLD rules will be updated; default: false;<br>deleteMissing - (boolean) if set to true, LLD rules not present in the imported data will be deleted from the database; default: false. |
| graphs         | object | Rules on how to import graphs.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new graphs will be created; default: false;<br>updateExisting - (boolean) if set to true, existing graphs will be updated; default: false;<br>deleteMissing - (boolean) if set to true, graphs not present in the imported data will be deleted from the database; default: false.             |
| groups         | object | Rules on how to import host groups.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new host groups will be created; default: false;<br>updateExisting - (boolean) if set to true, existing host groups will be updated; default: false.  |
| hosts          | object | Rules on how to import hosts.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new hosts will be created; default: false;<br>updateExisting - (boolean) if set to true, existing hosts will be updated; default: false.<br><br>This parameter will make no difference to the output. It is allowed only for consistency with configuration.import.                             |

| Parameter       | Type   | Description  |
|-----------------|--------|--|
| httpTests       | object | <p>Rules on how to import web scenarios.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new web scenarios will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing web scenarios will be updated; default: false;<br/> deleteMissing - (boolean) if set to true, web scenarios not present in the imported data will be deleted from the database; default: false.</p>   |
| images          | object | <p>Rules on how to import images.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new images will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing images will be updated; default: false.</p>   |
| items           | object | <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> <p>Rules on how to import items.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new items will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing items will be updated; default: false;<br/> deleteMissing - (boolean) if set to true, items not present in the imported data will be deleted from the database; default: false.</p>   |
| maps            | object | <p>Rules on how to import maps.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new maps will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing maps will be updated; default: false.</p>   |
| mediaTypes      | object | <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> <p>Rules on how to import media types.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, new media types will be created; default: false;<br/> updateExisting - (boolean) if set to true, existing media types will be updated; default: false.</p>  |
| templateLinkage | object | <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> <p>Rules on how to import template links.</p> <p>Supported parameters:<br/> createMissing - (boolean) if set to true, templates that are not linked to the host or template being imported, but are present in the imported data, will be linked; default: false;<br/> deleteMissing - (boolean) if set to true, templates that are linked to the host or template being imported, but are not present in the imported data, will be unlinked without removing entities (items, triggers, etc.) inherited from the unlinked templates; default: false.</p> |

| Parameter          | Type   | Description   |
|--------------------|--------|---|
| templates          | object | Rules on how to import templates.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new templates will be created; default: false;<br>updateExisting - (boolean) if set to true, existing templates will be updated; default: false.  |
| templateDashboards | object | Rules on how to import template dashboards.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new template dashboards will be created; default: false;<br>updateExisting - (boolean) if set to true, existing template dashboards will be updated; default: false;<br>deleteMissing - (boolean) if set to true, template dashboards not present in the imported data will be deleted from the database; default: false. |
| triggers           | object | Rules on how to import triggers.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new triggers will be created; default: false;<br>updateExisting - (boolean) if set to true, existing triggers will be updated; default: false;<br>deleteMissing - (boolean) if set to true, triggers not present in the imported data will be deleted from the database; default: false.   |
| valueMaps          | object | Rules on how to import host or template value maps.<br><br>Supported parameters:<br>createMissing - (boolean) if set to true, new value maps will be created; default: false;<br>updateExisting - (boolean) if set to true, existing value maps will be updated; default: false;<br>deleteMissing - (boolean) if set to true, value maps not present in the imported data will be deleted from the database; default: false.                    |

#### Return values

(array) Returns an array with changes in configuration, that will be made.

#### Examples

##### Comparing the import of a template

Compare the template contained in the XML string to the current system elements, and show what will be changed if this template will be imported.

Request:

```

## Correlation

This class is designed to work with correlations.

Object references:

- [Correlation](#)

Available methods:

- [correlation.create](#) - creating new correlations
- [correlation.delete](#) - deleting correlations
- [correlation.get](#) - retrieving correlations
- [correlation.update](#) - updating correlations

## > Correlation object

The following objects are directly related to the `correlation` API.

Correlation

The correlation object has the following properties.

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| correlationid             | string  | ( <i>readonly</i> ) ID of the correlation.  |
| <b>name</b><br>(required) | string  | Name of the correlation.  |
| description               | string  | Description of the correlation.   |
| status                    | integer | Whether the correlation is enabled or disabled.<br><br>Possible values are:<br>0 - ( <i>default</i> ) enabled;<br>1 - disabled. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Correlation operation

The correlation operation object defines an operation that will be performed when a correlation is executed. It has the following properties.

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| <b>type</b><br>(required) | integer | Type of operation.<br><br>Possible values:<br>0 - close old events;<br>1 - close new event. |

Correlation filter

The correlation filter object defines a set of conditions that must be met to perform the configured correlation operations. It has the following properties.

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>evaltype</b><br>(required)   | integer | Filter condition evaluation method.<br><br>Possible values:<br>0 - and/or;<br>1 - and;<br>2 - or;<br>3 - custom expression.  |
| <b>conditions</b><br>(required) | array   | Set of filter conditions to use for filtering results.   |
| eval_formula                    | string  | <i>(readonly)</i> Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its <code>formulaid</code> . The value of <code>eval_formula</code> is equal to the value of <code>formula</code> for filters with a custom expression.  |
| formula                         | string  | User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its <code>formulaid</code> . The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted.<br><br>Required for custom expression filters. |

#### Correlation filter condition

The correlation filter condition object defines a specific condition that must be checked before running the correlation operations.

| Property                  | Type    | Description  |
|---------------------------|---------|--|
| <b>type</b><br>(required) | integer | Type of condition.<br><br>Possible values:<br>0 - old event tag;<br>1 - new event tag;<br>2 - new event host group;<br>3 - event tag pair;<br>4 - old event tag value;<br>5 - new event tag value.   |
| tag                       | string  | Event tag (old or new). Required when type of condition is: 0, 1, 4, 5.  |
| groupid                   | string  | Host group ID. Required when type of condition is: 2.  |
| oldtag                    | string  | Old event tag. Required when type of condition is: 3.  |
| newtag                    | string  | New event tag. Required when type of condition is: 3.  |
| value                     | string  | Event tag (old or new) value. Required when type of condition is: 4, 5.  |
| formulaid                 | string  | Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| operator                  | integer | Condition operator.<br><br>Required when type of condition is: 2, 4, 5.  |

#### Note:

To better understand how to use filters with various types of expressions, see examples on the [correlation.get](#) and [correlation.create](#) method pages.

The following operators and values are supported for each condition type.

| Condition | Condition name      | Supported operators   | Expected value |
|-----------|---------------------|-----------------------|----------------|
| 2         | Host group          | =, <>                 | Host group ID. |
| 4         | Old event tag value | =, <>, like, not like | string         |
| 5         | New event tag value | =, <>, like, not like | string         |

## correlation.create

### Description

object correlation.create(object/array correlations)

This method allows to create new correlations.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Correlations to create.

Additionally to the [standard correlation properties](#), the method accepts the following parameters.

| Parameter                       | Type   | Description  |
|---------------------------------|--------|--|
| <b>operations</b><br>(required) | array  | Correlation <b>operations</b> to create for the correlation. |
| <b>filter</b><br>(required)     | object | Correlation <b>filter</b> object for the correlation.        |

### Return values

(object) Returns an object containing the IDs of the created correlations under the `correlationids` property. The order of the returned IDs matches the order of the passed correlations.

### Examples

#### Create a new event tag correlation

Create a correlation using evaluation method AND/OR with one condition and one operation. By default the correlation will be enabled.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.create",
  "params": {
    "name": "new event tag correlation",
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
          "type": 1,
          "tag": "ok"
        }
      ]
    },
    "operations": [
      {
        "type": 0
      }
    ]
  },
  "auth": "343baad4f88b4106b9b5961e77437688",
}
```

```
    "id": 1
  }
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1"
    ]
  },
  "id": 1
}
```

Using a custom expression filter

Create a correlation that will use a custom filter condition. The formula IDs "A" or "B" have been chosen arbitrarily. Condition type will be "Host group" with operator "<>".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.create",
  "params": {
    "name": "new host group correlation",
    "description": "a custom description",
    "status": 0,
    "filter": {
      "evaltype": 3,
      "formula": "A or B",
      "conditions": [
        {
          "type": 2,
          "operator": 1,
          "formulaid": "A"
        },
        {
          "type": 2,
          "operator": 1,
          "formulaid": "B"
        }
      ]
    },
    "operations": [
      {
        "type": 1
      }
    ]
  },
  "auth": "343baad4f88b4106b9b5961e77437688",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "2"
    ]
  },
  "id": 1
}
```

Source

CCorrelation::create() in *ui/include/classes/api/services/CCorrelation.php*.

## correlation.delete

Description

object correlation.delete(array correlationids)

This method allows to delete correlations.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the correlations to delete.

Return values

(object) Returns an object containing the IDs of the deleted correlations under the `correlationids` property.

Example

Delete multiple correlations

Delete two correlations.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.delete",
  "params": [
    "1",
    "2"
  ],
  "auth": "343baad4f88b4106b9b5961e77437688",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

CCorrelation::delete() in *ui/include/classes/api/services/CCorrelation.php*.

## correlation.get

Description

integer/array correlation.get(object parameters)

The method allows to retrieve correlations according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter  | Type         | Description   |
|--|--------------|---|
| correlationids   | string/array | Return only correlations with the given IDs.                          |
| selectFilter   | query        | Return a <b>filter</b> property with the correlation conditions.      |
| selectOperations   | query        | Return an <b>operations</b> property with the correlation operations. |
| sortfield  | string/array | Sort the result by the given properties.                              |
| Possible values are: correlationid, name and status.<br>These parameters are described in the <a href="#">reference commentary</a> . |              |   |
| countOutput  | boolean      |   |
| editable   | boolean      |   |
| excludeSearch  | boolean      |   |
| filter   | object       |   |
| limit  | integer      |   |
| output   | query        |   |
| preservekeys   | boolean      |   |
| search   | object       |   |
| searchByAny  | boolean      |   |
| searchWildcardsEnabled   | boolean      |   |
| sortorder  | string/array |   |
| startSearch  | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

##### Retrieve correlations

Retrieve all configured correlations together with correlation conditions and operations. The filter uses the "and/or" evaluation type, so the `formula` property is empty and `eval_formula` is generated automatically.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.get",
  "params": {
    "output": "extend",
    "selectOperations": "extend",
    "selectFilter": "extend"
  },
  "auth": "343baad4f88b4106b9b5961e77437688",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "correlationid": "1",
```

```

        "name": "Correlation 1",
        "description": "",
        "status": "0",
        "filter": {
            "evaltype": "0",
            "formula": "",
            "conditions": [
                {
                    "type": "3",
                    "oldtag": "error",
                    "newtag": "ok",
                    "formulaid": "A"
                }
            ],
            "eval_formula": "A"
        },
        "operations": [
            {
                "type": "0"
            }
        ]
    },
    "id": 1
}

```

## correlation.update

Description

object correlation.update(object/array correlations)

This method allows to update existing correlations.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Correlation properties to be updated.

The `correlationid` property must be defined for each correlation, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard correlation properties](#), the method accepts the following parameters.

| Parameter  | Type   | Description  |
|------------|--------|--|
| filter     | object | Correlation <a href="#">filter</a> object to replace the current filter. |
| operations | array  | Correlation <a href="#">operations</a> to replace existing operations.   |

Return values

(object) Returns an object containing the IDs of the updated correlations under the `correlationids` property.

Examples

## Disable correlation

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.update",
  "params": {
    "correlationid": "1",
    "status": "1"
  },
  "auth": "343baad4f88b4106b9b5961e77437688",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1"
    ]
  },
  "id": 1
}
```

## Replace conditions, but keep the evaluation method

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.update",
  "params": {
    "correlationid": "1",
    "filter": {
      "conditions": [
        {
          "type": 3,
          "oldtag": "error",
          "newtag": "ok"
        }
      ]
    }
  },
  "auth": "343baad4f88b4106b9b5961e77437688",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1"
    ]
  },
  "id": 1
}
```

## Dashboard

This class is designed to work with dashboards.

Object references:

- [Dashboard](#)
- [Dashboard page](#)
- [Dashboard widget](#)
- [Dashboard widget field](#)
- [Dashboard user](#)
- [Dashboard user group](#)

Available methods:

- [dashboard.create](#) - creating new dashboards
- [dashboard.delete](#) - deleting dashboards
- [dashboard.get](#) - retrieving dashboards
- [dashboard.update](#) - updating dashboards

### > Dashboard object

The following objects are directly related to the dashboard API.

Dashboard

The dashboard object has the following properties.

| Property           | Type    | Description  |
|--------------------|---------|--|
| dashboardid        | string  | (readonly) ID of the dashboard.  |
| name<br>(required) | string  | Name of the dashboard.   |
| userid             | string  | Dashboard owner user ID.   |
| private            | integer | Type of dashboard sharing.<br><br>Possible values:<br>0 - public dashboard;<br>1 - (default) private dashboard.                          |
| display_period     | integer | Default page display period (in seconds).<br><br>Possible values: 10, 30, 60, 120, 600, 1800, 3600.                                      |
| auto_start         | integer | Default: 30.<br>Auto start slideshow.<br><br>Possible values:<br>0 - do not auto start slideshow;<br>1 - (default) auto start slideshow. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Dashboard page

The dashboard page object has the following properties.

| Property         | Type   | Description  |
|------------------|--------|--|
| dashboard_pageid | string | (readonly) ID of the dashboard page.               |
| name             | string | Dashboard page name.<br><br>Default: empty string. |

| Property       | Type    | Description  |
|----------------|---------|--|
| display_period | integer | Dashboard page display period (in seconds).<br><br>Possible values: 0, 10, 30, 60, 120, 600, 1800, 3600.<br><br>Default: 0 (will use the default page display period). |
| widgets        | array   | Array of the <b>dashboard widget</b> objects.  |

## Dashboard widget

The dashboard widget object has the following properties.

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| widgetid                  | string  | <i>(readonly)</i> ID of the dashboard widget.   |
| <b>type</b><br>(required) | string  | Type of the dashboard widget.<br><br>Possible values:<br>actionlog - Action log;<br>clock - Clock;<br><i>(deprecated)</i> dataover - Data overview;<br>discovery - Discovery status;<br>favgraphs - Favorite graphs;<br>favmaps - Favorite maps;<br>geomap - Geomap;<br>graph - Graph (classic);<br>graphprototype - Graph prototype;<br>hostavail - Host availability;<br>item - Item value;<br>map - Map;<br>navtree - Map Navigation Tree;<br>plaintext - Plain text;<br>problemhosts - Problem hosts;<br>problems - Problems;<br>problemsbysv - Problems by severity;<br>slareport - SLA report;<br>svggraph - Graph;<br>systeminfo - System information;<br>tophosts - Top hosts;<br>trigover - Trigger overview;<br>url - URL;<br>web - Web monitoring. |
| name                      | string  | Custom widget name.   |
| x                         | integer | A horizontal position from the left side of the dashboard.<br><br>Valid values range from 0 to 23.  |
| y                         | integer | A vertical position from the top of the dashboard.<br><br>Valid values range from 0 to 62.  |
| width                     | integer | The widget width.<br><br>Valid values range from 1 to 24.   |
| height                    | integer | The widget height.<br><br>Valid values range from 2 to 32.  |
| view_mode                 | integer | The widget view mode.<br><br>Possible values:<br>0 - <i>(default)</i> default widget view;<br>1 - with hidden header;   |

| Property | Type  | Description  |
|----------|-------|--|
| fields   | array | Array of the <a href="#">dashboard widget field</a> objects.                                       |
|          |       | Required for specific widgets; see individual widgets in <a href="#">Dashboard widget fields</a> . |

#### Dashboard widget field

The dashboard widget field object has the following properties.

| Property                   | Type    | Description   |
|----------------------------|---------|---|
| <b>type</b><br>(required)  | integer | Type of the widget field.<br><br>Possible values:<br>0 - Integer;<br>1 - String;<br>2 - Host group;<br>3 - Host;<br>4 - Item;<br>5 - Item prototype;<br>6 - Graph;<br>7 - Graph prototype;<br>8 - Map;<br>9 - Service;<br>10 - SLA. |
| <b>name</b><br>(required)  | string  | Widget field name.  |
| <b>value</b><br>(required) | mixed   | Possible values: see <a href="#">Dashboard widget fields</a> .<br>Widget field value depending on the type.<br><br>Possible values: see <a href="#">Dashboard widget fields</a> .   |

#### Dashboard user group

List of dashboard permissions based on user groups. It has the following properties.

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>usrgrpid</b><br>(required)   | string  | User group ID.   |
| <b>permission</b><br>(required) | integer | Type of permission level.<br><br>Possible values:<br>2 - read only;<br>3 - read-write. |

#### Dashboard user

List of dashboard permissions based on users. It has the following properties.

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>userid</b><br>(required)     | string  | User ID.   |
| <b>permission</b><br>(required) | integer | Type of permission level.<br><br>Possible values:<br>2 - read only;<br>3 - read-write. |

## Dashboard widget fields

This page contains navigation links for dashboard widget parameters and possible property values for the respective **dashboard widget field** objects.

To see the parameters and property values for each widget, go to individual widget pages for:

- [Action log](#)
- [Clock](#)
- [Discovery status](#)
- [Favorite graphs](#)
- [Favorite maps](#)
- [Geomap](#)
- [Graph](#)
- [Graph \(classic\)](#)
- [Graph prototype](#)
- [Host availability](#)
- [Item value](#)
- [Map](#)
- [Map navigation tree](#)
- [Plain text](#)
- [Problem hosts](#)
- [Problems](#)
- [SLA report](#)
- [System information](#)
- [Problems by severity](#)

### Attention:

Deprecated widgets will be removed in the upcoming major release.

## 1 Action log

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the **Action log** widget in `dashboard.create` and `dashboard.update` methods.

### Parameters

The following parameters are supported for the **Action log** widget.

| Parameter               | type | name    | value  |
|-------------------------|------|---------|--|
| <i>Refresh interval</i> | 0    | rf_rate | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - <i>(default)</i> 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |

| Parameter       | type | name          | value  |
|-----------------|------|---------------|--|
| Sort entries by | 0    | sort_triggers | 3 - Time (ascending);<br>4 - (default) Time (descending);<br>5 - Type (ascending);<br>6 - Type (descending);<br>7 - Status (ascending);<br>8 - Status (descending);<br>11 - Recipient (ascending);<br>12 - Recipient (descending). |
| Show lines      | 0    | show_lines    | Valid values range from 1-100.<br><br>Default: 25.   |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Action log* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring an *Action log* widget

Configure an *Action log* widget that displays 10 entries of action operation details, sorted by time (in ascending order).

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "actionlog",
            "name": "Action log",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "show_lines",
                "value": 10
              },
              {
                "type": 0,
                "name": "sort_triggers",
                "value": 3
              }
            ]
          }
        ]
      }
    ]
  },
  "userGroups": [
    {
      "usrgrp_id": 7,
      "permission": 2
    }
  ],
}
```

## 2 Clock

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Clock* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Clock* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Clock* widget.

| Parameter               | type | name      | value   |
|-------------------------|------|-----------|---|
| <i>Refresh interval</i> | 0    | rf_rate   | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - (default) 15 minutes. |
| <i>Time type</i>        | 0    | time_type | 0 - (default) Local time;<br>1 - Server time;<br>2 - Host time.   |

The following parameters are supported if *Time type* is set to "Host time".

| Parameter                 | type | name   | value           |
|---------------------------|------|--------|-----------------|
| <b>Item</b><br>(required) | 4    | itemid | <b>Item</b> ID. |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Clock* widget. For more information on configuring a dashboard, see `dashboard.create`.

### Configuring a *Clock* widget

Configure a *Clock* widget that displays Zabbix server time.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "clock",
            "name": "Clock",
            "x": 0,
            "y": 0,
            "width": 4,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "time_type",
                "value": 1
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrpid": 7,
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": 1,
        "permission": 3
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```

    "result": {
      "dashboardids": [
        "3"
      ]
    },
    "id": 1
  }

```

### 3 Data overview

#### Attention:

This widget is deprecated and will be removed in the upcoming major release. Consider using the [Top hosts](#) widget instead.

#### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the [Data overview](#) widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify [built-in widgets](#) and create [custom widgets](#), but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Data overview* widget, please refer to the parameter requirements outlined in the tables below.

#### Parameters

The following parameters are supported for the *Data overview* widget.

| Parameter               | type | name     | value  |
|-------------------------|------|----------|--|
| <i>Refresh interval</i> | 0    | rf_rate  | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - <i>(default)</i> 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.   |
| <i>Host groups</i>      | 2    | groupids | <a href="#">Host group</a> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Hosts</i>            | 3    | hostids  | <a href="#">Host</a> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |

| Parameter  | type | name            | value   |
|--|------|-----------------|---|
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |                 |   |
| <i>Evaluation type</i>   | 0    | evaltype        | 0 - (default) And/Or;<br>2 - Or.  |
| <i>Tag name</i>  | 1    | tags.tag.0      | Any string value.   |
| <i>Operator</i>  | 0    | tags.operator.0 | Parameter <i>Tag name</i> required if configuring <i>Tags</i> .<br>0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist. |
| <i>Tag value</i>   | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.  |
| <i>Show suppressed problems</i>  | 0    | show_suppressed | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .<br>0 - (default) Disabled;<br>1 - Enabled.   |
| <i>Hosts location</i>  | 0    | style           | 0 - (default) Left;<br>1 - Top.   |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Data overview* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Data overview* widget

Configure a *Data overview* widget that displays data for host "10084" and only for items for which the tag with the name "component" contains value "cpu". In addition, display the data with hosts located on top.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "dataover",
            "name": "Data overview",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 3,
                "name": "hostids",
                "value": 10084
              },
              {
                "type": 1,
                "name": "tags.tag.0",
                "value": "component"
              },
              {
                "type": 0,
                "name": "tags.operator.0",
                "value": 0
              },
              {
                "type": 1,
                "name": "tags.value.0",
                "value": "cpu"
              },
              {
                "type": 0,
                "name": "style",
                "value": 1
              }
            ]
          }
        ]
      }
    ]
  },

#### 4 Discovery status

##### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Discovery status* widget in `dashboard.create` and `dashboard.update` methods.

##### Parameters

The following parameters are supported for the *Discovery status* widget.

| Parameter               | type | name    | value   |
|-------------------------|------|---------|---|
| <i>Refresh interval</i> | 0    | rf_rate | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |

##### Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Discovery status* widget. For more information on configuring a dashboard, see [dashboard.create](#).

##### Configuring *Discovery status* widget

Configure a *Discovery status* widget with the refresh interval set to 15 minutes.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "discovery",

```

```

        "name": "Discovery status",
        "x": 0,
        "y": 0,
        "width": 6,
        "height": 3,
        "view_mode": 0,
        "fields": [
            {
                "type": 0,
                "name": "rf_rate",
                "value": 900
            }
        ]
    },
    ],
    "userGroups": [
        {
            "usrgrpid": 7,

## 5 Favorite graphs

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Favorite graphs* widget in `dashboard.create` and `dashboard.update` methods.

### Parameters

The following parameters are supported for the *Favorite graphs* widget.

| Parameter               | type | name    | value  |
|-------------------------|------|---------|--|
| <i>Refresh interval</i> | 0    | rf_rate | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - ( <i>default</i> ) 15 minutes. |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Favorite graphs* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Favorite graphs* widget

Configure a *Favorite graphs* widget with the refresh interval set to 10 minutes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "favgraphs",
            "name": "Favorite graphs",
            "x": 0,
            "y": 0,
            "width": 4,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "rf_rate",
                "value": 600
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {

## 6 Favorite maps

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Favorite maps* widget in `dashboard.create` and `dashboard.update` methods.

### Parameters

The following parameters are supported for the *Favorite maps* widget.

| Parameter               | type | name    | value   |
|-------------------------|------|---------|---|
| <i>Refresh interval</i> | 0    | rf_rate | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - (default) 15 minutes. |

### Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Favorite maps* widget. For more information on configuring a dashboard, see [dashboard.create](#).

#### Configuring a *Favorite maps* widget

Configure a *Favorite maps* widget with the refresh interval set to 10 minutes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "favmaps",
            "name": "Favorite maps",
```

```

        "x": 0,
        "y": 0,
        "width": 4,
        "height": 3,
        "view_mode": 0,
        "fields": [
            {
                "type": 0,
                "name": "rf_rate",
                "value": 600
            }
        ]
    },
    ],
    "userGroups": [
        {
            "usrgrpid": 7,
            "permission": 2
        }
    ],
    "users": [
        {
            "userid": 1,
            "permission": 3
        }
    ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}

```

7 Geomap

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Geomap* widget in `dashboard.create` and `dashboard.update` methods.

**Attention:**

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Geomap* widget, please refer to the parameter requirements outlined in the tables below.

**Parameters**

The following parameters are supported for the *Geomap* widget.

| Parameter  | type | name       | value   |
|--|------|------------|---|
| <i>Refresh interval</i>  | 0    | rf_rate    | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.   |
| <i>Host groups</i>   | 2    | groupids   | <b>Host group</b> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Hosts</i>   | 3    | hostids    | <b>Host</b> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |            |   |
| <i>Evaluation type</i>   | 0    | evaltype   | 0 - (default) And/Or;<br>2 - Or.  |
| <i>Tag name</i>  | 1    | tags.tag.0 | Any string value.   |

Parameter *Tag name* required if configuring *Tags*.

| Parameter           | type | name            | value   |
|---------------------|------|-----------------|---|
| <i>Operator</i>     | 0    | tags.operator.0 | 0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist.  |
| <i>Tag value</i>    | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.  |
| <i>Initial view</i> | 1    | default_view    | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .<br>Comma separated <i>latitude</i> , <i>longitude</i> , <i>zoom level</i> (optional, valid values range from 0-30).<br>Example: 40.6892494,-74.0466891,10. |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Geomap* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Geomap* widget

Configure a *Geomap* widget that displays hosts from host groups "2" and "22" based on the following tag configuration: tag with the name "component" contains value "node", or tag with the name "location" equals value "New York". In addition, set the map initial view to coordinates "40.6892494" (latitude), "-74.0466891" (longitude) with the zoom level "10".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "geomap",
            "name": "Geomap",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 2,
                "name": "groupids",
                "value": 22
              },
              {
                "type": 2,
                "name": "groupids",
                "value": 2
              },
              {
                "type": 1,
                "name": "default_view",
                "value": "40.6892494,-74.0466891,10"
              }
            ]
          }
        ]
      }
    ]
  }
}
```

```

        "type": 0,

## 8 Graph

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Graph* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Graph* widget.

| Parameter               | type | name    | value  |
|-------------------------|------|---------|--|
| <i>Refresh interval</i> | 0    | rf_rate | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - <i>(default)</i> 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |

### Data set

The following parameters are supported for configuring a *Data set*.

#### Note:

The first number in the property name (e.g. `ds.hosts.0.0`, `ds.items.0.0`) represents the particular data set, while the second number, if present, represents the configured host or item.

| Parameter                         | type | name         | value   |
|-----------------------------------|------|--------------|---|
| <b>Host pattern</b><br>(required) | 1    | ds.hosts.0.0 | <b>Host</b> name or pattern (e.g. Zabbix*).   |
| <b>Item pattern</b><br>(required) | 1    | ds.items.0.0 | <b>Item</b> name or pattern (e.g. *: Number of processed *values per second).               |
| <i>Color</i>                      | 1    | ds.color.0   | Hexadecimal color code (e.g. FF0000).   |
| <i>Draw</i>                       | 0    | ds.type.0    | Default: FF465C.<br>0 - <i>(default)</i> Line;<br>1 - Points;<br>2 - Staircase;<br>3 - Bar. |

| Parameter                   | type | name                    | value  |
|-----------------------------|------|-------------------------|--|
| <i>Width</i>                | 0    | ds.width.0              | Valid values range from 1-10.<br><br>Default: 1.   |
| <i>Point size</i>           | 0    | ds.pointsize.0          | Parameter <i>Width</i> not available if <i>Draw</i> is set to "Points" or "Bar".<br>Valid values range from 1-10.<br><br>Default: 3.                     |
| <i>Transparency</i>         | 0    | ds.transparency.0       | Parameter <i>Point size</i> not available if <i>Draw</i> is set to "Line", "Staircase" or "Bar".<br>Valid values range from 1-10.<br><br>Default: 5.     |
| <i>Fill</i>                 | 0    | ds.fill.0               | Valid values range from 1-10.<br><br>Default: 3.   |
| <i>Missing data</i>         | 0    | ds.missingdatafunc.0    | Parameter <i>Fill</i> not available if <i>Draw</i> is set to "Points" or "Bar".<br>0 - (default) None;<br>1 - Connected;<br>2 - Treat as 0.              |
| <i>Y-axis</i>               | 0    | ds.axisy.0              | Parameter <i>Missing data</i> not available if <i>Draw</i> is set to "Points" or "Bar".<br>0 - (default) Left;<br>1 - Right.                             |
| <i>Time shift</i>           | 1    | ds.timeshift.0          | Valid time string (e.g. 3600, 1h, etc.).<br>You may use <b>time suffixes</b> . Negative values are also allowed.   |
| <i>Aggregation function</i> | 0    | ds.aggregate_function.0 | Default: "" (empty).<br>0 - (default) none;<br>1 - min;<br>2 - max;<br>3 - avg;<br>4 - count;<br>5 - sum;<br>6 - first;<br>7 - last.                     |
| <i>Aggregation interval</i> | 1    | ds.aggregate_interval.0 | Valid time string (e.g. 3600, 1h, etc.).<br>You may use <b>time suffixes</b> .   |
| <i>Aggregate</i>            | 0    | ds.aggregate_grouping.0 | Default: 1h.<br>0 (default) Each item;<br>1 - Data set.<br><br>Parameter <i>Aggregate</i> not available if <i>Aggregation function</i> is set to "none". |

#### Display options

The following parameters are supported for configuring *Display options*.

| Parameter                     | type | name   | value  |
|-------------------------------|------|--------|--|
| <i>History data selection</i> | 0    | source | 0 - (default) Auto;<br>1 - History;<br>2 - Trends. |

#### Time period

The following parameters are supported for configuring *Time period*.

| Parameter                     | type | name       | value   |
|-------------------------------|------|------------|---|
| <i>Set custom time period</i> | 0    | graph_time | 0 - (default) Disabled;<br>1 - Enabled.   |
| <i>From</i>                   | 1    | time_from  | Valid time string in format YYYY-MM-DD hh:mm:ss.<br><b>Relative time period</b> values (now, now/d, now/w-1w, etc.) are also supported.                           |
| <i>To</i>                     | 1    | time_to    | Default: now-1h.<br>Valid time string value in format YYYY-MM-DD hh:mm:ss.<br><b>Relative time period</b> values (now, now/d, now/w-1w, etc.) are also supported. |
|                               |      |            | Default: now.   |

## Axes

The following parameters are supported for configuring *Axes*.

| Parameter            | type | name                               | value   |
|----------------------|------|------------------------------------|---|
| <i>Left Y</i>        | 0    | lefty                              | 0 - Disabled;<br>1 - (default) Enabled.   |
| <i>Right Y</i>       | 0    | righty                             | Parameter available if Y-axis (in <i>Data set</i> configuration) is set to "Left".<br>0 - (default) Disabled;<br>1 - Enabled. |
| <i>Min</i>           | 1    | lefty_min                          | Parameter available if Y-axis (in <i>Data set</i> configuration) is set to "Right".<br>Any numeric value.                     |
| <i>Max</i>           | 1    | righty_min<br>lefty_max            | Default: "" (empty).<br>Any numeric value.  |
| <i>Units (type)</i>  | 0    | righty_max<br>lefty_units          | Default: "" (empty).<br>0 - (default) Auto;<br>1 - Static.  |
| <i>Units (value)</i> | 1    | righty_units<br>lefty_static_units | Any string value.   |
| <i>X-Axis</i>        | 0    | righty_static_units<br>xaxis       | Default: "" (empty).<br>0 - Disabled;<br>1 - (default) Enabled.   |

## Legend

The following parameters are supported for configuring *Legend*.

| Parameter             | type | name         | value                                   |
|-----------------------|------|--------------|---|
| <i>Show legend</i>    | 0    | legend       | 0 - Disabled;<br>1 - (default) Enabled. |
| <i>Number of rows</i> | 0    | legend_lines | Valid values range from 1-5.            |
|                       |      |              | Default: 1.                             |

## Problems

The following parameters are supported for configuring *Problems*.

| Parameter  | type | name                | value  |
|--|------|---------------------|--|
| <i>Show problems</i>   | 0    | show_problems       | 0 - (default) Disabled;<br>1 - Enabled.  |
| <i>Selected items only</i>   | 0    | graph_item_problems | 0 - Disabled;<br>1 - (default) Enabled.  |
| <i>Problem hosts</i>   | 1    | problemhosts.0      | Host name.<br><br>Note: The number in the property name references the configured host.<br>To configure multiple hosts, create a dashboard widget field object for each host.  |
| <i>Severity</i>  | 0    | severities          | 0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster.<br><br>Default: empty (all enabled).   |
| <i>Problem Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) | 1    | problem_name        | Note: To configure multiple values, create a dashboard widget field object for each value.<br>Problem <b>event name</b> (case insensitive, full name or part of it).   |
| <i>Evaluation type</i>   | 0    | evaltype            | 0 - (default) And/Or;<br>2 - Or.   |
| <i>Tag name</i>  | 1    | tags.tag.0          | Any string value.  |
| <i>Operator</i>  | 0    | tags.operator.0     | Parameter <i>Tag name</i> required if configuring <i>Tags</i> .<br>0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist.<br><br>Parameter <i>Operator</i> required if configuring <i>Tags</i> . |

| Parameter  | type | name         | value             |
|--|------|--------------|-------------------|
| <i>Tag value</i>   | 1    | tags.value.0 | Any string value. |
| Parameter <i>Tag value</i> required if configuring <i>Tags</i> . |      |              |                   |

## Overrides

The following parameters are supported for configuring *Overrides*.

### Note:

The first number in the property name (e.g. or.hosts.0.0, or.items.0.0) represents the particular data set, while the second number, if present, represents the configured host or item.

| Parameter                         | type | name                 | value   |
|-----------------------------------|------|----------------------|---|
| <b>Host pattern</b><br>(required) | 1    | or.hosts.0.0         | <b>Host</b> name or pattern (e.g. Zabbix*).   |
| <b>Item pattern</b><br>(required) | 1    | or.items.0.0         | <b>Item</b> name or pattern (e.g. *: Number of processed *values per second).                               |
| <i>Base color</i>                 | 1    | or.color.0           | Hexadecimal color code (e.g. FF0000).   |
| <i>Width</i>                      | 0    | or.width.0           | Valid values range from 1-10.   |
| <i>Draw</i>                       | 0    | or.type.0            | 0 - Line;<br>1 - Points;<br>2 - Staircase;<br>3 - Bar.  |
| <i>Transparency</i>               | 0    | or.transparency.0    | Valid values range from 1-10.   |
| <i>Fill</i>                       | 0    | or.fill.0            | Valid values range from 1-10.   |
| <i>Point size</i>                 | 0    | or.pointsize.0       | Valid values range from 1-10.   |
| <i>Missing data</i>               | 0    | or.missingdatafunc.0 | 0 - None;<br>1 - Connected;<br>2 - Treat as 0.  |
| <i>Y-axis</i>                     | 0    | or.axisy.0           | 0 - Left;<br>1 - Right.   |
| <i>Time shift</i>                 | 1    | or.timeshift.0       | Valid time string (e.g. 3600, 1h, etc.).<br>You may use <b>time suffixes</b> . Negative values are allowed. |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Graph* widget

Configure a *Graph* widget in the following way:

- 4 data sets for a total of 9 items on 1 host.
- Each data set consists of a line that has a custom color, width, transparency, and fill.
- Data set 4 has a configured aggregation.
- Data in the graph are displayed for a time period of the last 3 hours.
- Problems in the graph are displayed only for the configured items.
- Graph has two Y axes of which the right Y axis displays values only for Data set 4.
- Graph legend displays configured items in 2 rows.

## 9 Graph (classic)

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Graph (classic)* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph (classic)* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Graph (classic)* widget.

| Parameter               | type | name        | value   |
|-------------------------|------|-------------|---|
| <i>Refresh interval</i> | 0    | rf_rate     | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |
| <i>Source</i>           | 0    | source_type | 0 - (default) Graph;<br>1 - Simple graph.   |
| <i>Graph</i>            | 6    | graphid     | <b>Graph</b> ID.  |
| <i>Item</i>             | 4    | itemid      | Parameter <i>Graph</i> required if <i>Source</i> is set to "Graph".<br><b>Item</b> ID.  |
| <i>Show legend</i>      | 0    | show_legend | Parameter <i>Item</i> required if <i>Source</i> is set to "Simple graph".<br>0 - Disabled;<br>1 - (default) Enabled.                              |
| <i>Dynamic item</i>     | 0    | dynamic     | 0 - (default) Disabled;<br>1 - Enabled.   |

### Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph (classic)* widget. For more information on configuring a dashboard, see [dashboard.create](#).

#### Configuring a *Graph (classic)* widget

Configure a *Graph (classic)* widget that displays a simple graph for the item "42269".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "graph",
            "name": "Graph (classic)",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "source_type",
                "value": 1
              },
              {
                "type": 4,
                "name": "itemid",
                "value": 42269
              }
            ]
          }
        ]
      }
    ]
  },
  "userGroups": [
    {
      "usrgrpid": 7,
      "permission": 2
    }
  ],

## 10 Graph prototype

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Graph prototype* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph prototype* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Graph prototype* widget.

| Parameter               | type | name        | value   |
|-------------------------|------|-------------|---|
| <i>Refresh interval</i> | 0    | rf_rate     | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |
| <i>Source</i>           | 0    | source_type | 2 - (default) Graph prototype;<br>3 - Simple graph prototype.   |
| <i>Graph prototype</i>  | 7    | graphid     | <b>Graph prototype</b> ID.<br><br>Parameter <i>Graph prototype</i> required if <i>Source</i> is set to "Graph prototype".                         |
| <i>Item prototype</i>   | 5    | itemid      | <b>Item prototype</b> ID.<br><br>Parameter <i>Item prototype</i> required if <i>Source</i> is set to "Simple graph prototype".                    |
| <i>Show legend</i>      | 0    | show_legend | 0 - Disabled;<br>1 - (default) Enabled.   |
| <i>Dynamic item</i>     | 0    | dynamic     | 0 - (default) Disabled;<br>1 - Enabled.   |
| <i>Columns</i>          | 0    | columns     | Valid values range from 1-24.   |
| <i>Rows</i>             | 0    | rows        | Default: 2.<br>Valid values range from 1-16.  |
|                         |      |             | Default: 1.   |

### Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph prototype* widget. For more information on configuring a dashboard, see [dashboard.create](#).

#### Configuring a *Graph prototype* widget

Configure a *Graph prototype* widget that displays a grid of 3 graphs (3 columns, 1 row) created from an item prototype (ID: "42316") by low-level discovery.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "graphprototype",
            "name": "Graph prototype",
            "x": 0,
            "y": 0,
            "width": 16,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "source_type",
                "value": 3
              },
              {
                "type": 5,
                "name": "itemid",
                "value": 42316
              },
              {
                "type": 0,
                "name": "columns",
                "value": 3
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrpid": 7,
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": 1,
        "permission": 3
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  }
}

```

```

    ],
    "id": 1
}

## 11 Host availability

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Host availability* widget in `dashboard.create` and `dashboard.update` methods.

### Parameters

The following parameters are supported for the *Host availability* widget.

| Parameter                        | type | name           | value  |
|----------------------------------|------|----------------|--|
| <i>Refresh interval</i>          | 0    | rf_rate        | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - ( <i>default</i> ) 15 minutes.   |
| <i>Host groups</i>               | 2    | groupids       | <i>Host group</i> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.  |
| <i>Interface type</i>            | 0    | interface_type | 0 - None;<br>1 - Zabbix agent;<br>2 - SNMP;<br>3 - IPMI;<br>4 - JMX.<br><br>Default: 1, 2, 3, 4 (all enabled).<br><br>Note: To configure multiple values, create a dashboard widget field object for each value. |
| <i>Layout</i>                    | 0    | layout         | 0 - ( <i>default</i> ) Horizontal;<br>1 - Vertical.  |
| <i>Show hosts in maintenance</i> | 0    | maintenance    | 0 - ( <i>default</i> ) Disabled;<br>1 - Enabled.   |

### Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host availability* widget. For more information on configuring a dashboard, see [dashboard.create](#).

#### Configuring a *Host availability* widget

Configure a *Host availability* widget that displays availability information (in a vertical layout) for hosts in host group "4" with "Zabbix agent" and "SNMP" interfaces configured.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",

```

```

"params": {
  "name": "My dashboard",
  "display_period": 30,
  "auto_start": 1,
  "pages": [
    {
      "widgets": [
        {
          "type": "hostavail",
          "name": "Host availability",
          "x": 0,
          "y": 0,
          "width": 6,
          "height": 3,
          "view_mode": 0,
          "fields": [

12 Item value

## Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Item value* widget in `dashboard.create` and `dashboard.update` methods.

### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item value* widget, please refer to the parameter requirements outlined in the tables below.

## Parameters

The following parameters are supported for the *Item value* widget.

| Parameter                     | type | name     | value  |
|-------------------------------|------|----------|--|
| <i>Refresh interval</i>       | 0    | rf_rate  | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - <i>(default)</i> 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |
| <b>Item</b><br>(required)     | 4    | itemid   | <b>Item</b> ID.  |
| <i>Show</i>                   | 0    | show     | 1 - Description;<br>2 - Value;<br>3 - Time;<br>4 - Change indicator.<br><br>Default: 1, 2, 3, 4 (all enabled).   |
| <i>Dynamic item</i>           | 0    | dynamic  | Note: To configure multiple values, create a dashboard widget field object for each value.<br>0 - <i>(default)</i> Disabled;<br>1 - Enabled.             |
| <i>Advanced configuration</i> | 0    | adv_conf | 0 - <i>(default)</i> Disabled;<br>1 - Enabled.   |

## Advanced configuration

The following parameters are supported if *Advanced configuration* is set to "Enabled".

| Parameter               | type | name     | value   |
|-------------------------|------|----------|---|
| <i>Background color</i> | 1    | bg_color | Hexadecimal color code (e.g. FF0000).<br><br>Default: "" (empty). |

## Description

The following parameters are supported if *Advanced configuration* is set to "Enabled", and *Show* is set to "Description".

| Parameter                  | type | name        | value  |
|----------------------------|------|-------------|--|
| <i>Description</i>         | 1    | description | Any string value, including macros.<br>Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, User macros.<br><br>Default: {ITEM.NAME}.  |
| <i>Horizontal position</i> | 0    | desc_h_pos  | 0 - Left;<br>1 - <i>(default)</i> Center;<br>2 - Right.  |
| <i>Vertical position</i>   | 0    | desc_v_pos  | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> .<br>0 - Top;<br>1 - Middle;<br>2 - <i>(default)</i> Bottom. |
| <i>Size</i>                | 0    | desc_size   | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> .<br>Valid values range from 1-100.                          |
| <i>Bold</i>                | 0    | desc_bold   | Default: 15.<br>0 - <i>(default)</i> Disabled;<br>1 - Enabled.   |
| <i>Color</i>               | 1    | desc_color  | Hexadecimal color code (e.g. FF0000).<br><br>Default: "" (empty).  |

## Value

The following parameters are supported if *Advanced configuration* is set to "Enabled", and *Show* is set to "Value".

| Parameter                  | type | name           | value   |
|----------------------------|------|----------------|---|
| <i>Decimal places</i>      |      |                |   |
| <i>Decimal places</i>      | 0    | decimal_places | Valid values range from 1-10.   |
| <i>Size</i>                | 0    | decimal_size   | Default: 2.<br>Valid values range from 1-100.   |
| <i>Position</i>            |      |                | Default: 35.  |
| <i>Horizontal position</i> | 0    | value_h_pos    | 0 - Left;<br>1 - <i>(default)</i> Center;<br>2 - Right.   |
|                            |      |                | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> . |

| Parameter                | type | name        | value   |
|--------------------------|------|-------------|---|
| <i>Vertical position</i> | 0    | value_v_pos | 0 - Top;<br>1 - (default) Middle;<br>2 - Bottom.  |
| <i>Size</i>              | 0    | value_size  | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> .<br>Valid values range from 1-100. |
| <i>Bold</i>              | 0    | value_bold  | Default: 45.<br>0 - Disabled;<br>1 - (default) Enabled.   |
| <i>Color</i>             | 1    | value_color | Hexadecimal color code (e.g. FF0000).   |
| <i>Units</i>             |      |             | Default: "" (empty).  |
| <i>Units</i> (checkbox)  | 0    | units_show  | 0 - Disabled;<br>1 - (default) Enabled.   |
| <i>Units</i> (value)     | 1    | units       | Any string value.   |
| <i>Position</i>          | 0    | units_pos   | 0 - Before value;<br>1 - Above value;<br>2 - (default) After value;<br>3 - Below value.   |
| <i>Size</i>              | 0    | units_size  | Valid values range from 1-100.  |
| <i>Bold</i>              | 0    | units_bold  | Default: 35.<br>0 - Disabled;<br>1 - (default) Enabled.   |
| <i>Color</i>             | 1    | units_color | Hexadecimal color code (e.g. FF0000).   |
|                          |      |             | Default: "" (empty).  |

## Time

The following parameters are supported if *Advanced configuration* is set to "Enabled", and *Show* is set to "Time".

| Parameter                  | type | name       | value   |
|----------------------------|------|------------|---|
| <i>Horizontal position</i> | 0    | time_h_pos | 0 - Left;<br>1 - (default) Center;<br>2 - Right.  |
| <i>Vertical position</i>   | 0    | time_v_pos | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> .<br>0 - (default) Top;<br>1 - Middle;<br>2 - Bottom. |
| <i>Size</i>                | 0    | time_size  | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> .<br>Valid values range from 1-100.                   |
| <i>Bold</i>                | 0    | time_bold  | Default: 15.<br>0 - (default) Disabled;<br>1 - Enabled.   |
| <i>Color</i>               | 1    | time_color | Hexadecimal color code (e.g. FF0000).   |
|                            |      |            | Default: "" (empty).  |

## Change indicator

The following parameters are supported if *Advanced configuration* is set to "Enabled", and *Show* is set to "Change indicator".

| Parameter                | type | name         | value   |
|--------------------------|------|--------------|---|
| Change indicator ↑ color | 1    | up_color     | Hexadecimal color code (e.g. FF0000).<br><br>Default: "" (empty). |
| Change indicator ↓ color | 1    | down_color   | Hexadecimal color code (e.g. FF0000).<br><br>Default: "" (empty). |
| Change indicator ↕ color | 1    | updown_color | Hexadecimal color code (e.g. FF0000).<br><br>Default: "" (empty). |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item value* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring an *Item value* widget

Configure an *Item value* widget that displays the item value for the item "42266" (Zabbix agent availability). In addition, visually fine-tune the widget with multiple advanced options.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "item",
            "name": "Item value",
            "x": 0,
            "y": 0,
            "width": 4,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 4,
                "name": "itemid",
                "value": 42266
              },
              {
                "type": 0,
                "name": "show",
                "value": 1
              },
              {
                "type": 0,
                "name": "show",
                "value": 2
              },
              {
                "type": 0,
                "name": "show",
                "value": 3
              }

13 Map

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Map* widget in `dashboard.create` and `dashboard.update` methods.

**Attention:**

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Map* widget, please refer to the parameter requirements outlined in the tables below.

## Parameters

The following parameters are supported for the *Map* widget.

| Parameter                      | type | name                    | value   |
|--------------------------------|------|-------------------------|---|
| <i>Refresh interval</i>        | 0    | rf_rate                 | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - (default) 15 minutes.   |
| <i>Source type</i>             | 0    | source_type             | 1 - (default) Map;<br>2 - Map navigation tree.  |
| <i>Map</i>                     | 8    | sysmapid                | <b>Map</b> ID.  |
| <i>Linked widget reference</i> | 1    | filter_widget_reference | Parameter <i>Map</i> required if <i>Source type</i> is set to "Map".<br>Valid <b>Map navigation tree</b> widget parameter <i>Reference</i> value.<br><br>Parameter <i>Linked widget reference</i> required if <i>Source type</i> is set to "Map navigation tree". |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Map* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *Map* widget

Configure a *Map* widget that displays the map "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "map",
            "name": "Map",
            "x": 0,
            "y": 0,
            "width": 18,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 8,
                "name": "sysmapid",
                "value": 1
              }
            ]
          }
        ]
      }
    ]
  }
}
```

```

    }
  ],
  "userGroups": [
    {
      "usrgrpid": 7,
      "permission": 2
    }
  ],
  "users": [
    {
      "userid": 1,
      "permission": 3
    }
  ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

Configuring a linked *Map* widget

Configure a *Map* widget that is linked to a *Map navigation tree* widget.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "map",
            "name": "Map",
            "x": 0,
            "y": 5,
            "width": 18,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "source_type",
                "value": 2
              },
              {
                "type": 1,

```

```

        "name": "filter_widget_reference",
        "value": "ABCDE"
    }
]
},
{
    "type": "navtree",
    "name": "Map navigation tree",
    "x": 0,
    "y": 0,
    "width": 6,
    "height": 5,
    "view_mode": 0,
    "fields": [
        {
            "type": 1,
            "name": "navtree.name.1",
            "value": "Element A"
        },
        {
            "type": 1,
            "name": "navtree.name.2",
            "value": "Element B"
        },
        {
            "type": 1,
            "name": "navtree.name.3",

14 Map navigation tree

## Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Map navigation tree* widget in `dashboard.create` and `dashboard.update` methods.

### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Map navigation tree* widget, please refer to the parameter requirements outlined in the tables below.

## Parameters

The following parameters are supported for the *Map navigation tree* widget.

| Parameter  | type | name             | value   |
|--|------|------------------|---|
| <i>Refresh interval</i>  | 0    | rf_rate          | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - (default) 15 minutes. |
| <i>Show unavailable maps</i>   | 1    | show_unavailable | 0 - (default) Disabled;<br>1 - Enabled.   |
| <i>Reference</i>   | 1    | reference        | Any string value consisting of 5 characters (e.g. ABCDE, JBPNL, etc.).  |
| Parameter <i>Reference</i> value is used in the <i>Map</i> widget ( <i>Linked widget reference</i> ) for linking with the <i>Map navigation tree</i> widget. |      |                  |   |

The following parameters are supported for configuring map navigation tree elements.

| Parameter  | type | name               | value   |
|--|------|--------------------|---|
| <i>Name</i>                                      | 1    | navtree.name.1     | Any string value.   |
| <i>Linked map</i>                                | 8    | navtree.sysmapid.1 | Note: The number in the property name sets the element number.<br><b>Map</b> ID.  |
| <i>Parameters for creating element hierarchy</i> | 0    | navtree.parent.1   | Note: The number in the property name references the element to which the map is linked.<br>Parent element number.  |
|  | 0    | navtree.order.1    | Note: The number in the property name references the child element.<br>The property value references the parent element.<br>Element position in the map navigation tree.  |
|  |      |                    | Note: The number in the property name references the element number. The property value references the element position in the map navigation tree. Parent element position is determined within the whole map navigation tree. Child element position is determined within the parent element. |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Map navigation tree* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Map navigation tree* widget

Configure a *Map navigation tree* widget that displays the following map navigation tree:

- Element A
  - Element A1
  - Element A2
- Element B
  - Element B1 (contains linked map "1" that can be displayed in a *linked Map widget*)
  - Element B2
- Element C

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {

15 Plain text

## Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Plain text* widget in `dashboard.create` and `dashboard.update` methods.

### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Plain text* widget, please refer to the parameter requirements outlined in the tables below.

## Parameters

The following parameters are supported for the *Plain text* widget.

| Parameter                  | type | name         | value  |
|----------------------------|------|--------------|--|
| <i>Refresh interval</i>    | 0    | rf_rate      | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - <i>(default)</i> 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |
| <b>Items</b><br>(required) | 4    | itemids      | <b>Item</b> ID.<br><br>Note: To configure multiple items, create a dashboard widget field object for each item.  |
| <i>Items location</i>      | 0    | style        | 0 - <i>(default)</i> Left;<br>1 - Top.   |
| <i>Show lines</i>          | 0    | show_lines   | Valid values range from 1-100.   |
| <i>Show text as HTML</i>   | 0    | show_as_html | Default: 25.<br>0 - <i>(default)</i> Disabled;<br>1 - Enabled.   |
| <i>Dynamic item</i>        | 0    | dynamic      | 0 - <i>(default)</i> Disabled;<br>1 - Enabled.   |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Plain text* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Plain text* widget

Configure a *Plain text* widget that displays latest data for items "42269" and "42253". In addition, configure the item names to be located at the top of the data columns, and only 15 lines of data to be displayed.

Request:

```

{
  "jsonrpc": "2.0",

## 16 Problem hosts

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Problem hosts* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problem hosts* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Problem hosts* widget.

| Parameter                  | type | name             | value   |
|----------------------------|------|------------------|---|
| <i>Refresh interval</i>    | 0    | rf_rate          | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.   |
| <i>Host groups</i>         | 2    | groupids         | <b>Host group</b> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Exclude host groups</i> | 2    | exclude_groupids | <b>Host group</b> ID.<br><br>Note: To exclude multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Hosts</i>               | 3    | hostids          | <b>Host</b> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |
| <i>Problem</i>             | 1    | problem          | Problem <b>event name</b> (case insensitive, full name or part of it).  |

| Parameter  | type | name            | value  |
|--|------|-----------------|--|
| Severity   | 0    | severities      | 0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster.<br><br>Default: empty (all enabled).<br><br>Note: To configure multiple values, create a dashboard widget field object for each value. |
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |                 |  |
| <i>Evaluation type</i>   | 0    | evaltype        | 0 - (default) And/Or;<br>2 - Or.   |
| <i>Tag name</i>  | 1    | tags.tag.0      | Any string value.  |
| <i>Operator</i>  | 0    | tags.operator.0 | Parameter <i>Tag name</i> required if configuring <i>Tags</i> .<br>0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist.  |
| <i>Tag value</i>   | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.   |
| <i>Show suppressed problems</i>  | 0    | show_suppressed | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .<br>0 - (default) Disabled;<br>1 - Enabled.  |

| Parameter                     | type | name              | value  |
|-------------------------------|------|-------------------|--|
| Hide groups with-out problems | 0    | hide_empty_groups | 0 - (default) Disabled;<br>1 - Enabled.                          |
| Problem display               | 0    | ext_ack           | 0 - (default) All;<br>1 - Unacknowledged only;<br>2 - Separated. |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problem hosts* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Problem hosts* widget

Configure a *Problem hosts* widget that displays hosts from host groups "2" and "4" that have problems with a name that includes the string "CPU" and that have the following severities: "Warning", "Average", "High", "Disaster".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "problemhosts",
            "name": "Problem hosts",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 2,
                "name": "groupids",
                "value": 2
              },
              {
                "type": 2,
                "name": "groupids",
                "value": 4
              },
              {
                "type": 1,
                "name": "problem",
                "value": "cpu"
              },
              {
                "type": 0,
                "name": "severities",
                "value": 2
              },
              {
                "type": 0,
```

```

        "name": "severities",
        "value": 3
    },
    {
        "type": 0,
        "name": "severities",
        "value": 4
    },
    {
        "type": 0,
        "name": "severities",
        "value": 5
    }
]
}
],

17 Problems

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Problems* widget in `dashboard.create` and `dashboard.update` methods.

**Attention:**

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problems* widget, please refer to the parameter requirements outlined in the tables below.

**Parameters**

The following parameters are supported for the *Problems* widget.

| Parameter                  | type   | name                  | value  |
|----------------------------|--------|-----------------------|--|
| <i>Refresh interval</i>    | 0      | rf_rate               | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.  |
| <i>Show</i>                | 0      | show                  | 1 - (default) Recent problems;<br>2 - History;<br>3 - Problems.  |
| <i>Host groups</i>         | 2      | groupids              | <b>Host group</b> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.  |
| <i>Exclude host groups</i> | 2      | exclude_groupids      | <b>Host group</b> ID.<br><br>Note: To exclude multiple host groups, create a dashboard widget field object for each host group.  |
| <i>Hosts</i>               | 3      | hostids               | <b>Host</b> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to.                              |
| <i>Problem Severity</i>    | 1<br>0 | problem<br>severities | Problem <b>event name</b> (case insensitive, full name or part of it).<br>0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster.<br><br>Default: empty (all enabled).<br><br>Note: To configure multiple values, create a dashboard widget field object for each value. |

| Parameter  | type | name            | value  |
|--|------|-----------------|--|
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |                 |  |
| <i>Evaluation type</i>   | 0    | evaltype        | 0 - (default) And/Or;<br>2 - Or.   |
| <i>Tag name</i>  | 1    | tags.tag.0      | Any string value.  |
| <i>Operator</i>  | 0    | tags.operator.0 | Parameter <i>Tag name</i> required if configuring <i>Tags</i> .<br>0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist.                                    |
| <i>Tag value</i>   | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.   |
| <i>Show tags</i>   | 0    | show_tags       | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .<br>0 - (default) None;<br>1 - 1;<br>2 - 2;<br>3 - 3.  |
| <i>Tag name (format)</i>   | 0    | tag_name_format | 0 - (default) Full;<br>1 - Shortened;<br>2 - None.   |
| <i>Tag display priority</i>  | 1    | tag_priority    | Parameter <i>Tag name (format)</i> not available if <i>Show tags</i> is set to "None".<br>Comma-separated list of tags.<br><br>Parameter <i>Tag display priority</i> not available if <i>Show tags</i> is set to "None". |

| Parameter                | type | name            | value  |
|--------------------------|------|-----------------|--|
| Show operational data    | 0    | show_opdata     | 0 - (default) None;<br>1 - Separately;<br>2 - With problem name.   |
| Show suppressed problems | 0    | show_suppressed | 0 - (default) Disabled;<br>1 - Enabled.  |
| Show unacknowledged only | 0    | unacknowledged  | 0 - (default) Disabled;<br>1 - Enabled.  |
| Sort entries by          | 0    | sort_triggers   | 1 - Severity (descending);<br>2 - Host (ascending);<br>3 - Time (ascending);<br>4 - (default) Time (descending);<br>13 - Severity (ascending);<br>14 - Host (descending);<br>15 - Problem (ascending);<br>16 - Problem (descending). |
| Show timeline            | 0    | show_timeline   | For all values, except "Time (descending)" and "Time (ascending)", the parameter <i>Show timeline</i> must be set to "Disabled".<br>0 - Disabled;<br>1 - (default) Enabled.  |
| Show lines               | 0    | show_lines      | Parameter <i>Show timeline</i> available if <i>Sort entries by</i> is set to "Time (descending)" or "Time (ascending)".<br>Valid values range from 1-100.<br><br>Default: 25.  |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problems* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Problems* widget

Configure a *Problems* widget that displays problems for host group "4" that satisfy the following conditions:

- Problems that have a tag with the name "scope" that contains values "performance" or "availability", or "capacity".
- Problems that have the following severities: "Warning", "Average", "High", "Disaster".

In addition, configure the widget to show tags and operational data.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
```

```

## 18 Problems by severity

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Problems by severity* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problems by severity* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Problems by severity* widget.

| Parameter                  | type   | name                            | value  |
|----------------------------|--------|---------------------------------|--|
| <i>Refresh interval</i>    | 0      | <code>rf_rate</code>            | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.  |
| <i>Host groups</i>         | 2      | <code>groupids</code>           | <b>Host group</b> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.  |
| <i>Exclude host groups</i> | 2      | <code>exclude_groupids</code>   | <b>Host group</b> ID.<br><br>Note: To exclude multiple host groups, create a dashboard widget field object for each host group.  |
| <i>Hosts</i>               | 3      | <code>hostids</code>            | <b>Host</b> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to.                              |
| <i>Problem Severity</i>    | 1<br>0 | <code>problem severities</code> | Problem <b>event name</b> (case insensitive, full name or part of it).<br>0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster.<br><br>Default: empty (all enabled).<br><br>Note: To configure multiple values, create a dashboard widget field object for each value. |

| Parameter  | type | name            | value   |
|--|------|-----------------|---|
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |                 |   |
| <i>Evaluation type</i>   | 0    | evaltype        | 0 - (default) And/Or;<br>2 - Or.  |
| <i>Tag name</i>  | 1    | tags.tag.0      | Any string value.   |

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problems by severity* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Problems by severity* widget

Configure a *Problems by severity* widget that displays problem totals for all host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "problemsbysv",
            "name": "Problems by severity",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "show_type",
                "value": 1
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrp_id": 7,
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": 1,
        "permission": 3
      }
    ]
  }
}
```

```

    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

## 19 SLA report

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the **SLA report** widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *SLA report* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *SLA report* widget.

| Parameter                | type | name         | value   |
|--------------------------|------|--------------|---|
| <i>Refresh interval</i>  | 0    | rf_rate      | 0 - (default) No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.           |
| <b>SLA</b><br>(required) | 10   | slaid        | <b>SLA</b> ID.  |
| <i>Service</i>           | 9    | serviceid    | <b>Service</b> ID.  |
| <i>Show periods</i>      | 0    | show_periods | Valid values range from 1-100.  |
| <i>From</i>              | 1    | date_from    | Default: 20.<br>Valid date string in format YYYY-MM-DD.<br><b>Relative dates</b> with modifiers d, w, M, y (e.g. now, now/d, now/w-1w, etc.) are supported. |
| <i>To</i>                | 1    | date_to      | Valid date string in format YYYY-MM-DD.<br><b>Relative dates</b> with modifiers d, w, M, y (e.g. now, now/d, now/w-1w, etc.) are supported.                 |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *SLA report* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring an *SLA report* widget

Configure an *SLA report* widget that displays the SLA report for SLA "4" service "2" for the period of last 30 days.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "slareport",
            "name": "SLA report",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 10,
                "name": "slaid",
                "value": 4
              },
              {
                "type": 9,
                "name": "serviceid",
                "value": 2
              },
              {
                "type": 1,
                "name": "date_from",
                "value": "now-30d"
              },
              {
                "type": 1,
                "name": "date_to",
                "value": "now"
              }
            ]
          }
        ]
      }
    ]
  },
  "userGroups": [
    {
      "usrgrpId": 7,
      "permission": 2
    }
  ],
  "users": [
    {
      "userid": 1,
      "permission": 3
    }
  ]
}
```

```

    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

## 20 System information

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *System Information* widget in `dashboard.create` and `dashboard.update` methods.

### Parameters

The following parameters are supported for the *System Information* widget.

| Parameter               | type | name      | value   |
|-------------------------|------|-----------|---|
| <i>Refresh interval</i> | 0    | rf_rate   | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - (default) 15 minutes. |
| <i>Show</i>             | 0    | info_type | 0 - (default) System stats;<br>1 - High availability nodes.   |

### Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *System information* widget. For more information on configuring a dashboard, see [dashboard.create](#).

#### Configuring a *System information* widget

Configure a *System information* widget that displays system stats with a refresh interval of 10 minutes.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,

```

```

    "pages": [
      {
        "widgets": [
          {
            "type": "systeminfo",
            "name": "System information",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "rf_rate",
                "value": 600
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrpid": 7,
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": 1,
        "permission": 3
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

21 Top hosts

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Top hosts* widget in `dashboard.create` and `dashboard.update` methods.

**Attention:**

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top hosts* widget, please refer to the parameter requirements outlined in the tables below.

**Parameters**

The following parameters are supported for the *Top Hosts* widget.

| Parameter   | type | name       | value   |
|---|------|------------|---|
| <i>Refresh interval</i>   | 0    | rf_rate    | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.   |
| <i>Host groups</i>  | 2    | groupids   | <b>Host group</b> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Hosts</i>  | 3    | hostids    | <b>Host</b> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |
| <i>Host Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |            |   |
| <i>Evaluation type</i>  | 0    | evaltype   | 0 - (default) And/Or;<br>2 - Or.  |
| <i>Tag name</i>   | 1    | tags.tag.0 | Any string value.   |

Parameter *Tag name* required if configuring *Tags*.

| Parameter                     | type | name            | value  |
|-------------------------------|------|-----------------|--|
| <i>Operator</i>               | 0    | tags.operator.0 | 0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist. |
| <i>Tag value</i>              | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.                               |
| <i>Columns</i><br>(see below) |      |                 | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .   |
| <i>Order</i>                  | 0    | order           | 2 - (default) Top N;<br>3 - Bottom N.  |
| <i>Order column</i>           | 0    | column          | Column numeric value from the configured columns.  |
| <i>Host count</i>             | 0    | count           | Valid values range from 1-100.<br><br>Default: 10.   |

## Columns

Columns have common parameters and additional parameters depending on the configuration of the parameter *Data*.

### Note:

For all parameters related to columns the number in the property name (e.g. columns.name.0) references a column for which the parameter is configured.

The following parameters are supported for all columns.

| Parameter                       | type | name                 | value  |
|---------------------------------|------|----------------------|--|
| <i>Name</i>                     | 1    | columns.name.0       | Any string value.                              |
| <b>Data</b><br>(required)       | 0    | columns.data.0       | 1 - Item value;<br>2 - Host name;<br>3 - Text. |
| <b>Base color</b><br>(required) | 1    | columns.base_color.0 | Hexadecimal color code (e.g. FF0000).          |

## Item value

The following parameters are supported if *Data* is set to "Item value".

### Note:

The first number in the *Thresholds* property name (e.g. columnsthresholds.color.0.0) references the column for which thresholds are configured, while the second number references threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g. "threshold.threshold.0": "5" → "threshold.threshold.0": "1"; "threshold.threshold.1": "1" → "threshold.threshold.1": "5").

| Parameter                       | type | name                | value  |
|---------------------------------|------|---------------------|--|
| <i>Item</i>                     | 1    | columns.item.0      | Valid item name.   |
| <b>Time shift</b><br>(required) | 1    | columns.timeshift.0 | Valid numeric or time string value (e.g. 3600 or 1h).<br>You may use <b>time suffixes</b> . Negative values are allowed. |

| Parameter                   | type | name                        | value   |
|-----------------------------|------|-----------------------------|---|
| <i>Aggregation function</i> | 0    | columns.aggregate_function  | On <i>default</i> none;<br>1 - min;<br>2 - max;<br>3 - avg;<br>4 - count;<br>5 - sum;<br>6 - first;<br>7 - last.  |
| <i>Aggregation interval</i> | 1    | columns.aggregate_interval  | Valid string (e.g. 3600, 1h, etc.).<br>You may use <b>time suffixes</b> .<br><br>Parameter <i>Aggregation interval</i> not available if <i>Aggregation function</i> is set to <i>none</i> . |
| <i>Display</i>              | 0    | columns.display             | Default: 1h.<br>1 - (default) As is;<br>2 - Bar;<br>3 - Indicators.   |
| <i>Min</i>                  | 1    | columns.min                 | Any numeric value.  |
| <i>Max</i>                  | 1    | columns.max                 | Parameter <i>Min</i> not available if <i>Display</i> is set to "As is".<br>Any numeric value.   |
| <i>History data</i>         | 0    | columns.history             | Parameter <i>Max</i> not available if <i>Display</i> is set to "As is".<br>1 - (default) Auto;<br>2 - History;<br>3 - Trends.   |
| <i>Thresholds Color</i>     | 1    | columnsthresholds.color     | Hexadecimal color code (e.g. FF0000).   |
| <i>Threshold</i>            | 1    | columnsthresholds.threshold | Default: "" (empty).<br>Any string value.   |

## Text

The following parameters are supported if *Data* is set to "Text".

| Parameter   | type | name         | value  |
|-------------|------|--------------|--|
| <i>Text</i> | 1    | columns.text | Any string value, including macros.<br>Supported macros: {HOST.*}, {INVENTORY.*}.<br><br>Parameter <i>Text</i> required if <i>Data</i> is set to "Text". |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top hosts* widget. For more information on configuring a dashboard, see **dashboard.create**.

### Configuring a *Top hosts* widget

Configure a *Top hosts* widget that displays top hosts by CPU utilization in host group "4". In addition, configure the following custom columns: "Host name", "Utilization", "1m avg", "5m avg", "15m avg", "Processes".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
```

```

## 22 Trigger overview

### Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Trigger overview* widget in `dashboard.create` and `dashboard.update` methods.

#### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Trigger overview* widget, please refer to the parameter requirements outlined in the tables below.

### Parameters

The following parameters are supported for the *Trigger Overview* widget.

| Parameter               | type | name     | value   |
|-------------------------|------|----------|---|
| <i>Refresh interval</i> | 0    | rf_rate  | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.   |
| <i>Show</i>             | 0    | show     | 1 - (default) Recent problems;<br>2 - Any;<br>3 - Problems.   |
| <i>Host groups</i>      | 2    | groupids | <b>Host group</b> ID.<br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Hosts</i>            | 3    | hostids  | <b>Host</b> ID.<br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |

| Parameter  | type | name            | value   |
|--|------|-----------------|---|
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |                 |   |
| <i>Evaluation type</i>   | 0    | evaltype        | 0 - (default) And/Or;<br>2 - Or.  |
| <i>Tag name</i>  | 1    | tags.tag.0      | Any string value.   |
| <i>Operator</i>  | 0    | tags.operator.0 | Parameter <i>Tag name</i> required if configuring <i>Tags</i> .<br>0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist. |
| <i>Tag value</i>   | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.  |
| <i>Show suppressed problems</i>  | 0    | show_suppressed | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .<br>0 - (default) Disabled;<br>1 - Enabled.   |
| <i>Hosts location</i>  | 0    | style           | 0 - (default) Left;<br>1 - Top.   |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Trigger overview* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Trigger overview* widget

Configure a *Trigger overview* widget that displays trigger states for all host groups that have triggers with a tag that has the name "scope" and contains value "availability".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "trigover",
            "name": "Trigger overview",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 1,
                "name": "tags.tag.0",
                "value": "scope"
              },
              {
                "type": 0,
                "name": "tags.operator.0",
                "value": 0
              },
              {
                "type": 1,
                "name": "tags.value.0",
                "value": "availability"
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrpId": 7,
        "permission": 2
      }
    ],

23 URL

## Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the [URL](#) widget in `dashboard.create` and `dashboard.update` methods.

### Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify [built-in widgets](#) and create [custom widgets](#), but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the [URL](#) widget, please refer to the parameter requirements outlined in the tables below.

## Parameters

The following parameters are supported for the [URL](#) widget.

| Parameter                | type | name    | value   |
|--------------------------|------|---------|---|
| <i>Refresh interval</i>  | 0    | rf_rate | 0 - (default) No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes. |
| <b>URL</b><br>(required) | 1    | url     | Valid URL string.   |
| <i>Dynamic item</i>      | 0    | dynamic | 0 - (default) Disabled;<br>1 - Enabled.   |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the [URL](#) widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a [URL](#) widget

Configure a [URL](#) widget that displays the home page of Zabbix manual.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "url",

```

```

        "name": "URL",
        "x": 0,
        "y": 0,
        "width": 12,
        "height": 5,
        "view_mode": 0,
        "fields": [
            {
                "type": 1,
                "name": "url",
                "value": "https://www.zabbix.com/documentation/6.0/en"
            }
        ]
    },
    ],
    "userGroups": [
        {
            "usrgrp_id": 7,
            "permission": 2
        }
    ],
    "users": [
        {
            "userid": 1,
            "permission": 3
        }
    ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}

```

24 Web monitoring

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Web monitoring* widget in `dashboard.create` and `dashboard.update` methods.

**Attention:**

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Web monitoring* widget, please refer to the parameter requirements outlined in the tables below.

**Parameters**

The following parameters are supported for the *Web monitoring* widget.

| Parameter  | type | name             | value   |
|--|------|------------------|---|
| <i>Refresh interval</i>  | 0    | rf_rate          | 0 - No refresh;<br>10 - 10 seconds;<br>30 - 30 seconds;<br>60 - (default) 1 minute;<br>120 - 2 minutes;<br>600 - 10 minutes;<br>900 - 15 minutes.   |
| <i>Host groups</i>   | 2    | groupids         | <b>Host group ID.</b><br><br>Note: To configure multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Exclude host groups</i>   | 2    | exclude_groupids | <b>Host group ID.</b><br><br>Note: To exclude multiple host groups, create a dashboard widget field object for each host group.   |
| <i>Hosts</i>   | 3    | hostids          | <b>Host ID.</b><br><br>Note: To configure multiple hosts, create a dashboard widget field object for each host. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |
| <i>Tags</i><br>(the number in the property name (e.g. tags.tag.0) references tag order in the tag evaluation list) |      |                  |   |
| <i>Evaluation type</i>   | 0    | evaltype         | 0 - (default) And/Or;<br>2 - Or.  |
| <i>Tag name</i>  | 1    | tags.tag.0       | Any string value.   |

Parameter *Tag name* required if configuring *Tags*.

| Parameter                        | type | name            | value  |
|----------------------------------|------|-----------------|--|
| <i>Operator</i>                  | 0    | tags.operator.0 | 0 - Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist. |
| <i>Tag value</i>                 | 1    | tags.value.0    | Parameter <i>Operator</i> required if configuring <i>Tags</i> .<br>Any string value.                               |
| <i>Show hosts in maintenance</i> | 0    | maintenance     | Parameter <i>Tag value</i> required if configuring <i>Tags</i> .<br>0 - Disabled;<br>1 - (default) Enabled.        |

## Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Web monitoring* widget. For more information on configuring a dashboard, see [dashboard.create](#).

### Configuring a *Web monitoring* widget

Configure a *Web monitoring* widget that displays a status summary of the active web monitoring scenarios for host group "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "web",
            "name": "Web monitoring",
            "x": 0,
            "y": 0,
            "width": 6,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 2,
                "name": "groupids",
                "value": 4
              }
            ]
          }
        ]
      }
    ]
  },
  "userGroups": [
    {
      "usrgrpId": 7,
      "permission": 2
    }
  ]
}
```

```

    ],
    "users": [
      {
        "userid": 1,
        "permission": 3
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

## dashboard.create

Description

object dashboard.create(object/array dashboards)

This method allows to create new dashboards.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Dashboards to create.

Additionally to the [standard dashboard properties](#), the method accepts the following parameters.

| Parameter                  | Type  | Description  |
|----------------------------|-------|--|
| <b>pages</b><br>(required) | array | Dashboard <b>pages</b> to be created for the dashboard. Dashboard pages will be ordered in the same order as specified. At least one dashboard page object is required for pages property. |
| users                      | array | Dashboard <b>user</b> shares to be created on the dashboard.   |
| userGroups                 | array | Dashboard <b>user group</b> shares to be created on the dashboard.   |

Return values

(object) Returns an object containing the IDs of the created dashboards under the dashboardids property. The order of the returned IDs matches the order of the passed dashboards.

Examples

Creating a dashboard

Create a dashboard named "My dashboard" with one Problems widget with tags and using two types of sharing (user group and user) on a single dashboard page.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "problems",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 1,
                "name": "tags.tag.0",
                "value": "service"
              },
              {
                "type": 0,
                "name": "tags.operator.0",
                "value": 1
              },
              {
                "type": 1,
                "name": "tags.value.0",
                "value": "zabbix_server"
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrpid": "7",
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": "4",
        "permission": 3
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  }
}
```

```

    ],
    },
    "id": 1
}

```

Source

CDashboard::create() in *ui/include/classes/api/services/CDashboard.php*.

## dashboard.delete

Description

object dashboard.delete(array dashboardids)

This method allows to delete dashboards.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the dashboards to delete.

Return values

(object) Returns an object containing the IDs of the deleted dashboards under the dashboardids property.

Examples

Deleting multiple dashboards

Delete two dashboards.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.delete",
  "params": [
    "2",
    "3"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2",
      "3"
    ]
  },
  "id": 1
}

```

## Source

CDashboard::delete() in *ui/include/classes/api/services/CDashboard.php*.

## dashboard.get

### Description

integer/array dashboard.get(object parameters)

The method allows to retrieve dashboards according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| dashboardids           | string/array | Return only dashboards with the given IDs.  |
| selectPages            | query        | Return a <b>pages</b> property with dashboard pages, correctly ordered.   |
| selectUsers            | query        | Return a <b>users</b> property with users that the dashboard is shared with.                                    |
| selectUserGroups       | query        | Return a <b>userGroups</b> property with user groups that the dashboard is shared with.                         |
| sortfield              | string/array | Sort the result by the given properties.  |
| countOutput            | boolean      | Possible value is: dashboardid.<br>These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

### Examples

Retrieving a dashboard by ID

Retrieve all data about dashboards "1" and "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.get",
  "params": {
    "output": "extend",
    "selectPages": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
```

```

        "dashboardids": [
            "1",
            "2"
        ]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "dashboardid": "1",
            "name": "Dashboard",
            "userid": "1",
            "private": "0",
            "display_period": "30",
            "auto_start": "1",
            "users": [],
            "userGroups": [],
            "pages": [
                {
                    "dashboard_pageid": "1",
                    "name": "",
                    "display_period": "0",
                    "widgets": [
                        {
                            "widgetid": "9",
                            "type": "systeminfo",

## dashboard.update

Description

object dashboard.update(object/array dashboards)

This method allows to update existing dashboards.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Dashboard properties to be updated.

The dashboardid property must be specified for each dashboard, all other properties are optional. Only the specified properties will be updated.

Additionally to the [standard dashboard properties](#), the method accepts the following parameters.

| Parameter  | Type  | Description  |
|------------|-------|--|
| pages      | array | Dashboard <a href="#">pages</a> to replace the existing dashboard pages.<br><br>Dashboard pages are updated by the dashboard_pageid property. New dashboard pages will be created for objects without dashboard_pageid property and the existing dashboard pages will be deleted if not reused. Dashboard pages will be ordered in the same order as specified. Only the specified properties of the dashboard pages will be updated. At least one dashboard page object is required for pages property. |
| users      | array | Dashboard <a href="#">user</a> shares to replace the existing elements.  |
| userGroups | array | Dashboard <a href="#">user group</a> shares to replace the existing elements.  |

Return values

(object) Returns an object containing the IDs of the updated dashboards under the dashboardids property.

Examples

Renaming a dashboard

Rename a dashboard to "SQL server status".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.update",
  "params": {
    "dashboardid": "2",
    "name": "SQL server status"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 1
}
```

#### Updating dashboard pages

Rename the first dashboard page, replace widgets on the second dashboard page and add a new page as the third one. Delete all other dashboard pages.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.update",
  "params": {
    "dashboardid": "2",
    "pages": [
      {
        "dashboard_pageid": 1,
        "name": 'Renamed Page'
      },
      {
        "dashboard_pageid": 2,
        "widgets": [
          {
            "type": "clock",
            "x": 0,
            "y": 0,
            "width": 4,
            "height": 3
          }
        ]
      },
      {
        "display_period": 60
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 2
}
```

#### Change dashboard owner

Available only for admins and super admins.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.update",
  "params": {
    "dashboardid": "2",
    "userid": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 2
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 2
}
```

## Discovered host

This class is designed to work with discovered hosts.

Object references:

- [Discovered host](#)

Available methods:

- [dhost.get](#) - retrieve discovered hosts

## > Discovered host object

The following objects are directly related to the dhost API.

Discovered host

### Note:

Discovered host are created by the Zabbix server and cannot be modified via the API.

The discovered host object contains information about a host discovered by a network discovery rule. It has the following properties.

| Property | Type      | Description                                      |
|----------|-----------|--|
| dhostid  | string    | ID of the discovered host.                       |
| druleid  | string    | ID of the discovery rule that detected the host. |
| lastdown | timestamp | Time when the discovered host last went down.    |
| lastup   | timestamp | Time when the discovered host last went up.      |

| Property | Type    | Description   |
|----------|---------|---|
| status   | integer | Whether the discovered host is up or down. A host is up if it has at least one active discovered service.<br><br>Possible values:<br>0 - host up;<br>1 - host down. |

## dhost.get

### Description

integer/array dhost.get(object parameters)

The method allows to retrieve discovered hosts according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| dhostids               | string/array | Return only discovered hosts with the given IDs.   |
| druleids               | string/array | Return only discovered hosts that have been created by the given discovery rules.  |
| dserviceids            | string/array | Return only discovered hosts that are running the given services.  |
| selectDRules           | query        | Return a <b>drules</b> property with an array of the discovery rules that detected the host.   |
| selectDServices        | query        | Return a <b>dservices</b> property with the discovered services running on the host.   |
| limitSelects           | integer      | Supports count.<br>Limits the number of records returned by subselects.  |
| sortfield              | string/array | Applies to the following subselects:<br>selectDServices - results will be sorted by dserviceid.<br>Sort the result by the given properties.<br><br>Possible values are: dhostid and druleid.<br>These parameters are described in the <a href="#">reference commentary</a> . |
| countOutput            | boolean      |  |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

### Return values

(integer/array) Returns either:

- an array of objects;

- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieve discovered hosts by discovery rule

Retrieve all hosts and the discovered services they are running that have been detected by discovery rule "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dhost.get",
  "params": {
    "output": "extend",
    "selectDServices": "extend",
    "druleids": "4"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dservices": [
        {
          "dserviceid": "1",
          "dhostid": "1",
          "type": "4",
          "key_": "",
          "value": "",
          "port": "80",
          "status": "0",
          "lastup": "1337697227",
          "lastdown": "0",
          "dcheckid": "5",
          "ip": "192.168.1.1",
          "dns": "station.company.lan"
        }
      ],
      "dhostid": "1",
      "druleid": "4",

## Discovered service

This class is designed to work with discovered services.

Object references:

- [Discovered service](#)

Available methods:

- [dservice.get](#) - retrieve discovered services

### > Discovered service object

The following objects are directly related to the `dservice` API.

Discovered service

#### Note:

Discovered services are created by the Zabbix server and cannot be modified via the API.

The discovered service object contains information about a service discovered by a network discovery rule on a host. It has the following properties.

| Property                | Type      | Description   |
|-------------------------|-----------|---|
| <code>dserviceid</code> | string    | ID of the discovered service.   |
| <code>dcheckid</code>   | string    | ID of the discovery check used to detect the service.   |
| <code>dhostid</code>    | string    | ID of the discovered host running the service.  |
| <code>dns</code>        | string    | DNS of the host running the service.  |
| <code>ip</code>         | string    | IP address of the host running the service.   |
| <code>lastdown</code>   | timestamp | Time when the discovered service last went down.  |
| <code>lastup</code>     | timestamp | Time when the discovered service last went up.  |
| <code>port</code>       | integer   | Service port number.  |
| <code>status</code>     | integer   | Status of the service.  |
|                         |           | Possible values:<br>0 - service up;<br>1 - service down.  |
| <code>value</code>      | string    | Value returned by the service when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check. |

## `dservice.get`

Description

`integer/array dservice.get(object parameters)`

The method allows to retrieve discovered services according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| dserviceids            | string/array | Return only discovered services with the given IDs.   |
| dhostids               | string/array | Return only discovered services that belong to the given discovered hosts.  |
| dcheckids              | string/array | Return only discovered services that have been detected by the given discovery checks.  |
| druleids               | string/array | Return only discovered services that have been detected by the given discovery rules.   |
| selectDRules           | query        | Return a <b>drules</b> property with an array of the discovery rules that detected the service.   |
| selectDHosts           | query        | Return a <b>dhosts</b> property with an array the discovered hosts that the service belongs to.   |
| selectHosts            | query        | Return a <b>hosts</b> property with the hosts with the same IP address and proxy as the service.  |
| limitSelects           | integer      | Supports count.<br>Limits the number of records returned by subselects.   |
| sortfield              | string/array | Applies to the following subselects:<br><code>selectHosts</code> - result will be sorted by <code>hostid</code> .<br>Sort the result by the given properties.             |
| countOutput            | boolean      | Possible values are: <code>dserviceid</code> , <code>dhostid</code> and <code>ip</code> .<br>These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

Retrieve services discovered on a host

Retrieve all discovered services detected on discovered host "11".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dservice.get",
  "params": {
    "output": "extend",
    "dhostids": "11"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```

"result": [
  {
    "dserviceid": "12",
    "dhostid": "11",
    "value": "",
    "port": "80",
    "status": "1",
    "lastup": "0",
    "lastdown": "1348650607",
    "dcheckid": "5",
    "ip": "192.168.1.134",
    "dns": "john.local"
  },
  {
    "dserviceid": "13",
    "dhostid": "11",
    "value": "",
    "port": "21",
    "status": "1",
    "lastup": "0",
    "lastdown": "1348650610",
    "dcheckid": "6",
    "ip": "192.168.1.134",
    "dns": "john.local"
  }
],
"id": 1
}

```

## Discovery check

This class is designed to work with discovery checks.

Object references:

- [Discovery check](#)

Available methods:

- `dcheck.get` - retrieve discovery checks

## > Discovery check object

The following objects are directly related to the `dcheck` API.

Discovery check

The discovery check object defines a specific check performed by a network discovery rule. It has the following properties.

| Property              | Type   | Description   |
|-----------------------|--------|---|
| <code>dcheckid</code> | string | ( <i>readonly</i> ) ID of the discovery check.                          |
| <code>druleid</code>  | string | ( <i>readonly</i> ) ID of the discovery rule that the check belongs to. |

| Property                  | Type    | Description  |
|---------------------------|---------|--|
| key_                      | string  | The value of this property differs depending on the type of the check:<br>- key to query for Zabbix agent checks, required;<br>- SNMP OID for SNMPv1, SNMPv2 and SNMPv3 checks, required.  |
| ports                     | string  | One or several port ranges to check separated by commas. Used for all checks except for ICMP.  |
| snmp_community            | string  | Default: 0.<br>SNMP community.   |
| snmpv3_authpassphrase     | string  | Required for SNMPv1 and SNMPv2 agent checks.<br>Authentication passphrase used for SNMPv3 agent checks with security level set to <i>authNoPriv</i> or <i>authPriv</i> .   |
| snmpv3_authprotocol       | integer | Authentication protocol used for SNMPv3 agent checks with security level set to <i>authNoPriv</i> or <i>authPriv</i> .<br><br>Possible values:<br>0 - (default) MD5;<br>1 - SHA1;<br>2 - SHA224;<br>3 - SHA256;<br>4 - SHA384;<br>5 - SHA512.  |
| snmpv3_contextname        | string  | SNMPv3 context name. Used only by SNMPv3 checks.   |
| snmpv3_privpassphrase     | string  | Privacy passphrase used for SNMPv3 agent checks with security level set to <i>authPriv</i> .   |
| snmpv3_privprotocol       | integer | Privacy protocol used for SNMPv3 agent checks with security level set to <i>authPriv</i> .<br><br>Possible values:<br>0 - (default) DES;<br>1 - AES128;<br>2 - AES192;<br>3 - AES256;<br>4 - AES192C;<br>5 - AES256C.  |
| snmpv3_securitylevel      | string  | Security level used for SNMPv3 agent checks.<br><br>Possible values:<br>0 - noAuthNoPriv;<br>1 - authNoPriv;<br>2 - authPriv.  |
| snmpv3_securityname       | string  | Security name used for SNMPv3 agent checks.  |
| <b>type</b><br>(required) | integer | Type of check.<br><br>Possible values:<br>0 - SSH;<br>1 - LDAP;<br>2 - SMTP;<br>3 - FTP;<br>4 - HTTP;<br>5 - POP;<br>6 - NNTP;<br>7 - IMAP;<br>8 - TCP;<br>9 - Zabbix agent;<br>10 - SNMPv1 agent;<br>11 - SNMPv2 agent;<br>12 - ICMP ping;<br>13 - SNMPv3 agent;<br>14 - HTTPS;<br>15 - Telnet. |

| Property    | Type    | Description  |
|-------------|---------|--|
| uniq        | integer | Whether to use this check as a device uniqueness criteria. Only a single unique check can be configured for a discovery rule. Used for Zabbix agent, SNMPv1, SNMPv2 and SNMPv3 agent checks.<br><br>Possible values:<br>0 - <i>(default)</i> do not use this check as a uniqueness criteria;<br>1 - use this check as a uniqueness criteria. |
| host_source | integer | Source for host name.<br><br>Possible values:<br>1 - <i>(default)</i> DNS;<br>2 - IP;<br>3 - discovery value of this check.  |
| name_source | integer | Source for visible name.<br><br>Possible values:<br>0 - <i>(default)</i> not specified;<br>1 - DNS;<br>2 - IP;<br>3 - discovery value of this check.   |

## dcheck.get

### Description

`integer/array dcheck.get(object parameters)`

The method allows to retrieve discovery checks according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| dcheckids              | string/array | Return only discovery checks with the given IDs.   |
| druleids               | string/array | Return only discovery checks that belong to the given discovery rules.   |
| dserviceids            | string/array | Return only discovery checks that have detected the given discovered services.   |
| selectDRules           | query        | Return discovery rules related to the discovery checks.  |
| sortfield              | string/array | Sort the result by the given properties.<br><br>Possible values are: dcheckid and druleid.<br>These parameters are described in the <a href="#">reference commentary</a> . |
| countOutput            | boolean      |  |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve discovery checks for a discovery rule

Retrieve all discovery checks used by discovery rule "6".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dcheck.get",
  "params": {
    "output": "extend",
    "dcheckids": "6"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dcheckid": "6",
      "druleid": "4",
      "type": "3",
      "key_": "",
      "snmp_community": "",
      "ports": "21",
      "snmpv3_securityname": "",
      "snmpv3_securitylevel": "0",
      "snmpv3_authpassphrase": "",
      "snmpv3_privpassphrase": "",
      "uniq": "0",
      "snmpv3_authprotocol": "0",
      "snmpv3_privprotocol": "0",
      "host_source": "1",
      "name_source": "0"
    }
  ],
  "id": 1
}
```

`CDCheck::get()` in `ui/include/classes/api/services/CDCheck.php`.

## Discovery rule

This class is designed to work with network discovery rules.

### Note:

This API is meant to work with network discovery rules. For the low-level discovery rules see the [LLD rule API](#).

Object references:

- [Discovery rule](#)

Available methods:

- **drule.create** - create new discovery rules
- **drule.delete** - delete discovery rules
- **drule.get** - retrieve discovery rules
- **drule.update** - update discovery rules

## > Discovery rule object

The following objects are directly related to the **drule** API.

Discovery rule

The discovery rule object defines a network discovery rule. It has the following properties.

| Property                     | Type      | Description   |
|------------------------------|-----------|---|
| druleid                      | string    | ( <i>readonly</i> ) ID of the discovery rule.   |
| <b>iprange</b><br>(required) | string    | One or several IP ranges to check separated by commas.<br><br>Refer to the <b>network discovery configuration</b> section for more information on supported formats of IP ranges. |
| <b>name</b><br>(required)    | string    | Name of the discovery rule.   |
| delay                        | string    | Execution interval of the discovery rule. Accepts seconds, time unit with suffix and user macro.<br><br>Default: 1h.  |
| nextcheck                    | timestamp | ( <i>readonly</i> ) Time when the discovery rule will be executed next.   |
| proxy_hostid                 | string    | ID of the proxy used for discovery.   |
| status                       | integer   | Whether the discovery rule is enabled.<br><br>Possible values:<br>0 - ( <i>default</i> ) enabled;<br>1 - disabled.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## **drule.create**

Description

object **drule.create**(object/array discoveryRules)

This method allows to create new discovery rules.

### **Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Discovery rules to create.

Additionally to the **standard discovery rule properties**, the method accepts the following parameters.

| Parameter                    | Type  | Description   |
|------------------------------|-------|---|
| <b>dchecks</b><br>(required) | array | Discovery <b>checks</b> to create for the discovery rule. |

Return values

(object) Returns an object containing the IDs of the created discovery rules under the `druleids` property. The order of the returned IDs matches the order of the passed discovery rules.

#### Examples

##### Create a discovery rule

Create a discovery rule to find machines running the Zabbix agent in the local network. The rule must use a single Zabbix agent check on port 10050.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.create",
  "params": {
    "name": "Zabbix agent discovery",
    "iprange": "192.168.1.1-255",
    "dchecks": [
      {
        "type": "9",
        "key_": "system.uname",
        "ports": "10050",
        "uniq": "0"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "6"
    ]
  },
  "id": 1
}
```

#### See also

- [Discovery check](#)

#### Source

`CDRule::create()` in `ui/include/classes/api/services/CDRule.php`.

### **drule.delete**

#### Description

object `drule.delete(array discoveryRuleIds)`

This method allows to delete discovery rules.

##### **Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(array) IDs of the discovery rules to delete.

#### Return values

(object) Returns an object containing the IDs of the deleted discovery rules under the `druleids` property.

Examples

Delete multiple discovery rules

Delete two discovery rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.delete",
  "params": [
    "4",
    "6"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "4",
      "6"
    ]
  },
  "id": 1
}
```

Source

CDRule::delete() in ui/include/classes/api/services/CDRule.php.

drule.get

Description

integer/array drule.get(object parameters)

The method allows to retrieve discovery rules according to the given parameters.

**Note:**  
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter     | Type         | Description  |
|---------------|--------------|--|
| dhostids      | string/array | Return only discovery rules that created the given discovered hosts.                     |
| druleids      | string/array | Return only discovery rules with the given IDs.  |
| dserviceids   | string/array | Return only discovery rules that created the given discovered services.                  |
| selectDChecks | query        | Return a <b>dchecks</b> property with the discovery checks used by the discovery rule.   |
| selectDHosts  | query        | Supports count.  |
|               |              | Return a <b>dhosts</b> property with the discovered hosts created by the discovery rule. |
|               |              | Supports count.  |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| limitSelects           | integer      | Limits the number of records returned by subselects.   |
| sortfield              | string/array | <p>Applies to the following subselects:</p> <p>selectDChecks - results will be sorted by dcheckid;</p> <p>selectDHosts - results will be sorted by dhostsid.</p> <p>Sort the result by the given properties.</p> |
| countOutput            | boolean      | Possible values are: druleid and name.<br>These parameters are described in the <a href="#">reference commentary</a> .   |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieve all discovery rules

Retrieve all configured discovery rules and the discovery checks they use.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.get",
  "params": {
    "output": "extend",
    "selectDChecks": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "druleid": "2",
      "proxy_hostid": "0",

## drule.update

Description

`object drule.update(object/array discoveryRules)`

This method allows to update existing discovery rules.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Discovery rule properties to be updated.

The `druleid` property must be defined for each discovery rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard discovery rule properties](#), the method accepts the following parameters.

| Parameter | Type  | Description  |
|-----------|-------|--|
| dchecks   | array | Discovery <a href="#">checks</a> to replace existing checks. |

Return values

(object) Returns an object containing the IDs of the updated discovery rules under the `druleids` property.

Examples

Change the IP range of a discovery rule

Change the IP range of a discovery rule to "192.168.2.1-255".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.update",
  "params": {
    "druleid": "6",
    "iprange": "192.168.2.1-255"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "6"
    ]
  },
  "id": 1
}
```

**Event**

This class is designed to work with events.

Object references:

- [Event](#)

Available methods:

- [event.get](#) - retrieving events
- [event.acknowledge](#) - acknowledging events

> **Event object**

The following objects are directly related to the event API.

Event

**Note:**

Events are created by the Zabbix server and cannot be modified via the API.

The event object has the following properties.

| Property     | Type    | Description   |
|--------------|---------|---|
| eventid      | string  | ID of the event.  |
| source       | integer | Type of the event.<br><br>Possible values:<br>0 - event created by a trigger;<br>1 - event created by a discovery rule;<br>2 - event created by active agent autoregistration;<br>3 - internal event;<br>4 - event created on service status update.  |
| object       | integer | Type of object that is related to the event.<br><br>Possible values for trigger events:<br>0 - trigger.<br><br>Possible values for discovery events:<br>1 - discovered host;<br>2 - discovered service.<br><br>Possible values for autoregistration events:<br>3 - auto-registered host.<br><br>Possible values for internal events:<br>0 - trigger;<br>4 - item;<br>5 - LLD rule.<br><br>Possible values for service events:<br>6 - service. |
| objectid     | string  | ID of the related object.   |
| acknowledged | integer | Whether the event has been acknowledged.  |

| Property      | Type      | Description   |
|---------------|-----------|---|
| clock         | timestamp | Time when the event was created.  |
| ns            | integer   | Nanoseconds when the event was created.   |
| name          | string    | Resolved event name.  |
| value         | integer   | State of the related object.  |
|               |           | Possible values for trigger and service events:<br>0 - OK;<br>1 - problem.  |
|               |           | Possible values for discovery events:<br>0 - host or service up;<br>1 - host or service down;<br>2 - host or service discovered;<br>3 - host or service lost.     |
|               |           | Possible values for internal events:<br>0 - "normal" state;<br>1 - "unknown" or "not supported" state.  |
| severity      | integer   | This parameter is not used for active agent autoregistration events.<br>Event current severity.   |
|               |           | Possible values:<br>0 - not classified;<br>1 - information;<br>2 - warning;<br>3 - average;<br>4 - high;<br>5 - disaster.   |
| r_eventid     | string    | Recovery event ID   |
| c_eventid     | string    | ID of the event that was used to override (close) current event under global correlation rule. See <code>correlationid</code> to identify exact correlation rule. |
|               |           | This parameter is only defined when the event is closed by global correlation rule.   |
| correlationid | string    | ID of the correlation rule that generated closing of the problem.   |
|               |           | This parameter is only defined when the event is closed by global correlation rule.   |
| userid        | string    | User ID if the event was manually closed.   |
| suppressed    | integer   | Whether the event is suppressed.  |
|               |           | Possible values:<br>0 - event is in normal state;<br>1 - event is suppressed.   |
| opdata        | string    | Operational data with expanded macros.  |
| urls          | array     | Active <b>media type</b> URLs.  |

#### Event tag

The event tag object has the following properties.

| Property | Type   | Description      |
|----------|--------|------------------|
| tag      | string | Event tag name.  |
| value    | string | Event tag value. |

#### Media type URL

The media type URL object has the following properties.

| Property | Type   | Description                   |
|----------|--------|-------------------------------|
| name     | string | Media type defined URL name.  |
| url      | string | Media type defined URL value. |

Results will contain entries only for active media types with enabled event menu entry. Macro used in properties will be expanded, but if one of the properties contains an unexpanded macro, both properties will be excluded from results. For supported macros, see *Supported macros*.

## event.acknowledge

Description

`object event.acknowledge(object/array parameters)`

This method allows to update events. Following update actions can be performed:

- Close event. If event is already resolved, this action will be skipped.
- Acknowledge event. If event is already acknowledged, this action will be skipped.
- Unacknowledge event. If event is not acknowledged, this action will be skipped.
- Add message.
- Change event severity. If event already has same severity, this action will be skipped.

### Attention:

Only trigger events can be updated.

Only problem events can be updated.

Read/Write rights for trigger are required to close the event or to change event's severity.

To close an event, manual close should be allowed in the trigger.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See *User roles* for more information.

Parameters

(object/array) Parameters containing the IDs of the events and update operations that should be performed.

| Parameter                     | Type          | Description   |
|-------------------------------|---------------|---|
| <b>eventids</b><br>(required) | string/object | IDs of the events to acknowledge.   |
| <b>action</b><br>(required)   | integer       | Event update action(s).<br><br>Possible bitmap values are:<br>1 - close problem;<br>2 - acknowledge event;<br>4 - add message;<br>8 - change severity;<br>16 - unacknowledge event.<br><br>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for acknowledge event and add message). |
| message                       | string        | Text of the message.<br><b>Required</b> , if action contains 'add message' flag.  |

| Parameter | Type    | Description   |
|-----------|---------|---|
| severity  | integer | <p>New severity for events.<br/> <b>Required</b>, if action contains 'change severity' flag.</p> <p>Possible values:<br/> 0 - not classified;<br/> 1 - information;<br/> 2 - warning;<br/> 3 - average;<br/> 4 - high;<br/> 5 - disaster.</p> |

#### Return values

(object) Returns an object containing the IDs of the updated events under the eventids property.

#### Examples

##### Acknowledging an event

Acknowledge a single event and leave a message.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.acknowledge",
  "params": {
    "eventids": "20427",
    "action": 6,
    "message": "Problem resolved."
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "eventids": [
      "20427"
    ]
  },
  "id": 1
}
```

##### Changing event's severity

Change severity for multiple events and leave a message.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.acknowledge",
  "params": {
    "eventids": ["20427", "20428"],
    "action": 12,
    "message": "Maintenance required to fix it.",
    "severity": 4
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "eventids": [
      "20427",
      "20428"
    ]
  },
  "id": 1
}
```

CEvent::acknowledge() in *ui/include/classes/api/services/CEvent.php*.

## event.get

Description

integer/array event.get(object parameters)

The method allows to retrieve events according to the given parameters.

### Attention:

This method may return events of a deleted entity if these events have not been removed by the housekeeper yet.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type          | Description  |
|--------------|---------------|--|
| eventids     | string/array  | Return only events with the given IDs.   |
| groupids     | string/array  | Return only events created by objects that belong to the given host groups.  |
| hostids      | string/array  | Return only events created by objects that belong to the given hosts.  |
| objectids    | string/array  | Return only events created by the given objects.   |
| source       | integer       | Return only events with the given type.<br><br>Refer to the <a href="#">event object page</a> for a list of supported event types.   |
| object       | integer       | Default: 0 - trigger events.<br>Return only events created by objects of the given type.<br><br>Refer to the <a href="#">event object page</a> for a list of supported object types. |
| acknowledged | boolean       | Default: 0 - trigger.  |
| suppressed   | boolean       | If set to true return only acknowledged events.<br>true - return only suppressed events;<br>false - return events in the normal state.   |
| severities   | integer/array | Return only events with given event severities. Applies only if object is trigger.   |
| evaltype     | integer       | Rules for tag searching.<br><br>Possible values:<br>0 - (default) And/Or;<br>2 - Or.   |

| Parameter             | Type             | Description  |
|-----------------------|------------------|--|
| tags                  | array of objects | <p>Return only events with given tags. Exact match by tag and case-insensitive search by value and operator.<br/> Format: [{"tag": "&lt;tag&gt;", "value": "&lt;value&gt;", "operator": "&lt;operator&gt;"}, ...].<br/> An empty array returns all events.</p> <p>Possible operator types:<br/> 0 - (default) Like;<br/> 1 - Equal;<br/> 2 - Not like;<br/> 3 - Not equal<br/> 4 - Exists;<br/> 5 - Not exists.</p>  |
| eventid_from          | string           | Return only events with IDs greater or equal to the given ID.  |
| eventid_till          | string           | Return only events with IDs less or equal to the given ID.   |
| time_from             | timestamp        | Return only events that have been created after or at the given time.  |
| time_till             | timestamp        | Return only events that have been created before or at the given time.   |
| problem_time_from     | timestamp        | Returns only events that were in the problem state starting with problem_time_from. Applies only if the source is trigger event and object is trigger. Mandatory if problem_time_till is specified.  |
| problem_time_till     | timestamp        | Returns only events that were in the problem state until problem_time_till. Applies only if the source is trigger event and object is trigger. Mandatory if problem_time_from is specified.  |
| value                 | integer/array    | Return only events with the given values.  |
| selectHosts           | query            | Return a <b>hosts</b> property with hosts containing the object that created the event. Supported only for events generated by triggers, items or LLD rules.   |
| selectRelatedObject   | query            | Return a <b>relatedObject</b> property with the object that created the event. The type of object returned depends on the event type.  |
| select_alerts         | query            | Return an <b>alerts</b> property with alerts generated by the event. Alerts are sorted in reverse chronological order.   |
| select_acknowledges   | query            | Return an <b>acknowledges</b> property with event updates. Event updates are sorted in reverse chronological order.  |
|                       |                  | <p>The event update object has the following properties:<br/> <b>acknowledgeid</b> - (string) acknowledgment's ID;<br/> <b>userid</b> - (string) ID of the user that updated the event;<br/> <b>eventid</b> - (string) ID of the updated event;<br/> <b>clock</b> - (timestamp) time when the event was updated;<br/> <b>message</b> - (string) text of the message;<br/> <b>action</b> - (integer) update action that was performed see <b>event.acknowledge</b>;<br/> <b>old_severity</b> - (integer) event severity before this update action;<br/> <b>new_severity</b> - (integer) event severity after this update action;<br/> <b>username</b> - (string) username of the user that updated the event;<br/> <b>name</b> - (string) name of the user that updated the event;<br/> <b>surname</b> - (string) surname of the user that updated the event.</p> |
|                       |                  | Supports count.  |
| selectTags            | query            | Return a <b>tags</b> property with event tags.   |
| selectSuppressionData | query            | Return a <b>suppression_data</b> property with the list of maintenances:<br><b>maintenanceid</b> - (string) ID of the maintenance;<br><b>suppress_until</b> - (integer) time until the event is suppressed.  |
| sortfield             | string/array     | Sort the result by the given properties.   |
|                       |                  | Possible values are: eventid, objectid and clock.  |
| countOutput           | boolean          | These parameters are described in the <b>reference commentary</b> .  |
| editable              | boolean          |  |
| excludeSearch         | boolean          |  |
| filter                | object           |  |
| limit                 | integer          |  |

| Parameter              | Type         | Description |
|------------------------|--------------|-------------|
| output                 | query        |             |
| preservekeys           | boolean      |             |
| search                 | object       |             |
| searchByAny            | boolean      |             |
| searchWildcardsEnabled | boolean      |             |
| sortorder              | string/array |             |
| startSearch            | boolean      |             |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving trigger events

Retrieve the latest events from trigger "13926."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.get",

## Graph

This class is designed to work with graphs.

Object references:

- [Graph](#)

Available methods:

- [graph.create](#) - creating new graphs
- [graph.delete](#) - deleting graphs
- [graph.get](#) - retrieving graphs
- [graph.update](#) - updating graphs

## > Graph object

The following objects are directly related to the `graph` API.

Graph

The graph object has the following properties.

| Property                    | Type    | Description  |
|-----------------------------|---------|--|
| graphid                     | string  | <i>(readonly)</i> ID of the graph.   |
| <b>height</b><br>(required) | integer | Height of the graph in pixels.   |
| <b>name</b><br>(required)   | string  | Name of the graph  |
| <b>width</b><br>(required)  | integer | Width of the graph in pixels.  |
| flags                       | integer | <i>(readonly)</i> Origin of the graph.<br><br>Possible values are:<br>0 - <i>(default)</i> a plain graph;<br>4 - a discovered graph. |
| graphtype                   | integer | Graph's layout type.<br><br>Possible values:<br>0 - <i>(default)</i> normal;<br>1 - stacked;<br>2 - pie;<br>3 - exploded.            |

| Property         | Type    | Description   |
|------------------|---------|---|
| percent_left     | float   | Left percentile.  |
| percent_right    | float   | Default: 0.<br>Right percentile.  |
| show_3d          | integer | Default: 0.<br>Whether to show pie and exploded graphs in 3D.   |
| show_legend      | integer | Possible values:<br>0 - <i>(default)</i> show in 2D;<br>1 - show in 3D.<br>Whether to show the legend on the graph.   |
| show_work_period | integer | Possible values:<br>0 - hide;<br>1 - <i>(default)</i> show.<br>Whether to show the working time on the graph.   |
| show_triggers    | integer | Possible values:<br>0 - hide;<br>1 - <i>(default)</i> show.<br>Whether to show the trigger line on the graph.   |
| templateid       | string  | Possible values:<br>0 - hide;<br>1 - <i>(default)</i> show.<br><i>(readonly)</i> ID of the parent template graph.   |
| yaxismax         | float   | The fixed maximum value for the Y axis.   |
| yaxismin         | float   | Default: 100.<br>The fixed minimum value for the Y axis.  |
| ymax_itemid      | string  | Default: 0.<br>ID of the item that is used as the maximum value for the Y axis.   |
| ymax_type        | integer | Starting with Zabbix 6.0.7, if user have no access to specified item, the graph is rendered like ymax_type would be set to '0' (calculated).<br>Maximum value calculation method for the Y axis.<br><br>Possible values:<br>0 - <i>(default)</i> calculated;<br>1 - fixed;<br>2 - item. |
| ymin_itemid      | string  | ID of the item that is used as the minimum value for the Y axis.  |
| ymin_type        | integer | Starting with Zabbix 6.0.7, if user have no access to specified item, the graph is rendered like ymax_type would be set to '0' (calculated).<br>Minimum value calculation method for the Y axis.<br><br>Possible values:<br>0 - <i>(default)</i> calculated;<br>1 - fixed;<br>2 - item. |
| uuid             | string  | Universal unique identifier, used for linking imported graphs to already existing ones. Used only for graphs on templates. Auto-generated, if not given.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## graph.create

Description

object graph.create(object/array graphs)

This method allows to create new graphs.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Graphs to create.

Additionally to the **standard graph properties**, the method accepts the following parameters.

| Parameter                   | Type  | Description                                     |
|-----------------------------|-------|---|
| <b>gitems</b><br>(required) | array | Graph <b>items</b> to be created for the graph. |

Return values

(object) Returns an object containing the IDs of the created graphs under the **graphids** property. The order of the returned IDs matches the order of the passed graphs.

Examples

Creating a graph

Create a graph with two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.create",
  "params": {
    "name": "MySQL bandwidth",
    "width": 900,
    "height": 200,
    "gitems": [
      {
        "itemid": "22828",
        "color": "00AA00"
      },
      {
        "itemid": "22829",
        "color": "3333FF"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652"
    ]
  },
  "id": 1
}
```

## graph.delete

Description

object graph.delete(array graphIds)

This method allows to delete graphs.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the graphs to delete.

Return values

(object) Returns an object containing the IDs of the deleted graphs under the *graphids* property.

Examples

Deleting multiple graphs

Delete two graphs.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.delete",
  "params": [
    "652",
    "653"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652",
      "653"
    ]
  },
  "id": 1
}
```

Source

CGraph::delete() in *ui/include/classes/api/services/CGraph.php*.

## graph.get

Description

integer/array graph.get(object parameters)

The method allows to retrieve graphs according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| graphids               | string/array | Return only graphs with the given IDs.  |
| groupids               | string/array | Return only graphs that belong to hosts in the given host groups.   |
| templateids            | string/array | Return only graph that belong to the given templates.   |
| hostids                | string/array | Return only graphs that belong to the given hosts.  |
| itemids                | string/array | Return only graphs that contain the given items.  |
| templated              | boolean      | If set to true return only graphs that belong to templates.   |
| inherited              | boolean      | If set to true return only graphs inherited from a template.  |
| expandName             | flag         | Expand macros in the graph name.  |
| selectGroups           | query        | Return a <b>groups</b> property with the host groups that the graph belongs to.   |
| selectTemplates        | query        | Return a <b>templates</b> property with the templates that the graph belongs to.  |
| selectHosts            | query        | Return a <b>hosts</b> property with the hosts that the graph belongs to.  |
| selectItems            | query        | Return an <b>items</b> property with the items used in the graph.   |
| selectGraphDiscovery   | query        | Return a <b>graphDiscovery</b> property with the graph discovery object. The graph discovery objects links the graph to a graph prototype from which it was created.  |
|                        |              | It has the following properties:<br>graphid - (string) ID of the graph;<br>parent_graphid - (string) ID of the graph prototype from which the graph has been created. |
| selectGraphItems       | query        | Return a <b>gitems</b> property with the items used in the graph.   |
| selectDiscoveryRule    | query        | Return a <b>discoveryRule</b> property with the low-level discovery rule that created the graph.  |
| filter                 | object       | Return only those results that exactly match the given filter.  |
|                        |              | Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.                                 |
|                        |              | Supports additional filters:<br>host - technical name of the host that the graph belongs to;<br>hostid - ID of the host that the graph belongs to.                    |
| sortfield              | string/array | Sort the result by the given properties.  |
|                        |              | Possible values are: graphid, name and graphtype.<br>These parameters are described in the <a href="#">reference commentary</a> .                                     |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

**Return values**

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

##### Retrieving graphs from hosts

Retrieve all graphs from host "10107" and sort them by name.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.get",
  "params": {
    "output": "extend",
    "hostids": 10107,
    "sortfield": "name"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "graphid": "612",
      "name": "CPU jumps",
      "width": "900",
      "height": "200",
      "yaxismin": "0",
      "yaxismax": "100",
      "templateid": "439",
      "show_work_period": "1",
      "show_triggers": "1",
      "graphtype": "0",
      "show_legend": "1",
      "show_3d": "0",
      "percent_left": "0",
      "percent_right": "0",
      "ymin_type": "0",
      "ymax_type": "0",
      "ymin_itemid": "0",
      "ymax_itemid": "0",
      "flags": "0"
    },
    {
      "graphid": "613",
      "name": "CPU load",
      "width": "900",
      "height": "200",
      "yaxismin": "0",
      "yaxismax": "100",
      "templateid": "433",
      "show_work_period": "1",
      "show_triggers": "1",
      "graphtype": "0",
      "show_legend": "1",
      "show_3d": "0",
      "percent_left": "0",
      "percent_right": "0",
      "ymin_type": "1",
      "ymax_type": "0",

```

```

        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "flags": "0"
    },
    {
        "graphid": "614",
        "name": "CPU utilization",
        "width": "900",
        "height": "200",
        "yaxismin": "0",
        "yaxismax": "100",
        "templateid": "387",
        "show_work_period": "1",
        "show_triggers": "0",
        "graphtype": "1",
        "show_legend": "1",
        "show_3d": "0",
        "percent_left": "0",
        "percent_right": "0",
        "ymin_type": "1",
        "ymax_type": "1",
        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "flags": "0"
    },
    {
        "graphid": "645",
        "name": "Disk space usage /",
        "width": "600",
        "height": "340",
        "yaxismin": "0",
        "yaxismax": "0",
        "templateid": "0",
        "show_work_period": "0",
        "show_triggers": "0",
        "graphtype": "2",
        "show_legend": "1",
        "show_3d": "1",
        "percent_left": "0",
        "percent_right": "0",
        "ymin_type": "0",
        "ymax_type": "0",
        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "flags": "4"
    }
],
"id": 1
}

```

## graph.update

### Description

object graph.update(object/array graphs)

This method allows to update existing graphs.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Graph properties to be updated.

The `graphid` property must be defined for each graph, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard graph properties](#) the method accepts the following parameters.

| Parameter | Type  | Description  |
|-----------|-------|--|
| gitems    | array | Graph <a href="#">items</a> to replace existing graph items. If a graph item has the <code>gitemid</code> property defined it will be updated, otherwise a new graph item will be created. |

### Return values

(object) Returns an object containing the IDs of the updated graphs under the `graphids` property.

### Examples

Setting the maximum for the Y scale

Set the maximum of the Y scale to a fixed value of 100.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.update",
  "params": {
    "graphid": "439",
    "ymax_type": 1,
    "yaxismax": 100
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "439"
    ]
  },
  "id": 1
}
```

### Source

## Graph item

This class is designed to work with graph items.

Object references:

- [Graph item](#)

Available methods:

- [graphitem.get](#) - retrieving graph items

### > Graph item object

The following objects are directly related to the `graphitem` API.

Graph item

#### Note:

Graph items can only be modified via the `graph` API.

The graph item object has the following properties.

| Property                                 | Type    | Description  |
|--|---------|--|
| <code>gitemid</code>                     | string  | <i>(readonly)</i> ID of the graph item.  |
| <b><code>color</code></b><br>(required)  | string  | Graph item's draw color as a hexadecimal color code.   |
| <b><code>itemid</code></b><br>(required) | string  | ID of the item.  |
| <code>calc_fnc</code>                    | integer | Value of the item that will be displayed.<br><br>Possible values:<br>1 - minimum value;<br>2 - <i>(default)</i> average value;<br>4 - maximum value;<br>7 - all values;<br>9 - last value, used only by pie and exploded graphs. |
| <code>drawtype</code>                    | integer | Draw style of the graph item.<br><br>Possible values:<br>0 - <i>(default)</i> line;<br>1 - filled region;<br>2 - bold line;<br>3 - dot;<br>4 - dashed line;<br>5 - gradient line.  |
| <code>graphid</code>                     | string  | ID of the graph that the graph item belongs to.  |
| <code>sortorder</code>                   | integer | Position of the item in the graph.   |
| <code>type</code>                        | integer | Default: starts with 0 and increases by one with each entry.<br>Type of graph item.<br><br>Possible values:<br>0 - <i>(default)</i> simple;<br>2 - graph sum, used only by pie and exploded graphs.                              |
| <code>yaxisside</code>                   | integer | Side of the graph where the graph item's Y scale will be drawn.<br><br>Possible values:<br>0 - <i>(default)</i> left side;<br>1 - right side.  |

## graphitem.get

### Description

integer/array graphitem.get(object parameters)

The method allows to retrieve graph items according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type         | Description   |
|--------------|--------------|---|
| graphids     | string/array | Return only graph items that belong to the given graphs.  |
| itemids      | string/array | Return only graph items with the given item IDs.  |
| type         | integer      | Return only graph items with the given type.<br><br>Refer to the <a href="#">graph item object page</a> for a list of supported graph item types. |
| selectGraphs | query        | Return a <b>graphs</b> property with an array of graphs that the item belongs to.   |
| sortfield    | string/array | Sort the result by the given properties.<br><br>Possible values are: <code>gitemid</code> .   |
| countOutput  | boolean      | These parameters are described in the <a href="#">reference commentary</a> .  |
| editable     | boolean      |   |
| limit        | integer      |   |
| output       | query        |   |
| preservekeys | boolean      |   |
| sortorder    | string/array |   |

### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

### Examples

Retrieving graph items from a graph

Retrieve all graph items used in a graph with additional information about the item and the host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphitem.get",
  "params": {
    "output": "extend",
    "graphids": "387"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```

## > Graph prototype object

The following objects are directly related to the `graphprototype` API.

## Graph prototype

The graph prototype object has the following properties.

| Property                                 | Type    | Description  |
|--|---------|--|
| <code>graphid</code>                     | string  | <i>(readonly)</i> ID of the graph prototype.   |
| <b><code>height</code></b><br>(required) | integer | Height of the graph prototype in pixels.   |
| <b><code>name</code></b><br>(required)   | string  | Name of the graph prototype.   |
| <b><code>width</code></b><br>(required)  | integer | Width of the graph prototype in pixels.  |
| <code>graphtype</code>                   | integer | Graph prototypes's layout type.<br><br>Possible values:<br>0 - <i>(default)</i> normal;<br>1 - stacked;<br>2 - pie;<br>3 - exploded.   |
| <code>percent_left</code>                | float   | Left percentile.   |
| <code>percent_right</code>               | float   | Default: 0.<br>Right percentile.   |
| <code>show_3d</code>                     | integer | Default: 0.<br>Whether to show discovered pie and exploded graphs in 3D.   |
| <code>show_legend</code>                 | integer | Possible values:<br>0 - <i>(default)</i> show in 2D;<br>1 - show in 3D.<br>Whether to show the legend on the discovered graph.   |
| <code>show_work_period</code>            | integer | Possible values:<br>0 - hide;<br>1 - <i>(default)</i> show.<br>Whether to show the working time on the discovered graph.   |
| <code>templateid</code>                  | string  | Possible values:<br>0 - hide;<br>1 - <i>(default)</i> show.  |
| <code>yaxismax</code>                    | float   | <i>(readonly)</i> ID of the parent template graph prototype.   |
| <code>yaxismin</code>                    | float   | The fixed maximum value for the Y axis.  |
| <code>ymax_itemid</code>                 | string  | The fixed minimum value for the Y axis.  |
| <code>ymin_itemid</code>                 | string  | ID of the item that is used as the maximum value for the Y axis.   |
| <code>ymin_type</code>                   | integer | Starting with Zabbix 6.0.7, if user have no access to specified item, the graph is rendered like <code>ymin_type</code> would be set to '0' (calculated).<br>Maximum value calculation method for the Y axis.<br><br>Possible values:<br>0 - <i>(default)</i> calculated;<br>1 - fixed;<br>2 - item. |
| <code>ymin_type</code>                   | integer | ID of the item that is used as the minimum value for the Y axis.   |
| <code>ymin_type</code>                   | integer | Starting with Zabbix 6.0.7, if user have no access to specified item, the graph is rendered like <code>ymin_type</code> would be set to '0' (calculated).  |

| Property  | Type    | Description   |
|-----------|---------|---|
| ymin_type | integer | Minimum value calculation method for the Y axis.<br><br>Possible values:<br>0 - <i>(default)</i> calculated;<br>1 - fixed;<br>2 - item.   |
| discover  | integer | Graph prototype discovery status.<br><br>Possible values:<br>0 - <i>(default)</i> new graphs will be discovered;<br>1 - new graphs will not be discovered and existing graphs will be marked as lost. |
| uuid      | string  | Universal unique identifier, used for linking imported graph prototypes to already existing ones. Used only for graph prototypes on templates. Auto-generated, if not given.                          |

Note that for some methods (update, delete) the required/optional parameter combination is different.

### graphprototype.create

#### Description

object graphprototype.create(object/array graphPrototypes)

This method allows to create new graph prototypes.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(object/array) Graph prototypes to create.

Additionally to the [standard graph prototype properties](#), the method accepts the following parameters.

| Parameter                   | Type  | Description   |
|-----------------------------|-------|---|
| <b>gitems</b><br>(required) | array | Graph <b>items</b> to be created for the graph prototypes. Graph items can reference both items and item prototypes, but at least one item prototype must be present. |

#### Return values

(object) Returns an object containing the IDs of the created graph prototypes under the `graphids` property. The order of the returned IDs matches the order of the passed graph prototypes.

#### Examples

##### Creating a graph prototype

Create a graph prototype with two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.create",
  "params": {
    "name": "Disk space usage {#FSNAME}",
    "width": 900,
    "height": 200,
    "gitems": [
      {
```

```

        "itemid": "22828",
        "color": "00AA00"
    },
    {
        "itemid": "22829",
        "color": "3333FF"
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "graphids": [
            "652"
        ]
    },
    "id": 1
}

```

## graphprototype.delete

Description

object graphprototype.delete(array graphPrototypeIds)

This method allows to delete graph prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the graph prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted graph prototypes under the `graphids` property.

Examples

Deleting multiple graph prototypes

Delete two graph prototypes.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "graphprototype.delete",
    "params": [
        "652",
        "653"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
}

```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652",
      "653"
    ]
  },
  "id": 1
}
```

## graphprototype.get

Description

integer/array graphprototype.get(object parameters)

The method allows to retrieve graph prototypes according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter           | Type         | Description   |
|---------------------|--------------|---|
| discoveryids        | string/array | Return only graph prototypes that belong to the given discovery rules.  |
| graphids            | string/array | Return only graph prototypes with the given IDs.  |
| groupids            | string/array | Return only graph prototypes that belong to hosts in the given host groups.   |
| hostids             | string/array | Return only graph prototypes that belong to the given hosts.  |
| inherited           | boolean      | If set to <code>true</code> return only graph prototypes inherited from a template.   |
| itemids             | string/array | Return only graph prototypes that contain the given item prototypes.  |
| templated           | boolean      | If set to <code>true</code> return only graph prototypes that belong to templates.  |
| templateids         | string/array | Return only graph prototypes that belong to the given templates.  |
| selectDiscoveryRule | query        | Return a <code>discoveryRule</code> property with the LLD rule that the graph prototype belongs to.                             |
| selectGraphItems    | query        | Return a <code>gitems</code> property with the graph items used in the graph prototype.   |
| selectGroups        | query        | Return a <code>groups</code> property with the host groups that the graph prototype belongs to.                                 |
| selectHosts         | query        | Return a <code>hosts</code> property with the hosts that the graph prototype belongs to.  |
| selectItems         | query        | Return an <code>items</code> property with the <code>items</code> and <code>item prototypes</code> used in the graph prototype. |
| selectTemplates     | query        | Return a <code>templates</code> property with the templates that the graph prototype belongs to.                                |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| filter                 | object       | Return only those results that exactly match the given filter.<br><br>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.<br><br>Supports additional filters:<br>host - technical name of the host that the graph prototype belongs to;<br>hostid - ID of the host that the graph prototype belongs to.<br>Sort the result by the given properties. |
| sortfield              | string/array | Possible values are: graphid, name and graphtype.<br>These parameters are described in the <a href="#">reference commentary</a> .   |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieving graph prototypes from an LLD rule

Retrieve all graph prototypes from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.get",
  "params": {
    "output": "extend",
    "discoveryids": "27426"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "graphid": "1017",
      "name": "Disk space usage {#FSNAME}",
      "width": "600",
      "height": "340",
      "yaxismin": "0.0000",
      "yaxismax": "0.0000",
      "templateid": "442",
      "show_work_period": "0",
      "show_triggers": "0",
      "graphtype": "2",

```

```

        "show_legend": "1",
        "show_3d": "1",
        "percent_left": "0.0000",
        "percent_right": "0.0000",
        "ymin_type": "0",
        "ymax_type": "0",
        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "discover": "0"
    }
],
    "id": 1
}

```

## graphprototype.update

Description

object graphprototype.update(object/array graphPrototypes)

This method allows to update existing graph prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Graph prototype properties to be updated.

The `graphid` property must be defined for each graph prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard graph prototype properties](#), the method accepts the following parameters.

| Parameter | Type  | Description  |
|-----------|-------|--|
| gitems    | array | Graph <a href="#">items</a> to replace existing graph items. If a graph item has the <code>gitemid</code> property defined it will be updated, otherwise a new graph item will be created. |

Return values

(object) Returns an object containing the IDs of the updated graph prototypes under the `graphids` property.

Examples

Changing the size of a graph prototype

Change the size of a graph prototype to 1100 to 400 pixels.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.update",
  "params": {
    "graphid": "439",
    "width": 1100,
    "height": 400
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "439"
    ]
  },
  "id": 1
}
```

## High availability node

This class is designed to work with server nodes that are part of a High availability cluster, or a standalone server instance.

Object references:

- [High availability node](#)

Available methods:

- [hanode.get](#) - retrieving nodes

### > High availability node object

The following object is related to operating a High availability cluster of Zabbix servers.

High availability node

#### Note:

Nodes are created by the Zabbix server and cannot be modified via the API.

The High availability node object has the following properties.

| Property   | Type    | Description   |
|------------|---------|---|
| ha_nodeid  | string  | ID of the node.   |
| name       | string  | Name assigned to the node, using the HANodeName configuration entry of <code>zabbix_server.conf</code> . Empty for a server running in standalone mode. |
| address    | string  | IP or DNS name where the node connects from.  |
| port       | integer | Port on which the node is running.  |
| lastaccess | integer | Heartbeat time, t.i. time of last update from the node. UTC timestamp.  |

| Property | Type    | Description  |
|----------|---------|--|
| status   | integer | State of the node.<br><br>Possible values:<br>0 - standby;<br>1 - stopped manually;<br>2 - unavailable;<br>3 - active. |

## hanode.get

### Description

integer/array hanode.get(object parameters)

The method allows to retrieve a list of High availability cluster nodes according to the given parameters.

#### Note:

This method is only available to *Super admin* user types. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type         | Description  |
|--------------|--------------|--|
| ha_nodeids   | string/array | Return only nodes with the given node IDs.   |
| filter       | object       | Return only those results that exactly match the given filter.<br><br>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.<br><br>Allows filtering by the node properties: <code>name</code> , <code>address</code> , <code>status</code> .<br>Sort the result by the given properties. |
| sortfield    | string/array | Sort the result by the given properties.<br><br>Possible values are: <code>name</code> , <code>lastaccess</code> , <code>status</code> .<br>These parameters are described in the <a href="#">reference commentary</a> .   |
| countOutput  | flag         |  |
| limit        | integer      |  |
| output       | query        |  |
| preservekeys | boolean      |  |
| sortorder    | string/array |  |

### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

### Examples

Get a list of nodes ordered by status

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hanode.get",
  "params": {
    "preservekeys": true,
    "sortfield": "status",
    "sortorder": "DESC"
  },
}
```

```

    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "ckuo7i1nw000h0sajj3l3hh8u": {
      "ha_nodeid": "ckuo7i1nw000h0sajj3l3hh8u",
      "name": "node-active",
      "address": "192.168.1.13",
      "port": "10051",
      "lastaccess": "1635335704",
      "status": "3"
    },
    "ckuo7i1nw000e0sajwfttc1mp": {
      "ha_nodeid": "ckuo7i1nw000e0sajwfttc1mp",
      "name": "node6",
      "address": "192.168.1.10",
      "port": "10053",
      "lastaccess": "1635332902",
      "status": "2"
    },
    "ckuo7i1nv000c0sajz85xcrtt": {
      "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
      "name": "node4",
      "address": "192.168.1.8",
      "port": "10052",
      "lastaccess": "1635334214",
      "status": "1"
    },
    "ckuo7i1nv000a0saj1fcdkeu4": {
      "ha_nodeid": "ckuo7i1nv000a0saj1fcdkeu4",
      "name": "node2",
      "address": "192.168.1.6",
      "port": "10051",
      "lastaccess": "1635335705",
      "status": "0"
    }
  },
  "id": 1
}

```

Get a list of specific nodes by their IDs

Request:

```

{
  "jsonrpc": "2.0",
  "method": "hanode.get",
  "params": {
    "ha_nodeids": ["ckuo7i1nw000e0sajwfttc1mp", "ckuo7i1nv000c0sajz85xcrtt"]
  },
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",

```

```

        "name": "node4",
        "address": "192.168.1.8",
        "port": "10052",
        "lastaccess": "1635334214",
        "status": "1"
    },
    {
        "ha_nodeid": "ckuo7i1nw000e0sajwfttc1mp",
        "name": "node6",
        "address": "192.168.1.10",
        "port": "10053",
        "lastaccess": "1635332902",
        "status": "2"
    }
],
    "id": 1
}

```

Get a list of stopped nodes

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "output": ["ha_nodeid", "address", "port"],
        "filter": {
            "status": 1
        }
    },
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "ha_nodeid": "ckuo7i1nw000g0sajjsjre7e3",
            "address": "192.168.1.12",
            "port": "10051"
        },
        {
            "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
            "address": "192.168.1.8",
            "port": "10052"
        },
        {
            "ha_nodeid": "ckuo7i1nv000d0sajd95y1b6x",
            "address": "192.168.1.9",
            "port": "10053"
        }
    ],
    "id": 1
}

```

Get a count of standby nodes

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hanode.get",

```

```

    "params": {
      "countOutput": true,
      "filter": {
        "status": 0
      }
    },
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": "3",
  "id": 1
}

```

Check status of nodes at specific IP addresses

Request:

```

{
  "jsonrpc": "2.0",
  "method": "hanode.get",
  "params": {
    "output": ["name", "status"],
    "filter": {
      "address": ["192.168.1.7", "192.168.1.13"]
    }
  },
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "name": "node3",
      "status": "0"
    },
    {
      "name": "node-active",
      "status": "3"
    }
  ],
  "id": 1
}

```

## History

This class is designed to work with history data.

Object references:

- [History](#)

Available methods:

- `history.get` - retrieving history data.

## > History object

The following objects are directly related to the `history` API.

### Note:

History objects differ depending on the item's type of information. They are created by the Zabbix server and cannot be modified via the API.

### Float history

The float history object has the following properties.

| Property | Type      | Description                              |
|----------|-----------|--|
| clock    | timestamp | Time when that value was received.       |
| itemid   | string    | ID of the related item.                  |
| ns       | integer   | Nanoseconds when the value was received. |
| value    | float     | Received value.                          |

### Integer history

The integer history object has the following properties.

| Property | Type      | Description                              |
|----------|-----------|--|
| clock    | timestamp | Time when that value was received.       |
| itemid   | string    | ID of the related item.                  |
| ns       | integer   | Nanoseconds when the value was received. |
| value    | integer   | Received value.                          |

### String history

The string history object has the following properties.

| Property | Type      | Description                              |
|----------|-----------|--|
| clock    | timestamp | Time when that value was received.       |
| itemid   | string    | ID of the related item.                  |
| ns       | integer   | Nanoseconds when the value was received. |
| value    | string    | Received value.                          |

### Text history

The text history object has the following properties.

| Property | Type      | Description                              |
|----------|-----------|--|
| id       | string    | ID of the history entry.                 |
| clock    | timestamp | Time when that value was received.       |
| itemid   | string    | ID of the related item.                  |
| ns       | integer   | Nanoseconds when the value was received. |
| value    | text      | Received value.                          |

### Log history

The log history object has the following properties.

| Property | Type      | Description                        |
|----------|-----------|------------------------------------|
| id       | string    | ID of the history entry.           |
| clock    | timestamp | Time when that value was received. |

| Property   | Type      | Description                              |
|------------|-----------|--|
| itemid     | string    | ID of the related item.                  |
| logeventid | integer   | Windows event log entry ID.              |
| ns         | integer   | Nanoseconds when the value was received. |
| severity   | integer   | Windows event log entry level.           |
| source     | string    | Windows event log entry source.          |
| timestamp  | timestamp | Windows event log entry time.            |
| value      | text      | Received value.                          |

## history.clear

Description

object history.clear(array itemids)

This method allows to clear item history.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of items to clear.

Return values

(object) Returns an object containing the IDs of the cleared items under the `itemids` property.

Examples

Clear history

Request:

```
{
  "jsonrpc": "2.0",
  "method": "history.clear",
  "params": [
    "10325",
    "13205"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10325",
      "13205"
    ]
  },
  "id": 1
}
```

Source

CHistory::clear() in `ui/include/classes/api/services/CHistory.php`.

## history.get

Description

`integer/array history.get(object parameters)`

The method allows to retrieve history data according to the given parameters.

**Attention:**

This method may return historical data of a deleted entity if this data has not been removed by the housekeeper yet.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| history                | integer      | History object types to return.<br><br>Possible values:<br>0 - numeric float;<br>1 - character;<br>2 - log;<br>3 - numeric unsigned;<br>4 - text.<br><br>Default: 3. |
| hostids                | string/array | Return only history from the given hosts.  |
| itemids                | string/array | Return only history from the given items.  |
| time_from              | timestamp    | Return only values that have been received after or at the given time.   |
| time_till              | timestamp    | Return only values that have been received before or at the given time.  |
| sortfield              | string/array | Sort the result by the given properties.   |
| countOutput            | boolean      | Possible values are: <code>itemid</code> and <code>clock</code> .<br>These parameters are described in the <a href="#">reference commentary</a> .                    |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving item history data

Return 10 latest values received from a numeric(float) item.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "history.get",
  "params": {
```

```

    "output": "extend",
    "history": 0,
    "itemids": "23296",
    "sortfield": "clock",
    "sortorder": "DESC",
    "limit": 10
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "23296",
      "clock": "1351090996",
      "value": "0.085",

CHistory::get() in *ui/include/classes/api/services/CHistory.php*.

## Host

This class is designed to work with hosts.

Object references:

- [Host](#)
- [Host inventory](#)

Available methods:

- [host.create](#) - creating new hosts
- [host.delete](#) - deleting hosts
- [host.get](#) - retrieving hosts
- [host.massadd](#) - adding related objects to hosts
- [host.massremove](#) - removing related objects from hosts
- [host.massupdate](#) - replacing or removing related objects from hosts
- [host.update](#) - updating hosts

### > Host object

The following objects are directly related to the host API.

Host

The host object has the following properties.

| Property                  | Type    | Description                             |
|---------------------------|---------|---|
| hostid                    | string  | ( <i>readonly</i> ) ID of the host.     |
| <b>host</b><br>(required) | string  | Technical name of the host.             |
| description               | text    | Description of the host.                |
| flags                     | integer | ( <i>readonly</i> ) Origin of the host. |
| Possible values:          |         |   |
| 0 - a plain host;         |         |   |
| 4 - a discovered host.    |         |   |

| Property           | Type      | Description  |
|--------------------|-----------|--|
| inventory_mode     | integer   | Host inventory population mode.<br><br>Possible values are:<br>-1 - <i>(default)</i> disabled;<br>0 - manual;<br>1 - automatic.  |
| ipmi_authtype      | integer   | IPMI authentication algorithm.<br><br>Possible values are:<br>-1 - <i>(default)</i> default;<br>0 - none;<br>1 - MD2;<br>2 - MD5<br>4 - straight;<br>5 - OEM;<br>6 - RMCP+.        |
| ipmi_password      | string    | IPMI password.   |
| ipmi_privilege     | integer   | IPMI privilege level.<br><br>Possible values are:<br>1 - callback;<br>2 - <i>(default)</i> user;<br>3 - operator;<br>4 - admin;<br>5 - OEM.  |
| ipmi_username      | string    | IPMI username.   |
| maintenance_from   | timestamp | <i>(readonly)</i> Starting time of the effective maintenance.  |
| maintenance_status | integer   | <i>(readonly)</i> Effective maintenance status.<br><br>Possible values are:<br>0 - <i>(default)</i> no maintenance;<br>1 - maintenance in effect.                                  |
| maintenance_type   | integer   | <i>(readonly)</i> Effective maintenance type.<br><br>Possible values are:<br>0 - <i>(default)</i> maintenance with data collection;<br>1 - maintenance without data collection.    |
| maintenanceid      | string    | <i>(readonly)</i> ID of the maintenance that is currently in effect on the host.   |
| name               | string    | Visible name of the host.  |
| proxy_hostid       | string    | Default: host property value.  |
| status             | integer   | ID of the proxy that is used to monitor the host.<br>Status and function of the host.<br><br>Possible values are:<br>0 - <i>(default)</i> monitored host;<br>1 - unmonitored host. |
| tls_connect        | integer   | Connections to host.   |
| tls_accept         | integer   | Connections from host.<br><br>Possible values are:<br>1 - <i>(default)</i> No encryption;<br>2 - PSK;<br>4 - certificate.  |
|                    |           | Possible bitmap values are:<br>1 - <i>(default)</i> No encryption;<br>2 - PSK;<br>4 - certificate.   |
|                    |           | This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for PSK and certificate).   |

| Property         | Type   | Description   |
|------------------|--------|---|
| tls_issuer       | string | Certificate issuer.   |
| tls_subject      | string | Certificate subject.  |
| tls_psk_identity | string | (write-only) PSK identity; must be paired with only one PSK (across <b>autoregistration</b> , <b>hosts</b> , and <b>proxies</b> ). Required if either <code>tls_connect</code> or <code>tls_accept</code> has PSK enabled.<br>Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. |
| tls_psk          | string | (write-only) Pre-shared key (PSK); must be at least 32 hex digits.<br>Required if either <code>tls_connect</code> or <code>tls_accept</code> has PSK enabled.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Host inventory

The host inventory object has the following properties.

##### Note:

Each property has it's own unique ID number, which is used to associate host inventory fields with items.

| ID | Property          | Type   | Description                 | Maximum length  |
|----|-------------------|--------|-----------------------------|---|
| 4  | alias             | string | Alias.                      | 128 characters  |
| 11 | asset_tag         | string | Asset tag.                  | 64 characters   |
| 28 | chassis           | string | Chassis.                    | 64 characters   |
| 23 | contact           | string | Contact person.             | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 32 | contract_number   | string | Contract number.            | 64 characters   |
| 47 | date_hw_decomm    | string | HW decommissioning date.    | 64 characters   |
| 46 | date_hw_expiry    | string | HW maintenance expiry date. | 64 characters   |
| 45 | date_hw_install   | string | HW installation date.       | 64 characters   |
| 44 | date_hw_purchase  | string | HW purchase date.           | 64 characters   |
| 34 | deployment_status | string | Deployment status.          | 64 characters   |
| 14 | hardware          | string | Hardware.                   | 255 characters  |
| 15 | hardware_full     | string | Detailed hardware.          | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 39 | host_netmask      | string | Host subnet mask.           | 39 characters   |
| 38 | host_networks     | string | Host networks.              | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 40 | host_router       | string | Host router.                | 39 characters   |
| 30 | hw_arch           | string | HW architecture.            | 32 characters   |
| 33 | installer_name    | string | Installer name.             | 64 characters   |
| 24 | location          | string | Location.                   | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 25 | location_lat      | string | Location latitude.          | 16 characters   |
| 26 | location_lon      | string | Location longitude.         | 16 characters   |
| 12 | macaddress_a      | string | MAC address A.              | 64 characters   |
| 13 | macaddress_b      | string | MAC address B.              | 64 characters   |
| 29 | model             | string | Model.                      | 64 characters   |
| 3  | name              | string | Name.                       | 128 characters  |
| 27 | notes             | string | Notes.                      | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 41 | oob_ip            | string | OOB IP address.             | 39 characters   |
| 42 | oob_netmask       | string | OOB host subnet mask.       | 39 characters   |
| 43 | oob_router        | string | OOB router.                 | 39 characters   |
| 5  | os                | string | OS name.                    | 128 characters  |
| 6  | os_full           | string | Detailed OS name.           | 255 characters  |

| ID | Property       | Type   | Description                  | Maximum length  |
|----|----------------|--------|------------------------------|---|
| 7  | os_short       | string | Short OS name.               | 128 characters  |
| 61 | poc_1_cell     | string | Primary POC mobile number.   | 64 characters   |
| 58 | poc_1_email    | string | Primary email.               | 128 characters  |
| 57 | poc_1_name     | string | Primary POC name.            | 128 characters  |
| 63 | poc_1_notes    | string | Primary POC notes.           | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 59 | poc_1_phone_a  | string | Primary POC phone A.         | 64 characters   |
| 60 | poc_1_phone_b  | string | Primary POC phone B.         | 64 characters   |
| 62 | poc_1_screen   | string | Primary POC screen name.     | 64 characters   |
| 68 | poc_2_cell     | string | Secondary POC mobile number. | 64 characters   |
| 65 | poc_2_email    | string | Secondary POC email.         | 128 characters  |
| 64 | poc_2_name     | string | Secondary POC name.          | 128 characters  |
| 70 | poc_2_notes    | string | Secondary POC notes.         | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 66 | poc_2_phone_a  | string | Secondary POC phone A.       | 64 characters   |
| 67 | poc_2_phone_b  | string | Secondary POC phone B.       | 64 characters   |
| 69 | poc_2_screen   | string | Secondary POC screen name.   | 64 characters   |
| 8  | serialno_a     | string | Serial number A.             | 64 characters   |
| 9  | serialno_b     | string | Serial number B.             | 64 characters   |
| 48 | site_address_a | string | Site address A.              | 128 characters  |
| 49 | site_address_b | string | Site address B.              | 128 characters  |
| 50 | site_address_c | string | Site address C.              | 128 characters  |
| 51 | site_city      | string | Site city.                   | 128 characters  |
| 53 | site_country   | string | Site country.                | 64 characters   |
| 56 | site_notes     | string | Site notes.                  | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 55 | site_rack      | string | Site rack location.          | 128 characters  |
| 52 | site_state     | string | Site state.                  | 64 characters   |
| 54 | site_zip       | string | Site ZIP/postal code.        | 64 characters   |
| 16 | software       | string | Software.                    | 255 characters  |
| 18 | software_app_a | string | Software application A.      | 64 characters   |
| 19 | software_app_b | string | Software application B.      | 64 characters   |
| 20 | software_app_c | string | Software application C.      | 64 characters   |
| 21 | software_app_d | string | Software application D.      | 64 characters   |
| 22 | software_app_e | string | Software application E.      | 64 characters   |
| 17 | software_full  | string | Software details.            | Depends on the database used:<br>- 65535 characters for SQL databases<br>- 2048 characters for Oracle databases |
| 10 | tag            | string | Tag.                         | 64 characters   |
| 1  | type           | string | Type.                        | 64 characters   |
| 2  | type_full      | string | Type details.                | 64 characters   |
| 35 | url_a          | string | URL A.                       | 255 characters  |
| 36 | url_b          | string | URL B.                       | 255 characters  |
| 37 | url_c          | string | URL C.                       | 255 characters  |
| 31 | vendor         | string | Vendor.                      | 64 characters   |

## Host tag

The host tag object has the following properties.

| Property                 | Type   | Description     |
|--------------------------|--------|-----------------|
| <b>tag</b><br>(required) | string | Host tag name.  |
| value                    | string | Host tag value. |

## host.create

Description

object `host.create(object/array hosts)`

This method allows to create new hosts.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Hosts to create.

Additionally to the [standard host properties](#), the method accepts the following parameters.

| Parameter                   | Type         | Description   |
|-----------------------------|--------------|---|
| <b>groups</b><br>(required) | object/array | Host <b>groups</b> to add the host to.<br><br>The host groups must have the <code>groupid</code> property defined.      |
| interfaces                  | object/array | <b>Interfaces</b> to be created for the host.   |
| tags                        | object/array | Host <b>tags</b> .  |
| templates                   | object/array | <b>Templates</b> to be linked to the host.<br><br>The templates must have the <code>templateid</code> property defined. |
| macros                      | object/array | <b>User macros</b> to be created for the host.  |
| inventory                   | object       | Host <b>inventory</b> properties.   |

Return values

(object) Returns an object containing the IDs of the created hosts under the `hostids` property. The order of the returned IDs matches the order of the passed hosts.

Examples

Creating a host

Create a host called "Linux server" with an IP interface and tags, add it to a group, link a template to it and set the MAC addresses in the host inventory.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "Linux server",
    "interfaces": [
      {
        "type": 1,
        "main": 1,
        "useip": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050"
      }
    ],
    "groups": [
      {
        "groupid": "50"
      }
    ],
    "tags": [
      {
        "tag": "Host name",
        "value": "Linux server"
      }
    ]
  }
}
```

```

    }
  ],
  "templates": [
    {
      "templateid": "20045"
    }
  ],
  "macros": [
    {
      "macro": "{$USER_ID}",
      "value": "123321"
    },
    {
      "macro": "{$USER_LOCATION}",
      "value": "0:0:0",
      "description": "latitude, longitude and altitude coordinates"
    }
  ],
  "inventory_mode": 0,
  "inventory": {
    "macaddress_a": "01234",
    "macaddress_b": "56768"
  }
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "107819"
    ]
  },
  "id": 1
}

```

Creating a host with SNMP interface

Create a host called "SNMP host" with an SNMPv3 interface with details.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "SNMP host",
    "interfaces": [
      {
        "type": 2,
        "main": 1,
        "useip": 1,
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "details": {
          "version": 3,
          "bulk": 0,
          "securityname": "mysecurityname",
          "contextname": "",
          "securitylevel": 1
        }
      }
    ]
  }
}

```

```

    }
  },
  "groups": [
    {
      "groupid": "4"
    }
  ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10658"
    ]
  },
  "id": 1
}

```

Creating a host with PSK encryption

Create a host called "PSK host" with PSK encryption configured. Note that the host has to be **pre-configured to use PSK**.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "PSK host",
    "interfaces": [
      {
        "type": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050",
        "useip": 1,
        "main": 1
      }
    ],
    "groups": [
      {
        "groupid": "2"
      }
    ],
    "tls_accept": 2,
    "tls_connect": 2,
    "tls_psk_identity": "PSK 001",
    "tls_psk": "1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [

```

```

        "10590"
    ],
    },
    "id": 1
}

```

## host.delete

Description

`object host.delete(array hosts)`

This method allows to delete hosts.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of hosts to delete.

Return values

(object) Returns an object containing the IDs of the deleted hosts under the `hostids` property.

Examples

Deleting multiple hosts

Delete two hosts.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.delete",
    "params": [
        "13",
        "32"
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "13",
            "32"
        ]
    },
}

```

```
"id": 1
}
```

#### Source

`CHost::delete()` in `ui/include/classes/api/services/CHost.php`.

### host.get

#### Description

`integer/array host.get(object parameters)`

The method allows to retrieve hosts according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter                                      | Type         | Description  |
|--|--------------|--|
| <code>groupids</code>                          | string/array | Return only hosts that belong to the given groups.   |
| <code>dserviceids</code>                       | string/array | Return only hosts that are related to the given discovered services.   |
| <code>graphids</code>                          | string/array | Return only hosts that have the given graphs.  |
| <code>hostids</code>                           | string/array | Return only hosts with the given host IDs.   |
| <code>httptestids</code>                       | string/array | Return only hosts that have the given web checks.  |
| <code>interfaceids</code>                      | string/array | Return only hosts that use the given interfaces.   |
| <code>itemids</code>                           | string/array | Return only hosts that have the given items.   |
| <code>maintenanceids</code>                    | string/array | Return only hosts that are affected by the given maintenances.   |
| <code>monitored_hosts</code>                   | flag         | Return only monitored hosts.   |
| <code>proxy_hosts</code>                       | flag         | Return only proxies.   |
| <code>proxyids</code>                          | string/array | Return only hosts that are monitored by the given proxies.   |
| <code>templated_hosts</code>                   | flag         | Return both hosts and templates.   |
| <code>templateids</code>                       | string/array | Return only hosts that are linked to the given templates.  |
| <code>triggerids</code>                        | string/array | Return only hosts that have the given triggers.  |
| <code>with_items</code>                        | flag         | Return only hosts that have items.   |
| <code>with_item_prototypes</code>              | flag         | Overrides the <code>with_monitored_items</code> and <code>with_simple_graph_items</code> parameters.<br>Return only hosts that have item prototypes.   |
| <code>with_simple_graph_item_prototypes</code> | flag         | Overrides the <code>with_simple_graph_item_prototypes</code> parameter.<br>Return only hosts that have item prototypes, which are enabled for creation and have numeric type of information. |
| <code>with_graphs</code>                       | flag         | Return only hosts that have graphs.  |
| <code>with_graph_prototypes</code>             | flag         | Return only hosts that have graph prototypes.  |
| <code>with_httptests</code>                    | flag         | Return only hosts that have web checks.  |
| <code>with_monitored_httptests</code>          | flag         | Overrides the <code>with_monitored_httptests</code> parameter.<br>Return only hosts that have enabled web checks.  |
| <code>with_monitored_items</code>              | flag         | Return only hosts that have enabled items.   |
| <code>with_monitored_triggers</code>           | flag         | Overrides the <code>with_simple_graph_items</code> parameter.<br>Return only hosts that have enabled triggers. All of the items used in the trigger must also be enabled.                    |
| <code>with_simple_graph_items</code>           | flag         | Return only hosts that have items with numeric type of information.  |
| <code>with_triggers</code>                     | flag         | Return only hosts that have triggers.  |

Overrides the `with_monitored_triggers` parameter.

| Parameter              | Type          | Description  |
|------------------------|---------------|--|
| withProblemsSuppressed | boolean       | Return hosts that have suppressed problems.<br><br>Possible values:<br>null - (default) all hosts;<br>true - only hosts with suppressed problems;<br>false - only hosts with unsuppressed problems.  |
| evaltype               | integer       | Rules for tag searching.<br><br>Possible values:<br>0 - (default) And/Or;<br>2 - Or.   |
| severities             | integer/array | Return hosts that have only problems with given severities. Applies only if problem object is trigger.   |
| tags                   | object/array  | Return only hosts with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all hosts.<br><br>Possible operator values:<br>0 - (default) Contains;<br>1 - Equals;<br>2 - Not like;<br>3 - Not equal<br>4 - Exists;<br>5 - Not exists.  |
| inheritedTags          | boolean       | Return hosts that have given tags also in all of their linked templates.<br>Default:<br><br>Possible values:<br>true - linked templates must also have given tags;<br>false - (default) linked template tags are ignored.  |
| selectDiscoveries      | query         | Return a <b>discoveries</b> property with host low-level discovery rules.  |
| selectDiscoveryRule    | query         | Supports count.<br>Return a <b>discoveryRule</b> property with the low-level discovery rule that created the host (from host prototype in VMware monitoring).  |
| selectGraphs           | query         | Return a <b>graphs</b> property with host graphs.  |
| selectGroups           | query         | Supports count.<br>Return a <b>groups</b> property with host groups data that the host belongs to.   |
| selectHostDiscovery    | query         | Return a <b>hostDiscovery</b> property with host discovery object data.<br><br>The host discovery object links a discovered host to a host prototype or a host prototypes to an LLD rule and has the following properties:<br>host - ( <i>string</i> ) host of the host prototype;<br>hostid - ( <i>string</i> ) ID of the discovered host or host prototype;<br>parent_hostid - ( <i>string</i> ) ID of the host prototype from which the host has been created;<br>parent_itemid - ( <i>string</i> ) ID of the LLD rule that created the discovered host;<br>lastcheck - ( <i>timestamp</i> ) time when the host was last discovered;<br>ts_delete - ( <i>timestamp</i> ) time when a host that is no longer discovered will be deleted. |
| selectHttpTests        | query         | Return an <b>httpTests</b> property with host web scenarios.   |
| selectInterfaces       | query         | Supports count.<br>Return an <b>interfaces</b> property with host interfaces.<br><br>Supports count.   |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| selectInventory        | query        | Return an <b>inventory</b> property with host inventory data.  |
| selectItems            | query        | Return an <b>items</b> property with host items.   |
| selectMacros           | query        | Supports count.<br>Return a <b>macros</b> property with host macros.   |
| selectParentTemplates  | query        | Return a <b>parentTemplates</b> property with templates that the host is linked to.  |
| selectDashboards       | query        | Supports count.<br>Return a <b>dashboards</b> property.  |
| selectTags             | query        | Supports count.<br>Return a <b>tags</b> property with host tags.   |
| selectInheritedTags    | query        | Return an <b>inheritedTags</b> property with tags that are on all templates which are linked to host.  |
| selectTriggers         | query        | Return a <b>triggers</b> property with host triggers.  |
| selectValueMaps        | query        | Supports count.<br>Return a <b>valuemaps</b> property with host value maps.  |
| filter                 | object       | Return only those results that exactly match the given filter.<br><br>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.  |
| limitSelects           | integer      | Allows filtering by interface properties. Doesn't work for text fields.<br>Limits the number of records returned by subselects.<br><br>Applies to the following subselects:<br>selectParentTemplates - results will be sorted by host;<br>selectInterfaces;<br>selectItems - sorted by name;<br>selectDiscoveries - sorted by name;<br>selectTriggers - sorted by description;<br>selectGraphs - sorted by name;<br>selectDashboards - sorted by name. |
| search                 | object       | Return results that match the given pattern (case-insensitive).<br><br>Accepts an array, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.   |
| searchInventory        | object       | Allows searching by interface properties. Works only for string and text fields.<br>Return only hosts that have inventory data matching the given wildcard search.   |
| sortfield              | string/array | This parameter is affected by the same additional parameters as search.<br>Sort the result by the given properties.  |
| countOutput            | boolean      | Possible values are: hostid, host, name, status.   |
| editable               | boolean      | These parameters are described in the <b>reference commentary</b> .  |
| excludeSearch          | boolean      |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two hosts named "Zabbix server" and "Linux server".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "filter": {
      "host": [
        "Zabbix server",
        "Linux server"
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10160",
      "proxy_hostid": "0",
      "host": "Zabbix server",
      "status": "0",
      "lastaccess": "0",
      "ipmi_authtype": "-1",
      "ipmi_privilege": "2",
      "ipmi_username": "",
      "ipmi_password": "",
      "maintenanceid": "0",
      "maintenance_status": "0",
      "maintenance_type": "0",
      "maintenance_from": "0",
      "name": "Zabbix server",
      "flags": "0",
      "description": "The Zabbix monitoring server.",
      "tls_connect": "1",
      "tls_accept": "1",
      "tls_issuer": "",
      "tls_subject": "",
      "inventory_mode": "1"
    },
    {
      "hostid": "10167",
      "proxy_hostid": "0",
      "host": "Linux server",
      "status": "0",
      "lastaccess": "0",
      "ipmi_authtype": "-1",
      "ipmi_privilege": "2",
      "ipmi_username": "",

```

```

        "ipmi_password": "",
        "maintenanceid": "0",
        "maintenance_status": "0",
        "maintenance_type": "0",
        "maintenance_from": "0",
        "name": "Linux server",
        "flags": "0",
        "description": "",
        "tls_connect": "1",
        "tls_accept": "1",
        "tls_issuer": "",
        "tls_subject": "",
        "inventory_mode": "1"
    }
],
    "id": 1
}

```

Retrieving host groups

Retrieve names of the groups host "Zabbix server" is member of, but no host details themselves.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectGroups": "extend",
        "filter": {
            "host": [
                "Zabbix server"
            ]
        }
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 2
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10085",
            "groups": [
                {
                    "groupid": "2",
                    "name": "Linux servers",
                    "internal": "0",
                    "flags": "0"
                },
                {
                    "groupid": "4",
                    "name": "Zabbix servers",
                    "internal": "0",
                    "flags": "0"
                }
            ]
        }
    ],
    "id": 2
}

```

### Retrieving linked templates

Retrieve the IDs and names of templates linked to host "10084".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid"],
    "selectParentTemplates": [
      "templateid",
      "name"
    ],
    "hostids": "10084"
  },
  "id": 1,
  "auth": "70785d2b494a7302309b48afcdb3a401"
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "parentTemplates": [
        {
          "name": "Linux",
          "templateid": "10001"
        },
        {
          "name": "Zabbix Server",
          "templateid": "10047"
        }
      ]
    }
  ],
  "id": 1
}
```

### Retrieving hosts by template

Retrieve hosts that have the "10001" (*Linux by Zabbix agent*) template linked to them.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "name"],
    "templateids": "10001"
  },
  "auth": "70785d2b494a7302309b48afcdb3a401",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "templateid": "10001",
      "hosts": [
```

```

        {
            "hostid": "10084",
            "name": "Zabbix server"
        },
        {
            "hostid": "10603",
            "name": "Host 1"
        },
        {
            "hostid": "10604",
            "name": "Host 2"
        }
    ]
},
"id": 1
}

```

Searching by host inventory data

Retrieve hosts that contain "Linux" in the host inventory "OS" field.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": [
            "host"
        ],
        "selectInventory": [
            "os"
        ],
        "searchInventory": {
            "os": "Linux"
        }
    },
    "id": 2,
    "auth": "7f9e00124c75e8f25facd5c093f3e9a0"
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10084",
            "host": "Zabbix server",
            "inventory": {
                "os": "Linux Ubuntu"
            }
        },
        {
            "hostid": "10107",
            "host": "Linux server",
            "inventory": {
                "os": "Linux Mint"
            }
        }
    ],
    "id": 1
}

```

Searching by host tags

Retrieve hosts that have tag "Host name" equal to "Linux server".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid"],
    "selectTags": "extend",
    "evaltype": 0,
    "tags": [
      {
        "tag": "Host name",
        "value": "Linux server",
        "operator": 1
      }
    ]
  },
  "auth": "7f9e00124c75e8f25facd5c093f3e9a0",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10085",
      "tags": [
        {
          "tag": "Host name",
          "value": "Linux server"
        },
        {
          "tag": "OS",
          "value": "RHEL 7"
        }
      ]
    }
  ],
  "id": 1
}
```

Retrieve hosts that have these tags not only on host level but also in their linked parent templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "tags": [{"tag": "A", "value": "1", "operator": "0"}],
    "inheritedTags": true
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
```

```

        "hostid": "10623",
        "name": "PC room 1"
    },
    {
        "hostid": "10601",
        "name": "Office"
    }
],
"id": 1
}

```

Searching host with tags and template tags

Retrieve a host with tags and all tags that are linked to parent templates.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "hostids": 10502,
    "selectTags": ["tag", "value"],
    "selectInheritedTags": ["tag", "value"]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10502",
      "name": "Desktop",
      "tags": [
        {
          "tag": "A",
          "value": "1"
        }
      ],
      "inheritedTags": [
        {
          "tag": "B",
          "value": "2"
        }
      ]
    }
  ],
  "id": 1
}

```

Searching hosts by problem severity

Retrieve hosts that have "Disaster" problems.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "severities": 5
  }
}

```

```

    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10160",
      "name": "Zabbix server"
    }
  ],
  "id": 1
}

```

Retrieve hosts that have "Average" and "High" problems.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "severities": [3, 4]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "20170",
      "name": "Database"
    },
    {
      "hostid": "20183",
      "name": "workstation"
    }
  ],
  "id": 1
}

```

## host.massadd

Description

object `host.massadd(object parameters)`

This method allows to simultaneously add multiple related objects to all the given hosts.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object) Parameters containing the IDs of the hosts to update and the objects to add to all the hosts.

The method accepts the following parameters.

| Parameter                  | Type         | Description  |
|----------------------------|--------------|--|
| <b>hosts</b><br>(required) | object/array | Hosts to be updated.<br><br>The hosts must have the <code>hostid</code> property defined.                          |
| groups                     | object/array | Host groups to add to the given hosts.<br><br>The host groups must have the <code>groupid</code> property defined. |
| interfaces                 | object/array | <b>Host interfaces</b> to be created for the given hosts.  |
| macros                     | object/array | <b>User macros</b> to be created for the given hosts.  |
| templates                  | object/array | Templates to link to the given hosts.<br><br>The templates must have the <code>templateid</code> property defined. |

**Return values**

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

**Examples****Adding macros**

Add two new macros to two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massadd",
  "params": {
    "hosts": [
      {
        "hostid": "10160"
      },
      {
        "hostid": "10167"
      }
    ],
    "macros": [
      {
        "macro": "${TEST1}",
        "value": "MACROTEST1"
      },
      {
        "macro": "${TEST2}",
        "value": "MACROTEST2",
        "description": "Test description"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10160",
      "10167"
    ]
  },
  "id": 1
}
```

## host.massremove

Description

`object host.massremove(object parameters)`

This method allows to remove related objects from multiple hosts.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to update and the objects that should be removed.

| Parameter                    | Type         | Description   |
|------------------------------|--------------|---|
| <b>hostids</b><br>(required) | string/array | IDs of the hosts to be updated.   |
| groupids                     | string/array | Host groups to remove the given hosts from.   |
| interfaces                   | object/array | Host interfaces to remove from the given hosts.<br><br>The host interface object must have the <code>ip</code> , <code>dns</code> and <code>port</code> properties defined. |
| macros                       | string/array | User macros to delete from the given hosts.   |
| templateids                  | string/array | Templates to unlink from the given hosts.   |
| templateids_clear            | string/array | Templates to unlink and clear from the given hosts.   |

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Unlinking templates

Unlink a template from two hosts and delete all of the templated entities.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massremove",
```

```

    "params": {
      "hostids": ["69665", "69666"],
      "templateids_clear": "325"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
  }

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "69665",
      "69666"
    ]
  },
  "id": 1
}

```

`CHost::massRemove()` in `ui/include/classes/api/services/CHost.php`.

## host.massupdate

Description

`object host.massupdate(object parameters)`

This method allows to simultaneously replace or remove related objects and update properties on multiple hosts.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to update and the properties that should be updated.

Additionally to the [standard host properties](#), the method accepts the following parameters.

| Parameter                  | Type         | Description   |
|----------------------------|--------------|---|
| <b>hosts</b><br>(required) | object/array | <b>Hosts</b> to be updated.<br><br>The hosts must have the <code>hostid</code> property defined.  |
| groups                     | object/array | Host <b>groups</b> to replace the current host groups the hosts belong to.<br><br>The host groups must have the <code>groupid</code> property defined.              |
| interfaces                 | object/array | Host <b>interfaces</b> to replace the current host interfaces on the given hosts.   |
| inventory                  | object       | Host <b>inventory</b> properties.<br><br>Host inventory mode cannot be updated using the <code>inventory</code> parameter, use <code>inventory_mode</code> instead. |
| macros                     | object/array | <b>User macros</b> to replace the current user macros on the given hosts.   |
| templates                  | object/array | <b>Templates</b> to replace the currently linked templates on the given hosts.<br><br>The templates must have the <code>templateid</code> property defined.         |

| Parameter   | Type         | Description  |
|---|--------------|--|
| templates_clear   | object/array | <b>Templates</b> to unlink and clear from the given hosts. |
| The templates must have the <code>templateid</code> property defined. |              |  |

#### Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

#### Examples

##### Enabling multiple hosts

Enable monitoring of two hosts, i.e., set their status to 0.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massupdate",
  "params": {
    "hosts": [
      {
        "hostid": "69665"
      },
      {
        "hostid": "69666"
      }
    ],
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "69665",
      "69666"
    ]
  },
  "id": 1
}
```

- [Host interface](#)

#### Source

`CHost::massUpdate()` in `ui/include/classes/api/services/CHost.php`.

### **host.update**

#### Description

object `host.update(object/array hosts)`

This method allows to update existing hosts.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host properties to be updated.

The `hostid` property must be defined for each host, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Note, however, that updating the host technical name will also update the host’s visible name (if not given or empty) by the host’s technical name value.

Additionally to the **standard host properties**, the method accepts the following parameters.

| Parameter       | Type         | Description   |
|-----------------|--------------|---|
| groups          | object/array | Host <b>groups</b> to replace the current host groups the host belongs to.<br><br>The host groups must have the <code>groupid</code> property defined. All host groups that are not listed in the request will be unlinked. |
| interfaces      | object/array | Host <b>interfaces</b> to replace the current host interfaces.<br><br>All interfaces that are not listed in the request will be removed.  |
| tags            | object/array | Host <b>tags</b> to replace the current host tags.<br><br>All tags that are not listed in the request will be removed.  |
| inventory       | object       | Host <b>inventory</b> properties.   |
| macros          | object/array | <b>User macros</b> to replace the current user macros.<br><br>All macros that are not listed in the request will be removed.  |
| templates       | object/array | <b>Templates</b> to replace the currently linked templates. All templates that are not listed in the request will be only unlinked.   |
| templates_clear | object/array | The templates must have the <code>templateid</code> property defined.<br><b>Templates</b> to unlink and clear from the host.<br><br>The templates must have the <code>templateid</code> property defined.                   |

**Note:**

As opposed to the Zabbix frontend, when `name` (visible host name) is the same as `host` (technical host name), updating `host` via API will not automatically update `name`. Both properties need to be updated explicitly.

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Enabling a host

Enable host monitoring, i.e. set its status to 0.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
    "id": 1
  }
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}
```

Unlinking templates

Unlink and clear two templates from host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "templates_clear": [
      {
        "templateid": "10124"
      },
      {
        "templateid": "10125"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}
```

Updating host macros

Replace all host macros with two new ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "macros": [
      {
        "macro": "${PASS}",
        "value": "password"
      },
      {

```

```

        "macro": "${DISC}",
        "value": "sda",
        "description": "Updated description"
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}

```

Updating host inventory

Change inventory mode and add location

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10387",
    "inventory_mode": 0,
    "inventory": {
      "location": "Latvia, Riga"
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10387"
    ]
  },
  "id": 1
}

```

Updating host tags

Replace all host tags with a new one.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10387",
    "tags": {
      "tag": "OS",
      "value": "RHEL 7"
    }
  }
}

```

```

    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10387"
    ]
  },
  "id": 1
}

```

Updating host encryption

Update the host "10590" to use PSK encryption only for connections from host to Zabbix server, and change the PSK identity and PSK key. Note that the host has to be **pre-configured to use PSK**.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10590",
    "tls_connect": 1,
    "tls_accept": 2,
    "tls_psk_identity": "PSK 002",
    "tls_psk": "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10590"
    ]
  },

`CHost::update()` in `ui/include/classes/api/services/CHost.php`.

## Host group

This class is designed to work with host groups.

Object references:

- [Host group](#)

Available methods:

- [hostgroup.create](#) - creating new host groups
- [hostgroup.delete](#) - deleting host groups
- [hostgroup.get](#) - retrieving host groups
- [hostgroup.massadd](#) - adding related objects to host groups
- [hostgroup.massremove](#) - removing related objects from host groups
- [hostgroup.massupdate](#) - replacing or removing related objects from host groups
- [hostgroup.update](#) - updating host groups

### > Host group object

The following objects are directly related to the `hostgroup` API.

Host group

The host group object has the following properties.

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| groupid                   | string  | <i>(readonly)</i> ID of the host group.   |
| <b>name</b><br>(required) | string  | Name of the host group.   |
| flags                     | integer | <i>(readonly)</i> Origin of the host group.<br><br>Possible values:<br>0 - a plain host group;<br>4 - a discovered host group.  |
| internal                  | integer | <i>(readonly)</i> Whether the group is used internally by the system. An internal group cannot be deleted.<br><br>Possible values:<br>0 - <i>(default)</i> not internal;<br>1 - internal. |
| uuid                      | string  | Universal unique identifier, used for linking imported host groups to already existing ones. Auto-generated, if not given.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

### **hostgroup.create**

Description

`object hostgroup.create(object/array hostGroups)`

This method allows to create new host groups.

#### **Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host groups to create. The method accepts host groups with the **standard host group properties**.

Return values

(object) Returns an object containing the IDs of the created host groups under the `groupids` property. The order of the returned IDs matches the order of the passed host groups.

#### Examples

##### Creating a host group

Create a host group called "Linux servers".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.create",
  "params": {
    "name": "Linux servers"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107819"
    ]
  },
  "id": 1
}
```

#### Source

`CHostGroup::create()` in `ui/include/classes/api/services/CHostGroup.php`.

## hostgroup.delete

#### Description

object `hostgroup.delete(array hostGroupIds)`

This method allows to delete host groups.

A host group can not be deleted if:

- it contains hosts that belong to this group only;
- it is marked as internal;
- it is used by a host prototype;
- it is used in a global script;
- it is used in a correlation condition.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(array) IDs of the host groups to delete.

#### Return values

(object) Returns an object containing the IDs of the deleted host groups under the `groupids` property.

#### Examples

##### Deleting multiple host groups

Delete two host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.delete",
  "params": [
    "107824",
    "107825"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107824",
      "107825"
    ]
  },
  "id": 1
}
```

Source

CHostGroup::delete() in *ui/include/classes/api/services/CHostGroup.php*.

## hostgroup.get

Description

integer/array hostgroup.get(object parameters)

The method allows to retrieve host groups according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter                | Type         | Description  |
|--------------------------|--------------|--|
| graphids                 | string/array | Return only host groups that contain hosts or templates with the given graphs.   |
| groupids                 | string/array | Return only host groups with the given host group IDs.                           |
| hostids                  | string/array | Return only host groups that contain the given hosts.                            |
| maintenanceids           | string/array | Return only host groups that are affected by the given maintenances.             |
| monitored_hosts          | flag         | Return only host groups that contain monitored hosts.                            |
| real_hosts               | flag         | Return only host groups that contain hosts.                                      |
| templated_hosts          | flag         | Return only host groups that contain templates.                                  |
| templateids              | string/array | Return only host groups that contain the given templates.                        |
| triggerids               | string/array | Return only host groups that contain hosts or templates with the given triggers. |
| with_graphs              | flag         | Return only host groups that contain hosts with graphs.                          |
| with_graph_prototypes    | flag         | Return only host groups that contain hosts with graph prototypes.                |
| with_hosts_and_templates | flag         | Return only host groups that contain hosts or templates.                         |
| with_httptests           | flag         | Return only host groups that contain hosts with web checks.                      |

Overrides the `with_monitored_httptests` parameter.

| Parameter                         | Type         | Description  |
|-----------------------------------|--------------|--|
| with_items                        | flag         | Return only host groups that contain hosts or templates with items.  |
| with_item_prototypes              | flag         | Overrides the with_monitored_items and with_simple_graph_items parameters.<br>Return only host groups that contain hosts with item prototypes.   |
| with_simple_graph_item_prototypes | flag         | Overrides the with_simple_graph_item_prototypes parameter.<br>Return only host groups that contain hosts with item prototypes, which are enabled for creation and have numeric type of information.  |
| with_monitored_httptests          | flag         | Return only host groups that contain hosts with enabled web checks.  |
| with_monitored_items              | flag         | Return only host groups that contain hosts or templates with enabled items.  |
| with_monitored_triggers           | flag         | Overrides the with_simple_graph_items parameter.<br>Return only host groups that contain hosts with enabled triggers. All of the items used in the trigger must also be enabled.   |
| with_simple_graph_items           | flag         | Return only host groups that contain hosts with numeric items.   |
| with_triggers                     | flag         | Return only host groups that contain hosts with triggers.  |
| selectDiscoveryRule               | query        | Overrides the with_monitored_triggers parameter.<br>Return a <b>discoveryRule</b> property with the LLD rule that created the host group.  |
| selectGroupDiscovery              | query        | Return a groupDiscovery property with the host group discovery object.   |
|                                   |              | The host group discovery object links a discovered host group to a host group prototype and has the following properties:<br>groupid - (string) ID of the discovered host group;<br>lastcheck - (timestamp) time when the host group was last discovered;<br>name - (string) name of the host group prototype;<br>parent_group_prototypeid - (string) ID of the host group prototype from which the host group has been created;<br>ts_delete - (timestamp) time when a host group that is no longer discovered will be deleted. |
| selectHosts                       | query        | Return a <b>hosts</b> property with the hosts that belong to the host group.   |
| selectTemplates                   | query        | Supports count.<br>Return a <b>templates</b> property with the templates that belong to the host group.  |
| limitSelects                      | integer      | Supports count.<br>Limits the number of records returned by subselects.  |
| sortfield                         | string/array | Applies to the following subselects:<br>selectHosts - results will be sorted by host;<br>selectTemplates - results will be sorted by host.<br>Sort the result by the given properties.   |
| countOutput                       | boolean      | Possible values are: groupid, name.  |
| editable                          | boolean      | These parameters are described in the <b>reference commentary</b> .  |
| excludeSearch                     | boolean      |  |
| filter                            | object       |  |
| limit                             | integer      |  |
| output                            | query        |  |
| preservekeys                      | boolean      |  |
| search                            | object       |  |
| searchByAny                       | boolean      |  |
| searchWildcardsEnabled            | boolean      |  |
| sortorder                         | string/array |  |

| Parameter   | Type    | Description |
|-------------|---------|-------------|
| startSearch | boolean |             |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two host groups named "Zabbix servers" and "Linux servers".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.get",
  "params": {
    "output": "extend",
    "filter": {
      "name": [
        "Zabbix servers",
        "Linux servers"
      ]
    }
  },
  "auth": "6f38cddc44cfbb6c1bd186f9a220b5a0",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "groupid": "2",
      "name": "Linux servers",
      "internal": "0"
    },
    {
      "groupid": "4",
      "name": "Zabbix servers",
      "internal": "0"
    }
  ],
  "id": 1
}
```

## hostgroup.massadd

Description

object hostgroup.massadd(object parameters)

This method allows to simultaneously add multiple related objects to all the given host groups.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects to add to all the host groups.

The method accepts the following parameters.

| Parameter                   | Type         | Description   |
|-----------------------------|--------------|---|
| <b>groups</b><br>(required) | object/array | Host groups to be updated.<br><br>The host groups must have the <code>groupid</code> property defined.            |
| hosts                       | object/array | Hosts to add to all host groups.<br><br>The hosts must have the <code>hostid</code> property defined.             |
| templates                   | object/array | Templates to add to all host groups.<br><br>The templates must have the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Adding hosts to host groups

Add two hosts to host groups with IDs 5 and 6.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massadd",
  "params": {
    "groups": [
      {
        "groupid": "5"
      },
      {
        "groupid": "6"
      }
    ],
    "hosts": [
      {
        "hostid": "30050"
      },
      {
        "hostid": "30001"
      }
    ]
  },
  "auth": "f223adf833b2bf2ff38574a67bba6372",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
```

```

        "5",
        "6"
    ],
    },
    "id": 1
}

```

## hostgroup.massremove

Description

`object hostgroup.massremove(object parameters)`

This method allows to remove related objects from multiple host groups.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects that should be removed.

| Parameter                     | Type         | Description                               |
|-------------------------------|--------------|---|
| <b>groupids</b><br>(required) | string/array | IDs of the host groups to be updated.     |
| hostids                       | string/array | Hosts to remove from all host groups.     |
| templateids                   | string/array | Templates to remove from all host groups. |

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Removing hosts from host groups

Remove two hosts from the given host groups.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "hostgroup.massremove",
  "params": {
    "groupids": [
      "5",
      "6"
    ],
    "hostids": [
      "30050",
      "30001"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "5",
      "6"
    ]
  },
  "id": 1
}
```

Source

CHostGroup::massRemove() in *ui/include/classes/api/services/CHostGroup.php*.

## hostgroup.massupdate

Description

object hostgroup.massupdate(object parameters)

This method allows to replace hosts and templates with the specified ones in multiple host groups.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects that should be updated.

| Parameter                      | Type         | Description  |
|--------------------------------|--------------|--|
| <b>groups</b><br>(required)    | object/array | Host groups to be updated.   |
| <b>hosts</b><br>(required)     | object/array | The host groups must have the <code>groupid</code> property defined.<br>Hosts to replace the current hosts on the given host groups.<br>All other hosts, except the ones mentioned, will be excluded from host groups.<br>Discovered hosts will not be affected.   |
| <b>templates</b><br>(required) | object/array | The hosts must have the <code>hostid</code> property defined.<br>Templates to replace the current templates on the given host groups.<br>All other templates, except the ones mentioned, will be excluded from host groups.<br><br>The templates must have the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Replacing hosts and templates in a host group

Replace all hosts in a host group to ones mentioned host and unlink all templates from host group.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massupdate",
  "params": {
    "groups": [
```

```

        {
            "groupid": "6"
        }
    ],
    "hosts": [
        {
            "hostid": "30050"
        }
    ],
    "templates": []
},
"auth": "f223adf833b2bf2ff38574a67bba6372",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "6",
        ]
    },
    "id": 1
}

```

Source

`CHostGroup::massUpdate()` in `ui/include/classes/api/services/CHostGroup.php`.

## hostgroup.update

Description

`object hostgroup.update(object/array hostGroups)`

This method allows to update existing hosts groups.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Host group properties** to be updated.

The `groupid` property must be defined for each host group, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Renaming a host group

Rename a host group to "Linux hosts."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.update",
  "params": {
    "groupid": "7",
    "name": "Linux hosts"
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "7"
    ]
  },
  "id": 1
}
```

Source

## Host interface

This class is designed to work with host interfaces.

Object references:

- [Host interface](#)

Available methods:

- [hostinterface.create](#) - creating new host interfaces
- [hostinterface.delete](#) - deleting host interfaces
- [hostinterface.get](#) - retrieving host interfaces
- [hostinterface.massadd](#) - adding host interfaces to hosts
- [hostinterface.massremove](#) - removing host interfaces from hosts
- [hostinterface.replacehostinterfaces](#) - replacing host interfaces on a host
- [hostinterface.update](#) - updating host interfaces

## > Host interface object

The following objects are directly related to the `hostinterface` API.

Host interface

The host interface object has the following properties.

### Attention:

Note that both IP and DNS are required. If you do not want to use DNS, set it to an empty string.

| Property                    | Type      | Description   |
|-----------------------------|-----------|---|
| available                   | integer   | <i>(readonly)</i> Availability of host interface.<br><br>Possible values are:<br>0 - <i>(default)</i> unknown;<br>1 - available;<br>2 - unavailable.  |
| details                     | array     | Additional object for interface. <b>Required</b> if interface 'type' is SNMP.   |
| disable_until               | timestamp | <i>(readonly)</i> The next polling time of an unavailable host interface.   |
| <b>dns</b><br>(required)    | string    | DNS name used by the interface.   |
| error                       | string    | Can be empty if the connection is made via IP.<br><i>(readonly)</i> Error text if host interface is unavailable.  |
| errors_from                 | timestamp | <i>(readonly)</i> Time when host interface became unavailable.  |
| <b>hostid</b><br>(required) | string    | ID of the host the interface belongs to.  |
| interfaceid                 | string    | <i>(readonly)</i> ID of the interface.  |
| <b>ip</b><br>(required)     | string    | IP address used by the interface.   |
| <b>main</b><br>(required)   | integer   | Can be empty if the connection is made via DNS.<br>Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host.<br><br>Possible values are:<br>0 - not default;<br>1 - default. |
| <b>port</b><br>(required)   | string    | Port number used by the interface. Can contain user macros.   |
| <b>type</b><br>(required)   | integer   | Interface type.<br><br>Possible values are:<br>1 - agent;<br>2 - SNMP;<br>3 - IPMI;<br>4 - JMX.   |
| <b>useip</b><br>(required)  | integer   | Whether the connection should be made via IP.<br><br>Possible values are:<br>0 - connect using host DNS name;<br>1 - connect using host IP address for this host interface.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Details tag

The details object has the following properties.

| Property                     | Type    | Description  |
|------------------------------|---------|--|
| <b>version</b><br>(required) | integer | SNMP interface version.<br><br>Possible values are:<br>1 - SNMPv1;<br>2 - SNMPv2c;<br>3 - SNMPv3                                     |
| bulk                         | integer | Whether to use bulk SNMP requests.<br><br>Possible values are:<br>0 - don't use bulk requests;<br>1 - (default) - use bulk requests. |
| community                    | string  | SNMP community (required). Used only by SNMPv1 and SNMPv2 interfaces.  |

| Property       | Type    | Description  |
|----------------|---------|--|
| securityname   | string  | SNMPv3 security name. Used only by SNMPv3 interfaces.  |
| securitylevel  | integer | SNMPv3 security level. Used only by SNMPv3 interfaces.<br><br>Possible values are:<br>0 - (default) - noAuthNoPriv;<br>1 - authNoPriv;<br>2 - authPriv.                                      |
| authpassphrase | string  | SNMPv3 authentication passphrase. Used only by SNMPv3 interfaces.  |
| privpassphrase | string  | SNMPv3 privacy passphrase. Used only by SNMPv3 interfaces.   |
| authprotocol   | integer | SNMPv3 authentication protocol. Used only by SNMPv3 interfaces.<br><br>Possible values are:<br>0 - (default) - MD5;<br>1 - SHA1;<br>2 - SHA224;<br>3 - SHA256;<br>4 - SHA384;<br>5 - SHA512. |
| privprotocol   | integer | SNMPv3 privacy protocol. Used only by SNMPv3 interfaces.<br><br>Possible values are:<br>0 - (default) - DES;<br>1 - AES128;<br>2 - AES192;<br>3 - AES256;<br>4 - AES192C;<br>5 - AES256C.    |
| contextname    | string  | SNMPv3 context name. Used only by SNMPv3 interfaces.   |

## hostinterface.create

### Description

`object hostinterface.create(object/array hostInterfaces)`

This method allows to create new host interfaces.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Host interfaces to create. The method accepts host interfaces with the [standard host interface properties](#).

### Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property. The order of the returned IDs matches the order of the passed host interfaces.

### Examples

Create a new interface

Create a secondary IP agent interface on host "30052."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.create",
  "params": {
    "hostid": "30052",
    "main": "0",
    "type": "1",
```

```

        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "10050"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "interfaceids": [
            "30062"
        ]
    },
    "id": 1
}

```

Create an interface with SNMP details

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hostinterface.create",
    "params": {
        "hostid": "10456",
        "main": "0",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "1601",
        "details": {
            "version": "2",
            "bulk": "1",
            "community": "{$SNMP_COMMUNITY}"
        }
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "interfaceids": [
            "30063"
        ]
    },
    "id": 1
}

```

`CHostInterface::create()` in `ui/include/classes/api/services/CHostInterface.php`.

## hostinterface.delete

### Description

object hostinterface.delete(array hostInterfaceIds)

This method allows to delete host interfaces.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(array) IDs of the host interfaces to delete.

### Return values

(object) Returns an object containing the IDs of the deleted host interfaces under the `interfaceids` property.

### Examples

Delete a host interface

Delete the host interface with ID 30062.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.delete",
  "params": [
    "30062"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30062"
    ]
  },
  "id": 1
}
```

## hostinterface.get

### Description

integer/array hostinterface.get(object parameters)

The method allows to retrieve host interfaces according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

## Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| hostids                | string/array | Return only host interfaces used by the given hosts.  |
| interfaceids           | string/array | Return only host interfaces with the given IDs.   |
| itemids                | string/array | Return only host interfaces used by the given items.  |
| triggerids             | string/array | Return only host interfaces used by items in the given triggers.  |
| selectItems            | query        | Return an <b>items</b> property with the items that use the interface.  |
|                        |              | Supports count.   |
| selectHosts            | query        | Return a <b>hosts</b> property with an array of hosts that use the interface.   |
| limitSelects           | integer      | Limits the number of records returned by subselects.  |
|                        |              | Applies to the following subselects:<br><b>selectItems</b> .  |
| sortfield              | string/array | Sort the result by the given properties.  |
|                        |              | Possible values are: <b>interfaceid</b> , <b>dns</b> , <b>ip</b> .<br>These parameters are described in the <b>reference commentary</b> . |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

## Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

## Examples

### Retrieve host interfaces

Retrieve all data about the interfaces used by host "30057."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.get",
  "params": {
    "output": "extend",
    "hostids": "30057"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
```

```

        "interfaceid": "50039",
        "hostid": "30057",
        "main": "1",
        "type": "1",
        "useip": "0",
        "ip": "",
        "dns": "localhost",
        "port": "10050",
        "available": "0",
        "error": "",
        "errors_from": "0",
        "disable_until": "0",
        "details": []
    },
    {
        "interfaceid": "55082",
        "hostid": "30057",
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "available": "0",
        "error": "",
        "errors_from": "0",
        "disable_until": "0",
        "details": {
            "version": "2",
            "bulk": "0",
            "community": "${SNMP_COMMUNITY}"
        }
    }
],
    "id": 1
}

```

## hostinterface.massadd

Description

object `hostinterface.massadd(object parameters)`

This method allows to simultaneously add host interfaces to multiple hosts.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the host interfaces to be created on the given hosts.

The method accepts the following parameters.

| Parameter                       | Type         | Description   |
|---------------------------------|--------------|---|
| <b>hosts</b><br>(required)      | object/array | Hosts to be updated.<br><br>The hosts must have the <code>hostid</code> property defined. |
| <b>interfaces</b><br>(required) | object/array | <b>Host interfaces</b> to create on the given hosts.                                      |

#### Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property.

#### Examples

##### Creating interfaces

Create an interface on two hosts.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.massadd",
  "params": {
    "hosts": [
      {
        "hostid": "30050"
      },
      {
        "hostid": "30052"
      }
    ],
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "main": 0,
      "port": "10050",
      "type": 1,
      "useip": 1
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30069",
      "30070"
    ]
  },
  "id": 1
}
```

`CHostInterface::massAdd()` in `ui/include/classes/api/services/CHostInterface.php`.

hostinterface.massremove

Description

object hostinterface.massremove(object parameters)

This method allows to remove host interfaces from the given hosts.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to be updated and the interfaces to be removed.

| Parameter                       | Type         | Description  |
|---------------------------------|--------------|--|
| <b>hostids</b><br>(required)    | string/array | IDs of the hosts to be updated.  |
| <b>interfaces</b><br>(required) | object/array | Host interfaces to remove from the given hosts.<br><br>The host interface object must have the ip, dns and port properties defined |

Return values

(object) Returns an object containing the IDs of the deleted host interfaces under the `interfaceids` property.

Examples

Removing interfaces

Remove the "127.0.0.1" SNMP interface from two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.massremove",
  "params": {
    "hostids": [
      "30050",
      "30052"
    ],
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "port": "161"
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30069",
      "30070"
    ]
  },
  "id": 1
}
```

**hostinterface.replacehostinterfaces**

Description

`object hostinterface.replacehostinterfaces(object parameters)`

This method allows to replace all host interfaces on a given host.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the ID of the host to be updated and the new host interfaces.

| Parameter                       | Type         | Description   |
|---------------------------------|--------------|---|
| <b>hostid</b><br>(required)     | string       | ID of the host to be updated.                                       |
| <b>interfaces</b><br>(required) | object/array | <b>Host interfaces</b> to replace the current host interfaces with. |

Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property.

Examples

Replacing host interfaces

Replace all host interfaces with a single agent interface.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.replacehostinterfaces",
  "params": {
    "hostid": "30052",
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "main": 1,
      "port": "10050",
      "type": 1,
      "useip": 1
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
```

```

        "30081"
    ],
    },
    "id": 1
}

```

See also

- [host.update](#)
- [host.massupdate](#)

Source

`CHostInterface::replaceHostInterfaces()` in `ui/include/classes/api/services/CHostInterface.php`.

## hostinterface.update

Description

`object hostinterface.update(object/array hostInterfaces)`

This method allows to update existing host interfaces.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Host interface properties** to be updated.

The `interfaceid` property must be defined for each host interface, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host interfaces under the `interfaceids` property.

Examples

Changing a host interface port

Change the port of a host interface.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hostinterface.update",
    "params": {
        "interfaceid": "30048",
        "port": "30050"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "interfaceids": [
            "30048"
        ]
    },
    "id": 1
}

```

## Host prototype

This class is designed to work with host prototypes.

Object references:

- [Host prototype](#)
- [Host prototype inventory](#)
- [Group link](#)
- [Group prototype](#)

Available methods:

- [hostprototype.create](#) - creating new host prototypes
- [hostprototype.delete](#) - deleting host prototypes
- [hostprototype.get](#) - retrieving host prototypes
- [hostprototype.update](#) - updating host prototypes

### > Host prototype object

The following objects are directly related to the `hostprototype` API.

Host prototype

The host prototype object has the following properties.

| Property          | Type    | Description   |
|-------------------|---------|---|
| hostid            | string  | ( <i>readonly</i> ) ID of the host prototype.   |
| <b>host</b>       | string  | Technical name of the host prototype.   |
| (required)        |         |   |
| name              | string  | Visible name of the host prototype.   |
| status            | integer | Default: <code>host</code> property value.<br>Status of the host prototype.<br><br>Possible values are:<br>0 - ( <i>default</i> ) monitored host;<br>1 - unmonitored host.                          |
| inventory_mode    | integer | Host inventory population mode.<br><br>Possible values are:<br>-1 - ( <i>default</i> ) disabled;<br>0 - manual;<br>1 - automatic.   |
| templateid        | string  | ( <i>readonly</i> ) ID of the parent template host prototype.   |
| discover          | integer | Host prototype discovery status.<br><br>Possible values:<br>0 - ( <i>default</i> ) new hosts will be discovered;<br>1 - new hosts will not be discovered and existing hosts will be marked as lost. |
| custom_interfaces | integer | Source of interfaces for hosts created by the host prototype.<br><br>Possible values:<br>0 - ( <i>default</i> ) inherit interfaces from parent host;<br>1 - use host prototypes custom interfaces.  |

| Property | Type   | Description  |
|----------|--------|--|
| uuid     | string | Universal unique identifier, used for linking imported host prototypes to already existing ones. Used only for host prototypes on templates. Auto-generated, if not given. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Group link

The group link object links a host prototype with a host group and has the following properties.

| Property                     | Type   | Description           |
|------------------------------|--------|-----------------------|
| <b>groupid</b><br>(required) | string | ID of the host group. |

#### Group prototype

The group prototype object defines a group that will be created for a discovered host and has the following properties.

| Property                  | Type   | Description                                  |
|---------------------------|--------|--|
| <b>group_prototypeid</b>  | string | <i>(readonly)</i> ID of the group prototype. |
| <b>name</b><br>(required) | string | Name of the group prototype.                 |

#### Host prototype tag

The host prototype tag object has the following properties.

| Property                 | Type   | Description               |
|--------------------------|--------|---------------------------|
| <b>tag</b><br>(required) | string | Host prototype tag name.  |
| value                    | string | Host prototype tag value. |

#### Custom interface

The custom interface object has the following properties.

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| dns                       | string  | DNS name used by the interface.   |
| ip                        | string  | <b>Required</b> if the connection is made via DNS. Can contain macros.<br>IP address used by the interface.   |
| <b>main</b><br>(required) | integer | <b>Required</b> if the connection is made via IP. Can contain macros.<br>Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host.<br><br>Possible values are:<br>0 - not default;<br>1 - default. |
| <b>port</b><br>(required) | string  | Port number used by the interface. Can contain user and LLD macros.   |

| Property                   | Type    | Description   |
|----------------------------|---------|---|
| <b>type</b><br>(required)  | integer | Interface type.<br><br>Possible values are:<br>1 - agent;<br>2 - SNMP;<br>3 - IPMI;<br>4 - JMX.   |
| <b>useip</b><br>(required) | integer | Whether the connection should be made via IP.<br><br>Possible values are:<br>0 - connect using host DNS name;<br>1 - connect using host IP address for this host interface. |
| details                    | array   | Additional object for interface. <b>Required</b> if interface 'type' is SNMP.   |

#### Custom interface details

The details object has the following properties.

| Property                     | Type    | Description   |
|------------------------------|---------|---|
| <b>version</b><br>(required) | integer | SNMP interface version.<br><br>Possible values are:<br>1 - SNMPv1;<br>2 - SNMPv2c;<br>3 - SNMPv3  |
| bulk                         | integer | Whether to use bulk SNMP requests.<br><br>Possible values are:<br>0 - don't use bulk requests;<br>1 - <i>(default)</i> - use bulk requests.   |
| community                    | string  | SNMP community. Used only by SNMPv1 and SNMPv2 interfaces.  |
| securityname                 | string  | SNMPv3 security name. Used only by SNMPv3 interfaces.   |
| securitylevel                | integer | SNMPv3 security level. Used only by SNMPv3 interfaces.<br><br>Possible values are:<br>0 - <i>(default)</i> - noAuthNoPriv;<br>1 - authNoPriv;<br>2 - authPriv.                                      |
| authpassphrase               | string  | SNMPv3 authentication passphrase. Used only by SNMPv3 interfaces.   |
| privpassphrase               | string  | SNMPv3 privacy passphrase. Used only by SNMPv3 interfaces.  |
| authprotocol                 | integer | SNMPv3 authentication protocol. Used only by SNMPv3 interfaces.<br><br>Possible values are:<br>0 - <i>(default)</i> - MD5;<br>1 - SHA1;<br>2 - SHA224;<br>3 - SHA256;<br>4 - SHA384;<br>5 - SHA512. |
| privprotocol                 | integer | SNMPv3 privacy protocol. Used only by SNMPv3 interfaces.<br><br>Possible values are:<br>0 - <i>(default)</i> - DES;<br>1 - AES128;<br>2 - AES192;<br>3 - AES256;<br>4 - AES192C;<br>5 - AES256C.    |
| contextname                  | string  | SNMPv3 context name. Used only by SNMPv3 interfaces.  |

hostprototype.create

Description

object hostprototype.create(object/array hostPrototypes)

This method allows to create new host prototypes.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host prototypes to create.

Additionally to the [standard host prototype properties](#), the method accepts the following parameters.

| Parameter                       | Type         | Description  |
|---------------------------------|--------------|--|
| <b>groupLinks</b><br>(required) | array        | Group <a href="#">links</a> to be created for the host prototype.      |
| <b>ruleid</b><br>(required)     | string       | ID of the LLD rule that the host prototype belongs to.                 |
| groupPrototypes                 | array        | Group <a href="#">prototypes</a> to be created for the host prototype. |
| macros                          | object/array | <a href="#">User macros</a> to be created for the host prototype.      |
| tags                            | object/array | Host prototype <a href="#">tags</a> .                                  |
| interfaces                      | object/array | Host prototype <a href="#">custom interfaces</a> .                     |
| templates                       | object/array | <a href="#">Templates</a> to be linked to the host prototype.          |
|                                 |              | The templates must have the <code>templateid</code> property defined.  |

Return values

(object) Returns an object containing the IDs of the created host prototypes under the `hostids` property. The order of the returned IDs matches the order of the passed host prototypes.

Examples

Creating a host prototype

Create a host prototype `"{#VM.NAME}"` on LLD rule `"23542"` with a group prototype `"{#HV.NAME}"`, tag pair `"Datacenter": "{#DATACENTER.NAME}"` and custom SNMPv2 interface `127.0.0.1:161` with community `{$SNMP_COMMUNITY}`. Link it to host group `"2"`.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.create",
  "params": {
    "host": "{#VM.NAME}",
    "ruleid": "23542",
    "custom_interfaces": "1",
    "groupLinks": [
      {
        "groupid": "2"
      }
    ],
    "groupPrototypes": [
      {
        "name": "{#HV.NAME}"
      }
    ],
    "tags": [
      {
        "tag": "Datacenter",
```

```

        "value": "#{DATACENTER.NAME}"
    }
],
"interfaces": [
    {
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "details": {
            "version": "2",
            "bulk": "1",
            "community": "{$SNMP_COMMUNITY}"
        }
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10103"
        ]
    },
    "id": 1
}

```

## hostprototype.delete

Description

object `hostprototype.delete(array hostPrototypeIds)`

This method allows to delete host prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the host prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted host prototypes under the `hostids` property.

## Examples

### Deleting multiple host prototypes

Delete two host prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.delete",
  "params": [
    "10103",
    "10105"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10103",
      "10105"
    ]
  },
  "id": 1
}
```

## hostprototype.get

### Description

integer/array hostprototype.get(object parameters)

The method allows to retrieve host prototypes according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter             | Type         | Description  |
|-----------------------|--------------|--|
| hostids               | string/array | Return only host prototypes with the given IDs.  |
| discoveryids          | string/array | Return only host prototype that belong to the given LLD rules.                               |
| inherited             | boolean      | If set to true return only items inherited from a template.                                  |
| selectDiscoveryRule   | query        | Return a <b>discoveryRule</b> property with the LLD rule that the host prototype belongs to. |
| selectInterfaces      | query        | Return an <b>interfaces</b> property with host prototype custom interfaces.                  |
| selectGroupLinks      | query        | Return a <b>groupLinks</b> property with the group links of the host prototype.              |
| selectGroupPrototypes | query        | Return a <b>groupPrototypes</b> property with the group prototypes of the host prototype.    |
| selectMacros          | query        | Return a <b>macros</b> property with host prototype macros.                                  |
| selectParentHost      | query        | Return a <b>parentHost</b> property with the host that the host prototype belongs to.        |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| selectTags             | query        | Return a <b>tags</b> property with host prototype tags.  |
| selectTemplates        | query        | Return a <b>templates</b> property with the templates linked to the host prototype.  |
| sortfield              | string/array | Supports count.<br>Sort the result by the given properties.<br><br>Possible values are: <b>hostid</b> , <b>host</b> , <b>name</b> and <b>status</b> .<br>These parameters are described in the <b>reference commentary</b> . |
| countOutput            | boolean      |  |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

#### Examples

Retrieving host prototypes from an LLD rule

Retrieve all host prototypes, their group links, group prototypes and tags from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.get",
  "params": {
    "output": "extend",
    "selectInterfaces": "extend",
    "selectGroupLinks": "extend",
    "selectGroupPrototypes": "extend",
    "selectTags": "extend",
    "discoveryids": "23554"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10092",
      "host": "{#HV.UUID}",
      "name": "{#HV.UUID}",

## hostprototype.update

Description

`object hostprototype.update(object/array hostPrototypes)`

This method allows to update existing host prototypes.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object/array) Host prototype properties to be updated.

The `hostid` property must be defined for each host prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard host prototype properties](#), the method accepts the following parameters.

| Parameter       | Type         | Description  |
|-----------------|--------------|--|
| groupLinks      | array        | Group <a href="#">links</a> to replace the current group links on the host prototype.  |
| groupPrototypes | array        | Group <a href="#">prototypes</a> to replace the existing group prototypes on the host prototype.   |
| macros          | object/array | All group prototypes that are not listed in the request will be removed.<br><a href="#">User macros</a> to replace the current user macros.  |
| tags            | object/array | All macros that are not listed in the request will be removed.<br>Host prototype <a href="#">tags</a> to replace the current tags.   |
| interfaces      | object/array | All tags that are not listed in the request will be removed.<br>Host prototype <a href="#">custom interfaces</a> to replace the current interfaces.  |
| templates       | object/array | Custom interface object should contain all its parameters.<br>All interfaces that are not listed in the request will be removed.<br><a href="#">Templates</a> to replace the currently linked templates. |
|                 |              | The templates must have the <code>templateid</code> property defined.  |

**Return values**

(object) Returns an object containing the IDs of the updated host prototypes under the `hostids` property.

**Examples****Disabling a host prototype**

Disable a host prototype, that is, set its status to 1.

**Request:**

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "status": 1
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

**Response:**

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10092"
    ]
  },
}
```

```
    "id": 1
}
```

Updating host prototype tags

Replace host prototype tags with new ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "tags": [
      {
        "tag": "Datacenter",
        "value": "#{DATACENTER.NAME}"
      },
      {
        "tag": "Instance type",
        "value": "#{INSTANCE_TYPE}"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10092"
    ]
  },
  "id": 1
}
```

Updating host prototype custom interfaces

Replace inherited interfaces with host prototype custom interfaces.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "custom_interfaces": "1",
    "interfaces": [
      {
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "details": {
          "version": "2",
          "bulk": "1",
          "community": "${SNMP_COMMUNITY}"
        }
      }
    ]
  }
}
```

```

    ],
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10092"
    ]
  },
  "id": 1
}

```

## Housekeeping

This class is designed to work with housekeeping.

Object references:

- [Housekeeping](#)

Available methods:

- [housekeeping.get](#) - retrieve housekeeping
- [housekeeping.update](#) - update housekeeping

## > Housekeeping object

The following objects are directly related to the housekeeping API.

Housekeeping

The settings object has the following properties.

| Property          | Type    | Description   |
|-------------------|---------|---|
| hk_events_mode    | integer | Enable internal housekeeping for events and alerts.<br><br>Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable. |
| hk_events_trigger | string  | Trigger data storage period. Accepts seconds and time unit with suffix.   |
| hk_events_service | string  | Default: 365d.<br>Service data storage period. Accepts seconds and time unit with suffix.<br><br>Default: 1d.               |

| Property            | Type    | Description   |
|---------------------|---------|---|
| hk_events_internal  | string  | Internal data storage period. Accepts seconds and time unit with suffix.  |
| hk_events_discovery | string  | Default: 1d.<br>Network discovery data storage period. Accepts seconds and time unit with suffix.   |
| hk_events_autoreg   | string  | Default: 1d.<br>Autoregistration data storage period. Accepts seconds and time unit with suffix.  |
| hk_services_mode    | integer | Default: 1d.<br>Enable internal housekeeping for services.  |
| hk_services         | string  | Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable.<br>Services data storage period. Accepts seconds and time unit with suffix.          |
| hk_audit_mode       | integer | Default: 365d.<br>Enable internal housekeeping for audit.   |
| hk_audit            | string  | Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable.<br>Audit data storage period. Accepts seconds and time unit with suffix.             |
| hk_sessions_mode    | integer | Default: 365d.<br>Enable internal housekeeping for sessions.  |
| hk_sessions         | string  | Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable.<br>Sessions data storage period. Accepts seconds and time unit with suffix.          |
| hk_history_mode     | integer | Default: 365d.<br>Enable internal housekeeping for history.   |
| hk_history_global   | integer | Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable.<br>Override item history period.   |
| hk_history          | string  | Possible values:<br>0 - Do not override;<br>1 - <i>(default)</i> Override.<br>History data storage period. Accepts seconds and time unit with suffix. |
| hk_trends_mode      | integer | Default: 90d.<br>Enable internal housekeeping for trends.   |
| hk_trends_global    | integer | Possible values:<br>0 - Disable;<br>1 - <i>(default)</i> Enable.<br>Override item trend period.   |
|                     |         | Possible values:<br>0 - Do not override;<br>1 - <i>(default)</i> Override.  |

| Property                 | Type    | Description   |
|--------------------------|---------|---|
| hk_trends                | string  | Trends data storage period. Accepts seconds and time unit with suffix.  |
| db_extension             | string  | Default: 365d.<br>(readonly) Configuration flag DB extension. If this flag is set to "timescaledb" then the server changes its behavior for housekeeping and item deletion. |
| compression_status       | integer | Enable TimescaleDB compression for history and trends.<br><br>Possible values:<br>0 - (default) Off;<br>1 - On.   |
| compress_older           | string  | Compress history and trends records older than specified period. Accepts seconds and time unit with suffix.   |
| compression_availability | integer | Default: 7d.<br>(readonly) Compression availability.<br><br>Possible values:<br>0 - Unavailable;<br>1 - Available.  |

## housekeeping.get

### Description

object housekeeping.get(object parameters)

The method allows to retrieve housekeeping object according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type  | Description   |
|-----------|-------|---|
| output    | query | This parameter is described in the <a href="#">reference commentary</a> . |

### Return values

(object) Returns housekeeping object.

### Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "housekeeping.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hk_events_mode": "1",
    "hk_events_trigger": "365d",
    "hk_events_service": "1d",
    "hk_events_internal": "1d",
    "hk_events_discovery": "1d",
    "hk_events_autoreg": "1d",
    "hk_services_mode": "1",
    "hk_services": "365d",
    "hk_audit_mode": "1",
    "hk_audit": "365d",
    "hk_sessions_mode": "1",
    "hk_sessions": "365d",
    "hk_history_mode": "1",
    "hk_history_global": "0",
    "hk_history": "90d",
    "hk_trends_mode": "1",
    "hk_trends_global": "0",
    "hk_trends": "365d",
    "db_extension": "",
    "compression_status": "0",
    "compress_older": "7d"
  },
  "id": 1
}

## housekeeping.update

Description

object housekeeping.update(object housekeeping)

This method allows to update existing housekeeping settings.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Housekeeping properties to be updated.

Return values

(array) Returns array with the names of updated parameters.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "housekeeping.update",
  "params": {
    "hk_events_mode": "1",
    "hk_events_trigger": "200d",
    "hk_events_internal": "2d",
    "hk_events_discovery": "2d"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    "hk_events_mode",
    "hk_events_trigger",
    "hk_events_internal",
    "hk_events_discovery"
  ],
  "id": 1
}
```

## Icon map

This class is designed to work with icon maps.

Object references:

- [Icon map](#)
- [Icon mapping](#)

Available methods:

- [iconmap.create](#) - create new icon maps
- [iconmap.delete](#) - delete icon maps
- [iconmap.get](#) - retrieve icon maps
- [iconmap.update](#) - update icon maps

## > Icon map object

The following objects are directly related to the `iconmap` API.

Icon map

The icon map object has the following properties.

| Property   | Type   | Description                             |
|--|--------|---|
| <code>iconmapid</code>                           | string | ( <i>readonly</i> ) ID of the icon map. |
| <b><code>default_iconid</code></b><br>(required) | string | ID of the default icon.                 |
| <b><code>name</code></b><br>(required)           | string | Name of the icon map.                   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Icon mapping

The icon mapping object defines a specific icon to be used for hosts with a certain inventory field value. It has the following properties.

| Property                                 | Type   | Description                              |
|--|--------|--|
| <code>iconmappingid</code>               | string | ( <i>readonly</i> ) ID of the icon map.  |
| <b><code>iconid</code></b><br>(required) | string | ID of the icon used by the icon mapping. |

| Property                            | Type    | Description   |
|-------------------------------------|---------|---|
| <b>expression</b><br>(required)     | string  | Expression to match the inventory field against.  |
| <b>inventory_link</b><br>(required) | integer | ID of the host inventory field.<br><br>Refer to the <a href="#">host inventory object</a> for a list of supported inventory fields. |
| iconmapid                           | string  | ( <i>readonly</i> ) ID of the icon map that the icon mapping belongs to.  |
| sortorder                           | integer | ( <i>readonly</i> ) Position of the icon mapping in the icon map.   |

## iconmap.create

### Description

object iconmap.create(object/array iconMaps)

This method allows to create new icon maps.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Icon maps to create.

Additionally to the [standard icon map properties](#), the method accepts the following parameters.

| Parameter                     | Type  | Description   |
|-------------------------------|-------|---|
| <b>mappings</b><br>(required) | array | <a href="#">Icon mappings</a> to be created for the icon map. |

### Return values

(object) Returns an object containing the IDs of the created icon maps under the `iconmapids` property. The order of the returned IDs matches the order of the passed icon maps.

### Examples

Create an icon map

Create an icon map to display hosts of different types.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.create",
  "params": {
    "name": "Type icons",
    "default_iconid": "2",
    "mappings": [
      {
        "inventory_link": 1,
        "expression": "server",
        "iconid": "3"
      },
      {
        "inventory_link": 1,
        "expression": "switch",
        "iconid": "4"
      }
    ]
  }
},
```

```
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "2"
    ]
  },
  "id": 1
}
```

### iconmap.delete

Description

object iconmap.delete(array iconMapIds)

This method allows to delete icon maps.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the icon maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted icon maps under the `iconmapids` property.

Examples

Delete multiple icon maps

Delete two icon maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.delete",
  "params": [
    "2",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "2",

```

```

    ],
    "id": 1
}

```

Source

ClconMap::delete() in *ui/include/classes/api/services/ClconMap.php*.

## iconmap.get

Description

integer/array iconmap.get(object parameters)

The method allows to retrieve icon maps according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| iconmapids             | string/array | Return only icon maps with the given IDs.                                    |
| sysmapids              | string/array | Return only icon maps that are used in the given maps.                       |
| selectMappings         | query        | Return a <b>mappings</b> property with the icon mappings used.               |
| sortfield              | string/array | Sort the result by the given properties.                                     |
|                        |              | Possible values are: <b>iconmapid</b> and <b>name</b> .                      |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

Examples

Retrieve an icon map

Retrieve all data about icon map "3".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "iconmap.get",
  "params": {

```

```

        "iconmapids": "3",
        "output": "extend",
        "selectMappings": "extend"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "mappings": [
                {
                    "iconmappingid": "3",
                    "iconmapid": "3",
                    "iconid": "6",
                    "inventory_link": "1",
                    "expression": "server",
                    "sortorder": "0"
                },
                {
                    "iconmappingid": "4",
                    "iconmapid": "3",
                    "iconid": "10",
                    "inventory_link": "1",
                    "expression": "switch",
                    "sortorder": "1"
                }
            ],
            "iconmapid": "3",
            "name": "Host type icons",
            "default_iconid": "2"
        }
    ],
    "id": 1
}

```

## iconmap.update

Description

object iconmap.update(object/array iconMaps)

This method allows to update existing icon maps.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Icon map properties to be updated.

The `iconmapid` property must be defined for each icon map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard icon map properties](#), the method accepts the following parameters.

| Parameter | Type  | Description  |
|-----------|-------|--|
| mappings  | array | <a href="#">Icon mappings</a> to replace the existing icon mappings. |

Return values

(object) Returns an object containing the IDs of the updated icon maps under the `iconmapids` property.

Examples

Rename icon map

Rename an icon map to "OS icons".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.update",
  "params": {
    "iconmapid": "1",
    "name": "OS icons"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "1"
    ]
  },
  "id": 1
}
```

## Image

This class is designed to work with images.

Object references:

- [Image](#)

Available methods:

- [image.create](#) - create new images
- [image.delete](#) - delete images
- [image.get](#) - retrieve images
- [image.update](#) - update images

## > Image object

The following objects are directly related to the `image` API.

Image

The image object has the following properties.

| Property                               | Type    | Description   |
|--|---------|---|
| <code>imageid</code>                   | string  | ( <i>readonly</i> ) ID of the image.  |
| <b><code>name</code></b><br>(required) | string  | Name of the image.  |
| <code>imagetype</code>                 | integer | Type of image.<br><br>Possible values:<br>1 - ( <i>default</i> ) icon;<br>2 - background image. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

### **image.create**

Description

`object image.create(object/array images)`

This method allows to create new images.

#### **Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Images to create.

Additionally to the [standard image properties](#), the method accepts the following parameters.

| Parameter                                   | Type    | Description   |
|---|---------|---|
| <b><code>name</code></b><br>(required)      | string  | Name of the image.  |
| <b><code>imagetype</code></b><br>(required) | integer | Type of image.<br><br>Possible values:<br>1 - ( <i>default</i> ) icon;<br>2 - background image.   |
| <b><code>image</code></b><br>(required)     | string  | Base64 encoded image. The maximum size of the encoded image is 1 MB. Maximum size can be adjusted by changing <code>ZBX_MAX_IMAGE_SIZE</code> constant value.<br>Supported image formats are: PNG, JPEG, GIF. |

Return values

(object) Returns an object containing the IDs of the created images under the `imageids` property. The order of the returned IDs matches the order of the passed images.

Examples

Create an image

Create a cloud icon.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.create",
  "params": {
    "imagetype": 1,
    "name": "Cloud_(24)",
    "image": "iVBORw0KGgoAAAANSUhEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACmAAAAPgE
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "188"
    ]
  },
  "id": 1
}
```

Source

CImage::create() in `ui/include/classes/api/services/CImage.php`.

## image.delete

Description

object image.delete(array imageIds)

This method allows to delete images.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the images to delete.

Return values

(object) Returns an object containing the IDs of the deleted images under the `imageids` property.

Examples

Delete multiple images

Delete two images.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.delete",
  "params": [
    "188",
    "192"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "188",
      "192"
    ]
  },
  "id": 1
}
```

Source

CImage::delete() in *ui/include/classes/api/services/CImage.php*.

## image.get

Description

integer/array image.get(object parameters)

The method allows to retrieve images according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| imageids               | string/array | Return only images with the given IDs.                                       |
| sysmapids              | string/array | Return images that are used on the given maps.                               |
| select_image           | flag         | Return an <code>image</code> property with the Base64 encoded image.         |
| sortfield              | string/array | Sort the result by the given properties.                                     |
|                        |              | Possible values are: <code>imageid</code> and <code>name</code> .            |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve an image

Retrieve all data for image with ID "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.get",
  "params": {
    "output": "extend",
    "select_image": true,
    "imageids": "2"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "imageid": "2",
      "imagetype": "1",
      "name": "Cloud_(24)",
      "image": "iVBORwOKGgoAAAANSUhEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACmAA"
    }
  ],
  "id": 1
}
```

Source

## image.update

Description

object image.update(object/array images)

This method allows to update existing images.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Image properties to be updated.

The `imageid` property must be defined for each image, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard image properties](#), the method accepts the following parameters.

| Parameter | Type   | Description   |
|-----------|--------|---|
| image     | string | Base64 encoded image. The maximum size of the encoded image is 1 MB. Maximum size can be adjusted by changing <code>ZBX_MAX_IMAGE_SIZE</code> constant value.<br>Supported image formats are: PNG, JPEG, GIF. |

Return values

(object) Returns an object containing the IDs of the updated images under the `imageids` property.

Examples

Rename image

Rename image to "Cloud icon".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.update",
  "params": {
    "imageid": "2",
    "name": "Cloud icon"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "2"
    ]
  },
  "id": 1
}
```

## Item

This class is designed to work with items.

Object references:

- [Item](#)

Available methods:

- [item.create](#) - creating new items
- [item.delete](#) - deleting items
- [item.get](#) - retrieving items
- [item.update](#) - updating items

### > Item object

The following objects are directly related to the `item` API.

Item

#### Note:

Web items cannot be directly created, updated or deleted via the Zabbix API.

The item object has the following properties.

| Property | Type   | Description                         |
|----------|--------|-------------------------------------|
| itemid   | string | ( <i>readonly</i> ) ID of the item. |

| Property                         | Type    | Description  |
|----------------------------------|---------|--|
| <b>delay</b><br>(required)       | string  | <p>Update interval of the item. Accepts seconds or a time unit with suffix (30s,1m,2h,1d).</p> <p>Optionally one or more <b>custom intervals</b> can be specified either as flexible intervals or scheduling.</p> <p>Multiple intervals are separated by a semicolon.</p> <p>User macros may be used. A single macro has to fill the whole field.</p> <p>Multiple macros in a field or macros mixed with text are not supported.</p> <p>Flexible intervals may be written as two macros separated by a forward slash (e.g. {\$FLEX_INTERVAL}/{FLEX_PERIOD}).</p> <p>Optional for Zabbix trapper, dependent items and for Zabbix agent (active) with <code>mqtt.get</code> key.</p> |
| <b>hostid</b><br>(required)      | string  | ID of the host or template that the item belongs to.   |
| <b>interfaceid</b><br>(required) | string  | <p>For update operations this field is <i>readonly</i>.</p> <p>ID of the item's host interface.</p> <p>Used only for host items. Not required for Zabbix agent (active), Zabbix internal, Zabbix trapper, calculated, dependent, database monitor and script items. Optional for HTTP agent items.</p>   |
| <b>key_</b><br>(required)        | string  | Item key.  |
| <b>name</b><br>(required)        | string  | Name of the item.  |
| <b>type</b><br>(required)        | integer | <p>Type of the item.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>0 - Zabbix agent;</li> <li>2 - Zabbix trapper;</li> <li>3 - Simple check;</li> <li>5 - Zabbix internal;</li> <li>7 - Zabbix agent (active);</li> <li>9 - Web item;</li> <li>10 - External check;</li> <li>11 - Database monitor;</li> <li>12 - IPMI agent;</li> <li>13 - SSH agent;</li> <li>14 - Telnet agent;</li> <li>15 - Calculated;</li> <li>16 - JMX agent;</li> <li>17 - SNMP trap;</li> <li>18 - Dependent item;</li> <li>19 - HTTP agent;</li> <li>20 - SNMP agent;</li> <li>21 - Script</li> </ul>  |
| <b>url</b><br>(required)         | string  | URL string, required only for HTTP agent item type. Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}.   |
| <b>value_type</b><br>(required)  | integer | <p>Type of information of the item.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>0 - numeric float;</li> <li>1 - character;</li> <li>2 - log;</li> <li>3 - numeric unsigned;</li> <li>4 - text.</li> </ul>   |
| <b>allow_traps</b>               | integer | <p>HTTP agent item field. Allow to populate value as in trapper item type also.</p> <p>0 - (<i>default</i>) Do not allow to accept incoming data.<br/>1 - Allow to accept incoming data.</p>   |

| Property         | Type      | Description   |
|------------------|-----------|---|
| authtype         | integer   | Used only by SSH agent items or HTTP agent items.<br><br>SSH agent authentication method possible values:<br>0 - <i>(default)</i> password;<br>1 - public key.<br><br>HTTP agent authentication method possible values:<br>0 - <i>(default)</i> none<br>1 - basic<br>2 - NTLM<br>3 - Kerberos                                       |
| description      | string    | Description of the item.  |
| error            | string    | <i>(readonly)</i> Error text if there are problems updating the item value.   |
| flags            | integer   | <i>(readonly)</i> Origin of the item.<br><br>Possible values:<br>0 - a plain item;<br>4 - a discovered item.  |
| follow_redirects | integer   | HTTP agent item field. Follow response redirects while polling data.<br><br>0 - Do not follow redirects.<br>1 - <i>(default)</i> Follow redirects.  |
| headers          | object    | HTTP agent item field. Object with HTTP(S) request headers, where header name is used as key and header value as value.<br><br>Example:<br>{ "User-Agent": "Zabbix" }   |
| history          | string    | A time unit of how long the history data should be stored. Also accepts user macro.   |
| http_proxy       | string    | Default: 90d.<br>HTTP agent item field. HTTP(S) proxy connection string.  |
| inventory_link   | integer   | ID of the host inventory field that is populated by the item.<br><br>Refer to the <a href="#">host inventory page</a> for a list of supported host inventory fields and their IDs.  |
| ipmi_sensor      | string    | Default: 0.<br>IPMI sensor. Used only by IPMI items.  |
| jmx_endpoint     | string    | JMX agent custom connection string.   |
| lastclock        | timestamp | Default value:<br>service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi<br><i>(readonly)</i> Time when the item value was last updated.  |
| lastns           | integer   | By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of <i>Max history display period</i> parameter in the <a href="#">Administration</a> → <a href="#">General</a> menu section.<br><i>(readonly)</i> Nanoseconds when the item value was last updated. |
| lastvalue        | string    | By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of <i>Max history display period</i> parameter in the <a href="#">Administration</a> → <a href="#">General</a> menu section.<br><i>(readonly)</i> Last value of the item.                           |
|                  |           | By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of <i>Max history display period</i> parameter in the <a href="#">Administration</a> → <a href="#">General</a> menu section.  |

| Property         | Type    | Description  |
|------------------|---------|--|
| logtimefmt       | string  | Format of the time in log entries. Used only by log items.   |
| master_itemid    | integer | Master item ID.<br>Recursion up to 3 dependent items and maximum count of dependent items equal to 29999 are allowed.  |
| output_format    | integer | Required by dependent items.<br>HTTP agent item field. Should response be converted to JSON.<br><br>0 - <i>(default)</i> Store raw.<br>1 - Convert to JSON.  |
| params           | string  | Additional parameters depending on the type of the item:<br>- executed script for SSH and Telnet items;<br>- SQL query for database monitor items;<br>- formula for calculated items;<br>- the script for script item.                     |
| parameters       | array   | Additional parameters for script items. Array of objects with 'name' and 'value' properties, where name must be unique.  |
| password         | string  | Password for authentication. Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent items.<br>When used by JMX, username should also be specified together with password or both properties should be left blank.         |
| post_type        | integer | HTTP agent item field. Type of post data body stored in posts property.<br><br>0 - <i>(default)</i> Raw data.<br>2 - JSON data.<br>3 - XML data.   |
| posts            | string  | HTTP agent item field. HTTP(S) request body data. Used with post_type.   |
| prevvalue        | string  | <i>(readonly)</i> Previous value of the item.  |
|                  |         | By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of <i>Max history display period</i> parameter in the <i>Administration</i> → <i>General</i> menu section. |
| privatekey       | string  | Name of the private key file.  |
| publickey        | string  | Name of the public key file.   |
| query_fields     | array   | HTTP agent item field. Query parameters. Array of objects with 'key': 'value' pairs, where value can be empty string.  |
| request_method   | integer | HTTP agent item field. Type of request method.<br><br>0 - <i>(default)</i> GET<br>1 - POST<br>2 - PUT<br>3 - HEAD  |
| retrieve_mode    | integer | HTTP agent item field. What part of response should be stored.<br><br>0 - <i>(default)</i> Body.<br>1 - Headers.<br>2 - Both body and headers will be stored.  |
| snmp_oid         | string  | For request_method HEAD only 1 is allowed value.<br>SNMP OID.  |
| ssl_cert_file    | string  | HTTP agent item field. Public SSL Key file path.   |
| ssl_key_file     | string  | HTTP agent item field. Private SSL Key file path.  |
| ssl_key_password | string  | HTTP agent item field. Password for SSL Key file.  |
| state            | integer | <i>(readonly)</i> State of the item.<br><br>Possible values:<br>0 - <i>(default)</i> normal;<br>1 - not supported.   |

| Property      | Type    | Description   |
|---------------|---------|---|
| status        | integer | Status of the item.<br><br>Possible values:<br>0 - ( <i>default</i> ) enabled item;<br>1 - disabled item.   |
| status_codes  | string  | HTTP agent item field. Ranges of required HTTP status codes separated by commas. Also supports user macros as part of comma separated list.<br><br>Example: 200,200-{\$M},{M},200-400   |
| templateid    | string  | (readonly) ID of the parent template item.<br><br><i>Hint:</i> Use the <code>hostid</code> property to specify the template that the item belongs to.   |
| timeout       | string  | Item data polling request timeout. Used for HTTP agent and script items. Supports user macros.<br><br>default: 3s<br>maximum value: 60s   |
| trapper_hosts | string  | Allowed hosts. Used by trapper items or HTTP agent items.   |
| trends        | string  | A time unit of how long the trends data should be stored. Also accepts user macro.<br><br>Default: 365d.  |
| units         | string  | Value units.  |
| username      | string  | Username for authentication. Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent items.   |
| uuid          | string  | Required by SSH and Telnet items.<br>When used by JMX, password should also be specified together with username or both properties should be left blank.<br>Universal unique identifier, used for linking imported item to already existing ones. Used only for items on templates. Auto-generated, if not given. |
| valuemapid    | string  | ID of the associated value map.   |
| verify_host   | integer | HTTP agent item field. Whether to validate that the host name for the connection matches the one in the host's certificate.<br><br>0 - ( <i>default</i> ) Do not validate.<br>1 - Validate.   |
| verify_peer   | integer | HTTP agent item field. Whether to validate that the host's certificate is authentic.<br><br>0 - ( <i>default</i> ) Do not validate.<br>1 - Validate.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Item tag

The item tag object has the following properties.

| Property                 | Type   | Description     |
|--------------------------|--------|-----------------|
| <b>tag</b><br>(required) | string | Item tag name.  |
| value                    | string | Item tag value. |

#### Item preprocessing

The item preprocessing object has the following properties.

| Property                                  | Type    | Description  |
|---|---------|--|
| <b>type</b><br>(required)                 | integer | <p>The preprocessing option type.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>1 - Custom multiplier;</li> <li>2 - Right trim;</li> <li>3 - Left trim;</li> <li>4 - Trim;</li> <li>5 - Regular expression matching;</li> <li>6 - Boolean to decimal;</li> <li>7 - Octal to decimal;</li> <li>8 - Hexadecimal to decimal;</li> <li>9 - Simple change;</li> <li>10 - Change per second;</li> <li>11 - XML XPath;</li> <li>12 - JSONPath;</li> <li>13 - In range;</li> <li>14 - Matches regular expression;</li> <li>15 - Does not match regular expression;</li> <li>16 - Check for error in JSON;</li> <li>17 - Check for error in XML;</li> <li>18 - Check for error using regular expression;</li> <li>19 - Discard unchanged;</li> <li>20 - Discard unchanged with heartbeat;</li> <li>21 - JavaScript;</li> <li>22 - Prometheus pattern;</li> <li>23 - Prometheus to JSON;</li> <li>24 - CSV to JSON;</li> <li>25 - Replace;</li> <li>26 - Check unsupported;</li> <li>27 - XML to JSON.</li> </ul> |
| <b>params</b><br>(required)               | string  | Additional parameters used by preprocessing option. Multiple parameters are separated by LF (\n) character.  |
| <b>error_handler</b><br>(required)        | integer | <p>Action type used in case of preprocessing step failure.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>0 - Error message is set by Zabbix server;</li> <li>1 - Discard value;</li> <li>2 - Set custom value;</li> <li>3 - Set custom error message.</li> </ul>  |
| <b>error_handler_params</b><br>(required) | string  | <p>Error handler parameters. Used with <code>error_handler</code>.</p> <p>Must be empty, if <code>error_handler</code> is 0 or 1.<br/>Can be empty if, <code>error_handler</code> is 2.<br/>Cannot be empty, if <code>error_handler</code> is 3.</p>   |

The following parameters and error handlers are supported for each preprocessing type.

| Preprocessing type | Name                     | Parameter 1                        | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|--------------------------|------------------------------------|-------------|-------------|--------------------------|
| 1                  | Custom number multiplier | list of characters <sup>1, 6</sup> |             |             | 0, 1, 2, 3               |
| 2                  | Right trim               | list of characters <sup>2</sup>    |             |             |                          |
| 3                  | Left trim                | list of characters <sup>2</sup>    |             |             |                          |
| 4                  | Trim                     | list of characters <sup>2</sup>    |             |             |                          |

| Preprocessing type | Name   | Parameter 1 | Parameter 2         | Parameter 3 | Supported error handlers |
|--------------------|--|-------------|---------------------|-------------|--------------------------|
| 5                  | Regular pattern <sup>3</sup><br>ex-<br>pres-<br>sion   |             | output <sup>2</sup> |             | 0, 1, 2, 3               |
| 6                  | Boolean<br>to<br>deci-<br>mal  |             |                     |             | 0, 1, 2, 3               |
| 7                  | Octal<br>to<br>deci-<br>mal  |             |                     |             | 0, 1, 2, 3               |
| 8                  | Hexadecimal<br>to<br>deci-<br>mal  |             |                     |             | 0, 1, 2, 3               |
| 9                  | Simple<br>change   |             |                     |             | 0, 1, 2, 3               |
| 10                 | Change<br>per<br>sec-<br>ond   |             |                     |             | 0, 1, 2, 3               |
| 11                 | XML path <sup>4</sup><br>XPath   |             |                     |             | 0, 1, 2, 3               |
| 12                 | JSONPath <sup>4</sup>  |             |                     |             | 0, 1, 2, 3               |
| 13                 | In min <sup>1, 6</sup><br>range  |             | max <sup>1, 6</sup> |             | 0, 1, 2, 3               |
| 14                 | Matchespattern <sup>3</sup><br>regu-<br>lar<br>ex-<br>pres-<br>sion                              |             |                     |             | 0, 1, 2, 3               |
| 15                 | Does pattern <sup>3</sup><br>not<br>match<br>regu-<br>lar<br>ex-<br>pres-<br>sion                |             |                     |             | 0, 1, 2, 3               |
| 16                 | Check path <sup>4</sup><br>for<br>error<br>in<br>JSON  |             |                     |             | 0, 1, 2, 3               |
| 17                 | Check path <sup>4</sup><br>for<br>error<br>in<br>XML   |             |                     |             | 0, 1, 2, 3               |
| 18                 | Check pattern <sup>3</sup><br>for<br>error<br>us-<br>ing<br>regu-<br>lar<br>ex-<br>pres-<br>sion |             | output <sup>2</sup> |             | 0, 1, 2, 3               |

| Preprocessing type | Name  | Parameter 1            | Parameter 2               | Parameter 3            | Supported error handlers |
|--------------------|---|------------------------|---------------------------|------------------------|--------------------------|
| 19                 | Discard<br>un-<br>changed   |                        |                           |                        |                          |
| 20                 | Discard seconds <sup>5, 6</sup><br>un-<br>changed<br>with<br>heart-<br>beat |                        |                           |                        |                          |

| 24                 | CSV<br>to<br>JSON   | character <sup>2</sup> | character <sup>2</sup>    | 0,1                    | 0, 1, 2, 3               |
| 25                 | Replace search string <sup>2</sup>  |                        | replacement <sup>2</sup>  |                        |                          |
| 26                 | Check<br>un-<br>sup-<br>ported  |                        |                           |                        | 1, 2, 3                  |
| 27                 | XML<br>to<br>JSON   |                        |                           |                        | 0, 1, 2, 3               |

<sup>1</sup> integer or floating-point number

<sup>2</sup> string

<sup>3</sup> regular expression

<sup>4</sup> JSONPath or XML XPath

<sup>5</sup> positive integer (with support of time suffixes, e.g. 30s, 1m, 2h, 1d)

<sup>6</sup> user macro

<sup>7</sup> Prometheus pattern following the syntax: <metric name>{<label name>=<label value>, ...} == <value>. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.

<sup>8</sup> Prometheus output following the syntax: <label name> (can be a user macro) if label is selected as the second parameter.

<sup>9</sup> One of the aggregation functions: sum, min, max, avg, count if function is selected as the second parameter.

## item.create

### Description

object item.create(object/array items)

This method allows to create new items.

#### Note:

Web items cannot be created via the Zabbix API.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Items to create.

Additionally to the [standard item properties](#), the method accepts the following parameters.

| Parameter     | Type  | Description                        |
|---------------|-------|------------------------------------|
| preprocessing | array | Item <b>preprocessing</b> options. |
| tags          | array | Item <b>tags</b> .                 |

#### Return values

(object) Returns an object containing the IDs of the created items under the `itemids` property. The order of the returned IDs matches the order of the passed items.

#### Examples

##### Creating an item

Create a numeric Zabbix agent item with 2 item tags to monitor free disk space on host with ID "30074".

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Free disk space on /home/joe/",
    "key_": "vfs.fs.size[/home/joe/,free]",
    "hostid": "30074",
    "type": 0,
    "value_type": 3,
    "interfaceid": "30084",
    "tags": [
      {
        "tag": "Disk usage"
      },
      {
        "tag": "Equipment",
        "value": "Workstation"
      }
    ],
    "delay": "30s"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "24758"
    ]
  },
  "id": 1
}
```

##### Creating a host inventory item

Create a Zabbix agent item to populate the host's "OS" inventory field.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "uname",
    "key_": "system.uname",
    "hostid": "30021",

```

```

        "type": 0,
        "interfaceid": "30007",
        "value_type": 1,
        "delay": "10s",
        "inventory_link": 5
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "24759"
        ]
    },
    "id": 1
}

```

Creating an item with preprocessing

Create an item using custom multiplier.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "name": "Device uptime",
        "key_": "sysUpTime",
        "hostid": "11312",
        "type": 4,
        "snmp_oid": "SNMPv2-MIB::sysUpTime.0",
        "value_type": 1,
        "delay": "60s",
        "units": "uptime",
        "interfaceid": "1156",
        "preprocessing": [
            {
                "type": 1,
                "params": "0.01",
                "error_handler": 1,
                "error_handler_params": ""
            }
        ]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44210"
        ]
    },
    "id": 1
}

```

### Creating dependent item

Create a dependent item for the master item with ID 24759. Only dependencies on the same host are allowed, therefore master and the dependent item should have the same hostid.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "hostid": "30074",
    "name": "Dependent test item",
    "key_": "dependent.item",
    "type": 18,
    "master_itemid": "24759",
    "value_type": 2
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}
```

### Create HTTP agent item

Create POST request method item with JSON response preprocessing.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "url": "http://127.0.0.1/http.php",
    "query_fields": [
      {
        "mode": "json"
      },
      {
        "min": "10"
      },
      {
        "max": "100"
      }
    ],
    "interfaceid": "1",
    "type": 19,
    "hostid": "10254",
    "delay": "5s",
    "key_": "json",
    "name": "HTTP agent example JSON",
    "value_type": 0,
    "output_format": 1,
    "preprocessing": [
      {
        "type": 12,

```

```

        "params": "$.random",
        "error_handler": 0,
        "error_handler_params": ""
    }
    ],
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 2
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 3
}

```

Create script item

Create a simple data collection using a script item.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Script example",
    "key_": "custom.script.item",
    "hostid": "12345",
    "type": 21,
    "value_type": 4,
    "params": "var request = new CurlHttpRequest();\nreturn request.Post(\"https://postman-echo.com/post\");",
    "parameters": [
      {
        "name": "host",
        "value": "{HOST.CONN}"
      }
    ]
  },
  "timeout": "6s",
  "delay": "30s"
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 2
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 3
}

```

Source

Cltem::create() in *ui/include/classes/api/services/Cltem.php*.

## item.delete

### Description

object item.delete(array itemIds)

This method allows to delete items.

#### Note:

Web items cannot be deleted via the Zabbix API.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(array) IDs of the items to delete.

### Return values

(object) Returns an object containing the IDs of the deleted items under the `itemids` property.

### Examples

#### Deleting multiple items

Delete two items.

Dependent items and item prototypes are removed automatically if master item is deleted.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.delete",
  "params": [
    "22982",
    "22986"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22982",
      "22986"
    ]
  },
  "id": 1
}
```

### Source

CItem::delete() in `ui/include/classes/api/services/CItem.php`.

## item.get

### Description

integer/array item.get(object parameters)

The method allows to retrieve items according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter           | Type             | Description   |
|---------------------|------------------|---|
| itemids             | string/array     | Return only items with the given IDs.   |
| groupids            | string/array     | Return only items that belong to the hosts from the given groups.   |
| templateids         | string/array     | Return only items that belong to the given templates.   |
| hostids             | string/array     | Return only items that belong to the given hosts.   |
| proxyids            | string/array     | Return only items that are monitored by the given proxies.  |
| interfaceids        | string/array     | Return only items that use the given host interfaces.   |
| graphids            | string/array     | Return only items that are used in the given graphs.  |
| triggerids          | string/array     | Return only items that are used in the given triggers.  |
| webitems            | flag             | Include web items in the result.  |
| inherited           | boolean          | If set to true return only items inherited from a template.   |
| templated           | boolean          | If set to true return only items that belong to templates.  |
| monitored           | boolean          | If set to true return only enabled items that belong to monitored hosts.  |
| group               | string           | Return only items that belong to a group with the given name.   |
| host                | string           | Return only items that belong to a host with the given name.  |
| evaltype            | integer          | Rules for tag searching.<br><br>Possible values:<br>0 - (default) And/Or;<br>2 - Or.  |
| tags                | array of objects | Return only items with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all items.<br><br>Possible operator types:<br>0 - (default) Like;<br>1 - Equal;<br>2 - Not like;<br>3 - Not equal<br>4 - Exists;<br>5 - Not exists. |
| with_triggers       | boolean          | If set to true return only items that are used in triggers.   |
| selectHosts         | query            | Return a <b>hosts</b> property with an array of hosts that the item belongs to.   |
| selectInterfaces    | query            | Return an <b>interfaces</b> property with an array of host interfaces used by the item.   |
| selectTriggers      | query            | Return a <b>triggers</b> property with the triggers that the item is used in.   |
| selectGraphs        | query            | Supports count.<br>Return a <b>graphs</b> property with the graphs that contain the item.   |
| selectDiscoveryRule | query            | Supports count.<br>Return a <b>discoveryRule</b> property with the LLD rule that created the item.  |

| Parameter           | Type  | Description   |
|---------------------|-------|---|
| selectItemDiscovery | query | <p>Return an <code>itemDiscovery</code> property with the item discovery object. The item discovery object links the item to an item prototype from which it was created.</p> <p>It has the following properties:</p> <ul style="list-style-type: none"> <li><code>itemdiscoveryid</code> - (string) ID of the item discovery;</li> <li><code>itemid</code> - (string) ID of the discovered item;</li> <li><code>parent_itemid</code> - (string) ID of the item prototype from which the item has been created;</li> <li><code>key_</code> - (string) key of the item prototype;</li> <li><code>lastcheck</code> - (timestamp) time when the item was last discovered;</li> <li><code>ts_delete</code> - (timestamp) time when an item that is no longer discovered will be deleted.</li> </ul>   |
| selectPreprocessing | query | <p>Return a <code>preprocessing</code> property with item preprocessing options.</p> <p>It has the following properties:</p> <ul style="list-style-type: none"> <li><code>type</code> - (string) The preprocessing option type: <ul style="list-style-type: none"> <li>1 - Custom multiplier;</li> <li>2 - Right trim;</li> <li>3 - Left trim;</li> <li>4 - Trim;</li> <li>5 - Regular expression matching;</li> <li>6 - Boolean to decimal;</li> <li>7 - Octal to decimal;</li> <li>8 - Hexadecimal to decimal;</li> <li>9 - Simple change;</li> <li>10 - Change per second;</li> <li>11 - XML XPath;</li> <li>12 - JSONPath;</li> <li>13 - In range;</li> <li>14 - Matches regular expression;</li> <li>15 - Does not match regular expression;</li> <li>16 - Check for error in JSON;</li> <li>17 - Check for error in XML;</li> <li>18 - Check for error using regular expression;</li> <li>19 - Discard unchanged;</li> <li>20 - Discard unchanged with heartbeat;</li> <li>21 - JavaScript;</li> <li>22 - Prometheus pattern;</li> <li>23 - Prometheus to JSON;</li> <li>24 - CSV to JSON;</li> <li>25 - Replace;</li> <li>26 - Check for not supported value;</li> <li>27 - XML to JSON.</li> </ul> </li> <li><code>params</code> - (string) Additional parameters used by preprocessing option. Multiple parameters are separated by LF (\n) character.</li> <li><code>error_handler</code> - (string) Action type used in case of preprocessing step failure: <ul style="list-style-type: none"> <li>0 - Error message is set by Zabbix server;</li> <li>1 - Discard value;</li> <li>2 - Set custom value;</li> <li>3 - Set custom error message.</li> </ul> </li> <li><code>error_handler_params</code> - (string) Error handler parameters.</li> </ul> |
| selectTags          | query | Return the item tags in <code>tags</code> property.   |
| selectValueMap      | query | Return a <code>valuemap</code> property with item value map.  |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| filter                 | object       | Return only those results that exactly match the given filter.<br><br>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.<br><br>Supports additional filters:<br>host - technical name of the host that the item belongs to. |
| limitSelects           | integer      | Limits the number of records returned by subselects.   |
| sortfield              | string/array | Applies to the following subselects:<br>selectGraphs - results will be sorted by name;<br>selectTriggers - results will be sorted by description.<br>Sort the result by the given properties.<br><br>Possible values are: itemid, name, key_, delay, history, trends, type and status.                         |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> .   |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Finding items by key

Retrieve all items used in triggers specific host ID that have word "system.cpu" in the item key and sort results by name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.get",
  "params": {
    "output": "extend",

Finding dependent items by key

Retrieve all dependent items from host with ID "10116" that have the word "apache" in the key.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "item.get",
  "params": {
    "output": "extend",
    "hostids": "10116",
    "search": {
      "key_": "apache"
    },
    "filter": {
      "type": 18
    }
  }
},

```

```
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}
```

Response:

```

CItem::get() in *ui/include/classes/api/services/CItem.php*.

## item.update

Description

object item.update(object/array items)

This method allows to update existing items.

### Note:

Web items cannot be updated via the Zabbix API.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Item properties to be updated.

The *itemid* property must be defined for each item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard item properties](#), the method accepts the following parameters.

| Parameter     | Type  | Description  |
|---------------|-------|--|
| preprocessing | array | <a href="#">Item preprocessing</a> options to replace the current preprocessing options. |
| tags          | array | Item <a href="#">tags</a> .  |

Return values

(object) Returns an object containing the IDs of the updated items under the *itemids* property.

Examples

Enabling an item

Enable an item, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "10092",
    "status": 0
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10092"
    ]
  },
  "id": 1
}
```

Update dependent item

Update Dependent item name and Master item ID. Only dependencies on same host are allowed, therefore Master and Dependent item should have same hostid.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "name": "Dependent item updated name",
    "master_itemid": "25562",
    "itemid": "189019"
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "189019"
    ]
  },
  "id": 1
}
```

Update HTTP agent item

Enable item value trapping.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "23856",
    "allow_traps": 1
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23856"
    ]
  },
  "id": 1
}
```

```
    "id": 1
}
```

Updating an item with preprocessing

Update an item with item preprocessing rule "In range".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "23856",
    "preprocessing": [
      {
        "type": 13,
        "params": "\n100",
        "error_handler": 1,
        "error_handler_params": ""
      }
    ]
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23856"
    ]
  },
  "id": 1
}
```

Updating a script item

Update a script item with a different script and remove unnecessary parameters that were used by previous script.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "23865",
    "parameters": [],
    "script": "Zabbix.Log(3, 'Log test');\nreturn 1;"
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}
```

Source

CItem::update() in *ui/include/classes/api/services/CItem.php*.

## Item prototype

This class is designed to work with item prototypes.

Object references:

- [Item prototype](#)

Available methods:

- [itemprototype.create](#) - creating new item prototypes
- [itemprototype.delete](#) - deleting item prototypes
- [itemprototype.get](#) - retrieving item prototypes
- [itemprototype.update](#) - updating item prototypes

## > Item prototype object

The following objects are directly related to the `itemprototype` API.

Item prototype

The item prototype object has the following properties.

| Property                         | Type   | Description  |
|----------------------------------|--------|--|
| <b>itemid</b>                    | string | ( <i>readonly</i> ) ID of the item prototype.  |
| <b>delay</b><br>(required)       | string | Update interval of the item prototype. Accepts seconds or a time unit with suffix (30s,1m,2h,1d).<br>Optionally one or more <a href="#">custom intervals</a> can be specified either as flexible intervals or scheduling.<br>Multiple intervals are separated by a semicolon.<br>User macros and LLD macros may be used. A single macro has to fill the whole field. Multiple macros in a field or macros mixed with text are not supported.<br>Flexible intervals may be written as two macros separated by a forward slash (e.g. <code>{FLEX_INTERVAL}/{FLEX_PERIOD}</code> ). |
| <b>hostid</b><br>(required)      | string | Optional for Zabbix trapper, dependent items and for Zabbix agent (active) with <code>mqtt.get</code> key.<br>ID of the host that the item prototype belongs to.   |
| <b>ruleid</b><br>(required)      | string | For update operations this field is <i>readonly</i> .<br>ID of the LLD rule that the item belongs to.  |
| <b>interfaceid</b><br>(required) | string | For update operations this field is <i>readonly</i> .<br>ID of the item prototype's host interface. Used only for host item prototypes.  |
| <b>key_</b><br>(required)        | string | Not required for Zabbix agent (active), Zabbix internal, Zabbix trapper, calculated, dependent, database monitor and script item prototypes.<br>Optional for HTTP agent item prototypes.<br>Item prototype key.  |
| <b>name</b><br>(required)        | string | Name of the item prototype.  |

| Property                        | Type    | Description   |
|---------------------------------|---------|---|
| <b>type</b><br>(required)       | integer | Type of the item prototype.<br><br>Possible values:<br>0 - Zabbix agent;<br>2 - Zabbix trapper;<br>3 - simple check;<br>5 - Zabbix internal;<br>7 - Zabbix agent (active);<br>10 - external check;<br>11 - database monitor;<br>12 - IPMI agent;<br>13 - SSH agent;<br>14 - TELNET agent;<br>15 - calculated;<br>16 - JMX agent;<br>17 - SNMP trap;<br>18 - Dependent item;<br>19 - HTTP agent;<br>20 - SNMP agent;<br>21 - Script. |
| <b>url</b><br>(required)        | string  | URL string required only for HTTP agent item prototypes. Supports LLD macros, user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}.   |
| <b>value_type</b><br>(required) | integer | Type of information of the item prototype.<br><br>Possible values:<br>0 - numeric float;<br>1 - character;<br>2 - log;<br>3 - numeric unsigned;<br>4 - text.  |
| allow_traps                     | integer | HTTP agent item prototype field. Allow to populate value as in trapper item type also.<br><br>0 - ( <i>default</i> ) Do not allow to accept incoming data.<br>1 - Allow to accept incoming data.  |
| authtype                        | integer | Used only by SSH agent item prototypes or HTTP agent item prototypes.<br><br>SSH agent authentication method possible values:<br>0 - ( <i>default</i> ) password;<br>1 - public key.<br><br>HTTP agent authentication method possible values:<br>0 - ( <i>default</i> ) none<br>1 - basic<br>2 - NTLM<br>3 - Kerberos   |
| description                     | string  | Description of the item prototype.  |
| follow_redirects                | integer | HTTP agent item prototype field. Follow response redirects while polling data.<br><br>0 - Do not follow redirects.<br>1 - ( <i>default</i> ) Follow redirects.  |
| headers                         | object  | HTTP agent item prototype field. Object with HTTP(S) request headers, where header name is used as key and header value as value.<br><br>Example:<br>{ "User-Agent": "Zabbix" }   |

| Property         | Type    | Description   |
|------------------|---------|---|
| history          | string  | A time unit of how long the history data should be stored. Also accepts user macro and LLD macro.<br><br>Default: 90d.  |
| http_proxy       | string  | HTTP agent item prototype field. HTTP(S) proxy connection string.   |
| ipmi_sensor      | string  | IPMI sensor. Used only by IPMI item prototypes.   |
| jmx_endpoint     | string  | JMX agent custom connection string.<br><br>Default value:<br>service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi   |
| logtimefmt       | string  | Format of the time in log entries. Used only by log item prototypes.  |
| master_itemid    | integer | Master item ID.<br>Recursion up to 3 dependent items and item prototypes and maximum count of dependent items and item prototypes equal to 29999 are allowed.   |
| output_format    | integer | Required by Dependent items.<br>HTTP agent item prototype field. Should response be converted to JSON.<br><br>0 - ( <i>default</i> ) Store raw.<br>1 - Convert to JSON.   |
| params           | string  | Additional parameters depending on the type of the item prototype:<br>- executed script for SSH and Telnet item prototypes;<br>- SQL query for database monitor item prototypes;<br>- formula for calculated item prototypes. |
| parameters       | array   | Additional parameters for script item prototypes. Array of objects with 'name' and 'value' properties, where name must be unique.   |
| password         | string  | Password for authentication. Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent item prototypes.   |
| post_type        | integer | HTTP agent item prototype field. Type of post data body stored in posts property.<br><br>0 - ( <i>default</i> ) Raw data.<br>2 - JSON data.<br>3 - XML data.  |
| posts            | string  | HTTP agent item prototype field. HTTP(S) request body data. Used with post_type.  |
| privatekey       | string  | Name of the private key file.   |
| publickey        | string  | Name of the public key file.  |
| query_fields     | array   | HTTP agent item prototype field. Query parameters. Array of objects with 'key':'value' pairs, where value can be empty string.  |
| request_method   | integer | HTTP agent item prototype field. Type of request method.<br><br>0 - ( <i>default</i> ) GET<br>1 - POST<br>2 - PUT<br>3 - HEAD   |
| retrieve_mode    | integer | HTTP agent item prototype field. What part of response should be stored.<br><br>0 - ( <i>default</i> ) Body.<br>1 - Headers.<br>2 - Both body and headers will be stored.   |
| snmp_oid         | string  | For request_method HEAD only 1 is allowed value.<br>SNMP OID.   |
| ssl_cert_file    | string  | HTTP agent item prototype field. Public SSL Key file path.  |
| ssl_key_file     | string  | HTTP agent item prototype field. Private SSL Key file path.   |
| ssl_key_password | string  | HTTP agent item prototype field. Password for SSL Key file.   |

| Property      | Type    | Description  |
|---------------|---------|--|
| status        | integer | Status of the item prototype.<br><br>Possible values:<br>0 - ( <i>default</i> ) enabled item prototype;<br>1 - disabled item prototype;<br>3 - unsupported item prototype.   |
| status_codes  | string  | HTTP agent item prototype field. Ranges of required HTTP status codes separated by commas. Also supports user macros or LLD macros as part of comma separated list.<br><br>Example: 200,200-{\$M},{M},200-400                |
| templateid    | string  | (readonly) ID of the parent template item prototype.   |
| timeout       | string  | Item data polling request timeout. Used for HTTP agent and script item prototypes. Supports user macros and LLD macros.<br><br>default: 3s<br>maximum value: 60s   |
| trapper_hosts | string  | Allowed hosts. Used by trapper item prototypes or HTTP item prototypes.  |
| trends        | string  | A time unit of how long the trends data should be stored. Also accepts user macro and LLD macro.   |
| units         | string  | Default: 365d.<br>Value units.   |
| username      | string  | Username for authentication. Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent item prototypes.  |
| uuid          | string  | Required by SSH and Telnet item prototypes.<br>Universal unique identifier, used for linking imported item prototypes to already existing ones. Used only for item prototypes on templates.<br>Auto-generated, if not given. |
| valuemapid    | string  | ID of the associated value map.  |
| verify_host   | integer | HTTP agent item prototype field. Whether to validate that the host name for the connection matches the one in the host's certificate.<br><br>0 - ( <i>default</i> ) Do not validate.<br>1 - Validate.                        |
| verify_peer   | integer | HTTP agent item prototype field. Whether to validate that the host's certificate is authentic.<br><br>0 - ( <i>default</i> ) Do not validate.<br>1 - Validate.   |
| discover      | integer | Item prototype discovery status.<br><br>Possible values:<br>0 - ( <i>default</i> ) new items will be discovered;<br>1 - new items will not be discovered and existing items will be marked as lost.                          |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Item prototype tag

The item prototype tag object has the following properties.

| Property                 | Type   | Description               |
|--------------------------|--------|---------------------------|
| <b>tag</b><br>(required) | string | Item prototype tag name.  |
| value                    | string | Item prototype tag value. |

## Item prototype preprocessing

The item prototype preprocessing object has the following properties.

| Property                                  | Type    | Description  |
|---|---------|--|
| <b>type</b><br>(required)                 | integer | <p>The preprocessing option type.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>1 - Custom multiplier;</li> <li>2 - Right trim;</li> <li>3 - Left trim;</li> <li>4 - Trim;</li> <li>5 - Regular expression matching;</li> <li>6 - Boolean to decimal;</li> <li>7 - Octal to decimal;</li> <li>8 - Hexadecimal to decimal;</li> <li>9 - Simple change;</li> <li>10 - Change per second;</li> <li>11 - XML XPath;</li> <li>12 - JSONPath;</li> <li>13 - In range;</li> <li>14 - Matches regular expression;</li> <li>15 - Does not match regular expression;</li> <li>16 - Check for error in JSON;</li> <li>17 - Check for error in XML;</li> <li>18 - Check for error using regular expression;</li> <li>19 - Discard unchanged;</li> <li>20 - Discard unchanged with heartbeat;</li> <li>21 - JavaScript;</li> <li>22 - Prometheus pattern;</li> <li>23 - Prometheus to JSON;</li> <li>24 - CSV to JSON;</li> <li>25 - Replace;</li> <li>26 - Check unsupported;</li> <li>27 - XML to JSON.</li> </ul> |
| <b>params</b><br>(required)               | string  | Additional parameters used by preprocessing option. Multiple parameters are separated by LF (\n) character.  |
| <b>error_handler</b><br>(required)        | integer | <p>Action type used in case of preprocessing step failure.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>0 - Error message is set by Zabbix server;</li> <li>1 - Discard value;</li> <li>2 - Set custom value;</li> <li>3 - Set custom error message.</li> </ul>  |
| <b>error_handler_params</b><br>(required) | string  | <p>Error handler parameters. Used with <code>error_handler</code>.</p> <p>Must be empty, if <code>error_handler</code> is 0 or 1.<br/>Can be empty if, <code>error_handler</code> is 2.<br/>Cannot be empty, if <code>error_handler</code> is 3.</p>   |

The following parameters and error handlers are supported for each preprocessing type.

| Preprocessing type | Name                     | Parameter 1                        | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|--------------------------|------------------------------------|-------------|-------------|--------------------------|
| 1                  | Custom number multiplier | list of characters <sup>1, 6</sup> |             |             | 0, 1, 2, 3               |
| 2                  | Right trim               | list of characters <sup>2</sup>    |             |             |                          |
| 3                  | Left trim                | list of characters <sup>2</sup>    |             |             |                          |

| Preprocessing type | Name                              | Parameter 1                     | Parameter 2         | Parameter 3 | Supported error handlers |
|--------------------|-----------------------------------|---------------------------------|---------------------|-------------|--------------------------|
| 4                  | Trim                              | list of characters <sup>2</sup> |                     |             |                          |
| 5                  | Regular expression                | pattern <sup>3</sup>            | output <sup>2</sup> |             | 0, 1, 2, 3               |
| 6                  | Boolean to decimal                |                                 |                     |             | 0, 1, 2, 3               |
| 7                  | Octal to decimal                  |                                 |                     |             | 0, 1, 2, 3               |
| 8                  | Hexadecimal to decimal            |                                 |                     |             | 0, 1, 2, 3               |
| 9                  | Simple change                     |                                 |                     |             | 0, 1, 2, 3               |
| 10                 | Change per second                 |                                 |                     |             | 0, 1, 2, 3               |
| 11                 | XML XPath                         | path <sup>4</sup>               |                     |             | 0, 1, 2, 3               |
| 12                 | JSONPath                          | path <sup>4</sup>               |                     |             | 0, 1, 2, 3               |
| 13                 | In range                          | min <sup>1, 6</sup>             | max <sup>1, 6</sup> |             | 0, 1, 2, 3               |
| 14                 | Matches regular expression        | pattern <sup>3</sup>            |                     |             | 0, 1, 2, 3               |
| 15                 | Does not match regular expression | pattern <sup>3</sup>            |                     |             | 0, 1, 2, 3               |
| 16                 | Check for error in JSON           | path <sup>4</sup>               |                     |             | 0, 1, 2, 3               |
| 17                 | Check for error in XML            | path <sup>4</sup>               |                     |             | 0, 1, 2, 3               |

| Preprocessing type | Name  | Parameter 1            | Parameter 2              | Parameter 3            | Supported error handlers |
|--------------------|---|------------------------|--------------------------|------------------------|--------------------------|
| 18                 | Check for error using regular expression                  | pattern <sup>3</sup>   | output <sup>2</sup>      |                        | 0, 1, 2, 3               |
| 19                 | Discard unchanged   |                        |                          |                        |                          |
| 20                 | Discard seconds <sup>5, 6</sup> unchanged with heart-beat |                        |                          |                        |                          |
| 21                 | JavaScript <sup>2</sup>                                   |                        |                          |                        |                          |
| 22                 | Prometheus pattern <sup>6, 7</sup>                        |                        | value, label, function   | output <sup>8, 9</sup> | 0, 1, 2, 3               |
| 23                 | Prometheus pattern <sup>6, 7</sup> to JSON                |                        |                          |                        | 0, 1, 2, 3               |
| 24                 | CSV character <sup>2</sup> to JSON                        | character <sup>2</sup> | character <sup>2</sup>   | 0,1                    | 0, 1, 2, 3               |
| 25                 | Replace search string <sup>2</sup>                        |                        | replacement <sup>2</sup> |                        |                          |
| 26                 | Check unsupported   |                        |                          |                        | 1, 2, 3                  |
| 27                 | XML to JSON   |                        |                          |                        | 0, 1, 2, 3               |

<sup>1</sup> integer or floating-point number

<sup>2</sup> string

<sup>3</sup> regular expression

<sup>4</sup> JSONPath or XML XPath

<sup>5</sup> positive integer (with support of time suffixes, e.g. 30s, 1m, 2h, 1d)

<sup>6</sup> user macro, LLD macro

<sup>7</sup> Prometheus pattern following the syntax: <metric name>{<label name>=<label value>, ...} == <value>. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro or LLD macro.

<sup>8</sup> Prometheus output following the syntax: <label name> (can be a user macro or an LLD macro) if label is selected as the second parameter.

<sup>9</sup> One of the aggregation functions: sum, min, max, avg, count if function is selected as the second parameter.

## itemprototype.create

### Description

object itemprototype.create(object/array itemPrototypes)

This method allows to create new item prototypes.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object/array) Item prototype to create.

Additionally to the [standard item prototype properties](#), the method accepts the following parameters.

| Parameter                   | Type   | Description   |
|-----------------------------|--------|---|
| <b>ruleid</b><br>(required) | string | ID of the LLD rule that the item belongs to.          |
| preprocessing               | array  | Item prototype <a href="#">preprocessing</a> options. |
| tags                        | array  | Item prototype <a href="#">tags</a> .                 |

**Return values**

(object) Returns an object containing the IDs of the created item prototypes under the `itemids` property. The order of the returned IDs matches the order of the passed item prototypes.

**Examples****Creating an item prototype**

Create an item prototype to monitor free disk space on a discovered file system. Discovered items should be numeric Zabbix agent items updated every 30 seconds.

**Request:**

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "name": "Free disk space on {#FSNAME}",
    "key_": "vfs.fs.size[{#FSNAME},free]",
    "hostid": "10197",
    "ruleid": "27665",
    "type": 0,
    "value_type": 3,
    "interfaceid": "112",
    "delay": "30s"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

**Response:**

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27666"
    ]
  },
  "id": 1
}
```

**Creating an item prototype with preprocessing**

Create an item using change per second and a custom multiplier as a second step.

**Request:**

```
{
  "jsonrpc": "2.0",
```

```

"method": "itemprototype.create",
"params": {
  "name": "Incoming network traffic on {#IFNAME}",
  "key_": "net.if.in[{#IFNAME}]",
  "hostid": "10001",
  "ruleid": "27665",
  "type": 0,
  "value_type": 3,
  "delay": "60s",
  "units": "bps",
  "interfaceid": "1155",
  "preprocessing": [
    {
      "type": 10,
      "params": "",
      "error_handler": 0,
      "error_handler_params": ""
    },
    {
      "type": 1,
      "params": "8",
      "error_handler": 2,
      "error_handler_params": "10"
    }
  ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}

```

Creating dependent item prototype

Create Dependent item prototype for Master item prototype with ID 44211. Only dependencies on same host (template/discovery rule) are allowed, therefore Master and Dependent item should have same hostid and ruleid.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "hostid": "10001",
    "ruleid": "27665",
    "name": "Dependent test item prototype",
    "key_": "dependent.prototype",
    "type": 18,
    "master_itemid": "44211",
    "value_type": 3
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44212"
    ]
  },
  "id": 1
}
```

Create HTTP agent item prototype

Create item prototype with URL using user macro, query fields and custom headers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "type": "19",
    "hostid": "10254",
    "ruleid": "28256",
    "interfaceid": "2",
    "name": "api item prototype example",
    "key_": "api_http_item",
    "value_type": 3,
    "url": "${URL_PROTOTYPE}",
    "query_fields": [
      {
        "min": "10"
      },
      {
        "max": "100"
      }
    ],
    "headers": {
      "X-Source": "api"
    },
    "delay": "35"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28305"
    ]
  },
  "id": 1
}
```

Create script item prototype

Create a simple data collection using a script item prototype.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
```

```

    "name": "Script example",
    "key_": "custom.script.itemprototype",
    "hostid": "12345",
    "type": 21,
    "value_type": 4,
    "params": "var request = new CurlHttpRequest();\nreturn request.Post(\"https://postman-echo.com/post\");",
    "parameters": [
        {
            "name": "host",
            "value": "{HOST.CONN}"
        }
    ],
    "timeout": "6s",
    "delay": "30s"
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 2
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 3
}

```

Source

CItemPrototype::create() in `ui/include/classes/api/services/CItemPrototype.php`.

## itemprototype.delete

Description

object itemprototype.delete(array itemPrototypeIds)

This method allows to delete item prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the item prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted item prototypes under the `prototypeids` property.

Examples

Deleting multiple item prototypes

Delete two item prototypes.

Dependent item prototypes are removed automatically if master item or item prototype is deleted.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "itemprototype.delete",
    "params": [

```

```

        "27352",
        "27356"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "prototypeids": [
      "27352",
      "27356"
    ]
  },
  "id": 1
}

```

CItemPrototype::delete() in *ui/include/classes/api/services/CItemPrototype.php*.

## itemprototype.get

Description

integer/array itemprototype.get(object parameters)

The method allows to retrieve item prototypes according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter           | Type         | Description  |
|---------------------|--------------|--|
| discoveryids        | string/array | Return only item prototypes that belong to the given LLD rules.  |
| graphids            | string/array | Return only item prototypes that are used in the given graph prototypes.   |
| hostids             | string/array | Return only item prototypes that belong to the given hosts.  |
| inherited           | boolean      | If set to <code>true</code> return only item prototypes inherited from a template.                                 |
| itemids             | string/array | Return only item prototypes with the given IDs.  |
| monitored           | boolean      | If set to <code>true</code> return only enabled item prototypes that belong to monitored hosts.                    |
| templated           | boolean      | If set to <code>true</code> return only item prototypes that belong to templates.                                  |
| templateids         | string/array | Return only item prototypes that belong to the given templates.  |
| triggerids          | string/array | Return only item prototypes that are used in the given trigger prototypes.   |
| selectDiscoveryRule | query        | Return a <code>discoveryRule</code> property with the low-level discovery rule that the item prototype belongs to. |
| selectGraphs        | query        | Return a <code>graphs</code> property with graph prototypes that the item prototype is used in.                    |
|                     |              | Supports count.  |
| selectHosts         | query        | Return a <code>hosts</code> property with an array of hosts that the item prototype belongs to.                    |
| selectTags          | query        | Return the item prototype tags in <code>tags</code> property.  |

| Parameter           | Type         | Description   |
|---------------------|--------------|---|
| selectTriggers      | query        | Return a <b>triggers</b> property with trigger prototypes that the item prototype is used in.   |
| selectPreprocessing | query        | <p>Supports count.</p> <p>Return a <b>preprocessing</b> property with item preprocessing options.</p> <p>It has the following properties:</p> <p><b>type</b> - (string) The preprocessing option type:</p> <ul style="list-style-type: none"> <li>1 - Custom multiplier;</li> <li>2 - Right trim;</li> <li>3 - Left trim;</li> <li>4 - Trim;</li> <li>5 - Regular expression matching;</li> <li>6 - Boolean to decimal;</li> <li>7 - Octal to decimal;</li> <li>8 - Hexadecimal to decimal;</li> <li>9 - Simple change;</li> <li>10 - Change per second;</li> <li>11 - XML XPath;</li> <li>12 - JSONPath;</li> <li>13 - In range;</li> <li>14 - Matches regular expression;</li> <li>15 - Does not match regular expression;</li> <li>16 - Check for error in JSON;</li> <li>17 - Check for error in XML;</li> <li>18 - Check for error using regular expression;</li> <li>19 - Discard unchanged;</li> <li>20 - Discard unchanged with heartbeat;</li> <li>21 - JavaScript;</li> <li>22 - Prometheus pattern;</li> <li>23 - Prometheus to JSON;</li> <li>24 - CSV to JSON;</li> <li>25 - Replace;</li> <li>26 - Check for not supported value;</li> <li>27- XML to JSON.</li> </ul> <p><b>params</b> - (string) Additional parameters used by preprocessing option. Multiple parameters are separated by LF (\n)character.</p> <p><b>error_handler</b> - (string) Action type used in case of preprocessing step failure:</p> <ul style="list-style-type: none"> <li>0 - Error message is set by Zabbix server;</li> <li>1 - Discard value;</li> <li>2 - Set custom value;</li> <li>3 - Set custom error message.</li> </ul> <p><b>error_handler_params</b> - (string) Error handler parameters.</p> |
| selectValueMap      | query        | Return a <b>valuemap</b> property with item prototype value map.  |
| filter              | object       | Return only those results that exactly match the given filter.  |
|                     |              | Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.   |
| limitSelects        | integer      | <p>Supports additional filters:</p> <p><b>host</b> - technical name of the host that the item prototype belongs to.</p> <p>Limits the number of records returned by subselects.</p>   |
| sortfield           | string/array | <p>Applies to the following subselects:</p> <p><b>selectGraphs</b> - results will be sorted by name;</p> <p><b>selectTriggers</b> - results will be sorted by description.</p> <p>Sort the result by the given properties.</p> <p>Possible values are: itemid, name, key_, delay, type and status.</p>  |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieving item prototypes from an LLD rule

Retrieve all item prototypes for specific LLD rule ID.

Request:

```
{
  "jsonrpc": "2.0",

CItemPrototype::get() in *ui/include/classes/api/services/CItemPrototype.php*.

## itemprototype.update

Description

object itemprototype.update(object/array itemPrototypes)

This method allows to update existing item prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Item prototype properties to be updated.

The *itemid* property must be defined for each item prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard item prototype properties](#), the method accepts the following parameters.

| Parameter     | Type  | Description  |
|---------------|-------|--|
| preprocessing | array | Item prototype <a href="#">preprocessing</a> options to replace the current preprocessing options. |
| tags          | array | Item prototype <a href="#">tags</a> .  |

Return values

(object) Returns an object containing the IDs of the updated item prototypes under the *itemids* property.

Examples

Changing the interface of an item prototype

Change the host interface that will be used by discovered items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "27428",
    "interfaceid": "132"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27428"
    ]
  },
  "id": 1
}
```

Update dependent item prototype

Update Dependent item prototype with new Master item prototype ID. Only dependencies on same host (template/discovery rule) are allowed, therefore Master and Dependent item should have same *hostid* and *ruleid*.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "master_itemid": "25570",
    "itemid": "189030"
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "189030"
    ]
  },
  "id": 1
}
```

Update HTTP agent item prototype

Change query fields and remove all custom headers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "28305",
    "query_fields": [
      {
        "random": "qwertyuiopasdfghjklzxcvbnm"
      }
    ],
    "headers": []
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28305"
    ]
  },
  "id": 1
}
```

Updating item preprocessing options

Update an item prototype with item preprocessing rule “Custom multiplier”.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
```

```

        "itemid": "44211",
        "preprocessing": [
            {
                "type": 1,
                "params": "4",
                "error_handler": 2,
                "error_handler_params": "5"
            }
        ]
    },
    "auth": "700ca65537074ec963db7efabda78259",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44211"
        ]
    },
    "id": 1
}

```

Updating a script item prototype

Update a script item prototype with a different script and remove unnecessary parameters that were used by previous script.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "itemprototype.update",
    "params": {
        "itemid": "23865",
        "parameters": [],
        "script": "Zabbix.Log(3, 'Log test');\nreturn 1;"
    },
    "auth": "700ca65537074ec963db7efabda78259",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}

```

Source

CltemPrototype::update() in *ui/include/classes/api/services/CltemPrototype.php*.

## LLD rule

This class is designed to work with low level discovery rules.

Object references:

- **LLD rule**

Available methods:

- **discoveryrule.copy** - copying LLD rules
- **discoveryrule.create** - creating new LLD rules
- **discoveryrule.delete** - deleting LLD rules
- **discoveryrule.get** - retrieving LLD rules
- **discoveryrule.update** - updating LLD rules

## > LLD rule object

The following objects are directly related to the `discoveryrule` API.

LLD rule

The low-level discovery rule object has the following properties.

| Property                         | Type    | Description  |
|----------------------------------|---------|--|
| <b>itemid</b>                    | string  | ( <i>readonly</i> ) ID of the LLD rule.  |
| <b>delay</b><br>(required)       | string  | Update interval of the LLD rule. Accepts seconds or time unit with suffix and with or without one or more <b>custom intervals</b> that consist of either flexible intervals and scheduling intervals as serialized strings. Also accepts user macros. Flexible intervals could be written as two macros separated by a forward slash. Intervals are separated by a semicolon.          |
| <b>hostid</b><br>(required)      | string  | Optional for Zabbix trapper, dependent items and for Zabbix agent (active) with <code>mqtt.get</code> key. ID of the host that the LLD rule belongs to.  |
| <b>interfaceid</b><br>(required) | string  | ID of the LLD rule's host interface. Used only for host LLD rules.   |
| <b>key_</b><br>(required)        | string  | Not required for Zabbix agent (active), Zabbix internal, Zabbix trapper, dependent, database monitor and script LLD rules. Optional for HTTP agent LLD rules. LLD rule key.  |
| <b>name</b><br>(required)        | string  | Name of the LLD rule.  |
| <b>type</b><br>(required)        | integer | Type of the LLD rule.<br><br>Possible values:<br>0 - Zabbix agent;<br>2 - Zabbix trapper;<br>3 - simple check;<br>5 - Zabbix internal;<br>7 - Zabbix agent (active);<br>10 - external check;<br>11 - database monitor;<br>12 - IPMI agent;<br>13 - SSH agent;<br>14 - TELNET agent;<br>16 - JMX agent;<br>18 - Dependent item;<br>19 - HTTP agent;<br>20 - SNMP agent;<br>21 - Script. |
| <b>url</b><br>(required)         | string  | URL string, required for HTTP agent LLD rule. Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}.   |

| Property         | Type    | Description  |
|------------------|---------|--|
| allow_traps      | integer | HTTP agent LLD rule field. Allow to populate value as in trapper item type also.   |
| authtype         | integer | <p>0 - <i>(default)</i> Do not allow to accept incoming data.<br/> 1 - Allow to accept incoming data.</p> <p>Used only by SSH agent or HTTP agent LLD rules.</p> <p>SSH agent authentication method possible values:<br/> 0 - <i>(default)</i> password;<br/> 1 - public key.</p> <p>HTTP agent authentication method possible values:<br/> 0 - <i>(default)</i> none<br/> 1 - basic<br/> 2 - NTLM</p> |
| description      | string  | Description of the LLD rule.   |
| error            | string  | <i>(readonly)</i> Error text if there are problems updating the LLD rule value.  |
| follow_redirects | integer | <p>HTTP agent LLD rule field. Follow response redirects while polling data.</p> <p>0 - Do not follow redirects.<br/> 1 - <i>(default)</i> Follow redirects.</p>  |
| headers          | object  | <p>HTTP agent LLD rule field. Object with HTTP(S) request headers, where header name is used as key and header value as value.</p> <p>Example:<br/> { "User-Agent": "Zabbix" }</p>   |
| http_proxy       | string  | HTTP agent LLD rule field. HTTP(S) proxy connection string.  |
| ipmi_sensor      | string  | IPMI sensor. Used only by IPMI LLD rules.  |
| jmx_endpoint     | string  | JMX agent custom connection string.  |
| lifetime         | string  | <p>Default value:<br/> service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi</p> <p>Time period after which items that are no longer discovered will be deleted. Accepts seconds, time unit with suffix and user macro.</p>   |
| master_itemid    | integer | <p>Default: 30d.</p> <p>Master item ID.</p> <p>Recursion up to 3 dependent items and maximum count of dependent items equal to 999 are allowed.</p> <p>Discovery rule cannot be master item for another discovery rule.</p>  |
| output_format    | integer | <p>Required for Dependent item.</p> <p>HTTP agent LLD rule field. Should response be converted to JSON.</p> <p>0 - <i>(default)</i> Store raw.<br/> 1 - Convert to JSON.</p>   |
| params           | string  | <p>Additional parameters depending on the type of the LLD rule:</p> <ul style="list-style-type: none"> <li>- executed script for SSH and Telnet LLD rules;</li> <li>- SQL query for database monitor LLD rules;</li> <li>- formula for calculated LLD rules.</li> </ul>  |
| parameters       | array   | Additional parameters for script type LLD rule. Array of objects with 'name' and 'value' properties, where name must be unique.  |
| password         | string  | Password for authentication. Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent LLD rules.  |
| post_type        | integer | <p>HTTP agent LLD rule field. Type of post data body stored in posts property.</p> <p>0 - <i>(default)</i> Raw data.<br/> 2 - JSON data.<br/> 3 - XML data.</p>  |
| posts            | string  | HTTP agent LLD rule field. HTTP(S) request body data. Used with post_type.   |

| Property         | Type    | Description  |
|------------------|---------|--|
| privatekey       | string  | Name of the private key file.  |
| publickey        | string  | Name of the public key file.   |
| query_fields     | array   | HTTP agent LLD rule field. Query parameters. Array of objects with 'key': 'value' pairs, where value can be empty string.  |
| request_method   | integer | HTTP agent LLD rule field. Type of request method.<br><br>0 - <i>(default)</i> GET<br>1 - POST<br>2 - PUT<br>3 - HEAD  |
| retrieve_mode    | integer | HTTP agent LLD rule field. What part of response should be stored.<br><br>0 - <i>(default)</i> Body.<br>1 - Headers.<br>2 - Both body and headers will be stored.  |
| snmp_oid         | string  | For request_method HEAD only 1 is allowed value.<br>SNMP OID.  |
| ssl_cert_file    | string  | HTTP agent LLD rule field. Public SSL Key file path.   |
| ssl_key_file     | string  | HTTP agent LLD rule field. Private SSL Key file path.  |
| ssl_key_password | string  | HTTP agent LLD rule field. Password for SSL Key file.  |
| state            | integer | <i>(readonly)</i> State of the LLD rule.<br><br>Possible values:<br>0 - <i>(default)</i> normal;<br>1 - not supported.   |
| status           | integer | Status of the LLD rule.<br><br>Possible values:<br>0 - <i>(default)</i> enabled LLD rule;<br>1 - disabled LLD rule.  |
| status_codes     | string  | HTTP agent LLD rule field. Ranges of required HTTP status codes separated by commas. Also supports user macros as part of comma separated list.<br><br>Example: 200,200-{\$M},{M},200-400                  |
| templateid       | string  | <i>(readonly)</i> ID of the parent template LLD rule.  |
| timeout          | string  | Item data polling request timeout. Used for HTTP agent and script LLD rules. Supports user macros.<br><br>default: 3s<br>maximum value: 60s  |
| trapper_hosts    | string  | Allowed hosts. Used by trapper LLD rules or HTTP agent LLD rules.  |
| username         | string  | Username for authentication. Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent LLD rules.  |
| uuid             | string  | Required by SSH and Telnet LLD rules.<br>Universal unique identifier, used for linking imported LLD rules to already existing ones. Used only for LLD rules on templates.<br>Auto-generated, if not given. |
| verify_host      | integer | HTTP agent LLD rule field. Whether to validate that the host name for the connection matches the one in the host's certificate.<br><br>0 - <i>(default)</i> Do not validate.<br>1 - Validate.              |
| verify_peer      | integer | HTTP agent LLD rule field. Whether to validate that the host's certificate is authentic.<br><br>0 - <i>(default)</i> Do not validate.<br>1 - Validate.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### LLD rule filter

The LLD rule filter object defines a set of conditions that can be used to filter discovered objects. It has the following properties:

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>conditions</b><br>(required) | array   | Set of filter conditions to use for filtering results.   |
| <b>evaltype</b><br>(required)   | integer | Filter condition evaluation method.<br><br>Possible values:<br>0 - and/or;<br>1 - and;<br>2 - or;<br>3 - custom expression.  |
| eval_formula                    | string  | <i>(readonly)</i> Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its <code>formulaid</code> . The value of <code>eval_formula</code> is equal to the value of <code>formula</code> for filters with a custom expression.  |
| formula                         | string  | User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its <code>formulaid</code> . The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted.<br><br>Required for custom expression filters. |

#### LLD rule filter condition

The LLD rule filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

| Property                   | Type    | Description  |
|----------------------------|---------|--|
| <b>macro</b><br>(required) | string  | LLD macro to perform the check on.   |
| <b>value</b><br>(required) | string  | Value to compare with.   |
| formulaid                  | string  | Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| operator                   | integer | Condition operator.<br><br>Possible values:<br>8 - <i>(default)</i> matches regular expression;<br>9 - does not match regular expression;<br>12 - exists;<br>13 - does not exist.  |

#### Note:

To better understand how to use filters with various types of expressions, see examples on the [discoveryrule.get](#) and [discoveryrule.create](#) method pages.

#### LLD macro path

The LLD macro path has the following properties:

| Property                       | Type   | Description |
|--------------------------------|--------|-------------|
| <b>lld_macro</b><br>(required) | string | LLD macro.  |

| Property                  | Type   | Description   |
|---------------------------|--------|---|
| <b>path</b><br>(required) | string | Selector for value which will be assigned to corresponding macro. |

#### LLD rule preprocessing

The LLD rule preprocessing object has the following properties.

| Property                                  | Type    | Description  |
|---|---------|--|
| <b>type</b><br>(required)                 | integer | The preprocessing option type.<br><br>Possible values:<br>5 - Regular expression matching;<br>11 - XML XPath;<br>12 - JSONPath;<br>15 - Does not match regular expression;<br>16 - Check for error in JSON;<br>17 - Check for error in XML;<br>20 - Discard unchanged with heartbeat;<br>21 - JavaScript;<br>23 - Prometheus to JSON;<br>24 - CSV to JSON;<br>25 - Replace;<br>27 - XML to JSON. |
| <b>params</b><br>(required)               | string  | Additional parameters used by preprocessing option. Multiple parameters are separated by LF (\n) character.  |
| <b>error_handler</b><br>(required)        | integer | Action type used in case of preprocessing step failure.<br><br>Possible values:<br>0 - Error message is set by Zabbix server;<br>1 - Discard value;<br>2 - Set custom value;<br>3 - Set custom error message.  |
| <b>error_handler_params</b><br>(required) | string  | Error handler parameters. Used with <code>error_handler</code> .<br><br>Must be empty, if <code>error_handler</code> is 0 or 1.<br>Can be empty if, <code>error_handler</code> is 2.<br>Cannot be empty, if <code>error_handler</code> is 3.   |

The following parameters and error handlers are supported for each preprocessing type.

| Preprocessing type | Name                              | Parameter 1          | Parameter 2         | Parameter 3 | Supported error handlers |
|--------------------|-----------------------------------|----------------------|---------------------|-------------|--------------------------|
| 5                  | Regular expression                | pattern <sup>1</sup> | output <sup>2</sup> |             | 0, 1, 2, 3               |
| 11                 | XML XPath                         | path <sup>3</sup>    |                     |             | 0, 1, 2, 3               |
| 12                 | JSONPath                          | path <sup>3</sup>    |                     |             | 0, 1, 2, 3               |
| 15                 | Does not match regular expression | pattern <sup>1</sup> |                     |             | 0, 1, 2, 3               |

| Preprocessing type | Name   | Parameter 1            | Parameter 2              | Parameter 3 | Supported error handlers |
|--------------------|--|------------------------|--------------------------|-------------|--------------------------|
| 16                 | Check for error in JSON                                    | path <sup>3</sup>      |                          |             | 0, 1, 2, 3               |
| 17                 | Check for error in XML                                     | path <sup>3</sup>      |                          |             | 0, 1, 2, 3               |
| 20                 | Discard seconds <sup>4, 5</sup> un-changed with heart-beat |                        |                          |             |                          |
| 21                 | JavaScript <sup>2</sup>                                    |                        |                          |             |                          |
| 23                 | Prometheus pattern <sup>5, 6</sup>                         |                        |                          |             | 0, 1, 2, 3               |
| 24                 | CSV to JSON  | character <sup>2</sup> | character <sup>2</sup>   | 0,1         | 0, 1, 2, 3               |
| 25                 | Replace search string <sup>2</sup>                         |                        | replacement <sup>2</sup> |             |                          |
| 27                 | XML to JSON  |                        |                          |             | 0, 1, 2, 3               |

<sup>1</sup> regular expression

<sup>2</sup> string

<sup>3</sup> JSONPath or XML XPath

<sup>4</sup> positive integer (with support of time suffixes, e.g. 30s, 1m, 2h, 1d)

<sup>5</sup> user macro

<sup>6</sup> Prometheus pattern following the syntax: <metric name>{<label name>=<label value> , ...} == <value>. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.

#### LLD rule overrides

The LLD rule overrides object defines a set of rules (filters, conditions and operations) that are used to override properties of different prototype objects. It has the following properties:

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| <b>name</b><br>(required) | string  | Unique override name.   |
| <b>step</b><br>(required) | integer | Unique order number of the override.  |
| stop                      | integer | Stop processing next overrides if matches.  |
|                           |         | Possible values:<br>0 - ( <i>default</i> ) don't stop processing overrides;<br>1 - stop processing overrides if filter matches. |
| filter                    | object  | Override filter.  |
| operations                | array   | Override operations.  |

#### LLD rule override filter

The LLD rule override filter object defines a set of conditions that if they match the discovered object the override is applied. It has the following properties:

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>evaltype</b><br>(required)   | integer | Override filter condition evaluation method.<br><br>Possible values:<br>0 - and/or;<br>1 - and;<br>2 - or;<br>3 - custom expression.   |
| <b>conditions</b><br>(required) | array   | Set of override filter conditions to use for matching the discovered objects.  |
| eval_formula                    | string  | ( <i>readonly</i> ) Generated expression that will be used for evaluating override filter conditions. The expression contains IDs that reference specific override filter conditions by its <code>formulaid</code> . The value of <code>eval_formula</code> is equal to the value of <code>formula</code> for filters with a custom expression.  |
| formula                         | string  | User-defined expression to be used for evaluating conditions of override filters with a custom expression. The expression must contain IDs that reference specific override filter conditions by its <code>formulaid</code> . The IDs used in the expression must exactly match the ones defined in the override filter conditions: no condition can remain unused or omitted.<br><br>Required for custom expression override filters. |

#### LLD rule override filter condition

The LLD rule override filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

| Property                   | Type    | Description  |
|----------------------------|---------|--|
| <b>macro</b><br>(required) | string  | LLD macro to perform the check on.   |
| <b>value</b><br>(required) | string  | Value to compare with.   |
| formulaid                  | string  | Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| operator                   | integer | Condition operator.<br><br>Possible values:<br>8 - ( <i>default</i> ) matches regular expression;<br>9 - does not match regular expression;<br>12 - exists;<br>13 - does not exist.  |

#### LLD rule override operation

The LLD rule override operation is combination of conditions and actions to perform on the prototype object. It has the following properties:

| Property                             | Type    | Description  |
|--------------------------------------|---------|--|
| <b>operationobject</b><br>(required) | integer | Type of discovered object to perform the action.<br><br>Possible values:<br>0 - Item prototype;<br>1 - Trigger prototype;<br>2 - Graph prototype;<br>3 - Host prototype. |

| Property    | Type    | Description   |
|-------------|---------|---|
| operator    | integer | Override condition operator.<br><br>Possible values:<br>0 - (default) equals;<br>1 - does not equal;<br>2 - contains;<br>3 - does not contain;<br>8 - matches;<br>9 - does not match. |
| value       | string  | Pattern to match item, trigger, graph or host prototype name depending on selected object.  |
| opstatus    | object  | Override operation status object for item, trigger and host prototype objects.  |
| opdiscover  | object  | Override operation discover status object (all object types).   |
| opperiod    | object  | Override operation period (update interval) object for item prototype object.   |
| ophistory   | object  | Override operation history object for item prototype object.  |
| optrends    | object  | Override operation trends object for item prototype object.   |
| opseverity  | object  | Override operation severity object for trigger prototype object.  |
| optag       | array   | Override operation tag object for trigger and host prototype objects.   |
| optemplate  | array   | Override operation template object for host prototype object.   |
| opinventory | object  | Override operation inventory object for host prototype object.  |

#### LLD rule override operation status

LLD rule override operation status that is set to discovered object. It has the following properties:

| Property                    | Type    | Description   |
|-----------------------------|---------|---|
| <b>status</b><br>(required) | integer | Override the status for selected object.<br><br>Possible values:<br>0 - Create enabled;<br>1 - Create disabled. |

#### LLD rule override operation discover

LLD rule override operation discover status that is set to discovered object. It has the following properties:

| Property                      | Type    | Description   |
|-------------------------------|---------|---|
| <b>discover</b><br>(required) | integer | Override the discover status for selected object.<br><br>Possible values:<br>0 - Yes, continue discovering the objects;<br>1 - No, new objects will not be discovered and existing ones will be marked as lost. |

#### LLD rule override operation period

LLD rule override operation period is an update interval value (supports custom intervals) that is set to discovered item. It has the following properties:

| Property                   | Type   | Description  |
|----------------------------|--------|--|
| <b>delay</b><br>(required) | string | Override the update interval of the item prototype. Accepts seconds or a time unit with suffix (30s,1m,2h,1d) as well as flexible and scheduling intervals and user macros or LLD macros. Multiple intervals are separated by a semicolon. |

#### LLD rule override operation history

LLD rule override operation history value that is set to discovered item. It has the following properties:

| Property                     | Type   | Description   |
|------------------------------|--------|---|
| <b>history</b><br>(required) | string | Override the history of item prototype which is a time unit of how long the history data should be stored. Also accepts user macro and LLD macro. |

LLD rule override operation trends

LLD rule override operation trends value that is set to discovered item. It has the following properties:

| Property                    | Type   | Description   |
|-----------------------------|--------|---|
| <b>trends</b><br>(required) | string | Override the trends of item prototype which is a time unit of how long the trends data should be stored. Also accepts user macro and LLD macro. |

LLD rule override operation severity

LLD rule override operation severity value that is set to discovered trigger. It has the following properties:

| Property                      | Type    | Description  |
|-------------------------------|---------|--|
| <b>severity</b><br>(required) | integer | Override the severity of trigger prototype.<br><br>Possible values are: 0 - <i>(default)</i> not classified;<br>1 - information;<br>2 - warning;<br>3 - average;<br>4 - high;<br>5 - disaster. |

LLD rule override operation tag

LLD rule override operation tag object contains tag name and value that are set to discovered object. It has the following properties:

| Property                 | Type   | Description    |
|--------------------------|--------|----------------|
| <b>tag</b><br>(required) | string | New tag name.  |
| value                    | string | New tag value. |

LLD rule override operation template

LLD rule override operation template object that is linked to discovered host. It has the following properties:

| Property                        | Type   | Description   |
|---------------------------------|--------|---|
| <b>templateid</b><br>(required) | string | Override the template of host prototype linked templates. |

LLD rule override operation inventory

LLD rule override operation inventory mode value that is set to discovered host. It has the following properties:

| Property                            | Type    | Description   |
|-------------------------------------|---------|---|
| <b>inventory_mode</b><br>(required) | integer | Override the host prototype inventory mode.<br><br>Possible values are:<br>-1 - disabled;<br>0 - <i>(default)</i> manual;<br>1 - automatic. |

## discoveryrule.copy

### Description

object discoveryrule.copy(object parameters)

This method allows to copy LLD rules with all of the prototypes to the given hosts.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the LLD rules to copy and the target hosts.

| Parameter    | Type  | Description                                |
|--------------|-------|--|
| discoveryids | array | IDs of the LLD rules to be copied.         |
| hostids      | array | IDs of the hosts to copy the LLD rules to. |

### Return values

(boolean) Returns true if the copying was successful.

### Examples

Copy an LLD rule to multiple hosts

Copy an LLD rule to two hosts.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.copy",
  "params": {
    "discoveryids": [
      "27426"
    ],
    "hostids": [
      "10196",
      "10197"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Source

CDiscoveryRule::copy() in *ui/include/classes/api/services/CDiscoveryRule.php*.

## discoveryrule.create

Description

object discoveryrule.create(object/array lldRules)

This method allows to create new LLD rules.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) LLD rules to create.

Additionally to the [standard LLD rule properties](#), the method accepts the following parameters.

| Parameter       | Type   | Description                                       |
|-----------------|--------|---|
| filter          | object | LLD rule <a href="#">filter</a> for the LLD rule. |
| preprocessing   | array  | LLD rule <a href="#">preprocessing</a> options.   |
| lld_macro_paths | array  | LLD rule <a href="#">lld_macro_path</a> options.  |
| overrides       | array  | LLD rule <a href="#">overrides</a> options.       |

Return values

(object) Returns an object containing the IDs of the created LLD rules under the *itemids* property. The order of the returned IDs matches the order of the passed LLD rules.

Examples

Creating an LLD rule

Create a Zabbix agent LLD rule to discover mounted file systems. Discovered items will be updated every 30 seconds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Mounted filesystem discovery",
    "key_": "vfs.fs.discovery",
    "hostid": "10197",
    "type": 0,
    "interfaceid": "112",
    "delay": "30s"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}
```

## Using a filter

Create an LLD rule with a set of conditions to filter the results by. The conditions will be grouped together using the logical "and" operator.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Filtered LLD rule",
    "key_": "lld",
    "hostid": "10116",
    "type": 0,
    "interfaceid": "13",
    "delay": "30s",
    "filter": {
      "evaltype": 1,
      "conditions": [
        {
          "macro": "{#MACRO1}",
          "value": "@regex1"
        },
        {
          "macro": "{#MACRO2}",
          "value": "@regex2",
          "operator": "9"
        },
        {
          "macro": "{#MACRO3}",
          "value": "",
          "operator": "12"
        },
        {
          "macro": "{#MACRO4}",
          "value": "",
          "operator": "13"
        }
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}
```

## Creating an LLD rule with macro paths

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "LLD rule with LLD macro paths",
  }
```

```

    "key_": "lld",
    "hostid": "10116",
    "type": 0,
    "interfaceid": "13",
    "delay": "30s",
    "lld_macro_paths": [
      {
        "lld_macro": "#{MACRO1}",
        "path": "$.path.1"
      },
      {
        "lld_macro": "#{MACRO2}",
        "path": "$.path.2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}

```

Using a custom expression filter

Create an LLD rule with a filter that will use a custom expression to evaluate the conditions. The LLD rule must only discover objects the "#{MACRO1}" macro value of which matches both regular expression "regex1" and "regex2", and the value of "#{MACRO2}" matches either "regex3" or "regex4". The formula IDs "A", "B", "C" and "D" have been chosen arbitrarily.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Filtered LLD rule",
    "key_": "lld",
    "hostid": "10116",
    "type": 0,
    "interfaceid": "13",
    "delay": "30s",
    "filter": {
      "evaltype": 3,
      "formula": "(A and B) and (C or D)",
      "conditions": [
        {
          "macro": "#{MACRO1}",
          "value": "@regex1",
          "formulaid": "A"
        },
        {
          "macro": "#{MACRO1}",
          "value": "@regex2",
          "formulaid": "B"
        }
      ]
    }
  }
}

```

```

        "macro": "{#MACRO2}",
        "value": "@regex3",
        "formulaid": "C"
    },
    {
        "macro": "{#MACRO2}",
        "value": "@regex4",
        "formulaid": "D"
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}

```

Using custom query fields and headers

Create LLD rule with custom query fields and headers.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "hostid": "10257",
    "interfaceid": "5",
    "type": 19,
    "name": "API HTTP agent",
    "key_": "api_discovery_rule",
    "delay": "5s",
    "url": "http://127.0.0.1?discoverer.php",
    "query_fields": [
      {
        "mode": "json"
      },
      {
        "elements": "2"
      }
    ],
    "headers": {
      "X-Type": "api",
      "Authorization": "Bearer mF_A.B5f-2.1JcM"
    },
    "allow_traps": 1,
    "trapper_hosts": "127.0.0.1"
  },
  "auth": "d678e0b85688ce578ff061bd29a20d3b",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28336"
    ]
  },
  "id": 1
}
```

Creating an LLD rule with preprocessing

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Discovery rule with preprocessing",
    "key_": "lld.with.preprocessing",
    "hostid": "10001",
    "ruleid": "27665",
    "type": 0,
    "delay": "60s",
    "interfaceid": "1155",
    "preprocessing": [
      {
        "type": 20,
        "params": "20",
        "error_handler": 0,
        "error_handler_params": ""
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}
```

Creating an LLD rule with overrides

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Discover database host",
    "key_": "lld.with.overrides",
    "hostid": "10001",
    "type": 0,
    "delay": "60s",
    "interfaceid": "1155",
    "overrides": [
      {

```

```

"name": "Discover MySQL host",
"step": "1",
"stop": "1",
"filter": {
  "evaltype": "2",
  "conditions": [
    {
      "macro": "{#UNIT.NAME}",
      "operator": "8",
      "value": "~mysqld\\.service$"
    },
    {
      "macro": "{#UNIT.NAME}",
      "operator": "8",
      "value": "~mariadb\\.service$"
    }
  ]
},
"operations": [
  {
    "operationobject": "3",
    "operator": "2",
    "value": "Database host",
    "opstatus": {
      "status": "0"
    },
    "optemplate": [
      {
        "templateid": "10170"
      }
    ],
    "optag": [
      {
        "tag": "Database",
        "value": "MySQL"
      }
    ]
  }
],
},
{
  "name": "Discover PostgreSQL host",
  "step": "2",
  "stop": "1",
  "filter": {
    "evaltype": "0",
    "conditions": [
      {
        "macro": "{#UNIT.NAME}",
        "operator": "8",
        "value": "~postgresql\\.service$"
      }
    ]
  },
  "operations": [
    {
      "operationobject": "3",
      "operator": "2",
      "value": "Database host",
      "opstatus": {
        "status": "0"
      },
    },

```

```

        "optemplate": [
            {
                "templateid": "10263"
            }
        ],
        "optag": [
            {
                "tag": "Database",
                "value": "PostgreSQL"
            }
        ]
    }
}
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "30980"
        ]
    },
    "id": 1
}

```

Create script LLD rule

Create a simple data collection using a script LLD rule.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Script example",
        "key_": "custom.script.lldrule",
        "hostid": "12345",
        "type": 21,
        "params": "var request = new CurlHttpRequest();\nreturn request.Post(\"https://postman-echo.com/post\");",
        "parameters": [
            {
                "name": "host",
                "value": "{HOST.CONN}"
            }
        ]
    },
    "timeout": "6s",
    "delay": "30s"
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 2
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [

```

```

        "23865"
    ],
    },
    "id": 3
}

```

Source

CDiscoveryRule::create() in *ui/include/classes/api/services/CDiscoveryRule.php*.

## discoveryrule.delete

Description

object discoveryrule.delete(array lldRuleIds)

This method allows to delete LLD rules.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the LLD rules to delete.

Return values

(object) Returns an object containing the IDs of the deleted LLD rules under the `ruleids` property.

Examples

Deleting multiple LLD rules

Delete two LLD rules.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.delete",
  "params": [
    "27665",
    "27668"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "ruleids": [
      "27665",
      "27668"
    ]
  },
  "id": 1
}

```

CDiscoveryRule::delete() in *ui/include/classes/api/services/CDiscoveryRule.php*.

## discoveryrule.get

### Description

integer/array discoveryrule.get(object parameters)

The method allows to retrieve LLD rules according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter            | Type         | Description  |
|----------------------|--------------|--|
| itemids              | string/array | Return only LLD rules with the given IDs.  |
| groupids             | string/array | Return only LLD rules that belong to the hosts from the given groups.  |
| hostids              | string/array | Return only LLD rules that belong to the given hosts.  |
| inherited            | boolean      | If set to true return only LLD rules inherited from a template.  |
| interfaceids         | string/array | Return only LLD rules use the given host interfaces.   |
| monitored            | boolean      | If set to true return only enabled LLD rules that belong to monitored hosts.   |
| templated            | boolean      | If set to true return only LLD rules that belong to templates.   |
| templateids          | string/array | Return only LLD rules that belong to the given templates.  |
| selectFilter         | query        | Return a <b>filter</b> property with data of the filter used by the LLD rule.  |
| selectGraphs         | query        | Returns a <b>graphs</b> property with graph prototypes that belong to the LLD rule.  |
| selectHostPrototypes | query        | Supports count.<br>Return a <b>hostPrototypes</b> property with host prototypes that belong to the LLD rule.                                     |
| selectHosts          | query        | Supports count.<br>Return a <b>hosts</b> property with an array of hosts that the LLD rule belongs to.   |
| selectItems          | query        | Return an <b>items</b> property with item prototypes that belong to the LLD rule.  |
| selectTriggers       | query        | Supports count.<br>Return a <b>triggers</b> property with trigger prototypes that belong to the LLD rule.  |
| selectLLDMacroPaths  | query        | Supports count.<br>Return an <b>lld_macro_paths</b> property with a list of LLD macros and paths to values assigned to each corresponding macro. |
| selectPreprocessing  | query        | Return a <b>preprocessing</b> property with LLD rule preprocessing options.  |
| selectOverrides      | query        | Return an <b>lld_rule_overrides</b> property with a list of override filters, conditions and operations that are performed on prototype objects. |
| filter               | object       | Return only those results that exactly match the given filter.   |
|                      |              | Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.            |
|                      |              | Supports additional filters:<br>host - technical name of the host that the LLD rule belongs to.  |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| limitSelects           | integer      | Limits the number of records returned by subselects.   |
|                        |              | Applies to the following subselects:<br>selectItems;<br>selectGraphs;<br>selectTriggers.   |
| sortfield              | string/array | Sort the result by the given properties.   |
|                        |              | Possible values are: itemid, name, key_, delay, type and status.<br>These parameters are described in the <a href="#">reference commentary</a> . |
| countOutput            | boolean      |  |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieving discovery rules from a host

Retrieve all discovery rules for specific host ID.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.get",
  "params": {

#### Retrieving filter conditions

Retrieve the name of the LLD rule "24681" and its filter conditions. The filter uses the "and" evaluation type, so the formula property is empty and eval\_formula is generated automatically.

#### Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "output": ["name"],
        "selectFilter": "extend",
        "itemids": ["24681"]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

#### Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "24681",
            "name": "Filtered LLD rule",
            "filter": {
                "evaltype": "1",
                "formula": "",
                "conditions": [
                    {

}

```

Retrieve LLD rule by URL

Retrieve LLD rule for host by rule URL field value. Only exact match of URL string defined for LLD rule is supported.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "hostids": "10257",
        "filter": {
            "type": 19,
            "url": "http://127.0.0.1/discoverer.php"
        }
    },
    "id": 39,
    "auth": "d678e0b85688ce578ff061bd29a20d3b"
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "28336",
            "type": "19",
            "snmp_oid": "",
            "hostid": "10257",

Source

CDiscoveryRule::get() in `ui/include/classes/api/services/CDiscoveryRule.php`.

## discoveryrule.update

Description

object discoveryrule.update(object/array lldRules)

This method allows to update existing LLD rules.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) LLD rule properties to be updated.

The `itemid` property must be defined for each LLD rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard LLD rule properties](#), the method accepts the following parameters.

| Parameter     | Type   | Description   |
|---------------|--------|---|
| filter        | object | LLD rule <a href="#">filter</a> to replace the current filter.                                |
| preprocessing | array  | LLD rule <a href="#">preprocessing</a> options to replace the existing preprocessing options. |

| Parameter       | Type  | Description   |
|-----------------|-------|---|
| lld_macro_paths | array | LLD rule <code>lld_macro_path</code> options to replace the existing <code>lld_macro_path</code> options. |
| overrides       | array | LLD rule <code>overrides</code> options to replace the existing <code>overrides</code> options.           |

#### Return values

(object) Returns an object containing the IDs of the updated LLD rules under the `itemids` property.

#### Examples

##### Adding a filter to an LLD rule

Add a filter so that the contents of the `{#FSTYPE}` macro would match the `@File systems for discovery` regexp.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "22450",
    "filter": {
      "evaltype": 1,
      "conditions": [
        {
          "macro": "{#FSTYPE}",
          "value": "@File systems for discovery"
        }
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22450"
    ]
  },
  "id": 1
}
```

##### Adding LLD macro paths

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "22450",
    "lld_macro_paths": [
      {
        "lld_macro": "{#MACRO1}",
        "path": "$.json.path"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22450"
    ]
  },
  "id": 1
}
```

Disable trapping

Disable LLD trapping for discovery rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "28336",
    "allow_traps": 0
  },
  "id": 36,
  "auth": "d678e0b85688ce578ff061bd29a20d3b"
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28336"
    ]
  },
  "id": 36
}
```

Updating LLD rule preprocessing options

Update an LLD rule with preprocessing rule "JSONPath".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "44211",
    "preprocessing": [
      {
        "type": 12,
        "params": "$.path.to.json",
        "error_handler": 2,
        "error_handler_params": "5"
      }
    ]
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```

    "result": {
      "itemids": [
        "44211"
      ]
    },
    "id": 1
  }
}

```

Updating LLD rule script

Update an LLD rule script with a different script and remove unnecessary parameters that were used by previous script.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "23865",
    "parameters": [],
    "script": "Zabbix.Log(3, 'Log test');\nreturn 1;"
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}

```

Source

CDiscoveryRule::update() in *ui/include/classes/api/services/CDiscoveryRule.php*.

## Maintenance

This class is designed to work with maintenances.

Object references:

- [Maintenance](#)
- [Time period](#)

Available methods:

- [maintenance.create](#) - creating new maintenances
- [maintenance.delete](#) - deleting maintenances
- [maintenance.get](#) - retrieving maintenances
- [maintenance.update](#) - updating maintenances

### > Maintenance object

The following objects are directly related to the `maintenance` API.

Maintenance

The maintenance object has the following properties.

| Property                          | Type      | Description   |
|-----------------------------------|-----------|---|
| maintenanceid                     | string    | (readonly) ID of the maintenance.   |
| <b>name</b><br>(required)         | string    | Name of the maintenance.  |
| <b>active_since</b><br>(required) | timestamp | Time when the maintenance becomes active.   |
| <b>active_till</b><br>(required)  | timestamp | The given value will be rounded down to minutes.<br>Time when the maintenance stops being active.                         |
| description                       | string    | The given value will be rounded down to minutes.<br>Description of the maintenance.                                       |
| maintenance_type                  | integer   | Type of maintenance.  |
| tags_evaltype                     | integer   | Possible values:<br>0 - (default) with data collection;<br>1 - without data collection.<br>Problem tag evaluation method. |
|                                   |           | Possible values:<br>0 - (default) And/Or;<br>2 - Or.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Time period

The time period object is used to define periods when the maintenance must come into effect. It has the following properties.

| Property        | Type      | Description   |
|-----------------|-----------|---|
| period          | integer   | Duration of the maintenance period in seconds.<br><br>The given value will be rounded down to minutes.  |
| timeperiod_type | integer   | Default: 3600.<br>Type of time period.<br><br>Possible values:<br>0 - (default) one time only;<br>2 - daily;<br>3 - weekly;<br>4 - monthly.   |
| start_date      | timestamp | Date when the maintenance period must come into effect.<br><br>Used only for one time periods.<br><br>The given value will be rounded down to minutes.  |
| start_time      | integer   | Default: current date.<br>Time of day when the maintenance starts in seconds.<br><br>Used for daily, weekly and monthly periods.<br><br>The given value will be rounded down to minutes.<br><br>Default: 0. |

| Property  | Type    | Description  |
|-----------|---------|--|
| every     | integer | <p>Used for daily, weekly and monthly periods.</p> <p>For daily and weekly periods every defines day or week intervals at which the maintenance must come into effect.</p> <p>Default: 1.</p> <p>For monthly periods, if dayofweek property contains at least one selected day of week, the every property defines the week of the month when the maintenance must come into effect.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>1 - (<i>default</i>) first week;</li> <li>2 - second week;</li> <li>3 - third week;</li> <li>4 - fourth week;</li> <li>5 - last week.</li> </ul> |
| dayofweek | integer | <p>Days of the week when the maintenance must come into effect.</p> <p>Possible bitmap values are:</p> <ul style="list-style-type: none"> <li>1 - Monday;</li> <li>2 - Tuesday;</li> <li>4 - Wednesday;</li> <li>8 - Thursday;</li> <li>16 - Friday;</li> <li>32 - Saturday;</li> <li>64 - Sunday.</li> </ul> <p>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 21 for Monday, Wednesday, and Friday).</p> <p>Used for weekly and monthly time periods. Required only for weekly time periods.</p>   |
| day       | integer | <p>At least one dayofweek or day must be specified for monthly time periods.</p> <p>Day of the month when the maintenance must come into effect.</p> <p>Used only for monthly time periods.</p> <p>At least one dayofweek or day must be specified for monthly time periods.</p>   |

| Property | Type    | Description  |
|----------|---------|--|
| month    | integer | <p>Months when the maintenance must come into effect.</p> <p>Possible bitmap values are:</p> <p>1 - January;<br/> 2 - February;<br/> 4 - March;<br/> 8 - April;<br/> 16 - May;<br/> 32 - June;<br/> 64 - July;<br/> 128 - August;<br/> 256 - September;<br/> 512 - October;<br/> 1024 - November;<br/> 2048 - December.</p> <p>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 585 for January, April, July, and October).</p> <p>Required only for monthly time periods.</p> |

#### Problem tag

The problem tag object is used to define which problems must be suppressed when the maintenance comes into effect. It has the following properties.

| Property                 | Type    | Description   |
|--------------------------|---------|---|
| <b>tag</b><br>(required) | string  | Problem tag name.   |
| operator                 | integer | <p>Condition operator.</p> <p>Possible values:<br/> 0 - Equals;<br/> 2 - <i>(default)</i> Contains.</p> |
| value                    | string  | Problem tag value.  |

Tags can only be specified for maintenance periods with data collection ("maintenance\_type":0).

### **maintenance.create**

#### Description

object maintenance.create(object/array maintenances)

This method allows to create new maintenances.

#### **Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(object/array) Maintenances to create.

Additionally to the [standard maintenance properties](#), the method accepts the following parameters.

| Parameter                        | Type         | Description   |
|----------------------------------|--------------|---|
| groups                           | object/array | Host <b>groups</b> that will undergo maintenance.<br><br>The host groups must have the <code>groupid</code> property defined.   |
| hosts                            | object/array | At least one object of <code>groups</code> or <code>hosts</code> must be specified.<br><b>Hosts</b> that will undergo maintenance.<br><br>The hosts must have the <code>hostid</code> property defined. |
| <b>timeperiods</b><br>(required) | object/array | At least one object of <code>groups</code> or <code>hosts</code> must be specified.<br>Maintenance <b>time periods</b> .  |
| tags                             | object/array | <b>Problem tags</b> .<br><br>Define what problems must be suppressed.<br>If no tags are given, all active maintenance host problems will be suppressed.   |
| groupids<br>(deprecated)         | array        | This parameter is deprecated, please use <code>groups</code> instead.<br>IDs of the host groups that will undergo maintenance.  |
| hostids<br>(deprecated)          | array        | This parameter is deprecated, please use <code>hosts</code> instead.<br>IDs of the hosts that will undergo maintenance.   |

#### Return values

(object) Returns an object containing the IDs of the created maintenances under the `maintenanceids` property. The order of the returned IDs matches the order of the passed maintenances.

#### Examples

##### Creating a maintenance

Create a maintenance with data collection for host group with ID "2" and with problem tags **service:mysql** and **error**. It must be active from 22.01.2013 till 22.01.2014, come in effect each Sunday at 18:00 and last for one hour.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.create",
  "params": {
    "name": "Sunday maintenance",
    "active_since": 1358844540,
    "active_till": 1390466940,
    "tags_evaltype": 0,
    "groups": [
      {"groupid": "2"}
    ],
    "timeperiods": [
      {
        "period": 3600,
        "timeperiod_type": 3,
        "start_time": 64800,
        "every": 1,
        "dayofweek": 64
      }
    ],
    "tags": [
      {
        "tag": "service",
        "operator": "0",
        "value": "mysqld"
      },
      {
        "tag": "error",
```

```

        "operator": "2",
        "value": ""
    }
],
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "maintenanceids": [
            "3"
        ]
    },
    "id": 1
}

```

## **maintenance.delete**

Description

object maintenance.delete(array maintenanceIds)

This method allows to delete maintenance periods.

### **Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the maintenance periods to delete.

Return values

(object) Returns an object containing the IDs of the deleted maintenance periods under the `maintenanceids` property.

Examples

Deleting multiple maintenance periods

Delete two maintenance periods.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "maintenance.delete",
    "params": [
        "3",
        "1"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "maintenanceids": [
      "3",
      "1"
    ]
  },
  "id": 1
}
```

## maintenance.get

Description

integer/array maintenance.get(object parameters)

The method allows to retrieve maintenances according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| groupids               | string/array | Return only maintenances that are assigned to the given host groups.   |
| hostids                | string/array | Return only maintenances that are assigned to the given hosts.   |
| maintenanceids         | string/array | Return only maintenances with the given IDs.   |
| selectGroups           | query        | Return a <b>groups</b> property with host groups assigned to the maintenance.  |
| selectHosts            | query        | Return a <b>hosts</b> property with hosts assigned to the maintenance.   |
| selectTags             | query        | Return a <b>tags</b> property with problem tags of the maintenance.  |
| selectTimeperiods      | query        | Return a <b>timeperiods</b> property with time periods of the maintenance.   |
| sortfield              | string/array | Sort the result by the given properties.   |
| countOutput            | boolean      | Possible values are: <code>maintenanceid</code> , <code>name</code> and <code>maintenance_type</code> . These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

## Examples

### Retrieving maintenances

Retrieve all configured maintenances, and the data about the assigned host groups, defined time periods and problem tags.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.get",
  "params": {
    "output": "extend",
    "selectGroups": "extend",
    "selectTimeperiods": "extend",
    "selectTags": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "maintenanceid": "3",
      "name": "Sunday maintenance",
      "maintenance_type": "0",
      "description": "",
      "active_since": "1358844540",
      "active_till": "1390466940",
      "tags_evaltype": "0",
      "groups": [
        {
          "groupid": "4",
          "name": "Zabbix servers",
          "internal": "0"
        }
      ],
      "timeperiods": [
        {
          "timeperiod_type": "3",
          "every": "1",
          "month": "0",
          "dayofweek": "1",
          "day": "0",
          "start_time": "64800",
          "period": "3600",
          "start_date": "2147483647"
        }
      ],
      "tags": [
        {
          "tag": "service",
          "operator": "0",
          "value": "mysqld",
        },
        {
          "tag": "error",
          "operator": "2",
          "value": ""
        }
      ]
    }
  ]
}
```

```
],
  "id": 1
}
```

## **maintenance.update**

Description

object maintenance.update(object/array maintenances)

This method allows to update existing maintenances.

### **Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Maintenance properties to be updated.

The `maintenanceid` property must be defined for each maintenance, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard maintenance properties](#), the method accepts the following parameters.

| Parameter                | Type         | Description   |
|--------------------------|--------------|---|
| groups                   | object/array | Host <a href="#">groups</a> to replace the current groups.  |
| hosts                    | object/array | The host groups must have the <code>groupid</code> property defined.<br><a href="#">Hosts</a> to replace the current hosts.               |
| timeperiods              | object/array | The hosts must have the <code>hostid</code> property defined.<br>Maintenance <a href="#">time periods</a> to replace the current periods. |
| tags                     | object/array | <a href="#">Problem tags</a> to replace the current tags.   |
| groupids<br>(deprecated) | array        | This parameter is deprecated, please use <code>groups</code> instead.<br>IDs of the host groups that will undergo maintenance.            |
| hostids<br>(deprecated)  | array        | This parameter is deprecated, please use <code>hosts</code> instead.<br>IDs of the hosts that will undergo maintenance.                   |

### **Attention:**

At least one host or host group must be defined for each maintenance.

Return values

(object) Returns an object containing the IDs of the updated maintenances under the `maintenanceids` property.

Examples

Assigning different hosts

Replace the hosts currently assigned to maintenance with two different ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.update",
  "params": {
    "maintenanceid": "3",
    "hosts": [
      {"hostid": "10085"},
      {"hostid": "10084"}
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "maintenanceids": [
      "3"
    ]
  },
  "id": 1
}
```

## Map

This class is designed to work with maps.

Object references:

- [Map](#)
- [Map element](#)
- [Map link](#)
- [Map URL](#)
- [Map user](#)
- [Map user group](#)
- [Map shape](#)
- [Map line](#)

Available methods:

- [map.create](#) - create new maps
- [map.delete](#) - delete maps
- [map.get](#) - retrieve maps
- [map.update](#) - update maps

## > Map object

The following objects are directly related to the map API.

Map

The map object has the following properties.

| Property                    | Type    | Description  |
|-----------------------------|---------|--|
| sysmapid                    | string  | ( <i>readonly</i> ) ID of the map.   |
| <b>height</b><br>(required) | integer | Height of the map in pixels.   |
| <b>name</b><br>(required)   | string  | Name of the map.   |
| <b>width</b><br>(required)  | integer | Width of the map in pixels.  |
| backgroundid                | string  | ID of the image used as the background for the map.  |
| expand_macros               | integer | Whether to expand macros in labels when configuring the map.<br><br>Possible values:<br>0 - ( <i>default</i> ) do not expand macros;<br>1 - expand macros.   |
| expandproblem               | integer | Whether the problem trigger will be displayed for elements with a single problem.<br><br>Possible values:<br>0 - always display the number of problems;<br>1 - ( <i>default</i> ) display the problem trigger if there's only one problem. |
| grid_align                  | integer | Whether to enable grid aligning.<br><br>Possible values:<br>0 - disable grid aligning;<br>1 - ( <i>default</i> ) enable grid aligning.   |
| grid_show                   | integer | Whether to show the grid on the map.<br><br>Possible values:<br>0 - do not show the grid;<br>1 - ( <i>default</i> ) show the grid.   |
| grid_size                   | integer | Size of the map grid in pixels.<br><br>Supported values: 20, 40, 50, 75 and 100.   |
| highlight                   | integer | Default: 50.<br>Whether icon highlighting is enabled.<br><br>Possible values:<br>0 - highlighting disabled;<br>1 - ( <i>default</i> ) highlighting enabled.  |
| iconmapid                   | string  | ID of the icon map used on the map.  |
| label_format                | integer | Whether to enable advanced labels.<br><br>Possible values:<br>0 - ( <i>default</i> ) disable advanced labels;<br>1 - enable advanced labels.   |
| label_location              | integer | Location of the map element label.<br><br>Possible values:<br>0 - ( <i>default</i> ) bottom;<br>1 - left;<br>2 - right;<br>3 - top.  |
| label_string_host           | string  | Custom label for host elements.  |
| label_string_hostgroup      | string  | Required for maps with custom host label type.<br>Custom label for host group elements.  |
| label_string_image          | string  | Required for maps with custom host group label type.<br>Custom label for image elements.<br><br>Required for maps with custom image label type.  |

| Property             | Type    | Description   |
|----------------------|---------|---|
| label_string_map     | string  | Custom label for map elements.  |
| label_string_trigger | string  | Required for maps with custom map label type.<br>Custom label for trigger elements.   |
| label_type           | integer | Required for maps with custom trigger label type.<br>Map element label type.<br><br>Possible values:<br>0 - label;<br>1 - IP address;<br>2 - ( <i>default</i> ) element name;<br>3 - status only;<br>4 - nothing. |
| label_type_host      | integer | Label type for host elements.<br><br>Possible values:<br>0 - label;<br>1 - IP address;<br>2 - ( <i>default</i> ) element name;<br>3 - status only;<br>4 - nothing;  |
| label_type_hostgroup | integer | Label type for host group elements.<br><br>Possible values:<br>0 - label;<br>2 - ( <i>default</i> ) element name;<br>3 - status only;<br>4 - nothing;<br>5 - custom.  |
| label_type_image     | integer | Label type for host group elements.<br><br>Possible values:<br>0 - label;<br>2 - ( <i>default</i> ) element name;<br>4 - nothing;<br>5 - custom.  |
| label_type_map       | integer | Label type for map elements.<br><br>Possible values:<br>0 - label;<br>2 - ( <i>default</i> ) element name;<br>3 - status only;<br>4 - nothing;<br>5 - custom.   |
| label_type_trigger   | integer | Label type for trigger elements.<br><br>Possible values:<br>0 - label;<br>2 - ( <i>default</i> ) element name;<br>3 - status only;<br>4 - nothing;<br>5 - custom.   |
| markelements         | integer | Whether to highlight map elements that have recently changed their status.<br><br>Possible values:<br>0 - ( <i>default</i> ) do not highlight elements;<br>1 - highlight elements.                                |

| Property        | Type    | Description  |
|-----------------|---------|--|
| severity_min    | integer | Minimum severity of the triggers that will be displayed on the map.  |
| show_unack      | integer | Refer to the <b>trigger "severity" property</b> for a list of supported trigger severities.<br>How problems should be displayed.<br><br>Possible values:<br>0 - <i>(default)</i> display the count of all problems;<br>1 - display only the count of unacknowledged problems;<br>2 - display the count of acknowledged and unacknowledged problems separately. |
| userid          | string  | Map owner user ID.   |
| private         | integer | Type of map sharing.<br><br>Possible values:<br>0 - public map;<br>1 - <i>(default)</i> private map.   |
| show_suppressed | integer | Whether suppressed problems are shown.<br><br>Possible values:<br>0 - <i>(default)</i> hide suppressed problems;<br>1 - show suppressed problems.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Map element

The map element object defines an object displayed on a map. It has the following properties.

| Property                         | Type    | Description   |
|----------------------------------|---------|---|
| selementid                       | string  | <i>(readonly)</i> ID of the map element.  |
| <b>elements</b><br>(required)    | array   | Element data object. Required for host, host group, trigger and map type elements.  |
| <b>elementtype</b><br>(required) | integer | Type of map element.<br><br>Possible values:<br>0 - host;<br>1 - map;<br>2 - trigger;<br>3 - host group;<br>4 - image.  |
| <b>iconid_off</b><br>(required)  | string  | ID of the image used to display the element in default state.   |
| areatype                         | integer | How separate host group hosts should be displayed.<br><br>Possible values:<br>0 - <i>(default)</i> the host group element will take up the whole map;<br>1 - the host group element will have a fixed size. |
| elementsubtype                   | integer | How a host group element should be displayed on a map.<br><br>Possible values:<br>0 - <i>(default)</i> display the host group as a single element;<br>1 - display each host in the group separately.        |
| evaltype                         | integer | Map element tag filtering condition evaluation method.<br><br>Possible values:<br>0 - <i>(default)</i> AND / OR;<br>2 - OR.   |
| height                           | integer | Height of the fixed size host group element in pixels.<br><br>Default: 200.   |

| Property           | Type    | Description   |
|--------------------|---------|---|
| iconid_disabled    | string  | ID of the image used to display disabled map elements. Unused for image elements.   |
| iconid_maintenance | string  | ID of the image used to display map elements in maintenance. Unused for image elements.   |
| iconid_on          | string  | ID of the image used to display map elements with problems. Unused for image elements.  |
| label              | string  | Label of the element.   |
| label_location     | integer | Location of the map element label.<br><br>Possible values:<br>-1 - <i>(default)</i> default location;<br>0 - bottom;<br>1 - left;<br>2 - right;<br>3 - top.   |
| permission         | integer | Type of permission level.<br><br>Possible values:<br>-1 - none;<br>2 - read only;<br>3 - read-write.  |
| sysmapid           | string  | <i>(readonly)</i> ID of the map that the element belongs to.  |
| urls               | array   | Map element URLs.   |
| use_iconmap        | integer | The map element URL object is <b>described in detail below</b> . Whether icon mapping must be used for host elements.<br><br>Possible values:<br>0 - do not use icon mapping;<br>1 - <i>(default)</i> use icon mapping. |
| viewtype           | integer | Host group element placing algorithm.<br><br>Possible values:<br>0 - <i>(default)</i> grid.   |
| width              | integer | Width of the fixed size host group element in pixels.   |
| x                  | integer | Default: 200.<br>X-coordinates of the element in pixels.  |
| y                  | integer | Default: 0.<br>Y-coordinates of the element in pixels.  |
|                    |         | Default: 0.   |

#### Map element Host

The map element Host object defines one host element.

| Property | Type   | Description |
|----------|--------|-------------|
| hostid   | string | Host ID     |

#### Map element Host group

The map element Host group object defines one host group element.

| Property | Type   | Description   |
|----------|--------|---------------|
| groupid  | string | Host group ID |

#### Map element Map

The map element Map object defines one map element.

| Property | Type   | Description |
|----------|--------|-------------|
| sysmapid | string | Map ID      |

#### Map element Trigger

The map element Trigger object defines one or more trigger elements.

| Property  | Type   | Description |
|-----------|--------|-------------|
| triggerid | string | Trigger ID  |

#### Map element tag

The map element tag object has the following properties.

| Property                 | Type    | Description  |
|--------------------------|---------|--|
| <b>tag</b><br>(required) | string  | Map element tag name.  |
| operator                 | integer | Map element tag condition operator.<br><br>Possible values:<br>0 - <i>(default)</i> Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist. |
| value                    | string  | Map element tag value.   |

#### Map element URL

The map element URL object defines a clickable link that will be available for a specific map element. It has the following properties:

| Property                  | Type   | Description                                    |
|---------------------------|--------|--|
| sysmapelementurlid        | string | <i>(readonly)</i> ID of the map element URL.   |
| <b>name</b><br>(required) | string | Link caption.                                  |
| <b>url</b><br>(required)  | string | Link URL.                                      |
| selementid                | string | ID of the map element that the URL belongs to. |

#### Map link

The map link object defines a link between two map elements. It has the following properties.

| Property                         | Type   | Description   |
|----------------------------------|--------|---|
| linkid                           | string | <i>(readonly)</i> ID of the map link.                           |
| <b>selementid1</b><br>(required) | string | ID of the first map element linked on one end.                  |
| <b>selementid2</b><br>(required) | string | ID of the first map element linked on the other end.            |
| color                            | string | Line color as a hexadecimal color code.<br><br>Default: 000000. |

| Property     | Type    | Description   |
|--------------|---------|---|
| drawtype     | integer | Link line draw style.<br><br>Possible values:<br>0 - <i>(default)</i> line;<br>2 - bold line;<br>3 - dotted line;<br>4 - dashed line.                                     |
| label        | string  | Link label.   |
| linktriggers | array   | Map link triggers to use as link status indicators.   |
| permission   | integer | The map link trigger object is <b>described in detail below</b> .<br>Type of permission level.<br><br>Possible values:<br>-1 - none;<br>2 - read only;<br>3 - read-write. |
| sysmapid     | string  | ID of the map the link belongs to.  |

#### Map link trigger

The map link trigger object defines a map link status indicator based on the state of a trigger. It has the following properties:

| Property                       | Type    | Description   |
|--------------------------------|---------|---|
| linktriggerid                  | string  | <i>(readonly)</i> ID of the map link trigger.   |
| <b>triggerid</b><br>(required) | string  | ID of the trigger used as a link indicator.   |
| color                          | string  | Indicator color as a hexadecimal color code.  |
| drawtype                       | integer | Default: DD0000.<br>Indicator draw style.<br><br>Possible values:<br>0 - <i>(default)</i> line;<br>2 - bold line;<br>3 - dotted line;<br>4 - dashed line. |
| linkid                         | string  | ID of the map link that the link trigger belongs to.  |

#### Map URL

The map URL object defines a clickable link that will be available for all elements of a specific type on the map. It has the following properties:

| Property                  | Type    | Description  |
|---------------------------|---------|--|
| sysmapurlid               | string  | <i>(readonly)</i> ID of the map URL.   |
| <b>name</b><br>(required) | string  | Link caption.  |
| <b>url</b><br>(required)  | string  | Link URL.  |
| elementtype               | integer | Type of map element for which the URL will be available.<br><br>Refer to the <b>map element "type" property</b> for a list of supported types. |
| sysmapid                  | string  | Default: 0.<br>ID of the map that the URL belongs to.  |

#### Map user

List of map permissions based on users. It has the following properties:

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| sysmapuserid                    | string  | ( <i>readonly</i> ) ID of the map user.  |
| <b>userid</b><br>(required)     | string  | User ID.   |
| <b>permission</b><br>(required) | integer | Type of permission level.<br><br>Possible values:<br>2 - read only;<br>3 - read-write; |

#### Map user group

List of map permissions based on user groups. It has the following properties:

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| sysmapusrgrpid                  | string  | ( <i>readonly</i> ) ID of the map user group.  |
| <b>usrgrpid</b><br>(required)   | string  | User group ID.   |
| <b>permission</b><br>(required) | integer | Type of permission level.<br><br>Possible values:<br>2 - read only;<br>3 - read-write; |

#### Map shapes

The map shape object defines a geometric shape (with or without text) displayed on a map. It has the following properties:

| Property               | Type    | Description  |
|------------------------|---------|--|
| sysmap_shapeid         | string  | ( <i>readonly</i> ) ID of the map shape element.   |
| <b>type</b> (required) | integer | Type of map shape element.<br><br>Possible values:<br>0 - rectangle;<br>1 - ellipse.       |
| x                      | integer | Property is required when new shapes are created.<br>X-coordinates of the shape in pixels. |
| y                      | integer | Default: 0.<br>Y-coordinates of the shape in pixels.                                       |
| width                  | integer | Default: 0.<br>Width of the shape in pixels.   |
| height                 | integer | Default: 200.<br>Height of the shape in pixels.  |
| text                   | string  | Default: 200.<br>Text of the shape.  |

| Property         | Type    | Description   |
|------------------|---------|---|
| font             | integer | Font of the text within shape.<br><br>Possible values:<br>0 - Georgia, serif<br>1 - "Palatino Linotype", "Book Antiqua", Palatino, serif<br>2 - "Times New Roman", Times, serif<br>3 - Arial, Helvetica, sans-serif<br>4 - "Arial Black", Gadget, sans-serif<br>5 - "Comic Sans MS", cursive, sans-serif<br>6 - Impact, Charcoal, sans-serif<br>7 - "Lucida Sans Unicode", "Lucida Grande", sans-serif<br>8 - Tahoma, Geneva, sans-serif<br>9 - "Trebuchet MS", Helvetica, sans-serif<br>10 - Verdana, Geneva, sans-serif<br>11 - "Courier New", Courier, monospace<br>12 - "Lucida Console", Monaco, monospace |
| font_size        | integer | Default: 9.<br>Font size in pixels.   |
| font_color       | string  | Default: 11.<br>Font color.   |
| text_halign      | integer | Default: '000000'.<br>Horizontal alignment of text.<br><br>Possible values:<br>0 - center;<br>1 - left;<br>2 - right.   |
| text_valign      | integer | Default: 0.<br>Vertical alignment of text.<br><br>Possible values:<br>0 - middle;<br>1 - top;<br>2 - bottom.  |
| border_type      | integer | Default: 0.<br>Type of the border.<br><br>Possible values:<br>0 - none;<br>1 - _____;<br>2 - - - -;<br>3 - - - - -.   |
| border_width     | integer | Default: 0.<br>Width of the border in pixels.   |
| border_color     | string  | Default: 0.<br>Border color.  |
| background_color | string  | Default: '000000'.<br>Background color (fill color).  |
| zindex           | integer | Default: (empty).<br>Value used to order all shapes and lines (z-index).<br><br>Default: 0.   |

## Map lines

The map line object defines a line displayed on a map. It has the following properties:

| Property       | Type    | Description  |
|----------------|---------|--|
| sysmap_shapeid | string  | ( <i>readonly</i> ) ID of the map shape element.   |
| x1             | integer | X-coordinates of the line point 1 in pixels.   |
| y1             | integer | Default: 0.<br>Y-coordinates of the line point 1 in pixels.  |
| x2             | integer | Default: 0.<br>X-coordinates of the line point 2 in pixels.  |
| y2             | integer | Default: 200.<br>Y-coordinates of the line point 2 in pixels.  |
| line_type      | integer | Default: 200.<br>Type of the lines.<br><br>Possible values:<br>0 - none;<br>1 - _____;<br>2 - - - -;<br>3 - - - - -. |
| line_width     | integer | Default: 0.<br>Width of the lines in pixels.   |
| line_color     | string  | Default: 0.<br>Line color.   |
| zindex         | integer | Default: '000000'.<br>Value used to order all shapes and lines (z-index).  |
|                |         | Default: 0.  |

## map.create

### Description

`object map.create(object/array maps)`

This method allows to create new maps.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Maps to create.

Additionally to the [standard map properties](#), the method accepts the following parameters.

| Parameter  | Type  | Description   |
|------------|-------|---|
| links      | array | Map <a href="#">links</a> to be created on the map.             |
| selements  | array | Map <a href="#">elements</a> to be created on the map.          |
| urls       | array | Map <a href="#">URLs</a> to be created on the map.              |
| users      | array | Map <a href="#">user</a> shares to be created on the map.       |
| userGroups | array | Map <a href="#">user group</a> shares to be created on the map. |
| shapes     | array | Map <a href="#">shapes</a> to be created on the map.            |

| Parameter | Type  | Description                                |
|-----------|-------|--|
| lines     | array | Map <b>lines</b> to be created on the map. |

#### Note:

To create map links you'll need to set a map element `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. [See example.](#)

#### Return values

(object) Returns an object containing the IDs of the created maps under the `sysmapids` property. The order of the returned IDs matches the order of the passed maps.

#### Examples

Create an empty map

Create a map with no elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map",
    "width": 600,
    "height": 600
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "8"
    ]
  },
  "id": 1
}
```

Create a host map

Create a map with two host elements and a link between them. Note the use of temporary `"selementid1"` and `"selementid2"` values in the map link object to refer to map elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Host map",
    "width": 600,
    "height": 600,
    "selements": [
      {
        "selementid": "1",
        "elements": [
          {"hostid": "1033"}
        ]
      },
      {
        "selementid": "2",
        "elements": [
          {"hostid": "1033"}
        ]
      }
    ],
    "elementtype": 0,
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

```

        "iconid_off": "2"
      },
      {
        "selementid": "2",
        "elements": [
          {"hostid": "1037"}
        ],
        "elementtype": 0,
        "iconid_off": "2"
      }
    ],
    "links": [
      {
        "selementid1": "1",
        "selementid2": "2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 1
}

```

Create a trigger map

Create a map with trigger element, which contains two triggers.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Trigger map",
    "width": 600,
    "height": 600,
    "selements": [
      {
        "elements": [
          {"triggerid": "12345"},
          {"triggerid": "67890"}
        ],
        "elementtype": 2,
        "iconid_off": "2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "10"
    ]
  },
  "id": 1
}
```

### Map sharing

Create a map with two types of sharing (user and user group).

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map sharing",
    "width": 600,
    "height": 600,
    "users": [
      {
        "userid": "4",
        "permission": "3"
      }
    ],
    "userGroups": [
      {
        "usrgrpid": "7",
        "permission": "2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 1
}
```

### Map shapes

Create a map with map name title.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Host map",
    "width": 600,
    "height": 600,
    "shapes": [
      {

```

```

        "type": 0,
        "x": 0,
        "y": 0,
        "width": 600,
        "height": 11,
        "text": "{MAP.NAME}"
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "10"
    ]
  },
  "id": 1
}

```

Map lines

Create a map line.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map API lines",
    "width": 500,
    "height": 500,
    "lines": [
      {
        "x1": 30,
        "y1": 10,
        "x2": 100,
        "y2": 50,
        "line_type": 1,
        "line_width": 10,
        "line_color": "009900"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "11"
    ]
  },
  "id": 1
}

```

### map.delete

Description

object map.delete(array mapIds)

This method allows to delete maps.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted maps under the `sysmapids` property.

Examples

Delete multiple maps

Delete two maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.delete",
  "params": [
    "12",
    "34"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "12",
      "34"
    ]
  },
  "id": 1
}
```

## map.get

### Description

integer/array map.get(object parameters)

The method allows to retrieve maps according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| sysmapids              | string/array | Returns only maps with the given IDs.  |
| userids                | string/array | Returns only maps that belong to the given user IDs.   |
| expandUrls             | flag         | Adds global map URLs to the corresponding map elements and expands macros in all map element URLs. |
| selectIconMap          | query        | Returns an <b>iconmap</b> property with the icon map used on the map.                              |
| selectLinks            | query        | Returns a <b>links</b> property with the map links between elements.                               |
| selectSelements        | query        | Returns a <b>selements</b> property with the map elements.   |
| selectUrls             | query        | Returns a <b>urls</b> property with the map URLs.  |
| selectUsers            | query        | Returns a <b>users</b> property with users that the map is shared with.                            |
| selectUserGroups       | query        | Returns a <b>userGroups</b> property with user groups that the map is shared with.                 |
| selectShapes           | query        | Returns a <b>shapes</b> property with the map shapes.  |
| selectLines            | query        | Returns a <b>lines</b> property with the map lines.  |
| sortfield              | string/array | Sort the result by the given properties.   |
|                        |              | Possible values are: <b>name</b> , <b>width</b> and <b>height</b> .                                |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> .                       |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

### Examples

Retrieve a map

Retrieve all data about map "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.get",
```

```

"params": {
  "output": "extend",
  "selectSelements": "extend",
  "selectLinks": "extend",
  "selectUsers": "extend",
  "selectUserGroups": "extend",
  "selectShapes": "extend",
  "selectLines": "extend",
  "sysmapids": "3"
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "selements": [
        {
          "selementid": "10",
          "sysmapid": "3",
          "elementtype": "4",
          "evaltype": "0",
          "iconid_off": "1",
          "iconid_on": "0",
          "label": "Zabbix server",
          "label_location": "3",
          "x": "11",
          "y": "141",
          "iconid_disabled": "0",
          "iconid_maintenance": "0",
          "elementsubtype": "0",
          "areatype": "0",
          "width": "200",
          "height": "200",
          "tags": [
            {
              "tag": "service",
              "value": "mysqld",
              "operator": "0"
            }
          ],
          "viewtype": "0",
          "use_iconmap": "1",
          "urls": [],
          "elements": []
        },
        {
          "selementid": "11",

## map.update

Description

object map.update(object/array maps)

This method allows to update existing maps.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Map properties to be updated.

The `mapid` property must be defined for each map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard map properties](#), the method accepts the following parameters.

| Parameter  | Type  | Description   |
|------------|-------|---|
| links      | array | Map <a href="#">links</a> to replace the existing links.                |
| selements  | array | Map <a href="#">elements</a> to replace the existing elements.          |
| urls       | array | Map <a href="#">URLs</a> to replace the existing URLs.                  |
| users      | array | Map <a href="#">user</a> shares to replace the existing elements.       |
| userGroups | array | Map <a href="#">user group</a> shares to replace the existing elements. |
| shapes     | array | Map <a href="#">shapes</a> to replace the existing shapes.              |
| lines      | array | Map <a href="#">lines</a> to replace the existing lines.                |

### Note:

To create map links between new map elements you'll need to set an element's `selementid` to an arbitrary value and then use this value to reference this element in the `links selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. [See example for map.create](#).

Return values

(object) Returns an object containing the IDs of the updated maps under the `sysmapids` property.

Examples

## Resize a map

Change the size of the map to 1200x1200 pixels.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.update",
  "params": {
    "sysmapid": "8",
    "width": 1200,
    "height": 1200
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "8"
    ]
  },
  "id": 1
}
```

## Change map owner

Available only for admins and super admins.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.update",
  "params": {
    "sysmapid": "9",
    "userid": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 2
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 2
}
```

## Media type

This class is designed to work with media types.

Object references:

- [Media type](#)

Available methods:

- [mediatype.create](#) - creating new media types
- [mediatype.delete](#) - deleting media types
- [mediatype.get](#) - retrieving media types
- [mediatype.update](#) - updating media types

## > Media type object

The following objects are directly related to the mediatype API.

Media type

The media type object has the following properties.

| Property                  | Type    | Description  |
|---------------------------|---------|--|
| mediatypeid               | string  | ( <i>readonly</i> ) ID of the media type.  |
| <b>name</b><br>(required) | string  | Name of the media type.  |
| <b>type</b><br>(required) | integer | Transport used by the media type.<br><br>Possible values:<br>0 - email;<br>1 - script;<br>2 - SMS;<br>4 - Webhook. |
| exec_path                 | string  | For script media types exec_path contains the name of the executed script.   |
| gsm_modem                 | string  | Required for script media types.<br>Serial device name of the GSM modem.   |
| passwd                    | string  | Required for SMS media types.<br>Authentication password.  |
| smtp_email                | string  | Used for email media types.<br>Email address from which notifications will be sent.                                |
| smtp_helo                 | string  | Required for email media types.<br>SMTP HELO.  |
| smtp_server               | string  | Required for email media types.<br>SMTP server.  |
| smtp_port                 | integer | Required for email media types.<br>SMTP server port to connect to.   |

| Property            | Type    | Description  |
|---------------------|---------|--|
| smtp_security       | integer | SMTP connection security level to use.<br><br>Possible values:<br>0 - None;<br>1 - STARTTLS;<br>2 - SSL/TLS.   |
| smtp_verify_host    | integer | SSL verify host for SMTP.<br><br>Possible values:<br>0 - No;<br>1 - Yes.   |
| smtp_verify_peer    | integer | SSL verify peer for SMTP.<br><br>Possible values:<br>0 - No;<br>1 - Yes.   |
| smtp_authentication | integer | SMTP authentication method to use.<br><br>Possible values:<br>0 - None;<br>1 - Normal password.  |
| status              | integer | Whether the media type is enabled.<br><br>Possible values:<br>0 - <i>(default)</i> enabled;<br>1 - disabled.   |
| username            | string  | User name.   |
| exec_params         | string  | Used for email media types.<br>Script parameters.  |
| maxsessions         | integer | Each parameter ends with a new line feed.<br>The maximum number of alerts that can be processed in parallel.<br><br>Possible values for SMS:<br>1 - <i>(default)</i> |
| maxattempts         | integer | Possible values for other media types:<br>0-100<br>The maximum number of attempts to send an alert.<br><br>Possible values:<br>1-100                                 |
| attempt_interval    | string  | Default value:<br>3<br>The interval between retry attempts. Accepts seconds and time unit with suffix.   |
| content_type        | integer | Possible values:<br>0-1h<br>Default value:<br>10s<br>Message format.   |
| script              | text    | Possible values:<br>0 - plain text;<br>1 - <i>(default)</i> html.<br>Media type webhook script javascript body.  |

| Property        | Type    | Description  |
|-----------------|---------|--|
| timeout         | string  | Media type webhook script timeout. Accepts seconds and time unit with suffix.<br><br>Possible values:<br>1-60s<br><br>Default value:<br>30s  |
| process_tags    | integer | Defines should the webhook script response to be interpreted as tags and these tags should be added to associated event.<br><br>Possible values:<br>0 - <i>(default)</i> Ignore webhook script response.<br>1 - Process webhook script response as tags. |
| show_event_menu | integer | Show media type entry in <code>problem.get</code> and <code>event.get</code> property urls.<br><br>Possible values:<br>0 - <i>(default)</i> Do not add urls entry.<br>1 - Add media type to urls property.   |
| event_menu_url  | string  | Define url property of media type entry in urls property of <code>problem.get</code> and <code>event.get</code> .  |
| event_menu_name | string  | Define name property of media type entry in urls property of <code>problem.get</code> and <code>event.get</code> .   |
| parameters      | array   | Array of <b>webhook input parameters</b> .   |
| description     | text    | Media type description.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Webhook parameters

Parameters passed to webhook script when it is called, have the following properties.

| Property                  | Type   | Description  |
|---------------------------|--------|--|
| <b>name</b><br>(required) | string | Parameter name.  |
| value                     | string | Parameter value, supports macros.<br>Supported macros are described on the <b>Supported macros</b> page. |

#### Message template

The message template object defines a template that will be used as a default message for action operations to send a notification. It has the following properties.

| Property                          | Type    | Description   |
|-----------------------------------|---------|---|
| <b>eventsources</b><br>(required) | integer | Event source.<br><br>Possible values:<br>0 - triggers;<br>1 - discovery;<br>2 - autoregistration;<br>3 - internal;<br>4 - services. |
| <b>recovery</b><br>(required)     | integer | Operation mode.<br><br>Possible values:<br>0 - operations;<br>1 - recovery operations;<br>2 - update operations.                    |
| subject                           | string  | Message subject.  |

| Property | Type   | Description   |
|----------|--------|---------------|
| message  | string | Message text. |

## mediatype.create

### Description

object mediatype.create(object/array mediaTypes)

This method allows to create new media types.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Media types to create.

Additionally to the [standard media type properties](#), the method accepts the following parameters.

| Parameter         | Type  | Description  |
|-------------------|-------|--|
| parameters        | array | <a href="#">Webhook parameters</a> to be created for the media type. |
| message_templates | array | <a href="#">Message templates</a> to be created for the media type.  |

### Return values

(object) Returns an object containing the IDs of the created media types under the `mediatypeids` property. The order of the returned IDs matches the order of the passed media types.

### Examples

#### Creating an e-mail media type

Create a new e-mail media type with a custom SMTP port and message templates.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "type": "0",
    "name": "E-mail",
    "smtp_server": "mail.example.com",
    "smtp_helo": "example.com",
    "smtp_email": "zabbix@example.com",
    "smtp_port": "587",
    "content_type": "1",
    "message_templates": [
      {
        "eventsourcing": "0",
        "recovery": "0",
        "subject": "Problem: {EVENT.NAME}",
        "message": "Problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\" started at {EVENT.TIME}."
      },
      {
        "eventsourcing": "0",
        "recovery": "1",
        "subject": "Resolved in {EVENT.DURATION}: {EVENT.NAME}",
        "message": "Problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\" has been resolved at {EVENT.TIME}."
      }
    ]
  },
  "id": 1
}
```

```

        "recovery": "2",
        "subject": "Updated problem in {EVENT.AGE}: {EVENT.NAME}",
        "message": "{USER.FULLNAME} {EVENT.UPDATE.ACTION} problem \"{EVENT.NAME}\" on host \"{HOSTNAME}\""
    }
}
],
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "7"
    ]
  },
  "id": 1
}

```

Creating a script media type

Create a new script media type with a custom value for the number of attempts and the interval between them.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "type": "1",
    "name": "Push notifications",
    "exec_path": "push-notification.sh",
    "exec_params": "{ALERT.SENDTO}\n{ALERT.SUBJECT}\n{ALERT.MESSAGE}\n",
    "maxattempts": "5",
    "attempt_interval": "11s"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "8"
    ]
  },
  "id": 1
}

```

Creating a webhook media type

Create a new webhook media type.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "type": "4",
    "name": "Webhook",
    "script": "var Webhook = {\r\n    token: null,\r\n    to: null,\r\n    subject: null,\r\n    messa

```

```

    "parameters": [
      {
        "name": "Message",
        "value": "{ALERT.MESSAGE}"
      },
      {
        "name": "Subject",
        "value": "{ALERT.SUBJECT}"
      },
      {
        "name": "To",
        "value": "{ALERT.SENDTO}"
      },
      {
        "name": "Token",
        "value": "<Token>"
      }
    ],
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "9"
    ]
  },
  "id": 1
}

```

Source

CMediaType::create() in `ui/include/classes/api/services/CMediaType.php`.

## mediatype.delete

Description

object mediatype.delete(array mediaTypeIds)

This method allows to delete media types.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the media types to delete.

Return values

(object) Returns an object containing the IDs of the deleted media types under the `mediatypeids` property.

Examples

Deleting multiple media types

Delete two media types.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.delete",
  "params": [
    "3",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "3",
      "5"
    ]
  },
  "id": 1
}
```

Source

CMediaType::delete() in `ui/include/classes/api/services/CMediaType.php`.

## mediatype.get

Description

integer/array mediatype.get(object parameters)

The method allows to retrieve media types according to the given parameters.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

### Note:

Since Zabbix 6.0.34, when requesting user-related information of media types, *Admin* type users may retrieve only data about their own user. For an example, see [Retrieving media types as Admin](#).

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| mediatypeids           | string/array | Return only media types with the given IDs.   |
| mediaids               | string/array | Return only media types used by the given <a href="#">media</a> .                         |
| userids                | string/array | Return only media types used by the given users.  |
| selectMessageTemplates | query        | Return a <a href="#">message_templates</a> property with an array of media type messages. |
|                        |              | Since Zabbix 6.0.34, this parameter is supported only for <i>Super admin</i> type users.  |
| selectUsers            | query        | Return a <a href="#">users</a> property with the users that use the media type.           |

See [user.get](#) for restrictions based on user type.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| sortfield              | string/array | Sort the result by the given properties.   |
| filter                 | object       | <p>Possible values are: mediatypeid.</p> <p>Return only those results that exactly match the given filter.</p> <p>Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against.</p> <p>Does not support properties of text <b>data type</b>.</p>  |
| output                 | query        | <p>Possible <b>Media type object</b> properties for <i>Admin</i> type users (since Zabbix 6.0.34): mediatypeid, name, type, status, maxattempts. <b>Media type object</b> properties to be returned.</p> <p>Since Zabbix 6.0.34, <i>Admin</i> type users may retrieve only the following properties: mediatypeid, name, type, status, maxattempts, description. For an example, see <a href="#">Retrieving media types as Admin</a>.</p> |
| search                 | object       | <p>Default: extend.</p> <p>Return results that match the given pattern (case-insensitive).</p> <p>Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.</p> <p>Supports only properties of string and text <b>data type</b>.</p>  |
| countOutput            | boolean      | <p>Possible <b>Media type object</b> properties for <i>Admin</i> type users (since Zabbix 6.0.34): name, description.</p> <p>These parameters are described in the <a href="#">reference commentary</a>.</p>   |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| limit                  | integer      |  |
| preservekeys           | boolean      |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving media types

Retrieve all configured media types.

Retrieving media types as *Admin*

As an *Admin* type user, retrieve all media types that are enabled, with users that use these media types. The following example returns two media types:

- email media type with one user (since Zabbix 6.0.34, only *Admin* type user's own user);
- SMS media type with no users.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "mediatype.get",
  "params": {
    "output": "extend",
    "filter": {
      "status": 0
    },
    "selectUsers": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "mediatypeid": "1",
      "type": "0",
      "name": "Email",
      "status": "0",
      "description": "",
      "maxattempts": "3",
      "users": [
        {
          "userid": "3",

## mediatype.update

Description

`object mediatype.update(object/array mediaTypes)`

This method allows to update existing media types.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Media type properties to be updated.

The `mediatypeid` property must be defined for each media type, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard media type properties](#), the method accepts the following parameters.

| Parameter         | Type  | Description   |
|-------------------|-------|---|
| parameters        | array | <a href="#">Webhook parameters</a> to replace the current webhook parameters. |
| message_templates | array | <a href="#">Message templates</a> to replace the current message templates.   |

Return values

(object) Returns an object containing the IDs of the updated media types under the `mediatypeids` property.

Examples

Enabling a media type

Enable a media type, that is, set its status to "0".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "mediatype.update",
    "params": {
        "mediatypeid": "6",
        "status": "0"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
}

```

```
"id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "6"
    ]
  },
  "id": 1
}
```

## Problem

This class is designed to work with problems.

Object references:

- [Problem](#)

Available methods:

- [problem.get](#) - retrieving problems

## > Problem object

The following objects are directly related to the problem API.

Problem

### Note:

Problems are created by the Zabbix server and cannot be modified via the API.

The problem object has the following properties.

| Property | Type    | Description   |
|----------|---------|---|
| eventid  | string  | ID of the problem event.  |
| source   | integer | Type of the problem event.<br><br>Possible values:<br>0 - event created by a trigger;<br>3 - internal event;<br>4 - event created on service status update.   |
| object   | integer | Type of object that is related to the problem event.<br><br>Possible values for trigger events:<br>0 - trigger.<br><br>Possible values for internal events:<br>0 - trigger;<br>4 - item;<br>5 - LLD rule. |
| objectid | string  | Possible values for service events:<br>6 - service.<br>ID of the related object.  |

| Property      | Type      | Description   |
|---------------|-----------|---|
| clock         | timestamp | Time when the problem event was created.  |
| ns            | integer   | Nanoseconds when the problem event was created.   |
| r_eventid     | string    | Recovery event ID.  |
| r_clock       | timestamp | Time when the recovery event was created.   |
| r_ns          | integer   | Nanoseconds when the recovery event was created.  |
| correlationid | string    | Correlation rule ID if this event was recovered by global correlation rule.   |
| userid        | string    | User ID if the problem was manually closed.   |
| name          | string    | Resolved problem name.  |
| acknowledged  | integer   | Acknowledge state for problem.  |
|               |           | Possible values:<br>0 - not acknowledged;<br>1 - acknowledged.  |
| severity      | integer   | Problem current severity.   |
|               |           | Possible values:<br>0 - not classified;<br>1 - information;<br>2 - warning;<br>3 - average;<br>4 - high;<br>5 - disaster. |
| suppressed    | integer   | Whether the problem is suppressed.  |
|               |           | Possible values:<br>0 - problem is in normal state;<br>1 - problem is suppressed.   |
| opdata        | string    | Operational data with expanded macros.  |
| urls          | array     | Active <b>media type</b> URLs.  |

#### Problem tag

The problem tag object has the following properties.

| Property | Type   | Description        |
|----------|--------|--------------------|
| tag      | string | Problem tag name.  |
| value    | string | Problem tag value. |

#### Media type URL

The media type URL object has the following properties.

| Property | Type   | Description                   |
|----------|--------|-------------------------------|
| name     | string | Media type defined URL name.  |
| url      | string | Media type defined URL value. |

Results will contain entries only for active media types with enabled event menu entry. Macro used in properties will be expanded, but if one of the properties contains an unexpanded macro, both properties will be excluded from results. For supported macros, see *Supported macros*.

#### **problem.get**

##### Description

`integer/array problem.get(object parameters)`

The method allows to retrieve problems according to the given parameters.

This method is for retrieving unresolved problems. It is also possible, if specified, to additionally retrieve recently resolved problems. The period that determines how old is "recently" is defined in *Administration* → *General*. Problems that were resolved prior to that period are not kept in the problem table. To retrieve problems that were resolved further back in the past, use the [event.get](#) method.

**Attention:**

This method may return problems of a deleted entity if these problems have not been removed by the housekeeper yet.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type             | Description   |
|--------------|------------------|---|
| eventids     | string/array     | Return only problems with the given IDs.  |
| groupids     | string/array     | Return only problems created by objects that belong to the given host groups.   |
| hostids      | string/array     | Return only problems created by objects that belong to the given hosts.   |
| objectids    | string/array     | Return only problems created by the given objects.  |
| source       | integer          | Return only problems with the given type.<br><br>Refer to the <a href="#">problem event object page</a> for a list of supported event types.  |
| object       | integer          | Default: 0 - problem created by a trigger.<br>Return only problems created by objects of the given type.<br><br>Refer to the <a href="#">problem event object page</a> for a list of supported object types.  |
| acknowledged | boolean          | Default: 0 - trigger.<br><code>true</code> - return acknowledged problems only;<br><code>false</code> - unacknowledged only.  |
| suppressed   | boolean          | <code>true</code> - return only suppressed problems;<br><code>false</code> - return problems in the normal state.   |
| severities   | integer/array    | Return only problems with given event severities. Applies only if object is trigger.  |
| evaltype     | integer          | Rules for tag searching.  |
| tags         | array of objects | Possible values:<br>0 - (default) And/Or;<br>2 - Or.<br>Return only problems with given tags. Exact match by tag and case-insensitive search by value and operator.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all problems.                   |
| recent       | boolean          | Possible operator types:<br>0 - (default) Like;<br>1 - Equal;<br>2 - Not like;<br>3 - Not equal<br>4 - Exists;<br>5 - Not exists.<br><code>true</code> - return PROBLEM and recently RESOLVED problems (depends on Display OK triggers for N seconds)<br>Default: <code>false</code> - UNRESOLVED problems only |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| eventid_from           | string       | Return only problems with IDs greater or equal to the given ID.   |
| eventid_till           | string       | Return only problems with IDs less or equal to the given ID.  |
| time_from              | timestamp    | Return only problems that have been created after or at the given time.   |
| time_till              | timestamp    | Return only problems that have been created before or at the given time.  |
| selectAcknowledges     | query        | Return an acknowledges property with the problem updates. Problem updates are sorted in reverse chronological order.<br><br>The problem update object has the following properties:<br>acknowledgeid - (string) update's ID;<br>userid - (string) ID of the user that updated the event;<br>eventid - (string) ID of the updated event;<br>clock - (timestamp) time when the event was updated;<br>message - (string) text of the message;<br>action - (integer) type of update action (see <a href="#">event.acknowledge</a> );<br>old_severity - (integer) event severity before this update action;<br>new_severity - (integer) event severity after this update action; |
| selectTags             | query        | Supports count.<br>Return a tags property with the problem tags. Output format: [{"tag": "<tag>", "value": "<value>"}, ...].  |
| selectSuppressionData  | query        | Return a suppression_data property with the list of maintenances:<br>maintenanceid - (string) ID of the maintenance;<br>suppress_until - (integer) time until the problem is suppressed.  |
| sortfield              | string/array | Sort the result by the given properties.<br><br>Possible values are: eventid.<br>These parameters are described in the <a href="#">reference commentary</a> .   |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving trigger problem events

Retrieve recent events from trigger "15112."

Request:

```
{
  "jsonrpc": "2.0",

- Proxy interface

Available methods:

- **proxy.create** - create new proxies
- **proxy.delete** - delete proxies
- **proxy.get** - retrieve proxies
- **proxy.update** - update proxies

### > Proxy object

The following objects are directly related to the proxy API.

Proxy

The proxy object has the following properties.

| Property                    | Type      | Description  |
|-----------------------------|-----------|--|
| proxyid                     | string    | ( <i>readonly</i> ) ID of the proxy.   |
| <b>host</b><br>(required)   | string    | Name of the proxy.   |
| <b>status</b><br>(required) | integer   | Type of proxy.<br><br>Possible values:<br>5 - active proxy;<br>6 - passive proxy.  |
| description                 | text      | Description of the proxy.  |
| lastaccess                  | timestamp | ( <i>readonly</i> ) Time when the proxy last connected to the server.  |
| tls_connect                 | integer   | Connections to host.<br><br>Possible values are:<br>1 - ( <i>default</i> ) No encryption;<br>2 - PSK;<br>4 - certificate.  |
| tls_accept                  | integer   | Connections from host.<br><br>Possible bitmap values are:<br>1 - ( <i>default</i> ) No encryption;<br>2 - PSK;<br>4 - certificate.<br><br>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for PSK and certificate). |
| tls_issuer                  | string    | Certificate issuer.  |
| tls_subject                 | string    | Certificate subject.   |

| Property         | Type    | Description   |
|------------------|---------|---|
| tls_psk_identity | string  | (write-only) PSK identity; must be paired with only one PSK (across <b>autoregistration</b> , <b>hosts</b> , and <b>proxies</b> ). Required if either <b>tls_connect</b> or <b>tls_accept</b> has PSK enabled.<br>Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. |
| tls_psk          | string  | (write-only) Pre-shared key (PSK); must be at least 32 hex digits. Required if either <b>tls_connect</b> or <b>tls_accept</b> has PSK enabled.  |
| proxy_address    | string  | Comma-delimited IP addresses or DNS names of active Zabbix proxy.   |
| auto_compress    | integer | (readonly) Indicates if communication between Zabbix server and proxy is compressed.<br><br>Possible values are:<br>0 - No compression;<br>1 - Compression enabled;   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Proxy interface

The proxy interface object defines the interface used to connect to a passive proxy. It has the following properties.

| Property                   | Type    | Description   |
|----------------------------|---------|---|
| <b>dns</b><br>(required)   | string  | DNS name to connect to.<br><br>Can be empty if connections are made via IP address.   |
| <b>ip</b><br>(required)    | string  | IP address to connect to.<br><br>Can be empty if connections are made via DNS names.  |
| <b>port</b><br>(required)  | string  | Port number to connect to.  |
| <b>useip</b><br>(required) | integer | Whether the connection should be made via IP address.<br><br>Possible values are:<br>0 - connect using DNS name;<br>1 - connect using IP address. |

#### proxy.create

##### Description

`object proxy.create(object/array proxies)`

This method allows to create new proxies.

##### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

##### Parameters

(object/array) Proxies to create.

Additionally to the **standard proxy properties**, the method accepts the following parameters.

| Parameter | Type  | Description   |
|-----------|-------|---|
| hosts     | array | <b>Hosts</b> to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy. |

The hosts must have the `hostid` property defined.

| Parameter | Type   | Description  |
|-----------|--------|--|
| interface | object | Host <b>interface</b> to be created for the passive proxy. |
|           |        | Required for passive proxies.                              |

#### Return values

(object) Returns an object containing the IDs of the created proxies under the `proxyids` property. The order of the returned IDs matches the order of the passed proxies.

#### Examples

Create an active proxy

Create an action proxy "Active proxy" and assign a host to be monitored by it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "host": "Active proxy",
    "status": "5",
    "hosts": [
      {
        "hostid": "10279"
      }
    ]
  },
  "auth": "ab9638041ec6922cb14b07982b268f47",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10280"
    ]
  },
  "id": 1
}
```

Create a passive proxy

Create a passive proxy "Passive proxy" and assign two hosts to be monitored by it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "host": "Passive proxy",
    "status": "6",
    "interface": {
      "ip": "127.0.0.1",
      "dns": "",
      "useip": "1",
      "port": "10051"
    },
    "hosts": [
      {
        "hostid": "10192"
      }
    ]
  },
  "auth": "ab9638041ec6922cb14b07982b268f47",
  "id": 1
}
```

```

        },
        {
            "hostid": "10139"
        }
    ],
    "auth": "ab9638041ec6922cb14b07982b268f47",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10284"
        ]
    },
    "id": 1
}

```

## proxy.delete

Description

object proxy.delete(array proxies)

This method allows to delete proxies.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of proxies to delete.

Return values

(object) Returns an object containing the IDs of the deleted proxies under the `proxyids` property.

Examples

Delete multiple proxies

Delete two proxies.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "proxy.delete",
    "params": [
        "10286",
        "10285"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10286",
      "10285"
    ]
  },
  "id": 1
}
```

Source

CProxy::delete() in `ui/include/classes/api/services/CProxy.php`.

## proxy.get

Description

integer/array proxy.get(object parameters)

The method allows to retrieve proxies according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| proxyids               | string/array | Return only proxies with the given IDs.  |
| selectHosts            | query        | Return a <b>hosts</b> property with the hosts monitored by the proxy.                  |
| selectInterface        | query        | Return an <b>interface</b> property with the proxy interface used by a passive proxy.  |
| sortfield              | string/array | Sort the result by the given properties.   |
|                        |              | Possible values are: <code>hostid</code> , <code>host</code> and <code>status</code> . |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> .           |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all proxies

Retrieve all configured proxies and their interfaces.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.get",
  "params": {
    "output": "extend",
    "selectInterface": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "host": "Active proxy",
      "status": "5",
      "lastaccess": "0",
      "description": "",
      "tls_connect": "1",
      "tls_accept": "1",
      "tls_issuer": "",
      "tls_subject": "",
      "proxy_address": "",
      "auto_compress": "0",
      "proxyid": "30091",
      "interface": []
    },
    {
      "host": "Passive proxy",
      "status": "6",
      "lastaccess": "0",
      "description": "",
      "tls_connect": "1",
      "tls_accept": "1",
      "tls_issuer": "",
      "tls_subject": "",
      "proxy_address": "",
      "auto_compress": "0",
      "proxyid": "30092",
      "interface": {
        "interfaceid": "30109",
        "hostid": "30092",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "10051"
      }
    }
  ],
  "id": 1
}
```

proxy.update

Description

object proxy.update(object/array proxies)

This method allows to update existing proxies.

**Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Proxy properties to be updated.

The proxyid property must be defined for each proxy, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard proxy properties](#), the method accepts the following parameters.

| Parameter | Type   | Description  |
|-----------|--------|--|
| hosts     | array  | <a href="#">Hosts</a> to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy.     |
| interface | object | The hosts must have the <code>hostid</code> property defined.<br>Host <a href="#">interface</a> to replace the existing interface for the passive proxy. |

Return values

(object) Returns an object containing the IDs of the updated proxies under the proxyids property.

Examples

Change hosts monitored by a proxy

Update the proxy to monitor the two given hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.update",
  "params": {
    "proxyid": "10293",
    "hosts": [
      {
        "hostid": "10294"
      },
      {
        "hostid": "10295"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10293"
    ]
  },
}
```

```
"id": 1
}
```

Change proxy status

Change the proxy to an active proxy and rename it to "Active proxy".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.update",
  "params": {
    "proxyid": "10293",
    "host": "Active proxy",
    "status": "5"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10293"
    ]
  },
  "id": 1
}
```

CProxy::update() in *ui/include/classes/api/services/CProxy.php*.

## Regular expression

This class is designed to work with global regular expressions.

Object references:

- [Regular expression](#)

Available methods:

- [regexp.create](#) - creating new regular expressions
- [regexp.delete](#) - deleting regular expressions
- [regexp.get](#) - retrieving regular expressions
- [regexp.update](#) - updating regular expressions

## > Regular expression object

The following objects are directly related to the `regexp` API.

Regular expression

The global regular expression object has the following properties.

| Property                  | Type   | Description                                       |
|---------------------------|--------|---|
| regexpid                  | string | ( <i>readonly</i> ) ID of the regular expression. |
| <b>name</b><br>(required) | string | Name of the regular expression.                   |
| test_string               | string | Test string.                                      |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## Expressions

The expressions object has the following properties.

| Property                             | Type    | Description  |
|--------------------------------------|---------|--|
| <b>expression</b><br>(required)      | string  | Regular expression.  |
| <b>expression_type</b><br>(required) | integer | Type of Regular expression.<br><br>Possible values:<br>0 - Character string included;<br>1 - Any character string included;<br>2 - Character string not included;<br>3 - Result is TRUE;<br>4 - Result is FALSE. |
| exp_delimiter                        | string  | Expression delimiter. Only when <code>expression_type</code> <i>Any character string included</i> .<br><br>Default value <code>,</code> .  |
| case_sensitive                       | integer | Possible values: <code>,</code> , <code>.</code> , <code>/</code> .<br>Case sensitivity.<br><br>Default value 0.<br><br>Possible values:<br>0 - Case insensitive;<br>1 - Case sensitive.                         |

## regexp.create

### Description

`object regexp.create(object/array regularExpressions)`

This method allows to create new global regular expressions.

#### Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Regular expressions to create.

Additionally to the [standard properties](#), the method accepts the following parameters.

| Parameter   | Type  | Description                          |
|-------------|-------|--------------------------------------|
| expressions | array | <a href="#">Expressions</a> options. |

### Return values

(object) Returns an object containing the IDs of the created regular expressions under the `regexpids` property.

## Examples

Creating a new global regular expression.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regex.create",
  "params": {
    "name": "Storage devices for SNMP discovery",
    "test_string": "/boot",
    "expressions": [
      {
        "expression": "^(Physical memory|Virtual memory|Memory buffers|Cached memory|Swap space)$",
        "expression_type": "4",
        "case_sensitive": "1"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "regexpids": [
      "16"
    ]
  },
  "id": 1
}
```

## Source

CRegexp::create() in `ui/include/classes/api/services/CRegexp.php`.

## regex.delete

### Description

object regex.delete(array regexpids)

This method allows to delete global regular expressions.

#### Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(array) IDs of the regular expressions to delete.

### Return values

(object) Returns an object containing the IDs of the deleted regular expressions under the `regexpids` property.

## Examples

Deleting multiple global regular expressions.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regex.delete",
  "params": [
```

```

        "16",
        "17"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "regexpsids": [
      "16",
      "17"
    ]
  },
  "id": 1
}

```

Source

CRegexp::delete() in ui/include/classes/api/services/CRegexp.php.

## regex.get

Description

integer/array regex.get(object parameters)

The method allows to retrieve global regular expressions according to the given parameters.

### Note:

This method is available only to *Super Admin*. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| regexpsids             | string/array | Return only regular expressions with the given IDs.                          |
| selectExpressions      | query        | Return a <b>expressions</b> property.  |
| sortfield              | string/array | Sort the result by the given properties.                                     |
|                        |              | Possible values are: <code>regexpid</code> and <code>name</code> .           |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

Retrieving global regular expressions.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regexp.get",
  "params": {
    "output": ["regexpid", "name"],
    "selectExpressions": ["expression", "expression_type"],
    "regexpids": [1, 2],
    "preservekeys": true
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "1": {
      "regexpid": "1",
      "name": "File systems for discovery",
      "expressions": [
        {
          "expression": "^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|ntfs|fat32|)",
          "expression_type": "3"
        }
      ]
    },
    "2": {
      "regexpid": "2",
      "name": "Network interfaces for discovery",
      "expressions": [
        {
          "expression": "^Software Loopback Interface",
          "expression_type": "4"
        },
        {
          "expression": "^(In)?[Ll]oop[Bb]ack[0-9._]*$",
          "expression_type": "4"
        },
        {
          "expression": "^NULL[0-9.*]*$",
          "expression_type": "4"
        },
        {
          "expression": "^[Ll]o[0-9.*]*$",
          "expression_type": "4"
        },
        {
          "expression": "^[Ss]ystem$",
          "expression_type": "4"
        },
        {
          "expression": "^Nu[0-9.*]*$",
          "expression_type": "4"
        }
      ]
    }
  ]
}
```

```

    }
  },
  "id": 1
}

```

## regex.update

Description

object regex.update(object/array regularExpressions)

This method allows to update existing global regular expressions.

### Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Regular expression properties to be updated.

The `regexpid` property must be defined for each object, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard properties](#), the method accepts the following parameters.

| Parameter   | Type  | Description                          |
|-------------|-------|--------------------------------------|
| expressions | array | <a href="#">Expressions</a> options. |

Return values

(object) Returns an object containing the IDs of the updated regular expressions under the `regexpids` property.

Examples

Updating global regular expression for file systems discovery.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "regex.update",
  "params": {
    "regexpid": "1",
    "name": "File systems for discovery",
    "test_string": "",
    "expressions": [
      {
        "expression": "^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|zfs)$",
        "expression_type": "3",
        "exp_delimiter": ",",
        "case_sensitive": "0"
      },
      {
        "expression": "^(ntfs|fat32|fat16)$",
        "expression_type": "3",
        "exp_delimiter": ",",
        "case_sensitive": "0"
      }
    ]
  },
  "auth": "700ca65537074ec963db7efabda78259",

```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "regexpids": [
      "1"
    ]
  },
  "id": 1
}
```

## Report

This class is designed to work with scheduled reports.

Object references:

- [Report](#)
- [Users](#)
- [User groups](#)

Available methods:

- [report.create](#) - create new scheduled reports
- [report.delete](#) - delete scheduled reports
- [report.get](#) - retrieve scheduled reports
- [report.update](#) - update scheduled reports

### > Report object

The following objects are directly related to the `report` API.

Report

The report object has the following properties:

| Property                         | Type    | Description  |
|----------------------------------|---------|--|
| reportid                         | string  | ( <i>readonly</i> ) ID of the report.  |
| <b>userid</b><br>(required)      | string  | ID of the user who created the report.   |
| <b>name</b><br>(required)        | string  | Unique name of the report.   |
| <b>dashboardid</b><br>(required) | string  | ID of the dashboard that the report is based on.   |
| period                           | integer | Period for which the report will be prepared.<br><br>Possible values:<br>0 - ( <i>default</i> ) previous day;<br>1 - previous week;<br>2 - previous month;<br>3 - previous year. |

| Property     | Type      | Description  |
|--------------|-----------|--|
| cycle        | integer   | Period repeating schedule.<br><br>Possible values:<br>0 - ( <i>default</i> ) daily;<br>1 - weekly;<br>2 - monthly;<br>3 - yearly.  |
| start_time   | integer   | Time of the day, in seconds, when the report will be prepared for sending.   |
| weekdays     | integer   | Default: 0.<br>Days of the week for sending the report.<br><br>Required for weekly reports only.<br><br>Possible bitmap values:<br>1 - Monday;<br>2 - Tuesday;<br>4 - Wednesday;<br>8 - Thursday;<br>16 - Friday;<br>32 - Saturday;<br>64 - Sunday.<br><br>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 21 for Monday, Wednesday, and Friday). |
| active_since | string    | Default: 0.<br>On which date to start.<br><br>Possible values:<br>empty string - ( <i>default</i> ) not specified (stored as 0);<br>specific date in YYYY-MM-DD format (stored as a timestamp of the beginning of a day (00:00:00)).   |
| active_till  | string    | On which date to end.<br><br>Possible values:<br>empty string - ( <i>default</i> ) not specified (stored as 0);<br>specific date in YYYY-MM-DD format (stored as a timestamp of the end of a day (23:59:59)).  |
| subject      | string    | Report message subject.  |
| message      | string    | Report message text.   |
| status       | integer   | Whether the report is enabled or disabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - ( <i>default</i> ) Enabled.   |
| description  | text      | Description of the report.   |
| state        | integer   | ( <i>readonly</i> ) State of the report.<br><br>Possible values:<br>0 - ( <i>default</i> ) report was not yet processed;<br>1 - report was generated and successfully sent to all recipients;<br>2 - report generating failed; "info" contains error information;<br>3 - report was generated, but sending to some (or all) recipients failed; "info" contains error information.        |
| lastsent     | timestamp | ( <i>readonly</i> ) Unix timestamp of the last successfully sent report.   |
| info         | string    | ( <i>readonly</i> ) Error description or additional information.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## Users

The users object has the following properties:

| Property                    | Type    | Description   |
|-----------------------------|---------|---|
| <b>userid</b><br>(required) | string  | ID of user to send the report to.   |
| access_userid               | string  | ID of user on whose behalf the report will be generated.  |
| exclude                     | integer | 0 - <i>(default)</i> Generate report by recipient.<br>Whether to exclude the user from mailing list.<br><br>Possible values:<br>0 - <i>(default)</i> Include;<br>1 - Exclude. |

## User groups

The user groups object has the following properties:

| Property                      | Type   | Description  |
|-------------------------------|--------|--|
| <b>usrgrpId</b><br>(required) | string | ID of user group to send the report to.                  |
| access_userid                 | string | ID of user on whose behalf the report will be generated. |
|                               |        | 0 - <i>(default)</i> Generate report by recipient.       |

## report.create

### Description

`object report.create(object/array reports)`

This method allows to create new scheduled reports.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Scheduled reports to create.

Additionally to the [standard scheduled report properties](#), the method accepts the following parameters.

| Parameter   | Type         | Description  |
|-------------|--------------|--|
| users       | object/array | <a href="#">Users</a> to send the report to.       |
| user_groups | object/array | <a href="#">User groups</a> to send the report to. |

### Return values

(object) Returns an object containing the IDs of the created scheduled reports under the `reportids` property. The order of the returned IDs matches the order of the passed scheduled reports.

### Examples

#### Creating a scheduled report

Create a weekly report that will be prepared for the previous week every Monday-Friday at 12:00 from 2021-04-01 to 2021-08-31.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "report.create",
  "params": {
    "userid": "1",
    "name": "Weekly report",
    "dashboardid": "1",
    "period": "1",
    "cycle": "1",
    "start_time": "43200",
    "weekdays": "31",
    "active_since": "2021-04-01",
    "active_till": "2021-08-31",
    "subject": "Weekly report",
    "message": "Report accompanying text",
    "status": "1",
    "description": "Report description",
    "users": [
      {
        "userid": "1",
        "access_userid": "1",
        "exclude": "0"
      },
      {
        "userid": "2",
        "access_userid": "0",
        "exclude": "1"
      }
    ],
    "user_groups": [
      {
        "usrgrpid": "7",
        "access_userid": "0"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "reportids": [
      "1"
    ]
  },
  "id": 1
}

```

- [Users](#)
- [User groups](#)

Source

CReport::create() in `ui/include/classes/api/services/CReport.php`.

## report.delete

Description

`object report.delete(array reportids)`

This method allows to delete scheduled reports.

**Note:**

This method is only available to *Admin* and *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the scheduled reports to delete.

Return values

(object) Returns an object containing the IDs of the deleted scheduled reports under the `reportids` property.

Examples

Deleting multiple scheduled reports

Delete two scheduled reports.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.delete",
  "params": [
    "1",
    "2"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "reportids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

`CReport::delete()` in `ui/include/classes/api/services/CReport.php`.

## **report.get**

Description

`integer/array report.get(object parameters)`

The method allows to retrieve scheduled reports according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| reportids              | string/array | Return only scheduled reports with the given report IDs.  |
| expired                | boolean      | If set to true returns only expired scheduled reports, if false - only active scheduled reports.                    |
| selectUsers            | query        | Return a <b>users</b> property with users the report is configured to be sent to.                                   |
| selectUserGroups       | query        | Return a <b>user_groups</b> property with user groups the report is configured to be sent to.                       |
| sortfield              | string/array | Sort the result by the given properties.  |
| countOutput            | boolean      | Possible values are: reportid, name, status.<br>These parameters are described in the <b>reference commentary</b> . |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving report data

Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.get",
  "params": [
    "output": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
    "reportids": ["1", "2"]
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "reportid": "1",
      "userid": "1",
      "name": "Weekly report",
      "dashboardid": "1",
      "period": "1",
      "cycle": "1",
      "start_time": "43200",
      "weekdays": "31",
      "active_since": "2021-04-01",
      "active_till": "2021-08-31",
    }
  ]
}
```

```

    "subject": "Weekly report",
    "message": "Report accompanying text",
    "status": "1",

## report.update

### Description

object report.update(object/array reports)

This method allows to update existing scheduled reports.

#### Note:

This method is only available to *Admin* and *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Scheduled report properties to be updated.

The `reportid` property must be defined for each scheduled report, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard scheduled report properties](#) the method accepts the following parameters.

| Parameter   | Type         | Description  |
|-------------|--------------|--|
| users       | object/array | <a href="#">Users</a> to replace the current users assigned to the scheduled report.             |
| user_groups | object/array | <a href="#">User groups</a> to replace the current user groups assigned to the scheduled report. |

### Return values

(object) Returns an object containing the IDs of the updated scheduled reports under the `reportids` property.

### Examples

#### Disabling scheduled report

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.update",
  "params": {
    "reportid": "1",
    "status": "0"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "reportids": [
      "1"
    ]
  },
  "id": 1
}
```

### See also

## Role

This class is designed to work with user roles.

Object references:

- [Role](#)
- [Role rules](#)
- [UI element](#)
- [Service](#)
- [Service tag](#)
- [Module](#)
- [Action](#)

Available methods:

- [role.create](#) - create new user roles
- [role.delete](#) - delete user roles
- [role.get](#) - retrieve user roles
- [role.update](#) - update user roles

### > Role object

The following objects are directly related to the `role` API.

Role

The role object has the following properties:

| Property                               | Type    | Description   |
|--|---------|---|
| <code>roleid</code>                    | string  | <i>(readonly)</i> ID of the role.   |
| <b><code>name</code></b><br>(required) | string  | Name of the role.   |
| <b><code>type</code></b><br>(required) | integer | User type.<br><br>Possible values:<br>1 - <i>(default)</i> User;<br>2 - Admin;<br>3 - Super admin.              |
| <code>readonly</code>                  | integer | <i>(readonly)</i> Whether the role is readonly.<br><br>Possible values:<br>0 - <i>(default)</i> No;<br>1 - Yes. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Role rules

The role rules object has the following properties:

| Property                       | Type    | Description   |
|--------------------------------|---------|---|
| <code>ui</code>                | array   | Array of the <a href="#">UI element</a> objects.  |
| <code>ui.default_access</code> | integer | Whether access to new UI elements is enabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - <i>(default)</i> Enabled. |

| Property               | Type    | Description  |
|------------------------|---------|--|
| services.read.mode     | integer | Read-only access to services.<br><br>Possible values:<br><br>0 - Read-only access to the services, specified by the <code>services.read.list</code> or matched by the <code>services.read.tag</code> properties.<br>1 - <i>(default)</i> Read-only access to all services.   |
| services.read.list     | array   | Array of <b>Service</b> objects.<br><br>The specified services, including child services, will be granted a read-only access to the user role. Read-only access will not override read-write access to the services.   |
| services.read.tag      | object  | Only used if <code>services.read.mode</code> is set to 0.<br>Array of <b>Service tag</b> object.<br><br>The tag matched services, including child services, will be granted a read-only access to the user role. Read-only access will not override read-write access to the services.   |
| services.write.mode    | integer | Only used if <code>services.read.mode</code> is set to 0.<br>Read-write access to services.<br><br>Possible values:<br><br>0 - <i>(default)</i> Read-write access to the services, specified by the <code>services.write.list</code> or matched by the <code>services.write.tag</code> properties.<br>1 - Read-write access to all services. |
| services.write.list    | array   | Array of <b>Service</b> objects.<br><br>The specified services, including child services, will be granted a read-write access to the user role. Read-write access will override read-only access to the services.  |
| services.write.tag     | object  | Only used if <code>services.write.mode</code> is set to 0.<br>Array of <b>Service tag</b> object.<br><br>The tag matched services, including child services, will be granted a read-write access to the user role. Read-write access will override read-only access to the services.   |
| modules                | array   | Only used if <code>services.write.mode</code> is set to 0.<br>Array of the <b>module</b> objects.  |
| modules.default_access | integer | Whether access to new modules is enabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - <i>(default)</i> Enabled.  |
| api.access             | integer | Whether access to API is enabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - <i>(default)</i> Enabled.  |
| api.mode               | integer | Mode for treating API methods listed in the <code>api</code> property.<br><br>Possible values:<br>0 - <i>(default)</i> Deny list;<br>1 - Allow list.   |
| api                    | array   | Array of API methods.  |

| Property               | Type    | Description   |
|------------------------|---------|---|
| actions                | array   | Array of the <b>action</b> objects.   |
| actions.default_access | integer | Whether access to new actions is enabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - <i>(default)</i> Enabled. |

## UI element

The UI element object has the following properties:

| Property                  | Type   | Description  |
|---------------------------|--------|--|
| <b>name</b><br>(required) | string | <p>Name of the UI element.</p> <p>Possible values for users of any type:<br/> monitoring.dashboard - <i>Monitoring → Dashboard</i>;<br/> monitoring.problems - <i>Monitoring → Problems</i>;<br/> monitoring.hosts - <i>Monitoring → Hosts</i>;<br/> monitoring.latest_data - <i>Monitoring → Latest data</i>;<br/> monitoring.maps - <i>Monitoring → Maps</i>;<br/> services.services - <i>Services → Services</i>;<br/> services.sla_report - <i>Services → SLA report</i>;<br/> inventory.overview - <i>Inventory → Overview</i>;<br/> inventory.hosts - <i>Inventory → Hosts</i>;<br/> reports.availability_report - <i>Reports → Availability report</i>;<br/> reports.top_triggers - <i>Reports → Triggers top 100</i>.</p> <p>Possible values only for users of <i>Admin</i> and <i>Super admin</i> user types:<br/> monitoring.discovery - <i>Monitoring → Discovery</i>;<br/> services.actions - <i>Services → Service actions</i>;<br/> services.sla - <i>Services → SLA</i>;<br/> reports.scheduled_reports - <i>Reports → Scheduled reports</i>;<br/> reports.notifications - <i>Reports → Notifications</i>;<br/> configuration.host_groups - <i>Configuration → Host groups</i>;<br/> configuration.templates - <i>Configuration → Templates</i>;<br/> configuration.hosts - <i>Configuration → Hosts</i>;<br/> configuration.maintenance - <i>Configuration → Maintenance</i>;<br/> configuration.actions - <i>Configuration → Actions</i>;<br/> configuration.discovery - <i>Configuration → Discovery</i>.</p> <p>Possible values only for users of <i>Super admin</i> user type:<br/> reports.system_info - <i>Reports → System information</i>;<br/> reports.audit - <i>Reports → Audit</i>;<br/> reports.action_log - <i>Reports → Action log</i>;<br/> configuration.event_correlation - <i>Configuration → Event correlation</i>;<br/> administration.general - <i>Administration → General</i>;<br/> administration.proxies - <i>Administration → Proxies</i>;<br/> administration.authentication - <i>Administration → Authentication</i>;<br/> administration.user_groups - <i>Administration → User groups</i>;<br/> administration.user_roles - <i>Administration → User roles</i>;<br/> administration.users - <i>Administration → Users</i>;<br/> administration.media_types - <i>Administration → Media types</i>;<br/> administration.scripts - <i>Administration → Scripts</i>;<br/> administration.queue - <i>Administration → Queue</i>.</p> |

| Property | Type    | Description  |
|----------|---------|--|
| status   | integer | Whether access to the UI element is enabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - <i>(default)</i> Enabled. |

#### Service

| Property                       | Type   | Description        |
|--------------------------------|--------|--------------------|
| <b>serviceid</b><br>(required) | string | ID of the Service. |

#### Service tag

| Property                 | Type   | Description  |
|--------------------------|--------|--|
| <b>tag</b><br>(required) | string | Tag name.<br><br>If empty string is specified, the service tag will not be used for service matching.            |
| value                    | string | Tag value.<br><br>If no value or empty string is specified, only the tag name will be used for service matching. |

#### Module

The module object has the following properties:

| Property                      | Type    | Description  |
|-------------------------------|---------|--|
| <b>moduleid</b><br>(required) | string  | ID of the module.  |
| status                        | integer | Whether access to the module is enabled.<br><br>Possible values:<br>0 - Disabled;<br>1 - <i>(default)</i> Enabled. |

#### Action

The action object has the following properties:

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| <b>name</b><br>(required) | string  | <p>Name of the action.</p> <p>Possible values for users of any type:</p> <p>edit_dashboards - Create and edit dashboards;</p> <p>edit_maps - Create and edit maps;</p> <p>add_problem_comments - Add problem comments;</p> <p>change_severity - Change problem severity;</p> <p>acknowledge_problems - Acknowledge problems;</p> <p>close_problems - Close problems;</p> <p>execute_scripts - Execute scripts;</p> <p>manage_api_tokens - Manage API tokens.</p> <p>Possible values only for users of <i>Admin</i> and <i>Super admin</i> user types:</p> <p>edit_maintenance - Create and edit maintenances;</p> <p>manage_scheduled_reports - Manage scheduled reports;</p> <p>manage_sla - Manage SLA.</p> |
| status                    | integer | <p>Whether access to perform the action is enabled.</p> <p>Possible values:</p> <p>0 - Disabled;</p> <p>1 - <i>(default)</i> Enabled.</p>   |

## role.create

### Description

object role.create(object/array roles)

This method allows to create new roles.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Roles to create.

Additionally to the [standard role properties](#), the method accepts the following parameters.

| Parameter | Type  | Description  |
|-----------|-------|--|
| rules     | array | Role <a href="#">rules</a> to be created for the role. |

### Return values

(object) Returns an object containing the IDs of the created roles under the `roleids` property. The order of the returned IDs matches the order of the passed roles.

### Examples

#### Creating a role

Create a role with type "User" and denied access to two UI elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.create",
  "params": {
    "name": "Operator",
    "type": "1",
    "rules": {
```

```

        "ui": [
            {
                "name": "monitoring.hosts",
                "status": "0"
            },
            {
                "name": "monitoring.maps",
                "status": "0"
            }
        ]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "roleids": [
            "5"
        ]
    },
    "id": 1
}

```

- [Action](#)

Source

CRole::create() in `ui/include/classes/api/services/CRole.php`.

## role.delete

Description

object role.delete(array roleids)

This method allows to delete roles.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the roles to delete.

Return values

(object) Returns an object containing the IDs of the deleted roles under the `roleids` property.

Examples

Deleting multiple user roles

Delete two user roles.

Request:

```

{
    "jsonrpc": "2.0",

```

```

    "method": "role.delete",
    "params": [
        "4",
        "5"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "roleids": [
            "4",
            "5"
        ]
    },
    "id": 1
}

```

Source

CRole::delete() in *ui/include/classes/api/services/CRole.php*.

## role.get

Description

integer/array role.get(object parameters)

The method allows to retrieve roles according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| roleids                | string/array | Return only roles with the given IDs.   |
| selectRules            | query        | Return role rules in the <a href="#">rules</a> property.  |
| selectUsers            | query        | Select <a href="#">users</a> this role is assigned to.  |
| sortfield              | string/array | See <a href="#">user.get</a> for restrictions based on user type.<br>Sort the result by the given properties. |
| countOutput            | boolean      | Possible values are: roleid, name.  |
| editable               | boolean      | These parameters are described in the <a href="#">reference commentary</a> .                                  |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |

| Parameter   | Type    | Description |
|-------------|---------|-------------|
| startSearch | boolean |             |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving role data

Retrieve "Super admin role" role data and its access rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.get",
  "params": {
    "output": "extend",
    "selectRules": "extend",
    "roleids": "3"
  },
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "roleid": "3",
      "name": "Super admin role",
      "type": "3",
      "readonly": "1",
      "rules": {
        "ui": [
          {
            "name": "inventory.hosts",
            "status": "1"
          },
          {
            "name": "inventory.overview",
            "status": "1"
          },
          {
            "name": "monitoring.dashboard",
            "status": "1"
          },
          {
            "name": "monitoring.hosts",
            "status": "1"
          },
          {
            "name": "monitoring.latest_data",
            "status": "1"
          },
          {
            "name": "monitoring.maps",
            "status": "1"
          }
        ]
      }
    }
  ]
}
```

```

{

## role.update

Description

`object role.update(object/array roles)`

This method allows to update existing roles.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Role properties to be updated.

The `roleid` property must be defined for each role, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard role properties](#) the method accepts the following parameters.

| Parameter          | Type  | Description  |
|--------------------|-------|--|
| <code>rules</code> | array | Access <a href="#">rules</a> to update for the role. |

Return values

(object) Returns an object containing the IDs of the updated roles under the `roleids` property.

Examples

Disabling ability to execute scripts

Update role with ID "5", disable ability to execute scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.update",
  "params": [
    {
      "roleid": "5",
      "rules": {
        "actions": [
          {
            "name": "execute_scripts",
            "status": "0"
          }
        ]
      }
    ]
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "roleids": [
      "5"
    ]
  },
  "id": 1
}
```

Limiting access to API

Update role with ID "5", deny to call any "create", "update" or "delete" methods.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.update",
  "params": [
    {
      "roleid": "5",
      "rules": {
        "api.access": "1",
        "api.mode": "0",
        "api": ["*.create", "/*.update", "/*.delete"]
      }
    }
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "roleids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

`CRole::update()` in `ui/include/classes/api/services/CRole.php`.

## Script

This class is designed to work with scripts.

Object references:

- [Script](#)
- [Webhook parameters](#)
- [Debug](#)
- [Log entry](#)

Available methods:

- [script.create](#) - create new scripts
- [script.delete](#) - delete scripts
- [script.execute](#) - run scripts

- [script.get](#) - retrieve scripts
- [script.getscriptsbyhosts](#) - retrieve scripts for hosts
- [script.update](#) - update scripts

## > Script object

The following objects are directly related to the `script` API.

Script

The script object has the following properties.

| Property                                  | Type    | Description   |
|---|---------|---|
| <code>scriptid</code>                     | string  | ( <i>readonly</i> ) ID of the script.   |
| <b><code>name</code></b><br>(required)    | string  | Name of the script.   |
| <b><code>type</code></b><br>(required)    | integer | Script type.<br><br>Possible values:<br>0 - Script;<br>1 - IPMI;<br>2 - SSH;<br>3 - Telnet;<br>5 - ( <i>default</i> ) Webhook.  |
| <b><code>command</code></b><br>(required) | string  | Command to run.   |
| <code>scope</code>                        | integer | Script scope.<br><br>Possible values:<br>1 - <i>default</i> action operation;<br>2 - manual host action;<br>4 - manual event action.  |
| <code>execute_on</code>                   | integer | Where to run the script.<br>Used if <code>type</code> is 0 (script).<br><br>Possible values:<br>0 - run on Zabbix agent;<br>1 - run on Zabbix server;<br>2 - ( <i>default</i> ) run on Zabbix server (proxy). |
| <code>menu_path</code>                    | string  | Folders separated by slash that form a menu like navigation in frontend when clicked on host or event.<br>Used if <code>scope</code> is 2 or 4.   |
| <code>authtype</code>                     | integer | Authentication method used for SSH script type.<br>Used if <code>type</code> is 2.<br><br>Possible values:<br>0 - password;<br>1 - public key.  |
| <code>username</code>                     | string  | User name used for authentication.<br>Required if <code>type</code> is 2 or 3.  |
| <code>password</code>                     | string  | Password used for SSH scripts with password authentication and Telnet scripts.<br>Used if <code>type</code> is 2 and <code>authtype</code> is 0 or <code>type</code> is 3.                                    |
| <code>publickey</code>                    | string  | Name of the public key file used for SSH scripts with public key authentication.<br>Required if <code>type</code> is 2 and <code>authtype</code> is 1.  |
| <code>privatekey</code>                   | string  | Name of the private key file used for SSH scripts with public key authentication.<br>Required if <code>type</code> is 2 and <code>authtype</code> is 1.   |
| <code>port</code>                         | string  | Port number used for SSH and Telnet scripts.<br>Used if <code>type</code> is 2 or 3.  |

| Property     | Type    | Description   |
|--------------|---------|---|
| groupid      | string  | ID of the host group that the script can be run on. If set to 0, the script will be available on all host groups.   |
| usrgrpid     | string  | Default: 0.<br>ID of the user group that will be allowed to run the script. If set to 0, the script will be available for all user groups.<br>Used if scope is 2 or 4.                        |
| host_access  | integer | Default: 0.<br>Host permissions needed to run the script.<br>Used if scope is 2 or 4.   |
| confirmation | string  | Possible values:<br>2 - (default) read;<br>3 - write.<br>Confirmation pop up text. The pop up will appear when trying to run the script from the Zabbix frontend.<br>Used if scope is 2 or 4. |
| timeout      | string  | Webhook script execution timeout in seconds. Time suffixes are supported, e.g. 30s, 1m.<br>Required if type is 5.<br><br>Possible values:<br>1-60s  |
| parameters   | array   | Default value:<br>30s<br>Array of <b>webhook input parameters</b> .<br>Used if type is 5.   |
| description  | string  | Description of the script.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Webhook parameters

Parameters passed to webhook script when it is called have the following properties.

| Property                  | Type   | Description                               |
|---------------------------|--------|---|
| <b>name</b><br>(required) | string | Parameter name.                           |
| value                     | string | Parameter value. Supports <b>macros</b> . |

#### Debug

Debug information of executed webhook script. The debug object has the following properties.

| Property | Type   | Description                                |
|----------|--------|--|
| logs     | array  | Array of <b>log entries</b> .              |
| ms       | string | Script execution duration in milliseconds. |

#### Log entry

The log entry object has the following properties.

| Property | Type    | Description   |
|----------|---------|---|
| level    | integer | Log level.  |
| ms       | string  | The time elapsed in milliseconds since the script was run before log entry was added. |

| Property | Type   | Description  |
|----------|--------|--------------|
| message  | string | Log message. |

## script.create

### Description

object script.create(object/array scripts)

This method allows to create new scripts.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Scripts to create.

The method accepts scripts with the **standard script properties**.

### Return values

(object) Returns an object containing the IDs of the created scripts under the `scriptids` property. The order of the returned IDs matches the order of the passed scripts.

### Examples

Create a webhook script

Create a webhook script that sends HTTP request to external service.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "Webhook script",
    "command": "try {\n var request = new HttpRequest(),\n response,\n data;\n\n request.addHeader('Co",
    "type": 5,
    "timeout": "40s",
    "parameters": [
      {
        "name": "token",
        "value": "${WEBHOOK.TOKEN}"
      },
      {
        "name": "host",
        "value": "${HOST.HOST}"
      },
      {
        "name": "v",
        "value": "2.2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
```

```

    "3"
  ],
  },
  "id": 1
}

```

Create an SSH script

Create an SSH script with public key authentication that can be executed on a host and has a context menu.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "SSH script",
    "command": "my script command",
    "type": 2,
    "username": "John",
    "publickey": "pub.key",
    "privatekey": "priv.key",
    "password": "secret",
    "port": "12345",
    "scope": 2,
    "menu_path": "All scripts/SSH",
    "usrgrp": "7",
    "groupid": "4"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "5"
    ]
  },
  "id": 1
}

```

Create a custom script

Create a custom script that will reboot a server. The script will require write access to the host and will display a configuration message before running in the frontend.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "Reboot server",
    "command": "reboot server 1",
    "confirmation": "Are you sure you would like to reboot the server?",
    "scope": 2,
    "type": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "4"
    ]
  },
  "id": 1
}
```

Source

CScript::create() in *ui/include/classes/api/services/CScript.php*.

## script.delete

Description

object script.delete(array scriptIds)

This method allows to delete scripts.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the scripts to delete.

Return values

(object) Returns an object containing the IDs of the deleted scripts under the `scriptids` property.

Examples

Delete multiple scripts

Delete two scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.delete",
  "params": [
    "3",
    "4"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "3",
      "4"
    ]
  },
  "id": 1
}
```

Source

CScript::delete() in *ui/include/classes/api/services/CScript.php*.

## script.execute

### Description

`object script.execute(object parameters)`

This method allows to run a script on a host or event.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters containing the ID of the script to run and either the ID of the host or the ID of the event.

| Parameter                     | Type   | Description                           |
|-------------------------------|--------|---------------------------------------|
| <b>scriptid</b><br>(required) | string | ID of the script to run.              |
| hostid                        | string | ID of the host to run the script on.  |
| eventid                       | string | ID of the event to run the script on. |

### Return values

(object) Returns the result of script execution.

| Property | Type   | Description   |
|----------|--------|---|
| response | string | Whether the script was run successfully.  |
| value    | string | Possible value - success.<br>Script output.   |
| debug    | object | Contains a <b>debug object</b> if a webhook script is executed. For other script types, it contains empty object. |

### Examples

#### Run a webhook script

Run a webhook script that sends HTTP request to external service.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.execute",
  "params": {
    "scriptid": "4",
    "hostid": "30079"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "value": "{\"status\":\"sent\",\"timestamp\":\"1611235391\"}",
    "debug": {
      "logs": [
        {
          "level": 3,

```

```

        "ms": 480,
        "message": "[Webhook Script] HTTP status: 200."
    },
    ],
    "ms": 495
},
},
"id": 1
}

```

Run a custom script

Run a “ping” script on a host.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "script.execute",
  "params": {
    "scriptid": "1",
    "hostid": "30079"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "value": "PING 127.0.0.1 (127.0.0.1) 56(84) bytes of data.\n64 bytes from 127.0.0.1: icmp_req=1 tt",
    "debug": []
  },
  "id": 1
}

```

CScript::execute() in *ui/include/classes/api/services/CScript.php*.

## script.get

Description

integer/array script.get(object parameters)

The method allows to retrieve scripts according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type         | Description   |
|--------------|--------------|---|
| groupids     | string/array | Return only scripts that can be run on the given host groups.                   |
| hostids      | string/array | Return only scripts that can be run on the given hosts.                         |
| scriptids    | string/array | Return only scripts with the given IDs.   |
| usrgrpsids   | string/array | Return only scripts that can be run by users in the given user groups.          |
| selectGroups | query        | Return a <b>groups</b> property with host groups that the script can be run on. |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| selectHosts            | query        | Return a <b>hosts</b> property with hosts that the script can be run on.          |
| selectActions          | query        | Return a <b>actions</b> property with actions that the script is associated with. |
| sortfield              | string/array | Sort the result by the given properties.  |
|                        |              | Possible values are: scriptid and name.   |
|                        |              | These parameters are described in the <b>reference commentary</b> .               |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieve all scripts

Retrieve all configured scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "scriptid": "1",
      "name": "Ping",
      "command": "/bin/ping -c 3 {HOST.CONN} 2>&1",

## script.getscriptsbyhosts

### Description

object script.getscriptsbyhosts(array hostIds)

This method allows to retrieve scripts available on the given hosts.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(string/array) IDs of hosts to return scripts for.

### Return values

(object) Returns an object with host IDs as properties and arrays of available scripts as values.

#### Note:

The method will automatically expand macros in the confirmation text.

### Examples

#### Retrieve scripts by host IDs

Retrieve all scripts available on hosts "30079" and "30073".

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.getscriptsbyhosts",
  "params": [
    "30079",
    "30073"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "30079": [
      {
        "scriptid": "3",

CScript::getScriptsByHosts() in *ui/include/classes/api/services/CScript.php*.

### script.update

#### Description

object script.update(object/array scripts)

This method allows to update existing scripts.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(object/array) **Script properties** to be updated.

The `scriptid` property must be defined for each script, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged. An exception is type property change from 5 (Webhook) to other: the `parameters` property will be cleaned.

#### Return values

(object) Returns an object containing the IDs of the updated scripts under the `scriptids` property.

#### Examples

##### Change script command

Change the command of the script to `"/bin/ping -c 10 {HOST.CONN} 2>&1"`.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.update",
  "params": {
    "scriptid": "1",
    "command": "/bin/ping -c 10 {HOST.CONN} 2>&1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "1"
    ]
  },
  "id": 1
}
```

#### Source

CScript::update() in *ui/include/classes/api/services/CScript.php*.

## Service

This class is designed to work with IT infrastructure/business services.

Object references:

- [Service](#)
- [Status rule](#)
- [Service tag](#)
- [Service alarm](#)
- [Problem tag](#)

Available methods:

- [service.create](#) - creating new services
- [service.delete](#) - deleting services
- [service.get](#) - retrieving services
- [service.update](#) - updating services

### > Service object

The following objects are directly related to the `service` API.

Service

The service object has the following properties.

| Property                     | Type    | Description   |
|------------------------------|---------|---|
| <code>serviceid</code>       | string  | ( <i>readonly</i> ) ID of the service.  |
| <code>algorithm</code>       | integer | Status calculation rule. Only applicable if child services exist.<br><br>Possible values:<br>0 - set status to OK;<br>1 - most critical if all children have problems;<br>2 - most critical of child services.  |
| <code>name</code>            | string  | Name of the service.  |
| <code>sortorder</code>       | integer | Position of the service used for sorting.<br><br>Possible values: 0-999.  |
| <code>weight</code>          | integer | Service weight.<br><br>Possible values: 0-1000000.  |
| <code>propagationrule</code> | integer | Default: 0.<br>Status propagation rule. Must be set together with <code>propagation_value</code> .<br><br>Possible values:<br>0 - ( <i>default</i> ) propagate service status as is - without any changes;<br>1 - increase the propagated status by a given <code>propagation_value</code> (by 1 to 5 severities);<br>2 - decrease the propagated status by a given <code>propagation_value</code> (by 1 to 5 severities);<br>3 - ignore this service - the status is not propagated to the parent service at all;<br>4 - set fixed service status using a given <code>propagation_value</code> . |

| Property         | Type    | Description   |
|------------------|---------|---|
| propagation_rule | integer | Status propagation value. Must be set together with <code>propagation_rule</code> .<br><br>Possible values for <code>propagation_rule</code> with values 0 and 3: 0.<br><br>Possible values for <code>propagation_rule</code> with values 1 and 2: 1-5.<br><br>Possible values for <code>propagation_rule</code> with value 4:<br>-1 - OK;<br>0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster. |
| status           | integer | ( <i>readonly</i> ) Whether the service is in OK or problem state.<br><br>If the service is in problem state, <code>status</code> is equal either to:<br>- the severity of the most critical problem;<br>- the highest status of a child service in problem state.<br><br>If the service is in OK state, <code>status</code> is equal to -1.  |
| description      | string  | Description of the service.   |
| uuid             | string  | Universal unique identifier. For update operations this field is <i>readonly</i> .  |
| created          | integer | Unix timestamp when service was created.  |
| readonly         | boolean | ( <i>readonly</i> ) Access to the service.<br><br>Possible values:<br>0 - Read-write;<br>1 - Read-only.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Status rule

The status rule object has the following properties.

| Property                         | Type    | Description   |
|----------------------------------|---------|---|
| <b>type</b><br>(required)        | integer | Condition for setting (New status) status.<br><br>Possible values:<br>0 - if at least (N) child services have (Status) status or above;<br>1 - if at least (N%) of child services have (Status) status or above;<br>2 - if less than (N) child services have (Status) status or below;<br>3 - if less than (N%) of child services have (Status) status or below;<br>4 - if weight of child services with (Status) status or above is at least (W);<br>5 - if weight of child services with (Status) status or above is at least (N%);<br>6 - if weight of child services with (Status) status or below is less than (W);<br>7 - if weight of child services with (Status) status or below is less than (N%).<br><br>Where:<br>- N (W) is <code>limit_value</code> ;<br>- (Status) is <code>limit_status</code> ;<br>- (New status) is <code>new_status</code> . |
| <b>limit_value</b><br>(required) | integer | Limit value.<br><br>Possible values:<br>- for N and W: 1-100000;<br>- for N%: 1-100.  |

| Property                          | Type    | Description  |
|-----------------------------------|---------|--|
| <b>limit_status</b><br>(required) | integer | Limit status.<br><br>Possible values:<br>-1 - OK;<br>0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster. |
| <b>new_status</b><br>(required)   | integer | New status value.<br><br>Possible values:<br>0 - Not classified;<br>1 - Information;<br>2 - Warning;<br>3 - Average;<br>4 - High;<br>5 - Disaster.         |

### Service tag

The service tag object has the following properties.

| Property                 | Type   | Description        |
|--------------------------|--------|--------------------|
| <b>tag</b><br>(required) | string | Service tag name.  |
| value                    | string | Service tag value. |

### Service alarm

#### Note:

Service alarms cannot be directly created, updated or deleted via the Zabbix API.

The service alarm objects represent a service's state change. It has the following properties.

| Property  | Type      | Description                                      |
|---|-----------|--|
| clock   | timestamp | Time when the service state change has happened. |
| value   | integer   | Status of the service.                           |
| Refer to the <a href="#">service status property</a> for a list of possible values. |           |  |

### Problem tag

Problem tags allow linking services with problem events. The problem tag object has the following properties.

| Property                 | Type    | Description  |
|--------------------------|---------|--|
| <b>tag</b><br>(required) | string  | Problem tag name.  |
| operator                 | integer | Mapping condition operator.<br><br>Possible values:<br>0 - <i>(default)</i> equals;<br>2 - like. |
| value                    | string  | Problem tag value.   |

service.create

Description

object service.create(object/array services)

This method allows to create new services.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) services to create.

Additionally to the **standard service properties**, the method accepts the following parameters.

| Parameter    | Type  | Description   |
|--------------|-------|---|
| children     | array | Child services to be linked to the service.   |
| parents      | array | The children must have the serviceid property defined.<br>Parent services to be linked to the service.      |
| tags         | array | The parents must have the serviceid property defined.<br>Service <b>tags</b> to be created for the service. |
| problem_tags | array | <b>Problem tags</b> to be created for the service.  |
| status_rules | array | <b>Status rules</b> to be created for the service.  |

Return values

(object) Returns an object containing the IDs of the created services under the serviceids property. The order of the returned IDs matches the order of the passed services.

Examples

Creating a service

Create a service that will be switched to problem state, if at least one child has a problem.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.create",
  "params": {
    "name": "Server 1",
    "algorithm": 1,
    "sortorder": 1
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

CService::create() in *ui/include/classes/api/services/CService.php*.

## service.delete

### Description

object service.delete(array serviceIds)

This method allows to delete services.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(array) IDs of the services to delete.

### Return values

(object) Returns an object containing the IDs of the deleted services under the `serviceids` property.

### Examples

#### Deleting multiple services

Delete two services.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.delete",
  "params": [
    "4",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "4",
      "5"
    ]
  },
  "id": 1
}
```

## service.get

### Description

integer/array service.get(object parameters)

The method allows to retrieve services according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

## Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter            | Type         |  |
|----------------------|--------------|--|
| serviceids           | string/array | Return only services with the given IDs.   |
| parentids            | string/array | Return only services that are linked to the given parent services.   |
| deep_parentids       | flag         | Return all direct and indirect child services. Used together with <code>parentids</code> .   |
| childids             | string/array | Return only services that are linked to the given child services.  |
| evaltype             | integer      | Rules for tag searching.<br><br>Possible values:<br>0 - ( <i>default</i> ) And/Or;<br>2 - Or.  |
| tags                 | object/array | Return only services with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all services.<br><br>Possible operator values:<br>0 - ( <i>default</i> ) Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist.         |
| problem_tags         | object/array | Return only services with given problem tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all services.<br><br>Possible operator values:<br>0 - ( <i>default</i> ) Contains;<br>1 - Equals;<br>2 - Does not contain;<br>3 - Does not equal;<br>4 - Exists;<br>5 - Does not exist. |
| without_problem_tags | flag         | Return only services without problem tags.   |
| slaids               | string/array | Return only services that are linked to the specific SLA(s).   |
| selectChildren       | boolean      | Return a <code>children</code> property with the child services.<br><br>Supports count.  |
| selectParents        | boolean      | Return a <code>parents</code> property with the parent services.<br><br>Supports count.  |
| selectTags           | boolean      | Return a <code>tags</code> property with service tags.<br><br>Supports count.  |
| selectProblemEvents  | boolean      | Return a <code>problem_events</code> property with an array of problem event objects.<br><br>The problem event object has the following properties:<br><code>eventid</code> - ( <i>string</i> ) Event ID;<br><code>severity</code> - ( <i>string</i> ) Current event severity;<br><code>name</code> - ( <i>string</i> ) Resolved event name.   |
| selectProblemTags    | boolean      | Return a <code>problem_tags</code> property with problem tags.<br><br>Supports count.  |

| Parameter            | Type            |  |
|----------------------|-----------------|--|
| selectStatusRules    | boolean         | Return a <code>status_rules</code> property with status rules.   |
|                      |                 | Supports count.  |
| selectStatusTimeline | object/timeline | Return a <code>status_timeline</code> property containing service state changes for given periods.   |
|                      |                 | Format [{"period_from": "<period_from>", "period_to": "<period_to>"}, ...] - <code>period_from</code> being a starting date (inclusive; integer timestamp) and <code>period_to</code> being an ending date (exclusive; integer timestamp) for the period you're interested in. |
|                      |                 | Returns an array of entries containing a <code>start_value</code> property and an <code>alarms</code> array for the state changes within specified periods.  |
| sortfield            | string/array    | Sort the result by the given properties.   |
|                      |                 | Possible values are: <code>serviceid</code> , <code>name</code> , <code>status</code> , <code>sortorder</code> and <code>created_at</code> .   |
| countOutput          | boolean         | These parameters are described in the <a href="#">reference commentary</a> .   |
| editable             | boolean         |  |
| excludeSearch        | boolean         |  |
| filter               | object          |  |
| limit                | integer         |  |
| output               | query           |  |
| preservekeys         | boolean         |  |
| search               | object          |  |
| searchByAny          | boolean         |  |
| searchWildcard       | boolean         |  |
| sortorder            | string/array    |  |
| startSearch          | boolean         |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

##### Retrieving all services

Retrieve all data about all services and their dependencies.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.get",
  "params": {
    "output": "extend",
    "selectChildren": "extend",
    "selectParents": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "serviceid": "1",
      "name": "My Service - 0001",

```

## service.update

Description

object service.update(object/array services)

This method allows to update existing services.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) service properties to be updated.

The `serviceid` property must be defined for each service, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard service properties](#), the method accepts the following parameters.

| Parameter | Type  | Description  |
|-----------|-------|--|
| children  | array | Child services to replace the current service children.<br><br>The children must have the <code>serviceid</code> property defined. |
| parents   | array | Parent services to replace the current service parents.<br><br>The parents must have the <code>serviceid</code> property defined.  |

| Parameter    | Type  | Description  |
|--------------|-------|--|
| tags         | array | Service <b>tags</b> to replace the current service tags. |
| problem_tags | array | <b>Problem tags</b> to replace the current problem tags. |
| status_rules | array | <b>Status rules</b> to replace the current status rules. |

#### Return values

(object) Returns an object containing the IDs of the updated services under the `serviceids` property.

#### Examples

##### Setting the parent for a service

Make service with ID "3" to be the parent for service with ID "5".

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "serviceid": "5",
    "parents": [
      {
        "serviceid": "3"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "5"
    ]
  },
  "id": 1
}
```

##### Adding a scheduled downtime

Add a downtime for service with ID "4" scheduled weekly from Monday 22:00 till Tuesday 10:00.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "serviceid": "4",
    "times": [
      {
        "type": "1",
        "ts_from": "165600",
        "ts_to": "201600"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "4"
    ]
  },
  "id": 1
}
```

## Settings

This class is designed to work with common administration settings.

Object references:

- [Settings](#)

Available methods:

- [settings.get](#) - retrieve settings
- [settings.update](#) - update settings

## > Settings object

The following objects are directly related to the settings API.

Settings

The settings object has the following properties.

| Property                | Type    | Description  |
|-------------------------|---------|--|
| default_lang            | string  | System language by default.  |
| default_timezone        | string  | Default: <code>en_US</code> .<br>System time zone by default.<br><br>Default: <code>system</code> - system default.  |
| default_theme           | string  | For the full list of supported time zones please refer to <a href="#">PHP documentation</a> .<br>Default theme.  |
| search_limit            | integer | Possible values:<br><code>blue-theme</code> - (default) Blue;<br><code>dark-theme</code> - Dark;<br><code>hc-light</code> - High-contrast light;<br><code>hc-dark</code> - High-contrast dark.<br>Limit for search and filter results. |
| max_overview_table_size | integer | Default: 1000.<br>Max number of columns and rows in Data overview and Trigger overview dashboard widgets.  |
| max_in_table            | integer | Default: 50.<br>Max count of elements to show inside table cell.   |
|                         |         | Default: 50.   |

| Property              | Type    | Description  |
|-----------------------|---------|--|
| server_check_interval | integer | Show warning if Zabbix server is down.<br><br>Possible values:<br>0 - Do not show warning;<br>10 - <i>(default)</i> Show warning.  |
| work_period           | string  | Working time.<br><br>Default: 1-5,09:00-18:00.   |
| show_technical_errors | integer | Show technical errors (PHP/SQL) to non-Super admin users and to users that are not part of user groups with debug mode enabled.<br><br>Possible values:<br>0 - <i>(default)</i> Do not technical errors;<br>1 - Show technical errors. |
| history_period        | string  | Max period to display history data in Latest data, Web, and Data overview dashboard widgets. Accepts seconds and time unit with suffix.<br><br>Default: 24h.   |
| period_default        | string  | Time filter default period. Accepts seconds and time unit with suffix with month and year support (30s,1m,2h,1d,1M,1y).  |
| max_period            | string  | Default: 1h.<br>Max period for time filter. Accepts seconds and time unit with suffix with month and year support (30s,1m,2h,1d,1M,1y).  |
| severity_color_0      | string  | Default: 2y.<br>Color for "Not classified" severity as a hexadecimal color code.   |
| severity_color_1      | string  | Default: 97AAB3.<br>Color for "Information" severity as a hexadecimal color code.  |
| severity_color_2      | string  | Default: 7499FF.<br>Color for "Warning" severity as a hexadecimal color code.  |
| severity_color_3      | string  | Default: FFC859.<br>Color for "Average" severity as a hexadecimal color code.  |
| severity_color_4      | string  | Default: FFA059.<br>Color for "High" severity as a hexadecimal color code.   |
| severity_color_5      | string  | Default: E97659.<br>Color for "Disaster" severity as a hexadecimal color code.   |
| severity_name_0       | string  | Default: E45959.<br>Name for "Not classified" severity.  |
| severity_name_1       | string  | Default: Not classified.<br>Name for "Information" severity.   |
| severity_name_2       | string  | Default: Information.<br>Name for "Warning" severity.  |
| severity_name_3       | string  | Default: Warning.<br>Name for "Average" severity.  |
| severity_name_4       | string  | Default: Average.<br>Name for "High" severity.<br><br>Default: High.   |

| Property               | Type    | Description   |
|------------------------|---------|---|
| severity_name_5        | string  | Name for "Disaster" severity.   |
| custom_color           | integer | Default: Disaster.<br>Use custom event status colors.   |
| ok_period              | string  | Possible values:<br>0 - <i>(default)</i> Do not use custom event status colors;<br>1 - Use custom event status colors.<br>Display OK triggers period. Accepts seconds and time unit with suffix.                    |
| blink_period           | string  | Default: 5m.<br>On status change triggers blink period. Accepts seconds and time unit with suffix.  |
| problem_unack_color    | string  | Default: 2m.<br>Color for unacknowledged PROBLEM events as a hexadecimal color code.  |
| problem_ack_color      | string  | Default: CC0000.<br>Color for acknowledged PROBLEM events as a hexadecimal color code.  |
| ok_unack_color         | string  | Default: CC0000.<br>Color for unacknowledged RESOLVED events as a hexadecimal color code.   |
| ok_ack_color           | string  | Default: 009900.<br>Color for acknowledged RESOLVED events as a hexadecimal color code.   |
| problem_unack_style    | integer | Default: 009900.<br>Blinking for unacknowledged PROBLEM events.   |
| problem_ack_style      | integer | Possible values:<br>0 - Do not show blinking;<br>1 - <i>(default)</i> Show blinking.<br>Blinking for acknowledged PROBLEM events.   |
| ok_unack_style         | integer | Possible values:<br>0 - Do not show blinking;<br>1 - <i>(default)</i> Show blinking.<br>Blinking for unacknowledged RESOLVED events.  |
| ok_ack_style           | integer | Possible values:<br>0 - Do not show blinking;<br>1 - <i>(default)</i> Show blinking.<br>Blinking for acknowledged RESOLVED events.  |
| url                    | string  | Possible values:<br>0 - Do not show blinking;<br>1 - <i>(default)</i> Show blinking.<br>Frontend URL.   |
| discovery_groupid      | integer | ID of the host group to which will be automatically placed discovered hosts.  |
| default_inventory_mode | integer | Default host inventory mode.  |
| alert_usrgrpid         | integer | Possible values:<br>-1 - <i>(default)</i> Disabled;<br>0 - Manual;<br>1 - Automatic.<br>ID of the user group to which will be sending database down alarm message. If set to 0, the alarm message will not be sent. |

| Property                     | Type    | Description   |
|------------------------------|---------|---|
| snmptrap_logging             | integer | Log unmatched SNMP traps.<br><br>Possible values:<br>0 - Do not log unmatched SNMP traps;<br>1 - ( <i>default</i> ) Log unmatched SNMP traps.   |
| login_attempts               | integer | Number of failed login attempts after which login form will be blocked.<br><br>Default: 5.  |
| login_block                  | string  | Time interval during which login form will be blocked if number of failed login attempts exceeds defined in login_attempts field. Accepts seconds and time unit with suffix.<br><br>Default: 30s. |
| validate_uri_schemes         | integer | Validate URI schemes.<br><br>Possible values:<br>0 - Do not validate;<br>1 - ( <i>default</i> ) Validate.   |
| uri_valid_schemes            | string  | Valid URI schemes.<br><br>Default: http,https,ftp,file,mailto,tel,ssh.  |
| x_frame_options              | string  | X-Frame-Options HTTP header.<br><br>Default: SAMEORIGIN.  |
| iframe_sandboxing_enabled    | integer | Use iframe sandboxing.<br><br>Possible values:<br>0 - Do not use;<br>1 - ( <i>default</i> ) Use.  |
| iframe_sandboxing_exceptions | string  | Iframe sandboxing exceptions.   |
| connect_timeout              | string  | Connection timeout with Zabbix server.<br><br>Default: 3s.  |
| socket_timeout               | string  | Network default timeout.<br><br>Default: 3s.  |
| media_type_test_timeout      | string  | Network timeout for media type test.<br><br>Default: 65s.   |
| item_test_timeout            | string  | Network timeout for item tests.<br><br>Default: 60s.  |
| script_timeout               | string  | Network timeout for script execution.<br><br>Default: 60s.  |
| report_test_timeout          | string  | Network timeout for scheduled report test.<br><br>Default: 60s.   |
| auditlog_enabled             | integer | Enable audit logging.<br><br>Possible values:<br>0 - Disable;<br>1 - ( <i>default</i> ) Enable.   |
| ha_failover_delay            | string  | Failover delay in seconds (read only).<br><br>Default: 1m.  |

| Property              | Type    | Description   |
|-----------------------|---------|---|
| geomaps_tile_provider | string  | <p>Geomap tile provider.</p> <p>Possible values:<br/> OpenStreetMap.Mapnik - <i>(default)</i> OpenStreetMap Mapnik;<br/> OpenTopoMap - OpenTopoMap;<br/> Stamen.TonerLite - Stamen Toner Lite;<br/> Stamen.Terrain - Stamen Terrain;<br/> USGS.USTopo - USGS US Topo;<br/> USGS.USImagery - USGS US Imagery.</p> <p>Supports empty string to specify custom values of geomaps_tile_url, geomaps_max_zoom and geomaps_attribution.</p> |
| geomaps_tile_url      | string  | Geomap tile URL if geomaps_tile_provider is set to empty string.  |
| geomaps_max_zoom      | integer | Geomap max zoom level if geomaps_tile_provider is set to empty string. Max zoom must be in the range between 0 and 30.  |
| geomaps_attribution   | string  | Geomap attribution text if geomaps_tile_provider is set to empty string.  |

## settings.get

### Description

object settings.get(object parameters)

The method allows to retrieve settings object according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type  | Description   |
|-----------|-------|---|
| output    | query | This parameter is described in the <a href="#">reference commentary</a> . |

### Return values

(object) Returns settings object.

### Examples

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "settings.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
```

## settings.update

### Description

`object settings.update(object settings)`

This method allows to update existing common settings.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Settings properties to be updated.

### Return values

(array) Returns array with the names of updated parameters.

### Examples

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "settings.update",
  "params": {
    "login_attempts": "1",
    "login_block": "1m"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    "login_attempts",
    "login_block"
  ],
  "id": 1
}
```

## SLA

This class is designed to work with SLA (Service Level Agreement) objects used to estimate the performance of IT infrastructure and business services.

### Object references:

- [SLA](#)
- [SLA schedule](#)
- [SLA excluded downtime](#)
- [SLA service tag](#)

### Available methods:

- **sla.create** - creating new SLAs
- **sla.delete** - deleting SLAs
- **sla.get** - retrieving SLAs
- **sla.getsli** - retrieving Service Level Indicator (SLI) data for SLAs
- **sla.update** - updating SLAs

## > SLA object

The following objects are directly related to the `sla` (Service Level Agreement) API.

### SLA

The SLA object has the following properties.

| Property                      | Type    | Description   |
|-------------------------------|---------|---|
| <b>slaid</b>                  | string  | ( <i>readonly</i> ) ID of the SLA.  |
| <b>name</b><br>(required)     | string  | Name of the SLA.  |
| <b>period</b><br>(required)   | integer | Reporting period of the SLA.<br><br>Possible values:<br>0 - daily;<br>1 - weekly;<br>2 - monthly;<br>3 - quarterly;<br>4 - annually.  |
| <b>slo</b><br>(required)      | float   | Minimum acceptable Service Level Objective expressed as a percent. If the Service Level Indicator (SLI) drops lower, the SLA is considered to be in problem/unfulfilled state.<br><br>Possible values: 0-100 (up to 4 fractional digits). |
| <b>effective_date</b>         | integer | Effective date of the SLA.  |
| <b>timezone</b><br>(required) | string  | Possible values: date timestamp in UTC.<br>Reporting time zone, for example: Europe/London, UTC.  |
| <b>status</b>                 | integer | For the full list of supported time zones please refer to <a href="#">PHP documentation</a> .<br>Status of the SLA.<br><br>Possible values:<br>0 - ( <i>default</i> ) disabled SLA;<br>1 - enabled SLA.                                   |
| <b>description</b>            | string  | Description of the SLA.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

### SLA Schedule

The SLA schedule object defines periods where the connected service(s) are scheduled to be in working order. It has the following properties.

| Property                         | Type    | Description   |
|----------------------------------|---------|---|
| <b>period_from</b><br>(required) | integer | Starting time of the recurrent weekly period of time (inclusive).<br><br>Possible values: number of seconds (counting from Sunday). |
| <b>period_to</b><br>(required)   | integer | Ending time of the recurrent weekly period of time (exclusive).<br><br>Possible values: number of seconds (counting from Sunday).   |

### SLA excluded downtime

The excluded downtime object defines periods where the connected service(s) are scheduled to be out of working order, without affecting SLI, e.g. undergoing planned maintenance.

| Property                         | Type    | Description  |
|----------------------------------|---------|--|
| <b>name</b><br>(required)        | string  | Name of the excluded downtime.   |
| <b>period_from</b><br>(required) | integer | Starting time of the excluded downtime (inclusive).                              |
| <b>period_to</b><br>(required)   | integer | Possible values: timestamp.<br>Ending time of the excluded downtime (exclusive). |
|                                  |         | Possible values: timestamp.  |

#### SLA service tag

The SLA service tag object links services to include in the calculations for the SLA. It has the following properties.

| Property                 | Type    | Description   |
|--------------------------|---------|---|
| <b>tag</b><br>(required) | string  | SLA service tag name.   |
| operator                 | integer | SLA service tag operator.<br><br>Possible values:<br>0 - (default) equals;<br>2 - contains. |
| value                    | string  | SLA service tag value.  |

#### sla.create

##### Description

object `sla.create(object/array SLAs)`

This method allows to create new SLA objects.

##### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

##### Parameters

(object/array) SLA objects to create.

Additionally to the [standard SLA properties](#), the method accepts the following parameters.

| Parameter                         | Type  | Description   |
|-----------------------------------|-------|---|
| <b>service_tags</b><br>(required) | array | SLA service tags to be created for the SLA.<br>At least one service tag must be specified.  |
| schedule                          | array | SLA schedule to be created for the SLA.<br>Specifying an empty parameter will be interpreted as a 24x7 schedule.<br>Default: 24x7 schedule. |
| excluded_downtime                 | array | SLA excluded downtimes to be created for the SLA.   |

##### Return values

(object) Returns an object containing the IDs of the created SLAs under the `slaids` property. The order of the returned IDs matches the order of the passed SLAs.

##### Examples

##### Creating an SLA

Instruct to create an SLA entry for: \* tracking uptime for SQL-engine related services; \* custom schedule of all weekdays excluding last hour on Saturday; \* an effective date of the last day of the year 2022; \* with 1 hour and 15 minutes long planned downtime starting at midnight on the 4th of July; \* SLA weekly report calculation will be on; \* the minimum acceptable SLO will be 99.9995%.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "sla.create",
  "params": [
    {
      "name": "Database Uptime",
      "slo": "99.9995",
      "period": "1",
      "timezone": "America/Toronto",
      "description": "Provide excellent uptime for main database engines.",
      "effective_date": 1672444800,
      "status": 1,
      "schedule": [
        {
          "period_from": 0,
          "period_to": 601200
        }
      ],
      "service_tags": [
        {
          "tag": "Database",
          "operator": "0",
          "value": "MySQL"
        },
        {
          "tag": "Database",
          "operator": "0",
          "value": "PostgreSQL"
        }
      ],
      "excluded_downtimes": [
        {
          "name": "Software version upgrade rollout",
          "period_from": "1648760400",
          "period_to": "1648764900"
        }
      ]
    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "slais": [
      "5"
    ]
  },
  "id": 1
}

```

Source

CSla::create() in *ui/include/classes/api/services/CSla.php*.

## sla.delete

Description

object sla.delete(array slais)

This method allows to delete SLA entries.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the SLAs to delete.

Return values

(object) Returns an object containing the IDs of the deleted SLAs under the `slאים` property.

Examples

Deleting multiple SLAs

Delete two SLA entries.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.delete",
  "params": [
    "4",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "slאים": [
      "4",
      "5"
    ]
  },
  "id": 1
}
```

Source

`CSla::delete()` in `ui/include/classes/api/services/CSla.php`.

## **sla.get**

Description

integer/array `sla.get(object parameters)`

The method allows to retrieve SLA objects according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter               | Type         | Description  |
|-------------------------|--------------|--|
| slaid                   | string/array | Return only SLAs with the given IDs.   |
| serviceids              | string/array | Return only SLAs matching the specific services.   |
| selectSchedule          | query        | Return a schedule property with SLA schedules.   |
| selectExcludedDowntimes | query        | Supports count.<br>Return an excluded_downtimes property with SLA excluded downtimes.  |
| selectServiceTags       | query        | Supports count.<br>Return a service_tags property with SLA service tags.   |
| sortfield               | string/array | Supports count.<br>Sort the result by the given properties.  |
| countOutput             | boolean      | Possible values are: slaid, name, period, slo, effective_date, timezone, status and description.<br>These parameters are described in the <a href="#">reference commentary</a> . |
| editable                | boolean      |  |
| excludeSearch           | boolean      |  |
| filter                  | object       |  |
| limit                   | integer      |  |
| output                  | query        |  |
| preservekeys            | boolean      |  |
| search                  | object       |  |
| searchByAny             | boolean      |  |
| searchWildcardEnabled   | boolean      |  |
| sortorder               | string/array |  |
| startSearch             | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving all SLAs

Retrieve all data about all SLAs and their properties.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.get",
  "params": {
    "output": "extend",
    "selectSchedule": ["period_from", "period_to"],
    "selectExcludedDowntimes": ["name", "period_from", "period_to"],
    "selectServiceTags": ["tag", "operator", "value"],
    "preservekeys": true
  },
  "auth": "85dd04b94cbfad794616eb923be13c71",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "1": {
      "slaid": "1",
      "name": "Database Uptime",
```

```

        "period": "1",
        "slo": "99.9995",
        "effective_date": "1672444800",
        "timezone": "America/Toronto",
        "status": "1",
        "description": "Provide excellent uptime for main SQL database engines.",
        "service_tags": [
            {
                "tag": "Database",

## sla.getsli

Description

object sla.getsli(object parameters)

This method allows to calculate the Service Level Indicator (SLI) data for a Service Level Agreement (SLA).

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the SLA ID, reporting periods and, optionally, the IDs of the services - to calculate the SLI for.

| Parameter                  | Type    | Description   |
|----------------------------|---------|---|
| <b>slaid</b><br>(required) | string  | ID of the SLA to return availability information for.                               |
| period_from                | integer | Starting date (inclusive) to report the SLI for.<br><br>Possible values: timestamp. |

| Parameter  | Type         | Description   |
|------------|--------------|---|
| period_to  | integer      | Ending date (exclusive) to report the SLI for.                        |
| periods    | array        | Possible values: timestamp.<br>Preferred number of periods to report. |
| serviceids | string/array | Possible values: 1-100<br>IDs of services to return the SLI for.      |

#### Partitioning of periods

The following table demonstrates the arrangement of returned period slices based on combinations of parameters.

##### Note:

The returned periods will not precede the first available period based on the effective date of the SLA and will not exceed the current period.

| Parameters         | Description      |                |   |
|--------------------|------------------|----------------|---|
| <b>period_from</b> | <b>period_to</b> | <b>periods</b> |   |
| -                  | -                | -              | Return the last 20 periods.   |
| -                  | -                | specified      | Return the last periods specified by the <b>periods</b> parameter.  |
| -                  | specified        | -              | Return the last 20 periods before the specified <b>period_to</b> date.  |
| -                  | specified        | specified      | Return the last periods specified by the <b>periods</b> parameter before the specified <b>period_to</b> date.           |
| specified          | -                | -              | Return the first 20 periods starting with the specified <b>period_from</b> date.  |
| specified          | -                | specified      | Return the first periods specified by the <b>periods</b> parameter starting with the specified <b>period_from</b> date. |
| specified          | specified        | -              | Return up to 100 periods within the specified date range.   |
| specified          | specified        | specified      | Return periods specified by the <b>periods</b> parameter within the specified date range.                               |

#### Return values

(object) Returns the results of the calculation.

| Property   | Type  | Description  |
|------------|-------|--|
| periods    | array | List of the reported periods.<br><br>Each reported period is represented as an object consisting of:<br>- <i>period_from</i> - Starting date of the reported period (timestamp).<br>- <i>period_to</i> - Ending date of the reported period (timestamp).   |
| serviceids | array | Periods are sorted by <i>period_from</i> field ascending.<br>List of service IDs in the reported periods.  |
| sli        | array | The sorting order of the list is not defined. Even if <i>serviceids</i> parameter was passed to the <i>sla.getsli</i> method.<br>SLI data (as a <b>two-dimensional array</b> ) for each reported period and service.<br><br>The index of the <i>periods</i> property is used as the <b>first</b> dimension of the <i>sli</i> property.<br><br>The index of the <i>serviceids</i> property is used as the <b>second</b> dimension of the <i>sli</i> property. |

#### SLI data

The SLI data returned for each reported period and service consists of:

| Property           | Type    | Description   |
|--------------------|---------|---|
| uptime             | integer | Amount of time service spent in an <i>OK</i> state during scheduled uptime, less the excluded downtimes.  |
| downtime           | integer | Amount of time service spent in a <i>not OK</i> state during scheduled uptime, less the excluded downtimes.   |
| sli                | float   | SLI (per cent of total uptime), based on uptime and downtime.   |
| error_budget       | integer | Error budget (in seconds), based on the SLI and the SLO.  |
| excluded_downtimes | array   | Array of excluded downtimes in this reporting period.<br><br>Each object will contain the following parameters:<br>- <i>name</i> - Name of the excluded downtime.<br>- <i>period_from</i> - Starting date and time (inclusive) of the excluded downtime.<br>- <i>period_to</i> - Ending date and time (exclusive) of the excluded downtime.<br><br>Excluded downtimes are sorted by <i>period_from</i> field ascending. |

## Examples

### Calculating SLI

Retrieve SLI data on services with IDs "50", "60" and "70" that are linked to the SLA with ID "5". Retrieve data for 3 periods starting from Nov 01, 2021.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.getsli",
  "params": {
    "slaid": "5",
    "serviceids": [
      50,
      60,
      70
    ],
    "periods": 3,
    "period_from": "1635724800"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "periods": [
      {
        "period_from": 1635724800,
        "period_to": 1638316800
      },
      {
        "period_from": 1638316800,
        "period_to": 1640995200
      },
      {
        "period_from": 1640995200,
        "period_to": 1643673600
      }
    ],
    "serviceids": [
      50,
      60,
      70
    ]
  }
}
```

```

CSla::getSli() in *ui/include/classes/api/services/CSla.php*

### sla.update

Description

object sla.update(object/array slaids)

This method allows to update existing SLA entries.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object/array) SLA properties to be updated.

The `slaid` property must be defined for each SLA, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard SLA properties](#), the method accepts the following parameters.

| Parameter          | Type  | Description  |
|--------------------|-------|--|
| service_tags       | array | SLA <a href="#">service tags</a> to replace the current SLA service tags.<br><br>At least one service tag must be specified.<br>SLA <a href="#">schedule</a> to replace the current one. |
| schedule           | array |  |
| excluded_downtimes | array | Specifying parameter as empty will be interpreted as a 24x7 schedule.<br>SLA <a href="#">excluded downtimes</a> to replace the current ones.   |

**Return values**

(object) Returns an object containing the IDs of the updated SLAs under the `slaids` property.

**Examples****Updating service tags**

Make SLA with ID "5" to be calculated at monthly intervals for NoSQL related services, without changing its schedule or excluded downtimes; set SLO to 95%.

**Request:**

```
{
  "jsonrpc": "2.0",
  "method": "sla.update",
  "params": [
    {
      "slaid": "5",
      "name": "NoSQL Database engines",
      "slo": "95",
      "period": 2,
      "service_tags": [
        {
          "tag": "Database",
          "operator": "0",
          "value": "Redis"
        },
        {
          "tag": "Database",
          "operator": "0",
          "value": "MongoDB"
        }
      ]
    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

**Response:**

```
{
  "jsonrpc": "2.0",
```

```

    "result": {
      "slaid": [
        "5"
      ]
    },
    "id": 1
  }
}

```

Changing the schedule of an SLA

Switch the SLA with ID "5" to a 24x7 schedule.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "slaid": "5",
    "schedule": []
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "slaid": [
      "5"
    ]
  },
  "id": 1
}

```

Changing the excluded downtimes for an SLA

Add a planned 4 hour long RAM upgrade downtime on the 6th of April, 2022, while keeping (needs to be defined anew) a previously existing software upgrade planned on the 4th of July for the SLA with ID "5".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "slaid": "5",
    "excluded_downtimes": [
      {
        "name": "Software version upgrade rollout",
        "period_from": "1648760400",
        "period_to": "1648764900"
      },
      {
        "name": "RAM upgrade",
        "period_from": "1649192400",
        "period_to": "1649206800"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "slais": [
      "5"
    ]
  },
  "id": 1
}
```

## Task

This class is designed to work with tasks (such as checking items or low-level discovery rules without config reload).

Object references:

- [Task](#)
- ['Check now' request object](#)
- ['Diagnostic information' request object](#)
- [Statistic request object](#)
- [Statistic result object](#)

Available methods:

- [task.create](#) - creating new tasks
- [task.get](#) - retrieving tasks

## > Task object

The following objects are directly related to the task API.

The task object has the following properties:

| Property                     | Type      | Description  |
|------------------------------|-----------|--|
| taskid                       | string    | <i>(readonly)</i> ID of the task.  |
| <b>type</b><br>(required)    | integer   | Type of the task.<br><br>Possible values:<br>1 - Diagnostic information;<br>6 - Check now.   |
| status                       | integer   | <i>(readonly)</i> Status of the task.<br><br>Possible values:<br>1 - new task;<br>2 - task in progress;<br>3 - task is completed;<br>4 - task is expired.  |
| clock                        | timestamp | <i>(readonly)</i> Time when the task was created.  |
| ttl                          | integer   | <i>(readonly)</i> The time in seconds after which task expires.  |
| proxy_hostid                 | string    | ID of the proxy about which diagnostic information statistic is collected.<br>Ignored for 'Check now' tasks.   |
| <b>request</b><br>(required) | object    | Task request object according to the task type:<br>Object of 'Check now' task is <a href="#">described in detail below</a> ;<br>Object of 'Diagnostic information' task is <a href="#">described in detail below</a> . |
| result                       | object    | <i>(readonly)</i> Result object of the diagnostic information task. May contain NULL if result is not yet ready. Result object is <a href="#">described in detail below</a> .  |

#### 'Check now' request object

The 'Check now' task request object has the following properties.

| Property | Type   | Description                               |
|----------|--------|---|
| itemid   | string | ID of item and low-level discovery rules. |

#### 'Diagnostic information' request object

The diagnostic information task request object has the following properties. Statistic request object for all types of properties is [described in detail below](#).

| Property      | Type   | Description   |
|---------------|--------|---|
| historycache  | object | History cache statistic request. Available on server and proxy.         |
| valuecache    | object | Items cache statistic request. Available on server.                     |
| preprocessing | object | Preprocessing manager statistic request. Available on server and proxy. |
| alerting      | object | Alert manager statistic request. Available on server.                   |
| lld           | object | LLD manager statistic request. Available on server.                     |

#### Statistic request object

Statistic request object is used to define what type of information should be collected about server/proxy internal processes. It has the following properties.

| Property | Type   | Description  |
|----------|--------|--|
| stats    | query  | Statistic object properties to be returned. The list of available fields for each type of diagnostic information statistic are <a href="#">described in detail below</a> .   |
| top      | object | <p>Default: <code>extend</code> will return all available statistic fields.</p> <p>Object to sort and limit returned statistic values. The list of available fields for each type of diagnostic information statistic are <a href="#">described in detail below</a>.</p> <p>Example:<br/>{ "source.alerts": 10 }</p> |

#### List of statistic fields available for each type of diagnostic information request

Following statistic fields can be requested for each type of diagnostic information request property.

| Diagnostic type | Available fields | Description  |
|-----------------|------------------|--|
| historycache    | items            | Number of cached items.  |
|                 | values           | Number of cached values.   |
|                 | memory           | Shared memory statistics (free space, number of used chunks, number of free chunks, max size of free chunk). |
|                 | memory.data      | History data cache shared memory statistics.   |
| valuecache      | memory.index     | History index cache shared memory statistics.  |
|                 | items            | Number of cached items.  |
|                 | values           | Number of cached values.   |
|                 | memory           | Shared memory statistics (free space, number of used chunks, number of free chunks, max size of free chunk). |
| preprocessing   | mode             | Value cache mode.  |
|                 | values           | Number of queued values.   |

| Diagnostic type | Available fields | Description                                       |
|-----------------|------------------|---|
| alerting<br>lld | preproc.values   | Number of queued values with preprocessing steps. |
|                 | alerts           | Number of queued alerts.                          |
|                 | rules            | Number of queued rules.                           |
|                 | values           | Number of queued values.                          |

List of sorting fields available for each type of diagnostic information request

Following statistic fields can be used to sort and limit requested information.

| Diagnostic type | Available fields | Type    |
|-----------------|------------------|---------|
| historycache    | values           | integer |
| valuecache      | values           | integer |
|                 | request.values   | integer |
| preprocessing   | values           | integer |
| alerting        | media.alerts     | integer |
|                 | source.alerts    | integer |
| lld             | values           | integer |

Statistic result object

Statistic result object is retrieved in `result` field of task object.

| Property | Type          | Description   |
|----------|---------------|---|
| status   | integer       | ( <i>readonly</i> ) Status of the task result.  |
| data     | string/object | Possible values:<br>-1 - error occurred during performing task;<br>0 - task result is created.<br>Results according the statistic request object of particular diagnostic information task. Contains error message string if error occurred during performing task. |

## task.create

Description

`object task.create(object/array tasks)`

This method allows to create a new task (such as collect diagnostic data or check items or low-level discovery rules without config reload).

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) A task to create.

The method accepts the following parameters.

| Parameter                 | Type    | Description   |
|---------------------------|---------|---|
| <b>type</b><br>(required) | integer | Task type.<br><br>Possible values:<br>1 - Diagnostic information;<br>6 - Check now. |

| Parameter                    | Type    | Description  |
|------------------------------|---------|--|
| <b>request</b><br>(required) | object  | Task request object according to the task type. Correct format of request object is described in <b>Task object</b> section. |
| proxy_hostid                 | integer | Proxy about which Diagnostic information task will collect data.   |
|                              |         | Ignored for 'Check now' tasks.   |

Note that 'Check now' tasks can be created only for the following types of items/discovery rules:

- Zabbix agent
- SNMPv1/v2/v3 agent
- Simple check
- Internal check
- External check
- Database monitor
- HTTP agent
- IPMI agent
- SSH agent
- TELNET agent
- Calculated check
- JMX agent

Return values

(object) Returns an object containing the IDs of the created tasks under the `taskids` property. One task is created for each item and low-level discovery rule. The order of the returned IDs matches the order of the passed `itemids`.

Examples

Creating a task

Create a task `check now` for two items. One is an item, the other is a low-level discovery rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "task.create",
  "params": [
    {
      "type": 6,
      "request": {
        "itemid": "10092"
      }
    },
    {
      "type": "6",
      "request": {
        "itemid": "10093"
      }
    }
  ],
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "taskids": [
      "1",
      "2"
    ]
  },
}
```

```
    "id": 1
}
```

Create a task diagnostic information task.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "task.create",
  "params": [
    {
      "type": 1,
      "request": {
        "alerting": {
          "stats": [
            "alerts"
          ],
          "top": {
            "media.alerts": 10
          }
        },
        "l1d": {
          "stats": "extend",
          "top": {
            "values": 5
          }
        }
      },
      "proxy_hostid": 0
    }
  ],
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 2
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "taskids": [
      "3"
    ]
  },
  "id": 2
}
```

- [Statistic request object](#)

Source

CTask::create() in *ui/include/classes/api/services/CTask.php*.

## task.get

Description

integer/array task.get(object parameters)

The method allows to retrieve tasks according to the given parameters. Method returns details only about 'diagnostic information' tasks.

**Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter    | Type         | Description  |
|--------------|--------------|--|
| taskids      | string/array | Return only tasks with the given IDs.  |
| output       | query        | These parameters are described in the <a href="#">reference commentary</a> . |
| preservekeys | boolean      |  |

**Return values**

(integer/array) Returns an array of objects.

**Examples****Retrieve task by ID**

Retrieve all the data about the task with the ID "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "task.get",
  "params": {
    "output": "extend",
    "taskids": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "taskid": "1",
      "type": "7",
      "status": "3",
      "clock": "1601039076",
      "ttl": "3600",
      "proxy_hostid": null,
      "request": {
        "alerting": {
          "stats": [
            "alerts"
          ],
          "top": {
            "media.alerts": 10
          }
        },
        "l1d": {
          "stats": "extend",

## Template

This class is designed to work with templates.

Object references:

- [Template](#)

Available methods:

- [template.create](#) - creating new templates
- [template.delete](#) - deleting templates
- [template.get](#) - retrieving templates
- [template.massadd](#) - adding related objects to templates
- [template.massremove](#) - removing related objects from templates
- [template.massupdate](#) - replacing or removing related objects from templates
- [template.update](#) - updating templates

## > Template object

The following objects are directly related to the `template` API.

Template

The template object has the following properties.

| Property                  | Type   | Description                             |
|---------------------------|--------|---|
| <code>templateid</code>   | string | ( <i>readonly</i> ) ID of the template. |
| <b>host</b><br>(required) | string | Technical name of the template.         |
| <code>description</code>  | text   | Description of the template.            |

| Property | Type   | Description   |
|----------|--------|---|
| name     | string | Visible name of the template.   |
| uuid     | string | Default: host property value.<br>Universal unique identifier, used for linking imported templates to already existing ones. Auto-generated, if not given. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Template tag

The template tag object has the following properties.

| Property                 | Type   | Description         |
|--------------------------|--------|---------------------|
| <b>tag</b><br>(required) | string | Template tag name.  |
| value                    | string | Template tag value. |

## template.create

Description

`object template.create(object/array templates)`

This method allows to create new templates.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Templates to create.

Additionally to the [standard template properties](#), the method accepts the following parameters.

| Parameter                   | Type         | Description  |
|-----------------------------|--------------|--|
| <b>groups</b><br>(required) | object/array | Host <a href="#">groups</a> to add the template to.<br><br>The host groups must have the <code>groupid</code> property defined.      |
| tags                        | object/array | Template <a href="#">tags</a> .  |
| templates                   | object/array | <a href="#">Templates</a> to be linked to the template.<br><br>The templates must have the <code>templateid</code> property defined. |
| macros                      | object/array | <a href="#">User macros</a> to be created for the template.  |

Return values

(object) Returns an object containing the IDs of the created templates under the `templateids` property. The order of the returned IDs matches the order of the passed templates.

Examples

Creating a template

Create a template with tags and link two templates to this template.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.create",
  "params": {
    "host": "Linux template",
```

```

    "groups": {
        "groupid": 1
    },
    "templates": [
        {
            "templateid": "11115"
        },
        {
            "templateid": "11116"
        }
    ],
    "tags": [
        {
            "tag": "Host name",
            "value": "{HOST.NAME}"
        }
    ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "11117"
        ]
    },
    "id": 1
}

```

Source

CTemplate::create() in `ui/include/classes/api/services/CTemplate.php`.

## template.delete

Description

object `template.delete(array templateIds)`

This method allows to delete templates.

Deleting a template will cause deletion of all template entities (items, triggers, graphs, etc.). To leave template entities with the hosts, but delete the template itself, first unlink the template from required hosts using one of these methods: [template.update](#), [template.massupdate](#), [host.update](#), [host.massupdate](#).

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the templates to delete.

Return values

(object) Returns an object containing the IDs of the deleted templates under the `templateids` property.

Examples

Deleting multiple templates

Delete two templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.delete",
  "params": [
    "13",
    "32"
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "13",
      "32"
    ]
  },
  "id": 1
}
```

Source

CTemplate::delete() in *ui/include/classes/api/services/CTemplate.php*.

## template.get

Description

integer/array template.get(object parameters)

The method allows to retrieve templates according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter         | Type         | Description   |
|-------------------|--------------|---|
| templateids       | string/array | Return only templates with the given template IDs.                  |
| groupids          | string/array | Return only templates that belong to the given host groups.         |
| parentTemplateids | string/array | Return only templates that are parent to the given templates.       |
| hostids           | string/array | Return only templates that are linked to the given hosts/templates. |
| graphids          | string/array | Return only templates that contain the given graphs.                |
| itemids           | string/array | Return only templates that contain the given items.                 |
| triggerids        | string/array | Return only templates that contain the given triggers.              |
| with_items        | flag         | Return only templates that have items.                              |
| with_triggers     | flag         | Return only templates that have triggers.                           |
| with_graphs       | flag         | Return only templates that have graphs.                             |
| with_httptests    | flag         | Return only templates that have web scenarios.                      |
| evaltype          | integer      | Rules for tag searching.  |

Possible values:  
0 - (default) And/Or;  
2 - Or.

| Parameter  | Type         | Description   |
|--|--------------|---|
| tags   | object/array | <p>Return only templates with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.</p> <p>Format: [{"tag": "&lt;tag&gt;", "value": "&lt;value&gt;", "operator": "&lt;operator&gt;"}, ...].</p> <p>An empty array returns all templates.</p> <p>Possible operator values:</p> <ul style="list-style-type: none"> <li>0 - (default) Contains;</li> <li>1 - Equals;</li> <li>2 - Not like;</li> <li>3 - Not equal</li> <li>4 - Exists;</li> <li>5 - Not exists.</li> </ul> |
| selectGroups   | query        | Return the host groups that the template belongs to in the <b>groups</b> property.  |
| selectTags   | query        | Return template tags in the <b>tags</b> property.   |
| selectHosts  | query        | Return the hosts that are linked to the template in the <b>hosts</b> property.  |
| selectTemplates  | query        | <p>Supports count.</p> <p>Return templates to which the template is a child, in the <b>templates</b> property.</p>  |
| selectParentTemplates  | query        | <p>Supports count.</p> <p>Return templates to which the template is a parent, in the <b>parentTemplates</b> property.</p>   |
| selectHttpTests  | query        | <p>Supports count.</p> <p>Return the web scenarios from the template in the <b>httpTests</b> property.</p>  |
| selectItems  | query        | <p>Supports count.</p> <p>Return items from the template in the <b>items</b> property.</p>  |
| selectDiscoveries  | query        | <p>Supports count.</p> <p>Return low-level discoveries from the template in the <b>discoveries</b> property.</p>  |
| selectTriggers   | query        | <p>Supports count.</p> <p>Return triggers from the template in the <b>triggers</b> property.</p>  |
| selectGraphs   | query        | <p>Supports count.</p> <p>Return graphs from the template in the <b>graphs</b> property.</p>  |
| selectMacros   | query        | Supports count.<br>Return the macros from the template in the <b>macros</b> property..  |
| selectDashboards   | query        | Return dashboards from the template in the <b>dashboards</b> property.  |
| selectValueMaps  | query        | Supports count.<br>Return a <b>valuemaps</b> property with template value maps.   |
| limitSelects   | integer      | Limits the number of records returned by subselects.  |
| <p>Applies to the following subselects:</p> <ul style="list-style-type: none"> <li><b>selectTemplates</b> - results will be sorted by name;</li> <li><b>selectHosts</b> - sorted by host;</li> <li><b>selectParentTemplates</b> - sorted by host;</li> <li><b>selectItems</b> - sorted by name;</li> <li><b>selectDiscoveries</b> - sorted by name;</li> <li><b>selectTriggers</b> - sorted by description;</li> <li><b>selectGraphs</b> - sorted by name;</li> <li><b>selectDashboards</b> - sorted by name.</li> </ul> |              |   |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| sortfield              | string/array | Sort the result by the given properties.   |
| countOutput            | boolean      | Possible values are: <code>hostid</code> , <code>host</code> , <code>name</code> , <code>status</code> .<br>These parameters are described in the <a href="#">reference commentary</a> . |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

##### Retrieving templates by name

Retrieve all data about two templates named "Linux" and "Windows".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.get",
  "params": {
    "output": "extend",
    "filter": {
      "host": [
        "Linux",
        "Windows"
      ]
    }
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "proxy_hostid": "0",
      "host": "Linux",
      "status": "3",
      "disable_until": "0",
      "error": "",
      "available": "0",
      "errors_from": "0",
      "lastaccess": "0",
      "ipmi_authtype": "0",
      "ipmi_privilege": "2",
      "ipmi_username": "",
      "ipmi_password": "",

```

```

    "ipmi_disable_until": "0",
    "ipmi_available": "0",
    "snmp_disable_until": "0",
    "snmp_available": "0",
    "maintenanceid": "0",
    "maintenance_status": "0",
    "maintenance_type": "0",
    "maintenance_from": "0",
    "ipmi_errors_from": "0",
    "snmp_errors_from": "0",
    "ipmi_error": "",
    "snmp_error": "",
    "jmx_disable_until": "0",
    "jmx_available": "0",
    "jmx_errors_from": "0",
    "jmx_error": "",
    "name": "Linux",
    "flags": "0",

    "jmx_errors_from": "0",
    "jmx_error": "",
    "name": "Windows",
    "flags": "0",
    "templateid": "10081",
    "description": "",
    "tls_connect": "1",

```

```

        "tls_accept": "1",
        "tls_issuer": "",
        "tls_subject": "",
        "tls_psk_identity": "",
        "tls_psk": "",
        "uuid": "522d17e1834049be879287b7c0518e5d"
    }
],
    "id": 1
}

```

#### Retrieving hosts by template

Retrieve hosts that have the "10001" (*Linux by Zabbix agent*) template linked to them.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": "templateid",
        "templateids": "10001",
        "selectHosts": ["hostid", "name"]
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "templateid": "10001",
            "hosts": [
                {
                    "hostid": "10084",
                    "name": "Zabbix server"
                },
                {
                    "hostid": "10603",
                    "name": "Host 1"
                },
                {
                    "hostid": "10604",
                    "name": "Host 2"
                }
            ]
        }
    ],
    "id": 1
}

```

#### Searching by template tags

Retrieve templates that have tag "Host name" equal to "{HOST.NAME}".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": ["hostid"],
        "selectTags": "extend",

```

```

    "evaltype": 0,
    "tags": [
      {
        "tag": "Host name",
        "value": "{HOST.NAME}",
        "operator": 1
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10402",
      "tags": [
        {
          "tag": "Host name",
          "value": "{HOST.NAME}"
        }
      ]
    }
  ],
  "id": 1
}

```

## template.massadd

Description

object `template.massadd(object parameters)`

This method allows to simultaneously add multiple related objects to the given templates.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects to add to the templates.

The method accepts the following parameters.

| Parameter                      | Type         | Description   |
|--------------------------------|--------------|---|
| <b>templates</b><br>(required) | object/array | Templates to be updated.<br><br>The templates must have the <code>templateid</code> property defined. |

| Parameter      | Type         | Description  |
|----------------|--------------|--|
| groups         | object/array | Host groups to add the given templates to.   |
| macros         | object/array | The host groups must have the <code>groupid</code> property defined.<br>User macros to be created for the given templates. |
| templates_link | object/array | Templates to link to the given templates.<br>The templates must have the <code>templateid</code> property defined.         |

#### Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

#### Examples

Link a group to templates

Add host group "2" to two templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massadd",
  "params": {
    "templates": [
      {
        "templateid": "10085"
      },
      {
        "templateid": "10086"
      }
    ],
    "groups": [
      {
        "groupid": "2"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}
```

Link two templates to a template

Link templates "10106" and "10104" to template.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massadd",
  "params": {
    "templates": [
```

```

        {
            "templateid": "10073"
        }
    ],
    "templates_link": [
        {
            "templateid": "10106"
        },
        {
            "templateid": "10104"
        }
    ]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10073"
        ]
    },
    "id": 1
}

```

CTemplate::massAdd() in `ui/include/classes/api/services/CTemplate.php`.

## template.massremove

Description

object `template.massremove(object parameters)`

This method allows to remove related objects from multiple templates.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects that should be removed.

| Parameter                        | Type         | Description  |
|----------------------------------|--------------|--|
| <b>templateids</b><br>(required) | string/array | IDs of the templates to be updated.                                |
| groupids                         | string/array | Host groups to remove the given templates from.                    |
| macros                           | string/array | User macros to delete from the given templates.                    |
| templateids_clear                | string/array | Templates to unlink and clear from the given templates (upstream). |
| templateids_link                 | string/array | Templates to unlink from the given templates (upstream).           |

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

#### Examples

##### Removing templates from a group

Remove two templates from group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massremove",
  "params": {
    "templateids": [
      "10085",
      "10086"
    ],
    "groupids": "2"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}
```

##### Unlinking templates from a host

Unlink templates "10106", "10104" from template "10085".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massremove",
  "params": {
    "templateids": "10085",
    "templateids_link": [
      "10106",
      "10104"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085"
    ]
  },
  "id": 1
}
```

- [User macro](#)

Source

CTemplate::massRemove() in *ui/include/classes/api/services/CTemplate.php*.

**template.massupdate**

Description

object `template.massupdate(object parameters)`

This method allows to simultaneously replace or remove related objects and update properties on multiple templates.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects to replace for the templates.

The method accepts the following parameters.

| Parameter                      | Type         | Description  |
|--------------------------------|--------------|--|
| <b>templates</b><br>(required) | object/array | Templates to be updated.   |
| groups                         | object/array | The templates must have the <code>templateid</code> property defined.<br>Host groups to replace the current host groups the templates belong to. |
| macros                         | object/array | The host groups must have the <code>groupid</code> property defined.<br>User macros to replace the current user macros on the given templates.   |
| templates_clear                | object/array | Templates to unlink and clear from the given templates.  |
| templates_link                 | object/array | The templates must have the <code>templateid</code> property defined.<br>Templates to replace the currently linked templates.                    |
|                                |              | The templates must have the <code>templateid</code> property defined.  |

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Replacing host groups

Unlink and clear template "10091" from the given templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massupdate",
  "params": {
    "templates": [
      {
        "templateid": "10085"
      },
      {
        "templateid": "10086"
      }
    ]
  },
}
```

```

        "templates_clear": [
            {
                "templateid": "10091"
            }
        ],
        "auth": "038e1d7b1735c6a5436ee9eae095879e",
        "id": 1
    }
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10085",
            "10086"
        ]
    },
    "id": 1
}

```

Source

CTemplate::massUpdate() in `ui/include/classes/api/services/CTemplate.php`.

## template.update

Description

`object template.update(object/array templates)`

This method allows to update existing templates.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Template properties to be updated.

The `templateid` property must be defined for each template, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Additionally to the [standard template properties](#), the method accepts the following parameters.

| Parameter | Type         | Description   |
|-----------|--------------|---|
| groups    | object/array | Host <a href="#">groups</a> to replace the current host groups the templates belong to.                               |
| tags      | object/array | The host groups must have the <code>groupid</code> property defined.  |
| macros    | object/array | Template <a href="#">tags</a> to replace the current template tags.   |
|           |              | <a href="#">User macros</a> to replace the current user macros on the given templates.                                |
| templates | object/array | <a href="#">Templates</a> to replace the currently linked templates. Templates that are not passed are only unlinked. |

The templates must have the `templateid` property defined.

| Parameter  | Type         | Description  |
|--|--------------|--|
| templates_clear  | object/array | <b>Templates</b> to unlink and clear from the given templates. |
| The templates must have the templateid property defined. |              |  |

#### Return values

(object) Returns an object containing the IDs of the updated templates under the templateids property.

#### Examples

##### Changing the standard template properties

Change the technical name of the template to "Linux by Zabbix agent Custom", the visible name to "My template", and update the template description.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "host": "Linux by Zabbix agent Custom",
    "name": "My template",
    "description": "This is a custom Linux template."
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

##### Updating template groups

Replace all template groups for the given template with a different one.

##### Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "groups": [
      {
        "groupid": "24"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

##### Response:

```
{
  "jsonrpc": "2.0",
```

```
    "result": {
      "templateids": [
        "10086"
      ]
    },
    "id": 1
  }
}
```

#### Updating template tags

Replace all template tags with a different one.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "tags": [
      {
        "tag": "Host name",
        "value": "{HOST.NAME}"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

#### Updating template macros

Replace all template macros with a different one.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "macros": [
      {
        "macro": "{$MY_MACRO}",
        "value": "new_value"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```
    "result": {
      "templateids": [
        "10086"
      ]
    },
    "id": 1
  }
```

#### Updating template linked templates

Unlink (without clearing) all templates from the given template and link a different one to it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "templates": [
      {
        "templateid": "10087"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

#### Clearing template linked templates

Unlink and clear the given template from a specific linked template.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "templates_clear": [
      {
        "templateid": "10087"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
```

```

        "10086"
    ],
    },
    "id": 1
}

```

## Template dashboard

This class is designed to work with template dashboards.

Object references:

- [Template dashboard](#)
- [Template dashboard page](#)
- [Template dashboard widget](#)
- [Template dashboard widget field](#)

Available methods:

- [templatedashboard.create](#) - creating new template dashboards
- [templatedashboard.delete](#) - deleting template dashboards
- [templatedashboard.get](#) - retrieving template dashboards
- [templatedashboard.update](#) - updating template dashboards

### > Template dashboard object

The following objects are directly related to the `templatedashboard` API.

Template dashboard

The template dashboard object has the following properties.

| Property                                     | Type    | Description   |
|--|---------|---|
| <code>dashboardid</code>                     | string  | <i>(readonly)</i> ID of the template dashboard.   |
| <b><code>name</code></b><br>(required)       | string  | Name of the template dashboard.   |
| <b><code>templateid</code></b><br>(required) | string  | ID of the template the dashboard belongs to.  |
| <code>display_period</code>                  | integer | Default page display period (in seconds).<br><br>Possible values: 10, 30, 60, 120, 600, 1800, 3600.   |
| <code>auto_start</code>                      | integer | Default: 30.<br>Auto start slideshow.<br><br>Possible values:<br>0 - do not auto start slideshow;<br>1 - <i>(default)</i> auto start slideshow. |
| <code>uuid</code>                            | string  | Universal unique identifier, used for linking imported template dashboards to already existing ones. Auto-generated, if not given.              |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Template dashboard page

The template dashboard page object has the following properties.

| Property         | Type    | Description  |
|------------------|---------|--|
| dashboard_pageid | string  | ( <i>readonly</i> ) ID of the dashboard page.  |
| name             | string  | Dashboard page name.   |
| display_period   | integer | Default: empty string.<br>Dashboard page display period (in seconds).<br><br>Possible values: 0, 10, 30, 60, 120, 600, 1800, 3600. |
| widgets          | array   | Default: 0 (will use the default page display period).<br>Array of the <b>template dashboard widget</b> objects.                   |

#### Template dashboard widget

The template dashboard widget object has the following properties.

| Property                  | Type    | Description   |
|---------------------------|---------|---|
| widgetid                  | string  | ( <i>readonly</i> ) ID of the dashboard widget.   |
| <b>type</b><br>(required) | string  | Type of the dashboard widget.<br><br>Possible values:<br>clock - Clock;<br>graph - Graph (classic);<br>graphprototype - Graph prototype;<br>item - Item value;<br>plaintext - Plain text;<br>url - URL; |
| name                      | string  | Custom widget name.   |
| x                         | integer | A horizontal position from the left side of the dashboard.  |
| y                         | integer | Valid values range from 0 to 23.<br>A vertical position from the top of the dashboard.  |
| width                     | integer | Valid values range from 0 to 62.<br>The widget width.   |
| height                    | integer | Valid values range from 1 to 24.<br>The widget height.  |
| view_mode                 | integer | Valid values range from 2 to 32.<br>The widget view mode.   |
| fields                    | array   | Possible values:<br>0 - (default) default widget view;<br>1 - with hidden header;<br>Array of the <b>template dashboard widget field</b> objects.   |

#### Template dashboard widget field

The template dashboard widget field object has the following properties.

| Property                   | Type    | Description  |
|----------------------------|---------|--|
| <b>type</b><br>(required)  | integer | Type of the widget field.<br><br>Possible values:<br>0 - Integer;<br>1 - String;<br>4 - Item;<br>5 - Item prototype;<br>6 - Graph;<br>7 - Graph prototype. |
| name                       | string  | Widget field name.   |
| <b>value</b><br>(required) | mixed   | Widget field value depending on type.  |

## templatedashboard.create

### Description

object templatedashboard.create(object/array templateDashboards)

This method allows to create new template dashboards.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Template dashboards to create.

Additionally to the [standard template dashboard properties](#), the method accepts the following parameters.

| Parameter                  | Type  | Description   |
|----------------------------|-------|---|
| <b>pages</b><br>(required) | array | Template dashboard <b>pages</b> to be created for the dashboard. Dashboard pages will be ordered in the same order as specified. At least one dashboard page object is required for pages property. |

### Return values

(object) Returns an object containing the IDs of the created template dashboards under the dashboardids property. The order of the returned IDs matches the order of the passed template dashboards.

### Examples

#### Creating a template dashboard

Create a template dashboard named "Graphs" with one Graph widget on a single dashboard page.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.create",
  "params": {
    "templateid": "10318",
    "name": "Graphs",
    "pages": [
      {
        "widgets": [
          {
            "type": "graph",
            "x": 0,
            "y": 0,
            "width": 12,
```

```

        "height": 5,
        "view_mode": 0,
        "fields": [
            {
                "type": 6,
                "name": "graphid",
                "value": "1123"
            }
        ]
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "32"
        ]
    },
    "id": 1
}

```

Source

CTemplateDashboard::create() in *ui/include/classes/api/services/CTemplateDashboard.php*.

## templatedashboard.delete

Description

object templatedashboard.delete(array templateDashboardIds)

This method allows to delete template dashboards.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the template dashboards to delete.

Return values

(object) Returns an object containing the IDs of the deleted template dashboards under the dashboardids property.

Examples

Deleting multiple template dashboards

Delete two template dashboards.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.delete",
  "params": [
    "45",
    "46"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "45",
      "46"
    ]
  },
  "id": 1
}
```

Source

CTemplateDashboard::delete() in *ui/include/classes/api/services/CTemplateDashboard.php*.

## templatedashboard.get

Description

integer/array templatedashboard.get(object parameters)

The method allows to retrieve template dashboards according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| dashboardids           | string/array | Return only template dashboards with the given IDs.                              |
| templateids            | string/array | Return only template dashboards that belong to the given templates.              |
| selectPages            | query        | Return a <b>pages</b> property with template dashboard pages, correctly ordered. |
| sortfield              | string/array | Sort the result by the given properties.   |
|                        |              | Possible values are: dashboardid and name.                                       |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> .     |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |

| Parameter   | Type    | Description |
|-------------|---------|-------------|
| startSearch | boolean |             |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving template dashboards

Retrieve all template dashboards with widgets for a specified template.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.get",
  "params": {
    "output": "extend",
    "selectPages": "extend",
    "templateids": "10001"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dashboardid": "23",
      "name": "Docker overview",
      "templateid": "10001",

## templatedashboard.update

Description

object templatedashboard.update(object/array templateDashboards)

This method allows to update existing template dashboards.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Template dashboard properties to be updated.

The `dashboardid` property must be specified for each dashboard, all other properties are optional. Only the specified properties will be updated.

Additionally to the [standard template dashboard properties](#), the method accepts the following parameters.

| Parameter | Type  | Description   |
|-----------|-------|---|
| pages     | array | <p>Template dashboard <a href="#">pages</a> to replace the existing dashboard pages.</p> <p>Dashboard pages are updated by the <code>dashboard_pageid</code> property. New dashboard pages will be created for objects without <code>dashboard_pageid</code> property and the existing dashboard pages will be deleted if not reused. Dashboard pages will be ordered in the same order as specified. Only the specified properties of the dashboard pages will be updated. At least one dashboard page object is required for <code>pages</code> property.</p> |

Return values

(object) Returns an object containing the IDs of the updated template dashboards under the `dashboardids` property.

Examples

Renaming a template dashboard

Rename a template dashboard to "Performance graphs".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.update",
  "params": {
    "dashboardid": "23",
    "name": "Performance graphs"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "23"
    ]
  },
  "id": 1
}
```

Updating template dashboard pages

Rename the first dashboard page, replace widgets on the second dashboard page and add a new page as the third one. Delete all other dashboard pages.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.update",
  "params": {
    "dashboardid": "2",
    "pages": [
      {
        "dashboard_pageid": 1,
        "name": 'Renamed Page'
      },
      {
        "dashboard_pageid": 2,
        "widgets": [
          {
            "type": "clock",
            "x": 0,
            "y": 0,
            "width": 4,
            "height": 3
          }
        ]
      },
      {
        "display_period": 60
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
```

```

        "dashboardids": [
            "2"
        ],
        "id": 2
    }
}

```

## Token

This class is designed to work with tokens.

Object references:

- [Token](#)

Available methods:

- [token.create](#) - create new tokens
- [token.delete](#) - delete tokens
- [token.get](#) - retrieve tokens
- [token.update](#) - update tokens
- [token.generate](#) - generate tokens

## > Token object

The following objects are directly related to the token API.

Token

The token object has the following properties.

| Property                  | Type      | Description   |
|---------------------------|-----------|---|
| tokenid                   | string    | <i>(readonly)</i> ID of the token.  |
| <b>name</b><br>(required) | string    | Name of the token.  |
| description               | text      | Description of the token.   |
| userid                    | string    | <i>(readonly for update)</i> A user the token has been assigned to.   |
| lastaccess                | timestamp | <i>Default: current user.</i><br><i>(readonly)</i> Most recent date and time the token was authenticated.         |
| status                    | integer   | Zero if the token has never been authenticated.<br>Token status.  |
| expires_at                | timestamp | Possible values:<br>0 - <i>(default)</i> enabled token;<br>1 - disabled token.<br>Token expiration date and time. |
| created_at                | timestamp | Zero for never-expiring tokens.<br><i>(readonly)</i> Token creation date and time.                                |
| creator_userid            | string    | <i>(readonly)</i> The creator user of the token.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## token.create

### Description

object token.create(object/array tokens)

This method allows to create new tokens.

#### Note:

The *Manage API tokens* **permission** is required for the user role to manage tokens for other users.

#### Attention:

A token created by this method also has to be **generated** before it is usable.

### Parameters

(object/array) Tokens to create.

The method accepts tokens with the **standard token properties**.

### Return values

(object) Returns an object containing the IDs of the created tokens under the **tokenids** property. The order of the returned IDs matches the order of the passed tokens.

### Examples

Create a token

Create an enabled token that never expires and authenticates user of ID 2.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.create",
  "params": {
    "name": "Your token",
    "userid": "2"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tokenids": [
      "188"
    ]
  },
  "id": 1
}
```

Create a disabled token that expires at January 21st, 2021. This token will authenticate current user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.create",
  "params": {
    "name": "Your token",
    "status": "1",
    "expires_at": "1611238072"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tokenids": [
      "189"
    ]
  },
  "id": 1
}
```

Source

CToken::create() in *ui/include/classes/api/services/CToken.php*.

### token.delete

Description

object token.delete(array tokenids)

This method allows to delete tokens.

#### Note:

The *Manage API tokens permission* is required for the user role to manage tokens for other users.

Parameters

(array) IDs of the tokens to delete.

Return values

(object) Returns an object containing the IDs of the deleted tokens under the tokenids property.

Examples

Delete multiple tokens

Delete two tokens.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.delete",
  "params": [
    "188",
    "192"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tokenids": [
      "188",
      "192"
    ]
  },
  "id": 1
}
```

Source

CToken::delete() in *ui/include/classes/api/services/CToken.php*.

## token.generate

Description

object token.generate(array tokenids)

This method allows to generate tokens.

### Note:

The *Manage API tokens permission* is required for the user role to manage tokens for other users.

### Attention:

A token can be generated by this method only if it has been *created*.

Parameters

(array) IDs of the tokens to generate.

Return values

(array) Returns an array of objects containing the ID of the generated token under the *tokenid* property and generated authorization string under *token* property.

| Property | Type   | Description  |
|----------|--------|--|
| tokenid  | string | ID of the token.                                   |
| token    | string | The generated authorization string for this token. |

Examples

Generate multiple tokens

Generate two tokens.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.generate",
  "params": [
    "1",
    "2"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "tokenid": "1",
      "token": "bbcfce79a2d95037502f7e9a534906d3466c9a1484beb6ea0f4e7be28e8b8ce2"
    },
    {
      "tokenid": "2",
      "token": "fa1258a83d518eabd87698a96bd7f07e5a6ae8aeb8463cae33d50b91dd21bd6d"
    }
  ],
  "id": 0
}
```

Source

CToken::generate() in *ui/include/classes/api/services/CToken.php*.

## token.get

Description

integer/array token.get(object parameters)

The method allows to retrieve tokens according to the given parameters.

### Note:

Only *Super admin* user type is allowed to view tokens for other users.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| tokenids               | string/array | Return only tokens with the given IDs.  |
| userids                | string/array | Return only tokens created for the given users.   |
| token                  | string       | Return only tokens created for the given <i>Auth token</i> .  |
| valid_at               | timestamp    | Return only tokens, which are valid (not expired) at the given date and time.   |
| expired_at             | timestamp    | Return only tokens, which are expired (not valid) at the given date and time.   |
| sortfield              | string/array | Sort the result by the given properties.<br><br>Possible values are: <code>tokenid</code> , <code>name</code> , <code>lastaccess</code> , <code>status</code> , <code>expires_at</code> and <code>created_at</code> .<br>These parameters are described in the <a href="#">reference commentary</a> . |
| countOutput            | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve a token

Retrieve all data for the token with ID "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.get",
  "params": {
    "output": "extend",
    "tokenids": "2"
  },
}
```

```
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "tokenid": "1",
      "name": "The Token",
      "description": "",
      "userid": "1",
      "lastaccess": "0",
      "status": "0",
      "expires_at": "1609406220",
      "created_at": "1611239454",
      "creator_userid": "1"
    }
  ],
  "id": 1
}
```

Source

CToken::get() in `ui/include/classes/api/services/CToken.php`.

## token.update

Description

object token.update(object/array tokens)

This method allows to update existing tokens.

### Note:

The *Manage API tokens* **permission** is required for the user role to manage tokens for other users.

Parameters

(object/array) Token properties to be updated.

The `tokenid` property must be defined for each token, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts tokens with the **standard token properties**.

Return values

(object) Returns an object containing the IDs of the updated tokens under the `tokenids` property.

Examples

Remove token expiry

Remove expiry date from token.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.update",
  "params": {
    "tokenid": "2",
    "expires_at": "0"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tokenids": [
      "2"
    ]
  },
  "id": 1
}
```

Source

CToken::update() in *ui/include/classes/api/services/CToken.php*.

## Trend

This class is designed to work with trend data.

Object references:

- [Trend](#)

Available methods:

- [trend.get](#) - retrieving trends

### > Trend object

The following objects are directly related to the `trend` API.

#### Note:

Trend objects differ depending on the item's type of information. They are created by the Zabbix server and cannot be modified via the API.

#### Float trend

The float trend object has the following properties.

| Property  | Type      | Description  |
|-----------|-----------|--|
| clock     | timestamp | Timestamp of an hour for which the value was calculated. E. g. timestamp of 04:00:00 means values calculated for period 04:00:00-04:59:59. |
| itemid    | integer   | ID of the related item.  |
| num       | integer   | Number of values that were available for the hour.   |
| value_min | float     | Hourly minimum value.  |
| value_avg | float     | Hourly average value.  |
| value_max | float     | Hourly maximum value.  |

#### Integer trend

The integer trend object has the following properties.

| Property | Type      | Description  |
|----------|-----------|--|
| clock    | timestamp | Timestamp of an hour for which the value was calculated. E. g. timestamp of 04:00:00 means values calculated for period 04:00:00-04:59:59. |
| itemid   | integer   | ID of the related item.  |

| Property  | Type    | Description  |
|-----------|---------|--|
| num       | integer | Number of values that were available for the hour. |
| value_min | integer | Hourly minimum value.                              |
| value_avg | integer | Hourly average value.                              |
| value_max | integer | Hourly maximum value.                              |

## trend.get

### Description

integer/array trend.get(object parameters)

The method allows to retrieve trend data according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter   | Type         | Description  |
|-------------|--------------|--|
| itemids     | string/array | Return only trends with the given item IDs.                              |
| time_from   | timestamp    | Return only values that have been collected after or at the given time.  |
| time_till   | timestamp    | Return only values that have been collected before or at the given time. |
| countOutput | boolean      | Count the number of retrieved objects.                                   |
| limit       | integer      | Limit the amount of retrieved objects.                                   |
| output      | query        | Set <b>Trend object</b> properties to be returned.                       |

### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

### Examples

#### Retrieving item trend data

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trend.get",
  "params": {
    "output": [
      "itemid",
      "clock",
      "num",
      "value_min",
      "value_avg",
      "value_max",
    ],
    "itemids": [
      "23715"
    ],
    "limit": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "23715",
      "clock": "1446199200",
      "num": "60",
      "value_min": "0.165",
      "value_avg": "0.2168",
      "value_max": "0.35",
    }
  ],
  "id": 1
}
```

### > Trigger object

The following objects are directly related to the `trigger` API.

Trigger

The trigger object has the following properties.

| Property                         | Type   | Description  |
|----------------------------------|--------|--|
| triggerid                        | string | ( <i>readonly</i> ) ID of the trigger.   |
| <b>description</b><br>(required) | string | Name of the trigger.   |
| <b>expression</b><br>(required)  | string | Reduced trigger expression.  |
| event_name                       | string | Event name generated by the trigger.   |
| opdata                           | string | Operational data.  |
| comments                         | string | Additional description of the trigger.   |
| error                            | string | ( <i>readonly</i> ) Error text if there have been any problems when updating the state of the trigger. |

| Property            | Type      | Description   |
|---------------------|-----------|---|
| flags               | integer   | <i>(readonly)</i> Origin of the trigger.<br><br>Possible values are:<br>0 - <i>(default)</i> a plain trigger;<br>4 - a discovered trigger.                                      |
| lastchange          | timestamp | <i>(readonly)</i> Time when the trigger last changed its state.   |
| priority            | integer   | Severity of the trigger.<br><br>Possible values are:<br>0 - <i>(default)</i> not classified;<br>1 - information;<br>2 - warning;<br>3 - average;<br>4 - high;<br>5 - disaster.  |
| state               | integer   | <i>(readonly)</i> State of the trigger.<br><br>Possible values:<br>0 - <i>(default)</i> trigger state is up to date;<br>1 - current trigger state is unknown.                   |
| status              | integer   | Whether the trigger is enabled or disabled.<br><br>Possible values are:<br>0 - <i>(default)</i> enabled;<br>1 - disabled.   |
| templateid          | string    | <i>(readonly)</i> ID of the parent template trigger.  |
| type                | integer   | Whether the trigger can generate multiple problem events.<br><br>Possible values are:<br>0 - <i>(default)</i> do not generate multiple events;<br>1 - generate multiple events. |
| url                 | string    | URL associated with the trigger.  |
| value               | integer   | <i>(readonly)</i> Whether the trigger is in OK or problem state.<br><br>Possible values are:<br>0 - <i>(default)</i> OK;<br>1 - problem.  |
| recovery_mode       | integer   | OK event generation mode.<br><br>Possible values are:<br>0 - <i>(default)</i> Expression;<br>1 - Recovery expression;<br>2 - None.  |
| recovery_expression | string    | Reduced trigger recovery expression.  |
| correlation_mode    | integer   | OK event closes.<br><br>Possible values are:<br>0 - <i>(default)</i> All problems;<br>1 - All problems if tag values match.   |
| correlation_tag     | string    | Tag for matching.   |
| manual_close        | integer   | Allow manual close.<br><br>Possible values are:<br>0 - <i>(default)</i> No;<br>1 - Yes.   |
| uuid                | string    | Universal unique identifier, used for linking imported triggers to already existing ones. Used only for triggers on templates.<br>Auto-generated, if not given.                 |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## Trigger tag

The trigger tag object has the following properties.

| Property                 | Type   | Description        |
|--------------------------|--------|--------------------|
| <b>tag</b><br>(required) | string | Trigger tag name.  |
| value                    | string | Trigger tag value. |

## trigger.adddependencies

### Description

object trigger.adddependencies(object/array triggerDependencies)

This method allows to create new trigger dependencies.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Trigger dependencies to create.

Each trigger dependency has the following parameters:

| Parameter                               | Type   | Description                                    |
|---|--------|--|
| <b>triggerid</b><br>(required)          | string | ID of the dependent trigger.                   |
| <b>dependsOnTriggerid</b><br>(required) | string | ID of the trigger that the trigger depends on. |

### Return values

(object) Returns an object containing the IDs of the dependent triggers under the `triggerids` property.

### Examples

Add a trigger dependency

Make trigger "14092" dependent on trigger "13565."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.adddependencies",
  "params": {
    "triggerid": "14092",
    "dependsOnTriggerid": "13565"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "14092"
    ]
  },
}
```

```
    "id": 1
}
```

Source

CTrigger::addDependencies() in *ui/include/classes/api/services/CTrigger.php*.

## trigger.create

Description

object trigger.create(object/array triggers)

This method allows to create new triggers.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Triggers to create.

Additionally to the [standard trigger properties](#) the method accepts the following parameters.

| Parameter    | Type  | Description  |
|--------------|-------|--|
| dependencies | array | Triggers that the trigger is dependent on.   |
| tags         | array | The triggers must have the triggerid property defined.<br>Trigger <a href="#">tags</a> . |

### Attention:

The trigger expression has to be given in its expanded form.

Return values

(object) Returns an object containing the IDs of the created triggers under the `triggerids` property. The order of the returned IDs matches the order of the passed triggers.

Examples

Creating a trigger

Create a trigger with a single trigger dependency.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.create",
  "params": [
    {
      "description": "Processor load is too high on {HOST.NAME}",
      "expression": "last(/Linux server/system.cpu.load[percpu,avg1])>5",
      "dependencies": [
        {
          "triggerid": "17367"
        }
      ]
    }
  ],
  "id": 1
}
```

```

        "description": "Service status",
        "expression": "length(last(/Linux server/log[/var/log/system,Service .* has stopped]))<>0",
        "dependencies": [
            {
                "triggerid": "17368"
            }
        ],
        "tags": [
            {
                "tag": "service",
                "value": "{{ITEM.VALUE}.regsub(\"Service (.*?) has stopped\", \"\\\\1\")}"
            },
            {
                "tag": "error",
                "value": ""
            }
        ]
    }
],
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "17369",
            "17370"
        ]
    },
    "id": 1
}

```

Source

CTTrigger::create() in `ui/include/classes/api/services/CTTrigger.php`.

## trigger.delete

Description

object trigger.delete(array triggerIds)

This method allows to delete triggers.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the triggers to delete.

Return values

(object) Returns an object containing the IDs of the deleted triggers under the `triggerids` property.

Examples

Delete multiple triggers

Delete two triggers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.delete",
  "params": [
    "12002",
    "12003"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "12002",
      "12003"
    ]
  },
  "id": 1
}
```

Source

CTrigger::delete() in *ui/include/classes/api/services/CTrigger.php*.

## trigger.deletedependencies

Description

object trigger.deletedependencies(string/array triggers)

This method allows to delete all trigger dependencies from the given triggers.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(string/array) Triggers to delete the trigger dependencies from.

Return values

(object) Returns an object containing the IDs of the affected triggers under the `triggerids` property.

Examples

Deleting dependencies from multiple triggers

Delete all dependencies from two triggers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.deleteDependencies",
  "params": [
    {
      "triggerid": "14544"
    },
    {
      "triggerid": "14545"
    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
}
```

```

    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "14544",
      "14545"
    ]
  },
  "id": 1
}

```

## trigger.get

Description

integer/array trigger.get(object parameters)

The method allows to retrieve triggers according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter                   | Type         | Description  |
|-----------------------------|--------------|--|
| triggerids                  | string/array | Return only triggers with the given IDs.   |
| groupids                    | string/array | Return only triggers that belong to hosts from the given host groups.  |
| templateids                 | string/array | Return only triggers that belong to the given templates.   |
| hostids                     | string/array | Return only triggers that belong to the given hosts.   |
| itemids                     | string/array | Return only triggers that contain the given items.   |
| functions                   | string/array | Return only triggers that use the given functions.   |
| group                       | string       | Refer to the <a href="#">supported function</a> page for a list of supported functions. Return only triggers that belong to hosts from the host group with the given name. |
| host                        | string       | Return only triggers that belong to host with the given technical name.  |
| inherited                   | boolean      | If set to <code>true</code> return only triggers inherited from a template.  |
| templated                   | boolean      | If set to <code>true</code> return only triggers that belong to templates.   |
| dependent                   | boolean      | If set to <code>true</code> return only triggers that have dependencies. If set to <code>false</code> return only triggers that do not have dependencies.                  |
| monitored                   | flag         | Return only enabled triggers that belong to monitored hosts and contain only enabled items.  |
| active                      | flag         | Return only enabled triggers that belong to monitored hosts.   |
| maintenance                 | boolean      | If set to <code>true</code> return only enabled triggers that belong to hosts in maintenance.  |
| withUnacknowledgedEvents    | flag         | Return only triggers that have unacknowledged events.  |
| withAcknowledgedEvents      | flag         | Return only triggers with all events acknowledged.   |
| withLastEventUnacknowledged | flag         | Return only triggers with the last event unacknowledged.   |

| Parameter              | Type             | Description  |
|------------------------|------------------|--|
| skipDependent          | flag             | Skip triggers in a problem state that are dependent on other triggers. Note that the other triggers are ignored if disabled, have disabled items or disabled item hosts.   |
| lastChangeSince        | timestamp        | Return only triggers that have changed their state after the given time.   |
| lastChangeTill         | timestamp        | Return only triggers that have changed their state before the given time.  |
| only_true              | flag             | Return only triggers that have recently been in a problem state.   |
| min_severity           | integer          | Return only triggers with severity greater or equal than the given severity.   |
| evaltype               | integer          | Rules for tag searching.<br><br>Possible values:<br>0 - (default) And/Or;<br>2 - Or.   |
| tags                   | array of objects | Return only triggers with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all triggers.<br><br>Possible operator types:<br>0 - (default) Like;<br>1 - Equal;<br>2 - Not like;<br>3 - Not equal<br>4 - Exists;<br>5 - Not exists.  |
| expandComment          | flag             | Expand macros in the trigger description.  |
| expandDescription      | flag             | Expand macros in the name of the trigger.  |
| expandExpression       | flag             | Expand functions and macros in the trigger expression.   |
| selectGroups           | query            | Return the host groups that the trigger belongs to in the <b>groups</b> property.  |
| selectHosts            | query            | Return the hosts that the trigger belongs to in the <b>hosts</b> property.   |
| selectItems            | query            | Return items contained by the trigger in the <b>items</b> property.  |
| selectFunctions        | query            | Return functions used in the trigger in the <b>functions</b> property.<br><br>The function objects represent the functions used in the trigger expression and has the following properties:<br><b>functionid</b> - ( <i>string</i> ) ID of the function;<br><b>itemid</b> - ( <i>string</i> ) ID of the item used in the function;<br><b>function</b> - ( <i>string</i> ) name of the function;<br><b>parameter</b> - ( <i>string</i> ) parameter passed to the function. Query parameter is replaced by \$ symbol in returned string. |
| selectDependencies     | query            | Return triggers that the trigger depends on in the <b>dependencies</b> property.   |
| selectDiscoveryRule    | query            | Return the <b>low-level discovery rule</b> that created the trigger.   |
| selectLastEvent        | query            | Return the last significant trigger event in the <b>lastEvent</b> property.  |
| selectTags             | query            | Return the trigger tags in <b>tags</b> property.   |
| selectTriggerDiscovery | query            | Return the trigger discovery object in the <b>triggerDiscovery</b> property. The trigger discovery objects link the trigger to a trigger prototype from which it was created.<br><br>It has the following properties:<br><b>parent_triggerid</b> - ( <i>string</i> ) ID of the trigger prototype from which the trigger has been created.  |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| filter                 | object       | Return only those results that exactly match the given filter.<br><br>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.<br><br>Supports additional filters:<br>host - technical name of the host that the trigger belongs to;<br>hostid - ID of the host that the trigger belongs to. |
| limitSelects           | integer      | Limits the number of records returned by subselects.  |
| sortfield              | string/array | Applies to the following subselects:<br>selectHosts - results will be sorted by host.<br><b>Sort</b> the result by the given properties.<br><br>Possible values are: triggerid, description, status, priority, lastchange and hostname.   |
| countOutput            | boolean      | These parameters are described in the <a href="#">reference commentary</a> .  |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving data by trigger ID

Retrieve all data and the functions used in trigger "14062".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.get",
  "params": {
    "triggerids": "14062",
    "output": "extend",
    "selectFunctions": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "triggerid": "14062",
      "expression": "{13513}<10m",
      "description": "{HOST.NAME} has been restarted (uptime < 10m)",
      "url": "",

```

```

        "status": "0",
        "value": "0",
        "priority": "2",
        "lastchange": "0",
        "comments": "The host uptime is less than 10 minutes",
        "error": "",
        "templateid": "10016",
        "type": "0",
        "state": "0",
        "flags": "0",
        "recovery_mode": "0",
        "recovery_expression": "",
        "correlation_mode": "0",
        "correlation_tag": "",
        "manual_close": "0",
        "opdata": "",
        "functions": [
            {
                "functionid": "13513",
                "itemid": "24350",
                "triggerid": "14062",
                "parameter": "$",
                "function": "last"
            }
        ]
    },
    "id": 1
}

```

Retrieving triggers in problem state

Retrieve the ID, name and severity of all triggers in problem state and sort them by severity in descending order.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "trigger.get",
    "params": {
        "output": [
            "triggerid",
            "description",
            "priority"
        ],
        "filter": {
            "value": 1
        },
        "sortfield": "priority",
        "sortorder": "DESC"
    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "13907",
            "description": "Zabbix self-monitoring processes < 100% busy",
            "priority": "4"
        },
    ],
}

```

```

    {
      "triggerid": "13824",
      "description": "Zabbix discoverer processes more than 75% busy",
      "priority": "3"
    }
  ],
  "id": 1
}

```

Retrieving a specific trigger with tags

Retrieve a specific trigger with tags.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "trigger.get",
  "params": {
    "output": [
      "triggerid",
      "description"
    ],
    "selectTags": "extend",
    "triggerids": [
      "17578"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "triggerid": "17370",
      "description": "Service status",
      "tags": [
        {
          "tag": "service",
          "value": "{{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")}"
        },
        {
          "tag": "error",
          "value": ""
        }
      ]
    }
  ],
  "id": 1
}

```

## trigger.update

### Description

object trigger.update(object/array triggers)

This method allows to update existing triggers.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Trigger properties to be updated.

The `triggerid` property must be defined for each trigger, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard trigger properties](#) the method accepts the following parameters.

| Parameter    | Type  | Description  |
|--------------|-------|--|
| dependencies | array | Triggers that the trigger is dependent on.   |
| tags         | array | The triggers must have the <code>triggerid</code> property defined. Trigger <a href="#">tags</a> . |

#### Attention:

The trigger expression has to be given in its expanded form.

### Return values

(object) Returns an object containing the IDs of the updated triggers under the `triggerids` property.

### Examples

#### Enabling a trigger

Enable a trigger, that is, set its status to 0.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": {
    "triggerid": "13938",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

#### Replacing triggers tags

Replace tags for trigger.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": {
    "triggerid": "13938",
    "tags": [
      {
        "tag": "service",
        "value": "{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")"
      },
      {
        "tag": "error",
        "value": ""
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

## Trigger prototype

This class is designed to work with trigger prototypes.

Object references:

- [Trigger prototype](#)

Available methods:

- [triggerprototype.create](#) - creating new trigger prototypes
- [triggerprototype.delete](#) - deleting trigger prototypes
- [triggerprototype.get](#) - retrieving trigger prototypes
- [triggerprototype.update](#) - updating trigger prototypes

## > Trigger prototype object

The following objects are directly related to the triggerprototype API.

Trigger prototype

The trigger prototype object has the following properties.

| Property                         | Type    | Description   |
|----------------------------------|---------|---|
| triggerid                        | string  | ( <i>readonly</i> ) ID of the trigger prototype.  |
| <b>description</b><br>(required) | string  | Name of the trigger prototype.  |
| <b>expression</b><br>(required)  | string  | Reduced trigger expression.   |
| event_name                       | string  | Event name generated by the trigger.  |
| opdata                           | string  | Operational data.   |
| comments                         | string  | Additional comments to the trigger prototype.   |
| priority                         | integer | Severity of the trigger prototype.<br><br>Possible values:<br>0 - ( <i>default</i> ) not classified;<br>1 - information;<br>2 - warning;<br>3 - average;<br>4 - high;<br>5 - disaster.                          |
| status                           | integer | Whether the trigger prototype is enabled or disabled.<br><br>Possible values:<br>0 - ( <i>default</i> ) enabled;<br>1 - disabled.   |
| templateid                       | string  | ( <i>readonly</i> ) ID of the parent template trigger prototype.  |
| type                             | integer | Whether the trigger prototype can generate multiple problem events.<br><br>Possible values:<br>0 - ( <i>default</i> ) do not generate multiple events;<br>1 - generate multiple events.                         |
| url                              | string  | URL associated with the trigger prototype.  |
| recovery_mode                    | integer | OK event generation mode.<br><br>Possible values are:<br>0 - ( <i>default</i> ) Expression;<br>1 - Recovery expression;<br>2 - None.  |
| recovery_expression              | string  | Reduced trigger recovery expression.  |
| correlation_mode                 | integer | OK event closes.<br><br>Possible values are:<br>0 - ( <i>default</i> ) All problems;<br>1 - All problems if tag values match.   |
| correlation_tag                  | string  | Tag for matching.   |
| manual_close                     | integer | Allow manual close.<br><br>Possible values are:<br>0 - ( <i>default</i> ) No;<br>1 - Yes.   |
| discover                         | integer | Trigger prototype discovery status.<br><br>Possible values:<br>0 - ( <i>default</i> ) new triggers will be discovered;<br>1 - new triggers will not be discovered and existing triggers will be marked as lost. |
| uuid                             | string  | Universal unique identifier, used for linking imported trigger prototypes to already existing ones. Used only for trigger prototypes on templates. Auto-generated, if not given.                                |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Trigger prototype tag

The trigger prototype tag object has the following properties.

| Property                 | Type   | Description                  |
|--------------------------|--------|------------------------------|
| <b>tag</b><br>(required) | string | Trigger prototype tag name.  |
| value                    | string | Trigger prototype tag value. |

## triggerprototype.create

Description

object triggerprototype.create(object/array triggerPrototypes)

This method allows to create new trigger prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Trigger prototypes to create.

Additionally to the [standard trigger prototype properties](#) the method accepts the following parameters.

| Parameter    | Type  | Description  |
|--------------|-------|--|
| dependencies | array | Triggers and trigger prototypes that the trigger prototype is dependent on.                        |
| tags         | array | The triggers must have the triggerid property defined.<br>Trigger prototype <a href="#">tags</a> . |

### Attention:

The trigger expression has to be given in its expanded form and must contain at least one item prototype.

Return values

(object) Returns an object containing the IDs of the created trigger prototypes under the `triggerids` property. The order of the returned IDs matches the order of the passed trigger prototypes.

Examples

Creating a trigger prototype

Create a trigger prototype to detect when a file system has less than 20% free disk space.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.create",
  "params": {
    "description": "Free disk space is less than 20% on volume {#FSNAME}",
    "expression": "last(/Zabbix server/vfs.fs.size[{#FSNAME},pfree])<20",
    "tags": [
      {
        "tag": "volume",
        "value": "{#FSNAME}"
      },
      {
        "tag": "type",
        "value": "{#FSTYPE}"
      }
    ]
  }
}
```

```
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "17372"
    ]
  },
  "id": 1
}
```

Source

CTriggerPrototype::create() in *ui/include/classes/api/services/CTriggerPrototype.php*.

### triggerprototype.delete

Description

object triggerprototype.delete(array triggerPrototypeIds)

This method allows to delete trigger prototypes.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the trigger prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted trigger prototypes under the `triggerids` property.

Examples

Deleting multiple trigger prototypes

Delete two trigger prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.delete",
  "params": [
    "12002",
    "12003"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "12002",
      "12003"
    ]
  }
}
```

```

    },
    "id": 1
}

```

Source

CTriggerPrototype::delete() in *ui/include/classes/api/services/CTriggerPrototype.php*.

## triggerprototype.get

Description

integer/array triggerprototype.get(object parameters)

The method allows to retrieve trigger prototypes according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter           | Type         | Description   |
|---------------------|--------------|---|
| active              | flag         | Return only enabled trigger prototypes that belong to monitored hosts.  |
| discoveryids        | string/array | Return only trigger prototypes that belong to the given LLD rules.  |
| functions           | string/array | Return only triggers that use the given functions.  |
| group               | string       | Refer to the <a href="#">Supported functions</a> page for a list of supported functions.<br>Return only trigger prototypes that belong to hosts from the host groups with the given name. |
| groupids            | string/array | Return only trigger prototypes that belong to hosts from the given host groups.   |
| host                | string       | Return only trigger prototypes that belong to hosts with the given name.  |
| hostids             | string/array | Return only trigger prototypes that belong to the given hosts.  |
| inherited           | boolean      | If set to <code>true</code> return only trigger prototypes inherited from a template.   |
| maintenance         | boolean      | If set to <code>true</code> return only enabled trigger prototypes that belong to hosts in maintenance.   |
| min_severity        | integer      | Return only trigger prototypes with severity greater or equal than the given severity.  |
| monitored           | flag         | Return only enabled trigger prototypes that belong to monitored hosts and contain only enabled items.   |
| templated           | boolean      | If set to <code>true</code> return only trigger prototypes that belong to templates.  |
| templateids         | string/array | Return only trigger prototypes that belong to the given templates.  |
| triggerids          | string/array | Return only trigger prototypes with the given IDs.  |
| expandExpression    | flag         | Expand functions and macros in the trigger expression.  |
| selectDependencies  | query        | Return trigger prototypes and triggers that the trigger prototype depends on in the <code>dependencies</code> property.   |
| selectDiscoveryRule | query        | Return the <a href="#">LLD rule</a> that the trigger prototype belongs to.  |
| selectFunctions     | query        | Return functions used in the trigger prototype in the <code>functions</code> property.  |

The function objects represent the functions used in the trigger expression and has the following properties:

`functionid` - (*string*) ID of the function;

`itemid` - (*string*) ID of the item used in the function;

`function` - (*string*) name of the function;

`parameter` - (*string*) parameter passed to the function. Query parameter is replaced by `$` symbol in returned string.

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| selectGroups           | query        | Return the host groups that the trigger prototype belongs to in the <b>groups</b> property.   |
| selectHosts            | query        | Return the hosts that the trigger prototype belongs to in the <b>hosts</b> property.  |
| selectItems            | query        | Return items and item prototypes used the trigger prototype in the <b>items</b> property.   |
| selectTags             | query        | Return the trigger prototype tags in <b>tags</b> property.  |
| filter                 | object       | Return only those results that exactly match the given filter.<br><br>Accepts an array, where the keys are property names, and the values are either a single value or an array of values to match against.<br><br>Supports additional filters:<br>host - technical name of the host that the trigger prototype belongs to;<br>hostid - ID of the host that the trigger prototype belongs to. |
| limitSelects           | integer      | Limits the number of records returned by subselects.  |
| sortfield              | string/array | Applies to the following subselects:<br>selectHosts - results will be sorted by host.<br>Sort the result by the given properties.<br><br>Possible values are: triggerid, description, status and priority.<br>These parameters are described in the <b>reference commentary</b> .   |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieve trigger prototypes from an LLD rule

Retrieve all trigger prototypes and their functions from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.get",
  "params": {
    "output": "extend",
    "selectFunctions": "extend",
    "discoveryids": "22450"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "triggerid": "13272",
      "expression": "{12598}<20",
      "description": "Free inodes is less than 20% on volume {#FSNAME}",

      "url": "",
      "status": "0",
      "priority": "2",
      "comments": "",
      "templateid": "0",
      "type": "0",
      "flags": "2",
      "recovery_mode": "0",
      "recovery_expression": "",
      "correlation_mode": "0",
      "correlation_tag": "",
      "manual_close": "0",
      "opdata": "",
      "discover": "0",
      "functions": [
        {
          "functionid": "13500",
          "itemid": "22686",
          "triggerid": "13266",
          "parameter": "$",
          "function": "last"
        }
      ]
    }
  ],
  "id": 1
}

```

Retrieving a specific trigger prototype with tags

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.get",
  "params": {
    "output": [
      "triggerid",
      "description"
    ],
    "selectTags": "extend",
    "triggerids": [
      "17373"
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "triggerid": "17373",
      "description": "Free disk space is less than 20% on volume {#FSNAME}",
      "tags": [
        {
          "tag": "volume",
          "value": "{#FSNAME}"
        },
        {
          "tag": "type",
          "value": "{#FSTYPE}"
        }
      ]
    }
  ],
  "id": 1
}
```

## triggerprototype.update

Description

object triggerprototype.update(object/array triggerPrototypes)

This method allows to update existing trigger prototypes.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

## Parameters

(object/array) **Trigger prototype properties** to be updated.

The triggerid property must be defined for each trigger prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard trigger prototype properties** the method accepts the following parameters.

| Parameter    | Type  | Description   |
|--------------|-------|---|
| dependencies | array | Triggers and trigger prototypes that the trigger prototype is dependent on.               |
| tags         | array | The triggers must have the triggerid property defined.<br>Trigger prototype <b>tags</b> . |

### Attention:

The trigger expression has to be given in its expanded form and must contain at least one item prototype.

## Return values

(object) Returns an object containing the IDs of the updated trigger prototypes under the triggerids property.

## Examples

### Enabling a trigger prototype

Enable a trigger prototype, that is, set its status to 0.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.update",
  "params": {
    "triggerid": "13938",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

### Replacing trigger prototype tags

Replace tags for one trigger prototype.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.update",
  "params": {
    "triggerid": "17373",
    "tags": [
      {
        "tag": "volume",

```

```

        "value": "{#FSNAME}"
    },
    {
        "tag": "type",
        "value": "{#FSTYPE}"
    }
]
},
"auth": "038e1d7b1735c6a5436ee9eae095879e",
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "17373"
        ]
    },
    "id": 1
}

```

## User

This class is designed to work with users.

Object references:

- [User](#)

Available methods:

- [user.checkauthentication](#) - checking and prolonging user sessions
- [user.create](#) - creating new users
- [user.delete](#) - deleting users
- [user.get](#) - retrieving users
- [user.login](#) - logging in to the API
- [user.logout](#) - logging out of the API
- [user.unblock](#) - unblocking users
- [user.update](#) - updating users

### > User object

The following objects are directly related to the user API.

User

The user object has the following properties.

| Property                             | Type      | Description  |
|--------------------------------------|-----------|--|
| userid                               | string    | <i>(readonly)</i> ID of the user.                              |
| <b>username</b><br><i>(required)</i> | string    | User name.   |
| <b>roleid</b><br><i>(required)</i>   | string    | Role ID of the user.   |
| attempt_clock                        | timestamp | <i>(readonly)</i> Time of the last unsuccessful login attempt. |
| attempt_failed                       | integer   | <i>(readonly)</i> Recent failed login attempt count.           |

| Property              | Type    | Description   |
|-----------------------|---------|---|
| attempt_ip            | string  | ( <i>readonly</i> ) IP address from where the last unsuccessful login attempt came from.  |
| autologin             | integer | Whether to enable auto-login.<br><br>Possible values:<br>0 - ( <i>default</i> ) auto-login disabled;<br>1 - auto-login enabled.   |
| autologout            | string  | User session life time. Accepts seconds and time unit with suffix. If set to 0s, the session will never expire.   |
| lang                  | string  | Default: 15m.<br>Language code of the user's language, for example, en_US.  |
| name                  | string  | Default: default - system default.<br>Name of the user.   |
| refresh               | string  | Automatic refresh period. Accepts seconds or time unit with suffix (e.g., 30s, 90s, 1m, 1h).  |
| rows_per_page         | integer | Default: 30s.<br>Amount of object rows to show per page.  |
| surname               | string  | Default: 50.<br>Surname of the user.  |
| theme                 | string  | User's theme.<br><br>Possible values:<br>default - ( <i>default</i> ) system default;<br>blue-theme - Blue;<br>dark-theme - Dark.   |
| url                   | string  | URL of the page to redirect the user to after logging in.   |
| timezone              | string  | User's time zone, for example, Europe/London, UTC.<br><br>Default: default - system default.<br><br>For the full list of supported time zones please refer to <a href="#">PHP documentation</a> . |
| alias<br>(deprecated) | string  | This property is deprecated, please use username instead.<br>User alias.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## Media

The media object has the following properties.

| Property                         | Type         | Description  |
|----------------------------------|--------------|--|
| <b>mediatypeid</b><br>(required) | string       | ID of the media type used by the media.  |
| <b>sendto</b><br>(required)      | string/array | Address, user name or other identifier of the recipient.<br><br>If type of <b>Media type</b> is e-mail, values are represented as array. For other types of <b>Media types</b> , value is represented as a string. |
| <b>active</b>                    | integer      | Whether the media is enabled.<br><br>Possible values:<br>0 - ( <i>default</i> ) enabled;<br>1 - disabled.  |

| Property        | Type    | Description  |
|-----------------|---------|--|
| <b>severity</b> | integer | <p>Trigger severities to send notifications about.</p> <p>Possible bitmap values:</p> <ul style="list-style-type: none"> <li>1 - Not classified;</li> <li>2 - Information;</li> <li>4 - Warning;</li> <li>8 - Average;</li> <li>16 - High;</li> <li>32 - Disaster.</li> </ul> <p>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 48 for Average, High, and Disaster).</p> |
| <b>period</b>   | string  | <p>Default: 63.</p> <p>Time when the notifications can be sent as a <b>time period</b> or user macros separated by a semicolon.</p> <p>Default: 1-7,00:00-24:00</p>  |

## user.checkAuthentication

### Description

object `user.checkAuthentication`

This method checks and prolongs user session.

#### Attention:

Calling the **user.checkAuthentication** method with the parameter `sessionid` set prolongs user session by default.

### Parameters

The method accepts the following parameters.

| Parameter              | Type    | Description  |
|------------------------|---------|--|
| <code>extend</code>    | boolean | <p>Whether to prolong the user session.</p> <p>Default value: "true". Setting the value to "false" allows to check the user session without prolonging it.</p> |
| <code>sessionid</code> | string  | <p>Used if <code>sessionid</code> is set.</p> <p>User session ID.</p>  |
| <code>token</code>     | string  | <p><b>Required</b> if token is not set.</p> <p>User <b>API token</b>.</p> <p><b>Required</b> if <code>sessionid</code> is not set.</p>                         |

### Return values

(object) Returns an object containing information about user.

### Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.checkAuthentication",
  "params": {
    "sessionid": "673b8ba11562a35da902c66cf5c23fa2"
  }
}
```

```

    },
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "userid": "1",
    "username": "Admin",
    "name": "Zabbix",
    "surname": "Administrator",
    "url": "",
    "autologin": "1",
    "autologout": "0",
    "lang": "ru_RU",
    "refresh": "0",
    "theme": "default",
    "attempt_failed": "0",
    "attempt_ip": "127.0.0.1",
    "attempt_clock": "1355919038",
    "rows_per_page": "50",
    "timezone": "Europe/Riga",
    "roleid": "3",
    "type": 3,
    "sessionid": "673b8ba11562a35da902c66cf5c23fa2",
    "debug_mode": 0,
    "userip": "127.0.0.1",
    "gui_access": 0
  },
  "id": 1
}

```

**Note:**

Response is similar to [User.login](#) call response with "userData" parameter set to true (the difference is that user data is retrieved by session id and not by username / password).

Source

CUser::checkAuthentication() in *ui/include/classes/api/services/CUser.php*.

## user.create

Description

object user.create(object/array users)

This method allows to create new users.

**Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Note:**

The strength of user password is validated according the password policy rules defined by Authentication API. See [Authentication API](#) for more information.

Parameters

(object/array) Users to create.

Additionally to the [standard user properties](#), the method accepts the following parameters.

| Parameter                    | Type   | Description   |
|------------------------------|--------|---|
| <b>passwd</b><br>(required)  | string | User's password.  |
| <b>usrgrps</b><br>(required) | array  | Can be omitted if user is added only to groups that have LDAP access.<br>User <b>groups</b> to add the user to. |
| medias                       | array  | The user groups must have the usrgrpid property defined.<br>User <b>media</b> to be created.                    |
| user_medias<br>(deprecated)  | array  | This parameter is deprecated, please use medias instead.<br>User <b>media</b> to be created.                    |

#### Return values

(object) Returns an object containing the IDs of the created users under the `userids` property. The order of the returned IDs matches the order of the passed users.

#### Examples

##### Creating a user

Create a new user, add him to a user group and create a new media for him.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.create",
  "params": {
    "username": "John",
    "passwd": "Doe123",
    "roleid": "5",
    "usrgrps": [
      {
        "usrgrpid": "7"
      }
    ],
    "medias": [
      {
        "mediatypeid": "1",
        "sendto": [
          "support@company.com"
        ],
        "active": 0,
        "severity": 63,
        "period": "1-7,00:00-24:00"
      }
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "12"
    ]
  },
  "id": 1
}
```

## user.delete

Description

`object user.delete(array users)`

This method allows to delete users.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of users to delete.

Return values

(object) Returns an object containing the IDs of the deleted users under the `userids` property.

Examples

Deleting multiple users

Delete two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.delete",
  "params": [
    "1",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "5"
    ]
  },
  "id": 1
}
```

Source

CUser::delete() in *ui/include/classes/api/services/CUser.php*.

## user.get

Description

`integer/array user.get(object parameters)`

The method allows to retrieve users according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

**Note:**

Since Zabbix 6.0.38, when requesting user media, permissions, or role information, *Admin* and *User* type users may retrieve data only about their own user. For an example, see [Retrieving users as Admin](#).

| Parameter        | Type         | Description   |
|------------------|--------------|---|
| mediaids         | string/array | Return only users that use the given media.   |
| mediatypeids     | string/array | Return only users that use the given media types.   |
| userids          | string/array | Return only users with the given IDs.   |
| usrgrpids        | string/array | Return only users that belong to the given user groups.   |
| getAccess        | flag         | Adds additional information about user permissions.<br><br>Adds the following properties for each user:<br>gui_access - ( <i>integer</i> ) user's frontend authentication method. Refer to the gui_access property of the <a href="#">user group object</a> for a list of possible values.<br>debug_mode - ( <i>integer</i> ) indicates whether debug is enabled for the user. Possible values: 0 - debug disabled, 1 - debug enabled.<br>users_status - ( <i>integer</i> ) indicates whether the user is disabled. Possible values: 0 - user enabled, 1 - user disabled. |
| selectMedias     | query        | Return media used by the user in the <a href="#">medias</a> property.   |
| selectMediatypes | query        | Return media types used by the user in the <a href="#">mediatypes</a> property.   |
| selectUsrgrps    | query        | Return user groups that the user belongs to in the <a href="#">usrgrps</a> property.  |
| selectRole       | query        | See <a href="#">usergroup.get</a> for restrictions based on user type.  |
| filter           | object       | Return user role in the <a href="#">role</a> property.<br>Return only those results that exactly match the given filter.  |
|                  |              | Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against.  |
|                  |              | Does not support properties of text <a href="#">data type</a> .   |
|                  |              | Possible <a href="#">User object</a> properties for <i>Admin</i> and <i>User</i> type users when requesting data on users in their user group (since Zabbix 6.0.38):<br>userid, name, surname, username.  |
| output           | query        | <a href="#">User object</a> properties to be returned.<br><br>Since Zabbix 6.0.38, <i>Admin</i> and <i>User</i> type users may retrieve only the following properties:<br>- For their own user: userid, attempt_clock, attempt_failed, attempt_ip, autologin, autologout, lang, name, refresh, roleid, rows_per_page, surname, theme, timezone, url, username.<br>- For users in their user group: userid, name, surname, username.<br><br>Default: <code>extend</code> .   |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| search                 | object       | Return results that match the given pattern (case-insensitive).<br><br>Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.<br><br>Supports only properties of string and text <b>data type</b> .<br><br>Possible <b>User object</b> properties for <i>Admin</i> and <i>User</i> type users when requesting data on users in their user group (since Zabbix 6.0.38): name, surname, username.<br><br>Sort the result by the given properties.<br><br>Possible values are: userid and username.<br>These parameters are described in the <b>reference commentary</b> . |
| sortfield              | string/array |   |
| countOutput            | boolean      |   |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| limit                  | integer      |   |
| preservekeys           | boolean      |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving users

Retrieve all of the configured users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.get",
  "params": {
    "output": "extend"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "1",
      "username": "Admin",
      "name": "Zabbix",

        "timezone": "default",
        "roleid": "1"
    }
],
    "id": 1
}

```

Retrieving users as *Admin*

As an *Admin* type user, retrieve detailed data about your own user and limited data for users in your user group.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "user.get",
    "params": {
        "output": "extend",
        "getAccess": true,
        "selectMedias": "extend",
        "selectMediatypes": "extend",
        "selectUsrgrps": "extend",
        "selectRole": "extend"
    }
},

```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "1",
      "username": "Admin",
      "name": "Zabbix",
      "surname": "Administrator",
      "usrgrps": [
        {
          "usrgrpid": "7",
          "name": "Zabbix administrators",
          "gui_access": "0",
          "users_status": "0",
          "debug_mode": "0"
        }
      ]
    },
    {
      "userid": "3",
      "username": "database-admin",
      "name": "John",
      "surname": "Doe",
      "url": "",
      "autologin": "0",
      "autologout": "0",
      "lang": "default",
      "refresh": "30s",
      "theme": "default",
      "attempt_failed": "0",

  }
}
],
"id": 1
}

```

Retrieving user data

Retrieve data of a user with ID "12".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "user.get",
  "params": {
    "output": ["userid", "username"],
    "selectRole": "extend",
    "userids": "12"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "12",
      "username": "John",
      "role": {
        "roleid": "5",
        "name": "Operator",
        "type": "1",
        "readonly": "0"
      }
    }
  ],
  "id": 1
}

```

Source

CUser::get() in ui/include/classes/api/services/CUser.php.

## user.login

Description

string/object user.login(object parameters)

This method allows to log in to the API and generate an authentication token.

### Warning:

When using this method, you also need to do **user.logout** to prevent the generation of a large number of open session records.

### Attention:

This method is only available to unauthenticated users and must be called without the auth parameter in the JSON-RPC request.

Parameters

(object) Parameters containing the user name and password.

The method accepts the following parameters.

| Parameter                     | Type   | Description  |
|-------------------------------|--------|--|
| <b>password</b><br>(required) | string | User password.   |
| <b>username</b><br>(required) | string | User name.   |
| userData                      | flag   | Return information about the authenticated user.                         |
| user<br>(deprecated)          | string | This parameter is deprecated, please use username instead.<br>User name. |

Return values

(string/object) If the userData parameter is used, returns an object containing information about the authenticated user.

Additionally to the **standard user properties**, the following information is returned:

| Property   | Type    | Description  |
|------------|---------|--|
| debug_mode | integer | Whether debug mode is enabled for the user.  |
| gui_access | integer | Refer to the debug_mode property of the <b>User group object</b> for a list of possible values.<br>User's authentication method to the frontend.                           |
| sessionid  | string  | Refer to the gui_access property of the <b>User group object</b> for a list of possible values.<br>Authentication token, which must be used in the following API requests. |
| type       | integer | User type.<br>Refer to the type property of the <b>Role object</b> for a list of possible values.  |
| userip     | string  | IP address of the user.  |

### Note:

If a user has been successfully authenticated after one or more failed attempts, the method will return the current values for the attempt\_clock, attempt\_failed and attempt\_ip properties and then reset them.

If the userData parameter is not used, the method returns an authentication token.

**Note:**

The generated authentication token should be remembered and used in the `auth` parameter of the following JSON-RPC requests. It is also required when using HTTP authentication.

**Examples****Authenticating a user**

Authenticate a user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "username": "Admin",
    "password": "zabbix"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "0424bd59b807674191e7d77572075f33",
  "id": 1
}
```

**Requesting authenticated user's information**

Authenticate and return additional information about the user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "username": "Admin",
    "password": "zabbix",
    "userData": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userid": "1",
    "username": "Admin",
    "name": "Zabbix",
    "surname": "Administrator",
    "url": "",
    "autologin": "1",
    "autologout": "0",
    "lang": "ru_RU",
    "refresh": "0",
    "theme": "default",
    "attempt_failed": "0",
    "attempt_ip": "127.0.0.1",
    "attempt_clock": "1355919038",
    "rows_per_page": "50",
    "timezone": "Europe/Riga",
    "roleid": "3",
  }
}
```

```

        "type": 3,
        "userip": "127.0.0.1",
        "debug_mode": 0,
        "gui_access": 0,
        "sessionid": "5b56eee8be445e98f0bd42b435736e42"
    },
    "id": 1
}

```

- [user.logout](#)

Source

CUser::login() in *ui/include/classes/api/services/CUser.php*.

## user.logout

Description

string/object `user.logout(array)`

This method allows to log out of the API and invalidates the current authentication token.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) The method accepts an empty array.

Return values

(boolean) Returns true if the user has been logged out successfully.

Examples

Logging out

Log out from the API.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "user.logout",
    "params": [],
    "id": 1,
    "auth": "16a46baf181ef9602e1687f3110abf8a"
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}

```

- [user.login](#)

Source

CUser::login() in *ui/include/classes/api/services/CUser.php*.

## user.unblock

### Description

`object user.unblock(array userids)`

This method allows to unblock users.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(array) IDs of users to unblock.

### Return values

(object) Returns an object containing the IDs of the unblocked users under the `userids` property.

### Examples

Unblocking multiple users

Unblock two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.unblock",
  "params": [
    "1",
    "5"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "5"
    ]
  },
  "id": 1
}
```

### Source

`CUser::unblock()` in `ui/include/classes/api/services/CUser.php`.

## user.update

### Description

`object user.update(object/array users)`

This method allows to update existing users.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Note:**

The strength of user password is validated according to the password policy rules defined by Authentication API. See [Authentication API](#) for more information.

**Parameters**

(object/array) User properties to be updated.

The `userid` property must be defined for each user, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user properties](#), the method accepts the following parameters.

| Parameter                                | Type   | Description  |
|--|--------|--|
| <code>passwd</code>                      | string | User's password.   |
| <code>usrgrps</code>                     | array  | Can be empty string if user belongs to or is moved only to groups that have LDAP access.<br>User <a href="#">groups</a> to replace existing user groups. |
| <code>medias</code>                      | array  | The user groups must have the <code>usrgrpid</code> property defined.<br>User <a href="#">media</a> to replace existing media.                           |
| <code>user_medias</code><br>(deprecated) | array  | This parameter is deprecated, please use <code>medias</code> instead.<br>User <a href="#">media</a> to replace existing media.                           |

**Return values**

(object) Returns an object containing the IDs of the updated users under the `userids` property.

**Examples****Renaming a user**

Rename a user to John Doe.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.update",
  "params": {
    "userid": "1",
    "name": "John",
    "surname": "Doe"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1"
    ]
  },
  "id": 1
}
```

**Changing user role**

Change a role of a user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.update",
  "params": {
    "userid": "12",
    "roleid": "6"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "12"
    ]
  },
  "id": 1
}
```

## User group

This class is designed to work with user groups.

Object references:

- [User group](#)

Available methods:

- [usergroup.create](#) - creating new user groups
- [usergroup.delete](#) - deleting user groups
- [usergroup.get](#) - retrieving user groups
- [usergroup.update](#) - updating user groups

## > User group object

The following objects are directly related to the usergroup API.

User group

The user group object has the following properties.

| Property                  | Type    | Description  |
|---------------------------|---------|--|
| usrgrpId                  | string  | <i>(readonly)</i> ID of the user group.  |
| <b>name</b><br>(required) | string  | Name of the user group.  |
| debug_mode                | integer | Whether debug mode is enabled or disabled.<br><br>Possible values are:<br>0 - <i>(default)</i> disabled;<br>1 - enabled. |

| Property     | Type    | Description  |
|--------------|---------|--|
| gui_access   | integer | Frontend authentication method of the users in the group.<br><br>Possible values:<br>0 - <i>(default)</i> use the system default authentication method;<br>1 - use internal authentication;<br>2 - use LDAP authentication;<br>3 - disable access to the frontend. |
| users_status | integer | Whether the user group is enabled or disabled.<br><br>Possible values are:<br>0 - <i>(default)</i> enabled;<br>1 - disabled.   |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Permission

The permission object has the following properties.

| Property                        | Type    | Description  |
|---------------------------------|---------|--|
| <b>id</b><br>(required)         | string  | ID of the host group to add permission to.   |
| <b>permission</b><br>(required) | integer | Access level to the host group.<br><br>Possible values:<br>0 - access denied;<br>2 - read-only access;<br>3 - read-write access. |

#### Tag based permission

The tag based permission object has the following properties.

| Property                     | Type   | Description                                |
|------------------------------|--------|--|
| <b>groupid</b><br>(required) | string | ID of the host group to add permission to. |
| <b>tag</b>                   | string | Tag name.                                  |
| <b>value</b>                 | string | Tag value.                                 |

### usergroup.create

#### Description

`object usergroup.create(object/array userGroups)`

This method allows to create new user groups.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(object/array) User groups to create.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

| Parameter   | Type         | Description  |
|-------------|--------------|--|
| rights      | object/array | <a href="#">Permissions</a> to assign to the group           |
| tag_filters | array        | <a href="#">Tag based permissions</a> to assign to the group |

| Parameter                                       | Type         | Description                            |
|---|--------------|--|
| users   | object/array | <b>Users</b> to add to the user group. |
| The user must have the userid property defined. |              |  |

#### Return values

(object) Returns an object containing the IDs of the created user groups under the `usrgrpids` property. The order of the returned IDs matches the order of the passed user groups.

#### Examples

##### Creating a user group

Create a user group, which denies access to host group "2", and add a user to it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.create",
  "params": {
    "name": "Operation managers",
    "rights": {
      "permission": 0,
      "id": "2"
    },
    "users": [
      {"userid": "12"}
    ]
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "20"
    ]
  },
  "id": 1
}
```

- **Permission**

Source

`CUserGroup::create()` in `ui/include/classes/api/services/CUserGroup.php`.

#### **usergroup.delete**

##### Description

object `usergroup.delete(array userGroupIds)`

This method allows to delete user groups.

##### **Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

## Parameters

(array) IDs of the user groups to delete.

## Return values

(object) Returns an object containing the IDs of the deleted user groups under the `usrgrpids` property.

## Examples

### Deleting multiple user groups

Delete two user groups.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.delete",
  "params": [
    "20",
    "21"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "20",
      "21"
    ]
  },
  "id": 1
}
```

## Source

`CUserGroup::delete()` in `ui/include/classes/api/services/CUserGroup.php`.

## usergroup.get

### Description

`integer/array usergroup.get(object parameters)`

The method allows to retrieve user groups according to the given parameters.

#### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

## Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type         | Description   |
|-----------|--------------|---|
| status    | integer      | Return only user groups with the given status.  |
| userids   | string/array | Refer to the <a href="#">user group page</a> for a list of supported statuses.<br>Return only user groups that contain the given users. |
| usrgrpids | string/array | Return only user groups with the given IDs.   |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| selectTagFilters       | query        | Return user group tag based permissions in the <code>tag_filters</code> property.<br><br>It has the following properties:<br><code>groupid</code> - (string) ID of the host group;<br><code>tag</code> - (string) tag name;<br><code>value</code> - (string) tag value.   |
| selectUsers            | query        | Return the users from the user group in the <code>users</code> property.  |
| selectRights           | query        | See <code>user.get</code> for restrictions based on user type.<br>Return user group rights in the <code>rights</code> property.<br><br>It has the following properties:<br><code>permission</code> - (integer) access level to the host group;<br><code>id</code> - (string) ID of the host group.                      |
| limitSelects           | integer      | Refer to the <a href="#">user group page</a> for a list of access levels to host groups.  |
| output                 | query        | Limits the number of records returned by subselects.<br><code>User group object</code> properties to be returned.   |
| sortfield              | string/array | Since Zabbix 6.0.38, <i>Admin</i> and <i>User</i> type users may retrieve only the following properties: <code>usrgrp_id</code> , <code>name</code> , <code>gui_access</code> , <code>users_status</code> , <code>debug_mode</code> .<br><br>Default: <code>extend</code> .<br>Sort the result by the given properties. |
| countOutput            | boolean      | Possible values are: <code>usrgrp_id</code> , <code>name</code> .   |
| editable               | boolean      | These parameters are described in the <a href="#">reference commentary</a> .  |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

#### Examples

Retrieving enabled user groups

Retrieve all enabled user groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.get",
  "params": {
    "output": "extend",
    "status": 0
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "usrgrpid": "7",
      "name": "Zabbix administrators",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "1"
    },
    {
      "usrgrpid": "8",
      "name": "Guests",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "0"
    },
    {
      "usrgrpid": "11",
      "name": "Enabled debug mode",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "1"
    },
    {
      "usrgrpid": "12",
      "name": "No access to the frontend",
      "gui_access": "2",
      "users_status": "0",
      "debug_mode": "0"
    },
    {
      "usrgrpid": "14",
      "name": "Read only",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "0"
    },
    {
      "usrgrpid": "18",
      "name": "Deny",
      "gui_access": "0",
      "users_status": "0",
      "debug_mode": "0"
    }
  ],
  "id": 1
}
```

## **usergroup.update**

Description

`object usergroup.update(object/array userGroups)`

This method allows to update existing user groups.

**Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

**Parameters**

(object/array) User group properties to be updated.

The `usrgrpid` property must be defined for each user group, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

| Parameter   | Type         | Description  |
|---|--------------|--|
| rights  | object/array | <a href="#">Permissions</a> to replace the current permissions assigned to the user group.           |
| tag_filters   | array        | <a href="#">Tag based permissions</a> to replace the current permissions assigned to the user group. |
| users   | object/array | <a href="#">Users</a> to replace the current users assigned to the user group.                       |
| The user must have only the <code>userid</code> property defined. |              |  |

**Return values**

(object) Returns an object containing the IDs of the updated user groups under the `usrgrpids` property.

**Examples**

Disabling a user group

Disable a user group.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.update",
  "params": {
    "usrgrpid": "17",
    "users_status": "1"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "17"
    ]
  },
  "id": 1
}
```

## User macro

This class is designed to work with host and global macros.

Object references:

- [Global macro](#)
- [Host macro](#)

Available methods:

- [usermacro.create](#) - creating new host macros
- [usermacro.createglobal](#) - creating new global macros
- [usermacro.delete](#) - deleting host macros
- [usermacro.deleteglobal](#) - deleting global macros
- [usermacro.get](#) - retrieving host and global macros
- [usermacro.update](#) - updating host macros
- [usermacro.updateglobal](#) - updating global macros

### > User macro object

The following objects are directly related to the `usermacro` API.

Global macro

The global macro object has the following properties.

| Property                   | Type    | Description  |
|----------------------------|---------|--|
| globalmacroid              | string  | <i>(readonly)</i> ID of the global macro.  |
| <b>macro</b><br>(required) | string  | Macro string.  |
| <b>value</b><br>(required) | string  | Value of the macro.  |
| type                       | integer | Type of macro.<br><br>Possible values:<br>0 - <i>(default)</i> Text macro;<br>1 - Secret macro;<br>2 - Vault secret. |
| description                | string  | Description of the macro.  |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Host macro

The host macro object defines a macro available on a host, host prototype or template. It has the following properties.

| Property                    | Type    | Description  |
|-----------------------------|---------|--|
| hostmacroid                 | string  | <i>(readonly)</i> ID of the host macro.  |
| <b>hostid</b><br>(required) | string  | ID of the host that the macro belongs to.  |
| <b>macro</b><br>(required)  | string  | Macro string.  |
| <b>value</b><br>(required)  | string  | Value of the macro.  |
| type                        | integer | Type of macro.<br><br>Possible values:<br>0 - <i>(default)</i> Text macro;<br>1 - Secret macro;<br>2 - Vault secret. |

| Property    | Type   | Description               |
|-------------|--------|---------------------------|
| description | string | Description of the macro. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

## usermacro.create

Description

object usermacro.create(object/array hostMacros)

This method allows to create new host macros.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host macros to create.

The method accepts host macros with the [standard host macro properties](#).

Return values

(object) Returns an object containing the IDs of the created host macros under the `hostmacroids` property. The order of the returned IDs matches the order of the passed host macros.

Examples

Creating a host macro

Create a host macro "{\$SNMP\_COMMUNITY}" with the value "public" on host "10198".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.create",
  "params": {
    "hostid": "10198",
    "macro": "{$SNMP_COMMUNITY}",
    "value": "public"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "11"
    ]
  },
  "id": 1
}
```

Source

CUserMacro::create() in `ui/include/classes/api/services/CUserMacro.php`.

## usermacro.createglobal

Description

`object usermacro.createglobal(object/array globalMacros)`

This method allows to create new global macros.

**Note:**

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Global macros to create.

The method accepts global macros with the [standard global macro properties](#).

Return values

(object) Returns an object containing the IDs of the created global macros under the `globalmacroids` property. The order of the returned IDs matches the order of the passed global macros.

Examples

Creating a global macro

Create a global macro "{\$SNMP\_COMMUNITY}" with value "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.createglobal",
  "params": {
    "macro": "{$SNMP_COMMUNITY}",
    "value": "public"
  },

## **usermacro.delete**

Description

`object usermacro.delete(array hostMacroIds)`

This method allows to delete host macros.

**Note:**

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the host macros to delete.

Return values

(object) Returns an object containing the IDs of the deleted host macros under the `hostmacroids` property.

#### Examples

Deleting multiple host macros

Delete two host macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.delete",
  "params": [
    "32",
    "11"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "32",
      "11"
    ]
  },
  "id": 1
}
```

### usermacro.deleteglobal

#### Description

object usermacro.deleteglobal(array globalMacroIds)

This method allows to delete global macros.

#### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

#### Parameters

(array) IDs of the global macros to delete.

#### Return values

(object) Returns an object containing the IDs of the deleted global macros under the `globalmacroids` property.

#### Examples

Deleting multiple global macros

Delete two global macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.deleteglobal",
  "params": [
    "32",
```

```

        "11"
    ],
    "auth": "3a57200802b24cda67c4e4010b50c065",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "globalmacroids": [
      "32",
      "11"
    ]
  },
  "id": 1
}

```

## usermacro.get

Description

integer/array usermacro.get(object parameters)

The method allows to retrieve host and global macros according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter       | Type         | Description   |
|-----------------|--------------|---|
| globalmacro     | flag         | Return global macros instead of host macros.  |
| globalmacroids  | string/array | Return only global macros with the given IDs.   |
| groupids        | string/array | Return only host macros that belong to hosts or templates from the given host groups.                                       |
| hostids         | string/array | Return only macros that belong to the given hosts or templates.   |
| hostmacroids    | string/array | Return only host macros with the given IDs.   |
| inherited       | boolean      | If set to <code>true</code> return only host prototype user macros inherited from a template.                               |
| selectGroups    | query        | Return host groups that the host macro belongs to in the <b>groups</b> property.  |
| selectHosts     | query        | Used only when retrieving host macros.<br>Return hosts that the host macro belongs to in the <b>hosts</b> property.         |
| selectTemplates | query        | Used only when retrieving host macros.<br>Return templates that the host macro belongs to in the <b>templates</b> property. |
| sortfield       | string/array | Used only when retrieving host macros.<br>Sort the result by the given properties.  |
| countOutput     | boolean      | Possible value: <code>macro</code> .<br>These parameters are described in the <a href="#">reference commentary</a> .        |

| Parameter              | Type         | Description |
|------------------------|--------------|-------------|
| editable               | boolean      |             |
| excludeSearch          | boolean      |             |
| filter                 | object       |             |
| limit                  | integer      |             |
| output                 | query        |             |
| preservekeys           | boolean      |             |
| search                 | object       |             |
| searchByAny            | boolean      |             |
| searchWildcardsEnabled | boolean      |             |
| sortorder              | string/array |             |
| startSearch            | boolean      |             |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

Retrieving host macros for a host

Retrieve all host macros defined for host "10198".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.get",
  "params": {
    "output": "extend",
    "hostids": "10198"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostmacroid": "9",
      "hostid": "10198",
      "macro": "{$INTERFACE}",
      "value": "eth0",
      "description": "",
      "type": "0"
    },
    {
      "hostmacroid": "11",
      "hostid": "10198",
      "macro": "{$SNMP_COMMUNITY}",
      "value": "public",
      "description": "",
      "type": "0"
    }
  ],
  "id": 1
}
```

Retrieving global macros

Retrieve all global macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.get",
  "params": {
    "output": "extend",
    "globalmacro": true
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "globalmacroid": "6",
      "macro": "{$SNMP_COMMUNITY}",
      "value": "public",
      "description": "",
      "type": "0"
    }
  ],
  "id": 1
}
```

Source

CUserMacro::get() in `ui/include/classes/api/services/CUserMacro.php`.

## usermacro.update

Description

object usermacro.update(object/array hostMacros)

This method allows to update existing host macros.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Host macro properties** to be updated.

The `hostmacroid` property must be defined for each host macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host macros under the `hostmacroids` property.

Examples

Changing the value of a host macro

Change the value of a host macro to "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.update",
  "params": {
    "hostmacroid": "1",
    "value": "public"
  }
}
```

```

    },
    "auth": "038e1d7b1735c6a5436ee9eae095879e",
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "1"
    ]
  },
  "id": 1
}

```

## usermacro.updateglobal

Description

object usermacro.updateglobal(object/array globalMacros)

This method allows to update existing global macros.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Global macro properties** to be updated.

The globalmacroid property must be defined for each global macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated global macros under the globalmacroids property.

Examples

Changing the value of a global macro

Change the value of a global macro to "public".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "usermacro.updateglobal",
  "params": {
    "globalmacroid": "1",
    "value": "public"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "globalmacroids": [
      "1"
    ]
  }
}

```

```
    ],
    },
    "id": 1
}
```

## Value map

This class is designed to work with value maps.

Object references:

- [Value map](#)

Available methods:

- [valuemap.create](#) - creating new value maps
- [valuemap.delete](#) - deleting value maps
- [valuemap.get](#) - retrieving value maps
- [valuemap.update](#) - updating value maps

## > Value map object

The following objects are directly related to the `valuemap` API.

Value map

The value map object has the following properties.

| Property                                   | Type   | Description  |
|--|--------|--|
| <code>valuemapid</code>                    | string | ( <i>readonly</i> ) ID of the value map.   |
| <b><code>hostid</code></b><br>(required)   | id     | Value map host or template ID.   |
| <b><code>name</code></b><br>(required)     | string | Name of the value map.   |
| <b><code>mappings</code></b><br>(required) | array  | Value mappings for current value map. The mapping object is <a href="#">described in detail below</a> .  |
| <code>uuid</code>                          | string | Universal unique identifier, used for linking imported value maps to already existing ones. Used only for value maps on templates. Auto-generated, if not given. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

Value mappings

The value mappings object defines value mappings of the value map. It has the following properties.

| Property          | Type    | Description   |
|-------------------|---------|---|
| <code>type</code> | integer | Mapping match type. For type equal 0,1,2,3,4 <code>value</code> field cannot be empty, for type 5 <code>value</code> field should be empty. |

Possible values:

- 0 - (default) exact match ;
- 1 - mapping will be applied if value is greater or equal<sup>1</sup>;
- 2 - mapping will be applied if value is less or equal<sup>1</sup>;
- 3 - mapping will be applied if value is in range (ranges are inclusive), allow to define multiple ranges separated by comma character<sup>1</sup>;
- 4 - mapping will be applied if value match regular expression<sup>2</sup>;
- 5 - default value, mapping will be applied if no other match were found.

| Property                      | Type   | Description   |
|-------------------------------|--------|---|
| <b>value</b><br>(required)    | string | Original value.   |
| <b>newvalue</b><br>(required) | string | Is not required for mapping of type "default".<br>Value to which the original value is mapped to. |

<sup>1</sup> supported only for items having value type "numeric unsigned", "numeric float".

<sup>2</sup> supported only for items having value type "character".

## valuemap.create

Description

object valuemap.create(object/array valuemaps)

This method allows to create new value maps.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Value maps to create.

The method accepts value maps with the [standard value map properties](#).

Return values

(object) Returns an object containing the IDs of the created value maps the `valuemapids` property. The order of the returned IDs matches the order of the passed value maps.

Examples

Creating a value map

Create one value map with two mappings.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.create",
  "params": {
    "hostid": "50009",
    "name": "Service state",
    "mappings": [
      {
        "type": "1",
        "value": "1",
        "newvalue": "Up"
      },
      {
        "type": "5",
        "newvalue": "Down"
      }
    ]
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

CValueMap::create() in *ui/include/classes/api/services/CValueMap.php*.

## valuemap.delete

Description

object valuemap.delete(array valuemapids)

This method allows to delete value maps.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(array) IDs of the value maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted value maps under the *valuemapids* property.

Examples

Deleting multiple value maps

Delete two value maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.delete",
  "params": [
    "1",
    "2"
  ],
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

CValueMap::delete() in *ui/include/classes/api/services/CValueMap.php*.

**valuemap.get**

Description

integer/array valuemap.get(object parameters)

The method allows to retrieve value maps according to the given parameters.

**Note:**

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| valuemapids            | string/array | Return only value maps with the given IDs.   |
| selectMappings         | query        | Return the value mappings for current value map in the <b>mappings</b> property.   |
| sortfield              | string/array | Supports count.<br>Sort the result by the given properties.<br><br>Possible values are: <b>valuemapid</b> , <b>name</b> .<br>These parameters are described in the <b>reference commentary</b> . |
| countOutput            | boolean      |  |
| editable               | boolean      |  |
| excludeSearch          | boolean      |  |
| filter                 | object       |  |
| limit                  | integer      |  |
| output                 | query        |  |
| preservekeys           | boolean      |  |
| search                 | object       |  |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      |  |
| sortorder              | string/array |  |
| startSearch            | boolean      |  |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

Examples

Retrieving value maps

Retrieve all configured value maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.get",
  "params": {
    "output": "extend"
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "valuemapid": "4",
      "name": "APC Battery Replacement Status"
    },
    {
      "valuemapid": "5",
      "name": "APC Battery Status"
    },
    {
      "valuemapid": "7",
      "name": "Dell Open Manage System Status"
    }
  ],
  "id": 1
}

```

Retrieve one value map with its mappings.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "valuemap.get",
  "params": {
    "output": "extend",
    "selectMappings": "extend",
    "valuemapids": ["4"]
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "valuemapid": "4",
      "name": "APC Battery Replacement Status",
      "mappings": [
        {
          "type": "0",
          "value": "1",
          "newvalue": "unknown"
        },
        {
          "type": "0",
          "value": "2",
          "newvalue": "notInstalled"
        },
        {
          "type": "0",
          "value": "3",
          "newvalue": "ok"
        },
        {
          "type": "0",
          "value": "4",
          "newvalue": "failed"
        }
      ]
    }
  ]
}

```

```

        "type": "0",
        "value": "5",
        "newvalue": "highTemperature"
    },
    {
        "type": "0",
        "value": "6",
        "newvalue": "replaceImmediately"
    },
    {
        "type": "0",
        "value": "7",
        "newvalue": "lowCapacity"
    }
]
},
{id": 1
}

```

Source

## valuemap.update

Description

object valuemap.update(object/array valuemaps)

This method allows to update existing value maps.

### Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Value map properties** to be updated.

The valuemapid property must be defined for each value map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated value maps under the valuemapid property.

Examples

Changing value map name

Change value map name to "Device status".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "valuemap.update",
    "params": {
        "valuemapid": "2",
        "name": "Device status"
    },
    "auth": "57562fd409b3b3b9a4d916d45207bbcb",
    "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "2"
    ]
  },
  "id": 1
}
```

Changing mappings for one value map.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.update",
  "params": {
    "valuemapid": "2",
    "mappings": [
      {
        "type": "0",
        "value": "0",
        "newvalue": "Online"
      },
      {
        "type": "0",
        "value": "1",
        "newvalue": "Offline"
      }
    ]
  },
  "auth": "57562fd409b3b3b9a4d916d45207bbcb",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "2"
    ]
  },
  "id": 1
}
```

## > Web scenario object

The following objects are directly related to the webcheck API.

Web scenario

The web scenario object has the following properties.

| Property                    | Type                                 | Description  |
|-----------------------------|--------------------------------------|--|
| httptestid                  | string                               | ( <i>readonly</i> ) ID of the web scenario.  |
| <b>hostid</b><br>(required) | string                               | ID of the host that the web scenario belongs to.   |
| <b>name</b><br>(required)   | string                               | Name of the web scenario.  |
| agent                       | string                               | User agent string that will be used by the web scenario.   |
| authentication              | integer                              | Default: Zabbix<br>Authentication method that will be used by the web scenario.<br><br>Possible values:<br>0 - ( <i>default</i> ) none;<br>1 - basic HTTP authentication;<br>2 - NTLM authentication.  |
| delay                       | string                               | Execution interval of the web scenario. Accepts seconds, time unit with suffix and user macro.   |
| headers                     | array of <a href="#">HTTP fields</a> | Default: 1m.<br>HTTP headers that will be sent when performing a request.  |
| http_password               | string                               | Password used for basic HTTP or NTLM authentication.   |
| http_proxy                  | string                               | Proxy that will be used by the web scenario given as <i>http://[username[:password]]@[proxy.example.com][:port]</i> .  |
| http_user                   | string                               | User name used for basic HTTP or NTLM authentication.  |
| nextcheck                   | timestamp                            | ( <i>readonly</i> ) Time of the next web scenario execution.   |
| retries                     | integer                              | Number of times a web scenario will try to execute each step before failing.   |
| ssl_cert_file               | string                               | Default: 1.<br>Name of the SSL certificate file used for client authentication (must be in PEM format).  |
| ssl_key_file                | string                               | Name of the SSL private key file used for client authentication (must be in PEM format).   |
| ssl_key_password            | string                               | SSL private key password.  |
| status                      | integer                              | Whether the web scenario is enabled.<br><br>Possible values are:<br>0 - ( <i>default</i> ) enabled;<br>1 - disabled.   |
| templateid                  | string                               | ( <i>readonly</i> ) ID of the parent template web scenario.  |
| variables                   | array of <a href="#">HTTP fields</a> | Web scenario variables.  |
| verify_host                 | integer                              | Whether to validate that the host name for the connection matches the one in the host's certificate.<br><br>Possible values are:<br>0 - ( <i>default</i> ) skip host verification;<br>1 - verify host. |
| verify_peer                 | integer                              | Whether to validate that the host's certificate is authentic.<br><br>Possible values are:<br>0 - ( <i>default</i> ) skip peer verification;<br>1 - verify peer.  |

| Property | Type   | Description   |
|----------|--------|---|
| uuid     | string | Global unique identifier, used for linking imported web scenarios to already existing ones. Used only for web scenarios on templates. |

Note that for some methods (update, delete) the required/optional parameter combination is different.

#### Web scenario tag

The web scenario tag object has the following properties.

| Property                 | Type   | Description             |
|--------------------------|--------|-------------------------|
| <b>tag</b><br>(required) | string | Web scenario tag name.  |
| value                    | string | Web scenario tag value. |

#### Scenario step

The scenario step object defines a specific web scenario check. It has the following properties.

| Property                  | Type                           | Description  |
|---------------------------|--------------------------------|--|
| httpstepid                | string                         | <i>(readonly)</i> ID of the scenario step.   |
| <b>name</b><br>(required) | string                         | Name of the scenario step.   |
| <b>no</b><br>(required)   | integer                        | Sequence number of the step in a web scenario.   |
| <b>url</b><br>(required)  | string                         | URL to be checked.   |
| follow_redirects          | integer                        | Whether to follow HTTP redirects.<br><br>Possible values are:<br>0 - don't follow redirects;<br>1 - <i>(default)</i> follow redirects.                                       |
| headers                   | array of HTTP fields           | HTTP headers that will be sent when performing a request. Scenario step headers will overwrite headers specified for the web scenario.                                       |
| httptestid                | string                         | <i>(readonly)</i> ID of the web scenario that the step belongs to.   |
| posts                     | string<br>array of HTTP fields | HTTP POST variables as a string (raw post data) or as an array of HTTP fields (form field data).   |
| required                  | string                         | Text that must be present in the response.   |
| retrieve_mode             | integer                        | Part of the HTTP response that the scenario step must retrieve.<br><br>Possible values are:<br>0 - <i>(default)</i> only body;<br>1 - only headers;<br>2 - headers and body. |
| status_codes              | string                         | Ranges of required HTTP status codes separated by commas.  |
| timeout                   | string                         | Request timeout in seconds. Accepts seconds, time unit with suffix and user macro.<br><br>Default: 15s. Maximum: 1h. Minimum: 1s.  |
| variables                 | array of HTTP fields           | Scenario step variables.   |
| query_fields              | array of HTTP fields           | Query fields - array of HTTP fields that will be added to URL when performing a request  |

#### HTTP field

The HTTP field object defines a name and value that is used to specify variable, HTTP header, POST form field data of query field data. It has the following properties.

| Property                   | Type   | Description                                     |
|----------------------------|--------|---|
| <b>name</b><br>(required)  | string | Name of header / variable / POST or GET field.  |
| <b>value</b><br>(required) | string | Value of header / variable / POST or GET field. |

## httptest.create

### Description

object httptest.create(object/array webScenarios)

This method allows to create new web scenarios.

#### Note:

Creating a web scenario will automatically create a set of **web monitoring items**.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

### Parameters

(object/array) Web scenarios to create.

Additionally to the **standard web scenario properties**, the method accepts the following parameters.

| Parameter                  | Type  | Description                 |
|----------------------------|-------|-----------------------------|
| <b>steps</b><br>(required) | array | Web scenario <b>steps</b> . |
| tags                       | array | Web scenario <b>tags</b> .  |

### Return values

(object) Returns an object containing the IDs of the created web scenarios under the `httptestids` property. The order of the returned IDs matches the order of the passed web scenarios.

### Examples

#### Creating a web scenario

Create a web scenario to monitor the company home page. The scenario will have two steps, to check the home page and the "About" page and make sure they return the HTTP status code 200.

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.create",
  "params": {
    "name": "Homepage check",
    "hostid": "10085",
    "steps": [
      {
        "name": "Homepage",
        "url": "http://example.com",
        "status_codes": "200",
        "no": 1
      },
      {
        "name": "Homepage / About",
        "url": "http://example.com/about",
        "status_codes": "200",
        "no": 2
      }
    ]
  }
}
```

```

    }
  ],
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "httpstestids": [
      "5"
    ]
  },
  "id": 1
}

```

## httpstest.delete

Description

object httpstest.delete(array webScenarioIds)

This method allows to delete web scenarios.

### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the web scenarios to delete.

Return values

(object) Returns an object containing the IDs of the deleted web scenarios under the `httpstestids` property.

Examples

Deleting multiple web scenarios

Delete two web scenarios.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "httpstest.delete",
  "params": [
    "2",
    "3"
  ],
  "auth": "3a57200802b24cda67c4e4010b50c065",
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "2",
      "3"
    ]
  },
  "id": 1
}
```

CHttpTest::delete() in *ui/include/classes/api/services/CHttpTest.php*.

## httptest.get

Description

integer/array httptest.get(object parameters)

The method allows to retrieve web scenarios according to the given parameters.

### Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter      | Type             | Description   |
|----------------|------------------|---|
| groupids       | string/array     | Return only web scenarios that belong to the given host groups.   |
| hostids        | string/array     | Return only web scenarios that belong to the given hosts.   |
| httptestids    | string/array     | Return only web scenarios with the given IDs.   |
| inherited      | boolean          | If set to <code>true</code> return only web scenarios inherited from a template.  |
| monitored      | boolean          | If set to <code>true</code> return only enabled web scenarios that belong to monitored hosts.   |
| templated      | boolean          | If set to <code>true</code> return only web scenarios that belong to templates.   |
| templateids    | string/array     | Return only web scenarios that belong to the given templates.   |
| expandName     | flag             | Expand macros in the name of the web scenario.  |
| expandStepName | flag             | Expand macros in the names of scenario steps.   |
| evaltype       | integer          | Rules for tag searching.<br><br>Possible values:<br>0 - (default) And/Or;<br>2 - Or.  |
| tags           | array of objects | Return only web scenarios with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.<br>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].<br>An empty array returns all web scenarios.<br><br>Possible operator types:<br>0 - (default) Like;<br>1 - Equal;<br>2 - Not like;<br>3 - Not equal<br>4 - Exists;<br>5 - Not exists. |

| Parameter              | Type         | Description   |
|------------------------|--------------|---|
| selectHosts            | query        | Return the hosts that the web scenario belongs to as an array in the <b>hosts</b> property.                       |
| selectSteps            | query        | Return web scenario steps in the <b>steps</b> property.   |
| selectTags             | query        | Supports count.<br>Return the web scenario tags in <b>tags</b> property.  |
| sortfield              | string/array | Sort the result by the given properties.  |
| countOutput            | boolean      | Possible values are: httpstestid and name.<br>These parameters are described in the <b>reference commentary</b> . |
| editable               | boolean      |   |
| excludeSearch          | boolean      |   |
| filter                 | object       |   |
| limit                  | integer      |   |
| output                 | query        |   |
| preservekeys           | boolean      |   |
| search                 | object       |   |
| searchByAny            | boolean      |   |
| searchWildcardsEnabled | boolean      |   |
| sortorder              | string/array |   |
| startSearch            | boolean      |   |

#### Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

#### Examples

##### Retrieving a web scenario

Retrieve all data about web scenario "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httpstest.get",
  "params": {
    "output": "extend",
    "selectSteps": "extend",
    "httpstestids": "9"
  },
  "auth": "038e1d7b1735c6a5436ee9eae095879e",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "httpstestid": "9",
      "name": "Homepage check",
      "nextcheck": "0",
      "delay": "1m",
      "status": "0",
      "variables": [],
      "agent": "Zabbix",
      "authentication": "0",
      "http_user": "",
      "http_password": ""
    }
  ]
}
```

```

        "hostid": "10084",
        "templateid": "0",
        "http_proxy": "",
        "retries": "1",
        "ssl_cert_file": "",
        "ssl_key_file": "",

## httptest.update

### Description

object httptest.update(object/array webScenarios)

This method allows to update existing web scenarios.

#### Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

### Parameters

(object/array) Web scenario properties to be updated.

The `httptestid` property must be defined for each web scenario, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard web scenario properties](#), the method accepts the following parameters.

| Parameter | Type  | Description   |
|-----------|-------|---|
| steps     | array | Scenario <a href="#">steps</a> to replace existing steps. |
| tags      | array | Web scenario <a href="#">tags</a> .                       |

### Return values

(object) Returns an object containing the IDs of the updated web scenarios under the `httptestid` property.

### Examples

#### Enabling a web scenario

Enable a web scenario, that is, set its status to "0".

#### Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.update",
  "params": {
    "httptestid": "5",
    "status": 0
  },
  "auth": "700ca65537074ec963db7efabda78259",
  "id": 1
}
```

#### Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "5"
    ]
  },
  "id": 1
}
```

## Appendix 1. Reference commentary

### Notation Data types

The Zabbix API supports the following data types as input:

| Type      | Description   |
|-----------|---|
| boolean   | A boolean value, accepts either <code>true</code> or <code>false</code> .   |
| flag      | The value is considered to be <code>true</code> if it is passed and not equal to <code>null</code> ; otherwise, it is considered to be <code>false</code> .   |
| integer   | A whole number.   |
| float     | A floating point number.  |
| string    | A text string.  |
| text      | A longer text string.   |
| timestamp | A Unix timestamp.   |
| array     | An ordered sequence of values, that is, a plain array.  |
| object    | An associative array.   |
| query     | A value which defines, what data should be returned.<br><br>Can be defined as an array of property names to return only specific properties, or as one of the predefined values:<br><code>extend</code> - returns all object properties;<br><code>count</code> - returns the number of retrieved records, supported only by certain subselects. |

#### Attention:

Zabbix API always returns values as strings or arrays only.

### Property labels

Some of the objects properties are marked with short labels to describe their behavior. The following labels are used:

- *readonly* - the value of the property is set automatically and cannot be defined or changed by the client;
- *constant* - the value of the property can be set when creating an object, but cannot be changed after.

**Reserved ID value "0"** Reserved ID value "0" can be used to filter elements and to remove referenced objects. For example, to remove a referenced proxy from a host, `proxy_hostid` should be set to 0 ("`proxy_hostid`": "0") or to filter hosts monitored by server option `proxyids` should be set to 0 ("`proxyids`": "0").

**Common "get" method parameters** The following parameters are supported by all `get` methods:

| Parameter                  | Type    | Description   |
|----------------------------|---------|---|
| <code>countOutput</code>   | boolean | Return the number of records in the result instead of the actual data.  |
| <code>editable</code>      | boolean | If set to <code>true</code> , return only objects that the user has write permissions to.   |
| <code>excludeSearch</code> | boolean | Default: <code>false</code> .<br>Return results that do not match the criteria given in the <code>search</code> parameter.  |
| <code>filter</code>        | object  | Return only those results that exactly match the given filter.<br><br>Accepts an object, where the keys are property names (e.g., Host object properties in <code>host.get</code> , Item object properties in <code>item.get</code> , etc.), and the values are either a single value or an array of values to match against.<br><br>Does not support properties of text <b>data type</b> .<br><br>Note that some methods have specific functionality for this parameter, which is described on the method page (e.g., the <code>filter</code> parameter in <code>host.get</code> also supports Host interface properties). |
| <code>limit</code>         | integer | Limit the number of records returned.   |

| Parameter              | Type         | Description  |
|------------------------|--------------|--|
| output                 | query        | Object properties to be returned.  |
| preservekeys           | boolean      | Default: extend.<br>Use IDs as keys in the resulting array.  |
| search                 | object       | Return results that match the given pattern (case-insensitive).<br><br>Accepts an object, where the keys are property names (e.g., Host object properties in <code>host.get</code> , Item object properties in <code>item.get</code> , etc.), and the values are strings to search for. If no additional options are given, this will perform a LIKE <code>"%...%"</code> search.<br><br>Supports only properties of string and text <b>data type</b> .<br><br>Note that some methods have specific functionality for this parameter, which is described on the method page (e.g., the <code>search</code> parameter in <code>host.get</code> also supports Host interface properties).<br><br>If set to <code>true</code> , return results that match any of the criteria given in the <code>filter</code> or <code>search</code> parameter instead of all of them. |
| searchByAny            | boolean      |  |
| searchWildcardsEnabled | boolean      | Default: <code>false</code> .<br>If set to <code>true</code> , enables the use of <code>"*"</code> as a wildcard character in the <code>search</code> parameter.   |
| sortfield              | string/array | Default: <code>false</code> .<br>Sort the result by the given properties. Refer to a specific API get method description for a list of properties that can be used for sorting. Macros are not expanded before sorting.  |
| sortorder              | string/array | If no value is specified, data will be returned unsorted.<br>Order of sorting. If an array is passed, each value will be matched to the corresponding property given in the <code>sortfield</code> parameter.<br><br>Possible values are:<br>ASC - (default) ascending;<br>DESC - descending.  |
| startSearch            | boolean      | The search parameter will compare the beginning of fields, that is, perform a LIKE <code>"...%"</code> search instead.<br><br>Ignored if <code>searchWildcardsEnabled</code> is set to <code>true</code> .   |

#### Examples User permission check

Does the user have permission to write to hosts whose names begin with "MySQL" or "Linux" ?

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "countOutput": true,
    "search": {
      "host": ["MySQL", "Linux"]
    },
    "editable": true,
    "startSearch": true,
    "searchByAny": true
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
```

```
"result": "0",
"id": 1
}
```

**Note:**

Zero result means no hosts with read/write permissions.

### Mismatch counting

Count the number of hosts whose names do not contain the substring "ubuntu"

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "countOutput": true,
    "search": {
      "host": "ubuntu"
    },
    "excludeSearch": true
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "44",
  "id": 1
}
```

### Searching for hosts using wildcards

Find hosts whose name contains word "server" and have interface ports "10050" or "10071". Sort the result by host name in descending order and limit it to 5 hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "host"],
    "selectInterfaces": ["port"],
    "filter": {
      "port": ["10050", "10071"]
    },
    "search": {
      "host": "*server*"
    },
    "searchWildcardsEnabled": true,
    "searchByAny": true,
    "sortfield": "host",
    "sortorder": "DESC",
    "limit": 5
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}
```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "50003",
      "host": "WebServer-Tomcat02",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "50005",
      "host": "WebServer-Tomcat01",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "50004",
      "host": "WebServer-Nginx",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "99032",
      "host": "MySQL server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    },
    {
      "hostid": "99061",
      "host": "Linux server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    }
  ],
  "id": 1
}

```

Searching for hosts using wildcards with "preservekeys"

If you add the parameter "preservekeys" to the previous request, the result is returned as an associative array, where the keys are the id of the objects.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "host"],

```

```

    "selectInterfaces": ["port"],
    "filter": {
      "port": ["10050", "10071"]
    },
    "search": {
      "host": "*server*"
    },
    "searchWildcardsEnabled": true,
    "searchByAny": true,
    "sortfield": "host",
    "sortorder": "DESC",
    "limit": 5,
    "preservekeys": true
  },
  "auth": "766b71ee543230a1182ca5c44d353e36",
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "50003": {
      "hostid": "50003",
      "host": "WebServer-Tomcat02",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "50005": {
      "hostid": "50005",
      "host": "WebServer-Tomcat01",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "50004": {
      "hostid": "50004",
      "host": "WebServer-Nginx",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "99032": {
      "hostid": "99032",
      "host": "MySQL server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    },
    "99061": {
      "hostid": "99061",
      "host": "Linux server 01",
      "interfaces": [

```

```

        {
            "port": "10050"
        }
    ]
},
"id": 1
}

```

## Appendix 2. Changes from 5.4 to 6.0

### Backward incompatible changes action

Changes:

[ZBXNEXT-6920](#) `action.create`, `action.update`: added strict validation of the methods parameters.

[ZBXNEXT-6755](#) `action.create`, `action.update`: renamed parameter `acknowledge_operations` to `update_operations`.

[ZBXNEXT-6755](#) `action.get`: renamed parameter `selectAcknowledgeOperations` to `selectUpdateOperations`.

auditlog

Changes:

[ZBXNEXT-6715](#) dropped support of property `note`.

[ZBXNEXT-6715](#) dropped support of `resourcetype` values (2 - *Configuration of Zabbix*, 7 - *Graph element*).

[ZBXNEXT-6715](#) dropped support of action values (5 - *Enable*, 6 - *Disable*).

[ZBXNEXT-6718](#) dropped support of action value (3 - *Login*).

[ZBXNEXT-6715](#) `auditlog.get`: dropped support of parameter `selectDetails`.

host group

Changes:

[ZBXNEXT-6868](#) `hostgroup.massupdate`: `hosts` and `templates` fields are now required.

[ZBXNEXT-6868](#) `hostgroup.massadd`, `hostgroup.massupdate`, `hostgroup.massremove`: added strict validation of the method parameters.

host prototype

Changes:

[ZBXNEXT-6959](#) `hostprototype.get`: dropped support of properties `group_prototypeid`, `hostid`, `templateid` of group link and group prototype API objects.

[ZBXNEXT-6959](#) `hostprototype.update`: dropped the ability to modify the readonly fields `host`, `name`, `custom_interfaces`, `interfaces`, `groupLinks`, `groupPrototypes`, `templates`, `tags`, `macros`, `inventory_mode` of inherited host prototypes.

[ZBXNEXT-6959](#) `hostprototype.create`, `hostprototype.update`, `hostprototype.delete`: added strict validation of the method parameters.

iconmap

Changes:

[ZBXNEXT-6914](#) `iconmap.create`, `iconmap.update`: dropped support of the icon mapping object property `sortorder`.

maintenance

Changes:

[ZBXNEXT-6890](#) `maintenance.create`, `maintenance.update`, `maintenance.delete`: added strict validation of the methods parameters.

[ZBXNEXT-6890](#) `maintenance.get`, `maintenance.update`: dropped support for parameter `timeperiodid` of the `timeperiod` object.

mediatype

Changes:

[ZBXNEXT-6885](#) `mediatype.create`, `mediatype.update`: added strict validation of the methods parameters.

role

Changes:

[ZBXNEXT-6787](#) dropped support of value `manage_services` for name property in action object.

[ZBXNEXT-3022](#) dropped support of value `configuration.services` for name property in UI object.

service

Changes:

[ZBXNEXT-6999](#) added `uuid`, `description` and `created_at` properties.

[ZBXNEXT-6999](#) dropped support for the `showsla`, `goodsla` and `times` properties.

[ZBXNEXT-6800](#) changed status value "0" meaning from "OK" to "Not classified".

[ZBXNEXT-3022](#) dropped support of `service.adddependencies`, `service.addtimes`, `service.deletedependencies`, `service.deletetimes`.

[ZBXNEXT-6674](#) dropped support of property `triggerid`.

[ZBXNEXT-6999](#) `service.get`: dropped support for `showsla`, `selectAlarms`, `selectTimes` parameters.

[ZBXNEXT-6999](#) `service.getsla`: dropped support for the method.

[ZBXNEXT-6999](#) `sla.get`, `sla.create`, `sla.update`, `sla.delete`, `sla.getsli` methods added.

[ZBXNEXT-6999](#) `service.get`: added support for sorting by `serviceid`, `status` and `created_at`.

[ZBXNEXT-6999](#) `service.get`: added support for `slaids` parameter; added support for filtering by `uuid`.

[ZBXNEXT-6999](#) `service.create`, `service.update`: dropped support for `showsla`, `goodsla` and `times` parameters.

[ZBXNEXT-2406](#) `service.getsla`: removed `status` and `problems` properties from response of request with `intervals` parameter.

[ZBXNEXT-3022](#) `service.create`, `service.update`: dropped support of parameters `dependencies` and `parentid`.

[ZBXNEXT-3022](#) `service.get`: dropped support of parameters `selectParent`, `selectDependencies` and `selectParentDependencies`.

[ZBXNEXT-6674](#) `service.get`: dropped support of parameter `selectTrigger`.

template

Changes:

[ZBXNEXT-6867](#) `template.create`, `template.update`, `template.delete`, `template.massadd`, `template.massupdate`, `template.massremove`: added strict validation of the methods parameters.

[ZBXNEXT-6867](#) `template.create`, `template.update`, `template.massadd`, `template.massupdate`: dropped support of parameter `hosts`.

[ZBXNEXT-6867](#) `template.massremove`: dropped support of parameter `hostids`.

trigger

Changes:

[ZBXNEXT-6867](#) `trigger.adddependencies`, `trigger.deletedependencies`: dropped the ability to edit the dependencies of inherited triggers.

## Other changes and bug fixes `action`

Changes:

[ZBXNEXT-6755](#) added new `conditiontype` values (27 - *Service*, 28 - *Service name*).

[ZBXNEXT-6250](#) `action.get`, `action.create`, `action.update`: added new property `notify_if_canceled`.

auditlog

Changes:

[ZBXNEXT-6999](#) added new `resourcetype` (48 - *SLA*).

[ZBXNEXT-6923](#) added new `resourcetype` (47 - *High availability node*).

[ZBXNEXT-6718](#) added support of action values (8 - *Login*, 9 - *Failed login*, 10 - *History clear*).

[ZBXNEXT-6715](#) added support of properties: `username`, `recordsetid`, `details`.

authentication

Changes:

[ZBXNEXT-4029](#) added new password policy fields `passwd_min_length` and `passwd_check_rules`.

dashboard

Changes:

[ZBXNEXT-6999](#) added new widget type `slareport` and widget field types (*9 - Service, 10 - SLA*).

[ZBXNEXT-6966](#) added new widget type `item`.

history

Changes:

[ZBXNEXT-6714](#) added new API method `history.clear`.

housekeeping

Changes:

[ZBXNEXT-6755](#) added support of property `hk_events_service`.

item

Changes:

[ZBXNEXT-7049](#) `item.get`, `item.create`, `item.update`: added the third parameter to the Prometheus pattern preprocessing step. The second parameter will now determine an aggregation method: `value`, `label`, `function`. The third parameter will now contain Prometheus output for the aggregation method `label` or an aggregation function for the aggregation method `function`.

item prototype

Changes:

[ZBXNEXT-7049](#) `itemprototype.get`, `itemprototype.create`, `itemprototype.update`: added the third parameter to the Prometheus pattern preprocessing step. The second parameter will now determine an aggregation method: `value`, `label`, `function`. The third parameter will now contain Prometheus output for the aggregation method `label` or an aggregation function for the aggregation method `function`.

maintenance

Changes:

[ZBXNEXT-6890](#) `maintenance.create`, `maintenance.update`: the parameter `groupids` is now deprecated. Use `groups` instead.

[ZBXNEXT-6890](#) `maintenance.create`, `maintenance.update`: the parameter `hostids` is now deprecated. Use `hosts` instead.

[ZBXNEXT-6890](#) `maintenance.create`, `maintenance.update`: changed the type of parameters `groups`, `hosts`, `timeperiods` and `tags` from `array` to `object/array`.

mediatype

Changes:

[ZBXNEXT-6755](#) message template object: added support of `conditiontype` value: *4 - (event created on service status update)*.

proxy

Changes:

[ZBXNEXT-6889](#) `proxy.create`, `proxy.update`: dropped support of `interface.interfaceid` and `interface.hostid` properties.

regexp

Changes:

[ZBXNEXT-6717](#) added `regexp.get`, `regexp.create`, `regexp.update` and `regexp.delete` API.

role

Changes:

[ZBXNEXT-6787](#) added support of new properties `services.read.mode`, `services.read.list`, `services.read.tag`.

`services.write.mode`, `services.write.list` and `services.write.tag`.

[ZBXNEXT-3022](#) added support of value `manage_services` for name property in action object.

[ZBXNEXT-6999](#) added support of value `manage_sla` for name property in action object.

## service

Changes:

[ZBXNEXT-6787](#) added new property `readonly`.

[ZBXNEXT-6800](#) added support of properties `weight`, `propagation_rule` and `propagation_value`.

[ZBXNEXT-6800](#) added support of status value (-1 - OK).

[ZBXNEXT-2406](#) `service.get`: added support of parameters `deep_parentids` and `selectProblemEvents`.

[ZBXNEXT-6800](#) `service.create`, `service.update`: added support of parameter `status_rules`.

[ZBXNEXT-6800](#) `service.get`: added support of parameter `selectStatusRules`.

[ZBXNEXT-6800](#) `service.get`: added support of count for parameter `selectAlarms`.

[ZBXNEXT-3022](#) `service.create`, `service.update`: added support of parameters `children`, `parents` and `tags`.

[ZBXNEXT-3022](#) `service.get`: added support of parameters `evaltype`, `tags`, `selectChildren`, `selectParents`, `selectTags`.

[ZBXNEXT-3022](#) `service.get`: added support of parameters `problem_tags`, `without_problem_tags` and `selectProblemTags`.

[ZBXNEXT-6674](#) `service.create`, `service.update`: added support of parameter `problem_tags`.

## settings

Changes:

[ZBXNEXT-6945](#) `settings.get`, `settings.update`: added support of parameters `geomaps_tile_provider`, `geomaps_tile_url`, `geomaps_max_zoom` and `geomaps_attribution`.

[ZBXNEXT-6715](#) `settings.get`, `settings.update`: added support of parameter `auditlog_enabled`.

## sla

Changes:

[ZBXNEXT-6999](#) added new API `sla` with methods: `sla.create`, `sla.delete`, `sla.get`, `sla.getsli`, `sla.update`.

## templatedashboard

Changes:

[ZBXNEXT-6966](#) added support of new widget type `item`.

## user

Changes:

[ZBXNEXT-6718](#) added new method `user.unblock`.

[ZBXNEXT-4029](#) `user.create`, `user.update`: implemented password strength validation according the password policy.

## usergroup

Changes:

[ZBXNEXT-6866](#) `usergroup.create`, `usergroup.update`: `userid` parameter is now deprecated. Use `users` instead.

## Zabbix API changes in 6.0

### 6.0.39 alert

Changes:

[ZBX-26023](#) `alert.get`: *Admin* and *User* type users may now retrieve "message" (0) type alert data about users in their user group.

### 6.0.38 alert

Changes:

[ZBX-26258](#) `alert.get`: Parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

[ZBX-26258](#) `alert.get`: *Admin* and *User* type users may now retrieve "message" (0) type alert data only about their own user.

mediatype

Changes:

[ZBX-26258](#) `mediatype.get`: parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

role

Changes:

[ZBX-26258](#) `role.get`: parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

user

Changes:

[ZBX-26258](#) `user.get`: when requesting user media, permissions, or role information, *Admin* and *User* type users may retrieve data only about their own user.

[ZBX-26258](#) `user.get`: *Admin* and *User* type users may now retrieve only the following **User object** properties for their own user: `userid`, `attempt_clock`, `attempt_failed`, `attempt_ip`, `autologin`, `autologout`, `lang`, `name`, `refresh`, `roleid`, `rows_per_page`, `surname`, `theme`, `timezone`, `url`, `username`. For users in their user group: `userid`, `name`, `surname`, `username`.

usergroup

Changes:

[ZBX-26258](#) `usergroup.get`: parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

#### **6.0.34** mediatype

Changes:

[ZBX-25385](#) `mediatype.get`: parameter `selectMessageTemplates` is now supported only for *Super admin* type users.

[ZBX-25385](#) `mediatype.get`: *Admin* type users may now retrieve only the following **Media type object** properties: `mediatypeid`, `name`, `type`, `status`, `maxattempts`.

[ZBX-25385](#) `mediatype.get`: when requesting user-related information of media types, *Admin* type users may now retrieve only data about their own user.

#### **6.0.22** hostprototype

Changes:

[ZBX-23284](#) `hostprototype.get`, `hostprototype.update`: returned support for `group_prototypeid` property of Group prototype objects.

#### **6.0.19** action

Changes:

[ZBX-21804](#) `action.create`, `action.get`, `action.update`, `action.delete`: removed requirement of write permissions for hosts, host groups, templates, triggers, proxy.

#### **6.0.15** script

Changes:

[ZBX-19466](#) changed validation of `script` object to be unique by combination of 2 properties: `name` and `menu_path`.

#### **6.0.14** user

Changes:

[ZBXNEXT-8012](#) `user.checkAuthentication`: added new parameter `token`.

### 6.0.13 configuration

Changes:

[ZBXNEXT-7951](#) `configuration.import, configuration.importcompare: option deleteMissing: true` for `templateLinkage` will now unlink missing templates (instead of unlink and clear).

discoveryrule

Changes:

[ZBXNEXT-7951](#) `discoveryrule.update`: the parameter `uuid` can now be updated.

graph

Changes:

[ZBXNEXT-7951](#) `graph.update`: the parameter `uuid` can now be updated.

graphprototype

Changes:

[ZBXNEXT-7951](#) `graphprototype.update`: the parameter `uuid` can now be updated.

hostgroup

Changes:

[ZBXNEXT-7951](#) `hostgroup.update`: the parameter `uuid` can now be updated.

hostprototype

Changes:

[ZBXNEXT-7951](#) `hostprototype.update`: the parameter `uuid` can now be updated.

httptest

Changes:

[ZBXNEXT-7951](#) `httptest.update`: the parameter `uuid` can now be updated.

item

Changes:

[ZBXNEXT-7951](#) `item.update`: the parameter `uuid` can now be updated.

itemprototype

Changes:

[ZBXNEXT-7951](#) `itemprototype.update`: the parameter `uuid` can now be updated.

template

Changes:

[ZBXNEXT-7951](#) `template.update`: the parameter `uuid` can now be updated.

templatedashboard

Changes:

[ZBXNEXT-7951](#) `templatedashboard.update`: the parameter `uuid` can now be updated.

trigger

Changes:

[ZBXNEXT-7951](#) `trigger.update`: the parameter `uuid` can now be updated.

triggerprototype

Changes:

[ZBXNEXT-7951](#) `triggerprototype.update`: the parameter `uuid` can now be updated.

`valuemap`

Changes:

[ZBXNEXT-7951](#) `valuemap.update`: the parameter `uuid` can now be updated.

### 6.0.9 user

Changes:

[ZBXNEXT-7971](#) `user.create`, `user.update`: increased max length of the "url" field to 2048 characters.

### 6.0.7 graph

Changes:

[ZBX-7706](#) `graph.get`: Graph availability doesn't depend on permissions to items specified in graph "ymin\_itemid" and "ymax\_itemid" fields.

Graph having MIN or MAX Y axis linked to inaccessible items will still be accessible but MIN/MAX Y axis works the same way as if specified calculation method is "Calculated".

`graphprototype`

Changes:

[ZBX-7706](#) `graphprototype.get`: Graph prototype availability doesn't depend on permissions to items specified in graph prototype "ymin\_itemid" and "ymax\_itemid" fields.

### 6.0.3 discoveryrule

Bug fixes:

[ZBX-19118](#) `discoveryrule.create`, `discoveryrule.update`: property `interfaceid` is no longer required to create/update a HTTP agent type LLD rule.

`item`

Bug fixes:

[ZBX-19118](#) `item.create`, `item.update`: property `interfaceid` is no longer required to create/update a HTTP agent type item.

`itemprototype`

Bug fixes:

[ZBX-19118](#) `itemprototype.create`, `itemprototype.update`: property `interfaceid` is no longer required to create/update a HTTP agent type item prototype.

## 20 Modules

**Overview** It is possible to enhance Zabbix frontend functionality by adding third-party modules or by developing your own modules without the need to change the source code of Zabbix.

Note that the module code will run with the same privileges as Zabbix source code. This means:

- third-party modules can be harmful. You must trust the modules you are installing;
- Errors in a third-party module code may crash the frontend. If this happens, just remove the module code from the frontend. As soon as you reload Zabbix frontend, you'll see a note saying that some modules are absent. Go to **Module administration** (in *Administration* → *General* → *Modules*) and click *Scan directory* again to remove non-existent modules from the database.

**Installation** Please always read the installation manual for a particular module. It is recommended to install new modules one by one to catch failures easily.

Just before you install a module:

- Make sure you have downloaded the module from a trusted source. Installation of harmful code may lead to consequences, such as data loss
- Different versions of the same module (same ID) can be installed in parallel, but only a single version can be enabled at once

Steps to install a module:

- Unpack your module within its own folder in the `modules` folder of the Zabbix frontend
- Ensure that your module folder contains at least the `manifest.json` file
- Navigate to **Module administration** and click the *Scan directory* button
- New module will appear in the list along with its version, author, description and status
- Enable module by clicking on its status

Troubleshooting:

| Problem   | Solution  |
|---|---|
| <i>Module did not appear in the list</i>                              | Make sure that the <code>manifest.json</code> file exists in <code>modules/your-module/</code> folder of the Zabbix frontend. If it does that means the module does not suit the current Zabbix version. If <code>manifest.json</code> file does not exist, you have probably unpacked in the wrong directory.              |
| <i>Frontend crashed</i>   | The module code is not compatible with the current Zabbix version or server configuration. Please delete module files and reload the frontend. You'll see a notice that some modules are absent. Go to <b>Module administration</b> and click <i>Scan directory</i> again to remove non-existent modules from the database. |
| <i>Error message about identical namespace, ID or actions appears</i> | New module tried to register a namespace, ID or actions which are already registered by other enabled modules. Disable the conflicting module (mentioned in error message) prior to enabling the new one.   |
| <i>Technical error messages appear</i>                                | Report errors to the developer of the module.   |

**Developing modules** Modules are written in PHP language. Model-view-controller (MVC) software pattern design is preferred, as it is also used in Zabbix frontend and will ease the development. PHP strict typing is also welcome but not mandatory.

Please note that with modules you can easily add new menu items and respective views and actions to Zabbix frontend. Currently it is not possible to register new API or create new database tables through modules.

Module structure

Each module is a directory (placed within the `modules` directory) with sub-directories containing controllers, views and any other code:

|  |            |   |
|--|------------|---|
| <code>example_module_directory/</code>         | (required) |   |
| <code>  manifest.json</code>                   | (required) | Metadata and action definition.           |
| <code>  Module.php</code>                      |            | Module initialization and event handling. |
| <code>  actions/</code>                        |            | Action controller files.                  |
| <code>SomethingView.php</code>                 |            |   |
| <code>SomethingCreate.php</code>               |            |   |
| <code>SomethingDelete.php</code>               |            |   |
| <code>data_export/</code>                      |            |   |
| <code>ExportAsXml.php</code>                   |            |   |
| <code>ExportAsExcel.php</code>                 |            |   |
| <code>views/</code>                            |            | View files.                               |
| <code>example.something.view.php</code>        |            |   |
| <code>example.something.delete.php</code>      |            |   |
| <code>js/</code>                               |            | JavaScript files used in views.           |
| <code>example.something.view.js.php</code>     |            |   |
| <code>partials/</code>                         |            | View partial files.                       |
| <code>example.something.reusable.php</code>    |            |   |
| <code>js/</code>                               |            | JavaScript files used in partials.        |
| <code>example.something.reusable.js.php</code> |            |   |

As you can see, the only mandatory file within the custom module directory is `manifest.json`. The module will not register without this file. `Module.php` is responsible for registering menu items and processing events such as `'onBeforeAction'` and `'onTerminate'`. The *actions*, *views* and *partials* directories contain PHP and JavaScript code needed for module actions.

## Naming convention

Before you create a module, it is important to agree on the naming convention for different module items such as directories and files so that we could keep things well organized. You can also find examples above, in the [Module structure](#) section.

| Item                          | Naming rules  | Example                              |
|-------------------------------|---|--------------------------------------|
| <i>Module directory</i>       | Lowercase [a-z], underscore and decimal digits  | example_v2                           |
| <i>Action subdirectories</i>  | Lowercase [a-z] and underscore character  | data_export                          |
| <i>Action files</i>           | CamelCase, ending with action type  | SomethingView.php                    |
| <i>View and partial files</i> | Lowercase [a-z]<br>Words separated with dot<br>Prefixed by <code>module.</code> followed by module name<br>Ending with action type and <code>.php</code> file extension | module.example.something.view.php    |
| <i>Javascript files</i>       | The same rules apply as for view and partial files, except the <code>.js.php</code> file extension.   | module.example.something.view.js.php |

Note that the 'module' prefix and name inclusion is mandatory for view and partial file names, unless you need to override Zabbix core views or partials. This rule, however, does not apply to action file names.

## Manifest preparation

Each module is expected to have a `manifest.json` file with the following fields in JSON format:

| Parameter                     | Required | Type   | Default | Description   |
|-------------------------------|----------|--------|---------|---|
| <code>manifest_version</code> | Yes      | Double | -       | Manifest version of the module. Currently supported version is <b>1</b> . |
| <code>id</code>               | Yes      | String | -       | Module ID. Only one module with given ID can be enabled at the same time. |
| <code>name</code>             | Yes      | String | -       | Module name as displayed in the Administration section.                   |
| <code>version</code>          | Yes      | String | -       | Module version as displayed in the Administration section.                |
| <code>namespace</code>        | Yes      | String | -       | PHP namespace for <code>Module.php</code> and action classes.             |
| <code>author</code>           | No       | String | ""      | Module author as displayed in the Administration section.                 |
| <code>url</code>              | No       | String | ""      | Module URL as displayed in the Administration section.                    |
| <code>description</code>      | No       | String | ""      | Module description as displayed in the Administration section.            |
| <code>actions</code>          | No       | Object | {}      | Actions to register with this module. See Actions.                        |
| <code>config</code>           | No       | Object | {}      | Module configuration.   |

For reference, please see an example of `manifest.json` in the [Reference](#) section.

## Actions

The module will have control over frontend actions defined within the `actions` object in the `manifest.json` file. This way new actions are defined. In the same way you may redefine existing actions. Each key of actions should represent the action name and the corresponding value should contain `class` and optionally `layout` and `view` keys.

One action is defined by four counterparts: name, controller, view and layout. Data validation and preparation is typically done in the controller, output formatting is done in the view or partials, and the layout is responsible for decorating the page with elements such as menu, header, footer and others.

Module actions must be defined in the `manifest.json` file as `actions` object:

| Parameter           | Required | Type   | Default       | Description   |
|---------------------|----------|--------|---------------|---|
| <code>key</code>    | Yes      | String | -             | Action name, in lowercase [a-z], separating words with dot.   |
| <code>class</code>  | Yes      | String | -             | Action class name, including subdirectory path (if used) within the <code>actions</code> directory. |
| <code>layout</code> | No       | String | "layout.html" | Action layout.  |
| <code>view</code>   | No       | String | null          | Action view.  |

There are several predefined layouts, like `layout.json` or `layout.xml`. These are intended for actions which produce different result than an HTML. You may explore predefined layouts in the `app/views/` directory or even create your own.

Sometimes it is necessary to only redefine the view part of some action leaving the controller intact. In such case just place the necessary view and/or partial files inside the `views` directory of the module.

For reference, please see an example action controller file in the [Reference](#) section. Please do not hesitate to explore current actions of Zabbix source code, located in the `app/` directory.

### Module.php

This optional PHP file is responsible for module initialization as well as event handling. Class 'Module' is expected to be defined in this file, extending base class `\Core\CModule`. The Module class must be defined within the namespace specified in the `manifest.json` file.

```
<?php

namespace Modules\Example;
use Core\CModule as BaseModule;

class Module extends BaseModule {
    ...
}
```

For reference, please see an example of `Module.php` in the [Reference](#) section.

**Reference** This section contains basic versions of different module elements introduced in the previous sections.

### manifest.json

```
{
    "manifest_version": 1.0,
    "id": "example_module",
    "name": "Example module",
    "version": "1.0",
    "namespace": "Example",
    "author": "John Smith",
    "url": "http://module.example.com",
    "description": "Short description of the module.",
    "actions": {
        "example.something.view": {
            "class": "SomethingView",
            "view": "module.example.something.view"
        },
        "example.something.create": {
            "class": "SomethingCreate",
            "layout": null
        },
        "example.something.delete": {
            "class": "SomethingDelete",
            "layout": null
        },
        "example.something.export.xml": {
            "class": "data_export/ExportAsXml",
            "layout": null
        },
        "example.something.export.excel": {
            "class": "data_export/ExportAsExcel",
            "layout": null
        }
    },
    "config": {
        "username": "john_smith"
    }
}
```

### Module.php

```

<?php declare(strict_types = 1);

namespace Modules\Example;

use APP;
use CController as CAction;

/**
 * Please see Core\CModule class for additional reference.
 */
class Module extends \Core\CModule {

    /**
     * Initialize module.
     */
    public function init(): void {
        // Initialize main menu (CMenu class instance).
        APP::Component()->get('menu.main')
            ->findOrAdd(_('Reports'))
                ->getSubMenu()
                    ->add((new \CMenuItem(_('Example wide report'))
                        ->setAction('example.report.wide.php')
                    ))
                    ->add((new \CMenuItem(_('Example narrow report'))
                        ->setAction('example.report.narrow.php')
                    ));
    }

    /**
     * Event handler, triggered before executing the action.
     *
     * @param CAction $action Action instance responsible for current request.
     */
    public function onBeforeAction(CAction $action): void {
    }

    /**
     * Event handler, triggered on application exit.
     *
     * @param CAction $action Action instance responsible for current request.
     */
    public function onTerminate(CAction $action): void {
    }
}

```

#### Action controller

```

<?php declare(strict_types = 1);

namespace Modules\Example\Actions;

use CControllerResponseData;
use CControllerResponseFatal;
use CController as CAction;

/**
 * Example module action.
 */
class SomethingView extends CAction {

    /**
     * Initialize action. Method called by Zabbix core.
     */
}

```

```

* @return void
*/
public function init(): void {
    /**
     * Disable SID (Session ID) validation. Session ID validation should only be used for actions which
     * modification, such as update or delete actions. In such case Session ID must be presented in the URL
     * the URL would expire as soon as the session expired.
     */
    $this->disableSIDvalidation();
}

/**
 * Check and sanitize user input parameters. Method called by Zabbix core. Execution stops if false is
 *
 * @return bool true on success, false on error.
 */
protected function checkInput(): bool {
    $fields = [
        'name' => 'required|string',
        'email' => 'required|string',
        'phone' => 'string'
    ];

    // Only validated data will further be available using $this->hasInput() and $this->getInput().
    $ret = $this->validateInput($fields);

    if (!$ret) {
        $this->setResponse(new CControllerResponseFatal());
    }

    return $ret;
}

/**
 * Check if the user has permission to execute this action. Method called by Zabbix core.
 * Execution stops if false is returned.
 *
 * @return bool
 */
protected function checkPermissions(): bool {
    $permit_user_types = [USER_TYPE_ZABBIX_ADMIN, USER_TYPE_SUPER_ADMIN];

    return in_array($this->getUserType(), $permit_user_types);
}

/**
 * Prepare the response object for the view. Method called by Zabbix core.
 *
 * @return void
 */
protected function doAction(): void {
    $contacts = $this->getInput('email');

    if ($this->hasInput('phone')) {
        $contacts .= ', ' . $this->getInput('phone');
    }

    $data = [
        'name' => $this->getInput('name'),
        'contacts' => $contacts
    ];

```

```

        $response = new CControllerResponseData($data);

        $this->setResponse($response);
    }
}

```

#### Action view

```

<?php declare(strict_types = 1);

/**
 * @var CView $this
 */

$this->includeJsFile('example.something.view.js.php');

(new CWidget())
    ->setTitle(_('Something view'))
    ->addItem(new CDiv($data['name']))
    ->addItem(new CPartial('module.example.something.reusable', [
        'contacts' => $data['contacts']
    ]))
    ->show();

```

## 21 Appendixes

Please use the sidebar to access content in the Appendixes section.

### 1 Installation and setup

Please use the sidebar to access content in this section.

#### 1 Database creation

##### Overview

A Zabbix database must be created during the installation of Zabbix server or proxy.

This section provides instructions for creating a Zabbix database. A separate set of instructions is available for each supported database.

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings. See also [Limits of filtering with utf8mb4 collations](#).

##### Note:

If installing from [Zabbix Git repository](#), you need to run the following command prior to proceeding to the next steps:  
`<br><br> make dbschema`

##### MySQL/MariaDB

Character sets utf8 (aka utf8mb3) and utf8mb4 are supported (with utf8\_bin and utf8mb4\_bin collation respectively) for Zabbix server/proxy to work properly with MySQL database. It is recommended to use utf8mb4 for new installations.

For Zabbix 6.0.11 and newer, deterministic triggers need to be created during the import of schema. On MySQL and MariaDB, this requires `GLOBAL log_bin_trust_function_creators = 1` to be set if binary logging is enabled and there is no superuser privileges and `log_bin_trust_function_creators = 1` is not set in MySQL configuration file.

If you are installing from Zabbix **packages**, proceed to the [instructions](#) for your platform.

If you are installing Zabbix from sources:

- Create and configure a database and a user.

```
mysql -uroot -p<password>
```

```
mysql> create database zabbix character set utf8mb4 collate utf8mb4_bin;
mysql> create user 'zabbix'@'localhost' identified by '<password>';
mysql> grant all privileges on zabbix.* to 'zabbix'@'localhost';
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
mysql> quit;
```

- Import the data into the database. For a Zabbix proxy database, only `schema.sql` should be imported (no `images.sql` nor `data.sql`).

```
cd database/mysql
mysql -uzabbix -p<password> zabbix < schema.sql
#### stop here if you are creating database for Zabbix proxy
mysql -uzabbix -p<password> zabbix < images.sql
mysql -uzabbix -p<password> zabbix < data.sql
```

`log_bin_trust_function_creators` can be disabled after the schema has been successfully imported:

```
mysql -uroot -p<password>

mysql> SET GLOBAL log_bin_trust_function_creators = 0;
mysql> quit;
```

## PostgreSQL

You need to have database user with permissions to create database objects.

If you are installing from Zabbix **packages**, proceed to the [instructions](#) for your platform.

If you are installing Zabbix from sources:

- Create a database user.

The following shell command will create user `zabbix`. Specify a password when prompted and repeat the password (note, you may first be asked for `sudo` password):

```
sudo -u postgres createuser --pwprompt zabbix
```

- Create a database.

The following shell command will create the database `zabbix` (last parameter) with the previously created user as the owner (`-O zabbix`).

```
sudo -u postgres createdb -O zabbix -E Unicode -T template0 zabbix
```

- Import the initial schema and data (assuming you are in the root directory of Zabbix sources).

For a Zabbix proxy database, only `schema.sql` should be imported (no `images.sql` nor `data.sql`).

```
cd database/postgresql
cat schema.sql | sudo -u zabbix psql zabbix
#### stop here if you are creating database for Zabbix proxy
cat images.sql | sudo -u zabbix psql zabbix
cat data.sql | sudo -u zabbix psql zabbix
```

### Attention:

The above commands are provided as an example that will work in most of GNU/Linux installations. You can use different commands depending on how your system/database is configured, for example: `psql -U <username>`  
If you have any trouble setting up the database, please consult your Database administrator.

## TimescaleDB

Instructions for creating and configuring TimescaleDB are provided in a separate [section](#).

## Oracle

Instructions for creating and configuring Oracle database are provided in a separate [section](#).

## SQLite

Using SQLite is supported for **Zabbix proxy** only!

The database will be automatically created if it does not exist.

Return to the [installation section](#).

## 2 Repairing Zabbix database character set and collation

MySQL/MariaDB

Historically, MySQL and derivatives used 'utf8' as an alias for utf8mb3 - MySQL's own 3-byte implementation of the standard UTF8, which is 4-byte. Starting from MySQL 8.0.28 and MariaDB 10.6.1, 'utf8mb3' character set is deprecated and at some point its support will be dropped while 'utf8' will become a reference to 'utf8mb4'. Since Zabbix 6.0, 'utf8mb4' is supported. To avoid future problems, it is highly recommended to use 'utf8mb4'. Another advantage of switching to 'utf8mb4' is support of supplementary Unicode characters.

### Warning:

As versions before Zabbix 6.0 are not aware of utf8mb4, make sure to first upgrade Zabbix server and DB schema to 6.0.x before executing utf8mb4 conversion.

#### 1. Check the database character set and collation.

For example:

```
mysql> SELECT @@character_set_database, @@collation_database;
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| latin2                   | latin2_general_ci    |
+-----+-----+
```

Or:

```
mysql> SELECT @@character_set_database, @@collation_database;
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| utf8                    | utf8_bin              |
+-----+-----+
```

As we see, the character set here is not 'utf8mb4' and collation is not 'utf8mb4\_bin', so we need to fix them.

#### 2. Stop Zabbix.

#### 3. Create a backup copy of the database!

#### 4. Fix the character set and collation on database level:

```
alter database <your DB name> character set utf8mb4 collate utf8mb4_bin;
```

Fixed values:

```
mysql> SELECT @@character_set_database, @@collation_database;
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| utf8mb4                 | utf8mb4_bin          |
+-----+-----+
```

#### 5. Load the [script](#) to fix character set and collation on table and column level:

```
mysql <your DB name> < utf8mb4_convert.sql
```

#### 6. Execute the script:

```
SET @ZABBIX_DATABASE = '<your DB name>';
If MariaDB → set innodb_strict_mode = OFF;
              CALL zbx_convert_utf8();
If MariaDB → set innodb_strict_mode = ON;
              drop procedure zbx_convert_utf8;
```

Please note that 'utf8mb4' is expected to consume slightly more disk space.

#### 7. If no errors - you may want to create a database backup copy with the fixed database.

## 8. Start Zabbix.

### 3 Database upgrade to primary keys

#### Overview

This section provides instructions for manually upgrading tables in existing installations to primary keys.

Upgrading to primary keys optimizes how data is indexed and accessed, which may speed up queries and save space. It also improves data management and synchronization in clustered setups, helping with scaling and ensuring the system remains reliable even if some servers fail.

Primary keys are used for all tables in new installations since Zabbix 6.0.

There is no automatic database upgrade to primary keys; however, existing installations may be upgraded manually **after** upgrading Zabbix server to 6.0 or newer.

Instructions are available for:

- [MySQL](#)
- [PostgreSQL](#)
- [TimescaleDB](#)
- [Oracle](#)

#### Attention:

The instructions provided on this page are designed for advanced users and may need to be adjusted for your specific configuration. Upgrading to primary keys can be time-consuming and resource-intensive. Ensure that enough free disk space is available; depending on your database size and stored data, the process may require up to 2.5 times the space currently used by history tables.

#### Important notes

To perform the database upgrade:

1. Stop Zabbix server.

Stopping Zabbix server for the time of the upgrade is strongly recommended. However, if absolutely necessary, you can perform the upgrade while the server is running (only for MySQL, MariaDB, and PostgreSQL without TimescaleDB).

2. Back up your database.
3. Run the scripts for your database.
4. Start Zabbix server.

#### Warning:

Run the scripts for the server database only. The proxy will not benefit from this upgrade.

If the database uses partitions, contact the DB administrator or Zabbix Support for help.

CSV files can be removed after a successful upgrade to primary keys.

Optionally, Zabbix frontend may be switched to [maintenance mode](#).

#### MySQL

Export and import must be performed in tmux/screen to ensure that the session isn't dropped.

See also: [Important notes](#)

#### MySQL 8.0+ with mysqlsh

This method can be used with a running Zabbix server, but it is recommended to stop the server for the time of the upgrade. The MySQL Shell (*mysqlsh*) must be [installed](#) and able to connect to the DB.

- Log in to MySQL console as root (recommended) or as any user with FILE privileges.
- Start MySQL with [local\\_infile](#) variable enabled.
- Rename old tables and create new tables by running `history_pk_prepare.sql`.

```
mysql -uzabbix -p<password> zabbix < /usr/share/zabbix-sql-scripts/mysql/history_pk_prepare.sql
```

- Export and import data.

Connect via `mysqlsh`. If using a socket connection, specifying the path might be required.

```
sudo mysqlsh -uroot -S /run/mysqld/mysqld.sock --no-password -Dzabbix
```

Run (CSVPATH can be changed as needed):

```
CSVPATH="/var/lib/mysql-files";

util.exportTable("history_old", CSVPATH + "/history.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history.csv", {"dialect": "csv", "table": "history" });

util.exportTable("history_uint_old", CSVPATH + "/history_uint.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_uint.csv", {"dialect": "csv", "table": "history_uint" });

util.exportTable("history_str_old", CSVPATH + "/history_str.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_str.csv", {"dialect": "csv", "table": "history_str" });

util.exportTable("history_log_old", CSVPATH + "/history_log.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_log.csv", {"dialect": "csv", "table": "history_log" });

util.exportTable("history_text_old", CSVPATH + "/history_text.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_text.csv", {"dialect": "csv", "table": "history_text" });
```

- Follow [post-migration instructions](#) to drop the old tables.

MariaDB/MySQL 8.0+ without `mysqlsh`

This upgrade method takes more time and should be used only if an upgrade with `mysqlsh` is not possible.

Table upgrade

- Log in to MySQL console as root (recommended) or any user with FILE privileges.
- Start MySQL with `local_infile` variable enabled.
- Rename old tables and create new tables by running `history_pk_prepare.sql`:

```
mysql -uzabbix -p<password> zabbix < /usr/share/zabbix-sql-scripts/mysql/history_pk_prepare.sql
```

Migration with stopped server

`max_execution_time` must be disabled before migrating data to avoid timeout during migration.

```
SET @@max_execution_time=0;

INSERT IGNORE INTO history SELECT * FROM history_old;
INSERT IGNORE INTO history_uint SELECT * FROM history_uint_old;
INSERT IGNORE INTO history_str SELECT * FROM history_str_old;
INSERT IGNORE INTO history_log SELECT * FROM history_log_old;
INSERT IGNORE INTO history_text SELECT * FROM history_text_old;
```

Follow [post-migration instructions](#) to drop the old tables.

Migration with running server

Check for which paths import/export is enabled:

```
mysql> SELECT @@secure_file_priv;
+-----+
| @@secure_file_priv |
+-----+
| /var/lib/mysql-files/ |
+-----+
```

If `secure_file_priv` value is a path to a directory, export/import will be performed for files in that directory. In this case, edit paths to files in queries accordingly or set the `secure_file_priv` value to an empty string for the upgrade time.

If `secure_file_priv` value is empty, export/import can be performed from any location.

If `secure_file_priv` value is NULL, set it to the path that contains exported table data ('/var/lib/mysql-files/' in the example above).

For more information, see [MySQL documentation](#).

`max_execution_time` must be disabled before exporting data to avoid timeout during export.

```
SET @@max_execution_time=0;
```

```
SELECT * INTO OUTFILE '/var/lib/mysql-files/history.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TER  
LOAD DATA INFILE '/var/lib/mysql-files/history.csv' IGNORE INTO TABLE history FIELDS TERMINATED BY ',' ESC
```

```
SELECT * INTO OUTFILE '/var/lib/mysql-files/history_uint.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINE  
LOAD DATA INFILE '/var/lib/mysql-files/history_uint.csv' IGNORE INTO TABLE history_uint FIELDS TERMINATED
```

```
SELECT * INTO OUTFILE '/var/lib/mysql-files/history_str.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES  
LOAD DATA INFILE '/var/lib/mysql-files/history_str.csv' IGNORE INTO TABLE history_str FIELDS TERMINATED BY
```

```
SELECT * INTO OUTFILE '/var/lib/mysql-files/history_log.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES  
LOAD DATA INFILE '/var/lib/mysql-files/history_log.csv' IGNORE INTO TABLE history_log FIELDS TERMINATED BY
```

```
SELECT * INTO OUTFILE '/var/lib/mysql-files/history_text.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINE  
LOAD DATA INFILE '/var/lib/mysql-files/history_text.csv' IGNORE INTO TABLE history_text FIELDS TERMINATED
```

Follow [post-migration instructions](#) to drop the old tables.

#### PostgreSQL

Export and import must be performed in tmux/screen to ensure that the session isn't dropped. For installations with TimescaleDB, skip this section and proceed to [PostgreSQL + TimescaleDB](#).

See also: [Important notes](#)

#### Table upgrade

- Rename tables using `history_pk_prepare.sql`:

```
sudo -u zabbix psql zabbix < /usr/share/zabbix-sql-scripts/postgresql/history_pk_prepare.sql
```

#### Migration with stopped server

- Export current history, import it to the temp table, then insert the data into new tables while ignoring duplicates:

```
INSERT INTO history SELECT * FROM history_old ON CONFLICT (itemid,clock,ns) DO NOTHING;  
INSERT INTO history_uint SELECT * FROM history_uint_old ON CONFLICT (itemid,clock,ns) DO NOTHING;  
INSERT INTO history_str SELECT * FROM history_str_old ON CONFLICT (itemid,clock,ns) DO NOTHING;  
INSERT INTO history_log SELECT * FROM history_log_old ON CONFLICT (itemid,clock,ns) DO NOTHING;  
INSERT INTO history_text SELECT * FROM history_text_old ON CONFLICT (itemid,clock,ns) DO NOTHING;
```

See tips for improving INSERT performance: [PostgreSQL: Bulk Loading Huge Amounts of Data, Checkpoint Distance and Amount of WAL](#).

- Follow [post-migration instructions](#) to drop the old tables.

#### Migration with running server

- Export current history, import it to the temp table, then insert the data into new tables while ignoring duplicates:

```
\copy history_old TO '/tmp/history.csv' DELIMITER ',' CSV  
CREATE TEMP TABLE temp_history (  
    itemid          bigint          NOT NULL,  
    clock           integer         DEFAULT '0'      NOT NULL,  
    value           DOUBLE PRECISION DEFAULT '0.0000' NOT NULL,  
    ns             integer         DEFAULT '0'      NOT NULL  
);  
\copy temp_history FROM '/tmp/history.csv' DELIMITER ',' CSV  
INSERT INTO history SELECT * FROM temp_history ON CONFLICT (itemid,clock,ns) DO NOTHING;  
  
\copy history_uint_old TO '/tmp/history_uint.csv' DELIMITER ',' CSV  
CREATE TEMP TABLE temp_history_uint (  
    itemid          bigint          NOT NULL,  
    clock           integer         DEFAULT '0'      NOT NULL,
```

```

    value                numeric(20)    DEFAULT '0'          NOT NULL,
    ns                   integer         DEFAULT '0'          NOT NULL
);
\copy temp_history_uint FROM '/tmp/history_uint.csv' DELIMITER ',' CSV
INSERT INTO history_uint SELECT * FROM temp_history_uint ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_str_old TO '/tmp/history_str.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_str (
    itemid               bigint          NOT NULL,
    clock                integer         DEFAULT '0'          NOT NULL,
    value                varchar(255)    DEFAULT ''           NOT NULL,
    ns                   integer         DEFAULT '0'          NOT NULL
);
\copy temp_history_str FROM '/tmp/history_str.csv' DELIMITER ',' CSV
INSERT INTO history_str (itemid,clock,value,ns) SELECT * FROM temp_history_str ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_log_old TO '/tmp/history_log.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_log (
    itemid               bigint          NOT NULL,
    clock                integer         DEFAULT '0'          NOT NULL,
    timestamp            integer         DEFAULT '0'          NOT NULL,
    source               varchar(64)     DEFAULT ''           NOT NULL,
    severity             integer         DEFAULT '0'          NOT NULL,
    value                text            DEFAULT ''           NOT NULL,
    logeventid           integer         DEFAULT '0'          NOT NULL,
    ns                   integer         DEFAULT '0'          NOT NULL
);
\copy temp_history_log FROM '/tmp/history_log.csv' DELIMITER ',' CSV
INSERT INTO history_log SELECT * FROM temp_history_log ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_text_old TO '/tmp/history_text.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_text (
    itemid               bigint          NOT NULL,
    clock                integer         DEFAULT '0'          NOT NULL,
    value                text            DEFAULT ''           NOT NULL,
    ns                   integer         DEFAULT '0'          NOT NULL
);
\copy temp_history_text FROM '/tmp/history_text.csv' DELIMITER ',' CSV
INSERT INTO history_text SELECT * FROM temp_history_text ON CONFLICT (itemid,clock,ns) DO NOTHING;

```

- Follow [post-migration instructions](#) to drop the old tables.

#### PostgreSQL + TimescaleDB

Export and import must be performed in tmux/screen to ensure that the session isn't dropped. Zabbix server should be down during the upgrade.

See also: [Important notes](#)

- Rename tables using `history_pk_prepare.sql`.

```
sudo -u zabbix psql zabbix < /usr/share/zabbix-sql-scripts/postgresql/history_pk_prepare.sql
```

#### Attention:

The path to `history_pk_prepare.sql` has been **changed** since Zabbix 6.0.9. For versions older than 6.0.9, the following command should be used:

```
sudo -u zabbix psql zabbix < /usr/share/doc/zabbix-sql-scripts/postgresql/history_pk_prepare.sql
```

- Run TimescaleDB hypertable migration scripts (compatible with both TSDB v2.x and v1.x version) based on compression settings:
  - If compression is enabled (on default installation), run scripts from `/usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_with_compression/`

```
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_with_compression/history_pk_upgrade_with_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_with_compression/history_pk_upgrade_with_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_with_compression/history_pk_upgrade_with_compression.sql
```

```

cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_with_compression/history_pk_upgrade_with_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_with_compression/history_pk_upgrade_with_compression.sql
- If compression is disabled, run scripts from /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/history_pk_upgrade_no_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/history_pk_upgrade_no_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/history_pk_upgrade_no_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/history_pk_upgrade_no_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/history_pk_upgrade_no_compression.sql
cat /usr/share/zabbix-sql-scripts/postgresql/tsdb_history_pk_upgrade_no_compression/history_pk_upgrade_no_compression.sql

```

See also: [Tips](#) for improving INSERT performance.

- Follow [post-migration instructions](#) to drop the old tables.

## Oracle

Export and import must be performed in tmux/screen to ensure that the session isn't dropped. Zabbix server should be down during the upgrade.

See also: [Important notes](#)

## Table upgrade

- Install Oracle Data Pump (available in the [Instant Client Tools package](#)).

See Oracle Data Pump [documentation](#) for performance tips.

- Rename tables using `history_pk_prepare.sql`.

```

cd /path/to/zabbix-sources/database/oracle/option-patches
sqlplus zabbix/password@oracle_host/service
sqlplus> @history_pk_prepare.sql

```

## Batch migration of history tables

- Prepare directories for Data Pump.

Data Pump must have read and write permissions to these directories.

Example:

```

mkdir -pv /export/history
chown -R oracle:oracle /export

```

- Create a directory object and grant read and write permissions to this object to the user used for Zabbix authentication ('zabbix' in the example below). Under `sysdba` role, run:

```

create directory history as '/export/history';
grant read,write on directory history to zabbix;

```

- Export tables. Replace N with the desired thread count.

```

expdp zabbix/password@oracle_host/service \
  DIRECTORY=history \
  TABLES=history_old,history_uint_old,history_str_old,history_log_old,history_text_old \
  PARALLEL=N

```

- Import tables. Replace N with the desired thread count.

```

impdp zabbix/password@oracle_host/service \
  DIRECTORY=history \
  TABLES=history_uint_old \
  REMAP_TABLE=history_old:history,history_uint_old:history_uint,history_str_old:history_str,history_log_old:history_log,history_text_old:history_text \
  data_options=SKIP_CONSTRAINT_ERRORS table_exists_action=APPEND PARALLEL=N CONTENT=data_only

```

- Follow [post-migration instructions](#) to drop the old tables.

## Individual migration of history tables

- Prepare directories for Data Pump for each history table. Data Pump must have read and write permissions to these directories.

Example:

```
mkdir -pv /export/history /export/history_uint /export/history_str /export/history_log /export/history_text
chown -R oracle:oracle /export
```

- Create a directory object and grant read and write permissions to this object to the user used for Zabbix authentication ('zabbix' in the example below). Under *sysdba* role, run:

```
create directory history as '/export/history';
grant read,write on directory history to zabbix;

create directory history_uint as '/export/history_uint';
grant read,write on directory history_uint to zabbix;

create directory history_str as '/export/history_str';
grant read,write on directory history_str to zabbix;

create directory history_log as '/export/history_log';
grant read,write on directory history_log to zabbix;

create directory history_text as '/export/history_text';
grant read,write on directory history_text to zabbix;
```

- Export and import each table. Replace N with the desired thread count.

```
expdp zabbix/password@oracle_host:1521/xe DIRECTORY=history TABLES=history_old PARALLEL=N

impdp zabbix/password@oracle_host:1521/xe DIRECTORY=history TABLES=history_old REMAP_TABLE=history_old:his

expdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_uint TABLES=history_uint_old PARALLEL=N

impdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_uint TABLES=history_uint_old REMAP_TABLE=histo

expdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_str TABLES=history_str_old PARALLEL=N

impdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_str TABLES=history_str_old REMAP_TABLE=history

expdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_log TABLES=history_log_old PARALLEL=N

impdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_log TABLES=history_log_old REMAP_TABLE=history

expdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_text TABLES=history_text_old PARALLEL=N

impdp zabbix/password@oracle_host:1521/xe DIRECTORY=history_text TABLES=history_text_old REMAP_TABLE=histo
```

- Follow [post-migration instructions](#) to drop the old tables.

Post-migration

For all databases, once the migration is completed, do the following:

- Verify that everything works as expected.
- Drop old tables:

```
DROP TABLE history_old;
DROP TABLE history_uint_old;
DROP TABLE history_str_old;
DROP TABLE history_log_old;
DROP TABLE history_text_old;
```

## 4 Secure connection to the database

Overview

This section provides Zabbix setup steps and configuration examples for secure TLS connections between:

| Database   | Zabbix components                            |
|------------|--|
| MySQL      | Zabbix frontend, Zabbix server, Zabbix proxy |
| PostgreSQL | Zabbix frontend, Zabbix server, Zabbix proxy |

To set up connection encryption within the DBMS, see official vendor documentation for details:

- [MySQL](#): source and replica replication database servers.
- [MySQL](#): group replication, etc. database servers.
- [PostgreSQL](#) encryption options.

All examples are based on the GA releases of MySQL CE (8.0) and PgSQL (13) available through official repositories using AlmaLinux 8.

#### Requirements

The following is required to set up encryption:

- Developer-supported operating system with OpenSSL  $\geq 1.1.X$  or alternative.

#### Note:

It is recommended to avoid OS in the end-of-life status, especially in the case of new installations

- Database engine (RDBMS) installed and maintained from the official repository provided by developer. Operating systems often shipped with outdated database software versions for which encryption support is not implemented, for example RHEL 7 based systems and PostgreSQL 9.2, MariaDB 5.5 without encryption support.

#### Terminology

Setting this option enforces to use TLS connection to database from Zabbix server/proxy and frontend to database:

- `required` - connect using TLS as transport mode without identity checks
- `verify_ca` - connect using TLS and verify certificate
- `verify_full` - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate

#### Zabbix configuration

##### Frontend to the database

A secure connection to the database can be configured during frontend installation:

- Mark the *Database TLS encryption* checkbox in the **Configure DB connection** step to enable transport encryption.
- Mark the *Verify database certificate* checkbox that appears when *TLS encryption* field is checked to enable encryption with certificates.

#### Note:

For MySQL, the *Database TLS encryption* checkbox is disabled, if *Database host* is set to localhost, because connection that uses a socket file (on Unix) or shared memory (on Windows) cannot be encrypted.

For PostgreSQL, the *TLS encryption* checkbox is disabled, if the value of the *Database host* field begins with a slash or the field is empty.

The following parameters become available in the TLS encryption in certificates mode (if both checkboxes are marked):

| Parameter                            | Description   |
|--------------------------------------|---|
| <i>Database TLS CA file</i>          | Specify the full path to a valid TLS certificate authority (CA) file.   |
| <i>Database TLS key file</i>         | Specify the full path to a valid TLS key file.  |
| <i>Database TLS certificate file</i> | Specify the full path to a valid TLS certificate file.  |
| <i>Database host verification</i>    | Mark this checkbox to activate host verification.<br>Disabled for MYSQL, because PHP MySQL library does not allow to skip the peer certificate validation step. |
| <i>Database TLS cipher list</i>      | Specify a custom list of valid ciphers. The format of the cipher list must conform to the OpenSSL standard.<br>Available for MySQL only.                        |

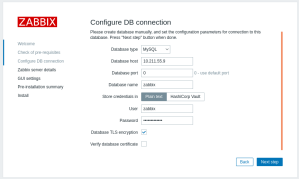

### Attention:

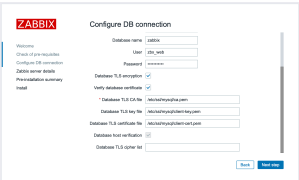

TLS parameters must point to valid files. If they point to non-existent or invalid files, it will lead to the authorization error. If certificate files are writable, the frontend generates a warning in the **System information** report that "TLS certificate files must be read-only." (displayed only if the PHP user is the owner of the certificate).

Certificates protected by passwords are not supported.

### Use cases

Zabbix frontend uses GUI interface to define possible options: `required`, `verify\_ca`, `verify\_full`. Specify required options in the installation wizard step *Configure DB connections*. These options are mapped to the configuration file (`zabbix.conf.php`) in the following manner:

| GUI settings  | Configuration file  | Description  | Result                               |
|---|---|--|--------------------------------------|
|    | <pre>... // Used for TLS connection. \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = ""; \$DB['CERT_FILE'] = ""; \$DB['CA_FILE'] = ""; \$DB['VERIFY_HOST'] = false; \$DB['CIPHER_LIST'] = ""; ...</pre> | <p>Check <i>Database TLS encryption</i><br/>Leave <i>Verify database certificate</i> unchecked</p>                                       | Enable required mode.                |
|  | <pre>... \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = ""; \$DB['CERT_FILE'] = ""; \$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem'; \$DB['VERIFY_HOST'] = false; \$DB['CIPHER_LIST'] = ""; ...</pre>        | <p>1. Check <i>Database TLS encryption</i> and <i>Verify database certificate</i><br/>2. Specify path to <i>Database TLS CA file</i></p> | Enable <code>verify\_ca</code> mode. |

| GUI settings  | Configuration file  | Description   | Result   |
|---|---|---|--|
|    | <pre>... // Used for TLS connection with strictly defined Cipher list. \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = '&lt;key_file_path&gt;'; \$DB['CERT_FILE'] = '&lt;key_file_path&gt;'; \$DB['CA_FILE'] = '&lt;key_file_path&gt;'; \$DB['VERIFY_HOST'] = true; \$DB['CIPHER_LIST'] = '&lt;cipher_list&gt;'; ...</pre> <p>Or:</p> <pre>... // Used for TLS connection without Cipher list defined - selected by MySQL server \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = '&lt;key_file_path&gt;'; \$DB['CERT_FILE'] = '&lt;key_file_path&gt;'; \$DB['CA_FILE'] = '&lt;key_file_path&gt;'; \$DB['VERIFY_HOST'] = true; \$DB['CIPHER_LIST'] = ''; ...</pre> | <ol style="list-style-type: none"> <li>1. Check <i>Database TLS encryption</i> and <i>Verify database certificate</i></li> <li>2. Specify path to <i>Database TLS key file</i></li> <li>3. Specify path to <i>Database TLS CA file</i></li> <li>4. Specify path to <i>Database TLS certificate file</i></li> <li>5. Specify <i>Database TLS cipher list</i> (optional)</li> </ol> | Enable <code>verify_full</code> mode for MySQL.      |
|  | <pre>... \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = '&lt;key_file_path&gt;'; \$DB['CERT_FILE'] = '&lt;key_file_path&gt;'; \$DB['CA_FILE'] = '&lt;key_file_path&gt;'; \$DB['VERIFY_HOST'] = true; \$DB['CIPHER_LIST'] = ' '; ...</pre>  | <ol style="list-style-type: none"> <li>1. Check <i>Database TLS encryption</i> and <i>Verify database certificate</i></li> <li>2. Specify path to <i>Database TLS key file</i></li> <li>3. Specify path to <i>Database TLS CA file</i></li> <li>4. Specify path to <i>Database TLS certificate file</i></li> <li>5. Check <i>Database host verification</i></li> </ol>            | Enable <code>verify_full</code> mode for PostgreSQL. |

**See also:** [Encryption configuration examples for MySQL](#), [Encryption configuration examples for PostgreSQL](#).

#### Zabbix server/proxy configuration

Secure connections to the database can be configured with the respective parameters in the Zabbix [server](#) and/or [proxy](#) configuration file.

| Configuration   | Result  |
|---|---|
| None  | Connection to the database without encryption.  |
| 1. Set DBTLSConnect=required  | Server/proxy make a TLS connection to the database. An unencrypted connection is not allowed.   |
| 1. Set DBTLSConnect=verify_ca   | Server/proxy make a TLS connection to the database after verifying the database certificate.  |
| 2. Set DBTLSCAFile - specify the TLS certificate authority file   |   |
| 1. Set DBTLSConnect=verify_full   | Server/proxy make a TLS connection to the database after verifying the database certificate and the database host identity.               |
| 2. Set DBTLSCAFile - specify TLS certificate authority file   |   |
| 1. Set DBTLSCAFile - specify TLS certificate authority file   | Server/proxy provide a client certificate while connecting to the database.   |
| 2. Set DBTLSCertFile - specify the client public key certificate file   |   |
| 3. Set DBTLSKeyFile - specify the client private key file   |   |
| 1. Set DBTLSCipher - the list of encryption ciphers that the client permits for connections using TLS protocols up to TLS 1.2 | (MySQL) TLS connection is made using a cipher from the provided list.<br>(PostgreSQL) Setting this option will be considered as an error. |
| or DBTLSCipher13 - the list of encryption ciphers that the client permits for connections using TLS 1.3 protocol              |   |

## 1 MySQL encryption configuration

### Overview

This section provides several encryption configuration examples for CentOS 8.2 and MySQL 8.0.21 and can be used as a quickstart guide for encrypting the connection to the database.

#### Attention:

If MySQL host is set to localhost, encryption options will not be available. In this case a connection between Zabbix frontend and the database uses a socket file (on Unix) or shared memory (on Windows) and cannot be encrypted.

#### Note:

List of encryption combinations is not limited to the ones listed on this page. There are a lot more combinations available.

### Pre-requisites

Install MySQL database from the [official repository](#).

See [MySQL documentation](#) for details on how to use MySQL repo.

MySQL server is ready to accept secure connections using a self-signed certificate.

To see which users are using an encrypted connection, run the following query (Performance Schema should be turned ON):

```
mysql> SELECT sbt.variable_value AS tls_version, t2.variable_value AS cipher, processlist_user AS user, pr
FROM performance_schema.status_by_thread AS sbt
JOIN performance_schema.threads AS t ON t.thread_id = sbt.thread_id
JOIN performance_schema.status_by_thread AS t2 ON t2.thread_id = t.thread_id
WHERE sbt.variable_name = 'Ssl_version' and t2.variable_name = 'Ssl_cipher'
ORDER BY tls_version;
```

### Transport-only encryption

#### MySQL configuration

Modern versions of the database are ready out-of-the-box for required **encryption mode**. A server-side certificate will be created after initial setup and launch.

Create users and roles for the main components:

```
mysql> CREATE USER
'zbx_srv'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>',
'zbx_web'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>'
REQUIRE SSL
PASSWORD HISTORY 5;
```

```
mysql> CREATE ROLE 'zbx_srv_role', 'zbx_web_role';

mysql> GRANT SELECT, UPDATE, DELETE, INSERT, CREATE, DROP, ALTER, INDEX, REFERENCES ON zabbix.* TO 'zbx_srv_role';
mysql> GRANT SELECT, UPDATE, DELETE, INSERT ON zabbix.* TO 'zbx_web_role';

mysql> GRANT 'zbx_srv_role' TO 'zbx_srv'@'%';
mysql> GRANT 'zbx_web_role' TO 'zbx_web'@'%';

mysql> SET DEFAULT ROLE 'zbx_srv_role' TO 'zbx_srv'@'%';
mysql> SET DEFAULT ROLE 'zbx_web_role' TO 'zbx_web'@'%';
```

Note that the X.509 protocol is not used to check identity, but the user is configured to use only encrypted connections. See [MySQL documentation](#) for more details about configuring users.

Run to check connection (socket connection cannot be used to test secure connections):

```
mysql -u zbx_srv -p -h 10.211.55.9 --ssl-mode=REQUIRED
```

Check current status and available cipher suites:

```
mysql> status
```

```
-----
mysql Ver 8.0.21 for Linux on x86_64 (MySQL Community Server - GPL)
```

```
Connection id: 62
```

```
Current database:
```

```
Current user: zbx_srv@bfdb.local
```

```
SSL: Cipher in use is TLS_AES_256_GCM_SHA384
```

```
mysql> SHOW SESSION STATUS LIKE 'Ssl_cipher_list'\G;
```

```
***** 1. row *****
```

```
Variable_name: Ssl_cipher_list
```

```
Value: TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256:TLS_AES_128_CCM_SHA256:TLS_AES_128_CCM_0_SHA256
```

```
1 row in set (0.00 sec)
```

Frontend

To enable transport-only encryption for connections between Zabbix frontend and the database:

- Check *Database TLS encryption*
- Leave *Verify database certificate* unchecked

## Configure DB connection

Please create database manually, and set the configuration parameters for connection to this database. Press "Next step" button when done.

Welcome  
Check of pre-requisites  
Configure DB connection  
Zabbix server details  
GUI settings  
Pre-installation summary  
Install

Database type MySQL  
Database host 10.211.55.9  
Database port 0 0 - use default port  
Database name zabbix  
Store credentials in Plain text HashiCorp Vault  
User zabbix  
Password \*\*\*\*\*  
Database TLS encryption ☒  
Verify database certificate ☐

Back Next step

### Server

To enable transport-only encryption for connections between server and the database, configure `/etc/zabbix/zabbix_server.conf`:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=required
...
```

### Encryption with certificate authority verification

Copy required MySQL CA to the Zabbix frontend server, assign proper permissions to allow the webserver to read this file.

#### Note:

This mode doesn't work on SLES 12 and RHEL 7 due to older MySQL libraries.

### Frontend

To enable encryption with certificate verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to Database TLS CA file

Welcome

Check of pre-requisites

Configure DB connection

Zabbix server details

Password

\*\*\*\*\*

Database TLS encryption

☒

Verify database certificate

☒

\* Database TLS CA file

/etc/ssl/mysql/ca.pem

Back

Next step

Alternatively, this can be set in `/etc/zabbix/web/zabbix.conf.php`:

```
...
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '';
$DB['CERT_FILE'] = '';
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';
$DB['VERIFY_HOST'] = false;
$DB['CIPHER_LIST'] = '';
...
```

Troubleshoot user using command-line tool to check if connection is possible for required user:

```
mysql -u zbx_web -p -h 10.211.55.9 --ssl-mode=REQUIRED --ssl-ca=/var/lib/mysql/ca.pem
```

Server

To enable encryption with certificate verification for connections between Zabbix server and the database, configure `/etc/zabbix/zabbix_server.conf`:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_ca
DBTLSCAFile=/etc/ssl/mysql/ca.pem
...
```

Encryption with full verification

MySQL configuration

Set MySQL CE server configuration option (`/etc/my.cnf.d/server-tls.cnf`) to:

```
[mysqld]
...
# in this examples keys are located in the MySQL CE datadir directory
ssl_ca=ca.pem
ssl_cert=server-cert.pem
ssl_key=server-key.pem

require_secure_transport=ON
```

```
tls_version=TLSv1.3
```

```
...
```

Keys for the MySQL CE server and client (Zabbix frontend) should be created manually according to the MySQL CE documentation: [Creating SSL and RSA certificates and keys using MySQL](#) or [Creating SSL certificates and keys using openssl](#)

**Attention:**

MySQL server certificate should contain the Common Name field set to the FQDN name as Zabbix frontend will use the DNS name to communicate with the database or IP address of the database host.

Create MySQL user:

```
mysql> CREATE USER
'zbx_srv'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>',
'zbx_web'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>'
REQUIRE X509
PASSWORD HISTORY 5;
```

Check if it is possible to log in with that user:

```
mysql -u zbx_web -p -h 10.211.55.9 --ssl-mode=VERIFY_IDENTITY --ssl-ca=/var/lib/mysql/ca.pem --ssl-cert=/v
```

Frontend

To enable encryption with full verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS key file*
- Specify path to *Database TLS CA file*
- Specify path to *Database TLS certificate file*

Note that *Database host verification* is checked and grayed out - this step cannot be skipped for MySQL.

**Warning:**

If *Database TLS cipher list* field is left empty, the common ciphers permitted by both frontend (client) and server will be enabled. Alternatively, the ciphers can be set explicitly, in conformance with the [cipher configuration requirements](#).

DBTLSKeyFile=/etc/ssl/pgsql/client.key
...
```

## 5 TimescaleDB setup

### Overview

Zabbix supports TimescaleDB, a PostgreSQL-based database solution of automatically partitioning data into time-based chunks to support faster performance at scale.

#### Warning:

Currently TimescaleDB is not supported by Zabbix proxy.

Instructions on this page can be used for creating TimescaleDB database or migrating from existing PostgreSQL tables to TimescaleDB.

### Configuration

We assume that TimescaleDB extension has been already installed on the database server (see installation instructions in [Timescale documentation](#)).

TimescaleDB extension must also be enabled for the specific DB by executing:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb CASCADE;" | sudo -u postgres psql zabbix
```

Running this command requires database administrator privileges.

**Note:**

If you use a database schema other than 'public' you need to add a SCHEMA clause to the command above. E.g.:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb SCHEMA yourschema CASCADE;" | sudo -u postgres psql zabbix
```

Then run the `postgresql/timescaledb.sql` script. For new installations the script must be run after the regular PostgreSQL database has been created with initial schema/data (see [database creation](#)):

```
cat /usr/share/zabbix-sql-scripts/postgresql/timescaledb.sql | sudo -u zabbix psql zabbix
```

**Attention:**

Please ignore warning messages informing that the best practices are not followed while running `timescaledb.sql` script on TimescaleDB version 2.9.0 and higher. Regardless of this warning, the configuration will be completed successfully.

The migration of existing history and trend data may take a lot of time. Zabbix server and frontend must be down for the period of migration.

The `timescaledb.sql` script sets the following housekeeping parameters:

- Override item history period
- Override item trend period

In order to use partitioned housekeeping for history and trends, both these options must be enabled. It is also possible to enable override individually either for history only or trends only.

For PostgreSQL version 10.2 or higher and TimescaleDB version 1.5 or higher, the `timescaledb.sql` script sets two additional parameters:

- Enable compression
- Compress records older than 7 days

To successfully remove compressed data by housekeeper, both *Override item history period* and *Override item trend period* options must be enabled. If override is disabled and tables have compressed chunks, the housekeeper will not remove data from these tables, and warnings about incorrect configuration will be displayed in the administration screen for *Housekeeping* and the *System information* section.

All of these parameters can be changed in *Administration* → *General* → *Housekeeping* after the installation.

**Note:**

You may want to run the `timescaledb-tune` tool provided by TimescaleDB to optimize PostgreSQL configuration parameters in your `postgresql.conf`.

## TimescaleDB compression

Native TimescaleDB compression is supported starting from Zabbix 5.0 for PostgreSQL version 10.2 or higher and TimescaleDB version 1.5 or higher for all Zabbix tables that are managed by TimescaleDB. During the upgrade or migration to TimescaleDB, initial compression of the large tables may take a lot of time.

Note that compression is supported under the "timescale" Timescale Community license and it is not supported under "apache" Apache 2.0 license. Starting with Zabbix 6.0.7, Zabbix detects if compression is supported. If it is not supported a warning message is written into the Zabbix server log and users cannot enable compression in the frontend.

**Note:**

Users are encouraged to get familiar with compression in [Timescale documentation](#) before using compression.

Note that there are certain limitations imposed by compression, specifically:

- Compressed chunk modifications (inserts, deletes, updates) are not allowed
- Schema changes for compressed tables are not allowed.

Compression settings can be changed in the *History and trends compression* block in *Administration* → *General* → *Housekeeping* section of Zabbix frontend.

| Parameter                          | Default | Comments  |
|------------------------------------|---------|---|
| <i>Enable compression</i>          | Enabled | <p>Checking or unchecking the checkbox does not activate/deactivate compression immediately. Because compression is handled by the Housekeeper, the changes will take effect in up to 2 times HousekeepingFrequency hours (set in <code>zabbix_server.conf</code>)</p> <p>After disabling compression, new chunks that fall into the compression period will not be compressed. However, all previously compressed data will stay compressed. To uncompress previously compressed chunks, follow the instructions in <a href="#">Timescale documentation</a>.</p> <p>When upgrading from older versions of Zabbix with TimescaleDB support, compression will not be enabled by default.</p> |
| <i>Compress records older than</i> | 7d      | <p>This parameter cannot be less than 7 days.</p> <p>Due to immutability of compressed chunks all late data (e.g. data delayed by a proxy) that is older than this value will be discarded.</p>   |

## 6 Elasticsearch setup

### Attention:

Elasticsearch support is experimental!

Zabbix supports the storage of historical data by means of Elasticsearch instead of a database. Users can choose the storage place for historical data between a compatible database and Elasticsearch. The setup procedure described in this section is applicable to Elasticsearch version 7.X. In case an earlier or later version of Elasticsearch is used, some functionality may not work as intended.

### Warning:

If all history data is stored in Elasticsearch, trends are **not** calculated nor stored in the database. With no trends calculated and stored, the history storage period may need to be extended.

### Configuration

To ensure proper communication between all elements involved make sure server configuration file and frontend configuration file parameters are properly configured.

#### Zabbix server and frontend

Zabbix server configuration file draft with parameters to be updated:

```
### Option: HistoryStorageURL
# History storage HTTP[S] URL.
#
# Mandatory: no
# Default:
# HistoryStorageURL=
### Option: HistoryStorageTypes
# Comma separated list of value types to be sent to the history storage.
#
# Mandatory: no
# Default:
# HistoryStorageTypes=uint,dbl,str,log,text
```

Example parameter values to fill the Zabbix server configuration file with:

```
HistoryStorageURL=http://test.elasticsearch.lan:9200
HistoryStorageTypes=str,log,text
```

This configuration forces Zabbix Server to store history values of numeric types in the corresponding database and textual history data in Elasticsearch.

Elasticsearch supports the following item types:

uint,dbl,str,log,text

Supported item type explanation:

| Item value type    | Database table | Elasticsearch type |
|--------------------|----------------|--------------------|
| Numeric (unsigned) | history_uint   | uint               |
| Numeric (float)    | history        | dbl                |
| Character          | history_str    | str                |
| Log                | history_log    | log                |
| Text               | history_text   | text               |

Zabbix frontend configuration file (conf/zabbix.conf.php) draft with parameters to be updated:

```
// Elasticsearch url (can be string if same url is used for all types).
$HISTORY['url'] = [
    'uint' => 'http://localhost:9200',
    'text' => 'http://localhost:9200'
];
// Value types stored in Elasticsearch.
$HISTORY['types'] = ['uint', 'text'];
```

Example parameter values to fill the Zabbix frontend configuration file with:

```
$HISTORY['url'] = 'http://test.elasticsearch.lan:9200';
$HISTORY['types'] = ['str', 'text', 'log'];
```

This configuration forces to store Text, Character and Log history values in Elasticsearch.

It is also required to make \$HISTORY global in conf/zabbix.conf.php to ensure everything is working properly (see conf/zabbix.conf.php.example for how to do it):

```
// Zabbix GUI configuration file.
global $DB, $HISTORY;
```

Installing Elasticsearch and creating mapping

Final two steps of making things work are installing Elasticsearch itself and creating mapping process.

To install Elasticsearch, please refer to [Elasticsearch installation guide](#).

**Note:**

Mapping is a data structure in Elasticsearch (similar to a table in a database). Mapping for all history data types is available here: database/elasticsearch/elasticsearch.map.

**Warning:**

Creation of mapping is mandatory. Some functionality will be broken if mapping is not created according to the instruction.

To create mapping for text type, send the following request to Elasticsearch:

```
curl -X PUT \
  http://your-elasticsearch.here:9200/text \
  -H 'content-type:application/json' \
  -d '{
    "settings": {
      "index": {
        "number_of_replicas": 1,
        "number_of_shards": 5
      }
    },
    "mappings": {
      "properties": {
        "itemid": {
          "type": "long"
        },
        "clock": {
          "format": "epoch_second",
```

```

        "type": "date"
    },
    "value": {
        "fields": {
            "analyzed": {
                "index": true,
                "type": "text",
                "analyzer": "standard"
            }
        },
        "index": false,
        "type": "text"
    }
}
}'

```

Similar request is required to be executed for Character and Log history values mapping creation with corresponding type correction.

**Note:**

To work with Elasticsearch, please refer to the [Requirements](#) for additional information.

**Note:**

**Housekeeper** is not deleting any data from Elasticsearch.

### Storing history data in multiple date-based indices

This section describes additional steps required to work with pipelines and ingest nodes.

To begin with, you must create templates for indices.

The following example shows a request for creating uint template:

```

curl -X PUT \
  http://your-elasticsearch.here:9200/_template/uint_template \
  -H 'content-type:application/json' \
  -d '{
    "index_patterns": [
      "uint*"
    ],
    "settings": {
      "index": {
        "number_of_replicas": 1,
        "number_of_shards": 5
      }
    },
    "mappings": {
      "properties": {
        "itemid": {
          "type": "long"
        },
        "clock": {
          "format": "epoch_second",
          "type": "date"
        },
        "value": {
          "type": "long"
        }
      }
    }
  }'

```

To create other templates, user should change the URL (last part is the name of template), change "index\_patterns" field to

match index name and to set valid mapping, which can be taken from database/elasticsearch/elasticsearch.map.

For example, the following command can be used to create a template for text index:

```
curl -X PUT \
  http://your-elasticsearch.here:9200/_template/text_template \
  -H 'content-type:application/json' \
  -d '{
    "index_patterns": [
      "text*"
    ],
    "settings": {
      "index": {
        "number_of_replicas": 1,
        "number_of_shards": 5
      }
    },
    "mappings": {
      "properties": {
        "itemid": {
          "type": "long"
        },
        "clock": {
          "format": "epoch_second",
          "type": "date"
        },
        "value": {
          "fields": {
            "analyzed": {
              "index": true,
              "type": "text",
              "analyzer": "standard"
            }
          },
          "index": false,
          "type": "text"
        }
      }
    }
  }'
```

This is required to allow Elasticsearch to set valid mapping for indices created automatically. Then it is required to create the pipeline definition. Pipeline is some sort of preprocessing of data before putting data in indices. The following command can be used to create pipeline for uint index:

```
curl -X PUT \
  http://your-elasticsearch.here:9200/_ingest/pipeline/uint-pipeline \
  -H 'content-type:application/json' \
  -d '{
    "description": "daily uint index naming",
    "processors": [
      {
        "date_index_name": {
          "field": "clock",
          "date_formats": [
            "UNIX"
          ],
          "index_name_prefix": "uint-",
          "date_rounding": "d"
        }
      }
    ]
  }'
```

User can change the rounding parameter ("date\_rounding") to set a specific index rotation period. To create other pipelines, user

should change the URL (last part is the name of pipeline) and change "index\_name\_prefix" field to match index name.

See also [Elasticsearch documentation](#).

Additionally, storing history data in multiple date-based indices should also be enabled in the new parameter in Zabbix server configuration:

```
### Option: HistoryStorageDateIndex
# Enable preprocessing of history values in history storage to store values in different indices based on
# 0 - disable
# 1 - enable
#
# Mandatory: no
# Default:
# HistoryStorageDateIndex=0
```

#### Troubleshooting

The following steps may help you troubleshoot problems with Elasticsearch setup:

1. Check if the mapping is correct (GET request to required index URL like `http://localhost:9200/uint`).
2. Check if shards are not in failed state (restart of Elasticsearch should help).
3. Check the configuration of Elasticsearch. Configuration should allow access from the Zabbix frontend host and the Zabbix server host.
4. Check Elasticsearch logs.

If you are still experiencing problems with your installation then please create a bug report with all the information from this list (mapping, error logs, configuration, version, etc.)

## 7 Real-time export of events, item values, trends

### Overview

It is possible to configure real-time exporting of trigger events, item values and trends in a newline-delimited JSON format.

Exporting is done into files, where each line of the export file is a JSON object. Value mappings are not applied.

In case of errors (data cannot be written to the export file or the export file cannot be renamed or a new one cannot be created after renaming it), the data item is dropped and never written to the export file. It is written only in the Zabbix database. Writing data to the export file is resumed when the writing problem is resolved.

For precise details on what information is exported, see the [export protocol](#) page.

Note that host/item can have no metadata (host groups, host name, item name) if the host/item was removed after the data was received, but before server exported data.

### Configuration

Real-time export of trigger events, item values and trends is configured by specifying a directory for the export files - see the `ExportDir` parameter in server [configuration](#).

Two other parameters are available:

- `ExportFileSize` may be used to set the maximum allowed size of an individual export file. When a process needs to write to a file it checks the size of the file first. If it exceeds the configured size limit, the file is renamed by appending `.old` to its name and a new file with the original name is created.

#### Attention:

A file will be created per each process that will write data (i.e. approximately 4-30 files). As the default size per export file is 1G, keeping large export files may drain the disk space fast.

- `ExportType` allows to specify which entity types (events, history, trends) will be exported.

## 8 Distribution-specific notes on setting up Nginx for Zabbix

### RHEL

Nginx is available only in EPEL:

```
dnf -y install epel-release
```

## SLES 12

In SUSE Linux Enterprise Server 12 you need to add the Nginx repository, before installing Nginx:

```
zypper addrepo -G -t dnf -c 'http://nginx.org/packages/sles/12' nginx
```

You also need to configure php-fpm:

```
cp /etc/php5/fpm/php-fpm.conf{.default,}  
sed -i 's/user = nobody/user = wwwrun; s/group = nobody/group = www/' /etc/php5/fpm/php-fpm.conf
```

## SLES 15

In SUSE Linux Enterprise Server 15 you need to configure php-fpm:

```
cp /etc/php7/fpm/php-fpm.conf{.default,}  
cp /etc/php7/fpm/php-fpm.d/www.conf{.default,}  
sed -i 's/user = nobody/user = wwwrun; s/group = nobody/group = www/' /etc/php7/fpm/php-fpm.d/www.conf
```

## 9 Running agent as root

Since Zabbix **5.0.0**, the systemd service file for Zabbix agent in [official packages](#) explicitly includes directives for User and Group. Both are set to zabbix.

It is no longer possible to configure which user Zabbix agent runs as via `zabbix_agentd.conf` file, because the agent will bypass this configuration and run as the user specified in the systemd service file. To run Zabbix agent as root you need to make the modifications described below.

### Zabbix agent

To override the default user and group for Zabbix agent, run:

```
systemctl edit zabbix-agent
```

Then, add the following content:

```
[Service]  
User=root  
Group=root
```

Reload daemons and restart the zabbix-agent service:

```
systemctl daemon-reload  
systemctl restart zabbix-agent
```

For **Zabbix agent** this re-enables the functionality of configuring user in the `zabbix_agentd.conf` file. Now you need to set `User=root` and `AllowRoot=1` configuration parameters in the agent [configuration file](#).

### Zabbix agent 2

To override the default user and group for Zabbix agent 2, run:

```
systemctl edit zabbix-agent2
```

Then, add the following content:

```
[Service]  
User=root  
Group=root
```

Reload daemons and restart the zabbix-agent2 service:

```
systemctl daemon-reload  
systemctl restart zabbix-agent2
```

For **Zabbix agent2** this completely determines the user that it runs as. No additional modifications are required.

## 10 Zabbix agent on Microsoft Windows

### Configuring agent

Both generations of Zabbix agents run as a Windows service. For Zabbix agent 2, replace *agentd* with *agent2* in the instructions below.

You can run a single instance of Zabbix agent or multiple instances of the agent on a Microsoft Windows host. A single instance can use the default configuration file `C:\zabbix_agentd.conf` or a configuration file specified in the command line. In case of multiple instances each agent instance must have its own configuration file (one of the instances can use the default configuration file).

An example configuration file is available in Zabbix source archive as `conf/zabbix_agentd.win.conf`.

See the [configuration file](#) options for details on configuring Zabbix Windows agent.

Hostname parameter

To perform [active checks](#) on a host Zabbix agent needs to have the hostname defined. Moreover, the hostname value set on the agent side should exactly match the "[Host name](#)" configured for the host in the frontend.

The hostname value on the agent side can be defined by either the **Hostname** or **Hostnameltem** parameter in the agent [configuration file](#) - or the default values are used if any of these parameters are not specified.

The default value for **Hostnameltem** parameter is the value returned by the "system.hostname" agent key. For Windows, it returns result of the `gethostname()` function, which queries namespace providers to determine the local host name. If no namespace provider responds, the NetBIOS name is returned.

The default value for **Hostname** is the value returned by the **Hostnameltem** parameter. So, in effect, if both these parameters are unspecified, the actual hostname will be the host NetBIOS name; Zabbix agent will use NetBIOS host name to retrieve the list of active checks from Zabbix server and send results to it.

The "system.hostname" key supports two optional parameters - *type* and *transform*.

*Type* parameter determines the type of the name the item should return. Supported values:

- *netbios* (default) - returns the NetBIOS host name which is limited to 15 symbols and is in the UPPERCASE only;
- *host* - case-sensitive, returns the full, real Windows host name (without a domain);
- *shorthost* (supported since Zabbix 5.4.7) - returns part of the hostname before the first dot. It will return a full string if the name does not contain a dot.

*Transform* parameter is supported since Zabbix 5.4.7 and allows to specify additional transformation rule for the hostname. Supported values:

- *none* (default) - use the original letter case;
- *lower* - convert the text into lowercase.

So, to simplify the configuration of `zabbix_agentd.conf` file and make it unified, two different approaches could be used.

1. leave **Hostname** or **Hostnameltem** parameters undefined and Zabbix agent will use NetBIOS host name as the hostname;
2. leave **Hostname** parameter undefined and define **Hostnameltem** like this:

**Hostnameltem=system.hostname[host]** - for Zabbix agent to use the full, real (case sensitive) Windows host name as the hostname

**Hostnameltem=system.hostname[shorthost,lower]** - for Zabbix agent to use only part of the hostname before the first dot, converted into lowercase.

Host name is also used as part of Windows service name which is used for installing, starting, stopping and uninstalling the Windows service. For example, if Zabbix agent configuration file specifies `Hostname=Windows_db_server`, then the agent will be installed as a Windows service "Zabbix Agent [Windows\_db\_server]". Therefore, to have a different Windows service name for each Zabbix agent instance, each instance must use a different host name.

Installing agent as Windows service

To install a single instance of Zabbix agent with the default configuration file `c:\zabbix_agentd.conf`:

```
zabbix_agentd.exe --install
```

**Attention:**

On a 64-bit system, a 64-bit Zabbix agent version is required for all checks related to running 64-bit processes to work correctly.

If you wish to use a configuration file other than `c:\zabbix_agentd.conf`, you should use the following command for service installation:

```
zabbix_agentd.exe --config <your_configuration_file> --install
```

A full path to the configuration file should be specified.

Multiple instances of Zabbix agent can be installed as services like this:

```
zabbix_agentd.exe --config <configuration_file_for_instance_1> --install --multiple-agents
zabbix_agentd.exe --config <configuration_file_for_instance_2> --install --multiple-agents
...
zabbix_agentd.exe --config <configuration_file_for_instance_N> --install --multiple-agents
```

The installed service should now be visible in Control Panel.

#### Starting agent

To start the agent service, you can use Control Panel or do it from command line.

To start a single instance of Zabbix agent with the default configuration file:

```
zabbix_agentd.exe --start
```

To start a single instance of Zabbix agent with another configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --start
```

To start one of multiple instances of Zabbix agent:

```
zabbix_agentd.exe --config <configuration_file_for_this_instance> --start --multiple-agents
```

#### Stopping agent

To stop the agent service, you can use Control Panel or do it from command line.

To stop a single instance of Zabbix agent started with the default configuration file:

```
zabbix_agentd.exe --stop
```

To stop a single instance of Zabbix agent started with another configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --stop
```

To stop one of multiple instances of Zabbix agent:

```
zabbix_agentd.exe --config <configuration_file_for_this_instance> --stop --multiple-agents
```

#### Uninstalling agent Windows service

To uninstall a single instance of Zabbix agent using the default configuration file:

```
zabbix_agentd.exe --uninstall
```

To uninstall a single instance of Zabbix agent using a non-default configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --uninstall
```

To uninstall multiple instances of Zabbix agent from Windows services:

```
zabbix_agentd.exe --config <configuration_file_for_instance_1> --uninstall --multiple-agents
zabbix_agentd.exe --config <configuration_file_for_instance_2> --uninstall --multiple-agents
...
zabbix_agentd.exe --config <configuration_file_for_instance_N> --uninstall --multiple-agents
```

#### Limitations

Zabbix agent for Windows does not support non-standard Windows configurations where CPUs are distributed non-uniformly across NUMA nodes. If logical CPUs are distributed non-uniformly, then CPU performance metrics may not be available for some CPUs. For example, if there are 72 logical CPUs with 2 NUMA nodes, both nodes must have 36 CPUs each.

## 11 SAML setup with Okta

This section describes how to configure Okta to enable SAML 2.0 authentication for Zabbix.

#### Okta configuration

1. Go to <https://okta.com> and register or sign in to your account.

2. In the Okta web interface navigate to *Applications* → *Applications* and press "Add Application" button (  ).

3. Press "Create New App" button (  ). In a popup window select *Platform*: Web, *Sign on method*: SAML 2.0 and press "Create" button.

Create a New Application Integration

X

Platform

Web

Sign on method

☐ Secure Web Authentication (SWA)

Uses credentials to sign in. This integration works with most apps.

☒ SAML 2.0

Uses the SAML protocol to log users into the app. This is a better option than SWA, if the app supports it.

☐ OpenID Connect

Uses the OpenID Connect protocol to log users into an app you've built.

Create

Cancel

4. Fill in the fields in the *General settings* tab (the first tab that appears) according to your preferences and press "Next".

5. In the *Configure SAML* tab enter the values provided below, then press "Next".

- In the **GENERAL** section:
  - *Single sign on URL*: `https://<your-zabbix-url>/ui/index_sso.php?acs`  
The checkbox *Use this for Recipient URL and Destination URL* should be marked)
  - *Audience URI (SP Entity ID)*: `zabbix`  
Note that this value will be used within the SAML assertion as a unique service provider identifier (if not matching, the operation will be rejected). It is possible to specify a URL or any string of data in this field.
  - *Default RelayState*:  
Leave this field blank; if a custom redirect is required, it can be added in Zabbix in the *Administration* → *Users* settings.
  - Fill in other fields according to your preferences.

## GENERAL

Single sign on URL ?

https://<your-zabbix-url>/ui/index\_sso.php?acs

☒ Use this for Recipient URL and Destination URL

☐ Allow this app to request other SSO URLs

Audience URI (SP Entity ID) ?

user.email ▼

Add Another

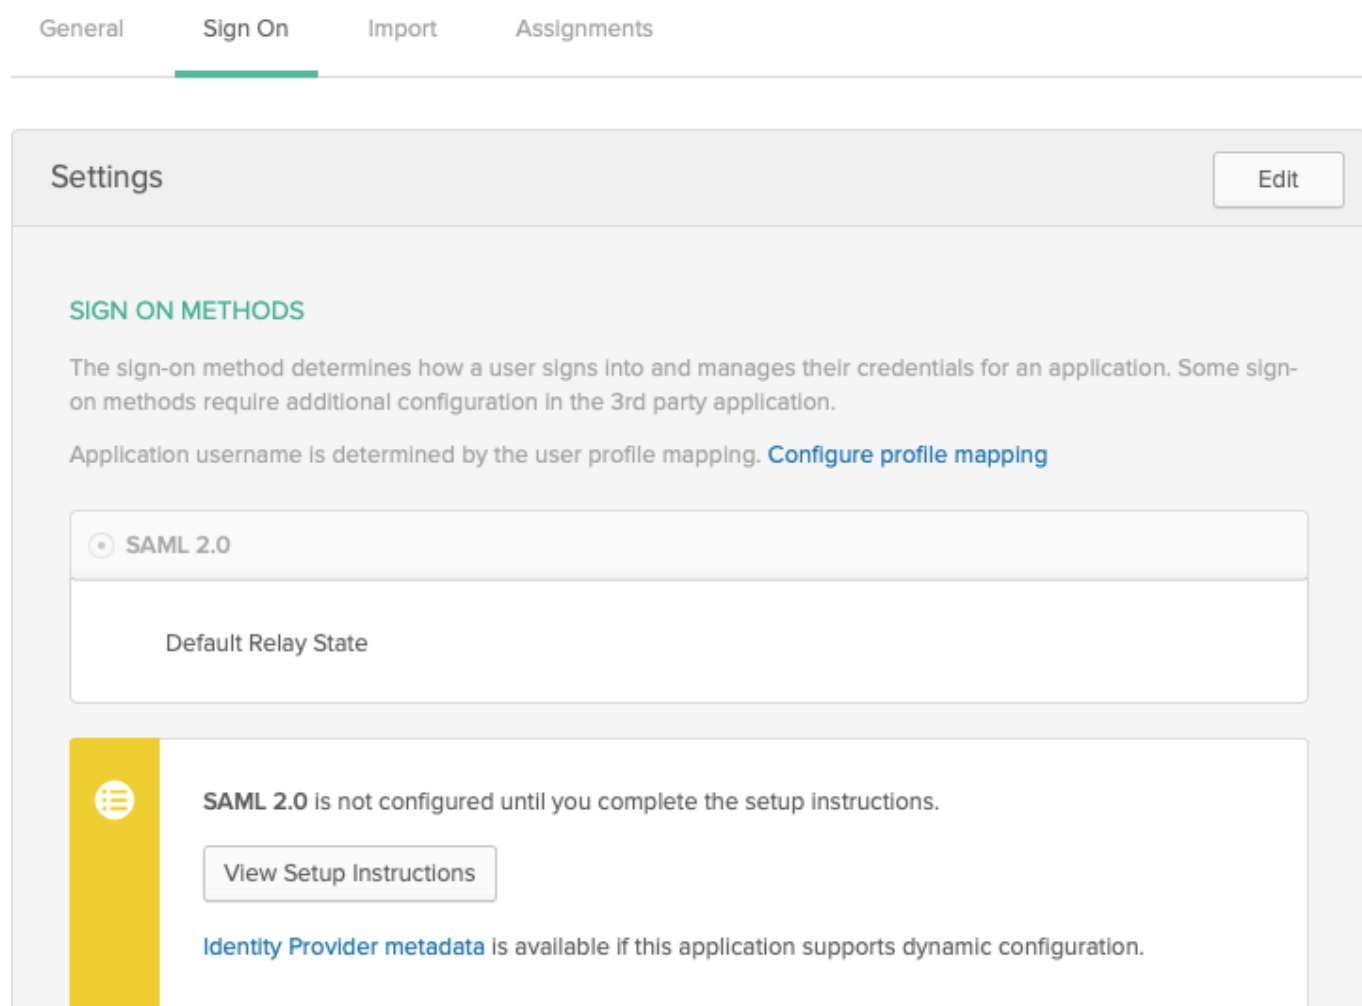

6. At the next tab, select "I'm a software vendor. I'd like to integrate my app with Okta" and press "Finish".

7. Now, navigate to *Assignments* tab and press the "Assign" button, then select *Assign to People* from the drop-down.

8. In a popup that appears, assign created app to people that will use SAML 2.0 to authenticate with Zabbix, then press "Save and go back".

9. Navigate to the *Sign On* tab and press the "View Setup Instructions" button. Setup instructions will be displayed in a new tab; keep this tab open while configuring Zabbix.

#### Zabbix configuration

1. In Zabbix, go to SAML settings in the *Administration* → *Authentication* section and copy information from Okta setup instructions into corresponding fields:

| Zabbix field              | Okta SAML setup field                |
|---------------------------|--------------------------------------|
| <i>IdP entity ID</i>      | Identity Provider Issuer             |
| <i>SSO service URL</i>    | Identity Provider Single Sign-On URL |
| <i>Username attribute</i> | Attribute name                       |

|                     |                       |
|---------------------|-----------------------|
| Zabbix field        | Okta SAML setup field |
| <i>SP entity ID</i> | Audience URI          |

2. Download the certificate provided in the Okta setup instructions page into `ui/conf/certs` folder as `idp.crt`, and set permission 644 by running:

```
chmod 644 idp.crt
```

Note that if you have upgraded to Zabbix 6.0 from an older version, you will also need to manually add these lines to `zabbix.conf.php` file (located in the `/ui/conf` directory):

```
// Used for SAML authentication.
$SSO['SP_KEY'] = 'conf/certs/sp.key'; // Path to your private key.
$SSO['SP_CERT'] = 'conf/certs/sp.crt'; // Path to your public key.
$SSO['IDP_CERT'] = 'conf/certs/idp.crt'; // Path to IdP public key.
$SSO['SETTINGS'] = []; // Additional settings
```

See generic [SAML Authentication](#) instructions for more details.

3. If *Assertion Encryption* has been set to Encrypted in Okta, a checkbox "Assertions" of the *Encrypt* parameter should be marked in Zabbix as well.

[Authentication](#)
[HTTP settings](#)
[LDAP settings](#)
[SAML settings](#)

---

Enable SAML authentication ☒

\* IdP entity ID

\* SSO service URL

SLO service URL

\* Username attribute

\* SP entity ID

SP name ID format

Sign ☒ Messages  
☒ Assertions  
☐ AuthN requests  
☐ Logout requests  
☐ Logout responses

Encrypt ☐ Name ID  
☐ Assertions

Case sensitive login ☐

4. Press the "Update" button to save these settings.

**Note:**

To sign in with SAML, the username in Zabbix should match the Okta e-mail. These settings can be changed in the *Administration* → *Users* section of Zabbix web interface.

## 12 Oracle database setup

Overview

This section contains instructions for creating Oracle database and configuring connections between the database and Zabbix server, proxy, and frontend.

#### Database creation

We assume that a *zabbix* database user with *password* password exists and has permissions to create database objects in ORCL service located on the *host* Oracle database server. Zabbix requires a Unicode database character set and a UTF8 national character set. Check current settings:

```
sqlplus> select parameter,value from v$nls_parameters where parameter='NLS_CHARACTERSET' or parameter='NLS
```

Now prepare the database:

```
cd /path/to/zabbix-sources/database/oracle
sqlplus zabbix/password@oracle_host/ORCL
sqlplus> @schema.sql
# stop here if you are creating database for Zabbix proxy
sqlplus> @images.sql
sqlplus> @data.sql
```

#### Note:

Please set the initialization parameter `CURSOR_SHARING=FORCE` for best performance.

#### Connection set up

Zabbix supports two types of connect identifiers (connection methods):

- Easy Connect
- Net Service Name

Connection configuration parameters for Zabbix server and Zabbix proxy can be set in the configuration files. Important parameters for the server and proxy are *DBHost*, *DBUser*, *DBName* and *DBPassword*. The same parameters are important for the frontend: `$DB["SERVER"]`, `$DB["PORT"]`, `$DB["DATABASE"]`, `$DB["USER"]`, `$DB["PASSWORD"]`.

Zabbix uses the following connection string syntax:

```
{DBUser/DBPassword[@<connect_identifier>]}
```

<connect\_identifier> can be specified either in the form of "Net Service Name" or "Easy Connect".

```
@[[/]]Host[:Port]/<service_name> | <net_service_name>
```

#### Easy Connect

Easy Connect uses the following parameters to connect to the database:

- *Host* - the host name or IP address of the database server computer (DBHost parameter in the configuration file).
- *Port* - the listening port on the database server (DBPort parameter in the configuration file; if not set the default 1521 port will be used).
- <service\_name> - the service name of the database you want to access (DBName parameter in the configuration file).

#### Example:

Database parameters set in the server or proxy configuration file (zabbix\_server.conf and zabbix\_proxy.conf):

```
DBHost=localhost
DBPort=1521
DBUser=myusername
DBName=ORCL
DBPassword=mypassword
```

Connection string used by Zabbix to establish connection:

```
DBUser/DBPassword@DBHost:DBPort/DBName
```

During Zabbix frontend installation, set the corresponding parameters in the *Configure DB connection* step of the setup wizard:

- Database host: localhost
- Database port: 1521
- Database name: ORCL
- User: myusername
- Password: mypassword

## Configure DB connection

Please create database manually, and set the configuration parameters for connection to this database.  
Press "Next step" button when done.

Welcome

Check of pre-requisites

Configure DB connection

Zabbix server details

GUI settings

Pre-installation summary

Install

Database type

Database host

Database port  0 - use default port

Database name

Store credentials in ☒ Plain text ☐ HashiCorp Vault

User

Password

Alternatively, these parameters can be set in the frontend configuration file (zabbix.conf.php):

```
$DB["TYPE"]           = 'ORACLE';
$DB["SERVER"]          = 'localhost';
$DB["PORT"]            = '1521';
$DB["DATABASE"]        = 'ORCL';
$DB["USER"]            = 'myusername';
$DB["PASSWORD"]        = 'mypassword';
```

Net service name

Since Zabbix 5.4.0 it is possible to connect to Oracle by using net service name.

<net\_service\_name> is a simple name for a service that resolves to a connect descriptor.

In order to use the service name for creating a connection, this service name has to be defined in the tnsnames.ora file located on both the database server and the client systems. The easiest way to make sure that the connection will succeed is to define the location of tnsnames.ora file in the TNS\_ADMIN environment variable. The default location of the tnsnames.ora file is:

\$ORACLE\_HOME/network/admin/

A simple tnsnames.ora file example:

```
ORCL =
(DESCRIPTION =
  (ADDRESS = (PROTOCOL = TCP)(HOST = localhost)(PORT = 1521))
  (CONNECT_DATA =
    (SERVER = DEDICATED)
    (SERVICE_NAME = ORCL)
  )
)
```

To set configuration parameters for the "Net Service Name" connection method, use one of the following options:

- Set an empty parameter DBHost and set DBName as usual:

```
DBHost=
DBName=ORCL
```

- Set both parameters and leave both empty:

```
DBHost=
DBName=
```

In the second case, the TWO\_TASK environment variable has to be set. It specifies the default remote Oracle service (service name). When this variable is defined, the connector connects to the specified database by using an Oracle listener that accepts connection requests. This variable is for use on Linux and UNIX only. Use the LOCAL environment variable for Microsoft Windows.

### Example:

Connect to a database using Net Service Name set as ORCL and the default port. Database parameters set in the server or proxy configuration file (zabbix\_server.conf and zabbix\_proxy.conf):

```
DBHost=  
#DBPort=  
DBUser=myusername  
DBName=ORCL  
DBPassword=mypassword
```

During Zabbix frontend installation, set the corresponding parameters in the *Configure DB connection* step of the setup wizard:

- Database host:
- Database port: 0
- Database name: ORCL
- User: myusername
- Password: mypassword

Alternatively, these parameters can be set in the frontend configuration file (zabbix.conf.php):

```
$DB["TYPE"]           = 'ORACLE';  
$DB["SERVER"]         = '';  
$DB["PORT"]           = '0';  
$DB["DATABASE"]       = 'ORCL';  
$DB["USER"]           = 'myusername';  
$DB["PASSWORD"]       = 'mypassword';
```

Connection string used by Zabbix to establish connection:

```
DBUser/DBPassword@ORCL
```

Known issues

To improve performance, you can convert the field types from *nclob* to *nvarchar2*, see [known issues](#).

## 13 Setting up scheduled reports

Overview

This section provides instructions on installing Zabbix web service and configuring Zabbix to enable generation of [scheduled reports](#).

### Attention:

Currently the support of scheduled reports is experimental.

Installation

A new [Zabbix web service](#) process and Google Chrome browser should be installed to enable generation of scheduled reports. The web service may be installed on the same machine where the Zabbix server is installed or on a different machine. Google Chrome browser should be installed on the same machine, where the web service is installed.

The official zabbix-web-service package is available in the [Zabbix repository](#). Google Chrome browser is not included into these packages and has to be installed separately.

To compile Zabbix web service from sources, see [Installing Zabbix web service](#).

After the installation, run `zabbix_web_service` on the machine, where the web service is installed:

```
zabbix_web_service
```

Configuration

To ensure proper communication between all elements involved make sure server configuration file and frontend configuration parameters are properly configured.

Zabbix server

The following parameters in Zabbix server configuration file need to be updated: *WebServiceURL* and *StartReportWriters*.

### WebServiceURL

This parameter is required to enable communication with the web service. The URL should be in the format `<host:port>/report`.

- By default, the web service listens on port 10053. A different port can be specified in the web service [configuration file](#).
- Specifying the `/report` path is mandatory (the path is hardcoded and cannot be changed).

Example:

```
WebServiceURL=http://localhost:10053/report
```

#### Attention:

It is strongly recommended to set up encryption between Zabbix server and Zabbix web service [using certificates](#). By default, data transmitted between Zabbix server and Zabbix web service is not encrypted, which can lead to unauthorized access.

### StartReportWriters

This parameter determines how many report writer processes should be started. If it is not set or equals 0, report generation is disabled. Based on the number and frequency of reports required, it is possible to enable from 1 to 100 report writer processes.

Example:

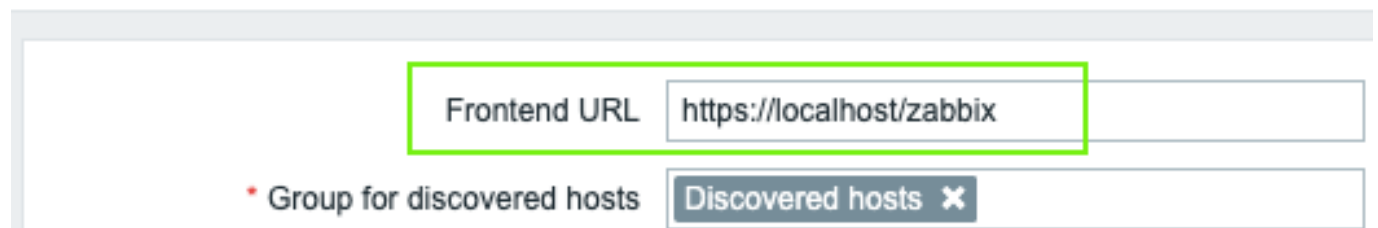

```
StartReportWriters=3
```

Zabbix frontend

A *Frontend URL* parameter should be set to enable communication between Zabbix frontend and Zabbix web service:

- Proceed to the *Administration* → *General* → *Other parameters* frontend menu section
- Specify the full URL of the Zabbix web interface in the *Frontend URL* parameter

## Other configuration parameters ▾

The screenshot shows a configuration interface with two input fields. The first field is labeled 'Frontend URL' and contains the text 'https://localhost/zabbix'. The second field is labeled 'Group for discovered hosts' and contains the text 'Discovered hosts' followed by a close button (X). The 'Frontend URL' field is highlighted with a green border.

#### Note:

Once the setup procedure is completed, you may want to configure and send a [test report](#) to make sure everything works correctly.

## 14 Additional frontend languages

Overview

In order to use any other language than English in Zabbix web interface, its locale should be installed on the web server. Additionally, the PHP gettext extension is required for the translations to work.

Installing locales

To list all installed languages, run:

```
locale -a
```

If some languages that are needed are not listed, open the `/etc/locale.gen` file and uncomment the required locales. Since Zabbix uses UTF-8 encoding, you need to select locales with UTF-8 charset.

Now, run:

```
locale-gen
```

Restart the web server.

The locales should now be installed. It may be required to reload Zabbix frontend page in browser using Ctrl + F5 for new languages to appear.

Installing Zabbix

If installing Zabbix directly from [Zabbix git repository](#), translation files should be generated manually. To generate translation files, run:

```
make gettext
locale/make_mo.sh
```

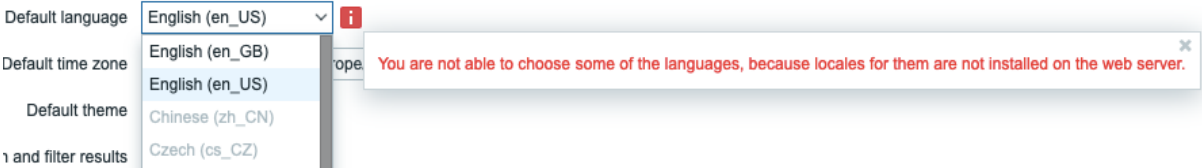

This step is not needed when installing Zabbix from packages or source tar.gz files.

Selecting a language

There are several ways to select a language in Zabbix web interface:

- When installing web interface - in the frontend **installation wizard**. Selected language will be set as system default.
- After the installation, system default language can be changed in the *Administration*→*General*→*GUI menu section*.
- Language for a particular user can be changed in the **user profile**.

If a locale for a language is not installed on the machine, this language will be greyed out in Zabbix language selector. A red icon is displayed next to the language selector if at least one locale is missing. Upon pressing on this icon the following message will be displayed: "You are not able to choose some of the languages, because locales for them are not installed on the web server."

2 Process configuration

Please use the sidebar to access content in this section.

1 Zabbix server

Overview

This section lists parameters supported in a Zabbix server configuration file (`zabbix_server.conf`).

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with `"#"` are only supported in the beginning of the line.

Parameters

| Parameter        | Mandatory | Range | Default                              | Description  |
|------------------|-----------|-------|--------------------------------------|--|
| AlertScriptsPath | no        |       | /usr/local/share/zabbix/alertscripts | Path to alert scripts (depends on compile-time installation variable <code>datadir</code> ). |

| Parameter                  | Mandatory  | Range      | Default   | Description  |
|----------------------------|--|------------|-----------|--|
| AllowRoot                  | no   |            | 0         | Allow the server to run as 'root'. If disabled and the server is started by 'root', the server will try to switch to the 'zabbix' user instead. Has no effect if started under a regular user.<br>0 - do not allow<br>1 - allow  |
| AllowUnsupportedDBVersions | no   |            | 0         | Allow the server to work with unsupported database versions.<br>0 - do not allow<br>1 - allow  |
| CacheSize                  | no   | 128K-64G   | 32M       | Size of configuration cache, in bytes.   |
| CacheUpdateFrequency       | no   | 1-3600     | 60        | Shared memory size for storing host, item and trigger data.<br>Determines how often Zabbix will perform update of configuration cache in seconds.<br>See also <b>runtime control</b> options.  |
| DBHost                     | no   |            | localhost | Database host name.<br>In case of MySQL localhost or empty string results in using a socket. In case of PostgreSQL only empty string results in attempt to use socket.<br>In case of <b>Oracle</b> empty string results in using the Net Service Name connection method; in this case consider using the TNS_ADMIN environment variable to specify the directory of the tnsnames.ora file.   |
| DBName                     | yes  |            |           | Database name.<br>In case of <b>Oracle</b> if the Net Service Name connection method is used, specify the service name from tnsnames.ora or set to empty string; set the TWO_TASK environment variable if DBName is set to empty string.   |
| DBPassword                 | no   |            |           | Database password.<br>Comment this line if no password is used.  |
| DBPort                     | no   | 1024-65535 |           | Database port when not using local socket.<br>In case of <b>Oracle</b> if the Net Service Name connection method is used this parameter will be ignored; the port number from the tnsnames.ora file will be used instead.  |
| DBSchema                   | no   |            |           | Schema name. Used for PostgreSQL.  |
| DBSocket                   | no   |            |           | Path to MySQL socket file.   |
| DBUser                     | no   |            |           | Database user.   |
| DBTLSConnect               | no   |            |           | Setting this option enforces the use of TLS connection to database:<br><i>required</i> - connect using TLS<br><i>verify_ca</i> - connect using TLS and verify certificate<br><i>verify_full</i> - connect using TLS, verify certificate and verify that database identity specified by DBHost matches its certificate<br><br>On MySQL starting from 5.7.11 and PostgreSQL the following values are supported: "required", "verify_ca", "verify_full".<br>On MariaDB starting from version 10.2.6 "required" and "verify_full" values are supported.<br>By default, not set to any option and the behavior depends on database configuration. |
| DBTLSCAFile                | no<br>(yes, if<br>DBTLSConnect set to<br>one of:<br>verify_ca,<br>verify_full) |            |           | This parameter is supported since Zabbix 5.0.0.<br>Full pathname of a file containing the top-level CA(s) certificates for database certificate verification.<br>This parameter is supported since Zabbix 5.0.0.   |
| DBTLSCertFile              | no   |            |           | Full pathname of file containing Zabbix server certificate for authenticating to database.<br>This parameter is supported since Zabbix 5.0.0.  |

| Parameter               | Mandatory | Range   | Default                                 | Description  |
|-------------------------|-----------|---------|---|--|
| DBTLSKeyFile            | no        |         |   | Full pathname of file containing the private key for authenticating to database.<br>This parameter is supported since Zabbix 5.0.0.  |
| DBTLSCipher             | no        |         |   | The list of encryption ciphers that Zabbix server permits for TLS protocols up through TLSv1.2.<br>Supported only for MySQL.<br>This parameter is supported since Zabbix 5.0.0.  |
| DBTLSCipher13           | no        |         |   | The list of encryption ciphersuites that Zabbix server permits for TLSv1.3 protocol.<br>Supported only for MySQL, starting from version 8.0.16.<br>This parameter is supported since Zabbix 5.0.0.   |
| DebugLevel              | no        | 0-5     | 3                                       | Specifies debug level:<br>0 - basic information about starting and stopping of Zabbix processes<br>1 - critical information<br>2 - error information<br>3 - warnings<br>4 - for debugging (produces lots of information)<br>5 - extended debugging (produces even more information)<br>See also <a href="#">runtime control</a> options.   |
| ExportDir               | no        |         |   | Directory for <a href="#">real-time export</a> of events, history and trends in newline-delimited JSON format. If set, enables real-time export.<br>This parameter is supported since Zabbix 4.0.0.  |
| ExportFileSize          | no        | 1M-1G   | 1G                                      | Maximum size per export file in bytes. Only used for rotation if ExportDir is set.<br>This parameter is supported since Zabbix 4.0.0.  |
| ExportType              | no        |         |   | List of comma-delimited entity types (events, history, trends) for <a href="#">real-time export</a> (all types by default). Valid only if ExportDir is set.<br><i>Note that if ExportType is specified, but ExportDir is not, then this is a configuration error and the server will not start.</i><br>e.g.:<br>ExportType=history,trends - export history and trends only<br>ExportType=events - export events only |
| ExternalScripts         | no        |         | /usr/local/share/zabbix/externalscripts | Location of external scripts (depends on compile-time installation variable <i>datadir</i> ).  |
| Fping6Location          | no        |         | /usr/sbin/fping6                        | Location of fping6.<br>Make sure that fping6 binary has root ownership and SUID flag set.<br>Make empty ("Fping6Location=") if your fping utility is capable to process IPv6 addresses.  |
| FpingLocation           | no        |         | /usr/sbin/fping                         | Location of fping.<br>Make sure that fping binary has root ownership and SUID flag set!  |
| HANodeName              | no        |         |   | The high availability cluster node name.<br>When empty the server is working in standalone mode and a node with empty name is created.   |
| HistoryCacheSize        | no        | 128K-2G | 16M                                     | Size of history cache, in bytes.   |
| HistoryIndexCacheSize   | no        | 128K-2G | 4M                                      | Shared memory size for storing history data.<br>Size of history index cache, in bytes.<br>Shared memory size for indexing history data stored in history cache.<br>The index cache size needs roughly 100 bytes to cache one item.<br>This parameter is supported since Zabbix 3.0.0.  |
| HistoryStorageDateIndex | no        |         | 0                                       | Enable preprocessing of history values in history storage to store values in different indices based on date:<br>0 - disable<br>1 - enable   |
| HistoryStorageURL       | no        |         |   | History storage HTTP[S] URL.<br>This parameter is used for <a href="#">Elasticsearch</a> setup.  |

| Parameter             | Mandatory | Range       | Default               | Description   |
|-----------------------|-----------|-------------|-----------------------|---|
| HistoryStorageTypes   | yes       |             | uint,dbl,str,log,text | Comma separated list of value types to be sent to the history storage.<br>This parameter is used for <a href="#">Elasticsearch</a> setup.   |
| HousekeepingFrequency |           | 0-24        | 1                     | Determines how often Zabbix will perform housekeeping procedure in hours.<br>Housekeeping is removing outdated information from the database.<br><i>Note:</i> To prevent housekeeper from being overloaded (for example, when history and trend periods are greatly reduced), no more than 4 times HousekeepingFrequency hours of outdated information are deleted in one housekeeping cycle, for each item. Thus, if HousekeepingFrequency is 1, no more than 4 hours of outdated information (starting from the oldest entry) will be deleted per cycle.<br><i>Note:</i> To lower load on server startup housekeeping is postponed for 30 minutes after server start. Thus, if HousekeepingFrequency is 1, the very first housekeeping procedure after server start will run after 30 minutes, and will repeat with one hour delay thereafter.<br>Since Zabbix 3.0.0 it is possible to disable automatic housekeeping by setting HousekeepingFrequency to 0. In this case the housekeeping procedure can only be started by <i>housekeeper_execute</i> runtime control option and the period of outdated information deleted in one housekeeping cycle is 4 times the period since the last housekeeping cycle, but not less than 4 hours and not greater than 4 days.<br>See also <a href="#">runtime control</a> options. |
| Include               | no        |             |                       | You may include individual files or all files in a directory in the configuration file.<br>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.<br>For example:<br><code>/absolute/path/to/config/files/*.conf</code> .<br>See <a href="#">special notes</a> about limitations.  |
| JavaGateway           | no        |             |                       | IP address (or hostname) of Zabbix Java gateway.<br>Only required if Java pollers are started.  |
| JavaGatewayPort       | no        | 1024-32767  | 10052                 | Port that Zabbix Java gateway listens on.   |
| ListenBacklog         | no        | 0 - INT_MAX | SOMAXCONN             | The maximum number of pending connections in the TCP queue.<br>Default value is a hard-coded constant, which depends on the system.<br>Maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.  |
| ListenIP              | no        |             | 0.0.0.0               | List of comma delimited IP addresses that the trapper should listen on.<br>Trapper will listen on all network interfaces if this parameter is missing.  |
| ListenPort            | no        | 1024-32767  | 10051                 | Listen port for trapper.  |
| LoadModule            | no        |             |                       | Module to load at server startup. Modules are used to extend functionality of the server.<br>Formats:<br><code>LoadModule=&lt;module.so&gt;</code><br><code>LoadModule=&lt;path/module.so&gt;</code><br><code>LoadModule=&lt;/abs_path/module.so&gt;</code><br>Either the module must be located in directory specified by LoadModulePath or the path must precede the module name.<br>If the preceding path is absolute (starts with '/') then LoadModulePath is ignored.<br>It is allowed to include multiple LoadModule parameters.  |
| LoadModulePath        | no        |             |                       | Full path to location of server modules.<br>Default depends on compilation options.   |

| Parameter                    | Mandatory  | Range     | Default                      | Description   |
|------------------------------|--|-----------|------------------------------|---|
| LogFile                      | yes, if LogType is set to <i>file</i> , otherwise no |           |                              | Name of log file.   |
| LogFileSize                  | no   | 0-1024    | 1                            | Maximum size of log file in MB.<br>0 - disable automatic log rotation.<br><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.   |
| LogType                      | no   |           | file                         | Log output type:<br><i>file</i> - write log to file specified by LogFile parameter,<br><i>system</i> - write log to syslog,<br><i>console</i> - write log to standard output.<br>This parameter is supported since Zabbix 3.0.0.  |
| LogSlowQueries               | no   | 0-3600000 | 0                            | Determines how long a database query may take before being logged in milliseconds.<br>0 - don't log slow queries.   |
| MaxHousekeeperDelete         | no   | 0-1000000 | 5000                         | This option becomes enabled starting with DebugLevel=3.<br>No more than 'MaxHousekeeperDelete' rows (corresponding to [tablename], [field], [value]) will be deleted per one task in one housekeeping cycle.<br>If set to 0 then no limit is used at all. In this case you must know what you are doing, so as not to <b>overload the database!</b><br><b>2</b>   |
| NodeAddress                  | no   |           | 10051                        | This parameter applies only to deleting history and trends of already deleted items.<br>IP or hostname with optional port to override how the frontend should connect to the server.<br>Format: <address>[:port]<br>If IP or hostname is not set, the value of ListenIP will be used.<br>If ListenIP is not set, the value localhost will be used.<br>This option can be overridden by the address specified in the frontend configuration.<br>See also: HANodeName parameter |
| PidFile                      | no   |           | /tmp/zabbix_server.pid       | Name of PID file.   |
| ProxyConfigFrequency         | no   | 1-604800  | 3600                         | Determines how often Zabbix server sends configuration data to a Zabbix proxy in seconds. Used only for proxies in a passive mode.  |
| ProblemHousekeepingFrequency | no   | 1-3600    | 60                           | Determines how often Zabbix will delete problems for deleted triggers in seconds.   |
| ProxyDataFrequency           | no   | 1-3600    | 1                            | Determines how often Zabbix server requests history data from a Zabbix proxy in seconds. Used only for proxies in a passive mode.   |
| ServiceManagerSyncFrequency  | no   | 1-3600    | 60                           | Determines how often Zabbix will synchronize configuration of a service manager in seconds.   |
| SNMPTrapperFile              | no   |           | /tmp/zabbix_trap_receiver.pl | Temporary file used for passing data from SNMP trap daemon to the server.<br>Must be the same as in zabbix_trap_receiver.pl or SNMPTT configuration file.   |
| SocketDir                    | no   |           | /tmp                         | Directory to store IPC sockets used by internal Zabbix services.<br>This parameter is supported since Zabbix 3.4.0.   |

| Parameter               | Mandatory | Range  | Default | Description  |
|-------------------------|-----------|--------|---------|--|
| SourceIP                | no        |        |         | Source IP address for:<br>- outgoing connections to Zabbix proxy and Zabbix agent;<br>- agentless connections (VMware, SSH, JMX, SNMP, Telnet and simple checks);<br>- HTTP agent connections;<br>- script item JavaScript HTTP requests;<br>- preprocessing JavaScript HTTP requests;<br>- sending notification emails (connections to SMTP server);<br>- webhook notifications (JavaScript HTTP connections);<br>- connections to the Vault  |
| SSHKeyLocation          | no        |        |         | Location of public and private keys for SSH checks and actions   |
| SSLCertLocation         | no        |        |         | Location of SSL client certificate files for client authentication.<br>This parameter is used in web monitoring only.  |
| SSLKeyLocation          | no        |        |         | Location of SSL private key files for client authentication.<br>This parameter is used in web monitoring only.   |
| SSLCALocation           | no        |        |         | Override the location of certificate authority (CA) files for SSL server certificate verification. If not set, system-wide directory will be used.<br>Note that the value of this parameter will be set as libcurl option CURLOPT_CAPATH. For libcurl versions before 7.42.0, this only has effect if libcurl was compiled to use OpenSSL.<br>For more information see <a href="#">cURL web page</a> .<br>This parameter is used in web monitoring since Zabbix 2.4.0 and in SMTP authentication since Zabbix 3.0.0. |
| StartAlerters           | no        | 1-100  | 3       | Number of pre-forked instances of <b>alerters</b> .<br>This parameter is supported since Zabbix 3.4.0.   |
| StartDBSyncers          | no        | 1-100  | 4       | Number of pre-forked instances of <b>history syncers</b> .<br><i>Note:</i> Be careful when changing this value, increasing it may do more harm than good. Roughly, the default value should be enough to handle up to 4000 NVPS.   |
| StartDiscoverers        | no        | 0-250  | 1       | Number of pre-forked instances of <b>discoverers</b> .   |
| StartEscalators         | no        | 1-100  | 1       | Number of pre-forked instances of <b>escalators</b> .<br>This parameter is supported since Zabbix 3.0.0.   |
| StartHistoryPollers     | no        | 0-1000 | 5       | Number of pre-forked instances of <b>history pollers</b> .<br>This parameter is supported since Zabbix 5.4.0.  |
| StartHTTPPollers        | no        | 0-1000 | 1       | Number of pre-forked instances of <b>HTTP pollers</b> <sup>1</sup> .   |
| StartIPMIPollers        | no        | 0-1000 | 0       | Number of pre-forked instances of <b>IPMI pollers</b> .  |
| StartJavaPollers        | no        | 0-1000 | 0       | Number of pre-forked instances of <b>Java pollers</b> <sup>1</sup> .   |
| StartLLDProcessors      | no        | 1-100  | 2       | Number of pre-forked instances of low-level discovery (LLD) <b>workers</b> <sup>1</sup> .<br>The LLD manager process is automatically started when an LLD worker is started.<br>This parameter is supported since Zabbix 4.2.0.  |
| StartODBCPollers        | no        | 0-1000 | 1       | Number of pre-forked instances of <b>ODBC pollers</b> <sup>1</sup> .   |
| StartPingers            | no        | 0-1000 | 1       | Number of pre-forked instances of <b>ICMP pingers</b> <sup>1</sup> .   |
| StartPollersUnreachable | no        | 0-1000 | 1       | Number of pre-forked instances of <b>pollers for unreachable hosts</b> (including IPMI and Java) <sup>1</sup> .<br>At least one poller for unreachable hosts must be running if regular, IPMI or Java pollers are started.   |
| StartPollers            | no        | 0-1000 | 5       | Number of pre-forked instances of <b>pollers</b> <sup>1</sup> .  |
| StartPreprocessors      | no        | 1-1000 | 3       | Number of pre-forked instances of preprocessing <b>workers</b> <sup>1</sup> .<br>The preprocessing manager process is automatically started when a preprocessor worker is started.<br>This parameter is supported since Zabbix 3.4.0.  |
| StartProxyPollers       | no        | 0-250  | 1       | Number of pre-forked instances of <b>pollers for passive proxies</b> <sup>1</sup> .  |
| StartReportWriters      | no        | 0-100  | 0       | Number of pre-forked instances of <b>report writers</b> .<br>If set to 0, scheduled report generation is disabled.<br>The report manager process is automatically started when a report writer is started.   |
| StartSNMPTrapper        | no        | 0-1    | 0       | This parameter is supported since Zabbix 5.4.0.<br>If set to 1, <b>SNMP trapper</b> process will be started.   |

| Parameter             | Mandatory | Range  | Default | Description  |
|-----------------------|-----------|--------|---------|--|
| StartTimers           | no        | 1-1000 | 1       | Number of pre-forked instances of <b>timers</b> .<br>Timers process maintenance periods.   |
| StartTrappers         | no        | 0-1000 | 5       | Number of pre-forked instances of <b>trappers</b> <sup>1</sup> .<br>Trappers accept incoming connections from Zabbix sender, active agents and active proxies.   |
| StartVMwareCollectors | no        | 0-250  | 0       | Number of pre-forked <b>VMware collector</b> instances.  |
| StatsAllowedIP        | no        |        |         | List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of external Zabbix instances. Stats request will be accepted only from the addresses listed here. If this parameter is not set no stats requests will be accepted. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address.<br>Example: StatsAllowedIP=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com<br>This parameter is supported since Zabbix 4.2.0. |
| Timeout               | no        | 1-30   | 3       | Specifies how long we wait for agent, SNMP device or external check in seconds.  |
| TLSCAFile             | no        |        |         | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSCertFile           | no        |        |         | Full pathname of a file containing the server certificate or certificate chain, used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSCipherAll          | no        |        |         | GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.<br>Example:<br>TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256<br>This parameter is supported since Zabbix 4.4.7.   |
| TLSCipherAll13        | no        |        |         | Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.<br>Example for GnuTLS: NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL::+SIGN-ALL:+CTYPE-X.509<br>Example for OpenSSL:<br>EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128:kRSA+AES128<br>This parameter is supported since Zabbix 4.4.7.  |
| TLSCipherCert         | no        |        |         | GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption.<br>Example for GnuTLS:<br>NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509<br>Example for OpenSSL:<br>EECDH+aRSA+AES128:RSA+aRSA+AES128<br>This parameter is supported since Zabbix 4.4.7.  |
| TLSCipherCert13       | no        |        |         | Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption.<br>This parameter is supported since Zabbix 4.4.7.  |

| Parameter              | Mandatory | Range      | Default                | Description  |
|------------------------|-----------|------------|------------------------|--|
| TLSCipherPSK           | no        |            |                        | GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption.<br>Example for GnuTLS:<br>NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL<br>Example for OpenSSL: kECDHEPSK+AES128:kPSK+AES128<br>This parameter is supported since Zabbix 4.4.7.                                 |
| TLSCipherPSK13         | no        |            |                        | Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption.<br>Example:<br>TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256<br>This parameter is supported since Zabbix 4.4.7.   |
| TLSCRLFile             | no        |            |                        | Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSKeyFile             | no        |            |                        | Full pathname of a file containing the server private key, used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.   |
| TmpDir                 | no        |            | /tmp                   | Temporary directory.   |
| TrapperTimeout         | no        | 1-300      | 300                    | Specifies how many seconds trapper may spend processing new data.  |
| TrendCacheSize         | no        | 128K-2G    | 4M                     | Size of trend cache, in bytes.   |
| TrendFunctionCacheSize | no        | 128K-2G    | 4M                     | Shared memory size for storing trends data.<br>Size of trend function cache, in bytes.<br>Shared memory size for caching calculated trend function data.   |
| UnavailableDelay       | no        | 1-3600     | 60                     | Determines how often host is checked for availability during the <b>unavailability</b> period, in seconds.   |
| UnreachableDelay       | no        | 1-3600     | 15                     | Determines how often host is checked for availability during the <b>unreachability</b> period in seconds.  |
| UnreachablePeriod      | no        | 1-3600     | 45                     | Determines after how many seconds of <b>unreachability</b> treat a host as unavailable.  |
| User                   | no        |            | zabbix                 | Drop privileges to a specific, existing user on the system. Only has effect if run as 'root' and AllowRoot is disabled.  |
| ValueCacheSize         | no        | 0,128K-64G | 8M                     | Size of history value cache, in bytes.<br>Shared memory size for caching item history data requests. Setting to 0 disables value cache (not recommended).<br>When value cache runs out of the shared memory a warning message is written to the server log every 5 minutes.  |
| VaultDBPath            | no        |            |                        | Vault path from where credentials for database will be retrieved by keys 'password' and 'username'.<br>Example: secret/zabbix/database<br>This option can only be used if DBUser and DBPassword are not specified.   |
| VaultToken             | no        |            |                        | This parameter is supported since Zabbix 5.2.0.<br>Vault authentication token that should have been generated exclusively for Zabbix server with read-only permission to the paths specified in <b>Vault macros</b> and read-only permission to the path specified in the optional VaultDBPath configuration parameter.<br>It is an error if VaultToken and VAULT_TOKEN environment variable are defined at the same time. |
| VaultURL               | no        |            | https://127.0.0.1:8200 | This parameter is supported since Zabbix 5.2.0.<br>Zabbix server HTTP[S] URL. System-wide CA certificates directory will be used if SSLCALocation is not specified.<br>This parameter is supported since Zabbix 5.2.0.   |

| Parameter                    | Mandatory | Range    | Default | Description   |
|------------------------------|-----------|----------|---------|---|
| VMwareCacheSize <sup>2</sup> | no        | 256K-2G  | 8M      | Shared memory size for storing VMware data.<br>A VMware internal check <code>zabbix[vmware,buffer,...]</code> can be used to monitor the VMware cache usage (see <a href="#">Internal checks</a> ).<br>Note that shared memory is not allocated if there are no vmware collector instances configured to start. |
| VMwareFrequency              | no        | 10-86400 | 60      | Delay in seconds between data gathering from a single VMware service.<br>This delay should be set to the least update interval of any VMware monitoring item.   |
| VMwarePerfFrequency          | no        | 10-86400 | 60      | Delay in seconds between performance counter statistics retrieval from a single VMware service.<br>This delay should be set to the least update interval of any VMware monitoring <a href="#">item</a> that uses VMware performance counters.   |
| VMwareTimeoutno              | no        | 1-300    | 10      | The maximum number of seconds vmware collector will wait for a response from VMware service (vCenter or ESX hypervisor).  |
| WebServiceURL                | no        |          |         | HTTP[S] URL to Zabbix web service in the format <code>&lt;host:port&gt;/report</code> . For example:<br><code>http://localhost:10053/report</code><br>This parameter is supported since Zabbix 5.4.0.   |

#### Footnotes

<sup>1</sup> Note that too many data gathering processes (pollers, unreachable pollers, ODBC pollers, HTTP pollers, Java pollers, pingers, trappers, proxypollers) together with IPMI manager, SNMP trapper and preprocessing workers can **exhaust** the per-process file descriptor limit for the preprocessing manager.

#### Warning:

This will cause Zabbix server to stop (usually shortly after the start, but sometimes it can take more time). The configuration file should be revised or the limit should be raised to avoid this situation.

<sup>2</sup> When a lot of items are deleted it increases the load to the database, because the housekeeper will need to remove all the history data that these items had. For example, if we only have to remove 1 item prototype from the template, but this template is linked to 50 hosts and for every host the prototype is expanded to 100 real items, 5000 items in total have to be removed (1\*50\*100). If 500 is set for `MaxHousekeeperDelete` (`MaxHousekeeperDelete=500`), the housekeeper process will have to remove up to 2500000 values (5000\*500) for the deleted items from history and trends tables in one cycle.

## 2 Zabbix proxy

### Overview

This section lists parameters supported in a Zabbix proxy configuration file (`zabbix_proxy.conf`).

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported in the beginning of the line.

### Parameters

| Parameter                  | Mandatory | Range | Default | Description  |
|----------------------------|-----------|-------|---------|--|
| AllowRoot                  | no        |       | 0       | Allow the proxy to run as 'root'. If disabled and the proxy is started by 'root', the proxy will try to switch to the 'zabbix' user instead. Has no effect if started under a regular user.<br>0 - do not allow<br>1 - allow |
| AllowUnsupportedDBVersions | no        |       | 0       | Allow the proxy to work with unsupported database versions.<br>0 - do not allow<br>1 - allow   |

| Parameter        | Mandatory  | Range    | Default   | Description  |
|------------------|--|----------|-----------|--|
| CacheSize        | no   | 128K-64G | 32M       | Size of configuration cache, in bytes.<br>Shared memory size, for storing host and item data.  |
| ConfigFrequency  | no   | 1-604800 | 3600      | How often proxy retrieves configuration data from Zabbix server in seconds.<br>Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).  |
| DataSetFrequency | no   | 1-3600   | 1         | Proxy will send collected data to the server every N seconds. Note that active proxy will still poll Zabbix server every second for remote command tasks.<br>Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).  |
| DBHost           | no   |          | localhost | Database host name.<br>In case of MySQL localhost or empty string results in using a socket. In case of PostgreSQL only empty string results in attempt to use socket.<br>In case of Oracle empty string results in using the Net Service Name connection method; in this case consider using the TNS_ADMIN environment variable to specify the directory of the tnsnames.ora file.  |
| DBName           | yes  |          |           | Database name or path to database file for SQLite3 (multi-process architecture of Zabbix does not allow to use <a href="#">in-memory database</a> , e.g. :memory:, file::memory:?cache=shared or file:memdb1?mode=memory&cache=shared).<br><br>Warning: Do not attempt to use the same database Zabbix server is using.<br>In case of Oracle, if the Net Service Name connection method is used, specify the service name from tnsnames.ora or set to empty string; set the TWO_TASK environment variable if DBName is set to empty string.  |
| DBPassword       | no   |          |           | Database password. Ignored for SQLite.<br>Comment this line if no password is used.  |
| DBSchema         | no   |          |           | Schema name. Used for PostgreSQL.  |
| DBSocket         | no   |          | 3306      | Path to MySQL socket.  |
| DBUser           |  |          |           | Database port when not using local socket. Ignored for SQLite.   |
| DBTLSConnect     | no   |          |           | Database user. Ignored for SQLite.<br>Setting this option enforces the use of TLS connection to database:<br><i>required</i> - connect using TLS<br><i>verify_ca</i> - connect using TLS and verify certificate<br><i>verify_full</i> - connect using TLS, verify certificate and verify that database identity specified by DBHost matches its certificate<br><br>On MySQL starting from 5.7.11 and PostgreSQL the following values are supported: "required", "verify", "verify_full". On MariaDB starting from version 10.2.6 "required" and "verify_full" values are supported.<br>By default, not set to any option and the behavior depends on database configuration. |
| DBTLSCAFile      | no<br>(yes, if<br>DBTLSConnect set to<br>one of:<br>verify_ca,<br>verify_full) |          |           | This parameter is supported since Zabbix 5.0.0.<br>Full pathname of a file containing the top-level CA(s) certificates for database certificate verification.<br>This parameter is supported since Zabbix 5.0.0.   |
| DBTLSCertFile    | no   |          |           | Full pathname of file containing Zabbix server certificate for authenticating to database.<br>This parameter is supported since Zabbix 5.0.0.  |

| Parameter             | Mandatory | Range   | Default                                 | Description   |
|-----------------------|-----------|---------|---|---|
| DBTLSKeyFile          | no        |         |   | Full pathname of file containing the private key for authenticating to database.<br>This parameter is supported since Zabbix 5.0.0.   |
| DBTLSCipher           | no        |         |   | The list of encryption ciphers that Zabbix server permits for TLS protocols up through TLSv1.2.<br>Supported only for MySQL.<br>This parameter is supported since Zabbix 5.0.0.   |
| DBTLSCipher13         | no        |         |   | The list of encryption ciphersuites that Zabbix server permits for TLSv1.3 protocol.<br>Supported only for MySQL, starting from version 8.0.16.<br>This parameter is supported since Zabbix 5.0.0.  |
| DebugLevel            | no        | 0-5     | 3                                       | Specifies debug level:<br>0 - basic information about starting and stopping of Zabbix processes<br>1 - critical information<br>2 - error information<br>3 - warnings<br>4 - for debugging (produces lots of information)<br>5 - extended debugging (produces even more information)   |
| EnableRemoteCommands  | no        |         | 0                                       | Whether remote commands from Zabbix server are allowed.<br>0 - not allowed<br>1 - allowed<br>This parameter is supported since Zabbix 3.4.0.  |
| ExternalScripts       | no        |         | /usr/local/share/zabbix/externalscripts | Location of external scripts (depends on compile-time installation variable <i>datadir</i> ).   |
| Fping6Location        | no        |         | /usr/sbin/fping6                        | Location of fping6.<br>Make sure that fping6 binary has root ownership and SUID flag set.<br>Make empty ("Fping6Location=") if your fping utility is capable to process IPv6 addresses.   |
| FpingLocation         | no        |         | /usr/sbin/fping                         | Location of fping.<br>Make sure that fping binary has root ownership and SUID flag set!   |
| HeartbeatFrequency    | no        | 0-3600  | 60                                      | Frequency of heartbeat messages in seconds.<br>Used for monitoring availability of proxy on server side.<br>0 - heartbeat messages disabled.<br>Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).  |
| HistoryCacheSize      | no        | 128K-2G | 16M                                     | Size of history cache, in bytes.  |
| HistoryIndexCacheSize | no        | 128K-2G | 4M                                      | Shared memory size for storing history data.<br>Size of history index cache, in bytes.<br>Shared memory size for indexing history data stored in history cache.<br>The index cache size needs roughly 100 bytes to cache one item.<br>This parameter is supported since Zabbix 3.0.0. |
| Hostname              | no        |         | Set by HostnameItem                     | Unique, case sensitive Proxy name. Make sure the proxy name is known to the server!<br>Allowed characters: alphanumeric, '.', '_', '-' and '-'.<br>Maximum length: 128  |
| HostnameItem          | no        |         | system.hostname                         | Item used for setting Hostname if it is undefined (this will be run on the proxy similarly as on an agent).<br>Does not support UserParameters, performance counters or aliases, but does support system.run[()].<br><br>Ignored if Hostname is set.                                  |

| Parameter             | Mandatory  | Range       | Default   | Description   |
|-----------------------|--|-------------|-----------|---|
| HousekeepingFrequency |  | 0-24        | 1         | How often Zabbix will perform housekeeping procedure (in hours).<br>Housekeeping is removing outdated information from the database.<br><i>Note:</i> To lower load on proxy startup, housekeeping is postponed for 30 minutes after proxy start. Thus, if HousekeepingFrequency is 1, the very first housekeeping procedure after proxy start will run after 30 minutes, and will repeat every hour thereafter.<br>Since Zabbix 3.0.0 it is possible to disable automatic housekeeping by setting HousekeepingFrequency to 0. In this case the housekeeping procedure can only be started by <i>housekeeper_execute</i> runtime control option. |
| Include               | no   |             |           | You may include individual files or all files in a directory in the configuration file.<br>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.<br>For example:<br><code>/absolute/path/to/config/files/*.conf</code> .<br>See <b>special notes</b> about limitations.   |
| JavaGateway           | no   |             |           | IP address (or hostname) of Zabbix Java gateway.<br>Only required if Java pollers are started.  |
| JavaGatewayPort       |  | 1024-32767  | 10052     | Port that Zabbix Java gateway listens on.   |
| ListenBacklog         | no   | 0 - INT_MAX | SOMAXCONN | The maximum number of pending connections in the TCP queue.<br>Default value is a hard-coded constant, which depends on the system.<br>Maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.  |
| ListenIP              | no   |             | 0.0.0.0   | List of comma delimited IP addresses that the trapper should listen on.<br>Trapper will listen on all network interfaces if this parameter is missing.  |
| ListenPort            | no   | 1024-32767  | 10051     | Listen port for trapper.  |
| LoadModule            | no   |             |           | Module to load at proxy startup. Modules are used to extend functionality of the proxy.<br>Formats:<br><code>LoadModule=&lt;module.so&gt;</code><br><code>LoadModule=&lt;path/module.so&gt;</code><br><code>LoadModule=&lt;/abs_path/module.so&gt;</code><br>Either the module must be located in directory specified by LoadModulePath or the path must precede the module name.<br>If the preceding path is absolute (starts with '/') then LoadModulePath is ignored.<br>It is allowed to include multiple LoadModule parameters.  |
| LoadModulePath        | no   |             |           | Full path to location of proxy modules.<br>Default depends on compilation options.  |
| LogFile               | yes, if LogType is set to <i>file</i> , otherwise no |             |           | Name of log file.   |
| LogFileSize           | no   | 0-1024      | 1         | Maximum size of log file in MB.<br>0 - disable automatic log rotation.<br><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.   |
| LogRemoteCommands     | no   |             | 0         | Enable logging of executed shell commands as warnings.<br>0 - disabled<br>1 - enabled<br>This parameter is supported since Zabbix 3.4.0.  |

| Parameter          | Mandatory | Range     | Default                      | Description   |
|--------------------|-----------|-----------|------------------------------|---|
| LogType            | no        |           | file                         | Log output type:<br><i>file</i> - write log to file specified by LogFile parameter,<br><i>system</i> - write log to syslog,<br><i>console</i> - write log to standard output.<br>This parameter is supported since Zabbix 3.0.0.  |
| LogSlowQueries     | no        | 0-3600000 | 0                            | How long a database query may take before being logged (in milliseconds).<br>0 - don't log slow queries.<br>This option becomes enabled starting with DebugLevel=3.   |
| PidFile            | no        |           | /tmp/zabbix_proxy.pid        | Name of PID file.   |
| ProxyLocalBuffer   | no        | 0-720     | 0                            | Proxy will keep data locally for N hours, even if the data have already been synced with the server.<br>This parameter may be used if local data will be used by third-party applications.  |
| ProxyMode          | no        | 0-1       | 0                            | Proxy operating mode.<br>0 - proxy in the active mode<br>1 - proxy in the passive mode<br><i>Note that (sensitive) proxy configuration data may become available to parties having access to the Zabbix server trapper port when using an active proxy. This is possible because anyone may pretend to be an active proxy and request configuration data; authentication does not take place.</i>   |
| ProxyOfflineBuffer | no        | 1-720     | 1                            | Proxy will keep data for N hours in case of no connectivity with Zabbix server.<br>Older data will be lost.   |
| Server             | yes       |           |                              | If ProxyMode is set to <i>active mode</i> :<br>Zabbix server IP address or DNS name (address:port) or <b>cluster</b> (address:port;address2:port) to get configuration data from and send data to.<br>If port is not specified, the default port is used.<br>Cluster nodes must be separated by a semicolon.<br><br>If ProxyMode is set to <i>passive mode</i> :<br>List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix server. Incoming connections will be accepted only from the addresses listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally.<br>'::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address.<br><i>Example:</i><br>Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com |
| SNMPTrapperFile    | no        |           | /tmp/zabbix_trap_receiver.pl | Temporary file used for passing data from SNMP trap daemon to the proxy.<br>Must be the same as in zabbix_trap_receiver.pl or SNMPTrapper configuration file.   |
| SocketDir          | no        |           | /tmp                         | Directory to store IPC sockets used by internal Zabbix services.  |
| SourceIP           | no        |           |                              | This parameter is supported since Zabbix 3.4.0.<br>Source IP address for:<br>- outgoing connections to Zabbix server;<br>- agentless connections (VMware, SSH, JMX, SNMP, Telnet and simple checks);<br>- HTTP agent connections;<br>- script item JavaScript HTTP requests;<br>- preprocessing JavaScript HTTP requests;<br>- connections to the Vault   |
| SSHKeyLocation     | no        |           |                              | Location of public and private keys for SSH checks and actions  |
| SSLCertLocation    | no        |           |                              | Location of SSL client certificate files for client authentication.<br>This parameter is used in web monitoring only.   |

| Parameter               | Mandatory  | Range  | Default | Description  |
|-------------------------|--|--------|---------|--|
| SSLKeyLocation          | no   |        |         | Location of SSL private key files for client authentication.<br>This parameter is used in web monitoring only.   |
| SSLCALocation           | no   |        |         | Location of certificate authority (CA) files for SSL server certificate verification.<br>Note that the value of this parameter will be set as libcurl option CURLOPT_CAPATH. For libcurl versions before 7.42.0, this only has effect if libcurl was compiled to use OpenSSL. For more information see <a href="#">cURL web page</a> .<br>This parameter is used in web monitoring since Zabbix 2.4.0 and in SMTP authentication since Zabbix 3.0.0.   |
| StartDBSyncers          | no   | 1-100  | 4       | Number of pre-forked instances of <b>history syncers</b> .<br><i>Note:</i> Be careful when changing this value, increasing it may do more harm than good.  |
| StartDiscoverers        | no   | 0-250  | 1       | Number of pre-forked instances of <b>discoverers</b> .   |
| StartHistoryPollers     | no   | 0-1000 | 1       | Number of pre-forked instances of <b>history pollers</b> .<br>This parameter is supported since Zabbix 5.4.0.  |
| StartHTTTPollers        | no   | 0-1000 | 1       | Number of pre-forked instances of <b>HTTP pollers</b> .  |
| StartIPMIPollers        | no   | 0-1000 | 0       | Number of pre-forked instances of <b>IPMI pollers</b> .  |
| StartJavaPollers        | no   | 0-1000 | 0       | Number of pre-forked instances of <b>Java pollers</b> .  |
| StartODBCPollers        | no   | 0-1000 | 1       | Number of pre-forked instances of <b>ODBC pollers</b> .  |
| StartPingers            | no   | 0-1000 | 1       | Number of pre-forked instances of <b>ICMP pingers</b> .  |
| StartPollersUnreachable | no   | 0-1000 | 1       | Number of pre-forked instances of <b>pollers for unreachable hosts</b> (including IPMI and Java).<br>At least one poller for unreachable hosts must be running if regular, IPMI or Java pollers are started.   |
| StartPollers            | no   | 0-1000 | 5       | Number of pre-forked instances of <b>pollers</b> .   |
| StartPreprocessors      | no   | 1-1000 | 3       | Number of pre-forked instances of preprocessing <b>workers</b> <sup>1</sup> .<br>The preprocessing manager process is automatically started when a preprocessor worker is started.<br>This parameter is supported since Zabbix 4.2.0.  |
| StartSNMPTrappers       | no   | 0-1    | 0       | If set to 1, <b>SNMP trapper</b> process will be started.  |
| StartTrappers           | no   | 0-1000 | 5       | Number of pre-forked instances of <b>trappers</b> .<br>Trappers accept incoming connections from Zabbix sender and active agents.  |
| StartVMwareCollectors   | no   | 0-250  | 0       | Number of pre-forked <b>VMware collector</b> instances.  |
| StatsAllowedIP          | no   |        |         | List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of external Zabbix instances. Stats request will be accepted only from the addresses listed here.<br>If this parameter is not set no stats requests will be accepted.<br>If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address.<br>Example: StatsAllowedIP=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com<br>This parameter is supported since Zabbix 4.2.0. |
| Timeout                 | no   | 1-30   | 3       | Specifies how long we wait for agent, SNMP device or external check (in seconds).  |
| TLSAccept               | yes for passive proxy, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |        |         | What incoming connections to accept from Zabbix server.<br>Used for a passive proxy, ignored on an active proxy. Multiple values can be specified, separated by comma:<br><i>unencrypted</i> - accept connections without encryption (default)<br><i>psk</i> - accept connections with TLS and a pre-shared key (PSK)<br><i>cert</i> - accept connections with TLS and a certificate<br>This parameter is supported since Zabbix 3.0.0.  |

| Parameter       | Mandatory | Range | Default | Description   |
|-----------------|-----------|-------|---------|---|
| TLSCAFile       | no        |       |         | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSCertFile     | no        |       |         | Full pathname of a file containing the proxy certificate or certificate chain, used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSCipherAll    | no        |       |         | GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.<br>Example:<br>TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256   |
| TLSCipherAll13  | no        |       |         | This parameter is supported since Zabbix 4.4.7.<br>Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.<br>Example for GnuTLS: NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL::+SIGN-ALL:+CTYPE-X.509<br>Example for OpenSSL:<br>EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128 |
| TLSCipherCert   | no        |       |         | This parameter is supported since Zabbix 4.4.7.<br>GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption.<br>Example for GnuTLS:<br>NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509<br>Example for OpenSSL:<br>EECDH+aRSA+AES128:RSA+aRSA+AES128   |
| TLSCipherCert13 | no        |       |         | This parameter is supported since Zabbix 4.4.7.<br>Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption.   |
| TLSCipherPSK    | no        |       |         | This parameter is supported since Zabbix 4.4.7.<br>GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption.<br>Example for GnuTLS:<br>NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL<br>Example for OpenSSL: kECDHEPSK+AES128:kPSK+AES128  |
| TLSCipherPSK13  | no        |       |         | This parameter is supported since Zabbix 4.4.7.<br>Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption.<br>Example:<br>TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256  |

| Parameter                   | Mandatory   | Range   | Default                | Description   |
|-----------------------------|---|---------|------------------------|---|
| TLSCConnect                 | yes for active proxy, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |         |                        | How the proxy should connect to Zabbix server. Used for an active proxy, ignored on a passive proxy. Only one value can be specified:<br><i>unencrypted</i> - connect without encryption (default)<br><i>psk</i> - connect using TLS and a pre-shared key (PSK)<br><i>cert</i> - connect using TLS and a certificate<br>This parameter is supported since Zabbix 3.0.0. |
| TLSCRLFile                  | no  |         |                        | Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSKeyFile                  | no  |         |                        | Full pathname of a file containing the proxy private key, used for encrypted communications between Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSPSKFile                  | no  |         |                        | Full pathname of a file containing the proxy pre-shared key, used for encrypted communications with Zabbix server.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSPSKIdentity              | no  |         |                        | Pre-shared key identity string, used for encrypted communications with Zabbix server.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSServerCertificateIssuer  | no  |         |                        | Allowed server certificate issuer.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSServerCertificateSubject | no  |         |                        | Allowed server certificate subject.<br>This parameter is supported since Zabbix 3.0.0.  |
| TmpDir                      | no  |         | /tmp                   | Temporary directory.  |
| TrapperTimeout              | no  | 1-300   | 300                    | Specifies how many seconds trapper may spend processing new data.   |
| User                        | no  |         | zabbix                 | Drop privileges to a specific, existing user on the system. Only has effect if run as 'root' and AllowRoot is disabled.   |
| UnavailableDelay            | no  | 1-3600  | 60                     | How often host is checked for availability during the <b>unavailability</b> period, in seconds.   |
| UnreachableDelay            | no  | 1-3600  | 15                     | How often host is checked for availability during the <b>unreachability</b> period, in seconds.   |
| UnreachablePeriod           | no  | 1-3600  | 45                     | After how many seconds of <b>unreachability</b> treat a host as unavailable.  |
| VaultDBPath                 | no  |         |                        | Vault path from where credentials for database will be retrieved by keys 'password' and 'username'.<br>Example: secret/zabbix/database<br>This option can only be used if DBUser and DBPassword are not specified.<br>This parameter is supported since Zabbix 5.2.0.   |
| VaultToken                  | no  |         |                        | Vault authentication token that should have been generated exclusively for Zabbix proxy with read-only permission to the path specified in the optional VaultDBPath configuration parameter.<br>It is an error if VaultToken and VAULT_TOKEN environment variable are defined at the same time.<br>This parameter is supported since Zabbix 5.2.0.                      |
| VaultURL                    | no  |         | https://127.0.0.1:8200 | Server HTTP[S] URL. System-wide CA certificates directory will be used if SSLCALocation is not specified.<br>This parameter is supported since Zabbix 5.2.0.  |
| VMwareCacheSize             | no  | 256K-2G | 8M                     | Shared memory size for storing VMware data.<br>A VMware internal check zabbix[vmware,buffer,...] can be used to monitor the VMware cache usage (see <b>Internal checks</b> ).<br>Note that shared memory is not allocated if there are no vmware collector instances configured to start.   |

| Parameter           | Mandatory | Range    | Default | Description   |
|---------------------|-----------|----------|---------|---|
| VMwareFrequency     | no        | 10-86400 | 60      | Delay in seconds between data gathering from a single VMware service.<br>This delay should be set to the least update interval of any VMware monitoring item.   |
| VMwarePerfFrequency | no        | 10-86400 | 60      | Delay in seconds between performance counter statistics retrieval from a single VMware service.<br>This delay should be set to the least update interval of any VMware monitoring item that uses VMware performance counters. |
| VMwareTimeoutno     | no        | 1-300    | 10      | The maximum number of seconds vmware collector will wait for a response from VMware service (vCenter or ESX hypervisor).  |

### 3 Zabbix agent (UNIX)

#### Overview

This section lists parameters supported in a Zabbix agent configuration file (zabbix\_agentd.conf).

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with "#" are only supported in the beginning of the line.

#### Parameters

| Parameter | Mandatory | Range | Default | Description   |
|-----------|-----------|-------|---------|---|
| Alias     | no        |       |         | <p>Sets an alias for an item key. It can be used to substitute long and complex item key with a smaller and simpler one. Multiple <i>Alias</i> parameters may be present. Multiple parameters with the same <i>Alias</i> key are not allowed. Different <i>Alias</i> keys may reference the same item key. Aliases can be used in <i>HostMetadataItem</i> but not in <i>HostnameItem</i> parameters.</p> <p>Examples:</p> <ol style="list-style-type: none"> <li>1. Retrieving the ID of user 'zabbix'.<br/>Alias=zabbix.userid:vfs.file.regexp[/etc/passwd,"^zabbix:..([0-9]+)"",1]<br/>Now shorthand key <b>zabbix.userid</b> may be used to retrieve data.</li> <li>2. Getting CPU utilization with default and custom parameters.<br/>Alias=cpu.util:system.cpu.util<br/>Alias=cpu.util[*]:system.cpu.util[*]<br/>This allows use <b>cpu.util</b> key to get CPU utilization percentage with default parameters as well as use <b>cpu.util[all, idle, avg15]</b> to get specific data about CPU utilization.</li> <li>3. Running multiple low-level discovery rules processing the same discovery items.<br/>Alias=vfs.fs.discovery[*]:vfs.fs.discovery<br/>Now it is possible to set up several discovery rules using <b>vfs.fs.discovery</b> with different parameters for each rule, e.g., <b>vfs.fs.discovery[foo]</b>, <b>vfs.fs.discovery[bar]</b>, etc.</li> </ol> |

| Parameter            | Mandatory | Range            | Default | Description   |
|----------------------|-----------|------------------|---------|---|
| AllowKey             | no        |                  |         | <p>Allow execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters.</p> <p>Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order.</p> <p>This parameter is supported since Zabbix 5.0.0.</p> <p>See also: <a href="#">Restricting agent checks</a>.</p>   |
| AllowRoot            | no        |                  | 0       | <p>Allow the agent to run as 'root'. If disabled and the agent is started by 'root', the agent will try to switch to user 'zabbix' instead. Has no effect if started under a regular user.</p> <p>0 - do not allow<br/>1 - allow</p>  |
| BufferSend           | no        | 1-3600           | 5       | Do not keep data longer than N seconds in buffer.   |
| BufferSize           | no        | 2-65535          | 100     | <p>Maximum number of values in a memory buffer. The agent will send</p> <p>all collected data to Zabbix server or proxy if the buffer is full.</p>  |
| DebugLevel           | no        | 0-5              | 3       | <p>Specifies debug level:</p> <p>0 - basic information about starting and stopping of Zabbix processes<br/>1 - critical information<br/>2 - error information<br/>3 - warnings<br/>4 - for debugging (produces lots of information)<br/>5 - extended debugging (produces even more information)</p>   |
| DenyKey              | no        |                  |         | <p>Deny execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters.</p> <p>Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order.</p> <p>This parameter is supported since Zabbix 5.0.0.</p> <p>See also: <a href="#">Restricting agent checks</a>.</p>   |
| EnableRemoteCommands |           |                  | 0       | <p>Whether remote commands from Zabbix server are allowed. This parameter is <b>deprecated</b>, use AllowKey=system.run[*] or DenyKey=system.run[*] instead</p> <p>It is internal alias for AllowKey/DenyKey parameters depending on value: 0 - DenyKey=system.run[*]<br/>1 - AllowKey=system.run[*]</p>  |
| HostInterface        | no        | 0-255 characters |         | <p>Optional parameter that defines host interface.</p> <p>Host interface is used at host <a href="#">autoregistration</a> process.</p> <p>An agent will issue an error and not start if the value is over the limit of 255 characters.</p> <p>If not defined, value will be acquired from HostInterfaceItem.</p> <p>Supported since Zabbix 4.4.0.</p>   |
| HostInterfaceItem    | no        |                  |         | <p>Optional parameter that defines an item used for getting host interface.</p> <p>Host interface is used at host <a href="#">autoregistration</a> process.</p> <p>During an autoregistration request an agent will log a warning message if the value returned by specified item is over limit of 255 characters.</p> <p>The <a href="#">system.run[]</a> item is supported regardless of AllowKey/DenyKey values.</p> <p>This option is only used when HostInterface is not defined.</p> <p>Supported since Zabbix 4.4.0.</p> |
| HostMetadata         | no        | 0-255 characters |         | <p>Optional parameter that defines host metadata. Host metadata is used only at host autoregistration process (active agent).</p> <p>If not defined, the value will be acquired from HostMetadataItem.</p> <p>An agent will issue an error and not start if the specified value is over the limit or a non-UTF-8 string.</p>  |

| Parameter        | Mandatory                                    | Range       | Default             | Description   |
|------------------|--|-------------|---------------------|---|
| HostMetadataItem | no   |             |                     | Optional parameter that defines a <i>Zabbix agent</i> item used for getting host metadata. This option is only used when HostMetadata is not defined.<br>Supports UserParameters and aliases. Supports <i>system.run[]</i> regardless of AllowKey/DenyKey values.<br>HostMetadataItem value is retrieved on each autoregistration attempt and is used only at host autoregistration process (active agent).<br>During an autoregistration request an agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.<br>The value returned by the item must be a UTF-8 string otherwise it will be ignored. |
| Hostname         | no   |             | Set by HostnameItem | List of comma-delimited unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. Value is acquired from HostnameItem if undefined.<br>Allowed characters: alphanumeric, '.', '_', '-' and '-'.<br>Maximum length: 128 characters per hostname, 2048 characters for the entire line.   |
| HostnameItem     | no   |             | system.hostname     | Optional parameter that defines a <i>Zabbix agent</i> item used for getting host name. This option is only used when Hostname is not defined.<br>Does not support UserParameters or aliases, but does support <i>system.run[]</i> regardless of AllowKey/DenyKey values.  |
| Include          | no   |             |                     | You may include individual files or all files in a directory in the configuration file.<br>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.<br>For example:<br>/absolute/path/to/config/files/*.conf.<br>See <b>special notes</b> about limitations.   |
| ListenBacklog    | no   | 0 - INT_MAX | SOMAXCONN           | The maximum number of pending connections in the TCP queue.<br>Default value is a hard-coded constant, which depends on the system.<br>Maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.  |
| ListenIP         | no   |             | 0.0.0.0             | List of comma delimited IP addresses that the agent should listen on.<br>Multiple IP addresses are supported in version 1.8.3 and higher.   |
| ListenPort       | no   | 1024-32767  | 10050               | Agent will listen on this port for connections from the server.   |
| LoadModule       | no   |             |                     | Module to load at agent startup. Modules are used to extend functionality of the agent.<br>Formats:<br>LoadModule=<module.so><br>LoadModule=<path/module.so><br>LoadModule=</abs_path/module.so><br>Either the module must be located in directory specified by LoadModulePath or the path must precede the module name.<br>If the preceding path is absolute (starts with '/') then LoadModulePath is ignored.<br>It is allowed to include multiple LoadModule parameters.   |
| LoadModulePath   | no   |             |                     | Full path to location of agent modules.<br>Default depends on compilation options.  |
| LogFile          | yes, if LogType is set to file, otherwise no |             |                     | Name of log file.   |

| Parameter           | Mandatory                                      | Range   | Default                | Description   |
|---------------------|--|---------|------------------------|---|
| LogFileSize         | no   | 0-1024  | 1                      | Maximum size of log file in MB.<br>0 - disable automatic log rotation.<br><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.   |
| LogType             | no   |         | file                   | Log output type:<br><i>file</i> - write log to file specified by LogFile parameter,<br><i>system</i> - write log to syslog,<br><i>console</i> - write log to standard output.<br>This parameter is supported since Zabbix 3.0.0.  |
| LogRemoteCommands   |  |         | 0                      | Enable logging of executed shell commands as warnings.<br>0 - disabled<br>1 - enabled<br>Commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by HostMetadataItem, HostInterfaceItem or HostnameItem parameters.  |
| MaxLinesPerSecond   |  | 1-1000  | 20                     | Maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log', 'logrt' or 'log.count' active checks.<br><i>The provided value will be overridden by the parameter 'maxlines', provided in 'log', 'logrt' or 'log.count' item key.</i><br><i>Note:</i> Zabbix will process 10 times more new lines than set in MaxLinesPerSecond to seek the required string in log items.  |
| PidFile             | no   |         | /tmp/zabbix_agentd.pid | Path of PID file.   |
| RefreshActiveChecks | no   | 60-3600 | 120                    | How often list of active checks is refreshed, in seconds.<br><i>Note</i> that after failing to refresh active checks the next refresh will be attempted after 60 seconds.   |
| Server              | yes, if StartAgents is not explicitly set to 0 |         |                        | List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. Incoming connections will be accepted only from the hosts listed here.<br>If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address.<br>'0.0.0.0/0' can be used to allow any IPv4 address.<br><i>Note</i> that "IPv4-compatible IPv6 addresses" (0000::/96 prefix) are supported but deprecated by <a href="#">RFC4291</a> .<br>Example:<br>Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com<br>Spaces are allowed. |

| Parameter    | Mandatory  | Range | Default | Description  |
|--------------|--|-------|---------|--|
| ServerActive | no   |       |         | <p>Zabbix server/proxy address or cluster configuration to get active checks from.</p> <p>Server/proxy address is IP address or DNS name and optional port separated by colon.</p> <p>Cluster configuration is one or more server addresses separated by semicolon.</p> <p>Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma.</p> <p>More than one Zabbix proxy should not be specified from each Zabbix server/cluster.</p> <p>If Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.</p> <p>Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.</p> <p>If port is not specified, default port is used.</p> <p>IPv6 addresses must be enclosed in square brackets if port for that host is specified.</p> <p>If port is not specified, square brackets for IPv6 addresses are optional.</p> <p>If this parameter is not specified, active checks are disabled.</p> <p>Example for Zabbix proxy:<br/> ServerActive=127.0.0.1:10051</p> <p>Example for multiple servers:<br/> ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]</p> <p>Example for high availability:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.clus</p> <p>Example for high availability with two clusters and one server:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.clus</p> |
| SourceIP     | no   |       |         | <p>Source IP address for:</p> <ul style="list-style-type: none"> <li>- outgoing connections to Zabbix server or Zabbix proxy;</li> <li>- making connections while executing some items (web.page.get, net.tcp.port, etc.)</li> </ul>   |
| StartAgents  | no   | 0-100 | 3       | <p>Number of pre-forked instances of zabbix_agentd that process passive checks.</p> <p>If set to 0, disables passive checks and the agent will not listen on any TCP port.</p>   |
| Timeout      | no   | 1-30  | 3       | <p>Spend no more than Timeout seconds on processing.</p>   |
| TLSAccept    | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |       |         | <p>What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma:</p> <p><i>unencrypted</i> - accept connections without encryption (default)</p> <p><i>psk</i> - accept connections with TLS and a pre-shared key (PSK)</p> <p><i>cert</i> - accept connections with TLS and a certificate</p> <p>This parameter is supported since Zabbix 3.0.0.</p>  |
| TLSCAFile    | no   |       |         | <p>Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>  |
| TLSCertFile  | no   |       |         | <p>Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>   |
| TLSCipherAll | no   |       |         | <p>GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.</p> <p>Example:<br/> TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_1</p> <p>This parameter is supported since Zabbix 4.4.7.</p>   |

| Parameter       | Mandatory  | Range | Default | Description   |
|-----------------|--|-------|---------|---|
| TLSCipherAll13  | no   |       |         | <p>Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.</p> <p>Example for GnuTLS: NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509</p> <p>Example for OpenSSL: ECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128</p> <p>This parameter is supported since Zabbix 4.4.7.</p> |
| TLSCipherCert   | no   |       |         | <p>GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption.</p> <p>Example for GnuTLS: NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509</p> <p>Example for OpenSSL: ECDH+aRSA+AES128:RSA+aRSA+AES128</p> <p>This parameter is supported since Zabbix 4.4.7.</p>   |
| TLSCipherCert13 | no   |       |         | <p>Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption.</p> <p>This parameter is supported since Zabbix 4.4.7.</p>  |
| TLSCipherPSK    | no   |       |         | <p>GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption.</p> <p>Example for GnuTLS: NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL</p> <p>Example for OpenSSL: kECDHEPSK+AES128:kPSK+AES128</p> <p>This parameter is supported since Zabbix 4.4.7.</p>  |
| TLSCipherPSK13  | no   |       |         | <p>Cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption.</p> <p>Example: TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256</p> <p>This parameter is supported since Zabbix 4.4.7.</p>  |
| TLSConnect      | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |       |         | <p>How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:</p> <p><i>unencrypted</i> - connect without encryption (default)</p> <p><i>psk</i> - connect using TLS and a pre-shared key (PSK)</p> <p><i>cert</i> - connect using TLS and a certificate</p> <p>This parameter is supported since Zabbix 3.0.0.</p>   |
| TLSCRLFile      | no   |       |         | <p>Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications with Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>  |
| TLSKeyFile      | no   |       |         | <p>Full pathname of a file containing the agent private key used for encrypted communications with Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>  |
| TLSPSKFile      | no   |       |         | <p>Full pathname of a file containing the agent pre-shared key used for encrypted communications with Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>   |
| TLSPSKIdentity  | no   |       |         | <p>Pre-shared key identity string, used for encrypted communications with Zabbix server.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>   |

| Parameter                   | Mandatory | Range | Default | Description   |
|-----------------------------|-----------|-------|---------|---|
| TLSServerCertificateIssuer  |           |       |         | Allowed server (proxy) certificate issuer.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSServerCertificateSubject |           |       |         | Allowed server (proxy) certificate subject.<br>This parameter is supported since Zabbix 3.0.0.  |
| UnsafeUserParameters        |           | 0,1   | 0       | Allow all characters to be passed in arguments to user-defined parameters.<br>0 - do not allow<br>1 - allow<br>The following characters are not allowed:<br>\ ' " * ? [ ] { } ~ \$ ! & ; ( ) >   # @<br>Additionally, newline characters are not allowed.   |
| User                        | no        |       | zabbix  | Drop privileges to a specific, existing user on the system.<br>Only has effect if run as 'root' and AllowRoot is disabled.  |
| UserParameter               | no        |       |         | User-defined parameter to monitor. There can be several user-defined parameters.<br>Format: UserParameter=<key>,<shell command><br>Note that shell command must not return empty string or EOL only.<br>Shell commands may have relative paths, if UserParameterDir parameter is specified.<br>Examples:<br>UserParameter=system.test,who wc -l<br>UserParameter=check_cpu,./custom_script.sh |
| UserParameterDir            |           |       |         | Default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path.<br>Only one entry is allowed.<br>Example: UserParameterDir=/opt/myscripts  |

## 4 Zabbix agent 2 (UNIX)

### Overview

Zabbix agent 2 is a new generation of Zabbix agent and may be used in place of Zabbix agent.

This section lists parameters supported in a Zabbix agent 2 configuration file (zabbix\_agent2.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with "#" are only supported in the beginning of the line.

### Parameters

| Parameter     | Mandatory | Range   | Default         | Description  |
|---------------|-----------|---------|-----------------|--|
| Alias         | no        |         |                 | <p>Sets an alias for an item key. It can be used to substitute long and complex item key with a smaller and simpler one. Multiple <i>Alias</i> parameters may be present. Multiple parameters with the same <i>Alias</i> key are not allowed. Different <i>Alias</i> keys may reference the same item key. Aliases can be used in <i>HostMetadataItem</i> but not in <i>HostnameItem</i> parameters.</p> <p>Examples:</p> <ol style="list-style-type: none"> <li>Retrieving the ID of user 'zabbix'.<br/>Alias=zabbix.userid:vfs.file.regexp[/etc/passwd,"^zabbix::([0-9]+)"",\1]<br/>Now shorthand key <b>zabbix.userid</b> may be used to retrieve data.</li> <li>Getting CPU utilization with default and custom parameters.<br/>Alias=cpu.util:system.cpu.util<br/>Alias=cpu.util[*]:system.cpu.util[*]<br/>This allows use <b>cpu.util</b> key to get CPU utilization percentage with default parameters as well as use <b>cpu.util[all, idle, avg15]</b> to get specific data about CPU utilization.</li> <li>Running multiple <b>low-level discovery</b> rules processing the same discovery items.<br/>Alias=vfs.fs.discovery[*]:vfs.fs.discovery<br/>Now it is possible to set up several discovery rules using <b>vfs.fs.discovery</b> with different parameters for each rule, e.g., <b>vfs.fs.discovery[foo]</b>, <b>vfs.fs.discovery[bar]</b>, etc. Allow execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters. Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order.<br/>This parameter is supported since Zabbix 5.0.0.<br/>See also: <b>Restricting agent checks</b>.</li> </ol> |
| AllowKey      | no        |         |                 | <p>Allow execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters. Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order.<br/>This parameter is supported since Zabbix 5.0.0.<br/>See also: <b>Restricting agent checks</b>.</p>  |
| BufferSend    | no        | 1-3600  | 5               | <p>The time interval in seconds which determines how often values are sent from the buffer to Zabbix server.<br/>Note that if the buffer is full, the data will be sent sooner.</p>  |
| BufferSize    | no        | 2-65535 | 100             | <p>Maximum number of values in a memory buffer. The agent will send all collected data to Zabbix server or proxy if the buffer is full.<br/>This parameter should only be used if persistent buffer is disabled (<i>EnablePersistentBuffer=0</i>).</p>   |
| ControlSocket | no        |         | /tmp/agent.sock | <p>The control socket, used to send runtime commands with '-R' option.</p>   |
| DebugLevel    | no        | 0-5     | 3               | <p>Specifies debug level:</p> <ul style="list-style-type: none"> <li>0 - basic information about starting and stopping of Zabbix processes</li> <li>1 - critical information</li> <li>2 - error information</li> <li>3 - warnings</li> <li>4 - for debugging (produces lots of information)</li> <li>5 - extended debugging (produces even more information)</li> </ul>  |

| Parameter                | Mandatory | Range            | Default | Description  |
|--------------------------|-----------|------------------|---------|--|
| DenyKey                  | no        |                  |         | Deny execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters. Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order. This parameter is supported since Zabbix 5.0.0. See also: <a href="#">Restricting agent checks</a> .   |
| EnablePersistentBuffer   |           | 0-1              | 0       | Enable usage of local persistent storage for active items.<br>0 - disabled<br>1 - enabled<br>If persistent storage is disabled, the memory buffer will be used.  |
| ForceActiveChecksOnStart |           | 0-1              | 0       | Perform active checks immediately after restart for the first received configuration.<br>0 - disabled<br>1 - enabled<br>Also available as per plugin configuration parameter, for example:<br><code>Plugins.Uptime.System.ForceActiveChecksOnStart=1</code><br>Supported since Zabbix 6.0.2.   |
| HostInterface            | no        | 0-255 characters |         | Optional parameter that defines host interface. Host interface is used at host autoregistration process. An agent will issue an error and not start if the value is over the limit of 255 characters. If not defined, value will be acquired from HostInterfaceItem.   |
| HostInterfaceItem        | no        |                  |         | Supported since Zabbix 4.4.0. Optional parameter that defines an item used for getting host interface. Host interface is used at host autoregistration process. During an autoregistration request an agent will log a warning message if the value returned by specified item is over limit of 255 characters. The <a href="#">system.run[]</a> item is supported regardless of AllowKey/DenyKey values. This option is only used when HostInterface is not defined. Supported since Zabbix 4.4.0.  |
| HostMetadata             | no        | 0-255 characters |         | Optional parameter that defines host metadata. Host metadata is used at host autoregistration process. An agent will issue an error and not start if the specified value is over the limit or a non-UTF-8 string. If not defined, the value will be acquired from HostMetadataItem.  |
| HostMetadataItem         | no        |                  |         | Optional parameter that defines an item used for getting host metadata. Host metadata item value is retrieved on each autoregistration attempt for host autoregistration process. During an autoregistration request an agent will log a warning message if the value returned by the specified item is over the limit of 255 characters. This option is only used when HostMetadata is not defined. Supports UserParameters and aliases. Supports <a href="#">system.run[]</a> regardless of AllowKey/DenyKey values. The value returned by the item must be a UTF-8 string otherwise it will be ignored. |

| Parameter              | Mandatory  | Range      | Default                | Description   |
|------------------------|--|------------|------------------------|---|
| Hostname               | no   |            | Set by Host-nameltem   | List of comma-delimited unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. Value is acquired from Hostnameltem if undefined.<br>Allowed characters: alphanumeric, '.', '/', '_' and '-'.<br>Maximum length: 128 characters per hostname, 2048 characters for the entire line.   |
| Hostnameltem           | no   |            | system.hostname        | Item used for generating Hostname if it is not defined. Ignored if Hostname is defined.<br>Does not support UserParameters or aliases, but does support <i>system.run[]</i> regardless of AllowKey/DenyKey values.  |
| Include                | no   |            |                        | You may include individual files or all files in a directory in the configuration file.<br>During the installation Zabbix will create the include directory in /usr/local/etc, unless modified during the compile time.<br>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example:<br>/absolute/path/to/config/files/*.conf.<br>Since Zabbix 6.0.0 a path can be relative to <i>zabbix_agent2.conf</i> file location.<br>See <i>special notes</i> about limitations. |
| ListenIP               | no   |            | 0.0.0.0                | List of comma-delimited IP addresses that the agent should listen on.<br>The first IP address is sent to Zabbix server, if connecting to it, to retrieve the list of active checks.   |
| ListenPort             | no   | 1024-32767 | 10050                  | Agent will listen on this port for connections from the server.   |
| LogFile                | yes, if LogType is set to <i>file</i> , otherwise no |            | /tmp/zabbix_agent2.log | Log file name if LogType is 'file'.   |
| LogFileSize            | no   | 0-1024     | 1                      | Maximum size of log file in MB.<br>0 - disable automatic log rotation.<br><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.   |
| LogType                | no   |            | file                   | Specifies where log messages are written to:<br><i>system</i> - syslog,<br><i>file</i> - file specified by LogFile parameter,<br><i>console</i> - standard output.  |
| PersistentBufferFileno |  |            |                        | The file, where Zabbix Agent2 should keep SQLite database.<br>Must be a full filename.<br>This parameter is only used if persistent buffer is enabled ( <i>EnablePersistentBuffer=1</i> ).  |
| PersistentBufferPeriod | no   | 1m-365d    | 1h                     | The time period for which data should be stored, when there is no connection to the server or proxy. Older data will be lost. Log data will be preserved.<br>This parameter is only used if persistent buffer is enabled ( <i>EnablePersistentBuffer=1</i> ).   |
| PidFile                | no   |            | /tmp/zabbix_agent2.pid | Zabbix Agent2 PID file.   |
| Plugin                 | no   |            |                        | Since Zabbix 6.0.0 most of the plugins have their own <i>configuration files</i> . The agent configuration file contains plugin parameters listed below.  |

| Parameter                           | Mandatory | Range   | Default                 | Description   |
|-------------------------------------|-----------|---------|-------------------------|---|
| Plugins.Log.MaxLinesPerSecond       | no        | 1-1000  | 20                      | Maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' or 'log.count' active checks. <i>The provided value will be overridden by the parameter 'maxlines', provided in 'log', 'logrt' or 'log.count' item key.</i><br><i>Note: Zabbix will process 10 times more new lines than set in MaxLinesPerSecond to seek the required string in log items.</i><br>This parameter is supported since 4.4.2 and replaces MaxLinesPerSecond.       |
| Plugins.SystemRun.LogRemoteCommands | no        |         | 0                       | Enable logging of executed shell commands as warnings.<br>0 - disabled<br>1 - enabled<br>Commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by HostMetadataItem, HostInterfaceItem or HostnameItem parameters.<br>This parameter is supported since 4.4.2 and replaces LogRemoteCommands.   |
| PluginSocket                        | no        |         | /tmp/agent.plugins.sock | Path to Unix socket for loadable plugin communications.   |
| PluginTimeout                       | no        | 1-30    | Global timeout          | Timeout for connections with loadable plugins.  |
| RefreshActiveChecks                 | no        | 60-3600 | 120                     | How often the list of active checks is refreshed, in seconds. Note that after failing to refresh active checks the next refresh will be attempted after 60 seconds.   |
| Server                              | yes       |         |                         | List of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies.<br>Incoming connections will be accepted only from the hosts listed here.<br>If IPv6 support is enabled then '127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address.<br>'0.0.0.0/0' can be used to allow any IPv4 address.<br>Example:<br>Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com<br>Spaces are allowed. |

| Parameter    | Mandatory  | Range      | Default | Description  |
|--------------|--|------------|---------|--|
| ServerActive | no   |            |         | <p>Zabbix server/proxy address or cluster configuration to get active checks from.</p> <p>Server/proxy address is IP address or DNS name and optional port separated by colon.</p> <p>Cluster configuration is one or more server addresses separated by semicolon.</p> <p>Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma.</p> <p>More than one Zabbix proxy should not be specified from each Zabbix server/cluster.</p> <p>If Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.</p> <p>Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.</p> <p>If port is not specified, default port is used.</p> <p>IPv6 addresses must be enclosed in square brackets if port for that host is specified.</p> <p>If port is not specified, square brackets for IPv6 addresses are optional.</p> <p>If this parameter is not specified, active checks are disabled.</p> <p>Example for Zabbix proxy:<br/> ServerActive=127.0.0.1:10051</p> <p>Example for multiple servers:<br/> ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]</p> <p>Example for high availability:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.clu</p> <p>Example for high availability with two clusters and one server:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.clu</p> |
| SourceIP     | no   |            |         | <p>Source IP address for:</p> <ul style="list-style-type: none"> <li>- outgoing connections to Zabbix server or Zabbix proxy;</li> <li>- making connections while executing some items (web.page.get, net.tcp.port, etc.)</li> </ul>   |
| StatusPort   | no   | 1024-32767 |         | <p>If set, agent will listen on this port for HTTP status requests (http://localhost:&lt;port&gt;/status).</p>   |
| Timeout      | no   | 1-30       | 3       | <p>Spend no more than Timeout seconds on processing.</p>   |
| TLSAccept    | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |            |         | <p>What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma:</p> <ul style="list-style-type: none"> <li><i>unencrypted</i> - accept connections without encryption (default)</li> <li><i>psk</i> - accept connections with TLS and a pre-shared key (PSK)</li> <li><i>cert</i> - accept connections with TLS and a certificate</li> </ul>  |
| TLSCAFile    | no   |            |         | <p>Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.</p>   |
| TLSCertFile  | no   |            |         | <p>Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.</p>  |

| Parameter            | Mandatory  | Range | Default | Description   |
|----------------------|--|-------|---------|---|
| TLSCConnect          | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |       |         | How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:<br><i>unencrypted</i> - connect without encryption (default)<br><i>psk</i> - connect using TLS and a pre-shared key (PSK)<br><i>cert</i> - connect using TLS and a certificate   |
| TLSCRLFile           | no   |       |         | Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications with Zabbix components.  |
| TLSKeyFile           | no   |       |         | Full pathname of a file containing the agent private key used for encrypted communications with Zabbix components.  |
| TLSPSKFile           | no   |       |         | Full pathname of a file containing the agent pre-shared key used for encrypted communications with Zabbix components.   |
| TLSPSKIdentity       | no   |       |         | Pre-shared key identity string, used for encrypted communications with Zabbix server.   |
| TLSServerCertIssuer  | no   |       |         | Allowed server (proxy) certificate issuer.  |
| TLSServerCertSubject | no   |       |         | Allowed server (proxy) certificate subject.   |
| UnsafeUserParameters | no   | 0,1   | 0       | Allow all characters to be passed in arguments to user-defined parameters.<br>The following characters are not allowed:<br>\\ ' " * ? [ ] { } ~ \$ ! & ; ( ) >   # @<br>Additionally, newline characters are not allowed.   |
| UserParameter        | no   |       |         | User-defined parameter to monitor. There can be several user-defined parameters.<br>Format: UserParameter=<key>,<shell command><br>Note that shell command must not return empty string or EOL only.<br>Shell commands may have relative paths, if UserParameterDir parameter is specified.<br>Examples:<br>UserParameter=system.test,who wc -l<br>UserParameter=check_cpu,./custom_script.sh |
| UserParameterDir     | no   |       |         | Default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path.<br>Only one entry is allowed.<br>Example: UserParameterDir=/opt/myscripts  |

## 5 Zabbix agent (Windows)

### Overview

This section lists parameters supported in a Zabbix agent (Windows) configuration file (zabbix\_agentd.conf).

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with "#" are only supported in the beginning of the line.

### Parameters

| Parameter  | Mandatory | Range   | Default | Description   |
|------------|-----------|---------|---------|---|
| Alias      | no        |         |         | <p>Sets an alias for an item key. It can be used to substitute long and complex item key with a smaller and simpler one. Multiple <i>Alias</i> parameters may be present. Multiple parameters with the same <i>Alias</i> key are not allowed. Different <i>Alias</i> keys may reference the same item key. Aliases can be used in <i>HostMetadataItem</i> but not in <i>HostnameItem</i> parameters.</p> <p>Examples:</p> <ol style="list-style-type: none"> <li>Retrieving the paging file usage in percentage from the server.<br/>Alias=pg_usage:perf_counter[\Paging File(_Total)% Usage]<br/>Now the shorthand key <b>pg_usage</b> may be used to retrieve data.</li> <li>Getting CPU load with default and custom parameters.<br/>Alias=cpu.load:system.cpu.load<br/>Alias=cpu.load[*]:system.cpu.load[*]<br/>This allows use <b>cpu.load</b> key to get the CPU load with default parameters as well as use <b>cpu.load[percpu,avg15]</b> to get specific data about the CPU load.</li> <li>Running multiple <b>low-level discovery</b> rules processing the same discovery items.<br/>Alias=vfs.fs.discovery[*]:vfs.fs.discovery<br/>Now it is possible to set up several discovery rules using <b>vfs.fs.discovery</b> with different parameters for each rule, e.g., <b>vfs.fs.discovery[foo]</b>, <b>vfs.fs.discovery[bar]</b>, etc.<br/>Allow execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters.<br/>Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order.<br/>This parameter is supported since Zabbix 5.0.0.<br/>See also: <b>Restricting agent checks</b>.</li> </ol> |
| AllowKey   | no        |         |         | <p>Do not keep data longer than N seconds in buffer.</p>  |
| BufferSend | no        | 1-3600  | 5       | Maximum number of values in a memory buffer. The agent will send  |
| BufferSize | no        | 2-65535 | 100     | all collected data to Zabbix server or proxy if the buffer is full.   |
| DebugLevel | no        | 0-5     | 3       | <p>Specifies debug level:</p> <p>0 - basic information about starting and stopping of Zabbix processes</p> <p>1 - critical information</p> <p>2 - error information</p> <p>3 - warnings</p> <p>4 - for debugging (produces lots of information)</p> <p>5 - extended debugging (produces even more information)</p>  |
| DenyKey    | no        |         |         | <p>Deny execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters.</p> <p>Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order.</p> <p>This parameter is supported since Zabbix 5.0.0.</p> <p>See also: <b>Restricting agent checks</b>.</p>  |

| Parameter            | Mandatory | Range            | Default             | Description   |
|----------------------|-----------|------------------|---------------------|---|
| EnableRemoteCommands |           |                  | 0                   | Whether remote commands from Zabbix server are allowed.<br>This parameter is <b>deprecated</b> , use AllowKey=system.run[*] or DenyKey=system.run[*] instead<br>It is internal alias for AllowKey/DenyKey parameters depending on value: 0 - DenyKey=system.run[*]<br>1 - AllowKey=system.run[*].   |
| HostInterface        | no        | 0-255 characters |                     | Optional parameter that defines host interface.<br>Host interface is used at host autoregistration process.<br>An agent will issue an error and not start if the value is over the limit of 255 characters.<br>If not defined, value will be acquired from HostInterfaceItem.   |
| HostInterfaceItem    | no        |                  |                     | Supported since Zabbix 4.4.0.<br>Optional parameter that defines an item used for getting host interface.<br>Host interface is used at host autoregistration process.<br>During an autoregistration request an agent will log a warning message if the value returned by specified item is over limit of 255 characters.<br>The <i>system.run[]</i> item is supported regardless of AllowKey/DenyKey values.<br>This option is only used when HostInterface is not defined.<br>Supported since Zabbix 4.4.0.  |
| HostMetadata         | no        | 0-255 characters |                     | Optional parameter that defines host metadata. Host metadata is used only at host autoregistration process (active agent).<br>If not defined, the value will be acquired from HostMetadataItem.   |
| HostMetadataItem     | no        |                  |                     | An agent will issue an error and not start if the specified value is over the limit or a non-UTF-8 string.<br>Optional parameter that defines a <i>Zabbix agent</i> item used for getting host metadata. This option is only used when HostMetadata is not defined.<br>Supports UserParameters, performance counters and aliases.<br>Supports <i>system.run[]</i> regardless of AllowKey/DenyKey value.<br>HostMetadataItem value is retrieved on each autoregistration attempt and is used only at host autoregistration process (active agent).<br>During an autoregistration request an agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.<br>The value returned by the item must be a UTF-8 string otherwise it will be ignored. |
| Hostname             | no        |                  | Set by HostnameItem | List of comma-delimited unique, case-sensitive hostnames.<br>Required for active checks and must match hostnames as configured on the server. Value is acquired from HostnameItem if undefined.<br>Allowed characters: alphanumeric, '.', '_', '-' and '-'.<br>Maximum length: 128 characters per hostname, 2048 characters for the entire line.  |
| HostnameItem         | no        |                  | system.hostname     | Optional parameter that defines a <i>Zabbix agent</i> item used for getting host name. This option is only used when Hostname is not defined.<br>Does not support UserParameters, performance counters or aliases, but does support <i>system.run[]</i> regardless of AllowKey/DenyKey value.<br>See also a <a href="#">more detailed description</a> .   |

| Parameter         | Mandatory  | Range       | Default              | Description   |
|-------------------|--|-------------|----------------------|---|
| Include           | no   |             |                      | <p>You may include individual files or all files in a directory in the configuration file (located in C:\Program Files\Zabbix Agent by default if Zabbix agent is installed using Windows MSI installer packages; located in the folder specified during installation if Zabbix agent is installed as a zip archive). All included files must have correct syntax, otherwise agent will not start.</p> <p>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example: C:\Program Files\Zabbix Agent\zabbix_agentd.d\*.conf.</p> <p>See <b>special notes</b> about limitations.</p> |
| ListenBacklog     | no   | 0 - INT_MAX | SOMAXCONN            | <p>The maximum number of pending connections in the TCP queue.</p> <p>Default value is a hard-coded constant, which depends on the system.</p> <p>Maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.</p>   |
| ListenIP          | no   |             | 0.0.0.0              | List of comma-delimited IP addresses that the agent should listen on.   |
| ListenPort        | no   | 1024-32767  | 10050                | Agent will listen on this port for connections from the server.   |
| LogFile           | yes, if LogType is set to <i>file</i> , otherwise no |             | C:\zabbix_agentd\log | Name of the agent log file.   |
| LogFileSize       | no   | 0-1024      | 1                    | <p>Maximum size of log file in MB.</p> <p>0 - disable automatic log rotation.</p> <p><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.</p>  |
| LogType           | no   |             | file                 | <p>Log output type:</p> <p><i>file</i> - write log to file specified by LogFile parameter,</p> <p><i>system</i> - write log Windows Event Log,</p> <p><i>console</i> - write log to standard output.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>   |
| LogRemoteCommands | no   |             | 0                    | <p>Enable logging of executed shell commands as warnings.</p> <p>0 - disabled</p> <p>1 - enabled</p>  |
| MaxLinesPerSecond | no   | 1-1000      | 20                   | <p>Maximum number of new lines the agent will send per second to Zabbix server</p> <p>or proxy processing 'log', 'logrt' and 'eventlog' active checks.</p> <p>The provided value will be overridden by the parameter 'maxlines',</p> <p>provided in 'log', 'logrt' or 'eventlog' item keys.</p> <p><i>Note:</i> Zabbix will process 10 times more new lines than set in <i>MaxLinesPerSecond</i> to seek the required string in log items.</p>  |

| Parameter           | Mandatory                                      | Range   | Default | Description  |
|---------------------|--|---------|---------|--|
| PerfCounter         | no   |         |         | <p>Defines a new parameter &lt;parameter_name&gt; which is an average value for system performance counter &lt;perf_counter_path&gt; for the specified time period &lt;period&gt; (in seconds).</p> <p>Syntax:<br/>           &lt;parameter_name&gt;,"&lt;perf_counter_path&gt;",&lt;period&gt;<br/>           For example, if you wish to receive average number of processor interrupts per second for last minute, you can define a new parameter "interrupts" as the following:<br/>           PerfCounter = interrupts,"\\Processor(0)\\Interrupts/sec",60<br/>           Please note double quotes around performance counter path. The parameter name (interrupts) is to be used as the item key when creating an item.<br/>           Samples for calculating average value will be taken every second.<br/>           You may run "typeperf -qx" to get list of all performance counters available in Windows.</p>  |
| PerfCounterEn       | no   |         |         | <p>Defines a new parameter &lt;parameter_name&gt; which is an average value for system performance counter &lt;perf_counter_path&gt; for the specified time period &lt;period&gt; (in seconds).</p> <p>Syntax:<br/>           &lt;parameter_name&gt;,"&lt;perf_counter_path&gt;",&lt;period&gt;<br/>           Compared to PerfCounter, perfcouter paths must be in English.</p> <p>Supported only on <b>Windows Server 2008/Vista</b> and above.<br/>           For example, if you wish to receive average number of processor interrupts per second for last minute, you can define a new parameter "interrupts" as the following:<br/>           PerfCounterEn = interrupts,"\\Processor(0)\\Interrupts/sec",60<br/>           Please note double quotes around performance counter path. The parameter name (interrupts) is to be used as the item key when creating an item.<br/>           Samples for calculating average value will be taken every second.<br/>           You can find the list of English strings by viewing the following registry key:<br/>           HKEY_LOCAL_MACHINE\\SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Perflib\\009.</p> |
| RefreshActiveChecks | yes  | 60-3600 | 120     | <p>This parameter is supported since Zabbix 4.0.13 and 4.2.7.<br/>           How often list of active checks is refreshed, in seconds.<br/>           Note that after failing to refresh active checks the next refresh will be attempted after 60 seconds.</p>  |
| Server              | yes, if StartAgents is not explicitly set to 0 |         |         | <p>List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers.<br/>           Incoming connections will be accepted only from the hosts listed here.<br/>           If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address.<br/>           '0.0.0.0/0' can be used to allow any IPv4 address.<br/>           Note that "IPv4-compatible IPv6 addresses" (0000::/96 prefix) are supported but deprecated by <a href="#">RFC4291</a>.<br/>           Example:<br/>           Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com<br/>           Spaces are allowed.</p>   |

| Parameter    | Mandatory  | Range     | Default | Description  |
|--------------|--|-----------|---------|--|
| ServerActive | no   | (*)       |         | <p>Zabbix server/proxy address or cluster configuration to get active checks from.</p> <p>Server/proxy address is IP address or DNS name and optional port separated by colon.</p> <p>Cluster configuration is one or more server addresses separated by semicolon.</p> <p>Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma.</p> <p>More than one Zabbix proxy should not be specified from each Zabbix server/cluster.</p> <p>If Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.</p> <p>Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.</p> <p>If port is not specified, default port is used.</p> <p>IPv6 addresses must be enclosed in square brackets if port for that host is specified.</p> <p>If port is not specified, square brackets for IPv6 addresses are optional.</p> <p>If this parameter is not specified, active checks are disabled.</p> <p>Example for Zabbix proxy:<br/> ServerActive=127.0.0.1:10051</p> <p>Example for multiple servers:<br/> ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]</p> <p>Example for high availability:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.clus</p> <p>Example for high availability with two clusters and one server:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.clus</p> |
| SourceIP     | no   |           |         | <p>Source IP address for:</p> <ul style="list-style-type: none"> <li>- outgoing connections to Zabbix server or Zabbix proxy;</li> <li>- making connections while executing some items (web.page.get, net.tcp.port, etc.)</li> </ul>   |
| StartAgents  | no   | 0-100 (*) | 3       | <p>Number of pre-forked instances of zabbix_agentd that process passive checks.</p> <p>If set to 0, disables passive checks and the agent will not listen on any TCP port.</p>   |
| Timeout      | no   | 1-30      | 3       | <p>Spend no more than Timeout seconds on processing</p>  |
| TLSAccept    | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |           |         | <p>What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma:</p> <p><i>unencrypted</i> - accept connections without encryption (default)</p> <p><i>psk</i> - accept connections with TLS and a pre-shared key (PSK)</p> <p><i>cert</i> - accept connections with TLS and a certificate</p> <p>This parameter is supported since Zabbix 3.0.0.</p>  |
| TLSCAFile    | no   |           |         | <p>Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>  |
| TLSCertFile  | no   |           |         | <p>Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.</p> <p>This parameter is supported since Zabbix 3.0.0.</p>   |

| Parameter                   | Mandatory  | Range | Default | Description  |
|-----------------------------|--|-------|---------|--|
| TLSCConnect                 | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |       |         | How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:<br><i>unencrypted</i> - connect without encryption (default)<br><i>psk</i> - connect using TLS and a pre-shared key (PSK)<br><i>cert</i> - connect using TLS and a certificate<br>This parameter is supported since Zabbix 3.0.0. |
| TLSCRLFile                  | no   |       |         | Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications with Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSKeyFile                  | no   |       |         | Full pathname of a file containing the agent private key used for encrypted communications with Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSPSKFile                  | no   |       |         | Full pathname of a file containing the agent pre-shared key used for encrypted communications with Zabbix components.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSPSKIdentity              | no   |       |         | Pre-shared key identity string, used for encrypted communications with Zabbix server.<br>This parameter is supported since Zabbix 3.0.0.   |
| TLSServerCertificateIssuer  | no   |       |         | Allowed server (proxy) certificate issuer.<br>This parameter is supported since Zabbix 3.0.0.  |
| TLSServerCertificateSubject | no   |       |         | Allowed server (proxy) certificate subject.<br>This parameter is supported since Zabbix 3.0.0.   |
| UnsafeUserParameters        | no   | 0-1   | 0       | Allow all characters to be passed in arguments to user-defined parameters.<br>0 - do not allow<br>1 - allow<br>The following characters are not allowed:<br>\\ ' " * ? [ ] { } ~ \$ ! & ; ( ) >   # @<br>Additionally, newline characters are not allowed.   |
| UserParameter               | no   |       |         |  |
| UserParameterDir            | no   |       |         | Default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path.<br>Only one entry is allowed.<br>Example: UserParameterDir=C:\opt\myscripts                       |

#### Note:

(\*) The number of active servers listed in ServerActive plus the number of pre-forked instances for passive checks specified in StartAgents must be less than 64.

## 6 Zabbix agent 2 (Windows)

### Overview

Zabbix agent 2 is a new generation of Zabbix agent and may be used in place of Zabbix agent.

This section lists parameters supported in a Zabbix agent 2 configuration file (zabbix\_agent2.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with "#" are only supported in the beginning of the line.

### Parameters

| Parameter     | Mandatory | Range   | Default             | Description  |
|---------------|-----------|---------|---------------------|--|
| Alias         | no        |         |                     | <p>Sets an alias for an item key. It can be used to substitute long and complex item key with a smaller and simpler one. Multiple <i>Alias</i> parameters may be present. Multiple parameters with the same <i>Alias</i> key are not allowed. Different <i>Alias</i> keys may reference the same item key. Aliases can be used in <i>HostMetadataItem</i> but not in <i>HostnameItem</i> parameters.</p> <p>Examples:</p> <ol style="list-style-type: none"> <li>Retrieving the paging file usage in percentage from the server.<br/>Alias=pg_usage:perf_counter[\\Paging File(_Total)% Usage]<br/>Now the shorthand key <b>pg_usage</b> may be used to retrieve data.</li> <li>Getting CPU load with default and custom parameters.<br/>Alias=cpu.load:system.cpu.load<br/>Alias=cpu.load[*]:system.cpu.load[*]<br/>This allows use <b>cpu.load</b> key to get the CPU load with default parameters as well as use <b>cpu.load[percpu,avg15]</b> to get specific data about the CPU load.</li> <li>Running multiple <b>low-level discovery</b> rules processing the same discovery items.<br/>Alias=vfs.fs.discovery[*]:vfs.fs.discovery<br/>Now it is possible to set up several discovery rules using <b>vfs.fs.discovery</b> with different parameters for each rule, e.g., <b>vfs.fs.discovery[foo]</b>, <b>vfs.fs.discovery[bar]</b>, etc. Allow execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters. Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order.<br/>This parameter is supported since Zabbix 5.0.0.<br/>See also: <b>Restricting agent checks</b>.</li> </ol> |
| AllowKey      | no        |         |                     | <p>Allow execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters. Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order.<br/>This parameter is supported since Zabbix 5.0.0.<br/>See also: <b>Restricting agent checks</b>.</p>  |
| BufferSend    | no        | 1-3600  | 5                   | <p>The time interval in seconds which determines how often values are sent from the buffer to Zabbix server.<br/>Note that if the buffer is full, the data will be sent sooner.</p>  |
| BufferSize    | no        | 2-65535 | 100                 | <p>Maximum number of values in a memory buffer. The agent will send all collected data to Zabbix server or proxy if the buffer is full.<br/>This parameter should only be used if persistent buffer is disabled (<i>EnablePersistentBuffer=0</i>).</p>   |
| ControlSocket | no        |         | \\.\pipe\agent.sock | <p>File control socket, used to send runtime commands with '-R' option.</p>  |
| DebugLevel    | no        | 0-5     | 3                   | <p>Specifies debug level:</p> <ul style="list-style-type: none"> <li>0 - basic information about starting and stopping of Zabbix processes</li> <li>1 - critical information</li> <li>2 - error information</li> <li>3 - warnings</li> <li>4 - for debugging (produces lots of information)</li> <li>5 - extended debugging (produces even more information)</li> </ul>  |

| Parameter                | Mandatory | Range            | Default | Description   |
|--------------------------|-----------|------------------|---------|---|
| DenyKey                  | no        |                  |         | Deny execution of those item keys that match a pattern. Key pattern is a wildcard expression that supports "*" character to match any number of any characters. Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order. This parameter is supported since Zabbix 5.0.0. See also: <a href="#">Restricting agent checks</a> .  |
| EnablePersistentBuffer   |           | 0-1              | 0       | Enable usage of local persistent storage for active items. 0 - disabled 1 - enabled If persistent storage is disabled, the memory buffer will be used.  |
| ForceActiveChecksOnStart |           | 0-1              | 0       | Perform active checks immediately after restart for the first received configuration. 0 - disabled 1 - enabled Also available as per plugin configuration parameter, for example: <code>Plugins.Uptime.System.ForceActiveChecksOnStart=1</code> Supported since Zabbix 6.0.2.   |
| HostInterface            | no        | 0-255 characters |         | Optional parameter that defines host interface. Host interface is used at host autoregistration process. An agent will issue an error and not start if the value is over the limit of 255 characters. If not defined, value will be acquired from HostInterfaceItem. Supported since Zabbix 4.4.0.  |
| HostInterfaceItem        | no        |                  |         | Optional parameter that defines an item used for getting host interface. Host interface is used at host autoregistration process. During an autoregistration request an agent will log a warning message if the value returned by specified item is over limit of 255 characters. The <a href="#">system.run[]</a> item is supported regardless of AllowKey/DenyKey values. This option is only used when HostInterface is not defined. Supported since Zabbix 4.4.0.   |
| HostMetadata             | no        | 0-255 characters |         | Optional parameter that defines host metadata. Host metadata is used at host autoregistration process. An agent will issue an error and not start if the specified value is over the limit or a non-UTF-8 string. If not defined, the value will be acquired from HostMetadataItem.   |
| HostMetadataItem         | no        |                  |         | Optional parameter that defines an item used for getting host metadata. Host metadata item value is retrieved on each autoregistration attempt for host autoregistration process. During an autoregistration request an agent will log a warning message if the value returned by the specified item is over the limit of 255 characters. This option is only used when HostMetadata is not defined. Supports UserParameters and aliases. Supports <a href="#">system.run[]</a> regardless of AllowKey/DenyKey value. The value returned by the item must be a UTF-8 string otherwise it will be ignored. |

| Parameter              | Mandatory  | Range      | Default                  | Description  |
|------------------------|--|------------|--------------------------|--|
| Hostname               | no   |            | Set by Host-nameltem     | List of comma-delimited unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. Value is acquired from Hostnameltem if undefined.<br>Allowed characters: alphanumeric, '.', ' ', '_' and '-'.<br>Maximum length: 128 characters per hostname, 2048 characters for the entire line.  |
| Hostnameltem           | no   |            | system.hostname          | Item used for generating Hostname if it is not defined. Ignored if Hostname is defined.<br>Does not support UserParameters or aliases, but does support <i>system.run[]</i> regardless of AllowKey/DenyKey value.  |
| Include                | no   |            |                          | You may include individual files or all files in a directory in the configuration file (located in C:\Program Files\Zabbix Agent 2 by default if Zabbix agent is installed using Windows MSI installer packages; located in the folder specified during installation if Zabbix agent is installed as a zip archive). All included files must have correct syntax, otherwise agent will not start.<br>The path can be relative to the <i>zabbix_agent2.conf</i> file location (e.g.,<br>Include=. \zabbix_agent2.d\plugins.d\*.conf).<br>To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. For example: C:\Program Files\Zabbix Agent2\zabbix_agent2.d\*.conf.<br>See <i>special notes</i> about limitations. |
| ListenIP               | no   |            | 0.0.0.0                  | List of comma-delimited IP addresses that the agent should listen on.<br>The first IP address is sent to Zabbix server, if connecting to it, to retrieve the list of active checks.  |
| ListenPort             | no   | 1024-32767 | 10050                    | Agent will listen on this port for connections from the server.  |
| LogFile                | yes, if LogType is set to <i>file</i> , otherwise no |            | c:\zabbix_agent2\logfile | Log file name if LogType is 'file'.  |
| LogFileSize            | no   | 0-1024     | 1                        | Maximum size of log file in MB.<br>0 - disable automatic log rotation.<br><i>Note:</i> If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.  |
| LogType                | no   |            | file                     | Specifies where log messages are written to:<br><i>file</i> - file specified by LogFile parameter,<br><i>console</i> - standard output.  |
| PersistentBufferFileno |  |            |                          | The file, where Zabbix Agent2 should keep SQLite database.<br>Must be a full filename.<br>This parameter is only used if persistent buffer is enabled ( <i>EnablePersistentBuffer=1</i> ).   |
| PersistentBufferPeriod | no   | 1m-365d    | 1h                       | The time period for which data should be stored, when there is no connection to the server or proxy. Older data will be lost. Log data will be preserved.<br>This parameter is only used if persistent buffer is enabled ( <i>EnablePersistentBuffer=1</i> ).  |
| Plugins                | no   |            |                          | Since Zabbix 6.0.0 most of the plugins have their own <i>configuration files</i> . The agent configuration file contains plugin parameters listed below.   |

| Parameter                           | Mandatory | Range  | Default                    | Description  |
|-------------------------------------|-----------|--------|----------------------------|--|
| Plugins.Log.MaxLinesPerSecond       | no        | 1-1000 | 20                         | <p>Maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'eventlog' active checks.</p> <p>The provided value will be overridden by the parameter 'maxlines', provided in 'log' or 'eventlog' item key.</p> <p><i>Note:</i> Zabbix will process 10 times more new lines than set in <i>MaxLinesPerSecond</i> to seek the required string in log items.</p> <p>This parameter is supported since 4.4.2 and replaces <i>MaxLinesPerSecond</i>.</p>   |
| Plugins.SystemRun.LogRemoteCommands | no        |        | 0                          | <p>Enable logging of executed shell commands as warnings.</p> <p>0 - disabled<br/>1 - enabled</p> <p>Commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by HostMetadataItem, HostInterfaceItem or HostnameItem parameters.</p> <p>This parameter is supported since 4.4.2 and replaces <i>LogRemoteCommands</i>.</p>   |
| PluginSocket                        | no        |        | \\.\pipe\agent.zabbix.sock | Path to zabbix socket for loadable plugin communications.  |
| PluginTimeout                       | no        | 1-30   | Global timeout             | Timeout for connections with loadable plugins.   |
| PerfCounter                         | no        |        |                            | <p>Defines a new parameter &lt;parameter_name&gt; which is an average value for system performance counter &lt;perf_counter_path&gt; for the specified time period &lt;period&gt; (in seconds).</p> <p>Syntax:</p> <p>&lt;parameter_name&gt;,"&lt;perf_counter_path&gt;",&lt;period&gt;</p> <p>For example, if you wish to receive average number of processor interrupts per second for last minute, you can define a new parameter "interrupts" as the following:</p> <p>PerfCounter = interrupts,"\\Processor(0)\\Interrupts/sec",60</p> <p>Please note double quotes around performance counter path.</p> <p>The parameter name (interrupts) is to be used as the item key when creating an item.</p> <p>Samples for calculating average value will be taken every second.</p> <p>You may run "typeperf -qx" to get list of all performance counters available in Windows.</p> |

| Parameter           | Mandatory | Range   | Default | Description   |
|---------------------|-----------|---------|---------|---|
| PerfCounterEn       | no        |         |         | <p>Defines a new parameter &lt;parameter_name&gt; which is an average value for system performance counter &lt;perf_counter_path&gt; for the specified time period &lt;period&gt; (in seconds).</p> <p>Syntax:<br/>           &lt;parameter_name&gt;,"&lt;perf_counter_path&gt;",&lt;period&gt;<br/>           Compared to PerfCounter, perfcounter paths must be in English.</p> <p>Supported only on <b>Windows Server 2008/Vista</b> and above.</p> <p>For example, if you wish to receive average number of processor interrupts per second for last minute, you can define a new parameter "interrupts" as the following:<br/>           PerfCounterEn =<br/>           interrupts,"\\Processor(0)\\Interrupts/sec",60</p> <p>Please note double quotes around performance counter path.</p> <p>The parameter name (interrupts) is to be used as the item key when creating an item.</p> <p>Samples for calculating average value will be taken every second.</p> <p>You can find the list of English strings by viewing the following registry key:<br/>           HKEY_LOCAL_MACHINE\\SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Perflib\\009.</p> |
| RefreshActiveChecks | no        | 60-3600 | 120     | <p>How often the list of active checks is refreshed, in seconds. Note that after failing to refresh active checks the next refresh will be attempted after 60 seconds.</p>  |
| Server              | yes       |         |         | <p>List of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies.</p> <p>Incoming connections will be accepted only from the hosts listed here.</p> <p>If IPv6 support is enabled then '127.0.0.1', '::ffff:127.0.0.1' are treated equally and ':::/0' will allow any IPv4 or IPv6 address.</p> <p>'0.0.0.0/0' can be used to allow any IPv4 address.</p> <p>Example:<br/>           Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com</p> <p>Spaces are allowed.</p>   |

| Parameter    | Mandatory   | Range      | Default | Description  |
|--------------|---|------------|---------|--|
| ServerActive | no  |            |         | <p>Zabbix server/proxy address or cluster configuration to get active checks from.</p> <p>Server/proxy address is IP address or DNS name and optional port separated by colon.</p> <p>Cluster configuration is one or more server addresses separated by semicolon.</p> <p>Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma.</p> <p>More than one Zabbix proxy should not be specified from each Zabbix server/cluster.</p> <p>If Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.</p> <p>Multiple addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.</p> <p>If port is not specified, default port is used.</p> <p>IPv6 addresses must be enclosed in square brackets if port for that host is specified.</p> <p>If port is not specified, square brackets for IPv6 addresses are optional.</p> <p>If this parameter is not specified, active checks are disabled.</p> <p>Example for Zabbix proxy:<br/> ServerActive=127.0.0.1:10051</p> <p>Example for multiple servers:<br/> ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]</p> <p>Example for high availability:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.clu</p> <p>Example for high availability with two clusters and one server:<br/> ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.clu</p> |
| SourceIP     | no  |            |         | <p>Source IP address for:</p> <ul style="list-style-type: none"> <li>- outgoing connections to Zabbix server or Zabbix proxy;</li> <li>- making connections while executing some items (web.page.get, net.tcp.port, etc.)</li> </ul>   |
| StatusPort   | no  | 1024-32767 |         | If set, agent will listen on this port for HTTP status requests (http://localhost:<port>/status).  |
| Timeout      | no  | 1-30       | 3       | Spend no more than Timeout seconds on processing.  |
| TLSAccept    | yes, if TLS certificate or PSK parameters are defined (even for <i>unen-crypted</i> connection), otherwise no |            |         | <p>What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma:</p> <p><i>unencrypted</i> - accept connections without encryption (default)</p> <p><i>psk</i> - accept connections with TLS and a pre-shared key (PSK)</p> <p><i>cert</i> - accept connections with TLS and a certificate</p>   |
| TLSCAFile    | no  |            |         | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.  |
| TLSCertFile  | no  |            |         | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.   |

| Parameter            | Mandatory  | Range | Default | Description  |
|----------------------|--|-------|---------|--|
| TLSCConnect          | yes, if TLS certificate or PSK parameters are defined (even for <i>unencrypted</i> connection), otherwise no |       |         | How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:<br><i>unencrypted</i> - connect without encryption (default)<br><i>psk</i> - connect using TLS and a pre-shared key (PSK)<br><i>cert</i> - connect using TLS and a certificate  |
| TLSCRLFile           | no   |       |         | Full pathname of a file containing revoked certificates. This parameter is used for encrypted communications with Zabbix components.   |
| TLSKeyFile           | no   |       |         | Full pathname of a file containing the agent private key used for encrypted communications with Zabbix components.   |
| TLSPSKFile           | no   |       |         | Full pathname of a file containing the agent pre-shared key used for encrypted communications with Zabbix components.  |
| TLSPSKIdentity       | no   |       |         | Pre-shared key identity string, used for encrypted communications with Zabbix server.  |
| TLSServerCertIssuer  | no   |       |         | Allowed server (proxy) certificate issuer.   |
| TLSServerCertSubject | no   |       |         | Allowed server (proxy) certificate subject.  |
| UnsafeUserParameters | no   | 0,1   | 0       | Allow all characters to be passed in arguments to user-defined parameters.<br>The following characters are not allowed:<br>` ' " * ? [ ] { } ~ \$ ! & ; ( ) >   # @<br>Additionally, newline characters are not allowed.   |
| UserParameter        | no   |       |         | User-defined parameter to monitor. There can be several user-defined parameters.<br>Format: UserParameter=<key>,<shell command><br>Note that shell command must not return empty string or EOL only.<br>Shell commands may have relative paths, if UserParameterDir parameter is specified.<br>Examples:<br>UserParameter=system.test,dir /b   find /c /v ""<br>UserParameter=check_cpu,.\\custom_script.bat |
| UserParameterDir     | no   |       |         | Default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path.<br>Only one entry is allowed.<br>Example: UserParameterDir=C:\opt\myscripts   |

## 7 Zabbix agent 2 plugins

### Overview

This section contains descriptions of configuration file parameters for Zabbix agent 2 plugins. Please use the sidebar to access information about the specific plugin.

### 1 Ceph plugin

#### Overview

This section lists parameters supported in the Ceph Zabbix agent 2 plugin configuration file (ceph.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

#### Parameters

| Parameter                                  | Mandatory | Range        | Default                | Description   |
|--|-----------|--------------|------------------------|---|
| Plugins.Ceph.Default.ApiKey                |           |              |                        | Default API key for connecting to Ceph; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18  |
| Plugins.Ceph.Default.User                  |           |              |                        | Default username for connecting to Ceph; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18   |
| Plugins.Ceph.Default.Uri                   |           |              | https://localhost:8003 | Default URI for connecting to Ceph; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Only https scheme is supported; a scheme can be omitted.<br>A port can be omitted (default=8003).<br>Examples: https://127.0.0.1:8003<br>localhost<br>Supported since version 6.0.18 |
| Plugins.Ceph.InsecureSkipVerify            |           | false / true | false                  | Determines whether an http client should verify the server's certificate chain and host name.<br>If true, TLS accepts any certificate presented by the server and any host name in that certificate. In this mode, TLS is susceptible to man-in-the-middle attacks (should be used only for testing).   |
| Plugins.Ceph.KeepAlive                     |           | 60-900       | 300                    | The maximum time of waiting (in seconds) before unused plugin connections are closed.   |
| Plugins.Ceph.Sessions.<SessionName>.ApiKey |           |              |                        | Named session API key.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Ceph.Sessions.<SessionName>.User   |           |              |                        | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.Ceph.Sessions.<SessionName>.Uri    |           |              |                        | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Only https scheme is supported; a scheme can be omitted.<br>A port can be omitted (default=8003).<br>Examples: https://127.0.0.1:8003<br>localhost               |
| Plugins.Ceph.Timeout                       |           | 1-30         | global timeout         | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).  |

## 2 Docker plugin

Overview

This section lists parameters supported in the Docker Zabbix agent 2 plugin configuration file (docker.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported at the beginning of the line.

Parameters

| Parameter               | Mandatory | Range | Default                     | Description  |
|-------------------------|-----------|-------|-----------------------------|--|
| Plugins.Docker.Endpoint |           |       | unix:///var/run/docker.sock | Docker daemon unix-socket location.<br>Must contain a scheme (only <code>unix://</code> is supported).           |
| Plugins.Docker.Timeout  |           | 1-30  | global<br>timeout           | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\)](#) / [Zabbix agent 2 \(Windows\)](#)

### 3 Ember+ plugin

Overview

This section lists parameters supported in the Ember+ Zabbix agent 2 plugin configuration file (ember.conf).

The Ember+ plugin is a loadable plugin and is available and fully described in the [Ember+ plugin repository](#).

This plugin is supported since Zabbix 6.0.30 and currently only available to be built from the source (for both Unix and Windows).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported at the beginning of the line.

Parameters

| Parameter                                    | Mandatory | Range  | Default              | Description   |
|--|-----------|--------|----------------------|---|
| Plugins.EmberPlus.Default.Uri                |           |        | tcp://localhost:9999 | Default URI to connect. The only supported schema is <code>tcp://</code> . A schema can be omitted. Embedded credentials will be ignored.   |
| Plugins.EmberPlus.KeepAlive                  |           | 60-900 | 300                  | The maximum time of waiting (in seconds) before unused plugin connections are closed.   |
| Plugins.EmberPlus.Sessions.<SessionName>.Uri |           |        | tcp://localhost:9999 | URI to connect, for the named session. The only supported schema is <code>tcp://</code> . A schema can be omitted. Embedded credentials will be ignored.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys. |
| Plugins.EmberPlus.System.Path                |           |        |                      | Path to the Ember+ plugin executable.<br>Example usage:<br><code>Plugins.EmberPlus.System.Path=/usr/sbin/zabbix-agent2-pl</code>  |
| Plugins.EmberPlus.Timeout                    |           | 1-30   | global<br>timeout    | The duration, in seconds, to wait for a server to respond when first connecting and on follow-up operations in the session.   |

## 4 Memcached plugin

### Overview

This section lists parameters supported in the Memcached Zabbix agent 2 plugin configuration file (memcached.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

### Parameters

| Parameter   | Mandatory | Range  | Default               | Description  |
|---|-----------|--------|-----------------------|--|
| Plugins.Memcached.Default.Password                |           |        |                       | Default password for connecting to Memcached; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18   |
| Plugins.Memcached.Default.Uri                     |           |        | tcp://localhost:11211 | Default URI for connecting to Memcached; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: tcp, unix; a scheme can be omitted.<br>A port can be omitted (default=11211).<br>Examples: tcp://localhost:11211<br>localhost<br>unix:/var/run/memcached.sock<br>Supported since version 6.0.18 |
| Plugins.Memcached.Default.User                    |           |        |                       | Default username for connecting to Memcached; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18   |
| Plugins.Memcached.KeepAlive                       |           | 60-900 | 300                   | The maximum time of waiting (in seconds) before unused plugin connections are closed.  |
| Plugins.Memcached.Sessions.<SessionName>.Password |           |        |                       | Named session password.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Memcached.Sessions.<SessionName>.Uri      |           |        |                       | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: tcp, unix; a scheme can be omitted.<br>A port can be omitted (default=11211).<br>Examples: tcp://localhost:11211<br>localhost<br>unix:/var/run/memcached.sock                    |
| Plugins.Memcached.Sessions.<SessionName>.User     |           |        |                       | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Memcached.Timeout                         |           | 1-30   | global timeout        | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).   |

## 5 Modbus plugin

## Overview

This section lists parameters supported in the Modbus Zabbix agent 2 plugin configuration file (modbus.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

## Parameters

| Parameter                                      | Mandatory | Range | Default        | Description   |
|--|-----------|-------|----------------|---|
| Plugins.Modbus.Sessions.<SessionName>.Endpoint |           |       |                | Endpoint is a connection string consisting of a protocol scheme, a host address and a port or serial port name and attributes.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Modbus.Sessions.<SessionName>.SlaveID  |           |       |                | Slave ID of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Example: <code>Plugins.Modbus.Sessions.MB1.SlaveID=20</code><br>Note that this named session parameter is checked only if the value provided in the <b>item key</b> slave ID parameter is empty. |
| Plugins.Modbus.Sessions.<SessionName>.Timeout  |           |       |                | Timeout of a named session in seconds.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Example: <code>Plugins.Modbus.Sessions.MB1.Timeout=2</code>  |
| Plugins.Modbus.Timeout                         |           | 1-30  | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).  |

## 6 MongoDB plugin

### Overview

This section lists parameters supported in the MongoDB Zabbix agent 2 plugin configuration file (mongo.conf).

Since Zabbix 6.0.6, the MongoDB plugin is a loadable plugin and is available and fully described in the [MongoDB plugin repository](#).

Pre-compiled plugin binaries for Windows are available since [Zabbix 6.0.19](#) and are compatible with previous 6.0 versions.

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

### Options

| Parameter    | Description                                       |
|--------------|---|
| -V --version | Print the plugin version and license information. |
| -h --help    | Print help information (shorthand).               |

## Parameters

### Note:

In Zabbix versions before 6.0.6, parameter names start with `Plugins.Mongo.<Parameter>` instead of `Plugins.MongoDB.<Parameter>`. For example, `Plugins.Mongo.KeepAlive`

| Parameter  | Mandatory | Range  | Default | Description   |
|--|-----------|--------|---------|---|
| Plugins.MongoDB.Default.Password   |           |        |         | Default password for connecting to MongoDB; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18  |
| Plugins.MongoDB.Default.Uri  |           |        |         | Default URI for connecting to MongoDB; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Only tcp scheme is supported; a scheme can be omitted.<br>A port can be omitted (default=27017).<br>Examples: tcp://127.0.0.1:27017, tcp:localhost, localhost<br>Supported since version 6.0.18               |
| Plugins.MongoDB.Default.User   |           |        |         | Default username for connecting to MongoDB; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18  |
| Plugins.MongoDB.KeepAlive  |           | 60-900 | 300     | The maximum time of waiting (in seconds) before unused plugin connections are closed.   |
| Plugins.MongoDB.Sessions.<SessionName>.Password  |           |        |         | Named session password.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.MongoDB.Sessions.<SessionName>.TLSCAFile<br>(yes, if Plugins.MongoDB.Sessions.<SessionName>.TLSConnect is set to one of:<br>verify_ca,<br>verify_full)   |           |        |         | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix agent 2 and monitored databases.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Supported in plugin versions 1.2.0, 6.0.13 and newer <sup>1</sup> .  |
| Plugins.MongoDB.Sessions.<SessionName>.TLSCertFile<br>(yes, if Plugins.MongoDB.Sessions.<SessionName>.TLSConnect is specified<br><br>Before version 6.0.24 always mandatory if Plugins.MongoDB.Sessions.<SessionName>.TLSConnect is set to one of:<br>verify_ca,<br>verify_full) |           |        |         | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix agent 2 and monitored databases.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Supported in plugin versions 1.2.0, 6.0.13 and newer <sup>1</sup> .  |
| Plugins.MongoDB.Sessions.<SessionName>.TLSConnect  |           |        |         | Encryption type for communications between Zabbix agent 2 and monitored databases.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Supported values:<br><i>required</i> - require TLS connection;<br><i>verify_ca</i> - verify certificates;<br><i>verify_full</i> - verify certificates and IP address.<br><br>Supported in plugin versions 1.2.0, 6.0.13 and newer <sup>1</sup> . |

| Parameter   | Mandatory   | Range | Default        | Description  |
|---|---|-------|----------------|--|
| Plugins.MongoDB.Sessions.<SessionName>.TLSKeyFile | Before version 6.0.24 always mandatory if Plug-ins.MongoDB.Sessions.<SessionName>.TLSConnect is set to one of: verify_ca, verify_full |       |                | Full pathname of a file containing the database private key used for encrypted communications between Zabbix agent 2 and monitored databases.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported in plugin versions 1.2.0, 6.0.13 and newer <sup>1</sup> .  |
| Plugins.MongoDB.Sessions.<SessionName>.Uri        |   |       |                | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Only tcp scheme is supported; a scheme can be omitted.<br>A port can be omitted (default=27017).<br>Examples: tcp://127.0.0.1:27017, tcp:localhost, localhost |
| Plugins.MongoDB.Sessions.<SessionName>.User       |   |       |                | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.MongoDB.System.Path                       |   |       |                | Path to external plugin executable. Supported since Zabbix 6.0.6   |
| Plugins.MongoDB.Timeout                           |   | 1-30  | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).   |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\) / Zabbix agent 2 \(Windows\)](#)
- Instructions for configuring [plugins](#)

Footnotes

<sup>1</sup> - Since Zabbix 6.0.13, loadable plugins started using the same versioning system as Zabbix itself. As a result, MongoDB plugin version has changed from 1.2.0 to 6.0.13.

## 7 MQTT plugin

Overview

This section lists parameters supported in the MQTT Zabbix agent 2 plugin configuration file (mqtt.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported at the beginning of the line.

Parameters

| Parameter                     | Mandatory | Range | Default | Description   |
|-------------------------------|-----------|-------|---------|---|
| Plugins.MQTT.Default.Password |           |       |         | Default password for connecting to MQTT; used if no value is specified in an item key or named session.<br>Supported since version 6.0.19 |

| Parameter                                       | Mandatory | Range | Default              | Description   |
|---|-----------|-------|----------------------|---|
| Plugins.MQTT.Default.TLSCAFile                  |           |       |                      | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification for encrypted communications between Zabbix agent 2 and MQTT broker; used if no value is specified in a named session.<br>Supported since version 6.0.19  |
| Plugins.MQTT.Default.TLSCertFile                |           |       |                      | Full pathname of a file containing the agent certificate or certificate chain for encrypted communications between Zabbix agent 2 and MQTT broker; used if no value is specified in a named session.<br>Supported since version 6.0.19  |
| Plugins.MQTT.Default.TLSKeyFile                 |           |       |                      | Full pathname of a file containing the MQTT private key for encrypted communications between Zabbix agent 2 and MQTT broker; used if no value is specified in a named session.<br>Supported since version 6.0.19  |
| Plugins.MQTT.Default.Topic                      |           |       |                      | Default topic for MQTT subscription; used if no value is specified in an item key or named session.<br><br>The topic may contain wildcards ("+", "#")<br>Examples: path/to/file<br>path/to/#<br>path/+/topic<br>Supported since version 6.0.19  |
| Plugins.MQTT.Default.Url                        |           |       | tcp://localhost:1883 | Default MQTT broker connection string; used if no value is specified in an item key or named session.<br><br>Should not include query parameters.<br>Must match the URL format.<br>Supported schemes: tcp (default), ws, tls; a scheme can be omitted.<br>A port can be omitted (default=1883).<br>Examples: tcp://host:1883<br>localhost<br>ws://host:8080<br>Supported since version 6.0.19 |
| Plugins.MQTT.Default.User                       |           |       |                      | Default username for connecting to MQTT; used if no value is specified in an item key or named session.<br>Supported since version 6.0.19   |
| Plugins.MQTT.Sessions.<SessionName>.Password    |           |       |                      | Named session password.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported since version 6.0.19  |
| Plugins.MQTT.Sessions.<SessionName>.TLSCAFile   |           |       |                      | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix agent 2 and MQTT broker.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported since version 6.0.19   |
| Plugins.MQTT.Sessions.<SessionName>.TLSCertFile |           |       |                      | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix agent 2 and MQTT broker.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported since version 6.0.19   |
| Plugins.MQTT.Sessions.<SessionName>.TLSKeyFile  |           |       |                      | Full pathname of a file containing the MQTT private key used for encrypted communications between Zabbix agent 2 and MQTT broker.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported since version 6.0.19  |

| Parameter                                 | Mandatory | Range | Default        | Description  |
|---|-----------|-------|----------------|--|
| Plugins.MQTT.Sessions.<SessionName>.Topic |           |       |                | Named session topic for MQTT subscription.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>The topic may contain wildcards ("+", "#")<br>Examples: path/to/file<br>path/to/#<br>path/+/topic<br>Supported since version 6.0.19   |
| Plugins.MQTT.Sessions.<SessionName>.Url   |           |       |                | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include query parameters.<br>Must match the URL format.<br>Supported schemes: tcp (default), ws, tls; a scheme can be omitted.<br>A port can be omitted (default=1883).<br>Examples: tcp://host:1883<br>localhost<br>ws://host:8080<br>Supported since version 6.0.19 |
| Plugins.MQTT.Sessions.<SessionName>.User  |           |       |                | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported since version 6.0.19   |
| Plugins.MQTT.Timeout                      |           | 1-30  | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).   |

## 8 MSSQL plugin

### Overview

This section lists parameters supported in the MSSQL Zabbix agent 2 plugin configuration file (mssql.conf).

The MSSQL plugin is a loadable plugin and is available and fully described in the [MSSQL plugin repository](#).

This plugin is supported since Zabbix 6.0.27. Pre-compiled plugin binaries for Windows are available since [Zabbix 6.0.28](#) and are compatible with 6.0.27 version.

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported at the beginning of the line.

### Parameters

| Parameter                        | Mandatory | Range | Default | Description   |
|----------------------------------|-----------|-------|---------|---|
| Plugins.MSSQL.CustomQueriesDir   |           |       | empty   | Specifies the file path to a directory containing user-defined .sql files with custom queries that the plugin can execute. The plugin loads all available .sql files in the configured directory at startup. This means that any changes to the custom query files will not be reflected until the plugin is restarted. The plugin is started and stopped together with Zabbix agent 2. |
| Plugins.MSSQL.Default.CACertPath |           |       |         | The default file path to the public key certificate of the certificate authority (CA) that issued the certificate of the MSSQL server. The certificate must be in PEM format.   |

| Parameter   | Mandatory | Range  | Default                    | Description   |
|---|-----------|--------|----------------------------|---|
| Plugins.MSSQL.Default.Database                              |           |        |                            | The default database name to connect to.  |
| Plugins.MSSQL.Default.Encrypt                               |           |        |                            | Specifies the default connection encryption type. Possible values are:<br><i>true</i> - data sending between plugin and server is encrypted;<br><i>false</i> - data sending between plugin and server is not encrypted beyond the login packet;<br><i>strict</i> - data sending between plugin and server is encrypted E2E using <a href="#">TDS8</a> ;<br><i>disable</i> - data sending between plugin and server is not encrypted.  |
| Plugins.MSSQL.Default.HostNameInCertificate                 |           |        |                            | The common name (CN) of the certificate of the MSSQL server by default.   |
| Plugins.MSSQL.Default.Password                              |           |        |                            | The password to be sent to a protected MSSQL server by default.   |
| Plugins.MSSQL.Default.TLSMinVersion                         |           |        |                            | The minimum TLS version to use by default. Possible values are: 1.0, 1.1, 1.2, 1.3.   |
| Plugins.MSSQL.Default.TrustServerCertificate                |           |        |                            | Whether the plugin should trust the server certificate without validating it by default. Possible values: <i>true</i> , <i>false</i> .  |
| Plugins.MSSQL.Default.Uri                                   |           |        | sqlserver://localhost:1433 | The default URI to connect. The only supported schema is <i>sqlserver://</i> . A schema can be omitted. Embedded credentials will be ignored.   |
| Plugins.MSSQL.Default.User                                  |           |        |                            | The default username to be sent to a protected MSSQL server.  |
| Plugins.MSSQL.KeepAlive                                     |           | 60-900 | 300                        | The maximum time of waiting (in seconds) before unused plugin connections are closed.   |
| Plugins.MSSQL.Sessions.<SessionName>.CACertPath             |           |        |                            | The file path to the public key certificate of the certificate authority (CA) that issued the certificate of the MSSQL server for the named session. The certificate must be in PEM format.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.MSSQL.Sessions.<SessionName>.Database               |           |        |                            | The database name to connect to for the named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.MSSQL.Sessions.<SessionName>.Encrypt                |           |        |                            | Specifies the connection encryption type for the named session. Possible values are:<br><i>true</i> - data sending between plugin and server is encrypted;<br><i>false</i> - data sending between plugin and server is not encrypted beyond the login packet;<br><i>strict</i> - data sending between plugin and server is encrypted E2E using <a href="#">TDS8</a> ;<br><i>disable</i> - data sending between plugin and server is not encrypted.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.HostNameInCertificate  |           |        |                            | The common name (CN) of the certificate of the MSSQL server for the named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.MSSQL.Sessions.<SessionName>.Password               |           |        |                            | The password to be sent to a protected MSSQL server for the named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.MSSQL.Sessions.<SessionName>.TLSMinVersion          |           |        |                            | The minimum TLS version to use for the named session. Possible values are: 1.0, 1.1, 1.2, 1.3.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.MSSQL.Sessions.<SessionName>.TrustServerCertificate |           |        |                            | Whether the plugin should trust the server certificate without validating it for the named session. Possible values: <i>true</i> , <i>false</i> .<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |

| Parameter                                 | Mandatory | Range | Default               | Description   |
|---|-----------|-------|-----------------------|---|
| Plugins.MSSQL.Sessions.<SessionName>.Uri  | yes       |       | sqlserver://localhost | URI to connect, for the named session. The only supported schema is sqlserver://. A schema can be omitted. Embedded credentials will be ignored.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.User | yes       |       |                       | The username to be sent to a protected MSSQL server for the named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.MSSQL.System.Path                 | yes       |       |                       | Path to the MSSQL plugin executable.<br>Global setting for the MSSQL plugin. Applied to all connections.<br>Example usage:<br>Plugins.MSSQL.System.Path=/usr/sbin/zabbix-agent2-plugin.   |
| Plugins.MSSQL.Timeout                     | no        | 1-30  | global timeout        | The duration, in seconds, to wait for a server to respond when first connecting and on follow-up operations in the session.   |

## 9 MySQL plugin

### Overview

This section lists parameters supported in the MySQL Zabbix agent 2 plugin configuration file (mysql.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

### Parameters

| Parameter   | Mandatory | Range | Default        | Description  |
|---|-----------|-------|----------------|--|
| Plugins.MySQL.Timeout   | no        | 1-30  | global timeout | The maximum amount of time in seconds to wait for a request to be done.  |
| Plugins.MySQL.CustomQueriesPath   | no        |       | empty          | Full path to the directory used for storing custom queries. Supported since version 6.0.21.  |
| Plugins.MySQL.Default.Password  | no        |       |                | Default password for connecting to MySQL; used if no value is specified in an item key or named session. Supported since version 6.0.18.   |
| Plugins.MySQL.Default.TLSCAFile<br>(yes, if Plugins.MySQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> )   | no        |       |                | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. Supported since version 6.0.18. |
| Plugins.MySQL.Default.TLSCertFile<br>(yes, if Plugins.MySQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> ) | no        |       |                | Full pathname of a file containing the agent certificate or certificate chain for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. Supported since version 6.0.18.                         |

| Parameter  | Mandatory  | Range  | Default              | Description  |
|--|--|--------|----------------------|--|
| Plugins.Mysql.Default.TLSConnect                 |  |        |                      | Encryption type for communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session.<br><br>Supported values:<br><i>required</i> - require TLS connection;<br><i>verify_ca</i> - verify certificates;<br><i>verify_full</i> - verify certificates and IP address.<br>Supported since version 6.0.18.   |
| Plugins.Mysql.Default.TLSKeyFile                 |  |        |                      | Full pathname of a file containing the database private key for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session.<br>Supported since version 6.0.18.  |
| Plugins.Mysql.Default.TLSConnect                 | (yes, if Plugins.Mysql.Default.TLSKeyFile is set to <i>verify_ca</i> or <i>verify_full</i> )   |        |                      |  |
| Plugins.Mysql.Default.Uri                        |  |        | tcp://localhost:3306 | Default URI for connecting to MySQL; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: <i>tcp</i> , <i>unix</i> ; a scheme can be omitted.<br>A port can be omitted (default=3306).<br>Examples: <i>tcp://localhost:3306</i><br><i>localhost</i><br><i>unix:/var/run/mysql.sock</i><br>Supported since version 6.0.18. |
| Plugins.Mysql.Default.User                       |  |        |                      | Default username for connecting to MySQL; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18.  |
| Plugins.Mysql.KeyTimeAlive                       |  | 60-900 | 300                  | The maximum time of waiting (in seconds) before unused plugin connections are closed.  |
| Plugins.Mysql.Sessions.<SessionName>.Password    |  |        |                      | Named session password.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Mysql.Sessions.<SessionName>.TLSCAFile   |  |        |                      | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix agent 2 and monitored databases.   |
| Plugins.Mysql.Sessions.<SessionName>.TLSConnect  | (yes, if Plugins.Mysql.Sessions.<SessionName>.TLSCAFile is set to <i>verify_ca</i> or <i>verify_full</i> )                                 |        |                      | <b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.Mysql.Sessions.<SessionName>.TLSCertFile |  |        |                      | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix agent 2 and monitored databases.   |
| Plugins.Mysql.Sessions.<SessionName>.TLSKeyFile  |  |        |                      | <b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.Mysql.Sessions.<SessionName>.TLSKeyFile  | Before version 6.0.23 always mandatory if Plugins.Mysql.Sessions.<SessionName>.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> |        |                      |  |

| Parameter  | Mandatory   | Range | Default        | Description  |
|--|---|-------|----------------|--|
| Plugins.Mysql.Sessions.<SessionName>.TLSConnect  | yes   |       |                | Encryption type for communications between Zabbix agent 2 and monitored databases.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Supported values:<br><i>required</i> - require TLS connection;<br><i>verify_ca</i> - verify certificates;<br><i>verify_full</i> - verify certificates and IP address.   |
| Plugins.Mysql.Sessions.<SessionName>.TLSKeyFile  | yes   |       |                | Full pathname of a file containing the database private key used for encrypted communications between Zabbix agent 2 and monitored databases.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Mysql.Sessions.<SessionName>.TLSCertFile | yes if PKCS#1 is specified  |       |                |  |
|  | Before version 6.0.23 always mandatory if Plug-ins.Mysql.Sessions.<SessionName>.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> |       |                |  |
| Plugins.Mysql.Sessions.<SessionName>.Uri         | yes   |       |                | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: <i>tcp</i> , <i>unix</i> ; a scheme can be omitted.<br>A port can be omitted (default=3306).<br>Examples: <i>tcp://localhost:3306</i><br><i>localhost</i><br><i>unix:/var/run/mysql.sock</i> |
| Plugins.Mysql.Sessions.<SessionName>.User        | yes   |       |                | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Mysql.Timeout                            |   | 1-30  | global timeout | The maximum time in seconds for waiting when a connection has to be established.   |

## 10 Oracle plugin

### Overview

This section lists parameters supported in the Oracle Zabbix agent 2 plugin configuration file (*oracle.conf*).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with *"#"* are only supported at the beginning of the line.

### Parameters

| Parameter   | Mandatory | Range  | Default              | Description   |
|---|-----------|--------|----------------------|---|
| Plugins.Oracle.<Item>.ConnectTimeout                  | Yes       | 1-30   | global timeout       | The maximum wait time in seconds for a request to be completed.   |
| Plugins.Oracle.<Item>.ConnectTimeout                  | Yes       | 1-30   | global timeout       | The maximum wait time in seconds for a connection to be established.  |
| Plugins.Oracle.<Item>.CustomQueriesPath               | Yes       |        |                      | Full pathname of a directory containing .sql files with custom queries.<br>Disabled by default.<br>Example: /etc/zabbix/oracle/sql  |
| Plugins.Oracle.<Item>.Default.Password                | Yes       |        |                      | Default password for connecting to Oracle; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18   |
| Plugins.Oracle.<Item>.Default.Service                 | Yes       |        |                      | Default service name for connecting to Oracle (SID is not supported); used if no value is specified in an item key or named session.<br>Supported since version 6.0.18  |
| Plugins.Oracle.<Item>.Default.Uri                     | Yes       |        | tcp://localhost:1521 | Default URI for connecting to Oracle; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Only tcp scheme is supported; a scheme can be omitted.<br>A port can be omitted (default=1521).<br>Examples: tcp://127.0.0.1:1521<br>localhost<br>Supported since version 6.0.18 |
| Plugins.Oracle.<Item>.Default.User                    | Yes       |        |                      | Default username for connecting to Oracle; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18   |
| Plugins.Oracle.<Item>.KeepAlive                       | Yes       | 60-900 | 300                  | The maximum time of waiting (in seconds) before unused plugin connections are closed.   |
| Plugins.Oracle.<Item>.Sessions.<SessionName>.Password | Yes       |        |                      | Named session password.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.Oracle.<Item>.Sessions.<SessionName>.Service  | Yes       |        |                      | Named session service name to be used for connection (SID is not supported).<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Oracle.<Item>.Sessions.<SessionName>.Uri      | Yes       |        |                      | Named session connection string for Oracle.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Only tcp scheme is supported; a scheme can be omitted.<br>A port can be omitted (default=1521).<br>Examples: tcp://127.0.0.1:1521<br>localhost           |
| Plugins.Oracle.<Item>.Sessions.<SessionName>.User     | Yes       |        |                      | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |

## 11 PostgreSQL plugin

Overview

This section lists parameters supported in the PostgreSQL Zabbix agent 2 plugin configuration file (postgresql.conf).

Since Zabbix 6.0.10, the PostgreSQL plugin is a loadable plugin and is available and fully described in the [PostgreSQL plugin repository](#).

Pre-compiled plugin binaries for Windows are available since [Zabbix 6.0.19](#) and are compatible with previous 6.0 versions.

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with “#” are only supported at the beginning of the line.

Options

| Parameter    | Description                                       |
|--------------|---|
| -V --version | Print the plugin version and license information. |
| -h --help    | Print help information (shorthand).               |

Parameters

**Note:**

In Zabbix versions before 6.0.10, parameter names start with *Plugins.Postgres.<Parameter>* instead of *Plugins.PostgreSQL.<Parameter>*. For example, *Plugins.Postgres.KeepAlive*.

| Parameter                              | Mandatory   | Range | Default        | Description   |
|--|---|-------|----------------|---|
| Plugins.PostgreSQL.Default.CacheMode   |   |       | prepare        | Cache mode for the PostgreSQL connection.<br>Supported values:<br><i>prepare</i> (default) - will create prepared statements on the PostgreSQL server;<br><i>describe</i> - will use the anonymous prepared statement to describe a statement without creating a statement on the server.<br>Note that “describe” is primarily useful when the environment does not allow prepared statements such as when running a connection pooler like PgBouncer.<br>Supported since version 6.0.25. |
| Plugins.PostgreSQL.CallTimeout         |   | 1-30  | global timeout | Maximum wait time (in seconds) for a request to be completed.   |
| Plugins.PostgreSQL.CustomQueriesPath   |   |       | disabled       | Full pathname of the directory containing .sql files with custom queries.   |
| Plugins.PostgreSQL.Default.Database    |   |       |                | Default database for connecting to PostgreSQL; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18.  |
| Plugins.PostgreSQL.Default.Password    |   |       |                | Default password for connecting to PostgreSQL; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18.  |
| Plugins.PostgreSQL.Default.TLSCAFile   | (yes, if Plugins.PostgreSQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> ) |       |                | Full pathname of a file containing the top-level CA(s) certificate for peer certificate verification for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session.<br>Supported since version 6.0.18.  |
| Plugins.PostgreSQL.Default.TLSCertFile | (yes, if Plugins.PostgreSQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> ) |       |                | Full pathname of a file containing the PostgreSQL certificate or certificate chain for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session.<br>Supported since version 6.0.18.  |

| Parameter   | Mandatory  | Range  | Default | Description  |
|---|--|--------|---------|--|
| Plugins.PostgreSQL.Default.TLSConnect               |  |        |         | Encryption type for communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session.<br>Supported values:<br><i>required</i> - connect using TLS as transport mode without identity checks;<br><i>verify_ca</i> - connect using TLS and verify certificate;<br><i>verify_full</i> - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate.<br>Undefined encryption type means unencrypted connection.<br>Supported since version 6.0.18.                |
| Plugins.PostgreSQL.Default.TLSKeyFile               | (yes, if Plugins.PostgreSQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> )                |        |         | Full pathname of a file containing the PostgreSQL private key for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session.<br>Supported since version 6.0.18.  |
| Plugins.PostgreSQL.Default.Uri                      |  |        |         | Default URI for connecting to PostgreSQL; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: <i>tcp</i> , <i>unix</i> .<br>Examples: <i>tcp://127.0.0.1:5432</i><br><i>tcp://localhost</i><br><i>unix:/var/run/postgresql/.s.PGSQL.5432</i><br>Supported since version 6.0.18.  |
| Plugins.PostgreSQL.Default.User                     |  |        |         | Default username for connecting to PostgreSQL; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18.   |
| Plugins.PostgreSQL.KeepAlive                        |  | 60-900 | 300     | Maximum time of waiting (in seconds) before unused plugin connections are closed.  |
| Plugins.PostgreSQL.Sessions.<SessionName>.CacheMode |  |        |         | Cache mode for the PostgreSQL connection.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br>Supported values:<br><i>prepare</i> (default) - will create prepared statements on the PostgreSQL server;<br><i>describe</i> - will use the anonymous prepared statement to describe a statement without creating a statement on the server.<br>Note that "describe" is primarily useful when the environment does not allow prepared statements such as when running a connection pooler like PgBouncer.<br>Supported since version 6.0.25. |
| Plugins.PostgreSQL.Sessions.<SessionName>.Database  |  |        |         | Database for session connection.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.PostgreSQL.Sessions.<SessionName>.Password  |  |        |         | Password for session connection.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSCAFile | (yes, if Plugins.PostgreSQL.Sessions.<SessionName>.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> ) |        |         | Full pathname of a file containing the top-level CA(s) certificate peer certificate verification.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |

| Parameter   | Mandatory   | Range | Default        | Description   |
|---|---|-------|----------------|---|
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSCertFile | ins.PostgreSQL.Sessions.<SessionName>.TLSCertFile is specified                                    |       |                | Full pathname of a file containing the PostgreSQL certificate and certificate chain.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSKeyFile  | ins.PostgreSQL.Sessions.<SessionName>.TLSKeyFile is specified                                     |       |                | Full pathname of a file containing the PostgreSQL private key.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSConnect  | ins.PostgreSQL.Sessions.<SessionName>.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i> |       |                | Encryption type for PostgreSQL connection.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Supported values:<br><i>required</i> - connect using TLS as transport mode without identity checks;<br><i>verify_ca</i> - connect using TLS and verify certificate;<br><i>verify_full</i> - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate.<br>Undefined encryption type means unencrypted connection. |
| Plugins.PostgreSQL.Sessions.<SessionName>.Uri         | ins.PostgreSQL.Sessions.<SessionName>.Uri is specified  |       |                | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: <i>tcp</i> , <i>unix</i> .<br>Examples: <i>tcp://127.0.0.1:5432</i><br><i>tcp://localhost</i><br><i>unix:/var/run/postgresql/.s.PGSQL.5432</i>  |
| Plugins.PostgreSQL.Sessions.<SessionName>.User        | ins.PostgreSQL.Sessions.<SessionName>.User is specified   |       |                | Named session username.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.  |
| Plugins.PostgreSQL.System.Path                        | ins.PostgreSQL.System.Path is specified   |       |                | Path to external plugin executable. Supported since Zabbix 6.0.10.  |
| Plugins.PostgreSQL.Timeout                            | ins.PostgreSQL.Timeout is specified   | 1-30  | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).  |

## 12 Redis plugin

### Overview

This section lists parameters supported in the Redis Zabbix agent 2 plugin configuration file (redis.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

### Parameters

| Parameter                                     | Mandatory | Range  | Default              | Description  |
|---|-----------|--------|----------------------|--|
| Plugins.Redis.Default.Password                |           |        |                      | Default password for connecting to Redis; used if no value is specified in an item key or named session.<br>Supported since version 6.0.18   |
| Plugins.Redis.Default.Uri                     |           |        | tcp://localhost:6379 | Default URI for connecting to Redis; used if no value is specified in an item key or named session.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: tcp, unix; a scheme can be omitted (since version 5.2.3).<br>A port can be omitted (default=6379).<br>Examples: tcp://localhost:6379<br>localhost<br>unix:/var/run/redis.sock<br>Supported since version 6.0.18 |
| Plugins.Redis.KeepAlive                       |           | 60-900 | 300                  | The maximum time of waiting (in seconds) before unused plugin connections are closed.  |
| Plugins.Redis.Sessions.<SessionName>.Password |           |        |                      | Named session password.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.   |
| Plugins.Redis.Sessions.<SessionName>.Uri      |           |        |                      | Connection string of a named session.<br><b>&lt;SessionName&gt;</b> - define name of a session for using in item keys.<br><br>Should not include embedded credentials (they will be ignored).<br>Must match the URI format.<br>Supported schemes: tcp, unix; a scheme can be omitted.<br>A port can be omitted (default=6379).<br>Examples: tcp://localhost:6379<br>localhost<br>unix:/var/run/redis.sock                                      |
| Plugins.Redis.Timeout                         |           | 1-30   | global timeout       | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down).   |

## 13 SMART plugin

### Overview

This section lists parameters supported in the SMART Zabbix agent 2 plugin configuration file (smart.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- The path to the `smartctl` executable must be set either by adding its directory to the system's `PATH` environment variable or by configuring `Plugins.Smart.Path`; this applies to both Linux and Windows;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter                          | Mandatory | Range | Default               | Description  |
|------------------------------------|-----------|-------|-----------------------|--|
| <code>Plugins.Smart.Path</code>    |           |       | <code>smartctl</code> | Path to the <code>smartctl</code> executable.  |
| <code>Plugins.Smart.Timeout</code> |           | 1-30  | global<br>timeout     | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

See also:

- Instructions for configuring [plugins](#)

8 Zabbix Java gateway

If you use `startup.sh` and `shutdown.sh` scripts for starting [Zabbix Java gateway](#), then you can specify the necessary configuration parameters in the `settings.sh` file. The startup and shutdown scripts source the settings file and take care of converting shell variables (listed in the first column) to Java properties (listed in the second column).

If you start Zabbix Java gateway manually by running `java` directly, then you specify the corresponding Java properties on the command line.

| Variable                     | Property                           | Mandatory | Range      | Default                           | Description  |
|------------------------------|------------------------------------|-----------|------------|-----------------------------------|--|
| <code>LISTEN_IP</code>       | <code>zabbix.listenIP</code>       | no        |            | 0.0.0.0                           | IP address to listen on.   |
| <code>LISTEN_PORT</code>     | <code>zabbix.listenPort</code>     | no        | 1024-32767 | 10052                             | Port to listen on.   |
| <code>PID_FILE</code>        | <code>zabbix.pidFile</code>        | no        |            | <code>/tmp/zabbix_java.pid</code> | Name of PID file. If omitted, Zabbix Java Gateway is started as a console application.   |
| <code>PROPERTIES_FILE</code> | <code>zabbix.propertiesFile</code> | no        |            |                                   | Name of properties file. Can be used to set additional properties using a key-value format in such a way that they are not visible on a command line or to overwrite existing ones. For example:<br><code>"javax.net.ssl.trustStorePassword=&lt;password&gt;"</code> |
| <code>START_POLLERS</code>   | <code>zabbix.startPollers</code>   | no        | 1-1000     | 5                                 | Number of worker threads to start.   |
| <code>TIMEOUT</code>         | <code>zabbix.timeout</code>        | no        | 1-30       | 3                                 | How long to wait for network operations.   |

**Warning:**  
Port 10052 is not [IANA registered](#).

9 Zabbix web service

Overview

Zabbix web service is a process that is used for communication with external web services.

This section lists parameters supported in Zabbix web service configuration file (zabbix\_web\_service.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Zabbix supports configuration files only in UTF-8 encoding without BOM;
- Comments starting with “#” are only supported at the beginning of the line.

#### Parameters

| Parameter   | Mandatory  | Range                   | Default     | Description   |
|-------------|--|-------------------------|-------------|---|
| AllowedIP   | yes  |                         |             | List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. Incoming connections will be accepted only from the hosts listed here.<br>If IPv6 support is enabled then 127.0.0.1, ::127.0.0.1, ::ffff:127.0.0.1 are treated equally and ::/0 will allow any IPv4 or IPv6 address.<br>0.0.0.0/0 can be used to allow any IPv4 address.<br>Example:<br>127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com |
| DebugLevel  | no   | 0-5                     | 3           | Specifies debug level:<br>0 - basic information about starting and stopping of Zabbix processes<br>1 - critical information<br>2 - error information<br>3 - warnings<br>4 - for debugging (produces lots of information)<br>5 - extended debugging (produces even more information)   |
| ListenPort  | no   | 1024-32767              | 10053       | The port service listens on for connections from the server.  |
| LogFile     | yes, if LogType is set to <i>file</i> , otherwise no |                         |             | Log file name for LogType 'file' parameter.<br>Example: /tmp/zabbix_web_service.log   |
| LogFileSize | no   | 0-1024                  | 1           | Maximum size of log file in MB.<br>0 - disable automatic log rotation.  |
| LogType     | no   | system / file / console | file        | Specifies where log messages are written to:<br><i>system</i> - syslog<br><i>file</i> - file specified with LogFile parameter<br><i>console</i> - standard output   |
| Timeout     | no   | 1-30                    | 3           | Spend no more than Timeout seconds on processing.   |
| TLSAccept   | no   | unencrypted / cert      | unencrypted | Specifies what type of connection to use:<br><i>unencrypted</i> - accept connections without encryption (default)<br><i>cert</i> - accept connections with TLS and a certificate  |
| TLSCAFile   | no   |                         |             | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.   |
| TLSCertFile | no   |                         |             | Full pathname of a file containing the service certificate or certificate chain, used for encrypted communications with Zabbix components.  |
| TLSKeyFile  | no   |                         |             | Full pathname of a file containing the service private key used for encrypted communications with Zabbix components.  |

## 10 Inclusion

### Overview

Additional files or directories can be included into server/proxy/agent configuration using the Include parameter.

#### Notes on inclusion

If the Include parameter is used for including a file, the file must be readable.

If the Include parameter is used for including a directory:

- All files in the directory must be readable.
- No particular order of inclusion should be assumed (e.g. files are not included in alphabetical order). Therefore do not define one parameter in several "Include" files (e.g. to override a general setting with a specific one).
- All files in the directory are included into configuration.
- Beware of file backup copies automatically created by some text editors. For example, if editing the "include/my\_specific.conf" file produces a backup copy "include/my\_specific\_conf.BAK" then both files will be included. Move "include/my\_specific\_conf.BAK" out of the "Include" directory. On Linux, contents of the "Include" directory can be checked with a "ls -al" command for unnecessary files.

If the Include parameter is used for including files using a pattern:

- All files matching the pattern must be readable.
- No particular order of inclusion should be assumed (e.g. files are not included in alphabetical order). Therefore do not define one parameter in several "Include" files (e.g. to override a general setting with a specific one).

### 3 Protocols

Please use the sidebar to access content in this section.

#### 1 Server-proxy data exchange protocol

Overview

Server - proxy data exchange is based on JSON format.

Request and response messages must begin with **header and data length**.

Passive proxy

Proxy config request

The proxy config request is sent by server to provide proxy configuration data. This request is sent every ProxyConfigFrequency (server configuration parameter) seconds.

| name                 | value type           | description   |
|----------------------|----------------------|---|
| server→proxy:        |                      |   |
| <b>request</b>       | <i>string</i>        | 'proxy config'  |
| <b>&lt;table&gt;</b> | <i>object</i>        | One or more objects with <table> data.                                  |
| <b>fields</b>        | <i>array</i>         | Array of field names.   |
| -                    | <i>string</i>        | Field name.   |
| <b>data</b>          | <i>array</i>         | Array of rows.  |
| -                    | <i>array</i>         | Array of columns.   |
| -                    | <i>string,number</i> | Column value with type depending on the column type in database schema. |
| proxy→server:        |                      |   |
| <b>response</b>      | <i>string</i>        | Request success information ('success' or 'failed').                    |
| <b>version</b>       | <i>string</i>        | Proxy version (<major>.<minor>.<build>).                                |

Example:

server→proxy:

```

{
  "request": "proxy config",
  "globalmacro":{
    "fields": [
      "globalmacroid",
      "macro",
      "value"
    ],
    "data": [
      [
        2,

```

```

        "${SNMP_COMMUNITY}",
        "public"
    ]
}
},
"hosts":{
    "fields":[
        "hostid",
        "host",
        "status",
        "ipmi_authtype",
        "ipmi_privilege",
        "ipmi_username",
        "ipmi_password",
        "name",
        "tls_connect",
        "tls_accept",
        "tls_issuer",
        "tls_subject",
        "tls_psk_identity",
        "tls_psk"
    ],
    "data":[

            1,
            1,
            "127.0.0.1",
            "",
            "10050",
            1
        ]
    ]
},
...
}

```

proxy→server:

```

{
    "response": "success",
    "version": "6.0.0"
}

```

#### Proxy request

The proxy data request is used to obtain host interface availability, historical, discovery and autoregistration data from proxy. This request is sent every ProxyDataFrequency (server configuration parameter) seconds.

| name                            | value type    | description   |
|---------------------------------|---------------|---|
| server→proxy:<br><b>request</b> | <i>string</i> | 'proxy data'  |
| proxy→server:<br><b>session</b> | <i>string</i> | Data session token.   |
| <b>interface</b>                | <i>array</i>  | ( <i>optional</i> ) Array of interface availability data objects. |
| <b>avail-<br/>abil-<br/>ity</b> |               |   |
| <b>interfaceid</b>              | <i>number</i> | Interface identifier.   |

| name                     | value type    | description   |
|--------------------------|---------------|---|
| <b>available</b>         | <i>number</i> | Interface availability:<br><br><b>0</b> , <i>INTERFACE_AVAILABLE_UNKNOWN</i> - unknown<br><b>1</b> , <i>INTERFACE_AVAILABLE_TRUE</i> - available<br><b>2</b> , <i>INTERFACE_AVAILABLE_FALSE</i> - unavailable   |
| <b>error</b>             | <i>string</i> | Interface error message or empty string.  |
| <b>history data</b>      | <i>array</i>  | ( <i>optional</i> ) Array of history data objects.  |
| <b>itemid</b>            | <i>number</i> | Item identifier.  |
| <b>clock</b>             | <i>number</i> | Item value timestamp (seconds).   |
| <b>ns</b>                | <i>number</i> | Item value timestamp (nanoseconds).   |
| <b>value</b>             | <i>string</i> | ( <i>optional</i> ) Item value.   |
| <b>id</b>                | <i>number</i> | Value identifier (ascending counter, unique within one data session).   |
| <b>timestamp</b>         | <i>number</i> | ( <i>optional</i> ) Timestamp of log type items.  |
| <b>source</b>            | <i>string</i> | ( <i>optional</i> ) Eventlog item source value.   |
| <b>severity</b>          | <i>number</i> | ( <i>optional</i> ) Eventlog item severity value.   |
| <b>eventid</b>           | <i>number</i> | ( <i>optional</i> ) Eventlog item eventid value.  |
| <b>state</b>             | <i>string</i> | ( <i>optional</i> ) Item state:<br><b>0</b> , <i>ITEM_STATE_NORMAL</i><br><b>1</b> , <i>ITEM_STATE_NOTSUPPORTED</i>   |
| <b>lastlogsize</b>       | <i>number</i> | ( <i>optional</i> ) Last log size of log type items.  |
| <b>mtime</b>             | <i>number</i> | ( <i>optional</i> ) Modification time of log type items.  |
| <b>discovery data</b>    | <i>array</i>  | ( <i>optional</i> ) Array of discovery data objects.  |
| <b>clock</b>             | <i>number</i> | Discovery data timestamp.   |
| <b>druleid</b>           | <i>number</i> | Discovery rule identifier.  |
| <b>dcheckid</b>          | <i>number</i> | Discovery check identifier or null for discovery rule data.   |
| <b>type</b>              | <i>number</i> | Discovery check type:<br><br><b>-1</b> discovery rule data<br><b>0</b> , <i>SVC_SSH</i> - SSH service check<br><b>1</b> , <i>SVC_LDAP</i> - LDAP service check<br><b>2</b> , <i>SVC_SMTP</i> - SMTP service check<br><b>3</b> , <i>SVC_FTP</i> - FTP service check<br><b>4</b> , <i>SVC_HTTP</i> - HTTP service check<br><b>5</b> , <i>SVC_POP</i> - POP service check<br><b>6</b> , <i>SVC_NNTP</i> - NNTP service check<br><b>7</b> , <i>SVC_IMAP</i> - IMAP service check<br><b>8</b> , <i>SVC_TCP</i> - TCP port availability check<br><b>9</b> , <i>SVC_AGENT</i> - Zabbix agent<br><b>10</b> , <i>SVC_SNMPv1</i> - SNMPv1 agent<br><b>11</b> , <i>SVC_SNMPv2</i> - SNMPv2 agent<br><b>12</b> , <i>SVC_ICMPPING</i> - ICMP ping<br><b>13</b> , <i>SVC_SNMPv3</i> - SNMPv3 agent<br><b>14</b> , <i>SVC_HTTPS</i> - HTTPS service check<br><b>15</b> , <i>SVC_TELNET</i> - Telnet availability check |
| <b>ip</b>                | <i>string</i> | Host IP address.  |

## Active proxy

### Proxy heartbeat request

The proxy heartbeat request is sent by proxy to report that proxy is running. This request is sent every HeartbeatFrequency (proxy configuration parameter) seconds.

| name            | value type    | description  |
|-----------------|---------------|--|
| proxy→server:   |               |  |
| <b>request</b>  | <i>string</i> | 'proxy heartbeat'                                    |
| <b>host</b>     | <i>string</i> | Proxy name.  |
| <b>version</b>  | <i>string</i> | Proxy version (<major>.<minor>.<build>).             |
| server→proxy:   |               |  |
| <b>response</b> | <i>string</i> | Request success information ('success' or 'failed'). |

proxy→server:

```

{
  "request": "proxy heartbeat",
  "host": "Proxy #12",
  "version": "5.4.0"
}

```

server→proxy:

```

{
  "response": "success"
}

```

### Proxy config request

The proxy config request is sent by proxy to obtain proxy configuration data. This request is sent every ConfigFrequency (proxy configuration parameter) seconds.

| name                 | value type           | description   |
|----------------------|----------------------|---|
| proxy→server:        |                      |   |
| <b>request</b>       | <i>string</i>        | 'proxy config'  |
| <b>host</b>          | <i>string</i>        | Proxy name.   |
| <b>version</b>       | <i>string</i>        | Proxy version (<major>.<minor>.<build>).                                |
| server→proxy:        |                      |   |
| <b>request</b>       | <i>string</i>        | 'proxy config'  |
| <b>&lt;table&gt;</b> | <i>object</i>        | One or more objects with <table> data.                                  |
| <b>fields</b>        | <i>array</i>         | Array of field names.   |
| -                    | <i>string</i>        | Field name.   |
| <b>data</b>          | <i>array</i>         | Array of rows.  |
| -                    | <i>array</i>         | Array of columns.   |
| -                    | <i>string,number</i> | Column value with type depending on the column type in database schema. |
| proxy→server:        |                      |   |
| <b>response</b>      | <i>string</i>        | Request success information ('success' or 'failed').                    |

### Example:

proxy→server:

```

{
  "request": "proxy config",

```

```

"host": "Proxy #12",
"version": "5.4.0"
}

```

server→proxy:

#### Proxy data request

The proxy data request is sent by proxy to provide host interface availability, history, discovery and autoregistration data. This

request is sent every DataSenderFrequency (proxy configuration parameter) seconds. Note that active proxy will still poll Zabbix server every second for remote command tasks (with an empty proxy data request).

| name                            | value type    | description   |
|---------------------------------|---------------|---|
| proxy→server:                   |               |   |
| <b>request</b>                  | <i>string</i> | 'proxy data'  |
| <b>host</b>                     | <i>string</i> | Proxy name.   |
| <b>session</b>                  | <i>string</i> | Data session token.   |

| <b>source</b>                   | <i>string</i> | (optional) Eventlog item source value.  |
| <b>severity</b>                 | <i>number</i> | (optional) Eventlog item severity value.  |
| <b>eventid</b>                  | <i>number</i> | (optional) Eventlog item eventid value.   |
| <b>state</b>                    | <i>string</i> | (optional) Item state:<br><b>0</b> , <i>ITEM_STATE_NORMAL</i><br><b>1</b> , <i>ITEM_STATE_NOTSUPPORTED</i>  |
| <b>lastlogsize</b>              | <i>number</i> | (optional) Last log size of log type items.   |
| <b>mtime</b>                    | <i>number</i> | (optional) Modification time of log type items.   |
| <b>discovery</b>                | <i>array</i>  | (optional) Array of discovery data objects.   |
| <b>data</b>                     |               |   |
| <b>clock</b>                    | <i>number</i> | Discovery data timestamp.   |
| <b>druleid</b>                  | <i>number</i> | Discovery rule identifier.  |
| <b>dcheckid</b>                 | <i>number</i> | Discovery check identifier or null for discovery rule data.   |
| <b>type</b>                     | <i>number</i> | Discovery check type:<br><br><b>-1</b> discovery rule data<br><b>0</b> , <i>SVC_SSH</i> - SSH service check<br><b>1</b> , <i>SVC_LDAP</i> - LDAP service check<br><b>2</b> , <i>SVC_SMTP</i> - SMTP service check<br><b>3</b> , <i>SVC_FTP</i> - FTP service check<br><b>4</b> , <i>SVC_HTTP</i> - HTTP service check<br><b>5</b> , <i>SVC_POP</i> - POP service check<br><b>6</b> , <i>SVC_NNTP</i> - NNTP service check<br><b>7</b> , <i>SVC_IMAP</i> - IMAP service check<br><b>8</b> , <i>SVC_TCP</i> - TCP port availability check<br><b>9</b> , <i>SVC_AGENT</i> - Zabbix agent<br><b>10</b> , <i>SVC_SNMPv1</i> - SNMPv1 agent<br><b>11</b> , <i>SVC_SNMPv2</i> - SNMPv2 agent<br><b>12</b> , <i>SVC_ICMPPING</i> - ICMP ping<br><b>13</b> , <i>SVC_SNMPv3</i> - SNMPv3 agent<br><b>14</b> , <i>SVC_HTTPS</i> - HTTPS service check<br><b>15</b> , <i>SVC_TELNET</i> - Telnet availability check |
| <b>ip</b>                       | <i>string</i> | Host IP address.  |
| <b>dns</b>                      | <i>string</i> | Host DNS name.  |
| <b>port</b>                     | <i>number</i> | (optional) Service port number.   |

| name                    | value type | description  |
|-------------------------|------------|--|
| <b>key_</b>             | string     | (optional) Item key for discovery check of type <b>9 SVC_AGENT</b>   |
| <b>value</b>            | string     | (optional) Value received from the service, can be empty for most services.  |
| <b>status</b>           | number     | (optional) Service status:<br><br><b>0</b> , <i>DOBJECT_STATUS_UP</i> - Service UP<br><b>1</b> , <i>DOBJECT_STATUS_DOWN</i> - Service DOWN   |
| <b>autoregistration</b> | array      | (optional) Array of autoregistration data objects.   |
| <b>clock</b>            | number     | Autoregistration data timestamp.   |
| <b>host</b>             | string     | Host name.   |
| <b>ip</b>               | string     | (optional) Host IP address.  |
| <b>dns</b>              | string     | (optional) Resolved DNS name from IP address.  |
| <b>port</b>             | string     | (optional) Host port.  |
| <b>host_metadata</b>    | string     | (optional) Host metadata sent by the agent (based on HostMetadata or HostMetadataItem agent configuration parameter).  |
| <b>tasks</b>            | array      | (optional) Array of tasks.   |
| <b>type</b>             | number     | Task type:<br><br><b>0</b> , <i>ZBX_TM_TASK_PROCESS_REMOTE_COMMAND_RESULT</i> - remote command result  |
| <b>status</b>           | number     | Remote-command execution status:<br><br><b>0</b> , <i>ZBX_TM_REMOTE_COMMAND_COMPLETED</i> - remote command completed successfully<br><b>1</b> , <i>ZBX_TM_REMOTE_COMMAND_FAILED</i> - remote command failed  |
| <b>error</b>            | string     | (optional) Error message.  |
| <b>parent_taskid</b>    | number     | Parent task ID.  |
| <b>more</b>             | number     | (optional) 1 - there are more history data to send.  |
| <b>clock</b>            | number     | (optional) Data transfer timestamp (seconds).  |
| <b>ns</b>               | number     | (optional) Data transfer timestamp (nanoseconds).  |
| <b>version</b>          | string     | Proxy version (<major>.<minor>.<build>).   |
| server→proxy:           |            |  |
| <b>response</b>         | string     | Request success information ('success' or 'failed').   |
| <b>upload</b>           | string     | Upload control for historical data (history, autoregistration, host availability, network discovery).<br><br>Possible values:<br><b>enabled</b> - normal operation<br><b>disabled</b> - server is not accepting data (possibly due to internal cache over limit)   |
| <b>tasks</b>            | array      | (optional) Array of tasks.   |
| <b>type</b>             | number     | Task type:<br><br><b>1</b> , <i>ZBX_TM_TASK_PROCESS_REMOTE_COMMAND</i> - remote command  |
| <b>clock</b>            | number     | Task creation time.  |
| <b>ttd</b>              | number     | Time in seconds after which the task expires.  |
| <b>commandtype</b>      | number     | Remote-command type:<br><br><b>0</b> , <i>ZBX_SCRIPT_TYPE_CUSTOM_SCRIPT</i> - use custom script<br><b>1</b> , <i>ZBX_SCRIPT_TYPE_IPMI</i> - use IPMI<br><b>2</b> , <i>ZBX_SCRIPT_TYPE_SSH</i> - use SSH<br><b>3</b> , <i>ZBX_SCRIPT_TYPE_TELNET</i> - use Telnet<br><b>4</b> , <i>ZBX_SCRIPT_TYPE_GLOBAL_SCRIPT</i> - use global script (currently functionally equivalent to custom script) |
| <b>command</b>          | string     | Remote command to execute.   |
| <b>execute_on</b>       | number     | Execution target for custom scripts:<br><br><b>0</b> , <i>ZBX_SCRIPT_EXECUTE_ON_AGENT</i> - execute script on agent<br><b>1</b> , <i>ZBX_SCRIPT_EXECUTE_ON_SERVER</i> - execute script on server<br><b>2</b> , <i>ZBX_SCRIPT_EXECUTE_ON_PROXY</i> - execute script on proxy  |
| <b>port</b>             | number     | (optional) Port for Telnet and SSH commands.   |
| <b>authtype</b>         | number     | (optional) Authentication type for SSH commands.   |

| name                 | value type    | description                                       |
|----------------------|---------------|---|
| <b>username</b>      | <i>string</i> | (optional) User name for Telnet and SSH commands. |
| <b>password</b>      | <i>string</i> | (optional) Password for Telnet and SSH commands.  |
| <b>publickey</b>     | <i>string</i> | (optional) Public key for SSH commands.           |
| <b>privatekey</b>    | <i>string</i> | (optional) Private key for SSH commands.          |
| <b>parent_taskid</b> | <i>number</i> | Parent task ID.                                   |
| <b>hostid</b>        | <i>number</i> | Target host ID.                                   |

## 2 Zabbix agent protocol

Please refer to [Passive and active agent checks](#) page for more information.

## 3 Zabbix agent 2 protocol

Overview

This section provides information on:

- Agent2 -> Server : active checks request
- Server -> Agent2 : active checks response
- Agent2 -> Server : agent data request
- Server -> Agent2 : agent data response

#### Active checks request

The active checks request is used to obtain the active checks to be processed by agent. This request is sent by the agent upon start and then with *RefreshActiveChecks* intervals.

| Field         | Type   | Mandatory | Value   |
|---------------|--------|-----------|---|
| request       | string | yes       | active checks   |
| host          | string | yes       | Host name.  |
| version       | string | yes       | The agent version: <major>.<minor>.   |
| host_metadata | string | no        | The configuration parameter HostMetadata or HostMetadataItem metric value.                |
| interface     | string | no        | The configuration parameter HostInterface or HostInterfaceItem metric value.              |
| ip            | string | no        | The configuration parameter ListenIP first IP if set.                                     |
| port          | number | no        | The configuration parameter ListenPort value if set and not default agent listening port. |

Example:

```
{
  "request": "active checks",
  "host": "Zabbix server",
  "version": "6.0",
  "host_metadata": "mysql,nginx",
  "hostinterface": "zabbix.server.lan",
  "ip": "159.168.1.1",
  "port": 12050
}
```

#### Active checks response

The active checks response is sent by the server back to agent after processing active checks request.

| Field           | Type                     | Mandatory | Value   |
|-----------------|--------------------------|-----------|---|
| response        | string                   | yes       | success   failed                                    |
| info            | string                   | no        | Error information in the case of failure.           |
| data            | array<br>of ob-<br>jects | no        | Active check items.                                 |
| key             | string                   | no        | Item key with expanded macros.                      |
| itemid          | number                   | no        | Item identifier.                                    |
| delay           | string                   | no        | Item update interval.                               |
| lastlogsize     | number                   | no        | Item lastlogsize.                                   |
| mtime           | number                   | no        | Item mtime.   |
| regexp          | array<br>of ob-<br>jects | no        | Global regular expressions.                         |
| name            | string                   | no        | Global regular expression name.                     |
| expression      | string                   | no        | Global regular expression.                          |
| expression_type | number                   | no        | Global regular expression type.                     |
| exp_delimiter   | string                   | no        | Global regular expression delimiter.                |
| case_sensitive  | number                   | no        | Global regular expression case sensitivity setting. |

Example:

```
{
  "response": "success",
  "data": [
    {
      "key": "log[/home/zabbix/logs/zabbix_agentd.log]",
      "itemid": 1234,
      "delay": "30s",
      "lastlogsize": 0,
      "mtime": 0
    },
    {
      "key": "agent.version",
      "itemid": 5678,
      "delay": "10m",
      "lastlogsize": 0,
      "mtime": 0
    }
  ]
}
```

#### Agent data request

The agent data request contains the gathered item values.

| Field       | Type             | Mandatory | Value   |
|-------------|------------------|-----------|---|
| request     | string           | yes       | agent data  |
| host        | string           | yes       | Host name.  |
| version     | string           | yes       | The agent version: <major>.<minor>.   |
| session     | string           | yes       | Unique session identifier generated each time when agent is started.  |
| data        | array of objects | yes       | Item values.  |
| id          | number           | yes       | The value identifier (incremental counter used for checking duplicated values in the case of network problems). |
| itemid      | number           | yes       | Item identifier.  |
| value       | string           | no        | The item value.   |
| lastlogsize | number           | no        | The item lastlogsize.   |
| mtime       | number           | no        | The item mtime.   |
| state       | number           | no        | The item state.   |
| source      | string           | no        | The value event log source.   |
| eventid     | number           | no        | The value event log eventid.  |
| severity    | number           | no        | The value event log severity.   |
| timestamp   | number           | no        | The value event log timestamp.  |
| clock       | number           | yes       | The value timestamp (seconds since Epoch).  |
| ns          | number           | yes       | The value timestamp nanoseconds.  |

Example:

```
{
  "request": "agent data",
  "data": [
    {
      "id": 1,
      "itemid": 5678,
      "value": "2.4.0",
      "clock": 1400675595,
      "ns": 76808644
    },
    {
      "id": 2,
      "itemid": 1234,
      "lastlogsize": 112,
      "value": " 19845:20140621:141708.521 Starting Zabbix Agent [hostname>]. Zabbix 2.4.0 (revision 5000"
    }
  ]
}
```

```

    "clock": 1400675595,
    "ns": 77053975
  }
],
"host": "Zabbix server",
"version": "6.0",
"session": "1234456akdsjhfoi"
}

```

Agent data response

The agent data response is sent by the server back to agent after processing the agent data request.

| Field    | Type          | Mandatory | Value                    |
|----------|---------------|-----------|--------------------------|
| response | <i>string</i> | yes       | success   failed         |
| info     | <i>string</i> | yes       | Item processing results. |

Example:

```

{
  "response": "success",
  "info": "processed: 2; failed: 0; total: 2; seconds spent: 0.003534"
}

```

#### 4 Zabbix agent 2 plugin protocol

Zabbix agent 2 protocol is based on code, size and data model.

Code

| Type | Size | Comments  |
|------|------|---|
| Byte | 4    | Payload type, currently only JSON is supported. |

Size

| Type | Size | Comments                              |
|------|------|---------------------------------------|
| Byte | 4    | Size of the current payload in bytes. |

Payload data

| Type | Size                             | Comments             |
|------|----------------------------------|----------------------|
| Byte | Defined by the <i>Size</i> field | JSON formatted data. |

Payload data definition

Common data

These parameters are present in all requests/responses:

| Name | Type   | Comments  |
|------|--------|---|
| id   | uint32 | For requests - the incrementing identifier used to link requests with responses. Unique within a request direction (i.e. from agent to plugin or from plugin to agent). |
| type | uint32 | For responses - ID of the corresponding request. The request type.  |

Log request

A request sent by a plugin to write a log message into the agent log file.

|           |                |
|-----------|----------------|
| direction | plugin → agent |
| response  | no             |

Parameters specific to log requests:

| Name     | Type   | Comments                          |
|----------|--------|-----------------------------------|
| severity | uint32 | The message severity (log level). |
| message  | string | The message to log.               |

*Example:*

```
{"id":0,"type":1,"severity":3,"message":"message"}
```

Register request

A request sent by the agent during the agent startup phase to obtain provided metrics to register a plugin.

|           |                |
|-----------|----------------|
| direction | agent → plugin |
| response  | yes            |

Parameters specific to register requests:

| Name    | Type   | Comments                             |
|---------|--------|--------------------------------------|
| version | string | The protocol version <major>.<minor> |

*Example:*

```
{"id":1,"type":2,"version":"1.0"}
```

Register response

Plugin's response to the register request.

|           |                |
|-----------|----------------|
| direction | plugin → agent |
| response  | n/a            |

Parameters specific to register responses:

| Name       | Type                        | Comments   |
|------------|-----------------------------|--|
| name       | string                      | The plugin name.   |
| metrics    | array of strings (optional) | The metrics with descriptions as used in the plugin. Returns RegisterMetrics(). Absent if error is returned. |
| interfaces | uint32 (optional)           | The bit mask of plugin's supported interfaces. Absent if error is returned.                                  |
| error      | string (optional)           | An error message returned if a plugin cannot be started. Absent, if metrics are returned.                    |

*Examples:*

```
{"id":2,"type":3,"metrics":["external.test", "External exporter Test."], "interfaces": 4}
```

or

```
{"id":2,"type":3,"error":"error message"}
```

## Start request

A request to execute the Start function of the Runner interface.

|           |                |
|-----------|----------------|
| direction | agent → plugin |
| response  | no             |

The request doesn't have specific parameters, it only contains **common data** parameters.

*Example:*

```
{"id":3,"type":4}
```

## Terminate request

A request sent by the agent to shutdown a plugin.

|           |                |
|-----------|----------------|
| direction | agent → plugin |
| response  | no             |

The request doesn't have specific parameters, it only contains **common data** parameters.

*Example:*

```
{"id":3,"type":5}
```

## Export request

A request to execute the Export function of the Exporter interface.

|           |                |
|-----------|----------------|
| direction | agent → plugin |
| response  | no             |

Parameters specific to export requests:

| Name       | Type                        | Comments                            |
|------------|-----------------------------|-------------------------------------|
| key        | string                      | The plugin key.                     |
| parameters | array of strings (optional) | The parameters for Export function. |

*Example:*

```
{"id":4,"type":6,"key":"test.key","parameters":["foo","bar"]}
```

## Export response

Response from the Export function of the Exporter interface.

|           |                |
|-----------|----------------|
| direction | plugin → agent |
| response  | n/a            |

Parameters specific to export responses:

| Name  | Type              | Comments   |
|-------|-------------------|--|
| value | string (optional) | Response value from the Export function. Absent, if error is returned.                                 |
| error | string (optional) | Error message if the Export function has not been executed successfully. Absent, if value is returned. |

*Examples:*

```
{"id":5,"type":7,"value":"response"}
```

or

```
{"id":5,"type":7,"error":"error message"}
```

Configure request

A request to execute the *Configure* function of the *Configurator* interface.

|           |                |
|-----------|----------------|
| direction | agent → plugin |
| response  | n/a            |

Parameters specific to *Configure* requests:

| Name            | Type                   | Comments  |
|-----------------|------------------------|---|
| global_options  | JSON object            | JSON object containing global agent configuration options.                |
| private_options | JSON object (optional) | JSON object containing private plugin configuration options, if provided. |

Example:

```
{"id":6,"type":8,"global_options":{"..."},"private_options":{"..."}}
```

Validate request

A request to execute *Validate* function of the *Configurator* interface.

|           |                |
|-----------|----------------|
| direction | agent → plugin |
| response  | yes            |

Parameters specific to *Validate* requests:

| Name            | Type                   | Comments  |
|-----------------|------------------------|---|
| private_options | JSON object (optional) | JSON object containing private plugin configuration options, if provided. |

Example:

```
{"id":7,"type":9,"private_options":{"..."}}
```

Validate response

Response from *Validate* function of *Configurator* interface.

|           |                |
|-----------|----------------|
| direction | plugin → agent |
| response  | n/a            |

Parameters specific to *Validate* responses:

| Name  | Type              | Comments  |
|-------|-------------------|---|
| error | string (optional) | An error message returned if the <i>Validate</i> function is not executed successfully.<br>Absent if executed successfully. |

Example:

```
{"id":8,"type":10}
```

or

```
{"id":8,"type":10,"error":"error message"}
```

5 Zabbix sender protocol

Please refer to the [trapper item](#) page for more information.

6 Header

Overview

The header is present in all request and response messages between Zabbix components. It is required to determine the message length, if it is compressed or not, if it is a large packet or not.

Zabbix communications protocol has 1GB packet size limit per connection. The limit of 1GB is applied to both the received packet data length and the uncompressed data length.

When sending configuration to Zabbix proxy, the packet size limit is increased to 4GB to allow syncing large configurations. When data length before compression exceeds 4GB, Zabbix server automatically starts using the large packet format (0x04 flag) which increases the packet size limit to 16GB.

Note that while a large packet format can be used for sending any data, currently only the Zabbix proxy configuration syncer can handle packets that are larger than 1GB.

Structure

The header consists of four fields. All numbers in the header are formatted as little-endian.

| Field      | Size | Size<br>(large<br>packet) | Description  |
|------------|------|---------------------------|--|
| <PROTOCOL> | 4    | 4                         | "ZBXD" or 5A 42 58 44  |
| <FLAGS>    | 1    | 1                         | Protocol flags:<br>0x01 - Zabbix communications protocol<br>0x02 - compression<br>0x04 - large packet                |
| <DATALEN>  | 4    | 8                         | Data length.   |
| <RESERVED> | 4    | 8                         | When compression is used (0x02 flag) - the length of uncompressed data<br>When compression is not used - 00 00 00 00 |

Examples

Here are some code snippets showing how to add Zabbix protocol header to the data you want to send in order to obtain the packet you should send to Zabbix so that it is interpreted correctly. These code snippets assume that the data is not larger than 1GB, thus the large packet format is not used.

Python

```
packet = b"ZBXD\1" + struct.pack("<II", len(data), 0) + data
```

or

```
def zbx_create_header(plain_data_size, compressed_data_size=None):
    protocol = b"ZBXD"
    flags = 0x01
    if compressed_data_size is None:
        datalen = plain_data_size
        reserved = 0
    else:
        flags |= 0x02
        datalen = compressed_data_size
        reserved = plain_data_size
    return protocol + struct.pack("<BII", flags, datalen, reserved)

packet = zbx_create_header(len(data)) + data
```

Perl

```
my $packet = "ZBXD\1" . pack("(II)<", length($data), 0) . $data;
```

or

```
sub zbx_create_header($;$)
{
    my $plain_data_size = shift;
    my $compressed_data_size = shift;

    my $protocol = "ZBXD";
    my $flags = 0x01;
    my $datalen;
    my $reserved;

    if (!defined($compressed_data_size))
    {
        $datalen = $plain_data_size;
        $reserved = 0;
    }
    else
    {
        $flags |= 0x02;
        $datalen = $compressed_data_size;
        $reserved = $plain_data_size;
    }

    return $protocol . chr($flags) . pack("(II)<", $datalen, $reserved);
}

my $packet = zbx_create_header(length($data)) . $data;
```

PHP

```
$packet = "ZBXD\1" . pack("VV", strlen($data), 0) . $data;
```

or

```
function zbx_create_header($plain_data_size, $compressed_data_size = null)
{
    $protocol = "ZBXD";
    $flags = 0x01;
    if (is_null($compressed_data_size))
    {
        $datalen = $plain_data_size;
        $reserved = 0;
    }
    else
    {
        $flags |= 0x02;
        $datalen = $compressed_data_size;
        $reserved = $plain_data_size;
    }
    return $protocol . chr($flags) . pack("VV", $datalen, $reserved);
}

$packet = zbx_create_header(strlen($data)) . $data;
```

Bash

```
datalen=$(printf "%08x" ${#data})
datalen="\x${datalen:6:2}\x${datalen:4:2}\x${datalen:2:2}\x${datalen:0:2}"
printf "ZBXD\1${datalen}\0\0\0\0%s" "$data"
```

## 7 Real-time export protocol

This section presents details of the **real-time export** protocol in a newline-delimited JSON format for:

- **trigger events**
- **item values**
- **trends**

All files have a .ndjson extension. Each line of the export file is a JSON object.

Trigger events

The following information is exported for a problem event:

| Field           | Type   | Description   |
|-----------------|--------|---|
| <i>clock</i>    | number | Number of seconds since Epoch to the moment when problem was detected (integer part).                               |
| <i>ns</i>       | number | Number of nanoseconds to be added to <i>clock</i> to get a precise problem detection time.                          |
| <i>value</i>    | number | 1 (always).   |
| <i>eventid</i>  | number | Problem event ID.   |
| <i>name</i>     | string | Problem event name.   |
| <i>severity</i> | number | Problem event severity (0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster).     |
| <i>hosts</i>    | array  | List of hosts involved in the trigger expression; there should be at least one element in array.                    |
| -               | object |   |
| <i>host</i>     | string | Host name.  |
| <i>name</i>     | string | Visible host name.  |
| <i>groups</i>   | array  | List of host groups of all hosts involved in the trigger expression; there should be at least one element in array. |
| -               | string | Host group name.  |
| <i>tags</i>     | array  | List of problem tags (can be empty).  |
| -               | object |   |
| <i>tag</i>      | string | Tag name.   |
| <i>value</i>    | string | Tag value (can be empty).   |

The following information is exported for a recovery event:

| Field            | Type   | Description   |
|------------------|--------|---|
| <i>clock</i>     | number | Number of seconds since Epoch to the moment when problem was resolved (integer part).       |
| <i>ns</i>        | number | Number of nanoseconds to be added to <i>clock</i> to get a precise problem resolution time. |
| <i>value</i>     | number | 0 (always).   |
| <i>eventid</i>   | number | Recovery event ID.  |
| <i>p_eventid</i> | number | Problem event ID.   |

Examples

Problem:

```
{"clock":1519304285,"ns":123456789,"value":1,"name":"Either Zabbix agent is unreachable on Host B or polle
```

Recovery:

```
{"clock":1519304345,"ns":987654321,"value":0,"eventid":43,"p_eventid":42}
```

Problem (multiple problem event generation):

```
{"clock":1519304286,"ns":123456789,"value":1,"eventid":43,"name":"Either Zabbix agent is unreachable on Ho
```

```
{"clock":1519304286,"ns":123456789,"value":1,"eventid":43,"name":"Either Zabbix agent is unreachable on Ho
```

Recovery:

```
{"clock":1519304346,"ns":987654321,"value":0,"eventid":44,"p_eventid":43}
```

```
{"clock":1519304346,"ns":987654321,"value":0,"eventid":44,"p_eventid":42}
```

## Item values

The following information is exported for a collected item value:

| Field            | Type  | Description  |
|------------------|---|--|
| <i>host</i>      | object  | Host name of the item host.  |
| <i>host</i>      | string  | Host name.   |
| <i>name</i>      | string  | Visible host name.   |
| <i>groups</i>    | array   | List of host groups of the item host; there should be at least one element in array.               |
| -                | string  | Host group name.   |
| <i>itemid</i>    | number  | Item ID.   |
| <i>name</i>      | string  | Visible item name.   |
| <i>clock</i>     | number  | Number of seconds since Epoch to the moment when value was collected (integer part).               |
| <i>ns</i>        | number  | Number of nanoseconds to be added to <i>clock</i> to get a precise value collection time.          |
| <i>timestamp</i> | number  | 0 if not available.  |
| (Log only)       |   |  |
| <i>source</i>    | string  | Empty string if not available.   |
| (Log only)       |   |  |
| <i>severity</i>  | number  | 0 if not available.  |
| (Log only)       |   |  |
| <i>eventid</i>   | number  | 0 if not available.  |
| (Log only)       |   |  |
| <i>value</i>     | number (for numeric items) or string (for text items) | Collected item value.  |
| <i>type</i>      | number  | Collected value type:<br>0 - numeric float, 1 - character, 2 - log, 3 - numeric unsigned, 4 - text |

## Examples

Numeric (unsigned) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"itemid":3,"name":"Host B visible"}
```

Numeric (float) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"itemid":4,"name":"Host B visible"}
```

Character, text value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"itemid":2,"name":"Host B visible"}
```

Log value:

```
{"host":{"host":"Host A","name":"Host A visible"},"groups":["Group X","Group Y","Group Z"],"itemid":1,"name":"Host A visible"}
```

## Trends

The following information is exported for a calculated trend value:

| Field         | Type   | Description  |
|---------------|--------|--|
| <i>host</i>   | object | Host name of the item host.  |
| <i>host</i>   | string | Host name.   |
| <i>name</i>   | string | Visible host name.   |
| <i>groups</i> | array  | List of host groups of the item host; there should be at least one element in array. |
| -             | string | Host group name.   |
| <i>itemid</i> | number | Item ID.   |

| Field        | Type   | Description  |
|--------------|--------|--|
| <i>name</i>  | string | Visible item name.   |
| <i>clock</i> | number | Number of seconds since Epoch to the moment when value was collected (integer part). |
| <i>count</i> | number | Number of values collected for a given hour.   |
| <i>min</i>   | number | Minimum item value for a given hour.   |
| <i>avg</i>   | number | Average item value for a given hour.   |
| <i>max</i>   | number | Maximum item value for a given hour.   |
| <i>type</i>  | number | Value type:<br>0 - numeric float, 3 - numeric unsigned                               |

## Examples

Numeric (unsigned) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"itemid":3,"name":"Host B visible"}
```

Numeric (float) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"itemid":4,"name":"Host B visible"}
```

## 4 Items

Please use the sidebar to access content in this section.

## 1 Items supported by platform

The table displays support for Zabbix **agent items** on various platforms:

- Items marked with "X" are supported, the ones marked with "-" are not supported.
- If an item is marked with "?", it is not known whether it is supported or not.
- If an item is marked with "r", it means that it requires root privileges.
- Parameters that are included in angle brackets <like\_this> are optional.

### Note:

Windows-only Zabbix agent items are not included in this table.

|                    |    |    |    |    |   |    |    |    |    |    |    |    |
|--------------------|----|----|----|----|---|----|----|----|----|----|----|----|
| NetBSD             |    |    |    |    |   |    |    |    |    |    |    | ▼▼ |
| OpenBSD            |    |    |    |    |   |    |    |    |    |    | ▼▼ |    |
| Mac                |    |    |    |    |   |    |    |    | ▼▼ |    |    |    |
| OS X               |    |    |    |    |   |    |    |    |    |    |    |    |
| Tru64              |    |    |    |    |   |    |    | ▼▼ |    |    |    |    |
| AIX                |    |    |    |    |   |    | ▼▼ |    |    |    |    |    |
| HP-UX              |    |    |    |    |   | ▼▼ |    |    |    |    |    |    |
| Solaris            |    |    |    | ▼▼ |   |    |    |    |    |    |    |    |
| FreeBSD            |    |    | ▼▼ |    |   |    |    |    |    |    |    |    |
| Linux              |    | ▼▼ |    |    |   |    |    |    |    |    |    |    |
| 2.6                |    |    |    |    |   |    |    |    |    |    |    |    |
| (and later)        |    |    |    |    |   |    |    |    |    |    |    |    |
| Linux              |    | ▼▼ |    |    |   |    |    |    |    |    |    |    |
| 2.4                |    |    |    |    |   |    |    |    |    |    |    |    |
| Windows            | ▼▼ |    |    |    |   |    |    |    |    |    |    |    |

#### Note:

See also a description of **vm.memory.size** parameters.

#### Footnotes

<sup>1</sup> net.if.in, net.if.out and net.if.total items do not provide statistics of loopback interfaces (e.g. lo0).

<sup>2</sup> These values for these items are not supported for loopback interfaces on Solaris systems up to and including Solaris 10 6/06 as byte, error and utilization statistics are not stored and/or reported by the kernel. However, if you're monitoring a Solaris system via net-snmp, values may be returned as net-snmp carries legacy code from the cmu-snmp dated as old as 1997 that, upon failing to read byte values from the interface statistics returns the packet counter (which does exist on loopback interfaces) multiplied by an arbitrary value of 308. This makes the assumption that the average length of a packet is 308 octets, which is a very rough estimation as the MTU limit on Solaris systems for loopback interfaces is 8892 bytes.

These values should not be assumed to be correct or even closely accurate. They are guesstimates. The Zabbix agent does not do any guess work, but net-snmp will return a value for these fields.

<sup>3</sup> The command line on Solaris, obtained from /proc/pid/psinfo, is limited to 80 bytes and contains the command line as it was when the process was started.

<sup>4</sup> Not supported on Windows Event Log.

<sup>5</sup> On Windows XP vfs.file.time[file,change] may be equal to vfs.file.time[file,access].

<sup>6</sup> Supported only by Zabbix agent 2; not supported by Zabbix agent.

<sup>7</sup> Supported only by Zabbix agent 2 on 64-bit Windows; not supported by Zabbix agent.

## 2 vm.memory.size parameters

### Overview

This section provides some parameter details for the **vm.memory.size[<mode>]** agent item.

## Parameters

The following parameters are available for this item:

- **active** - memory currently in use or very recently used, and so it is in RAM
- **anon** - memory not associated with a file (cannot be re-read from it)
- **available** - available memory, calculated differently depending on the platform (see the table below)
- **buffers** - cache for things like file system metadata
- **cached** - cache for various things
- **exec** - executable code, typically from a (program) file
- **file** - cache for contents of recently accessed files
- **free** - memory that is readily available to any entity requesting memory
- **inactive** - memory that is marked as not used
- **pavailable** - 'available' memory as percentage of 'total' (calculated as  $\text{available}/\text{total} \times 100$ )
- **pinned** - same as 'wired'
- **pusd** - 'used' memory as percentage of 'total' (calculated as  $\text{used}/\text{total} \times 100$ )
- **shared** - memory that may be simultaneously accessed by multiple processes
- **slab** - total amount of memory used by the kernel to cache data structures for its own use
- **total** - total physical memory available
- **used** - used memory, calculated differently depending on the platform (see the table below)
- **wired** - memory that is marked to always stay in RAM. It is never moved to disk.

### Warning:

Some of these parameters are platform-specific and might not be available on your platform. See [Items supported by platform](#) for details.

Platform-specific calculation of **available** and **used**:

| Platform                            | "available"   | "used"                  |
|-------------------------------------|---|-------------------------|
| AIX                                 | free + cached   | real memory in use      |
| FreeBSD                             | inactive + cached + free  | active + wired + cached |
| HP UX                               | free  | total - free            |
| Linux<3.14                          | free + buffers + cached   | total - free            |
| Linux 3.14+                         | /proc/meminfo, see "MemAvailable" in Linux kernel   | total - free            |
| (also backported to 3.10 on RHEL 7) | <a href="#">documentation</a> for details.<br>Note that free + buffers + cached is no longer equal to 'available' due to not all the page cache can be freed and low watermark being used in calculation. |                         |
| NetBSD                              | inactive + execpages + file + free  | total - free            |
| OpenBSD                             | inactive + free + cached  | active + wired          |
| OSX                                 | inactive + free   | active + wired          |
| Solaris                             | free  | total - free            |
| Win32                               | free  | total - free            |

### Attention:

The sum of `vm.memory.size[used]` and `vm.memory.size[available]` does not necessarily equal total. For instance, on FreeBSD:

- \* Active, inactive, wired, cached memories are considered used, because they store some useful information.
- \* At the same time inactive, cached, free memories are considered available, because these kinds of memories can be given instantly to processes that request more memory.

So inactive memory is both used and available simultaneously. Because of this, the `vm.memory.size[used]` item is designed for informational purposes only, while `vm.memory.size[available]` is designed to be used in triggers.

## 3 Passive and active agent checks

Overview

This section provides details on passive and active checks performed by **Zabbix agent**.

Zabbix uses a JSON based communication protocol for communicating with Zabbix agent.

See also: **Zabbix agent 2** protocol details.

#### Passive checks

A passive check is a simple data request. Zabbix server or proxy asks for some data (for example, CPU load) and Zabbix agent sends back the result to the server.

#### Server request

For definition of header and data length please refer to **protocol details**.

<item key>

#### Agent response

<DATA>[\0<ERROR>]

Above, the part in square brackets is optional and is only sent for not supported items.

For example, for supported items:

1. Server opens a TCP connection
2. Server sends **<HEADER><DATALEN>agent.ping**
3. Agent reads the request and responds with **<HEADER><DATALEN>1**
4. Server processes data to get the value, '1' in our case
5. TCP connection is closed

For not supported items:

1. Server opens a TCP connection
2. Server sends **<HEADER><DATALEN>vfs.fs.size[/nono]**
3. Agent reads the request and responds with **<HEADER><DATALEN>ZBX\_NOTSUPPORTED\0Cannot obtain filesystem information: [2] No such file or directory**
4. Server processes data, changes item state to not supported with the specified error message
5. TCP connection is closed

#### Active checks

Active checks require more complex processing. The agent must first retrieve from the server(s) a list of items for independent processing.

The servers to get the active checks from are listed in the 'ServerActive' parameter of the agent **configuration file**. The frequency of asking for these checks is set by the 'RefreshActiveChecks' parameter in the same configuration file. However, if refreshing active checks fails, it is retried after hardcoded 60 seconds.

The agent then periodically sends the new values to the server(s).

#### Note:

If an agent is behind the firewall you might consider using only Active checks because in this case you wouldn't need to modify the firewall to allow initial incoming connections.

#### Getting the list of items

#### Agent request

The active checks request is used to obtain the active checks to be processed by agent. This request is sent by the agent upon start and then with *RefreshActiveChecks* intervals.

```
{
  "request": "active checks",
  "host": "Zabbix server",
  "host_metadata": "mysql,nginx",
  "interface": "zabbix.server.lan",
  "ip": "159.168.1.1",
  "port": 12050
}
```

| Field         | Type          | Mandatory | Value   |
|---------------|---------------|-----------|---|
| request       | <i>string</i> | yes       | active checks   |
| host          | <i>string</i> | yes       | Host name.  |
| host_metadata | <i>string</i> | no        | The configuration parameter HostMetadata or HostMetadataItem metric value.                |
| interface     | <i>string</i> | no        | The configuration parameter HostInterface or HostInterfaceItem metric value.              |
| ip            | <i>string</i> | no        | The configuration parameter ListenIP first IP if set.                                     |
| port          | <i>number</i> | no        | The configuration parameter ListenPort value if set and not default agent listening port. |

## Server response

The active checks response is sent by the server back to agent after processing the active checks request.

```
{
  "response": "success",
  "data": [
    {
      "key": "log[/home/zabbix/logs/zabbix_agentd.log]",
      "key_orig": "log[/home/zabbix/logs/zabbix_agentd.log]",
      "itemid": 1234,
      "delay": 30,
      "lastlogsize": 0,
      "mtime": 0
    },
    {
      "key": "agent.version",
      "key_orig": "agent.version",
      "itemid": 5678,
      "delay": 10,
      "lastlogsize": 0,
      "mtime": 0
    }
  ]
}
```

| Field               | Type                    | Mandatory | Value   |
|---------------------|-------------------------|-----------|---|
| response            | <i>string</i>           | yes       | success   failed                                    |
| info                | <i>string</i>           | no        | Error information in the case of failure.           |
| data                | <i>array of objects</i> | no        | Active check items.                                 |
| key                 | <i>string</i>           | no        | Item key with expanded macros.                      |
| key_orig            | <i>string</i>           | no        | Item key without expanded macros.                   |
| itemid              | <i>number</i>           | no        | Item identifier.                                    |
| delay               | <i>integer</i>          | no        | Item update interval.                               |
| lastlogsize         | <i>number</i>           | no        | Item lastlogsize.                                   |
| mtime               | <i>number</i>           | no        | Item mtime.   |
| refresh_unsupported | <i>number</i>           | no        | Unsupported item refresh interval.                  |
| regexp              | <i>array of objects</i> | no        | Global regular expressions.                         |
| name                | <i>string</i>           | no        | Global regular expression name.                     |
| expression          | <i>string</i>           | no        | Global regular expression.                          |
| expression_type     | <i>number</i>           | no        | Global regular expression type.                     |
| exp_delimiter       | <i>string</i>           | no        | Global regular expression delimiter.                |
| case_sensitive      | <i>number</i>           | no        | Global regular expression case sensitivity setting. |

The server must respond with success.

For example:

1. Agent opens a TCP connection

2. Agent asks for the list of checks
3. Server responds with a list of items (item key, delay)
4. Agent parses the response
5. TCP connection is closed
6. Agent starts periodical collection of data

#### Attention:

Note that (sensitive) configuration data may become available to parties having access to the Zabbix server trapper port when using an active check. This is possible because anyone may pretend to be an active agent and request item configuration data; authentication does not take place unless you use **encryption** options.

Sending in collected data

#### Agent sends

The agent data request contains the gathered item values.

```
{
  "request": "agent data",
  "data": [
    {
      "host": "Zabbix server",
      "key": "agent.version",
      "value": "2.4.0",
      "clock": 1400675595,
      "ns": 76808644
    },
    {
      "host": "Zabbix server",
      "key": "log[/home/zabbix/logs/zabbix_agentd.log]",
      "lastlogsize": 112,
      "value": " 19845:20140621:141708.521 Starting Zabbix Agent [<hostname>]. Zabbix 2.4.0 (revision 5000)",
      "clock": 1400675595,
      "ns": 77053975
    }
  ],
  "session": "1234456akdsjhfoui"
}
```

| Field       | Type             | Mandatory | Value   |
|-------------|------------------|-----------|---|
| request     | string           | yes       | agent data  |
| session     | string           | yes       | Unique session identifier generated each time when agent is started.  |
| data        | array of objects | yes       | Item values.  |
| id          | number           | yes       | The value identifier (incremental counter used for checking duplicated values in the case of network problems). |
| host        | string           | yes       | Host name.  |
| key         | string           | yes       | The item key.   |
| value       | string           | no        | The item value.   |
| lastlogsize | number           | no        | The item lastlogsize.   |
| mtime       | number           | no        | The item mtime.   |
| state       | number           | no        | The item state.   |
| source      | string           | no        | The value event log source.   |
| eventid     | number           | no        | The value event log eventid.  |
| severity    | number           | no        | The value event log severity.   |
| timestamp   | number           | no        | The value event log timestamp.  |
| clock       | number           | yes       | The value timestamp (seconds since Epoch).  |
| ns          | number           | yes       | The value timestamp nanoseconds.  |

A virtual ID is assigned to each value. Value ID is a simple ascending counter, unique within one data session (identified by the session token). This ID is used to discard duplicate values that might be sent in poor connectivity environments.

#### Server response

The agent data response is sent by the server back to agent after processing the agent data request.

```
{
  "response": "success",
  "info": "processed: 2; failed: 0; total: 2; seconds spent: 0.003534"
}
```

| Field    | Type   | Mandatory | Value                    |
|----------|--------|-----------|--------------------------|
| response | string | yes       | success   failed         |
| info     | string | yes       | Item processing results. |

**Attention:**

If sending of some values fails on the server (for example, because host or item has been disabled or deleted), agent will not retry sending of those values.

For example:

1. Agent opens a TCP connection
2. Agent sends a list of values
3. Server processes the data and sends the status back
4. TCP connection is closed

Note how in the example above the not supported status for `vfs.fs.size[/nono]` is indicated by the "state" value of 1 and the error message in "value" property.

**Attention:**

Error message will be trimmed to 2048 symbols on server side.

Older XML protocol

**Note:**

Zabbix will take up to 16 MB of XML Base64-encoded data, but a single decoded value should be no longer than 64 KB otherwise it will be truncated to 64 KB while decoding.

## 4 Trapper items

Overview

Zabbix server uses a JSON- based communication protocol for receiving data from Zabbix sender with the help of **trapper item**.

Request and response messages must begin with **header and data length**.

Zabbix sender request

```
{
  "request": "sender data",
  "data": [
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value"
    }
  ]
}
```

Zabbix server response

```
{
  "response": "success",
  "info": "processed: 1; failed: 0; total: 1; seconds spent: 0.060753"
}
```

Zabbix sender request with a timestamp

Alternatively Zabbix sender can send a request with a timestamp and nanoseconds.

```

{
  "request": "sender data",
  "data": [
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value",
      "clock": 1516710794,
      "ns": 592397170
    },
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value",
      "clock": 1516710795,
      "ns": 192399456
    }
  ],
  "clock": 1516712029,
  "ns": 873386094
}

```

Zabbix server response

```

{
  "response": "success",
  "info": "processed: 2; failed: 0; total: 2; seconds spent: 0.060904"
}

```

## 5 Minimum permission level for Windows agent items

### Overview

When monitoring systems using an agent, a good practice is to obtain metrics from the host on which the agent is installed. To use the principle of least privilege, it is necessary to determine what metrics are obtained from the agent.

The table in this document allows you to select the minimum rights for guaranteed correct operation of Zabbix agent.

If a different user is selected for the agent to work, rather than 'LocalSystem', then for the operation of agent as a Windows service, the new user must have the rights "Log on as a service" from "Local Policy→User Rights Assignment" and the right to create, write and delete the Zabbix agent log file. An Active Directory user must be added to the *Performance Monitor Users* group.

#### Note:

When working with the rights of an agent based on the "minimum technically acceptable" group, prior provision of rights to objects for monitoring is required.

### Common agent items supported on Windows

| Item key         | User group     |   |
|------------------|----------------|---|
|                  | Recommended    | Minimum technically acceptable (functionality is limited) |
| agent.hostname   | Guests         | Guests  |
| agent.ping       | Guests         | Guests  |
| agent.variant    | Guests         | Guests  |
| agent.version    | Guests         | Guests  |
| log              | Administrators | Guests  |
| log.count        | Administrators | Guests  |
| logrt            | Administrators | Guests  |
| logrt.count      | Administrators | Guests  |
| net.dns          | Guests         | Guests  |
| net.dns.record   | Guests         | Guests  |
| net.if.discovery | Guests         | Guests  |
| net.if.in        | Guests         | Guests  |
| net.if.out       | Guests         | Guests  |

| Item key             | User group                |                           |
|----------------------|---------------------------|---------------------------|
| net.if.total         | Guests                    | Guests                    |
| net.tcp.listen       | Guests                    | Guests                    |
| net.tcp.port         | Guests                    | Guests                    |
| net.tcp.service      | Guests                    | Guests                    |
| net.tcp.service.perf | Guests                    | Guests                    |

| vm.vmemory.size   | Guests                    | Guests  |

## 6 Encoding of returned values

Zabbix server expects every returned text value in the UTF8 encoding. This is related to any type of checks: zabbix agent, ssh, telnet, etc.

Different monitored systems/devices and checks can return non-ASCII characters in the value. For such cases, almost all possible zabbix keys contain an additional item key parameter - **<encoding>**. This key parameter is optional but it should be specified if

the returned value is not in the UTF8 encoding and it contains non-ASCII characters. Otherwise the result can be unexpected and unpredictable.

A description of behavior with different database backends in such cases follows.

#### MySQL

If a value contains a non-ASCII character in non UTF8 encoding - this character and the following will be discarded when the database stores this value. No warning messages will be written to the *zabbix\_server.log*.

Relevant for at least MySQL version 5.1.61

#### PostgreSQL

If a value contains a non-ASCII character in non UTF8 encoding - this will lead to a failed SQL query (PGRES\_FATAL\_ERROR:ERROR invalid byte sequence for encoding) and data will not be stored. An appropriate warning message will be written to the *zabbix\_server.log*.

Relevant for at least PostgreSQL version 9.1.3

## 7 Large file support

Large file support, often abbreviated to LFS, is the term applied to the ability to work with files larger than 2 GB on 32-bit operating systems. Since Zabbix 2.0 support for large files has been added. This change affects at least **log file monitoring** and all **vfs.file.\* items**. Large file support depends on the capabilities of a system at Zabbix compilation time, but is completely disabled on a 32-bit Solaris due to its incompatibility with procs and swapctl.

## 8 Sensor

Each sensor chip gets its own directory in the sysfs */sys/devices* tree. To find all sensor chips, it is easier to follow the device symlinks from */sys/class/hwmon/hwmon\**, where *\** is a real number (0,1,2,...).

The sensor readings are located either in */sys/class/hwmon/hwmon\*/* directory for virtual devices, or in */sys/class/hwmon/hwmon\*/device* directory for non-virtual devices. A file, called name, located inside *hwmon\** or *hwmon\*/device* directories contains the name of the chip, which corresponds to the name of the kernel driver used by the sensor chip.

There is only one sensor reading value per file. The common scheme for naming the files that contain sensor readings inside any of the directories mentioned above is: *<type><number>\_<item>*, where

- **type** - for sensor chips is "in" (voltage), "temp" (temperature), "fan" (fan), etc.,
- **item** - "input" (measured value), "max" (high threshold), "min" (low threshold), etc.,
- **number** - always used for elements that can be present more than once (usually starts from 1, except for voltages which start from 0). If files do not refer to a specific element they have a simple name with no number.

The information regarding sensors available on the host can be acquired using **sensor-detect** and **sensors** tools (lm-sensors package: <http://lm-sensors.org/>). **Sensors-detect** helps to determine which modules are necessary for available sensors. When modules are loaded the **sensors** program can be used to show the readings of all sensor chips. The labeling of sensor readings, used by this program, can be different from the common naming scheme (*<type><number>\_<item>*):

- if there is a file called *<type><number>\_label*, then the label inside this file will be used instead of *<type><number><item>* name;
- if there is no *<type><number>\_label* file, then the program searches inside the */etc/sensors.conf* (could be also */etc/sensors3.conf*, or different) for the name substitution.

This labeling allows user to determine what kind of hardware is used. If there is neither *<type><number>\_label* file nor label inside the configuration file the type of hardware can be determined by the name attribute (*hwmon\*/device/name*). The actual names of sensors, which zabbix\_agent accepts, can be obtained by running **sensors** program with -u parameter (**sensors -u**).

In **sensor** program the available sensors are separated by the bus type (ISA adapter, PCI adapter, SPI adapter, Virtual device, ACPI interface, HID adapter).

On Linux 2.4:

(Sensor readings are obtained from */proc/sys/dev/sensors* directory)

- **device** - device name (if *<mode>* is used, it is a regular expression);
- **sensor** - sensor name (if *<mode>* is used, it is a regular expression);
- **mode** - possible values: avg, max, min (if this parameter is omitted, device and sensor are treated verbatim).

Example key: *sensor[w83781d-i2c-0-2d,temp1]*

Prior to Zabbix 1.8.4, the *sensor[temp1]* format was used.

On Linux 2.6+:

(Sensor readings are obtained from `/sys/class/hwmon` directory)

- **device** - device name (non regular expression). The device name could be the actual name of the device (e.g 0000:00:18.3) or the name acquired using `sensors` program (e.g. k8temp-pci-00c3). It is up to the user to choose which name to use;
- **sensor** - sensor name (non regular expression);
- **mode** - possible values: avg, max, min (if this parameter is omitted, device and sensor are treated verbatim).

Example key:

`sensor[k8temp-pci-00c3,temp,max]` or `sensor[0000:00:18.3,temp1]`

`sensor[smc47b397-isa-0880,in,avg]` or `sensor[smc47b397.2176,in1]`

Obtaining sensor names

Sensor labels, as printed by the `sensors` command, cannot always be used directly because the naming of labels may be different for each sensor chip vendor. For example, `sensors` output might contain the following lines:

```
$ sensors
in0:          +2.24 V  (min =  +0.00 V, max =  +3.32 V)
Vcore:        +1.15 V  (min =  +0.00 V, max =  +2.99 V)
+3.3V:        +3.30 V  (min =  +2.97 V, max =  +3.63 V)
+12V:         +13.00 V  (min =  +0.00 V, max = +15.94 V)
M/B Temp:     +30.0°C  (low  = -127.0°C, high = +127.0°C)
```

Out of these, only one label may be used directly:

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in0]
2.240000
```

Attempting to use other labels (like `Vcore` or `+12V`) will not work.

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,Vcore]
ZBX_NOTSUPPORTED
```

To find out the actual sensor name, which can be used by Zabbix to retrieve the sensor readings, run `sensors -u`. In the output, the following may be observed:

```
$ sensors -u
...
Vcore:
  in1_input: 1.15
  in1_min: 0.00
  in1_max: 2.99
  in1_alarm: 0.00
...
+12V:
  in4_input: 13.00
  in4_min: 0.00
  in4_max: 15.94
  in4_alarm: 0.00
...
```

So `Vcore` should be queried as `in1`, and `+12V` should be queried as `in4`. According to [specification](#), these are voltages on chip pins and generally speaking may need scaling.

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in1]
1.301000
```

Not only voltage (in), but also current (curr), temperature (temp) and fan speed (fan) readings can be retrieved by Zabbix.

## 9 Notes on memtype parameter in proc.mem items

Overview

The **memtype** parameter is supported on Linux, AIX, FreeBSD, and Solaris platforms.

Three common values of 'memtype' are supported on all of these platforms: `pmem`, `rss` and `vsize`. Additionally, platform-specific 'memtype' values are supported on some platforms.

## AIX

See values supported for 'memtype' parameter on AIX in the table.

| Supported value    | Description                   | Source in proctentry64 structure | Tries to be compatible with |
|--------------------|-------------------------------|----------------------------------|-----------------------------|
| vsize <sup>1</sup> | Virtual memory size           | pi_size                          |                             |
| pmem               | Percentage of real memory     | pi_prm                           | ps -o pmem                  |
| rss                | Resident set size             | pi_trss + pi_drss                | ps -o rssize                |
| size               | Size of process (code + data) | pi_dvm                           | "ps gvw" SIZE column        |
| dsize              | Data size                     | pi_dsize                         |                             |
| tsize              | Text (code) size              | pi_tsize                         | "ps gvw" TSIZ column        |
| sdsiz              | Data size from shared library | pi_sdsiz                         |                             |
| drss               | Data resident set size        | pi_drss                          |                             |
| trss               | Text resident set size        | pi_trss                          |                             |

Notes for AIX:

1. When choosing parameters for proc.mem[] item key on AIX, try to specify narrow process selection criteria. Otherwise there is a risk of getting unwanted processes counted into proc.mem[] result.

Example:

```
$ zabbix_agentd -t proc.mem[,,,NonExistingProcess,rss]
proc.mem[,,,NonExistingProcess,rss] [u|2879488]
```

This example shows how specifying only command line (regular expression to match) parameter results in Zabbix agent self-accounting - probably not what you want.

2. Do not use "ps -ef" to browse processes - it shows only non-kernel processes. Use "ps -Af" to see all processes which will be seen by Zabbix agent.
3. Let's go through example of 'topasrec' how Zabbix agent proc.mem[] selects processes.

```
$ ps -Af | grep topasrec
root 10747984      1   0   Mar 16      -   0:00 /usr/bin/topasrec -L -s 300 -R 1 -r 6 -o /var/perf daily
```

proc.mem[] has arguments:

```
proc.mem[<name>,<user>,<mode>,<cmdline>,<memtype>]
```

The 1st criterion is a process name (argument <name>). In our example Zabbix agent will see it as 'topasrec'. In order to match, you need to either specify 'topasrec' or to leave it empty. The 2nd criterion is a user name (argument <user>). To match, you need to either specify 'root' or to leave it empty. The 3rd criterion used in process selection is an argument <cmdline>. Zabbix agent will see its value as '/usr/bin/topasrec -L -s 300 -R 1 -r 6 -o /var/perf/daily/ -ypersistent=1 -O type=bin -ystart\_time=04:08:54,Mar16,2023'. To match, you need to either specify a regular expression which matches this string or to leave it empty.

Arguments <mode> and <memtype> are applied after using the three criteria mentioned above.

## FreeBSD

See values supported for 'memtype' parameter on FreeBSD in the table.

| Supported value   | Description                           | Source in kinfo_proc structure       | Tries to be compatible with |
|-------------------|---------------------------------------|--------------------------------------|-----------------------------|
| vsize             | Virtual memory size                   | kp_eproc.e_vm.vm_mapsize or ki_size  | ps -o vsize                 |
| pmem              | Percentage of real memory             | calculated from rss                  | ps -o pmem                  |
| rss               | Resident set size                     | kp_eproc.e_vm.vm_rssize or ki_rssize | ps -o rss                   |
| size <sup>1</sup> | Size of process (code + data + stack) | tsize + dsize + ssize                |                             |

| Supported value | Description      | Source in<br>kinfo_proc<br>structure  | Tries to be<br>compatible with |
|-----------------|------------------|---------------------------------------|--------------------------------|
| tsize           | Text (code) size | kp_eproc.e_vm.vm_tsize<br>or ki_tsize | ps -o tsiz                     |
| dsize           | Data size        | kp_eproc.e_vm.vm_dsize<br>or ki_dsize | ps -o dsiz                     |
| ssize           | Stack size       | kp_eproc.e_vm.vm_ssize<br>or ki_ssize | ps -o ssiz                     |

## Linux

See values supported for 'memtype' parameter on Linux in the table.

| Supported value   | Description                                  | Source in /proc/<pid>/status file |
|-------------------|--|-----------------------------------|
| vsiz <sup>1</sup> | Virtual memory size                          | VmSize                            |
| pmem              | Percentage of real memory                    | (VmRSS/total_memory) * 100        |
| rss               | Resident set size                            | VmRSS                             |
| data              | Size of data segment                         | VmData                            |
| exe               | Size of code segment                         | VmExe                             |
| hwm               | Peak resident set size                       | VmHWM                             |
| lck               | Size of locked memory                        | VmLck                             |
| lib               | Size of shared libraries                     | VmLib                             |
| peak              | Peak virtual memory size                     | VmPeak                            |
| pin               | Size of pinned pages                         | VmPin                             |
| pte               | Size of page table entries                   | VmPTE                             |
| size              | Size of process code + data + stack segments | VmExe + VmData + VmStk            |
| stk               | Size of stack segment                        | VmStk                             |
| swap              | Size of swap space used                      | VmSwap                            |

Notes for Linux:

1. Not all 'memtype' values are supported by older Linux kernels. For example, Linux 2.4 kernels do not support hwm, pin, peak, pte and swap values.
2. We have noticed that self-monitoring of the Zabbix agent active check process with `proc.mem[...,...,...,data]` shows a value that is 4 kB larger than reported by VmData line in the agent's /proc/<pid>/status file. At the time of self-measurement the agent's data segment increases by 4 kB and then returns to the previous size.

## Solaris

See values supported for 'memtype' parameter on Solaris in the table.

| Supported value   | Description  | Source in psinfo<br>structure | Tries to be<br>compatible with |
|-------------------|--|-------------------------------|--------------------------------|
| vsiz <sup>1</sup> | Size of process image  | pr_size                       | ps -o vsz                      |
| pmem              | Percentage of real memory  | pr_pctmem                     | ps -o pmem                     |
| rss               | Resident set size<br>It may be underestimated - see rss description in "man ps". | pr_rssize                     | ps -o rss                      |

## Footnotes

- <sup>1</sup> Default value.

## 10 Notes on selecting processes in proc.mem and proc.num items

### Processes modifying their commandline

Some programs use modifying their commandline as a method for displaying their current activity. A user can see the activity by running `ps` and `top` commands. Examples of such programs include *PostgreSQL*, *Sendmail*, *Zabbix*.

Let's see an example from Linux. Let's assume we want to monitor a number of Zabbix agent processes.

ps command shows processes of interest as

```
$ ps -fu zabbix
UID          PID  PPID  C STIME TTY          TIME CMD
...
zabbix      6318     1   0 12:01 ?        00:00:00 sbin/zabbix_agentd -c /home/zabbix/ZBXNEXT-1078/zabbix_age
zabbix      6319    6318   0 12:01 ?        00:00:01 sbin/zabbix_agentd: collector [idle 1 sec]
zabbix      6320    6318   0 12:01 ?        00:00:00 sbin/zabbix_agentd: listener #1 [waiting for connection]
zabbix      6321    6318   0 12:01 ?        00:00:00 sbin/zabbix_agentd: listener #2 [waiting for connection]
zabbix      6322    6318   0 12:01 ?        00:00:00 sbin/zabbix_agentd: listener #3 [waiting for connection]
zabbix      6323    6318   0 12:01 ?        00:00:00 sbin/zabbix_agentd: active checks #1 [idle 1 sec]
...
```

Selecting processes by name and user does the job:

```
$ zabbix_get -s localhost -k 'proc.num[zabbix_agentd,zabbix]'
6
```

Now let's rename zabbix\_agentd executable to zabbix\_agentd\_30 and restart it.

ps now shows

```
$ ps -fu zabbix
UID          PID  PPID  C STIME TTY          TIME CMD
...
zabbix      6715     1   0 12:53 ?        00:00:00 sbin/zabbix_agentd_30 -c /home/zabbix/ZBXNEXT-1078/zabbix_
zabbix      6716    6715   0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: collector [idle 1 sec]
zabbix      6717    6715   0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: listener #1 [waiting for connection]
zabbix      6718    6715   0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: listener #2 [waiting for connection]
zabbix      6719    6715   0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: listener #3 [waiting for connection]
zabbix      6720    6715   0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: active checks #1 [idle 1 sec]
...
```

Now selecting processes by name and user produces an incorrect result:

```
$ zabbix_get -s localhost -k 'proc.num[zabbix_agentd_30,zabbix]'
1
```

Why a simple renaming of executable to a longer name lead to quite different result ?

Zabbix agent starts with checking the process name. /proc/<pid>/status file is opened and the line Name is checked. In our case the Name lines are:

```
$ grep Name /proc/{6715,6716,6717,6718,6719,6720}/status
/proc/6715/status:Name:  zabbix_agentd_3
/proc/6716/status:Name:  zabbix_agentd_3
/proc/6717/status:Name:  zabbix_agentd_3
/proc/6718/status:Name:  zabbix_agentd_3
/proc/6719/status:Name:  zabbix_agentd_3
/proc/6720/status:Name:  zabbix_agentd_3
```

The process name in status file is truncated to 15 characters.

A similar result can be seen with ps command:

```
$ ps -u zabbix
PID TTY          TIME CMD
...
6715 ?          00:00:00 zabbix_agentd_3
6716 ?          00:00:01 zabbix_agentd_3
6717 ?          00:00:00 zabbix_agentd_3
6718 ?          00:00:00 zabbix_agentd_3
6719 ?          00:00:00 zabbix_agentd_3
6720 ?          00:00:00 zabbix_agentd_3
...
```

Obviously, that is not equal to our proc.num[] name parameter value zabbix\_agentd\_30. Having failed to match the process name from status file the Zabbix agent turns to /proc/<pid>/cmdline file.

How the agent sees the "cmdline" file can be illustrated with running a command

```
$ zabbix_get -s localhost -k 'proc.mem[kthreadd] '
4157440
```

`proc.num[]` counted both the kernel thread and the user process. `proc.mem[]` reports memory for the user process only and counts the kernel thread memory as if it was 0. This is different from the case above when `ZBX_NOTSUPPORTED` was reported.

Be careful when using `proc.mem[]` and `proc.num[]` items if the program name happens to match one of the thread.

Before putting parameters into `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

## 11 Implementation details of net.tcp.service and net.udp.service checks

Implementation of `net.tcp.service` and `net.udp.service` checks is detailed on this page for various services specified in the service parameter.

Item `net.tcp.service` parameters

### ftp

Creates a TCP connection and expects the first 4 characters of the response to be "220 ", then sends "QUIT\r\n". Default port 21 is used if not specified.

### http

Creates a TCP connection without expecting and sending anything. Default port 80 is used if not specified.

### https

Uses (and only works with) libcurl, does not verify the authenticity of the certificate, does not verify the host name in the SSL certificate, only fetches the response header (HEAD request). Default port 443 is used if not specified.

### imap

Creates a TCP connection and expects the first 4 characters of the response to be "\* OK", then sends "a1 LOGOUT\r\n". Default port 143 is used if not specified.

### ldap

Opens a connection to an LDAP server and performs an LDAP search operation with filter set to (objectClass=\*). Expects successful retrieval of the first attribute of the first entry. Default port 389 is used if not specified.

### nntp

Creates a TCP connection and expects the first 3 characters of the response to be "200" or "201", then sends "QUIT\r\n". Default port 119 is used if not specified.

### pop

Creates a TCP connection and expects the first 3 characters of the response to be "+OK", then sends "QUIT\r\n". Default port 110 is used if not specified.

### smtp

Creates a TCP connection and expects the first 3 characters of the response to be "220", followed by a space, the line ending or a dash. The lines containing a dash belong to a multiline response and the response will be re-read until a line without the dash is received. Then sends "QUIT\r\n". Default port 25 is used if not specified.

### ssh

Creates a TCP connection. If the connection has been established, both sides exchange an identification string (SSH-major.minor-XXXX), where major and minor are protocol versions and XXXX is a string. Zabbix checks if the string matching the specification is found and then sends back the string "SSH-major.minor-zabbix\_agent\r\n" or "0\r\n" on mismatch. Default port 22 is used if not specified.

### tcp

Creates a TCP connection without expecting and sending anything. Unlike the other checks requires the port parameter to be specified.

### telnet

Creates a TCP connection and expects a login prompt (':' at the end). Default port 23 is used if not specified.

Item net.udp.service parameters

## ntp

Sends an SNTP packet over UDP and validates the response according to [RFC 4330, section 5](#). Default port 123 is used if not specified.

## 12 Unreachable/unavailable host interface settings

### Overview

Several configuration **parameters** define how Zabbix server should behave when an agent check (Zabbix, SNMP, IPMI, JMX) fails and a host interface becomes unreachable.

### Unreachable interface

A host interface is treated as unreachable after a failed check (network error, timeout) by Zabbix, SNMP, IPMI or JMX agents. Note that Zabbix agent active checks do not influence interface availability in any way.

From that moment **UnreachableDelay** defines how often an interface is rechecked using one of the items (including LLD rules) in this unreachability situation and such rechecks will be performed already by unreachable pollers (or IPMI pollers for IPMI checks). By default it is 15 seconds before the next check.

In the Zabbix server log unreachability is indicated by messages like these:

```
Zabbix agent item "system.cpu.load[percpu,avg1]" on host "New host" failed: first network error, wait for
Zabbix agent item "system.cpu.load[percpu,avg15]" on host "New host" failed: another network error, wait f
```

Note that the exact item that failed is indicated and the item type (Zabbix agent).

#### Note:

The *Timeout* parameter will also affect how early an interface is rechecked during unreachability. If the Timeout is 20 seconds and UnreachableDelay 30 seconds, the next check will be in 50 seconds after the first attempt.

The **UnreachablePeriod** parameter defines how long the unreachability period is in total. By default UnreachablePeriod is 45 seconds. UnreachablePeriod should be several times bigger than UnreachableDelay, so that an interface is rechecked more than once before an interface becomes unavailable.

### Switching interface back to available

When the unreachability period is over, the interface is polled again, decreasing priority for item that turned the interface into unreachable state. If the unreachable interface reappears, the monitoring returns to normal automatically:

```
resuming Zabbix agent checks on host "New host": connection restored
```

#### Note:

Once interface becomes available, the host does not poll all its items immediately for two reasons:

- It might overload the host.
- The interface restore time is not always matching planned item polling schedule time.

So, after the interface becomes available, items are not polled immediately, but they are getting rescheduled to their next polling round.

### Unavailable interface

After the UnreachablePeriod ends and the interface has not reappeared, the interface is treated as unavailable.

In the server log it is indicated by messages like these:

```
temporarily disabling Zabbix agent checks on host "New host": interface unavailable
```

and in the **frontend** the host availability icon goes from green/gray to yellow/red (the unreachable interface details can be seen in the hint box that is displayed when a mouse is positioned on the host availability icon):

| ZBX Items 7 Triggers 3 Graphs Discovery rules Web scenarios 2 |                 |               |   |
|---|-----------------|---------------|---|
|   | Interface       | Status        | Error   |
|   | 127.0.0.1:10050 | Available     |   |
| me: S   | 192.0.0.1:10050 | Not available | Get value from agent failed: cannot connect to [[192.0.0.1]:10050]: [4] system call |

The **UnavailableDelay** parameter defines how often an interface is checked during interface unavailability.

By default it is 60 seconds (so in this case "temporarily disabling", from the log message above, will mean disabling checks for one minute).

When the connection to the interface is restored, the monitoring returns to normal automatically, too:

enabling Zabbix agent checks on host "New host": interface became available

### 13 Remote monitoring of Zabbix stats

#### Overview

It is possible to make some internal metrics of Zabbix server and proxy accessible remotely by another Zabbix instance or a third-party tool. This can be useful so that supporters/service providers can monitor their client Zabbix servers/proxies remotely or, in organizations where Zabbix is not the main monitoring tool, that Zabbix internal metrics can be monitored by a third-party system in an umbrella-monitoring setup.

Zabbix internal stats are exposed to a configurable set of addresses listed in the new 'StatsAllowedIP' **server/proxy** parameter. Requests will be accepted only from these addresses.

#### Items

To configure querying of internal stats on another Zabbix instance, you may use two items:

- `zabbix[stats,<ip>,<port>]` internal item - for direct remote queries of Zabbix server/proxy. `<ip>` and `<port>` are used to identify the target instance.
- `zabbix.stats[<ip>,<port>]` agent item - for agent-based remote queries of Zabbix server/proxy. `<ip>` and `<port>` are used to identify the target instance.

See also: [Internal items](#), [Zabbix agent items](#)

The following diagram illustrates the use of either item depending on the context.

- █ - Server → external Zabbix instance (zabbix[stats,<ip>,<port>])
- █ - Server → proxy → external Zabbix instance (zabbix[stats,<ip>,<port>])
- █ - Server → agent → external Zabbix instance (zabbix.stats[<ip>,<port>])
- █ - Server → proxy → agent → external Zabbix instance (zabbix.stats[<ip>,<port>])

To make sure that the target instance allows querying it by the external instance, list the address of the external instance in the 'StatsAllowedIP' parameter on the target instance.

#### Exposed metrics

The stats items gather the statistics in bulk and return a JSON, which is the basis for dependent items to get their data from. The following **internal metrics** are returned by either of the two items:

- zabbix[boottime]
- zabbix[hosts]
- zabbix[items]
- zabbix[items\_unsupported]
- zabbix[preprocessing\_queue] (server only)
- zabbix[process,<type>,<mode>,<state>] (only process type based statistics)
- zabbix[rcache,<cache>,<mode>]
- zabbix[requiredperformance]
- zabbix[triggers] (server only)
- zabbix[uptime]
- zabbix[vcache,buffer,<mode>] (server only)
- zabbix[vcache,cache,<parameter>]

- zabbix[version]
- zabbix[vmware,buffer,<mode>]
- zabbix[wcache,<cache>,<mode>] ('trends' cache type server only)

## Templates

Templates are available for remote monitoring of Zabbix server or proxy internal metrics from an external instance:

- Remote Zabbix server health
- Remote Zabbix proxy health

Note that in order to use a template for remote monitoring of multiple external instances, a separate host is required for each external instance monitoring.

## Trapper process

Receiving internal metric requests from an external Zabbix instance is handled by the trapper process that validates the request, gathers the metrics, creates the JSON data buffer and sends the prepared JSON back, for example, from server:

```
{
  "response": "success",
  "data": {
    "boottime": N,
    "uptime": N,
    "hosts": N,
    "items": N,
    "items_unsupported": N,
    "preprocessing_queue": N,
    "process": {
      "alert_manager": {
        "busy": {
          "avg": N,
          "max": N,
          "min": N
        },
        "idle": {
          "avg": N,
          "max": N,
          "min": N
        },
        "count": N
      },
      ...
    },
    "queue": N,
    "rcache": {
      "total": N,
      "free": N,
      "pfree": N,
      "used": N,
      "pused": N
    },
    "requiredperformance": N,
    "triggers": N,
    "uptime": N,
    "vcache": {
      "buffer": {
        "total": N,
        "free": N,
        "pfree": N,
        "used": N,
        "pused": N
      },
      "cache": {
        "requests": N,
        "hits": N,
```

```

        "misses": N,
        "mode": N
    }
},
"vmware": {
    "total": N,
    "free": N,
    "pfree": N,
    "used": N,
    "pused": N
},
"version": "N",
"wcache": {
    "values": {
        "all": N,
        "float": N,
        "uint": N,
        "str": N,
        "log": N,
        "text": N,
        "not supported": N
    },
    "history": {
        "pfree": N,
        "free": N,
        "total": N,
        "used": N,
        "pused": N
    },
    "index": {
        "pfree": N,
        "free": N,
        "total": N,
        "used": N,
        "pused": N
    },
    "trend": {
        "pfree": N,
        "free": N,
        "total": N,
        "used": N,
        "pused": N
    }
}
}
}
}

```

#### Internal queue items

There are also another two items specifically allowing to remote query internal queue stats on another Zabbix instance:

- `zabbix[stats,<ip>,<port>,queue,<from>,<to>]` internal item - for direct internal queue queries to remote Zabbix server/proxy
- `zabbix.stats[<ip>,<port>,queue,<from>,<to>]` agent item - for agent-based internal queue queries to remote Zabbix server/proxy

See also: [Internal items](#), [Zabbix agent items](#)

## 14 Configuring Kerberos with Zabbix

### Overview

Kerberos authentication can be used in web monitoring and HTTP items in Zabbix since version 4.4.0.

This section describes an example of configuring Kerberos with Zabbix server to perform web monitoring of `www.example.com` with user 'zabbix'.

#### Steps

##### Step 1

Install Kerberos package.

For Debian/Ubuntu:

```
apt install krb5-user
```

For RHEL:

```
dnf install krb5-workstation
```

##### Step 2

Configure Kerberos configuration file (see MIT documentation for details)

```
cat /etc/krb5.conf
[libdefaults]
    default_realm = EXAMPLE.COM

#### The following krb5.conf variables are only for MIT Kerberos.
    kdc_timesync = 1
    ccache_type = 4
    forwardable = true
    proxiable = true

[realms]
    EXAMPLE.COM = {
    }

[domain_realm]
    .example.com=EXAMPLE.COM
    example.com=EXAMPLE.COM
```

##### Step 3

Create a Kerberos ticket for user *zabbix*. Run the following command as user *zabbix*:

```
kinit zabbix
```

#### Attention:

It is important to run the above command as user *zabbix*. If you run it as *root* the authentication will not work.

##### Step 4

Create a web scenario or HTTP agent item with Kerberos authentication type.

Optionally can be tested with the following curl command:

```
curl -v --negotiate -u : http://example.com
```

Note that for lengthy web monitoring it is necessary to take care of renewing the Kerberos ticket. Default time of ticket expiration is 10h.

## 15 modbus.get parameters

#### Overview

The table below presents details of the `modbus.get[]` *item* parameters.

#### Parameters

| Parameter       | Description   | Defaults   | Example  |
|-----------------|---|--|--|
| <i>endpoint</i> | <p>Protocol and address of the endpoint, defined as <code>protocol://connection_string</code></p> <p>Possible protocol values: <i>rtu</i>, <i>ascii</i> (Agent 2 only), <i>tcp</i></p> <p>Connection string format:</p> <p>with <i>tcp</i> - <code>address:port</code><br/> with serial line: <i>rtu</i>, <i>ascii</i> - <code>port_name:speed:params</code><br/> where<br/> 'speed' - 1200, 9600 etc<br/> 'params' - data bits (5,6,7 or 8), parity (n,e or o for none/even/odd), stop bits (1 or 2)</p> | <p>protocol: none</p> <p><i>rtu/ascii</i> protocol:<br/> port_name: none<br/> speed: 115200<br/> params: 8n1</p> <p><i>tcp</i> protocol:<br/> address: none<br/> port: 502</p> | <p><code>tcp://192.168.6.1:511</code><br/> <code>tcp://192.168.6.2</code><br/> <code>tcp://[::1]:511</code><br/> <code>tcp://:1</code><br/> <code>tcp://localhost:511</code><br/> <code>tcp://localhost</code><br/> <code>rtu://COM1:9600:8n</code><br/> <code>ascii://COM2:1200:7o2</code><br/> <code>rtu://ttyS0:9600</code><br/> <code>ascii://ttyS1</code></p> |
| <i>slave id</i> | Modbus address of the device it is intended for (1 to 247), see <a href="#">MODBUS Messaging Implementation Guide</a> (page 23)   | <p>serial: 1</p> <p>tcp: 255 (0xFF)</p>  | 2  |
| <i>function</i> | <p>tcp device (not GW) will ignore the field</p> <p>Empty or value of a supported function:</p> <p>1 - Read Coil,<br/> 2 - Read Discrete Input,<br/> 3 - Read Holding Registers,<br/> 4 - Read Input Registers</p>  | empty  | 3  |
| <i>address</i>  | <p>Address of the first registry, coil or input.</p> <p>If 'function' is empty, then 'address' should be in range for:<br/> Coil - 00001 - 09999<br/> Discrete input - 10001 - 19999<br/> Input register - 30001 - 39999<br/> Holding register - 40001 - 49999</p> <p>If 'function' is not empty, the 'address' field will be from 0 till 65535 and used without modification (PDU)</p>   | <p>empty function:<br/> 00001</p> <p>non-empty<br/> function: 0</p>  | 9999   |
| <i>count</i>    | <p>Count of sequenced 'type' which will be read from device, where:</p> <p>for Coil or Discrete input the 'type' = 1 bit<br/> for other cases: <math>(count * sizeof(type)) / 2 = \text{real count of registers for reading}</math><br/> If 'offset' is not 0, the value will be added to 'real count'</p> <p>Acceptable range for 'real count' is 1:65535</p>  | 1  | 2  |
| <i>type</i>     | <p>Data type:</p> <p>for Read Coil and Read Discrete Input - <i>bit</i></p> <p>for Read Holding Registers and Read Input Registers:<br/> <i>int8</i> - 8bit<br/> <i>uint8</i> - 8bit (unsigned)<br/> <i>int16</i> - 16bit<br/> <i>uint16</i> - 16bit (unsigned)<br/> <i>int32</i> - 32bit<br/> <i>uint32</i> - 32bit (unsigned)<br/> <i>float</i> - 32bit<br/> <i>uint64</i> - 64bit (unsigned)<br/> <i>double</i> - 64bit</p>  | <p>bit</p> <p>uint16</p>   | uint64   |

| Parameter         | Description   | Defaults | Example |
|-------------------|---|----------|---------|
| <i>endianness</i> | Endianness type:<br><i>be</i> - Big Endian<br><i>le</i> - Little Endian<br><i>mbe</i> - Mid-Big Endian<br><i>mle</i> - Mid-Little Endian<br><br>Limitations:<br>for 1 bit - be<br>for 8 bits - be,le<br>for 16 bits - be,le | be       | le      |
| <i>offset</i>     | Number of registers, starting from 'address', the result of which will be discarded.<br><br>The size of each register is 16bit (needed to support equipment that does not support random read access).                      | 0        | 4       |

## 16 Creating custom performance counter names for VMware

### Overview

The VMware performance counter path has the `group/counter[rollup]` format where:

- `group` - the performance counter group, for example *cpu*
- `counter` - the performance counter name, for example *usagemhz*
- `rollup` - the performance counter rollup type, for example *average*

So the above example would give the following counter path: `cpu/usagemhz[average]`

The performance counter group descriptions, counter names and rollup types can be found in [VMware documentation](#).

It is possible to obtain internal names and create custom performance counter names by using script item in Zabbix.

### Configuration

1. Create disabled Script item on the main VMware host (where the **eventlog[]** item is present) with the following parameters:

Item
Tags
Preprocessing

\* Name

VMware metrics

Type

Script

\* Key

vmware.metrics

Type of information

Text

Parameters

| Name | Value |
|------|-------|
|      |       |

Add

- *Enabled*: unmarked

Script

```
try {
  Zabbix.log(4, 'vmware metrics script');

  var result, resp,
  req = new HttpRequest();
  req.addHeader('Content-Type: application/xml');
```

```

req.addHeader('SOAPAction: "urn:vim25/6.0"');

login = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:vim25/6.0">\n
<soapenv:Header/>\n
<soapenv:Body>\n
  <urn:Login>\n
    <urn:_this type="SessionManager">SessionManager</urn:_this>\n
    <urn:userName>{$VMWARE.USERNAME}</urn:userName>\n
    <urn:password>{$VMWARE.PASSWORD}</urn:password>\n
  </urn:Login>\n
</soapenv:Body>\n
</soapenv:Envelope>'
resp = req.post("{$VMWARE.URL}", login);
if (req.getStatus() != 200) {
  throw 'Response code: '+req.getStatus();
}

query = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:vim25/6.0">\n
<soapenv:Header/>\n
<soapenv:Body>\n
  <urn:RetrieveProperties>\n
    <urn:_this type="PropertyCollector">propertyCollector</urn:_this>\n
    <urn:specSet>\n
      <urn:propSet>\n
        <urn:type>PerformanceManager</urn:type>\n
        <urn:pathSet>perfCounter</urn:pathSet>\n
      </urn:propSet>\n
      <urn:objectSet>\n
        <urn:obj type="PerformanceManager">PerfMgr</urn:obj>\n

resp = req.post("{$VMWARE.URL}", logout);
if (req.getStatus() != 200) {
  throw 'Response code: '+req.getStatus();
}

} catch (error) {
  Zabbix.log(4, 'vmware call failed : '+error);
  result = {};
}

return result;

```

Once the item is configured, press *Test* button, then press *Get value*.

Get value from host ☒

Host address

Port

Proxy

(no proxy) [Get value](#)

Copy received XML to any XML formatter and find the desired metric.

An example of XML for one metric:

```
<PerfCounterInfo xsi:type="PerfCounterInfo">
  <key>6</key>
  <nameInfo>
    <label>Usage in MHz</label>
    <summary>CPU usage in megahertz during the interval</summary>
    <key>usagemhz</key>
  </nameInfo>
  <groupInfo>
    <label>CPU</label>
    <summary>CPU</summary>
    <key>cpu</key>
  </groupInfo>
  <unitInfo>
    <label>MHz</label>
    <summary>Megahertz</summary>
    <key>megaHertz</key>
  </unitInfo>
  <rollupType>average</rollupType>
  <statsType>rate</statsType>
  <level>1</level>
  <perDeviceLevel>3</perDeviceLevel>
</PerfCounterInfo>
```

Use XPath to extract the counter path from received XML. For the example above, the XPath will be:

| field   | xPath                     | value    |
|---------|---------------------------|----------|
| group   | //groupInfo[../key=6]/key | cpu      |
| counter | //nameInfo[../key=6]/key  | usagemhz |
| rollup  | //rollupType[../key=6]    | average  |

Resulting performance counter path in this case is: `cpu/usagemhz[average]`

## 17 Notes on system.cpu.util items on Windows

`system.cpu.util` item provides the CPU utilization percentage.

When a collector process is started on Zabbix agent for Windows, a buffer for N items for N logical processors (threads) is initialized. Values are periodically updated in the buffer using Windows performance counters. These values are reported when `system.cpu.util[n]` is requested, where  $0 \leq n < N$ .

One more item in the buffer is used for `system.cpu.util[total]`.

Zabbix automatically selects different performance counters to support both NUMA systems and older Windows versions with no processor group support.

If logical processor (thread) count is less or equal than 64 and number of processor groups is equal to 1, then:

N is logical processor (thread) count.

```
\Processor(_Total)\% Processor Time
\Processor(0)\% Processor Time
\Processor(1)\% Processor Time
```

```

\Processor(2)\% Processor Time
...
\Processor(N-1)\% Processor Time

```

Else:

G is processor group count and N is logical processor (thread) count in group.

```

\Processor Information(_Total)\% Processor Time
\Processor Information(0,0)\% Processor Time
\Processor Information(0,1)\% Processor Time
\Processor Information(0,2)\% Processor Time
...
\Processor Information(0,N-1)\% Processor Time
...
\Processor Information(G-1,0)\% Processor Time
\Processor Information(G-1,1)\% Processor Time
\Processor Information(G-1,2)\% Processor Time
...
\Processor Information(G-1,N-1)\% Processor Time

```

## 5 Supported functions

Click on the respective function group to see more details.

| Function group                  | Functions   |
|---------------------------------|---|
| <b>Aggregate func-tions</b>     | avg, bucket_percentile, count, histogram_quantile, item_count, kurtosis, mad, max, min, skewness, stddevpop, stddevsamp, sum, sumofsquares, varpop, varsamp   |

These functions are supported in **trigger expressions** and **calculated items**.

Foreach functions are supported only for **aggregate calculations**.

## 1 Aggregate functions

Except where stated otherwise, all functions listed here are supported in:

- **Trigger expressions**
- **Calculated items**

Aggregate functions can work with either:

- history of items, for example, `min(/host/key,1h)`
- **foreach functions** as the only parameter, for example, `min(last_foreach(/*/key))` (only in calculated items; cannot be used in triggers)

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by `< >`
- Function-specific parameters are described with each function
- `/host/key` and `(sec|#num)<:time shift>` parameters must never be quoted

Common parameters

- `/host/key` is a common mandatory first parameter for the functions referencing the host item history
- `(sec|#num)<:time shift>` is a common second parameter for the functions referencing the host item history, where:
  - **sec** - maximum **evaluation period** in seconds (time **suffixes** can be used), or
  - **#num** - maximum **evaluation range** in latest collected values (if preceded by a hash mark)
  - **time shift** (optional) allows to move the evaluation point back in time. See **more details** on specifying time shift.

Aggregate functions

| FUNCTION   |                                |   |

| <b>bucket_percentile</b> (item filter,time period,percentage)  |                                |   |

---

## FUNCTION

---

Calculates the percentile from the buckets of a histogram.

**item filter** - see [item filter](#)  
**time period** - see [time period](#)  
**percentage** - percentage (0-100)

Supported only in calculated items.

This function is an alias for `histogram_quantile(percentage/100, bucket_rate_foreach(item filter, time period, 1))`

**count** (func\_foreach(item filter,<time period>))

Count of values in an array returned by a foreach function.

**func\_foreach** - foreach function for which the number of returned values should be counted (with supported arguments). See [foreach functions](#) for details.

Supported value type: int

Supported [foreach functions](#):  
 avg\_foreach, count\_foreach, exists\_foreach, last\_foreach, max\_foreach, min\_foreach, sum\_foreach

Example:

=>

**count**(max\_foreach(/\*/net.if.in[\*],1h))  
 → number of net.if.in items that received data in the last hour until [now](#)

Note that using **count()** with a history-related foreach function (max\_foreach, avg\_foreach, etc.) may lead to performance implications, whereas using **exists\_foreach()**, which works only with configuration data, will not have such effect.

**histogram\_quantile** (quantile,bucket1,value1,bucket2,value2,...)

Calculates the  $\phi$ -quantile from the buckets of a histogram.

**quantile** -  $0 \leq \phi \leq 1$   
**bucketN, valueN** - manually entered pairs ( $\geq 2$ ) of parameters or response of [bucket\\_rate\\_foreach](#)

Supported only in calculated items.

Supported [foreach functions](#):  
 bucket\_rate\_foreach

Functionally corresponds to '[histogram\\_quantile](#)' of PromQL.

Returns -1 if values of the last 'Infinity' bucket ("*inf*") are equal to 0.

Examples:

=> **his-**

**togram\_quantile**(0.75,1.0,last(/host/rate\_bucket[1.0

=> **his-**

**togram\_quantile**(0.5,bucket\_rate\_foreach(/item\_ke

**item\_count** (item filter)

Count of existing items in configuration that match filter criteria.

**item filter** - criteria for item selection, allows referencing by host group, host, item key, and tags. Wildcards are supported. See [item filter](#) for more details.

Supported only in calculated items.

Supported value type: int

Works as an alias for the `count(exists_foreach(item_filter))` function.

Example:

=>

**item\_count**(/\*/agent.ping?[group="Host group 1"]) → number of hosts with the *agent.ping* item in the "Host group 1"

---

## FUNCTION

---

**kurtosis** (/host/key,(sec|#num)<:time shift>)

"Tailedness" of the probability distribution in collected values within the defined evaluation period.

See [common parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
last\_foreach

See also: [Kurtosis](#)

Example:

=> **kurtosis**(/host/key,**1h**) → kurtosis for the last hour until **now**

**mad** (/host/key,(sec|#num)<:time shift>)

Median absolute deviation in collected values within the defined evaluation period.

See [common-parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
last\_foreach

See also: [Median absolute deviation](#)

Example:

=> **mad**(/host/key,**1h**) → median absolute deviation for the last hour until **now**

**max** (/host/key,(sec|#num)<:time shift>)

Highest value of an item within the defined evaluation period.

See [common parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
avg\_foreach, count\_foreach, exists\_foreach, last\_foreach, max\_foreach, min\_foreach, sum\_foreach

Example:

=> **max**(/host/key,**1h**) - **min**(/host/key,**1h**) → calculate the difference between the maximum and minimum values within the last hour until **now** (delta of values)

**min** (/host/key,(sec|#num)<:time shift>)

Lowest value of an item within the defined evaluation period.

See [common parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
avg\_foreach, count\_foreach, exists\_foreach, last\_foreach, max\_foreach, min\_foreach, sum\_foreach

Example:

=> **max**(/host/key,**1h**) - **min**(/host/key,**1h**) → calculate the difference between the maximum and minimum values within the last hour until **now** (delta of values)

**skewness**

(/host/key,(sec|#num)<:time shift>)

---

## FUNCTION

---

Asymmetry of the probability distribution in collected values within the defined evaluation period.

See also: [Skewness](#)

### **stddevpop**

(/host/key,(sec|#num)<:time shift>)

Population standard deviation in collected values within the defined evaluation period.

See also: [Standard deviation](#)

### **stddevsamp**

(/host/key,(sec|#num)<:time shift>)

Sample standard deviation in collected values within the defined evaluation period.

See also: [Standard deviation](#)

**sum** (/host/key,(sec|#num)<:time shift>)

Sum of collected values within the defined evaluation period.

### **sumofsquares**

(/host/key,(sec|#num)<:time shift>)

The sum of squares in collected values within the defined evaluation period.

**varpop** (/host/key,(sec|#num)<:time shift>)

See [common parameters](#).

See [common parameters](#).

See [common parameters](#).

See [common parameters](#).

See [common parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
last\_foreach

Example:

=> **skewness**(/host/key,**1h**) →  
skewness for the last hour until **now**

Supported value types: float, int

Supported [foreach functions](#):  
last\_foreach

Example:

=> **stddevpop**(/host/key,**1h**) →  
population standard deviation for the  
last hour until **now**

Supported value types: float, int

Supported [foreach functions](#):  
last\_foreach

At least two data values are required  
for this function to work.

Example:

=> **stddevsamp**(/host/key,**1h**) →  
sample standard deviation for the last  
hour until **now**

Supported value types: float, int

Supported [foreach functions](#):  
avg\_foreach, count\_foreach,  
exists\_foreach, last\_foreach,  
max\_foreach, min\_foreach,  
sum\_foreach

Example:

=> **sum**(/host/key,**1h**) → sum of  
values for the last hour until **now**

Supported value types: float, int

Supported [foreach functions](#):  
last\_foreach

Example:

=> **sumofsquares**(/host/key,**1h**) →  
sum of squares for the last hour until  
**now**

---

## FUNCTION

---

Population variance of collected values within the defined evaluation period. See [common parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
`last_foreach`

Example:

=> **varpop**(/host/key,**1h**) →  
population variance for the last hour  
until **now**

### **varsamp**

(/host/key,(sec|#num)<:time shift>)

Sample variance of collected values within the defined evaluation period. See [common parameters](#).

Supported value types: float, int

Supported [foreach functions](#):  
`last_foreach`

See also: [Variance](#)

At least two data values are required for this function to work.

Example:

=> **varsamp**(/host/key,**1h**) → sample  
variance for the last hour until **now**

---

## 1 Foreach functions

### Overview

Foreach functions are used in [aggregate calculations](#) to return one aggregate value for each item that is selected by the used **item filter**. An array of values is returned.

For example, the *avg\_foreach* function will return an array of values, where each value is the *average* history value of the selected item, during the time interval that is specified.

The **item filter** is part of the syntax used by foreach functions. The use of wildcards is supported in the item filter, thus the required items can be selected quite flexibly.

### Supported functions

| Function                   | Description   |
|----------------------------|---|
| <i>avg_foreach</i>         | Returns the average value for each item.  |
| <i>bucket_rate_foreach</i> | Returns pairs (bucket upper bound, rate value) suitable for use in the <a href="#">histogram_quantile()</a> function, where "bucket upper bound" is the value of item key parameter defined by the <parameter number> <a href="#">parameter</a> . |
| <i>count_foreach</i>       | Returns the number of values for each item.   |
| <i>exists_foreach</i>      | Returns '1' for each enabled item.  |
| <i>last_foreach</i>        | Returns the last value for each item.   |
| <i>max_foreach</i>         | Returns the maximum value for each item.  |
| <i>min_foreach</i>         | Returns the minimum value for each item.  |
| <i>sum_foreach</i>         | Returns the sum of values for each item.  |

---

### Function syntax

Foreach functions support two common parameters: `item filter` (see details below) and `time period`:

`foreach_function(item filter,time period)`

For example:

`avg_foreach(/*/mysql.qps?[group="MySQL Servers"],5m)`

will return the five-minute average of each 'mysql.qps' item in the MySQL server group.

Note that some functions support additional [parameters](#).

## Item filter syntax

The item filter:

`/host/key[parameters]?[conditions]`

consists of four parts, where:

- host - host name
- key - item key (without parameters)
- parameters - item key parameters
- conditions - host group and/or item tag based conditions (as expression)

Spaces are allowed only inside the conditions expression.

### Wildcard usage

- Wildcard can be used to replace the host name, item key or an individual item key parameter.
- Either the host or item key must be specified without wildcard. So `/host/*` and `/*/key` are valid filters, but `/*/*` is invalid.
- Wildcard cannot be used for a *part* of host name, item key, item key parameter.
- Wildcard does not match more than a single item key parameter. So a wildcard must be specified for each parameter in separation (i.e. `key[abc,*,*]`).

### Conditions expression

The conditions expression supports:

- operands:
  - group - host group
  - tag - item tag
  - "<text>" - string constant, with the `\` escape character to escape `"` and `\`
- case-sensitive string comparison operators: `=`, `<>`
- logical operators: `and`, `or`, `not`
- grouping with parentheses: `( )`

Quotation of string constants is mandatory. Only case-sensitive full string comparison is supported.

#### Warning:

When specifying tags in the filter (i.e. `tag="tagname:value"`), the colon `:` is used as a delimiter. Everything after it is considered the tag value. Thus it is currently not supported to specify a tag name containing `:` in it.

### Examples

A complex filter may be used, referencing the item key, host group and tags, as illustrated by the examples:

| Syntax example  | Description   |
|---|---|
| <code>/host/key[abc,*]</code>   | Matches similar items on this host.   |
| <code>/*/key</code>   | Matches the same item of any host.  |
| <code>/*/key?[group="ABC" and tag="tagname:value"]</code>   | Matches the same item of any host from the ABC group having 'tagname:value' tags.     |
| <code>/*/key[a,*,c]?[(group="ABC" and tag="Tag1") or (group="DEF" and (tag="Tag2" or tag="Tag3:value"))]</code> | Matches similar items of any host from the ABC or DEF group with the respective tags. |

All referenced items must exist and collect data. Only enabled items on enabled hosts are included in the calculations.

#### Attention:

If the item key of a referenced item is changed, the filter must be updated manually.

Specifying a parent host group includes the parent group and all nested host groups with their items.

### Time period

The **second** parameter allows to specify the time period for aggregation. The time period can only be expressed as time, the amount of values (prefixed with `#`) is not supported.

**Supported unit symbols** can be used in this parameter for convenience, for example `'5m'` (five minutes) instead of `'300s'` (300 seconds) or `'1d'` (one day) instead of `'86400'` (86400 seconds).

Time period is ignored by the server if passed with the *last\_foreach* function and can thus be omitted:

```
last_foreach(/*/key?[group="host group"])
```

Time period is not supported with the *exists\_foreach* function.

Additional parameters

A third optional parameter is supported by the *bucket\_rate\_foreach* function:

```
bucket_rate_foreach(item filter,time period,<parameter number>)
```

where <parameter number> is the position of the "bucket" value in the item key. For example, if the "bucket" value in myItem[aaa,0.2] is '0.2', then its position is 2.

The default value of <parameter number> is '1'.

See [aggregate calculations](#) for more details and examples on using foreach functions.

Behavior depending on availability

The following table illustrates how each function behaves in cases of limited availability of host/item and history data.

| Function                   | Disabled host | Unavailable host with data | Unavailable host without data | Disabled item | Unsupported item | Data retrieval error (SQL) |
|----------------------------|---------------|----------------------------|-------------------------------|---------------|------------------|----------------------------|
| <i>avg_foreach</i>         | ignore        | return avg                 | ignore                        | ignore        | ignore           | ignore                     |
| <i>bucket_rate_foreach</i> | ignore        | return bucket rate         | ignore                        | ignore        | ignore           | ignore                     |
| <i>count_foreach</i>       | ignore        | return count               | 0                             | ignore        | ignore           | ignore                     |
| <i>exists_foreach</i>      | ignore        | 1                          | 1                             | ignore        | 1                | n/a                        |
| <i>last_foreach</i>        | ignore        | return last                | ignore                        | ignore        | ignore           | ignore                     |
| <i>max_foreach</i>         | ignore        | return max                 | ignore                        | ignore        | ignore           | ignore                     |
| <i>min_foreach</i>         | ignore        | return min                 | ignore                        | ignore        | ignore           | ignore                     |
| <i>sum_foreach</i>         | ignore        | return sum                 | ignore                        | ignore        | ignore           | ignore                     |

If the item is *ignored*, nothing is added to the aggregation.

## 2 Bitwise functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters
- Optional function parameters (or parameter parts) are indicated by < >

### FUNCTION

| Description                | Function-specific parameters | Comments |
|----------------------------|------------------------------|----------|
| <b>bitand</b> (value,mask) |                              |          |

---

## FUNCTION

---

Value of "bitwise AND" of an item value and mask.

**value** - value to check  
**mask** (mandatory) - 64-bit unsigned integer (0 - 18446744073709551615)

Supported value types: int

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

Examples:

=> **bitand**(last(/host/key),**12**)=8 or  
**bitand**(last(/host/key),**12**)=4 → 3rd or 4th bit set, but not both at the same time  
=> **bitand**(last(/host/key),**20**)=16 → 3rd bit not set and 5th bit set.

**bitlshift** (value,bits to shift)

Bitwise shift left of an item value.

**value** - value to check  
**bits to shift** (mandatory) - number of bits to shift

Supported value types: int

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

**bitnot** (value)

Value of "bitwise NOT" of an item value.

**value** - value to check

Supported value types: int

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

**bitor** (value,mask)

Value of "bitwise OR" of an item value and mask.

**value** - value to check  
**mask** (mandatory) - 64-bit unsigned integer (0 - 18446744073709551615)

Supported value types: int

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

**bitrshift** (value,bits to shift)

Bitwise shift right of an item value.

**value** - value to check  
**bits to shift** (mandatory) - number of bits to shift

Supported value types: int

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

**bitxor** (value,mask)

Value of "bitwise exclusive OR" of an item value and mask.

**value** - value to check  
**mask** (mandatory) - 64-bit unsigned integer (0 - 18446744073709551615)

Supported value types: int

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

---

### 3 Date and time functions

All functions listed here are supported in:

- **Trigger expressions**

- [Calculated items](#)

#### Attention:

Date and time functions cannot be used in the expression by themselves; at least one function from [another group](#), referencing the host item, must be included in the expression (except the nodata function). For detailed information on how date and time functions work within expressions, see [Calculation time](#).

| FUNCTION   |                              |   |
|--|------------------------------|---|
| Description  | Function-specific parameters | Comments  |
| <b>date</b><br>Current date in YYYYMMDD format.                                  |                              | Example:<br>=> <b>date()</b> <20220101  |
| <b>dayofmonth</b><br>Day of month in range of 1 to 31.                           |                              | Example:<br>=> <b>dayofmonth()</b> =1   |
| <b>dayofweek</b><br>Day of week in range of 1 to 7 (Mon - 1, Sun - 7).           |                              | Example (only weekdays):<br>=> <b>dayofweek()</b> <6<br><br>Example (only weekend):<br>=> <b>dayofweek()</b> >5 |
| <b>now</b><br>Number of seconds since the Epoch (00:00:00 UTC, January 1, 1970). |                              | Example:<br>=> <b>now()</b> <1640998800   |
| <b>time</b><br>Current time in HHMMSS format.                                    |                              | Example (only nighttime, 00:00-06:00):<br>=> <b>time()</b> <060000  |

## 4 History functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by < >
- Function-specific parameters are described with each function
- /host/key and (sec|#num)<:time shift> parameters must never be quoted

Common parameters

- /host/key is a common mandatory first parameter for the functions referencing the host item history
- (sec|#num)<:time shift> is a common second parameter for the functions referencing the host item history, where:
  - **sec** - maximum [evaluation period](#) in seconds (time [suffixes](#) can be used), or
  - **#num** - maximum [evaluation range](#) in latest collected values (if preceded by a hash mark)
  - **time shift** (optional) allows to move the evaluation point back in time. See [more details](#) on specifying time shift.

History functions

| FUNCTION                  |                              |          |
|---------------------------|------------------------------|----------|
| Description               | Function-specific parameters | Comments |
| <b>change</b> (/host/key) |                              |          |

---

## FUNCTION

---

The amount of difference between the previous and latest value.

Supported value types: float, int, str, text, log

For strings returns:  
0 - values are equal  
1 - values differ

Example:  
=> **change**(/host/key)>10

Numeric difference will be calculated, as seen with these incoming example values ('previous' and 'latest' value = difference):

'1' and '5' = +4

'3' and '1' = -2

'0' and '-2.5' = -2.5

See also: [abs](#) for comparison

### **changecount**

(/host/key,(sec|#num)<:time shift>,<mode>)

Number of changes between adjacent values within the defined evaluation period.

See [common parameters](#).

**mode** (optional; must be double-quoted)

Supported modes:  
*all* - count all changes (default)  
*dec* - count decreases  
*inc* - count increases

Supported value types: float, int, str, text, log

For non-numeric value types, *mode* parameter is ignored.

Examples:  
=> **changecount**(/host/key, 1w) →  
number of value changes for the last week until [now](#)  
=>

**changecount**(/host/key,#10,"inc") →  
number of value increases (relative to the adjacent value) among the last 10 values  
=>

**changecount**(/host/key,24h,"dec") →  
number of value decreases (relative to the adjacent value) for the last 24 hours until [now](#)

**count** (/host/key,(sec|#num)<:time shift>,<operator>,<pattern>)

## FUNCTION

Number of values within the defined evaluation period.

See [common parameters](#).

**operator** (optional; must be double-quoted)

Supported operators:

*eq* - equal (default for integer, float)

*ne* - not equal

*gt* - greater

*ge* - greater or equal

*lt* - less

*le* - less or equal

*like* (default for string, text, log) - matches if contains pattern (case-sensitive)

*bitand* - bitwise AND

*regexp* - case-sensitive match of the regular expression given in *pattern*

*iregexp* - case-insensitive match of the regular expression given in *pattern*

Note that:

*eq* (default), *ne*, *gt*, *ge*, *lt*, *le*, *band*, *regexp*, *iregexp* are supported for integer items

*eq* (default), *ne*, *gt*, *ge*, *lt*, *le*, *regexp*, *iregexp* are supported for float items

*like* (default), *eq*, *ne*, *regexp*, *iregexp* are supported for string, text and log items

**pattern** (optional) - required pattern (string arguments must be double-quoted)

Supported value types: float, integer, string, text, log

Float items match with the precision of 2.22e-16; if database is [not upgraded](#) the precision is 0.000001.

With *bitand* as the third parameter, the fourth *pattern* parameter can be specified as two numbers, separated by '/':

**number\_to\_compare\_with/mask.**

*count()* calculates "bitwise AND" from the value and the *mask* and compares the result to

*number\_to\_compare\_with*. If the result of "bitwise AND" is equal to *number\_to\_compare\_with*, the value is counted.

If *number\_to\_compare\_with* and *mask* are equal, only the *mask* need be specified (without '/').

With *regexp* or *iregexp* as the third parameter, the fourth *pattern* parameter can be an ordinary or [global](#) (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings. For the purpose of regexp matching, float values will always be represented with 4 decimal digits after '.'. Also note that for large numbers difference in decimal (stored in database) and binary (used by Zabbix server) representation may affect the 4th decimal digit.

Examples:

=> **count**(/host/key,**10m**) → number of values for the last 10 minutes until [now](#)

=>

**count**(/host/key,**10m**,"like","error") → number of values for the last 10 minutes until [now](#) that contain 'error'

=> **count**(/host/key,**10m**,12) → number of values for the last 10 minutes until [now](#) that equal '12'

=> **count**(/host/key,**10m**,"gt",12) → number of values for the last 10 minutes until [now](#) that are over '12'

=> **count**(/host/key,**#10**,"gt",12) → number of values within the last 10 values until [now](#) that are over '12'

=> **count**(/host/key,**10m:now-1d**,"gt",12) → number of values between 24 hours and 10 minutes and 24 hours ago from [now](#) that were over '12'

=>

**count**(/host/key,**10m**,"bitand","6/7") → number of values for the last 10 minutes until [now](#) having '110' (in

---

FUNCTION

---

**countunique**

(/host/key,(sec|#num)<:time  
shift>,<operator>,<pattern>)

## FUNCTION

Number of unique values within the defined evaluation period.

See [common parameters](#).

**operator** (optional; must be double-quoted)

Supported operators:

*eq* - equal (default for integer, float)

*ne* - not equal

*gt* - greater

*ge* - greater or equal

*lt* - less

*le* - less or equal

*like* (default for string, text, log) - matches if contains pattern (case-sensitive)

*bitand* - bitwise AND

*regex* - case-sensitive match of the regular expression given in *pattern*

*iregex* - case-insensitive match of the regular expression given in *pattern*

Note that:

*eq* (default), *ne*, *gt*, *ge*, *lt*, *le*, *band*, *regex*, *iregex* are supported for integer items

*eq* (default), *ne*, *gt*, *ge*, *lt*, *le*, *regex*, *iregex* are supported for float items

*like* (default), *eq*, *ne*, *regex*, *iregex* are supported for string, text and log items

**pattern** (optional) - required pattern (string arguments must be double-quoted)

Supported value types: float, integer, string, text, log

Float items match with the precision of 2.22e-16; if database is [not upgraded](#) the precision is 0.000001.

With *bitand* as the third parameter, the fourth *pattern* parameter can be specified as two numbers, separated by '/':

**number\_to\_compare\_with/mask.**

*countunique()* calculates "bitwise AND" from the value and the *mask* and compares the result to *number\_to\_compare\_with*. If the result of "bitwise AND" is equal to *number\_to\_compare\_with*, the value is counted.

If *number\_to\_compare\_with* and *mask* are equal, only the *mask* need be specified (without '/').

With *regex* or *iregex* as the third parameter, the fourth *pattern* parameter can be an ordinary or [global](#) (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings. For the purpose of regex matching, float values will always be represented with 4 decimal digits after '.'. Also note that for large numbers difference in decimal (stored in database) and binary (used by Zabbix server) representation may affect the 4th decimal digit.

Examples:

=> **countunique(/host/key,10m)** → number of unique values for the last 10 minutes until **now**

=> **countunique(/host/key,10m,"like","error")** → number of unique values for the last 10 minutes until **now** that contain 'error'

=> **countunique(/host/key,10m,"gt",12)** → number of unique values for the last 10 minutes until **now** that are over '12'

=> **countunique(/host/key,#10,"gt",12)** → number of unique values within the last 10 values until **now** that are over '12'

=> **countunique(/host/key,10m:now-1d,"gt",12)** → number of unique values between 24 hours and 10 minutes and 24 hours ago from **now** that were over '12'

=> **countunique(/host/key,10m,"bitand","6/7")**

---

## FUNCTION

---

**find** (/host/key,<(sec|#num)<:time shift>,<operator>,<pattern>)  
Find a value match.

See [common parameters](#).

**sec** or **#num** (optional) - defaults to the latest value if not specified

**operator** (optional; must be double-quoted)

Supported operators:

*eq* - equal (default for integer, float)

*ne* - not equal

*gt* - greater

*ge* - greater or equal

*lt* - less

*le* - less or equal

*like* (default for string, text, log) - value contains the string given in *pattern* (case-sensitive)

*bitand* - bitwise AND

*regex* - case-sensitive match of the regular expression given in *pattern*

*iregex* - case-insensitive match of the regular expression given in *pattern*

Note that:

*eq* (default), *ne*, *gt*, *ge*, *lt*, *le*, *band*, *regex*, *iregex* are supported for integer items

*eq* (default), *ne*, *gt*, *ge*, *lt*, *le*, *regex*, *iregex* are supported for float items

*like* (default), *eq*, *ne*, *regex*, *iregex* are supported for string, text and log items

**pattern** - required pattern (string arguments must be double-quoted); [Perl Compatible Regular Expression](#) (PCRE) regular expression if operator is *regex*, *iregex*.

Supported value types: float, int, str, text, log

Returns:

1 - found

0 - otherwise

If more than one value is processed, '1' is returned if there is at least one matching value.

With *regex* or *iregex* as the third parameter, the fourth *pattern* parameter can be an ordinary or [global](#) (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings.

Example:

=> **find**(/host/key,**10m**,"like","error")  
→ find a value that contains 'error' within the last 10 minutes until **now**

**first** (/host/key,sec<:time shift>)  
The first (the oldest) value within the defined evaluation period.

See [common parameters](#).

Supported value types: float, int, str, text, log

Example:

=> **first**(/host/key,**1h**) → retrieve the oldest value within the last hour until **now**

See also `last()`.

**fuzzytime** (/host/key,sec)

---

## FUNCTION

---

Checking how much the passive agent time differs from the Zabbix server/proxy time.

See [common parameters](#).

Supported value types: float, int

Returns:

1 - difference between the passive item value (as timestamp) and Zabbix server/proxy timestamp (clock of value collection) is less than or equal to *sec* seconds

0 - otherwise

Usually used with the 'system.localtime' item to check that local time is in sync with the local time of Zabbix server. *Note* that 'system.localtime' must be configured as a [passive check](#).

Can be used also with `vfs.file.time[/path/file,modify]` key to check that file didn't get updates for long time.

Example:

=> **fuzzytime**(/host/key,**60s**)=0 → detect a problem if the time difference is over 60 seconds

This function is not recommended for use in complex trigger expressions (with multiple items involved), because it may cause unexpected results (time difference will be measured with the most recent metric), e.g. in

`fuzzytime(/Host/system.localtime,60s)=0`  
or `last(/Host/trap)<>0`

**last** (/host/key,<#num<:time shift>)

The most recent value.

See [common parameters](#).

**#num** (optional) - the Nth most recent value

Supported value types: float, int, str, text, log

Take note that a hash-tagged time period (**#N**) works differently here than with many other functions.

For example:

`last(/host/key)` is always equal to

`last(/host/key,#1)`

`last(/host/key,#3)` - third most recent value (*not* three latest values)

Zabbix does not guarantee the exact order of values if more than two values exist within one second in history.

Example:

=> **last**(/host/key) → retrieve the last value

=> **last**(/host/key,**#2**) → retrieve the previous value

=> **last**(/host/key,**#1**) <>

**last**(/host/key,**#2**) → the last and previous values differ

See also `first()`.

---

## FUNCTION

---

**logeventid** (/host/key,<#num<:time shift>,<pattern>)

Checking if event ID of the last log entry matches a regular expression.

See [common parameters](#).

**#num** (optional) - the Nth most recent value

**pattern** (optional) - regular expression describing the required pattern, [Perl Compatible Regular Expression](#) (PCRE) style (string arguments must be double-quoted).

Supported value types: log

Returns:  
0 - does not match  
1 - matches

**logseverity** (/host/key,<#num<:time shift>)

Log severity of the last log entry.

See [common parameters](#).

**#num** (optional) - the Nth most recent value

Supported value types: log

Returns:  
0 - default severity  
N - severity (integer, useful for Windows event logs: 1 - Information, 2 - Warning, 4 - Error, 7 - Failure Audit, 8 - Success Audit, 9 - Critical, 10 - Verbose).  
Zabbix takes log severity from **Information** field of Windows event log.

**logsource** (/host/key,<#num<:time shift>,<pattern>)

Checking if log source of the last log entry matches a regular expression.

See [common parameters](#).

**#num** (optional) - the Nth most recent value

**pattern** (optional) - regular expression describing the required pattern, [Perl Compatible Regular Expression](#) (PCRE) style (string arguments must be double-quoted).

Supported value types: log

Returns:  
0 - does not match  
1 - matches

Normally used for Windows event logs.  
For example, logsource("VMware Server").

**monodec**

(/host/key,(sec|#num)<:time shift>,<mode>)

Check if there has been a monotonous decrease in values.

See [common parameters](#).

**mode** (must be double-quoted) - *weak* (every value is smaller or the same as the previous one; default) or *strict* (every value has decreased)

Supported value types: int

Returns 1 if all elements in the time period continuously decrease, 0 otherwise.

Example:

=> **monodec**(/Host1/system.swap.size[all,free],**60s**)  
+ **monodec**(/Host2/system.swap.size[all,free],**60s**)  
+ **monodec**(/Host3/system.swap.size[all,free],**60s**)  
- calculate in how many hosts there has been a decrease in free swap size

**monoinc**

(/host/key,(sec|#num)<:time shift>,<mode>)

---

## FUNCTION

---

Check if there has been a monotonous increase in values.

See **common parameters**.

**mode** (must be double-quoted) - *weak* (every value is bigger or the same as the previous one; default) or *strict* (every value has increased)

Supported value types: int

Returns 1 if all elements in the time period continuously increase, 0 otherwise.

Example:

=>

**monoinc**(/Host1/system.localtime,#3,"strict")=0

- check if system local time has been increasing consistently

**nodata** (/host/key,sec,<mode>)

---

## FUNCTION

---

Checking for no data received.

See [common parameters](#).

All value types are supported.

**sec** period should not be less than 30 seconds because the history syncer process calculates this function only every 30 seconds.

Returns:  
1 - if no data received during the defined period of time  
0 - otherwise

`nodata(/host/key,0)` is disallowed.

Since Zabbix 5.0, the 'nodata' triggers monitored by proxy are, by default, sensitive to proxy availability - if proxy becomes unavailable, the 'nodata' triggers will not fire immediately after a restored connection, but will skip the data for the delayed period. Note that for passive proxies suppression is activated if connection is restored more than 15 seconds and no less than 2 seconds later. For active proxies suppression is activated if connection is restored more than 15 seconds later.

**mode** - if set to *strict* (double-quoted), this function will be insensitive to proxy availability (see comments for details).

To turn off sensitiveness to proxy availability, use the third parameter, e.g.: `nodata(/host/key,5m,"strict");` in this case the function will work the same as before 5.0.0 and fire as soon as the evaluation period (five minutes) without data has past.

Note that this function will display an error if, within the period of the 1st parameter:

- there's no data and Zabbix server was restarted
- there's no data and maintenance was completed
- there's no data and the item was added or re-enabled

Errors are displayed in the *Info* column in trigger [configuration](#).

This function may not work properly if there are time differences between Zabbix server, proxy and agent. See also: [Time synchronization requirement](#);

`nodata()` function cannot be used in the expression by itself; at least one function from [another group](#), referencing the host item, must be included in the expression (except [date and time functions](#)). For detailed information on how the `nodata()` function works within expressions, see [Calculation time](#).

### percentile

`(/host/key,(sec|#num)<:time shift>,percentage)`

| FUNCTION  |  |  |
|---|--|--|
| P-th percentile of a period, where P (percentage) is specified by the third parameter.  | See <a href="#">common parameters</a> .<br><br><b>percentage</b> - a floating-point number between 0 and 100 (inclusive) with up to 4 digits after the decimal point | Supported value types: float, int  |
| <b>rate</b> (/host/key,sec<:time shift>)<br>Per-second average rate of the increase in a monotonically increasing counter within the defined time period. | See <a href="#">common parameters</a> .  | Supported value types: float, int<br><br>Functionally corresponds to 'rate' of PromQL.<br><br>Example:<br>=> <b>rate</b> (/host/key, <b>30s</b> ) → If the monotonic increase over 30 seconds is 20, this function will return 0.67. |

## 5 Trend functions

Trend functions, in contrast to [history functions](#), use [trend](#) data for calculations.

Trends store hourly aggregate values. Trend functions use these hourly averages, and thus are useful for long-term analysis.

Trend function results are cached so multiple calls to the same function with the same parameters fetch info from the database only once. The trend function cache is controlled by the [TrendFunctionCacheSize](#) server parameter.

Triggers that reference trend functions **only** are evaluated once per the smallest time period in the expression. For instance, a trigger like

```
trendavg(/host/key,1d:now/d) > 1 or trendavg(/host/key2,1w:now/w) > 2
```

will be evaluated once per day. If the trigger contains both trend and history (or [date and time](#) and/or [nodata\(\)](#)) functions, it is calculated in accordance with the [usual principles](#).

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by < >
- Function-specific parameters are described with each function
- /host/key and time period:time shift parameters must never be quoted

Common parameters

- /host/key is a common mandatory first parameter
- time period:time shift is a common second parameter, where:
  - **time period** - the time period (minimum '1h'), defined as <N><time unit> where N - the number of time units, time unit - h (hour), d (day), w (week), M (month) or y (year).
  - **time shift** - the time period offset (see function examples)

Trend functions

| FUNCTION  |                              |          |
|---|------------------------------|----------|
| Description   | Function-specific parameters | Comments |
| <b>baselinedev</b> (/host/key,data period:time shift,season_unit,num_seasons) |                              |          |

---

## FUNCTION

---

Returns the number of deviations (by stddevpop algorithm) between the last data period and the same data periods in preceding seasons.

**data\_period** - the data gathering period within a season, defined as `<N><time unit>` where `N` - number of time units  
`time unit` - h (hour), d (day), w (week), M (month) or y (year), must be equal to or less than season

**Time shift** - the time period offset (see examples)

**season\_unit** - duration of one season (h, d, w, M, y), cannot be smaller than data period

**num\_seasons** - number of seasons to evaluate

**baselinewma** (/host/key,data period:time

shift,season\_unit,num\_seasons)

Calculates the baseline by averaging data from the same timeframe in multiple equal time periods ('seasons') using the weighted moving average algorithm.

**data\_period** - the data gathering period within a season, defined as `<N><time unit>` where `N` - number of time units  
`time unit` - h (hour), d (day), w (week), M (month) or y (year), must be equal to or less than season

**Time shift** - the time period offset, defines the end of data gathering time frame in seasons (see examples)

**season\_unit** - duration of one season (h, d, w, M, y), cannot be smaller than data period

**num\_seasons** - number of seasons to evaluate

**trendavg** (/host/key,time period:time shift)

Examples:

=> **base-linedev**(/host/key,1d:now/d,"M",6) → calculating the number of standard deviations (population) between the previous day and the same day in the previous 6 months. If the date doesn't exist in a previous month, the last day of the month will be used (Jul,31 will be analysed against Jan,31, Feb, 28,... June, 30).

=> **base-linedev**(/host/key,1h:now/h,"d",10) → calculating the number of standard deviations (population) between the previous hour and the same hours over the period of ten days before yesterday.

Examples:

=> **base-linewma**(/host/key,1h:now/h,"d",3) → calculating baseline based on the last full hour within a 3-day period that ended yesterday. If "now" is Monday 13:30, the data for 12:00-12:59 on Friday, Saturday, and Sunday will be analyzed.

=> **base-linewma**(/host/key,2h:now/h,"d",3) → calculating baseline based on the last two hours within a 3-day period that ended yesterday. If "now" is Monday 13:30, the data for 11:00-12:59 on Friday, Saturday, and Sunday will be analyzed.

=> **base-linewma**(/host/key,1d:now/d,"M",4) → calculating baseline based on the same day of month as 'yesterday' in the 4 months preceding the last full month. If required date doesn't exist, the last day of month is taken. If today is September 1st, the data for July 31st, June 30th, May 31st, April 30th will be analyzed.

---

## FUNCTION

---

Average of trend values within the defined time period.

See [common parameters](#).

Examples:

=> **trendavg**(/host/key,**1h:now/h**) →  
average for the previous hour (e.g.  
12:00-13:00)

=>

**trendavg**(/host/key,**1h:now/h-1h**) →  
average for two hours ago  
(11:00-12:00)

=>

**trendavg**(/host/key,**1h:now/h-2h**) →  
average for three hours ago  
(10:00-11:00)

=>

**trendavg**(/host/key,**1M:now/M-1y**) →  
average for the previous month a year  
ago

**trendcount** (/host/key,time  
period:time shift)

Number of successfully retrieved  
history values used to calculate the  
trend value within the defined time  
period.

See [common parameters](#).

Examples:

=> **trendcount**(/host/key,**1h:now/h**)  
→ count for the previous hour (e.g.  
12:00-13:00)

=>

**trendcount**(/host/key,**1h:now/h-1h**)  
→ count for two hours ago  
(11:00-12:00)

=>

**trendcount**(/host/key,**1h:now/h-2h**)  
→ count for three hours ago  
(10:00-11:00)

=>

**trendcount**(/host/key,**1M:now/M-1y**)  
→ count for the previous month a year  
ago

**trendmax** (/host/key,time period:time  
shift)

The maximum in trend values within  
the defined time period.

See [common parameters](#).

Examples:

=> **trendmax**(/host/key,**1h:now/h**) →  
maximum for the previous hour (e.g.  
12:00-13:00)

=> **trendmax**(/host/key,**1h:now/h**) -  
**trendmin**(/host/key,**1h:now/h**) →  
calculate the difference between the  
maximum and minimum values (trend  
delta) for the previous hour  
(12:00-13:00)

=>

**trendmax**(/host/key,**1h:now/h-1h**) →  
maximum for two hours ago  
(11:00-12:00)

=>

**trendmax**(/host/key,**1h:now/h-2h**) →  
maximum for three hours ago  
(10:00-11:00)

=>

**trendmax**(/host/key,**1M:now/M-1y**)  
→ maximum for the previous month a  
year ago

**trendmin** (/host/key,time period:time  
shift)

---

## FUNCTION

---

The minimum in trend values within the defined time period.

See [common parameters](#).

Examples:

=> **trendmin**(/host/key,**1h:now/h**) → minimum for the previous hour (e.g. 12:00-13:00)

=> **trendmax**(/host/key,**1h:now/h**) - **trendmin**(/host/key,**1h:now/h**) → calculate the difference between the maximum and minimum values (trend delta) for the previous hour (12:00-13:00)

=>

**trendmin**(/host/key,**1h:now/h-1h**) → minimum for two hours ago (11:00-12:00)

=>

**trendmin**(/host/key,**1h:now/h-2h**) → minimum for three hours ago (10:00-11:00)

=>

**trendmin**(/host/key,**1M:now/M-1y**) → minimum for the previous month a year ago

**trendstl** (/host/key,eval period:time shift,detection period,season,<deviations>,<devalg>,<s\_window>)

---

## FUNCTION

---

Returns the rate of anomalies during the detection period - a decimal value between 0 and 1 that is ((the number of anomaly values)/(total number of values)).

**eval period** - the time period that must be decomposed (minimum '1h'), defined as <N><time unit> where N - number of time units  
time unit - h (hour), d (day), w (week), M (month) or y (year).

**Time shift** - the time period offset (see examples)

**detection period** - the time period before the end of eval period for which anomalies are calculated (minimum '1h', cannot be longer than eval period), defined as <N><time unit> where  
N - number of time units  
time unit - h (hour), d (day), w (week).

**season** - the shortest time period where a repeating pattern ("season") is expected (minimum '2h', cannot be longer than eval period, number of entries in the eval period must be greater than the two times of the resulting frequency (season/h)), defined as <N><time unit> where  
N - number of time units  
time unit - h (hour), d (day), w (week).

**deviations** - the number of deviations (calculated by devalg) to count as anomaly (can be decimal), (must be greater than or equal to 1, default is 3)

**devalg** (must be double-quoted) - deviation algorithm, can be *stddevpop*, *stddevsamp* or *mad* (default)

**s\_window** - the span (in lags) of the loess window for seasonal extraction (default is 10 \* number of entries in eval period + 1)

Examples:

=> **trend-stl**(/host/key,**100h:now/h**,10h,2h) → analyse the last 100 hours of trend data, find the anomaly rate for the last 10 hours of that period, expecting the periodicity to be 2h, the remainder series values of the evaluation period are considered anomalies if they reach the value of 3 deviations of the MAD of that remainder series  
=> **trendstl**(/host/key,**100h:now/h-10h**,100h,2h,2.1,"mad") → analyse the period of 100 hours of trend data, up to 10 hours ago, find the anomaly rate for that entire period expecting the periodicity to be 2h, the remainder series values of the evaluation period are considered anomalies if they reach the value of 2,1 deviations of the MAD of that remainder series  
=> **trendstl**(/host/key,**100d:now/d-1d**,10d,1d,4,,10) → analyse 100 days of trend data up to a day ago, find the anomaly rate for the period of last 10d of that period, expecting the periodicity to be 1d, the remainder series values of the evaluation period are considered anomalies if they reach the value of 4 deviations of the MAD of that remainder series, overriding the default span of the loess window for seasonal extraction of "10 \* number of entries in eval period + 1" with the span of 10 lags  
=> **trendstl**(/host/key,**1M:now/M-1y**,1d,2h,,,"stddevsamp") → analyse the previous month a year ago, find the anomaly rate of the last day of that period expecting the periodicity to be 2h, the remainder series values of the evaluation period are considered anomalies if they reach the value of 3 deviation of the sample standard deviation of that remainder series

**trendsum** (/host/key,time period:time shift)

---

## FUNCTION

---

Sum of trend values within the defined time period. See [common parameters](#).

Examples:  
=> **trendsum**(/host/key,**1h:now/h**) →  
sum for the previous hour (e.g.  
12:00-13:00)  
=>  
**trendsum**(/host/key,**1h:now/h-1h**) →  
sum for two hours ago (11:00-12:00)  
=>  
**trendsum**(/host/key,**1h:now/h-2h**) →  
sum for three hours ago (10:00-11:00)  
=>  
**trendsum**(/host/key,**1M:now/M-1y**)  
→ sum for the previous month a year ago

---

## 6 Mathematical functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Mathematical functions are supported with float and integer value types, unless stated otherwise.

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters
- Optional function parameters (or parameter parts) are indicated by < >

---

## FUNCTION

---

### Description

**abs** (value)

The absolute value (from 0) of a value.

### Function-specific parameters

**value** - value to check

### Comments

For example, the absolute value of either '3' or '-3' will be '3'.

Example:

=> **abs**(last(/host/key))>10

**acos** (value)

The arccosine of a value as an angle, expressed in radians.

**value** - value to check

The value must be between -1 and 1.

For example, the arccosine of a value '0.5' will be '2.0943951'.

Example:

=> **acos**(last(/host/key))

**asin** (value)

The arcsine of a value as an angle, expressed in radians.

**value** - value to check

The value must be between -1 and 1.

For example, the arcsine of a value '0.5' will be '-0.523598776'.

Example:

=> **asin**(last(/host/key))

**atan** (value)

The arctangent of a value as an angle, expressed in radians.

**value** - value to check

For example, the arctangent of a value '1' will be '0.785398163'.

Example:

=> **atan**(last(/host/key))

**atan2** (value,abscissa)

---

## FUNCTION

---

The arctangent of the ordinate (value) and abscissa coordinates specified as an angle, expressed in radians.

**value** - value to check  
**abscissa** - abscissa value

For example, the arctangent of the ordinate and abscissa coordinates of a value '1' will be '2.21429744'.

Example:  
=> **atan2**(last(/host/key),2)

**avg** (<value1>,<value2>,...)

Average value of the referenced item values.

**valueX** - value returned by another function that is working with item history

Example:  
=> **avg**(avg(/host/key),avg(/host2/key2))

**cbrt** (value)

Cube root of a value.

**value** - value to check

For example, the cube root of '64' will be '4', of '63' will be '3.97905721'.

Example:  
=> **cbrt**(last(/host/key))

**ceil** (value)

Round the value up to the nearest greater or equal integer.

**value** - value to check

For example, '2.4' will be rounded up to '3'.

Example:  
=> **ceil**(last(/host/key))

See also floor().

**cos** (value)

The cosine of a value, where the value is an angle expressed in radians.

**value** - value to check

For example, the cosine of a value '1' will be '0.54030230586'.

Example:  
=> **cos**(last(/host/key))

**cosh** (value)

The hyperbolic cosine of a value.

**value** - value to check

For example, the hyperbolic cosine of a value '1' will be '1.54308063482'.

Returns value as a real number, not as scientific notation.

Example:  
=> **cosh**(last(/host/key))

**cot** (value)

The cotangent of a value, where the value is an angle, expressed in radians.

**value** - value to check

For example, the cotangent of a value '1' will be '0.54030230586'.

Example:  
=> **cot**(last(/host/key))

**degrees** (value)

Converts a value from radians to degrees.

**value** - value to check

For example, a value '1' converted to degrees will be '57.2957795'.

Example:  
=> **degrees**(last(/host/key))

**e**

Euler's number (2.718281828459045).

Example:  
=> **e**()

**exp** (value)

Euler's number at a power of a value.

**value** - value to check

For example, Euler's number at a power of a value '2' will be '7.38905609893065'.

Example:  
=> **exp**(last(/host/key))

---

## FUNCTION

---

### **expm1 (value)**

Euler's number at a power of a value minus 1.

**value** - value to check

For example, Euler's number at a power of a value '2' minus 1 will be '6.38905609893065'.

Example:

=> **expm1**(last(/host/key))

### **floor (value)**

Round the value down to the nearest smaller or equal integer.

**value** - value to check

For example, '2.6' will be rounded down to '2'.

Example:

=> **floor**(last(/host/key))

### **log (value)**

Natural logarithm.

**value** - value to check

For example, the natural logarithm of a value '2' will be '0.69314718055994529'.

Example:

=> **log**(last(/host/key))

### **log10 (value)**

Decimal logarithm.

**value** - value to check

For example, the decimal logarithm of a value '5' will be '0.69897000433'.

Example:

=> **log10**(last(/host/key))

### **max (<value1>,<value2>,...)**

Highest value of the referenced item values.

**valueX** - value returned by another function that is working with item history

Example:

=>

**max**(avg(/host/key),avg(/host2/key2))

### **min (<value1>,<value2>,...)**

Lowest value of the referenced item values.

**valueX** - value returned by another function that is working with item history

Example:

=>

**min**(avg(/host/key),avg(/host2/key2))

### **mod (value,denominator)**

Division remainder.

**value** - value to check

**denominator** - division denominator

For example, division remainder of a value '5' with division denominator '2' will be '1'.

Example:

=> **mod**(last(/host/key),2)

### **pi**

Pi constant (3.14159265358979).

Example:

=> **pi**()

### **power (value,power value)**

The power of a value.

**value** - value to check

**power value** - the Nth power to use

For example, the 3rd power of a value '2' will be '8'.

Example:

=> **power**(last(/host/key),3)

### **radians (value)**

Convert a value from degrees to radians.

**value** - value to check

For example, a value '1' converted to radians will be '0.0174532925'.

Example:

=> **radians**(last(/host/key))

### **rand**

---

## FUNCTION

---

Return a random integer value.

A pseudo-random generated number using time as seed (enough for mathematical purposes, but not cryptography).

Example:

=> **rand()**

**round** (value,decimal places)

Round the value to decimal places.

**value** - value to check

**decimal places** - specify decimal places for rounding (0 is also possible)

For example, a value '2.5482' rounded to 2 decimal places will be '2.55'.

Example:

=> **round**(last(/host/key),2)

**signum** (value)

Returns '-1' if a value is negative, '0' if a value is zero, '1' if a value is positive.

**value** - value to check

**sin** (value)

The sine of a value, where the value is an angle expressed in radians.

**value** - value to check

Example:

=> **signum**(last(/host/key))

For example, the sine of a value '1' will be '0.8414709848'.

Example:

=> **sin**(last(/host/key))

**sinh** (value)

The hyperbolical sine of a value.

**value** - value to check

For example, the hyperbolical sine of a value '1' will be '1.17520119364'.

Example:

=> **sinh**(last(/host/key))

**sqrt** (value)

Square root of a value.

**value** - value to check

This function will fail with a negative value.

For example, the square root of a value '3.5' will be '1.87082869339'.

Example:

=> **sqrt**(last(/host/key))

**sum** (<value1>,<value2>,...)

Sum of the referenced item values.

**valueX** - value returned by another function that is working with item history

Example:

=>

**sum**(avg(/host/key),avg(/host2/key2))

**tan** (value)

The tangent of a value.

**value** - value to check

For example, the tangent of a value '1' will be '1.55740772465'.

Example:

=> **tan**(last(/host/key))

**truncate** (value,decimal places)

Truncate the value to decimal places.

**value** - value to check

**decimal places** - specify decimal places for truncating (0 is also possible)

Example:

=> **truncate**(last(/host/key),2)

---

## 7 Operator functions

All functions listed here are supported in:

- Trigger expressions
- Calculated items

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters

---

## FUNCTION

---

| Description  | Function-specific parameters  | Comments   |
|--|---|--|
| <b>between</b> (value,min,max)<br>Check if a value belongs to the given range.                               | <b>value</b> - value to check<br><b>min</b> - minimum value<br><b>max</b> - maximum value                             | Supported value types: integer, float<br><br>Returns:<br>1 - in range<br>0 - otherwise<br><br>Example:<br>=> <b>between</b> (last(/host/key), <b>1,10</b> )=1<br>- trigger if the value is between 1 and 10.   |
| <b>in</b> (value,value1,value2,...valueN)<br>Check if a value is equal to at least one of the listed values. | <b>value</b> - value to check<br><b>value1,value2,...valueN</b> - listed values (string values must be double-quoted) | Supported value types: all<br><br>Returns:<br>1 - if equal<br>0 - otherwise<br><br>The value is compared to the listed values as numbers, if all of these values can be converted to numeric; otherwise compared as strings.<br><br>Example:<br>=> <b>in</b> (last(/host/key), <b>5,10</b> )=1 - trigger if the last value is equal to 5 or 10<br>=> <b>in</b> ("text", last(/host/key),last(/host/key,#2))=1 - trigger if "text" is equal to either of the last 2 values. |

---

## 8 Prediction functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by < >
- Function-specific parameters are described with each function
- /host/key and (sec|#num)<:time shift> parameters must never be quoted

Common parameters

- /host/key is a common mandatory first parameter for the functions referencing the host item history
- (sec|#num)<:time shift> is a common second parameter for the functions referencing the host item history, where:
  - **sec** - maximum [evaluation period](#) in seconds (time [suffixes](#) can be used), or
  - **#num** - maximum [evaluation range](#) in latest collected values (if preceded by a hash mark)
  - **time shift** (optional) allows to move the evaluation point back in time. See [more details](#) on specifying time shift.

Prediction functions

---

## FUNCTION

---

| Description | Function-specific parameters | Comments |
|-------------|------------------------------|----------|
|-------------|------------------------------|----------|

**forecast**

(/host/key,(sec|#num)<:time  
shift>,time,<fit>,<mode>)

Future value, max, min, delta or avg of  
the item.

See [common parameters](#).

Supported value types: float, int

**time** - forecasting horizon in seconds  
(time suffixes can be used); negative  
values are supported

If value to return is larger than  
1.7976931348623157E+308 or less  
than -1.7976931348623157E+308,  
return value is cropped to  
1.7976931348623157E+308 or  
-1.7976931348623157E+308  
correspondingly.

**fit** (optional; must be double-quoted) -  
function used to fit historical data

Becomes unsupported only if misused  
in expression (wrong item type, invalid  
parameters), otherwise returns -1 in  
case of errors.

Supported fits:

*linear* - linear function

*polynomialN* - polynomial of degree N  
(1 ≤ N ≤ 6)

*exponential* - exponential function

*logarithmic* - logarithmic function

*power* - power function

Examples:

=> **forecast**(/host/key,#10,1h) →  
forecast item value in one hour based  
on the last 10 values

=> **forecast**(/host/key,1h,30m) →  
forecast item value in 30 minutes  
based on the last hour data

=>

**forecast**(/host/key,1h:now-1d,12h)  
→ forecast item value in 12 hours  
based on one hour one day ago

=> **fore-**  
**cast**(/host/key,1h,10m,"exponential")  
→ forecast item value in 10 minutes  
based on the last hour data and  
exponential function

=> **fore-**  
**cast**(/host/key,1h,2h,"polynomial3","max")  
→ forecast the maximum value the  
item can reach in the next two hours  
based on last hour data and cubic  
(third degree) polynomial

=> **forecast**(/host/key,#2,-20m) →  
estimate the item value 20 minutes  
ago based on the last two values (this  
can be more precise than using last(),  
especially if item is updated rarely,  
say, once an hour)

See also additional information on  
[predictive trigger functions](#).

Note that:

*linear* is default, *polynomial1* is  
equivalent to *linear*

**mode** (optional; must be  
double-quoted) - demanded output

Supported modes:

*value* - value (default)

*max* - maximum

*min* - minimum

*delta* - max-min

*avg* - average

Note that:

*value* estimates item value at the  
moment now + time

*max*, *min*, *delta* and *avg* investigate  
item value estimate on the interval  
between now and now + time

**timeleft** (/host/key,(sec|#num)<:time  
shift>,threshold,<fit>)

---

## FUNCTION

---

Time in seconds needed for an item to reach a specified threshold.

See [common parameters](#).

Supported value types: float, int

**threshold** - value to reach ([unit suffixes](#) can be used)

If value to return is larger than 1.7976931348623157E+308, return value is cropped to 1.7976931348623157E+308.

**fit** (optional; must be double-quoted) - see [forecast\(\)](#)

Returns 1.7976931348623157E+308 if threshold cannot be reached.

Becomes unsupported only if misused in the expression (wrong item type, invalid parameters), otherwise returns -1 in case of errors.

Examples:

=> **timeleft(/host/key,#10,0)** → time until the item value reaches zero based on the last 10 values

=> **timeleft(/host/key,1h,100)** → time until the item value reaches 100 based on the last hour data

=>

**timeleft(/host/key,1h:now-1d,100)**

→ time until the item value reaches 100 based on one hour one day ago

=>

**timeleft(/host/key,1h,200,"polynomial2")**

→ time until the item value reaches 200 based on the last hour data and assumption that the item behaves like quadratic (second degree) polynomial  
See also additional information on [predictive trigger functions](#).

---

## 9 String functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters
- String parameters must be double-quoted; otherwise they might get misinterpreted
- Optional function parameters (or parameter parts) are indicated by < >

---

## FUNCTION

---

### Description

**ascii** (value)

The ASCII code of the leftmost character of the value.

### Function-specific parameters

**value** - value to check

### Comments

Supported value types: string, text, log

For example, a value like 'Abc' will return '65' (ASCII code for 'A').

Example:

=> **ascii**(last(/host/key))

**bitlength** (value)

---

## FUNCTION

---

|   |   |  |
|---|---|--|
| The length of value in bits.  | <b>value</b> - value to check   | Supported value types: string, text, log, integer<br><br>Example:<br>=> <b>bitlength</b> (last(/host/key))   |
| <b>bitlength</b> (value)<br>The length of value in bytes.   | <b>value</b> - value to check   | Supported value types: string, text, log, integer<br><br>Example:<br>=> <b>bitlength</b> (last(/host/key))   |
| <b>char</b> (value)<br>Return the character by interpreting the value as ASCII code.  | <b>value</b> - value to check   | Supported value types: integer<br><br>The value must be in the 0-255 range. For example, a value like '65' (interpreted as ASCII code) will return 'A'.<br><br>Example:<br>=> <b>char</b> (last(/host/key))  |
| <b>concat</b> (<value1>,<value2>,...)<br>The string resulting from concatenating referenced item values or constant values.   | <b>value</b> - a value returned by one of the history functions or a constant value (string, integer, or float number)                            | Supported value types: string, text, log, float, integer<br><br>For example, a value like 'Zab' concatenated to 'bix' (the constant string) will return 'Zabbix'.<br><br>Must contain at least two parameters.<br><br>Examples:<br>=> <b>concat</b> (last(/host/key),"bix")<br>=> <b>concat</b> ("1 min:",last(/host/system.cpu.load[all,avg1]),",",15 min:",last(/host/system.cpu.load[all,avg15])) |
| <b>insert</b><br>(value,start,length,replacement)<br>Insert specified characters or spaces into the character string beginning at the specified position in the string. | <b>value</b> - value to check<br><b>start</b> - start position<br><b>length</b> - positions to replace<br><b>replacement</b> - replacement string | Supported value types: string, text, log<br><br>For example, a value like 'Zabbbix' will be replaced by 'Zabbix' if 'bb' (starting position 3, positions to replace 2) is replaced by 'b'.<br><br>Example:<br>=> <b>insert</b> (last(/host/key),3,2,"b")   |
| <b>left</b> (value,count)<br>The leftmost characters of the value.  | <b>value</b> - value to check<br><b>count</b> - number of characters to return  | Supported value types: string, text, log<br><br>For example, you may return 'Zab' from 'Zabbix' by specifying 3 leftmost characters to return.<br><br>Example:<br>=> <b>left</b> (last(/host/key),3) - return three leftmost characters<br><br>See also right().   |

---

## FUNCTION

---

### **length** (value)

The length of value in characters.

**value** - value to check

Supported value types: str, text, log

Example:

=> **length**(last(/host/key)) → length of the latest value

=> **length**(last(/host/key,#3)) →

length of the third most recent value

=> **length**(last(/host/key,#1:now-1d))

→ length of the most recent value one day ago

### **ltrim** (value,<chars>)

Remove specified characters from the beginning of string.

**value** - value to check

**chars** - (optional) specify characters to remove

Supported value types: string, text, log

Example:

=> **ltrim**(last(/host/key)) - remove whitespace from the beginning of string

=> **ltrim**(last(/host/key),"Z") -

remove any 'Z' from the beginning of string

=> **ltrim**(last(/host/key)," Z") -

remove any space and 'Z' from the beginning of string

See also: rtrim(), trim()

### **mid** (value,start,length)

Return a substring of N characters beginning at the character position specified by 'start'.

**value** - value to check

**start** - start position of substring

**length** - positions to return in substring

Supported value types: string, text, log

For example, it is possible return 'abbi' from a value like 'Zabbix' if starting position is 2, and positions to return is 4).

Example:

=> **mid**(last(/host/key),2,4)="abbi"

### **repeat** (value,count)

Repeat a string.

**value** - value to check

**count** - number of times to repeat

Supported value types: string, text, log

Example:

=> **repeat**(last(/host/key),2) - repeat the value two times

### **replace** (value,pattern,replacement)

Find pattern in the value and replace with replacement. All occurrences of the pattern will be replaced.

**value** - value to check

**pattern** - pattern to find

**replacement** - string to replace the pattern with

Supported value types: string, text, log

Example:

=>

**replace**(last(/host/key),"ibb","abb")

- replace all 'ibb' with 'abb'

### **right** (value,count)

---

## FUNCTION

---

The rightmost characters of the value.

**value** - value to check  
**count** - number of characters to return

Supported value types: string, text, log

For example, you may return 'bix' from 'Zabbix' by specifying 3 rightmost characters to return.

Example:

=> **right**(last(/host/key),**3**) - return three rightmost characters

See also left().

**rtrim** (value,<chars>)

Remove specified characters from the end of string.

**value** - value to check  
**chars** - (optional) specify characters to remove

Whitespace is right-trimmed by default (if no optional characters are specified).

Supported value types: string, text, log

Example:

=> **rtrim**(last(/host/key)) - remove whitespace from the end of string  
=> **rtrim**(last(/host/key),"**x**") - remove any 'x' from the end of string  
=> **rtrim**(last(/host/key),"**x** ") - remove any 'x' or space from the end of string

See also: ltrim(), trim()

**trim** (value,<chars>)

Remove specified characters from the beginning and end of string.

**value** - value to check  
**chars** - (optional) specify characters to remove

Whitespace is trimmed from both sides by default (if no optional characters are specified).

Supported value types: string, text, log

Example:

=> **trim**(last(/host/key)) - remove whitespace from the beginning and end of string  
=> **trim**(last(/host/key),"**\_**") - remove '\_' from the beginning and end of string

See also: ltrim(), rtrim()

---

## 6 Macros

It is possible to use out-of-the-box [Supported macros](#) and [User macros supported by location](#).

### 1 Supported macros

#### Overview

The table contains a complete list of macros supported by Zabbix out-of-the-box.

#### Note:

To see all macros supported in a location (for example, in "map URL"), you may paste the location name into the search box at the bottom of your browser window (accessible by pressing CTRL+F) and do a search for *next*.

| Macro                        | Supported in  | Description  |
|------------------------------|---|--|
| {ACTION.ID}                  | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Discovery notifications and commands</li> <li>→ Autoregistration notifications and commands</li> <li>→ Internal notifications</li> </ul>   | <i>Numeric ID of the triggered action.</i>   |
| {ACTION.NAME}                | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Discovery notifications and commands</li> <li>→ Autoregistration notifications and commands</li> <li>→ Internal notifications</li> </ul>   | <i>Name of the triggered action.</i>   |
| {ALERT.MESSAGE}              | → Alert script parameters   | <i>'Default message' value from action configuration.</i><br>Supported since 3.0.0.  |
| {ALERT.SENDTO}               | → Alert script parameters   | <i>'Send to' value from user media configuration.</i><br>Supported since 3.0.0.  |
| {ALERT.SUBJECT}              | → Alert script parameters   | <i>'Default subject' value from action configuration.</i><br>Supported since 3.0.0.  |
| {DATE}                       | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Discovery notifications and commands</li> <li>→ Autoregistration notifications and commands</li> <li>→ Internal notifications</li> <li>→ Manual event action <b>scripts</b></li> </ul> | <i>Current date in yyyy.mm.dd. format.</i>   |
| {DISCOVERY.DEVICE.IPADDRESS} | → Discovery notifications and commands  | <i>IP address of the discovered device.</i><br>Available always, does not depend on host being added.  |
| {DISCOVERY.DEVICE.DNS}       | → Discovery notifications and commands  | <i>DNS name of the discovered device.</i><br>Available always, does not depend on host being added.  |
| {DISCOVERY.DEVICE.STATUS}    | → Discovery notifications and commands  | <i>Status of the discovered device: can be either UP or DOWN.</i>  |
| {DISCOVERY.DEVICE.UPTIME}    | → Discovery notifications and commands  | <i>Time since the last change of discovery status for a particular device, with precision down to a second.</i><br>For example: 1h 29m 01s.<br>For devices with status DOWN, this is the period of their downtime.   |
| {DISCOVERY.RULE.NAME}        | → Discovery notifications and commands  | <i>Name of the discovery rule that discovered the presence or absence of the device or service.</i>  |
| {DISCOVERY.SERVICE.NAME}     | → Discovery notifications and commands  | <i>Name of the service that was discovered.</i><br>For example: HTTP.  |
| {DISCOVERY.SERVICE.PORT}     | → Discovery notifications and commands  | <i>Port of the service that was discovered.</i><br>For example: 80.  |
| {DISCOVERY.SERVICE.STATUS}   | → Discovery notifications and commands  | <i>Status of the discovered service: can be either UP or DOWN.</i>   |
| {DISCOVERY.SERVICE.UPTIME}   | → Discovery notifications and commands  | <i>Time since the last change of discovery status for a particular service, with precision down to a second.</i><br>For example: 1h 29m 01s.<br>For services with status DOWN, this is the period of their downtime. |
| {ESC.HISTORY}                | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Internal notifications</li> </ul>  | <i>Escalation history. Log of previously sent messages.</i><br>Shows previously sent notifications, on which escalation step they were sent and their status ( <i>sent, in progress or failed</i> ).                 |

| Macro              | Supported in   | Description  |
|--------------------|--|--|
| {EVENT.ACK.STATUS} | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b>  | <i>Acknowledgment status of the event (Yes/No).</i>  |
| {EVENT.AGE}        | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Manual event action <b>scripts</b>                   | <i>Age of the event that triggered an action, with precision down to a second.<br/>Useful in escalated messages.</i>   |
| {EVENT.DATE}       | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Manual event action <b>scripts</b>                   | <i>Date of the event that triggered an action.</i>   |
| {EVENT.DURATION}   | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Internal notifications<br>→ Manual event action <b>scripts</b>  | <i>Duration of the event (time difference between problem and recovery events), with precision down to a second.<br/>Useful in problem recovery messages.</i><br><br>Supported since 5.0.0.                  |
| {EVENT.ID}         | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Trigger URLs<br>→ Manual event action <b>scripts</b> | <i>Numeric ID of the event that triggered an action.</i>   |
| {EVENT.NAME}       | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Internal notifications<br>→ Manual event action <b>scripts</b>  | <i>Name of the problem event that triggered an action.</i><br>Supported since 4.0.0.   |
| {EVENT.NSEVERITY}  | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b>  | <i>Numeric value of the event severity. Possible values: 0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster.</i><br>Supported since 4.0.0.                                |
| {EVENT.OBJECT}     | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Manual event action <b>scripts</b>                   | <i>Numeric value of the event object. Possible values: 0 - Trigger, 1 - Discovered host, 2 - Discovered service, 3 - Autoregistration, 4 - Item, 5 - Low-level discovery rule.</i><br>Supported since 4.4.0. |

| Macro                     | Supported in  | Description  |
|---------------------------|---|--|
| {EVENT.OPDATA}            | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b>   | <i>Operational data of the underlying trigger of a problem.</i><br>Supported since 4.4.0.  |
| {EVENT.RECOVERY.DATE}     | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>Date of the recovery event.</i>   |
| {EVENT.RECOVERY.ID}       | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>Numeric ID of the recovery event.</i>   |
| {EVENT.RECOVERY.NAME}     | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>Name of the recovery event.</i><br>Supported since 4.4.1.   |
| {EVENT.RECOVERY.START}    | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>Verbal value of the recovery event.</i>   |
| {EVENT.RECOVERY.TAGS}     | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>A comma separated list of recovery event tags.</i><br>Expanded to an empty string if no tags exist.<br>Supported since 3.2.0.   |
| {EVENT.RECOVERY.TAGSJSON} | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>A JSON array containing event tag <b>objects</b>.</i><br>Expanded to an empty array if no tags exist.<br>Supported since 5.0.0. |
| {EVENT.RECOVERY.TIME}     | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>Time of the recovery event.</i>   |
| {EVENT.RECOVERY.VALUE}    | → Problem <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands (if recovery took place)<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> (if recovery took place)                                  | <i>Numeric value of the recovery event.</i>  |
| {EVENT.SEVERITY}          | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Manual event action <b>scripts</b> | <i>Name of the event severity.</i><br>Supported since 4.0.0.   |

| Macro                   | Supported in   | Description   |
|-------------------------|--|---|
| {EVENT.SOURCE}          | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Service recovery notifications and commands</li> <li>→ Discovery notifications and commands</li> <li>→ Autoregistration notifications and commands</li> <li>→ Internal notifications</li> <li>→ Manual event action <b>scripts</b></li> </ul> | <i>Numeric value of the event source.</i> Possible values: 0 - Trigger, 1 - Discovery, 2 - Autoregistration, 3 - Internal, 4 - Service. Supported since 4.4.0.  |
| {EVENT.STATUS}          | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Service recovery notifications and commands</li> <li>→ Internal notifications</li> <li>→ Manual event action <b>scripts</b></li> </ul>  | <i>Verbal value of the event that triggered an action.</i>  |
| {EVENT.TAGS}            | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Service recovery notifications and commands</li> <li>→ Manual event action <b>scripts</b></li> </ul>  | <i>A comma separated list of event tags.</i> Expanded to an empty string if no tags exist. Supported since 3.2.0.   |
| {EVENT.TAGSJSON}        | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Service recovery notifications and commands</li> <li>→ Manual event action <b>scripts</b></li> </ul>  | <i>A JSON array containing event tag <b>objects</b>.</i> Expanded to an empty array if no tags exist. Supported since 5.0.0.  |
| {EVENT.TAGS.<tag name>} | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Service recovery notifications and commands</li> <li>→ Webhook media type URL names and URLs</li> <li>→ Manual event action <b>scripts</b></li> </ul>   | <i>Event tag value referenced by the tag name.</i> A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) should be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash. Supported since 4.4.2.   |
| {EVENT.TIME}            | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Service-based notifications and commands</li> <li>→ Service update notifications and commands</li> <li>→ Service recovery notifications and commands</li> <li>→ Discovery notifications and commands</li> <li>→ Autoregistration notifications and commands</li> <li>→ Internal notifications</li> <li>→ Manual event action <b>scripts</b></li> </ul> | <i>Time of the event that triggered an action.</i>  |
| {EVENT.UPDATE.ACTION}   | <ul style="list-style-type: none"> <li>→ Problem update notifications and commands</li> </ul>  | <i>Human-readable name of the action(s) performed during <b>problem update</b>.</i> Resolves to the following values: <i>acknowledged</i> , <i>commented</i> , <i>changed severity from (original severity) to (updated severity)</i> and <i>closed</i> (depending on how many actions are performed in one update). Supported since 4.0.0. |
| {EVENT.UPDATE.DATE}     | <ul style="list-style-type: none"> <li>→ Problem update notifications and commands</li> <li>→ Service update notifications and commands</li> </ul>   | <i>Date of event <b>update</b> (acknowledgment, etc).</i> Deprecated name: {ACK.DATE}   |
| {EVENT.UPDATE.HISTORY}  | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Manual event action <b>scripts</b></li> </ul>  | <i>Log of problem updates (acknowledgments, etc).</i> Deprecated name: {EVENT.ACK.HISTORY}  |
| {EVENT.UPDATE.MESSAGE}  | <ul style="list-style-type: none"> <li>→ Problem update notifications and commands</li> </ul>  | <i>Problem update message.</i> Deprecated name: {ACK.MESSAGE}   |
| {EVENT.UPDATE.SEVERITY} | <ul style="list-style-type: none"> <li>→ Problem update notifications and commands</li> </ul>  | <i>Numeric value of the new event severity set during problem update operation.</i>   |

| Macro                     | Supported in  | Description   |
|---------------------------|---|---|
| {EVENT.UPDATE.SEVERITY}   | → Service update notifications and commands   | <i>Name of the new event severity set during problem update operation.</i>  |
| {EVENT.UPDATE.STATUS}     | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b>   | <i>Numeric value of the problem update status.</i><br>Possible values: 0 - Webhook was called because of problem/recovery event, 1 - Update operation.<br>Supported since 4.4.0.  |
| {EVENT.UPDATE.TIME}       | → Problem update notifications and commands<br>→ Service update notifications and commands  | <i>Time of event <b>update</b> (acknowledgment, etc).</i><br>Deprecated name: {ACK.TIME}  |
| {EVENT.VALUE}             | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Service recovery notifications and commands<br>→ Internal notifications<br>→ Manual event action <b>scripts</b> | <i>Numeric value of the event that triggered an action (1 for problem, 0 for recovering).</i>   |
| {FUNCTION.VALUE}          | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b><br>→ Event names  | <i>Results of the Nth item-based function in the trigger expression at the time of the event.</i><br>Only functions with /host/key as the first parameter are counted.<br><br>This macro may be used with a numeric index e.g. {FUNCTION.VALUE<1-9>} to point to the first, second, third, etc. function in a trigger expression.<br>See <b>indexed macros</b> .  |
| {FUNCTION.RECOVERY.VALUE} | → <b>recovery notifications</b> and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b>   | <i>Results of the Nth item-based function in the recovery expression at the time of the event.</i><br>Only functions with /host/key as the first parameter are counted.<br><br>This macro may be used with a numeric index e.g. {FUNCTION.RECOVERY.VALUE<1-9>} to point to the first, second, third, etc. function in a trigger expression. See <b>indexed macros</b> .<br><br><b>Note</b> that before Zabbix 6.0.35, {FUNCTION.RECOVERY.VALUE} is not supported; use {FUNCTION.RECOVERY.VALUE1} instead. |

| Macro             | Supported in   | Description  |
|-------------------|--|--|
| {HOST.CONN}       | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Internal notifications</li> <li>→ Map element labels, map URL names and values</li> <li>→ Item key parameters<sup>1</sup></li> <li>→ Host interface IP/DNS</li> <li>→ Trapper item "Allowed hosts" field</li> <li>→ Database monitoring additional parameters</li> <li>→ SSH and Telnet scripts</li> <li>→ JMX item endpoint field</li> <li>→ Web monitoring<sup>4</sup></li> <li>→ Low-level discovery rule filter regular expressions</li> <li>→ URL field of dynamic URL dashboard widget</li> <li>→ Trigger names, event names, operational data and descriptions</li> <li>→ Trigger URLs</li> <li>→ <b>Tag names and values</b></li> <li>→ Script type item, item prototype and discovery rule parameter names and values</li> <li>→ HTTP agent type item, item prototype and discovery rule fields:<br/>URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts.</li> <li>→ Manual host action <b>scripts</b> (including confirmation text)</li> <li>→ Manual event action <b>scripts</b> (including confirmation text)</li> <li>→ Description of item value widget</li> <li>→ Column of data type <i>Text</i> in <b>Top hosts</b> widget</li> </ul> | <p><i>Host IP address or DNS name, depending on host settings<sup>2</sup>.</i></p> <p>May be used with a numeric index as {HOST.CONN&lt;1-9&gt;} to point to the first, second, third, etc. host in a trigger expression. See <b>indexed macros</b>.</p> |
| {HOST.DESCRPTION} | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Internal notifications</li> <li>→ Map element labels</li> <li>→ Manual event action <b>scripts</b></li> <li>→ Description of item value widget</li> <li>→ Column of data type <i>Text</i> in <b>Top hosts</b> widget</li> </ul>  | <p><i>Host description.</i></p> <p>This macro may be used with a numeric index e.g. {HOST.DESCRPTION&lt;1-9&gt;} to point to the first, second, third, etc. host in a trigger expression. See <b>indexed macros</b>.</p>                                 |

| Macro      | Supported in  | Description   |
|------------|---|---|
| {HOST.DNS} | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Internal notifications</li> <li>→ Map element labels, map URL names and values</li> <li>→ Item key parameters<sup>1</sup></li> <li>→ Host interface IP/DNS</li> <li>→ Trapper item "Allowed hosts" field</li> <li>→ Database monitoring additional parameters</li> <li>→ SSH and Telnet scripts</li> <li>→ JMX item endpoint field</li> <li>→ Web monitoring<sup>4</sup></li> <li>→ Low-level discovery rule filter regular expressions</li> <li>→ URL field of dynamic URL dashboard widget</li> <li>→ Trigger names, event names, operational data and descriptions</li> <li>→ Trigger URLs</li> <li>→ <b>Tag names and values</b></li> <li>→ Script type item, item prototype and discovery rule parameter names and values</li> <li>→ HTTP agent type item, item prototype and discovery rule fields:<br/>URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts.</li> <li>→ Manual host action <b>scripts</b> (including confirmation text)</li> <li>→ Manual event action <b>scripts</b> (including confirmation text)</li> <li>→ Description of item value widget</li> <li>→ Column of data type <i>Text</i> in <i>Top hosts</i> widget</li> </ul>  | <p><i>Host DNS name</i><sup>2</sup>.</p> <p>This macro may be used with a numeric index e.g. {HOST.DNS&lt;1-9&gt;} to point to the first, second, third, etc. host in a trigger expression. | Macro            | Supported in  | Description  |
|------------------|---|--|
| {ITEM.LASTVALUE} | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Trigger names, event names, operational data and descriptions</li> <li>→ <a href="#">Tag names and values</a></li> <li>→ Trigger URLs</li> <li>→ Manual event action <a href="#">scripts</a></li> <li>→ Description of item value widget</li> </ul> | <p><i>The latest value of the Nth item in the trigger expression that caused a notification.</i></p> <p>It will resolve to *UNKNOWN* in the frontend if the latest history value has been collected more than the <i>Max history display period</i> time ago (set in the <a href="#">Administration→General</a> menu section).</p> <p>When used in the problem name, the macro will not resolve to the latest item value when viewing problem events; instead, it will keep the item value from the time when the problem happened.</p> <p>When used in notifications, in some cases the macro might not resolve to the latest item value at the moment the trigger fired. For example, if an item quickly receives two values, "A" and "B", and the trigger fires for "A", notifications might show "B" as the latest value due to a slight processing delay - the latest item value changed between the time the trigger fired and when the notification was created. To avoid this, you can use the {ITEM.VALUE} macro, which resolves to the value at the moment the trigger fires, ensuring the correct value is used in the notification.</p> <p>It is alias to<br/> <code>last (/ {HOST.HOST} / {ITEM.KEY} ).</code></p> <p>The resolved value for text/log items is truncated to 20 characters by the frontend in the following locations:</p> <ul style="list-style-type: none"> <li>- Operational data;</li> <li>- Trigger description;</li> <li>- Trigger URLs;</li> <li>- Description of the item value widget.</li> </ul> <p>To resolve to a full value, you may use <a href="#">macro functions</a>. No values are truncated by the server.</p> <p><a href="#">Customizing</a> the macro value is supported for this macro; starting with Zabbix 3.2.0.</p> <p>This macro may be used with a numeric index e.g. {ITEM.LASTVALUE&lt;1-9&gt;} to point to the first, second, third, etc. item in a trigger expression. See <a href="#">indexed macros</a>.</p> |
| {ITEM.LOG.AGE}   | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Trigger names, operational data and descriptions</li> <li>→ Trigger URLs</li> <li>→ Event tags and values</li> <li>→ Manual event action <a href="#">scripts</a></li> <li>→ Description of item value widget</li> </ul>                             | <p><i>Age of the log event, with precision down to a second.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.AGE&lt;1-9&gt;} to point to the first, second, third, etc. item in a trigger expression. See <a href="#">indexed macros</a>.</p>  |
| {ITEM.LOG.DATE}  | <ul style="list-style-type: none"> <li>→ Trigger-based notifications and commands</li> <li>→ Problem update notifications and commands</li> <li>→ Trigger names, operational data and descriptions</li> <li>→ Trigger URLs</li> <li>→ Event tags and values</li> <li>→ Manual event action <a href="#">scripts</a></li> <li>→ Description of item value widget</li> </ul>                             | <p><i>Date when the log entry was written to the log.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.DATE&lt;1-9&gt;} to point to the first, second, third, etc. item in a trigger expression. See <a href="#">indexed macros</a>.</p>  |

| Macro                | Supported in  | Description  |
|----------------------|---|--|

See <a href="#">indexed macros</a>.</p> <p>Supported since 5.4.0.</p>  |

| Macro                        | Supported in   | Description  |
|------------------------------|--|--|
| {LLDRULE.DESCRPTION}         | → LLD-rule based internal notifications  | <i>Description of the low-level discovery rule which caused a notification.</i>  |
| {LLDRULE.DESCRPTION.LLDRULE} | → LLD-rule based internal notifications  | <i>Description (with macros unresolved) of the low-level discovery rule which caused a notification.</i><br>Supported since 5.2.0.   |
| {LLDRULE.ID}                 | → LLD-rule based internal notifications  | <i>Numeric ID of the low-level discovery rule which caused a notification.</i>   |
| {LLDRULE.KEY}                | → LLD-rule based internal notifications  | <i>Key of the low-level discovery rule which caused a notification.</i>  |
| {LLDRULE.KEY.ORIG}           | → LLD-rule based internal notifications  | <i>Original key (with macros not expanded) of the low-level discovery rule which caused a notification.</i>  |
| {LLDRULE.NAME}               | → LLD-rule based internal notifications  | <i>Name of the low-level discovery rule (with macros resolved) that caused a notification.</i>   |
| {LLDRULE.NAME.ORIG}          | → LLD-rule based internal notifications  | <i>Original name (i.e. without macros resolved) of the low-level discovery rule that caused a notification.</i>  |
| {LLDRULE.STATE}              | → LLD-rule based internal notifications  | <i>The latest state of the low-level discovery rule.</i><br>Possible values: <b>Not supported</b> and <b>Normal</b> .  |
| {LLDRULE.STATE.ERROR}        | → LLD-rule based internal notifications  | <i>Error message with details why an LLD rule became unsupported.</i><br><br>If an LLD rule goes into the unsupported state and then immediately gets supported again the error field can be empty.  |
| {MAP.ID}                     | → Map element labels, map URL names and values   | <i>Network map ID.</i>   |
| {MAP.NAME}                   | → Map element labels, map URL names and values   | <i>Network map name.</i>   |
| {PROXY.DESCRPTION}           | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Manual event action <i>scripts</i> | <i>Description of the proxy.</i> Resolves to either:<br>1) proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use <i>indexed</i> macros here.<br>2) proxy, which executed discovery (in discovery notifications). Use {PROXY.DESCRPTION} here, without indexing.<br>3) proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.DESCRPTION} here, without indexing.<br><br>This macro may be used with a numeric index e.g. {PROXY.DESCRPTION<1-9>} to point to the first, second, third, etc. item in a trigger expression. See <i>indexed macros</i> . |
| {PROXY.NAME}                 | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Manual event action <i>scripts</i> | <i>Name of the proxy.</i> Resolves to either:<br>1) proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use <i>indexed</i> macros here.<br>2) proxy, which executed discovery (in discovery notifications). Use {PROXY.NAME} here, without indexing.<br>3) proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.NAME} here, without indexing.<br><br>This macro may be used with a numeric index e.g. {PROXY.NAME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See <i>indexed macros</i> .                          |
| {SERVICE.DESCRPTION}         | → Service-based notifications and commands<br>→ Service update notifications and commands  | <i>Description of the service (with macros resolved).</i>  |

| Macro                                      | Supported in   | Description   |
|--|--|---|
| {SERVICE.NAME}                             | → Service-based notifications and commands<br>→ Service update notifications and commands  | <i>Name of the service (with macros resolved).</i>  |
| {SERVICE.ROOTCAUSE}                        | → Service-based notifications and commands<br>→ Service update notifications and commands  | <i>List of trigger problem events that caused a service to fail, sorted by severity and host name. Includes the following details: host name, event name, severity, age, service tags and values.</i>   |
| {SERVICE.TAGS}                             | → Service-based notifications and commands<br>→ Service update notifications and commands  | <i>A comma separated list of service event tags. Service event tags can be defined in the service configuration section Tags. Expanded to an empty string if no tags exist.</i>   |
| {SERVICE.TAGSJSON}                         | → Service-based notifications and commands<br>→ Service update notifications and commands  | <i>A JSON array containing service event tag objects. Service event tags can be defined in the service configuration section Tags. Expanded to an empty array if no tags exist.</i>   |
| {SERVICE.TAGS.<tag name>}                  | → Service-based notifications and commands<br>→ Service update notifications and commands  | <i>Service event tag value referenced by the tag name. Service event tags can be defined in the service configuration section Tags. A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) should be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash.</i> |
| {TIME}                                     | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Service-based notifications and commands<br>→ Service update notifications and commands<br>→ Discovery notifications and commands<br>→ Autoregistration notifications and commands<br>→ Internal notifications<br>→ Trigger event names<br>→ Manual event action <b>scripts</b> | <i>Current time in hh:mm:ss.</i>  |
| {TRIGGER.DESCRPTION}                       | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | <i>Trigger description.</i><br>All macros supported in a trigger description will be expanded if {TRIGGER.DESCRPTION} is used in notification text.<br>{TRIGGER.COMMENT} is deprecated.   |
| {TRIGGER.EXPRESSION}                       | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b><br>→ Event names   | <i>Partially evaluated trigger expression.</i><br>Item-based functions are evaluated and replaced by the results at the time of event generation whereas all other functions are displayed as written in the expression. Can be used for debugging trigger expressions.   |
| {TRIGGER.EXPRESSION.RECOVER BY EVERYTHING} | → Problem update notifications and commands<br>→ Manual event action <b>scripts</b>  | <i>Partially evaluated trigger recovery expression.</i><br>Item-based functions are evaluated and replaced by the results at the time of event generation whereas all other functions are displayed as written in the expression. Can be used for debugging trigger recovery expressions.   |
| {TRIGGER.EVENTS.ACK}                       | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Map element labels<br>→ Manual event action <b>scripts</b>  | <i>Number of acknowledged events for a map element in maps, or for the trigger which generated current event in notifications.</i>  |
| {TRIGGER.EVENTS.PROBLEM.ACK}               | → Problem update notifications and commands<br>→ Problem update notifications and commands<br>→ Map element labels<br>→ Manual event action <b>scripts</b>   | <i>Number of acknowledged PROBLEM events for all triggers disregarding their state.</i>   |
| {TRIGGER.EVENTS.PROBLEM.UNACK}             | → Problem update notifications and commands<br>→ Problem update notifications and commands<br>→ Map element labels<br>→ Manual event action <b>scripts</b>   | <i>Number of unacknowledged PROBLEM events for all triggers disregarding their state.</i>   |

| Macro                                 | Supported in   | Description  |
|---------------------------------------|--|--|
| {TRIGGER.EVENTS.UNACK}                | Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Map element labels<br>→ Manual event action <b>scripts</b>  | Number of unacknowledged events for a map element in maps, or for the trigger which generated current event in notifications.  |
| {TRIGGER.HOSTGROUPNAME}               | Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | A sorted (by SQL query), comma-space separated list of host groups in which the trigger is defined.  |
| {TRIGGER.PROBLEM.EVENTS.PROBLEMACK}   |  | Number of acknowledged PROBLEM events for triggers in PROBLEM state.   |
| {TRIGGER.PROBLEM.EVENTS.PROBLEMUNACK} |  | Number of unacknowledged PROBLEM events for triggers in PROBLEM state.   |
| {TRIGGER.EXPRESSION}                  | Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | Trigger expression.  |
| {TRIGGER.EXPRESSIONRECOVERY}          | Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | Trigger recovery expression if OK event generation in <b>trigger configuration</b> is set to 'Recovery expression'; otherwise an empty string is returned.<br>Supported since 3.2.0.     |
| {TRIGGER.ID}                          | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Map element labels, map URL names and values<br>→ Trigger URLs<br>→ Trigger tag value<br>→ Manual event action <b>scripts</b> | Numeric trigger ID which triggered this action.<br>Supported in trigger tag values since 4.4.1.  |
| {TRIGGER.NAME}                        | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | Name of the trigger (with macros resolved).<br>Note that since 4.0.0 {EVENT.NAME} can be used in actions to display the triggered event/problem name with macros resolved.               |
| {TRIGGER.NAME.ORIGINAL}               | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | Original name of the trigger (i.e. without macros resolved).   |
| {TRIGGER.NSEVERITY}                   | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | Numerical trigger severity. Possible values: 0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster.  |
| {TRIGGER.SEVERITY}                    | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | Trigger severity name. Can be defined in Administration → General → Trigger displaying options.  |
| {TRIGGER.STATE}                       | → Trigger-based internal notifications   | The latest state of the trigger. Possible values: <b>Unknown</b> and <b>Normal</b> .   |
| {TRIGGER.STATE.ERROR}                 | → Trigger-based internal notifications   | Error message with details why a trigger became unsupported.<br><br>If a trigger goes into the unsupported state and then immediately gets supported again the error field can be empty. |
| {TRIGGER.STATUS}                      | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Manual event action <b>scripts</b>  | Trigger value at the time of operation step execution. Can be either PROBLEM or OK.<br>{STATUS} is deprecated.   |
| {TRIGGER.TEMPLATE}                    | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | A sorted (by SQL query), comma-space separated list of templates in which the trigger is defined, or *UNKNOWN* if the trigger is defined in a host.                                      |

| Macro                    | Supported in   | Description   |
|--------------------------|--|---|
| {TRIGGER.URL}            | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger-based internal notifications<br>→ Manual event action <b>scripts</b>  | <i>Trigger URL.</i>   |
| {TRIGGER.VALUE}          | → Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Trigger expressions<br>→ Manual event action <b>scripts</b>   | <i>Current trigger numeric value: 0 - trigger is in OK state, 1 - trigger is in PROBLEM state.</i>  |
| {TRIGGERS.UNACK}         | → Map element labels   | <i>Number of unacknowledged triggers for a map element, disregarding trigger state.<br/>A trigger is considered to be unacknowledged if at least one of its PROBLEM events is unacknowledged.</i> |
| {TRIGGERS.PROBLEM.UNACK} | → Map element labels   | <i>Number of unacknowledged PROBLEM triggers for a map element.<br/>A trigger is considered to be unacknowledged if at least one of its PROBLEM events is unacknowledged.</i>                     |
| {TRIGGERS.ACK}           | → Map element labels   | <i>Number of acknowledged triggers for a map element, disregarding trigger state.<br/>A trigger is considered to be acknowledged if all of its PROBLEM events are acknowledged.</i>               |
| {TRIGGERS.PROBLEM.ACK}   | → Map element labels   | <i>Number of acknowledged PROBLEM triggers for a map element.<br/>A trigger is considered to be acknowledged if all of its PROBLEM events are acknowledged.</i>                                   |
| {USER.FULLNAME}          | → Problem update notifications and commands<br>→ Manual host action <b>scripts</b> (including confirmation text)<br>→ Manual event action <b>scripts</b> (including confirmation text)   | <i>Name, surname and username of the user who added event acknowledgment or started the script.<br/>Supported for problem updates since 3.4.0, for global scripts since 5.0.2</i>                 |
| {USER.NAME}              | → Manual host action <b>scripts</b> (including confirmation text)<br>→ Manual event action <b>scripts</b> (including confirmation text)  | <i>Name of the user who started the script.<br/>Supported since 5.0.2.</i>  |
| {USER.SURNAME}           | → Manual host action <b>scripts</b> (including confirmation text)<br>→ Manual event action <b>scripts</b> (including confirmation text)  | <i>Surname of the user who started the script.<br/>Supported since 5.0.2.</i>   |
| {USER.USERNAME}          | → Manual host action <b>scripts</b> (including confirmation text)<br>→ Manual event action <b>scripts</b> (including confirmation text)  | <i>Username of the user who started the script.<br/>Supported since 5.0.2.</i>  |
| {\$MACRO}                | → See: <b>User macros supported by location</b>  | <i>{USER.ALIAS}, supported before Zabbix 5.4.0, is now deprecated.</i>  |
| {#MACRO}                 | → See: <b>Low-level discovery macros</b>   | <i>User-definable macros.<br/>Low-level discovery macros.</i>   |
|                          |  | <i>Customizing the macro value is supported for this macro, starting with Zabbix 4.0.0.</i>   |
| {?EXPRESSION}            | → Trigger event names<br>→ Trigger-based notifications and commands<br>→ Problem update notifications and commands<br>→ Script commands and their webhook parameters<br>→ Map element labels <sup>3</sup><br>→ Map shape labels <sup>3</sup><br>→ Link labels in maps <sup>3</sup><br>→ Graph names <sup>5</sup> | <i>See <b>expression macros</b>.<br/>Supported since 5.2.0.</i>   |
| \$1...\$9                | → Trigger <b>names</b><br>→ User parameter <b>commands</b>   | <i>Positional macros/references.</i>  |

<sup>1</sup> The {HOST.\*} macros supported in item key parameters will resolve to the interface that is selected for the item. When used in items without interfaces they will resolve to either the Zabbix agent, SNMP, JMX or IPMI interface of the host in this order of priority or to 'UNKNOWN' if the host does not have any interface.

<sup>2</sup> In global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface. If an agent interface is not defined, the main SNMP interface will be used. If an SNMP interface is also not defined, the main JMX interface will be used. If a JMX interface is not defined either, the main IPMI interface will be used. If the host does not have any interface, the macro resolves to 'UNKNOWN'.

<sup>3</sup> Only the **avg**, **last**, **max** and **min** functions, with seconds as parameter are supported in this macro in map labels.

<sup>4</sup> {HOST.\*} macros are supported in web scenario *Variables*, *Headers*, *SSL certificate file* and *SSL key file* fields and in scenario step *URL*, *Post*, *Headers* and *Required string* fields. Since Zabbix 5.2.2, {HOST.\*} macros are no longer supported in web scenario *Name* and web scenario step *Name* fields.

<sup>5</sup> Only the **avg**, **last**, **max** and **min** functions, with seconds as parameter are supported within this macro in graph names. The {HOST.HOST<1-9>} macro can be used as host within the macro. For example:

```
last(/Cisco switch/ifAlias[{#SNMPINDEX}])
last(/{HOST.HOST}/ifAlias[{#SNMPINDEX}])
```

<sup>6</sup> Supported since 5.2.5.

#### Indexed macros

The indexed macro syntax of {MACRO<1-9>} works only in the context of **trigger expressions**. It can be used to reference hosts or functions in the order in which they appear in the expression. Macros like {HOST.IP1}, {HOST.IP2}, {HOST.IP3} will resolve to the IP of the first, second, and third host in the trigger expression (providing the trigger expression contains those hosts). Macros like {FUNCTION.VALUE1}, {FUNCTION.VALUE2}, {FUNCTION.VALUE3} will resolve to the value of the first, second, and third item-based function in the trigger expression at the time of the event (providing the trigger expression contains those functions).

Additionally the {HOST.HOST<1-9>} macro is also supported within the {?func(/host/key,param)} expression macro in **graph names**. For example, {?func(/{HOST.HOST2}/key,param)} in the graph name will refer to the host of the second item in the graph.

#### Warning:

Indexed macros will not resolve in any other context, except the two cases mentioned here. For other contexts, use macros **without** index (i. e. {HOST.HOST}, {HOST.IP}, etc) instead.

## 2 User macros supported by location

### Overview

This section contains a list of locations, where **user-definable** macros are supported.

#### Note:

Only global-level user macros are supported for *Actions*, *Network discovery*, *Proxies* and all locations listed under *Other locations* section of this page. In the mentioned locations, host-level and template-level macros will not be resolved.

### Actions

In **actions**, user macros can be used in the following fields:

| Location                                 | Multiple macros/mix with text <sup>1</sup> |
|--|--|
| Trigger-based notifications and commands | yes  |
| Trigger-based internal notifications     | yes  |
| Problem update notifications             | yes  |
| Service-based notifications and commands | yes  |
| Service update notifications             | yes  |
| Time period condition                    | no   |
| <i>Operations</i>                        |  |
| Default operation step duration          | no   |
| Step duration                            | no   |

### Hosts/host prototypes

In a **host** and **host prototype** configuration, user macros can be used in the following fields:

| Location                  | Multiple macros/mix with text <sup>1</sup> |
|---------------------------|--|
| Interface IP/DNS          | DNS only                                   |
| Interface port            | no   |
| SNMP v1, v2               |  |
| SNMP community            | yes  |
| SNMP v3                   |  |
| Context name              | yes  |
| Security name             | yes  |
| Authentication passphrase | yes  |
| Privacy passphrase        | yes  |
| IPMI                      |  |
| Username                  | yes  |
| Password                  | yes  |
| Tags <sup>2</sup>         |  |
| Tag names                 | yes  |
| Tag values                | yes  |

#### Items / item prototypes

In an **item** or an **item prototype** configuration, user macros can be used in the following fields:

| Location   | Multiple macros/mix with text <sup>1</sup> |
|--|--|
| Item   | yes  |
| key  |  |
| pa-  |  |
| ram-   |  |
| e-   |  |
| ters   |  |
| Update   | no   |
| in-  |  |
| ter-   |  |
| val  |  |
| Custom   | no   |
| in-  |  |
| ter-   |  |
| vals   |  |
| History  | no   |
| stor-  |  |
| age  |  |
| pe-  |  |
| riod   |  |
| Trend  | no   |
| stor-  |  |
| age  |  |
| pe-  |  |
| riod   |  |
| Description  | yes  |
| Calculated/aggregate   |  |
| item   |  |
| Formula (expression constants and function parameters; item key parameters;<br>(aggregate item only) filter conditions (host group name and tag name)) | yes  |
| Database   |  |
| mon-   |  |
| i-   |  |
| tor  |  |
| Username   | yes  |
| Password   | yes  |
| SQL query  | yes  |

| Location                                   | Multiple macros/mix with text <sup>1</sup> |
|--|--|
| <i>HTTP</i>                                |  |
| <i>agent</i>                               |  |
| URL <sup>3</sup>                           | yes  |
| Query fields                               | yes  |
| Timeout                                    | no   |
| Request body                               | yes  |
| Headers (names and values)                 | yes  |
| Required status codes                      | yes  |
| HTTP proxy                                 | yes  |
| HTTP authentication username               | yes  |
| HTTP authentication password               | yes  |
| SSI certificate file                       | yes  |
| SSI key file                               | yes  |
| SSI key password                           | yes  |
| Allowed hosts                              | yes  |
| <i>JMX</i>                                 |  |
| <i>agent</i>                               |  |
| JMX endpoint                               | yes  |
| <i>Script</i>                              |  |
| <i>item</i>                                |  |
| Parameter names and values                 | yes  |
| <i>SNMP</i>                                |  |
| <i>agent</i>                               |  |
| SNMP OID                                   | yes  |
| <i>SSH</i>                                 |  |
| <i>agent</i>                               |  |
| Username                                   | yes  |
| Public key file                            | yes  |
| Private key file                           | yes  |
| Password                                   | yes  |
| Script                                     | yes  |
| <i>TELNET</i>                              |  |
| <i>agent</i>                               |  |
| Username                                   | yes  |
| Password                                   | yes  |
| Script                                     | yes  |
| <i>Zabbix</i>                              |  |
| <i>trap-</i>                               |  |
| <i>per</i>                                 |  |
| Allowed hosts                              | yes  |
| <i>Tags<sup>2</sup></i>                    |  |
| Tag names                                  | yes  |
| Tag values                                 | yes  |
| <i>Preprocessing</i>                       |  |
| Step parameters (including custom scripts) | yes  |

#### Low-level discovery

In a **low-level discovery rule**, user macros can be used in the following fields:

| Location                   | Multiple macros/mix with text <sup>1</sup> |
|----------------------------|--|
| Key parameters             | yes  |
| Update interval            | no   |
| Custom interval            | no   |
| Keep lost resources period | no   |
| Description                | yes  |
| <i>SNMP agent</i>          |  |
| SNMP OID                   | yes  |
| <i>SSH agent</i>           |  |
| Username                   | yes  |

| Location                |  | Multiple macros/mix with text <sup>1</sup> |
|-------------------------|--|--|
| <i>TELNET agent</i>     | Public key file  | yes  |
|                         | Private key file   | yes  |
|                         | Password   | yes  |
|                         | Script   | yes  |
| <i>Zabbix trapper</i>   | Username   | yes  |
|                         | Password   | yes  |
|                         | Script   | yes  |
| <i>Database monitor</i> | Allowed hosts  | yes  |
|                         | Username   | yes  |
|                         | Password   | yes  |
| <i>JMX agent</i>        | SQL query  | yes  |
|                         | JMX endpoint   | yes  |
| <i>HTTP agent</i>       | URL <sup>3</sup>   | yes  |
|                         | Query fields   | yes  |
|                         | Timeout  | no   |
|                         | Request body   | yes  |
|                         | Headers (names and values)                               | yes  |
|                         | Required status codes                                    | yes  |
|                         | HTTP authentication username                             | yes  |
|                         | HTTP authentication password                             | yes  |
| <i>Filters</i>          |  |  |
|                         | Regular expression                                       | yes  |
| <i>Overrides</i>        |  |  |
|                         | Filters: regular expression                              | yes  |
|                         | Operations: update interval (for item prototypes)        | no   |
|                         | Operations: history storage period (for item prototypes) | no   |
|                         | Operations: trend storage period (for item prototypes)   | no   |

## Network discovery

In a **network discovery rule**, user macros can be used in the following fields:

| Location           |                           | Multiple macros/mix with text <sup>1</sup> |
|--------------------|---------------------------|--|
| Update interval    |                           | no   |
| <i>SNMP v1, v2</i> |                           |  |
|                    | SNMP community            | yes  |
| <i>SNMP v3</i>     | SNMP OID                  | yes  |
|                    |                           |  |
|                    | Context name              | yes  |
|                    | Security name             | yes  |
|                    | Authentication passphrase | yes  |
|                    | Privacy passphrase        | yes  |
|                    | SNMP OID                  | yes  |

## Proxies

In a **proxy** configuration, user macros can be used in the following field:

| Location                           | Multiple macros/mix with text <sup>1</sup> |
|------------------------------------|--|
| Interface port (for passive proxy) | no   |

## Templates

In a **template** configuration, user macros can be used in the following fields:

| Location                 | Multiple macros/mix with text <sup>1</sup> |  |
|--------------------------|--|--|
| <i>Tags</i> <sup>2</sup> |  |  |
| Tag names                | yes  |  |
| Tag values               | yes  |  |

## Triggers

In a **trigger** configuration, user macros can be used in the following fields:

| Location  | Multiple macros/mix with text <sup>1</sup> |  |
|---|--|--|
| Name  | yes  |  |
| Operational data  | yes  |  |
| Expression (only in constants and function parameters; secret macros are not supported) | yes  |  |
| Description   | yes  |  |
| URL <sup>3</sup>  | yes  |  |
| Tag for matching  | yes  |  |
| <i>Tags</i> <sup>2</sup>  |  |  |
| Tag names   | yes  |  |
| Tag values  | yes  |  |

## Web scenario

In a **web scenario** configuration, user macros can be used in the following fields:

| Location                   | Multiple macros/mix with text <sup>1</sup> |  |
|----------------------------|--|--|
| Name                       | yes  |  |
| Update interval            | no   |  |
| Agent                      | yes  |  |
| HTTP proxy                 | yes  |  |
| Variables (values only)    | yes  |  |
| Headers (names and values) | yes  |  |
| <i>Steps</i>               |  |  |
| Name                       | yes  |  |
| URL <sup>3</sup>           | yes  |  |
| Variables (values only)    | yes  |  |
| Headers (names and values) | yes  |  |
| Timeout                    | no   |  |
| Required string            | yes  |  |

| Location                |                       | Multiple macros/mix with text <sup>1</sup> |
|-------------------------|-----------------------|--|
| <i>Authentication</i>   | Required status codes | no   |
|                         | User                  | yes  |
|                         | Password              | yes  |
|                         | SSL certificate       | yes  |
|                         | SSL key file          | yes  |
|                         | SSL key password      | yes  |
| <i>Tags<sup>2</sup></i> | Tag names             | yes  |
|                         | Tag values            | yes  |

#### Other locations

In addition to the locations listed here, user macros can be used in the following fields:

| Location   | Multiple macros/mix with text <sup>1</sup> |
|--|--|
| Global scripts<br>(script, SSH, Telnet, IPMI), including confirmation text | yes  |
| Webhooks   |  |
| JavaScript script  | no   |
| JavaScript script parameter name   | no   |
| JavaScript script parameter value  | yes  |
| <i>Monitoring</i>  |  |
| →  |  |
| <i>Dashboards</i>  |  |
| Column of data type <i>Text</i> in <i>Top hosts</i> dashboard widget       | yes  |
| <i>Description</i> parameter in <i>Item value</i> dashboard widget         | yes  |
| <i>URL<sup>3</sup></i> parameter in <i>URL</i> dashboard widget            | yes  |
| <i>Administration</i>  |  |
| →  |  |
| <i>Users</i>   |  |
| →  |  |
| <i>Media</i>   |  |
| When active  | no   |
| <i>Administration</i>  |  |
| →  |  |
| <i>General</i>   |  |
| →  |  |
| <i>GUI</i>   |  |
| Working time   | no   |

| Location  | Multiple macros/mix with text <sup>1</sup> |
|---|--|
| <i>Administration</i>   |  |
| →   |  |
| <i>Me-</i>  |  |
| <i>dia</i>  |  |
| <i>types</i>  |  |
| →   |  |
| <i>Mes-</i>   |  |
| <i>sage</i>   |  |
| <i>tem-</i>   |  |
| <i>plates</i>   |  |
| Subject   | yes  |
| Message   | yes  |
| <i>Administration</i>   |  |
| →   |  |
| <i>Me-</i>  |  |
| <i>dia</i>  |  |
| <i>types</i>  |  |
| →   |  |
| <i>Me-</i>  |  |
| <i>dia</i>  |  |
| <i>type</i>   |  |
| Username and Password fields for the Email media type (when Authentication is set to "Username and password"; <b>secret macros</b> recommended) | yes  |

For a complete list of all macros supported in Zabbix, see **supported macros**.

#### Footnotes

- <sup>1</sup> If multiple macros in a field or macros mixed with text are not supported for the location, a single macro has to fill the whole field.
- <sup>2</sup> Macros used in tag names and values are resolved only during event generation process.
- <sup>3</sup> URLs that contain a **secret macro** will not work, as the macro in them will be resolved as "\*\*\*\*\*".

## 7 Unit symbols

### Overview

Having to use some large numbers, for example '86400' to represent the number of seconds in one day, is both difficult and error-prone. This is why you can use some appropriate unit symbols (or suffixes) to simplify Zabbix trigger expressions and item keys.

Instead of '86400' for the number of seconds you can simply enter '1d'. Suffixes function as multipliers.

### Time suffixes

For time you can use:

- **s** - seconds (when used, works the same as the raw value)
- **m** - minutes
- **h** - hours
- **d** - days
- **w** - weeks
- **M** - months (**trend functions** only)
- **y** - years (**trend functions** only)

Time suffixes support only integer numbers (so '1h' is supported, '1,5h' or '1.5h' are not; use '90m' instead).

Time suffixes are supported in:

- trigger **expression** constants and function parameters
- constants of **calculated item** formulas
- parameters of the **zabbix[queue,<from>,<to>]** **internal item**
- time period parameter of **aggregate calculations**

- item configuration ('Update interval', 'Custom intervals', 'History storage period' and 'Trend storage period' fields)
- item prototype configuration ('Update interval', 'Custom intervals', 'History storage period' and 'Trend storage period' fields)
- low-level discovery rule configuration ('Update interval', 'Custom intervals', 'Keep lost resources' fields)
- network discovery configuration ('Update interval' field)
- web scenario configuration ('Update interval', 'Timeout' fields)
- action operation configuration ('Default operation step duration', 'Step duration' fields)
- user profile settings ('Auto-logout', 'Refresh', 'Message timeout' fields)
- graph **widget** of *Monitoring* → *Dashboard* ('Time shift' field)
- *Administration* → *General* → *Housekeeping* (storage period fields)
- *Administration* → *General* → *Trigger displaying options* ('Display OK triggers for', 'On status change triggers blink for' fields)
- *Administration* → *General* → *Other* ('Login blocking interval' field and fields related to communication with Zabbix server)
- Zabbix server `ha_set_failover_delay=delay` **runtime control** option

## Memory suffixes

Memory size suffixes are supported in:

- trigger **expression** constants and function parameters
- constants of **calculated item** formulas

For memory size you can use:

- **K** - kilobyte
- **M** - megabyte
- **G** - gigabyte
- **T** - terabyte

## Other uses

Unit symbols are also used for a human-readable representation of data in the frontend.

In both Zabbix server and frontend these symbols are supported:

- **K** - kilo
- **M** - mega
- **G** - giga
- **T** - tera

When **configuring items**, such units as **B**, **Bps**, **s**, **uptime**, and **unixtime** are supported for human-readable conversion of received values.

When item values in B, Bps are displayed in the frontend, base 2 is applied (1K = 1024). Otherwise a base of 10 is used (1K = 1000).

Additionally the frontend also supports the display of:

- **P** - peta
- **E** - exa
- **Z** - zetta
- **Y** - yotta

## Usage examples

By using some appropriate suffixes you can write trigger expressions that are easier to understand and maintain, for example these expressions:

```
last(/host/system.uptime)<86400s
avg(/host/system.cpu.load,600s)<10
last(/host/vm.memory.size[available])<20971520
```

could be changed to:

```
last(/host/system.uptime)<1d
avg(/host/system.cpu.load,10m)<10
last(/host/vm.memory.size[available])<20M
```

## Preventing unit conversion

By default, specifying a unit for an item results in a multiplier prefix being added - for example, an incoming value '2048' with unit 'B' would be displayed as '2KB' by the frontend (for more details, see *Units* in **item configuration**).

To prevent a unit from conversion, use the **!** prefix, for example, **!B**. To better understand how the conversion works with and without the exclamation mark, see the following examples of values and units:

```
1024 !B → 1024 B
1024 B → 1 KB
61 !s → 61 s
61 s → 1m 1s
0 !uptime → 0 uptime
0 uptime → 00:00:00
0 !! → 0 !
0 ! → 0
```

**Note:**

Before Zabbix 4.0, there was a hardcoded unit stoplist consisting of `ms`, `rpm`, `RPM`, `%`. This stoplist has been deprecated, thus the correct way to prevent converting such units is `!ms`, `!rpm`, `!RPM`, `!%`.

## 8 Time period syntax

### Overview

To set a time period, the following format has to be used:

`d-d, hh:mm-hh:mm`

where the symbols stand for the following:

| Symbol    | Description  |
|-----------|--|
| <i>d</i>  | Day of the week: 1 - Monday, 2 - Tuesday ,... , 7 - Sunday |
| <i>hh</i> | Hours: 00-24   |
| <i>mm</i> | Minutes: 00-59   |

You can specify more than one time period using a semicolon (;) separator:

`d-d, hh:mm-hh:mm; d-d, hh:mm-hh:mm . . .`

Leaving the time period empty equals 1-7,00:00-24:00, which is the default value.

**Attention:**

The upper limit of a time period is not included. Thus, if you specify 09:00-18:00 the last second included in the time period is 17:59:59.

### Examples

Working hours. Monday - Friday from 9:00 till 18:00:

`1-5,09:00-18:00`

Working hours plus weekend. Monday - Friday from 9:00 till 18:00 and Saturday, Sunday from 10:00 till 16:00:

`1-5,09:00-18:00;6-7,10:00-16:00`

## 9 Command execution

Zabbix uses common functionality for external checks, user parameters, `system.run` items, custom alert scripts, remote commands and global scripts.

### Execution steps

**Note:**

By default, all scripts in Zabbix are executed using the `sh` shell, and it is not possible to modify the default shell. To utilize a different shell, you can employ a workaround: create a script file and invoke that script during command execution.

The command/script is executed similarly on both Unix and Windows platforms:

1. Zabbix (the parent process) creates a pipe for communication

2. Zabbix sets the pipe as the output for the to-be-created child process
3. Zabbix creates the child process (runs the command/script)
4. A new process group (in Unix) or a job (in Windows) is created for the child process
5. Zabbix reads from the pipe until timeout occurs or no one is writing to the other end (ALL handles/file descriptors have been closed). Note that the child process can create more processes and exit before they exit or close the handle/file descriptor.
6. If the timeout has not been reached, Zabbix waits until the initial child process exits or timeout occurs
7. If the initial child process exited and the timeout has not been reached, Zabbix checks exit code of the initial child process and compares it to 0 (non-zero value is considered as execution failure, only for custom alert scripts, remote commands and user scripts executed on Zabbix server and Zabbix proxy)
8. At this point it is assumed that everything is done and the whole process tree (i.e. the process group or the job) is terminated

**Attention:**

Zabbix assumes that a command/script has done processing when the initial child process has exited AND no other process is still keeping the output handle/file descriptor open. When processing is done, ALL created processes are terminated.

All double quotes and backslashes in the command are escaped with backslashes and the command is enclosed in double quotes.

Exit code checking

Exit code are checked with the following conditions:

- Only for custom alert scripts, remote commands and user scripts executed on Zabbix server and Zabbix proxy.
- Any exit code that is different from 0 is considered as execution failure.
- Contents of standard error and standard output for failed executions are collected and available in frontend (where execution result is displayed).
- Additional log entry may be created for remote commands executed on Zabbix agent/proxy by enabling the LogRemoteCommands parameter on **agent/proxy**.

Possible frontend messages and log entries for failed commands/scripts:

- Contents of standard error and standard output for failed executions (if any).
- "Process exited with code: N." (for empty output, and exit code not equal to 0).
- "Process killed by signal: N." (for process terminated by a signal, on Linux only).
- "Process terminated unexpectedly." (for process terminated for unknown reasons).

## 10 Version compatibility

Supported agents

To be compatible with Zabbix 6.0, Zabbix agent must not be older than version 1.4 and must not be newer than 6.0.

You may need to review the configuration of older agents as some parameters have changed, for example, parameters related to [logging](#) for versions before 3.0.

To take full advantage of the latest metrics, improved performance and reduced memory usage, use the latest supported agent.

### Notes for Windows XP

On Windows XP/Server 2003, do not use agent templates that are newer than Zabbix 4.0.x. The newer templates use English performance counters, which are only supported since Windows Vista/Server 2008.

Supported agents 2

Older Zabbix agents 2 from version 4.4 onwards are compatible with Zabbix 6.0; Zabbix agent 2 must not be newer than 6.0.

Note that when using Zabbix agent 2 versions 4.4 and 5.0, the default interval of 10 minutes is used for refreshing unsupported items.

To take full advantage of the latest metrics, improved performance and reduced memory usage, use the latest supported agent 2.

## Supported Zabbix proxies

To be compatible with Zabbix 6.0, the proxy must be of the same major version; thus only Zabbix 6.0.x proxies can work with Zabbix 6.0.x server.

### Attention:

It is no longer possible to start the upgraded server and have older and unupgraded proxies report data to a newer server. This approach, which was never recommended nor supported by Zabbix, now is officially disabled, as the server will ignore data from unupgraded proxies. See also the [upgrade procedure](#).

Warnings about using incompatible Zabbix daemon versions are logged.

## Supported XML files

XML files not older than version 1.8 are supported for import in Zabbix 6.0.

### Attention:

In the XML export format, trigger dependencies are stored by name only. If there are several triggers with the same name (for example, having different severities and expressions) that have a dependency defined between them, it is not possible to import them. Such dependencies must be manually removed from the XML file and re-added after import.

## 11 Database error handling

If Zabbix detects that the backend database is not accessible, it will send a notification message and continue the attempts to connect to the database. For some database engines, specific error codes are recognized.

### MySQL

- CR\_CONN\_HOST\_ERROR
- CR\_SERVER\_GONE\_ERROR
- CR\_CONNECTION\_ERROR
- CR\_SERVER\_LOST
- CR\_UNKNOWN\_HOST
- ER\_SERVER\_SHUTDOWN
- ER\_ACCESS\_DENIED\_ERROR
- ER\_ILLEGAL\_GRANT\_FOR\_TABLE
- ER\_TABLEACCESS\_DENIED\_ERROR
- ER\_UNKNOWN\_ERROR

## 12 Zabbix sender dynamic link library for Windows

### Overview

In a Windows environment applications can send data to Zabbix server/proxy by using the Zabbix sender dynamic link library (zabbix\_sender.dll) instead of having to launch an external process (zabbix\_sender.exe).

zabbix\_sender.h and zabbix\_sender.lib are required for compiling user applications with zabbix\_sender.dll.

### Getting it

There are two ways of getting zabbix\_sender.dll.

1. [Download](#) zabbix\_sender.h, zabbix\_sender.lib and zabbix\_sender.dll files as a ZIP archive.

When choosing download options make sure to select "No encryption" under *Encryption* and "Archive" under *Packaging*. Then download Zabbix agent (not Zabbix agent 2).

The zabbix\_sender.h, zabbix\_sender.lib and zabbix\_sender.dll files will be inside the downloaded ZIP archive in the bin\dev directory. Unzip the files where you need it.

See also [known issues](#).

2. Build zabbix\_sender.dll from source (see [instructions](#)).

The dynamic link library with the development files will be located in the `bin\winXX\dev` directory. To use it, include the `zabbix_sender.h` header file and link with the `zabbix_sender.lib` library.

See also

- [example](#) of a simple Zabbix sender utility implemented with Zabbix sender dynamic link library to illustrate the library usage;
- [zabbix\\_sender.h](#) file for the interface functions of the Zabbix sender dynamic link library. This file contains documentation explaining the purpose of each interface function, its arguments, and return value.

### 13 Python library for Zabbix API

Overview

[zabbix\\_utils](#) is a Python library for:

- working with Zabbix API;
- acting like Zabbix sender;
- acting like Zabbix get.

It is supported for Zabbix 5.0, 6.0, 6.4 and later.

### 14 Service monitoring upgrade

**Overview** In Zabbix 6.0, [service monitoring](#) functionality has been reworked significantly (see [What's new in Zabbix 6.0.0](#) for the list of changes).

This page describes how services and SLAs, defined in earlier Zabbix versions, are changed during an upgrade to Zabbix 6.0 or newer.

**Services** In older Zabbix versions, services had two types of dependencies: soft and hard. After an upgrade, all dependencies will become equal.

If a service "Child service" has been previously linked to "Parent service 1" via hard dependency and additionally "Parent service 2" via soft dependency, after an upgrade the "Child service" will have two parent services "Parent service 1" and "Parent service 2".

Trigger-based mapping between problems and services has been replaced by tag-based mapping. In Zabbix 6.0 and newer, service configuration form has a new parameter *Problem tags*, which allows specifying one or multiple tag name and value pairs for problem matching. Triggers that have been linked to a service will get a new tag `ServiceLink: <trigger ID>:<trigger name>` (tag value will be truncated to 32 characters). Linked services will get `ServiceLink problem tag` with the same value.

Status calculation rules

The 'Status calculation algorithm' will be upgraded using the following rules:

- Do not calculate → Set status to OK
- Problem, if at least one child has a problem → Most critical of child services
- Problem, if all children have problems → Most critical if all children have problems

**Note:**

If you have upgraded from Zabbix pre-6.0 to Zabbix 6.0.0, 6.0.1 or 6.0.2, see [Known issues](#) for Zabbix 6.0 documentation.

**SLAs** Previously, SLA targets had to be defined for each service separately. Since Zabbix 6.0, SLA has become a separate entity, which contains information about service schedule, expected service level objective (SLO) and downtime periods to exclude from the calculation. Once configured, an SLA can be assigned to multiple services through [service tags](#).

During an upgrade:

- Identical SLAs defined for each service will be grouped and one SLA per each group will be created.
- Each affected service will get a special tag `SLA:<ID>` and the same tag will be specified in the *Service tags* parameter of the corresponding SLA.
- Service creation time, a new metric in SLA reports, will be set to 01/01/2000 00:00 for existing services.

## 15 Other issues

### Login and systemd

We recommend **creating** a *zabbix* user as system user, that is, without ability to log in. Some users ignore this recommendation and use the same account to log in (e. g. using SSH) to host running Zabbix. This might crash Zabbix daemon on log out. In this case you will get something like the following in Zabbix server log:

```
zabbix_server [27730]: [file:'selfmon.c',line:375] lock failed: [22] Invalid argument
zabbix_server [27716]: [file:'dbconfig.c',line:5266] lock failed: [22] Invalid argument
zabbix_server [27706]: [file:'log.c',line:238] lock failed: [22] Invalid argument
```

and in Zabbix agent log:

```
zabbix_agentd [27796]: [file:'log.c',line:238] lock failed: [22] Invalid argument
```

This happens because of default systemd setting `RemoveIPC=yes` configured in `/etc/systemd/logind.conf`. When you log out of the system the semaphores created by Zabbix previously are removed which causes the crash.

A quote from systemd documentation:

`RemoveIPC=`

Controls whether System V and POSIX IPC objects belonging to the user shall be removed when the user fully logs out. Takes a boolean argument. If enabled, the user may not consume IPC resources after the last of the user's sessions terminated. This covers System V semaphores, shared memory and message queues, as well as POSIX shared memory and message queues. Note that IPC objects of the root user and other system users are excluded from the effect of this setting. Defaults to "yes".

There are 2 solutions to this problem:

1. (recommended) Stop using *zabbix* account for anything else than Zabbix processes, create a dedicated account for other things.
2. (not recommended) Set `RemoveIPC=no` in `/etc/systemd/logind.conf` and reboot the system. Note that `RemoveIPC` is a system-wide parameter, changing it will affect the whole system.

### Using Zabbix frontend behind proxy

If Zabbix frontend runs behind proxy server, the cookie path in the proxy configuration file needs to be rewritten in order to match the reverse-proxied path. See examples below. If the cookie path is not rewritten, users may experience authorization issues, when trying to login to Zabbix frontend.

Example configuration for nginx

```
# ..
location / {
# ..
proxy_cookie_path /zabbix /;
proxy_pass http://192.168.0.94/zabbix/;
# ..
```

Example configuration for Apache

```
# ..
ProxyPass "/" http://host/zabbix/
ProxyPassReverse "/" http://host/zabbix/
ProxyPassReverseCookiePath /zabbix /
ProxyPassReverseCookieDomain host zabbix.example.com
# ..
```

## 16 Agent vs agent 2 comparison

This section describes the differences between the Zabbix agent and the Zabbix agent 2.

| Parameter                           | Zabbix agent  | Zabbix agent 2  |
|-------------------------------------|---|---|
| Programming language                | C   | Go with some parts in C   |
| Daemonization                       | yes   | by systemd only (yes on Windows)  |
| Supported extensions                | Custom <b>loadable modules</b> in C.  | Custom <b>plugins</b> in Go.  |
| <i>Requirements</i>                 |   |   |
| Supported platforms                 | Linux, IBM AIX, FreeBSD, NetBSD, OpenBSD, HP-UX, Mac OS X, Solaris: 9, 10, 11, Windows: all desktop and server versions since XP  | Linux, Windows: all desktop and server versions, on which an up-to-date <b>supported Go version</b> can be installed.   |
| Supported crypto libraries          | GnuTLS 3.1.18 and newer<br>OpenSSL 1.0.1, 1.0.2, 1.1.0, 1.1.1, 3.0.x. Note that 3.0.x is supported since Zabbix 6.0.4.<br>LibreSSL - tested with versions 2.7.4, 2.8.2 (certain limitations apply, see the <b>Encryption</b> page for details). | Linux: OpenSSL 1.0.1 and later is supported since Zabbix 4.4.8.<br>MS Windows: OpenSSL 1.1.1 or later.<br>The OpenSSL library must have PSK support enabled. LibreSSL is not supported.   |
| Monitoring processes                |   |   |
| Processes                           | A separate active check process for each server/proxy record.   | Single process with automatically created threads. The maximum number of threads is determined by the GOMAXPROCS environment variable.  |
| Metrics                             | <b>UNIX:</b> see a list of supported <b>items</b> .<br><br><b>Windows:</b> see a list of additional Windows-specific <b>items</b> .   | <b>UNIX:</b> All metrics supported by Zabbix agent. Additionally, the agent 2 provides Zabbix-native monitoring solution for: Docker, Memcached, MySQL, PostgreSQL, Redis, systemd, and other monitoring targets - see a full list of agent 2 specific <b>items</b> .<br><br><b>Windows:</b> All metrics supported by Zabbix agent, and also net.tcp.service* checks of HTTPS, LDAP. Additionally, the agent 2 provides Zabbix-native monitoring solution for: PostgreSQL, Redis. Checks from different plugins or multiple checks within one plugin can be executed concurrently. Supported for passive and active checks. |
| Concurrency                         | Active checks for single server are executed sequentially.  |   |
| Scheduled/flexible intervals        | Supported for passive checks only.  |   |
| Third-party traps                   | no  | yes   |
| <i>Additional features</i>          |   |   |
| Persistent storage                  | no  | yes   |
| Persistent files for log*[] metrics | yes (only on Unix)  | no  |
| Log data upload                     | Can be performed during log gathering to free the buffer.   | Log gathering is stopped when the buffer is full, therefore the <b>BufferSize</b> parameter must be at least MaxLinesPerSecond x 2.   |
| Timeout settings                    | Defined on an agent level only.   | Plugin timeout can override the timeout defined on an agent level.  |
| Changes user at runtime             | yes (Unix-like systems only)  | no (controlled by systemd)  |
| User-configurable ciphersuites      | yes   | no  |

## 17 Escaping examples

### Overview

This page provides examples of using correct escaping when using regular expressions in various contexts.

#### Note:

When using the trigger expression constructor, correct escaping in regular expressions is added automatically.

### Examples

#### User macro with context

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{${MACRO:regex:\".+\\\"[a-z]+\"}`

Notice:

- backslashes are **not escaped**;
- quotation marks are escaped.

#### Macro function inside item key parameter

Regular expression: `.+:(\\d+)$<br>` Item key: `net.tcp.service[tcp,,\"{{ITEM.VALUE}.regsub(\".+:(\\d+)$\",\\1)}\"]`

Notice:

- regular expression inside the `regsub` macro function is double-quoted (because of contains closing parenthesis);
- quotation marks around the regular expression are escaped (because the whole third item parameter is double-quoted);
- third item key parameter is double-quoted because it contains a comma.

#### LLD macro function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{{#MACRO}.iregsub(\".+\\\"([a-z]+)\", \\1)}`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

#### LLD macro function inside user macro context

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{{#MACRO}.iregsub(\".+\\\"([a-z]+)\", \\1)}<br>` User macro with context: `{${MACRO: \"{{#MACRO}.iregsub(\".+\\\"([a-z]+)\", \\1)}\"}`

Notice:

- backslash escaping for LLD does not change;
- upon inserting the LLD macro into user macro context, we need to put it into string:
  1. Quotation marks are added around the macro expression;
  2. Quotation marks get escaped; in total, 3 new backslashes are introduced.

#### String parameter of non-history function

String content: `\.+\"[a-z]+<br>` Expression: `concat(\"abc\", \"\\.\\.\\.\\.\"[a-z]+\" )`

Notice:

- String parameters require escaping both for backslashes and quotation marks.

#### String parameter of history function

String content: `\.+\"[a-z]+<br>` Expression: `find(__ITEM_KEY__, \"regexp\", \".+\\\"[a-z]+\" )`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

#### LLD macro function inside string parameter of non-history function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{{#MACRO}.iregsub(\".+\\\"([a-z]+)\", \\1)}<br>` Expression: `concat(\"abc\", \"{{#MACRO}.iregsub(\".+\\\"([a-z]+)\", \\1)}\" )`

Notice:

- String parameters require escaping both for backslashes and quotation marks;
- Another layer of escaping is added, because the macro will be resolved only after string is unquoted;

#### LLD macro function inside string parameter of history function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}<br>` Expression: `find(__ITEM_KEY__, "eq", "{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}")`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

#### User macro with context inside string parameter of non-history function

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{${MACRO:regex:\".+\"[a-z]+}<br>` Expression: `concat("abc", "${MACRO:regex:\".+\"[a-z]+}")`

Notice:

- Same as in the previous example an additional layer of escaping is needed;
- Backslashes and quotation marks are escaped only for the top-level escaping (by virtue of it being a string parameter).

#### User macro with context inside string parameter of history function

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{${MACRO:regex:\".+\"[a-z]+}<br>` Expression: `find(__ITEM_KEY__, "eq", "{${MACRO:regex:\".+\"[a-z]+}")`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

#### LLD macro function inside user macro context inside non-history function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}<br>` User macro with context: `{${MACRO: "{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}"}<br>` Expression: `concat("abc", "${MACRO: "{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}"}")`

Notice the three layers of escaping:

1. For LLD macro function, without escaping of backslashes;
2. For User macro with context, without escaping of backslashes;
3. For the string parameter of a function, with escaping of backslashes.

#### LLD macro function inside user macro context inside history function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}<br>` User macro with context: `{${MACRO: "{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}"}<br>` Expression: `find(__ITEM_KEY__, "eq", "${MACRO: "{#{MACRO}.iregsub(\".+\"([a-z]+)\", \1)}"}")`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

#### User macro with context just inside string

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{${MACRO:regex:\".+\"[a-z]+}<br>` Inside string of some expression, for example: `func(arg1, arg2, arg3)="${MACRO:regex:\".+\"[a-z]+}"`

Notice:

- Strings also require backslash escaping;
  - Strings also require quotation mark escaping;
  - Again a case with 2 levels of escaping:
1. Escaping for user macro context without backslash escaping;
  2. Escaping for it being a string with backslash escaping.

## Zabbix manpages

These are Zabbix manpages for Zabbix processes.

## zabbix\_agent2

Section: Maintenance Commands (8)

Updated: 2019-01-29

[Index](#) [Return to Main Contents](#)

---

### NAME

zabbix\_agent2 - Zabbix agent 2

### SYNOPSIS

```
zabbix_agent2 [-c config-file]  
zabbix_agent2 [-c config-file] [-v] -p  
zabbix_agent2 [-c config-file] [-v] -t item-key  
zabbix_agent2 [-c config-file] -R runtime-option  
zabbix_agent2 -h  
zabbix_agent2 -V
```

### DESCRIPTION

**zabbix\_agent2** is an application for monitoring parameters of various services.

### OPTIONS

**-c, --config** *config-file*

Use the alternate *config-file* instead of the default one.

**-R, --runtime-control** *runtime-option*

Perform administrative functions according to *runtime-option*.

#### Runtime control options: **userparameter\_reload**

Reload user parameters from the configuration file

#### **log\_level\_increase**

Increase log level

#### **log\_level\_decrease**

Decrease log level

#### **help**

List available runtime control options

#### **metrics**

List available metrics

#### **version**

Display version

#### **-p, --print**

Print known items and exit. For each item either generic defaults are used, or specific defaults for testing are supplied. These defaults are listed in square brackets as item key parameters. Returned values are enclosed in square brackets and prefixed with the type of the returned value, separated by a pipe character. For user parameters type is always **t**, as the agent can not determine

all possible return values. Items, displayed as working, are not guaranteed to work from the Zabbix server or `zabbix_get` when querying a running agent daemon as permissions or environment may be different. Returned value types are:

**d**

Number with a decimal part.

**m**

Not supported. This could be caused by querying an item that only works in the active mode like a log monitoring item or an item that requires multiple collected values. Permission issues or incorrect user parameters could also result in the not supported state.

**s**

Text. Maximum length not limited.

**t**

Text. Same as **s**.

**u**

Unsigned integer.

**-t, --test** *item-key*

Test single item and exit. See **--print** for output description.

**-v, --verbose**

Enable verbose output when test item or print known items.

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

## FILES

*/usr/local/etc/zabbix\_agent2.conf*

Default location of Zabbix agent 2 configuration file (if not modified during compile time).

### NAME

zabbix\_agentd - Zabbix agent daemon

### SYNOPSIS

```
zabbix_agentd [-c config-file]  
zabbix_agentd [-c config-file] -p  
zabbix_agentd [-c config-file] -t item-key  
zabbix_agentd [-c config-file] -R runtime-option  
zabbix_agentd -h  
zabbix_agentd -V
```

### DESCRIPTION

**zabbix\_agentd** is a daemon for monitoring various server parameters.

### OPTIONS

**-c, --config** *config-file*

Use the alternate *config-file* instead of the default one.

**-f, --foreground**

Run Zabbix agent in foreground.

**-R, --runtime-control** *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options

#### **userparameter\_reload**

Reload user parameters from the configuration file

**log\_level\_increase**[=*target*]

Increase log level, affects all processes if target is not specified

**log\_level\_decrease**[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

*process-type*

All processes of specified type (active checks, collector, listener)

*process-type,N*

Process type and number (e.g., listener,3)

*pid*

Process identifier, up to 65535. For larger values specify target as "process-type,N"

**-p, --print**

Print known items and exit. For each item either generic defaults are used, or specific defaults for testing are supplied. These defaults are listed in square brackets as item key parameters. Returned values are enclosed in square brackets and prefixed with the type of the returned value, separated by a pipe character. For user parameters type is always **t**, as the agent can not determine

all possible return values. Items, displayed as working, are not guaranteed to work from the Zabbix server or `zabbix_get` when querying a running agent daemon as permissions or environment may be different. Returned value types are:

**d**

Number with a decimal part.

**m**

Not supported. This could be caused by querying an item that only works in the active mode like a log monitoring item or an item that requires multiple collected values. Permission issues or incorrect user parameters could also result in the not supported state.

**s**

Text. Maximum length not limited.

**t**

Text. Same as **s**.

**u**

Unsigned integer.

**-t, --test** *item-key*

Test single item and exit. See **--print** for output description.

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

## FILES

*/usr/local/etc/zabbix\_agentd.conf*

Default location of Zabbix agent configuration file (if not modified during compile time).

## NAME

zabbix\_get - Zabbix get utility

## SYNOPSIS

```
zabbix_get -s host-name-or-IP [-p port-number] [-I IP-address] [-t timeout] -k item-key  
zabbix_get -s host-name-or-IP [-p port-number] [-I IP-address] [-t timeout] --tls-connect cert --tls-ca-file CA-file [--tls-crl-file CRL-file] [--tls-agent-cert-issuer cert-issuer] [--tls-agent-cert-subject cert-subject] --tls-cert-file cert-file --tls-key-file key-file [--tls-cipher13 cipher-string] [--tls-cipher cipher-string] -k item-key  
zabbix_get -s host-name-or-IP [-p port-number] [-I IP-address] [-t timeout] --tls-connect psk --tls-psk-identity PSK-identity --tls-psk-file PSK-file [--tls-cipher13 cipher-string] [--tls-cipher cipher-string] -k item-key  
zabbix_get -h  
zabbix_get -V
```

## DESCRIPTION

**zabbix\_get** is a command line utility for getting data from Zabbix agent.

## OPTIONS

**-s, --host** *host-name-or-IP*

Specify host name or IP address of a host.

**-p, --port** *port-number*

Specify port number of agent running on the host. Default is 10050.

**-I, --source-address** *IP-address*

Specify source IP address.

**-t, --timeout** *seconds*

Specify timeout. Valid range: 1-30 seconds (default: 30)

**-k, --key** *item-key*

Specify key of item to retrieve value for.

**--tls-connect** *value*

How to connect to agent. Values:

### **unencrypted**

connect without encryption (default)

### **psk**

connect using TLS and a pre-shared key

### **cert**

connect using TLS and a certificate

**--tls-ca-file** *CA-file*

Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

**--tls-crl-file** *CRL-file*

Full pathname of a file containing revoked certificates.

**--tls-agent-cert-issuer** *cert-issuer*

Allowed agent certificate issuer.

**--tls-agent-cert-subject** *cert-subject*

Allowed agent certificate subject.

**--tls-cert-file** *cert-file*

Full pathname of a file containing the certificate or certificate chain.

**--tls-key-file** *key-file*

Full pathname of a file containing the private key.

**--tls-psk-identity** *PSK-identity*

PSK-identity string.

**--tls-psk-file** *PSK-file*

Full pathname of a file containing the pre-shared key.

**--tls-cipher13** *cipher-string*

Cipher string for OpenSSL 1.1.1 or newer for TLS 1.3. Override the default ciphersuite selection criteria. This option is not available if OpenSSL version is less than 1.1.1.

**--tls-cipher** *cipher-string*

GnuTLS priority string (for TLS 1.2 and up) or OpenSSL cipher string (only for TLS 1.2). Override the default ciphersuite selection criteria.

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

**EXAMPLES**

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]"
```

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]" --tls-connect cert --tls-ca-file /home/zabbix/zabbix_ca_file  
--tls-agent-cert-issuer "CN=Signing CA,OU=IT operations,O=Example Corp,DC=example,DC=com" --tls-agent-cert-  
subject "CN=server1,OU=IT operations,O=Example Corp,DC=example,DC=com" --tls-cert-file /home/zabbix/zabbix_get.crt  
--tls-key-file /home/zabbix/zabbix_get.key
```

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]" --tls-connect psk --tls-psk-identity "PSK ID Zabbix  
agentd" --tls-psk-file /home/zabbix/zabbix_agentd.psk
```

**NAME**

zabbix\_js - Zabbix JS utility

## SYNOPSIS

```
zabbix_js -s script-file -p input-param [-l log-level] [-t timeout]  
zabbix_js -s script-file -i input-file [-l log-level] [-t timeout]  
zabbix_js -h  
zabbix_js -V
```

## DESCRIPTION

**zabbix\_js** is a command line utility that can be used for embedded script testing.

## OPTIONS

**-s, --script** *script-file*

Specify the file name of the script to execute. If '-' is specified as file name, the script will be read from stdin.

**-p, --param** *input-param*

Specify the input parameter.

**-i, --input** *input-file*

Specify the file name of the input parameter. If '-' is specified as file name, the input will be read from stdin.

**-l, --loglevel** *log-level*

Specify the log level.

**-t, --timeout** *timeout*

Specify the timeout in seconds. Valid range: 1-60 seconds (default: 10)

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

## EXAMPLES

```
zabbix_js -s script-file.js -p example
```

### NAME

zabbix\_proxy - Zabbix proxy daemon

### SYNOPSIS

**zabbix\_proxy** [-c *config-file*]

**zabbix\_proxy** [-c *config-file*] -R *runtime-option*

**zabbix\_proxy** -h

**zabbix\_proxy** -V

### DESCRIPTION

**zabbix\_proxy** is a daemon that collects monitoring data from devices and sends it to Zabbix server.

### OPTIONS

**-c, --config** *config-file*

Use the alternate *config-file* instead of the default one.

**-f, --foreground**

Run Zabbix proxy in foreground.

**-R, --runtime-control** *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options

#### **config\_cache\_reload**

Reload configuration cache. Ignored if cache is being currently loaded. Active Zabbix proxy will connect to the Zabbix server and request configuration data. Default configuration file (unless **-c** option is specified) will be used to find PID file and signal will be sent to process, listed in PID file.

#### **snmp\_cache\_reload**

Reload SNMP cache.

#### **housekeeper\_execute**

Execute the housekeeper. Ignored if housekeeper is being currently executed.

#### **diaginfo**[=*section*]

Log internal diagnostic information of the specified section. Section can be *historycache*, *preprocessing*, *locks*. By default diagnostic information of all sections is logged.

#### **log\_level\_increase**[=*target*]

Increase log level, affects all processes if target is not specified.

#### **log\_level\_decrease**[=*target*]

Decrease log level, affects all processes if target is not specified.

Log level control targets

*process-type*

All processes of specified type (configuration syncer, data sender, discoverer, heartbeat sender, history syncer, housekeeper, http

poller, icmp pinger, ipmi manager, ipmi poller, java poller, poller, preprocessing manager, preprocessing worker, self-monitoring, snmp trapper, task manager, trapper, unreachable poller, vmware collector, history poller, availability manager, odbc poller)

*process-type,N*

Process type and number (e.g., poller,3)

*pid*

Process identifier, up to 65535. For larger values specify target as "process-type,N"

Profiling control targets

*process-type*

All processes of specified type (configuration syncer, data sender, discoverer, heartbeat sender, history syncer, housekeeper, http poller, icmp pinger, ipmi manager, ipmi poller, java poller, poller, preprocessing manager, preprocessing worker, self-monitoring, snmp trapper, task manager, trapper, unreachable poller, vmware collector, history poller, availability manager, odbc poller)

*process-type,N*

Process type and number (e.g., history syncer,1)

*pid*

Process identifier, up to 65535. For larger values specify target as "process-type,N"

*scope*

Profiling scope (rwlock, mutex, processing) can be used with process type (e.g., history syncer,1,processing)

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

## FILES

*/usr/local/etc/zabbix\_proxy.conf*

Default location of Zabbix proxy configuration file (if not modified during compile time).

zabbix_sender -h
zabbix_sender -V
```

## DESCRIPTION

**zabbix\_sender** is a command line utility for sending monitoring data to Zabbix server or proxy. On the Zabbix server an item of type **Zabbix trapper** should be created with corresponding key. Note that incoming values will only be accepted from hosts specified in **Allowed hosts** field for this item.

## OPTIONS

**-c, --config** *config-file*

Use *config-file*. **Zabbix sender** reads server details from the agentd configuration file. By default **Zabbix sender** does not read any configuration file. Only parameters **Hostname**, **ServerActive**, **SourceIP**, **TLSCConnect**, **TLSCAFile**, **TLSCRLFile**, **TLSServerCertIssuer**, **TLSServerCertSubject**, **TLSCertFile**, **TLSKeyFile**, **TLSPSKIdentity** and **TLSPSKFile** are supported. Hostname defined through **Hostnameltem** parameter will not be picked up, in this case the hostname should be specified via command line (see **-s** option). All addresses defined in the agent **ServerActive** configuration parameter are used for sending data. If sending of batch data fails to one address, the following batches are not sent to this address.

**-z, --zabbix-server** *server*

Hostname or IP address of Zabbix server. If a host is monitored by a proxy, proxy hostname or IP address should be used instead. When used together with **--config**, overrides the entries of **ServerActive** parameter specified in agentd configuration file.

**-p, --port** *port*

Specify port number of Zabbix server trapper running on the server. Default is 10051. When used together with **--config**, overrides the port entries of **ServerActive** parameter specified in agentd configuration file.

**-I, --source-address** *IP-address*

Specify source IP address. When used together with **--config**, overrides **SourceIP** parameter specified in agentd configuration file.

**-t, --timeout** *seconds*

Specify timeout. Valid range: 1-300 seconds (default: 60)

**-s, --host** *host*

Specify host name the item belongs to (as registered in Zabbix frontend). Host IP address and DNS name will not work. When used together with **--config**, overrides **Hostname** parameter specified in agentd configuration file.

**-k, --key** *key*

Specify item key to send value to.

**-o, --value** *value*

Specify item value.

**-i, --input-file** *input-file*

Load values from input file. Specify - as **<input-file>** to read values from standard input. Each line of file contains whitespace delimited: **<hostname> <key> <value>**. Each value must be specified on its own line. Each line must contain 3 whitespace delimited entries: **<hostname> <key> <value>**, where "hostname" is the name of monitored host as registered in Zabbix frontend, "key" is target item key and "value" - the value to send. Specify - as **<hostname>** to use hostname from agent configuration file or from **--host** argument.

An example of a line of an input file:

**"Linux DB3" db.connections 43**

The value type must be correctly set in item configuration of Zabbix frontend. Zabbix sender will send up to 250 values in one connection. **Size limit** for sending values from an input file depends on the size described in Zabbix communication protocol. Contents of the input file must be in the UTF-8 encoding. All values from the input file are sent in a sequential order top-down. Entries must be formatted using the following rules:

- Quoted and non-quoted entries are supported.
- Double-quote is the quoting character.
- Entries with whitespace must be quoted.
- Double-quote and backslash characters inside quoted entry must be escaped with a backslash.
- Escaping is not supported in non-quoted entries.
- Linefeed escape sequences (\n) are supported in quoted strings.
- Linefeed escape sequences are trimmed from the end of an entry.

**-T, --with-timestamps**

This option can be only used with **--input-file** option.

Each line of the input file must contain 4 whitespace delimited entries: **<hostname> <key> <timestamp> <value>**. Timestamp should be specified in Unix timestamp format. If target item has triggers referencing it, all timestamps must be in an increasing order, otherwise event calculation will not be correct.

An example of a line of the input file:

**"Linux DB3" db.connections 1429533600 43**

For more details please see option **--input-file**.

If a timestamped value is sent for a host that is in a "no data" maintenance type then this value will be dropped; however, it is possible to send a timestamped value in for an expired maintenance period and it will be accepted.

**-N, --with-ns**

This option can be only used with **--with-timestamps** option.

Each line of the input file must contain 5 whitespace delimited entries: **<hostname> <key> <timestamp> <ns> <value>**.

An example of a line of the input file:

**"Linux DB3" db.connections 1429533600 7402561 43**

For more details please see option **--input-file**.

**-r, --real-time**

Send values one by one as soon as they are received. This can be used when reading from standard input.

**--tls-connect** *value*

How to connect to server or proxy. Values:

**unencrypted**

connect without encryption (default)

**psk**

connect using TLS and a pre-shared key

## **cert**

connect using TLS and a certificate

**--tls-ca-file** *CA-file*

Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

**--tls-crl-file** *CRL-file*

Full pathname of a file containing revoked certificates.

**--tls-server-cert-issuer** *cert-issuer*

Allowed server certificate issuer.

**--tls-server-cert-subject** *cert-subject*

Allowed server certificate subject.

**--tls-cert-file** *cert-file*

Full pathname of a file containing the certificate or certificate chain.

**--tls-key-file** *key-file*

Full pathname of a file containing the private key.

**--tls-psk-identity** *PSK-identity*

PSK-identity string.

**--tls-psk-file** *PSK-file*

Full pathname of a file containing the pre-shared key.

**--tls-cipher13** *cipher-string*

Cipher string for OpenSSL 1.1.1 or newer for TLS 1.3. Override the default ciphersuite selection criteria. This option is not available if OpenSSL version is less than 1.1.1.

**--tls-cipher** *cipher-string*

GnuTLS priority string (for TLS 1.2 and up) or OpenSSL cipher string (only for TLS 1.2). Override the default ciphersuite selection criteria.

**-v, --verbose**

Verbose mode, **-vv** for more details.

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

## **EXIT STATUS**

The exit status is 0 if the values were sent and all of them were successfully processed by server. If data was sent, but processing of at least one of the values failed, the exit status is 2. If data sending failed, the exit status is 1.

## **EXAMPLES**

**zabbix\_sender -c /etc/zabbix/zabbix\_agentd.conf -k mysql.queries -o 342.45**

Send **342.45** as the value for **mysql.queries** item of monitored host. Use monitored host and Zabbix server defined in agent configuration file.

**zabbix\_sender -c /etc/zabbix/zabbix\_agentd.conf -s "Monitored Host" -k mysql.queries -o 342.45**

Send **342.45** as the value for **mysql.queries** item of **Monitored Host** host using Zabbix server defined in agent configuration file.

**zabbix\_sender -z 192.168.1.113 -i data\_values.txt**

Send values from file **data\_values.txt** to Zabbix server with IP **192.168.1.113**. Host names and keys are defined in the file.

```
echo "- hw.serial.number 1287872261 SQ4321ASDF" | zabbix_sender -c /usr/local/etc/zabbix_agentd.conf -T -i -
```

Send a timestamped value from the commandline to Zabbix server, specified in the agent configuration file. Dash in the input data indicates that hostname also should be used from the same configuration file.

```
echo "'Zabbix server' trapper.item ''" | zabbix_sender -z 192.168.1.113 -p 10000 -i -
```

Send empty value of an item to the Zabbix server with IP address **192.168.1.113** on port **10000** from the commandline. Empty values must be indicated by empty double quotes.

```
zabbix_sender -z 192.168.1.113 -s "Monitored Host" -k mysql.queries -o 342.45 --tls-connect cert --tls-ca-file /home/zabbix/zabbix_ca_file --tls-cert-file /home/zabbix/zabbix_agentd.crt --tls-key-file /home/zabbix/zabbix_agentd.key
```

Send **342.45** as the value for **mysql.queries** item in **Monitored Host** host to server with IP **192.168.1.113** using TLS with certificate.

```
zabbix_sender -z 192.168.1.113 -s "Monitored Host" -k mysql.queries -o 342.45 --tls-connect psk --tls-psk-identity "PSK ID Zabbix agentd" --tls-psk-file /home/zabbix/zabbix_agentd.psk
```

Send **342.45** as the value for **mysql.queries** item in **Monitored Host** host to server with IP **192.168.1.113** using TLS with pre-shared key (PSK).

## NAME

zabbix\_server - Zabbix server daemon

## SYNOPSIS

```
zabbix_server [-c config-file]  
zabbix_server [-c config-file] -R runtime-option  
zabbix_server -h  
zabbix_server -V
```

## DESCRIPTION

**zabbix\_server** is the core daemon of Zabbix software.

## OPTIONS

**-c, --config** *config-file*

Use the alternate *config-file* instead of the default one.

**-f, --foreground**

Run Zabbix server in foreground.

**-R, --runtime-control** *runtime-option*

Perform administrative functions according to *runtime-option*.

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.

Examples of running Zabbix server with command line parameters:

```
zabbix_server -c /usr/local/etc/zabbix_server.conf  
zabbix_server --help  
zabbix_server -V
```

## RUNTIME CONTROL

Runtime control options:

### **config\_cache\_reload**

Reload configuration cache. Ignored if cache is being currently loaded. Default configuration file (unless **-c** option is specified) will be used to find PID file and signal will be sent to process, listed in PID file.

### **snmp\_cache\_reload**

Reload SNMP cache, clear the SNMP properties (engine time, engine boots, engine id, credentials) for all hosts.

### **housekeeper\_execute**

Execute the housekeeper. Ignored if housekeeper is being currently executed.

### **trigger\_housekeeper\_execute**

Execute the trigger housekeeper (remove problems for deleted triggers). Ignored if trigger housekeeper for services is being currently executed.

### **diaginfo**[=*section*]

Log internal diagnostic information of the specified section. Section can be *historycache*, *preprocessing*, *alerting*, *lld*, *valuecache*, *locks*. By default diagnostic information of all sections is logged.

### **ha\_status**

Log high availability (HA) cluster status.

### **ha\_remove\_node**[=*target*]

Remove the high availability (HA) node specified by its name or ID. Note that active/standby nodes cannot be removed.

### **ha\_set\_failover\_delay**[=*delay*]

Set high availability (HA) failover delay. Time suffixes are supported, e.g. 10s, 1m.

### **secrets\_reload**

Reload secrets from Vault.

### **service\_cache\_reload**

Reload the service manager cache.

**prof\_enable**[=*target*]

Enable profiling. Affects all processes if target is not specified. Enabled profiling provides details of all rwlocks/mutexes by function name. Supported since Zabbix 6.0.13.

**prof\_disable**[=*target*]

Disable profiling. Affects all processes if target is not specified. Supported since Zabbix 6.0.13.

**log\_level\_increase**[=*target*]

Increase log level, affects all processes if target is not specified

**log\_level\_decrease**[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

*process-type*

All processes of specified type (alerter, alert manager, configuration syncer, discoverer, escalator, ha manager, history syncer, housekeeper, http poller, icmp pinger, ipmi manager, ipmi poller, java poller, lld manager, lld worker, poller, preprocessing manager, preprocessing worker, proxy poller, self-monitoring, snmp trapper, task manager, timer, trapper, unreachable poller, vmware collector, history poller, availability manager, service manager, odbc poller)

*process-type,N*

Process type and number (e.g., poller,3)

*pid*

Process identifier, up to 65535. For larger values specify target as "process-type,N"

Profiling control targets

*process-type*

All processes of specified type (alerter, alert manager, configuration syncer, discoverer, escalator, history syncer, housekeeper, http poller, icmp pinger, ipmi manager, ipmi poller, java poller, lld manager, lld worker, poller, preprocessing manager, preprocessing worker, proxy poller, self-monitoring, snmp trapper, task manager, timer, trapper, unreachable poller, vmware collector, history poller, availability manager, service manager, odbc poller)

*process-type,N*

Process type and number (e.g., history syncer,1)

*pid*

Process identifier, up to 65535. For larger values specify target as "process-type,N"

*scope*

Profiling scope (rwlock, mutex, processing) can be used with process type (e.g., history syncer,1,processing)

## FILES

*/usr/local/etc/zabbix\_server.conf*

Default location of Zabbix server configuration file (if not modified during compile time).

### NAME

zabbix\_web\_service - Zabbix web service

### SYNOPSIS

**zabbix\_web\_service** [-c *config-file*]

**zabbix\_web\_service -h**

**zabbix\_web\_service -V**

### DESCRIPTION

**zabbix\_web\_service** is an application for providing web services to Zabbix components.

### OPTIONS

**-c, --config** *config-file*

Use the alternate *config-file* instead of the default one.

**-h, --help**

Display this help and exit.

**-V, --version**

Output version information and exit.
