| 43 Upgrade notes for 6.0.33 . . . . .    | 166 |
| 44 Upgrade notes for 6.0.34 . . . . .    | 166 |
| 45 Upgrade notes for 6.0.35 . . . . .    | 166 |
| 46 Upgrade notes for 6.0.36 . . . . .    | 166 |
| 47 Upgrade notes for 6.0.37 . . . . .    | 166 |
| 48 Upgrade notes for 6.0.38 . . . . .    | 166 |
| 49 Upgrade notes for 6.0.39 . . . . .    | 167 |
| 50 Upgrade notes for 6.0.40 . . . . .    | 167 |
| 5 Quickstart . . . . .                   | 167 |
| 1 Login and configuring user . . . . .   | 167 |
| 2 New host . . . . .                     | 171 |

|  |     |
|--|-----|
| 3 New item . . . . .                             | 173 |
| 4 New trigger . . . . .                          | 174 |
| 5 Receiving problem notification . . . . .       | 176 |
| 6 New template . . . . .                         | 180 |
| 6 Zabbix appliance . . . . .                     | 182 |
| 7 Configuration . . . . .                        | 185 |
| 1 Hosts and host groups . . . . .                | 193 |
| 2 Items . . . . .                                | 204 |
| 3 Triggers . . . . .                             | 426 |
| 4 Events . . . . .                               | 444 |
| 5 Event correlation . . . . .                    | 447 |
| 6 Tagging . . . . .                              | 453 |
| 7 Visualization . . . . .                        | 456 |
| 8 Templates . . . . .                            | 483 |
| 9 Templates out of the box . . . . .             | 484 |
| 10 Notifications upon events . . . . .           | 494 |
| 11 Macros . . . . .                              | 537 |
| 12 Users and user groups . . . . .               | 547 |
| 13 Storage of secrets . . . . .                  | 554 |
| 14 Scheduled reports . . . . .                   | 555 |
| 8 Service monitoring . . . . .                   | 559 |
| 1 Service tree . . . . .                         | 560 |
| 2 Service actions . . . . .                      | 564 |
| 3 SLA . . . . .                                  | 565 |
| 4 Setup example . . . . .                        | 566 |
| 9 Web monitoring . . . . .                       | 571 |
| 1 Web monitoring items . . . . .                 | 580 |
| 2 Real-life scenario . . . . .                   | 581 |
| 10 Virtual machine monitoring . . . . .          | 589 |
| 1 Virtual machine discovery key fields . . . . . | 594 |
| 11 Maintenance . . . . .                         | 596 |
| 12 Regular expressions . . . . .                 | 600 |
| 13 Problem acknowledgment . . . . .              | 605 |
| 14 Configuration export/import . . . . .         | 607 |
| 1 Host groups . . . . .                          | 609 |
| 2 Templates . . . . .                            | 609 |
| 3 Hosts . . . . .                                | 629 |
| 4 Network maps . . . . .                         | 646 |
| 5 Media types . . . . .                          | 652 |
| 15 Discovery . . . . .                           | 659 |
| 1 Network discovery . . . . .                    | 659 |
| 2 Active agent autoregistration . . . . .        | 667 |
| 3 Low-level discovery . . . . .                  | 670 |
| 16 Distributed monitoring . . . . .              | 717 |
| 1 Proxies . . . . .                              | 718 |
| 17 Encryption . . . . .                          | 721 |
| 1 Using certificates . . . . .                   | 728 |
| 2 Using pre-shared keys . . . . .                | 735 |
| 3 Troubleshooting . . . . .                      | 737 |
| 18 Web interface . . . . .                       | 740 |
| 1 Menu . . . . .                                 | 740 |
| 2 Frontend sections . . . . .                    | 742 |
| 3 User settings . . . . .                        | 887 |
| 4 Global search . . . . .                        | 891 |
| 5 Frontend maintenance mode . . . . .            | 892 |
| 6 Page parameters . . . . .                      | 893 |
| 7 Definitions . . . . .                          | 894 |
| 8 Creating your own theme . . . . .              | 895 |
| 9 Debug mode . . . . .                           | 896 |
| 10 Cookies used by Zabbix . . . . .              | 896 |
| 11 Time zones . . . . .                          | 897 |
| 12 Resetting password . . . . .                  | 898 |
| 19 API . . . . .                                 | 899 |

|   |      |

# Zabbix Manual

Welcome to the user manual for Zabbix software. These pages are created to help users successfully manage their monitoring tasks with Zabbix, from the simple to the more complex ones.

## Copyright notice

Zabbix documentation is NOT distributed under a GPL license. Use of Zabbix documentation is subject to the following terms:

You may create a printed copy of this documentation solely for your own personal use. Conversion to other formats is allowed as long as the actual content is not altered or edited in any way. You shall not publish or distribute this documentation in any form or on any media, except if you distribute the documentation in a manner similar to how Zabbix disseminates it (that is, electronically for download on a Zabbix web site) or on a USB or similar medium, provided however that the documentation is disseminated together with the software on the same medium. Any other use, such as any dissemination of printed copies or use of this documentation, in whole or in part, in another publication, requires the prior written consent from an authorized representative of Zabbix. Zabbix reserves any and all rights to this documentation not expressly granted above.

## 1 Introduction

Please use the sidebar to access content in the Introduction section.

### 1 Manual structure

#### Structure

The content of this manual is divided into sections and subsections to provide easy access to particular subjects of interest.

When you navigate to respective sections, make sure that you expand section folders to reveal full content of what is included in subsections and individual pages.

Cross-linking between pages of related content is provided as much as possible to make sure that relevant information is not missed by the users.

#### Sections

**Introduction** provides general information about current Zabbix software. Reading this section should equip you with some good reasons to choose Zabbix.

**Zabbix definitions** explain the terminology used in Zabbix, while **Zabbix processes** provides details on Zabbix components.

**Installation** and **Quickstart** sections should help you to get started with Zabbix. **Zabbix appliance** is an alternative for getting a quick taster of what it is like to use Zabbix.

**Configuration** is one of the largest and more important sections in this manual. It contains loads of essential advice about how to set up Zabbix to monitor your environment, from setting up hosts to getting essential data to viewing data to configuring notifications and remote commands to be executed in case of problems.

**Service monitoring** details how to use Zabbix for a high-level overview of your monitoring environment.

**Web monitoring** should help you learn how to monitor the availability of web sites.

**Virtual machine monitoring** presents a how-to for configuring VMware environment monitoring.

**Maintenance**, **Regular expressions**, **Event acknowledgment** and **Configuration export/import** are further sections that reveal how to use these various aspects of Zabbix software.

**Discovery** contains instructions for setting up automatic discovery of network devices, active agents, file systems, network interfaces, etc.

**Distributed monitoring** deals with the possibilities of using Zabbix in larger and more complex environments.

**Encryption** helps explaining the possibilities of encrypting communications between Zabbix components.

**Web interface** contains information specific for using the web interface of Zabbix.

**API** section presents details of working with Zabbix API.

Detailed lists of technical information are included in **Appendixes**. This is where you will also find a FAQ section.

## 2 What is Zabbix

### Overview

Zabbix was created by Alexei Vladishev, and currently is actively developed and supported by Zabbix SIA.

Zabbix is an enterprise-class open source distributed monitoring solution.

Zabbix is a software that monitors numerous parameters of a network and the health and integrity of servers, virtual machines, applications, services, databases, websites, the cloud and more. Zabbix uses a flexible notification mechanism that allows users to configure email based alerts for virtually any event. This allows a fast reaction to server problems. Zabbix offers excellent reporting and data visualization features based on the stored data. This makes Zabbix ideal for capacity planning.

Zabbix supports both polling and trapping. All Zabbix reports and statistics, as well as configuration parameters, are accessed through a web-based frontend. A web-based frontend ensures that the status of your network and the health of your servers can be assessed from any location. Properly configured, Zabbix can play an important role in monitoring IT infrastructure. This is equally true for small organizations with a few servers and for large companies with a multitude of servers.

Zabbix is free of cost. Zabbix is written and distributed under the GPL General Public License version 2. It means that its source code is freely distributed and available for the general public.

[Commercial support](#) is available and provided by Zabbix Company and its partners around the world.

Learn more about [Zabbix features](#).

### Users of Zabbix

Many organizations of different size around the world rely on Zabbix as a primary monitoring platform.

## 3 Zabbix features

### Overview

Zabbix is a highly integrated network monitoring solution, offering a multiplicity of features in a single package.

#### Data gathering

- availability and performance checks
- support for SNMP (both trapping and polling), IPMI, JMX, VMware monitoring
- custom checks
- gathering desired data at custom intervals
- performed by server/proxy and by agents

#### Flexible threshold definitions

- you can define very flexible problem thresholds, called triggers, referencing values from the backend database

#### Highly configurable alerting

- sending notifications can be customized for the escalation schedule, recipient, media type
- notifications can be made meaningful and helpful using macro variables
- automatic actions include remote commands

#### Real-time graphing

- monitored items are immediately graphed using the built-in graphing functionality

#### Web monitoring capabilities

- Zabbix can follow a path of simulated mouse clicks on a web site and check for functionality and response time

#### Extensive visualization options

- ability to create custom graphs that can combine multiple items into a single view
- network maps
- slideshows in a dashboard-style overview
- reports
- high-level (business) view of monitored resources

#### Historical data storage

- data stored in a database
- configurable history
- built-in housekeeping procedure

### **Easy configuration**

- add monitored devices as hosts
- hosts are picked up for monitoring, once in the database
- apply templates to monitored devices

### **Use of templates**

- grouping checks in templates
- templates can inherit other templates

### **Network discovery**

- automatic discovery of network devices
- agent autoregistration
- discovery of file systems, network interfaces and SNMP OIDs

### **Fast web interface**

- a web-based frontend in PHP
- accessible from anywhere
- you can click your way through
- audit log

### **Zabbix API**

- Zabbix API provides programmable interface to Zabbix for mass manipulations, third-party software integration and other purposes.

### **Permissions system**

- secure user authentication
- certain users can be limited to certain views

### **Full featured and easily extensible agent**

- deployed on monitoring targets
- can be deployed on both Linux and Windows

### **Binary daemons**

- written in C, for performance and small memory footprint
- easily portable

### **Ready for complex environments**

- remote monitoring made easy by using a Zabbix proxy

## **4 Zabbix overview**

### Architecture

Zabbix consists of several major software components. Their responsibilities are outlined below.

#### Server

**Zabbix server** is the central component to which agents report availability and integrity information and statistics. The server is the central repository in which all configuration, statistical and operational data are stored.

#### Database storage

All configuration information as well as the data gathered by Zabbix is stored in a database.

#### Web interface

For an easy access to Zabbix from anywhere and from any platform, the web-based interface is provided. The interface is part of Zabbix server, and usually (but not necessarily) runs on the same physical machine as the one running the server.

#### Proxy

**Zabbix proxy** can collect performance and availability data on behalf of Zabbix server. A proxy is an optional part of Zabbix deployment; however, it may be very beneficial to distribute the load of a single Zabbix server.

## Agent

Zabbix agents are deployed on monitoring targets to actively monitor local resources and applications and report the gathered data to Zabbix server. Since Zabbix 4.4, there are two types of agents available: the **Zabbix agent** (lightweight, supported on many platforms, written in C) and the **Zabbix agent 2** (extra-flexible, easily extendable with plugins, written in Go).

## Data flow

In addition it is important to take a step back and have a look at the overall data flow within Zabbix. In order to create an item that gathers data you must first create a host. Moving to the other end of the Zabbix spectrum you must first have an item to create a trigger. You must have a trigger to create an action. Thus if you want to receive an alert that your CPU load is too high on *Server X* you must first create a host entry for *Server X* followed by an item for monitoring its CPU, then a trigger which activates if the CPU is too high, followed by an action which sends you an email. While that may seem like a lot of steps, with the use of templating it really isn't. However, due to this design it is possible to create a very flexible setup.

## 5 What's new in Zabbix 6.0.0

See **breaking changes** for this version.

### High availability cluster for Zabbix server

The new version comes with a native high availability solution for Zabbix server.

The solution consists of multiple `zabbix_server` instances or nodes, where only one node can be active (working) at a time, while other nodes are on standby, ready to take over in case the current node is stopped or fails.

See also: **High availability cluster**.

### Updated service monitoring

Several updates have been made to the monitoring of **services**. Service monitoring offers a high-level view of the monitored infrastructure in Zabbix.

### Tag-based mapping of services to problems

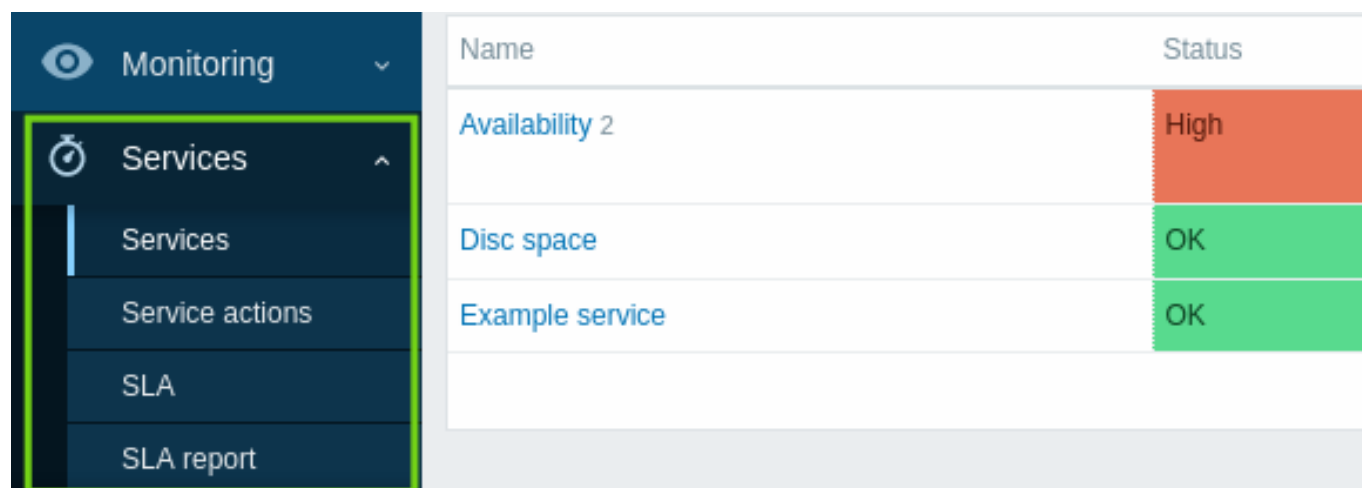

The availability of **services** in previous Zabbix versions depended on triggers and their states. In the new version that is replaced by a tag-based mapping to problems for the respective service.

In service configuration, hard and soft dependencies no longer exist. Instead, a service can have multiple parent services.

### Services menu

There is now a new Services menu in Zabbix, with four menu sections:

- **Services** - for service overview and service configuration (moved from *Monitoring* -> *Services*)
- **Service actions** - for service actions (new action type)
- **SLA** - for configuring SLAs
- **SLA report** - for SLA reports (also available as dashboard widget)

The screenshot shows the Zabbix 6.0.0 interface. On the left, a dark blue sidebar contains a 'Monitoring' menu with a dropdown arrow. Below it, a 'Services' menu is highlighted with a green border, containing sub-items: 'Services', 'Service actions', 'SLA', and 'SLA report'. The main content area on the right displays a table with two columns: 'Name' and 'Status'.

| Name            | Status |
|-----------------|--------|
| Availability 2  | High   |
| Disc space      | OK     |
| Example service | OK     |

Note that a separate section for service configuration no longer exists (previously in *Configuration* → *Services*).

An *Item value* widget has been added to dashboard widgets.

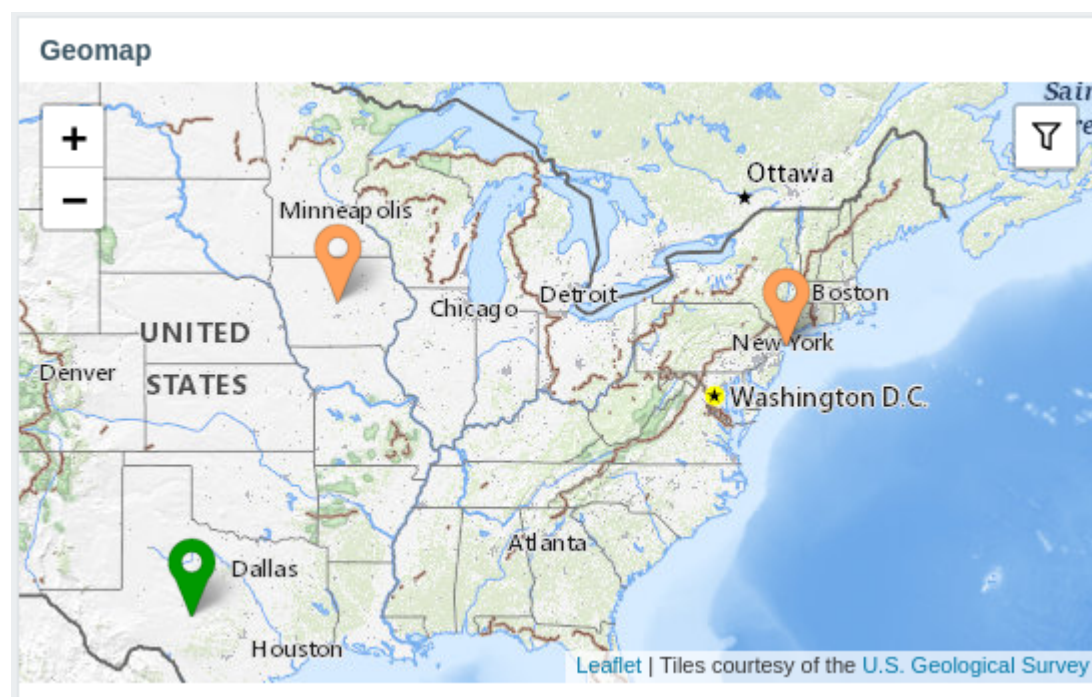

This type of widget is useful for displaying values of single items prominently. Different visual styles of display are possible:

For more information, see [Item value widget](#).

#### Geomap

A new geomap widget for the dashboards has been introduced providing a way to display hosts on geographical maps. For more information see the [Geomap dashboard widget](#) and [geographical maps](#).

#### Functions Functions for Prometheus histograms

It has been possible to collect [Prometheus metrics](#) in Zabbix for a while now, but some of the metrics are difficult to work with. Specifically, the metrics of histogram type can be presented in Zabbix as multiple items with the same key names, but different parameters. However, even though such items are logically related and represent the same data, it has been difficult to analyze the collected data without specialized functions. To cover this functionality gap in the new version, **rate()** and **histogram\_quantile()** functions, producing the same result as their PromQL counterparts, have been added.

Other new additions to complement this functionality are the **bucket\_rate\_foreach()** and the **bucket\_percentile()** functions. For more information see:

- [History functions](#) (see **rate()**)
- [Aggregate functions](#) (see **histogram\_quantile()**, **bucket\_percentile()**)
- [Foreach functions](#) (see **bucket\_rate\_foreach()**)

#### Monotonic change

It is now possible to check for monotonic increase or decrease in item values using the new **monoinc()** or **monodec()** [history functions](#).

#### Change count

A new [history function](#) **changecount()** has been added allowing to count the number of changes between adjacent values. The function supports three different modes for counting all changes, only decreases, or only increases. As an example, it can be used to track changes in the number of users or the number of system uptime decreases.

#### Entity count

New [functions](#) have been added to simplify the counting of specific hosts, items, or values, returned by [foreach functions](#).

#### Aggregate functions:

- **count** - total number of values in an array returned by a foreach function (returns an integer);
- **item\_count** - total number of currently enabled items that match filter criteria (returns an integer).

#### Foreach function:

- **exists\_foreach** - number of currently enabled items that match filter criteria (returns an array).

#### Baseline monitoring

Set of available baseline monitoring options has been extended with the two new functions **baselinedev** and **baselinewma**.

- **baselinedev** - compares the last data period with the same data periods in preceding seasons and returns the number of deviations;
- **baselinewma** - calculates the baseline by averaging data from the same timeframe in multiple equal time periods ('seasons') using the weighted moving average algorithm.

In context of these functions, the term 'season' refers to a configurable timeframe, which could be hours, days, weeks, months or years. The length of a season and the number of seasons to analyse is set in function parameters.

See [history functions](#) for more info.

#### Anomaly detection

Zabbix 5.2 introduced new trend functions useful for baseline monitoring. However, they still require defining relative thresholds (e.g. check that web traffic in September, 2021 is less than 2x higher compared to September, 2020). There are use cases when such thresholds are hard to define. For instance, the web traffic of a new but highly popular web site can organically grow many times over a year but the growth rate is unknown. Yet, a sudden traffic spike due to DDOS attack must generate an alert regardless of organic traffic growth.

Anomaly detection algorithms do exactly this - find data that doesn't look normal (outliers) in a context of other values.

New [trend function](#) **trendstl()** has been added which uses 'decomposition' method to calculate the anomaly rate. It splits a single time series sequence into three other sequences:

- trend sequence that only contains big changes in the original data (e.g. website traffic shows growth)
- season sequence that only contains seasonal changes (e.g. less website traffic in summer, more in autumn)
- remainder sequence that only contains residual values that can not be interpreted as parts of trend or season

Anomaly detection works with remainder sequence and checks if there are values that are too far from the majority of remainder values. "Far" means that the absolute value from the remainder sequence is N times greater than the standard or mean deviation.

## String functions

**String function concat** now allows concatenating more than two parameters. It can be used to combine strings and values in different combinations or append two or more values to each other. Numeric data types are also supported.

## Items Automated type selection

Item configuration form now automatically suggests the matching type of information, if selected item key returns data only of the specific type (for example, **log[]** item requires *Type of information: Log*). *Type of information* parameter is now located under the *Key* parameter on the primary *Item* tab and is duplicated on the *Preprocessing* tab if at least one preprocessing step is specified. If Zabbix detects a possible mismatch of the selected type of information and key, a warning icon will be displayed next to the *Type of information* field.

## Agent items

Several **new** items have been added to Zabbix agent/agent 2:

- **agent.hostmetadata** - return host metadata
- **kernel.openfiles** - return the number of open file descriptors
- **net.tcp.socket.count[]** - return the number of TCP sockets that match parameters
- **net.udp.socket.count[]** - return the number of UDP sockets that match parameters
- **vfs.dir.get[]** - return list of directory files as JSON
- **vfs.file.get[]** - return information about a file as JSON
- **vfs.file.owner[]** - return the ownership of a file
- **vfs.file.permissions[]** - return a 4-digit string containing octal number with Unix permissions

Additionally:

- **vfs.file.cksum[]** now supports a second mode parameter (*crc32*, *md5*, *sha256*)
- **vfs.file.size[]** now supports a second mode parameter (*bytes* or *lines*)
- **vfs.fs.discovery** and **vfs.fs.get** now return an `{#FSLABEL}` macro on Windows (with volume names)

For more details see [agent items](#).

## Calculated items

Calculated items now support not only numeric, but also **text**, **log**, and **character** types of information.

## Bulk processing for Prometheus metrics

Bulk processing of dependent items has been introduced in the preprocessing queue to improve the performance of retrieving Prometheus metrics.

See [Prometheus checks](#) for more details.

## JavaScript methods

HTTP methods PATCH, HEAD, OPTIONS, TRACE, CONNECT have been added to the JavaScript engine. Also, the engine now allows sending custom HTTP method requests with the new JS method `HttpRequest.customRequest`.

See also: [Additional JavaScript objects](#).

## Compressed content in web monitoring

The ability to handle compressed content has been added to Zabbix web monitoring. All encoding formats supported by **libcurl** are supported.

## Preprocessing Prometheus query language

Zabbix Prometheus preprocessing [query language](#) now supports two additional label matching operators:

- **!=** -- select labels that are not equal to the provided string;
- **!~** -- select labels that do not regex-match the provided string.

## Result processing for Prometheus pattern

A Prometheus pattern step in the preprocessing can produce a result where multiple lines are matched. To handle this situation, a new result processing [parameter](#) has been added to the Prometheus pattern preprocessing step that allows to aggregate the data of potentially multiple matching lines by introducing functions such as `sum`, `min`, `max`, `avg`, and `count`.

## Macros New macros

New macros are now supported for trigger expression debugging and internal actions.

Expression debugging macros simplify the process of debugging trigger expressions:

- {TRIGGER.EXPRESSION.EXPLAIN}, {TRIGGER.EXPRESSION.RECOVERY.EXPLAIN} - resolve to a partially evaluated trigger or recovery expression, where only item-based functions are applied;
- {FUNCTION.VALUE<1-9>}, {FUNCTION.RECOVERY.VALUE<1-9>} - resolve to the results of the Nth item-based function at the time of the event.

Macros for internal actions contain the reason why an item, an LLD-rule, or a trigger became unsupported:

- {ITEM.STATE.ERROR} - for item-based internal notifications;
- {LLDRULE.STATE.ERROR} - for LLD-rule based internal notifications;
- {TRIGGER.STATE.ERROR} - for trigger-based internal notifications.

For more details, see [Supported macros](#).

Simple macros replaced by expression macros

A new expression syntax for triggers and calculated items was introduced in [Zabbix 5.4](#). However, the old syntax still remained in use in simple macros. In the new version, the functionality of simple macros has been transferred to expression macros and the new expression syntax is used. See the comparison below for details of the change:

| In Zabbix 6.0                                      | Before Zabbix 6.0                               |
|--|---|
| {?avg(/host/key,1h)}                               | {host:key.avg(1h)}                              |
| Example of an expression macro in the new version. | Example of a simple macro in previous versions. |

The existing simple macros will be converted to expression macros during the upgrade. The scope of expression macros covers the same that was offered by simple macros. Thus, expression macros can be used in:

- problem notifications and commands
- problem update notifications and commands
- map element labels
- map link labels
- map shape labels
- graph names

Positional macros no longer supported

The support for positional macros in item name (\$1, \$2...\$9), deprecated since Zabbix 4.0, has been fully removed.

User macros in item name no longer supported

The support for user macros in item names (including discovery rule names), deprecated since Zabbix 4.0, has been fully removed.

**Databases** To create the optimal user experience and ensure the best Zabbix performance in various production environments, the support of some older database releases has been dropped. This primarily applies to the database versions that are nearing their end of service life point and versions with unfixed issues that may interfere with normal performance.

Starting from Zabbix 6.0, the following [database](#) versions are officially supported:

- *MySQL/Percona* 8.0.X
- *MariaDB* 10.5.X - 10.6.X
- *PostgreSQL* 13.X - 14.X
- *Oracle* 19c - 21c
- *TimescaleDB* 2.0.1-2.3
- *SQLite* 3.3.5-3.34.X

By default, Zabbix server and proxy will not start if an unsupported database version is detected. It is now possible, though not recommended, to turn off DB version check by modifying AllowUnsupportedDBVersions configuration parameter for the [server](#) or [proxy](#).

Primary keys

Primary keys are now used for all tables, including history tables, in new installations.

There is no automatic upgrade to primary keys for existing installations. Instructions for a **manual upgrade** of history tables to primary keys in pre-existing installations are available for [MySQL/MariaDB](#), [PostgreSQL](#), [TimescaleDB v1](#) and [v2](#), and [Oracle](#).

utf8mb4 support for MySQL

utf8mb4 encoding with utf8mb4\_bin collation is now supported for Zabbix installations with the MySQL/MariaDB database.

Previously only utf8 encoding was supported, which with MySQL stands for utf8mb3 encoding and thus supports only a subset of proper UTF-8 characters. In the new version utf8mb4 support has been added with support for the [full](#) UTF-8 character set. Old installations using utf8mb3 are kept intact and may continue using that encoding.

See also instructions on executing [utf8mb4 conversion](#) post-upgrade to 6.0.

**Processes** User parameter reload without agent restart

User parameters now can be reloaded from the configuration file without restarting the agent. To do so, run the new `userparameter_reload` runtime control option, e. g.:

```
zabbix_agentd -R userparameter_reload
```

or

```
zabbix_agent2 -R userparameter_reload
```

UserParameter is the only agent configuration option that will be reloaded with this command.

PCRE2 support

Support for PCRE2 has been added and Zabbix installation packages for RHEL 7 and newer, SLES (all versions), Debian 9 and newer, Ubuntu 16.04 and newer have been updated to use PCRE2. PCRE is still supported, but Zabbix can only be compiled with one of the libraries PCRE or PCRE2, both cannot be used at the same time.

Zabbix get and Zabbix sender timeout

Zabbix get and Zabbix sender utilities now support a `-t <seconds>` or `--timeout <seconds>` timeout parameter. The valid range is:

- 1-30 seconds for Zabbix get (default: 30 seconds)
- 1-300 seconds for Zabbix sender (default: 60 seconds)

Extended SNMP gateway functionality

SNMP gateway can now provide information about triggers in a problem state and reveal host information in trigger details.

Additionally, it is now possible to limit the rate of SNMP traps sent by SNMP gateway.

The list of supported OIDs has been extended with a new OID **.10** for a comma-delimited list of trigger hostnames.

New parameters have been added to the SNMP gateway configuration file:

- *ProblemBaseOID* - OID of the problem trigger table;
- *ProblemMinSeverity* - minimum severity, triggers having lower severity will not be included;
- *ProblemHideAck* - if specified, only triggers with unacknowledged problems will be included;
- *ProblemTagFilter* - if specified, only triggers with the specified tag name will be included;
- *TrapTimer* - if set, Zabbix will send no more than one trap of the highest severity in the given time frame.

For details, see [Zabbix SNMP Gateway](#).

Separate processing for ODBC checks

Processing ODBC checks has been moved from regular poller processes to separate server/proxy processes *ODBC pollers*. This change allows limiting the number of connections to the database created by poller processes. Previously, ODBC checks were performed by regular pollers, which also work with Zabbix agent items, SSH checks, etc.

A new configuration parameter *StartODBCPollers* has been added to Zabbix **server** and **proxy** configuration files.

You can use internal item `zabbix[process,<type>]` to monitor ODBC pollers load.

Runtime command transfer

Zabbix server and proxy runtime commands are now sent via socket instead of Unix signals. This change allowed to improve user experience working with runtime control options:

- Results of the command execution are now printed to the console.
- It is possible to send longer input parameters, such as HA node name instead of node number.

Runtime controls on BSD-based OS

Previously, Zabbix server and Zabbix proxy runtime control options were not supported on BSD-based systems. Changing the runtime command transfer method has allowed to withdraw this limitation. Now the majority of the commands are supported on, *FreeBSD*, *NetBSD*, *OpenBSD*, and other operating systems from the **\*BSD** family.

For the exact list, see *Runtime control* for Zabbix [server](#) or [proxy](#).

Zabbix agent 2 plugins

### Separate configuration files

Each Zabbix agent 2 plugin now has a separate [configuration file](#). By default, these files are located in the `./zabbix_agent2.d/plugins.d/` directory. The path is specified in the `Include` parameter of the agent 2 configuration file and can be relative to the [zabbix\\_agent2.conf](#) or [zabbix\\_agent2.win.conf](#) file location.

### External plugin loader

Previously, plugins could only be compiled into Zabbix agent 2, which required recompiling the agent every time you need to change the set of available plugins. Now, with the addition of the external plugin loader, plugins don't have to be integrated into the agent 2 directly and can be added as separate external add-ons (loadable plugins), thus making the creation process of additional plugins for gathering new monitoring metrics easier.

Introduction of loadable plugins caused the following configuration parameter changes:

- `Plugins.<PluginName>.Path` parameter has been moved to `Plugins.<PluginName>.System.Path`.
- `Plugins.<PluginName>.Capacity` parameter, while still supported, has been deprecated, please use `Plugins.<PluginName>.System.Capacity` instead.

**Templates** New official templates are available for monitoring.

Kubernetes

- *Kubernetes nodes by HTTP*
- *Kubernetes cluster state by HTTP*
- *Kubernetes API server by HTTP*
- *Kubernetes Controller manager by HTTP*
- *Kubernetes Scheduler by HTTP*
- *Kubernetes kubelet by HTTP*

To enable Kubernetes monitoring, you need to use the new tool [Zabbix Helm Chart](#), which installs Zabbix proxy and Zabbix agents in the Kubernetes cluster.

To learn more about configuring templates, see [HTTP template operation](#).

Mikrotik

- *MikroTik <device model> SNMP* - 53 new model-specific templates for monitoring various models of MikroTik ethernet routers and switches, see [full list](#);
- *Mikrotik SNMP* - a generic template for monitoring MikroTik devices.

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**Notifications** Webhook integrations

A new integration is available allowing to use the [webhook](#) media type for creating [Github issues](#) from Zabbix notifications.

Notification about canceled escalations

When configuring [action operations](#), it is now possible to cancel notifications about canceled escalations by unmarking the checkbox of the corresponding option.

**Frontend** Password requirements

Custom password complexity requirements can now be provided for Zabbix internal [authentication method](#). To prevent Zabbix users from setting weak passwords, it is possible to enforce the following restrictions:

- Set the minimum password length.
- Require a password to contain a combination of uppercase and lowercase letters, digits, and/or special characters.

- Prohibit usage of most common and easily guessable passwords.

## Audit log

### Records

The audit log now contains records about all configuration changes for all Zabbix objects, including changes that occurred as a result of executing an LLD rule, a network discovery action, an autoregistration action, or a script execution. Previously, configuration changes initiated from Zabbix server, for example, as a result of executing a discovery rule, were not recorded. Now such object modifications will be stored as audit records attributed to the user System.

### Record filter

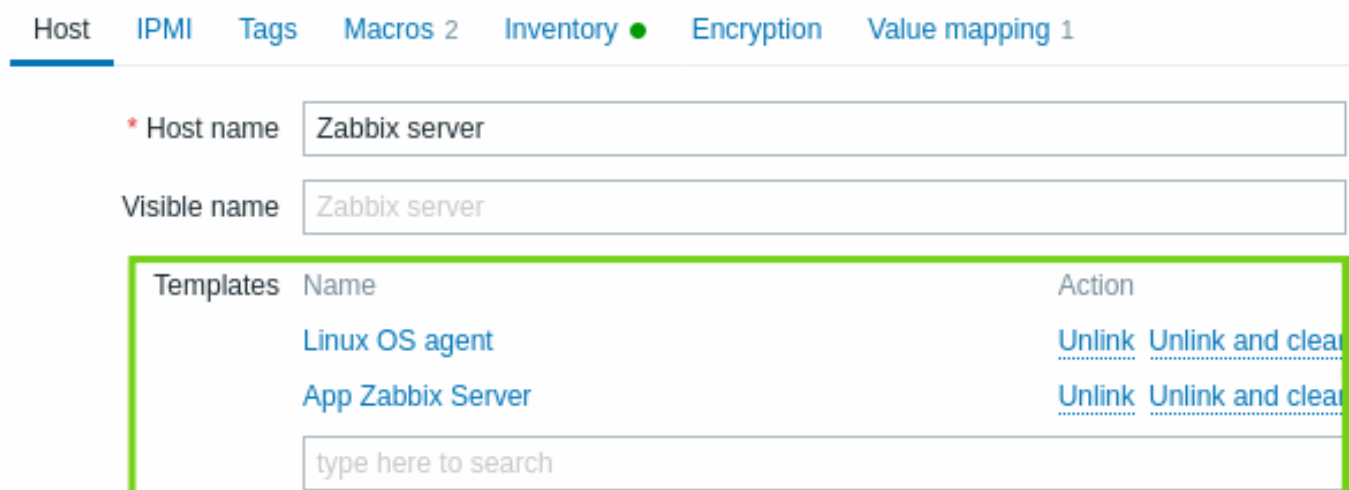

A functionality for filtering records by the frontend operation that caused these entries has been added. If several log records have been created as a result of a single operation, for example, linking/unlinking a template, such records will have the same *Recordset ID*.

### Audit settings

New [section Audit log](#) has been added to the *Administration*→*General* menu allowing to enable or disable audit logging. House-keeping settings for audit, previously located under the *Housekeeper* section, have also been moved to the new *Audit log* section.

### Template linking more visible

To make template linking more visible, it is now placed in the first tab of the host, host prototype and template configuration forms and host/template mass update forms.

| Host   | IPMI              | Tags                    | Macros 2 | Inventory ● | Encryption | Value mapping 1 |           |      |        |  |                |                         |  |                   |                         |  |  |  |
|--|-------------------|-------------------------|----------|-------------|------------|-----------------|-----------|------|--------|--|----------------|-------------------------|--|-------------------|-------------------------|--|--|--|
| <p>* Host name <input type="text" value="Zabbix server"/></p> <p>Visible name <input type="text" value="Zabbix server"/></p> <table border="1"> <thead> <tr> <th>Templates</th> <th>Name</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td></td> <td>Linux OS agent</td> <td>Unlink Unlink and clear</td> </tr> <tr> <td></td> <td>App Zabbix Server</td> <td>Unlink Unlink and clear</td> </tr> <tr> <td colspan="3"> <input type="text" value="type here to search"/> </td> </tr> </tbody> </table> |                   |                         |          |             |            |                 | Templates | Name | Action |  | Linux OS agent | Unlink Unlink and clear |  | App Zabbix Server | Unlink Unlink and clear | <input type="text" value="type here to search"/> |  |  |
| Templates  | Name              | Action                  |          |             |            |                 |           |      |        |  |                |                         |  |                   |                         |  |  |  |
|  | Linux OS agent    | Unlink Unlink and clear |          |             |            |                 |           |      |        |  |                |                         |  |                   |                         |  |  |  |
|  | App Zabbix Server | Unlink Unlink and clear |          |             |            |                 |           |      |        |  |                |                         |  |                   |                         |  |  |  |
| <input type="text" value="type here to search"/>   |                   |                         |          |             |            |                 |           |      |        |  |                |                         |  |                   |                         |  |  |  |

Consequently, a separate tab for template linking has been removed from all the respective forms.

In a related development, in host prototype configuration the fields for host group/host group prototype selection have also been moved from a separate tab to the first tab.

### Subfilter in latest data

A subfilter has been added in the *Latest data* section. The subfilter is useful for a quick one-click access to groups of related items.

The subfilter shows **clickable links** allowing to filter items based on a common entity - the host, tag name or tag value. As soon as the entity is clicked, items are immediately filtered.

For more details, see the [latest data](#) section.

### Usability improvements to custom graphs

The graph page in *Monitoring* → *Hosts* → *Graphs* has seen several usability improvements:

- There is no longer a 20 graph limit in the page
- A subfilter has been added allowing to quickly select groups of related graphs based on a common tag or tag value
- Simple graphs for the host can be displayed alongside custom graphs

For more details, see the [graph](#) page.

### Creating hosts from Monitoring

It is now also possible to create new hosts from *Monitoring* → *Hosts*.

## Hosts

[Create host](#)

| Name ▼        | Interface       | Availability      | Tags    | Problems |
|---------------|-----------------|-------------------|---------|----------|
| Zabbix server | 127.0.0.1:10050 | ZBX SNMP IPMI JMX | fff1: 1 | 1        |

The *Create host* button is available for Admin and Super Admin users.

Host editing as popup

The form for host creation and editing is now opened in a modal (popup) window, in *Configuration → Hosts*, *Monitoring → Hosts* and in any page, where there is a host menu or other direct link to the host configuration.

Direct links to the host edit page still work and are opening the host edit page in full page.

Better navigation between item configuration and latest data

A new context menu for items has been introduced in *Latest data* allowing to access the item configuration and available graphs:

| <input type="checkbox"/> Host          | Name ▲              | Last check |
|--|---------------------|------------|
| <input type="checkbox"/> Zabbix server | /: Free inodes in % | 5s         |
| <input type="checkbox"/> Zabbix server | /: Free space ?     | 33s        |
| <input type="checkbox"/> Zabbix server | /: Sp               | 6s         |
| <input type="checkbox"/> Zabbix server | /: Tot              | 7s         |
| <input type="checkbox"/> Zabbix server | /: Us               | 8s         |
| <input type="checkbox"/> Zabbix server | A Int               | 19s        |

ITEM

Graph

Values

500 latest values

Configuration

Conversely, a new context menu has been introduced in the *item list* in configuration menu allowing to access the latest data for the item and other useful options:

## Items

|                           |  |     |      |      |           |             |           |          |
|---------------------------|--|-----|------|------|-----------|-------------|-----------|----------|
| All hosts / Zabbix server | Enabled  | ZBX | SNMP | IPMI | Items 146 | Triggers 67 | Graphs 27 | Discover |
| <input type="checkbox"/>  | Name   |     |      |      |           |             |           |          |
| <input type="checkbox"/>  | Template Module Linux generic by Zabbix agent: Maximum number of open file descriptors |     |      |      |           |             |           |          |
|                           | MAXIMUM NUMBER OF OPEN FILE DES...   |     |      |      |           |             |           |          |
|                           | Latest data  |     |      |      |           |             |           |          |
|                           | Create trigger   |     |      |      |           |             |           |          |
|                           | Triggers   |     |      |      |           |             |           |          |
|                           | Create dependent item  |     |      |      |           |             |           |          |
|                           | Create dependent discovery rule  |     |      |      |           |             |           |          |

Configured max number of open filedescript

This menu replaces the wizard option in previous versions. A similar menu has also been introduced for *template items* and *item prototypes*.

Monitoring → Latest data updated

Several improvements have been made to the Latest data section:

- Time since last check (for example, 1m 20s) is now displayed instead of the last item execution time.
- Hovering over an item's last value will show the raw value without units or value mapping applied.
- If a host is in maintenance, an orange wrench icon will be visible next to the host name.

Monitoring → Overview removed

The Overview section in the Monitoring menu has been removed completely. The same functionality can be still accessed by using the *Data overview* and *Trigger overview* dashboard **widgets**.

Miscellaneous

- Maximum field size has been increased for the following fields:
  - **Item preprocessing** parameters
  - **Media type** message
- The default language of Zabbix web interface has been changed from British to American English. Support of British English has been dropped.
- The Share link in the main menu has been replaced by an Integrations link, leading to the **Integrations** page on the Zabbix website.
- If Zabbix web interface is opened in one of the languages available on the Zabbix website, clicking the Integrations link will open the Integrations page in the appropriate language. For all other languages, including English, the Integrations page will be opened in English.
- A custom expression, used in **action configuration** for calculating conditions, now can be up to 1024 characters long (previously 255).
- *Monitoring->Hosts* section now shows link to host problems screen even if no problems are currently open.

## Breaking changes Audit log

In order to implement the changes in **audit log functionality**, the previously existing database structure had to be reworked. During the upgrade `auditlog` and `auditlog_details` DB tables will be replaced by the new table `auditlog` with a different format.

**Existing audit log records will be deleted.**

Supported DB versions check

Zabbix **server** and **proxy** will now check the database version before launch and will not start if the version is out of the supported range. For more details, see **databases**.

PCRE2 support

Zabbix now supports both PCRE and PCRE2. Zabbix packages for RHEL 7 and newer, SLES (all versions), Debian 9 and newer, Ubuntu 16.04 and newer have been updated to compile with PCRE2 instead of PCRE. When compiling from sources, users can choose to specify `--with-libpcre` or `--with-libpcre2` flag. If you are upgrading an existing installation, changing PCRE to PCRE2 may lead to some regular expressions behaving differently - see **Known issues** for details.

## 6 What's new in Zabbix 6.0.1

### Zabbix agent 2 items

- Native support for the **items net.dns** and **net.dns.record** has been added. These items, used with Zabbix agent 2, now support concurrent check processing. On Windows, custom DNS IP addresses are allowed in the `ip` parameter, `timeout` and `count` parameters are no longer ignored.
- *smart.disk.discovery* and *smart.attribute.discovery* **items**, supported for S.M.A.R.T. plugin, have been updated and now return `{#DISKTYPE}` macro value in the lower case.

**Discovery of disabled systemd units** It is now also possible to discover **disabled** systemd units using the *systemd.unit.discovery* item key, supported by Zabbix agent 2. Note that to have items and triggers created from prototypes for disabled systemd units, it may be necessary to adjust (or remove) prohibiting LLD filters for the `{#UNIT.ACTIVESTATE}` and `{#UNIT.UNITFILESTATE}` macros.

For more details, see **Discovery of systemd services**.

**SNI support in encrypted connections** Encrypted TCP connections between Zabbix agent and Zabbix server or proxy now support SNI.

**SourceIP support in LDAP simple checks** SourceIP support has been added to LDAP **simple checks**. Note that with OpenLDAP, version 2.6.1 or above is required.

## 7 What's new in Zabbix 6.0.2

Zabbix agent 2 active check configuration

A new optional **configuration parameter** *ForceActiveChecksOnStart* has been added to Zabbix agent 2. Setting the parameter to *ForceActiveChecksOnStart=1* will ensure item data for active checks is collected immediately upon Zabbix agent restart, except for items with *Scheduling update interval*. Otherwise, the first data collection after an agent restart will happen at random time, which is less than item update interval, to prevent spikes in resource usage.

It is also possible to set this option only for a specific plugin by using *Plugins.<PluginName>.System.ForceActiveChecksOnStart* (for example, *Plugins.Uptime.System.ForceActiveChecksOnStart=1*). If set, a plugin-level parameter will override the global setting.

**JMX monitoring** The template *Generic Java JMX* now contains discovery rules for low-level discovery of memory pools and garbage collectors.

**Keyboard navigation** Keyboard control has been implemented for info icons in the frontend. Thus it is now possible to focus on info icons, and open the hints, using the keyboard.

## 8 What's new in Zabbix 6.0.3

PostgreSQL metrics

A new **item** has been added to PostgreSQL plugin for Zabbix agent 2. The metric **pgsql.queries** is used for monitoring query execution time.

Templates

A new template *OpenWeatherMap by HTTP* is now available allowing to monitor OpenWeatherMap via HTTP. See **HTTP template operation** for setup instructions.

The following changes have been made in the existing templates:

- In the templates *Windows services by Zabbix agent*, *Windows services by Zabbix agent active*, *Windows by Zabbix agent*, *Windows by Zabbix agent active* `{SERVICE.NAME.NOT_MATCHES}` macro value has been updated to filter out an extended list of services.
- The template *PostgreSQL by Zabbix agent 2* now will check the number of slow queries and generate a problem if the amount exceeds a threshold.

You can get these templates:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## 9 What's new in Zabbix 6.0.4

**Text data for Top hosts widget** It is now possible to select items with any type of information (including *Character*, *Text*, and *Log*) in the **Top hosts** widget. For example, it is now possible to use this widget to display the versions of Zabbix agents running on each host.

**OpenSSL 3.0 support** OpenSSL 3.0.x is now supported. Note that this change does not affect frontend encryption (which uses its own openssl-php package) and Java gateway JMX encrypted connections to monitoring targets (which uses its own Java encrypted libraries).

**Templates** New templates are available:

- *TrueNAS SNMP* - monitoring of TrueNAS storage OS by SNMP
- *Proxmox VE by HTTP* - see setup instructions for [HTTP templates](#)

New macros allowing to define warning and critical thresholds of the filesystem utilization for virtual file system monitoring have been added to the templates *HOST-RESOURCES-MIB storage SNMP*, *Linux by Prom*, *Linux filesystems SNMP*, *Linux filesystems by Zabbix agent active*, *Linux filesystems by Zabbix agent*, *Mellanox SNMP*, *PFSense SNMP*, *Windows filesystems by Zabbix agent active*, *Windows filesystems by Zabbix agent*. Filesystem utilization triggers have been updated to use these macros.

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**GLPi integration** A new [GLPi integration](#) is available allowing to use the [webhook](#) media type to create problems in GLPi Assistance section based on Zabbix problem notifications.

**S.M.A.R.T. monitoring** *Smart plugin*, supported for Zabbix agent 2, now provides more efficient disk discovery and allows returning information about a specific disk, instead of all discovered disks. Zabbix agent 2 items **smart.disk.discovery** and **smart.disk.get** have been updated. The templates *SMART by Zabbix agent 2* and *SMART by Zabbix agent 2 (active)* have also been modified to incorporate the new functionality.

## 10 What's new in Zabbix 6.0.5

**Templates** New templates are available:

- CockroachDB by HTTP
- Envoy Proxy by HTTP
- HashiCorp Consul Cluster by HTTP
- HashiCorp Consul Node by HTTP

See setup instructions for [HTTP templates](#).

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**Handling of NaN values in Prometheus preprocessing** There is a new behavior for handling (skipping) NaN values. So, if a dataset consists of valid numeric values and NaNs, then NaN values are skipped and:

- 'avg', 'max', 'min', 'sum' return a result that is calculated from the valid values
- 'count' returns the number of valid values

If all values in a dataset are NaNs then 'avg', 'max', 'min', and 'sum' return a "no data (at least one value is required)" error, while 'count' returns 0.

Previously, if NaN was the first value in a dataset then:

- 'avg', 'max', 'min', 'sum' returned a "Value "NaN" of type "string" is not suitable for value type "Numeric (float)" error
- 'count' returned the number of values (including NaN values)

Also previously, if NaN was not the first value in a dataset then:

- 'avg', 'sum' returned a "Value "NaN" of type "string" is not suitable for value type "Numeric (float)" error
- 'max' returned the maximum of values until the first NaN was encountered
- 'min' returned the minimum of values until the first NaN was encountered
- 'count' returned the number of values (including NaN values)

**Latest data link for hosts shows numbers** The latest data link for hosts in *Monitoring -> Hosts* now shows the number of items with latest data.

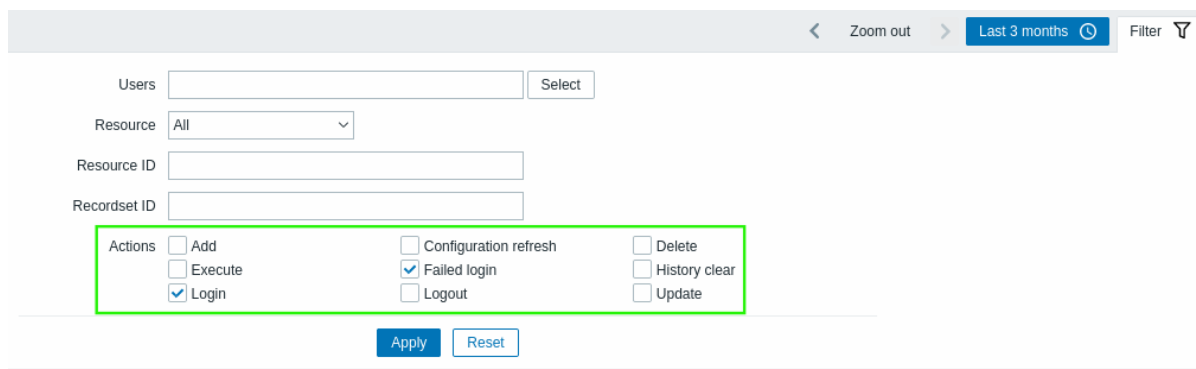

**Frontend languages** German and Vietnamese languages are now enabled in the frontend.

**Expandable lists in latest data subfilter** Expandable lists have been introduced in the *latest data* subfilter:

- For each entity group (e.g. tags, hosts) up to 10 rows of entities are now displayed. If there are more entities, this list can be expanded to a maximum of 1000 entries (the value of SUBFILTER\_VALUES\_PER\_GROUP in *frontend definitions*) by clicking on a three-dot icon displayed at the end. Previously a non-expandable maximum of 100 entries was the limit.
- In the list of *Tag values* up to 10 rows of tag names are now displayed. If there are more tag names with values, this list can be expanded to a maximum of 200 tag names by clicking on a three-dot icon displayed at the bottom. Previously, a non-expandable maximum of 20 rows with tag names was the limit.

For each tag name up to 10 rows of values are displayed (expandable to 1000 entries (the value of SUBFILTER\_VALUES\_PER\_GROUP in *frontend definitions*)).

**Audit log filter** Multiple actions now can be selected in the audit log filter in *Reports -> Audit*:

This is useful to see all related actions (for example, successful and failed logins into the frontend) in the audit list.

## 11 What's new in Zabbix 6.0.6

**PHP 8 support** PHP 8.0 and 8.1 is now supported.

**MariaDB 10.7 support** The maximum supported version for MariaDB is now 10.7.X.

**Loadable MongoDB plugin** MongoDB [plugin](#) is no longer part of Zabbix agent 2 and is now available as a loadable plugin instead. List of supported MongoDB versions has been extended to 2.6-5.3.

Plugin functionality and set of supported *items* haven't change.

**Templates** New templates

New templates are available:

- HPE MSA 2040 Storage by HTTP
- HPE MSA 2060 Storage by HTTP
- HPE Primera by HTTP

See setup instructions for [HTTP templates](#).

You can get these templates:

- In *Configuration -> Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration -> Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**ExpressMS messenger webhook API changed** API version changed to v4 in ExpressMS messenger webhook.

## 12 What's new in Zabbix 6.0.7

**MariaDB 10.8 support** The maximum supported version for MariaDB is now 10.8.X.

**TimescaleDB 2.6 support** The maximum supported version for TimescaleDB is now 2.6.

**Templates** New templates

A new template *HPE Synergy by HTTP* is available.

See setup instructions for [HTTP templates](#).

You can get this template:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

Updated templates

PostgreSQL Agent 2 template has been updated.

A trigger for detecting checksum failures has been added to the Dbstat item of the [PostgreSQL Agent 2 template](#).

You can get this template:

- In *Configuration* → *Templates* in new installations;
- If you are upgrading from previous versions, you can download new templates from Zabbix [Git repository](#) or find them in the `templates` directory of the downloaded latest Zabbix version. Then, while in *Configuration* → *Templates* you can import them manually into Zabbix.

## 13 What's new in Zabbix 6.0.8

**Month abbreviated with capital letter** A "month" is now abbreviated with the capital "M" in the frontend. Previously it was abbreviated with the small "m", overlapping with the abbreviation of a minute.

**TimescaleDB 2.7 support** The maximum supported version for TimescaleDB is now 2.7.

**Templates** A new [template](#) *OPNsense by SNMP* is available.

You can get this template:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**RHEL packages renamed** RHEL packages have been renamed by adding a "release" word in the name:

| Naming | Package name  |
|--------|---|
| Old    | <code>zabbix-agent-6.0.7-1.el9.x86_64.rpm</code>        |
| New    | <code>zabbix-agent-6.0.8-release1.el9.x86_64.rpm</code> |

There is no functional change associated with this change.

This is necessary as preparation for providing packages of minor version (i.e. 6.0.x) release candidates, expected to start with 6.0.9. The naming change will ensure that for someone who has both stable and unstable repositories enabled on their system, repository updates will be received in the correct order. This naming change is for RHEL packages only.

## 14 What's new in Zabbix 6.0.9

**Expression macros** {ITEM.KEY<1-9>} macros are now supported inside **expression macros**.

**Packages** SQL scripts have been moved from the `/usr/share/doc` directory to `/usr/share` in Zabbix packages.

## 15 What's new in Zabbix 6.0.10

Filter settings remembered

In several Monitoring pages (*Problems*, *Hosts*, *Latest data*) the current filter settings are now remembered in the user profile. When the user opens the page again, the filter settings will have stayed the same.

Additionally, the marking of a changed (but not saved) favorite filter is now a green dot next to the filter name, instead of the filter name in italics.

**TimescaleDB 2.8 support** The maximum supported version for TimescaleDB is now 2.8.

**PostgreSQL 15 support** PostgreSQL 15 is now supported. Note that TimescaleDB **does not** support PostgreSQL 15 yet.

**Possible to build Zabbix agent 2 offline** Zabbix agent 2 now can be built offline. The source tarball now includes the `src/go/vendor` directory, which should make sure that go lang is not forced to download dependency modules automatically. It is still possible to update to the latest modules manually by using `go mod tidy` or `go get` commands.

**PostgreSQL plugin loadable** The PostgreSQL **plugin** is now loadable in Zabbix agent 2 (previously built-in).

See also: [PostgreSQL loadable plugin](#) repository

**Frontend** Miscellaneous

- Warnings about incorrect housekeeping configuration for TimescaleDB are now displayed if history or trend tables contain compressed chunks, but *Override item history period* or *Override item trend period* options are disabled. For more information, see [TimescaleDB setup](#).

## 16 What's new in Zabbix 6.0.11

**Reporting file systems with zero inodes** `vfs.fs.get` agent items are now capable of reporting file systems with the inode count equal to zero, which can be the case for file systems with dynamic inodes (e.g. `btrfs`).

Additionally `vfs.fs.inode` items now will not become unsupported in such cases with mode set to 'pfree' or 'pused'. Instead the pfree/pused values for such file systems will be reported as "100" and "0" respectively.

**Optimized API queries** API database queries, used when searching through names in *hosts* and *items* tables, have been optimized and will now be processed more efficiently.

## 17 What's new in Zabbix 6.0.12

**Improved performance of history syncers** The performance of history syncers has been improved by introducing a new read-write lock. This reduces locking between history syncers, trappers and proxy pollers by using a shared read lock while accessing the configuration cache. The new lock can be write locked only by the configuration syncer performing a configuration cache reload.

## 18 What's new in Zabbix 6.0.13

### Breaking changes Loadable plugin versioning

**Loadable plugins** for Zabbix agent 2 now use the same versioning system as Zabbix itself. The following version changes have been made:

- MongoDB 1.2.0 -> MongoDB 6.0.13
- PostgreSQL 1.2.1 -> PostgreSQL 6.0.13

These plugins are supported for any minor version of Zabbix 6.0. Note that source code repository for each plugin now contains a dedicated *release/6.0* branch (previously, there was only *master* branch).

**MariaDB 10.10 support** The maximum supported version for MariaDB is now 10.10.X.

**TimescaleDB 2.9 support** The maximum supported version for TimescaleDB is now 2.9.

**Configuration import** Previously, the import process would fail on a UUID mismatch of an importable entity (host group, item, graph, etc). For example, it was not possible to import a host group if a host group with the same name already existed on the host.

In the new version the import will not fail because of a UUID mismatch; instead the entity will be matched by the uniqueness criteria such as entity ID (name). The entity will be imported, and the UUID will be updated to the UUID of the imported entity.

In another improvement, when removing template linkage (the *Delete missing* option for template linkage) through the imported template or host, the inherited entities of the unlinked template are no longer removed (template gets unlinked, not unlinked and cleared), unless these entities are missing in the import file **and** the *Delete missing* option for the specific entity is marked.

Due to this change, the warning message when marking the *Delete missing* option for template linkage will no longer be displayed.

**Query separate tablespaces in Oracle databases with Zabbix agent 2** The following **Zabbix agent 2 items**, supported for the Oracle plugin, now have additional optional parameters:

- `oracle.diskgroups.stats[<existingParameters>,<diskgroup>]`
- `oracle.archive.info[<existingParameters>,<destination>]`
- `oracle.cdb.info[<existingParameters>,<database>]`
- `oracle.pdb.info[<existingParameters>,<database>]`
- `oracle.ts.stats[<existingParameters>,<tablespace>,<type>]`

These parameters allow to query separate instances of data instead of all data, thus improving performance.

**Retrieving additional information with `docker.container_info[]`** The `docker.container_info[]` **Zabbix agent 2 item** now supports the option to retrieve either partial (short) or full low-level information about a Docker container.

**Runtime commands for profiling** Runtime commands for profiling have been added to Zabbix server and Zabbix proxy.

- `prof_enable` - enable profiling
- `prof_disable` - disable profiling

Profiling can be enabled per server/proxy process. Enabled profiling provides details of all rwlocks/mutexes by function name.

See also:

- [Zabbix server runtime commands](#)
- [Zabbix proxy runtime commands](#)

**HMAC function for JavaScript** A new function has been added to the JavaScript engine allowing to return HMAC hash:

- `hmac('<hash type>',key,string)`

This is useful for cases when hash-based message authentication code (HMAC) is required for signing requests. MD5 and SHA256 hash types are supported, e. g.:

- `hmac('md5',key,string)`
- `hmac('sha256',key,string)`

**Templates** New templates are available:

- AWS EC2 by HTTP
- AWS by HTTP
- AWS RDS instance by HTTP
- AWS S3 bucket by HTTP
- Azure by HTTP
- Control-M server by HTTP
- Control-M enterprise manager by HTTP
- Veeam Backup Enterprise Manager by HTTP
- Veeam Backup and Replication by HTTP

See setup instructions for [HTTP templates](#).

The template [Oracle by Zabbix agent 2](#) has been updated (multiple static items removed; multiple item prototypes added) according to the changes made to multiple [Zabbix agent 2 items](#).

For more information about the updates, see [Template changes](#).

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**Webhook integrations** A new media type *LINE* is now available allowing to use the [webhook](#) feature for sending notifications about Zabbix events to *LINE* messenger.

**Frontend languages** Catalan and Romanian languages are now enabled in the frontend.

**Go library for Windows updated** Go library used by Zabbix agent 2 in conjunction with MongoDB or PostgreSQL plugins to monitor Windows now is [github.com/Microsoft/go-winio](https://github.com/Microsoft/go-winio), version 0.6.0 (previously [github.com/natefinch/npipes](https://github.com/natefinch/npipes)). See also [Go libraries](#), [MongoDB plugin dependencies](#), and [PostgreSQL plugin dependencies](#).

**Open file descriptor limit increase for Zabbix agent 2** The systemd service file shipped in Zabbix agent 2 packages now declares the open file descriptor limit of 8196. Previously, the system default limit of 1024 has been used. The new limit is sufficient for the default Zabbix agent 2 configuration. If you have a non-standard agent 2 configuration, for example, use additional plugins or extended features, this limit may need to be manually increased further. In this case, adjust the `LimitNOFILE` parameter in the systemd unit file.

## 19 What's new in Zabbix 6.0.14

**Loadable plugins** Encrypted MongoDB plugin connection

MongoDB plugin now supports TLS encryption when connecting to MongoDB using named sessions.

Updated plugin (MongoDB plugin 1.2.1) is included into Zabbix official packages starting from Zabbix 6.0.14. Note that MongoDB is a loadable plugin and can be installed separately either from packages or from sources. The plugin will work with any minor version of Zabbix 6.0. For more details see [MongoDB plugin](#).

**PHP support** The maximum supported version for PHP is now 8.2.

**Limits for JavaScript objects in preprocessing** The following limits for [JavaScript objects](#) in preprocessing have been introduced:

- The total size of all messages that can be logged with the `log()` method has been limited to 8 MB per script execution.
- The initialization of multiple `HttpRequest` objects has been limited to 10 per script execution.
- The total length of header fields that can be added to a single `HttpRequest` object with the `addHeader()` method has been limited to 128 Kbytes (special characters and header names included).

## 20 What's new in Zabbix 6.0.15

**MariaDB 10.11 support** The maximum **supported version** for MariaDB is now 10.11.X.

**TimescaleDB 2.10 support** The maximum **supported version** for TimescaleDB is now 2.10.

**Connection options for Oracle plugin** The Oracle plugin, supported for Zabbix agent 2, now allows to specify `as sysdba`, `as sysoper`, or `as sysasm` login option. The option can be appended either to the user item key parameter or to the plugin configuration parameter `Plugins.Oracle.Sessions.<SessionName>.User` in the format `user as sysdba` (login option is case-insensitive; must not contain a trailing space).

**Signing data using RS256** A new `sign(hash,key,data)` JavaScript function has been implemented allowing to use the RS256 encryption algorithm to calculate the signature.

For more details see: [Additional JavaScript objects](#).

## 21 What's new in Zabbix 6.0.16

Configuration sync optimization for Oracle

For Zabbix installations with Oracle, it is now possible to manually change item and item preprocessing database field types from `nclob` to `nvarchar2` by applying a database patch.

Patch application may increase the speed of configuration sync in environments with large number of items and item preprocessing steps, but will reduce the maximum field size limit from 65535 bytes to 4000 bytes for some item parameters. See [Known issues](#) for details.

## 22 What's new in Zabbix 6.0.17

**Webhook integrations** New **webhook** media type for pushing Zabbix notifications to [Event-Driven Ansible](#) has been added.

**Mixing item key and session parameters in Zabbix agent 2 plugins** Zabbix agent 2 now allows to override **named session** parameters by specifying new values in the item key parameters. Previously, users had to select if they prefer to provide connection string values in a named session or in an item key. If a named session has been used, related item key parameters had to be empty. Now, if using named sessions, only the first parameter (usually, a URI) has to be specified in the named session, whereas other parameters can be defined either in the named session or in the item key.

**HTML support in Geomap attribution dropped** The attribution text for the **Geomap dashboard widget** can now only contain plain text; HTML support has been dropped.

In **Geographical maps** settings in the Administration → General section, the field *Attribution* is now only visible when *Tile provider* is set to *Other*.

## 23 What's new in Zabbix 6.0.18

**Items** `docker.container_stats`

The `docker.container_stats` item on Zabbix agent 2 now also returns a `pids_stats` property with the current number of processes/threads on the container.

**Cleaner configuration export** YAML files generated during Zabbix entity configuration export no longer contain empty lines between entities in an array, which makes such files shorter and more convenient to work with. See [Configuration export/import](#) section for updated export examples.

**UTF-8 BOM in configuration import** **Configuration import** now supports files with a UTF-8 byte-order mark (BOM).

**Cosmos DB monitoring** The template *Azure by HTTP* now also works with Azure Cosmos DB for MongoDB.

You can get this template:

- In *Configuration* → *Templates* in new installations.
- If you are upgrading from previous versions, you can download this template from Zabbix [Git repository](#) or find it in the *zabbix/templates* directory of the downloaded latest Zabbix version. Then, while in *Configuration* → *Templates* you can import it manually into Zabbix.

**Proxy history housekeeping** The limitation on the amount of outdated information deleted from the proxy database per proxy history housekeeping cycle has been removed.

Previously the **housekeeper** deleted only no more than 4 times the **HousekeepingFrequency** hours of outdated information. For example, if **HousekeepingFrequency** was set to "1", no more than 4 hours of outdated information (starting from the oldest entry) was deleted. In cases when a proxy would constantly receive data older than set in **ProxyOfflineBuffer**, this could result in excessive data accumulation.

Now this limitation has been removed, providing a more effective proxy history housekeeping solution.

**Google Cloud Platform Monitoring** A new [template](#) *Google Cloud Platform by HTTP (GCP by HTTP)* is available.

See setup instructions for [HTTP templates](#).

You can get this template:

- In *Configuration* → *Templates* in new installations.
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**Default values for Zabbix agent 2** Zabbix agent 2 plugins now allow to define default values for connecting to monitoring targets in the configuration file. If no value is specified in an item key or a named session, the plugin will use the value defined in the corresponding default parameter. New parameters have the structure `Plugins.<PluginName>.Default.<Parameter>` - for example, `Plugins.MongoDB.Default.Uri=tcp://localhost:27017`. See for more info:

- [Configuring plugins](#)
- [Plugin configuration file parameters](#)

## 24 What's new in Zabbix 6.0.19

**Aggregate functions** The **count\_foreach** function now returns '0' for a matching item in the array, if no data are present for the item or the data do not match the filter. Previously such items would be ignored (no data added to the aggregation).

**TimescaleDB 2.11 support** Support for TimescaleDB version 2.11 is now available.

**Configurable TLS and connection parameters in MQTT plugin** The **MQTT plugin** for Zabbix agent 2 now provides additional configuration options, which can be defined in the plugin configuration file as **named session** or **default** parameters:

- Connection-related parameters: broker URL, topic, username, and password;
- TLS encryption parameters: location of the top-level CA(s) certificate, MQTT certificate or certificate chain, private key.

All of the new parameters are optional.

**JavaScript preprocessing** The heap limit for scripts has been upped from 64 to 512 megabytes.

**Supported platforms** Support for Debian 12 (Bookworm) has been added, and official packages are available for download on [Zabbix website](#).

## 25 What's new in Zabbix 6.0.20

**Templates** New templates are available:

- [AWS ECS Cluster by HTTP](#) (along with its [Serverless Cluster version](#))
- [Cisco SD-WAN by HTTP](#)
- [OpenStack by HTTP](#), which includes *OpenStack Nova by HTTP* template for monitoring OpenStack Nova service
- [PostgreSQL by ODBC](#)

You can get these templates:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**Frontend** Spellcheck disabled in non-descriptive text areas

Spellcheck has been disabled for the text areas in which non-descriptive text is entered, such as scripts, expressions, macro values, etc.

**Miscellaneous** Database TLS connection for MySQL on SLES 12

The packages for server/proxy installation on SUSE Linux Enterprise Server version 12 are now built using MariaDB Connector/C library, thus enabling the encryption of connection to MySQL using the `DBTLSConnect` [parameter](#). The supported encryption values are "required" and "verify\_full".

## 26 What's new in Zabbix 6.0.21

MySQL 8.1 support

The maximum [supported version](#) for MySQL is now 8.1.X.

MariaDB 11.0 support

The maximum [supported version](#) for MariaDB is now 11.0.X.

Log file monitoring

For `log[]`, `logrt[]`, `log.count[]`, `logrt.count[]` items, regular expression runtime errors are now logged in the Zabbix agent log file. See [more details](#).

**Items** New item for Zabbix agent 2

A new item has been added to MySQL plugin for Zabbix agent 2. This new item, `mysql.custom.query`, can be used for executing custom MySQL queries.

**Templates** New template is available:

- [AWS Cost Explorer by HTTP](#)

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

**Notifications** Webhook integrations

New [webhook](#) media type for pushing Zabbix notifications to [Mantis Bug Tracker](#) has been added.

**Installation** Support for ARM64/AArch64

ARM64/AArch64 installation packages are now available for Debian, RHEL 8, 9 and its derivatives, as well as SLES/OpenSUSE Leap 15.

## 27 What's new in Zabbix 6.0.22

### Aggregate functions

The **last\_foreach** function is now also supported in the following **aggregate functions**: kurtosis, mad, skewness, stddevpop, stddevsamp, sumofsquares, varpop, and varsamp.

### Return value limit

The return value limit for receiving data from external sources (such as scripts or other programs) has been raised to 16MB. This affects:

- Agent items **system.run[]** and **vfs.file.contents[]**
- Custom agent checks defined in **user parameters**
- **SSH agent**, **External check** items and frontend **scripts** items
- **Remote commands**

**Templates** New templates are available:

- [Acronis Cyber Protect Cloud by HTTP](#)
- [HashiCorp Nomad by HTTP](#)
- [MantisBT by HTTP](#)

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## 28 What's new in Zabbix 6.0.23

See **breaking changes** for this version.

**Databases** Supported versions

PostgreSQL **16** and MariaDB **11.1** are now supported. See also: **Requirements**.

**Plugins** New item for PostgreSQL Zabbix agent 2 plugin

New **item**, **pgsql.version**, has been added to PostgreSQL Zabbix agent 2 plugin. This item is used for returning the PostgreSQL version.

**Templates** New templates

New templates are available:

- [FortiGate by HTTP](#)
- [FortiGate by SNMP](#)
- [Nextcloud by HTTP](#)

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

Updated templates

[PostgreSQL by ODBC](#) and [PostgreSQL by Zabbix agent 2](#) templates now include the item and trigger for monitoring PostgreSQL version.

[Cisco Meraki organization by HTTP](#) template has been supplemented with items, item prototypes, LLD rules, and macros related to authentication, licenses, networks, SAML roles, and VPN statuses.

#### **Frontend** Miscellaneous

The *Clear history* button located in *Configuration → Hosts → Items* has been renamed *Clear history and trends* to more accurately describe its function, which is the same as the *Clear history and trends* button in the item *configuration form*.

In *trigger action* configuration, the condition type *Trigger name* has been renamed *Event name* to better describe its function. Note that by default, the event name matches the trigger name unless a custom event name is specified in *trigger configuration*.

## **29 What's new in Zabbix 6.0.24**

#### **Databases** TimescaleDB 2.12 support

Support for TimescaleDB version 2.12 is now available.

#### **Plugins** New items in Zabbix agent 2 plugins

The items for returning the database server version are now available in [MongoDB plugin](#) (*mongodb.version*) and [Oracle Database plugin](#) (*oracle.version*).

#### **Items** Content conversion to UTF-8

HTTP agent items, web scenarios, web checks and JavaScript items have been improved to convert to UTF-8 from the character set specified in the HTTP header or HTTP meta tag.

#### **Templates** New templates

New template is available:

- [HPE iLO by HTTP](#)

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

Updated templates

Integration with OpenShift has been added to [Kubernetes cluster state by HTTP](#) template.

## **30 What's new in Zabbix 6.0.25**

#### TimescaleDB 2.13 support

Support for TimescaleDB version 2.13 is now available.

#### **Items** Additional ssh.run options

The **ssh.run[]** item has been updated and now allows passing additional SSH options as a part of the item key. These options are supported only using libssh of version 0.9.0 and higher or libssh2. Supported option keys and values depend on the SSH library. See [SSH checks](#) for details.

#### **Plugins** Cache mode parameter for PostgreSQL plugin

New parameters for controlling the cache mode by default or on session name level have been added to the PostgreSQL plugin *configuration*:

- `Plugins.PostgreSQL.Default.CacheMode`
- `Plugins.PostgreSQL.Sessions.<SessionName>.CacheMode`

The cache mode parameter may have one of two allowed values: *prepare* (default) or *describe*. Note that "describe" is primarily useful when the environment does not allow prepared statements such as when running a connection pooler like PgBouncer.

## 31 What's new in Zabbix 6.0.26

### Templates New templates

The set of [Azure by HTTP](#) templates has been supplemented with the Azure Cost Management by HTTP template.

You can get this template:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

### Updated templates

[MSSQL by ODBC](#) template has been updated for working with AlwaysOn features such as Failover Cluster Instances (FCI) and Availability Groups (AG). It is now possible to use the template for monitoring a host in cluster, standalone host and host by cluster name. A macro for instance name is no longer used; when the master is switched, it is not required to change any macros:

- new LLD rules and metrics for quorum and quorum members have been added;
- the type of the LLD rules has been changed from "Database monitor" to "Dependent item";
- items with `db.odbc.discovery` key have been turned into items dependent on the `db.odbc.get` item
- new item has been added - MSSQL DB '{#DBNAME}': Recovery model, which returns the database recovery model under the database discovery;
- new macros, namely, `{MSSQL.BACKUP_FULL.USED}`, `{MSSQL.BACKUP_DIFF.USED}`, `{MSSQL.BACKUP_LOG.USED}`, have been added - those can be used for disabling backup age triggers for a certain database.

### Frontend PHP support

The maximum supported version for PHP is now 8.3.

### X-Frame-Options HTTP header

The *X-Frame-Options* header parameter has been renamed to *Use X-Frame-Options header*, now consists of a checkbox and an input field (allowing you to disable the header by unmarking a checkbox instead of specifying "null" in the input field), and supports additional values.

Other security parameters now also follow the same structure. For more information, see the [security](#) parameters in *Administration* → *General*.

### Databases MySQL 8.2 support

The maximum [supported version](#) for MySQL is now 8.2.X.

## 32 What's new in Zabbix 6.0.27

### Databases MySQL 8.3 support

The maximum [supported version](#) for MySQL is now 8.3.X.

### MariaDB 11.2 support

The maximum [supported version](#) for MariaDB is now 11.2.X.

### Plugins MSSQL

A new plugin for direct monitoring of MSSQL by Zabbix agent 2 has been added.

For more information, see:

- [MSSQL plugin readme](#)

- [Agent 2 items](#)
- [MSSQL plugin parameters](#)
- [Agent 2 installation](#)

#### **Templates** New templates

A new template is available:

- [YugabyteDB by HTTP](#), which includes the *YugabyteDB Cluster by HTTP* template for monitoring each YugabyteDB cluster.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

#### **Platforms** Zabbix agent 2 support on Windows

To prevent critical security vulnerabilities, the minimum Windows version for Zabbix agent 2 has been raised to Windows 10/Windows Server 2016. See note under [Supported platforms](#) for more information.

### **33 What's new in Zabbix 6.0.28**

#### **Databases** TimescaleDB 2.14 support

The maximum [supported version](#) for TimescaleDB is now 2.14.X.

#### **Templates** New templates

New templates are available:

- [AWS ELB Application Load Balancer by HTTP](#)
- [Check Point Next Generation Firewall by SNMP](#)
- [MSSQL by Zabbix agent 2](#)

You can get these templates:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

### **34 What's new in Zabbix 6.0.29**

#### **Databases** MariaDB 11.3 support

The maximum [supported version](#) for MariaDB is now 11.3.X.

#### **Templates** New templates

A new template is available:

- [Oracle Cloud by HTTP](#), a master template that discovers various Oracle Cloud Infrastructure (OCI) services and resources.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## Updated templates

- [FortiGate by SNMP](#) template has been supplemented with metrics regarding VPN, high availability (HA), wireless termination points (WTPs), SD-WAN health checks, and HW sensors.
- [MySQL by ODBC](#) template has been supplemented with the items "MySQL: Get database" and "MySQL: Get replication". The LLD rules "Database discovery" and "Replication discovery" have been changed to the "Dependent item" type.
- [Oracle by ODBC](#) template has been supplemented with the items "Oracle: Get archive log", "Oracle: Get ASM disk groups", "Oracle: Get database", "Oracle: Get PDB", and "Oracle: Get tablespace". The LLD rules "Archive log discovery", "ASM disk groups discovery", "Database discovery", "PDB discovery", and "Tablespace discovery" have been changed to the "Dependent item" type.
- The VMware Hypervisor template within the [VMware](#) and [VMware FQDN](#) template sets has been supplemented with a new LLD rule, "Sensor discovery".

## 35 What's new in Zabbix 6.0.30

### Frontend Frontend languages

Dutch, Georgian, and Spanish languages are now enabled in the frontend.

### Plugins Ember+

A new plugin for direct monitoring of Ember+ by Zabbix agent 2 has been added.

For more information, see:

- [Ember+ plugin readme](#)
- [Agent 2 items](#)
- [Ember+ plugin parameters](#)
- [Agent 2 installation](#)

### Templates New templates

The AWS ELB template set has been supplemented with the template [AWS ELB Network Load Balancer by HTTP](#).

You can get this template:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## Updated templates

The [OS templates](#) (agent, SNMP, and Prometheus-based) have been given a mounted filesystem update. In mounted filesystem discovery, the "Space is low" and "Space is critically low" triggers no longer have the absolute threshold and burst condition.

### Macros Macro support for email media types

When configuring an [email media type](#), it is now possible to use macros in the [username and password fields](#).

## 36 What's new in Zabbix 6.0.31

### Items More secure JavaScript preprocessing

The JavaScript function [atob](#) now returns an array of 8-bit unsigned integers instead of a decoded string.

### Frontend Preprocessing test result truncation

When [testing preprocessing steps](#), test results are now truncated to a maximum size of 512KB when sent to the frontend. Note that data larger than 512KB is still processed fully by Zabbix server.

### GSM modem validation for SMS media type

In SMS media type configuration, the GSM modem path is now validated to be a modem device or symlink to such.

## **Templates** New templates

A new template is available:

- [Jira Data Center by JMX](#), a template for monitoring Jira Data Center health.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## **37 What's new in Zabbix 6.0.32**

### **Databases** MySQL 8.4 support

The maximum **supported version** for MySQL is now 8.4.X.

MariaDB 11.4 support

The maximum **supported version** for MariaDB is now 11.4.X.

TimescaleDB 2.15 support

The maximum **supported version** for TimescaleDB is now 2.15.X.

## **Templates** New templates

The set of [Azure by HTTP](#) templates has been supplemented with the Azure VM Scale Set by HTTP template.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

Updated templates

The templates [Zabbix server health](#), [Remote Zabbix server health](#), [Zabbix proxy health](#), and [Remote Zabbix proxy health](#) have been updated for improved data visualization in item graphs by regrouping the displayed metrics.

## **38 What's new in Zabbix 6.0.33**

### **Databases** MySQL 9.0 support

The maximum **supported version** for MySQL is now 9.0.X.

## **Templates** New templates

- [AWS Lambda by HTTP](#), a template for monitoring AWS Lambda metrics.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## **39 What's new in Zabbix 6.0.34**

## Databases TimescaleDB 2.16 support

The maximum **supported version** for TimescaleDB is now 2.16.X.

## MariaDB 11.5 support

The maximum **supported version** for MariaDB is now 11.5.X.

## Notifications Webhook integrations

A new integration is available that allows to integrate Zabbix with the [MS Teams workflow feature](#) using the Zabbix **webhook** media type.

## Items Special characters supported in ODBC check user password

Special characters are now supported when specifying the **ODBC check** user password in the frontend.

## Templates New templates

- [GitHub repository by HTTP](#), a template for monitoring GitHub repositories.
- [Microsoft 365 reports by HTTP](#), a template for monitoring Microsoft 365 services.

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## 40 What's new in Zabbix 6.0.35

### Items Internal item for monitoring high-availability manager

The `ha_manager` (high-availability manager) process now can be monitored by the `zabbix[process*]` **internal item**.

### Templates New templates

- [Huawei OceanStor V6 by SNMP](#), a template for monitoring SAN Huawei OceanStor V6.

Updated templates

- In all [APC templates](#), the discovery rule for external defective battery packs has been supplemented with a filter to avoid creating unsupported items.
- In the templates [MSSQL by Zabbix agent 2](#) and [MSSQL by ODBC](#), a timeout has been added and certain item keys have been adjusted to increase monitoring stability.

You can get these templates:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## 41 What's new in Zabbix 6.0.36

### TimescaleDB 2.17 support

The maximum **supported version** for TimescaleDB is now 2.17.X.

### PostgreSQL 17 support

PostgreSQL 17 is now **supported**.

MSSQL instance names supported in agent 2 plugin

It is now possible to specify MSSQL instance names as part of the connection string in MSSQL agent 2 plugin items, for example:

```
mssql.custom.query[sqlserver://localhost/InstanceName,...]
```

Note that in this case **no port** must be specified. If port is specified, then the instance name will be ignored and the specified port will be used for connection.

Performance counter query updated in MSSQL agent 2 plugin

The [performance counter query](#) of the MSSQL agent 2 plugin has been updated, resolving issues in the data retrieval of unnamed (default) MSSQL instances.

New templates

- [Nutanix Prism Element by HTTP](#), a template set that also includes the templates *Nutanix Cluster Prism Element by HTTP* and *Nutanix Host Prism Element by HTTP*.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

Updated templates

- The template *VMware Hypervisor* within the [VMware](#) and [VMware FQDN](#) template sets has been updated with the option to be used as a standalone template.
- [Proxmox VE by HTTP](#) has been updated with new items and trigger prototypes for disk space usage in LXC containers.
- In the template [MSSQL by ODBC](#), the performance counter query has been updated to improve data retrieval. Both *MSSQL by ODBC* and [MSSQL by Zabbix agent 2](#) template documentation has been reviewed and updated.

## 42 What's new in Zabbix 6.0.37

This minor version does not have any functional changes.

## 43 What's new in Zabbix 6.0.38

See [breaking changes](#) for this version.

## 44 What's new in Zabbix 6.0.39

See [breaking changes](#) for this version.

TimescaleDB 2.18 support

The maximum [supported version](#) for TimescaleDB is now 2.18.X.

New templates

- The [Azure by HTTP](#) template set has been supplemented with the template *Azure SQL Managed Instance by HTTP*.

You can get this template:

- In *Configuration → Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration → Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

Updated templates

- All [Dell HTTP and SNMP](#) templates have been updated with improvements, including fixes for items, macros, and scripts.

## 45 What's new in Zabbix 6.0.40

### New templates

- The template set [Zabbix server health](#) has been supplemented with the templates *Zabbix server health by Zabbix agent*, *Zabbix server health by Zabbix agent active*, and [Zabbix proxy health](#) - with *Zabbix proxy health by Zabbix agent* and *Zabbix proxy health by Zabbix agent active*, enabling the monitoring of internal Zabbix metrics via Zabbix agent.

You can get this template:

- In *Configuration* → *Templates* in new installations;
- When upgrading from previous versions, the latest templates can be downloaded from the [Zabbix Git repository](#) and manually imported into Zabbix in the *Configuration* → *Templates* section. If a template with the same name already exists, check the *Delete missing* option before importing to achieve a clean import. This way the items that have been excluded from the updated template will be removed (note that history of the deleted items will be lost).

## 2 Definitions

**Overview** In this section you can learn the meaning of some terms commonly used in Zabbix.

### Definitions **host**

- any physical or virtual device, application, service, or any other logically-related collection of monitored parameters.

### **host group**

- a logical grouping of hosts; it may contain hosts and templates. Hosts and templates within a host group are not in any way linked to each other. Host groups are used when assigning access rights to hosts for different user groups.

### **item**

- a particular piece of data that you want to receive from a host, a metric of data.

### **value preprocessing**

- a transformation of received metric value before saving it to the database.

### **trigger**

- a logical expression that defines a problem threshold and is used to "evaluate" data received in items.

When received data are above the threshold, triggers go from 'Ok' into a 'Problem' state. When received data are below the threshold, triggers stay in/return to an 'Ok' state.

### **event**

- a single occurrence of something that deserves attention such as a trigger changing state or a discovery/agent autoregistration taking place.

### **event tag**

- a pre-defined marker for the event. It may be used in event correlation, permission granulation, etc.

### **event correlation**

- a method of correlating problems to their resolution flexibly and precisely.

For example, you may define that a problem reported by one trigger may be resolved by another trigger, which may even use a different data collection method.

### **problem**

- a trigger that is in "Problem" state.

### **problem update**

- problem management options provided by Zabbix, such as adding comment, acknowledging, changing severity or closing manually.

### **action**

- a predefined means of reacting to an event.

An action consists of operations (e.g. sending a notification) and conditions (when the operation is carried out)

### **escalation**

- a custom scenario for executing operations within an action; a sequence of sending notifications/executing remote commands.

### **media**

- a means of delivering notifications; delivery channel.

### **notification**

- a message about some event sent to a user via the chosen media channel.

### **remote command**

- a pre-defined command that is automatically executed on a monitored host upon some condition.

### **template**

- a set of entities (items, triggers, graphs, low-level discovery rules, web scenarios) ready to be applied to one or several hosts.

The job of templates is to speed up the deployment of monitoring tasks on a host; also to make it easier to apply mass changes to monitoring tasks. Templates are linked directly to individual hosts.

### **web scenario**

- one or several HTTP requests to check the availability of a web site.

### **frontend**

- the web interface provided with Zabbix.

### **dashboard**

- customizable section of the web interface displaying summaries and visualizations of important information in visual units called widgets.

### **widget**

- visual unit displaying information of a certain kind and source (a summary, a map, a graph, the clock, etc.), used in the dashboard.

### **Zabbix API**

- Zabbix API allows you to use the JSON RPC protocol to create, update and fetch Zabbix objects (like hosts, items, graphs and others) or perform any other custom tasks.

### **Zabbix server**

- a central process of Zabbix software that performs monitoring, interacts with Zabbix proxies and agents, calculates triggers, sends notifications; a central repository of data.

### **Zabbix proxy**

- a process that may collect data on behalf of Zabbix server, taking some processing load from the server.

### **Zabbix agent**

- a process deployed on monitoring targets to actively monitor local resources and applications.

### **Zabbix agent 2**

- a new generation of Zabbix agent to actively monitor local resources and applications, allowing to use custom plugins for monitoring.

#### **Attention:**

Because Zabbix agent 2 shares much functionality with Zabbix agent, the term "Zabbix agent" in documentation stands for both - Zabbix agent and Zabbix agent 2, if the functional behavior is the same. Zabbix agent 2 is only specifically named where its functionality differs.

### **encryption**

- support of encrypted communications between Zabbix components (server, proxy, agent, zabbix\_sender and zabbix\_get utilities) using Transport Layer Security (TLS) protocol.

### **network discovery**

- *automated discovery of network devices.*

#### **low-level discovery**

- *automated discovery of low-level entities on a particular device (e.g. file systems, network interfaces, etc).*

#### **low-level discovery rule**

- *set of definitions for automated discovery of low-level entities on a device.*

#### **item prototype**

- *a metric with certain parameters as variables, ready for low-level discovery.* After low-level discovery the variables are automatically substituted with the real discovered parameters and the metric automatically starts gathering data.

#### **trigger prototype**

- *a trigger with certain parameters as variables, ready for low-level discovery.* After low-level discovery the variables are automatically substituted with the real discovered parameters and the trigger automatically starts evaluating data.

Prototypes of some other Zabbix entities are also in use in low-level discovery - graph prototypes, host prototypes, host group prototypes.

#### **agent autoregistration**

- *automated process whereby a Zabbix agent itself is registered as a host and started to monitor.*

### **3 Zabbix processes**

Please use the sidebar to access content in the Zabbix process section.

#### **1 Server**

##### Overview

Zabbix server is the central process of Zabbix software.

The server performs the polling and trapping of data, it calculates triggers, sends notifications to users. It is the central component to which Zabbix agents and proxies report data on availability and integrity of systems. The server can itself remotely check networked services (such as web servers and mail servers) using simple service checks.

The server is the central repository in which all configuration, statistical and operational data is stored, and it is the entity in Zabbix that will actively alert administrators when problems arise in any of the monitored systems.

The functioning of a basic Zabbix server is broken into three distinct components; they are: Zabbix server, web frontend and database storage.

All of the configuration information for Zabbix is stored in the database, which both the server and the web frontend interact with. For example, when you create a new item using the web frontend (or API) it is added to the items table in the database. Then, about once a minute Zabbix server will query the items table for a list of the items which are active that is then stored in a cache within the Zabbix server. This is why it can take up to two minutes for any changes made in Zabbix frontend to show up in the latest data section.

##### Running server

If installed as package

Zabbix server runs as a daemon process. The server can be started by executing:

```
systemctl start zabbix-server
```

This will work on most of GNU/Linux systems. On other systems you may need to run:

```
/etc/init.d/zabbix-server start
```

Similarly, for stopping/restarting/viewing status, use the following commands:

```
systemctl stop zabbix-server
systemctl restart zabbix-server
systemctl status zabbix-server
```

Start up manually

If the above does not work you have to start it manually. Find the path to the zabbix\_server binary and execute:

zabbix\_server

You can use the following command line parameters with Zabbix server:

|                               |   |
|-------------------------------|---|
| -c --config <file>            | path to the configuration file (default is /usr/local/etc/zabbix_server.conf) |
| -f --foreground               | run Zabbix server in foreground   |
| -R --runtime-control <option> | perform administrative functions  |
| -h --help                     | give this help  |
| -V --version                  | display version number  |

Examples of running Zabbix server with command line parameters:

```
zabbix_server -c /usr/local/etc/zabbix_server.conf
zabbix_server --help
zabbix_server -V
```

Runtime control

Runtime control options:

| Option                          | Description  | Target  |
|---------------------------------|--|---|
| config_cache_reload             | Reload configuration cache. Ignored if cache is being currently loaded.  |   |
| diaginfo[=<section>]            | Gather diagnostic information in the server log file.  | <b>historycache</b> - history cache statistics<br><b>valuecache</b> - value cache statistics<br><b>preprocessing</b> - preprocessing manager statistics<br><b>alerting</b> - alert manager statistics<br><b>lld</b> - LLD manager statistics<br><b>locks</b> - list of mutexes (is empty on <i>BSD</i> systems) |
| ha_status                       | Log high availability (HA) cluster status.   |   |
| ha_remove_node=tag              | Remove the high availability (HA) node specified by its name or ID.<br>Note that active/standby nodes cannot be removed. | <b>target</b> - name or ID of the node (can be obtained by running ha_status)   |
| ha_set_failover_delay=tag delay | Set high availability (HA) failover delay.<br>Time suffixes are supported, e.g. 10s, 1m.                                 |   |
| secrets_reload                  | Reload secrets from Vault.   |   |
| service_cache_reload            | Reload the service manager cache.  |   |
| snmp_cache_reload               | Reload SNMP cache, clear the SNMP properties (engine time, engine boots, engine id, credentials) for all hosts.          |   |
| housekeeper_execute             | Start the <b>housekeeping</b> procedure.<br>Ignored if the housekeeping procedure is currently in progress.              |   |

| Option                          | Description   | Target  |
|---------------------------------|---|---|
| trigger_housekeeping[=<target>] | Start the trigger housekeeping procedure for <b>services</b> to remove problems caused by triggers that have since been deleted, including service problems generated by such problems (considered as resolved at the time of housekeeping).<br>Note that, until the housekeeping procedure is started, problems caused by now-deleted triggers might still generate service problems and assign them to services.<br><br>If your setup involves many service <b>status calculation rules</b> based on frequently discovered/undiscovered triggers, consider increasing the frequency of the trigger housekeeping procedure by adjusting the <b>ProblemHousekeepingFrequency</b> server configuration parameter.<br><br>Ignored if the trigger housekeeping procedure is currently in progress. |   |
| log_level_increase[=<target>]   | Increases <b>log</b> level, affects all processes if target is not specified.<br>Not supported on <i>BSD</i> systems.   | <b>process type</b> - All processes of specified type (e.g., poller)<br>See all <b>server process types</b> .<br><b>process type,N</b> - Process type and number (e.g., poller,3)<br><b>pid</b> - Process identifier (1 to 65535). For larger values specify target as 'process type,N'.  |
| log_level_decrease[=<target>]   | Decreases <b>log</b> level, affects all processes if target is not specified.<br>Not supported on <i>BSD</i> systems.   |   |
| prof_enable[=<target>]          | Enable profiling.<br>Affects all processes if target is not specified.<br>Enabled profiling provides details of all rwlocks/mutexes by function name.<br>Supported since Zabbix 6.0.13.   | <b>process type</b> - All processes of specified type (e.g. history syncer)<br>Supported process types as profiling targets: alerter, alert manager, availability manager, configuration syncer, discoverer, escalator, history poller, history syncer, housekeeper, http poller, icmp pinger, ipmi manager, ipmi poller, java poller, lld manager, lld worker, odbc poller, poller, preprocessing manager, preprocessing worker, proxy poller, self-monitoring, service manager, snmp trapper, task manager, timer, trapper, unreachable poller, vmware collector<br><b>process type,N</b> - Process type and number (e.g., history syncer,1)<br><b>pid</b> - Process identifier (1 to 65535). For larger values specify target as 'process type,N'.<br><b>scope</b> - rwlock, mutex, processing can be used with the process type and number (e.g., history syncer,1,processing) or all processes of type (e.g., history syncer,rwlock) |
| prof_disable[=<target>]         | Disable profiling.<br>Affects all processes if target is not specified.<br>Supported since Zabbix 6.0.13.   | <b>process type</b> - All processes of specified type (e.g. history syncer)<br>Supported process types as profiling targets: see <b>prof_enable</b><br><b>process type,N</b> - Process type and number (e.g., history syncer,1)<br><b>pid</b> - Process identifier (1 to 65535). For larger values specify target as 'process type,N'.  |

Example of using runtime control to reload the server configuration cache:

```
zabbix_server -c /usr/local/etc/zabbix_server.conf -R config_cache_reload
```

Examples of using runtime control to gather diagnostic information:

```
# Gather all available diagnostic information in the server log file:
```

```
zabbix_server -R diaginfo
```

```
# Gather history cache statistics in the server log file:
```

```
zabbix_server -R diaginfo=historycache
```

Example of using runtime control to reload the SNMP cache:

```
zabbix_server -R snmp_cache_reload
```

Example of using runtime control to trigger execution of housekeeper:

```
zabbix_server -c /usr/local/etc/zabbix_server.conf -R housekeeper_execute
```

Examples of using runtime control to change log level:

```
# Increase log level of all processes:
```

```
zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_increase
```

```
# Increase log level of second poller process:
```

```
zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_increase=poller,2
```

```
# Increase log level of process with PID 1234:
```

```
zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_increase=1234
```

```
# Decrease log level of all http poller processes:
```

```
zabbix_server -c /usr/local/etc/zabbix_server.conf -R log_level_decrease="http poller"
```

Example of setting the HA failover delay to the minimum of 10 seconds:

```
zabbix_server -R ha_set_failover_delay=10s
```

Process user

Zabbix server is designed to run as a non-root user. It will run as whatever non-root user it is started as. So you can run server as any non-root user without any issues.

If you will try to run it as 'root', it will switch to a hardcoded 'zabbix' user, which must be **present** on your system. You can only run server as 'root' if you modify the 'AllowRoot' parameter in the server configuration file accordingly.

If Zabbix server and **agent** are run on the same machine it is recommended to use a different user for running the server than for running the agent. Otherwise, if both are run as the same user, the agent can access the server configuration file and any Admin level user in Zabbix can quite easily retrieve, for example, the database password.

Configuration file

See the **configuration file** options for details on configuring zabbix\_server.

Start-up scripts

The scripts are used to automatically start/stop Zabbix processes during system's start-up/shutdown. The scripts are located under directory misc/init.d.

Server process types

- **alert manager** - alert queue manager
- **alert syncer** - alert DB writer
- **alerter** - process for sending notifications
- **availability manager** - process for host availability updates
- **configuration syncer** - process for managing in-memory cache of configuration data
- **discoverer** - process for discovery of devices
- **escalator** - process for escalation of actions
- **ha manager** - process for managing high availability
- **history poller** - process for handling calculated and internal checks requiring a database connection
- **history syncer** - history DB writer
- **housekeeper** - process for removal of old historical data
- **http poller** - web monitoring poller
- **icmp pinger** - poller for icmping checks
- **ipmi manager** - IPMI poller manager

- `ipmi poller` - poller for IPMI checks
- `java poller` - poller for Java checks
- `lld manager` - manager process of low-level discovery tasks
- `lld worker` - worker process of low-level discovery tasks
- `odbc poller` - poller for ODBC checks
- `poller` - normal poller for passive checks
- `preprocessing manager` - manager of preprocessing tasks
- `preprocessing worker` - process for data preprocessing
- `proxy poller` - poller for passive proxies
- `report manager` - manager of scheduled report generation tasks
- `report writer` - process for generating scheduled reports
- `self-monitoring` - process for collecting internal server statistics
- `service manager` - process for managing services by receiving information about problems, problem tags, and problem recovery from history syncer, task manager, and alert manager
- `snmp trapper` - trapper for SNMP traps
- `task manager` - process for remote execution of tasks requested by other components (e.g., close problem, acknowledge problem, check item value now, remote command functionality)
- `timer` - timer for processing maintenances
- `trapper` - trapper for active checks, traps, proxy communication
- `trigger housekeeper` - process for removing problems generated by triggers that have been deleted
- `unreachable poller` - poller for unreachable devices
- `vmware collector` - VMware data collector responsible for data gathering from VMware services

The server log file can be used to observe these process types.

Various types of Zabbix server processes can be monitored using the **`zabbix[process,<type>,<mode>,<state>]`** internal **item**.

#### Supported platforms

Due to the security requirements and mission-critical nature of server operation, UNIX is the only operating system that can consistently deliver the necessary performance, fault tolerance and resilience. Zabbix operates on market leading versions.

Zabbix server is tested on the following platforms:

- Linux
- Solaris
- AIX
- HP-UX
- Mac OS X
- FreeBSD
- OpenBSD
- NetBSD
- SCO Open Server
- Tru64/OSF1

#### Note:

Zabbix may work on other Unix-like operating systems as well.

#### Locale

Note that the server requires a UTF-8 locale so that some textual items can be interpreted correctly. Most modern Unix-like systems have a UTF-8 locale as default, however, there are some systems where that may need to be set specifically.

## 1 High availability

#### Overview

High availability (HA) is typically required in critical infrastructures that can afford virtually no downtime. So for any service that may fail there must be a failover option in place to take over should the current service fail.

Zabbix offers a **native** high-availability solution that is easy to set up and does not require any previous HA expertise. Native Zabbix HA may be useful for an extra layer of protection against software/hardware failures of Zabbix server or to have less downtime due to maintenance.

In the Zabbix high availability mode multiple Zabbix servers are run as nodes in a cluster. While one Zabbix server in the cluster is active, others are on standby, ready to take over if necessary.

Switching to Zabbix HA is non-committal. You may switch back to standalone operation at any point.

See also: [Implementation details](#)

Enabling high availability

Starting Zabbix server as cluster node

Two parameters are required in the server [configuration](#) to start a Zabbix server as cluster node:

- **HANodeName** parameter must be specified for each Zabbix server that will be an HA cluster node.

This is a unique node identifier (e.g. `zabbix-node-01`) that the server will be referred to in agent and proxy configurations. If you do not specify `HANodeName`, then the server will be started in standalone mode.

- **NodeAddress** parameter must be specified for each node.

The `NodeAddress` parameter (`address:port`) will be used by Zabbix frontend to connect to the active server node. `NodeAddress` must match the IP or FQDN name of the respective Zabbix server.

Restart all Zabbix servers after making changes to the configuration files. They will now be started as cluster nodes. The new status of the servers can be seen in *Reports* → [System information](#) and also by running:

```
zabbix_server -R ha_status
```

This runtime command will log the current HA cluster status into the Zabbix server log (and to stdout):

```
Failover delay: 60 seconds
Cluster status:
# ID Name Address Status Last Access
1. ckzxxqg7u0001lsropenyzh3m zabbix-node-01 64.227.66.193:10051 standby 0s
2. ckzxyqo1k00013frpq539e1jp zabbix-node-02 64.227.74.25:10051 active 3s
```

Preparing frontend

Make sure that Zabbix server `address:port` is **not defined** in the frontend configuration (found in `conf/zabbix.conf.php` of the frontend files directory).

```
// Uncomment and set to desired values to override Zabbix hostname/IP and port.
// $ZBX_SERVER = '';
// $ZBX_SERVER_PORT = '';
```

Zabbix frontend will autodetect the active node by reading settings from the nodes table in Zabbix database. Node address of the active node will be used as the Zabbix server address.

Proxy configuration

HA cluster nodes (servers) must be listed in the configuration of either passive or active Zabbix proxy.

For a passive proxy, the node names must be listed in the `Server` [parameter](#) of the proxy, separated by a **comma**.

```
Server=zabbix-node-01,zabbix-node-02
```

For an active proxy, the node names must be listed in the `Server` [parameter](#) of the proxy, separated by a **semicolon**.

```
Server=zabbix-node-01;zabbix-node-02
```

## Agent configuration

HA cluster nodes (servers) must be listed in the configuration of Zabbix agent or Zabbix agent 2.

To enable passive checks, the node names must be listed in the Server **parameter**, separated by a **comma**.

```
Server=zabbix-node-01,zabbix-node-02
```

To enable active checks, the node names must be listed in the ServerActive **parameter**. Note that for active checks the nodes must be separated by a comma from any other servers, while the nodes themselves must be separated by a **semicolon**, e.g.:

```
ServerActive=zabbix-node-01;zabbix-node-02
```

### Failover to standby node

Zabbix will fail over to another node automatically if the active node stops. There must be at least one node in standby status for the failover to happen.

How fast will the failover be? All nodes update their last access time (and status, if it is changed) every 5 seconds. So:

- If the active node shuts down and manages to report its status as "stopped", another node will take over within **5 seconds**.
- If the active node shuts down/becomes unavailable without being able to update its status, standby nodes will wait for the **failover delay** + 5 seconds to take over

The failover delay is configurable, with the supported range between 10 seconds and 15 minutes (one minute by default). To change the failover delay, you may run:

```
zabbix_server -R ha_set_failover_delay=5m
```

### Managing HA cluster

The current status of the HA cluster can be managed using the dedicated **runtime control** options:

- **ha\_status** - log HA cluster status in the Zabbix server log (and to stdout)
- **ha\_remove\_node=target** - remove an HA node identified by its <target> - name or ID of the node (name/ID can be obtained from the output of running **ha\_status**), e.g.:

```
zabbix_server -R ha_remove_node=zabbix-node-02
```

Note that active/standby nodes cannot be removed.

- **ha\_set\_failover\_delay=delay** - set HA failover delay (between 10 seconds and 15 minutes; time suffixes are supported, e.g. 10s, 1m)

Node status can be monitored:

- in Reports → **System information**
- in the **System information** dashboard widget
- using the **ha\_status** runtime control option of the server (see above).

The `zabbix[cluster,discovery,nodes]` internal item can be used for node discovery, as it returns a JSON with the high-availability node information.

## Disabling high availability

To disable a high availability cluster:

- make backup copies of configuration files
- stop standby nodes
- remove the HANodeName parameter from the active primary server
- restart the primary server (it will start in standalone mode)

## Implementation details

The high availability (HA) cluster is an opt-in solution and it is supported for Zabbix server. The native HA solution is designed to be simple in use, it will work across sites and does not have specific requirements for the databases that Zabbix recognizes. Users are free to use the native Zabbix HA solution, or a third-party HA solution, depending on what best suits the high availability requirements in their environment.

The solution consists of multiple zabbix\_server instances or nodes. Every node:

- is configured separately
- uses the same database
- may have several modes: active, standby, unavailable, stopped

Only one node can be active (working) at a time. A standby node runs only one process - the HA manager. A standby node does no data collection, processing or other regular server activities; they do not listen on ports; they have minimum database connections.

Both active and standby nodes update their last access time every 5 seconds. Each standby node monitors the last access time of the active node. If the last access time of the active node is over 'failover delay' seconds, the standby node switches itself to be the active node and assigns 'unavailable' status to the previously active node.

The active node monitors its own database connectivity - if it is lost for more than failover delay-5 seconds, it must stop all processing and switch to standby mode. The active node also monitors the status of the standby nodes - if the last access time of a standby node is over 'failover delay' seconds, the standby node is assigned the 'unavailable' status.

The nodes are designed to be compatible across minor Zabbix versions.

## 2 Agent

### Overview

Zabbix agent is deployed on a monitoring target to actively monitor local resources and applications (hard drives, memory, processor statistics, etc.).

The agent gathers operational information locally and reports data to Zabbix server for further processing. In case of failures (such as a hard disk running full or a crashed service process), Zabbix server can actively alert the administrators of the particular machine that reported the failure.

Zabbix agents are extremely efficient because of use of native system calls for gathering statistical information.

### Passive and active checks

Zabbix agents can perform passive and active checks.

In a **passive check** the agent responds to a data request. Zabbix server (or proxy) asks for data, for example, CPU load, and Zabbix agent sends back the result.

**Active checks** require more complex processing. The agent must first retrieve a list of items from Zabbix server for independent processing. Then it will periodically send new values to the server.

Whether to perform passive or active checks is configured by selecting the respective monitoring **item type**. Zabbix agent processes items of type 'Zabbix agent' or 'Zabbix agent (active)'.

### Supported platforms

Zabbix agent is **supported** on the following platforms:

- Windows (all desktop and server versions since XP)
- Linux (also available in **distribution packages**)
- macOS
- IBM AIX
- FreeBSD
- OpenBSD

- Solaris

It is also possible to download legacy Zabbix agent binaries for [NetBSD](#) and [HP-UX](#), and those are compatible with current Zabbix server/proxy version.

#### Agent on UNIX-like systems

Zabbix agent on UNIX-like systems is run on the host being monitored.

#### Installation

See the [package installation](#) section for instructions on how to install Zabbix agent as package.

Alternatively see instructions for [manual installation](#) if you do not want to use packages.

#### Attention:

In general, 32bit Zabbix agents will work on 64bit systems, but may fail in some cases.

#### If installed as package

Zabbix agent runs as a daemon process. The agent can be started by executing:

```
systemctl start zabbix-agent
```

This will work on most of GNU/Linux systems. On other systems you may need to run:

```
/etc/init.d/zabbix-agent start
```

Similarly, for stopping/restarting/viewing status of Zabbix agent, use the following commands:

```
systemctl stop zabbix-agent
systemctl restart zabbix-agent
systemctl status zabbix-agent
```

#### Start up manually

If the above does not work you have to start it manually. Find the path to the `zabbix_agentd` binary and execute:

```
zabbix_agentd
```

#### Agent on Windows systems

Zabbix agent on Windows runs as a Windows service.

#### Preparation

Zabbix agent is distributed as a zip archive. After you download the archive you need to unpack it. Choose any folder to store Zabbix agent and the configuration file, e. g.

```
C:\zabbix
```

Copy `bin\zabbix_agentd.exe` and `conf\zabbix_agentd.conf` files to `c:\zabbix`.

Edit the `c:\zabbix\zabbix_agentd.conf` file to your needs, making sure to specify a correct "Hostname" parameter.

#### Installation

After this is done use the following command to install Zabbix agent as Windows service:

```
C:\> c:\zabbix\zabbix_agentd.exe -c c:\zabbix\zabbix_agentd.conf -i
```

Now you should be able to configure "Zabbix agent" service normally as any other Windows service.

See [more details](#) on installing and running Zabbix agent on Windows.

#### Other agent options

It is possible to run multiple instances of the agent on a host. A single instance can use the default configuration file or a configuration file specified in the command line. In case of multiple instances each agent instance must have its own configuration file (one of the instances can use the default configuration file).

The following command line parameters can be used with Zabbix agent:

| Parameter                     | Description |
|-------------------------------|-------------|
| <b>UNIX and Windows agent</b> |             |

| Parameter                             | Description  |
|---------------------------------------|--|
| -c --config <config-file>             | Path to the configuration file.<br>You may use this option to specify a configuration file that is not the default one.<br>On UNIX, default is /usr/local/etc/zabbix_agentd.conf or as set by <b>compile-time</b> variables <b>--sysconfdir</b> or <b>--prefix</b><br>On Windows, default is c:\zabbix_agentd.conf |
| -p --print                            | Print known items and exit.<br><b>Note:</b> To return <b>user parameter</b> results as well, you must specify the configuration file (if it is not in the default location).   |
| -t --test <item key>                  | Test specified item and exit.<br><b>Note:</b> To return <b>user parameter</b> results as well, you must specify the configuration file (if it is not in the default location).   |
| -h --help                             | Display help information   |
| -V --version                          | Display version number   |
| <b>UNIX agent only</b>                |  |
| -R --runtime-control <option>         | Perform administrative functions. See <b>runtime control</b> .   |
| <b>Windows agent only</b>             |  |
| -m --multiple-agents                  | Use multiple agent instances (with -i,-d,-s,-x functions).<br>To distinguish service names of instances, each service name will include the Hostname value from the specified configuration file.  |
| <b>Windows agent only (functions)</b> |  |
| -i --install                          | Install Zabbix Windows agent as service  |
| -d --uninstall                        | Uninstall Zabbix Windows agent service   |
| -s --start                            | Start Zabbix Windows agent service   |
| -x --stop                             | Stop Zabbix Windows agent service  |

Specific **examples** of using command line parameters:

- printing all built-in agent items with values
- testing a user parameter with "mysql.ping" key defined in the specified configuration file
- installing a "Zabbix Agent" service for Windows using the default path to configuration file c:\zabbix\_agentd.conf
- installing a "Zabbix Agent [Hostname]" service for Windows using the configuration file zabbix\_agentd.conf located in the same folder as agent executable and make the service name unique by extending it by Hostname value from the config file

```
zabbix_agentd --print
zabbix_agentd -t "mysql.ping" -c /etc/zabbix/zabbix_agentd.conf
zabbix_agentd.exe -i
zabbix_agentd.exe -i -m -c zabbix_agentd.conf
```

Runtime control

With runtime control options you may change the log level of agent processes.

| Option                               | Description   | Target   |
|--------------------------------------|---|--|
| log_level_increase[= <b>target</b> ] | Increase log level.<br>If target is not specified, all processes are affected.                            | Target can be specified as:<br><b>process type</b> - all processes of specified type (e.g., listener)<br>See all <b>agent process types</b> .<br><b>process type,N</b> - process type and number (e.g., listener,3)<br><b>pid</b> - process identifier (1 to 65535). For larger values specify target as 'process-type,N'. |
| log_level_decrease[= <b>target</b> ] | Decrease log level.<br>If target is not specified, all processes are affected.                            |  |
| userparameter_reload                 | Reload values of the <i>UserParameter</i> and <i>Include</i> options from the current configuration file. |  |

Examples:

- increasing log level of all processes

- increasing log level of the third listener process
- increasing log level of process with PID 1234
- decreasing log level of all active check processes

```
zabbix_agentd -R log_level_increase
zabbix_agentd -R log_level_increase=listener,3
zabbix_agentd -R log_level_increase=1234
zabbix_agentd -R log_level_decrease="active checks"
```

**Note:**

Runtime control is not supported on OpenBSD, NetBSD and Windows.

#### Agent process types

- `active checks` - process for performing active checks
- `collector` - process for data collection
- `listener` - process for listening to passive checks

The agent log file can be used to observe these process types.

#### Process user

Zabbix agent on UNIX is designed to run as a non-root user. It will run as whatever non-root user it is started as. So you can run agent as any non-root user without any issues.

If you will try to run it as 'root', it will switch to a hardcoded 'zabbix' user, which must be present on your system. You can only run agent as 'root' if you modify the 'AllowRoot' parameter in the agent configuration file accordingly.

#### Configuration file

For details on configuring Zabbix agent see the configuration file options for `zabbix_agentd` or `Windows agent`.

#### Locale

Note that the agent requires a UTF-8 locale so that some textual agent items can return the expected content. Most modern Unix-like systems have a UTF-8 locale as default, however, there are some systems where that may need to be set specifically.

#### Exit code

Before version 2.2 Zabbix agent returned 0 in case of successful exit and 255 in case of failure. Starting from version 2.2 and higher Zabbix agent returns 0 in case of successful exit and 1 in case of failure.

## 3 Agent 2

#### Overview

Zabbix agent 2 is a new generation of Zabbix agent and may be used in place of Zabbix agent. Zabbix agent 2 has been developed to:

- reduce the number of TCP connections
- provide improved concurrency of checks
- be easily extendible with plugins. A plugin should be able to:
  - provide trivial checks consisting of only a few simple lines of code
  - provide complex checks consisting of long-running scripts and standalone data gathering with periodic sending back of the data
- be a drop-in replacement for Zabbix agent (in that it supports all the previous functionality)

Agent 2 is written in Go programming language (with some C code of Zabbix agent reused). A configured Go environment with a currently supported [Go version](#) is required for building Zabbix agent 2.

Agent 2 does not have built-in daemonization support on Linux; it can be run as a `Windows service`.

Passive checks work similarly to Zabbix agent. Active checks support scheduled/flexible intervals and check concurrency within one active server.

**Note:**

By default, Zabbix agent 2 will schedule the first data collection for active checks at a conditionally random time within the item's update interval to prevent spikes in resource usage. To perform active checks that do not have *Scheduling update intervals* immediately after the agent restart, set `ForceActiveChecksOnStart` parameter (global-level) or `Plugins.<Plugin name>.System.ForceActiveChecksOnStart` (affects only specific plugin checks) in the *configuration file*. Plugin-level parameter, if set, will override the global parameter. Forcing active checks on start is supported since Zabbix 6.0.2.

**Check concurrency**

Checks from different plugins can be executed concurrently. The number of concurrent checks within one plugin is limited by the plugin capacity setting. Each plugin may have a hardcoded capacity setting (100 being default) that can be lowered using the `Plugins.<PluginName>.System.Capacity=N` setting in the *Plugins* configuration *parameter*. Former name of this parameter `Plugins.<PluginName>.Capacity` is still supported, but has been deprecated in Zabbix 6.0.

See also: [Plugin development guidelines](#).

**Supported platforms**

Zabbix agent 2 is supported on the following platforms:

- Windows (all desktop and server versions *since Windows 10/Server 2016*) - available as a [pre-compiled binary](#) or in [Zabbix sources](#)
- Linux - available in [distribution packages](#) or [Zabbix sources](#)

**Attention:**

Since Zabbix 6.0.35, Zabbix agent 2 packages are no longer available for [RHEL 6](#) due to Go 1.22 (and newer) being incompatible with GCC 4.4.7 provided by RHEL 6, which results in compilation errors. Note, however, that *Zabbix agent packages* are still supported.

**Installation**

To install Zabbix agent 2, the following options are available:

**Windows:**

- from a pre-compiled binary - download the binary and follow the instructions on the *Windows agent installation from MSI* page
- from sources - see *Building Zabbix agent 2 on Windows*

**Linux:**

- from distribution packages - follow the instructions on the [Zabbix packages](#) page, available by choosing your distribution and the Agent 2 component
- from sources - see *Installation from sources*; note that you must configure the sources by specifying the `--enable-agent2` configuration option

**Note:**

Zabbix agent 2 monitoring capabilities can be extended with plugins. While built-in plugins are available out-of-the-box, loadable plugins must be installed separately. For more information, see [Plugins](#).

**Options**

The following command line parameters can be used with Zabbix agent 2:

| Parameter                                    | Description   |
|--|---|
| <code>-c --config &lt;config-file&gt;</code> | Path to the configuration file.<br>You may use this option to specify a configuration file that is not the default one.<br>On UNIX, default is <code>/usr/local/etc/zabbix_agent2.conf</code> or as set by <i>compile-time</i> variables <code>--sysconfdir</code> or <code>--prefix</code> |
| <code>-f --foreground</code>                 | Run Zabbix agent in foreground (default: true).   |
| <code>-p --print</code>                      | Print known items and exit.<br><i>Note:</i> To return <i>user parameter</i> results as well, you must specify the configuration file (if it is not in the default location).  |
| <code>-t --test &lt;item key&gt;</code>      | Test specified item and exit.<br><i>Note:</i> To return <i>user parameter</i> results as well, you must specify the configuration file (if it is not in the default location).  |

| Parameter                        | Description   |
|----------------------------------|---|
| -h --help                        | Print help information and exit.  |
| -v --verbose                     | Print debugging information. Use this option with -p and -t options.    |
| -V --version                     | Print agent version and license information.                            |
| -R --runtime-control<br><option> | Perform administrative functions. See <a href="#">runtime control</a> . |

Specific **examples** of using command line parameters:

- print all built-in agent items with values
- test a user parameter with "mysql.ping" key defined in the specified configuration file

```
zabbix_agent2 --print
```

```
zabbix_agent2 -t "mysql.ping" -c /etc/zabbix/zabbix_agentd.conf
```

Runtime control

Runtime control provides some options for remote control.

| Option               | Description   |
|----------------------|---|
| log_level_increase   | Increase log level.   |
| log_level_decrease   | Decrease log level.   |
| metrics              | List available metrics.   |
| version              | Display agent version.  |
| userparameter_reload | Reload values of the <i>UserParameter</i> and <i>Include</i> options from the current configuration file. |
| help                 | Display help information on runtime control.  |

Examples:

- increasing log level for agent 2
- print runtime control options

```
zabbix_agent2 -R log_level_increase
```

```
zabbix_agent2 -R help
```

Configuration file

The configuration parameters of agent 2 are mostly compatible with Zabbix agent with some exceptions.

| New parameters  | Description   |
|---|---|
| <i>ControlSocket</i>  | The runtime control socket path. Agent 2 uses a control socket for <a href="#">runtime commands</a> .   |
| <i>EnablePersistentBuffer,</i><br><i>PersistentBufferFile,</i><br><i>PersistentBufferPeriod</i> | These parameters are used to configure persistent storage on agent 2 for active items.  |
| <i>ForceActiveChecksOnStart</i>   | Determines whether the agent should perform active checks immediately after restart or spread evenly over time. Supported since Zabbix 6.0.2.   |
| <i>Plugins</i>  | Plugins may have their own parameters, in the format <code>Plugins.&lt;Plugin name&gt;.&lt;Parameter&gt;=&lt;value&gt;</code> . A common plugin parameter is <i>System.Capacity</i> , setting the limit of checks that can be executed at the same time.          |
| <i>StatusPort</i>   | The port agent 2 will be listening on for HTTP status request and display of a list of configured plugins and some internal parameters  |
| <b>Dropped parameters</b>   | <b>Description</b>  |
| <i>AllowRoot, User</i>  | Not supported because daemonization is not supported.   |
| <i>LoadModule,</i><br><i>LoadModulePath</i>   | Loadable modules are not supported.   |
| <i>StartAgents</i>  | This parameter was used in Zabbix agent to increase passive check concurrency or disable them. In Agent 2, the concurrency is configured at a plugin level and can be limited by a capacity setting. Whereas disabling passive checks is not currently supported. |
| <i>HostInterface,</i><br><i>HostInterfaceItem</i>   | Not yet supported.  |

For more details see the configuration file options for [zabbix\\_agent2](#).

## Exit codes

Starting from version 4.4.8 Zabbix agent 2 can also be compiled with older OpenSSL versions (1.0.1, 1.0.2).

In this case Zabbix provides mutexes for locking in OpenSSL. If a mutex lock or unlock fails then an error message is printed to the standard error stream (STDERR) and Agent 2 exits with return code 2 or 3, respectively.

## 4 Proxy

### Overview

Zabbix proxy is a process that may collect monitoring data from one or more monitored devices and send the information to the Zabbix server, essentially working on behalf of the server. All collected data is buffered locally and then transferred to the Zabbix server the proxy belongs to.

Deploying a proxy is optional, but may be very beneficial to distribute the load of a single Zabbix server. If only proxies collect data, processing on the server becomes less CPU and disk I/O hungry.

A Zabbix proxy is the ideal solution for centralized monitoring of remote locations, branches and networks with no local administrators.

Zabbix proxy requires a separate database.

#### Attention:

Note that databases supported with Zabbix proxy are SQLite, MySQL and PostgreSQL. Using Oracle is at your own risk and may contain some limitations as, for example, in **return values** of low-level discovery rules.

See also: [Using proxies in a distributed environment](#)

### Running proxy

If installed as package

Zabbix proxy runs as a daemon process. The proxy can be started by executing:

```
systemctl start zabbix-proxy
```

This will work on most of GNU/Linux systems. On other systems you may need to run:

```
/etc/init.d/zabbix-proxy start
```

Similarly, for stopping/restarting/viewing status of Zabbix proxy, use the following commands:

```
systemctl stop zabbix-proxy
systemctl restart zabbix-proxy
systemctl status zabbix-proxy
```

Start up manually

If the above does not work you have to start it manually. Find the path to the zabbix\_proxy binary and execute:

```
zabbix_proxy
```

You can use the following command line parameters with Zabbix proxy:

|  |                                  |
|--|----------------------------------|
| <code>-c --config &lt;file&gt;</code>            | path to the configuration file   |
| <code>-f --foreground</code>                     | run Zabbix proxy in foreground   |
| <code>-R --runtime-control &lt;option&gt;</code> | perform administrative functions |
| <code>-h --help</code>                           | give this help                   |
| <code>-V --version</code>                        | display version number           |

Examples of running Zabbix proxy with command line parameters:

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf
zabbix_proxy --help
zabbix_proxy -V
```

Runtime control

Runtime control options:

| Option   | Description   | Target  |
|--|---|---|
| <code>config_cache_reload</code>                 | Reload configuration cache. Ignored if cache is being currently loaded.<br>Active Zabbix proxy will connect to the Zabbix server and request configuration data.                        |   |
| <code>diagnfo[=&lt;section&gt;]</code>           | Gather diagnostic information in the proxy log file.  | <b>historycache</b> - history cache statistics<br><b>preprocessing</b> - preprocessing manager statistics<br><b>locks</b> - list of mutexes (is empty on <i>BSD</i> systems)  |
| <code>snmp_cache_reload</code>                   | Reload SNMP cache, clear the SNMP properties (engine time, engine boots, engine id, credentials) for all hosts.   |   |
| <code>housekeeper_execute</code>                 | Start the housekeeping procedure. Ignored if the housekeeping procedure is currently in progress.   |   |
| <code>log_level_increase[=&lt;target&gt;]</code> | Increase log level, affects all processes if target is not specified.<br>Not supported on <i>BSD</i> systems.   | <b>process type</b> - All processes of specified type (e.g., poller)<br>See all <b>proxy process types</b> .<br><b>process type,N</b> - Process type and number (e.g., poller,3)<br><b>pid</b> - Process identifier (1 to 65535). For larger values specify target as 'process type,N'.   |
| <code>log_level_decrease[=&lt;target&gt;]</code> | Decrease log level, affects all processes if target is not specified.<br>Not supported on <i>BSD</i> systems.   |   |
| <code>prof_enable[=&lt;target&gt;]</code>        | Enable profiling.<br>Affects all processes if target is not specified.<br>Enabled profiling provides details of all rwlocks/mutexes by function name.<br>Supported since Zabbix 6.0.13. | <b>process type</b> - All processes of specified type (e.g., history syncer)<br>See all <b>proxy process types</b> .<br><b>process type,N</b> - Process type and number (e.g., history syncer,1)<br><b>pid</b> - Process identifier (1 to 65535). For larger values specify target as 'process type,N'.<br><b>scope</b> - rwlock, mutex, processing can be used with the process type and number (e.g., history syncer,1,processing) or all processes of type (e.g., history syncer,rwlock) |
| <code>prof_disable[=&lt;target&gt;]</code>       | Disable profiling.<br>Affects all processes if target is not specified.<br>Supported since Zabbix 6.0.13.   | <b>process type</b> - All processes of specified type (e.g., history syncer)<br>See all <b>proxy process types</b> .<br><b>process type,N</b> - Process type and number (e.g., history syncer,1)<br><b>pid</b> - Process identifier (1 to 65535). For larger values specify target as 'process type,N'.   |

Example of using runtime control to reload the proxy configuration cache:

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R config_cache_reload
```

Examples of using runtime control to gather diagnostic information:

Gather all available diagnostic information in the proxy log file:

```
zabbix_proxy -R diagnfo
```

Gather history cache statistics in the proxy log file:

```
zabbix_proxy -R diagnfo=historycache
```

Example of using runtime control to reload the SNMP cache:

```
zabbix_proxy -R snmp_cache_reload
```

Example of using runtime control to trigger execution of housekeeper

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R housekeeper_execute
```

Examples of using runtime control to change log level:

Increase log level of all processes:

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_increase
```

Increase log level of second poller process:

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_increase=poller,2
```

Increase log level of process with PID 1234:

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_increase=1234
```

Decrease log level of all http poller processes:

```
zabbix_proxy -c /usr/local/etc/zabbix_proxy.conf -R log_level_decrease="http poller"
```

#### Process user

Zabbix proxy is designed to run as a non-root user. It will run as whatever non-root user it is started as. So you can run proxy as any non-root user without any issues.

If you will try to run it as 'root', it will switch to a hardcoded 'zabbix' user, which must be present on your system. You can only run proxy as 'root' if you modify the 'AllowRoot' parameter in the proxy configuration file accordingly.

#### Configuration file

See the [configuration file](#) options for details on configuring zabbix\_proxy.

#### Proxy process types

- `availability manager` - process for host availability updates
- `configuration syncer` - process for managing in-memory cache of configuration data
- `data sender` - proxy data sender
- `discoverer` - process for discovery of devices
- `heartbeat sender` - proxy heartbeat sender
- `history poller` - process for handling calculated, aggregated and internal checks requiring a database connection
- `history syncer` - history DB writer
- `housekeeper` - process for removal of old historical data
- `http poller` - web monitoring poller
- `icmp pinger` - poller for icmping checks
- `ipmi manager` - IPMI poller manager
- `ipmi poller` - poller for IPMI checks
- `java poller` - poller for Java checks
- `odbc poller` - poller for ODBC checks
- `poller` - normal poller for passive checks
- `preprocessing manager` - manager of preprocessing tasks
- `preprocessing worker` - process for data preprocessing
- `self-monitoring` - process for collecting internal server statistics
- `snmp trapper` - trapper for SNMP traps
- `task manager` - process for remote execution of tasks requested by other components (e.g. close problem, acknowledge problem, check item value now, remote command functionality)
- `trapper` - trapper for active checks, traps, proxy communication
- `unreachable poller` - poller for unreachable devices
- `vmware collector` - VMware data collector responsible for data gathering from VMware services

The proxy log file can be used to observe these process types.

Various types of Zabbix proxy processes can be monitored using the **zabbix[process,<type>,<mode>,<state>]** internal [item](#).

#### Supported platforms

Zabbix proxy runs on the same list of [supported platforms](#) as Zabbix server.

#### Locale

Note that the proxy requires a UTF-8 locale so that some textual items can be interpreted correctly. Most modern Unix-like systems have a UTF-8 locale as default, however, there are some systems where that may need to be set specifically.

## 5 Java gateway

### Overview

Native support for monitoring JMX applications exists in the form of a Zabbix daemon called "Zabbix Java gateway", available since Zabbix 2.0. Zabbix Java gateway is a daemon written in Java. To find out the value of a particular JMX counter on a host, Zabbix server queries Zabbix Java gateway, which uses the [JMX management API](#) to query the application of interest remotely. The application does not need any additional software installed, it just has to be started with `-Dcom.sun.management.jmxremote` option on the command line.

Java gateway accepts incoming connection from Zabbix server or proxy and can only be used as a "passive proxy". As opposed to Zabbix proxy, it may also be used from Zabbix proxy (Zabbix proxies cannot be chained). Access to each Java gateway is configured directly in Zabbix server or proxy configuration file, thus only one Java gateway may be configured per Zabbix server or Zabbix proxy. If a host will have items of type **JMX agent** and items of other type, only the **JMX agent** items will be passed to Java gateway for retrieval.

When an item has to be updated over Java gateway, Zabbix server or proxy will connect to the Java gateway and request the value, which Java gateway in turn retrieves and passes back to the server or proxy. As such, Java gateway does not cache any values.

Zabbix server or proxy has a specific type of processes that connect to Java gateway, controlled by the option **StartJavaPollers**. Internally, Java gateway starts multiple threads, controlled by the **START\_POLLERS** option. On the server side, if a connection takes more than **Timeout** seconds, it will be terminated, but Java gateway might still be busy retrieving value from the JMX counter. To solve this, there is the **TIMEOUT** option in Java gateway that allows to set timeout for JMX network operations.

Zabbix server or proxy will try to pool requests to a single JMX target together as much as possible (affected by item intervals) and send them to the Java gateway in a single connection for better performance.

It is suggested to have **StartJavaPollers** less than or equal to **START\_POLLERS**, otherwise there might be situations when no threads are available in the Java gateway to service incoming requests; in such a case Java gateway uses `ThreadPoolExecutor.CallerRunsPolicy`, meaning that the main thread will service the incoming request and temporarily will not accept any new requests.

If you are trying to monitor Wildfly-based Java applications with Zabbix Java gateway, please install the latest `jboss-client.jar` available on the [Wildfly download page](#).

#### Getting Java gateway

You can install Java gateway either from the sources or packages downloaded from [Zabbix website](#).

Using the links below you can access information how to get and run Zabbix Java gateway, how to configure Zabbix server (or Zabbix proxy) to use Zabbix Java gateway for JMX monitoring, and how to configure Zabbix items in Zabbix frontend that correspond to particular JMX counters.

| Installation from             | Instructions                 | Instructions          |
|-------------------------------|------------------------------|-----------------------|
| <i>Sources</i>                | <a href="#">Installation</a> | <a href="#">Setup</a> |
| <i>RHEL packages</i>          | <a href="#">Installation</a> | <a href="#">Setup</a> |
| <i>Debian/Ubuntu packages</i> | <a href="#">Installation</a> | <a href="#">Setup</a> |

## 1 Setup from sources

### Overview

If **installed** from sources, the following information will help you in setting up Zabbix **Java gateway**.

#### Overview of files

If you obtained Java gateway from sources, you should have ended up with a collection of shell scripts, JAR and configuration files under `$PREFIX/sbin/zabbix_java`. The role of these files is summarized below.

`bin/zabbix-java-gateway-$VERSION.jar`

Java gateway JAR file itself.

`lib/logback-core-1.5.16.jar`

`lib/logback-classic-1.5.16.jar`

`lib/slf4j-api-2.0.16.jar`

`lib/android-json-4.3_r3.1.jar`

Dependencies of Java gateway: [Logback](#), [SLF4J](#), and [Android JSON](#) library.

`lib/logback.xml`

`lib/logback-console.xml`

Configuration files for Logback.

shutdown.sh

startup.sh

Convenience scripts for starting and stopping Java gateway.

settings.sh

Configuration file that is sourced by startup and shutdown scripts above.

Configuring and running Java gateway

By default, Java gateway listens on port 10052. If you plan on running Java gateway on a different port, you can specify that in settings.sh script. See the description of [Java gateway configuration file](#) for how to specify this and other options.

**Warning:**

Port 10052 is not [IANA registered](#).

Once you are comfortable with the settings, you can start Java gateway by running the startup script:

```
./startup.sh
```

Likewise, once you no longer need Java gateway, run the shutdown script to stop it:

```
./shutdown.sh
```

Note that unlike server or proxy, Java gateway is lightweight and does not need a database.

Configuring server for use with Java gateway

With Java gateway up and running, you have to tell Zabbix server where to find Zabbix Java gateway. This is done by specifying JavaGateway and JavaGatewayPort parameters in the [server configuration file](#). If the host on which JMX application is running is monitored by Zabbix proxy, then you specify the connection parameters in the [proxy configuration file](#) instead.

```
JavaGateway=192.168.3.14
```

```
JavaGatewayPort=10052
```

By default, server does not start any processes related to JMX monitoring. If you wish to use it, however, you have to specify the number of pre-forked instances of Java pollers. You do this in the same way you specify regular pollers and trappers.

```
StartJavaPollers=5
```

Do not forget to restart server or proxy, once you are done with configuring them.

Debugging Java gateway

In case there are any problems with Java gateway or an error message that you see about an item in the frontend is not descriptive enough, you might wish to take a look at Java gateway log file.

By default, Java gateway logs its activities into /tmp/zabbix\_java.log file with log level "info". Sometimes that information is not enough and there is a need for information at log level "debug". In order to increase logging level, modify file lib/logback.xml and change the level attribute of <root> tag to "debug":

```
<root level="debug">
  <appender-ref ref="FILE" />
</root>
```

Note that unlike Zabbix server or Zabbix proxy, there is no need to restart Zabbix Java gateway after changing logback.xml file - changes in logback.xml will be picked up automatically. When you are done with debugging, you can return the logging level to "info".

If you wish to log to a different file or a completely different medium like database, adjust logback.xml file to meet your needs. See [Logback Manual](#) for more details.

Sometimes for debugging purposes it is useful to start Java gateway as a console application rather than a daemon. To do that, comment out PID\_FILE variable in settings.sh. If PID\_FILE is omitted, startup.sh script starts Java gateway as a console application and makes Logback use lib/logback-console.xml file instead, which not only logs to console, but has logging level "debug" enabled as well.

Finally, note that since Java gateway uses SLF4J for logging, you can replace Logback with the framework of your choice by placing an appropriate JAR file in lib directory. See [SLF4J Manual](#) for more details.

JMX monitoring

See [JMX monitoring](#) page for more details.

## 2 Setup from RHEL packages

### Overview

If **installed** from RHEL packages, the following information will help you in setting up Zabbix **Java gateway**.

### Configuring and running Java gateway

Configuration parameters of Zabbix Java gateway may be tuned in the file:

```
/etc/zabbix/zabbix_java_gateway.conf
```

For more details, see Zabbix Java gateway configuration **parameters**.

To start Zabbix Java gateway:

```
systemctl restart zabbix-java-gateway
```

To automatically start Zabbix Java gateway on boot:

RHEL 7 and later:

```
systemctl enable zabbix-java-gateway
```

RHEL prior to 7:

```
chkconfig --level 12345 zabbix-java-gateway on
```

### Configuring server for use with Java gateway

With Java gateway up and running, you have to tell Zabbix server where to find Zabbix Java gateway. This is done by specifying `JavaGateway` and `JavaGatewayPort` parameters in the **server configuration file**. If the host on which JMX application is running is monitored by Zabbix proxy, then you specify the connection parameters in the **proxy configuration file** instead.

```
JavaGateway=192.168.3.14
```

```
JavaGatewayPort=10052
```

By default, server does not start any processes related to JMX monitoring. If you wish to use it, however, you have to specify the number of pre-forked instances of Java pollers. You do this in the same way you specify regular pollers and trappers.

```
StartJavaPollers=5
```

Do not forget to restart server or proxy, once you are done with configuring them.

### Debugging Java gateway

Zabbix Java gateway log file is:

```
/var/log/zabbix/zabbix_java_gateway.log
```

If you like to increase the logging, edit the file:

```
/etc/zabbix/zabbix_java_gateway_logback.xml
```

and change `level="info"` to `"debug"` or even `"trace"` (for deep troubleshooting):

```
<configuration scan="true" scanPeriod="15 seconds">
[...]  
    <root level="info">  
        <appender-ref ref="FILE" />  
    </root>  
  
</configuration>
```

### JMX monitoring

See **JMX monitoring** page for more details.

## 3 Setup from Debian/Ubuntu packages

### Overview

If **installed** from Debian/Ubuntu packages, the following information will help you in setting up Zabbix **Java gateway**.

### Configuring and running Java gateway

Java gateway configuration may be tuned in the file:

/etc/zabbix/zabbix\_java\_gateway.conf

For more details, see Zabbix Java gateway configuration [parameters](#).

To start Zabbix Java gateway:

```
systemctl restart zabbix-java-gateway
```

To automatically start Zabbix Java gateway on boot:

```
systemctl enable zabbix-java-gateway
```

Configuring server for use with Java gateway

With Java gateway up and running, you have to tell Zabbix server where to find Zabbix Java gateway. This is done by specifying `JavaGateway` and `JavaGatewayPort` parameters in the [server configuration file](#). If the host on which JMX application is running is monitored by Zabbix proxy, then you specify the connection parameters in the [proxy configuration file](#) instead.

```
JavaGateway=192.168.3.14
```

```
JavaGatewayPort=10052
```

By default, server does not start any processes related to JMX monitoring. If you wish to use it, however, you have to specify the number of pre-forked instances of Java pollers. You do this in the same way you specify regular pollers and trappers.

```
StartJavaPollers=5
```

Do not forget to restart server or proxy, once you are done with configuring them.

Debugging Java gateway

Zabbix Java gateway log file is:

```
/var/log/zabbix/zabbix_java_gateway.log
```

If you like to increase the logging, edit the file:

```
/etc/zabbix/zabbix_java_gateway_logback.xml
```

and change `level="info"` to `"debug"` or even `"trace"` (for deep troubleshooting):

```
<configuration scan="true" scanPeriod="15 seconds">
```

```
[...]
```

```
  <root level="info">
```

```
    <appender-ref ref="FILE" />
```

```
  </root>
```

```
</configuration>
```

JMX monitoring

See [JMX monitoring](#) page for more details.

## 6 Sender

### Overview

Zabbix sender is a command line utility that may be used to send performance data to Zabbix server for processing.

The utility is usually used in long running user scripts for periodical sending of availability and performance data.

For sending results directly to Zabbix server or proxy, a [trapper item](#) type must be configured.

See also [zabbix\\_utils](#) - a Python library that has built-in functionality to act like Zabbix sender.

Running Zabbix sender

An example of running Zabbix UNIX sender:

```
cd bin
```

```
./zabbix_sender -z zabbix -s "Linux DB3" -k db.connections -o 43
```

where:

- `z` - Zabbix server host (IP address can be used as well)
- `s` - technical name of monitored host (as registered in Zabbix frontend)

- k - item key
- o - value to send

#### Attention:

Options that contain whitespaces, must be quoted using double quotes.

Zabbix sender can be used to send multiple values from an input file. See the [Zabbix sender manpage](#) for more information.

If a configuration file is specified, Zabbix sender uses all addresses defined in the agent `ServerActive` configuration parameter for sending data. If sending to one address fails, the sender tries sending to the other addresses. If sending of batch data fails to one address, the following batches are not sent to this address.

Zabbix sender accepts strings in UTF-8 encoding (for both UNIX-like systems and Windows) without byte order mark (BOM) first in the file.

Zabbix sender on Windows can be run similarly:

```
zabbix_sender.exe [options]
```

Since Zabbix 1.8.4, `zabbix_sender` realtime sending scenarios have been improved to gather multiple values passed to it in close succession and send them to the server in a single connection. A value that is not further apart from the previous value than 0.2 seconds can be put in the same stack, but maximum polling time still is 1 second.

#### Note:

Zabbix sender will terminate if invalid (not following *parameter=value* notation) parameter entry is present in the specified configuration file.

Running Zabbix sender with low-level discovery

An example of running Zabbix sender for sending a JSON-formatted value for low-level discovery:

```
./zabbix_sender -z 192.168.1.113 -s "Zabbix server" -k trapper.discovery.item -o '[{"#FSNAME}":"/",{"#FSNAME}":"/"}]
```

For this to work, the low-level discovery rule must have a Zabbix trapper item type (in this example, with `trapper.discovery.item` key).

## 7 Get

Overview

Zabbix get is a command line utility which can be used to communicate with Zabbix agent and retrieve required information from the agent.

The utility is usually used for the troubleshooting of Zabbix agents.

See also [zabbix\\_utils](#) - a Python library that has built-in functionality to act like Zabbix get.

Running Zabbix get

An example of running Zabbix get under UNIX to get the processor load value from the agent:

```
cd bin
./zabbix_get -s 127.0.0.1 -p 10050 -k system.cpu.load[all,avg1]
```

Another example of running Zabbix get for capturing a string from a website:

```
cd bin
./zabbix_get -s 192.168.1.1 -p 10050 -k "web.page.regex[www.example.com,,,\"USA: ([a-zA-Z0-9.-]+)\",,\\1]"
```

Note that the item key here contains a space so quotes are used to mark the item key to the shell. The quotes are not part of the item key; they will be trimmed by the shell and will not be passed to Zabbix agent.

Zabbix get accepts the following command line parameters:

|   |   |
|---|---|
| <code>-s --host &lt;host name or IP&gt;</code>      | Specify host name or IP address of a host                         |
| <code>-p --port &lt;port number&gt;</code>          | Specify port number of agent running on the host (default: 10050) |
| <code>-I --source-address &lt;IP address&gt;</code> | Specify source IP address   |
| <code>-t --timeout &lt;seconds&gt;</code>           | Specify timeout. Valid range: 1-30 seconds (default: 30 seconds)  |
| <code>-k --key &lt;item key&gt;</code>              | Specify key of item to retrieve value for                         |

|                           |                           |
|---------------------------|---------------------------|
| <code>-h --help</code>    | Display this help message |
| <code>-V --version</code> | Display version number    |

See also [Zabbix get manpage](#) for more information.

Zabbix get on Windows can be run similarly:

```
zabbix_get.exe [options]
```

## 8 JS

### Overview

`zabbix_js` is a command line utility that can be used for embedded script testing.

This utility will execute a user script with a string parameter and print the result. Scripts are executed using the embedded Zabbix scripting engine.

In case of compilation or execution errors `zabbix_js` will print the error in `stderr` and exit with code 1.

### Usage

```
zabbix_js -s script-file -p input-param [-l log-level] [-t timeout]
zabbix_js -s script-file -i input-file [-l log-level] [-t timeout]
zabbix_js -h
zabbix_js -V
```

`zabbix_js` accepts the following command line parameters:

|                                       |  |
|---------------------------------------|--|
| <code>-s, --script script-file</code> | Specify the file name of the script to execute. If '-' is specified as f |
| <code>-i, --input input-file</code>   | Specify the file name of the input parameter. If '-' is specified as f   |
| <code>-p, --param input-param</code>  | Specify the input parameter.   |
| <code>-l, --loglevel log-level</code> | Specify the log level.   |
| <code>-t, --timeout timeout</code>    | Specify the timeout in seconds. Valid range: 1-60 seconds (default: 10   |
| <code>-h, --help</code>               | Display help information.  |
| <code>-V, --version</code>            | Display the version number.  |

Example:

```
zabbix_js -s script-file.js -p example
```

## 9 Web service

### Overview

Zabbix web service is a process that is used for communication with external web services. Currently, Zabbix web service is used for generating and sending [scheduled reports](#) with plans to add additional functionality in the future.

Zabbix server connects to the web service via HTTP(S). Zabbix web service requires Google Chrome to be installed on the same host; on some distributions the service may also work with Chromium (see [known issues](#)).

### Installation

The official `zabbix-web-service` package is available in the [Zabbix repository](#).

To compile Zabbix web service [from sources](#), specify the `--enable-webservice` configure option.

To configure Zabbix web service, update the `zabbix_web_service.conf` configuration file parameters.

#### Attention:

It is strongly recommended to set up encryption between Zabbix server and Zabbix web service [using certificates](#). By default, data transmitted between Zabbix server and Zabbix web service is not encrypted, which can lead to unauthorized access.

## 4 Installation

Please use the sidebar to access content in the Installation section.

### 1 Getting Zabbix

#### Overview

There are four ways of getting Zabbix:

- Install it from the **packages**
- Download the latest source archive and **compile it yourself**
- Install it from the **containers**
- Download the **virtual appliance**

To download the latest distribution packages, pre-compiled sources or the virtual appliance, go to the [Zabbix download page](#), where direct links to latest versions are provided.

#### Getting Zabbix source code

There are several ways of getting Zabbix source code:

- You can [download](#) the released stable versions from the official Zabbix website
- You can [download](#) nightly builds from the official Zabbix website developer page
- You can get the latest development version from the Git source code repository system:
  - The primary location of the full repository is at <https://git.zabbix.com/scm/zbx/zabbix.git>
  - Master and supported releases are also mirrored to Github at <https://github.com/zabbix/zabbix>

A Git client must be installed to clone the repository. The official commandline Git client package is commonly called **git** in distributions. To install, for example, on Debian/Ubuntu, run:

```
sudo apt-get update
sudo apt-get install git
```

To grab all Zabbix source, change to the directory you want to place the code in and execute:

```
git clone https://git.zabbix.com/scm/zbx/zabbix.git
```

### 2 Requirements

#### Hardware

##### Memory

Zabbix requires both physical and disk memory. The amount of required disk memory obviously depends on the number of hosts and parameters that are being monitored. If you're planning to keep a long history of monitored parameters, you should be thinking of at least a couple of gigabytes to have enough space to store the history in the database. Each Zabbix daemon process requires several connections to a database server. The amount of memory allocated for the connection depends on the configuration of the database engine.

##### Note:

The more physical memory you have, the faster the database (and therefore Zabbix) works.

##### CPU

Zabbix and especially Zabbix database may require significant CPU resources depending on number of monitored parameters and chosen database engine.

##### Other hardware

A serial communication port and a serial GSM modem are required for using SMS notification support in Zabbix. USB-to-serial converter will also work.

Examples of hardware configuration

The table provides examples of hardware configuration, assuming a **Linux/BSD/Unix** platform.

These are size and hardware configuration examples to start with. Each Zabbix installation is unique. Make sure to benchmark the performance of your Zabbix system in a staging or development environment, so that you can fully understand your requirements before deploying the Zabbix installation to its production environment.

| Installation size | Monitored metrics <sup>1</sup> | CPU/vCPU cores | Memory (GiB) | Database   | Amazon EC2 <sup>2</sup> |
|-------------------|--------------------------------|----------------|--------------|--|-------------------------|
| Small             | 1 000                          | 2              | 8            | MySQL Server, Percona Server, MariaDB Server, PostgreSQL         | m6i.large/m6g.large     |
| Medium            | 10 000                         | 4              | 16           | MySQL Server, Percona Server, MariaDB Server, PostgreSQL         | m6i.xlarge/m6g.xlarge   |
| Large             | 100 000                        | 16             | 64           | MySQL Server, Percona Server, MariaDB Server, PostgreSQL, Oracle | m6i.4xlarge/m6g.4xlarge |
| Very large        | 1 000 000                      | 32             | 96           | MySQL Server, Percona Server, MariaDB Server, PostgreSQL, Oracle | m6i.8xlarge/m6g.8xlarge |

<sup>1</sup> 1 metric = 1 item + 1 trigger + 1 graph  
<sup>2</sup> Example with Amazon general purpose EC2 instances, using ARM64 or x86\_64 architecture, a proper instance type like Compute/Memory/Storage optimised should be selected during Zabbix installation evaluation and testing before installing in its production environment.

**Note:**

Actual configuration depends on the number of active items and refresh rates very much (see [database size](#) section of this page for details). It is highly recommended to run the database on a separate server for large installations.

## Supported platforms

Due to security requirements and the mission-critical nature of the monitoring server, UNIX is the only operating system that can consistently deliver the necessary performance, fault tolerance, and resilience. Zabbix operates on market-leading versions.

Zabbix components are available and tested for the following platforms:

| Platform | Server | Agent | Agent2 |
|----------|--------|-------|--------|
| Linux    | x      | x     | x      |
| IBM AIX  | x      | x     | -      |
| FreeBSD  | x      | x     | -      |
| NetBSD   | x      | x     | -      |
| OpenBSD  | x      | x     | -      |
| HP-UX    | x      | x     | -      |
| Mac OS X | x      | x     | -      |
| Solaris  | x      | x     | -      |
| Windows  | -      | x     | x      |

**Note:**

Zabbix server/agent may work on other Unix-like operating systems as well. Zabbix agent is supported on all Windows desktop and server versions since XP.

To prevent critical security vulnerabilities in Zabbix agent 2, it is compiled only with [supported Go releases](#). As of Go 1.21, the [minimum required Windows versions](#) are raised; therefore, since Zabbix 6.0.27, the minimum Windows version for Zabbix agent 2 is Windows 10/Server 2016.

**Attention:**

Zabbix disables core dumps if compiled with encryption and does not start if the system does not allow disabling of core dumps.

**Required software**

Zabbix is built around modern web servers, leading database engines, and PHP scripting language.

**Third-party external surrounding software**

If stated as mandatory, the required software/library is strictly necessary. Optional ones are needed for supporting some specific function.

| Software                           | Mandatory status | Supported versions     | Comments   |
|------------------------------------|------------------|------------------------|--|
| <i>MySQL/Percona</i>               | One of           | 8.0.30-9.0.X           | <p>Required if MySQL (or Percona) is used as Zabbix backend database. InnoDB engine is required.</p> <p>Added support for MySQL versions:</p> <ul style="list-style-type: none"> <li>- 8.1 since Zabbix 6.0.21;</li> <li>- 8.2 since Zabbix 6.0.26;</li> <li>- 8.3 since Zabbix 6.0.27;</li> <li>- 8.4 since Zabbix 6.0.32;</li> <li>- 9.0 since Zabbix 6.0.33.</li> </ul> <p>We recommend using the <a href="#">C API (libmysqlclient)</a> library for building server/proxy.</p>   |
| <i>MariaDB</i>                     |                  | 10.5.00-11.5.X         | <p>For MySQL versions 8.0.0-8.0.28, see also: <a href="#">Possible deadlocks</a>. InnoDB engine is required.</p> <p>The recommended version is 11.4.</p> <p>We recommend using the <a href="#">MariaDB Connector/C</a> library for building server/proxy.</p> <p>Added support for MariaDB versions:</p> <ul style="list-style-type: none"> <li>- 10.7.X since Zabbix 6.0.6;</li> <li>- 10.8.X since Zabbix 6.0.7;</li> <li>- 10.9.X and 10.10.X since Zabbix 6.0.13;</li> <li>- 10.11.X since Zabbix 6.0.15;</li> <li>- 11.0.X since Zabbix 6.0.21;</li> <li>- 11.1.X since Zabbix 6.0.23;</li> <li>- 11.2.X since Zabbix 6.0.27;</li> <li>- 11.3.X since Zabbix 6.0.29;</li> <li>- 11.4.X since Zabbix 6.0.32;</li> <li>- 11.5.X since Zabbix 6.0.34.</li> </ul> |
| <i>Oracle</i><br><i>PostgreSQL</i> |                  | 19c - 21c<br>13.0-17.X | <p>See also: <a href="#">Possible deadlocks</a>.</p> <p>Required if Oracle is used as Zabbix backend database.</p> <p>Required if PostgreSQL is used as Zabbix backend database. Depending on the installation size, it might be required to increase PostgreSQL <i>work_mem</i> configuration property (4MB being the default value), so that the amount of memory used by the database for particular operation is sufficient and query execution does not take too much time.</p> <p>Added support for PostgreSQL versions:</p> <ul style="list-style-type: none"> <li>- 15.X since Zabbix 6.0.10;</li> <li>- 16.X since Zabbix 6.0.23;</li> <li>- 17.X since Zabbix 6.0.36.</li> </ul>   |

| Software                          | Mandatory status | Supported versions | Comments  |
|-----------------------------------|------------------|--------------------|---|
| <i>TimescaleDB</i> for PostgreSQL |                  | 2.1.0-2.18.X       | <p>Required if TimescaleDB is used as a PostgreSQL database extension. Make sure to install TimescaleDB Community Edition, which supports compression.</p> <p>Note that PostgreSQL 15 is supported since TimescaleDB 2.10. You may also refer to the <a href="#">Timescale documentation</a> for details regarding PostgreSQL and TimescaleDB version compatibility.</p> <p>Added support for TimescaleDB versions:</p> <ul style="list-style-type: none"> <li>- 2.6 since Zabbix 6.0.7;</li> <li>- 2.7 since Zabbix 6.0.8;</li> <li>- 2.8 since Zabbix 6.0.10;</li> <li>- 2.9 since Zabbix 6.0.13;</li> <li>- 2.10 since Zabbix 6.0.15;</li> <li>- 2.11 since Zabbix 6.0.19;</li> <li>- 2.12 since Zabbix 6.0.24;</li> <li>- 2.13 since Zabbix 6.0.25;</li> <li>- 2.14 since Zabbix 6.0.28;</li> <li>- 2.15 since Zabbix 6.0.32;</li> <li>- 2.16 since Zabbix 6.0.34;</li> <li>- 2.17 since Zabbix 6.0.36;</li> <li>- 2.18 since Zabbix 6.0.39.</li> </ul> |
| <i>SQLite</i>                     | Optional         | 3.3.5-3.34.X       | SQLite is only supported with Zabbix proxies. Required if SQLite is used as Zabbix proxy database.  |
| <i>smartmontools</i>              |                  | 7.1 or later       | Required for Zabbix agent 2.  |
| <i>who</i>                        |                  |                    | Required for the user count plugin.   |
| <i>dpkg</i>                       |                  |                    | Required for the system.sw.packages plugin.   |
| <i>pkgtool</i>                    |                  |                    | Required for the system.sw.packages plugin.   |
| <i>rpm</i>                        |                  |                    | Required for the system.sw.packages plugin.   |
| <i>pacman</i>                     |                  |                    | Required for the system.sw.packages plugin.   |

#### Note:

Although Zabbix can work with databases available in the operating systems, for the best experience, we recommend using databases installed from the official database developer repositories.

## Frontend

The minimum supported screen width for Zabbix frontend is 1200px.

If stated as mandatory, the required software/library is strictly necessary. Optional ones are needed for supporting some specific function.

| Software                      | Mandatory status | Version                       | Comments   |
|-------------------------------|------------------|-------------------------------|--|
| <i>Apache</i><br><i>Nginx</i> | One of           | 2.4 or later<br>1.20 or later |  |
| <i>PHP</i>                    | Yes              | 7.2.5 or later,<br>8.0-8.3    | <p>Recommended to use PHP 7.4 or later.</p> <p>Added support for PHP versions:</p> <ul style="list-style-type: none"> <li>- 8.0 and 8.1 since Zabbix 6.0.6;</li> <li>- 8.2 since Zabbix 6.0.14;</li> <li>- 8.3 since Zabbix 6.0.26.</li> </ul>                                       |
| PHP extensions:<br><i>gd</i>  | Yes              | 2.0.28 or later               | <p>PHP GD extension must support PNG images (<i>--with-png-dir</i>), JPEG (<i>--with-jpeg-dir</i>) images and FreeType 2 (<i>--with-freetype-dir</i>). Version 2.3.0 or later might be required to avoid possible <b>text overlapping in graphs</b> for some frontend languages.</p> |
| <i>bcmath</i><br><i>ctype</i> |                  |                               | <p>php-bcmath (<i>--enable-bcmath</i>)</p> <p>php-ctype (<i>--enable-ctype</i>)</p>  |

| Software         | Mandatory status | Version         | Comments  |
|------------------|------------------|-----------------|---|
| <i>libXML</i>    | No               | 2.6.15 or later | php-xml, if provided as a separate package by the distributor.                |
| <i>xmlreader</i> |                  |                 | php-xmlreader, if provided as a separate package by the distributor.          |
| <i>xmlwriter</i> |                  |                 | php-xmlwriter, if provided as a separate package by the distributor.          |
| <i>session</i>   |                  |                 | php-session, if provided as a separate package by the distributor.            |
| <i>sockets</i>   |                  |                 | php-net-socket ( <i>--enable-sockets</i> ). Required for user script support. |
| <i>mbstring</i>  |                  |                 | php-mbstring ( <i>--enable-mbstring</i> )                                     |
| <i>gettext</i>   |                  |                 | php-gettext ( <i>--with-gettext</i> ). Required for translations to work.     |
| <i>ldap</i>      |                  |                 | php-ldap. Required only if LDAP authentication is used in the frontend.       |
| <i>openssl</i>   |                  |                 | php-openssl. Required only if SAML authentication is used in the frontend.    |
| <i>mysqli</i>    |                  |                 | Required if MySQL is used as Zabbix backend database.                         |
| <i>oci8</i>      |                  |                 | Required if Oracle is used as Zabbix backend database.                        |
| <i>pgsql</i>     |                  |                 | Required if PostgreSQL is used as Zabbix backend database.                    |

Third-party frontend libraries that are supplied with Zabbix:

| Library  | Mandatory status | Minimum version | Comments   |
|--|------------------|-----------------|--|
| <a href="#">jQuery JavaScript Library</a><br><a href="#">jQuery UI</a> | Yes              | 3.6.0           | JavaScript library that simplifies the process of cross-browser development.               |
| <a href="#">SAML PHP Toolkit</a>                                       |                  | 1.12.1          | A set of user interface interactions, effects, widgets, and themes built on top of jQuery. |
| <a href="#">Symfony Yaml Component</a>                                 |                  | 3.4.1           | A PHP toolkit that adds SAML 2.0 authentication support to be able to sign in to Zabbix.   |
|  |                  | 5.1.0           | Adds support to export and import Zabbix configuration elements in the YAML format.        |

**Note:**

Zabbix may work on previous versions of Apache, MySQL, Oracle, and PostgreSQL as well.

**Attention:**

For other fonts than the default DejaVu, PHP function [imagerotate](#) might be required. If it is missing, these fonts might be rendered incorrectly when a graph is displayed. This function is only available if PHP is compiled with bundled GD, which is not the case in Debian and other distributions.

Third-party libraries used for writing and debugging Zabbix frontend code:

| Library                  | Mandatory status | Minimum version | Description  |
|--------------------------|------------------|-----------------|--|
| <a href="#">Composer</a> | No               | 2.4.1           | An application-level package manager for PHP that provides a standard format for managing dependencies of PHP software and required libraries. |
| <a href="#">PHPUnit</a>  |                  | 8.5.29          | A PHP unit testing framework for testing Zabbix frontend.  |
| <a href="#">SASS</a>     |                  | 3.4.22          | A preprocessor scripting language that is interpreted and compiled into Cascading Style Sheets (CSS).  |

Web browser on client side

Cookies and JavaScript must be enabled.

The latest stable versions of Google Chrome, Mozilla Firefox, Microsoft Edge, Apple Safari, and Opera are supported.

**Warning:**

The same-origin policy for IFrames is implemented, which means that Zabbix cannot be placed in frames on a different domain.

Still, pages placed into a Zabbix frame will have access to Zabbix frontend (through JavaScript) if the page that is placed in the frame and Zabbix frontend are on the same domain. A page like `http://secure-zabbix.com/cms/page.html`, if placed into dashboards on `http://secure-zabbix.com/zabbix/`, will have full JS access to Zabbix.

**Server/proxy**

If stated as mandatory, the required software/library is strictly necessary. Optional ones are needed for supporting some specific function.

| Requirement                           | Mandatory status | Description  |
|---------------------------------------|------------------|--|
| <i>libpcre/libpcre2</i>               | One of           | PCRE/PCRE2 library is required for <a href="#">Perl Compatible Regular Expression</a> (PCRE) support.<br>The naming may differ depending on the GNU/Linux distribution, for example 'libpcre3' or 'libpcre1'. PCRE v8.x and PCRE2 v10.x (from Zabbix 6.0.0) are supported.   |
| <i>libevent</i>                       | Yes              | Required for inter-process communication. Version 1.4 or higher.   |
| <i>libpthread</i>                     |                  | Required for mutex and read-write lock support (could be part of libc).  |
| <i>libresolv</i>                      |                  | Required for DNS resolution (could be part of libc).   |
| <i>libiconv</i>                       |                  | Required for text encoding/format conversion (could be part of libc). Mandatory for Zabbix server on Linux.  |
| <i>libz</i>                           | One of           | Required for compression support.  |
| <i>libm</i>                           |                  | Math library. Required by Zabbix server only.  |
| <i>libmysqlclient</i>                 |                  | Required if MySQL is used.   |
| <i>libmariadb</i>                     |                  | Required if MariaDB is used.   |
| <i>libclntsh</i>                      | No               | Required if Oracle is used; <i>libclntsh</i> version must match or be higher than the version of the Oracle database used.   |
| <i>libpq5</i>                         |                  | Required if PostgreSQL is used; <i>libpq5</i> version must match or be higher than the version of the PostgreSQL database used.  |
| <i>libsqlite3</i>                     |                  | Required if Sqlite is used. Required for Zabbix proxy only.  |
| <i>libOpenIPMI</i>                    |                  | Required for IPMI support. Required for Zabbix server only.  |
| <i>libssh2</i> or <i>libssh</i>       | No               | Required for <b>SSH checks</b> . Version 1.0 or higher (libssh2); 0.6.0 or higher (libssh). libssh is supported since Zabbix 4.4.6.  |
| <i>libcurl</i>                        |                  | Required for web monitoring, VMware monitoring, SMTP authentication, <code>web.page.*</code> Zabbix agent <b>items</b> , HTTP agent items and Elasticsearch (if used). Version 7.28.0 or higher is recommended.<br>Libcurl version requirements:<br>- SMTP authentication: version 7.20.0 or higher<br>- Elasticsearch: version 7.28.0 or higher |
| <i>libxml2</i>                        |                  | Required for VMware monitoring and XML XPath preprocessing.  |
| <i>net-snmp</i>                       |                  | Required for SNMP support. Version 5.3.0 or higher.<br>Support of strong encryption protocols (AES192/AES192C, AES256/AES256C) is available starting with net-snmp library 5.8; on RHEL 8+ based systems it is recommended to use net-snmp 5.8.15 or later.  |
| <i>libunixodbc</i>                    | No               | Required for database monitoring.  |
| <i>libgnutls</i> or <i>libopenssl</i> |                  | Required when using <b>encryption</b> .<br>Minimum versions: <i>libgnutls</i> - 3.1.18, <i>libopenssl</i> - 1.0.1  |
| <i>libldap</i>                        |                  | Required for LDAP support.   |
| <i>fping</i>                          |                  | Required for <b>ICMP ping items</b> .  |

**Agent**

| Requirement                           | Mandatory status | Description  |
|---------------------------------------|------------------|--|
| <i>libpcre/libpcre2</i>               | One of           | PCRE/PCRE2 library is required for <a href="#">Perl Compatible Regular Expression</a> (PCRE) support.<br>The naming may differ depending on the GNU/Linux distribution, for example 'libpcre3' or 'libpcre1'. PCRE v8.x and PCRE2 v10.x (from Zabbix 6.0.0) are supported.<br>Required for log monitoring. Also required on Windows. |
| <i>libpthread</i>                     | Yes              | Required for mutex and read-write lock support (could be part of libc). Not required on Windows.   |
| <i>libresolv</i>                      |                  | Required for DNS resolution (could be part of libc). Not required on Windows.  |
| <i>libiconv</i>                       |                  | Required for text encoding/format conversion to UTF-8 in log items, file content, file regex and regmatch items (could be part of libc). Not required on Windows.  |
| <i>libgnutls</i> or <i>libopenssl</i> | No               | Required if using <b>encryption</b> .<br>Minimum versions: <i>libgnutls</i> - 3.1.18, <i>libopenssl</i> - 1.0.1<br>On Microsoft Windows OpenSSL 1.1.1 or later is required.  |
| <i>libldap</i>                        |                  | Required if LDAP is used. Not supported on Windows.  |
| <i>libcurl</i>                        |                  | Required for <code>web.page.*</code> Zabbix agent <b>items</b> . Not supported on Windows.<br>Version 7.28.0 or higher is recommended.   |
| <i>libmodbus</i>                      |                  | Only required if Modbus monitoring is used.<br>Version 3.0 or higher.  |

**Note:**

Starting from version 5.0.3, Zabbix agent will not work on AIX platforms below versions 6.1 TL07 / AIX 7.1 TL01.

## Agent 2

| Requirement             | Mandatory status | Description  |
|-------------------------|------------------|--|
| <i>libpcre/libpcre2</i> | One of           | PCRE/PCRE2 library is required for <a href="#">Perl Compatible Regular Expression</a> (PCRE) support.<br>The naming may differ depending on the GNU/Linux distribution, for example 'libpcre3' or 'libpcre1'. PCRE v8.x and PCRE2 v10.x (from Zabbix 6.0.0) are supported.<br>Required for log monitoring. Also required on Windows. |
| <i>libopenssl</i>       | No               | Required when using encryption.<br>OpenSSL 1.0.1 or later is required on UNIX platforms.<br>The OpenSSL library must have PSK support enabled. LibreSSL is not supported.<br>On Microsoft Windows systems OpenSSL 1.1.1 or later is required.  |

## Go libraries

| Requirement   | Mandatory status | Minimum version | Description   |
|---|------------------|-----------------|---|
| <a href="https://github.com/zabbix/zabbix-agent2/blob/master/README.md#go-libraries">git.zabbix.com/ap/plugin</a> | Yes              | 1.X.X           | Zabbix own support library. Mostly for plugins.                                 |
| <a href="https://github.com/BurntSushi/locker">github.com/BurntSushi/locker</a>                                   |                  | 0.0.0           | Named read/write locks, access sync.  |
| <a href="https://github.com/chromedp/cdproto">github.com/chromedp/cdproto</a>                                     |                  | 0.0.0           | Generated commands, types, and events for the Chrome DevTools Protocol domains. |
| <a href="https://github.com/chromedp/chromedp">github.com/chromedp/chromedp</a>                                   |                  | 0.6.0           | Chrome DevTools Protocol support (report generation).                           |
| <a href="https://github.com/dustin/gomemcached">github.com/dustin/gomemcached</a>                                 |                  | 0.0.0           | A memcached binary protocol toolkit for go.                                     |
| <a href="https://github.com/eclipse/paho.mqtt.golang">github.com/eclipse/paho.mqtt.golang</a>                     |                  | 1.2.0           | A library to handle MQTT connections.   |
| <a href="https://github.com/fsnotify/fsnotify">github.com/fsnotify/fsnotify</a>                                   |                  | 1.4.9           | Cross-platform file system notifications for Go.                                |
| <a href="https://github.com/go-ldap/ldap">github.com/go-ldap/ldap</a>   |                  | 3.0.3           | Basic LDAP v3 functionality for the Go programming language.                    |
| <a href="https://github.com/go-ole/go-ole">github.com/go-ole/go-ole</a>   |                  | 1.2.4           | Win32 ole implementation for Go.  |
| <a href="https://github.com/godbus/dbus">github.com/godbus/dbus</a>   |                  | 4.1.0           | Native Go bindings for D-Bus.   |
| <a href="https://github.com/go-sql-driver/mysql">github.com/go-sql-driver/mysql</a>                               |                  | 1.5.0           | MySQL driver.   |

| Requirement   | Mandatory status                       | Minimum version | Description  |
|---|--|-----------------|--|

<sup>1</sup> "Indirect" means that it is used in one of the libraries that the agent uses. It's required since Zabbix uses the library that uses the package.

See also dependencies for loadable plugins:

- [PostgreSQL](#)
- [MongoDB](#)

#### Java gateway

If you obtained Zabbix from the source repository or an archive, then the necessary dependencies are already included in the source tree.

If you obtained Zabbix from your distribution's package, then the necessary dependencies are already provided by the packaging system.

In both cases above, the software is ready to be used and no additional downloads are necessary.

If, however, you wish to provide your versions of these dependencies (for instance, if you are preparing a package for some Linux distribution), below is the list of library versions that Java gateway is known to work with. Zabbix may work with other versions of these libraries, too.

The following table lists JAR files that are currently bundled with Java gateway in the original code:

| Library                         | Mandatory status | Comments   |
|---------------------------------|------------------|--|
| <a href="#">android-json</a>    | Yes              | Version 4.3r1 or higher.<br>JSON (JavaScript Object Notation) is a lightweight data-interchange format. This is the org.json compatible Android implementation extracted from the Android SDK. |
| <a href="#">logback-classic</a> |                  | Version 1.5.16 or higher.  |

| Library                      | Mandatory status | Comments                  |
|------------------------------|------------------|---------------------------|
| <a href="#">logback-core</a> |                  | Version 1.5.16 or higher. |
| <a href="#">slf4j-api</a>    |                  | Version 2.0.16 or higher. |

Java gateway can be built using either Oracle Java or open source OpenJDK (version 1.6 or newer). Packages provided by Zabbix are compiled using OpenJDK. The following table lists OpenJDK packages used for building Zabbix packages by distribution:

| Distribution       | OpenJDK package  |
|--------------------|--|
| Debian 12          | default-jdk-headless (amd64, arm64: 2:1.17-74)   |
| Debian 11          | default-jdk-headless (amd64: 2:1.11-72)  |
| Debian 10          | default-jdk-headless (amd64, i386: 2:1.11-71)  |
| OpenSUSE Leap 15   | java-17-openjdk-devel (amd64: 17.0.5.0-150400.3.9.3; arm64: 17.0.8.0-150400.3.27.1)                        |
| Oracle Linux 9     | java-11-openjdk-devel (amd64: 11.0.19.0.7-4.0.1; arm64: 11.0.20.0.8-2.0.1)                                 |
| Oracle Linux 8     | java-1.8.0-openjdk-devel (amd64: 1.8.0.372.b07-4.0.1);<br>java-11-openjdk-devel (arm64: 11.0.20.0.8-3.0.1) |
| Oracle Linux 7     | java-1.8.0-openjdk-devel (amd64: 1.8.0.282.b08-1)  |
| Raspberry Pi OS 12 | default-jdk-headless (arm64, armhf: 2:1.17-74)   |
| Raspberry Pi OS 11 | default-jdk-headless (arm64: 2:1.11-72; armhf: 2:1.11-72+b4)   |
| Raspberry Pi OS 10 | default-jdk (armhf: 2:1.11-71+b2)  |
| RHEL 9             | java-11-openjdk-devel (amd64: 11.0.19.0.7-4; arm64: 11.0.20.0.8-3)   |
| RHEL 8             | java-1.8.0-openjdk-devel (amd64: 1.8.0.372.b07-4; arm64: 1.8.0.382.b05-2)                                  |
| RHEL 7             | java-1.8.0-openjdk-devel (amd64: 1.8.0.282.b08-1)  |
| SLES 15            | java-17-openjdk-devel (amd64: 17.0.5.0-150400.3.9.3; arm64: 17.0.8.0-150400.3.27.1)                        |
| SLES 12            | java-1_8_0-openjdk-devel (amd64: 1.8.0.252-27.45.6)  |
| Ubuntu 24.04       | default-jdk-headless (amd64, arm64: 2:1.21-75+exp1)  |
| Ubuntu 22.04       | default-jdk-headless (amd64, arm64: 2:1.11-72build2)   |
| Ubuntu 20.04       | default-jdk-headless (amd64, arm64: 2:1.11-72)   |
| Ubuntu 18.04       | default-jdk (amd64: 2:1.11-68ubuntu1~18.04.1; i386: 2:1.10-63ubuntu1~02)                                   |

#### Default port numbers

The following list of open ports per component is applicable for default configuration:

| Zabbix component    | Port number | Protocol | Type of connection |
|---------------------|-------------|----------|--------------------|
| Zabbix agent        | 10050       | TCP      | on demand          |
| Zabbix agent 2      | 10050       | TCP      | on demand          |
| Zabbix server       | 10051       | TCP      | on demand          |
| Zabbix proxy        | 10051       | TCP      | on demand          |
| Zabbix Java gateway | 10052       | TCP      | on demand          |
| Zabbix web service  | 10053       | TCP      | on demand          |
| Zabbix frontend     | 80          | HTTP     | on demand          |
|                     | 443         | HTTPS    | on demand          |
| Zabbix trapper      | 10051       | TCP      | on demand          |

#### Note:

The port numbers should be open in firewall to enable Zabbix communications. Outgoing TCP connections usually do not require explicit firewall settings.

#### Database size

Zabbix configuration data require a fixed amount of disk space and do not grow much.

Zabbix database size mainly depends on these variables, which define the amount of stored historical data:

- Number of processed values per second

This is the average number of new values Zabbix server receives every second. For example, if you have 3000 items for monitoring with a refresh rate of 60 seconds, the number of values per second is calculated as  $3000/60 = 50$ . It means that 50 new values are added to Zabbix database every second.

- Housekeeper settings for history

Zabbix keeps values for a fixed period of time, normally several weeks or months. Each new value requires a certain amount of disk space for data and index.

So, if you would like to keep 30 days of history and you receive 50 values per second, the total number of values will be around  $(30 \times 24 \times 3600) \times 50 = 129.600.000$ , or about 130M of values.

Depending on the database engine used, type of received values (floats, integers, strings, log files, etc), the disk space for keeping a single value may vary from 40 bytes to hundreds of bytes. Normally it is around 90 bytes per value for numeric items<sup>2</sup>.

In this case, it means that 130M of values will require  $130M \times 90 \text{ bytes} = 10.9GB$  of disk space.

**Note:**

The size of text/log item values is impossible to predict exactly, but you may expect around 500 bytes per value.

- Housekeeper setting for trends

Zabbix keeps a 1-hour max/min/avg/count set of values for each item in the table **trends**. The data is used for trending and long period graphs. The one hour period can not be customized.

Zabbix database, depending on the database type, requires about 90 bytes per each total.

Suppose you would like to keep trend data for 5 years. Values for 3000 items will require  $3000 \times 24 \times 365 \times 90 = 2.2GB$  per year, or **11GB** for 5 years.

- Housekeeper settings for events

Each Zabbix event requires approximately 250 bytes of disk space<sup>1</sup>.

It is hard to estimate the number of events generated by Zabbix daily. In the worst-case scenario, you may assume that Zabbix generates one event per second. For each recovered event, an `event_recovery` record is created. Normally, most of the events will be recovered. So, you can assume one `event_recovery` record per event. That means additional 80 bytes per event.

Optionally, events can have tags, each tag record requiring approximately 100 bytes of disk space<sup>1</sup>. The number of tags per event (#tags) depends on configuration.

So, each will need an additional  $\#tags \times 100$  bytes of disk space.

It means that if you want to keep 3 years of events, this would require  $3 \times 365 \times 24 \times 3600 \times (250 + 80 + \#tags \times 100) = \sim 30GB + \#tags \times 100B$  disk space<sup>2</sup>.

**Note:**

<sup>1</sup> More when having non-ASCII event names, tags and values.

<sup>2</sup> The size approximations are based on MySQL and might be different for other databases.

The table contains formulas that can be used to calculate the disk space required for Zabbix system:

| Parameter                   | Formula for required disk space (in bytes)   |
|-----------------------------|--|
| <i>Zabbix configuration</i> | Fixed size. Normally 10MB or less.   |
| <i>History</i>              | $\text{days} \times (\text{items} / \text{refresh rate}) \times 24 \times 3600 \times \text{bytes}$<br>items : number of items<br>days : number of days to keep history<br>refresh rate : average refresh rate of items<br>bytes : number of bytes required to keep single value, depends on database engine, normally ~90 bytes.                                      |
| <i>Trends</i>               | $\text{days} \times (\text{items} / 3600) \times 24 \times 3600 \times \text{bytes}$<br>items : number of items<br>days : number of days to keep history<br>bytes : number of bytes required to keep single trend, depends on the database engine, normally ~90 bytes.   |
| <i>Events</i>               | $\text{days} \times \text{events} \times 24 \times 3600 \times \text{bytes}$<br>events : number of event per second. One (1) event per second in worst-case scenario.<br>days : number of days to keep history<br>bytes : number of bytes required to keep single trend, depends on the database engine, normally ~330 + average number of tags per event * 100 bytes. |

So, the total required disk space can be calculated as:

### Configuration + History + Trends + Events

The disk space will NOT be used immediately after Zabbix installation. Database size will grow then it will stop growing at some point, which depends on housekeeper settings.

### Time synchronization

It is very important to have precise system time on the server with Zabbix running. [ntpd](#) is the most popular daemon that synchronizes the host's time with the time of other machines. It's strongly recommended to maintain synchronized system time on all systems Zabbix components are running on.

## 1 Plugins

Please use the sidebar to access content in the Plugins section.

### 1 PostgreSQL plugin dependencies

#### Overview

The required libraries for the PostgreSQL loadable plugin are listed in this page.

Go libraries

| Requirement   | Mandatory status      | Minimum version | Description  |
|---|-----------------------|-----------------|--|
| <a href="https://git.zabbix.com/ap/plugin/support">git.zabbix.com/ap/plugin/support</a> | Yes                   | 1.X.X           | Zabbix own support library. Mostly for plugins.    |
| <a href="https://github.com/jackc/pgx/v4">github.com/jackc/pgx/v4</a>                   |                       | 4.17.2          | PostgreSQL driver.                                 |
| <a href="https://github.com/omeid/go-yarn">github.com/omeid/go-yarn</a>                 |                       | 0.0.1           | Embeddable filesystem mapped key-string store.     |
| <a href="https://github.com/jackc/chunkedio">github.com/jackc/chunkedio</a>             | Indirect <sup>1</sup> | 2.0.1           |  |
| <a href="https://github.com/jackc/pgconn">github.com/jackc/pgconn</a>                   |                       | 1.13.0          |  |
| <a href="https://github.com/jackc/pgio">github.com/jackc/pgio</a>                       |                       | 1.0.0           |  |
| <a href="https://github.com/jackc/pgpassfile">github.com/jackc/pgpassfile</a>           |                       | 1.0.0           |  |
| <a href="https://github.com/jackc/pgproto3">github.com/jackc/pgproto3</a>               |                       | 2.3.1           |  |
| <a href="https://github.com/jackc/pgservicefile">github.com/jackc/pgservicefile</a>     |                       | 0.0.0           |  |
| <a href="https://github.com/jackc/pgtype">github.com/jackc/pgtype</a>                   |                       | 1.12.0          |  |
| <a href="https://github.com/jackc/puddle">github.com/jackc/puddle</a>                   |                       | 1.3.0           |  |
| <a href="https://github.com/Microsoft/go-winio">github.com/Microsoft/go-winio</a>       |                       | 0.6.0           | Required package for PostgreSQL plugin on Windows. |
| <a href="https://golang.org/x/crypto">golang.org/x/crypto</a>                           |                       | 0.0.0           |  |
| <a href="https://golang.org/x/sys">golang.org/x/sys</a>                                 |                       | 0.0.0           |  |
| <a href="https://golang.org/x/text">golang.org/x/text</a>                               |                       | 0.3.7           |  |

<sup>1</sup> "Indirect" means that it is used in one of the libraries that the agent uses. It's required since Zabbix uses the library that uses the package.

### 2 MongoDB plugin dependencies

#### Overview

The required libraries for the MongoDB loadable plugin are listed in this page.

Go libraries

| Requirement   | Mandatory status      | Minimum version | Description   |
|---|-----------------------|-----------------|---|
| <a href="https://git.zabbix.com/ap/plugin/support">git.zabbix.com/ap/plugin/support</a> | Yes                   | 1.X.X           | Zabbix own support library. Mostly for plugins.       |
| <a href="https://go.mongodb.org/mongo-driver">go.mongodb.org/mongo-driver</a>           |                       | 1.7.6           | Named read/write locks, access sync.                  |
| <a href="https://github.com/go-stack/stack">github.com/go-stack/stack</a>               | Indirect <sup>1</sup> | 1.8.0           | Required package for MongoDB plugin mongo-driver lib. |

| Requirement   | Mandatory status | Minimum version | Description   |
|---|------------------|-----------------|---|
| <a href="https://github.com/golang/snappy">github.com/golang/snappy</a>           |                  | 0.0.1           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/klauspost/compress">github.com/klauspost/compress</a> |                  | 1.13.6          | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/Microsoft/go-winio">github.com/Microsoft/go-winio</a> |                  | 0.6.0           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/pkg/errors">github.com/pkg/errors</a>                 |                  | 0.9.1           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/xdg-go/pbkdf2">github.com/xdg-go/pbkdf2</a>           |                  | 1.0.0           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/xdg-go/scram">github.com/xdg-go/scram</a>             |                  | 1.0.2           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/xdg-go/stringprep">github.com/xdg-go/stringprep</a>   |                  | 1.0.2           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://github.com/youmark/pkcs8">github.com/youmark/pkcs8</a>           |                  | 0.0.0           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://golang.org/x/crypto">golang.org/x/crypto</a>                     |                  | 0.0.0           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://golang.org/x/sync">golang.org/x/sync</a>                         |                  | 0.0.0           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://golang.org/x/sys">golang.org/x/sys</a>                           |                  | 0.0.0           | Required package for MongoDB plugin mongo-driver lib. |
| <a href="https://golang.org/x/text">golang.org/x/text</a>                         |                  | 0.3.7           | Required package for MongoDB plugin mongo-driver lib. |

<sup>1</sup> "Indirect" means that it is used in one of the libraries that the agent uses. It's required since Zabbix uses the library that uses the package.

## 2 Best practices for secure Zabbix setup

### Overview

This section contains best practices that should be observed in order to set up Zabbix in a secure way.

The practices contained here are not required for the functioning of Zabbix. They are recommended for better security of the system.

### Access control

#### Principle of least privilege

The principle of least privilege should be used at all times for Zabbix. This principle means that user accounts (in Zabbix frontend) or process user (for Zabbix server/proxy or agent) have only those privileges that are essential to perform intended functions. In other words, user accounts at all times should run with as few privileges as possible.

#### Attention:

Giving extra permissions to 'zabbix' user will allow it to access configuration files and execute operations that can compromise the overall security of the infrastructure.

When implementing the least privilege principle for user accounts, Zabbix **frontend user types** should be taken into account. It is important to understand that while a "Admin" user type has less privileges than "Super Admin" user type, it has administrative permissions that allow managing configuration and execute custom scripts.

#### Note:

Some information is available even for non-privileged users. For example, while *Administration* → *Scripts* is not available for non-Super Admins, scripts themselves are available for retrieval by using Zabbix API. Limiting script permissions and not adding sensitive information (like access credentials, etc) should be used to avoid exposure of sensitive information available in global scripts.

### Secure user for Zabbix agent

In the default configuration, Zabbix server and Zabbix agent processes share one 'zabbix' user. If you wish to make sure that the agent cannot access sensitive details in server configuration (e.g. database login information), the agent should be run as a different user:

1. Create a secure user
2. Specify this user in the agent **configuration file** ('User' parameter)
3. Restart the agent with administrator privileges. Privileges will be dropped to the specified user.

Revoke write access to SSL configuration file in Windows

Zabbix Windows agent compiled with OpenSSL will try to reach the SSL configuration file in c:\openssl-64bit. The "openssl-64bit" directory on disk C: can be created by non-privileged users.

So for security hardening, it is required to create this directory manually and revoke write access from non-admin users.

Please note that the directory names will be different on 32-bit and 64-bit versions of Windows.

## Cryptography

### Setting up SSL for Zabbix frontend

On RHEL-based systems, install the `mod_ssl` package:

```
dnf install mod_ssl
```

Create a directory for SSL keys:

```
mkdir -p /etc/httpd/ssl/private
chmod 700 /etc/httpd/ssl/private
```

Create the SSL certificate:

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout /etc/httpd/ssl/private/apache-selfsigned.key -
```

Fill out the prompts appropriately. The most important line is the one that requests the `Common Name`. You need to enter the domain name that you want to be associated with your server. You can enter the public IP address instead if you do not have a domain name.

```
Country Name (2 letter code) [XX]:
State or Province Name (full name) []:
Locality Name (eg, city) [Default City]:
Organization Name (eg, company) [Default Company Ltd]:
Organizational Unit Name (eg, section) []:
Common Name (eg, your name or your server's hostname) []:example.com
Email Address []:
```

Edit the Apache SSL configuration file (`/etc/httpd/conf.d/ssl.conf`):

```
DocumentRoot "/usr/share/zabbix"
ServerName example.com:443
SSLCertificateFile /etc/httpd/ssl/apache-selfsigned.crt
SSLCertificateKeyFile /etc/httpd/ssl/private/apache-selfsigned.key
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

## Web server hardening

### Enabling Zabbix on root directory of URL

On RHEL-based systems, add a virtual host to Apache configuration (`/etc/httpd/conf/httpd.conf`) and set permanent redirect for document root to Zabbix SSL URL. Note that `example.com` should be replaced with the actual name of the server.

#### Add lines:

```
<VirtualHost *:*>
    ServerName example.com
    Redirect permanent / https://example.com
</VirtualHost>
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

### Enabling HTTP Strict Transport Security (HSTS) on the web server

To protect Zabbix frontend against protocol downgrade attacks, we recommend enabling [HSTS](#) policy on the web server.

To enable HSTS policy for your Zabbix frontend in Apache configuration, follow these steps:

1. Locate your virtual host's configuration file:

- `/etc/httpd/conf/httpd.conf` on RHEL-based systems
- `/etc/apache2/sites-available/000-default.conf` on Debian/Ubuntu

2. Add the following directive to your virtual host's configuration file:

```
<VirtualHost *:*>
    Header set Strict-Transport-Security "max-age=31536000"
</VirtualHost>
```

3. Restart the Apache service to apply the changes:

```
#### On RHEL-based systems:
systemctl restart httpd.service

#### On Debian/Ubuntu
systemctl restart apache2.service
```

#### Enforcing Secure and SameSite session cookies in Zabbix

When configuring Zabbix, it is essential to enforce secure and SameSite attributes for session cookies to enhance security and prevent cross-site request forgery (CSRF) attacks. However, enforcing SameSite=Strict may cause issues in certain scenarios, such as:

- Dashboard URL widgets displaying "user not logged in" when embedding same-domain iframes.
- Users accessing the dashboard via HTTP instead of HTTPS may face login issues.
- Inability to share URLs to specific Zabbix menu sections or hosts.

To mitigate these issues, users should have a way to adjust the SameSite policy.

##### 1. Secure cookies

Setting the secure flag ensures that cookies are only transmitted over HTTPS, preventing exposure over unencrypted connections.

To enable secure cookies in Zabbix, add or modify the following setting in the web server configuration:

For Apache:

```
Header always edit Set-Cookie ^(.*)$ $1;Secure
```

For Nginx:

```
proxy_cookie_path / "/; Secure";
```

Ensure that your Zabbix frontend is accessed via HTTPS; otherwise, cookies with the Secure flag will not be sent.

##### 2. Configuring the SameSite attribute

Web server settings can also enforce the SameSite attribute:

For Apache:

```
<IfModule mod_headers.c>
    Header onsuccess edit Set-Cookie (.*?) "$1; SameSite=Strict"
</IfModule>
```

For Nginx (version 1.19.3+):

```
proxy_cookie_flags ~ samesite=Strict; # Replace ~ with 'zbx_session' for specificity
```

#### Enabling Content Security Policy (CSP) on the web server

To protect Zabbix frontend against Cross Site Scripting (XSS), data injection, and similar attacks, we recommend enabling Content Security Policy on the web server. To do so, configure the web server to return the [HTTP header](#).

#### Attention:

The following CSP header configuration is only for the default Zabbix frontend installation and for cases when all content originates from the site's domain (excluding subdomains). A different CSP header configuration may be required if you are, for example, configuring the [URL](#) widget to display content from the site's subdomains or external domains, switching from *OpenStreetMap* to another map engine, or adding external CSS or widgets.

To enable CSP for your Zabbix frontend in Apache configuration, follow these steps:

##### 1. Locate your virtual host's configuration file:

- `/etc/httpd/conf/httpd.conf` on RHEL-based systems
- `/etc/apache2/sites-available/000-default.conf` on Debian/Ubuntu

2. Add the following directive to your virtual host's configuration file:

```
<VirtualHost *:*>
    Header set Content-Security-Policy: "default-src 'self' *.openstreetmap.org; script-src 'self' 'unsafe-inline'"
</VirtualHost>
```

3. Restart the Apache service to apply the changes:

```
#### On RHEL-based systems:
systemctl restart httpd.service

#### On Debian/Ubuntu
systemctl restart apache2.service
```

Disabling web server information exposure

It is recommended to disable all web server signatures as part of the web server hardening process. The web server is exposing software signature by default:

▼ **Response Headers** [view source](#)

```
Cache-Control: no-store, no-cache, must-revalidate
Connection: Keep-Alive
Content-Encoding: gzip
Content-Length: 1160
Content-Type: text/html; charset=UTF-8
Keep-Alive: timeout=5, max=100
Pragma: no-cache
Server: Apache/2.4.18 (Ubuntu)
```

The signature can be disabled by adding two lines to the Apache (used as an example) configuration file:

```
ServerSignature Off
ServerTokens Prod
```

PHP signature (X-Powered-By HTTP header) can be disabled by changing the php.ini configuration file (signature is disabled by default):

```
expose_php = Off
```

Web server restart is required for configuration file changes to be applied.

Additional security level can be achieved by using the mod\_security (package libapache2-mod-security2) with Apache. mod\_security allows to remove server signature instead of only removing version from server signature. Signature can be altered to any value by changing "SecServerSignature" to any desired value after installing mod\_security.

Please refer to documentation of your web server to find help on how to remove/change software signatures.

Disabling default web server error pages

It is recommended to disable default error pages to avoid information exposure. Web server is using built-in error pages by default:

# Not Found

The requested URL /custom-text was not found on this server.

---

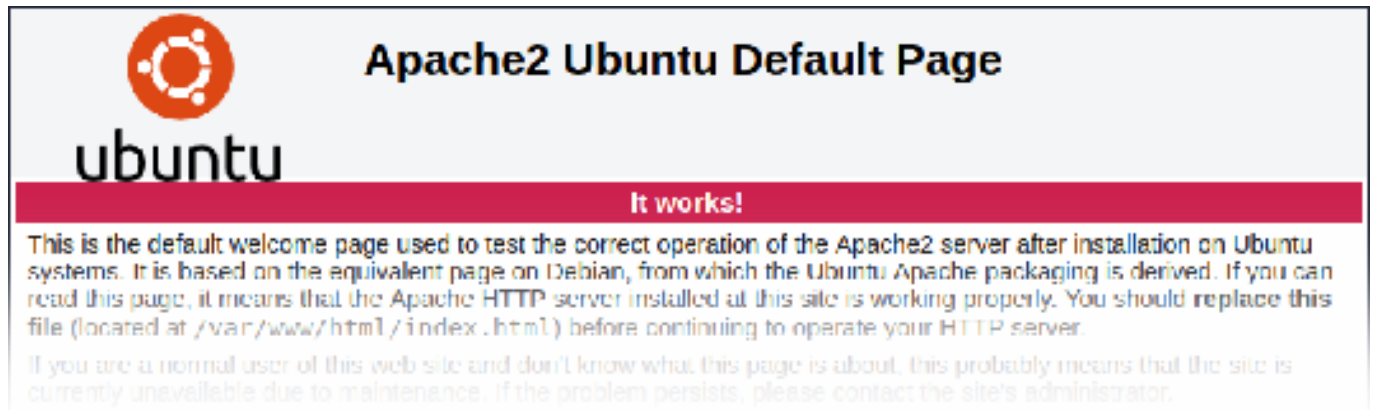

Apache/2.4.18 (Ubuntu) Server at localhost Port 80

Default error pages should be replaced/removed as part of the web server hardening process. The "ErrorDocument" directive can be used to define a custom error page/text for Apache web server (used as an example).

Please refer to documentation of your web server to find help on how to replace/remove default error pages.

#### Removing web server test page

It is recommended to remove the web server test page to avoid information exposure. By default, web server webroot contains a test page called index.html (Apache2 on Ubuntu is used as an example):

The test page should be removed or should be made unavailable as part of the web server hardening process.

#### Set X-Frame-Options HTTP response header

By default, Zabbix is configured with X-Frame-Options HTTP header\* set to SAMEORIGIN. This means that content can only be loaded in a frame that has the same origin as the page itself.

Zabbix frontend elements that pull content from external URLs (namely, the URL **dashboard widget**) display retrieved content in a sandbox with all sandboxing restrictions enabled.

These settings enhance the security of the Zabbix frontend and provide protection against XSS and clickjacking attacks. *Super admin* users can **modify** the *Use iframe sandboxing* and *Use X-Frame-Options HTTP header* parameters as needed. Please carefully weigh the risks and benefits before changing default settings. Turning iframe sandboxing or X-Frame-Options HTTP header off completely is not recommended.

#### Hiding the file with list of common passwords

To increase the complexity of password brute force attacks, it is suggested to limit access to the file `ui/data/top_passwords.txt` by modifying web server configuration. This file contains a list of the most common and context-specific passwords, and is used to prevent users from setting such passwords if *Avoid easy-to-guess passwords* parameter is enabled in the **password policy**.

For example, on NGINX file access can be limited by using the location directive:

```
location = /data/top_passwords.txt {
    deny all;
    return 404;
}
```

On Apache - by using `.htaccess` file:

```
<Files "top_passwords.txt">
    Order Allow,Deny
    Deny from all
</Files>
```

#### UTF-8 encoding

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings.

#### Windows installer paths

When using Windows installers, it is recommended to use default paths provided by the installer as using custom paths without proper permissions could compromise the security of the installation.

#### Zabbix Security Advisories and CVE database

See [Zabbix Security Advisories and CVE database](#).

### 3 Installation from sources

You can get the very latest version of Zabbix by compiling it from the sources.

A step-by-step tutorial for installing Zabbix from the sources is provided here.

#### 1 Installing Zabbix daemons

##### 1 Download the source archive

Go to the [Zabbix download page](#) and download the source archive. Once downloaded, extract the sources, by running:

```
tar -zxvf zabbix-6.0.0.tar.gz
```

#### Note:

Enter the correct Zabbix version in the command. It must match the name of the downloaded archive.

##### 2 Create user account

For all of the Zabbix daemon processes, an unprivileged user is required. If a Zabbix daemon is started from an unprivileged user account, it will run as that user.

However, if a daemon is started from a 'root' account, it will switch to a 'zabbix' user account, which must be present. To create such a user account (in its own group, "zabbix"),

on a RedHat-based system, run:

```
groupadd --system zabbix
useradd --system -g zabbix -d /usr/lib/zabbix -s /sbin/nologin -c "Zabbix Monitoring System" zabbix
```

on a Debian-based system, run:

```
addgroup --system --quiet zabbix
adduser --quiet --system --disabled-login --ingroup zabbix --home /var/lib/zabbix --no-create-home zabbix
```

#### Attention:

Zabbix processes do not need a home directory, which is why we do not recommend creating it. However, if you are using some functionality that requires it (e. g. store MySQL credentials in \$HOME/.my.cnf) you are free to create it using the following commands.

On RedHat-based systems, run:

```
mkdir -m u=rwx,g=rwx,o= -p /usr/lib/zabbix
chown zabbix:zabbix /usr/lib/zabbix
```

On Debian-based systems, run:

```
mkdir -m u=rwx,g=rwx,o= -p /var/lib/zabbix
chown zabbix:zabbix /var/lib/zabbix
```

A separate user account is not required for Zabbix frontend installation.

If Zabbix **server** and **agent** are run on the same machine it is recommended to use a different user for running the server than for running the agent. Otherwise, if both are run as the same user, the agent can access the server configuration file and any Admin level user in Zabbix can quite easily retrieve, for example, the database password.

#### Attention:

Running Zabbix as root, bin, or any other account with special rights is a security risk.

##### 3 Create Zabbix database

For Zabbix **server** and **proxy** daemons, as well as Zabbix frontend, a database is required. It is not needed to run Zabbix **agent**.

SQL **scripts are provided** for creating database schema and inserting the dataset. Zabbix proxy database needs only the schema while Zabbix server database requires also the dataset on top of the schema.

Having created a Zabbix database, proceed to the following steps of compiling Zabbix.

##### 4 Configure the sources

C99 with GNU extensions is required for building Zabbix server, Zabbix proxy or Zabbix agent. This version can be explicitly specified by setting `CFLAGS="-std=gnu99"`:

```
export CFLAGS="-std=gnu99"
```

**Note:**

If installing from [Zabbix Git repository](#), it is required to run first:

```
./bootstrap.sh
```

When configuring the sources for a Zabbix server or proxy, you must specify the database type to be used. Only one database type can be compiled with a server or proxy process at a time.

To see all of the supported configuration options, inside the extracted Zabbix source directory run:

```
./configure --help
```

To configure the sources for a Zabbix server and agent, you may run something like:

```
./configure --enable-server --enable-agent --with-mysql --enable-ipv6 --with-net-snmp --with-libcurl --with-
```

To configure the sources for a Zabbix server (with PostgreSQL etc.), you may run:

```
./configure --enable-server --with-postgresql --with-net-snmp
```

To configure the sources for a Zabbix proxy (with SQLite etc.), you may run:

```
./configure --prefix=/usr --enable-proxy --with-net-snmp --with-sqlite3 --with-ssh2
```

To configure the sources for a Zabbix agent, you may run:

```
./configure --enable-agent
```

or, for Zabbix agent 2:

```
./configure --enable-agent2
```

**Note:**

A configured Go environment with a currently supported [Go version](#) is required for building Zabbix agent 2. See [go.dev](#) for installation instructions.

Notes on compilation options:

- Command-line utilities `zabbix_get` and `zabbix_sender` are compiled if `--enable-agent` option is used.
- `--with-libcurl` and `--with-libxml2` configuration options are required for virtual machine monitoring; `--with-libcurl` is also required for SMTP authentication and `web.page.*` Zabbix agent [items](#). Note that cURL 7.20.0 or higher is [required](#) with the `--with-libcurl` configuration option.
- Zabbix always compiles with the PCRE library (since version 3.4.0); installing it is not optional. `--with-libpcre=[DIR]` only allows pointing to a specific base install directory, instead of searching through a number of common places for the libpcre files.
- You may use the `--enable-static` flag to statically link libraries. If you plan to distribute compiled binaries among different servers, you must use this flag to make these binaries work without required libraries. Note that `--enable-static` does not work in [Solaris](#).
- Using `--enable-static` option is not recommended when building server. In order to build the server statically, you must have a static version of every external library needed. There is no strict check for that in configure script.
- Add optional path to the MySQL configuration file `--with-mysql=/<path_to_the_file>/mysql_config` to select the desired MySQL client library when there is a need to use one that is not located in the default location. It is useful when there are several versions of MySQL installed or MariaDB installed alongside MySQL on the same system.
- Use `--with-oracle` flag to specify location of the OCI API.

**Attention:**

If `./configure` fails due to missing libraries or some other circumstance, please see the `config.log` file for more details on the error. For example, if `libssl` is missing, the immediate error message may be misleading:

```
checking for main in -lmysqlclient... no
configure: error: Not found mysqlclient library
```

While `config.log` has a more detailed description:

```
/usr/bin/ld: cannot find -lssl
/usr/bin/ld: cannot find -lcrypto
```

See also:

- [Compiling Zabbix with encryption support](#) for encryption support
- [Known issues](#) with compiling Zabbix agent on HP-UX

## 5 Make and install everything

### Note:

If installing from [Zabbix Git repository](#), it is required to run first:

```
$ make dbschema
```

`make install`

This step should be run as a user with sufficient permissions (commonly 'root', or by using `sudo`).

Running `make install` will by default install the daemon binaries (`zabbix_server`, `zabbix_agentd`, `zabbix_proxy`) in `/usr/local/sbin` and the client binaries (`zabbix_get`, `zabbix_sender`) in `/usr/local/bin`.

### Note:

To specify a different location than `/usr/local`, use a `--prefix` key in the previous step of configuring sources, for example `--prefix=/home/zabbix`. In this case daemon binaries will be installed under `<prefix>/sbin`, while utilities under `<prefix>/bin`. Man pages will be installed under `<prefix>/share`.

## 6 Review and edit configuration files

- edit the Zabbix agent configuration file **`/usr/local/etc/zabbix_agentd.conf`**

You need to configure this file for every host with `zabbix_agentd` installed.

You must specify the Zabbix server **IP address** in the file. Connections from other hosts will be denied.

- edit the Zabbix server configuration file **`/usr/local/etc/zabbix_server.conf`**

You must specify the database name, user and password (if using any).

The rest of the parameters will suit you with their defaults if you have a small installation (up to ten monitored hosts). You should change the default parameters if you want to maximize the performance of Zabbix server (or proxy) though.

- if you have installed a Zabbix proxy, edit the proxy configuration file **`/usr/local/etc/zabbix_proxy.conf`**

You must specify the server IP address and proxy hostname (must be known to the server), as well as the database name, user and password (if using any).

### Note:

With SQLite the full path to database file must be specified; DB user and password are not required.

## 7 Start up the daemons

Run `zabbix_server` on the server side.

`zabbix_server`

### Note:

Make sure that your system allows allocation of 36MB (or a bit more) of shared memory, otherwise the server may not start and you will see "Cannot allocate shared memory for <type of cache>." in the server log file. This may happen on FreeBSD, Solaris 8.

Run `zabbix_agentd` on all the monitored machines.

`zabbix_agentd`

### Note:

Make sure that your system allows allocation of 2MB of shared memory, otherwise the agent may not start and you will see "Cannot allocate shared memory for collector." in the agent log file. This may happen on Solaris 8.

If you have installed Zabbix proxy, run `zabbix_proxy`.

`zabbix_proxy`

## 2 Installing Zabbix web interface

### Copying PHP files

Zabbix frontend is written in PHP, so to run it a PHP supported webserver is needed. Installation is done by simply copying the PHP files from the ui directory to the webserver HTML documents directory.

Common locations of HTML documents directories for Apache web servers include:

- /usr/local/apache2/htdocs (default directory when installing Apache from source)
- /srv/www/htdocs (OpenSUSE, SLES)
- /var/www/html (Debian, Ubuntu, Fedora, RHEL)

It is suggested to use a subdirectory instead of the HTML root. To create a subdirectory and copy Zabbix frontend files into it, execute the following commands, replacing the actual directory:

```
mkdir <htdocs>/zabbix
cd ui
cp -a . <htdocs>/zabbix
```

If planning to use any other language than English, see [Installation of additional frontend languages](#) for instructions.

### Installing frontend

Please see [Web interface installation](#) page for information about Zabbix frontend installation wizard.

## 3 Installing Java gateway

It is required to install Java gateway only if you want to monitor JMX applications. Java gateway is lightweight and does not require a database.

To install from sources, first [download](#) and extract the source archive.

To compile Java gateway, run the `./configure` script with `--enable-java` option. It is advisable that you specify the `--prefix` option to request installation path other than the default `/usr/local`, because installing Java gateway will create a whole directory tree, not just a single executable.

```
./configure --enable-java --prefix=$PREFIX
```

To compile and package Java gateway into a JAR file, run `make`. Note that for this step you will need `javac` and `jar` executables in your path.

```
make
```

Now you have a `zabbix-java-gateway-$VERSION.jar` file in `src/zabbix_java/bin`. If you are comfortable with running Java gateway from `src/zabbix_java` in the distribution directory, then you can proceed to instructions for configuring and running [Java gateway](#). Otherwise, make sure you have enough privileges and run `make install`.

```
make install
```

Proceed to [setup](#) for more details on configuring and running Java gateway.

## 4 Installing Zabbix web service

Installing Zabbix web service is only required if you want to use [scheduled reports](#).

To install from sources, first [download](#) and extract the source archive.

To compile Zabbix web service, run the `./configure` script with `--enable-webservice` option.

### Note:

A configured [Go](#) version 1.13+ environment is required for building Zabbix web service.

Run `zabbix_web_service` on the machine, where the web service is installed:

```
zabbix_web_service
```

Proceed to [setup](#) for more details on configuring Scheduled reports generation.

## 1 Building Zabbix agent on Windows

### Overview

This section demonstrates how to build Zabbix Windows agent binaries from sources with or without TLS.

## Compiling OpenSSL

The following steps will help you to compile OpenSSL from sources on MS Windows 10 (64-bit).

1. For compiling OpenSSL you will need on Windows machine:
  1. C compiler (e.g. VS 2017 RC),
  2. NASM (<https://www.nasm.us/>),
  3. Perl (e.g. Strawberry Perl from <http://strawberryperl.com/>),
  4. Perl module Text::Template (cpan Text::Template).
2. Get OpenSSL sources from <https://www.openssl.org/>. OpenSSL 1.1.1 is used here.
3. Unpack OpenSSL sources, for example, in E:\openssl-1.1.1.
4. Open a commandline window e.g. the x64 Native Tools Command Prompt for VS 2017 RC.
5. Go to the OpenSSL source directory, e.g. E:\openssl-1.1.1.
  1. Verify that NASM can be found: `e:\openssl-1.1.1> nasm --version` NASM version 2.13.01 compiled on May 1 2017
6. Configure OpenSSL, for example: `e:\openssl-1.1.1> perl E:\openssl-1.1.1\Configure VC-WIN64A no-shared no-capieng no-srp no-gost no-dgram no-dtls1-method no-dtls1_2-method --api=1.1.0 --prefix=C:\OpenSSL --openssldir=C:\OpenSSL-Win64-111-static`
  - Note the option 'no-shared': if 'no-shared' is used then the OpenSSL static libraries libcrypto.lib and libssl.lib will be 'self-sufficient' and resulting Zabbix binaries will include OpenSSL in themselves, no need for external OpenSSL DLLs. Advantage: Zabbix binaries can be copied to other Windows machines without OpenSSL libraries. Disadvantage: when a new OpenSSL bugfix version is released, Zabbix agent needs to be recompiled and reinstalled.
  - If 'no-shared' is not used, then the static libraries libcrypto.lib and libssl.lib will be using OpenSSL DLLs at runtime. Advantage: when a new OpenSSL bugfix version is released, probably you can upgrade only OpenSSL DLLs, without recompiling Zabbix agent. Disadvantage: copying Zabbix agent to another machine requires copying OpenSSL DLLs, too.
7. Compile OpenSSL, run tests, install: `e:\openssl-1.1.1> nmake` `e:\openssl-1.1.1> nmake test` ... All tests successful. Files=152, Tests=1152, 501 wallclock secs ( 0.67 usr + 0.61 sys = 1.28 CPU) Result: PASS `e:\openssl-1.1.1> nmake install_sw` 'install\_sw' installs only software components (i.e. libraries, header files, but no documentation). If you want everything, use "nmake install".

## Compiling PCRE

1. Download the PCRE or PCRE2 (supported since Zabbix 6.0) library (<https://pcre.org/>).
2. Extract to directory E:\pcre2-10.39.
3. Install CMake from <https://cmake.org/download/>, during install select: and ensure that cmake\bin is on your path (tested version 3.9.4).
4. Create a new, empty build directory, preferably a subdirectory of the source dir. For example, E:\pcre2-10.39\build.
5. Open a commandline window e.g. the x64 Native Tools Command Prompt for VS 2017 and from that shell environment run cmake-gui. Do not try to start CMake from the Windows Start menu, as this can lead to errors.
6. Enter E:\pcre2-10.39 and E:\pcre2-10.39\build for the source and build directories, respectively.
7. Hit the "Configure" button.
8. When specifying the generator for this project select "NMake Makefiles".
9. Create a new, empty install directory. For example, E:\pcre2-10.39-install.
10. The GUI will then list several configuration options. Make sure the following options are selected:
  - **PCRE\_SUPPORT\_UNICODE\_PROPERTIES ON**
  - **PCRE\_SUPPORT\_UTF ON**
  - **CMAKE\_INSTALL\_PREFIX E:\pcre2-10.39-install**
11. Hit "Configure" again. The adjacent "Generate" button should now be active.
12. Hit "Generate".
13. In the event that errors occur, it is recommended that you delete the CMake cache before attempting to repeat the CMake build process. In the CMake GUI, the cache can be deleted by selecting "File > Delete Cache".
14. The build directory should now contain a usable build system - *Makefile*.
15. Open a commandline window e.g. the x64 Native Tools Command Prompt for VS 2017 and navigate to the *Makefile* mentioned above.
16. Run NMake command: `E:\pcre2-10.39\build> nmake install`

## Compiling Zabbix

The following steps will help you to compile Zabbix from sources on MS Windows 10 (64-bit). When compiling Zabbix with/without TLS support the only significant difference is in step 4.

1. On a Linux machine check out the source from git: 

```
$ git clone https://git.zabbix.com/scm/zbx/zabbix.git
$ cd zabbix      $ ./bootstrap.sh      $ ./configure --enable-agent --enable-ipv6 --prefix=`pwd`
$ make dbschema  $ make dist
```
2. Copy and unpack the archive, e.g. zabbix-4.4.0.tar.gz, on a Windows machine.

- Let's assume that sources are in e:\zabbix-4.4.0. Open a commandline window e.g. the x64 Native Tools Command Prompt for VS 2017 RC. Go to E:\zabbix-4.4.0\build\win32\project.
- Compile zabbix\_get, zabbix\_sender and zabbix\_agent.
  - without TLS: E:\zabbix-4.4.0\build\win32\project> nmake /K PCREINCDIR=E:\pcre2-10.39-install\include PCRELIBDIR=E:\pcre2-10.39-install\lib
  - with TLS: E:\zabbix-4.4.0\build\win32\project> nmake /K -f Makefile\_get TLS=openssl TLSINCDIR=C:\OpenSSL-Win64-111-static\include PCRELIBDIR=E:\pcre2-10.39-install\lib E:\zabbix-4.4.0\build\win32\project> nmake /K -f Makefile\_sender TLS=openssl TLSINCDIR="C:\OpenSSL-Win64-111-static\include" PCRELIBDIR=E:\pcre2-10.39-install\lib E:\zabbix-4.4.0\build\win32\project> nmake /K -f Makefile\_agent TLS=openssl TLSINCDIR=C:\OpenSSL-Win64-111-static\include PCRELIBDIR=E:\pcre2-10.39-install\lib
- New binaries are located in e:\zabbix-4.4.0\bin\win64. Since OpenSSL was compiled with 'no-shared' option, Zabbix binaries contain OpenSSL within themselves and can be copied to other machines that do not have OpenSSL.

#### Compiling Zabbix with LibreSSL

The process is similar to compiling with OpenSSL, but you need to make small changes in files located in the build\win32\project directory:

- In Makefile\_tls delete /DHAVE\_OPENSSL\_WITH\_PSK, i.e. find:

```
CFLAGS = $(CFLAGS) /DHAVE_OPENSSL /DHAVE_OPENSSL_WITH_PSK
```

and replace it with

```
CFLAGS = $(CFLAGS) /DHAVE_OPENSSL
```

- In Makefile\_common.inc add /NODEFAULTLIB:LIBCMT i.e. find:

```
/MANIFESTUAC:"level='asInvoker' uiAccess='false'" /DYNAMICBASE:NO /PDB:${TARGETDIR}\$(TARGETNAME).pdb
```

and replace it with

```
/MANIFESTUAC:"level='asInvoker' uiAccess='false'" /DYNAMICBASE:NO /PDB:${TARGETDIR}\$(TARGETNAME).pdb /NODEFAULTLIB:LIBCMT
```

## 2 Building Zabbix agent 2 on Windows

### Overview

This section demonstrates how to build Zabbix agent 2 (Windows) from sources.

#### Installing MinGW Compiler

- Download MinGW-w64 with SJLJ (set jump/long jump) Exception Handling and Windows threads (for example x86\_64-8.1.0-release-win32-sjlj-rt\_v6-rev0.7z)
- Extract and move to c:\mingw
- Setup environmental variable

```
@echo off
set PATH=%PATH%;c:\mingw\bin
cmd
```

When compiling use Windows prompt instead of MSYS terminal provided by MinGW

#### Compiling PCRE development libraries

The following instructions will compile and install 64-bit PCRE libraries in c:\dev\pcre and 32-bit libraries in c:\dev\pcre32:

- Download the PCRE or PCRE2 (supported since Zabbix 6.0) library (<https://pcre.org/>) and extract
- Open cmd and navigate to the extracted sources

#### Build 64bit PCRE

- Delete old configuration/cache if exists:

```
del CMakeCache.txt
rmdir /q /s CMakeFiles
```

- Run cmake (CMake can be installed from <https://cmake.org/download/>):

```
cmake -G "MinGW Makefiles" -DCMAKE_C_COMPILER=gcc -DCMAKE_C_FLAGS="-O2 -g" -DCMAKE_CXX_FLAGS="-O2 -g" -DCMAKE_BUILD_TYPE=Release
```

3. Next, run:

```
mingw32-make clean
mingw32-make install
```

Build 32bit PCRE

1. Run:

```
mingw32-make clean
```

2. Delete *CMakeCache.txt*:

```
del CMakeCache.txt
rmdir /q /s CMakeFiles
```

3. Run cmake:

```
cmake -G "MinGW Makefiles" -DCMAKE_C_COMPILER=gcc -DCMAKE_C_FLAGS="-m32 -O2 -g" -DCMAKE_CXX_FLAGS="-m32 -O2 -g"
```

4. Next, run:

```
mingw32-make install
```

Installing OpenSSL development libraries

1. Download 32 and 64 bit builds from <https://curl.se/windows/>
2. Extract files into *c:\dev\openssl32* and *c:\dev\openssl* directories accordingly.
3. After that remove extracted \*.dll.a (dll call wrapper libraries) as MinGW prioritizes them before static libraries.

Compiling Zabbix agent 2

32 bit

Open MinGW environment (Windows command prompt) and navigate to *build/mingw* directory in the Zabbix source tree.

Run:

```
mingw32-make clean
mingw32-make ARCH=x86 PCRE=c:\dev\pcre32 OPENSSL=c:\dev\openssl32
```

64 bit

Open MinGW environment (Windows command prompt) and navigate to *build/mingw* directory in the Zabbix source tree.

Run:

```
mingw32-make clean
mingw32-make PCRE=c:\dev\pcre OPENSSL=c:\dev\openssl
```

**Note:**

Both 32- and 64- bit versions can be built on a 64-bit platform, but only a 32-bit version can be built on a 32-bit platform. When working on the 32-bit platform, follow the same steps as for 64-bit version on 64-bit platform.

### 3 Building Zabbix agent on macOS

#### Overview

This section demonstrates how to build Zabbix macOS agent binaries from sources with or without TLS.

#### Prerequisites

You will need command line developer tools (Xcode is not required), Automake, pkg-config and PCRE (v8.x) or PCRE2 (v10.x). If you want to build agent binaries with TLS, you will also need OpenSSL or GnuTLS.

To install Automake and pkg-config, you will need a Homebrew package manager from <https://brew.sh/>. To install it, open terminal and run the following command:

```
/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

Then install Automake and pkg-config:

```
brew install automake
brew install pkg-config
```

Preparing PCRE, OpenSSL and GnuTLS libraries depends on the way how they are going to be linked to the agent.

If you intend to run agent binaries on a macOS machine that already has these libraries, you can use precompiled libraries that are provided by Homebrew. These are typically macOS machines that use Homebrew for building Zabbix agent binaries or for other purposes.

If agent binaries will be used on macOS machines that don't have the shared version of libraries, you should compile static libraries from sources and link Zabbix agent with them.

Building agent binaries with shared libraries

Install PCRE2 (replace *pcre2* with *pcre* in the commands below, if needed):

```
brew install pcre2
```

When building with TLS, install OpenSSL and/or GnuTLS:

```
brew install openssl
brew install gnutls
```

Download Zabbix source:

```
git clone https://git.zabbix.com/scm/zbx/zabbix.git
```

Build agent without TLS:

```
cd zabbix
./bootstrap.sh
./configure --sysconfdir=/usr/local/etc/zabbix --enable-agent --enable-ipv6
make
make install
```

Build agent with OpenSSL:

```
cd zabbix
./bootstrap.sh
./configure --sysconfdir=/usr/local/etc/zabbix --enable-agent --enable-ipv6 --with-openssl=/usr/local/opt/openssl
make
make install
```

Build agent with GnuTLS:

```
cd zabbix-source/
./bootstrap.sh
./configure --sysconfdir=/usr/local/etc/zabbix --enable-agent --enable-ipv6 --with-gnutls=/usr/local/opt/gnutls
make
make install
```

Building agent binaries with static libraries without TLS

Let's assume that PCRE static libraries will be installed in `$HOME/static-libs`. We will use PCRE2 10.39.

```
PCRE_PREFIX="$HOME/static-libs/pcre2-10.39"
```

Download and build PCRE with Unicode properties support:

```
mkdir static-libs-source
cd static-libs-source
curl --remote-name https://github.com/PhilipHazel/pcre2/releases/download/pcre2-10.39/pcre2-10.39.tar.gz
tar xf pcre2-10.39.tar.gz
cd pcre2-10.39
./configure --prefix="$PCRE_PREFIX" --disable-shared --enable-static --enable-unicode-properties
make
make check
make install
```

Download Zabbix source and build agent:

```
git clone https://git.zabbix.com/scm/zbx/zabbix.git
cd zabbix
./bootstrap.sh
./configure --sysconfdir=/usr/local/etc/zabbix --enable-agent --enable-ipv6 --with-libpcre2="$PCRE_PREFIX"
make
make install
```

## Building agent binaries with static libraries with OpenSSL

When building OpenSSL, it's recommended to run `make test` after successful building. Even if building was successful, tests sometimes fail. If this is the case, problems should be researched and resolved before continuing.

Let's assume that PCRE and OpenSSL static libraries will be installed in `$HOME/static-libs`. We will use PCRE2 10.39 and OpenSSL 1.1.1a.

```
PCRE_PREFIX="$HOME/static-libs/pcre2-10.39"
OPENSSL_PREFIX="$HOME/static-libs/openssl-1.1.1a"
```

Let's build static libraries in `static-libs-source`:

```
mkdir static-libs-source
cd static-libs-source
```

Download and build PCRE with Unicode properties support:

```
curl --remote-name https://github.com/PhilipHazel/pcre2/releases/download/pcre2-10.39/pcre2-10.39.tar.gz
tar xf pcre2-10.39.tar.gz
cd pcre2-10.39
./configure --prefix="$PCRE_PREFIX" --disable-shared --enable-static --enable-unicode-properties
make
make check
make install
cd ..
```

Download and build OpenSSL:

```
curl --remote-name https://www.openssl.org/source/openssl-1.1.1a.tar.gz
tar xf openssl-1.1.1a.tar.gz
cd openssl-1.1.1a
./Configure --prefix="$OPENSSL_PREFIX" --openssldir="$OPENSSL_PREFIX" --api=1.1.0 no-shared no-capieng no-
make
make test
make install_sw
cd ..
```

Download Zabbix source and build agent:

```
git clone https://git.zabbix.com/scm/zbx/zabbix.git
cd zabbix
./bootstrap.sh
./configure --sysconfdir=/usr/local/etc/zabbix --enable-agent --enable-ipv6 --with-libpcre2="$PCRE_PREFIX"
make
make install
```

## Building agent binaries with static libraries with GnuTLS

GnuTLS depends on the Nettle crypto backend and GMP arithmetic library. Instead of using full GMP library, this guide will use mini-gmp which is included in Nettle.

When building GnuTLS and Nettle, it's recommended to run `make check` after successful building. Even if building was successful, tests sometimes fail. If this is the case, problems should be researched and resolved before continuing.

Let's assume that PCRE, Nettle and GnuTLS static libraries will be installed in `$HOME/static-libs`. We will use PCRE2 10.39, Nettle 3.4.1 and GnuTLS 3.6.5.

```
PCRE_PREFIX="$HOME/static-libs/pcre2-10.39"
NETTLE_PREFIX="$HOME/static-libs/nettle-3.4.1"
GNUTLS_PREFIX="$HOME/static-libs/gnutls-3.6.5"
```

Let's build static libraries in `static-libs-source`:

```
mkdir static-libs-source
cd static-libs-source
```

Download and build Nettle:

```
curl --remote-name https://ftp.gnu.org/gnu/nettle/nettle-3.4.1.tar.gz
tar xf nettle-3.4.1.tar.gz
cd nettle-3.4.1
./configure --prefix="$NETTLE_PREFIX" --enable-static --disable-shared --disable-documentation --disable-a-
```

```
make
make check
make install
cd ..
```

Download and build GnuTLS:

```
curl --remote-name https://www.gnupg.org/ftp/gcrypt/gnutls/v3.6/gnutls-3.6.5.tar.xz
tar xf gnutls-3.6.5.tar.xz
cd gnutls-3.6.5
PKG_CONFIG_PATH="$NETTLE_PREFIX/lib/pkgconfig" ./configure --prefix="$GNUTLS_PREFIX" --enable-static --dis
make
make check
make install
cd ..
```

Download Zabbix source and build agent:

```
git clone https://git.zabbix.com/scm/zbx/zabbix.git
cd zabbix
./bootstrap.sh
CFLAGS="-Wno-unused-command-line-argument -framework Foundation -framework Security" \
> LIBS="-lgnutls -lhogweed -lnettle" \
> LDFLAGS="-L$GNUTLS_PREFIX/lib -L$NETTLE_PREFIX/lib" \
> ./configure --sysconfdir=/usr/local/etc/zabbix --enable-agent --enable-ipv6 --with-libpcre2="$PCRE_PREFI
make
make install
```

## 4 Installation from packages

Zabbix SIA provides official RPM and DEB packages for:

- [Red Hat Enterprise Linux](#)
- [Debian/Ubuntu/Raspbian](#)
- [SUSE Linux Enterprise Server](#)

Package files for yum/dnf, apt, and zypper repositories for various OS distributions are available in the [Zabbix official repository](#).

Note that though some OS distributions (in particular, Debian-based distributions) provide their own Zabbix packages, these packages are not supported by Zabbix. Zabbix packages provided by third parties can be out of date and may lack the latest features and bug fixes. It is recommended to use only the packages from the [Zabbix official repository](#). If you have previously used unofficial Zabbix packages, see notes about [upgrading Zabbix packages from OS repositories](#).

### 1 Red Hat Enterprise Linux

#### Overview

Official Zabbix 6.0 LTS packages for Red Hat Enterprise Linux and Oracle Linux are available on [Zabbix website](#).

#### Attention:

Zabbix packages for Red Hat Enterprise Linux systems are intended only for RHEL systems. Alternative environments, such as [Red Hat Universal Base Image](#), may lack the necessary dependencies and repository access requirements for successful installation. To address such issues, verify compatibility with the target environment and ensure access to required repositories and dependencies before proceeding with Zabbix installation from packages. For more information, see [Known issues](#).

Packages are available with either MySQL/PostgreSQL database and Apache/Nginx web server support.

*Zabbix agent* packages and utilities *Zabbix get* and *Zabbix sender* are available on Zabbix Official Repository for [RHEL 9](#), [RHEL 8](#), [RHEL 7](#), [RHEL 6](#), and [RHEL 5](#).

**Attention:**

Since Zabbix 6.0.35, Zabbix agent 2 packages are no longer available for [RHEL 6](#) due to Go 1.22 (and newer) being incompatible with GCC 4.4.7 provided by RHEL 6, which results in compilation errors. Note, however, that **Zabbix agent packages** are still supported.

Zabbix Official Repository provides *fping*, *iksemel* and *libssh2* packages as well. These packages are located in the [non-supported](#) directory.

**Attention:**

The EPEL repository for EL9 also provides Zabbix packages. If both the official Zabbix repository and EPEL repositories are installed, then the Zabbix packages in EPEL **must be** excluded by adding the following clause to the EPEL repo configuration file under `/etc/yum.repos.d/`:

```
[epel]
```

```
...
```

```
excludepkgs=zabbix*
```

See also: [Accidental installation of EPEL Zabbix packages](#)

## Notes on installation

See [installation instructions](#) per platform in the download page for:

- installing the repository
- installing server/agent/frontend
- creating initial database, importing initial data
- configuring database for Zabbix server
- configuring PHP for Zabbix frontend
- starting server/agent processes
- configuring Zabbix frontend

If you want to run Zabbix agent as root, see [Running agent as root](#).

Zabbix web service process, which is used for [scheduled report generation](#), requires Google Chrome browser. The browser is not included into packages and has to be installed manually.

## Importing data with Timescale DB

With TimescaleDB, in addition to the import command for PostgreSQL, also run:

```
cat /usr/share/zabbix-sql-scripts/postgresql/timescaledb.sql | sudo -u zabbix psql zabbix
```

**Warning:**

TimescaleDB is supported with Zabbix server only.

## PHP 7.2

Zabbix frontend requires PHP version **7.2 or newer**.

## SELinux configuration

Zabbix uses socket-based inter-process communication. On systems where SELinux is enabled, it may be required to add SELinux rules to allow Zabbix create/use UNIX domain sockets in the SocketDir directory. Currently socket files are used by server (alerter, preprocessing, IPMI) and proxy (IPMI). Socket files are persistent, meaning they are present while the process is running.

Having SELinux status enabled in enforcing mode, you need to execute the following commands to enable communication between Zabbix frontend and server:

RHEL 7 and later:

```
setsebool -P httpd_can_connect_zabbix on
```

If the database is accessible over network (including 'localhost' in case of PostgreSQL), you need to allow Zabbix frontend to connect to the database too:

```
setsebool -P httpd_can_network_connect_db on
```

RHEL prior to 7:

```
setsebool -P httpd_can_network_connect on
```

```
setsebool -P zabbix_can_network on
```

After the frontend and SELinux configuration is done, restart the Apache web server:

```
systemctl restart httpd
```

In addition, Zabbix provides the zabbix-selinux-policy package as part of source RPM packages for [RHEL 8](#) and [RHEL 7](#). This package provides a basic default policy for SELinux and makes zabbix components work out-of-the-box by allowing Zabbix to create and use sockets and enabling httpd connection to PostgreSQL (used by frontend).

The source *zabbix\_policy.te* file contains the following rules:

```
module zabbix_policy 1.2;

require {
    type zabbix_t;
    type zabbix_port_t;
    type zabbix_var_run_t;
    type postgresql_port_t;
    type httpd_t;
    class tcp_socket name_connect;
    class sock_file { create unlink };
    class unix_stream_socket connectto;
}

#===== zabbix_t =====
allow zabbix_t self:unix_stream_socket connectto;
allow zabbix_t zabbix_port_t:tcp_socket name_connect;
allow zabbix_t zabbix_var_run_t:sock_file create;
allow zabbix_t zabbix_var_run_t:sock_file unlink;
allow httpd_t zabbix_port_t:tcp_socket name_connect;

#===== httpd_t =====
allow httpd_t postgresql_port_t:tcp_socket name_connect;
```

This package has been created to prevent users from turning off SELinux because of the configuration complexity. It contains the default policy that is sufficient to speed up Zabbix deployment and configuration. For maximum security level, it is recommended to set custom SELinux settings.

#### Proxy installation

Once the required repository is added, you can install Zabbix proxy by running:

```
dnf install zabbix-proxy-mysql zabbix-sql-scripts
```

Substitute 'mysql' in the commands with 'pgsql' to use PostgreSQL, or with 'sqlite3' to use SQLite3 (proxy only).

The package 'zabbix-sql-scripts' contains database schemas for all supported database management systems for both Zabbix server and Zabbix proxy and will be used for data import.

#### Creating database

**Create** a separate database for Zabbix proxy.

Zabbix server and Zabbix proxy cannot use the same database. If they are installed on the same host, the proxy database must have a different name.

#### Importing data

Import initial schema:

```
cat /usr/share/zabbix-sql-scripts/mysql/proxy.sql | mysql -uzabbix -p zabbix
```

For proxy with PostgreSQL (or SQLite):

```
cat /usr/share/zabbix-sql-scripts/postgresql/proxy.sql | sudo -u zabbix psql zabbix
cat /usr/share/zabbix-sql-scripts/sqlite3/proxy.sql | sqlite3 zabbix.db
```

#### Configure database for Zabbix proxy

Edit Zabbix proxy configuration file (/etc/zabbix/zabbix\_proxy.conf):

```
DBHost=localhost
DBName=zabbix
DBUser=zabbix
```

DBPassword=<password>

In DBName for Zabbix proxy use a separate database from Zabbix server.

In DBPassword use Zabbix database password for MySQL; PostgreSQL user password for PostgreSQL.

Use DBHost= with PostgreSQL. You might want to keep the default setting DBHost=localhost (or an IP address), but this would make PostgreSQL use a network socket for connecting to Zabbix. See [SELinux configuration](#) for instructions.

Starting Zabbix proxy process

To start a Zabbix proxy process and make it start at system boot:

```
systemctl start zabbix-proxy
systemctl enable zabbix-proxy
```

Frontend configuration

A Zabbix proxy does not have a frontend; it communicates with Zabbix server only.

Java gateway installation

It is required to install [Java gateway](#) only if you want to monitor JMX applications. Java gateway is lightweight and does not require a database.

Once the required repository is added, you can install Zabbix Java gateway by running:

```
dnf install zabbix-java-gateway
```

Proceed to [setup](#) for more details on configuring and running Java gateway.

Installing debuginfo packages

**Note:**

Debuginfo packages are currently available for RHE versions 7, 6 and 5.

To enable debuginfo repository, edit `/etc/yum.repos.d/zabbix.repo` file. Change `enabled=0` to `enabled=1` for zabbix-debuginfo repository.

```
[zabbix-debuginfo]
name=Zabbix Official Repository debuginfo - $basearch
baseurl=http://repo.zabbix.com/zabbix/5.5/rhel/7/$basearch/debuginfo/
enabled=0
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-ZABBIX-A14FE591
gpgcheck=1
```

This will allow you to install the zabbix-debuginfo package.

```
dnf install zabbix-debuginfo
```

This single package contains debug information for all binary Zabbix components.

## 2 Debian/Ubuntu/Raspbian

Overview

Official Zabbix 6.0 LTS packages for Debian, Ubuntu, and Raspberry Pi OS (Raspbian) are available on [Zabbix website](#).

Packages are available with either MySQL/PostgreSQL database and Apache/Nginx web server support.

Notes on installation

See the [installation instructions](#) per platform in the download page for:

- installing the repository
- installing server/agent/frontend
- creating initial database, importing initial data
- configuring database for Zabbix server
- configuring PHP for Zabbix frontend
- starting server/agent processes
- configuring Zabbix frontend

If you want to run Zabbix agent as root, see [running agent as root](#).

Zabbix web service process, which is used for [scheduled report generation](#), requires Google Chrome browser. The browser is not included into packages and has to be installed manually.

Importing data with Timescale DB

With TimescaleDB, in addition to the import command for PostgreSQL, also run:

```
cat /usr/share/zabbix-sql-scripts/postgresql/timescaledb.sql | sudo -u zabbix psql zabbix
```

**Warning:**

TimescaleDB is supported with Zabbix server only.

PHP 7.2

Zabbix frontend requires PHP version **7.2 or newer** starting with Zabbix 5.0.

See [instructions](#) for installing Zabbix frontend on distributions with PHP versions below 7.2.

SELinux configuration

See [SELinux configuration](#) for RHEL.

After the frontend and SELinux configuration is done, restart the Apache web server:

```
systemctl restart apache2
```

Proxy installation

Once the required repository is added, you can install Zabbix proxy by running:

```
apt install zabbix-proxy-mysql zabbix-sql-scripts
```

Substitute 'mysql' in the command with 'pgsql' to use PostgreSQL, or with 'sqlite3' to use SQLite3.

The package 'zabbix-sql-scripts' contains database schemas for all supported database management systems for both Zabbix server and Zabbix proxy and will be used for data import.

Creating database

[Create](#) a separate database for Zabbix proxy.

Zabbix server and Zabbix proxy cannot use the same database. If they are installed on the same host, the proxy database must have a different name.

Importing data

Import initial schema:

```
cat /usr/share/zabbix-sql-scripts/mysql/proxy.sql | mysql -uzabbix -p zabbix
```

For proxy with PostgreSQL (or SQLite):

```
cat /usr/share/zabbix-sql-scripts/postgresql/proxy.sql | sudo -u zabbix psql zabbix
cat /usr/share/zabbix-sql-scripts/sqlite3/proxy.sql | sqlite3 zabbix.db
```

Configure database for Zabbix proxy

Edit Zabbix proxy configuration file (/etc/zabbix/zabbix\_proxy.conf):

```
DBHost=localhost
DBName=zabbix
DBUser=zabbix
DBPassword=<password>
```

In DBName for Zabbix proxy use a separate database from Zabbix server.

In DBPassword use Zabbix database password for MySQL; PostgreSQL user password for PostgreSQL.

Use DBHost= with PostgreSQL. You might want to keep the default setting DBHost=localhost (or an IP address), but this would make PostgreSQL use a network socket for connecting to Zabbix. Refer to the [respective section](#) for RHEL for instructions.

Starting Zabbix proxy process

To start a Zabbix proxy process and make it start at system boot:

```
systemctl restart zabbix-proxy
systemctl enable zabbix-proxy
```

## Frontend configuration

A Zabbix proxy does not have a frontend; it communicates with Zabbix server only.

## Java gateway installation

It is required to install **Java gateway** only if you want to monitor JMX applications. Java gateway is lightweight and does not require a database.

Once the required repository is added, you can install Zabbix Java gateway by running:

```
apt install zabbix-java-gateway
```

Proceed to **setup** for more details on configuring and running Java gateway.

## 3 SUSE Linux Enterprise Server

### Overview

Official Zabbix 6.0 LTS packages for SUSE Linux Enterprise Server are available on [Zabbix website](#).

*Zabbix agent* packages and utilities *Zabbix get* and *Zabbix sender* are available on Zabbix Official Repository for [SLES 15 \(SP4 and newer\)](#) and [SLES 12 \(SP4 and newer\)](#).

#### Note:

Using SLES 15 with SP3 or older is not recommended and may contain limitations. Also, please note that the *Verify CA encryption mode* does not work on SLES 12 (all minor OS versions) with MySQL due to older MySQL libraries.

### Adding Zabbix repository

Install the repository configuration package. This package contains yum (software package manager) configuration files.

SLES 15:

```
rpm -Uvh --nosignature https://repo.zabbix.com/zabbix/6.0/sles/15/x86_64/zabbix-release-latest.sles15.noarch.rpm  
zypper --gpg-auto-import-keys refresh 'Zabbix Official Repository'
```

SLES 12:

```
rpm -Uvh --nosignature https://repo.zabbix.com/zabbix/6.0/sles/12/x86_64/zabbix-release-latest.sles12.noarch.rpm  
zypper --gpg-auto-import-keys refresh 'Zabbix Official Repository'
```

Please note that Zabbix web service process, which is used for **scheduled report generation**, requires Google Chrome browser. The browser is not included into packages and has to be installed manually.

### Server/frontend/agent installation

To install Zabbix server/frontend/agent with MySQL support:

```
zypper install zabbix-server-mysql zabbix-web-mysql zabbix-apache-conf zabbix-agent
```

Substitute 'apache' in the command with 'nginx' if using the package for Nginx web server. See also: [Nginx setup for Zabbix on SLES 12/15](#).

Substitute 'zabbix-agent' with 'zabbix-agent2' in these commands if using Zabbix agent 2 (only SLES 15).

To install Zabbix proxy with MySQL support:

```
zypper install zabbix-proxy-mysql zabbix-sql-scripts
```

Substitute 'mysql' in the commands with 'pgsql' to use PostgreSQL.

The package 'zabbix-sql-scripts' contains database schemas for all supported database management systems for both Zabbix server and Zabbix proxy and will be used for data import.

### Creating database

For Zabbix **server** and **proxy** daemons a database is required. It is not needed to run Zabbix **agent**.

#### Warning:

Separate databases are needed for Zabbix server and Zabbix proxy; they cannot use the same database. Therefore, if they are installed on the same host, their databases must be created with different names!

Create the database using the provided instructions for **MySQL** or **PostgreSQL**.

## Importing data

Now import initial schema and data for the **server** with MySQL:

```
zcat /usr/share/packages/zabbix-sql-scripts/mysql/create.sql.gz | mysql -uzabbix -p zabbix
```

You will be prompted to enter your newly created database password.

With PostgreSQL:

```
zcat /usr/share/packages/zabbix-sql-scripts/postgresql/create.sql.gz | sudo -u zabbix psql zabbix
```

With TimescaleDB, in addition to the previous command, also run:

```
zcat /usr/share/packages/zabbix-sql-scripts/postgresql/timescaledb.sql.gz | sudo -u <username> psql zabbix
```

### Warning:

TimescaleDB is supported with Zabbix server only.

For proxy, import initial schema:

```
zcat /usr/share/packages/zabbix-sql-scripts/mysql/schema.sql.gz | mysql -uzabbix -p zabbix
```

For proxy with PostgreSQL:

```
zcat /usr/share/packages/zabbix-sql-scripts/postgresql/schema.sql.gz | sudo -u zabbix psql zabbix
```

Configure database for Zabbix server/proxy

Edit Zabbix server configuration file (/etc/zabbix/zabbix\_server.conf) and, if required, Zabbix proxy configuration file (/etc/zabbix/zabbix\_proxy.conf) for their respective databases. For example:

```
DBHost=localhost
DBName=zabbix
DBUser=zabbix
DBPassword=<password>
```

In DBPassword use Zabbix database password for MySQL; PostgreSQL user password for PostgreSQL.

Use DBHost= with PostgreSQL. You might want to keep the default setting DBHost=localhost (or an IP address), but this would make PostgreSQL use a network socket for connecting to Zabbix.

## Zabbix frontend configuration

Depending on the web server used (Apache/Nginx) edit the corresponding configuration file for Zabbix frontend:

- For Apache the configuration file is located in /etc/apache2/conf.d/zabbix.conf. Some PHP settings are already configured. But it's necessary to uncomment the "date.timezone" setting and [set the right timezone](#) for you.

```
php_value max_execution_time 300
php_value memory_limit 128M
php_value post_max_size 16M
php_value upload_max_filesize 2M
php_value max_input_time 300
php_value max_input_vars 10000
php_value always_populate_raw_post_data -1
# php_value date.timezone Europe/Riga
```

- The zabbix-nginx-conf package installs a separate Nginx server for Zabbix frontend. Its configuration file is located in /etc/nginx/conf.d/zabbix.conf. For Zabbix frontend to work, it's necessary to uncomment and set listen and/or server\_name directives.

```
# listen 80;
# server_name example.com;
```

- Zabbix uses its own dedicated php-fpm connection pool with Nginx:

Its configuration file is located in /etc/php7/fpm/php-fpm.d/zabbix.conf. Some PHP settings are already configured. But it's necessary to set the right [date.timezone](#) setting for you.

```
php_value[max_execution_time] = 300
php_value[memory_limit] = 128M
php_value[post_max_size] = 16M
php_value[upload_max_filesize] = 2M
php_value[max_input_time] = 300
```

```
php_value[max_input_vars] = 10000
; php_value[date.timezone] = Europe/Riga
```

Now you are ready to proceed with **frontend installation steps** which will allow you to access your newly installed Zabbix.

Note that a Zabbix proxy does not have a frontend; it communicates with Zabbix server only.

Starting Zabbix server/agent process

Start Zabbix server and agent processes and make it start at system boot.

With Apache web server:

```
systemctl restart zabbix-server zabbix-agent apache2 php-fpm
systemctl enable zabbix-server zabbix-agent apache2 php-fpm
```

Substitute 'apache2' with 'nginx' for Nginx web server.

Installing debuginfo packages

To enable debuginfo repository edit `/etc/zypp/repos.d/zabbix.repo` file. Change `enabled=0` to `enabled=1` for zabbix-debuginfo repository.

```
[zabbix-debuginfo]
name=Zabbix Official Repository debuginfo
type=rpm-md
baseurl=http://repo.zabbix.com/zabbix/6.0/sles/15/x86_64/debuginfo/
gpgcheck=1
gpgkey=http://repo.zabbix.com/zabbix/6.0/sles/15/x86_64/debuginfo/repodata/repomd.xml.key
enabled=0
update=1
```

This will allow you to install zabbix-**<component>**-debuginfo packages.

## 4 Windows agent installation from MSI

Overview

Zabbix Windows agent can be installed from Windows MSI installer packages (32-bit or 64-bit) available for [download](#).

The minimum requirement for a Zabbix agent 2 MSI installation is Windows 10 32-bit/Server 2016.

The Zabbix get and sender utilities can also be installed, either together with Zabbix agent/agent 2 or separately.

A 32-bit package cannot be installed on a 64-bit Windows.

All packages come with TLS support, however, configuring TLS is optional.

Both UI and command-line based installation is supported.

### Note:

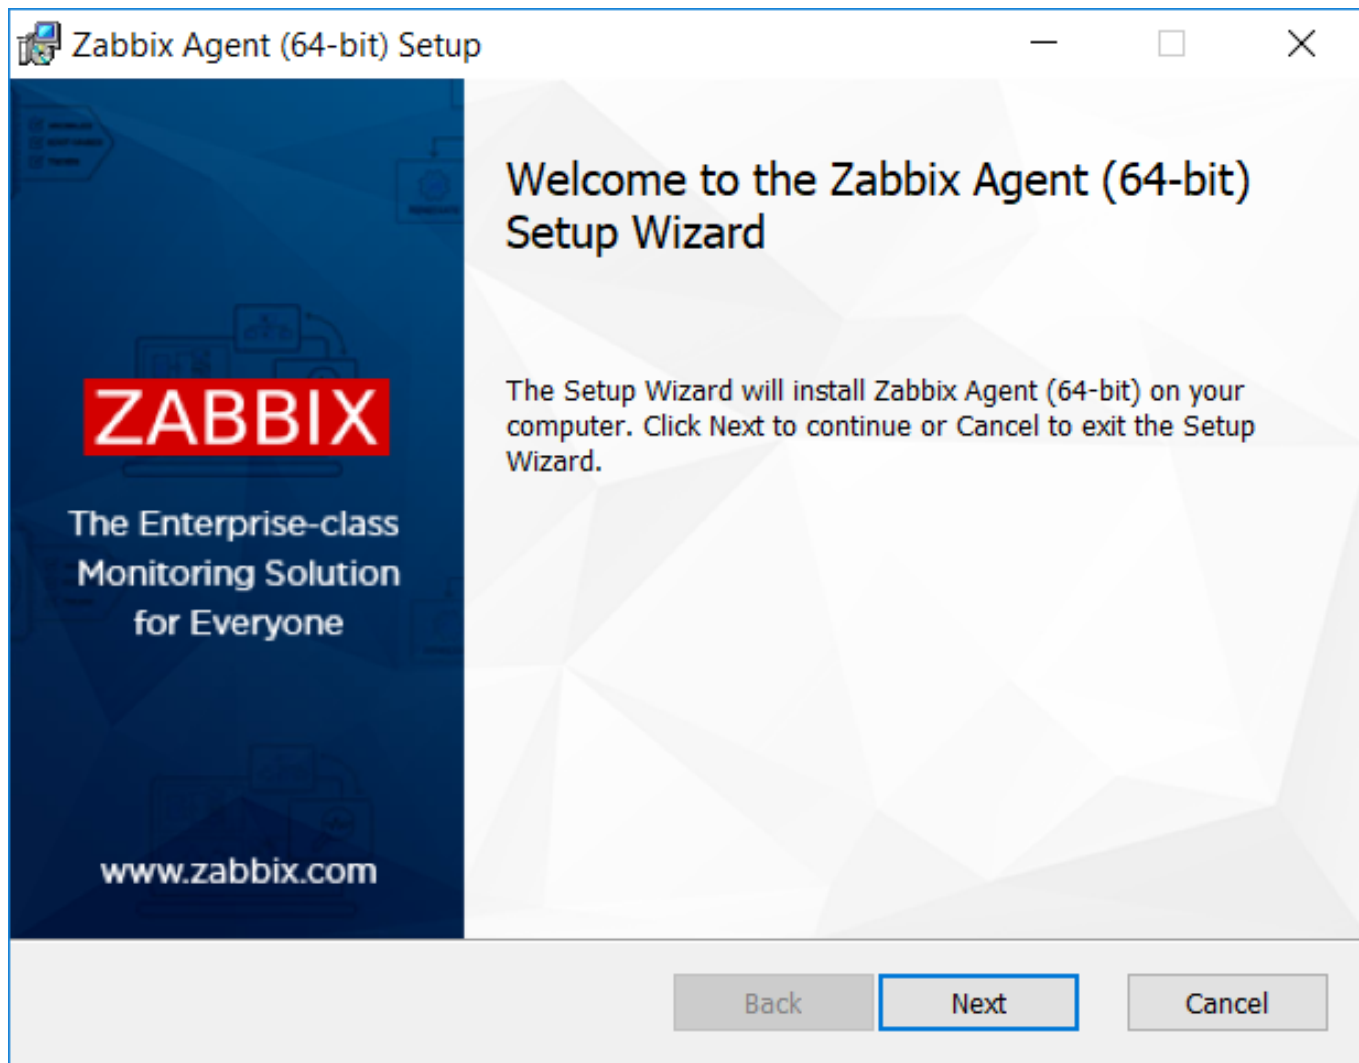

Although Zabbix installation from MSI installer packages is fully supported, it is recommended to install at least *Microsoft .NET Framework 2* for proper error handling. See [Microsoft Download .NET Framework](#).

### Attention:

It is recommended to use default paths provided by the installer as using custom paths without proper permissions could compromise the security of the installation.

Installation steps

To install, double-click the downloaded MSI file.

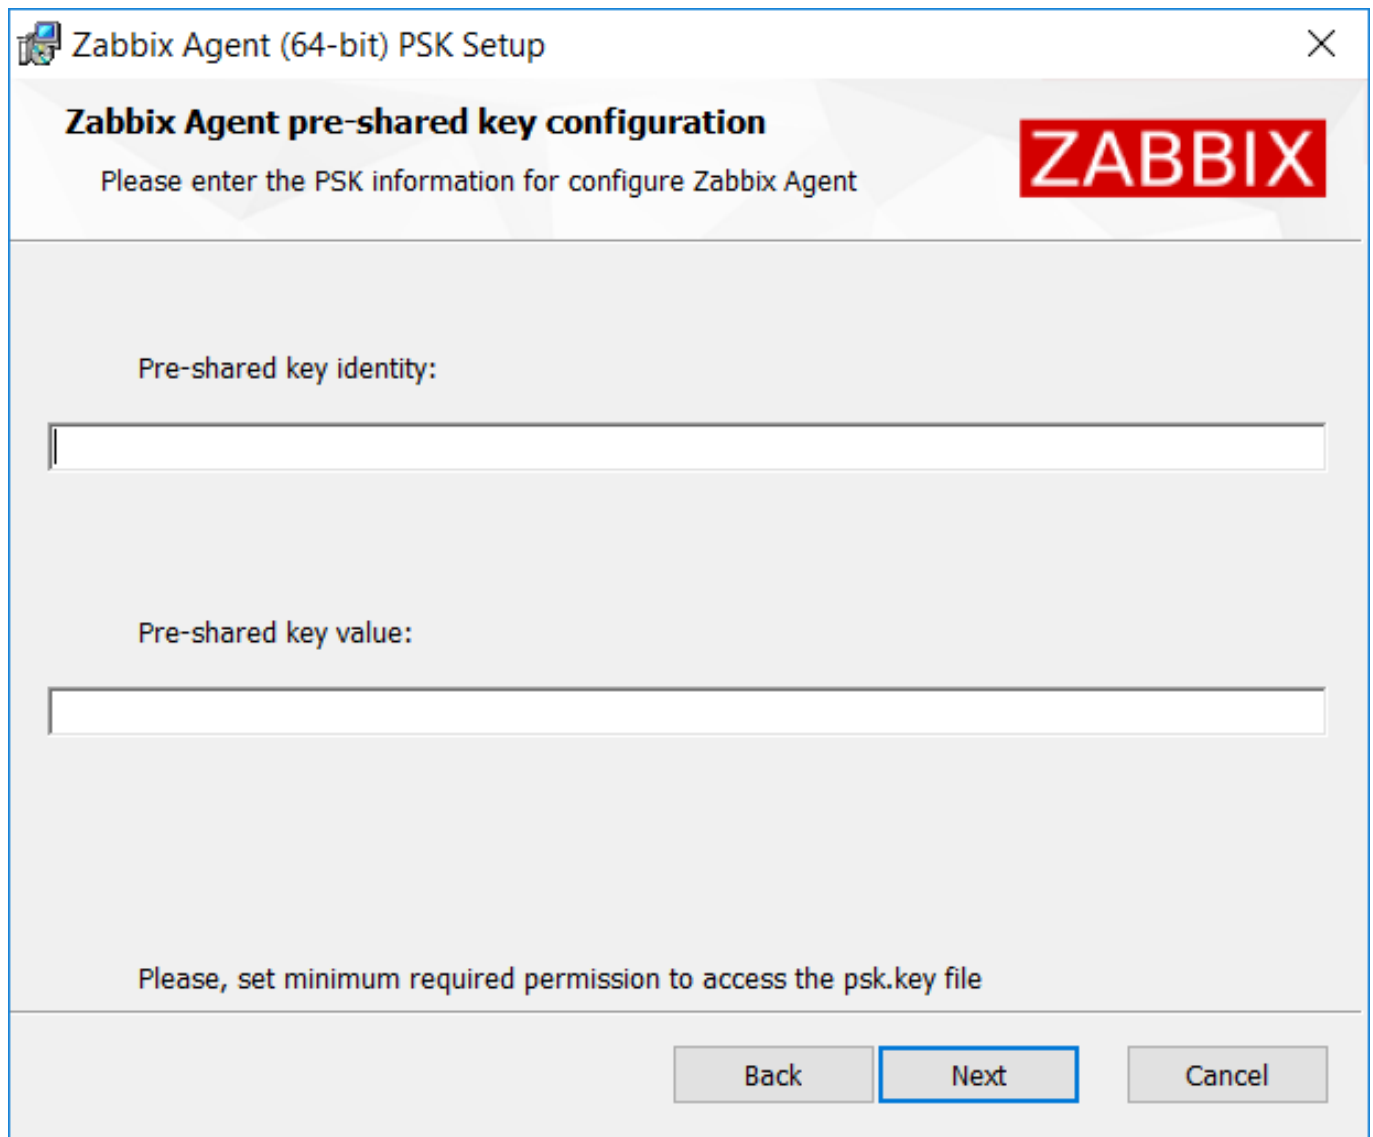

Accept the license to proceed to the next step.

Specify the following parameters.

| Parameter                                | Description  |
|--|--|
| <i>Host name</i>                         | Specify host name.   |
| <i>Zabbix server IP/DNS</i>              | Specify IP/DNS of Zabbix server.                               |
| <i>Agent listen port</i>                 | Specify agent listen port (10050 by default).                  |
| <i>Server or Proxy for active checks</i> | Specify IP/DNS of Zabbix server/proxy for active agent checks. |
| <i>Enable PSK</i>                        | Mark the checkbox to enable TLS support via pre-shared keys.   |
| <i>Add agent location to the PATH</i>    | Add agent location to the PATH variable.                       |

**Zabbix Agent (64-bit) PSK Setup**

**Zabbix Agent pre-shared key configuration**

Please enter the PSK information for configure Zabbix Agent

Pre-shared key identity:

Pre-shared key value:

Please, set minimum required permission to access the psk.key file

Back Next Cancel

Enter pre-shared key identity and value. This step is only available if you checked *Enable PSK* in the previous step.

Select Zabbix components to install - **Zabbix agent daemon**, **Zabbix sender**, **Zabbix get**.

Zabbix components along with the configuration file will be installed in a *Zabbix Agent* folder in Program Files. `zabbix_agentd.exe` will be set up as Windows service with automatic startup.

Command-line based installation

Supported parameters

The following set of parameters is supported by created MSIs:

| Number | Parameter            | Description |
|--------|----------------------|-------------|
| 1      | LOGTYPE              |             |
| 2      | LOGFILE              |             |
| 3      | SERVER               |             |
| 4      | LISTENPORT           |             |
| 5      | SERVERACTIVE         |             |
| 6      | HOSTNAME             |             |
| 7      | TIMEOUT              |             |
| 8      | TLSCONNECT           |             |
| 9      | TLSACCEPT            |             |
| 10     | TLSPSKIDENTITY       |             |
| 11     | TLSPSKFILE           |             |
| 12     | TLSPSKVALUE          |             |
| 13     | TLSCAFILE            |             |
| 14     | TLSCRLFILE           |             |
| 15     | TLSSERVERCERTISSUER  |             |
| 16     | TLSSERVERCERTSUBJECT |             |
| 17     | TLSCERTFILE          |             |
| 18     | TLSKEYFILE           |             |
| 19     | LISTENIP             |             |
| 20     | HOSTINTERFACE        |             |
| 21     | HOSTMETADATA         |             |
| 22     | HOSTMETADATAITEM     |             |

| Number | Parameter              | Description  |
|--------|------------------------|--|
| 23     | STATUSPORT             | Zabbix agent 2 only.   |
| 24     | ENABLEPERSISTENTBUFFER | Zabbix agent 2 only.   |
| 25     | PERSISTENTBUFFERPERIOD | Zabbix agent 2 only.   |
| 26     | PERSISTENTBUFFERFILE   | Zabbix agent 2 only.   |
| 27     | INSTALLFOLDER          |  |
| 28     | ENABLEPATH             |  |
| 29     | SKIP                   | SKIP=fw - do not install firewall exception rule   |
| 30     | INCLUDE                | Sequence of includes separated by ;  |
| 31     | ALLOWDENYKEY           | Sequence of "AllowKey" and "DenyKey" <b>parameters</b> separated by ;.<br>Use \; to escape the delimiter.<br>Example: ALLOWDENYKEY="AllowKey=system.run[type<br>c:\windows\system32\drivers\etc\hosts] ;DenyKey=system.run[*]" |
| 32     | ADDDEFAULT             | A comma-delimited list of programs to install in their default configuration.<br>Possible values: AgentProgram, GetProgram, SenderProgram, ALL<br>E.g., ADDDEFAULT=AgentProgram,GetProgram                                     |
| 33     | ADDLOCAL               | A comma-delimited list of programs to install locally.<br>Possible values: AgentProgram, GetProgram, SenderProgram, ALL<br>E.g., ADDLOCAL=AgentProgram,SenderProgram   |
| 34     | CONF                   | Specify path to custom configuration file, e.g.,<br>CONF=c:\full\path\to\user.conf   |

To install you may run, for example:

```
SET INSTALLFOLDER=C:\Program Files\za
```

```
msiexec /l*v log.txt /i zabbix_agent-6.0.0-x86.msi /qn^
LOGTYPE=file^
LOGFILE="%INSTALLFOLDER%\za.log"^
SERVER=192.168.6.76^
LISTENPORT=12345^
SERVERACTIVE=:1^
HOSTNAME=myHost^
TLSCONNECT=psk^
TLSACCEPT=psk^
TLSPSKIDENTITY=MyPSKID^
TLSPSKFILE="%INSTALLFOLDER%\mykey.psk"^
TLSCAFILE="c:\temp\f.txt1"^
TLSCRLFILE="c:\temp\f.txt2"^
TLSSERVERCERTISSUER="My CA"^
TLSSERVERCERTSUBJECT="My Cert"^
TLSCERTFILE="c:\temp\f.txt5"^
TLSKEYFILE="c:\temp\f.txt6"^
ENABLEPATH=1^
INSTALLFOLDER="%INSTALLFOLDER%"^
SKIP=fw^
ALLOWDENYKEY="DenyKey=vfs.file.contents[/etc/passwd]"
```

or

```
msiexec /l*v log.txt /i zabbix_agent-6.0.0-x86.msi /qn^
SERVER=192.168.6.76^
TLSCONNECT=psk^
TLSACCEPT=psk^
TLSPSKIDENTITY=MyPSKID^
TLSPSKVALUE=1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952
```

If both TLSPSKFILE and TLSPSKVALUE are passed, then TLSPSKVALUE will be written to TLSPSKFILE.

## 5 Mac OS agent installation from PKG

## Overview

Zabbix Mac OS agent can be installed from PKG installer packages available for [download](#). Versions with or without encryption are available.

## Installing agent

The agent can be installed using the graphical user interface or from the command line, for example:

```
sudo installer -pkg zabbix_agent-6.0.12-macos-amd64-openssl.pkg -target /
```

Make sure to use the correct Zabbix package version in the command. It must match the name of the downloaded package.

## Running agent

The agent will start automatically after installation or restart.

You may edit the configuration file at `/usr/local/etc/zabbix/zabbix_agentd.conf` if necessary.

To start the agent manually, you may run:

```
sudo launchctl start com.zabbix.zabbix_agentd
```

To stop the agent manually:

```
sudo launchctl stop com.zabbix.zabbix_agentd
```

During upgrade, the existing configuration file is not overwritten. Instead a new `zabbix_agentd.conf.NEW` file is created to be used for reviewing and updating the existing configuration file, if necessary. Remember to restart the agent after manual changes to the configuration file.

## Troubleshooting and removing agent

This section lists some useful commands that can be used for troubleshooting and removing Zabbix agent installation.

See if Zabbix agent is running:

```
ps aux | grep zabbix_agentd
```

See if Zabbix agent has been installed from packages:

```
pkgutil --pkgs | grep zabbix  
com.zabbix.pkg.ZabbixAgent
```

See the files that were installed from the installer package (note that the initial `/` is not displayed in this view):

```
pkgutil --only-files --files com.zabbix.pkg.ZabbixAgent  
Library/LaunchDaemons/com.zabbix.zabbix_agentd.plist  
usr/local/bin/zabbix_get  
usr/local/bin/zabbix_sender  
usr/local/etc/zabbix/zabbix_agentd/userparameter_examples.conf.NEW  
usr/local/etc/zabbix/zabbix_agentd/userparameter_mysql.conf.NEW  
usr/local/etc/zabbix/zabbix_agentd.conf.NEW  
usr/local/sbin/zabbix_agentd
```

Stop Zabbix agent if it was launched with `launchctl`:

```
sudo launchctl unload /Library/LaunchDaemons/com.zabbix.zabbix_agentd.plist
```

Remove files (including configuration and logs) that were installed with installer package:

```
sudo rm -f /Library/LaunchDaemons/com.zabbix.zabbix_agentd.plist  
sudo rm -f /usr/local/sbin/zabbix_agentd  
sudo rm -f /usr/local/bin/zabbix_get  
sudo rm -f /usr/local/bin/zabbix_sender  
sudo rm -rf /usr/local/etc/zabbix  
sudo rm -rf /var/log/zabbix
```

Forget that Zabbix agent has been installed:

```
sudo pkgutil --forget com.zabbix.pkg.ZabbixAgent
```

## 6 Unstable releases

### Overview

Packages for minor Zabbix version (i.e. Zabbix 6.0.x) release candidates are provided starting with Zabbix 6.0.9.

The instructions below are for enabling unstable Zabbix release repositories (disabled by default).

First, install or update to the latest zabbix-release package. To enable rc packages on your system do the following:

#### Red Hat Enterprise Linux

Open the `/etc/yum.repos.d/zabbix.repo` file and set `enabled=1` for the `zabbix-unstable` repo.

```
[zabbix-unstable]
name=Zabbix Official Repository (unstable) - $basearch
baseurl=https://repo.zabbix.com/zabbix/5.5/rhel/8/$basearch/
enabled=1
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-ZABBIX-A14FE591
```

#### Debian/Ubuntu

Open the `/etc/apt/sources.list.d/zabbix.list` and uncomment "Zabbix unstable repository".

```
# Zabbix unstable repository
deb https://repo.zabbix.com/zabbix/5.5/debian bullseye main
deb-src https://repo.zabbix.com/zabbix/5.5/debian bullseye main
```

#### SUSE

Open the `/etc/zypp/repos.d/zabbix.repo` file and set `enable=1` for the `zabbix-unstable` repo.

```
[zabbix-unstable]
name=Zabbix Official Repository
type=rpm-md
baseurl=https://repo.zabbix.com/zabbix/5.5/sles/15/x86_64/
gpgcheck=1
gpgkey=https://repo.zabbix.com/zabbix/5.5/sles/15/x86_64/repoata/repomd.xml.key
enabled=1
update=1
```

## 5 Installation from containers

**Docker** Zabbix provides [Docker](#) images for each Zabbix component as portable and self-sufficient containers to speed up deployment and update procedure.

Zabbix components come with MySQL and PostgreSQL database support, Apache2 and Nginx web server support. These images are separated into different images.

### Attention:

Since Zabbix 6.0, deterministic triggers need to be created during the installation. If binary logging is enabled for MySQL/MariaDB, this requires superuser privileges or setting the variable/configuration parameter `log_bin_trust_function_creators = 1`. See [Database creation scripts](#) for instructions how to set the variable.

Note that if executing from a console, the variable will only be set temporarily and will be dropped when a Docker is restarted. In this case, keep your SQL service running, only stop `zabbix-server` service by running `'docker compose down zabbix-server'` and then `'docker compose up -d zabbix-server'`.

Alternatively, you can set this variable in the configuration file.

### Docker base images

Zabbix components are provided on Ubuntu, Alpine Linux and CentOS base images:

| Image                  | Version       |
|------------------------|---------------|
| <a href="#">alpine</a> | 3.16          |
| <a href="#">ubuntu</a> | 22.04 (jammy) |

| Image  | Version |
|--------|---------|
| centos | 8       |

All images are configured to rebuild latest images if base images are updated.

#### Docker file sources

Everyone can follow Docker file changes using the Zabbix [official repository](#) on [github.com](#). You can fork the project or make your own images based on official Docker files.

#### Structure

All Zabbix components are available in the following Docker repositories:

- Zabbix agent - [zabbix/zabbix-agent](#)
- Zabbix server
  - Zabbix server with MySQL database support - [zabbix/zabbix-server-mysql](#)
  - Zabbix server with PostgreSQL database support - [zabbix/zabbix-server-pgsql](#)
- Zabbix web-interface
  - Zabbix web-interface based on Apache2 web server with MySQL database support - [zabbix/zabbix-web-apache-mysql](#)
  - Zabbix web-interface based on Apache2 web server with PostgreSQL database support - [zabbix/zabbix-web-apache-pgsql](#)
  - Zabbix web-interface based on Nginx web server with MySQL database support - [zabbix/zabbix-web-nginx-mysql](#)
  - Zabbix web-interface based on Nginx web server with PostgreSQL database support - [zabbix/zabbix-web-nginx-pgsql](#)
- Zabbix proxy
  - Zabbix proxy with SQLite3 database support - [zabbix/zabbix-proxy-sqlite3](#)
  - Zabbix proxy with MySQL database support - [zabbix/zabbix-proxy-mysql](#)
- Zabbix Java Gateway - [zabbix/zabbix-java-gateway](#)

Additionally there is SNMP trap support. It is provided as additional repository ([zabbix/zabbix-snmptraps](#)) based on Ubuntu Trusty only. It could be linked with Zabbix server and Zabbix proxy.

#### Versions

Each repository of Zabbix components contains the following tags:

- latest - latest stable version of a Zabbix component based on Alpine Linux image
- alpine-latest - latest stable version of a Zabbix component based on Alpine Linux image
- ubuntu-latest - latest stable version of a Zabbix component based on Ubuntu image
- alpine-6.0-latest - latest minor version of a Zabbix 6.0 component based on Alpine Linux image
- ubuntu-6.0-latest - latest minor version of a Zabbix 6.0 component based on Ubuntu image
- alpine-6.0.\* - different minor versions of a Zabbix 6.0 component based on Alpine Linux image, where \* is the minor version of Zabbix component
- ubuntu-6.0.\* - different minor versions of a Zabbix 6.0 component based on Ubuntu image, where \* is the minor version of Zabbix component

#### Initial configuration

After downloading the images, start the containers by executing `docker run` command followed by additional arguments to specify required **environment variables** and/or **mount points**. Some **configuration examples** are provided below.

##### Attention:

Zabbix must not be run as PID1/as an init process in containers.

#### Environment variables

All Zabbix component images provide environment variables to control configuration. These environment variables are listed in each component repository. These environment variables are options from Zabbix configuration files, but with different naming method. For example, `ZBX_LOGSLOWQUERIES` is equal to `LogSlowQueries` from Zabbix server and Zabbix proxy configuration files.

##### Attention:

Some of configuration options are not allowed to change. For example, `PIDFile` and `LogType`.

Some of components have specific environment variables, which do not exist in official Zabbix configuration files:

| Variable               | Components    | Description  |
|------------------------|---------------|--|
| DB_SERVER_HOST         | Server        | This variable is IP or DNS name of MySQL or PostgreSQL server.   |
|                        | Proxy         | By default, value is <code>mysql-server</code> or <code>postgres-server</code> for MySQL or PostgreSQL respectively  |
|                        | Web interface |  |
| DB_SERVER_PORT         | Server        | This variable is port of MySQL or PostgreSQL server.   |
|                        | Proxy         | By default, value is '3306' or '5432' respectively.  |
|                        | Web interface |  |
| MYSQL_USER             | Server        | MySQL database user.   |
|                        | Proxy         | By default, value is 'zabbix'.   |
|                        | Web-interface |  |
| MYSQL_PASSWORD         | Server        | MySQL database password.   |
|                        | Proxy         | By default, value is 'zabbix'.   |
|                        | Web interface |  |
| MYSQL_DATABASE         | Server        | Zabbix database name.  |
|                        | Proxy         | By default, value is 'zabbix' for Zabbix server and 'zabbix_proxy' for Zabbix proxy.   |
|                        | Web interface |  |
| POSTGRES_USER          | Server        | PostgreSQL database user.  |
|                        | Web interface | By default, value is 'zabbix'.   |
| POSTGRES_PASSWORD      | Server        | PostgreSQL database password.  |
|                        | Web interface | By default, value is 'zabbix'.   |
| POSTGRES_DB            | Server        | Zabbix database name.  |
|                        | Web interface | By default, value is 'zabbix'.   |
| PHP_TZ                 | Web-interface | Timezone in PHP format. Full list of supported timezones are available on <a href="http://php.net">php.net</a> .   |
|                        |               | By default, value is 'Europe/Riga'.  |
| ZBX_SERVER_NAME        | Web interface | Visible Zabbix installation name in right top corner of the web interface. By default, value is 'Zabbix Docker'  |
| ZBX_JAVAGATEWAY_ENABLE | Server        | Enables communication with Zabbix Java gateway to collect Java related checks.   |
|                        | Proxy         | By default, value is "false"   |
| ZBX_ENABLE_SNMP_TRAPS  | Server        | Enables SNMP trap feature. It requires <b>zabbix-snmptraps</b> instance and shared volume <code>/var/lib/zabbix/snmptraps</code> to Zabbix server or Zabbix proxy. |
|                        | Proxy         |  |

## Volumes

The images allow to use some mount points. These mount points are different and depend on Zabbix component type:

| Volume                                       | Description   |
|--|---|
| <b>Zabbix agent</b>                          |   |
| <code>/etc/zabbix/zabbix_agentd.d</code>     | The volume allows to include <code>*.conf</code> files and extend Zabbix agent using the <code>UserParameter</code> feature   |
| <code>/var/lib/zabbix/modules</code>         | The volume allows to load additional modules and extend Zabbix agent using the <code>LoadModule</code> feature  |
| <code>/var/lib/zabbix/enc</code>             | The volume is used to store TLS-related files. These file names are specified using <code>ZBX_TLSCAFILE</code> , <code>ZBX_TLSCRLFILE</code> , <code>ZBX_TLSKEY_FILE</code> and <code>ZBX_TLSPSKFILE</code> environment variables |
| <b>Zabbix server</b>                         |   |
| <code>/usr/lib/zabbix/alertscripts</code>    | The volume is used for custom alert scripts. It is the <code>AlertScriptsPath</code> parameter in <code>zabbix_server.conf</code>   |
| <code>/usr/lib/zabbix/externalscripts</code> | The volume is used by <code>external checks</code> . It is the <code>ExternalScripts</code> parameter in <code>zabbix_server.conf</code>  |
| <code>/var/lib/zabbix/modules</code>         | The volume allows to load additional modules and extend Zabbix server using the <code>LoadModule</code> feature   |
| <code>/var/lib/zabbix/enc</code>             | The volume is used to store TLS related files. These file names are specified using <code>ZBX_TLSCAFILE</code> , <code>ZBX_TLSCRLFILE</code> , <code>ZBX_TLSKEY_FILE</code> and <code>ZBX_TLSPSKFILE</code> environment variables |
| <code>/var/lib/zabbix/ssl/certs</code>       | The volume is used as location of SSL client certificate files for client authentication. It is the <code>SSLCertLocation</code> parameter in <code>zabbix_server.conf</code>   |
| <code>/var/lib/zabbix/ssl/keys</code>        | The volume is used as location of SSL private key files for client authentication. It is the <code>SSLKeyLocation</code> parameter in <code>zabbix_server.conf</code>   |

| Volume  | Description   |
|---|---|
| <code>/var/lib/zabbix/ssl/ssl_ca</code>                 | The volume is used as location of certificate authority (CA) files for SSL server certificate verification. It is the <code>SSLCALocation</code> parameter in <code>zabbix_server.conf</code>   |
| <code>/var/lib/zabbix/snmptraps</code>                  | The volume is used as location of <code>snmptraps.log</code> file. It could be shared by <code>zabbix-snmptraps</code> container and inherited using the <code>volumes_from</code> Docker option while creating a new instance of Zabbix server. SNMP trap processing feature could be enabled by using shared volume and switching the <code>ZBX_ENABLE_SNMP_TRAPS</code> environment variable to 'true'     |
| <code>/var/lib/zabbix/mibs</code>                       | The volume allows to add new MIB files. It does not support subdirectories, all MIBs must be placed in <code>/var/lib/zabbix/mibs</code>  |
| <b>Zabbix proxy</b>                                     |   |
| <code>/usr/lib/zabbix/externalscripts</code>            | The volume is used by <code>external checks</code> . It is the <code>ExternalScripts</code> parameter in <code>zabbix_proxy.conf</code>   |
| <code>/var/lib/zabbix/db_data/</code>                   | The volume allows to store database files on external devices. Supported only for Zabbix proxy with SQLite3   |
| <code>/var/lib/zabbix/modules</code>                    | The volume allows to load additional modules and extend Zabbix server using the <code>LoadModule</code> feature   |
| <code>/var/lib/zabbix/enc</code>                        | The volume is used to store TLS related files. These file names are specified using <code>ZBX_TLSCAFILE</code> , <code>ZBX_TLSCRLFILE</code> , <code>ZBX_TLSKEY_FILE</code> and <code>ZBX_TLSPSKFILE</code> environment variables   |
| <code>/var/lib/zabbix/ssl/certs</code>                  | The volume is used as location of SSL client certificate files for client authentication. It is the <code>SSLCertLocation</code> parameter in <code>zabbix_proxy.conf</code>  |
| <code>/var/lib/zabbix/ssl/keys</code>                   | The volume is used as location of SSL private key files for client authentication. It is the <code>SSLKeyLocation</code> parameter in <code>zabbix_proxy.conf</code>  |
| <code>/var/lib/zabbix/ssl/ssl_ca</code>                 | The volume is used as location of certificate authority (CA) files for SSL server certificate verification. It is the <code>SSLCALocation</code> parameter in <code>zabbix_proxy.conf</code>  |
| <code>/var/lib/zabbix/snmptraps</code>                  | The volume is used as location of <code>snmptraps.log</code> file. It could be shared by the <code>zabbix-snmptraps</code> container and inherited using the <code>volumes_from</code> Docker option while creating a new instance of Zabbix server. SNMP trap processing feature could be enabled by using shared volume and switching the <code>ZBX_ENABLE_SNMP_TRAPS</code> environment variable to 'true' |
| <code>/var/lib/zabbix/mibs</code>                       | The volume allows to add new MIB files. It does not support subdirectories, all MIBs must be placed in <code>/var/lib/zabbix/mibs</code>  |
| <b>Zabbix web interface based on Apache2 web server</b> |   |
| <code>/etc/ssl/apache2</code>                           | The volume allows to enable HTTPS for Zabbix web interface. The volume must contain the two <code>ssl.crt</code> and <code>ssl.key</code> files prepared for Apache2 SSL connections  |
| <b>Zabbix web interface based on Nginx web server</b>   |   |
| <code>/etc/ssl/nginx</code>                             | The volume allows to enable HTTPS for Zabbix web interface. The volume must contain the two <code>ssl.crt</code> , <code>ssl.key</code> files and <code>dhparam.pem</code> prepared for Nginx SSL connections   |
| <b>Zabbix snmptraps</b>                                 |   |
| <code>/var/lib/zabbix/snmptraps</code>                  | The volume contains the <code>snmptraps.log</code> log file named with received SNMP traps  |
| <code>/var/lib/zabbix/mibs</code>                       | The volume allows to add new MIB files. It does not support subdirectories, all MIBs must be placed in <code>/var/lib/zabbix/mibs</code>  |

For additional information use Zabbix official repositories in Docker Hub.

## Examples

### Example 1

The example demonstrates how to run Zabbix server with MySQL database support, Zabbix web interface based on the Nginx web server and Zabbix Java gateway.

1. Create network dedicated for Zabbix component containers:

```
docker network create --subnet 172.20.0.0/16 --ip-range 172.20.240.0/20 zabbix-net
```

2. Start empty MySQL server instance

```
docker run --name mysql-server -t \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
```

```
-e MYSQL_ROOT_PASSWORD="root_pwd" \
--network=zabbix-net \
--restart unless-stopped \
-d mysql:8.0 \
--character-set-server=utf8 --collation-server=utf8_bin \
--default-authentication-plugin=mysql_native_password
```

### 3. Start Zabbix Java gateway instance

```
docker run --name zabbix-java-gateway -t \
--network=zabbix-net \
--restart unless-stopped \
-d zabbix/zabbix-java-gateway:alpine-6.0-latest
```

### 4. Start Zabbix server instance and link the instance with created MySQL server instance

```
docker run --name zabbix-server-mysql -t \
-e DB_SERVER_HOST="mysql-server" \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
-e ZBX_JAVAGATEWAY="zabbix-java-gateway" \
--network=zabbix-net \
-p 10051:10051 \
--restart unless-stopped \
-d zabbix/zabbix-server-mysql:alpine-6.0-latest
```

#### Note:

Zabbix server instance exposes 10051/TCP port (Zabbix trapper) to host machine.

### 5. Start Zabbix web interface and link the instance with created MySQL server and Zabbix server instances

```
docker run --name zabbix-web-nginx-mysql -t \
-e ZBX_SERVER_HOST="zabbix-server-mysql" \
-e DB_SERVER_HOST="mysql-server" \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
--network=zabbix-net \
-p 80:8080 \
--restart unless-stopped \
-d zabbix/zabbix-web-nginx-mysql:alpine-6.0-latest
```

#### Note:

Zabbix web interface instance exposes 80/TCP port (HTTP) to host machine.

## Example 2

The example demonstrates how to run Zabbix server with PostgreSQL database support, Zabbix web interface based on the Nginx web server and SNMP trap feature.

### 1. Create network dedicated for Zabbix component containers:

```
docker network create --subnet 172.20.0.0/16 --ip-range 172.20.240.0/20 zabbix-net
```

### 2. Start empty PostgreSQL server instance

```
docker run --name postgres-server -t \
-e POSTGRES_USER="zabbix" \
-e POSTGRES_PASSWORD="zabbix_pwd" \
-e POSTGRES_DB="zabbix" \
--network=zabbix-net \
--restart unless-stopped \
-d postgres:latest
```

### 3. Start Zabbix snmptraps instance

```
docker run --name zabbix-snmptests -t \
  -v /zbx_instance/snmptests:/var/lib/zabbix/snmptests:rw \
  -v /var/lib/zabbix/mibs:/usr/share/snmp/mibs:ro \
  --network=zabbix-net \
  -p 162:1162/udp \
  --restart unless-stopped \
  -d zabbix/zabbix-snmptests:alpine-6.0-latest
```

**Note:**

Zabbix snmptest instance exposes the 162/UDP port (SNMP traps) to host machine.

4. Start Zabbix server instance and link the instance with created PostgreSQL server instance

```
docker run --name zabbix-server-pgsql -t \
  -e DB_SERVER_HOST="postgres-server" \
  -e POSTGRES_USER="zabbix" \
  -e POSTGRES_PASSWORD="zabbix_pwd" \
  -e POSTGRES_DB="zabbix" \
  -e ZBX_ENABLE_SNMP_TRAPS="true" \
  --network=zabbix-net \
  -p 10051:10051 \
  --volumes-from zabbix-snmptests \
  --restart unless-stopped \
  -d zabbix/zabbix-server-pgsql:alpine-6.0-latest
```

**Note:**

Zabbix server instance exposes the 10051/TCP port (Zabbix trapper) to host machine.

5. Start Zabbix web interface and link the instance with created PostgreSQL server and Zabbix server instances

```
docker run --name zabbix-web-nginx-pgsql -t \
  -e ZBX_SERVER_HOST="zabbix-server-pgsql" \
  -e DB_SERVER_HOST="postgres-server" \
  -e POSTGRES_USER="zabbix" \
  -e POSTGRES_PASSWORD="zabbix_pwd" \
  -e POSTGRES_DB="zabbix" \
  --network=zabbix-net \
  -p 443:8443 \
  -p 80:8080 \
  -v /etc/ssl/nginx:/etc/ssl/nginx:ro \
  --restart unless-stopped \
  -d zabbix/zabbix-web-nginx-pgsql:alpine-6.0-latest
```

**Note:**

Zabbix web interface instance exposes the 443/TCP port (HTTPS) to host machine.

Directory `/etc/ssl/nginx` must contain certificate with required name.

### Example 3

The example demonstrates how to run Zabbix server with MySQL database support, Zabbix web interface based on the Nginx web server and Zabbix Java gateway using podman on Red Hat 8.

1. Create new pod with name zabbix and exposed ports (web-interface, Zabbix server trapper):

```
podman pod create --name zabbix -p 80:8080 -p 10051:10051
```

2. (optional) Start Zabbix agent container in zabbix pod location:

```
podman run --name zabbix-agent \
  -e ZBX_SERVER_HOST="127.0.0.1,localhost" \
  --restart=always \
  --pod=zabbix \
  -d registry.connect.redhat.com/zabbix/zabbix-agent-60:latest
```

3. Create `./mysql/` directory on host and start Oracle MySQL server 8.0:

```
podman run --name mysql-server -t \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
-v ./mysql:/var/lib/mysql/:Z \
--restart=always \
--pod=zabbix \
-d mysql:8.0 \
--character-set-server=utf8 --collation-server=utf8_bin \
--default-authentication-plugin=mysql_native_password
```

4. Start Zabbix server container:

```
podman run --name zabbix-server-mysql -t \
-e DB_SERVER_HOST="127.0.0.1" \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
-e ZBX_JAVAGATEWAY="127.0.0.1" \
--restart=always \
--pod=zabbix \
-d registry.connect.redhat.com/zabbix/zabbix-server-mysql-60
```

5. Start Zabbix Java Gateway container:

```
podman run --name zabbix-java-gateway -t \
--restart=always \
--pod=zabbix \
-d registry.connect.redhat.com/zabbix/zabbix-java-gateway-60
```

6. Start Zabbix web-interface container:

```
podman run --name zabbix-web-mysql -t \
-e ZBX_SERVER_HOST="127.0.0.1" \
-e DB_SERVER_HOST="127.0.0.1" \
-e MYSQL_DATABASE="zabbix" \
-e MYSQL_USER="zabbix" \
-e MYSQL_PASSWORD="zabbix_pwd" \
-e MYSQL_ROOT_PASSWORD="root_pwd" \
--restart=always \
--pod=zabbix \
-d registry.connect.redhat.com/zabbix/zabbix-web-mysql-60
```

#### Note:

Pod zabbix exposes 80/TCP port (HTTP) to host machine from 8080/TCP of zabbix-web-mysql container.

**Docker Compose** Zabbix provides compose files also for defining and running multi-container Zabbix components in Docker. These compose files are available in Zabbix docker official repository on github.com: <https://github.com/zabbix/zabbix-docker>. These compose files are added as examples, they are overloaded. For example, they contain proxies with MySQL and SQLite3 support.

There are a few different versions of compose files:

| File name  | Description   |
|--|---|
| docker-compose_v3_alpine-mysql-latest            | The compose file starts the latest version of Zabbix 6.0 components on Alpine Linux with MySQL database support.                              |
| docker-compose_v3_alpine-mysql-latest-build      | The compose file locally builds the latest version of Zabbix 6.0 and runs Zabbix components on Alpine Linux with MySQL database support.      |
| docker-compose_v3_alpine-postgresql-latest       | The compose file starts the latest version of Zabbix 6.0 components on Alpine Linux with PostgreSQL database support.                         |
| docker-compose_v3_alpine-postgresql-latest-build | The compose file locally builds the latest version of Zabbix 6.0 and runs Zabbix components on Alpine Linux with PostgreSQL database support. |

| File name   | Description   |
|---|---|
| <code>docker-compose_v3_centos_mysql_latest.yaml</code> | The compose file starts the latest version of Zabbix 6.0 components on CentOS 8 with MySQL database support.                                  |
| <code>docker-compose_v3_centos_mysql_local.yaml</code>  | The compose file locally builds the latest version of Zabbix 6.0 and runs Zabbix components on CentOS 8 with MySQL database support.          |
| <code>docker-compose_v3_centos_pgsql_latest.yaml</code> | The compose file starts the latest version of Zabbix 6.0 components on CentOS 8 with PostgreSQL database support.                             |
| <code>docker-compose_v3_centos_pgsql_local.yaml</code>  | The compose file locally builds the latest version of Zabbix 6.0 and runs Zabbix components on CentOS 8 with PostgreSQL database support.     |
| <code>docker-compose_v3_ubuntu_mysql_latest.yaml</code> | The compose file starts the latest version of Zabbix 6.0 components on Ubuntu 20.04 with MySQL database support.                              |
| <code>docker-compose_v3_ubuntu_mysql_local.yaml</code>  | The compose file locally builds the latest version of Zabbix 6.0 and runs Zabbix components on Ubuntu 20.04 with MySQL database support.      |
| <code>docker-compose_v3_ubuntu_pgsql_latest.yaml</code> | The compose file starts the latest version of Zabbix 6.0 components on Ubuntu 20.04 with PostgreSQL database support.                         |
| <code>docker-compose_v3_ubuntu_pgsql_local.yaml</code>  | The compose file locally builds the latest version of Zabbix 6.0 and runs Zabbix components on Ubuntu 20.04 with PostgreSQL database support. |

#### Attention:

Available Docker compose files support version 3 of Docker Compose.

## Storage

Compose files are configured to support local storage on a host machine. Docker Compose will create a `zbx_env` directory in the folder with the compose file when you run Zabbix components using the compose file. The directory will contain the same structure as described above in the **Volumes** section and directory for database storage.

There are also volumes in read-only mode for `/etc/localtime` and `/etc/timezone` files.

## Environment files

In the same directory with compose files on github.com you can find files with default environment variables for each component in compose file. These environment files are named like `.env_<type of component>`.

## Examples

#### Note:

The commands listed below are for Docker Compose V2. If you are using Docker Compose V1, replace `docker compose` `-f` with `docker-compose -f`

### Example 1

```
# git checkout 6.0
# docker compose -f ./docker-compose_v3_alpine_mysql_latest.yaml up -d
```

The command will download latest Zabbix 6.0 images for each Zabbix component and run them in detach mode.

#### Attention:

Do not forget to download `.env_<type of component>` files from github.com official Zabbix repository with compose files.

### Example 2

```
# git checkout 6.0
# docker compose -f ./docker-compose_v3_ubuntu_mysql_local.yaml up -d
```

The command will download base image Ubuntu 20.04 (focal), then build Zabbix 6.0 components locally and run them in detach mode.

## Installation with OpenShift

## Overview

Zabbix helps you to do a real-time monitoring of millions of metrics collected from tens of thousands of servers, virtual machines and network devices. The Zabbix Operator allows users to easily deploy, manage, and maintain Zabbix deployments on OpenShift. By installing this integration you will be able to deploy Zabbix server/proxies and other components with a single command.

#### Supported features

Zabbix Operator comes with a few possible installation options:

- **Zabbix server** - a simple Zabbix installation with included Zabbix server, Zabbix web interface and Zabbix Java gateway with MySQL database support. The feature does not provide MySQL service and requires an external MySQL database.
- **Zabbix server (full)** - a Zabbix installation with included Zabbix server, Zabbix web interface, Zabbix Java gateway and MySQL server instance.
- **Zabbix proxy (SQLite3)** - a very simple way to gain power of Zabbix proxy. The feature has SQLite3 support for Zabbix proxies and allows to specify the amount of proxies.
- **Zabbix proxy (MySQL)** - another option of Zabbix proxy. This option supports and delivers a MySQL database. It is possible to use a built-in MySQL database instance or an external one.
- **Zabbix agent** - a Zabbix agent can be deployed on each available node for stability and performance monitoring on remote nodes. It allows to gather metrics with full automation!
- **Zabbix appliance** - a Zabbix appliance is a very simple way to test and check Zabbix features. This option provides all the core components in one solution. It includes Zabbix server, Zabbix Java gateway, Zabbix web interface and MySQL server in deployment. It is very useful for testing Zabbix features!

Currently Zabbix Operator is based on the Zabbix 6.0 LTS version and supports OpenShift 4.1, 4.2, 4.3, 4.4, 4.5, and 4.6.

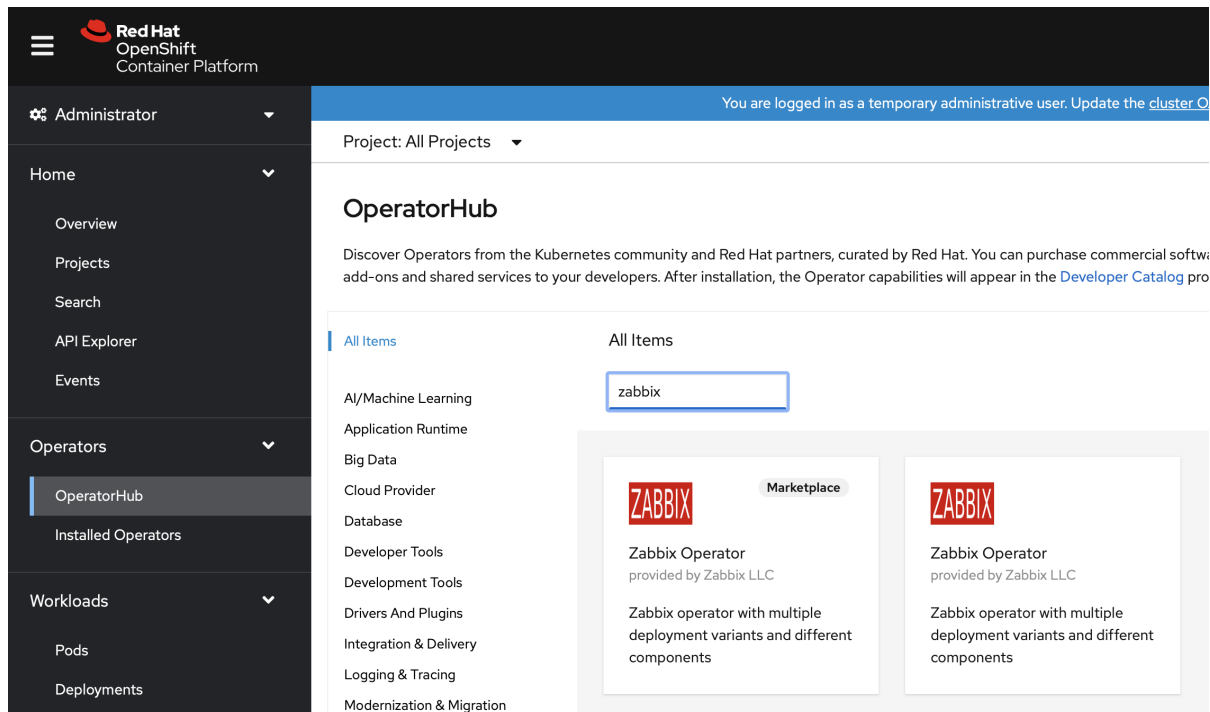

#### Installing Zabbix Operator

##### Using RedHat Marketplace

#### Attention:

The installation of Zabbix Operator using Red Hat Marketplace requires the OpenShift cluster to be registered in the Marketplace Portal, including the roll out of the PullSecret in your cluster. Failure to do so will result in an image pull authentication failure with the Red Hat registry.

1. Select the OperatorHub from the Operators submenu and search for Zabbix.

Choose the RedHat Marketplace option.

2. Select "Zabbix Operator" and click on *Purchase*.

#### Attention:

Openshift needs to be registered with the Red Hat Marketplace portal.

**Description**

**About this Operator**

Zabbix helps you to real-time monitoring of millions of metrics collected from tens of thousands of servers, virtual machines and network devices. The Zabbix Operator allows users to easily deploy, manage, and maintain Zabbix deployments on OpenShift. By installing this integration you will be able to deploy Zabbix server / proxies and other components with a single command.

## Using OperatorHub

### Note:

If you have installed OpenShift in AWS ensure that the requisite ports are opened for the worker nodes' security group.

### 1. Select OperatorHub from the Operators submenu and search for Zabbix.

Red Hat OpenShift Container Platform

You are logged in as a temporary administrative user. Update the cluster O

Zabbix

**About this Operator**

Zabbix helps you to real-time monitoring of millions of metrics collected from tens of thousands of servers, virtual machines and network devices. The Zabbix Operator allows users to easily deploy, manage, and maintain Zabbix deployments on OpenShift. By installing this integration you will be able to deploy Zabbix server / proxies and other components with a single command.

**Supported Features**

- Zabbix Server** - Simple Zabbix installation with included Zabbix server, Zabbix web-interface and Zabbix Java Gateway with MySQL database support. The feature does not provide MySQL service and requires an external MySQL database.
- Zabbix Server (Full)** - Zabbix installation with included Zabbix server, Zabbix web-interface, Zabbix Java Gateway and MySQL server instance.
- Zabbix proxy (SQLite3)** - Very simple way to gain power of Zabbix proxy. The feature has SQLite3 support for Zabbix proxies and allow to specify amount of proxies.
- Zabbix proxy (MySQL)** - Another option of Zabbix proxy. The option support and deliver MySQL database.
- Zabbix agent** - Zabbix agent can be deployed on each available node for stability and performance monitoring on remote nodes. It allows to gather metrics with full automation!
- Zabbix Appliance** - Zabbix appliance very simple way to test and check Zabbix features. The option provides all core components in one solution. It includes Zabbix server, Zabbix Java Gateway, Zabbix web-interface and MySQL server in deployment. It is very useful for testing Zabbix features!

**Prerequisites**

All deployment options are require additional information during deployment. Please, check the following instructions and provide required configuration:

- Zabbix Server** - MySQL database host information and MySQL database credentials in specially formatted `Secret`. Additionally it is possible to specify SSL certificates for HTTPS support in `Secret`.
- Zabbix Server (Full)** - MySQL database credentials in specially formatted `Secret`. MySQL database volume name information. Additionally it is possible to specify SSL certificates for HTTPS support in `Secret`.
- Zabbix proxy (SQLite3)** - Zabbix server host information only.

### 3. Select the installation options.

**OperatorHub** > Operator Installation

**Install Operator**

Install your Operator by subscribing to one of the update channels to keep the Operator up to date. The strategy determines either manual or automatic updates.

**Update channel \***

- ☒ Its

**Installation mode \***

- ☐ All namespaces on the cluster (default)  
This mode is not supported by this Operator
- ☒ A specific namespace on the cluster  
Operator will be available in a single Namespace only.

**Installed Namespace \***

- ☒ Operator recommended Namespace: **zabbix**

**Namespace creation**  
Namespace **zabbix** does not exist and will be created.

**Update approval \***

- ☒ Automatic

**About this Operator**

Zabbix helps you to real-time monitoring of millions of metrics collected from tens of thousands of servers, virtual machines and network devices. The Zabbix Operator allows

## Configuration

Some of the operands (installation options) require additional resources to be created before. The following section describes these prerequisites. All possible configuration options are available during operand deployment. For example, **Zabbix proxy (MySQL)**:

Red Hat OpenShift Container Platform

Project: zabbix

Search for configuration options:

**TLS connection to database**  
Setting this option enforces to use TLS connection to database

**Zabbix server**  
Select Service  
IP address, optionally in CIDR notation, or hostname of Zabbix server

**Debug level**  
3  
Specifies debug level

**Host name**  
Unique, case sensitive Proxy name

**Configuration cache size**  
8M  
Size of configuration cache, in bytes

**Timeout**  
4  
Specifies how long we wait for agent, SNMP device or external check (in seconds)

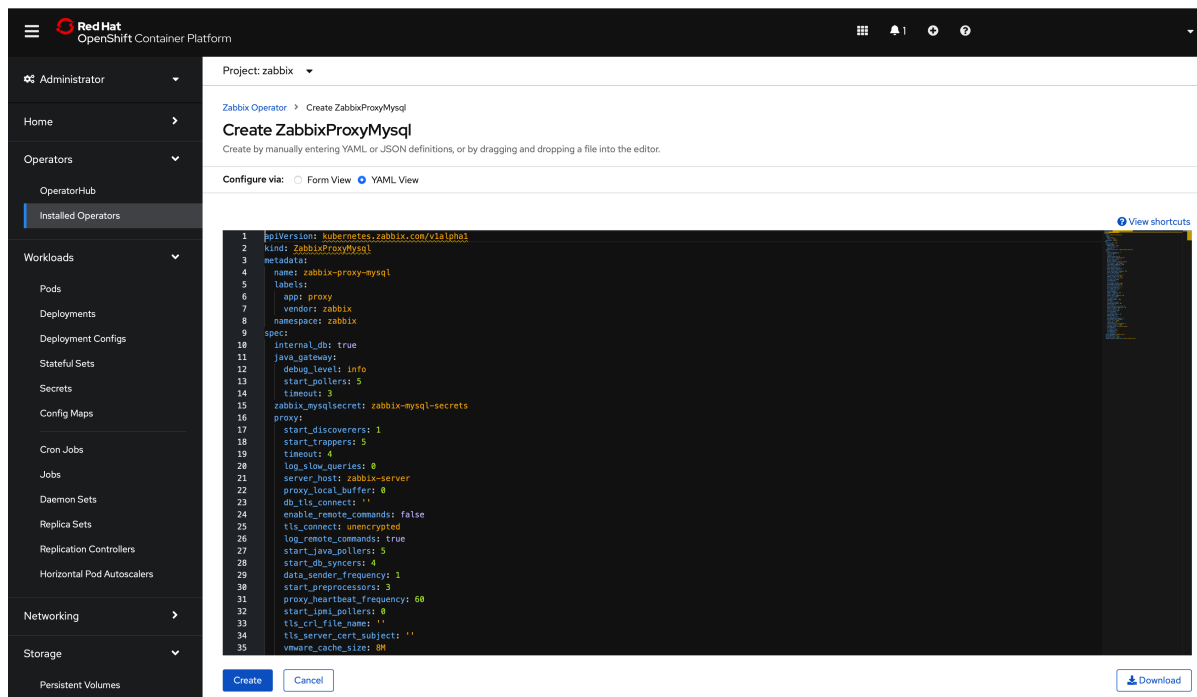

**Log slow queries**  
0  
How long a database query may take before being logged (in milliseconds)

**Proxy mode**  
0  
Proxy operating mode

**Zabbix server port**  
10051  
Port of Zabbix trapper on Zabbix server

**Configuration sync frequency**

The YAML section provides all available options with default values:

## Zabbix server

This operand has a few prerequisites:

1. An existing MySQL database entry point - a MySQL database/cluster must be created before running the "Zabbix Server" operand. For example, a standalone MySQL server with persistent volume:

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: mysql-pv-claim
spec:
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 20Gi
---
```

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: mysql
spec:
  selector:
    matchLabels:
      app: mysql
  strategy:
    type: Recreate
  template:
    metadata:
      labels:
        app: mysql
    spec:
      containers:
        - image: mysql:8.0
          name: mysql
          args:
            - mysqld
            - '--character-set-server=utf8'
            - '--collation-server=utf8_bin'
            - '--default-authentication-plugin=mysql_native_password'
          env:
```

```

    # Use secret in real usage
    - name: MYSQL_ROOT_PASSWORD
      value: Welcome1!
  ports:
    - containerPort: 3306
      name: mysql
  volumeMounts:
    - name: mysql-persistent-storage
      mountPath: /var/lib/mysql
  volumes:
    - name: mysql-persistent-storage
      persistentVolumeClaim:
        claimName: mysql-pv-claim
---
apiVersion: v1
kind: Service
metadata:
  name: mysql
spec:
  ports:
    - port: 3306
  selector:
    app: mysql
  clusterIP: None

```

Please, note that Zabbix does not support a utf8\_mb4 charset and default caching\_sha2\_password authentication plugin.

**2.** MySQL credentials using secret - must be secret with mysql\_root\_password, mysql\_zabbix\_username and mysql\_zabbix\_password data. For example:

```

kind: Secret
apiVersion: v1
metadata:
  name: zabbix-server-secrets
data:
  mysql_root_password: V2VsY29tZTEh
  mysql_zabbix_password: emFiYm14X3N1cGVyIQ==
  mysql_zabbix_username: emFiYm14
type: Opaque

```

where all fields are encoded using base64. For example:

```

# echo -n "zabbix" | base64
emFiYm14Cg

```

An example of "Zabbix Server" operand configuration:

Red Hat OpenShift Container Platform

You are logged in as a temporary administrative user. Update the cluster OAuth configuration to allow others to log in.

Project: zabbix

Zabbix Operator > Create ZabbixServer

### Create ZabbixServer

Create by completing the form. Default values may be provided by the Operator authors.

Configure via: ☒ Form view ☐ YAML view

**Note:** Some fields may not be represented in this form view. Please select "YAML view" for full control.

**Zabbix Server**  
provided by Zabbix LLC  
Zabbix server with MySQL database support, Nginx web-server and Zabbix Java Gateway

**Name \***  
zabbix-server

**Labels**  
app=zabbix vendor=zabbix

**MySQL database host \***  
mysql  
MySQL database host name

**MySQL database name \***  
zabbix  
Database name for Zabbix installation

**MySQL database credentials secret \***  
zabbix-server-secret  
MySQL database credentials secret name

**Zabbix server configuration**  
Configuration parameters for Zabbix server

**Zabbix Java Gateway configuration**  
Configuration parameters for Zabbix Java Gateway

All configuration options are available using the form view, but it is possible to use the YAML view as well. For example:

Red Hat OpenShift Container Platform

You are logged in as a temporary administrative user. Update the cluster OAuth configuration to allow others to log in.

Project: zabbix

Zabbix Operator > Create ZabbixServer

### Create ZabbixServer

Create by manually entering YAML or JSON definitions, or by dragging and dropping a file into the editor.

Configure via: ☐ Form view ☒ YAML view

```

67:
68:   tlsCertPath: ''
69:   tlsPrivateKeyPath: ''
70:   debug_level: info
71:   start_pollers: 5
72:   timeout: 3
73:   zabbix_mysql_secret: zabbix-server-secret

The route for Zabbix web interface is located under Networking → Routes. The URL provides access to the Zabbix web interface. In the following example it is `http://zabbix-server-zabbix.apps-crc.testing/`:

## Zabbix full

This operand has a few prerequisites:

1. MySQL volume claim - must be persistent volume claim. For example:

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: zabbix-database
  namespace: zabbix
spec:
  accessModes:
    - ReadWriteOnce
  volumeMode: Filesystem
  resources:
    requests:
      storage: 50Gi
```

2. MySQL credentials using secret - must be secret with `mysql_root_password`, `mysql_zabbix_username` and `mysql_zabbix_password` data. For example:

```
kind: Secret
apiVersion: v1
metadata:
  name: zabbix-full-secrets
data:
  mysql_root_password: V2VsY29tZTEh
  mysql_zabbix_password: emFiYml4X3N1cGVyIQ==
  mysql_zabbix_username: emFiYml4
type: Opaque
```

where all fields are encoded using base64. For example:

```
# echo -n "zabbix" | base64
emFiYml4Cg
```

An example of "Zabbix Full" operand configuration:

**Project:** zabbix

**Zabbix Operator** > Create ZabbixFull

Create by completing the form. Default values may be provided by the Operator authors.

Configure via: ☒ Form view ☐ YAML view

**Note:** Some fields may not be represented in this form view. Please select "YAML view" for full control.

The route for Zabbix web interface is located under Networking → Routes. The URL provides access to the Zabbix web interface. In the following example it is `http://zabbix-full-zabbix.apps-crc.testing/`:

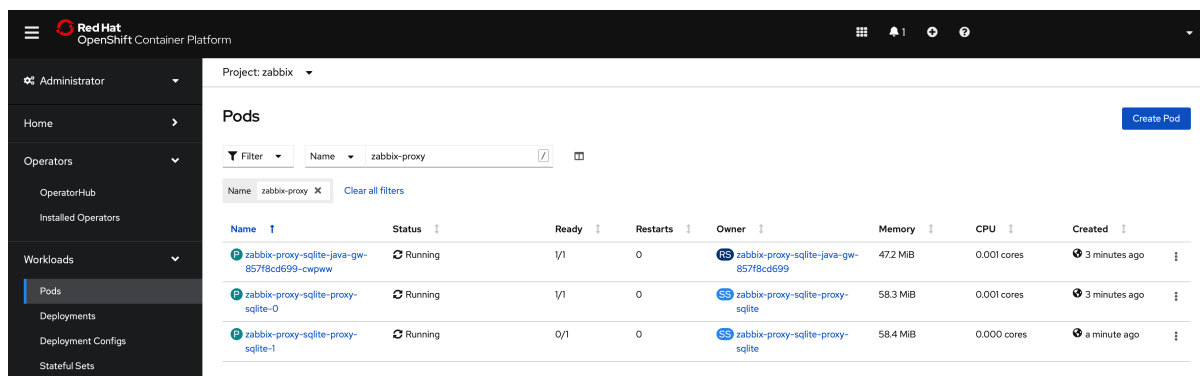

## Zabbix proxy (SQLite3)

An example of "Zabbix proxy (SQLite3)" operand configuration:

Finally, the operand will create multiple pods. It is possible to examine them in the Workloads → Pods section:

## Additional information

### Creating new secret

The following procedure describes how to create a new secret using Openshift Console.

1. Open the Workloads → Secrets section and switch project to the Zabbix Operator project (by default, "zabbix").

Project: zabbix

### Secrets

Filter Name Search by name...

| Name                                      | Type                                | Size | Created            |
|---|-------------------------------------|------|--------------------|
| builder-dockercfg-vrpdv                   | kubernetes.io/dockercfg             | 1    | 18 Aug 2021, 14:53 |

## 2. Create a new secret using the *From YAML* option.

### Create Secret

Create by manually entering YAML or JSON definitions, or by dragging and dropping a file into the editor.

```

1 kind: Secret
2 apiVersion: v1
3 metadata:
4   name: zabbix-server-secret
5 data:
6   mysql_root_password: enF1Ym14X3N1c0V0YXJ3b3Q=
7   mysql_zabbix_password: enF1Ym14X3V2ZDZjOGZzc3dvcnQ=
8   mysql_zabbix_username: enF1Ym14Cg==
9 type: Opaque
  
```

Buttons: Create, Cancel, Download

#### Secret

Schema

Secret holds secret data of a certain type. The total bytes of the values in the Data field must be less than MaxSecretSize bytes.

- apiVersion** `string`  
APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources>
- data** `object`  
Data contains the secret data. Each key must consist of alphanumeric characters, '-', '\_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <https://tools.ietf.org/html/rfc4648#section-4>
- immutable** `boolean`  
Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil.
- kind** `string`

## SSL certificates for HTTPS

It is possible to enable HTTPS directly in the Zabbix web interface pods. In this case create the following secret using the YAML option:

```

kind: Secret
apiVersion: v1
metadata:
  name: zabbix-web-sslsecret
data:
  ssl.crt: >-
    < ssl.crt data>
  ssl.key: >-
    < ssl.key data >
  dhparam.pem: >-
    < dhparam.pem data >
  
```

The names of certificates and DH Parameters file are static. Please use the listed in the above example only!

MySQL database certificate base encryption

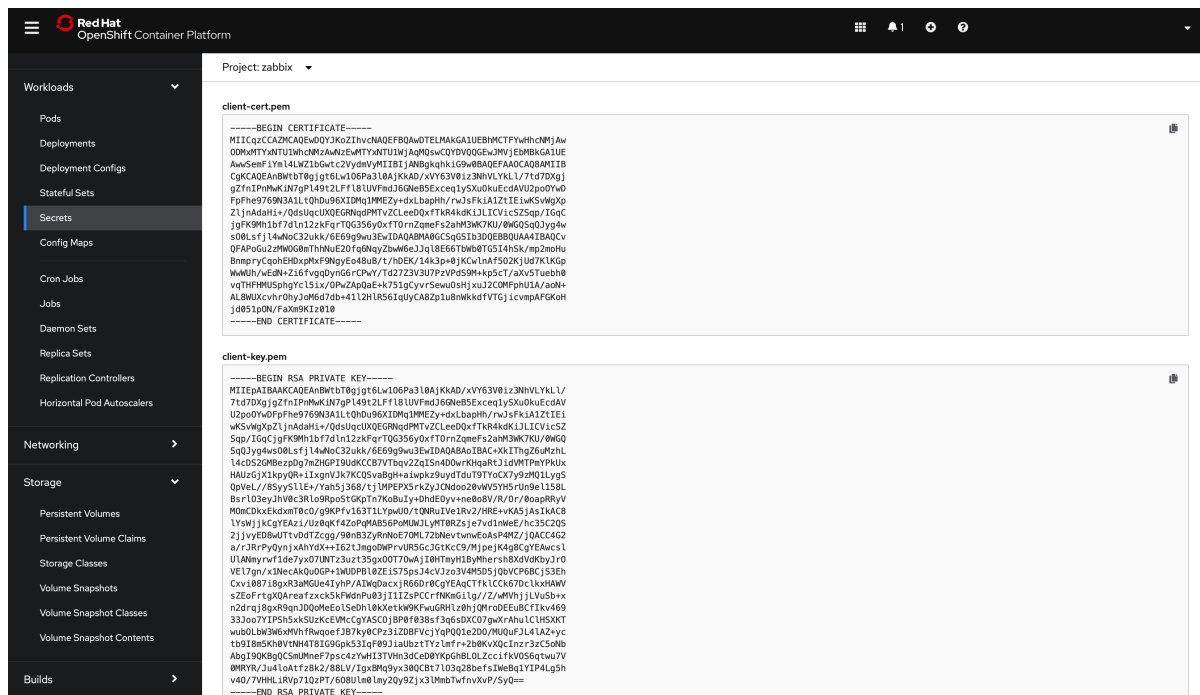

MySQL database side:

```
apiVersion: v1
data:
  root-ca.pem: >-
    < root-ca.pem data>
  server-cert.pem: >-
    < server-cert.pem data>
  server-key.pem: >-
    < server-key.pem data>
kind: Secret
metadata:
  name: zabbix-db-server-tls-secret
type: Opaque
```

Zabbix components side:

```
apiVersion: v1
data:
  client-cert.pem: >-
    < client-cert.pem data>
  client-key.pem: >-
    < client-key.pem data>
  root-ca.pem: >-
    < root-ca.pem data>
kind: Secret
metadata:
  name: zabbix-db-client-tls-secret
type: Opaque
```

Certificates must include "-----BEGIN RSA PRIVATE KEY-----" and "-----END RSA PRIVATE KEY-----". For example:

Then, during deployment, in the Zabbix component section and MySQL server (if using built-in server) choose the proper "TLS connection to database" option value and the "MySQL database certificates (client)" secret value.

Known issues

1. Zabbix agent does not have the possibility to determine proper node name. It always has dynamic hostname.

## 6 Web interface installation

This section provides step-by-step instructions for installing Zabbix web interface. Zabbix frontend is written in PHP, so to run it a PHP supported webserver is needed.

**Note:**  
You can find out more about setting up SSL for Zabbix frontend by referring to these [best practices](#).

Welcome screen

Open Zabbix frontend URL in the browser. If you have installed Zabbix from packages, the URL is:

- for Apache: `http://<server_ip_or_name>/zabbix`
- for Nginx: `http://<server_ip_or_name>`

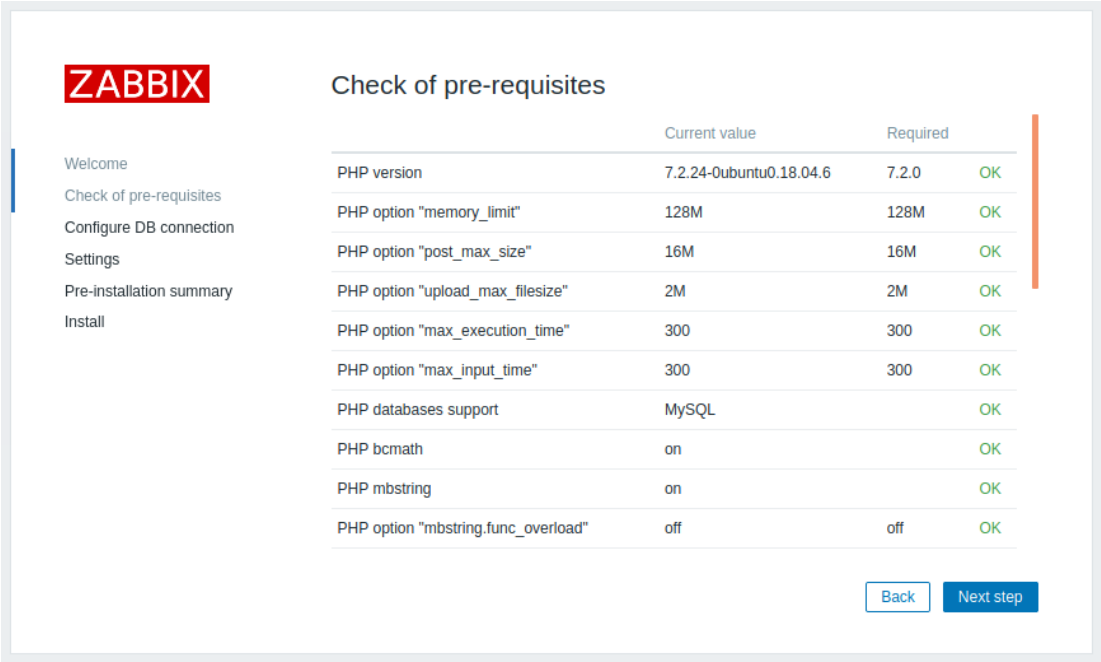

You should see the first screen of the frontend installation wizard.

Use the *Default language* drop-down menu to change system default language and continue the installation process in the selected language (optional). For more information, see [Installation of additional frontend languages](#).

Check of pre-requisites

Make sure that all software prerequisites are met.

| Pre-requisite                             | Minimum value                             | Description   |
|---|---|---|
| <i>PHP version</i>                        | 7.2.5                                     |   |
| <i>PHP memory_limit option</i>            | 128MB                                     | In php.ini:<br>memory_limit = 128M  |
| <i>PHP post_max_size option</i>           | 16MB                                      | In php.ini:<br>post_max_size = 16M  |
| <i>PHP upload_max_filesize option</i>     | 2MB                                       | In php.ini:<br>upload_max_filesize = 2M   |
| <i>PHP max_execution_time option</i>      | 300 seconds (values 0 and -1 are allowed) | In php.ini:<br>max_execution_time = 300   |
| <i>PHP max_input_time option</i>          | 300 seconds (values 0 and -1 are allowed) | In php.ini:<br>max_input_time = 300   |
| <i>PHP session.auto_start option</i>      | must be disabled                          | In php.ini:<br>session.auto_start = 0   |
| <i>Database support</i>                   | One of: MySQL, Oracle, PostgreSQL.        | One of the following modules must be installed:<br>mysql, oci8, pgsql   |
| <i>bcmath</i>                             |   | php-bcmath  |
| <i>mbstring</i>                           |   | php-mbstring  |
| <i>PHP mb-string.func_overload option</i> | must be disabled                          | In php.ini:<br>mbstring.func_overload = 0   |
| <i>sockets</i>                            |   | php-net-socket. Required for user script support.   |
| <i>gd</i>                                 | 2.0.28                                    | php-gd. PHP GD extension must support PNG images ( <i>--with-png-dir</i> ), JPEG ( <i>--with-jpeg-dir</i> ) images and FreeType 2 ( <i>--with-freetype-dir</i> ).   |
| <i>libxml</i>                             | 2.6.15                                    | php-xml   |
| <i>xmlwriter</i>                          |   | php-xmlwriter   |
| <i>xmlreader</i>                          |   | php-xmlreader   |
| <i>ctype</i>                              |   | php-ctype   |
| <i>session</i>                            |   | php-session   |
| <i>gettext</i>                            |   | php-gettext<br>Since Zabbix 2.2.1, the PHP gettext extension is not a mandatory requirement for installing Zabbix. If gettext is not installed, the frontend will work as usual, however, the translations will not be available. |

Optional pre-requisites may also be present in the list. A failed optional prerequisite is displayed in orange and has a *Warning* status. With a failed optional pre-requisite, the setup may continue.

**Attention:**

If there is a need to change the Apache user or user group, permissions to the session folder must be verified. Otherwise Zabbix setup may be unable to continue.

Configure DB connection

Enter details for connecting to the database. Zabbix database must already be created.

Install

Details ▲

Cannot create the configuration file.

Unable to create the configuration file.

Alternatively, you can install it manually:

1. [Download the configuration file](#)

2. Save it as "/var/www/html/zabbix/conf/zabbix.conf.php"

Back

Finish

**Note:**

Providing the webserver user has write access to conf/ directory the configuration file would be saved automatically and it would be possible to proceed to the next step right away.

Finish the installation.

Log in

Zabbix frontend is ready! The default user name is **Admin**, password **zabbix**.

Proceed to [getting started with Zabbix](#).

## 1 Debian/Ubuntu frontend installation

### Overview

Starting from version 5.0, Zabbix frontend requires PHP version 7.2 or later. Unfortunately, older versions of Debian & Ubuntu provide only PHP versions below 7.2.

Supported PHP versions by distribution

| Distribution         | PHP Version |
|----------------------|-------------|
| Debian 12 (bookworm) | 8.2         |

| Distribution          | PHP Version |
|-----------------------|-------------|
| Debian 11 (bullseye)  | 7.4         |
| Debian 10 (buster)    | 7.3         |
| Debian 9 (stretch)    | 7.0         |
| Debian 8 (jessie)     | 5.6         |
| Ubuntu 20.04 (focal)  | 7.4         |
| Ubuntu 18.04 (bionic) | 7.2         |
| Ubuntu 16.04 (xenial) | 7.0         |
| Ubuntu 14.04 (trusty) | 5.5         |
| Raspbian 10 (buster)  | 7.3         |
| Raspbian 8 (stretch)  | 7.0         |

On *stretch*, *jessie*, *xenial* and *trusty* distributions, PHP 7.2 dependency is not available, and therefore Zabbix frontend 5.0 or newer cannot be easily installed. Considering this, `zabbix-frontend-php` package has been replaced with `zabbix-frontend-php-deprecated` package on aforementioned distributions.

The main difference is absence of direct dependencies on any php or web-server packages. Thus, the user can (and must) provide these dependencies on their own. In other words, installing `zabbix-frontend-php-deprecated` package on its own will not give you a working frontend. A web server as well as PHP 7.2 with its modules have to be installed manually (use PPAs / build PHP from source). We don't endorse any particular method.

**Note:**

The official way of getting PHP 7.2 or later on older versions of Debian/Ubuntu is to upgrade to buster/bionic.

PHP modules required for Zabbix frontend are `php-gd`, `php-bcmath`, `php-mbstring`, `php-xml`, `php-ldap` and `php-json`.

## 7 Upgrade procedure

### Overview

This section provides upgrade information for Zabbix **6.0**:

- using packages:
  - for [Red Hat Enterprise Linux](#)
  - for [Debian/Ubuntu](#)
- using [sources](#)

Direct upgrade to Zabbix 6.0.x is possible from Zabbix **5.4.x**, **5.2.x**, **5.0.x**, **4.4.x**, **4.2.x**, **4.0.x**, **3.4.x**, **3.2.x**, **3.0.x**, **2.4.x**, **2.2.x** and **2.0.x**. For upgrading from earlier versions consult Zabbix documentation for 2.0 and earlier.

**Note:**

Please be aware that after upgrading some third-party software integrations in Zabbix might be affected, if the external software is not compatible with the upgraded Zabbix version.

### 1 Upgrade from sources

#### Overview

This section provides the steps required for a successful **upgrade** from Zabbix **5.4.x** to Zabbix **6.0.x** using official Zabbix sources.

While upgrading Zabbix agents is not mandatory (but recommended), Zabbix server and proxies must be of the **same major version**. Therefore, in a server-proxy setup, Zabbix server and all proxies have to be stopped and upgraded. Keeping proxies running no longer will bring any benefit as during proxy upgrade their old data will be discarded and no new data will be gathered until proxy configuration is synced with server.

**Attention:**

It is no longer possible to start the upgraded server and have older and unupgraded proxies report data to a newer server. This approach, which was never recommended nor supported by Zabbix, now is officially disabled, as the server will ignore data from unupgraded proxies.

Note that with SQLite database on proxies, history data from proxies before the upgrade will be lost, because SQLite database upgrade is not supported and the SQLite database file has to be manually removed. When proxy is started for the first time and the SQLite database file is missing, proxy creates it automatically.

Depending on database size the database upgrade to version 6.0 may take a long time.

**Warning:**

Before the upgrade make sure to read the relevant **upgrade notes!**

The following upgrade notes are available:

| Upgrade from | Read full upgrade notes  | Most important changes between versions   |
|--------------|--|---|
| 5.4.x        | For:<br>Zabbix <b>6.0</b>  | Minimum required database versions upped;<br>Server/proxy will not start if outdated database;<br>Audit log records lost because of database structure change.  |
| 5.2.x        | For:<br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>   | Minimum required database versions upped;<br>Aggregate items removed as a separate type.  |
| 5.0.x LTS    | For:<br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>  | Minimum required PHP version upped from 7.2.0 to 7.2.5.   |
| 4.4.x        | For:<br>Zabbix <b>5.0</b><br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>   | Support of IBM DB2 dropped;<br>Minimum required PHP version upped from 5.4.0 to 7.2.0;<br>Minimum required database versions upped;<br>Changed Zabbix PHP file directory.   |
| 4.2.x        | For:<br>Zabbix <b>4.4</b><br>Zabbix <b>5.0</b><br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>  | Jabber, Ez Texting media types removed.   |
| 4.0.x LTS    | For:<br>Zabbix <b>4.2</b><br>Zabbix <b>4.4</b><br>Zabbix <b>5.0</b><br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>   | Older proxies no longer can report data to an upgraded server;<br>Newer agents no longer will be able to work with an older Zabbix server.  |
| 3.4.x        | For:<br>Zabbix <b>4.0</b><br>Zabbix <b>4.2</b><br>Zabbix <b>4.4</b><br>Zabbix <b>5.0</b><br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>                      | 'libpthread' and 'zlib' libraries now mandatory;<br>Support for plain text protocol dropped and header is mandatory;<br>Pre-1.4 version Zabbix agents are no longer supported;<br>The Server parameter in passive proxy configuration now mandatory.  |
| 3.2.x        | For:<br>Zabbix <b>3.4</b><br>Zabbix <b>4.0</b><br>Zabbix <b>4.2</b><br>Zabbix <b>4.4</b><br>Zabbix <b>5.0</b><br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b> | SQLite support as backend database dropped for Zabbix server/frontend;<br>Perl Compatible Regular Expressions (PCRE) supported instead of POSIX extended;<br>'libpcre' and 'libevent' libraries mandatory for Zabbix server;<br>Exit code checks added for user parameters, remote commands and system.run[] items without the 'nowait' flag as well as Zabbix server executed scripts;<br>Zabbix Java gateway has to be upgraded to support new functionality. |

| Upgrade from | Read full upgrade notes  | Most important changes between versions  |
|--------------|--|--|
| 3.0.x LTS    | For:<br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a>   | Database upgrade may be slow, depending on the history table size.   |
| 2.4.x        | For:<br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a>   | Minimum required PHP version upped from 5.3.0 to 5.4.0<br>LogFile agent parameter must be specified  |
| 2.2.x LTS    | For:<br>Zabbix <a href="#">2.4</a><br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a>                               | Node-based distributed monitoring removed  |
| 2.0.x        | For:<br>Zabbix <a href="#">2.2</a><br>Zabbix <a href="#">2.4</a><br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a> | Minimum required PHP version upped from 5.1.6 to 5.3.0;<br>Case-sensitive MySQL database required for proper server work;<br>character set utf8 and utf8_bin collation is required for Zabbix server to work properly with MySQL database. See <a href="#">database creation scripts</a> .<br>'mysqli' PHP extension required instead of 'mysql' |

You may also want to check the [requirements](#) for 6.0.

**Note:**

It may be handy to run two parallel SSH sessions during the upgrade, executing the upgrade steps in one and monitoring the server/proxy logs in another. For example, run `tail -f zabbix_server.log` or `tail -f zabbix_proxy.log` in the second SSH session showing you the latest log file entries and possible errors in real time. This can be critical for production instances.

## Server upgrade process

### 1 Stop server

Stop Zabbix server to make sure that no new data is inserted into database.

## 2 Back up the existing Zabbix database

This is a very important step. Make sure that you have a backup of your database. It will help if the upgrade procedure fails (lack of disk space, power off, any unexpected problem).

## 3 Back up configuration files, PHP files and Zabbix binaries

Make a backup copy of Zabbix binaries, configuration files and the PHP file directory.

## 4 Install new server binaries

Use these [instructions](#) to compile Zabbix server from sources.

## 5 Review server configuration parameters

Make sure to implement the latest configuration parameters (if any) usually mentioned in the relevant subsection of *Upgrade notes* and *What's new* page.

## 6 Start new Zabbix binaries

Start new binaries. Check log files to see if the binaries have started successfully.

Zabbix server will automatically upgrade the database. When starting up, Zabbix server reports the current (mandatory and optional) and required database versions. If the current mandatory version is older than the required version, Zabbix server automatically executes the required database upgrade patches. The start and progress level (percentage) of the database upgrade is written to the Zabbix server log file. When the upgrade is completed, a "database upgrade fully completed" message is written to the log file. If any of the upgrade patches fail, Zabbix server will not start. Zabbix server will also not start if the current mandatory database version is newer than the required one. Zabbix server will only start if the current mandatory database version corresponds to the required mandatory version.

```
8673:20161117:104750.259 current database version (mandatory/optional): 03040000/03040000
8673:20161117:104750.259 required mandatory version: 03040000
```

Before you start the server:

- Make sure the database user has enough permissions (create table, drop table, create index, drop index)
- Make sure you have enough free disk space.

## 7 Install new Zabbix web interface

The minimum required PHP version is 7.2.5. Update if needed and follow [installation instructions](#).

## 8 Clear web browser cookies and cache

After the upgrade you may need to clear web browser cookies and web browser cache for the Zabbix web interface to work properly.

### Proxy upgrade process

#### 1 Stop proxy

Stop Zabbix proxy.

#### 2 Back up configuration files and Zabbix proxy binaries

Make a backup copy of the Zabbix proxy binary and configuration file.

#### 3 Install new proxy binaries

Use these [instructions](#) to compile Zabbix proxy from sources.

#### 4 Review proxy configuration parameters

Make sure to review [Upgrade notes](#) to check if any changes in the configuration parameters are required.

#### 5 Start new Zabbix proxy

Start the new Zabbix proxy. Check log files to see if the proxy has started successfully.

Zabbix proxy will automatically upgrade the database. Database upgrade takes place similarly as when starting [Zabbix server](#).

### Agent upgrade process

#### **Attention:**

Upgrading agents is not mandatory. You only need to upgrade agents if it is required to access the new functionality.

The upgrade procedure described in this section may be used for upgrading both the Zabbix agent and the Zabbix agent 2.

#### 1 Stop agent

Stop Zabbix agent.

## 2 Back up configuration files and Zabbix agent binaries

Make a backup copy of the Zabbix agent binary and configuration file.

## 3 Install new agent binaries

Use these [instructions](#) to compile Zabbix agent from sources.

Alternatively, you may download pre-compiled Zabbix agents from the [Zabbix download page](#).

## 4 Review agent configuration parameters

There are no mandatory changes in this version neither to **agent** nor to **agent 2** parameters.

## 5 Start new Zabbix agent

Start the new Zabbix agent. Check log files to see if the agent has started successfully.

## Upgrade between minor versions

When upgrading between minor versions of 6.0.x (for example from 6.0.1 to 6.0.3) it is required to execute the same actions for server/proxy/agent as during the upgrade between major versions. The only difference is that when upgrading between minor versions no changes to the database are made.

# 2 Upgrade from packages

## Overview

This section provides the steps required for a successful **upgrade** using official RPM and DEB packages provided by Zabbix for:

- **Red Hat Enterprise Linux**
- **Debian/Ubuntu**

## Zabbix packages from OS repositories

Often, OS distributions (in particular, Debian-based distributions) provide their own Zabbix packages.

Note that these packages are not supported by Zabbix, they are typically out of date and lack the latest features and bug fixes. Only the packages from [repo.zabbix.com](#) are officially supported.

If you are upgrading from packages provided by OS distributions (or had them installed at some point), follow this procedure to switch to official Zabbix packages:

1. Always uninstall the old packages first.
2. Check for residual files that may have been left after deinstallation.
3. Install official packages following [installation instructions](#) provided by Zabbix.

Never do a direct update, as this may result in a broken installation.

# 1 Red Hat Enterprise Linux

## Overview

This section provides the steps required for a successful **upgrade** from Zabbix **5.4.x** to the latest version of Zabbix **6.0.x** using official Zabbix packages for Red Hat Enterprise Linux.

While upgrading Zabbix agents is not mandatory (but recommended), Zabbix server and proxies must be of the **same major version**. Therefore, in a server-proxy setup, Zabbix server and all proxies have to be stopped and upgraded. Keeping proxies running during server upgrade no longer will bring any benefit as during proxy upgrade their old data will be discarded and no new data will be gathered until proxy configuration is synced with server.

Note that with SQLite database on proxies, history data from proxies before the upgrade will be lost, because SQLite database upgrade is not supported and the SQLite database file has to be manually removed. When proxy is started for the first time and the SQLite database file is missing, proxy creates it automatically.

Depending on database size the database upgrade to version 6.0 may take a long time.

### Warning:

Before the upgrade make sure to read the relevant **upgrade notes**!

The following upgrade notes are available:

| Upgrade from | Read full upgrade notes  | Most important changes between versions   |
|--------------|--|---|
| 5.4.x        | For:<br>Zabbix 6.0   | Minimum required database versions upped;<br>Server/proxy will not start if outdated database;<br>Audit log records lost because of database structure change.  |
| 5.2.x        | For:<br>Zabbix 5.4<br>Zabbix 6.0   | Minimum required database versions upped;<br>Aggregate items removed as a separate type.  |
| 5.0.x LTS    | For:<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Minimum required PHP version upped from 7.2.0 to 7.2.5.   |
| 4.4.x        | For:<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Support of IBM DB2 dropped;<br>Minimum required PHP version upped from 5.4.0 to 7.2.0;<br>Minimum required database versions upped;<br>Changed Zabbix PHP file directory.   |
| 4.2.x        | For:<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Jabber, Ez Texting media types removed.   |
| 4.0.x LTS    | For:<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Older proxies no longer can report data to an upgraded server;<br>Newer agents no longer will be able to work with an older Zabbix server.  |
| 3.4.x        | For:<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0                             | 'libpthreads' and 'zlib' libraries now mandatory;<br>Support for plain text protocol dropped and header is mandatory;<br>Pre-1.4 version Zabbix agents are no longer supported;<br>The Server parameter in passive proxy configuration now mandatory.   |
| 3.2.x        | For:<br>Zabbix 3.4<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0               | SQLite support as backend database dropped for Zabbix server/frontend;<br>Perl Compatible Regular Expressions (PCRE) supported instead of POSIX extended;<br>'libpcre' and 'libevent' libraries mandatory for Zabbix server;<br>Exit code checks added for user parameters, remote commands and system.run[] items without the 'nowait' flag as well as Zabbix server executed scripts;<br>Zabbix Java gateway has to be upgraded to support new functionality. |
| 3.0.x LTS    | For:<br>Zabbix 3.2<br>Zabbix 3.4<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0 | Database upgrade may be slow, depending on the history table size.  |

| Upgrade from | Read full upgrade notes  | Most important changes between versions  |
|--------------|--|--|
| 2.4.x        | For:<br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a>   | Minimum required PHP version upped from 5.3.0 to 5.4.0<br>LogFile agent parameter must be specified  |
| 2.2.x LTS    | For:<br>Zabbix <a href="#">2.4</a><br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a>                               | Node-based distributed monitoring removed  |
| 2.0.x        | For:<br>Zabbix <a href="#">2.2</a><br>Zabbix <a href="#">2.4</a><br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a> | Minimum required PHP version upped from 5.1.6 to 5.3.0;<br>Case-sensitive MySQL database required for proper server work;<br>character set utf8 and utf8_bin collation is required for Zabbix server to work properly with MySQL database. See <a href="#">database creation scripts</a> .<br>'mysqli' PHP extension required instead of 'mysql' |

You may also want to check the [requirements](#) for 6.0.

**Note:**

It may be handy to run two parallel SSH sessions during the upgrade, executing the upgrade steps in one and monitoring the server/proxy logs in another. For example, run `tail -f zabbix_server.log` or `tail -f zabbix_proxy.log` in the second SSH session showing you the latest log file entries and possible errors in real time. This can be critical for production instances.

For instructions on upgrading between Zabbix 6.0.x minor versions (for example, from 6.0.1 to 6.0.3), see [Upgrade between minor versions](#).

## Upgrade procedure

### 1 Stop Zabbix processes

Stop Zabbix server to make sure that no new data is inserted into database.

```
systemctl stop zabbix-server
```

If upgrading Zabbix proxy, agent, or agent 2, stop these components too:

```
systemctl stop zabbix-proxy
```

```
systemctl stop zabbix-agent
```

```
systemctl stop zabbix-agent2
```

**Attention:**

It is no longer possible to start the upgraded server and have older and unupgraded proxies report data to a newer server. This approach, which was never recommended nor supported by Zabbix, now is officially disabled, as the server will ignore data from unupgraded proxies.

## 2 Back up the existing Zabbix database

This is a very important step. Make sure that you have a backup of your database. It will help if the upgrade procedure fails (lack of disk space, power off, any unexpected problem).

## 3 Back up configuration files, PHP files and Zabbix binaries

Make a backup copy of Zabbix binaries, configuration files and the PHP file directory.

Configuration files:

```
mkdir /opt/zabbix-backup/  
cp /etc/zabbix/zabbix_server.conf /opt/zabbix-backup/  
cp /etc/httpd/conf.d/zabbix.conf /opt/zabbix-backup/
```

PHP files and Zabbix binaries:

```
cp -R /usr/share/zabbix/ /opt/zabbix-backup/  
cp -R /usr/share/zabbix-* /opt/zabbix-backup/
```

## 4 Update repository configuration package

Before proceeding with the upgrade, update your current repository package to the latest version to ensure compatibility with the newest packages and to include any recent security patches or bug fixes.

On **RHEL 9**, run:

```
rpm -Uvh https://repo.zabbix.com/zabbix/6.0/rhel/9/x86_64/zabbix-release-latest.el9.noarch.rpm
```

On **RHEL 8**, run:

```
rpm -Uvh https://repo.zabbix.com/zabbix/6.0/rhel/8/x86_64/zabbix-release-latest.el8.noarch.rpm
```

For older RHEL versions, replace the link above with the correct one from [Zabbix repository](#). Note, however, that packages for those versions may not include all Zabbix components. For a list of components included, see [Zabbix packages](#).

Then, clean up the dnf package manager's cache (including headers, metadata, and package files downloaded during previous installations or updates):

```
dnf clean all
```

On the next dnf operation, dnf will download fresh metadata from the repositories since the old metadata is cleared.

See also: [Known issues](#) for updating the repository configuration package on RHEL.

## 5 Upgrade Zabbix components

To upgrade Zabbix components you may run something like:

```
dnf install zabbix-server-mysql zabbix-web-mysql zabbix-agent
```

- If using PostgreSQL, substitute mysql with postgresql in the command.
- If upgrading the proxy, substitute server with proxy in the command.
- If upgrading the agent 2, substitute zabbix-agent with zabbix-agent2 zabbix-agent2-plugin-\* in the command.

**Attention:**

Upgrading Zabbix agent 2 with the `dnf install zabbix-agent2` command could lead to an error. For more information, see [Known issues](#).

Then, to upgrade the web frontend with Apache and restart Apache, run:

```
dnf install zabbix-apache-conf  
systemctl restart httpd
```

## 6 Review component configuration parameters

Make sure to review [Upgrade notes](#) to check if any changes in the configuration parameters are required.

## 7 Start Zabbix processes

Start the updated Zabbix components.

```
systemctl start zabbix-server
systemctl start zabbix-proxy
systemctl start zabbix-agent
systemctl start zabbix-agent2
```

8 Clear web browser cookies and cache

After the upgrade you may need to clear web browser cookies and web browser cache for the Zabbix web interface to work properly.

Upgrade between minor versions

It is possible to upgrade between Zabbix 6.0.x minor versions (for example, from 6.0.1 to 6.0.3).

To upgrade Zabbix minor version, please run:

```
dnf upgrade 'zabbix-*'
```

To upgrade Zabbix server minor version only, please run:

```
dnf upgrade 'zabbix-server-*'
```

To upgrade Zabbix agent minor version only, please run:

```
dnf upgrade 'zabbix-agent-*'
```

or, for Zabbix agent 2:

```
dnf upgrade 'zabbix-agent2-*'
```

## 2 Debian/Ubuntu

### Overview

This section provides the steps required for a successful **upgrade** from Zabbix **5.4.x** to the latest version of Zabbix **6.0.x** using official Zabbix packages for Debian/Ubuntu.

While upgrading Zabbix agents is not mandatory (but recommended), Zabbix server and proxies must be of the **same major version**. Therefore, in a server-proxy setup, Zabbix server and all proxies have to be stopped and upgraded. Keeping proxies running during server upgrade no longer will bring any benefit as during proxy upgrade their old data will be discarded and no new data will be gathered until proxy configuration is synced with server.

Note that with SQLite database on proxies, history data from proxies before the upgrade will be lost, because SQLite database upgrade is not supported and the SQLite database file has to be manually removed. When proxy is started for the first time and the SQLite database file is missing, proxy creates it automatically.

Depending on database size the database upgrade to version 6.0 may take a long time.

#### **Warning:**

Before the upgrade make sure to read the relevant **upgrade notes**!

The following upgrade notes are available:

| Upgrade from | Read full upgrade notes   | Most important changes between versions  |
|--------------|---|--|
| 5.4.x        | For:<br>Zabbix <b>6.0</b>   | Minimum required database versions upped;<br>Server/proxy will not start if outdated database;<br>Audit log records lost because of database structure change. |
| 5.2.x        | For:<br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b>                      | Minimum required database versions upped;<br>Aggregate items removed as a separate type.   |
| 5.0.x LTS    | For:<br>Zabbix <b>5.2</b><br>Zabbix <b>5.4</b><br>Zabbix <b>6.0</b> | Minimum required PHP version upped from 7.2.0 to 7.2.5.  |

| Upgrade from | Read full upgrade notes  | Most important changes between versions   |
|--------------|--|---|
| 4.4.x        | For:<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Support of IBM DB2 dropped;<br>Minimum required PHP version upped from 5.4.0 to 7.2.0;<br>Minimum required database versions upped;<br>Changed Zabbix PHP file directory.   |
| 4.2.x        | For:<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Jabber, Ez Texting media types removed.   |
| 4.0.x LTS    | For:<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | Older proxies no longer can report data to an upgraded server;<br>Newer agents no longer will be able to work with an older Zabbix server.  |
| 3.4.x        | For:<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0   | 'libpthread' and 'zlib' libraries now mandatory;<br>Support for plain text protocol dropped and header is mandatory;<br>Pre-1.4 version Zabbix agents are no longer supported;<br>The Server parameter in passive proxy configuration now mandatory.  |
| 3.2.x        | For:<br>Zabbix 3.4<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0                             | SQLite support as backend database dropped for Zabbix server/frontend;<br>Perl Compatible Regular Expressions (PCRE) supported instead of POSIX extended;<br>'libpcre' and 'libevent' libraries mandatory for Zabbix server;<br>Exit code checks added for user parameters, remote commands and system.run[] items without the 'nowait' flag as well as Zabbix server executed scripts;<br>Zabbix Java gateway has to be upgraded to support new functionality. |
| 3.0.x LTS    | For:<br>Zabbix 3.2<br>Zabbix 3.4<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0               | Database upgrade may be slow, depending on the history table size.  |
| 2.4.x        | For:<br>Zabbix 3.0<br>Zabbix 3.2<br>Zabbix 3.4<br>Zabbix 4.0<br>Zabbix 4.2<br>Zabbix 4.4<br>Zabbix 5.0<br>Zabbix 5.2<br>Zabbix 5.4<br>Zabbix 6.0 | Minimum required PHP version upped from 5.3.0 to 5.4.0<br>LogFile agent parameter must be specified   |

| Upgrade from | Read full upgrade notes  | Most important changes between versions  |
|--------------|--|--|
| 2.2.x LTS    | For:<br>Zabbix <a href="#">2.4</a><br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a>                               | Node-based distributed monitoring removed  |
| 2.0.x        | For:<br>Zabbix <a href="#">2.2</a><br>Zabbix <a href="#">2.4</a><br>Zabbix <a href="#">3.0</a><br>Zabbix <a href="#">3.2</a><br>Zabbix <a href="#">3.4</a><br>Zabbix <a href="#">4.0</a><br>Zabbix <a href="#">4.2</a><br>Zabbix <a href="#">4.4</a><br>Zabbix <a href="#">5.0</a><br>Zabbix <a href="#">5.2</a><br>Zabbix <a href="#">5.4</a><br>Zabbix <a href="#">6.0</a> | Minimum required PHP version upped from 5.1.6 to 5.3.0;<br>Case-sensitive MySQL database required for proper server work;<br>character set utf8 and utf8_bin collation is required for Zabbix server to work properly with MySQL database. See <a href="#">database creation scripts</a> .<br>'mysqli' PHP extension required instead of 'mysql' |

You may also want to check the [requirements](#) for 6.0.

**Note:**

It may be handy to run two parallel SSH sessions during the upgrade, executing the upgrade steps in one and monitoring the server/proxy logs in another. For example, run `tail -f zabbix_server.log` or `tail -f zabbix_proxy.log` in the second SSH session showing you the latest log file entries and possible errors in real time. This can be critical for production instances.

For instructions on upgrading between Zabbix 6.0.x minor versions (for example, from 6.0.1 to 6.0.3), see [Upgrade between minor versions](#).

## Upgrade procedure

### 1 Stop Zabbix processes

Stop Zabbix server to make sure that no new data is inserted into database.

```
systemctl stop zabbix-server
```

If upgrading Zabbix proxy, agent, or agent 2, stop these components too:

```
systemctl stop zabbix-proxy
systemctl stop zabbix-agent
systemctl stop zabbix-agent2
```

### 2 Back up the existing Zabbix database

This is a very important step. Make sure that you have a backup of your database. It will help if the upgrade procedure fails (lack of disk space, power off, any unexpected problem).

### 3 Back up configuration files, PHP files and Zabbix binaries

Make a backup copy of Zabbix binaries, configuration files and the PHP file directory.

Configuration files:

```
mkdir /opt/zabbix-backup/
cp /etc/zabbix/zabbix_server.conf /opt/zabbix-backup/
cp /etc/apache2/conf-enabled/zabbix.conf /opt/zabbix-backup/
```

PHP files and Zabbix binaries:

```
cp -R /usr/share/zabbix/ /opt/zabbix-backup/
cp -R /usr/share/zabbix-* /opt/zabbix-backup/
```

#### 4 Update repository configuration package

Before proceeding with the upgrade, uninstall your current repository package:

```
rm -Rf /etc/apt/sources.list.d/zabbix.list
```

Then, install the latest repository configuration package to ensure compatibility with the newest packages and to include any recent security patches or bug fixes.

On **Debian 12**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/debian/pool/main/z/zabbix-release/zabbix-release_latest+debian12_all.deb
dpkg -i zabbix-release_latest+debian12_all.deb
```

On **Debian 11**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/debian/pool/main/z/zabbix-release/zabbix-release_latest+debian11_all.deb
dpkg -i zabbix-release_latest+debian11_all.deb
```

On **Debian 10**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/debian/pool/main/z/zabbix-release/zabbix-release_latest+debian10_all.deb
dpkg -i zabbix-release_latest+debian10_all.deb
```

For older Debian versions, replace the link above with the correct one from [Zabbix repository](#). Note, however, that packages for those versions may not include all Zabbix components. For a list of components included, see [Zabbix packages](#).

On **Ubuntu 24.04**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_latest+ubuntu24.04_all.deb
dpkg -i zabbix-release_latest+ubuntu24.04_all.deb
```

On **Ubuntu 22.04**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_latest+ubuntu22.04_all.deb
dpkg -i zabbix-release_latest+ubuntu22.04_all.deb
```

On **Ubuntu 20.04**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_latest+ubuntu20.04_all.deb
dpkg -i zabbix-release_latest+ubuntu20.04_all.deb
```

On **Ubuntu 18.04**, run:

```
wget https://repo.zabbix.com/zabbix/6.0/ubuntu/pool/main/z/zabbix-release/zabbix-release_latest+ubuntu18.04_all.deb
dpkg -i zabbix-release_latest+ubuntu18.04_all.deb
```

For older Ubuntu versions, replace the link above with the correct one from [Zabbix repository](#). Note, however, that packages for those versions may not include all Zabbix components. For a list of components included, see [Zabbix packages](#).

You may see a prompt about the Zabbix repository configuration:

```
Configuration file '/etc/apt/sources.list.d/zabbix.list'
==> Deleted (by you or by a script) since installation.
==> Package distributor has shipped an updated version.
What would you like to do about it ? Your options are:
Y or I  : install the package maintainer's version
N or O  : keep your currently-installed version
D       : show the differences between the versions
Z       : start a shell to examine the situation
The default action is to keep your current version.
*** zabbix.list (Y/I/N/O/D/Z) [default=N] ?
```

Enter Y (or I) to install the package maintainer's version of the Zabbix repository configuration.

Then, update the repository information:

```
apt update
```

#### 5 Upgrade Zabbix components

To upgrade Zabbix components you may run something like:

```
apt install --only-upgrade zabbix-server-mysql zabbix-frontend-php zabbix-agent
```

- If using PostgreSQL, substitute `mysql` with `pgsql` in the command.
- If upgrading the proxy, substitute `server` with `proxy` in the command.
- If upgrading the Zabbix agent 2, substitute `zabbix-agent` with `zabbix-agent2 zabbix-agent2-plugin-*` in the command.

**Attention:**

Upgrading Zabbix agent 2 with the `apt install zabbix-agent2` command could lead to an error. For more information, see [Known issues](#).

You may see a prompt about the Zabbix server (or proxy) configuration:

```
Configuration file '/etc/zabbix/zabbix_server.conf'
==> Modified (by you or by a script) since installation.
==> Package distributor has shipped an updated version.
What would you like to do about it ? Your options are:
Y or I  : install the package maintainer's version
N or O  : keep your currently-installed version
D       : show the differences between the versions
Z       : start a shell to examine the situation
The default action is to keep your current version.
*** zabbix_server.conf (Y/I/N/O/D/Z) [default=N] ?
```

Enter the option that best fits your situation. For example, enter `D` to compare the current and new configuration, then decide if you want to install the package maintainer's version (`Y` or `I`).

Then, to upgrade the web frontend with Apache and restart Apache, run:

```
apt install zabbix-apache-conf
systemctl restart apache2
```

Distributions **prior to Debian 10 (buster) / Ubuntu 18.04 (bionic) / Raspbian 10 (buster)** do not provide PHP 7.2 or newer, which is required for Zabbix frontend 6.0. See [information](#) about installing Zabbix frontend on older distributions.

## 6 Review component configuration parameters

Make sure to review [Upgrade notes](#) to check if any changes in the configuration parameters are required.

## 7 Start Zabbix processes

Start the updated Zabbix components.

```
systemctl start zabbix-server
systemctl start zabbix-proxy
systemctl start zabbix-agent
systemctl start zabbix-agent2
```

## 8 Clear web browser cookies and cache

After the upgrade you may need to clear web browser cookies and web browser cache for the Zabbix web interface to work properly.

## Upgrade between minor versions

It is possible to upgrade between Zabbix 6.0.x minor versions (for example, from 6.0.1 to 6.0.3).

First, update the repository information:

```
apt update
```

Then, to upgrade Zabbix minor version, please run:

```
apt install --only-upgrade 'zabbix*'
```

To upgrade Zabbix server minor version only, please run:

```
apt install --only-upgrade 'zabbix-server*'
```

To upgrade Zabbix agent minor version only, please run:

```
apt install --only-upgrade 'zabbix-agent*'
```

or, for Zabbix agent 2:

```
apt install --only-upgrade 'zabbix-agent2*'
```

## 8 Known issues

See also: [Compilation issues](#).

Proxy startup with MySQL 8.0.0-8.0.17

zabbix\_proxy on MySQL versions 8.0.0-8.0.17 fails with the following "access denied" error:

```
[Z3001] connection to database 'zabbix' failed: [1227] Access denied; you need (at least one of) the SUPER
```

That is due to MySQL 8.0.0 starting to enforce special permissions for setting session variables. However, in 8.0.18 this behavior was removed: [As of MySQL 8.0.18, setting the session value of this system variable is no longer a restricted operation](#).

The workaround is based on granting additional privileges to the zabbix user:

For MySQL versions 8.0.14 - 8.0.17:

```
grant SESSION_VARIABLES_ADMIN on *.* to 'zabbix'@'localhost';
```

For MySQL versions 8.0.0 - 8.0.13:

```
grant SYSTEM_VARIABLES_ADMIN on *.* to 'zabbix'@'localhost';
```

Timescale DB: high memory usage with large number of partitions

PostgreSQL versions 9.6-12 use too much memory when updating tables with a large number of partitions. This issue manifests itself when Zabbix updates trends on systems with TimescaleDB if trends are split into relatively small (e.g. 1 day) chunks. This leads to hundreds of chunks present in the trends tables with default housekeeping settings - the condition where PostgreSQL is likely to run out of memory.

The issue has been resolved since Zabbix 5.0.1 for new installations with TimescaleDB, but if TimescaleDB was set up with Zabbix before that, please see [ZBX-16347](#) for the migration notes.

Timescale DB 2.5.0: compression policy can fail on tables that contain integers

This issue manifests when TimescaleDB 2.5.0 is used. It has been resolved since TimescaleDB 2.5.1.

For more information, please see [TimescaleDB Issue #3773](#).

Upgrade

SQL mode setting for successful upgrade

The `sql_mode` setting in MySQL/MariaDB must have the "STRICT\_TRANS\_TABLES" mode set. If it is absent, the Zabbix database upgrade will fail (see also [ZBX-19435](#)).

Upgrade with MariaDB 10.2.1 and before

Upgrading Zabbix may fail if database tables were created with MariaDB 10.2.1 and before, because in those versions the default row format is compact. This can be fixed by changing the row format to dynamic (see also [ZBX-17690](#)).

Templates

Template compatibility in dual-stack (IPv4/IPv6) environments

In dual-stack environments (systems configured to support both IPv4 and IPv6), the hostname `localhost` typically resolves to both IPv4 and IPv6 addresses. Due to the common prioritization of IPv6 over IPv4 by many operating systems and DNS resolvers, Zabbix templates may fail to work correctly if the service being monitored is configured to listen only on IPv4.

Services that are not configured to listen on IPv6 addresses may become inaccessible, leading to monitoring failures. Users might configure access correctly for IPv4 but still face connectivity issues due to the default behavior of prioritizing IPv6.

A workaround for this is to ensure that the services (Nginx, Apache, PostgreSQL, etc.) are configured to listen on both IPv4 and IPv6 addresses, and Zabbix server/agent is allowed access via IPv6. Additionally, in Zabbix templates and configurations, use `localhost` explicitly instead of `127.0.0.1` to ensure compatibility with both IPv4 and IPv6.

**For example**, when monitoring PostgreSQL with the [PostgreSQL by Zabbix agent 2](#) template, you may need to edit the `pg_hba.conf` file to allow connections for the `zbx_monitor` user. If the dual-stack environment prioritizes IPv6 (system resolves `localhost` to `::1`) and you configure `localhost` but only add an IPv4 entry (`127.0.0.1/32`), the connection will fail because there is no matching IPv6 entry.

The following `pg_hba.conf` file example ensures that the `zbx_monitor` user can connect to any database from the local machine using both IPv4 and IPv6 addresses with different authentication methods:

| # | TYPE | DATABASE | USER        | ADDRESS      | METHOD        |
|---|------|----------|-------------|--------------|---------------|
|   | host | all      | zbx_monitor | localhost    | trust         |
|   | host | all      | zbx_monitor | 127.0.0.1/32 | md5           |
|   | host | all      | zbx_monitor | ::1/128      | scram-sha-256 |

If necessary, you can also use the IPv4 address (127.0.0.1) directly when configuring the [PostgreSQL by Zabbix agent 2](#) template macro for the connection string.

#### Accidental installation of EPEL Zabbix packages

With EPEL repository installed and enabled, installing Zabbix from packages will lead to EPEL Zabbix packages being installed rather than official Zabbix packages.

In this case uninstall Zabbix packages from EPEL, i.e.:

```
dnf remove zabbix-server-mysql
```

Block Zabbix packages from EPEL. Add the following line in the `/etc/yum.conf` file:

```
exclude=zabbix6.0*
```

Install Zabbix server again:

```
dnf install zabbix-server-mysql
```

Notice that official Zabbix packages have the word `release` in their version string:

```
6.0.25-release1.el8
```

#### Zabbix packages for RHEL on Red Hat UBI environments

When installing Zabbix from Red Hat Enterprise Linux packages on [Red Hat Universal Base Image](#) environments, ensure access to required repositories and dependencies. Zabbix packages depend on `libOpenIPMI.so` and `libOpenIPMIposix.so` libraries, which are not provided by any package in the default package manager repositories enabled on UBI systems and will result in installation failures.

The `libOpenIPMI.so` and `libOpenIPMIposix.so` libraries are available in the `OpenIPMI-libs` package, which is provided by the `redhat-#-for-<arch>-appstream-rpms` repository. Access to this repository is curated by subscriptions, which, in the case of UBI environments, get propagated by mounting repository configuration and secrets directories of the RHEL host into the container file-system namespace.

For more information, see [ZBX-24291](#).

#### Expired signing key for RHEL packages

When upgrading Zabbix on [Red Hat Enterprise Linux](#), you may encounter an expired signing key issue for packages on [Zabbix repository](#). When a signing key expires, attempts to verify package signatures will result in an error indicating that the certificate or key is no longer valid. For example:

```
error: Verifying a signature using certificate D9AA84C2B617479C6E4FCF4D19F2475308EFA7DD (Zabbix LLC (Jul 2
  1. Certificate 19F2475308EFA7DD invalid: certificate is not alive
     because: The primary key is not live
     because: Expired on 2024-07-04T11:41:23Z
  2. Key 19F2475308EFA7DD invalid: key is not alive
     because: The primary key is not live
     because: Expired on 2024-07-04T11:41:23Z
```

To resolve such issues, manually reinstall the latest `zabbix-release` package for your specific variant of RHEL (replace the link below with the correct one from [Zabbix repository](#)).

For example, on **RHEL 9**, run:

```
rpm -Uvh https://repo.zabbix.com/zabbix/6.0/rhel/9/x86_64/zabbix-release-latest.el9.noarch.rpm
```

Then, update the repository information:

```
dnf update
```

For more information, see [ZBX-24761](#).

#### Database TLS connection with MariaDB

Database TLS connection is not supported with the `verify_ca` option for the `DBTLSConnect` [parameter](#) if MariaDB is used.

#### Possible deadlocks with MySQL/MariaDB

When running under high load, and with more than one LLD worker involved, it is possible to run into a deadlock caused by an InnoDB error related to the row-locking strategy (see [upstream bug](#)). The error has been fixed in MySQL since 8.0.29, but not in MariaDB. For more details, see [ZBX-21506](#).

#### Global event correlation

Events may not get correlated correctly if the time interval between the first and second event is very small, i.e. half a second and less.

#### Numeric (float) data type range with PostgreSQL 11 and earlier

PostgreSQL 11 and earlier versions only support floating point value range of approximately -1.34E-154 to 1.34E+154.

#### NetBSD 8.0 and newer

Various Zabbix processes may randomly crash on startup on the NetBSD versions 8.X and 9.X. That is due to the too small default stack size (4MB), which must be increased by running:

```
ulimit -s 10240
```

For more information, please see the related problem report: [ZBX-18275](#).

#### Regular expression limitations in Zabbix agent 2

Zabbix agent 2 does not support lookaheads and lookbehinds in regular expressions due to the standard Go regexp library limitations.

#### IPMI checks

IPMI checks will not work with the standard OpenIPMI library package on Debian prior to 9 (stretch) and Ubuntu prior to 16.04 (xenial). To fix that, recompile OpenIPMI library with OpenSSL enabled as discussed in [ZBX-6139](#).

#### SSH checks

- Some Linux distributions like Debian, Ubuntu do not support encrypted private keys (with passphrase) if the libssh2 library is installed from packages. Please see [ZBX-4850](#) for more details.
- When using libssh 0.9.x on some Linux distributions with OpenSSH 8 SSH checks may occasionally report "Cannot read data from SSH server". This is caused by a libssh [issue](#) ([more detailed report](#)). The error is expected to have been fixed by a stable libssh 0.9.5 release. See also [ZBX-17756](#) for details.
- Using the pipe "|" in the SSH script may lead to a "Cannot read data from SSH server" error. In this case it is recommended to upgrade the libssh library version. See also [ZBX-21337](#) for details.

#### ODBC checks

- MySQL unixODBC driver should not be used with Zabbix server or Zabbix proxy compiled against MariaDB connector library and vice versa, if possible it is also better to avoid using the same connector as the driver due to an [upstream bug](#). Suggested setup:

PostgreSQL, SQLite or Oracle connector → MariaDB or MySQL unixODBC driver MariaDB connector → MariaDB unixODBC driver MySQL connector → MySQL unixODBC driver

See [ZBX-7665](#) for more information and available workarounds.

- XML data queried from Microsoft SQL Server may get truncated in various ways on Linux and UNIX systems.
- It has been observed that using ODBC checks for monitoring Oracle databases using various versions of Oracle Instant Client for Linux causes Zabbix server to crash. See also: [ZBX-18402](#), [ZBX-20803](#).
- If using FreeTDS UnixODBC driver, you need to prepend a 'SET NOCOUNT ON' statement to an SQL query (for example, SET NOCOUNT ON DECLARE @strsql NVARCHAR(max) SET @strsql = ...). Otherwise, database monitor item in Zabbix will fail to retrieve the information with an error "SQL query returned empty result". See [ZBX-19917](#) for more information.

#### Incorrect request method parameter in items

The request method parameter, used only in HTTP checks, may be incorrectly set to '1', a non-default value for all items as a result of upgrade from a pre-4.0 Zabbix version. For details on how to fix this situation, see [ZBX-19308](#).

#### Web monitoring and HTTP agent

Zabbix server leaks memory on some Linux distributions due to an [upstream bug](#) when "SSL verify peer" is enabled in web scenarios or HTTP agent. Please see [ZBX-10486](#) for more information and available workarounds.

#### Simple checks

There is a bug in **fping** versions earlier than v3.10 that mishandles duplicate echo replay packets. This may cause unexpected results for `icmpping`, `icmppingloss`, `icmppingsec` items. It is recommended to use the latest version of **fping**. Please see [ZBX-11726](#) for more details.

#### Errors with fping execution in rootless containers

When containers are running in rootless mode or in a specific-restrictions environment, you may face errors related to fping execution when performing ICMP checks, such as `fping: Operation not permitted` or `all packets to all resources lost`.

To fix this problem add `--cap-add=net_raw` to "docker run" or "podman run" commands.

Additionally fping execution in non-root environments may require `sysctl` modification, i.e.:

```
sudo sysctl -w "net.ipv4.ping_group_range=0 1995"
```

where "1995" is the zabbix GID. For more details, see [ZBX-22833](#).

#### SNMP checks

If the OpenBSD operating system is used, a use-after-free bug in the Net-SNMP library up to the 5.7.3 version can cause a crash of Zabbix server if the `SourceIP` parameter is set in the Zabbix server configuration file. As a workaround, please do not set the `SourceIP` parameter. The same problem applies also for Linux, but it does not cause Zabbix server to stop working. A local patch for the `net-snmp` package on OpenBSD was applied and will be released with OpenBSD 6.3.

#### SNMP data spikes

Spikes in SNMP data have been observed that may be related to certain physical factors like voltage spikes in the mains. See [ZBX-14318](#) more details.

#### SNMP traps

The "net-snmp-perl" package, needed for SNMP traps, has been removed in RHEL 8.0-8.2; re-added in RHEL 8.3.

So if you are using RHEL 8.0-8.2, the best solution is to upgrade to RHEL 8.3.

Please also see [ZBX-17192](#) for more information.

#### Alerter process crash in RHEL 7

Instances of a Zabbix server alerter process crash have been encountered in RHEL 7. Please see [ZBX-10461](#) for details.

#### Upgrading Zabbix agent 2 (6.0.5 or older)

When upgrading Zabbix agent 2 (version 6.0.5 or older) from packages, a plugin-related file conflict error may occur. To fix the error, back up your agent 2 configuration (if necessary), uninstall agent 2 and install it anew.

On RHEL-based systems, run:

```
dnf remove zabbix-agent2
dnf install zabbix-agent2
```

On Debian-based systems, run:

```
apt remove zabbix-agent2
apt install zabbix-agent2
```

For more information, see [ZBX-23250](#).

#### Flipping frontend locales

It has been observed that frontend locales may flip without apparent logic, i. e. some pages (or parts of pages) are displayed in one language while other pages (or parts of pages) in a different language. Typically the problem may appear when there are several users, some of whom use one locale, while others use another.

A known workaround to this is to disable multithreading in PHP and Apache.

The problem is related to how setting the locale works in PHP: locale information is maintained per process, not per thread. So in a multi-thread environment, when there are several projects run by same Apache process, it is possible that the locale gets changed in another thread and that changes how data can be processed in the Zabbix thread.

For more information, please see related problem reports:

- [ZBX-10911](#) (Problem with flipping frontend locales)
- [ZBX-16297](#) (Problem with number processing in graphs using the `bcdiv` function of BC Math functions)

## PHP 7.3 opcache configuration

If "opcache" is enabled in the PHP 7.3 configuration, Zabbix frontend may show a blank screen when loaded for the first time. This is a registered [PHP bug](#). To work around this, please set the "opcache.optimization\_level" parameter to 0x7FFFBFDF in the PHP configuration (php.ini file).

## Graphs

### Daylight Saving Time

Changes to Daylight Saving Time (DST) result in irregularities when displaying X axis labels (date duplication, date missing, etc.).

### Sum aggregation

When using **sum aggregation** in a graph for period that is less than one hour, graphs display incorrect (multiplied) values when data come from trends.

### Text overlapping

For some frontend languages (e.g., Japanese), local fonts can cause text overlapping in graph legend. To avoid this, use version 2.3.0 (or later) of PHP GD extension.

### Log file monitoring

`log[]` and `logrt[]` items repeatedly reread log file from the beginning if file system is 100% full and the log file is being appended (see [ZBX-10884](#) for more information).

### Slow MySQL queries

Zabbix server generates slow SELECT queries in case of non-existing values for items. This [issue](#) is known to occur in MySQL 5.6/5.7 versions (for an extended discussion, see [ZBX-10652](#)), and, in specific cases, may also occur in later MySQL versions. A workaround to this is disabling the [index\\_condition\\_pushdown](#) or [prefer\\_ordering\\_index](#) optimizer in MySQL. Note, however, that this workaround may not fix all issues related to slow queries.

### Slow configuration sync with Oracle

Configuration sync might be slow in Zabbix 6.0 installations with Oracle DB that have high number of items and item preprocessing steps. This is caused by the Oracle database engine speed processing *nclob* type fields.

To improve performance, you can convert the field types from *nclob* to *nvarchar2* by manually applying the database patch [items\\_nvarchar2\\_prepare.sql](#). Note that this conversion will reduce the maximum field size limit from 65535 bytes to 4000 bytes for item preprocessing parameters and item parameters such as *Description*, Script item's field *Script*, HTTP agent item's fields *Request body* and *Headers*, Database monitor item's field *SQL query*. Queries to determine template names that need to be deleted before applying the patch are provided in the patch as a comment. Alternatively, if MAX\_STRING\_SIZE is set you can change *nvarchar2(4000)* to *nvarchar2(32767)* in the patch queries to set the 32767 bytes field size limit.

For an extended discussion, see [ZBX-22363](#).

## API login

A large number of open user sessions can be created when using custom scripts with the `user.login` **method** without a following `user.logout`.

### Persistent filter settings from links

When opening a link to Zabbix frontend page that contains filter settings, including the time selector, the filter is automatically saved in the database for the user, replacing the previously saved filter and/or time selector settings for that page. These settings remain active until the user manually updates or resets them.

### IPv6 address issue in SNMPv3 traps

Due to a net-snmp bug, IPv6 address may not be correctly displayed when using SNMPv3 in SNMP traps. For more details and a possible workaround, see [ZBX-14541](#).

### Trimmed long IPv6 IP address in failed login information

A failed login attempt message will display only the first 39 characters of a stored IP address as that's the character limit in the database field. That means that IPv6 IP addresses longer than 39 characters will be shown incompletely.

### Zabbix agent checks on Windows

Non-existing DNS entries in a `Server` parameter of Zabbix agent configuration file (`zabbix_agentd.conf`) may increase Zabbix agent response time on Windows. This happens because Windows DNS caching daemon doesn't cache negative responses for IPv4 addresses. However, for IPv6 addresses negative responses are cached, so a possible workaround to this is disabling IPv4 on the host.

## YAML export/import

There are some known issues with **YAML export/import**:

- Error messages are not translatable;
- Valid JSON with a .yaml file extension sometimes cannot be imported;
- Unquoted human-readable dates are automatically converted to Unix timestamps.

## Setup wizard on SUSE with NGINX and php-fpm

Frontend setup wizard cannot save configuration file on SUSE with NGINX + php-fpm. This is caused by a setting in `/usr/lib/systemd/system/php-fpm.service` unit, which prevents Zabbix from writing to `/etc`. (introduced in [PHP 7.4](#)).

There are two workaround options available:

- Set the [ProtectSystem](#) option to 'true' instead of 'full' in the php-fpm systemd unit.
- Manually save `/etc/zabbix/web/zabbix.conf.php` file.

## Chromium for Zabbix web service on Ubuntu 20

Though in most cases, Zabbix web service can run with Chromium, on Ubuntu 20.04 using Chromium causes the following error:

```
Cannot fetch data: chrome failed to start:cmd_run.go:994:
WARNING: cannot create user data directory: cannot create
"/var/lib/zabbix/snap/chromium/1564": mkdir /var/lib/zabbix: permission denied
Sorry, home directories outside of /home are not currently supported. See https://forum.snapcraft.io/t/112
```

This error occurs because `/var/lib/zabbix` is used as a home directory of user 'zabbix'.

## MySQL custom error codes

If Zabbix is used with MySQL installation on Azure, an unclear error message *[9002] Some errors occurred* may appear in Zabbix logs. This generic error text is sent to Zabbix server or proxy by the database. To get more information about the cause of the error, check Azure logs.

## Invalid regular expressions after switching to PCRE2

In Zabbix 6.0 support for PCRE2 has been added. Even though PCRE is still supported, Zabbix installation packages for RHEL 7 and newer, SLES (all versions), Debian 9 and newer, Ubuntu 16.04 and newer have been updated to use PCRE2. While providing many benefits, switching to PCRE2 may cause certain existing PCRE regexp patterns becoming invalid or behaving differently. In particular, this affects the pattern `^[w-l.]`. In order to make this regexp valid again without affecting semantics, change the expression to `^[w-l]`. This happens due to the fact that PCRE2 treats the dash sign as a delimiter, creating a range inside a character class. The following Zabbix installation packages have been updated and now use PCRE2: RHEL 7 and newer, SLES (all versions), Debian 9 and newer, Ubuntu 16.04 and newer.

## Wrong conversion of services in Zabbix 6.0.0-6.0.2

In Zabbix 6.0, new more flexible service status calculation algorithms were introduced.

After an upgrade from Zabbix <6.0 to Zabbix 6.0.0, 6.0.1, 6.0.2, the service status calculation rules 'Most critical if all children have problems' and 'Most critical of child services' will become swapped. Services created in Zabbix 6.0.0 and newer will have correct status calculation rules.

When upgrading from versions <6.0 to Zabbix 6.0.3 or newer, Zabbix will correctly update service status calculation rules. Upgrading from 6.0.x to 6.0.3 will have no effect on service status calculation rules.

## Geomap widget error

The maps in the Geomap widget may not load correctly, if you have upgraded from an older Zabbix version with NGINX and didn't switch to the new NGINX configuration file during the upgrade.

To fix the issue, you can discard the old configuration file, use the configuration file from 6.0 package and reconfigure it as described in the [download instructions](#) in section e. *Configure PHP for Zabbix frontend*.

Alternatively, you can manually edit an existing NGINX configuration file (typically, `/etc/zabbix/nginx.conf`). To do so, open the file and locate the following block:

```
location ~ /(api\|/|conf[^\.]|include|locale|vendor) {
    deny                all;
    return              404;
}
```

Then, replace this block with:

```
location ~ /(api\|/|conf[^\.]|include|locale) {
    deny          all;
    return        404;
}

location /vendor {
    deny          all;
    return        404;
}
```

Incorrect information from nested host groups in maps

Information from nested host groups is incorrectly displayed in maps, for example:

- Host group label displays the problem summary not including all hosts in nested host groups;
- "Host group elements" view does not display a separate map element for each host in the nested host groups;
- Map label displays summary of all problems not including those in nested host groups.

Logrotate for Zabbix server and proxy

The logrotate utility is only included into packages for zabbix-agent, zabbix-agent2 and zabbix-web-service, but needs to be installed separately for Zabbix server and proxy. The logrotate dependency has been added to the server and proxy packages for RHEL and SUSE starting from Zabbix 6.4.4rc1.

Issues in Zabbix 6.0.11

JSONPath parsing errors

JSONPath parsing errors occur in case of leading whitespace and empty array/object. Fixed in Zabbix 6.0.12.

AND/OR evaluation in LLD filters

The evaluation of AND/OR expressions in the low-level discovery filters/overrides may fail in this version. Fixed in Zabbix 6.0.12.

Missing files in Windows agent archive

The Windows Zabbix agent download ZIP file is missing zabbix\_sender.h and zabbix\_sender.lib files in versions 6.0.0-6.0.27, required for zabbix\_sender.dll.

Use case with global variables shared across webhook calls

As global variables are shared across different webhook calls, the following code will result in the tag value counter gradually increasing:

```
try
{
    aa = aa + 1;
}
catch(e)
{
    aa = 0;
}

result = {
    'tags': {
        'endpoint': aa
    }
};
return JSON.stringify(result);
```

Using local variables instead of global ones is recommended to make sure that each script operates on its own data and that there are no collisions between simultaneous calls.

Processor groups on Windows

Microsoft documentation states that systems with fewer than 64 logical processors always have a single processor group, Group 0. However, Zabbix users have reported a rare bug [ZBX-20260](#), when there are two processor groups on systems with 64 or less logical processors. This resulted in having the "\Processor(n)" performance counters for only one processor group out of two. The actual root cause of this bug is not known. However, a similar case was described at [stackoverflow.com](#), and the root cause there was in interoperation between BIOS and Windows.

Limits of filtering with utf8mb4 collations

Filters (e.g., in *Configuration* → *Maintenance*) may not function correctly when applied to entities containing certain Unicode characters (e.g., *æ*, *ø*). This issue arises due to how the default `utf8mb4_bin` collation for MySQL or MariaDB databases handles sorting and comparison of Unicode characters.

To address this limitation, users can change the collation of database columns to alternatives such as `utf8mb4_0900_bin`, `utf8mb4_0900_ai_ci`, or `utf8mb4_unicode_520_ci`. Note, however, that changing the collation may cause unexpected behavior in the handling of empty spaces, as well as sorting and filtering for other characters.

For more information on changing collations, see [MySQL documentation](#) or [MariaDB documentation](#). For details on collation differences, see [Unicode Character Sets](#) in MySQL documentation.

## 1 Compilation issues

These are the known issues regarding Zabbix compilation from sources. For all other cases, see the [Known issues](#) page.

Compiling Zabbix agent on HP-UX

If you install the PCRE library from the popular HP-UX package site <http://hpux.connect.org.uk> (for example, from file `pcre-8.42-ia64_64-11.31.depot`), only the 64-bit version of the library will be installed in the `/usr/local/lib/hpux64` directory.

In this case, for successful agent compilation, a customized option is needed for the `configure` script, for example:

```
CFLAGS="+DD64" ./configure --enable-agent --with-libpcre-include=/usr/local/include --with-libpcre-lib=/usr
```

Library in a non-standard location

Zabbix allows you to specify a library located in a non-standard location. In the example below, Zabbix will run `curl-config` from the specified non-standard location and use its output to determine the correct `libcurl` to use.

```
$ ./configure --enable-server --with-mysql --with-libcurl=/usr/local/bin/curl-config
```

This will work if it is the only `libcurl` installed in the system, but might not if there is another `libcurl` installed in a standard location (by the package manager, for example). Such is the case when you need a newer version of the library for Zabbix and the older one for other applications.

Therefore, specifying a component in a non-standard location will not always work when the same component also exists in a standard location.

For example, if you use a newer `libcurl` installed in `/usr/local` with the `libcurl` package still installed, Zabbix might pick up the wrong one and compilation will fail:

```
usr/bin/ld: ../../src/libs/zbxhttp/libzbxhttp.a(http.o): in function 'zbx_http_convert_to_utf8':  
/tmp/zabbix-master/src/libs/zbxhttp/http.c:957: undefined reference to 'curl_easy_header'  
collect2: error: ld returned 1 exit status
```

Here, the function `curl_easy_header()` is not available in the older `/usr/lib/x86_64-linux-gnu/libcurl.so`, but is available in the newer `/usr/local/lib/libcurl.so`.

The problem lies with the order of linker flags, and one solution is to specify the full path to the library in an `LDFLAGS` variable:

```
$ LDFLAGS="-Wl,--no-as-needed /usr/local/lib/libcurl.so" ./configure --enable-server --with-mysql --with-l
```

Note the `-Wl,--no-as-needed` option which might be needed on some systems (see also: default linking options on [Debian-based](#) systems).

## 9 Template changes

This page lists all changes to the stock templates that are shipped with Zabbix.

Note that upgrading to the latest Zabbix version will not automatically upgrade the templates used. It is suggested to modify the templates in existing installations by:

- Downloading the latest templates from the [Zabbix Git repository](#);
- Then, while in *Configuration* → *Templates* you can import them manually into Zabbix. If templates with the same names already exist, the *Delete missing* options should be checked when importing to achieve a clean import. This way the old items that are no longer in the updated template will be removed (note that it will mean losing history of these old items).

## CHANGES IN 6.0.0

### Updated template format

As of Zabbix 6.0, all templates follow an updated format, which may impact the import of pre-6.0 templates.

The updated default template name no longer contains the initial denominator 'Template' or the target application, e.g. 'Net' or 'OS'. The target application is instead specified in the **template file** using tags.

For example, as of Zabbix 6.0, 'Template Net TP-LINK SNMP' is named 'TP-LINK by SNMP'; 'Template OS Windows SNMP' is named 'Windows by SNMP', whereby its YAML export file contains the following tags:

```
tags:
  - tag: class
    value: os
```

In the new format, each template and its elements are also assigned a UUID property for looking up matching objects, for example:

```
groups:
  - uuid: 846977d1dfed4968bc5f8bdb363285bc
    name: 'Templates/Operating systems'
templates:
  - uuid: f9a59315c8944853bb91c0a9ec3056d7
    template: 'Windows by SNMP'
    name: 'Windows by SNMP'
```

Importing a pre-6.0 template in Zabbix 6.0 may therefore result in the old template being renamed and suggested to be merged with the updated template. To avoid any unwanted merges, consider implementing one of these options:

- Migrating your setup to the updated template format and moving customizations (if any) to separate templates.
- Renaming your pre-6.0 template to include a custom prefix or suffix, e.g. 'Template OS Windows SNMP *custom*'. In most cases, this can be done directly in the import file. If not, you can use the Zabbix frontend or API to rename and export the templates.
- Adding a `uuid` tag and custom value to the template import file.

To compare templates between different Zabbix versions, you can open a given template in the [Zabbix Git repository](#) and switch between the relevant release branches.

### New templates

See the list of **new templates** in Zabbix 6.0.0.

### Changes in templates

- The `{#FSLABEL}` macro has been added to the corresponding item names and descriptions in *Windows by Zabbix agent* and *Windows by Zabbix agent active* templates
- The `vfs.file.cksum[/etc/passwd]` agent item has been changed to `vfs.file.cksum[/etc/passwd,sha256]`
- A new check `zabbix[process,odbc poller,avg,busy]` has been added to *Zabbix server*, *Zabbix proxy*, *Remote Zabbix server* and *Remote Zabbix proxy* templates. The metric is used for monitoring the average time for which ODBC processes have been busy during the last minute (in percentage).

## CHANGES IN 6.0.2

The template *Generic Java JMX* now contains two discovery rules:

- Garbage collector discovery
- Memory pool discovery

## CHANGES IN 6.0.3

A new template *OpenWeatherMap by HTTP* is available.

The following changes have been made in the existing templates:

- In the templates *Windows services by Zabbix agent*, *Windows services by Zabbix agent active*, *Windows by Zabbix agent*, *Windows by Zabbix agent active* `{$SERVICE.NAME.NOT_MATCHES}` macro value has been updated to filter out an extended list of services.
- The template *PostgreSQL by Zabbix agent 2* now will check the number of slow queries and generate a problem if the amount exceeds a threshold.

## CHANGES IN 6.0.4

New templates are available:

- *TrueNAS SNMP* - monitoring of TrueNAS storage OS by SNMP
- *Proxmox VE by HTTP* - see setup instructions for [HTTP templates](#)

The templates *SMART by Zabbix agent 2* and *SMART by Zabbix agent 2 (active)* have been updated:

- the *Attribute discovery* LLD rule has been deleted, whereas the *Disk discovery* LLD rule will now discover disks based on the pre-defined vendor-specific set of attributes;
- **smart.disk.get** item can now return information about a specific disk only, instead of all disks.

New macros allowing to define warning and critical thresholds of the filesystem utilization for virtual file system monitoring have been added to the templates *HOST-RESOURCES-MIB storage SNMP*, *Linux by Prom*, *Linux filesystems SNMP*, *Linux filesystems by Zabbix agent active*, *Linux filesystems by Zabbix agent*, *Mellanox SNMP*, *PFSense SNMP*, *Windows filesystems by Zabbix agent active*, *Windows filesystems by Zabbix agent*. Filesystem utilization triggers have been updated to use these macros.

#### CHANGES IN 6.0.5

New templates are available:

- CockroachDB by HTTP
- Envoy Proxy by HTTP
- HashiCorp Consul Cluster by HTTP
- HashiCorp Consul Node by HTTP

See setup instructions for [HTTP templates](#).

#### CHANGES IN 6.0.6

New templates are available:

- HPE MSA 2040 Storage by HTTP
- HPE MSA 2060 Storage by HTTP
- HPE Primera by HTTP

See setup instructions for [HTTP templates](#).

#### CHANGES IN 6.0.7

A new [template](#) *HPE Synergy by HTTP* is available.

The templates *HashiCorp Consul Node by HTTP* and *HashiCorp Consul Cluster by HTTP* now support Consul namespaces.

[PostgreSQL Agent 2 template](#) has been updated:

A trigger for detecting checksum failures has been added to the Dbstat item of the PostgreSQL Agent 2 template. According to [PostgreSQL documentation](#), you can use checksums on data pages to help detect corruption by the I/O system that would otherwise be silent.

#### CHANGES IN 6.0.8

A new [template](#) *OPNsense by SNMP* is available.

#### CHANGES IN 6.0.13

New templates are available:

- AWS EC2 by HTTP
- AWS by HTTP
- AWS RDS instance by HTTP
- AWS S3 bucket by HTTP
- Azure by HTTP
- Control-M server by HTTP
- Control-M enterprise manager by HTTP
- Veeam Backup Enterprise Manager by HTTP
- Veeam Backup and Replication by HTTP

See setup instructions for [HTTP templates](#).

The template [Oracle by Zabbix agent 2](#) has been updated:

- The following static items, that requested data for all existing relevant DB objects in a single query, have been removed:
  - "Oracle: Get archive log info"
  - "Oracle: Get ASM stats"
  - "Oracle: Get CDB and No-CDB info"
  - "Oracle: Get PDB info"
  - "Oracle: Get tablespaces stats"

- The following agent item prototypes have been added to the corresponding discovery rules:
  - Archive log discovery rule: "Archivelog '#{DEST\_NAME}': Get archive log info"
  - ASM disk groups discovery: "ASM '#{DGNAME}': Get ASM stats"
  - Database discovery: "Oracle Database '#{DBNAME}': Get CDB and No-CDB info"
  - PDB discovery: "Oracle Database '#{DBNAME}': Get PDB info"
  - Tablespace discovery: "Oracle TBS '#{TABLESPACE}': Get tablespace stats"

#### CHANGES IN 6.0.18

A new [template Google Cloud Platform by HTTP \(GCP by HTTP\)](#) is available.

See setup instructions for [HTTP templates](#).

The template *Azure by HTTP* now also works with Azure Cosmos DB for MongoDB.

#### CHANGES IN 6.0.20

New templates are available:

- [AWS ECS Cluster by HTTP](#) (along with its [Serverless Cluster version](#))
- [Cisco SD-WAN by HTTP](#)
- [OpenStack by HTTP](#), which includes *OpenStack Nova by HTTP* template for monitoring OpenStack Nova service
- [PostgreSQL by ODBC](#)

#### CHANGES IN 6.0.21

New template is available:

- [AWS Cost Explorer by HTTP](#)

#### CHANGES IN 6.0.22

New templates are available:

- [Acronis Cyber Protect Cloud by HTTP](#)
- [HashiCorp Nomad by HTTP](#)
- [MantisBT by HTTP](#)

#### CHANGES IN 6.0.23

##### **New templates**

New templates are available:

- [FortiGate by HTTP](#)
- [FortiGate by SNMP](#)
- [Nextcloud by HTTP](#)

##### **Updated templates**

- [PostgreSQL by ODBC](#) and [PostgreSQL by Zabbix agent 2](#) templates now include the item and trigger for monitoring PostgreSQL version.
- [Cisco Meraki organization by HTTP](#) template has been supplemented with items, item prototypes, LLD rules, and macros related to authentication, licenses, networks, SAML roles, and VPN statuses.

#### CHANGES IN 6.0.24

##### **New templates**

New template is available:

- [HPE iLO by HTTP](#)

##### **Updated templates**

Integration with OpenShift has been added to [Kubernetes cluster state by HTTP](#) template.

#### CHANGES IN 6.0.26

##### **New templates**

The set of [Azure by HTTP](#) templates has been supplemented with the Azure Cost Management by HTTP template.

##### **Updated templates**

[MSSQL by ODBC](#) template has been updated for working with AlwaysOn features such as Failover Cluster Instances (FCI) and Availability Groups (AG). It is now possible to use the template for monitoring a host in cluster, standalone host and host by cluster name. A macro for instance name is no longer used; when the master is switched, it is not required to change any macros:

- new LLD rules and metrics for quorum and quorum members have been added;
- the type of the LLD rules has been changed from “Database monitor” to “Dependent item”;
- items with `db.odbc.discovery` key have been turned into items dependent on the `db.odbc.get` item
- new item has been added - MSSQL DB ‘{#DBNAME}’: Recovery model, which returns the database recovery model under the database discovery;
- new macros, namely, `{MSSQL.BACKUP_FULL.USED}`, `{MSSQL.BACKUP_DIFF.USED}`, `{MSSQL.BACKUP_LOG.USED}`, have been added - those can be used for disabling backup age triggers for a certain database.

CHANGES IN 6.0.27

### New templates

A new template is available:

- [YugabyteDB by HTTP](#), which includes the *YugabyteDB Cluster by HTTP* template for monitoring each YugabyteDB cluster.

CHANGES IN 6.0.28

### New templates

New templates are available:

- [AWS ELB Application Load Balancer by HTTP](#)
- [Check Point Next Generation Firewall by SNMP](#)
- [MSSQL by Zabbix agent 2](#)

CHANGES IN 6.0.29

### New templates

A new template is available:

- [Oracle Cloud by HTTP](#), a master template that discovers various Oracle Cloud Infrastructure (OCI) services and resources.

### Updated templates

- [FortiGate by SNMP](#) template has been supplemented with metrics regarding VPN, high availability (HA), wireless termination points (WTPs), SD-WAN health checks, and HW sensors.
- [MySQL by ODBC](#) template has been supplemented with the items “MySQL: Get database” and “MySQL: Get replication”. The LLD rules “Database discovery” and “Replication discovery” have been changed to the “Dependent item” type.
- [Oracle by ODBC](#) template has been supplemented with the items “Oracle: Get archive log”, “Oracle: Get ASM disk groups”, “Oracle: Get database”, “Oracle: Get PDB”, and “Oracle: Get tablespace”. The LLD rules “Archive log discovery”, “ASM disk groups discovery”, “Database discovery”, “PDB discovery”, and “Tablespace discovery” have been changed to the “Dependent item” type.
- The VMware Hypervisor template within the [VMware](#) and [VMware FQDN](#) template sets has been supplemented with a new LLD rule, “Sensor discovery”.

CHANGES IN 6.0.30

### New templates

The AWS ELB template set has been supplemented with the template [AWS ELB Network Load Balancer by HTTP](#).

### Updated templates

The [OS templates](#) (agent, SNMP, and Prometheus-based) have been given a mounted filesystem update. In mounted filesystem discovery, the “Space is low” and “Space is critically low” triggers no longer have the absolute threshold and burst condition.

CHANGES IN 6.0.31

### New templates

A new template is available:

- [Jira Data Center by JMX](#), a template for monitoring Jira Data Center health.

CHANGES IN 6.0.32

### New templates

A new template is available:

The set of [Azure by HTTP](#) templates has been supplemented with the Azure VM Scale Set by HTTP template.

### Updated templates

The templates [Zabbix server health](#), [Remote Zabbix server health](#), [Zabbix proxy health](#), and [Remote Zabbix proxy health](#) have been updated for improved data visualization in item graphs by regrouping the displayed metrics.

#### CHANGES IN 6.0.33

##### New templates

A new template is available:

- [AWS Lambda by HTTP](#), a template for monitoring AWS Lambda metrics.

#### CHANGES IN 6.0.34

##### New templates

New templates are available:

- [GitHub repository by HTTP](#), a template for monitoring GitHub repositories.
- [Microsoft 365 reports by HTTP](#), a template for monitoring Microsoft 365 services.

#### CHANGES IN 6.0.35

##### New templates

A new template is available:

- [Huawei OceanStor V6 by SNMP](#), a template for monitoring SAN Huawei OceanStor V6.

##### Updated templates

- In all [APC templates](#), the discovery rule for external defective battery packs has been supplemented with a filter to avoid creating unsupported items.
- In the templates [MSSQL by Zabbix agent 2](#) and [MSSQL by ODBC](#), a timeout has been added and certain item keys have been adjusted to increase monitoring stability.

#### CHANGES IN 6.0.36

##### New templates

A new template is available:

- [Nutanix Prism Element by HTTP](#), a template set that also includes the templates *Nutanix Cluster Prism Element by HTTP* and *Nutanix Host Prism Element by HTTP*.

##### Updated templates

- The template *VMware Hypervisor* within the [VMware](#) and [VMware FQDN](#) template sets has been updated with the option to be used as a standalone template.
- [Proxmox VE by HTTP](#) has been updated with new items and trigger prototypes for disk space usage in LXC containers.
- In the template [MSSQL by ODBC](#), the performance counter query has been updated to improve data retrieval. Both [MSSQL by ODBC](#) and [MSSQL by Zabbix agent 2](#) template documentation has been reviewed and updated.

#### CHANGES IN 6.0.39

##### New templates

A new template is available:

- The [Azure by HTTP](#) template set has been supplemented with the template *Azure SQL Managed Instance by HTTP*.

##### Updated templates

- All [Dell HTTP and SNMP](#) templates have been updated with improvements, including fixes for items, macros, and scripts.
- The templates [MSSQL by ODBC](#) and [MSSQL by Zabbix agent 2](#) have been updated with filters to include or exclude discovered quorum members by name as well as a service filter that allows filtering by cluster name to exclude empty clusters. Please see [Breaking changes](#) for additional information on *MSSQL by Zabbix agent 2*.

#### CHANGES IN 6.0.40

##### New templates

A new template is available:

- The template set [Zabbix server health](#) has been supplemented with the templates *Zabbix server health by Zabbix agent*, *Zabbix server health by Zabbix agent active*, and [Zabbix proxy health](#) - with *Zabbix proxy health by Zabbix agent* and *Zabbix proxy health by Zabbix agent active*, enabling the monitoring of internal Zabbix metrics via Zabbix agent.

## 10 Upgrade notes for 6.0.0

These notes are for upgrading from Zabbix 5.4.x to Zabbix 6.0.0. All notes are grouped into:

- **Critical** - the most critical information related to the upgrade process and the changes in Zabbix functionality
- **Informational** - all remaining information describing the changes in Zabbix functionality

It is possible to upgrade to Zabbix 6.0.0 from versions before Zabbix 5.4.0. See the [upgrade procedure](#) section for all relevant information about upgrading from previous Zabbix versions.

**Critical** To complete successful Zabbix server upgrade on MySQL and MariaDB, you may require to set `GLOBAL log_bin_trust_function_creators = 1` in MySQL if binary logging is enabled, there are no superuser privileges and `log_bin_trust_function_creators = 1` is not set in MySQL configuration file.

To set the variable using the MySQL console, run:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
```

Once the upgrade has been successfully completed, `log_bin_trust_function_creators` can be disabled:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 0;
```

### Databases

To create the optimal user experience and ensure the best Zabbix performance in various production environments, the support of some older database releases has been dropped. This primarily applies to the database versions that are nearing their end of service life point and versions with unfixed issues that may interfere with normal performance.

Starting from Zabbix 6.0, the following **database** versions are officially supported:

- *MySQL/Percona* 8.0.X
- *MariaDB* 10.5.X - 10.6.X
- *PostgreSQL* 13.X
- *Oracle* 19c - 21c
- *TimescaleDB* 2.0.1-2.3
- *SQLite* 3.3.5-3.34.X

By default, Zabbix server and proxy will not start if an unsupported database version is detected. It is now possible, though not recommended, to turn off DB version check by modifying `AllowUnsupportedDBVersions` configuration parameter for the **server** or **proxy**.

### Primary keys

Primary keys are now used for all tables, including history tables, in new installations.

There is no automatic upgrade to primary keys for existing installations. Instructions for a **manual upgrade** of history tables to primary keys in pre-existing installations are available for **MySQL/MariaDB**, **PostgreSQL**, **TimescaleDB v1** and **v2**, and **Oracle**.

### PCRE2 support

Support for PCRE2 has been added. PCRE is still supported, but Zabbix can only be compiled with one of the libraries PCRE or PCRE2, both cannot be used at the same time.

The following Zabbix installation packages have been updated and now use PCRE2:

- RHEL 7 and newer
- SLES (all versions)
- Debian 9 and newer
- Ubuntu 16.04 and newer

Please note that after switching to PCRE2, you may need to update some regular expressions. In particular, the pattern `^[\w-\.]` needs to be changed to `^[ -\\w\\. ]` to continue working correctly - see [Known issues](#) for a more detailed explanation.

### Separate processing for ODBC checks

ODBC checks processing is now performed by separate server/proxy processes *odbc pollers*. Previously, ODBC checks were performed by regular pollers, which also work with Zabbix agent items, SSH checks, etc.

A new configuration parameter *StartODBCPollers* has been added to Zabbix **server** and **proxy** configuration files with the default value *1*. This parameter may need to be adjusted based on the number of ODBC checks performed by the server or proxy. You may also want to reduce the number of regular pollers set by the *StartPollers* parameter accordingly.

Internal item `zabbix[process,<type>]` can be used to monitor ODBC pollers load.

#### Audit log

In order to improve audit logging in Zabbix and make the Audit log complete and reliable, the previously existing database structure had to be reworked. During an upgrade DB tables `auditlog` and `auditlog_details` will be replaced by the new table `auditlog` with a different format. **Old audit records will not be preserved.**

New **section** *Audit log* has been added to the *Administration*→*General* menu allowing to enable (default) or disable audit logging. Housekeeping settings for audit, previously located under the *Housekeeper* menu section, have also been moved to the new *Audit log* section. Existing housekeeping settings will be saved.

#### API changes

See the list of **API changes** in Zabbix 6.0.0.

#### Monitoring → Overview removed

The Overview section in the Monitoring menu has been removed completely. The same functionality can be still accessed by using the *Data overview* and *Trigger overview* dashboard **widgets**.

#### Changing dependency for inherited triggers disabled

The possibility to change dependencies for triggers inherited from a template is now disabled. The reason is that upon updating the dependencies of a template trigger, the dependencies of inherited triggers are overwritten. Thus it is more reliable always to set trigger dependencies only on the root template level.

#### Macros

##### Positional macros no longer supported

The support for positional macros in item name (`$1`, `$2...$9`), deprecated since Zabbix 4.0, has been fully removed.

##### User macros in item name no longer supported

The support for user macros in item names (including discovery rule names), deprecated since Zabbix 4.0, has been fully removed.

##### Simple macros replaced by expression macros

The functionality of simple macros has been **transferred** to expression macros. The existing simple macros will be converted to expression macros during the upgrade. Macros that can not be converted without exceeding the length limit will not be converted with a warning printed in the log file.

#### **Informational** Deprecated internal items for history/trends

The following internal items are now deprecated and will be removed in a future major release:

- `zabbix[history]`
- `zabbix[history_log]`
- `zabbix[history_str]`
- `zabbix[history_text]`
- `zabbix[history_uint]`
- `zabbix[trends]`
- `zabbix[trends_uint]`

#### Zabbix agent 2 plugins

Each Zabbix agent 2 plugin now has a separate **configuration file**. By default, these files are located in the `./zabbix_agent2.d/plugins.d/` directory. The path is specified in the `Include` parameter of the agent 2 configuration file and can be relative to the **zabbix\_agent2.conf** or **zabbix\_agent2.win.conf** file location.

#### User passwords

Previously, spaces in user passwords have been automatically trimmed in both the User configuration form and the Login form. After the introduction of configurable **password complexity requirements**, spaces in passwords are no longer trimmed. So users, who thought that they had spaces in their passwords, will not be able to log in as usual and will have to enter their 'old' password without spaces. To continue using passwords with spaces, they will need to recreate their passwords.

#### Bulk processing for Prometheus metrics

As bulk processing of dependent items has been introduced in the preprocessing queue for Prometheus metrics, dependent items will no longer be processed in parallel and that may have an affect on how fast they are processed.

#### Runtime command transfer

Zabbix server and proxy runtime commands are now sent via socket instead of Unix signals. This change allows to improve user experience working with runtime control options:

- Results of the command execution are now printed to the console.
- It is possible to send longer input parameters, such as HA node name instead of node number.

Favorite custom graphs no longer supported

It is no longer possible to add custom graphs to favorites in *Monitoring -> Hosts -> Graphs*. After the upgrade any existing custom graphs will be removed from favorites.

Service monitoring

Several **major updates** related to service monitoring functionality have been made. An existing service tree configuration will be changed during an upgrade in the following way:

- Trigger-based dependencies between problems and services are replaced by tag-based mapping of services to problems. Triggers that have been linked to a service will get a new tag `ServiceLink: <trigger ID>:<trigger name>` (tag value will be truncated to 32 characters). Linked services will get the same **problem tag**.
- Hard and soft dependencies no longer exist. Instead, a service will have multiple parent services.
- The 'Status calculation algorithm' will be upgraded using the following rules:
  - Do not calculate → Set status to OK
  - Problem, if at least one child has a problem → Most critical of child services
  - Problem, if all children have problems → Most critical if all children have problems
- SLA is no longer a service attribute, but a separate entity which can be assigned to multiple services. During an upgrade, identical SLAs will be grouped and one SLA per each group will be created. Services will get a new **service tag** `SLA:<ID>` for matching.

See also:

- Detailed description of **service monitoring upgrade**;
- Configuration of **services**.

## 11 Upgrade notes for 6.0.1

Configuration syncer

Performance of the configuration syncer has been improved. It is recommended to increase the `CacheSize` on server/proxy if there is a large amount of templates. It is also recommended to remove unused templates.

Note that the default `CacheSize` on server/proxy has been increased to 32M.

Item changes

Native support for the **items** `net.dns` and `net.dns.record` has been added to Zabbix agent 2. On Zabbix agent 2 for Windows, these items now allow custom DNS IP addresses in the `ip` parameter and no longer ignore `timeout` and `count` parameters.

## 12 Upgrade notes for 6.0.2

This minor version doesn't have any upgrade notes.

## 13 Upgrade notes for 6.0.3

This minor version doesn't have any upgrade notes.

## 14 Upgrade notes for 6.0.4

This minor version doesn't have any upgrade notes.

## 15 Upgrade notes for 6.0.5

This minor version doesn't have any upgrade notes.

## 16 Upgrade notes for 6.0.6

**Loadable MongoDB plugin** MongoDB [plugin](#) is no longer part of Zabbix agent 2 and is now available as a loadable plugin instead. List of supported MongoDB versions has been extended to 2.6-5.3.

Plugin functionality and set of supported [items](#) haven't change.

The MongoDB plugin, along with other loadable plugins which may potentially be added in the future, is stored in the new repository [zabbix-agent2-plugins](#). The package *zabbix-release* now adds this repository to the user's system.

To continue monitoring MongoDB on the installations from official Zabbix packages, update *zabbix-release* package and install *zabbix-agent2-plugin-mongodb* package.

Sources are available on [CDN](#).

## 17 Upgrade notes for 6.0.7

**Symlink name expansion** Symlink name and full path of the symlink are now returned in `vfs.dir.get[]` and `vfs.file.get[]` items, instead of resolving to the symlink target.

## 18 Upgrade notes for 6.0.8

This minor version doesn't have any upgrade notes.

## 19 Upgrade notes for 6.0.9

This minor version doesn't have any upgrade notes.

## 20 Upgrade notes for 6.0.10

### Breaking changes

**PostgreSQL plugin moved to loadable plugins** The PostgreSQL [plugin](#) is no longer built-in in Zabbix agent 2. Instead it is now a loadable plugin in the agent 2.

This change may/will break automations with Ansible, Chef, etc, because it is no longer possible to pull the plugin repository directly.

See also: [PostgreSQL loadable plugin](#) repository

## 21 Upgrade notes for 6.0.11

### Breaking changes

**DB schema update** A new column *name\_upper* has been added to the database table **items**. The column contains a capitalized version of the item name or the LLD rule name. This change has been implemented to allow the use of the index with case-insensitive search for API query **optimization**.

**Optimized API queries** API database queries, used when searching through names in the *hosts* and *items* tables, have been optimized and will now be processed more efficiently. As a result of this change, deterministic triggers need to be created during an upgrade.

On MySQL and MariaDB, this requires `GLOBAL log_bin_trust_function_creators = 1` to be set if binary logging is enabled and there is no superuser privileges and `log_bin_trust_function_creators = 1` is not set in MySQL configuration file. To set the variable using MySQL console, run:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
```

Once the upgrade has been successfully completed, `log_bin_trust_function_creators` can be disabled:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 0;
```

Triggers are also created for PostgreSQL and Oracle database.

**JSONPath parsing errors** JSONPath parsing errors occur in this version in case of leading whitespace and empty array/object. Fixed in Zabbix 6.0.12.

**AND/OR evaluation in LLD filters** The evaluation of AND/OR expressions in the low-level discovery filters/overrides may fail in this version. Fixed in Zabbix 6.0.12.

## 22 Upgrade notes for 6.0.12

**Improved performance of history syncers** The performance of history syncers has been improved by introducing a new read-write lock. This reduces locking between history syncers, trappers and proxy pollers by using a shared read lock while accessing the configuration cache. The new lock can be write locked only by the configuration syncer performing a configuration cache reload.

## 23 Upgrade notes for 6.0.13

**Breaking changes** Loadable plugin versioning

**Loadable plugins** for Zabbix agent 2 now use the same versioning system as Zabbix itself. The following version changes have been made:

- MongoDB 1.2.0 -> MongoDB 6.0.13
- PostgreSQL 1.2.1 -> PostgreSQL 6.0.13

These plugins are supported for any minor version of Zabbix 6.0. Note that source code repository for each plugin now contains a dedicated *release/6.0* branch (previously, there was only *master* branch).

**Configuration import** See changes in the **configuration import** process.

**Query separate tablespaces in Oracle databases with Zabbix agent 2** The following **Zabbix agent 2 items**, supported for the Oracle plugin, now have additional optional parameters:

- `oracle.diskgroups.stats[<existingParameters>,<diskgroup>]`
- `oracle.archive.info[<existingParameters>,<destination>]`
- `oracle.cdb.info[<existingParameters>,<database>]`
- `oracle.pdb.info[<existingParameters>,<database>]`
- `oracle.ts.stats[<existingParameters>,<tablespace>,<type>]`

These parameters allow to query separate instances of data instead of all data, thus improving performance.

**Open file descriptor limit increase for Zabbix agent 2** The systemd service file shipped in Zabbix agent 2 packages now declares the open file descriptor limit of 8196. Previously, the system default limit of 1024 has been used. The new limit is sufficient for the default Zabbix agent 2 configuration. If you have a non-standard agent 2 configuration, for example, use additional plugins or extended features, this limit may need to be manually increased further. In this case, adjust the `LimitNOFILE` parameter in the systemd unit file.

## 24 Upgrade notes for 6.0.14

**Limits for JavaScript objects in preprocessing** The following limits for **JavaScript objects** in preprocessing have been introduced:

- The total size of all messages that can be logged with the `log()` method has been limited to 8 MB per script execution.
- The initialization of multiple `HttpRequest` objects has been limited to 10 per script execution.
- The total length of header fields that can be added to a single `HttpRequest` object with the `addHeader()` method has been limited to 128 Kbytes (special characters and header names included).

## 25 Upgrade notes for 6.0.15

This minor version doesn't have any upgrade notes.

## 26 Upgrade notes for 6.0.16

This minor version doesn't have any upgrade notes.

## 27 Upgrade notes for 6.0.17

**HTML support in Geomap attribution dropped** The attribution text for the **Geomap dashboard widget** can now only contain plain text; HTML support has been dropped. If this field already contains HTML, it will be rendered as plain text after the upgrade.

In **Geographical maps** settings in the Administration → General section, the field *Attribution* is now only visible when *Tile provider* is set to *Other*.

## 28 Upgrade notes for 6.0.18

**Proxy history housekeeping** The limitation on the amount of outdated information deleted from the proxy database per proxy history housekeeping cycle has been removed.

Previously the **housekeeper** deleted only no more than 4 times the **HousekeepingFrequency** hours of outdated information. For example, if **HousekeepingFrequency** was set to "1", no more than 4 hours of outdated information (starting from the oldest entry) was deleted. In cases when a proxy would constantly receive data older than set in **ProxyOfflineBuffer**, this could result in excessive data accumulation.

Now this limitation has been removed, providing a more effective proxy history housekeeping solution.

## 29 Upgrade notes for 6.0.19

**Aggregate functions** The **count\_foreach** function now returns '0' for a matching item in the array, if no data are present for the item or the data do not match the filter. Previously such items would be ignored (no data added to the aggregation).

### 30 Upgrade notes for 6.0.20

This minor version doesn't have any upgrade notes.

### 31 Upgrade notes for 6.0.21

Maximum JSON depth

The maximum allowed JSON depth has been set to 64 to improve security and performance during JSON parsing.

Macro functions

The range of the `fmtnum` **macro function** is now limited to 0-20.

### 32 Upgrade notes for 6.0.22

Autoregistration table cleared from orphaned records

Previously the `autoreg_host` table was never cleared. Now orphaned records that reference neither an autoregistration event nor an existing host will be removed by the Housekeeper.

PostgreSQL plugin parameters

The following PostgreSQL plugin parameters are no longer mandatory if `Plugins.PostgreSQL.Sessions.<SessionName>.TLSConnect` is set to `verify_ca` or `verify_full`:

- `Plugins.PostgreSQL.Sessions.<SessionName>.TLSCertFile`
- `Plugins.PostgreSQL.Sessions.<SessionName>.TLSKeyFile`

### 33 Upgrade notes for 6.0.23

#### Breaking changes Agent 2 plugins

MySQL

The correct master host is now returned if specified in the `mysql.replication.get_slave_status[]` **item** "masterHost" parameter. Previously the "masterHost" parameter was ignored and always the first master host was returned.

If this parameter is not specified, all hosts are returned.

#### MySQL plugin parameters

The following MySQL plugin parameters are no longer mandatory if `Plugins.Mysql.Sessions.<SessionName>.TLSConnect` is set to `verify_ca` or `verify_full`:

- `Plugins.Mysql.Sessions.<SessionName>.TLSCertFile`
- `Plugins.Mysql.Sessions.<SessionName>.TLSKeyFile`

PostgreSQL-TimescaleDB combination no longer checked

Zabbix no longer checks for the supported PostgreSQL-TimescaleDB combination. As before, Zabbix does check for the supported PostgreSQL version or TimescaleDB version separately.

### 34 Upgrade notes for 6.0.24

MongoDB plugin parameters

The following MongoDB plugin parameters are no longer mandatory if `Plugins.MongoDB.Sessions.<SessionName>.TLSConnect` is set to `verify_ca` or `verify_full`:

- Plugins.MongoDB.Sessions.<SessionName>.TLSCertFile
- Plugins.MongoDB.Sessions.<SessionName>.TLSKeyFile

See also: [MongoDB plugin parameters](#)

### 35 Upgrade notes for 6.0.25

Consistency introduced in sha256 checksums of vfs.file.cksum item

In earlier Zabbix versions, the Zabbix agent item `vfs.file.cksum` produced different sha256 sums for the same file depending on the platform (processor architecture) – sha256 sums on AIX, HP-UX (Itanium) and Solaris (SPARC) differed from those produced on Intel x86-64 platforms.

The issue has now been fixed; however, after upgrading, monitoring sha256 sums of files on AIX, HP-UX, or Solaris SPARC may result in false positives of files having been modified.

### 36 Upgrade notes for 6.0.26

This minor version doesn't have any upgrade notes.

### 37 Upgrade notes for 6.0.27

Zabbix agent 2 support on Windows

To prevent critical security vulnerabilities, the minimum Windows version for Zabbix agent 2 has been raised to Windows 10/Server 2016. See note under [Supported platforms](#) for more information.

### 38 Upgrade notes for 6.0.28

Guest user authorization

Automatic login for the guest user has been removed. After this change, the guest user will need to log in like any other user. Previously, a guest could immediately get to almost any monitoring or reporting page without going through authorization.

Invalid regular expression in proc.\* items

`proc.*` agent items will now become 'not supported' if an invalid regular expression is supplied.

### 39 Upgrade notes for 6.0.29

This minor version doesn't have any upgrade notes.

### 40 Upgrade notes for 6.0.30

This minor version doesn't have any upgrade notes.

### 41 Upgrade notes for 6.0.31

This minor version doesn't have any upgrade notes.

## 42 Upgrade notes for 6.0.32

New index on auditlog table

A new index has been added to the auditlog table to improve database and frontend response times when filtering records by *Recordset ID* in the [Audit log](#).

Note that users with large audit logs may experience extended upgrade times due to the database size.

Server to stop with read-only database

A standalone Zabbix server will now stop if the database becomes read-only.

## 43 Upgrade notes for 6.0.33

This minor version does not have any upgrade notes.

## 44 Upgrade notes for 6.0.34

### Databases Database changes

A slow template cloning issue has been resolved by adding indexes for the uuid field. This change may cause long upgrade times on large datasets.

### Processes Problems no longer cached without enabled services

The service manager no longer caches problems if there are no services enabled.

The service manager will check for enabled services in configuration cache during startup and cache problems only if there are enabled services; it will also detect when the first service is added/last service removed and will initialize/free the problem cache.

## 45 Upgrade notes for 6.0.35

Agent 2 package support for RHEL 6 dropped

Since Zabbix 6.0.35, Zabbix agent 2 packages are no longer available for [RHEL 6](#) due to Go 1.22 (and newer) being incompatible with GCC 4.4.7 provided by RHEL 6, which results in compilation errors. Note, however, that [Zabbix agent packages](#) are still supported.

## 46 Upgrade notes for 6.0.36

This minor version does not have any upgrade notes.

## 47 Upgrade notes for 6.0.37

This minor version does not have any upgrade notes.

## 48 Upgrade notes for 6.0.38

### Breaking changes

Java 11 required for Java gateway

Zabbix Java gateway now requires Java 11 for runtime (building from source is still possible with Java 8), due to updated minimum logback library versions:

| Library                         | New minimum version | Old minimum version |
|---------------------------------|---------------------|---------------------|
| <a href="#">logback-classic</a> | <b>1.5.16</b>       | 1.2.9               |
| <a href="#">logback-core</a>    | <b>1.5.16</b>       | 1.2.9               |
| <a href="#">slf4j-api</a>       | <b>2.0.16</b>       | 1.7.32              |

## 49 Upgrade notes for 6.0.39

### Breaking changes

MSSQL Zabbix agent 2 plugin update

The template [MSSQL by Zabbix agent 2](#) has been updated with filters to include or exclude discovered quorum members by name as well as a service filter that allows filtering by cluster name to exclude empty clusters. To have the template work without errors, the [MSSQL Zabbix agent 2 plugin](#) must be updated to a version equal to or above 6.0.39.

## 50 Upgrade notes for 6.0.40

This minor version does not have any upgrade notes.

## 5 Quickstart

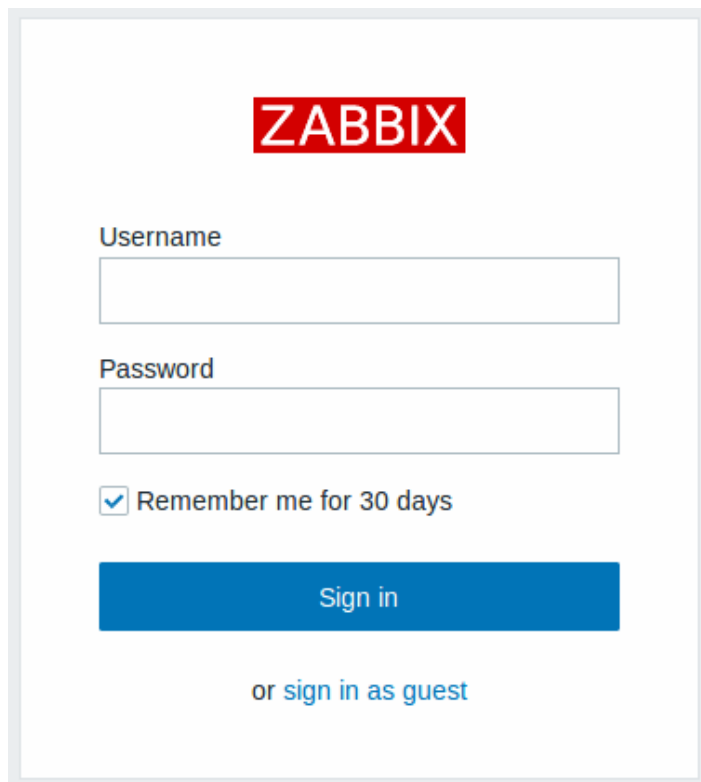

Please use the sidebar to access content in the Quickstart section.

### 1 Login and configuring user

#### Overview

In this section, you will learn how to log in and set up a system user in Zabbix.

#### Login

The image shows the Zabbix login interface. At the top is the ZABBIX logo in a red box. Below it are two input fields for 'Username' and 'Password'. A checkbox labeled 'Remember me for 30 days' is checked. A blue 'Sign in' button is below the password field. At the bottom, there is a link 'or sign in as guest'.

This is the Zabbix welcome screen. Enter the user name **Admin** with password **zabbix** to log in as a **Zabbix superuser**. Access to *Configuration* and *Administration* menus will be granted.

For security reasons, it is strongly recommended to change the default password for the Admin account immediately after the first login.

Protection against brute force attacks

In case of five consecutive failed login attempts, Zabbix interface will pause for 30 seconds in order to prevent brute force and dictionary attacks.

The IP address of a failed login attempt will be displayed after a successful login.

Adding user

To view information about users, go to *Administration* → *Users*.

| <input type="checkbox"/> Alias | Name   | Surname       | User role        | Groups                | Is online?                | Login | Frontend access | API access | Debug mode | Status   |
|--------------------------------|--------|---------------|------------------|-----------------------|---------------------------|-------|-----------------|------------|------------|----------|
| <input type="checkbox"/> Admin | Zabbix | Administrator | Super admin role | Zabbix administrators | Yes (2020-10-28 11:38:16) | OK    | System default  | Enabled    | Enabled    | Enabled  |
| <input type="checkbox"/> guest | John   | Snow          | User role        | Guests                | No (2020-07-16 11:06:52)  | OK    | System default  | Enabled    | Disabled   | Disabled |

Displaying 2 of 2 found

To add a new user, click on *Create user*.

In the new user form, make sure to add your user to one of the existing **user groups**, for example 'Zabbix administrators'.

User

Add

Cancel

In this pop-up, enter an email address for the user.

You can specify a time period when the medium will be active (see [Time period specification](#) page for a description of the format), by default a medium is always active. You can also customize **trigger severity** levels for which the medium will be active, but leave all of them enabled for now.

Click on *Add* to save the medium, then go to the Permissions tab.

Permissions tab has a mandatory field *Role*. The role determines which frontend elements the user can view and which actions he

is allowed to perform. Press **Select** and select one of the roles from the list. For example, select *Admin role* to allow access to all Zabbix frontend sections, except Administration. Later on, you can modify permissions or create more user roles. Upon selecting a role, permissions will appear in the same tab:

☒ Linux servers

☐ Templates

☐ Templates/Applications

☐ Virtual machines

☐ Zabbix servers

Select

In this popup, mark the checkbox next to 'Linux servers', then click *Select*. *Linux servers* should be displayed in the selection field. Click the 'Read' button to set the permission level and then *Add* to add the group to the list of permissions. In the user group properties form, click *Update*.

### Attention:

In Zabbix, access rights to hosts are assigned to **user groups**, not individual users.

Done! You may try to log in using the credentials of the new user.

## 2 New host

### Overview

In this section you will learn how to set up a new host.

A host in Zabbix is a networked entity (physical, virtual) that you wish to monitor. The definition of what can be a "host" in Zabbix is quite flexible. It can be a physical server, a network switch, a virtual machine or some application.

Adding host

Information about configured hosts in Zabbix is available in *Configuration → Hosts* as well as *Monitoring → Hosts*. There is already one pre-defined host, called "Zabbix server", but we want to learn adding another.

To add a new host, click on *Create host*. This will present us with a host configuration form.

127.0.0.1

Add

.....

Description

All mandatory input fields are marked with a red asterisk.

The bare minimum to enter here is:

**Host name**

- Enter a host name. Alphanumerics, spaces, dots, dashes and underscores are allowed.

**Groups**

- Select one or several existing groups by clicking *Select* button or enter a non-existing group name to create a new group.

Note:

All access permissions are assigned to host groups, not individual hosts. That is why a host must belong to at least one group.

**Interfaces: IP address**

- Although not a required field technically, a host interface is necessary for collecting certain metrics. To use Zabbix agent passive checks, specify the agent's IP or DNS in this field. Note that you should also specify Zabbix server's IP or DNS in the Zabbix agent configuration file 'Server' directive. If Zabbix agent and Zabbix server are installed on the same machine, you need to specify the same IP/DNS in both places.

Other options can be left at their defaults for now.

When done, click *Add*. Your new host should be visible in the host list.

Hosts

Create hostImport

Filter

| <input type="checkbox"/> | Name ▲   | Applications | Items | Triggers | Graphs | Discovery | Web | Interface        | Proxy | Templates    | Status  | Availability            | Agent encryption | Info | Tags |
|--------------------------|----------|--------------|-------|----------|--------|-----------|-----|------------------|-------|--------------|---------|-------------------------|------------------|------|------|
| <input type="checkbox"/> | New host | Applications | Items | Triggers | Graphs | Discovery | Web | 127.0.0.1: 10050 |       | New template | Enabled | ZBX   SNMP   JMX   IPMI | NONE             |      |      |

The Availability column contains indicators of host availability per each interface. You have defined a Zabbix agent interface, so you can use the agent availability icon (with "ZBX" on it) to understand the host availability:

-  - host status has not been established; no metric check has happened yet
-  - host is available, a metric check has been successful

- **ZBX** - host is unavailable, a metric check has failed (move your mouse cursor over the icon to see the error message). There might be some error with communication, possibly caused by incorrect interface credentials. Check that Zabbix server is running, and try refreshing the page later as well.

### 3 New item

#### Overview

In this section, you will learn how to set up an item.

Items are the basis of gathering data in Zabbix. Without items, there is no data - because only an item defines a single metric or what kind of data to collect from a host.

#### Adding item

All items are grouped around hosts. That is why to configure a sample item we go to *Configuration* → *Hosts* and find the 'New host' we have created.

Click on the *Items* link in the row of 'New host', and then click on *Create item*. This will present us with an item definition form.

Item
Tags
Preprocessing

\* Name

CPU load

Type

\* History storage period

Do not keep history

Storage period

90d

\* Trend storage period

Do not keep trends

Storage period

365d

All mandatory input fields are marked with a red asterisk.

For our sample item, the essential information to enter is:

#### Name

- Enter *CPU load* as the value. This will be the item name displayed in lists and elsewhere.

#### Key

- Manually enter *system.cpu.load* as the value. This is the technical name of an item that identifies the type of information that will be gathered. The particular key is just one of **pre-defined keys** that come with Zabbix agent.

#### Type of information

- This attribute defines the format of the expected data. For the *system.cpu.load* key, this field will be automatically set to *Numeric (float)*.

#### Note:

You may also want to reduce the number of days **item history** will be kept, to 7 or 14. This is good practice to relieve the database from keeping lots of historical values.

**Other options** will suit us with their defaults for now.

When done, click **Add**. The new item should appear in the item list, and you should see a success message.

#### Seeing data

With an item defined, you might be curious if it is actually gathering data. For that, go to **Monitoring** → **Latest data**, select 'New host' in the filter and click on **Apply**.

≡ Latest data Filter

| Host                              | Name     | Last check            | Last value | Change | Tags                  |
|-----------------------------------|----------|-----------------------|------------|--------|-----------------------|
| <input type="checkbox"/> New host | CPU load | 05/24/2021 10:40:5... | 1.17       | -0.11  | <a href="#">Graph</a> |

0 selected Display stacked graph Display graph

With that said, it may take up to 60 seconds for the first data to arrive. That, by default, is how often the server reads configuration changes and picks up new items to execute.

If you see no value in the 'Change' column, maybe only one value has been received so far. Wait for 30 seconds for another value to arrive.

If you do not see the information about the item as in the screenshot, make sure that:

- you have filled out the item 'Key' and 'Type of information' fields exactly as in the screenshot;
- both the agent and the server are running;
- host status is 'Enabled' and its availability icon is green;
- a host is selected in the host filter;
- the item is enabled.

#### Graphs

With the item working for a while, it might be time to see something visual. **Simple graphs** are available for any monitored numeric item without any additional configuration. These graphs are generated on runtime.

To view the graph, go to **Monitoring** → **Latest data** and click on the 'Graph' link next to the item.

## 4 New trigger

### Overview

In this section you will learn how to set up a trigger.

Items only collect data. To automatically evaluate incoming data we need to define triggers. A trigger contains an expression that defines a threshold of what is an acceptable level for the data.

If that level is surpassed by the incoming data, a trigger will "fire" or go into a 'Problem' state - letting us know that something has happened that may require attention. If the level is acceptable again, trigger returns to an 'Ok' state.

Adding trigger

To configure a trigger for our item, go to *Configuration* → *Hosts*, find 'New host' and click on *Triggers* next to it and then on *Create trigger*. This presents us with a trigger definition form.

The screenshot shows the 'Create trigger' form with the following fields and values:

- Name:** CPU load too high on 'New host' for 3 minutes
- Event name:** CPU load too high on 'New host' for 3 minutes
- Operational data:** (empty)
- Severity:** Not classified (selected), Information, Warning, Average, High, Dis
- Expression:** avg(/New host/system.cpu.load, 3m)>2
- OK event generation:** Expression (selected), Recovery expression, None
- PROBLEM event generation mode:** Single (selected), Multiple
- OK event closes:** All problems (selected), All problems if tag values match
- Allow manual close:** ☐
- URL:** (empty)
- Description:** (empty)
- Enabled:** ☒

Buttons: Add, Cancel

For our trigger, the essential information to enter here is:

*Name*

- Enter *CPU load too high on 'New host' for 3 minutes* as the value. This will be the trigger name displayed in lists and elsewhere.

*Expression*

- Enter: avg(/New host/system.cpu.load,3m)>2

This is the trigger expression. Make sure that the expression is entered right, down to the last symbol. The item key here (system.cpu.load) is used to refer to the item. This particular expression basically says that the problem threshold is exceeded when the CPU load average value for 3 minutes is over 2. You can learn more about the [syntax of trigger expressions](#).

When done, click *Add*. The new trigger should appear in the trigger list.

Displaying trigger status

With a trigger defined, you might be interested to see its status.

If the CPU load has exceeded the threshold level you defined in the trigger, the problem will be displayed in *Monitoring* → *Problems*.

| Time     | <input type="checkbox"/> Severity       | Recovery time | Status  | Info | Host ▲   | Problem                                       | Operational data | Duration |
|----------|---|---------------|---------|------|----------|---|------------------|----------|
| 16:23:06 | <input type="checkbox"/> Not classified |               | PROBLEM |      | New host | CPU load too high on "New host" for 3 minutes | 6.6              | 56s      |

The flashing in the status column indicates a recent change of trigger status, one that has taken place in the last 30 minutes.

## 5 Receiving problem notification

### Overview

In this section you will learn how to set up alerting in the form of notifications in Zabbix.

With items collecting data and triggers designed to "fire" upon problem situations, it would also be useful to have some alerting mechanism in place that would notify us about important events even when we are not directly looking at Zabbix frontend.

This is what notifications do. Email being the most popular delivery method for problem notifications, we will learn how to set up an email notification.

### Email settings

Initially there are several predefined notification **delivery methods** in Zabbix. **Email** is one of those.

To configure email settings, go to *Administration* → *Media types* and click on *Email* in the list of pre-defined media types.

## Media types

| <input type="checkbox"/> | Name ▲     | Type    | Status  | Used in actions | Details                         |
|--------------------------|------------|---------|---------|-----------------|---------------------------------|
| <input type="checkbox"/> | Email      | Email   | Enabled |                 | SMTP server: "mail.zabbix.com", |
| <input type="checkbox"/> | Mattermost | Webhook | Enabled |                 |                                 |
| <input type="checkbox"/> | Opsgenie   | Webhook | Enabled |                 |                                 |

This will present us with the email settings definition form.

## Media types

Connection security

None

STARTTLS

SSL/TLS

Authentication

None

Username and password

Message format

HTML

Plain text

Description

Enabled

☒

Add

Cancel

All mandatory input fields are marked with a red asterisk.

In the *Media type* tab, set the values of SMTP server, SMTP helo and SMTP email to the appropriate for your environment.

**Note:**

'SMTP email' will be used as the 'From' address for the notifications sent from Zabbix.

Next, it is required to define the content of the problem message. The content is defined by means of a message template, configured in the *Message templates* tab.

Click on *Add* to create a message template, and select *Problem* as the message type.

## Message template

| Message type | Problem |  |
|--------------|---------|--|
|--------------|---------|--|

|         |                       |
|---------|-----------------------|
| Subject | Problem: {EVENT.NAME} |
|---------|-----------------------|

|         |  |
|---------|--|
| Message | Problem started at {EVENT.TIME} on {EVENT.DATE}<br>Problem name: {EVENT.NAME}<br>Host: {HOST.NAME}<br>Severity: {EVENT.SEVERITY}<br>Operational data: {EVENT.OPDATA}<br>Original problem ID: {EVENT.ID}<br>{TRIGGER.URL} |
|---------|--|

Click on *Add* when ready and save the form.

Now you have configured 'Email' as a working media type. The media type must also be linked to users by defining specific delivery addresses (like we did when [configuring a new user](#)), otherwise it will not be used.

New action

Delivering notifications is one of the things **actions** do in Zabbix. Therefore, to set up a notification, go to *Configuration* → *Actions* and click on *Create action*.

≡ Actions

Action

Operations

\* Name

Test action

Conditions

Label

Name

Add

Enabled

☒

\* At least one operation must exist.

Add

Cancel

All mandatory input fields are marked with a red asterisk.

In this form, enter a name for the action.

In the most simple case, if we do not add any more specific **conditions**, the action will be taken upon any trigger change from 'Ok' to 'Problem'.

We still should define what the action should do - and that is done in the *Operations* tab. Click on *Add* in the Operations block, which opens a new operation form.

Operation details

Add

Add

Cancel

All mandatory input fields are marked with a red asterisk.

Here, click on *Add* in the *Send to Users* block and select the user ('user') we have defined. Select 'Email' as the value of *Send only to*. When done with this, click on *Add*, and the operation should be added:

### ≡ Actions

Action

Operations

\* Default operation step duration

1h

Pause operations for suppressed problems

☒

Operations

| Steps               | Details  | Start in    | Duration |
|---------------------|--|-------------|----------|
| 1                   | Send message to users: user (New User) via Email | Immediately | Default  |
| <a href="#">Add</a> |  |             |          |

## Operations

\* Default operation step duration 1h

Pause operations for suppressed problems ☒

| Operations | Steps               | Details   | Start in    | Duration |
|------------|---------------------|---|-------------|----------|
|            | 1                   | <b>Send message to users:</b> user (New User) via Email | Immediately | Default  |
|            | <a href="#">Add</a> |   |             |          |

That is all for a simple action configuration, so click *Add* in the action form.

### Receiving notification

Now, with delivering notifications configured it would be fun to actually receive one. To help with that, we might on purpose increase the load on our host - so that our **trigger** "fires" and we receive a problem notification.

Open the console on your host and run:

```
cat /dev/urandom | md5sum
```

You may run one or several of [these processes](#).

Now go to *Monitoring* → *Latest data* and see how the values of 'CPU Load' have increased. Remember, for our trigger to *fire*, the 'CPU Load' value has to go over '2' for 3 minutes running. Once it does:

- in *Monitoring* → *Problems* you should see the trigger with a flashing 'Problem' status
- you should receive a problem notification in your email

#### Attention:

If notifications do not work:

- verify once again that both the email settings and the action have been configured properly
- make sure the user you created has at least read permissions on the host which generated the event, as noted in the *Adding user* step. The user, being part of the 'Zabbix administrators' user group must have at least read access to 'Linux servers' host group that our host belongs to.
- Additionally, you can check out the action log by going to *Reports* → *Action log*.

## 6 New template

### Overview

In this section you will learn how to set up a template.

Previously we learned how to set up an item, a trigger and how to get a problem notification for the host.

While all of these steps offer a great deal of flexibility in themselves, it may appear like a lot of steps to take if needed for, say, a thousand hosts. Some automation would be handy.

This is where templates come to help. Templates allow to group useful items, triggers and other entities so that those can be reused again and again by applying to hosts in a single step.

When a template is linked to a host, the host inherits all entities of the template. So, basically a pre-prepared bunch of checks can be applied very quickly.

### Adding template

To start working with templates, we must first create one. To do that, in *Configuration* → *Templates* click on *Create template*. This will present us with a template configuration form.

The screenshot shows the 'Create template' form in Zabbix. The 'Template' tab is selected. The form contains the following fields:

- \* Template name**: Input field with the value 'New template'.
- Visible name**: Input field with the value 'New template'.
- Templates**: Input field with the placeholder 'type here to search' and a 'Select' button.
- \* Groups**: Input field with a dropdown menu showing 'Templates' and a search field with the placeholder 'type here to search', and a 'Select' button.
- Description**: A large text area for the template description.

At the bottom of the form are two buttons: 'Add' and 'Cancel'.

All mandatory input fields are marked with a red asterisk.

The required parameters to enter here are:

#### Template name

- Enter a template name. Alpha-numericals, spaces and underscores are allowed.

## Groups

- Select one or several groups by clicking *Select* button. The template must belong to a group.

When done, click *Add*. Your new template should be visible in the list of templates.

## ≡ Templates

| <input type="checkbox"/> | Name ▲       | Hosts | Items | Triggers | Graphs | Dashboards | Discovery | Web |
|--------------------------|--------------|-------|-------|----------|--------|------------|-----------|-----|
| <input type="checkbox"/> | New template | Hosts | Items | Triggers | Graphs | Dashboards | Discovery | Web |

As you may see, the template is there, but it holds nothing in it - no items, triggers or other entities.

Adding item to template

To add an item to the template, go to the item list for 'New host'. In *Configuration → Hosts* click on *Items* next to 'New host'.

Then:

- mark the checkbox of the 'CPU Load' item in the list
- click on *Copy* below the list
- select the template to copy item to

Target type: Host groups, Hosts, **Templates**

\* Target:  × Select

All mandatory input fields are marked with a red asterisk.

- click on *Copy*

If you now go to *Configuration → Templates*, 'New template' should have one new item in it.

We will stop at one item only for now, but similarly you can add any other items, triggers or other entities to the template until it's a fairly complete set of entities for given purpose (monitoring OS, monitoring single application).

Linking template to host

With a template ready, it only remains to add it to a host. For that, go to *Configuration → Hosts*, click on 'New host' to open its property form and find the **Templates** field.

Start typing *New template* in the *Templates* field. The name of template we have created should appear in the dropdown list. Scroll down to select. See that it appears in the *Templates* field.

# Host

Host

IPMI

Tags

Macros

Inventory

Encryption

Value mapping

\* Host name

New host

Visible name

New host

Templates

New template X

type here to search

\* Groups

Linux servers X

type here to search

Click *Update* in the form to save the changes. The template is now added to the host, with all entities that it holds.

As you may have guessed, this way it can be applied to any other host as well. Any changes to the items, triggers and other entities at the template level will propagate to the hosts the template is linked to.

Linking pre-defined templates to hosts

As you may have noticed, Zabbix comes with a set of predefined templates for various OS, devices and applications. To get started with monitoring very quickly, you may link the appropriate one of them to a host, but beware that these templates need to be fine-tuned for your environment. Some checks may not be needed, and polling intervals may be way too frequent.

More information about [templates](#) is available.

## 6 Zabbix appliance

**Overview** As an alternative to setting up manually or reusing an existing server for Zabbix, users may [download](#) a Zabbix appliance or a Zabbix appliance installation CD image.

Zabbix appliance and installation CD versions are based on AlmaLinux 8 (x86\_64).

Zabbix appliance installation CD can be used for instant deployment of Zabbix server (MySQL).

### Attention:

You can use this Appliance to evaluate Zabbix. The Appliance is not intended for serious production use.

System requirements:

- *RAM*: 1.5 GB
- *Disk space*: at least 8 GB should be allocated for the virtual machine.

Zabbix installation CD/DVD boot menu:

Zabbix appliance contains a Zabbix server (configured and running on MySQL) and a frontend.

Zabbix virtual appliance is available in the following formats:

- VMware (.vmx)
- Open virtualization format (.ovf)
- Microsoft Hyper-V 2012 (.vhdx)
- Microsoft Hyper-V 2008 (.vhd)
- KVM, Parallels, QEMU, USB stick, VirtualBox, Xen (.raw)
- KVM, QEMU (.qcow2)

To get started, boot the appliance and point a browser at the IP the appliance has received over DHCP.

**Attention:**

DHCP must be enabled on the host.

To get the IP address from inside the virtual machine run:

```
ip addr show
```

To access Zabbix frontend, go to **http://<host\_ip>** (for access from the host's browser bridged mode should be enabled in the VM network settings).

**Note:**

If the appliance fails to start up in Hyper-V, you may want to press Ctrl+Alt+F2 to switch tty sessions.

**1 Changes to AlmaLinux 8 configuration** The appliance is based on AlmaLinux 8. There are some changes applied to the base AlmaLinux configuration.

### 1.1 Repositories

Official Zabbix **repository** has been added to `/etc/yum.repos.d:`

```
[zabbix]
name=Zabbix Official Repository - $basearch
baseurl=http://repo.zabbix.com/zabbix/6.0/rhel/8/$basearch/
enabled=1
```

```
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-ZABBIX-A14FE591
```

## 1.2 Firewall configuration

The appliance uses iptables firewall with predefined rules:

- Opened SSH port (22 TCP);
- Opened Zabbix agent (10050 TCP) and Zabbix trapper (10051 TCP) ports;
- Opened HTTP (80 TCP) and HTTPS (443 TCP) ports;
- Opened SNMP trap port (162 UDP);
- Opened outgoing connections to NTP port (53 UDP);
- ICMP packets limited to 5 packets per second;
- All other incoming connections are dropped.

## 1.3 Using a static IP address

By default the appliance uses DHCP to obtain the IP address. To specify a static IP address:

- Log in as root user;
- Open `/etc/sysconfig/network-scripts/ifcfg-eth0` file;
- Replace `BOOTPROTO=dhcp` with `BOOTPROTO=none`
- Add the following lines:
  - `IPADDR=<IP address of the appliance>`
  - `PREFIX=<CIDR prefix>`
  - `GATEWAY=<gateway IP address>`
  - `DNS1=<DNS server IP address>`
- Run **systemctl restart network** command.

Consult the official Red Hat [documentation](#) if needed.

## 1.4 Changing time zone

By default the appliance uses UTC for the system clock. To change the time zone, copy the appropriate file from `/usr/share/zoneinfo` to `/etc/localtime`, for example:

```
cp /usr/share/zoneinfo/Europe/Riga /etc/localtime
```

## 2 Zabbix configuration

Zabbix appliance setup has the following passwords and configuration changes:

### 2.1 Credentials (login:password)

System:

- root:zabbix

Zabbix frontend:

- Admin:zabbix

Database:

- root:<random>
- zabbix:<random>

#### Note:

Database passwords are randomly generated during the installation process.

Root password is stored inside the `/root/.my.cnf` file. It is not required to input a password under the "root" account.

To change the database user password, changes have to be made in the following locations:

- MySQL;
- `/etc/zabbix/zabbix_server.conf`;
- `/etc/zabbix/web/zabbix.conf.php`.

#### Note:

Separate users `zabbix_srv` and `zabbix_web` are defined for the server and the frontend respectively.

### 2.2 File locations

- Configuration files are located in **/etc/zabbix**.
- Zabbix server, proxy and agent logfiles are located in **/var/log/zabbix**.

- Zabbix frontend is located in **/usr/share/zabbix**.
- Home directory for the user **zabbix** is **/var/lib/zabbix**.

### 2.3 Changes to Zabbix configuration

- Frontend timezone is set to Europe/Riga (this can be modified in **/etc/php-fpm.d/zabbix.conf**);

**3 Frontend access** By default, access to the frontend is allowed from anywhere.

The frontend can be accessed at `http://<host>`.

This can be customized in **/etc/nginx/conf.d/zabbix.conf**. Nginx has to be restarted after modifying this file. To do so, log in using SSH as **root** user and execute:

```
systemctl restart nginx
```

**4 Firewall** By default, only the ports listed in the **configuration changes** above are open. To open additional ports, modify `"/etc/sysconfig/iptables"` file and reload firewall rules:

```
systemctl reload iptables
```

**5 Upgrading** The Zabbix appliance packages may be upgraded. To do so, run:

```
dnf update zabbix*
```

**6 System Services** Systemd services are available:

```
systemctl list-units zabbix*
```

### 7 Format-specific notes 7.1 VMware

The images in *vmdk* format are usable directly in VMware Player, Server and Workstation products. For use in ESX, ESXi and vSphere they must be converted using **VMware vCenter Converter** (authentication required for download). If you use VMWare vCenter Converter, you may encounter issues with the hybrid network adapter. In that case, you can try specifying the E1000 adapter during the conversion process. Alternatively, after the conversion is complete, you can delete the existing adapter and add an E1000 adapter.

#### 7.2 HDD/flash image (raw)

```
dd if=./zabbix_appliance_5.2.0.raw of=/dev/sdc bs=4k conv=fdatasync
```

Replace `/dev/sdc` with your Flash/HDD disk device.

## 7 Configuration

Please use the sidebar to access content in the Configuration section.

### 1 Configuring a template

#### Overview

Configuring a template requires that you first create a template by defining its general parameters and then you add entities (items, triggers, graphs, etc.) to it.

#### Creating a template

To create a template, do the following:

- Go to *Configuration* → *Templates*
- Click on *Create template*
- Edit template attributes

The **Template** tab contains general template attributes.

All mandatory input fields are marked with a red asterisk.

Template attributes:

| Parameter            | Description   |
|----------------------|---|
| <i>Template name</i> | Unique template name. Alphanumerics, spaces, dots, dashes, and underscores are allowed. However, leading and trailing spaces are disallowed.  |
| <i>Visible name</i>  | If you set this name, it will be the one visible in lists, maps, etc.   |
| <i>Templates</i>     | Link one or more "nested" templates to this template. All entities (items, triggers, graphs, etc.) will be inherited from the linked templates.<br>To link a new template, start typing the template name in the <i>Templates</i> field. A list of matching templates will appear; scroll down to select. Alternatively, you may click on <i>Select</i> next to the <i>Templates</i> field; then, first select the host group by clicking on <i>Select</i> next to the <i>Host groups</i> field; mark the checkbox in front of one or multiple templates from the list displayed below; click on <i>Select</i> . The template(s) that are selected in the <i>Templates</i> field will be linked to the template when the template configuration form is saved or updated.<br>To unlink a template, use one of the two options in the <i>Templates</i> block:<br><i>Unlink</i> - unlink the template, but preserve its items, triggers, and graphs<br><i>Unlink and clear</i> - unlink the template and remove all its items, triggers, and graphs |
| <i>Groups</i>        | Host/template groups the template belongs to.   |
| <i>Description</i>   | Enter the template description.   |

The **Tags** tab allows you to define template-level **tags**. All problems of hosts linked to this template will be tagged with the values entered here.

User macros, {INVENTORY.\*} macros, {HOST.HOST}, {HOST.NAME}, {HOST.CONN}, {HOST.DNS}, {HOST.IP}, {HOST.PORT} and {HOST.ID} macros are supported in tags.

The **Macros** tab allows you to define template-level **user macros** as a name-value pairs. Note that macro values can be kept as plain text, secret text, or Vault secret. Adding a description is also supported.

|  |        |          |               |
|--|--------|----------|---------------|
| Template   | Tags 1 | Macros 9 | Value mapping |
| <div> <div>Template macros</div> <div>Inherited and template macros</div> </div> |        |          |               |
| Macro  | Value  |          | Description   |
| {TEMPLATE_THRESHOLD1}  | 10M    | T ▾      | description   |
| {TEMPLATE_THRESHOLD2}  | 20M    | T ▾      | description   |
| {TEMPLATE_THRESHOLD3}  | 30M    | T ▾      | description   |
| {TEMPLATE_THRESHOLD4}  | 40M    | T ▾      | description   |
| {TEMPLATE_THRESHOLD5}  | 50M    | T ▾      | description   |

You may also view here macros from linked templates and global macros if you select the *Inherited and template macros* option. That is where all defined user macros for the template are displayed with the value they resolve to as well as their origin.

|   |                 |          |               |
|---|-----------------|----------|---------------|
| Template  | Tags 1          | Macros 9 | Value mapping |
| <div> <div>Template macros</div> <div>Inherited and template macros</div> </div>  |                 |          |               |
| Macro   | Effective value |          |               |
| {\$AGENT.TIMEOUT}   | 3m              | T ▾      |               |
| Timeout after which agent is considered unavailable. Works only for agents reachable from Zabbix server/proxy (passive mode). |                 |          |               |
| {\$CPU.UTIL.CRIT}   | 90              | T ▾      |               |
| description   |                 |          |               |
| {\$IF.ERRORS.WARN}  | 2               | T ▾      |               |
| description   |                 |          |               |
| {\$IFCONTROL}   | 1               | T ▾      |               |

For convenience, links to respective templates and global macro configuration are provided. It is also possible to edit a nested template/global macro on the template level, effectively creating a copy of the macro on the template.

The **Value mapping** tab allows to configure human-friendly representation of item data in **value mappings**.

Buttons:

|                  |  |
|------------------|--|
| Add              | Add the template. The added template should appear in the list.  |
| Update           | Update the properties of an existing template.   |
| Clone            | Create another template based on the properties of the current template, including the entities (items, triggers, etc) inherited from linked templates.  |
| Full clone       | Create another template based on the properties of the current template, including the entities (items, triggers, etc) both inherited from linked templates and directly attached to the current template. |
| Delete           | Delete the template; entities of the template (items, triggers, etc) remain with the linked hosts.   |
| Delete and clear | Delete the template and all its entities from linked hosts.  |
| Cancel           | Cancel the editing of template properties.   |

With a template created, it is time to add some entities to it.

**Attention:**

Items have to be added to a template first. Triggers and graphs cannot be added without the corresponding item.

Adding items, triggers, graphs

There are two ways to add items to the template:

1. To create new items, follow the guidelines for [Creating an item](#).
2. To add existing items to the template:
  - Go to *Configuration → Hosts* (or *Templates*).
  - Click on *Items* in the row of the required host/template.
  - Mark the checkboxes of items you want to add to the template.
  - Click on *Copy* below the item list.
  - Select the template (or group of templates) the items should be copied to and click on *Copy*.All the selected items should be copied to the template.

Adding triggers and graphs is done in a similar fashion (from the list of triggers and graphs respectively), again, keeping in mind that they can only be added if the required items are added first.

Adding dashboards

To add dashboards to a template in *Configuration → Templates*, do the following:

- Click on *Dashboards* in the row of the template
- Configure a dashboard following the guidelines of [configuring dashboards](#)

**Attention:**

The widgets that can be included in a template dashboard are: *Clock*, *Graph (classic)*, *Graph prototype*, *Item value*, *Plain text*, *URL*.

**Note:**

For details on accessing host dashboards that are created from template dashboards, see the [host dashboard](#) section.

Configuring low-level discovery rules

See the [low-level discovery](#) section of the manual.

Adding web scenarios

To add web scenarios to a template in *Configuration → Templates*, do the following:

- Click on *Web* in the row of the template
- Configure a web scenario following the usual method of [configuring web scenarios](#)

## 2 Linking/unlinking

Overview

Linking is a process whereby templates are applied to hosts, whereas unlinking removes the association with the template from a host.

**Attention:**

Templates are linked directly to individual hosts and not to host groups. Simply adding a template to a host group will not link it. Host groups are used only for logical grouping of hosts and templates.

Linking a template

To link a template to the host, do the following:

- Go to *Configuration → Hosts*
- Click on the required host
- Start typing the template name in the *Templates* field. A list of matching templates will appear; scroll down to select.
- Alternatively, you may click on *Select* next to the field and select one or several templates from the list in a popup window
- Click on *Add/Update* in the host attributes form

The host will now have all the entities (items, triggers, graphs, etc) of the template.

**Attention:**

Linking multiple templates to the same host will fail if in those templates there are items with the same item key. And, as triggers and graphs use items, they cannot be linked to a single host from multiple templates either, if using identical item keys.

When entities (items, triggers, graphs etc.) are added from the template:

- previously existing identical entities on the host are updated as entities of the template, and **any existing host-level customizations to the entity are lost**
- entities from the template are added
- any directly linked entities that, prior to template linkage, existed only on the host remain untouched

In the lists, all entities from the template now are prefixed by the template name, indicating that these belong to the particular template. The template name itself (in gray text) is a link allowing to access the list of those entities on the template level.

If some entity (item, trigger, graph etc.) is not prefixed by the template name, it means that it existed on the host before and was not added by the template.

Entity uniqueness criteria

When adding entities (items, triggers, graphs etc.) from a template it is important to know what of those entities already exist on the host and need to be updated and what entities differ. The uniqueness criteria for deciding upon the sameness/difference are:

- for items - the item key
- for triggers - trigger name and expression
- for custom graphs - graph name and its items

Linking templates to several hosts

To update template linkage of many hosts, in *Configuration* → *Hosts* select some hosts by marking their checkboxes, then click on **Mass update** below the list and then select *Link templates*:

**Mass update**

Host IPMI Tags Macros Inventory Encryption Value mapping

Link templates ☒ Link Replace Unlink

type here to search

☐ Clear when unlinking

To link additional templates, start typing the template name in the auto-complete field until a dropdown appears offering the matching templates. Just scroll down to select the template to link.

The *Replace* option will allow to link a new template while unlinking any template that was linked to the hosts before. The *Unlink* option will allow to specify which templates to unlink. The *Clear when unlinking* option will allow to not only unlink any previously linked templates, but also remove all elements inherited from them (items, triggers, etc.).

**Note:**

Zabbix offers a sizable set of predefined templates. You can use these for reference, but beware of using them unchanged in production as they may contain too many items and poll for data too often. If you feel like using them, finetune them to fit you real needs.

Editing linked entities

If you try to edit an item or trigger that was linked from the template, you may realize that many key options are disabled for editing. This makes sense as the idea of templates is that things are edited in one-touch manner on the template level. However,

you still can, for example, enable/disable an item on the individual host and set the update interval, history length and some other parameters.

**Attention:**

Any customizations to the entities implemented on a template-level will override the previous customizations of the entities on a host-level.

If you want to edit the entity fully, you have to edit it on the template level (template level shortcut is displayed in the form name), keeping in mind that these changes will affect all hosts that have this template linked to them.

#### Unlinking a template

To unlink a template from a host, do the following:

- Go to *Configuration* → *Hosts*
- Click on the required host and find the *Templates* field
- Click on *Unlink* or *Unlink and clear* next to the template to unlink
- Click on *Update* in the host attributes form

Choosing the *Unlink* option will simply remove association with the template, while leaving all its entities (items, triggers, graphs etc.) with the host.

Choosing the *Unlink and clear* option will remove both the association with the template and all its entities (items, triggers, graphs etc.).

### 3 Nesting

#### Overview

Nesting is a way of one template encompassing one or more other templates.

As it makes sense to separate out entities on individual templates for various services, applications, etc., you may end up with quite a few templates all of which may need to be linked to quite a few hosts. To simplify the picture, it is possible to link some templates together in a single template.

The benefit of nesting is that you have to link only one template ("nest", parent template) to the host and the host will inherit all entities of the linked templates ("nested", child templates) automatically. For example, if we link templates T1 and T2 to template T3, we supplement T3 with entities from T1 and T2, and not vice versa. If we link template A to templates B and C, we supplement B and C with entities from A.

#### Configuring nested templates

To link templates, you need to take an existing template or a new one, and then:

- Open the **template configuration form**
- Find the *Templates* field
- Click *Select* to open the *Templates* popup window
- In the popup window, choose required templates, then click *Select* to add the templates to the list
- Click *Add* or *Update* in the template configuration form

Thus, all entities of the parent template, as well as all entities of linked templates (such as items, triggers, graphs, etc.) will now appear in the template configuration, except for linked template dashboards, which will, nevertheless, be inherited by hosts.

To unlink any of the linked templates, in the same form use the *Unlink* or *Unlink and clear* buttons and click *Update*.

Choosing the *Unlink* option will simply remove the association with the linked template, while not removing all its entities (items, triggers, graphs, etc.).

Choosing the *Unlink and clear* option will remove both the association with the linked template and all its entities (items, triggers, graphs, etc.).

### 4 Mass update

#### Overview

Sometimes you may want to change some attribute for a number of templates at once. Instead of opening each individual template for editing, you may use the mass update function for that.

#### Using mass update

To mass-update some templates, do the following:

- Mark the checkboxes before the templates you want to update in the **template list**
- Click on *Mass update* below the list
- Navigate to the tab with required attributes (*Template*, *Tags*, *Macros* or *Value mapping*)
- Mark the checkboxes of any attribute to update and enter a new value for them

The following options are available when selecting the respective button for **template** linkage update:

- *Link* - specify which additional templates to link
- *Replace* - specify which templates to link while unlinking any template that was linked to the templates before
- *Unlink* - specify which templates to unlink

To specify the templates to link/unlink start typing the template name in the auto-complete field until a dropdown appears offering the matching templates. Just scroll down to select the required template.

The *Clear when unlinking* option will allow to not only unlink any previously linked templates, but also remove all elements inherited from them (items, triggers, etc.).

The following options are available when selecting the respective button for **host group** update:

- *Add* - allows to specify additional host groups from the existing ones or enter completely new host groups for the templates
- *Replace* - will remove the template from any existing host groups and replace them with the one(s) specified in this field (existing or new host groups)
- *Remove* - will remove specific host groups from templates

These fields are auto-complete - starting to type in them offers a dropdown of matching host groups. If the host group is new, it also appears in the dropdown and it is indicated by *(new)* after the string. Just scroll down to select.

Update existing

Buttons with the following options are available for value map update:

- *Add* - add value maps to the templates. If you mark *Update existing*, all properties of the value map with this name will be updated. Otherwise, if a value map with that name already exists, it will not be updated.
- *Update* - update existing value maps. If you mark *Add missing*, a value map that didn't previously exist on a template will be added as a new value map. Otherwise only the value maps that already exist on a template will be updated.
- *Rename* - give new name to an existing value map
- *Remove* - remove the specified value maps from the templates. If you mark *Except selected*, all value maps will be removed **except** the ones that are specified.
- *Remove all* - remove all value maps from the templates. If the *I confirm to remove all value maps* checkbox is not marked, a new popup window will open asking to confirm the removal.

When done with all required changes, click on *Update*. The attributes will be updated accordingly for all the selected templates.

### 1 Hosts and host groups

What is a "host"?

In Zabbix, a "host" refers to any physical or virtual device, application, service, or any other logically-related collection of monitored parameters.

Creating hosts is one of the first monitoring tasks in Zabbix. For example, if you want to monitor some parameters on a server "x", you must first create a host called, say, "Server X" and then you can look to add monitoring items to it.

Hosts are organized into host groups.

Proceed to [creating and configuring a host](#).

#### 1 Configuring a host

Overview

To configure a host in Zabbix frontend, do the following:

- Go to: *Configuration > Hosts* or *Monitoring > Hosts*
- Click on *Create host* to the right (or on the host name to edit an existing host)
- Enter parameters of the host in the form

You can also use the *Clone* and *Full clone* buttons in the form of an existing host to create a new host. Clicking on *Clone* will retain all the host's parameters and template linkage (keeping all entities from those templates). *Full clone* will additionally retain directly attached entities (tags, items, triggers, graphs, low-level discovery rules and web scenarios).

*Note:* When a host is cloned, it will retain all template entities as they are originally on the template. Any changes to those entities made on the existing host level (such as changed item interval, modified regular expression or added prototypes to the low-level discovery rule) will not be cloned to the new host; instead they will be as on the template.

Configuration

The **Host** tab contains general host attributes:

## Host

Monitored by proxy

Enabled ☒

All mandatory input fields are marked with a red asterisk.

| Parameter    | Description  |
|--------------|--|
| Host name    | Enter a unique host name. Alphanumerics, spaces, dots, dashes and underscores are allowed. However, leading and trailing spaces are disallowed.<br><i>Note:</i> With Zabbix agent running on the host you are configuring, the agent <b>configuration file</b> parameter <i>Hostname</i> must have the same value as the host name entered here. The name in the parameter is needed in the processing of <b>active checks</b> . |
| Visible name | Enter a unique visible name for the host. If you set this name, it will be the one visible in lists, maps, etc instead of the technical host name. This attribute has UTF-8 support.   |

| Parameter           | Description  |
|---------------------|--|
| <i>Templates</i>    | <p>Link <b>templates</b> to the host. All entities (items, triggers, graphs, etc) will be inherited from the template.</p> <p>To link a new template, start typing the template name in the <i>Templates</i> field. A list of matching templates will appear; scroll down to select. Alternatively, you may click on <i>Select</i> next to the <i>Templates</i> field; then, first select the host group by clicking on <i>Select</i> next to the <i>Host groups</i> field; mark the checkbox in front of one or multiple templates from the list displayed below; click on <i>Select</i>. The template(s) that are selected in the <i>Templates</i> field will be linked to the host when the host configuration form is saved or updated.</p> <p>To unlink a template, use one of the two options in the <i>Templates</i> block:<br/> <i>Unlink</i> - unlink the template, but preserve its items, triggers and graphs<br/> <i>Unlink and clear</i> - unlink the template and remove all its items, triggers and graphs</p> <p>Listed template names are clickable links leading to the template configuration form.</p> |
| <i>Groups</i>       | <p>Select <b>host groups</b> the host belongs to. A host must belong to at least one host group. A new group can be created and linked to a host by typing in a non-existing group name; the new name will be displayed in a dropdown list as "new" in the brackets; clicking on it, will add it to the selection field.</p>   |
| <i>Interfaces</i>   | <p>Several host interface types are supported for a host: <i>Agent</i>, <i>SNMP</i>, <i>JMX</i> and <i>IPMI</i>.<br/> No interfaces are defined by default. To add a new interface, click on <i>Add</i> in the <i>Interfaces</i> block, select the interface type and enter <i>IP/DNS</i>, <i>Connect to</i> and <i>Port</i> info.<br/> <i>Note</i>: Interfaces that are used in any items cannot be removed and link <i>Remove</i> is grayed out for them.</p> <p>The "IP" or "DNS" from an SNMP interface is also used for <b>SNMP traps</b>.<br/> During matching, only the selected "IP" or "DNS" in the host interface is used.<br/> See <b>Configuring SNMP monitoring</b> for additional details on configuring an SNMP interface (v1, v2 and v3).</p>  |
| <i>IP address</i>   | Host IP address (optional).  |
| <i>DNS name</i>     | Host DNS name (optional).  |
| <i>Connect to</i>   | <p>Clicking the respective button will tell Zabbix server what to use to retrieve data from agents:<br/> <b>IP</b> - Connect to the host IP address (recommended)<br/> <b>DNS</b> - Connect to the host DNS name</p>   |
| <i>Port</i>         | TCP/UDP port number. Default values are: 10050 for Zabbix agent, 161 for SNMP agent, 12345 for JMX and 623 for IPMI.   |
| <i>Default</i>      | Check the radio button to set the default interface.   |
| <i>Description</i>  | Enter the host description.  |
| <i>Monitored by</i> | The host can be monitored either by Zabbix server or one of Zabbix proxies:  |
| <i>proxy</i>        | <p><b>(no proxy)</b> - host is monitored by Zabbix server<br/> <b>Proxy name</b> - host is monitored by Zabbix proxy "Proxy name"</p>  |
| <i>Enabled</i>      | When the checkbox is checked, the host is enabled - ready for monitoring.  |
|                     | <p>When the checkbox is unchecked, the host is disabled - not monitored:<br/> For passive data requests initiated by Zabbix server/proxy (for example, <b>Zabbix agent</b>, <b>SNMP agent</b>, <b>simple checks</b>), monitoring stops as soon as you disable the host.<br/> For Zabbix agent <b>active checks</b>, monitoring stops within the time frame (under 2 minutes) that Zabbix agent receives information about the host having been disabled. During this brief interval, the host will continue to locally collect data for the active checks and try sending it to the server/proxy; however, since the host is marked as <i>Disabled</i>, the server/proxy will reject the data.</p>   |

The **IPMI** tab contains IPMI management attributes.

| Parameter                       | Description  |
|---------------------------------|--|
| <i>Authentication algorithm</i> | Select the authentication algorithm.                   |
| <i>Privilege level</i>          | Select the privilege level.                            |
| <i>Username</i>                 | User name for authentication. User macros may be used. |
| <i>Password</i>                 | Password for authentication. User macros may be used.  |

The **Tags** tab allows you to define host-level **tags**. All problems of this host will be tagged with the values entered here.

## Encryption

The **Encryption** tab allows you to require **encrypted** connections with the host.

| Parameter                    | Description  |
|------------------------------|--|
| <i>Connections to host</i>   | How Zabbix server or proxy connects to Zabbix agent on a host: no encryption (default), using PSK (pre-shared key) or certificate.   |
| <i>Connections from host</i> | Select what type of connections are allowed from the host (i.e. from Zabbix agent and Zabbix sender). Several connection types can be selected at the same time (useful for testing and switching to other connection type). Default is "No encryption".   |
| <i>Issuer</i>                | Allowed issuer of certificate. Certificate is first validated with CA (certificate authority). If it is valid, signed by the CA, then the <i>Issuer</i> field can be used to further restrict allowed CA. This field is intended to be used if your Zabbix installation uses certificates from multiple CAs. If this field is empty then any CA is accepted. |
| <i>Subject</i>               | Allowed subject of certificate. Certificate is first validated with CA. If it is valid, signed by the CA, then the <i>Subject</i> field can be used to allow only one value of <i>Subject</i> string. If this field is empty then any valid certificate signed by the configured CA is accepted.   |
| <i>PSK identity</i>          | Pre-shared key identity string.<br>Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.   |
| <i>PSK</i>                   | Pre-shared key (hex-string). Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library. Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952   |

## Value mapping

The **Value mapping** tab allows to configure human-friendly representation of item data in **value mappings**.

## 2 Configuring a host group

### Overview

Host groups are used for the logical grouping of hosts and assigning user permissions to them.

Each host must have at least one host group assigned. A host may belong to multiple host groups, and each host group may contain multiple hosts.

Note that in Zabbix, all permissions are based on **user groups** and host/**template** groups. So, even if a single user needs access to a single host, it is granted by adding the user to a user group that has permission to access the host group containing that host.

### Configuration

#### Attention:

Only Super admin users can create host groups.

There are two options of creating a host group in Zabbix frontend.

#### Option one:

- Go to: *Configuration* → *Host groups*
- Click on *Create Group* in the upper right corner of the screen
- Enter the group name in the form

## ≡ Host groups

\* Group name

**Option two:** when **configuring a host**, enter a non-existing group name in the *Groups* input field.

Once the host group is created, you can click on the group name in the list under *Configuration → Host groups* to edit the group name, clone the group, or delete the group.

Deleting a host group only deletes the logical group, not the hosts in the group. It is not possible to delete a host group that is the only group for any existing host.

### Creating host subgroups

A host subgroup (or nested host group) is a child of the parent host group that contains it. Nested representation of host groups is supported since Zabbix 3.2.0.

A subgroup is created by using the forward slash '/' in the group name input field to denote its relation to the parent group(s). For example:

- inputting `Europe/Latvia` creates the `Europe/Latvia` subgroup of the parent group `Europe`.
- inputting `Europe/Latvia/Riga/Zabbix servers` creates the respective subgroup within the nested parent groups `Europe`, `Europe/Latvia`, `Europe/Latvia/Riga`.

When creating a subgroup, using leading or trailing slashes, or several slashes in a row is not allowed. Escaping of '/' is not supported.

It is not required to create any parent host group(s) before creating a subgroup. You can choose whether to start by creating a subgroup (for example, `Europe/Latvia`) or any parent host group(s) (in our example, `Europe`). If you start by creating a subgroup, parent host group(s) will **not** be created automatically.

### Permissions to host groups

- When creating a subgroup to an existing parent host group (for example, creating `Europe/Latvia` when `Europe` already exists), **user group** permissions to the subgroup are inherited from the parent.
- When creating a parent host group to an existing subgroup (for example, creating `Europe` when `Europe/Latvia` already exists), no permissions to the parent are set.

When editing any host group, you can also set an additional option, *Apply permissions and tag filters to all subgroups*. Marking this checkbox and clicking on *Update* will apply the same level of permissions and tag filters to all current and future subgroups of the host group being edited. This option is supported since Zabbix 3.4.0.

So, if any user groups have been given varying **permissions** to the subgroups of the host group being edited, marking the checkbox will grant all current and future subgroups the same user permissions and tag-based permissions as the group being edited.

Note that this option is not saved in the database and will override existing permissions. Any changes made through this option can be reverted only manually.

## 3 Inventory

### Overview

You can keep the inventory of networked devices in Zabbix.

There is a special *Inventory* menu in the Zabbix frontend. However, you will not see any data there initially and it is not where you enter data. Building inventory data is done manually when configuring a host or automatically by using some automatic population options.

### Building inventory

#### Manual mode

When **configuring a host**, in the *Inventory* tab you can enter such details as the type of device, serial number, location, responsible person, etc., - the data that will populate inventory information.

If a URL is included in the host inventory information and it starts with 'http' or 'https', it will result in a clickable link in the *Inventory* section.

## Automatic mode

A host's inventory can also be populated automatically. For that to work, when configuring the host's inventory mode in the *Inventory* tab, it must be set to *Automatic*.

Then you can **configure host items** to populate any host inventory field with their value, indicating the destination field with the respective attribute (called *Item will populate host inventory field*) in item configuration.

Items that are especially useful for automated inventory data collection:

- system.hw.chassis[full|type|vendor|model|serial] - default is [full], root permissions needed
- system.hw.cpu[all|cpunum,full|maxfreq|vendor|model|curfreq] - default is [all,full]
- system.hw.devices[pci|usb] - default is [pci]
- system.hw.macaddr[interface,short|full] - default is [all,full], interface is regexp
- system.sw.arch
- system.sw.os[name|short|full] - default is [name]
- system.sw.packages[regexp,manager,short|full] - default is [all,all,full]

## Inventory mode selection

Inventory mode can be selected in the host configuration form.

Inventory mode by default for new hosts is selected based on the *Default host inventory mode* setting in *Administration* → *General* → *Other*.

For hosts added by network discovery or autoregistration actions, it is possible to define a *Set host inventory mode* operation selecting manual or automatic mode. This operation overrides the *Default host inventory mode* setting.

## Inventory overview

The details of all existing inventory data are available in the *Inventory* menu.

In *Inventory* → *Overview* you can get a host count by various fields of the inventory.

In *Inventory* → *Hosts* you can see all hosts that have inventory information. Clicking on the host name will reveal the inventory details in a form.

## ≡ Host inventory

Overview Details

Host name Zabbix server

Agent interfaces

| IP address | DNS name | Connect to | Port  |
|------------|----------|------------|-------|
| 127.0.0.1  |          | IP DNS     | 10050 |

| <i>OS</i>  | Operating system inventory field of the host (if defined).  |

| Parameter            | Description   |
|----------------------|---|
| <i>Hardware</i>      | Host hardware inventory field (if defined).   |
| <i>Software</i>      | Host software inventory field (if defined).   |
| <i>Description</i>   | Host description.   |
| <i>Monitoring</i>    | Links to monitoring sections with data for this host: <i>Web, Latest data, Problems, Graphs, Dashboards</i> .   |
| <i>Configuration</i> | Links to configuration sections for this host: <i>Host, Items, Triggers, Graphs, Discovery, Web</i> .<br>The number of configured entities is listed after each link. |

The **Details** tab shows all inventory fields that are populated (are not empty).

Inventory macros

There are host inventory macros {INVENTORY.\*} available for use in notifications, for example:

"Server in {INVENTORY.LOCATION1} has a problem, responsible person is {INVENTORY.CONTACT1}, phone number {INVENTORY.POC.PRIMARY.PHONE.A1}."

For more details, see the [Supported macros](#) page.

## 4 Mass update

Overview

Sometimes you may want to change some attribute for a number of hosts at once. Instead of opening each individual host for editing, you may use the mass update function for that.

Using mass update

To mass-update some hosts, do the following:

- Mark the checkboxes before the hosts you want to update in the [host list](#)
- Click on *Mass update* below the list
- Navigate to the tab with required attributes (*Host, IPMI, Tags, Macros, Inventory, Encryption* or *Value mapping*)
- Mark the checkboxes of any attribute to update and enter a new value for them

The following options are available when selecting the respective button for **template** linkage update:

- *Link* - specify which additional templates to link
- *Replace* - specify which templates to link while unlinking any template that was linked to the hosts before
- *Unlink* - specify which templates to unlink

To specify the templates to link/unlink start typing the template name in the auto-complete field until a dropdown appears offering the matching templates. Just scroll down to select the required template.

The *Clear when unlinking* option will allow to not only unlink any previously linked templates, but also remove all elements inherited from them (items, triggers, etc.).

The following options are available when selecting the respective button for **host group** update:

- *Add* - allows to specify additional host groups from the existing ones or enter completely new host groups for the hosts
- *Replace* - will remove the host from any existing host groups and replace them with the one(s) specified in this field (existing or new host groups)
- *Remove* - will remove specific host groups from hosts

These fields are auto-complete - starting to type in them offers a dropdown of matching host groups. If the host group is new, it also appears in the dropdown and it is indicated by *(new)* after the string. Just scroll down to select.

☐ Update existing

The following options are available when selecting the respective button for macros update:

- **Add** - allows to specify additional user macros for the hosts. If *Update existing* checkbox is checked, value, type and description for the specified macro name will be updated. If unchecked, if a macro with that name already exist on the host(s), it will not be updated.
- **Update** - will replace values, types and descriptions of macros specified in this list. If *Add missing* checkbox is checked, macro that didn't previously exist on a host will be added as new macro. If unchecked, only macros that already exist on a host will be updated.
- **Remove** - will remove specified macros from hosts. If *Except selected* box is checked, all macros except specified in the list

will be removed. If unchecked, only macros specified in the list will be removed.

- *Remove all* - will remove all user macros from hosts. If *I confirm to remove all macros* checkbox is not checked, a new popup window will open asking to confirm removal of all macros.

☐ Update existing

Buttons with the following options are available for value map update:

- *Add* - add value maps to the hosts. If you mark *Update existing*, all properties of the value map with this name will be

updated. Otherwise, if a value map with that name already exists, it will not be updated.

- *Update* - update existing value maps. If you mark *Add missing*, a value map that didn't previously exist on a host will be added as a new value map. Otherwise only the value maps that already exist on a host will be updated.
- *Rename* - give new name to an existing value map
- *Remove* - remove the specified value maps from the hosts. If you mark *Except selected*, all value maps will be removed **except** the ones that are specified.
- *Remove all* - remove all value maps from the hosts. If the *I confirm to remove all value maps* checkbox is not marked, a new popup window will open asking to confirm the removal.

When done with all required changes, click on *Update*. The attributes will be updated accordingly for all the selected hosts.

## 2 Items

### Overview

An item is an individual metric.

Items are used for collecting data. Once you have configured a host, you must add items to get actual data. One way of quickly adding many items is to attach one of the predefined templates to a host. However, for optimized system performance, you may need to fine-tune the templates to have as many items and as frequent monitoring as necessary.

To specify what sort of data to collect from a host, use the **item key**. For example, an item with the key name **system.cpu.load** will collect processor load data, while an item with the key name **net.if.in** will collect incoming traffic information.

Additional parameters can be specified in square brackets after the key name. For example, **system.cpu.load[avg5]** will return the processor load average for the last 5 minutes, while **net.if.in[eth0]** will show incoming traffic in the interface "eth0".

#### Note:

See individual sections of **item types** for all supported item types and item keys.

Proceed to **creating and configuring an item**.

## 1 Creating an item

### Overview

To create an item in Zabbix frontend, do the following:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item* in the upper right corner of the screen
- Enter parameters of the item in the form

You can also create an item by opening an existing one, pressing the *Clone* button and then saving under a different name.

### Configuration

The **Item** tab contains general item attributes.

All mandatory input fields are marked with a red asterisk.

205

| Parameter                  | Description  |
|----------------------------|--|
| <i>Type of information</i> | <p>Type of data as stored in the database after performing conversions, if any.</p> <p><b>Numeric (unsigned)</b> - 64-bit unsigned integer</p> <p><b>Numeric (float)</b> - 64-bit floating point number</p> <p>This type will allow precision of approximately 15 digits and range from approximately -1.79E+308 to 1.79E+308 (with exception of <b>PostgreSQL 11 and earlier versions</b>).</p> <p>Receiving values in scientific notation is also supported. E.g., 1.23E+7, 1e308, 1.1E-4.</p> <p><b>Character</b> - short text data</p> <p><b>Log</b> - long text data with optional log related properties (timestamp, source, severity, logeventid)</p> <p><b>Text</b> - long text data. See also <b>text data limits</b>.</p> <p>For item keys that return data only in one specific format, matching type of information is selected automatically.</p>   |
| <i>Host interface</i>      | Select the host interface. This field is available when editing an item on the host level.   |
| <i>Units</i>               | <p>If a unit symbol is set, Zabbix will add postprocessing to the received value and display it with the set unit postfix.</p> <p>By default, if the raw value exceeds 1000, it is divided by 1000 and displayed accordingly. For example, if you set <i>bps</i> and receive a value of 881764, it will be displayed as 881.76 Kbps.</p> <p>The <b>JEDEC</b> memory standard is used for processing <b>B</b> (byte), <b>Bps</b> (bytes per second) units, which are divided by 1024. Thus, if units are set to <b>B</b> or <b>Bps</b> Zabbix will display:</p> <p>1 as 1B/1Bps<br/> 1024 as 1KB/1KBps<br/> 1536 as 1.5KB/1.5KBps</p> <p>Special processing is used if the following time-related units are used:</p> <p><b>unixtime</b> - translated to "yyyy.mm.dd hh:mm:ss". To translate correctly, the received value must be a <i>Numeric (unsigned)</i> type of information.</p> <p><b>uptime</b> - translated to "hh:mm:ss" or "N days, hh:mm:ss"</p> <p>For example, if you receive the value as 881764 (seconds), it will be displayed as "10 days, 04:56:04"</p> <p><b>s</b> - translated to "yyy mmm ddd hhh mmm sss ms"; parameter is treated as number of seconds. For example, if you receive the value as 881764 (seconds), it will be displayed as "10d 4h 56m"</p> <p>Only 3 upper major units are shown, like "1m 15d 5h" or "2h 4m 46s". If there are no days to display, only two levels are displayed - "1m 5h" (no minutes, seconds or milliseconds are shown). Will be translated to "&lt; 1 ms" if the value is less than 0.001.</p> <p>Note that if a unit is prefixed with !, then no unit prefixes/processing is applied to item values. See <b>preventing unit conversion</b>.</p> |
| <i>Update interval</i>     | <p>Retrieve a new value for this item every N seconds. Maximum allowed update interval is 86400 seconds (1 day).</p> <p><b>Time suffixes</b> are supported, e.g., 30s, 1m, 2h, 1d.</p> <p><b>User macros</b> are supported.</p> <p>A single macro has to fill the whole field. Multiple macros in a field or macros mixed with text are not supported.</p> <p>Note: The update interval can only be set to '0' if custom intervals exist with a non-zero value. If set to '0', and a custom interval (flexible or scheduled) exists with a non-zero value, the item will be polled during the custom interval duration.</p> <p>Note that the first item poll after the item became active or after update interval change might occur earlier than the configured value.</p> <p>An existing passive item can be polled for value immediately by pushing the <i>Execute now</i> button.</p>   |
| <i>Custom intervals</i>    | <p>You can create custom rules for checking the item:</p> <p><b>Flexible</b> - create an exception to the <i>Update interval</i> (interval with different frequency)</p> <p><b>Scheduling</b> - create a custom polling schedule.</p> <p>For detailed information see <b>Custom intervals</b>.</p> <p><b>Time suffixes</b> are supported in the <i>Interval</i> field, e.g., 30s, 1m, 2h, 1d.</p> <p><b>User macros</b> are supported.</p> <p>A single macro has to fill the whole field. Multiple macros in a field or macros mixed with text are not supported.</p> <p>Scheduling is supported since Zabbix 3.0.0.</p> <p>Note: custom intervals for active checks are supported by Zabbix agent 2 only.</p>   |

| Parameter                             | Description   |
|---------------------------------------|---|
| <i>History storage period</i>         | <p>Select either:</p> <p><b>Do not keep history</b> - item history is not stored. Useful for master items if only dependent items need to keep history.</p> <p>This setting cannot be overridden by global housekeeper <a href="#">settings</a>.</p> <p><b>Storage period</b> - specify the duration of keeping detailed history in the database (1 hour to 25 years). Older data will be removed by the housekeeper. Stored in seconds.</p> <p><a href="#">Time suffixes</a> are supported, e.g., 2h, 1d. <a href="#">User macros</a> are supported.</p> <p>The <i>Storage period</i> value can be overridden globally in <i>Administration</i> → <i>General</i> → <a href="#">Housekeeper</a>.</p> <p>If a global overriding setting exists, an orange  info icon is displayed. If you position your mouse on it, a warning message is displayed, e.g., <i>Overridden by global housekeeper settings (1d)</i>.</p> <p>It is recommended to keep the recorded values for the smallest possible time to reduce the size of value history in the database. Instead of keeping a long history of values, you can keep longer data of trends.</p> <p>See also <a href="#">History and trends</a>.</p> |
| <i>Trend storage period</i>           | <p>Select either:</p> <p><b>Do not keep trends</b> - trends are not stored.</p> <p>This setting cannot be overridden by global housekeeper <a href="#">settings</a>.</p> <p><b>Storage period</b> - specify the duration of keeping aggregated (hourly min, max, avg, count) history in the database (1 day to 25 years). Older data will be removed by the housekeeper. Stored in seconds.</p> <p><a href="#">Time suffixes</a> are supported, e.g., 24h, 1d. <a href="#">User macros</a> are supported.</p> <p>The <i>Storage period</i> value can be overridden globally in <i>Administration</i> → <i>General</i> → <a href="#">Housekeeper</a>.</p> <p>If a global overriding setting exists, an orange  info icon is displayed. If you position your mouse on it, a warning message is displayed, e.g., <i>Overridden by global housekeeper settings (7d)</i>.</p> <p><i>Note:</i> Keeping trends is not available for non-numeric data - character, log and text.</p> <p>See also <a href="#">History and trends</a>.</p>   |
| <i>Value mapping</i>                  | <p>Apply value mapping to this item. <a href="#">Value mapping</a> does not change received values, it is for displaying data only.</p> <p>It works with <i>Numeric(unsigned)</i>, <i>Numeric(float)</i> and <i>Character</i> items.</p> <p>For example, "Windows service states".</p>  |
| <i>Log time format</i>                | <p>Available for items of type <b>Log</b> only. Supported placeholders:</p> <ul style="list-style-type: none"> <li>* <b>y</b>: Year (1970-2038)</li> <li>* <b>M</b>: Month (01-12)</li> <li>* <b>d</b>: Day (01-31)</li> <li>* <b>h</b>: Hour (00-23)</li> <li>* <b>m</b>: Minute (00-59)</li> <li>* <b>s</b>: Second (00-59)</li> </ul> <p>If left blank, the timestamp will be set to 0 in Unix time, representing January 1, 1970.</p> <p>For example, consider the following line from the Zabbix agent log file:</p> <p>" 23480:20100328:154718.045 Zabbix agent started. Zabbix 1.8.2 (revision 11211)."</p> <p>It begins with six character positions for PID, followed by date, time, and the rest of the message. The log time format for this line would be "pppppp:yyyyMMdd:hhmmss".</p> <p>Note that "p" and ":" characters are placeholders and can be any characters except "yMdhms".</p>   |
| <i>Populates host inventory field</i> | <p>You can select a host inventory field that the value of item will populate. This will work if automatic <a href="#">inventory</a> population is enabled for the host.</p> <p>This field is not available if <i>Type of information</i> is set to 'Log'.</p>  |
| <i>Description</i>                    | Enter an item description. <a href="#">User macros</a> are supported.   |
| <i>Enabled</i>                        | Mark the checkbox to enable the item so it will be processed.   |
| <i>Latest data</i>                    | <p>Click on the link to view the latest data for the item.</p> <p>This link is only available when editing an already existing item.</p>  |

**Note:**

Item type specific fields are described on [corresponding pages](#).

**Note:**

When editing an existing **template** level item on a host level, a number of fields are read-only. You can use the link in the form header and go to the template level and edit them there, keeping in mind that the changes on a template level will change the item for all hosts that the template is linked to.

The **Tags** tab allows to define item-level **tags**.

The screenshot shows the Zabbix item configuration interface with the 'Tags' tab selected. The interface has three tabs: 'Item', 'Tags 1', and 'Preprocessing'. The 'Tags 1' tab is active and contains two sub-tabs: 'Item tags' and 'Inherited and item tags'. The 'Item tags' sub-tab is selected, showing a table with two columns: 'Name' and 'Value'. The table contains one entry with 'Application' in the 'Name' column and 'CPU' in the 'Value' column. Below the table is an 'Add' button.

| Name        | Value |
|-------------|-------|
| Application | CPU   |

[Add](#)

Item value preprocessing

The **Preprocessing** tab allows to define **transformation rules** for the received values.

Testing

**Attention:**

To perform item testing, ensure that the system time on the server and the proxy is **synchronized**. In the case when the server time is behind, item testing may return an error message "The task has been expired." Having set different time zones on the server and the proxy, however, won't affect the testing result.

It is possible to test an item and, if configured correctly, get a real value in return. Testing can occur even before an item is saved.

Testing is available for host and template items, item prototypes and low-level discovery rules. Testing is not available for active items.

Item testing is available for the following passive item types:

- Zabbix agent
- SNMP agent (v1, v2, v3)
- IPMI agent
- SSH checks
- Telnet checks
- JMX agent
- Simple checks (except icmping\*, vmware.\* items)
- Zabbix internal
- Calculated items
- External checks
- Database monitor
- HTTP agent
- Script

To test an item, click on the *Test* button at the bottom of the item configuration form. Note that the *Test* button will be disabled for items that cannot be tested (like active checks, excluded simple checks).

Description

Space utilization in % for /

Enabled

☒

Add

Test

Cancel

The item testing form has fields for the required host parameters (host address, port, proxy name/no proxy) and item-specific details (such as SNMPv2 community or SNMPv3 security credentials). These fields are context aware:

- The values are pre-filled when possible, i.e. for items requiring an agent, by taking the information from the selected agent interface of the host
- The values have to be filled manually for template items
- Plain-text macro values are resolved
- Fields where the value (or part of the value) is a secret or Vault macro are empty and have to be entered manually. If any item parameter contains a secret macro value, the following warning message is displayed: "Item contains user-defined macros with secret values. Values of these macros should be entered manually."
- The fields are disabled when not needed in the context of the item type (e.g., the host address field and the proxy field are disabled for calculated items)

To test the item, click on *Get value*. If the value is retrieved successfully, it will fill the *Value* field, moving the current value (if any) to the *Previous value* field while also calculating the *Prev. time* field, i.e., the time difference between the two values (clicks) and trying to detect an EOL sequence and switch to CRLF if detecting "\n\r" in retrieved value.

A successfully retrieved value from host can also be used to test [preprocessing steps](#).

Form buttons

Buttons at the bottom of the form allow to perform several operations.

Add

Add an item. This button is only available for new items.

Update

Update the properties of an item.

Clone

Create another item based on the properties of the current item.

Execute now

Execute a check for a new item value immediately. Supported for **passive** checks only (see [more details](#)).

*Note that when checking for a value immediately, configuration cache is not updated, thus the value will not reflect very recent changes to item configuration.*

Test

Test if item configuration is correct by getting a value.

Clear history and trends

Delete the item history and trends.

Delete

Delete the item.

Cancel

Cancel the editing of item properties.

Text data limits

Text data limits depend on the database backend. Before storing text values in the database they get truncated to match the database value type limit:

| Database            | Type of information |                  |                  |
|---------------------|---------------------|------------------|------------------|
|                     | Character           | Log              | Text             |
| MySQL               | 255 characters      | 65536 bytes      | 65536 bytes      |
| PostgreSQL          | 255 characters      | 65536 characters | 65536 characters |
| Oracle              | 255 characters      | 65536 characters | 65536 characters |
| SQLite              | 255 characters      | 65536 characters | 65536 characters |
| (only Zabbix proxy) |                     |                  |                  |

Custom script limit

Available custom script length depends on the database used:

| Database                          | Limit in characters | Limit in bytes |
|-----------------------------------|---------------------|----------------|
| <b>MySQL</b>                      | 65535               | 65535          |
| <b>Oracle Database</b>            | 2048                | 4000           |
| <b>PostgreSQL</b>                 | 65535               | not limited    |
| <b>SQLite (only Zabbix proxy)</b> | 65535               | not limited    |

## Unsupported items

Unsupported items are reported as having a *Not supported* status and are still rechecked at their standard *Update interval*.

An item becomes unsupported if its value cannot be retrieved for some reason (e.g. connection error, no pollers configured to process the item). In addition, items that do not receive historical data remain in the *Not supported* status. This is expected behavior—an item transitions to a *Normal* status only when it receives new, valid historical data.

Like problems, unsupported items are re-evaluated only when new data is received—even if there is no historical data available for that item anymore. In other words, items and triggers change their state solely upon receiving new data. However, if a trigger expression includes a *date and time* and/or *nodata()* function, the trigger will be recalculated every 30 seconds (see *triggers calculation time* for details).

## 1 Item key format

Item key format, including key parameters, must follow syntax rules. The following illustrations depict the supported syntax. Allowed elements and characters at each point can be determined by following the arrows - if some block can be reached through the line, it is allowed, if not - it is not allowed.

To construct a valid item key, one starts with specifying the key name, then there's a choice to either have parameters or not - as depicted by the two lines that could be followed.

### Key name

The key name itself has a limited range of allowed characters, which just follow each other. Allowed characters are:

0-9a-zA-Z\_-. .

Which means:

- all numbers;
- all lowercase letters;
- all uppercase letters;
- underscore;
- dash;
- dot.

### Key parameters

An item key can have multiple parameters that are comma separated.

Each key parameter can be either a quoted string, an unquoted string or an array.

The parameter can also be left empty, thus using the default value. In that case, the appropriate number of commas must be added if any further parameters are specified. For example, item key **icmping[,,200,,500]** would specify that the interval between individual pings is 200 milliseconds, timeout - 500 milliseconds, and all other parameters are left at their defaults.

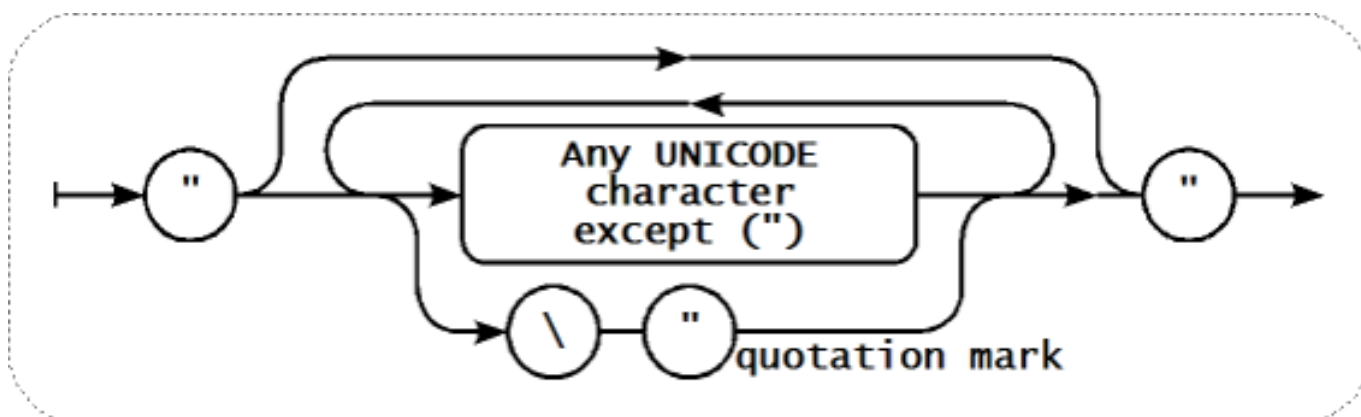

It is possible to include macros in the parameters. Those can be **user macros** or some of the built-in macros. To see what particular built-in macros are supported in item key parameters, search the page **Supported macros** for "item key parameters".

Parameter - quoted string

If the key parameter is a quoted string, any Unicode character is allowed.

If the key parameter string contains comma, this parameter has to be quoted.

If the key parameter string contains quotation mark, this parameter has to be quoted and each quotation mark which is a part of the parameter string has to be escaped with a backslash (\) character.

**Warning:**

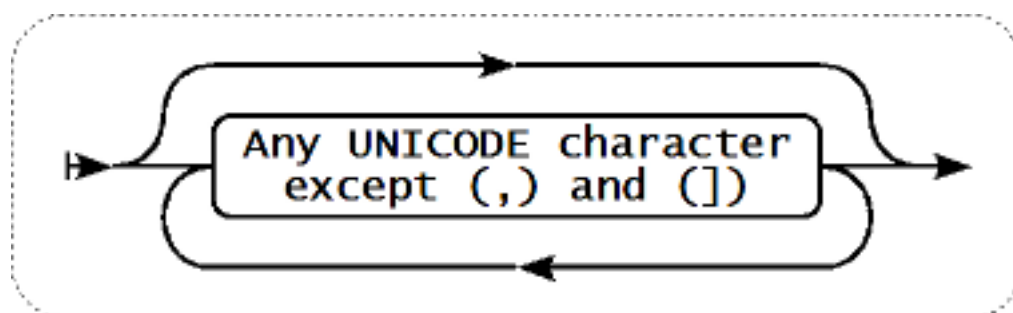

To quote item key parameters, use double quotes only. Single quotes are not supported.

**Attention:**

Multi-level parameter arrays, e.g. [a, [b, [c,d]], e], are not allowed.

Parameter - unquoted string

If the key parameter is an unquoted string, any Unicode character is allowed except comma and right square bracket (]). Unquoted parameter cannot start with left square bracket ([).

Parameter - array

If the key parameter is an array, it is again enclosed in square brackets, where individual parameters come in line with the rules and syntax of specifying multiple parameters.

## 2 Custom intervals

### Overview

It is possible to create custom rules regarding the times when an item is checked. The two methods for that are *Flexible intervals*, which allow to redefine the default update interval, and *Scheduling*, whereby an item check can be executed at a specific time or sequence of times.

### Flexible intervals

Flexible intervals allow to redefine the default update interval for specific time periods. A flexible interval is defined with *Interval* and *Period* where:

- *Interval* - the update interval for the specified time period
- *Period* - the time period when the flexible interval is active (see the [time periods](#) for detailed description of the *Period* format)

If multiple flexible intervals overlap, the smallest *Interval* value is used for the overlapping period. Note that if the smallest value of overlapping flexible intervals is '0', no polling will take place. Outside the flexible intervals the default update interval is used.

Note that if the flexible interval equals the length of the period, the item will be checked exactly once. If the flexible interval is greater than the period, the item might be checked once or it might not be checked at all (thus such configuration is not advisable). If the flexible interval is less than the period, the item will be checked at least once.

If the flexible interval is set to '0', the item is not polled during the flexible interval period and resumes polling according to the default *Update interval* once the period is over. Examples:

| Interval | Period          | Description   |
|----------|-----------------|---|
| 10       | 1-5,09:00-18:00 | Item will be checked every 10 seconds during working hours.   |
| 0        | 1-7,00:00-7:00  | Item will not be checked during the night.  |
| 0        | 7-7,00:00-24:00 | Item will not be checked on Sundays.  |
| 60       | 1-7,12:00-12:01 | Item will be checked at 12:00 every day. Note that this was used as a workaround for scheduled checks and starting with Zabbix 3.0 it is recommended to use scheduling intervals for such checks. |

### Scheduling intervals

Scheduling intervals are used to check items at specific times. While flexible intervals are designed to redefine the default item update interval, the scheduling intervals are used to specify an independent checking schedule, which is executed in parallel.

A scheduling interval is defined as: md<filter>wd<filter>h<filter>m<filter>s<filter> where:

- **md** - month days
- **wd** - week days
- **h** - hours
- **m** - minutes
- **s** - seconds

`<filter>` is used to specify values for its prefix (days, hours, minutes, seconds) and is defined as: `[<from>[-<to>]] [/<step>] [,<filter>]` where:

- `<from>` and `<to>` define the range of matching values (included). If `<to>` is omitted then the filter matches a `<from>` - `<from>` range. If `<from>` is also omitted then the filter matches all possible values.
- `<step>` defines the skips of the number value through the range. By default `<step>` has the value of 1, which means that all values of the defined range are matched.

While the filter definitions are optional, at least one filter must be used. A filter must either have a range or the `<step>` value defined.

An empty filter matches either '0' if no lower-level filter is defined or all possible values otherwise. For example, if the hour filter is omitted then only '0' hour will match, provided minute and seconds filters are omitted too, otherwise an empty hour filter will match all hour values.

Valid `<from>` and `<to>` values for their respective filter prefix are:

| Prefix | Description | <code>&lt;from&gt;</code> | <code>&lt;to&gt;</code> |
|--------|-------------|---------------------------|-------------------------|
| md     | Month days  | 1-31                      | 1-31                    |
| wd     | Week days   | 1-7                       | 1-7                     |
| h      | Hours       | 0-23                      | 0-23                    |
| m      | Minutes     | 0-59                      | 0-59                    |
| s      | Seconds     | 0-59                      | 0-59                    |

The `<from>` value must be less or equal to `<to>` value. The `<step>` value must be greater or equal to 1 and less or equal to `<to>` - `<from>`.

Single digit month days, hours, minutes and seconds values can be prefixed with 0. For example `md01-31` and `h/02` are valid intervals, but `md01-031` and `wd01-07` are not.

In Zabbix frontend, multiple scheduling intervals are entered in separate rows. In Zabbix API, they are concatenated into a single string with a semicolon ; as a separator.

If a time is matched by several intervals it is executed only once. For example, `wd1h9;h9` will be executed only once on Monday at 9am.

Examples:

| Interval                                  | Will be executed                                    |
|---|---|
| m0-59                                     | every minute  |
| h9-17/2                                   | every 2 hours starting with 9:00 (9:00, 11:00 ...)  |
| m0,30 or m/30                             | hourly at hh:00 and hh:30                           |
| m0,5,10,15,20,25,30,35,40,45,50,55 or m/5 | every five minutes                                  |
| wd1-5h9                                   | every Monday till Friday at 9:00                    |
| wd1-5h9-18                                | every Monday till Friday at 9:00,10:00,...,18:00    |
| h9,10,11 or h9-11                         | every day at 9:00, 10:00 and 11:00                  |
| md1h9m30                                  | every 1st day of each month at 9:30                 |
| md1wd1h9m30                               | every 1st day of each month at 9:30 if it is Monday |
| h9m/30                                    | every day at 9:00, 9:30                             |
| h9m0-59/30                                | every day at 9:00, 9:30                             |
| h9,10m/30                                 | every day at 9:00, 9:30, 10:00, 10:30               |
| h9-10m30                                  | every day at 9:30, 10:30                            |
| h9m10-40/30                               | every day at 9:10, 9:40                             |
| h9,10m10-40/30                            | every day at 9:10, 9:40, 10:10, 10:40               |
| h9-10m10-40/30                            | every day at 9:10, 9:40, 10:10, 10:40               |
| h9m10-40                                  | every day at 9:10, 9:11, 9:12, ... 9:40             |
| h9m10-40/1                                | every day at 9:10, 9:11, 9:12, ... 9:40             |
| h9-12,15                                  | every day at 9:00, 10:00, 11:00, 12:00, 15:00       |

| Interval                                  | Will be executed  |
|---|---|
| h9-12,15m0                                | every day at 9:00, 10:00, 11:00, 12:00, 15:00                 |
| h9-12,15m0s30                             | every day at 9:00:30, 10:00:30, 11:00:30, 12:00:30, 15:00:30  |
| h9-12s30                                  | every day at 9:00:30, 9:01:30, 9:02:30 ... 12:58:30, 12:59:30 |
| h9m/30;h10 (API-specific syntax)          | every day at 9:00, 9:30, 10:00                                |
| h9m/30                                    | every day at 9:00, 9:30, 10:00                                |
| h10 (add this as another row in frontend) |   |

## Aligning time zones for proxies and agent 2

Note that Zabbix proxies and agent 2 use their local time zones when processing scheduling intervals.

For this reason, when scheduling intervals are applied to items monitored by Zabbix proxy or agent 2 active items, it is recommended to set the time zone of the respective proxies or agent 2 the same as Zabbix server, otherwise the **queue** may report item delays incorrectly.

Custom intervals for active checks are supported by Zabbix agent 2 only. Ensure you are using Zabbix agent 2 if you intend to configure custom intervals for active checks.

The time zone for Zabbix proxy or agent 2 can be set using the environment variable TZ in the systemd unit file:

```
[Service]
...
Environment="TZ=Europe/Amsterdam"
```

## 2 Item value preprocessing

### Overview

Preprocessing allows to define transformation rules for the received item values. One or several transformations are possible before saving to the database.

Transformations are executed in the order in which they are defined. Preprocessing is done by Zabbix server or proxy (if items are monitored by proxy).

Note that all values passed to preprocessing are of the string type, conversion to desired value type (as defined in item configuration) is performed at the end of the preprocessing pipeline; conversions, however, may also take place if required by the corresponding preprocessing step. See [preprocessing details](#) for more technical information.

See also: [Usage examples](#)

### Configuration

Preprocessing rules are defined in the **Preprocessing** tab of the item **configuration** form.

### Items

[All hosts](#) / [Zabbix server](#) Enabled ZBX Items 145 Triggers 75 Graphs 28 Discovery rules 3 Web scenarios

[Item](#) [Tags](#) [Preprocessing 2](#)

| Preprocessing steps | Name              | Parameters | Custom on fail           |
|---------------------|-------------------|------------|--------------------------|
| 1:                  | Change per second |            | <input type="checkbox"/> |
| 2:                  | Custom multiplier | 0.01       | <input type="checkbox"/> |

[Add](#)

Type of information Numeric (float)

[Add](#) [Test](#) [Cancel](#)

**Attention:**

An item will become **unsupported** if any of the preprocessing steps fail, unless *Custom on fail* error-handling (available for supported transformations) has been configured to discard the value or to set a specified value.

For log items, log metadata (without value) will always reset item unsupported state and make item supported again, even if the initial error occurred after receiving a log value from agent.

User macros and user macros with context are supported in item value preprocessing parameters, including JavaScript code.

**Note:**

Context is ignored when a macro is replaced with its value. Macro value is inserted in the code as is, it is not possible to add additional escaping before placing the value in the JavaScript code. Please be advised, that this can cause JavaScript errors in some cases.

| Type               |   |
|--------------------|---|
| Transformation     | Description   |
| Text               |   |
| Regular expression | <p>Match the value to the &lt;pattern&gt; regular expression and replace value with &lt;output&gt;. The regular expression supports extraction of maximum 10 captured groups with the \N sequence. Failure to match the input value will make the item unsupported.</p> <p>Parameters:</p> <p><b>pattern</b> - regular expression</p> <p><b>output</b> - output formatting template. An \N (where N=1...9) escape sequence is replaced with the Nth matched group. A \0 escape sequence is replaced with the matched text. Please refer to <a href="#">regular expressions</a> section for some existing examples.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| Replace            | <p>Find the search string and replace it with another (or nothing). All occurrences of the search string will be replaced.</p> <p>Parameters:</p> <p><b>search string</b> - the string to find and replace, case-sensitive (required)</p> <p><b>replacement</b> - the string to replace the search string with. The replacement string may also be empty effectively allowing to delete the search string when found.</p> <p>It is possible to use escape sequences to search for or replace line breaks, carriage return, tabs and spaces "\n \r \t \s"; backslash can be escaped as "\\" and escape sequences can be escaped as "\\n". Escaping of line breaks, carriage return, tabs is automatically done during low-level discovery.</p>   |
| Trim               | Remove specified characters from the beginning and end of the value.  |
| Right trim         | Remove specified characters from the end of the value.  |
| Left trim          | Remove specified characters from the beginning of the value.  |
| Structured data    |   |
| XML XPath          | <p>Extract value or fragment from XML data using XPath functionality.</p> <p>For this option to work, Zabbix server must be compiled with libxml support.</p> <p>Examples:</p> <p><code>number(/document/item/value)</code> will extract 10 from<br/> <code>&lt;document&gt;&lt;item&gt;&lt;value&gt;10&lt;/value&gt;&lt;/item&gt;&lt;/document&gt;</code></p> <p><code>number(/document/item/@attribute)</code> will extract 10 from <code>&lt;document&gt;&lt;item attribute="10"&gt;&lt;/item&gt;&lt;/document&gt;</code></p> <p><code>/document/item</code> will extract <code>&lt;item&gt;&lt;value&gt;10&lt;/value&gt;&lt;/item&gt;</code> from<br/> <code>&lt;document&gt;&lt;item&gt;&lt;value&gt;10&lt;/value&gt;&lt;/item&gt;&lt;/document&gt;</code></p> <p>Note that namespaces are not supported.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p> |

| Type                     |   |
|--------------------------|---|
| <i>JSON Path</i>         | <p>Extract value or fragment from JSON data using <a href="#">JSONPath functionality</a>.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>  |
| <i>CSV to JSON</i>       | <p>Convert CSV file data into JSON format.</p> <p>For more information, see: <a href="#">CSV to JSON preprocessing</a>.</p>   |
| <i>XML to JSON</i>       | <p>Convert data in XML format to JSON.</p> <p>For more information, see: <a href="#">Serialization rules</a>.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>  |
| Arithmetic               |   |
| <i>Custom multiplier</i> | <p>Multiply the value by the specified integer or floating-point value.</p> <p>Use this option to convert values received in KB, MBps, etc into B, Bps. Otherwise Zabbix cannot correctly set <a href="#">prefixes</a> (K, M, G etc).</p> <p><i>Note</i> that if the item type of information is <i>Numeric (unsigned)</i>, incoming values with a fractional part will be trimmed (i.e. '0.9' will become '0') before the custom multiplier is applied.</p> <p>Supported: scientific notation, for example, 1e+70 (since version 2.2); user macros and LLD macros (since version 4.0); strings that include macros, for example, {#MACRO}e+10, {\$MACRO1}e+{\$MACRO2}(since version 5.2.3)</p> <p>The macros must resolve to an integer or a floating-point number.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| Change                   |   |
| <i>Simple change</i>     | <p>Calculate the difference between the current and previous value.</p> <p>Evaluated as <b>value-prev_value</b>, where<br/> <i>value</i> - current value; <i>prev_value</i> - previously received value</p> <p>This setting can be useful to measure a constantly growing value. If the current value is smaller than the previous value, Zabbix discards that difference (stores nothing) and waits for another value.</p> <p>Only one change operation per item is allowed.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>  |
| <i>Change per second</i> | <p>Calculate the value change (difference between the current and previous value) speed per second.</p> <p>Evaluated as <b>(value-prev_value)/(time-prev_time)</b>, where<br/> <i>value</i> - current value; <i>prev_value</i> - previously received value; <i>time</i> - current timestamp; <i>prev_time</i> - timestamp of previous value.</p> <p>This setting is useful for calculating the speed per second for a constantly growing value. If the current value is smaller than the previous value, Zabbix discards that difference (stores nothing) and waits for another value. This helps to work correctly with, for instance, a wrapping (overflow) of 32-bit SNMP counters.</p> <p><i>Note:</i> As this calculation may produce floating-point numbers, it is recommended to set the 'Type of information' to <i>Numeric (float)</i>, even if the incoming raw values are integers. This is especially relevant for small numbers where the decimal part matters. If the floating-point values are large and may exceed the 'float' field length in which case the entire value may be lost, it is actually suggested to use <i>Numeric (unsigned)</i> and thus trim only the decimal part.</p> <p>Only one change operation per item is allowed.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p> |
| Numeral                  |   |
| sys-                     |   |
| tems                     |   |

| Type                                     |   |
|--|---|
| <i>Boolean to decimal</i>                | <p>Convert the value from boolean format to decimal. The textual representation is translated into either 0 or 1. Thus, 'TRUE' is stored as 1 and 'FALSE' is stored as 0. All values are matched in a case-insensitive way. Currently recognized values are, for:</p> <p><i>TRUE</i> - true, t, yes, y, on, up, running, enabled, available, ok, master</p> <p><i>FALSE</i> - false, f, no, n, off, down, unused, disabled, unavailable, err, slave</p> <p>Additionally, any non-zero numeric value is considered to be TRUE and zero is considered to be FALSE.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p> |
| <i>Octal to decimal</i>                  | <p>Convert the value from octal format to decimal.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| <i>Hexadecimal to decimal</i>            | <p>Convert the value from hexadecimal format to decimal.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| Custom scripts                           |   |
| <i>JavaScript</i>                        | <p>Enter JavaScript code in the block that appears when clicking in the parameter field or on a pencil icon.</p> <p>Note that available JavaScript length depends on the <b>database used</b>.</p> <p>For more information, see: <a href="#">Javascript preprocessing</a>.</p>  |
| Validation                               |   |
| <i>In range</i>                          | <p>Define a range that a value should be in by specifying minimum/maximum values (inclusive). Numeric values are accepted (including any number of digits, optional decimal part and optional exponential part, negative values). User macros and low-level discovery macros can be used. The minimum value should be less than the maximum.</p> <p>At least one value must exist.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| <i>Matches regular expression</i>        | <p>Specify a regular expression that a value must match.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| <i>Does not match regular expression</i> | <p>Specify a regular expression that a value must not match.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| <i>Check for error in JSON</i>           | <p>Check for an application-level error message located at JSONPath. Stop processing if succeeded and the message is not empty; otherwise, continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to the user as is, without adding preprocessing step information.</p> <p>No error will be reported in case of failing to parse invalid JSON.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |

---

**Type**

---

|   |  |
|---|--|
| <i>Check for error in XML</i>                     | <p>Check for an application-level error message located at XPath. Stop processing if succeeded and the message is not empty; otherwise, continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to the user as is, without adding preprocessing step information.</p> <p>No error will be reported in case of failing to parse invalid XML.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>  |
| <i>Check for error using a regular expression</i> | <p>Check for an application-level error message using a regular expression. Stop processing if succeeded and the message is not empty; otherwise, continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to the user as is, without adding preprocessing step information.</p> <p>Parameters:</p> <p><b>pattern</b> - regular expression</p> <p><b>output</b> - output formatting template. An \N (where N=1...9) escape sequence is replaced with the Nth matched group. A \0 escape sequence is replaced with the matched text.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to select custom error-handling options: either to discard the value, set a specified value, or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected.</p>   |
| <i>Check for not supported value</i>              | <p>Check if no item value could be retrieved. Normally that would lead to the item becoming unsupported, but you may modify that behavior by specifying the <i>Custom on fail</i> error-handling options: to discard the value, to set a specified value (that can also be used in triggers) or set a specified error message. In case of a failed preprocessing step, the item will not become unsupported if the option to discard the value or set a specified value is selected. Note that for this preprocessing step, the <i>Custom on fail</i> checkbox is grayed out and always marked.</p> <p>This preprocessing step only checks if no item value could be retrieved. It does not check, for example, if the type of the retrieved value (e.g., string) matches the item's type of information (e.g., numeric). If there is a type mismatch, the item may still become unsupported after all preprocessing steps are executed. To check for a type mismatch, you may use, for example, the <i>Custom multiplier</i> preprocessing step; see <a href="#">Preprocessing examples</a>.</p> <p>This step is always executed as the first preprocessing step and is placed above all others after saving changes to the item. It can be used only once.</p> <p>Supported since 5.2.0.</p> |

**Throttling**

|                          |   |
|--------------------------|---|
| <i>Discard unchanged</i> | <p>Discard a value if it has not changed.</p> <p>If a value is discarded, it is not saved in the database and Zabbix server has no knowledge that this value was received. No trigger expressions will be evaluated, as a result, no problems for related triggers will be created/resolved. Functions will work only based on data that is actually saved in the database. As trends are built based on data in the database, if there is no value saved for an hour then there will also be no trends data for that hour.</p> <p>Only one throttling option can be specified for an item.</p> <p>Note that in case of a very small difference (less than 0.000001) between the values of the items monitored by Zabbix proxy, it is possible that discarding will not be performed correctly by the proxy, and the values will be stored in the history as the same value, unless Zabbix server database is <a href="#">upgraded</a>.</p> |
|--------------------------|---|

| Type                                    |  |
|---|--|
| <i>Discard unchanged with heartbeat</i> | <p>Discard a value if it has not changed within the defined time period (in seconds). Positive integer values are supported to specify the seconds (minimum - 1 second). Time suffixes can be used in this field (e.g. 30s, 1m, 2h, 1d). User macros and low-level discovery macros can be used in this field.</p> <p>If a value is discarded, it is not saved in the database and Zabbix server has no knowledge that this value was received. No trigger expressions will be evaluated, as a result, no problems for related triggers will be created/resolved. Functions will work only based on data that is actually saved in the database. As trends are built based on data in the database, if there is no value saved for an hour then there will also be no trends data for that hour.</p> <p>Only one throttling option can be specified for an item.</p> <p>Note that in case of a very small difference (less than 0.000001) between the values of the items monitored by Zabbix proxy, it is possible that discarding will not be performed correctly by the proxy, and the values will be stored in the history as the same value, unless Zabbix server database is <a href="#">upgraded</a>.</p> |
| Prometheus                              |  |
| <i>Prometheus pattern</i>               | <p>Use the following query to extract required data from Prometheus metrics.</p> <p>See <a href="#">Prometheus checks</a> for more details.</p>  |
| <i>Prometheus to JSON</i>               | <p>Convert required Prometheus metrics to JSON.</p> <p>See <a href="#">Prometheus checks</a> for more details.</p>   |

#### Attention:

For change and throttling preprocessing steps Zabbix has to remember the last value to calculate/compare the new value as required. These previous values are handled by the preprocessing manager. If Zabbix server or proxy is restarted or there is any change made to preprocessing steps the last value of the corresponding item is reset, resulting in:

- for *Simple change*, *Change per second* steps - the next value will be ignored because there is no previous value to calculated change from;
- for *Discard unchanged*, *Discard unchanged with heartbeat* steps - the next value will never be discarded, even if it should have been because of discarding rules.

Item's *Type of information* parameter is displayed at the bottom of the tab when at least one preprocessing step is defined. If required, it is possible to change the type of information without leaving the *Preprocessing* tab. See [Creating an item](#) for the detailed parameter description.

#### Note:

If you use a custom multiplier or store value as *Change per second* for items with the type of information set to *Numeric (unsigned)* and the resulting calculated value is actually a float number, the calculated value is still accepted as a correct one by trimming the decimal part and storing the value as an integer.

## Testing

Testing preprocessing steps is useful to make sure that complex preprocessing pipelines yield the results that are expected from them, without waiting for the item value to be received and preprocessed.

It is possible to test:

- against a hypothetical value
- against a real value from a host

Each preprocessing step can be tested individually as well as all steps can be tested together. When you click on the *Test* or *Test all steps* button respectively in the Actions block, a testing window is opened.

If a result is truncated, a warning icon is displayed. The warning description is displayed on mouseover. Note that data larger than 512KB is still processed fully by Zabbix server.<br>If the step failed in testing, an error icon is displayed. The error description is displayed on mouseover.<br>In case "Custom on fail" is specified for the step and that action is performed, a new line appears right after the preprocessing test step row, showing what action was done and what outcome it produced (error or value). |

221

| Parameter     | Description  |
|---------------|--|
| <i>Result</i> | <p>The final result of testing preprocessing steps is displayed in all cases when all steps are tested together (when you click on the <i>Test all steps</i> button).</p> <p>The type of conversion to the value type of the item is also displayed, for example <i>Result converted to Numeric (unsigned)</i>.</p> <p>Since Zabbix 6.0.31, test results are truncated to a maximum size of 512KB when sent to the frontend. If a result is truncated, a warning icon is displayed. The warning description is displayed on mouseover. Note that data larger than 512KB is still processed fully by Zabbix server.</p> |

Click on *Test* to see the result after each preprocessing step.

Test values are stored between test sessions for either individual steps or all steps, allowing the user to change preprocessing steps or item configuration and then return to the testing window without having to re-enter information. Values are lost on a page refresh though.

The testing is done by Zabbix server. The frontend sends a corresponding request to the server and waits for the result. The request contains the input value and preprocessing steps (with expanded user macros). For *Change* and *Throttling* steps, an optional previous value and time can be specified. The server responds with results for each preprocessing step.

All technical errors or input validation errors are displayed in the error box at the top of the testing window.

#### Testing real value

To test preprocessing against a real value:

- Mark the *Get value from host* checkbox
- Enter or verify host parameters (host address, port, proxy name/no proxy) and item-specific details (such as SNMPv2 community or SNMPv3 security credentials). These fields are context-aware:
  - The values are pre-filled when possible, i.e. for items requiring an agent, by taking the information from the selected agent interface of the host
  - The values have to be filled manually for template items
  - Plain-text macro values are resolved
  - Fields where the value (or part of the value) is a secret or Vault macro are empty and have to be entered manually. If any item parameter contains a secret macro value, the following warning message is displayed: "Item contains user-defined macros with secret values. Values of these macros should be entered manually."
  - The fields are disabled when not needed in the context of the item type (e.g. the host address and the proxy fields are disabled for calculated items)
- Click on *Get value and test* to test the preprocessing

If you have specified a value mapping in the item configuration form ('Show value' field), the item test dialog will show another line after the final result, named 'Result with value map applied'.

Parameters that are specific to getting a real value from a host:

| Parameter  | Description   |
|--|---|
| <i>Get value from host</i>   | Mark this checkbox to get a real value from the host.   |
| <i>Host address</i>  | Enter the host address.<br>This field is automatically filled by the address of the item host interface.                        |
| <i>Port</i>  | Enter the host port.<br>This field is automatically filled by the port of item host interface.                                  |
| <i>Additional fields for SNMP</i>  | See <a href="#">Configuring SNMP monitoring</a> for additional details on configuring an SNMP interface (v1, v2 and v3).        |
| <i>interfaces&lt;br&gt;(SNMP version, SNMP community, Context name, etc)</i> | These fields are automatically filled from the item host interface.   |
| <i>Proxy</i>   | Specify the proxy if the host is monitored by a proxy.<br>This field is automatically filled by the proxy of the host (if any). |

For the rest of the parameters, see [Testing hypothetical value](#) above.

## 1 Usage examples

### Overview

This section presents examples of using preprocessing steps to accomplish some practical tasks.

#### Filtering VMware event log records

This example uses the [Matches regular expression](#) preprocessing step to filter unnecessary events from the VMware event log.

1. On a working VMware Hypervisor host, check that the event log item `vmware.eventlog` is present and working properly. Note that the event log item could already be present on the hypervisor if a **VMware** template has been linked during the host creation.
2. On the VMware Hypervisor host, create a [dependent item](#) of "Log" type and set the event log item as its master.
3. In the *Preprocessing* tab of the dependent item, select the "Matches regular expression" preprocessing step and specify, for example, one of the following parameters:

```
##### Filters all log events:
pattern: .* logged in .*
```

```
##### Filters lines containing usernames after "User":
pattern: \bUser\s+\K\S+
```

#### Attention:

If the regular expression is not matched, then the dependent item becomes unsupported with a corresponding error message. To avoid this, mark the "Custom on fail" checkbox and select an option such as discarding the value or setting a custom one.

Alternatively, you may use the [Regular expression](#) preprocessing step to extract matching groups and control output. For example:

```
##### Extracts and outputs the entire log event containing "logged in":
pattern: .*logged in.*
output: \0
```

```
##### Extracts and outputs usernames following "User":
pattern: User (.*?)(?=\s)
output: \1
```

#### Checking retrieved value type

This example uses the [Custom multiplier](#) preprocessing step to check if the retrieved item value type is numeric.

In the *Preprocessing* tab of an item, select the "Custom multiplier" preprocessing step and set the following parameter:

```
##### Multiplies the retrieved value by 1:
number: 1
```

**Attention:**

If preprocessing fails (e.g., input is not numeric), then the item becomes unsupported with a corresponding error message. To avoid this, mark the "Custom on fail" checkbox and select an option such as discarding the value or setting a custom one.

## 2 Preprocessing details

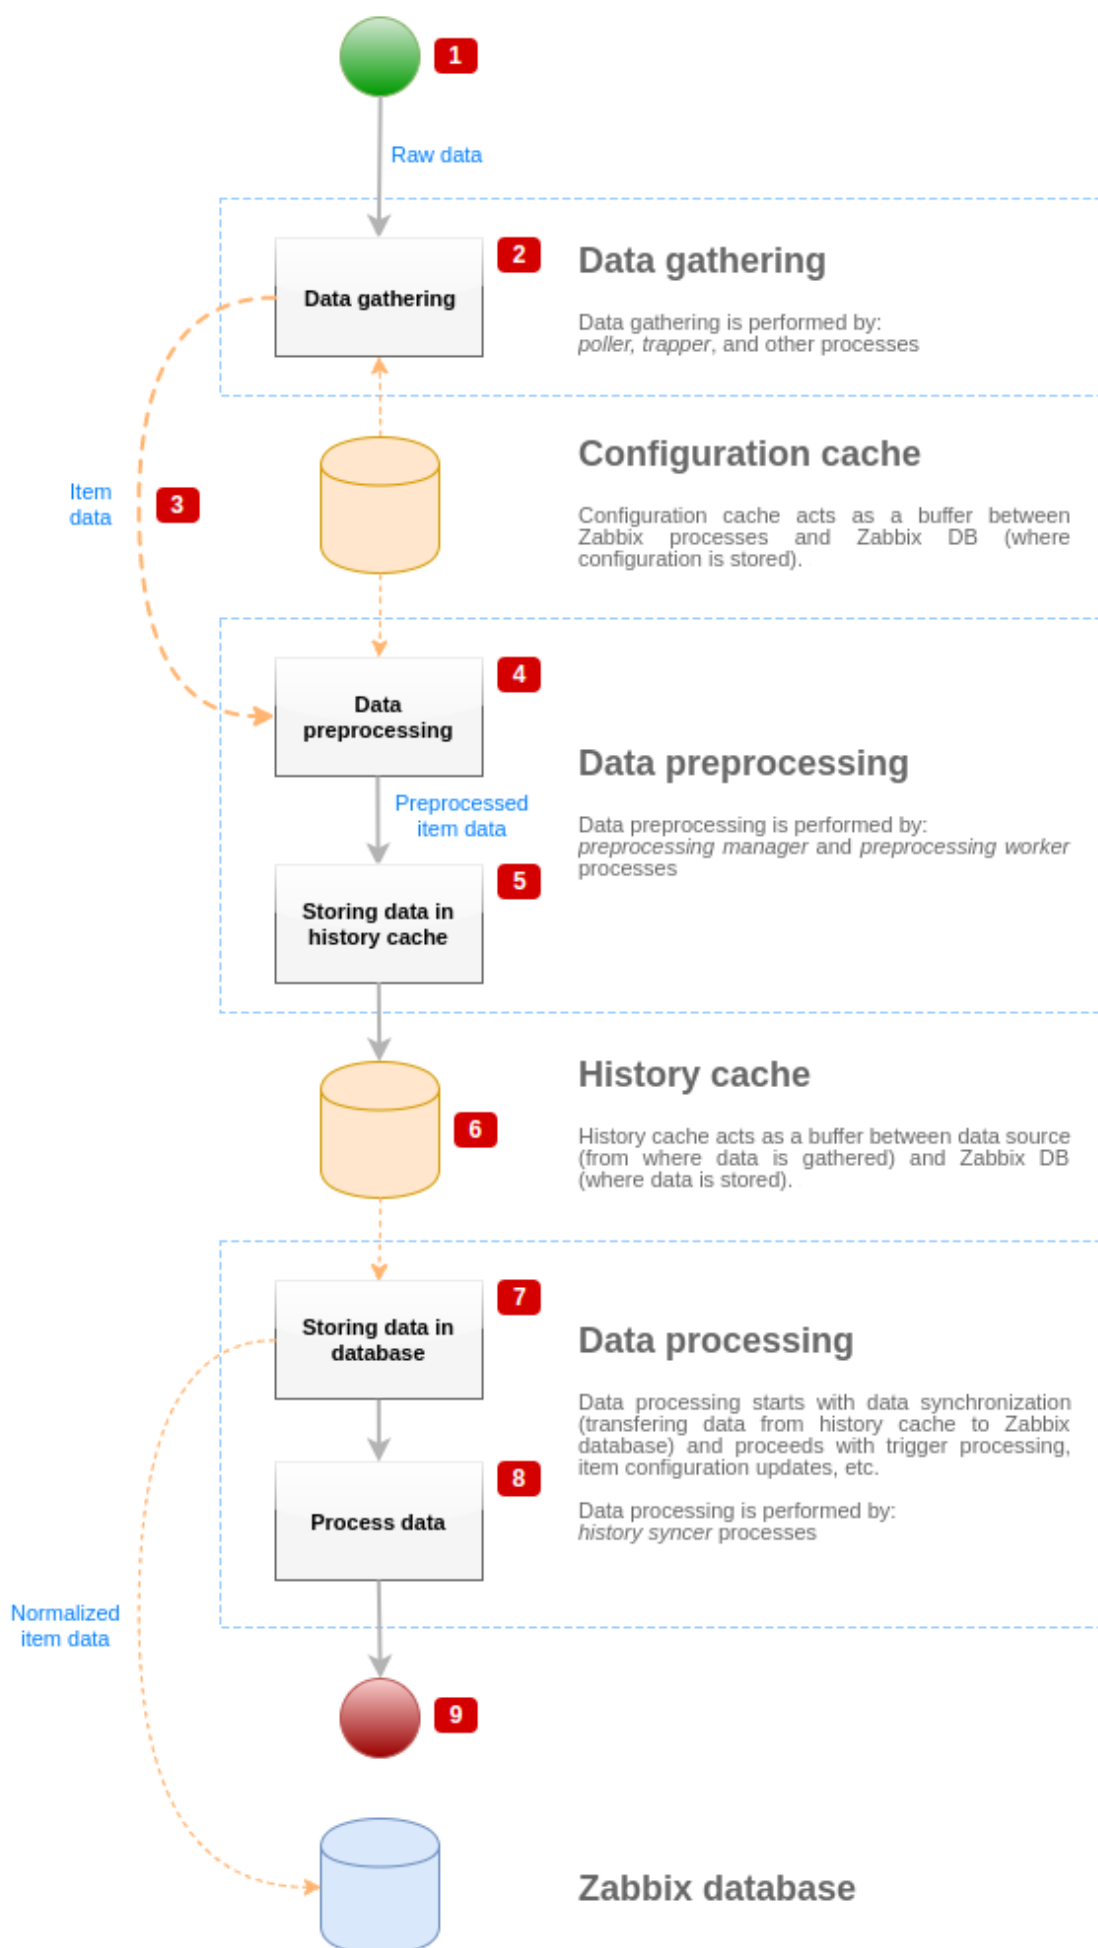

### Overview

This section provides item value preprocessing details. Item value preprocessing allows to define and execute **transformation rules** for the received item values.

Preprocessing is managed by a preprocessing manager process, which was added in Zabbix 3.4, along with preprocessing workers that perform the preprocessing steps. All values (with or without preprocessing) from different data gatherers pass through the preprocessing manager before being added to the history cache. Socket-based IPC communication is used between data gatherers (pollers, trappers, etc) and the preprocessing process. Either Zabbix server or Zabbix proxy (for items monitored by the proxy) is performing preprocessing steps.

### Item value processing

To visualize the data flow from data source to the Zabbix database, we can use the following simplified diagram:

The diagram above shows only processes, objects and actions related to item value processing in a **simplified** form. The diagram does not show conditional direction changes, error handling or loops. Local data cache of preprocessing manager is not shown either because it doesn't affect data flow directly. The aim of this diagram is to show processes involved in item value processing and the way they interact.

- Data gathering starts with raw data from a data source. At this point, data contains only ID, timestamp and value (can be multiple values as well)
- No matter what type of data gatherer is used, the idea is the same for active or passive checks, for trapper items and etc, as it only changes the data format and the communication starter (either data gatherer is waiting for a connection and data, or data gatherer initiates the communication and requests the data). Raw data is validated, item configuration is retrieved from configuration cache (data is enriched with the configuration data).
- Socket-based IPC mechanism is used to pass data from data gatherers to preprocessing manager. At this point data gatherer continue to gather data without waiting for the response from preprocessing manager.
- Data preprocessing is performed. This includes execution of preprocessing steps and dependent item processing.

**Note:**

Item can change its state to NOT SUPPORTED while preprocessing is performed if any of preprocessing steps fail.

- History data from local data cache of preprocessing manager is being flushed into history cache.
- At this point data flow stops until the next synchronization of history cache (when history syncer process performs data synchronization).
- Synchronization process starts with data normalization storing data in Zabbix database. Data normalization performs conversions to desired item type (type defined in item configuration), including truncation of textual data based on pre-defined sizes allowed for those types (HISTORY\_STR\_VALUE\_LEN for string, HISTORY\_TEXT\_VALUE\_LEN for text and HISTORY\_LOG\_VALUE\_LEN for log values). Data is being sent to Zabbix database after normalization is done.

**Note:**

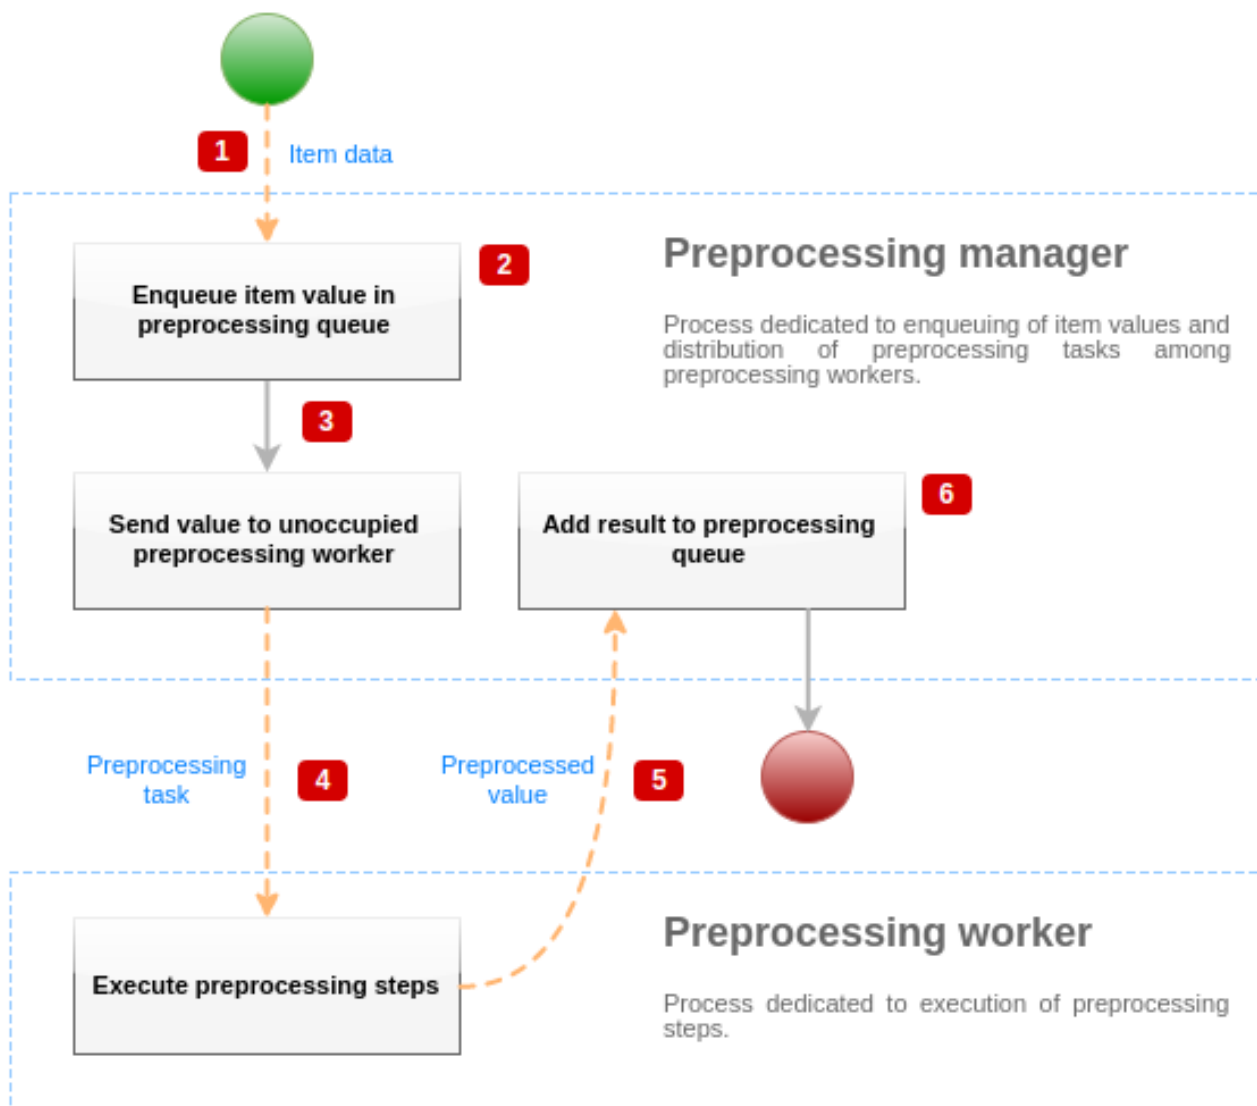

Item can change its state to NOT SUPPORTED if data normalization fails (for example, when textual value cannot be converted to number).

- Gathered data is being processed - triggers are checked, item configuration is updated if item becomes NOT SUPPORTED, etc.
- This is considered the end of data flow from the point of view of item value processing.

Item value preprocessing

To visualize the data preprocessing process, we can use the following simplified diagram:

The diagram above shows only processes, objects and main actions related to item value preprocessing in a **simplified** form. The diagram does not show conditional direction changes, error handling or loops. Only one preprocessing worker is shown on this diagram (multiple preprocessing workers can be used in real-life scenarios), only one item value is being processed and we assume that this item requires to execute at least one preprocessing step. The aim of this diagram is to show the idea behind item value preprocessing pipeline.

- Item data and item value is passed to preprocessing manager using socket-based IPC mechanism.
- Item is placed in the preprocessing queue.

**Note:**

Item can be placed at the end or at the beginning of the preprocessing queue. Zabbix internal items are always placed at the beginning of preprocessing queue, while other item types are enqueued at the end.

- At this point data flow stops until there is at least one unoccupied (that is not executing any tasks) preprocessing worker.
- When preprocessing worker is available, preprocessing task is being sent to it.
- After preprocessing is done (both failed and successful execution of preprocessing steps), preprocessed value is being passed back to preprocessing manager.
- Preprocessing manager converts result to desired format (defined by item value type) and places result in preprocessing queue. If there are dependent items for current item, then dependent items are added to preprocessing queue as well. Dependent items are enqueued in preprocessing queue right after the master item, but only for master items with value set and not in NOT SUPPORTED state.

**Value processing pipeline**

Item value processing is executed in multiple steps (or phases) by multiple processes. This can cause:

- Dependent item can receive values, while THE master value cannot. This can be achieved by using the following use case:

- Master item has value type UINT, (trapper item can be used), dependent item has value type TEXT.
- No preprocessing steps are required for both master and dependent items.
- Textual value (like, "abc") should be passed to master item.
- As there are no preprocessing steps to execute, preprocessing manager checks if master item is not in NOT SUPPORTED state and if value is set (both are true) and enqueues dependent item with the same value as master item (as there are no preprocessing steps).
- When both master and dependent items reach history synchronization phase, master item becomes NOT SUPPORTED, because of the value conversion error (textual data cannot be converted to unsigned integer).

As a result, dependent item receives a value, while master item changes its state to NOT SUPPORTED.

- Dependent item receives value that is not present in master item history. The use case is very similar to the previous one, except for the master item type. For example, if CHAR type is used for master item, then master item value will be truncated at the history synchronization phase, while dependent items will receive their value from the initial (not truncated) value of master item.

#### Preprocessing queue

Preprocessing queue is a FIFO data structure that stores values preserving the order in which values are reviewed by preprocessing manager. There are multiple exceptions to FIFO logic:

- Internal items are enqueued at the beginning of the queue
- Dependent items are always enqueued after the master item

To visualize the logic of preprocessing queue, we can use the following diagram:

Values from the preprocessing queue are flushed from the beginning of the queue to the first unprocessed value. So, for example, preprocessing manager will flush values 1, 2 and 3, but will not flush value 5 as value 4 is not processed yet:

Only two values will be left in queue (4 and 5) after flushing, values are added into local data cache of preprocessing manager and then values are transferred from local cache into history cache. Preprocessing manager can flush values from local data cache in

single item mode or in bulk mode (used for dependent items and values received in bulk).

#### Preprocessing workers

Zabbix server configuration file allows users to set count of preprocessing worker processes. StartPreprocessors configuration parameter should be used to set number of pre-forked instances of preprocessing workers. Optimal number of preprocessing workers can be determined by many factors, including the count of "preprocessable" items (items that require to execute any preprocessing steps), count of data gathering processes, average step count for item preprocessing, etc.

But assuming that there is no heavy preprocessing operations like parsing of large XML / JSON chunks, number of preprocessing workers can match total number of data gatherers. This way, there will mostly (except for the cases when data from gatherer comes in bulk) be at least one unoccupied preprocessing worker for collected data.

#### Warning:

Too many data gathering processes (pollers, unreachable pollers, ODBC pollers, HTTP pollers, Java pollers, pingers, trappers, proxypollers) together with IPMI manager, SNMP trapper and preprocessing workers can exhaust the per-process file descriptor limit for the preprocessing manager. This will cause Zabbix server to stop (usually shortly after the start, but sometimes it can take more time). The configuration file should be revised or the limit should be raised to avoid this situation.

### 3 JSONPath functionality

#### Overview

This section provides details of supported JSONPath functionality in item value preprocessing steps.

JSONPath consists of segments separated with dots. A segment can be either a simple word like a JSON value name, \* or a more complex construct enclosed within square brackets []. The separating dot before bracket segment is optional and can be omitted. For example:

| Path   | Description   |
|--|---|
| \$.object.name                                     | Return the object.name contents.  |
| \$.object['name']                                  | Return the object.name contents.  |
| \$.object.[ 'name' ]                               | Return the object.name contents.  |
| \$["object"]['name']                               | Return the object.name contents.  |
| \$.['object'].["name"]                             | Return the object.name contents.  |
| \$.object.history.length()                         | Return the number of object.history array elements.                                 |
| \$[?(@.name == 'Object')].price.first()            | Return the price field of the first object with name 'Object'.                      |
| \$[?(@.name == 'Object')].history.first().length() | Return the number of history array elements of the first object with name 'Object'. |
| \$[?(@.price > 10)].length()                       | Return the number of objects with price being greater than 10.                      |

See also: [Escaping special characters from LLD macro values in JSONPath](#).

#### Supported segments

| Segment                   | Description   |
|---------------------------|---|
| <name>                    | Match object property by name.  |
| *                         | Match all object properties.  |
| ['<name>']                | Match object property by name.  |
| ['<name>', '<name>', ...] | Match object property by any of the listed names.   |
| [<index>]                 | Match array element by the index.   |
| [<number>, <number>, ...] | Match array element by any of the listed indexes.   |
| [*]                       | Match all object properties or array elements.  |
| [<start>:<end>]           | Match array elements by the defined range:<br><start> - the first index to match (including). If not specified matches all array elements from the beginning. If negative specifies starting offset from the end of array.<br><end> - the last index to match (excluding). If not specified matches all array elements to the end. If negative specifies starting offset from the end of array. |

| Segment           | Description   |
|-------------------|---|
| [?(<expression>)] | Match objects/array elements by applying a filter expression. |

To find a matching segment ignoring its ancestry (detached segment) it must be prefixed with '..' , for example \$...name or \$. . ['name'] return values of all 'name' properties.

Matched element names can be extracted by adding a ~ suffix to the JSONPath. It returns the name of the matched object or an index in string format of the matched array item. The output format follows the same rules as other JSONPath queries - definite path results are returned 'as is' and indefinite path results are returned in array. However there is not much point of extracting the name of an element matching a definite path - it's already known.

#### Filter expression

The filter expression is an arithmetical expression in infix notation.

Supported operands:

| Operand                     | Description   | Example        |
|-----------------------------|---|----------------|
| "<text>"                    | Text constant.  | 'value: \'1\'" |
| '<text>'                    |   | "value: '1'"   |
| <number>                    | Numeric constant supporting scientific notation.  | 123            |
| <jsonpath starting with \$> | Value referred to by the JSONPath from the input document root node; only definite paths are supported. | \$.object.name |
| <jsonpath starting with @>  | Value referred to by the JSONPath from the current object/element; only definite paths are supported.   | @.name         |

Supported operators:

| Operator | Type   | Description                  | Result            |
|----------|--------|------------------------------|-------------------|
| -        | binary | Subtraction.                 | Number.           |
| +        | binary | Addition.                    | Number.           |
| /        | binary | Division.                    | Number.           |
| *        | binary | Multiplication.              | Number.           |
| ==       | binary | Is equal to.                 | Boolean (1 or 0). |
| !=       | binary | Is not equal to.             | Boolean (1 or 0). |
|          | binary | Is less than.                | Boolean (1 or 0). |
| <=       | binary | Is less than or equal to.    | Boolean (1 or 0). |
| >        | binary | Is greater than.             | Boolean (1 or 0). |
| >=       | binary | Is greater than or equal to. | Boolean (1 or 0). |
| =~       | binary | Matches regular expression.  | Boolean (1 or 0). |
| !        | unary  | Boolean not.                 | Boolean (1 or 0). |
|          | binary | Boolean or.                  | Boolean (1 or 0). |
| &&       | binary | Boolean and.                 | Boolean (1 or 0). |

#### Functions

Functions can be used at the end of JSONPath. Multiple functions can be chained if the preceding function returns value that is accepted by the following function.

Supported functions:

| Function | Description                              | Input             | Output  |
|----------|--|-------------------|---------|
| avg      | Average value of numbers in input array. | Array of numbers. | Number. |
| min      | Minimum value of numbers in input array. | Array of numbers. | Number. |
| max      | Maximum value of numbers in input array. | Array of numbers. | Number. |
| sum      | Sum of numbers in input array.           | Array of numbers. | Number. |
| length   | Number of elements in input array.       | Array.            | Number. |

| Function           | Description              | Input  | Output   |
|--------------------|--------------------------|--------|--|
| <code>first</code> | The first array element. | Array. | A JSON construct (object, array, value) depending on input array contents. |

Quoted numeric values are accepted by the JSONPath aggregate functions. It means that the values are converted from string type to numeric if aggregation is required.

Incompatible input will cause the function to generate error.

Output value

JSONPaths can be divided in definite and indefinite paths. A definite path can return only null or a single match. An indefinite path can return multiple matches, basically JSONPaths with detached, multiple name/index list, array slice or expression segments. However, when a function is used the JSONPath becomes definite, as functions always output single value.

A definite path returns the object/array/value it's referencing, while indefinite path returns an array of the matched objects/arrays/values.

#### Attention:

The property order in JSONPath query results may not align with the original JSON property order due to internal optimization methods. For example, the JSONPath `$.books[1]["author", "title"]` may return `["title", "author"]`. If preserving the original property order is essential, alternative post-query processing methods should be considered.

Whitespace

Whitespace (space, tab characters) can be freely used in bracket notation segments and expressions, for example, `$[ 'a' ][ 0 ][ ?( $.b == 'c' ) ][ : -1 ].first( )`.

Strings

Strings should be enclosed with single ' or double " quotes. Inside the strings, single or double quotes (depending on which are used to enclose it) and backslashes \ are escaped with the backslash \ character.

Examples

Input data

```
{
  "books": [
    {
      "category": "reference",
      "author": "Nigel Rees",
      "title": "Sayings of the Century",
      "price": 8.95,
      "id": 1
    },
    {
      "category": "fiction",
      "author": "Evelyn Waugh",
      "title": "Sword of Honour",
      "price": 12.99,
      "id": 2
    },
    {
      "category": "fiction",
      "author": "Herman Melville",
      "title": "Moby Dick",
      "isbn": "0-553-21311-3",
      "price": 8.99,
      "id": 3
    },
    {
      "category": "fiction",
      "author": "J. R. R. Tolkien",
      "title": "The Lord of the Rings",

```

```

    "isbn": "0-395-19395-8",
    "price": 22.99,
    "id": 4
  }
],
"services": {
  "delivery": {
    "servicegroup": 1000,
    "description": "Next day delivery in local town",
    "active": true,
    "price": 5
  },
  "bookbinding": {
    "servicegroup": 1001,

```

| JSONPath                 | Type     | Result       | Comments |
|--------------------------|----------|--------------|----------|
| \$.filters.price         | definite | 10           |          |
| \$.filters.category      | definite | fiction      |          |
| \$.filters['no filters'] | definite | no "filters" |          |

| JSONPath   | Type       | Result   | Comments   |
|--|------------|--|--|
| \$.filters   | definite   | {<br>"price": 10,<br>"category": "fiction",<br>"no filters": "no \"filters\""<br>} |  |
| \$.books[1].title  | definite   | Sword of Honour  |  |
| \$.books[-1].author  | definite   | J. R. R. Tolkien   |  |
| \$.books.length  | definite   | 4  |  |
| \$.tags[:]   | indefinite | ["a", "b", "c", "d", "e"]  |  |
| \$.tags[2:]  | indefinite | ["c", "d", "e"]  |  |
| \$.tags[:3]  | indefinite | ["a", "b", "c"]  |  |
| \$.tags[1:4]   | indefinite | ["b", "c", "d"]  |  |
| \$.tags[-2:]   | indefinite | ["d", "e"]   |  |
| \$.tags[: -3]  | indefinite | ["a", "b"]   |  |
| \$.tags[: -3].length                                       | definite   | 2  |  |
| \$.books[0, 2].title                                       | indefinite | ["Moby Dick", "Sayings of the Century"]  |  |
| \$.books[1]['author', 'title']                             | indefinite | ["Sword of Honour", "Evelyn Waugh"]  |  |
| \$.id  | indefinite | [1, 2, 3, 4]   |  |
| \$.services..price   | indefinite | [154.99, 5, 46, 24.5, 99.49]   |  |
| \$.books[?(@.id == 4 - 0.4 * 5)].title                     | indefinite | ["Sword of Honour", "The Lord of the Rings"]                                       | This query shows that arithmetical operations can be used in queries. Of course this query can be simplified to \$.books[?(@.id == 2)].title |
| \$.books[?(@.id == 2 \\  \\  @.id == 4)].title             | indefinite | ["Sayings of the Century", "Moby Dick", "The Lord of the Rings"]                   |  |
| \$.books[?(@.id == 2)    (@.id == 4)].title                | indefinite | ["Sayings of the Century", "Moby Dick", "The Lord of the Rings"]                   |  |
| \$.books[?(@.id != 2)].title                               | indefinite | ["Sayings of the Century", "Moby Dick", "The Lord of the Rings"]                   |  |
| \$.books[?(@.id == ~ " of ")].title                        | indefinite | ["Sayings of the Century", "Sword of Honour", "The Lord of the Rings"]             |  |
| \$.books[?(@.price > 12.99)].title                         | indefinite | ["The Lord of the Rings"]  |  |
| \$.books[?(@.author > "Herman Melville")].title            | indefinite | ["Sayings of the Century", "The Lord of the Rings"]                                |  |
| \$.books[?(@.price > \$.filters.price)].title              | indefinite | ["Sword of Honour", "The Lord of the Rings"]                                       |  |
| \$.books[?(@.category == \$.filters.category)].title       | indefinite | ["Sword of Honour", "Moby Dick", "The Lord of the Rings"]                          |  |
| \$.books[?(@.category == "fiction" && @.price < 10)].title | indefinite | ["Moby Dick"]  |  |

When low-level discovery macros are used in JSONPath preprocessing and their values are resolved, the following rules of escaping special characters are applied:

- only backslash (\) and double quote (") characters are considered for escaping;
- if the resolved macro value contains these characters, each of them is escaped with a backslash;
- if they are already escaped with a backslash, it is not considered as escaping and both the backslash and the following special characters are escaped once again.

For example:

| JSONPath                      | LLD macro value | After substitution                     |
|-------------------------------|-----------------|--|
| \$.[?(@.value == "{#MACRO}")] | special "value" | \$.[?(@.value == "special \"value\"")] |
|                               | c:\temp         | \$.[?(@.value == "c:\\temp")]          |
|                               | a\\b            | \$.[?(@.value == "a\\\\b")]            |

When used in the expression the macro that may have special characters should be enclosed in double quotes:

| JSONPath                      | LLD macro value | After substitution                     | Result                         |
|-------------------------------|-----------------|--|--------------------------------|
| \$.[?(@.value == "{#MACRO}")] | special "value" | \$.[?(@.value == "special \"value\"")] | OK                             |
| \$.[?(@.value == {#MACRO})]   |                 | \$.[?(@.value == special \"value\"")]  | <b>Bad JSONPath expression</b> |

When used in the path the macro that may have special characters should be enclosed in square brackets **and** double quotes:

| JSONPath              | LLD macro value | After substitution    | Result                         |
|-----------------------|-----------------|-----------------------|--------------------------------|
| \$.["{#MACRO}"].value | c:\temp         | \$.["c:\\temp"].value | OK                             |
| \$.{#MACRO}.value     |                 | \$.c:\\temp.value     | <b>Bad JSONPath expression</b> |

## 4 JavaScript preprocessing

### Overview

This section provides details of preprocessing by JavaScript.

#### JavaScript preprocessing

JavaScript preprocessing is done by invoking JavaScript function with a single parameter 'value' and user provided function body. The preprocessing step result is the value returned from this function, for example, to perform Fahrenheit to Celsius conversion user must enter:

```
return (value - 32) * 5 / 9
```

in JavaScript preprocessing parameters, which will be wrapped into a JavaScript function by server:

```
function (value)
{
    return (value - 32) * 5 / 9
}
```

The input parameter 'value' is always passed as a string. The return value is automatically coerced to string via ToString() method (if it fails then the error is returned as string value), with a few exceptions:

- returning undefined value will result in an error
- returning null value will cause the input value to be discarded, much like 'Discard value' preprocessing on 'Custom on fail' action.

Errors can be returned by throwing values/objects (normally either strings or Error objects).

For example:

```
if (value == 0)
    throw "Zero input value"
return 1/value
```

Each script has a 10 second execution timeout (depending on the script it might take longer for the timeout to trigger); exceeding it will return error. A 512-megabyte heap limit is enforced (64 megabytes before Zabbix 6.0.19).

The JavaScript preprocessing step bytecode is cached and reused when the step is applied next time. Any changes to the item's preprocessing steps will cause the cached script to be reset and recompiled later.

Consecutive runtime failures (3 in a row) will cause the engine to be reinitialized to mitigate the possibility of one script breaking the execution environment for the next scripts (this action is logged with DebugLevel 4 and higher).

JavaScript preprocessing is implemented with Duktape (<https://duktape.org/>) JavaScript engine.

See also: [Additional JavaScript objects and global functions](#)

Using macros in scripts

It is possible to use user macros in JavaScript code. If a script contains user macros, these macros are resolved by server/proxy before executing specific preprocessing steps. Note that when testing preprocessing steps in the frontend, macro values will not be pulled and need to be entered manually.

**Note:**

Context is ignored when a macro is replaced with its value. Macro value is inserted in the code as is, it is not possible to add additional escaping before placing the value in the JavaScript code. Please be advised, that this can cause JavaScript errors in some cases.

In an example below, if received value exceeds a `{ $THRESHOLD }` macro value, the threshold value (if present) will be returned instead:

```
var threshold = '{ $THRESHOLD }';
return (!isNaN(threshold) && value > threshold) ? threshold : value;
```

## 1 Additional JavaScript objects

### Overview

This section describes Zabbix additions to the JavaScript language implemented with Duktape and supported global JavaScript functions.

#### Built-in objects

##### Zabbix

The Zabbix object provides interaction with the internal Zabbix functionality.

| Method                              | Description   |
|-------------------------------------|---|
| <code>log(loglevel, message)</code> | Writes <code>&lt;message&gt;</code> into Zabbix log using <code>&lt;loglevel&gt;</code> log level (see configuration file <code>DebugLevel</code> parameter). |

Example:

```
Zabbix.log(3, "this is a log entry written with 'Warning' log level")
```

You may use the following aliases:

| Alias                              | Alias to   |
|------------------------------------|--|
| <code>console.log(object)</code>   | <code>Zabbix.log(4, JSON.stringify(object))</code> |
| <code>console.warn(object)</code>  | <code>Zabbix.log(3, JSON.stringify(object))</code> |
| <code>console.error(object)</code> | <code>Zabbix.log(2, JSON.stringify(object))</code> |

**Attention:**

The total size of all logged messages is limited to 8 MB per script execution.

| Method                    | Description  |
|---------------------------|--|
| <code>sleep(delay)</code> | Delay JavaScript execution by <code>delay</code> milliseconds. |

Example (delay execution by 15 seconds):

```
Zabbix.sleep(15000)
```

HttpRequest

**Attention:**

"HttpRequest" is a new name for this object since Zabbix 5.4. Previously it was called "CurlHttpRequest". Method names have also been changed in Zabbix 5.4. The old object/method names are now deprecated and their support will be discontinued after Zabbix 6.0.

This object encapsulates cURL handle allowing to make simple HTTP requests. Errors are thrown as exceptions.

**Attention:**

The initialization of multiple `HttpRequest` objects is limited to 10 per script execution.

| Method  | Description  |
|---|--|
| <code>addHeader(value)</code>                         | Adds HTTP header field. This field is used for all following requests until cleared with the <code>clearHeader()</code> method.<br>The total length of header fields that can be added to a single <code>HttpRequest</code> object is limited to 128 Kbytes (special characters and header names included).  |
| <code>clearHeader()</code>                            | Clears HTTP header. If no header fields are set, <code>HttpRequest</code> will set Content-Type to application/json if the data being posted is JSON-formatted; text/plain otherwise.  |
| <code>connect(url)</code>                             | Sends HTTP CONNECT request to the URL and returns the response.  |
| <code>customRequest(method, url, data)</code>         | Allows to specify any HTTP method in the first parameter. Sends the method request to the URL with optional <code>data</code> payload and returns the response.  |
| <code>delete(url, data)</code>                        | Sends HTTP DELETE request to the URL with optional <code>data</code> payload and returns the response.   |
| <code>getHeaders(&lt;asArray&gt;)</code>              | Returns the object of received HTTP header fields.<br>The <code>asArray</code> parameter may be set to "true" (e.g. <code>getHeaders(true)</code> ), "false" or be undefined. If set to "true" the received HTTP header field values will be returned as arrays; this should be used to retrieve the field values of multiple same-name headers.<br>If not set or set to "false", the received HTTP header field values will be returned as strings. |
| <code>get(url, data)</code>                           | Sends HTTP GET request to the URL with optional <code>data</code> payload and returns the response.  |
| <code>head(url)</code>                                | Sends HTTP HEAD request to the URL and returns the response.   |
| <code>options(url)</code>                             | Sends HTTP OPTIONS request to the URL and returns the response.  |
| <code>patch(url, data)</code>                         | Sends HTTP PATCH request to the URL with optional <code>data</code> payload and returns the response.  |
| <code>put(url, data)</code>                           | Sends HTTP PUT request to the URL with optional <code>data</code> payload and returns the response.  |
| <code>post(url, data)</code>                          | Sends HTTP POST request to the URL with optional <code>data</code> payload and returns the response.   |
| <code>getStatus()</code>                              | Returns the status code of the last HTTP request.  |
| <code>setProxy(proxy)</code>                          | Sets HTTP proxy to "proxy" value. If this parameter is empty then no proxy is used.  |
| <code>setHttpAuth(bitmask, username, password)</code> | Sets enabled HTTP authentication methods (HTTPAUTH_BASIC, HTTPAUTH_DIGEST, HTTPAUTH_NEGOTIATE, HTTPAUTH_NTLM, HTTPAUTH_NONE) in the 'bitmask' parameter.<br>The HTTPAUTH_NONE flag allows to disable HTTP authentication.<br>Examples:<br><code>request.setHttpAuth(HTTPAUTH_NTLM   HTTPAUTH_BASIC, username, password)</code><br><code>'request.setHttpAuth(HTTPAUTH_NONE)</code>   |
| <code>trace(url, data)</code>                         | Sends HTTP TRACE request to the URL with optional <code>data</code> payload and returns the response.  |

Example:

```
try {
  Zabbix.log(4, 'jira webhook script value='+value);

  var result = {
    'tags': {
      'endpoint': 'jira'
    }
  },
```

```

params = JSON.parse(value),
req = new HttpRequest(),
fields = {},
resp;

req.addHeader('Content-Type: application/json');
req.addHeader('Authorization: Basic '+params.authentication);

fields.summary = params.summary;
fields.description = params.description;
fields.project = {"key": params.project_key};
fields.issuetype = {"id": params.issue_id};
resp = req.post('https://jira.example.com/rest/api/2/issue/',
    JSON.stringify({"fields": fields})
);

if (req.getStatus() != 201) {
    throw 'Response code: '+req.getStatus();
}

resp = JSON.parse(resp);
result.tags.issue_id = resp.id;
result.tags.issue_key = resp.key;
} catch (error) {
    Zabbix.log(4, 'jira issue creation failed json : '+JSON.stringify({"fields": fields}));
    Zabbix.log(4, 'jira issue creation failed : '+error);

    result = {};
}

return JSON.stringify(result);

```

## XML

The XML object allows the processing of XML data in the item and low-level discovery preprocessing and webhooks.

### Attention:

In order to use XML object, server/proxy must be compiled with libxml2 support.

| Method                      | Description   |
|-----------------------------|---|
| XML.query(data, expression) | Retrieves node content using XPath. Returns null if node is not found.<br><b>expression</b> - an XPath expression;<br><b>data</b> - XML data as a string. |
| XML.toJson(data)            | Converts data in XML format to JSON.  |
| XML.fromJson(object)        | Converts data in JSON format to XML.  |

Example:

Input:

```

<menu>
  <food type = "breakfast">
    <name>Chocolate</name>
    <price>$5.95</price>
    <description></description>
    <calories>650</calories>
  </food>
</menu>

```

Output:

```

{
  "menu": {

```

```

    "food": {
      "@type": "breakfast",
      "name": "Chocolate",
      "price": "$5.95",
      "description": null,
      "calories": "650"
    }
  }
}

```

#### Serialization rules

XML to JSON conversion will be processed according to the following rules (for JSON to XML conversions reversed rules are applied):

1. XML attributes will be converted to keys that have their names prepended with '@'.

Example:

*Input:*

```

<xml foo="FOO">
  <bar>
    <baz>BAZ</baz>
  </bar>
</xml>

```

*Output:*

```

{
  "xml": {
    "@foo": "FOO",
    "bar": {
      "baz": "BAZ"
    }
  }
}

```

2. Self-closing elements (<foo/>) will be converted as having 'null' value.

Example:

*Input:*

```

<xml>
  <foo/>
</xml>

```

*Output:*

```

{
  "xml": {
    "foo": null
  }
}

```

3. Empty attributes (with "" value) will be converted as having empty string ("") value.

Example:

*Input:*

```

<xml>
  <foo bar="" />
</xml>

```

*Output:*

```

{
  "xml": {
    "foo": {
      "@bar": ""
    }
  }
}

```

```
}  
}
```

4. Multiple child nodes with the same element name will be converted to a single key that has an array of values as its value.

Example:

*Input:*

```
<xml>  
  <foo>BAR</foo>  
  <foo>BAZ</foo>  
  <foo>QUX</foo>  
</xml>
```

*Output:*

```
{  
  "xml": {  
    "foo": ["BAR", "BAZ", "QUX"]  
  }  
}
```

5. If a text element has no attributes and no children, it will be converted as a string.

Example:

*Input:*

```
<xml>  
  <foo>BAZ</foo>  
</xml>
```

*Output:*

```
{  
  "xml": {  
    "foo": "BAZ"  
  }  
}
```

6. If a text element has no children, but has attributes: text content will be converted to an element with the key '#text' and content as a value; attributes will be converted as described in the serialization rule 1.

Example:

*Input:*

```
<xml>  
  <foo bar="BAR">  
    BAZ  
  </foo>  
</xml>
```

*Output:*

```
{  
  "xml": {  
    "foo": {  
      "@bar": "BAR",  
      "#text": "BAZ"  
    }  
  }  
}
```

## Global JavaScript functions

Additional global JavaScript functions have been implemented with Duktape:

- `btoa(data)` - encodes the data to Base64 string;
- `atob(base64_string)` - since version 6.0.31, decodes Base64 string as Uint8Array buffer (in Zabbix 6.0.0 - 6.0.30 returns a decoded string).

```
try {
  b64 = btoa("test string");
  buffer = atob(b64);

  // Note that decoding logic depends on the data format of the buffer.
  decoded = String.fromCharCode.apply(this, [].slice.call(buffer));
}
catch (error) {
  return {'error.name' : error.name, 'error.message' : error.message};
}
```

- md5(data) - calculates the MD5 hash of the data
- sha256(data) - calculates the SHA256 hash of the data
- hmac('<hash type>',key,data) - returns HMAC hash as hex formatted string; MD5 and SHA256 hash types are supported; key and data parameters support binary data. Examples:
  - hmac('md5',key,data)
  - hmac('sha256',key,data)
- sign(hash,key,data) - returns calculated signature (RSA signature with SHA-256) as a string, where:
  - **hash** - only 'sha256' is allowed, otherwise an error is thrown;
  - **key** - the private key. It should correspond to PKCS#1 or PKCS#8 standard. The key can be provided in different forms:
    - with spaces instead of newlines;
    - with escaped or non-escaped '\n's instead of newlines;
    - without any newlines as a single-line string;
    - as a JSON-formatted string.

The key also can be loaded from a user macro/secret macro/vault.

**data** - the data that will be signed. It can be a string (binary data also supported) or buffer (Uint8Array/ArrayBuffer).  
OpenSSL or GnuTLS is used to calculate the signatures. If Zabbix was built without any of these encryption libraries, an error will be thrown ('missing OpenSSL or GnuTLS library'). This function is supported since Zabbix 6.0.15.

## 5 CSV to JSON preprocessing

### Overview

In this preprocessing step it is possible to convert CSV file data into JSON format. It's supported in:

- items (item prototypes)
- low-level discovery rules

### Configuration

To configure a CSV to JSON preprocessing step:

- Go to the Preprocessing tab in **item/discovery rule** configuration
- Click on **Add**
- Select the **CSV to JSON** option

The first parameter allows to set a custom delimiter. Note that if the first line of CSV input starts with "Sep=" and is followed by a single UTF-8 character then that character will be used as the delimiter in case the first parameter is not set. If the first parameter is not set and a delimiter is not retrieved from the "Sep=" line, then a comma is used as a separator.

The second optional parameter allows to set a quotation symbol.

If the *With header row* checkbox is marked, the header line values will be interpreted as column names (see **Header processing** for more information).

If the *Custom on fail* checkbox is marked, the item will not become unsupported in case of a failed preprocessing step. Additionally custom error handling options may be set: discard the value, set a specified value or set a specified error message.

#### Header processing

The CSV file header line can be processed in two different ways:

- If the *With header row* checkbox is marked - header line values are interpreted as column names. In this case the column names must be unique and the data row should not contain more columns than the header row;
- If the *With header row* checkbox is not marked - the header line is interpreted as data. Column names are generated automatically (1,2,3,4...)

CSV file example:

```
Nr,Item name,Key,Qty
1,active agent item,agent.hostname,33
"2","passive agent item","agent.version","44"
3,"active,passive agent items",agent.ping,55
```

#### Note:

A quotation character within a quoted field in the input must be escaped by preceding it with another quotation character.

#### Processing header line

JSON output when a header line is expected:

```
[
  {
    "Nr": "1",
    "Item name": "active agent item",
    "Key": "agent.hostname",
    "Qty": "33"
  },
  {
    "Nr": "2",
    "Item name": "passive agent item",
    "Key": "agent.version",
    "Qty": "44"
  },
  {
    "Nr": "3",
    "Item name": "active,passive agent items",
    "Key": "agent.ping",
    "Qty": "55"
  }
]
```

#### No header line processing

JSON output when a header line is not expected:

```
[
  {
    "1": "Nr",
    "2": "Item name",
    "3": "Key",
    "4": "Qty"
  },
  {
    "1": "1",
    "2": "active agent item",
    "3": "agent.hostname",
    "4": "33"
  },
  {
    "1": "2",
    "2": "passive agent item",
    "3": "agent.version",
    "4": "44"
  },
  {
    "1": "3",
    "2": "active,passive agent items",
    "3": "agent.ping",
    "4": "55"
  }
]
```

```

    "3": "agent.version",
    "4": "44"
  },
  {
    "1": "3",
    "2": "active,passive agent items",
    "3": "agent.ping",
    "4": "55"
  }
]

```

### 3 Item types

#### Overview

Item types cover various methods of acquiring data from your system. Each item type comes with its own set of supported item keys and required parameters.

The following items types are currently offered by Zabbix:

- Zabbix agent checks
- SNMP agent checks
- SNMP traps
- IPMI checks
- Simple checks
  - VMware monitoring
- Log file monitoring
- Calculated items
  - Aggregate calculations
- Zabbix internal checks
- SSH checks
- Telnet checks
- External checks
- Trapper items
- JMX monitoring
- ODBC checks
- Dependent items
- HTTP checks
- Prometheus checks
- Script items

Details for all item types are included in the subpages of this section. Even though item types offer a lot of options for data gathering, there are further options through [user parameters](#) or [loadable modules](#).

Some checks are performed by Zabbix server alone (as agent-less monitoring) while others require Zabbix agent or even Zabbix Java gateway (with JMX monitoring).

#### Attention:

If a particular item type requires a particular interface (like an IPMI check needs an IPMI interface on the host) that interface must exist in the host definition.

Multiple interfaces can be set in the host definition: Zabbix agent, SNMP agent, JMX and IPMI. If an item can use more than one interface, it will search the available host interfaces (in the order: Agent→SNMP→JMX→IPMI) for the first appropriate one to be linked with.

All items that return text (character, log, text types of information) can return whitespace only as well (where applicable) setting the return value to an empty string (supported since 2.0).

### 1 Zabbix agent

#### Overview

These checks use the communication with Zabbix agent for data gathering.

There are [passive](#) and [active](#) agent checks. When configuring an item, you can select the required type:

- *Zabbix agent* - for passive checks
- *Zabbix agent (active)* - for active checks

Supported item keys

The table provides details on the item keys that you can use with Zabbix agent items grouped by the item family.

See also:

- [Items supported by platform](#)
- [Item keys supported by Zabbix agent 2](#)
- [Item keys specific for Windows agent](#)
- [Minimum permission level for Windows agent items](#)

### Mandatory and optional parameters

Parameters without angle brackets are mandatory. Parameters marked with angle brackets < > are optional.

### Usage with command-line utilities

Note that when testing or using item keys with `zabbix_agentd` or `zabbix_get` from the command line you should consider shell syntax too.

For example, if a certain parameter of the key has to be enclosed in double quotes you have to explicitly escape double quotes, otherwise they will be trimmed by the shell as special characters and will not be passed to the Zabbix utility.

Examples:

```
zabbix_agentd -t 'vfs.dir.count[/var/log,,,"file,dir",,0]'
```

```
zabbix_agentd -t vfs.dir.count[/var/log,,,\"file,dir\",,0]
```

Kernel data

| Item key  |              |            |  |
|---|--------------|------------|--|
| Description   | Return value | Parameters | Comments                                 |
| <b>kernel.maxfiles</b>                                |              |            |  |
| Maximum number of opened files supported by OS.       | Integer      |            |  |
| <b>kernel.maxproc</b>                                 |              |            |  |
| Maximum number of processes supported by OS.          | Integer      |            |  |
| <b>kernel.openfiles</b>                               |              |            |  |
| Return the number of currently open file descriptors. | Integer      |            | This item is supported since Zabbix 6.0. |

Log data

See additional information on [log monitoring](#).

| Item key   |              |            |          |
|--|--------------|------------|----------|
| Description  | Return value | Parameters | Comments |
| <b>log</b> [file,<regexp>,<encoding>,<maxlines>,<mode>,<output>,<maxdelay>,<options>,<persistent_dir>] |              |            |          |

Monitoring of  
a log file.

Log

**file** - full path and name of log file  
**regexp** - regular **expression** describing the required pattern  
**encoding** - code page **identifier**  
**maxlines** - maximum number of new lines per second the agent will send to Zabbix server or proxy. This parameter overrides the value of 'MaxLinesPerSecond' in **zabbix\_agentd.conf**  
**mode** (since version 2.0)- possible values: *all* (default), *skip* - skip processing of older data (affects only newly created items).  
**output** (since version 2.2) - an optional output formatting template. The **\0** escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an **\N** (where N=1...9) escape sequence is replaced with Nth matched group (or an empty string if the N exceeds the number of captured groups).  
**maxdelay** (since version 3.2) - maximum delay in seconds. Type: float. Values: 0 - (default) never ignore log file lines; > 0.0 - ignore older lines in order to get the most recent lines analyzed within "maxdelay" seconds. Read the **maxdelay** notes before using it!  
**options** (since version 4.4.7) - additional options:  
*mtime-noread* - non-unique records, reread only if the file size changes (ignore modification time change). (This parameter is deprecated since 5.0.2, because now mtime is ignored.)  
**persistent\_dir** (since versions 5.0.18, 5.4.9, only in zabbix\_agentd on Unix systems; not supported in Agent2) - absolute pathname of directory where to store persistent files. See also additional notes on **persistent files**.

The item must be configured as an **active check**.

If file is missing or permissions do not allow access, item turns unsupported.

If output is left empty - the whole line containing the matched text is returned. Note that all global regular expression types except 'Result is TRUE' always return the whole matched line and the output parameter is ignored.

Content extraction using the output parameter takes place on the agent.

Examples:

```
=> log[/var/log/syslog]
=> log[/var/log/syslog,error]
=> log[/home/zabbix/logs/logfile,,,100]
```

*Using output parameter for extracting a number from log record:*

```
=> log[/app1/app.log,"task run [0-9.]+
sec, processed ([0-9.]+) records, [0-9.]+
errors",,,1] → will match a log record
"2015-11-13 10:08:26 task run 6.08 sec,
processed 6080 records, 0 errors" and
send only '6080' to server. Because a
numeric value is being sent, the "Type of
information" for this item can be set to
"Numeric (unsigned)" and the value can
be used in graphs, triggers etc.
```

*Using output parameter for rewriting log record before sending to server:*

```
=> log[/app1/app.log,"([0-9.]+) task run
([0-9.]+) sec, processed ([0-9.]+) records,
([0-9.]+) errors",,,1 RECORDS: \3,
ERRORS: \4, DURATION: \2"] → will match
a log record "2015-11-13 10:08:26 task
run 6.08 sec, processed 6080 records, 0
errors" and send a modified record
"2015-11-13 10:08:26 RECORDS: 6080,
ERRORS: 0, DURATION: 6.08" to server.
```

**log.count**[file,<regexp>,<encoding>,<maxproclines>,<mode>,<maxdelay>,<options>,<persistent\_dir>]

| Item key  |         |  |  |
|---|---------|--|--|
| Count of matched lines in a monitored log file.   | Integer | <p><b>file</b> - full path and name of log file</p> <p><b>regexp</b> - regular <b>expression</b> describing the required pattern</p> <p><b>encoding</b> - code page <b>identifier</b></p> <p><b>maxproclines</b> - maximum number of new lines per second the agent will analyze (cannot exceed 10000). Default value is 10*<code>MaxLinesPerSecond</code> in <code>zabbix_agentd.conf</code>.</p> <p><b>mode</b> - possible values:<br/> <i>all</i> (default), <i>skip</i> - skip processing of older data (affects only newly created items).</p> <p><b>maxdelay</b> - maximum delay in seconds. Type: float. Values: 0 - (default) never ignore log file lines; &gt; 0.0 - ignore older lines in order to get the most recent lines analyzed within "maxdelay" seconds. Read the <b>maxdelay</b> notes before using it!</p> <p><b>options</b> (since version 4.4.7) - additional options:<br/> <i>mtime-noread</i> - non-unique records, reread only if the file size changes (ignore modification time change). (This parameter is deprecated since 5.0.2, because now mtime is ignored.)</p> <p><b>persistent_dir</b> (since versions 5.0.18, 5.4.9, only in <code>zabbix_agentd</code> on Unix systems; not supported in Agent2) - absolute pathname of directory where to store persistent files. See also additional notes on <b>persistent files</b>.</p> | <p>The item must be configured as an <b>active check</b>.</p> <p>Matching lines are counted in the new lines since the last log check by the agent, and thus depend on the item update interval.</p> <p>If the file is missing or permissions do not allow access, item turns unsupported.</p> <p>This item is not supported for Windows Event Log.</p> <p>Supported since Zabbix 3.2.0.</p> |
| <b>logrt</b> [file_regexp,<regexp>,<encoding>,<maxlines>,<mode>,<output>,<maxdelay>,<options>,<persistent_dir>] |         |  |  |

Monitoring of  
a log file that  
is rotated.

Log

**file\_regexp** - absolute path to file, with the file name specified using a regular **expression**. Note that the regular expression applies only to the file name and does not need to match the entire name (e.g., /path/to/agent will match zabbix\_agentd.log)

**regexp** - regular **expression** describing the required content pattern

**encoding** - code page **identifier**

**maxlines** - maximum number of new lines per second the agent will send to Zabbix server or proxy. This parameter overrides the value of 'MaxLinesPerSecond' in **zabbix\_agentd.conf**

**mode** (since version 2.0) - possible values:  
*all* (default), *skip* - skip processing of older data (affects only newly created items).

**output** (since version 2.2) - an optional output formatting template. The **\0** escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an **\N** (where N=1...9) escape sequence is replaced with Nth matched group (or an empty string if the N exceeds the number of captured groups).

**maxdelay** (since version 3.2) - maximum delay in seconds. Type: float. Values: 0 - (default) never ignore log file lines; > 0.0 - ignore older lines in order to get the most recent lines analyzed within "maxdelay" seconds. Read the **maxdelay** notes before using it!

**options** (since version 4.0; *mtime-reread*, *mtime-noread* options since 4.4.7) - type of log file rotation and other options. Possible values:  
*rotate* (default),  
*copytruncate* - note that *copytruncate* cannot be used together with *maxdelay*. In this case *maxdelay* must be 0 or not specified; see **copytruncate** notes,  
*mtime-reread* - non-unique records, reread if modification time or size changes (default),  
*mtime-noread* - non-unique records, reread only if the size changes (ignore modification time change).

**persistent\_dir** (since versions 5.0.18, 5.4.9, only in zabbix\_agentd on Unix systems; not supported in Agent2) - absolute pathname of directory where to store persistent files. See also additional notes on **persistent files**.

The item must be configured as an **active check**.

Log rotation is based on the last modification time of files.

Note that logrt is designed to work with one currently active log file, with several other matching inactive files rotated. If, for example, a directory has many active log files, a separate logrt item should be created for each one. Otherwise if one logrt item picks up too many files it may lead to exhausted memory and a crash of monitoring.

If output is left empty - the whole line containing the matched text is returned. Note that all global regular expression types except 'Result is TRUE' always return the whole matched line and the output parameter is ignored.

Content extraction using the output parameter takes place on the agent.

In the **file regexp** parameter, the log directory path and log file regular expression must be separated by the correct directory separator:

- on Windows, the separator must be a backslash (\);
- on other systems, it must be a forward slash (/).

Forward slashes may be tolerated on Windows at other positions, except the one that separates the log directory path and the log file regular expression (see examples below).

Examples for Windows:

```
=> lo-
grt["c:/dir1/dir2/dir3&#92;filename.*.log","pattern_to_m
→ will collect data from log files in
"c:/dir1/dir2/dir3" where the file name
starts with "filename" and ends with any
extension matching ".log"
=> lo-
grt["//example.com/share/dir1/dir2/dir3\filename.*.log",
→ will collect data from log files in the
network share
"//example.com/share/dir1/dir2/dir3"
where the file name starts with "filename"
and ends with any extension matching
".log".
```

Examples for other systems:

```
=> logrt[/home/zabbix/logs/^logfile[0-
9]{1,3}$",,,100] → will match a file like
"logfile1" (will not match ".logfile1")
=> logrt[/home/user/^logfile_.*_[0-
9]{1,3}$","pattern_to_match","UTF-
8",100] → will collect data from files such
"logfile_abc_1" or "logfile__001".
```

Using *output* parameter for extracting a

---

```
logrt.count[file_regexp,<regexp>,<encoding>,<maxproclines>,<mode>,<maxdelay>,<options>,<persistent_dir>]
```

---

Count of  
matched lines  
in a  
monitored log  
file that is  
rotated.

Integer

**file\_regexp** - absolute path to file, with the file name specified using a regular expression. Note that the regular expression applies only to the file name and does not need to match the entire name (e.g., /path/to/agent will match zabbix\_agentd.log)

**regexp** - regular expression describing the required content pattern

**encoding** - code page identifier

**maxproclines** - maximum number of new lines per second the agent will analyze (cannot exceed 10000). Default value is 10\*MaxLinesPerSecond' in

**zabbix\_agentd.conf**.

**mode** - possible values:

*all* (default), *skip* - skip processing of older data (affects only newly created items).

**maxdelay** - maximum delay in seconds.

Type: float. Values: 0 - (default) never ignore log file lines; > 0.0 - ignore older lines in order to get the most recent lines analyzed within "maxdelay" seconds.

Read the **maxdelay** notes before using it!

**options** (since version 4.0; *mtime-reread*, *mtime-noread* options since 4.4.7) -

type of log file rotation and other options.

Possible values:

*rotate* (default),

*copytruncate* - note that *copytruncate* cannot be used together with *maxdelay*.

In this case *maxdelay* must be 0 or not specified; see **copytruncate** notes,

*mtime-reread* - non-unique records, reread if modification time or size changes (default),

*mtime-noread* - non-unique records, reread only if the size changes (ignore modification time change).

**persistent\_dir** (since versions 5.0.18, 5.4.9, only in zabbix\_agentd on Unix systems; not supported in Agent2) - absolute pathname of directory where to store persistent files. See also additional notes on **persistent files**.

The item must be configured as an **active check**.

Matching lines are counted in the new lines since the last log check by the agent, and thus depend on the item update interval.

Log rotation is based on the last modification time of files.

This item is not supported for Windows Event Log.

Supported since Zabbix 3.2.0.

In the **file regexp** parameter, the log directory path and log file regular expression must be separated by the correct directory separator:

- on Windows, the separator must be a backslash (\);

- on other systems, it must be a forward slash (/).

Forward slashes may be tolerated on Windows at other positions, except the one that separates the log directory path and the log file regular expression (see examples below):

Examples for Windows:

=> lo-

grt.count["c:/dir1/dir2/dir3&#92;filename.\*.log","pattern\_to\_match"]  
→ will count the number of matches for the pattern "pattern\_to\_match" in log files located in "c:/dir1/dir2/dir3"

=> lo-

grt.count["//example.com/share/dir1/dir2/dir3\\filename.\*.log","pattern\_to\_match"]  
→ will count the number of matches for the pattern "pattern\_to\_match" in log files on the network share  
"//example.com/share/dir1/dir2/dir3".

Examples for other systems:

=>

logrt.count["/home/zabbix/logs/^logfile[0-9]{1,3}\$",,100] → will count the number of matches for the pattern

"^logfile[0-9]{1,3}\$" in log files in the "/home/zabbix/logs" directory

=> logrt.count["/home/user/^logfile.\_\*[0-9]{1,3}\$","pattern\_to\_match","UTF-8",100] → will count the number of occurrences of the pattern "pattern\_to\_match" in log files located in "/home/user".

---

| Item key  |              |  |                               |
|---|--------------|--|-------------------------------|
| Description   | Return value | Parameters   | Comments                      |
| <b>modbus.get</b> [endpoint,<slave id>,<function>,<address>,<count>,<type>,<endianness>,<offset>] |              |  |                               |
| Reads Modbus data.  | JSON object  | <b>endpoint</b> - endpoint defined as <code>protocol://connection_string</code><br><b>slave id</b> - slave ID<br><b>function</b> - Modbus function<br><b>address</b> - address of first registry, coil or input<br><b>count</b> - number of records to read<br><b>type</b> - type of data<br><b>endianness</b> - endianness configuration<br><b>offset</b> - number of registers, starting from 'address', the results of which will be discarded. | Supported since Zabbix 5.2.0. |
| See a <a href="#">detailed description</a> of parameters.   |              |  |                               |

## Network data

| Item key  |  |   |   |
|---|--|---|---|
| Description   | Return value   | Parameters  | Comments  |
| <b>net.dns</b> [<ip>,<name>,<type>,<timeout>,<count>,<protocol>]        |  |   |   |
| Checks if DNS service is up.  | 0 - DNS is down (server did not respond or DNS resolution failed)<br><br>1 - DNS is up | <b>ip</b> - IP address of DNS server (leave empty for the default DNS server, on Windows supported for Zabbix agent 2, ignored for Zabbix agent)<br><b>name</b> - DNS name to query<br><b>type</b> - record type to be queried (default is <i>SOA</i> )<br><b>timeout</b> (ignored on Windows, unless using Zabbix agent 2 version 6.0.1 or newer) - timeout for the request in seconds (default is 1 second)<br><b>count</b> (ignored on Windows, unless using Zabbix agent 2 version 6.0.1 or newer) - number of tries for the request (default is 2)<br><b>protocol</b> (since version 3.0) - the protocol used to perform DNS queries: <i>udp</i> (default) or <i>tcp</i> | Example:<br>=> <code>net.dns[8.8.8.8,example.com,MX,2,1]</code><br><br>The possible values for type are:<br><i>ANY, A, NS, CNAME, MB, MG, MR, PTR, MD, MF, MX, SOA, NULL, WKS</i> (not supported for Zabbix agent on Windows, Zabbix agent 2 on all OS), <i>HINFO, MINFO, TXT, AAAA, SRV</i><br><br>Internationalized domain names are not supported, please use IDNA encoded names instead.<br><br>SRV record type is supported since Zabbix 1.8.6 (Unix) and 2.0.0 (Windows).<br><br>Naming before Zabbix 2.0 (still supported): <i>net.tcp.dns</i> |
| <b>net.dns.record</b> [<ip>,<name>,<type>,<timeout>,<count>,<protocol>] |  |   |   |

| Item key  |  |  |  |
|---|--|--|--|
| Performs a DNS query.   | Character string with the required type of information | <p><b>ip</b> - IP address of DNS server (leave empty for the default DNS server, ignored on Windows, unless using Zabbix agent 2 version 6.0.1 or newer)</p> <p><b>name</b> - DNS name to query</p> <p><b>type</b> - record type to be queried (default is SOA)</p> <p><b>timeout</b> (ignored on Windows, unless using Zabbix agent 2 version 6.0.1 or newer) - timeout for the request in seconds (default is 1 second)</p> <p><b>count</b> (ignored on Windows, unless using Zabbix agent 2 version 6.0.1 or newer) - number of tries for the request (default is 2)</p> <p><b>protocol</b>(since version 3.0) - the protocol used to perform DNS queries: <i>udp</i> (default) or <i>tcp</i></p> | <p>Example:</p> <pre>=&gt; net.dns.record[8.8.8.8,example.com,MX,2,1]</pre> <p>The possible values for type are: <i>ANY, A, NS, CNAME, MB, MG, MR, PTR, MD, MF, MX, SOA, NULL, WKS</i> (not supported for Zabbix agent on Windows, Zabbix agent 2 on all OS), <i>HINFO, MINFO, TXT, AAAA, SRV</i></p> <p>Internationalized domain names are not supported, please use IDNA encoded names instead.</p> <p>SRV record type is supported since Zabbix 1.8.6 (Unix) and 2.0.0 (Windows).</p> <p>Naming before Zabbix 2.0 (still supported): <i>net.tcp.dns.query</i></p>   |
| <p><b>net.if.collisions</b>[if]</p> <p>Number of out-of-window collisions.</p> <p><b>net.if.discovery</b></p> <p>List of network interfaces.</p> <p>Used for low-level discovery.</p> | <p>Integer</p> <p>JSON object</p>                      | <p><b>if</b> - network interface name</p>  | <p>Supported since Zabbix 2.0.</p> <p>On FreeBSD, OpenBSD and NetBSD supported since Zabbix 2.2.</p> <p>Some Windows versions (for example, Server 2008) might require the latest updates installed to support non-ASCII characters in interface names.</p>  |
| <p><b>net.if.in</b>[if,&lt;mode&gt;]</p> <p>Incoming traffic statistics on network interface.</p>   | Integer  | <p><b>if</b> - network interface name (Unix); network interface full description or IPv4 address; or, if in braces, network interface GUID (Windows)</p> <p><b>mode</b> - possible values:</p> <p><i>bytes</i> - number of bytes (default)</p> <p><i>packets</i> - number of packets</p> <p><i>errors</i> - number of errors</p> <p><i>dropped</i> - number of dropped packets</p> <p><i>overruns (fifo)</i> - the number of FIFO buffer errors</p> <p><i>frame</i> - the number of packet framing errors</p> <p><i>compressed</i> - the number of compressed packets received by the device driver</p> <p><i>multicast</i> - the number of multicast frames received by the device driver</p>       | <p>On Windows, the item gets values from 64-bit counters if available. 64-bit interface statistic counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters.</p> <p>Multi-byte interface names on Windows are supported since Zabbix 1.8.6.</p> <p>Examples:</p> <pre>=&gt; net.if.in[eth0,errors] =&gt; net.if.in[eth0]</pre> <p>You may obtain network interface descriptions on Windows with <i>net.if.discovery</i> or <i>net.if.list</i> items.</p> <p>You may use this key with the <i>Change per second</i> preprocessing step in order to get bytes per second statistics.</p> |
| <b>net.if.out</b> [if,<mode>]   |  |  |  |

| Item key   |  |  |  |
|--|--|--|--|
| Outgoing traffic statistics on network interface.  | Integer  | <b>if</b> - network interface name (Unix); network interface full description or IPv4 address; or, if in braces, network interface GUID (Windows)<br><b>mode</b> - possible values:<br><i>bytes</i> - number of bytes (default)<br><i>packets</i> - number of packets<br><i>errors</i> - number of errors<br><i>dropped</i> - number of dropped packets<br><i>overruns (fifo)</i> - the number of FIFO buffer errors<br><i>collisions (colls)</i> - the number of collisions detected on the interface<br><i>carrier</i> - the number of carrier losses detected by the device driver<br><i>compressed</i> - the number of compressed packets transmitted by the device driver | <p>On Windows, the item gets values from 64-bit counters if available. 64-bit interface statistic counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters.</p> <p>Multi-byte interface names on Windows are supported since Zabbix agent 1.8.6 version.</p> <p>Examples:<br/> =&gt; net.if.out[eth0,errors]<br/> =&gt; net.if.out[eth0]</p> <p>You may obtain network interface descriptions on Windows with net.if.discovery or net.if.list items.</p> <p>You may use this key with the <i>Change per second</i> preprocessing step in order to get bytes per second statistics.</p>  |
| <b>net.if.total</b> [if,<mode>]<br>Sum of incoming and outgoing traffic statistics on network interface. | Integer  | <b>if</b> - network interface name (Unix); network interface full description or IPv4 address; or, if in braces, network interface GUID (Windows)<br><b>mode</b> - possible values:<br><i>bytes</i> - number of bytes (default)<br><i>packets</i> - number of packets<br><i>errors</i> - number of errors<br><i>dropped</i> - number of dropped packets<br><i>overruns (fifo)</i> - the number of FIFO buffer errors<br><i>compressed</i> - the number of compressed packets transmitted or received by the device driver  | <p>On Windows, the item gets values from 64-bit counters if available. 64-bit interface statistic counters were introduced in Windows Vista and Windows Server 2008. If 64-bit counters are not available, the agent uses 32-bit counters.</p> <p>Examples:<br/> =&gt; net.if.total[eth0,errors]<br/> =&gt; net.if.total[eth0]</p> <p>You may obtain network interface descriptions on Windows with net.if.discovery or net.if.list items.</p> <p>You may use this key with the <i>Change per second</i> preprocessing step in order to get bytes per second statistics.</p> <p>Note that dropped packets are supported only if both net.if.in and net.if.out work for dropped packets on your platform.</p> |
| <b>net.tcp.listen</b> [port]<br>Checks if this TCP port is in LISTEN state.                              | 0 - it is not in LISTEN state<br><br>1 - it is in LISTEN state | <b>port</b> - TCP port number  | <p>Example:<br/> =&gt; net.tcp.listen[80]</p> <p>On Linux supported since Zabbix 1.8.4</p> <p>Since Zabbix 3.0.0, on Linux kernels 2.6.14 and above, information about listening TCP sockets is obtained from the kernel's NETLINK interface, if possible. Otherwise, the information is retrieved from /proc/net/tcp and /proc/net/tcp6 files.</p>  |
| <b>net.tcp.port</b> [<ip>,port]  |  |  |  |

| Item key  |   |  |  |
|---|---|--|--|
| Checks if it is possible to make TCP connection to specified port.    | 0 - cannot connect<br><br>1 - can connect   | <b>ip</b> - IP or DNS name (default is 127.0.0.1)<br><b>port</b> - port number   | <p>Example:<br/>=&gt; net.tcp.port[,80] → can be used to test availability of web server running on port 80.</p> <p>For simple TCP performance testing use net.tcp.service.perf[tcp,&lt;ip&gt;,&lt;port&gt;]</p> <p>Note that these checks may result in additional messages in system daemon logfiles (SMTP and SSH sessions being logged usually).</p>   |
| <b>net.tcp.service</b> [service,<ip>,<port>]                          |   |  |  |
| Checks if service is running and accepting TCP connections.           | 0 - service is down<br><br>1 - service is running   | <b>service</b> - either of:<br><i>ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet</i> (see <a href="#">details</a> )<br><b>ip</b> - IP or DNS name (default is 127.0.0.1)<br><b>port</b> - port number (by default standard service port number is used) | <p>Example:<br/>=&gt; net.tcp.service[ftp,45] → can be used to test the availability of FTP server on TCP port 45.</p> <p>Note that these checks may result in additional messages in system daemon logfiles (SMTP and SSH sessions being logged usually).</p> <p>Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use net.tcp.port for checks like these.</p> <p>Checking of LDAP and HTTPS on Windows is only supported by Zabbix agent 2.</p> <p>Note that the telnet check looks for a login prompt (':' at the end).</p> <p><i>https</i> and <i>telnet</i> services are supported since Zabbix 2.0.</p> |
| <b>net.tcp.service.perf</b> [service,<ip>,<port>]                     |   |  |  |
| Checks performance of TCP service.                                    | Float<br><br>0 - service is down<br><br>seconds - the number of seconds spent while connecting to the service | <b>service</b> - either of:<br><i>ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet</i> (see <a href="#">details</a> )<br><b>ip</b> - IP or DNS name (default is 127.0.0.1)<br><b>port</b> - port number (by default standard service port number is used) | <p>Example:<br/>=&gt; net.tcp.service.perf[ssh] → can be used to test the speed of initial response from SSH server.</p> <p>Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use net.tcp.service.perf[tcp,&lt;ip&gt;,&lt;port&gt;] for checks like these.</p> <p>Checking of LDAP and HTTPS on Windows is only supported by Zabbix agent 2.</p> <p>Note that the telnet check looks for a login prompt (':' at the end).</p> <p><i>https</i> and <i>telnet</i> services are supported since Zabbix 2.0.</p>  |
| <b>net.tcp.socket.count</b> [<laddr>,<lport>,<raddr>,<rport>,<state>] |   |  |  |

| Item key  |   |   |  |
|---|---|---|--|
| Return the number of TCP sockets that match parameters.               | Integer   | <b>laddr</b> - local IPv4/6 address or CIDR subnet<br><b>lport</b> - local port number or service name<br><b>raddr</b> - remote IPv4/6 address or CIDR subnet<br><b>rport</b> - remote port number or service name<br><b>state</b> - connection state ( <i>established</i> , <i>syn_sent</i> , <i>syn_recv</i> , <i>fin_wait1</i> , <i>fin_wait2</i> , <i>time_wait</i> , <i>close</i> , <i>close_wait</i> , <i>last_ack</i> , <i>listen</i> , <i>closing</i> ) | <p>This item is supported on Linux only on both Zabbix agent/agent 2. On Zabbix agent 2 it is also supported on 64-bit Windows.</p> <p>Example:<br/> =&gt; net.tcp.socket.count[,80,,,established]<br/> → returns the number of connections to local TCP port 80 in the <i>established</i> state</p> <p>This item is supported since Zabbix 6.0.</p> |
| <b>net.udp.listen</b> [port]  |   |   |  |
| Checks if this UDP port is in LISTEN state.                           | 0 - it is not in LISTEN state<br><br>1 - it is in LISTEN state  | <b>port</b> - UDP port number   | <p>Example:<br/> =&gt; net.udp.listen[68]</p> <p>On Linux supported since Zabbix 1.8.4</p>   |
| <b>net.udp.service</b> [service,<ip>,<port>]                          |   |   |  |
| Checks if service is running and responding to UDP requests.          | 0 - service is down<br><br>1 - service is running   | <b>service</b> - <i>ntp</i> (see <a href="#">details</a> )<br><b>ip</b> - IP or DNS name (default is 127.0.0.1)<br><b>port</b> - port number (by default standard service port number is used)  | <p>Example:<br/> =&gt; net.udp.service[ntp,,45] → can be used to test the availability of NTP service on UDP port 45.</p> <p>This item is supported since Zabbix 3.0.0, but <i>ntp</i> service was available for net.tcp.service[] item in prior versions.</p>   |
| <b>net.udp.service.perf</b> [service,<ip>,<port>]                     |   |   |  |
| Checks performance of UDP service.                                    | Float<br><br>0 - service is down<br><br>seconds - the number of seconds spent waiting for response from the service | <b>service</b> - <i>ntp</i> (see <a href="#">details</a> )<br><b>ip</b> - IP or DNS name (default is 127.0.0.1)<br><b>port</b> - port number (by default standard service port number is used)  | <p>Example:<br/> =&gt; net.udp.service.perf[ntp] → can be used to test response time from NTP service.</p> <p>This item is supported since Zabbix 3.0.0, but <i>ntp</i> service was available for net.tcp.service[] item in prior versions.</p>  |
| <b>net.udp.socket.count</b> [<laddr>,<lport>,<raddr>,<rport>,<state>] |   |   |  |
| Return the number of UDP sockets that match parameters.               | Integer   | <b>laddr</b> - local IPv4/6 address or CIDR subnet<br><b>lport</b> - local port number or service name<br><b>raddr</b> - remote IPv4/6 address or CIDR subnet<br><b>rport</b> - remote port number or service name<br><b>state</b> - connection state ( <i>established</i> , <i>unconn</i> )  | <p>This item is supported on Linux only on both Zabbix agent/agent 2. On Zabbix agent 2 it is also supported on 64-bit Windows.</p> <p>Example:<br/> =&gt; net.udp.socket.count[,,,,established] → returns the number of UDP sockets in the connected state</p> <p>This item is supported since Zabbix 6.0.</p>                                      |

## Process data

| Item key  |              |            |          |
|---|--------------|------------|----------|
| Description   | Return value | Parameters | Comments |
| <b>proc.cpu.util</b> [<name>,<user>,<type>,<cmdline>,<mode>,<zone>] |              |            |          |

| Item key   |       |   |   |
|--|-------|---|---|
| Process CPU utilization percentage.                        | Float | <p><b>name</b> - process name (default is <i>all processes</i>)</p> <p><b>user</b> - user name (default is <i>all users</i>)</p> <p><b>type</b> - CPU utilization type: <i>total</i> (default), <i>user</i>, <i>system</i></p> <p><b>cmdline</b> - filter by command line (it is a regular <i>expression</i>)</p> <p><b>mode</b> - data gathering mode: <i>avg1</i> (default), <i>avg5</i>, <i>avg15</i></p> <p><b>zone</b> - target zone: <i>current</i> (default), <i>all</i>. This parameter is supported on Solaris only.</p> | <p>Examples:</p> <p>=&gt; <code>proc.cpu.util[,root]</code> → CPU utilization of all processes running under the "root" user</p> <p>=&gt; <code>proc.cpu.util[zabbix_server,zabbix]</code> → CPU utilization of all <code>zabbix_server</code> processes running under the <code>zabbix</code> user</p> <p>The returned value is based on single CPU core utilization percentage. For example CPU utilization of a process fully using two cores is 200%.</p> <p>The process CPU utilization data is gathered by a collector which supports the maximum of 1024 unique (by name, user and command line) queries. Queries not accessed during the last 24 hours are removed from the collector.</p> <p><i>Note</i> that when setting the <code>zone</code> parameter to <i>current</i> (or default) in case the agent has been compiled on a Solaris without zone support, but running on a newer Solaris where zones are supported, then the agent will return NOTSUPPORTED (the agent cannot limit results to only the current zone). However, <i>all</i> is supported in this case.</p> <p>This key is supported since Zabbix 3.0.0 and is available on several platforms (see <i>Items supported by platform</i>).</p> |
| <b>proc.mem</b> [<name>,<user>,<mode>,<cmdline>,<memtype>] |       |   |   |

| Item key   |  |   |  |
|--|--|---|--|
| Memory used by process in bytes.                         | Integer - with mode as <i>max, min, sum</i><br><br>Float - with mode as <i>avg</i> | <b>name</b> - process name (default is <i>all processes</i> )<br><b>user</b> - user name (default is <i>all users</i> )<br><b>mode</b> - possible values: <i>avg, max, min, sum</i> (default)<br><b>cmdline</b> - filter by command line (it is a regular <i>expression</i> )<br><b>memtype</b> - <i>type of memory</i> used by process | Examples:<br>=> <code>proc.mem[,root]</code> → memory used by all processes running under the "root" user<br>=> <code>proc.mem[zabbix_server,zabbix]</code> → memory used by all <code>zabbix_server</code> processes running under the <code>zabbix</code> user<br>=> <code>proc.mem[,oracle,max,oracleZABBIX]</code> → memory used by the most memory-hungry process running under <code>oracle</code> having <code>oracleZABBIX</code> in its command line<br><br><i>Note:</i> When several processes use shared memory, the sum of memory used by processes may result in large, unrealistic values.<br><br>See <i>notes</i> on selecting processes with <code>name</code> and <code>cmdline</code> parameters (Linux-specific).<br><br>When this item is invoked from the command line and contains a command line parameter (e.g. using the agent test mode: <code>zabbix_agentd -t proc.mem[, , ,apache2]</code> ), one extra process will be counted, as the agent will count itself.<br><br>The <code>memtype</code> parameter is supported on several <i>platforms</i> since Zabbix 3.0.0. |
| <b>proc.num</b> [<name>,<user>,<state>,<cmdline>,<zone>] |  |   |  |

| Item key                 |         |  |  |
|--------------------------|---------|--|--|
| The number of processes. | Integer | <p><b>name</b> - process name (default is <i>all processes</i>)</p> <p><b>user</b> - user name (default is <i>all users</i>)</p> <p><b>state</b> (<i>disk</i> and <i>trace</i> options since version 3.4.0) - possible values:<br/> <i>all</i> (default),<br/> <i>disk</i> - uninterruptible sleep,<br/> <i>run</i> - running,<br/> <i>sleep</i> - interruptible sleep,<br/> <i>trace</i> - stopped,<br/> <i>zomb</i> - zombie</p> <p><b>cmdline</b> - filter by command line (it is a regular <i>expression</i>)</p> <p><b>zone</b> - target zone: <i>current</i> (default), <i>all</i>. This parameter is supported on Solaris only.</p> | <p>Examples:</p> <p>=&gt; <code>proc.num[mysql]</code> → number of processes running under the mysql user</p> <p>=&gt; <code>proc.num[apache2,www-data]</code> → number of apache2 processes running under the www-data user</p> <p>=&gt; <code>proc.num[oracle,sleep,oracleZABBIX]</code> → number of processes in sleep state running under oracle having oracleZABBIX in its command line</p> <p>See <i>notes</i> on selecting processes with <i>name</i> and <i>cmdline</i> parameters (Linux-specific).</p> <p>On Windows, only the <i>name</i> and <i>user</i> parameters are supported.</p> <p>When this item is invoked from the command line and contains a command line parameter (e.g. using the agent test mode: <code>zabbix_agentd -t proc.num[, , apache2]</code>), one extra process will be counted, as the agent will count itself.</p> <p><i>Note</i> that when setting the <i>zone</i> parameter to <i>current</i> (or default) in case the agent has been compiled on a Solaris without zone support, but running on a newer Solaris where zones are supported, then the agent will return NOTSUPPORTED (the agent cannot limit results to only the current zone). However, <i>all</i> is supported in this case.</p> |

## Sensor data

| Item key                             |              |   |   |
|--------------------------------------|--------------|---|---|
| Description                          | Return value | Parameters  | Comments  |
| <b>sensor</b> [device,sensor,<mode>] |              |   |   |
| Hardware sensor reading.             | Float        | <p><b>device</b> - device name; can be a regular <i>expression</i> if mode is omitted</p> <p><b>sensor</b> - sensor name; can be a regular <i>expression</i> if mode is omitted</p> <p><b>mode</b> - possible values:<br/> <i>avg</i>, <i>max</i>, <i>min</i> (if this parameter is omitted, device and sensor are treated verbatim).</p> | <p>Reads <code>/proc/sys/dev/sensors</code> on Linux 2.4.</p> <p>Example:<br/> =&gt; <code>sensor[w83781d-i2c-0-2d,temp1]</code></p> <p>Prior to Zabbix 1.8.4, the <i>sensor[temp1]</i> format was used.</p> <p>Reads <code>/sys/class/hwmon</code> on Linux 2.6+.</p> <p>See a more detailed description of <i>sensor</i> item on Linux.</p> |

| Item key |  |
|----------|--|
|          | Reads the <i>hw.sensors</i> MIB on OpenBSD.  |
|          | <p>Examples:</p> <p>=&gt; sensor[cpu0,temp0] → temperature of one CPU</p> <p>=&gt; sensor["cpu[0-2]\$,temp,avg] → average temperature of the first three CPU's</p> |
|          | Supported on OpenBSD since Zabbix 1.8.4.   |

## System data

| Item key   |                          |   |   |
|--|--------------------------|---|---|
| Description  | Return value             | Parameters  | Comments  |
| <b>system.boottime</b>   |                          |   |   |
| System boot time.  | Integer (Unix timestamp) |   |   |
| <b>system.cpu.discovery</b>  |                          |   |   |
| List of detected CPUs/CPU cores. Used for low-level discovery.     | JSON object              |   | Supported on all platforms since 2.4.0.   |
| <b>system.cpu.intr</b>   |                          |   |   |
| Device interrupts.   | Integer                  |   |   |
| <b>system.cpu.load</b> [<cpu>,<mode>]                              |                          |   |   |
| <a href="#">CPU load</a> .   | Float                    | <b>cpu</b> - possible values:<br><i>all</i> (default), <i>percpu</i> (since version 2.0; total load divided by online CPU count)<br><b>mode</b> - possible values:<br><i>avg1</i> (one-minute average, default), <i>avg5</i> , <i>avg15</i> | <p>When a collector process is started on Zabbix agent on Windows, the following performance counters are initialized and later used for this item:</p> <p>\System\Processor Queue Length</p> <p>Example:<br/>=&gt; system.cpu.load[,avg5].</p> |
| <b>system.cpu.num</b> [<type>]                                     |                          |   |   |
| Number of CPUs.  | Integer                  | <b>type</b> - possible values:<br><i>online</i> (default), <i>max</i>   | <p>Example:<br/>=&gt; system.cpu.num</p>  |
| <b>system.cpu.switches</b>   |                          |   |   |
| Count of context switches.   | Integer                  |   |   |
| <b>system.cpu.util</b> [<cpu>,<type>,<mode>,<logical_or_physical>] |                          |   |   |

| Item key  |        |   |   |
|---|--------|---|---|
| CPU utilization percentage.                                       | Float  | <p><b>cpu</b> - &lt;CPU number&gt; or <i>all</i> (default)</p> <p><b>type</b> - possible values:<br/> <i>user</i> (default), <i>idle</i>, <i>nice</i>, <i>system</i> (default for Windows), <i>iowait</i>, <i>interrupt</i>, <i>softirq</i>, <i>steal</i>, <i>guest</i> (on Linux kernels 2.6.24 and above), <i>guest_nice</i> (on Linux kernels 2.6.33 and above).</p> <p>See also <a href="#">platform-specific</a> details for this parameter.</p> <p><b>mode</b> - possible values:<br/> <i>avg1</i> (one-minute average, default), <i>avg5</i>, <i>avg15</i></p> <p><b>logical_or_physical</b> (since version 5.0.3; on AIX only) - possible values: <i>logical</i> (default), <i>physical</i>. This parameter is supported on AIX only.</p> | <p>On Windows the value is acquired using the <i>Processor Time</i> performance counter. Note that since Windows 8 its Task Manager shows CPU utilization based on the <i>Processor Utility</i> performance counter, while in previous versions it was the <i>Processor Time</i> counter (see <a href="#">more details</a>).</p> <p>Example:<br/> =&gt; system.cpu.util[0,user,avg5]</p> <p>Old naming: <i>system.cpu.idleX</i>, <i>system.cpu.niceX</i>, <i>system.cpu.systemX</i>, <i>system.cpu.userX</i></p>  |
| <b>system.hostname</b> [<type>, <transform>]<br>System host name. | String | <p><b>type</b> (before version 5.4.7 supported on Windows only) - possible values: <i>netbios</i> (default on Windows), <i>host</i> (default on Linux), <i>shorthost</i> (since version 5.4.7; returns part of the hostname before the first dot, a full string for names without dots).</p> <p><b>transform</b> (since version 5.4.7) - possible values:<br/> <i>none</i> (default), <i>lower</i> (convert to lowercase)</p>   | <p>The value is acquired by either GetComputerName() (for <b>netbios</b>) or gethostname() (for <b>host</b>) functions on Windows and by taking <i>nodename</i> from the uname() system API output on other systems.</p> <p>Examples of returned values:<br/> <i>on Linux:</i><br/> =&gt; system.hostname → linux-w7x1<br/> =&gt; system.hostname → example.com<br/> =&gt; system.hostname[shorthost] → example<br/> <i>on Windows:</i><br/> =&gt; system.hostname → WIN-SERV2008-I6<br/> =&gt; system.hostname[host] → Win-Serv2008-I6LonG<br/> =&gt; system.hostname[host,lower] → win-serv2008-i6long</p> <p>See also a <a href="#">more detailed description</a>.</p> |
| <b>system.hw.chassis</b> [<info>]<br>Chassis information.         | String | <p><b>info</b> - one of <i>full</i> (default), <i>model</i>, <i>serial</i>, <i>type</i> or <i>vendor</i></p>  | <p>Example:<br/> =&gt; system.hw.chassis[full] → Hewlett-Packard HP Pro 3010 Small Form Factor PC CZXXXXXXXX Desktop</p> <p>This key depends on the availability of the <a href="#">SMBIOS</a> table. Will try to read the DMI table from sysfs, if sysfs access fails then try reading directly from memory.</p> <p><b>Root permissions</b> are required because the value is acquired by reading from sysfs or memory.</p> <p>Supported since Zabbix 2.0.</p>   |
| <b>system.hw.cpu</b> [<cpu>, <info>]                              |        |   |   |

| Item key   |   |  |   |
|--|---|--|---|
| CPU information.   | String or integer   | <b>cpu</b> - <CPU number> or <i>all</i> (default)<br><b>info</b> - possible values:<br><i>full</i> (default), <i>curfreq</i> , <i>maxfreq</i> , <i>model</i> or <i>vendor</i>  | <p>Example:<br/> =&gt; system.hw.cpu[0,vendor] → AuthenticAMD</p> <p>Gathers info from /proc/cpuinfo and /sys/devices/system/cpu/[cpunum]/cpufreq/cpuinfo_max</p> <p>If a CPU number and <i>curfreq</i> or <i>maxfreq</i> is specified, a numeric value is returned (Hz).</p> <p>Supported since Zabbix 2.0.</p>  |
| <b>system.hw.devices</b> [<type>]<br>Listing of PCI or USB devices.          | Text  | <b>type</b> (since version 2.0) - <i>pci</i> (default) or <i>usb</i>   | <p>Example:<br/> =&gt; system.hw.devices[pci] → 00:00.0<br/> Host bridge: Advanced Micro Devices [AMD] RS780 Host Bridge<br/> [..]</p> <p>Returns the output of either lspci or lsusb utility (executed without any parameters).</p>  |
| <b>system.hw.macaddr</b> [<interface>,<format>]<br>Listing of MAC addresses. | String  | <b>interface</b> - <i>all</i> (default) or a regular <i>expression</i><br><b>format</b> - <i>full</i> (default) or <i>short</i>  | <p>Lists MAC addresses of the interfaces whose name matches the given <i>interface</i> regular <i>expression</i> (<i>all</i> lists for all interfaces).</p> <p>Example:<br/> =&gt; system.hw.macaddr["eth0\$",full] → [eth0] 00:11:22:33:44:55</p> <p>If <i>format</i> is specified as <i>short</i>, interface names and identical MAC addresses are not listed.</p> <p>Supported since Zabbix 2.0.</p> |
| <b>system.localtime</b> [<type>]<br>System time.                             | Integer - with type as <i>utc</i><br><br>String - with type as <i>local</i> | <b>type</b> (since version 2.0) - possible values:<br><i>utc</i> - (default) the time since the Epoch (00:00:00 UTC, January 1, 1970), measured in seconds.<br><i>local</i> - the time in the 'yyyy-mm-dd,hh:mm:ss.nnn, +hh:mm' format | <p>Must be used as a <i>passive check</i> only.</p> <p>Example:<br/> =&gt; system.localtime[local] → create an item using this key and then use it to display host time in the <i>Clock dashboard widget</i>.</p>   |
| <b>system.run</b> [command,<mode>]   |   |  |   |

| Item key                             |   |   |  |
|--------------------------------------|---|---|--|
| Run specified command on the host.   | Text result of the command<br><br>1 - with mode as <i>nowait</i> (regardless of command result) | <b>command</b> - command for execution<br><b>mode</b> - possible values:<br><i>wait</i> - wait end of execution (default),<br><i>nowait</i> - do not wait | <p>The return value of the item is a standard output together with a standard error produced by the command. <b>Exit code checking</b> is not performed.<br/>See also: <b>Command execution</b></p> <p>To be processed correctly, the return value of the command must be of text data type. An empty result is also allowed.</p> <p>The return value is limited to 16MB (including trailing whitespace that is truncated); <b>database limits</b> also apply.</p> <p>Note that system.run items are disabled by default. Learn how to <b>enable them</b>.</p> <p>Example:<br/>=&gt; system.run[ls -l /] → detailed file list of root directory.</p> |
| <b>system.stat</b> [resource,<type>] |   |   |  |

| Item key                          |                                    |   |   |
|-----------------------------------|------------------------------------|---|---|
| System statistics.                | Integer or float                   | <p><b>ent</b> - number of processor units this partition is entitled to receive (float)</p> <p><b>kthr,&lt;type&gt;</b> - information about kernel thread states:</p> <p><i>r</i> - average number of runnable kernel threads (float)</p> <p><i>b</i> - average number of kernel threads placed in the Virtual Memory Manager wait queue (float)</p> <p><b>memory,&lt;type&gt;</b> - information about the usage of virtual and real memory:</p> <p><i>avm</i> - active virtual pages (integer)</p> <p><i>fre</i> - size of the free list (integer)</p> <p><b>page,&lt;type&gt;</b> - information about page faults and paging activity:</p> <p><i>fi</i> - file page-ins per second (float)</p> <p><i>fo</i> - file page-outs per second (float)</p> <p><i>pi</i> - pages paged in from paging space (float)</p> <p><i>po</i> - pages paged out to paging space (float)</p> <p><i>fr</i> - pages freed (page replacement) (float)</p> <p><i>sr</i> - pages scanned by page-replacement algorithm (float)</p> <p><b>faults,&lt;type&gt;</b> - trap and interrupt rate:</p> <p><i>in</i> - device interrupts (float)</p> <p><i>sy</i> - system calls (float)</p> <p><i>cs</i> - kernel thread context switches (float)</p> <p><b>cpu,&lt;type&gt;</b> - breakdown of percentage usage of processor time:</p> <p><i>us</i> - user time (float)</p> <p><i>sy</i> - system time (float)</p> <p><i>id</i> - idle time (float)</p> <p><i>wa</i> - idle time during which the system had outstanding disk/NFS I/O request(s) (float)</p> <p><i>pc</i> - number of physical processors consumed (float)</p> <p><i>ec</i> - the percentage of entitled capacity consumed (float)</p> <p><i>lbusy</i> - indicates the percentage of logical processor(s) utilization that occurred while executing at the user and system level (float)</p> <p><i>app</i> - indicates the available physical processors in the shared pool (float)</p> <p><b>disk,&lt;type&gt;</b> - disk statistics:</p> <p><i>bps</i> - indicates the amount of data transferred (read or written) to the drive in bytes per second (integer)</p> <p><i>tps</i> - indicates the number of transfers per second that were issued to the physical disk/tape (float)</p> | <p>This item is <b>supported</b> on AIX only.</p> <p>Take note of the following limitations in these items:</p> <p>=&gt; system.stat[cpu,app] - supported only on AIX LPAR of type "Shared"</p> <p>=&gt; system.stat[cpu,ec] - supported on AIX LPAR of type "Shared" and "Dedicated" ("Dedicated" always returns 100 (percent))</p> <p>=&gt; system.stat[cpu,lbusy] - supported only on AIX LPAR of type "Shared"</p> <p>=&gt; system.stat[cpu,pc] - supported on AIX LPAR of type "Shared" and "Dedicated"</p> <p>=&gt; system.stat[ent] - supported on AIX LPAR of type "Shared" and "Dedicated"</p> |
| <b>system.sw.arch</b>             | Software architecture information. | String  | <p>Example:</p> <p>=&gt; system.sw.arch → i686</p> <p>Info is acquired from uname() function.</p> <p>Supported since Zabbix 2.0.</p>  |
| <b>system.sw.os[&lt;info&gt;]</b> |                                    |   |   |

| Item key   |         |  |   |
|--|---------|--|---|
| Operating system information.  | String  | <b>info</b> - possible values:<br><i>full</i> (default), <i>short</i> or <i>name</i>   | Example:<br>=> system.sw.os[short] → Ubuntu 2.6.35-28.50-generic 2.6.35.11<br><br>Info is acquired from (note that not all files and options are present in all distributions):<br>/proc/version ( <i>full</i> )<br>/proc/version_signature ( <i>short</i> )<br>PRETTY_NAME parameter from /etc/os-release on systems supporting it, or /etc/issue.net ( <i>name</i> )<br><br>Supported since Zabbix 2.0.   |
| <b>system.sw.packages</b> [<regexp>,<manager>,<format>]<br>Listing of installed packages.  | Text    | <b>regexp</b> - <i>all</i> (default) or a regular <b>expression</b><br><b>manager</b> - <i>all</i> (default) or a package manager<br><b>format</b> - <i>full</i> (default) or <i>short</i>   | Lists (alphabetically) installed packages whose name matches the given package regular <b>expression</b> ( <i>all</i> lists them all).<br><br>Example:<br>=> system.sw.packages[mini,dpkg,short]<br>→ python-minimal, python2.6-minimal, ubuntu-minimal<br><br>Supported package managers (executed command):<br>dpkg (dpkg --get-selections)<br>pkgtool (ls /var/log/packages)<br>rpm (rpm -qa)<br>pacman (pacman -Q)<br><br>If <b>format</b> is specified as <i>full</i> , packages are grouped by package managers (each manager on a separate line beginning with its name in square brackets).<br>If <b>format</b> is specified as <i>short</i> , packages are not grouped and are listed on a single line.<br><br>Supported since Zabbix 2.0. |
| <b>system.swap.in</b> [<device>,<type>]<br>Swap in (from device into memory) statistics.   | Integer | <b>device</b> - device used for swapping (default is <i>all</i> )<br><b>type</b> - possible values:<br><i>count</i> (number of swapins), <i>sectors</i> (sectors swapped in), <i>pages</i> (pages swapped in).<br>See also <b>platform-specific</b> details for this parameter.    | Example:<br>=> system.swap.in[,pages]<br><br>The source of this information is:<br>/proc/swaps, /proc/partitions, /proc/stat (Linux 2.4)<br>/proc/swaps, /proc/diskstats, /proc/vmstat (Linux 2.6)  |
| <b>system.swap.out</b> [<device>,<type>]<br>Swap out (from memory onto device) statistics. | Integer | <b>device</b> - device used for swapping (default is <i>all</i> )<br><b>type</b> - possible values:<br><i>count</i> (number of swapouts), <i>sectors</i> (sectors swapped out), <i>pages</i> (pages swapped out).<br>See also <b>platform-specific</b> details for this parameter. | Example:<br>=> system.swap.out[,pages]<br><br>The source of this information is:<br>/proc/swaps, /proc/partitions, /proc/stat (Linux 2.4)<br>/proc/swaps, /proc/diskstats, /proc/vmstat (Linux 2.6)   |
| <b>system.swap.size</b> [<device>,<type>]  |         |  |   |

| Item key  |   |   |  |
|---|---|---|--|
| Swap space size in bytes or in percentage from total. | Integer - for bytes<br><br>Float - for percentage | <b>device</b> - device used for swapping (default is <i>all</i> )<br><b>type</b> - possible values:<br><i>free</i> (free swap space, default), <i>pfree</i> (free swap space, in percent), <i>pusd</i> (used swap space, in percent), <i>total</i> (total swap space), <i>used</i> (used swap space)<br>Note that <i>pfree</i> , <i>pusd</i> are not supported on Windows if swap size is 0.<br>See also <b>platform-specific</b> details for this parameter. | Example:<br>=> system.swap.size[,pfree] → free swap space percentage<br><br>If <i>device</i> is not specified Zabbix agent will only take into account swap devices (files), physical memory will be ignored. For example, on Solaris systems <i>swap -s</i> command includes a portion of physical memory and swap devices (unlike <i>swap -l</i> ).<br><br>Note that this key might report incorrect swap space size/percentage on virtualized (VMware ESXi, VirtualBox) Windows platforms. In this case you may use the <code>perf_counter[\700(_Total)\702]</code> key to obtain correct swap space percentage.  |
| <b>system.uname</b>                                   |   |   |  |
| Identification of the system.                         | String  |   | Example of returned value (Unix):<br>FreeBSD localhost 4.2-RELEASE FreeBSD 4.2-RELEASE #0: Mon Nov i386<br><br>Example of returned value (Windows):<br>Windows ZABBIX-WIN 6.0.6001 Microsoft® Windows Server® 2008 Standard Service Pack 1 x86<br><br>On Unix since Zabbix 2.2.0 the value for this item is obtained with <code>uname()</code> system call. Previously it was obtained by invoking " <code>uname -a</code> ". The value of this item might differ from the output of " <code>uname -a</code> " and does not include additional information that " <code>uname -a</code> " prints based on other sources.<br><br>On Windows since Zabbix 3.0 the value for this item is obtained from <code>Win32_OperatingSystem</code> and <code>Win32_Processor</code> WMI classes. Previously it was obtained from volatile Windows APIs and undocumented registry keys. The OS name (including edition) might be translated to the user's display language. On some versions of Windows it contains trademark symbols and extra spaces.<br><br>Note that on Windows the item returns OS architecture, whereas on Unix it returns CPU architecture. |
| <b>system.uptime</b>                                  |   |   |  |
| System uptime in seconds.                             | Integer   |   | In <b>item configuration</b> , use <b>s</b> or <b>uptime</b> units to get readable values.   |
| <b>system.users.num</b>                               |   |   |  |
| Number of users logged in.                            | Integer   |   | <b>who</b> command is used on the agent side to obtain the value.  |

| Item key   |   |   |  |
|--|---|---|--|
| Description  | Return value  | Parameters  | Comments   |
| <b>vfs.dev.discovery</b>   |   |   |  |
| List of block devices and their type.<br>Used for low-level discovery.   | JSON object   |   | This item is supported on Linux platform only.<br><br>Supported since Zabbix 4.4.0.  |
| <b>vfs.dev.read</b> [<device>,<type>,<mode>]   |   |   |  |
| Disk read statistics.  | Integer - with type in <i>sectors, operations, bytes</i><br><br>Float - with type in <i>sps, ops, bps</i><br><br><i>Note</i> : if using an update interval of three hours or more <sup>2</sup> , will always return '0' | <b>device</b> - disk device (default is <i>all</i> <sup>3</sup> )<br><b>type</b> - possible values: <i>sectors, operations, bytes, sps, ops, bps</i><br>Note that 'type' parameter support and defaults depend on the platform. See <a href="#">platform-specific</a> details.<br><i>sps, ops, bps</i> stand for: sectors, operations, bytes per second, respectively.<br><b>mode</b> - possible values: <i>avg1</i> (one-minute average, default), <i>avg5</i> , <i>avg15</i> .<br>This parameter is supported only with type in: <i>sps, ops, bps</i> . | You may use relative device names (for example, <i>sda</i> ) as well as an optional <i>/dev/</i> prefix (for example, <i>/dev/sda</i> ).<br><br>LVM logical volumes are supported.<br><br>Default values of 'type' parameter for different OSes:<br>AIX - operations<br>FreeBSD - bps<br>Linux - sps<br>OpenBSD - operations<br>Solaris - bytes<br><br>Example:<br>=> <code>vfs.dev.read[,operations]</code><br><br><i>sps, ops</i> and <i>bps</i> on supported platforms used to be limited to 8 devices (7 individual and one <i>all</i> ). Since Zabbix 2.0.1 this limit is 1024 devices (1023 individual and one for <i>all</i> ). |
| <b>vfs.dev.write</b> [<device>,<type>,<mode>]  |   |   |  |
| Disk write statistics.   | Integer - with type in <i>sectors, operations, bytes</i><br><br>Float - with type in <i>sps, ops, bps</i><br><br><i>Note</i> : if using an update interval of three hours or more <sup>2</sup> , will always return '0' | <b>device</b> - disk device (default is <i>all</i> <sup>3</sup> )<br><b>type</b> - possible values: <i>sectors, operations, bytes, sps, ops, bps</i><br>Note that 'type' parameter support and defaults depend on the platform. See <a href="#">platform-specific</a> details.<br><i>sps, ops, bps</i> stand for: sectors, operations, bytes per second, respectively.<br><b>mode</b> - possible values: <i>avg1</i> (one-minute average, default), <i>avg5</i> , <i>avg15</i> .<br>This parameter is supported only with type in: <i>sps, ops, bps</i> . | You may use relative device names (for example, <i>sda</i> ) as well as an optional <i>/dev/</i> prefix (for example, <i>/dev/sda</i> ).<br><br>LVM logical volumes are supported.<br><br>Default values of 'type' parameter for different OSes:<br>AIX - operations<br>FreeBSD - bps<br>Linux - sps<br>OpenBSD - operations<br>Solaris - bytes<br><br>Example:<br>=> <code>vfs.dev.write[,operations]</code><br><br><i>sps, ops</i> and <i>bps</i> on supported platforms used to be limited to 8 devices (7 individual and one <i>all</i> ). Since Zabbix 2.0.1 this limit is 1024 (1023 individual and one for <i>all</i> ).        |
| <b>vfs.dir.count</b> [dir,<regex_incl>,<regex_excl>,<types_incl>,<types_excl>,<max_depth>,<min_size>,<max_size>,<min_age>,<max_age>] |   |   |  |

| Item key   |         |   |  |
|--|---------|---|--|
| Directory entry count.   | Integer | <p><b>dir</b> - absolute path to directory</p> <p><b>regex_incl</b> - regular <b>expression</b> describing the name pattern of the entity (file, directory, symbolic link) to include; include all if empty (default value)</p> <p><b>regex_excl</b> - regular <b>expression</b> describing the name pattern of the entity (file, directory, symbolic link) to exclude; don't exclude any if empty (default value)</p> <p><b>types_incl</b> - directory entry types to count, possible values:<br/> <i>file</i> - regular file, <i>dir</i> - subdirectory, <i>sym</i> - symbolic link, <i>sock</i> - socket, <i>bdev</i> - block device, <i>cdev</i> - character device, <i>fifo</i> - FIFO, <i>dev</i> - synonymous with "bdev,cdev", <i>all</i> - all types (default), i.e. "file,dir,sym,sock,bdev,cdev,fifo". Multiple types must be separated with comma and quoted.</p> <p><b>types_excl</b> - directory entry types (see &lt;types_incl&gt;) to NOT count. If some entry type is in both &lt;types_incl&gt; and &lt;types_excl&gt;, directory entries of this type are NOT counted.</p> <p><b>max_depth</b> - maximum depth of subdirectories to traverse. <b>-1</b> (default) - unlimited, <b>0</b> - no descending into subdirectories.</p> <p><b>min_size</b> - minimum size (in bytes) for file to be counted. Smaller files will not be counted. <b>Memory suffixes</b> can be used.</p> <p><b>max_size</b> - maximum size (in bytes) for file to be counted. Larger files will not be counted. <b>Memory suffixes</b> can be used.</p> <p><b>min_age</b> - minimum age (in seconds) of directory entry to be counted. More recent entries will not be counted. <b>Time suffixes</b> can be used.</p> <p><b>max_age</b> - maximum age (in seconds) of directory entry to be counted. Entries so old and older will not be counted (modification time). <b>Time suffixes</b> can be used.</p> <p><b>regex_excl_dir</b> - regular <b>expression</b> describing the name pattern of the directory to exclude. All content of the directory will be excluded (in contrast to <b>regex_excl</b>)</p> | <p>Environment variables, e.g. %APP_HOME%, \$HOME and %TEMP% are not supported.</p> <p>Pseudo-directories "." and ".." are never counted.</p> <p>Symbolic links are never followed for directory traversal.</p> <p>On Windows, directory symlinks are skipped.</p> <p>Both <b>regex_incl</b> and <b>regex_excl</b> are being applied to files and directories when calculating entry count, but are ignored when picking subdirectories to traverse (if <b>regex_incl</b> is "(?i)^.+\.zip\$" and <b>max_depth</b> is not set, then all subdirectories will be traversed, but only files of type zip will be counted).</p> <p>Execution time is limited by the timeout value in agent <b>configuration</b>. Since large directory traversal may take longer than that, no data will be returned and the item will turn unsupported. Partial count will not be returned.</p> <p>When filtering by size, only regular files have meaningful sizes. Under Linux and BSD, directories also have non-zero sizes (a few Kb typically). Devices have zero sizes, e.g. the size of <b>/dev/sda1</b> does not reflect the respective partition size. Therefore, when using &lt;min_size&gt; and &lt;max_size&gt;, it is advisable to specify &lt;types_incl&gt; as "file", to avoid surprises.</p> <p>Examples:<br/> ⇒ <b>vfs.dir.count[/dev]</b> - monitors number of devices in /dev (Linux)<br/> ⇒<br/> <b>vfs.dir.count["C:\Users\ADMINI~1\AppData\Local\Temp"]</b><br/> - monitors number of files in temporary directory (Windows)</p> <p>Supported since Zabbix 4.0.0.</p> |
| <b>vfs.dir.get</b> [dir,<regex_incl>,<regex_excl>,<types_incl>,<types_excl>,<max_depth>,<min_size>,<max_size>,<min_age>,<max_age>] |         |   |  |

| Item key              |      |   |  |
|-----------------------|------|---|--|
| Directory entry list. | JSON | <p><b>dir</b> - absolute path to directory</p> <p><b>regex_incl</b> - regular <b>expression</b> describing the name pattern of the entity (file, directory, symbolic link) to include; include all if empty (default value)</p> <p><b>regex_excl</b> - regular <b>expression</b> describing the name pattern of the entity (file, directory, symbolic link) to exclude; don't exclude any if empty (default value)</p> <p><b>types_incl</b> - directory entry types to list, possible values:<br/> <i>file</i> - regular file, <i>dir</i> - subdirectory, <i>sym</i> - symbolic link, <i>sock</i> - socket, <i>bdev</i> - block device, <i>cdev</i> - character device, <i>fifo</i> - FIFO, <i>dev</i> - synonymous with "bdev,cdev", <i>all</i> - all types (default), i.e. "file,dir,sym,sock,bdev,cdev,fifo". Multiple types must be separated with comma and quoted.</p> <p><b>types_excl</b> - directory entry types (see &lt;types_incl&gt;) to NOT list. If some entry type is in both &lt;types_incl&gt; and &lt;types_excl&gt;, directory entries of this type are NOT listed.</p> <p><b>max_depth</b> - maximum depth of subdirectories to traverse. <b>-1</b> (default) - unlimited, <b>0</b> - no descending into subdirectories.</p> <p><b>min_size</b> - minimum size (in bytes) for file to be listed. Smaller files will not be listed. <b>Memory suffixes</b> can be used.</p> <p><b>max_size</b> - maximum size (in bytes) for file to be listed. Larger files will not be counted. <b>Memory suffixes</b> can be used.</p> <p><b>min_age</b> - minimum age (in seconds) of directory entry to be listed. More recent entries will not be listed. <b>Time suffixes</b> can be used.</p> <p><b>max_age</b> - maximum age (in seconds) of directory entry to be listed. Entries so old and older will not be listed (modification time). <b>Time suffixes</b> can be used.</p> <p><b>regex_excl_dir</b> - regular <b>expression</b> describing the name pattern of the directory to exclude. All content of the directory will be excluded (in contrast to <b>regex_excl</b>)</p> | <p>Environment variables, e.g. %APP_HOME%, \$HOME and %TEMP% are not supported.</p> <p>Pseudo-directories "." and ".." are never listed.</p> <p>Symbolic links are never followed for directory traversal.</p> <p>On Windows, directory symlinks are skipped.</p> <p>Both <b>regex_incl</b> and <b>regex_excl</b> are being applied to files and directories when generating entry list, but are ignored when picking subdirectories to traverse (if <b>regex_incl</b> is "(?i)^.+\.zip\$" and <b>max_depth</b> is not set, then all subdirectories will be traversed, but only files of type zip will be listed).</p> <p>Execution time is limited by timeout value in agent <b>configuration</b>. Since large directory traversal may take longer than that, no data will be returned and the item will turn unsupported. Partial list will not be returned.</p> <p>When filtering by size, only regular files have meaningful sizes. Under Linux and BSD, directories also have non-zero sizes (a few Kb typically). Devices have zero sizes, e.g. the size of <b>/dev/sda1</b> does not reflect the respective partition size. Therefore, when using &lt;<b>min_size</b>&gt; and &lt;<b>max_size</b>&gt;, it is advisable to specify &lt;<b>types_incl</b>&gt; as "file", to avoid surprises.</p> <p>Examples:<br/> ⇒ <b>vfs.dir.get[/dev]</b> - retrieves device list in /dev (Linux)<br/> ⇒<br/> <b>vfs.dir.get["C:\Users\ADMINI~1\AppData\Local\Temp"]</b><br/> - retrieves file list in temporary directory (Windows)</p> <p>Supported since Zabbix 6.0.0.</p> |
|                       |      | <b>vfs.dir.size</b> [dir,<regex_incl>,<regex_excl>,<mode>,<max_depth>,<regex_excl_dir>]   |  |

| Item key  |   |   |  |
|---|---|---|--|
| Directory size<br>(in bytes).   | Integer   | <b>dir</b> - absolute path to directory<br><b>regex_incl</b> - regular <b>expression</b> describing the name pattern of the entity (file, directory, symbolic link) to include; include all if empty (default value)<br><b>regex_excl</b> - regular <b>expression</b> describing the name pattern of the entity (file, directory, symbolic link) to exclude; don't exclude any if empty (default value)<br><b>mode</b> - possible values:<br><i>apparent</i> (default) - gets apparent file sizes rather than disk usage (acts as <code>du -sb dir</code> ), <i>disk</i> - gets disk usage (acts as <code>du -s -B1 dir</code> ). Unlike <code>du</code> command, <code>vfs.dir.size</code> item takes hidden files in account when calculating directory size (acts as <code>du -sb .[^.]* *</code> within dir).<br><b>max_depth</b> - maximum depth of subdirectories to traverse. <b>-1</b> (default) - unlimited, <b>0</b> - no descending into subdirectories.<br><b>regex_excl_dir</b> - regular <b>expression</b> describing the name pattern of the directory to exclude. All content of the directory will be excluded (in contrast to <code>regex_excl</code> ) | Only directories with at least read permission for <i>zabbix</i> user are calculated.<br><br>On Windows any symlink is skipped and hard links are taken into account only once.<br><br>With large directories or slow drives this item may time out due to the Timeout setting in <b>agent</b> and <b>server/proxy</b> configuration files. Increase the timeout values as necessary.<br><br>Examples:<br>⇒ <code>vfs.dir.size[/tmp,log]</code> - calculates size of all files in <code>/tmp</code> which contain 'log'<br>⇒ <code>vfs.dir.size[/tmp,log,^.+\.old\$]</code> - calculates size of all files in <code>/tmp</code> which contain 'log' in their names, excluding files with names ending with '.old'<br><br>The file size limit depends on <b>large file support</b> .<br><br>Supported since Zabbix 3.4.0. |
| <b>vfs.file.cksum</b> [file,<mode>]<br>File checksum, calculated by the UNIX cksum algorithm. | Integer - with mode as <i>crc32</i><br><br>String - with mode as <i>md5</i> , <i>sha256</i> | <b>file</b> - full path to file<br><b>mode</b> - <i>crc32</i> (default), <i>md5</i> , <i>sha256</i>   | Example:<br>⇒ <code>vfs.file.cksum[/etc/passwd]</code><br><br>Example of returned values ( <i>crc32/md5/sha256</i> respectively):<br>675436101<br>9845acf68b73991eb7fd7ee0ded23c44<br>ae67546e4aac995e5c921042d0cf0f1f7147703aa42bfbfbf<br><br>The file size limit depends on <b>large file support</b> .<br><br>The <code>mode</code> parameter is supported since Zabbix 6.0.<br><br>Returns an empty string if the file is empty or contains LF/CR characters only.<br><br>The return value is limited to 16MB (including trailing whitespace that is truncated); <b>database limits</b> also apply.<br><br>Byte order mark (BOM) is excluded from the output.<br><br>Example:<br>⇒ <code>vfs.file.cksum[/etc/passwd]</code>  |
| <b>vfs.file.contents</b> [file,<encoding>]<br>Retrieving contents of a file.                  | Text  | <b>file</b> - full path to file<br><b>encoding</b> - code page <b>identifier</b>  | Returns an empty string if the file is empty or contains LF/CR characters only.<br><br>The return value is limited to 16MB (including trailing whitespace that is truncated); <b>database limits</b> also apply.<br><br>Byte order mark (BOM) is excluded from the output.<br><br>Example:<br>⇒ <code>vfs.file.contents[/etc/passwd]</code>  |
| <b>vfs.file.exists</b> [file,<types_incl>,<types_excl>]                                       |   |   |  |

| Item key   |  |   |   |
|--|--|---|---|
| Checks if file exists.   | 0 - not found<br><br>1 - file of the specified type exists | <b>file</b> - full path to file<br><b>types_incl</b> - list of file types to include, possible values: <i>file</i> (regular file, default (if <i>types_excl</i> is not set)), <i>dir</i> (directory), <i>sym</i> (symbolic link), <i>sock</i> (socket), <i>bdev</i> (block device), <i>cdev</i> (character device), <i>fifo</i> (FIFO), <i>dev</i> (synonymous with "bdev,cdev"), <i>all</i> (all mentioned types, default if <i>types_excl</i> is set).<br><b>types_excl</b> - list of file types to exclude, see <i>types_incl</i> for possible values (by default no types are excluded) | <p>Multiple types must be separated with a comma and the entire set enclosed in quotes "".</p> <p>On Windows the double quotes have to be backslash '\' escaped and the whole item key enclosed in double quotes when using the command line utility for calling <i>zabbix_get.exe</i> or <i>agent2</i>.</p> <p>If the same type is in both &lt;<i>types_incl</i>&gt; and &lt;<i>types_excl</i>&gt;, files of this type are excluded.</p> <p>Examples:<br/>           =&gt; <i>vfs.file.exists[/tmp/application.pid]</i><br/>           =&gt;<br/> <i>vfs.file.exists[/tmp/application.pid,"file,dir,sym"]</i><br/>           =&gt; <i>vfs.file.exists[/tmp/application_dir,dir]</i></p> <p>The file size limit depends on <b>large file support</b>.</p> <p>Note that the item may turn unsupported on Windows if a directory is searched within a non-existing directory, e.g. <i>vfs.file.exists[C:\no\dir,dir]</i> (where 'no' does not exist).</p> |
| <b>vfs.file.get</b> [file]<br>Return information about a file. | JSON object  | <b>file</b> - full path to file   | <p>Supported file types on UNIX-like systems: regular file, directory, symbolic link, socket, block device, character device, FIFO</p> <p>Supported file types on Windows: regular file, directory, symbolic link</p> <p>Example:<br/>           =&gt; <i>vfs.file.get[/etc/passwd]</i> → return a JSON with information about the <i>/etc/passwd</i> file (type, user, permissions, SID, uid etc)</p> <p>The file size limit depends on <b>large file support</b>.</p> <p>Supported since Zabbix 6.0.</p>  |
| <b>vfs.file.md5sum</b> [file]<br>MD5 checksum of file.         | Character string (MD5 hash of the file)                    | <b>file</b> - full path to file   | <p>Example:<br/>           =&gt;<br/> <i>vfs.file.md5sum[/usr/local/etc/zabbix_agentd.conf]</i></p> <p>Example of returned value:<br/>           b5052decb577e0fffd622d6ddc017e82</p> <p>The file size limit depends on <b>large file support</b>.</p>  |
| <b>vfs.file.owner</b> [file,<ownertype>,<resulttype>]          |  |   |   |

| Item key   |  |  |  |
|--|--|--|--|
| Retrieve owner of a file.  | Character string   | <b>file</b> - full path to file<br><b>ownertype</b> - <i>user</i> (default) or <i>group</i> (Unix only)<br><b>resulttype</b> - <i>name</i> (default) or <i>id</i> ; for <i>id</i> - return uid/gid on Unix, SID on Windows   | <p>Example:</p> <pre>=&gt; vfs.file.owner[/tmp/zabbix_server.log] → return file owner of /tmp/zabbix_server.log =&gt; vfs.file.owner[/tmp/zabbix_server.log,,id] → return file owner ID of /tmp/zabbix_server.log</pre> <p>The file size limit depends on <b>large file support</b>.</p> <p>Supported since Zabbix 6.0.</p>  |
| <b>vfs.file.permissions</b> [file]   |  |  |  |
| Return a 4-digit string containing the octal number with Unix permissions.       | String   | <b>file</b> - full path to the file  | <p>Not supported on Windows.</p> <p>Example:</p> <pre>=&gt; vfs.file.permissions[/etc/passwd] → return permissions of /etc/passwd, for example, '0644'</pre> <p>The file size limit depends on <b>large file support</b>.</p> <p>Supported since Zabbix 6.0.</p>   |
| <b>vfs.file.regexp</b> [file,regexp,<encoding>,<start line>,<end line>,<output>] |  |  |  |
| Find string in a file.   | The line containing the matched string, or as specified by the optional output parameter | <b>file</b> - full path to file<br><b>regexp</b> - regular <b>expression</b> describing the required pattern<br><b>encoding</b> - code page <b>identifier</b><br><b>start line</b> - the number of first line to search (first line of file by default).<br><b>end line</b> - the number of last line to search (last line of file by default).<br><b>output</b> - an optional output formatting template. The <b>\0</b> escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an <b>\N</b> (where N=1...9) escape sequence is replaced with Nth matched group (or an empty string if the N exceeds the number of captured groups). | <p>Only the first matching line is returned. An empty string is returned if no line matched the expression.</p> <p>Byte order mark (BOM) is excluded from the output.</p> <p>Content extraction using the output parameter takes place on the agent.</p> <p>The <b>start line</b>, <b>end line</b> and output parameters are supported from version 2.2.</p> <p>Examples:</p> <pre>=&gt; vfs.file.regexp[/etc/passwd,zabbix] =&gt; vfs.file.regexp[/path/to/some/file,"([0-9]+)\$","3,5,\1] =&gt; vfs.file.regexp[/etc/passwd,"^zabbix:([0-9]+)","\1] → getting the ID of user zabbix</pre> <p>The file size limit depends on <b>large file support</b>.</p> |
| <b>vfs.file.regmatch</b> [file,regexp,<encoding>,<start line>,<end line>]        |  |  |  |

| Item key   |                                      |   |  |
|--|--------------------------------------|---|--|
| Find string in a file.   | 0 - match not found<br><br>1 - found | <b>file</b> - full path to file<br><b>regexp</b> - regular <b>expression</b> describing the required pattern<br><b>encoding</b> - code page <b>identifier</b><br><b>start line</b> - the number of first line to search (first line of file by default).<br><b>end line</b> - the number of last line to search (last line of file by default). | <p>Byte order mark (BOM) is ignored.</p> <p>The <code>start line</code> and <code>end line</code> parameters are supported from version 2.2.</p> <p>Example:<br/>=&gt;<br/>vfs.file.regmatch[/var/log/app.log,error]</p> <p>The file size limit depends on <b>large file support</b>.</p>  |
| <b>vfs.file.size</b> [file,<mode>]<br>File size (in bytes).  | Integer                              | <b>file</b> - full path to file<br><b>mode</b> - possible values:<br><i>bytes</i> (default) or <i>lines</i> (empty lines are counted, too)  | <p>The file must have read permissions for user <i>zabbix</i>.</p> <p>Example:<br/>=&gt; vfs.file.size[/var/log/syslog]</p> <p>The file size limit depends on <b>large file support</b>.</p> <p>The <code>mode</code> parameter is supported since Zabbix 6.0.</p>   |
| <b>vfs.file.time</b> [file,<mode>]<br>File time information.   | Integer (Unix timestamp)             | <b>file</b> - full path to the file<br><b>mode</b> - possible values:<br><i>modify</i> (default) - last time of modifying file content,<br><i>access</i> - last time of reading file,<br><i>change</i> - last time of changing file properties  | <p>Example:<br/>=&gt; vfs.file.time[/etc/passwd,modify]</p> <p>The file size limit depends on <b>large file support</b>.</p>   |
| <b>vfs.fs.discovery</b><br>List of mounted filesystems and their types. Used for low-level discovery.                                | JSON object                          |   | <p>Supported since Zabbix 2.0.</p>   |
| <b>vfs.fs.get</b><br>List of mounted filesystems, their types, disk space and inode statistics. Can be used for low-level discovery. | JSON object                          |   | <p>The <code>{#FSDRIVETYPE}</code> macro is supported on Windows since Zabbix 3.0.</p> <p>The <code>{#FSLABEL}</code> macro is supported on Windows since Zabbix 6.0.</p> <p>The <code>{#FSLABEL}</code> macro is supported on Windows since Zabbix 6.0.</p> <p>Since Zabbix 6.0.11, this item is capable of reporting file systems with the inode count equal to zero, which can be the case for file systems with dynamic inodes (e.g. btrfs).</p> |
| <b>vfs.fs.inode</b> [fs,<mode>]  |                                      |   |  |

| Item key   |  |  |  |
|--|--|--|--|
| Number or percentage of inodes.  | Integer - for number<br><br>Float - for percentage | <b>fs</b> - filesystem<br><b>mode</b> - possible values:<br><i>total</i> (default), <i>free</i> , <i>used</i> , <i>pfree</i> (free, percentage), <i>pused</i> (used, percentage) | Since Zabbix 6.0.11, this item will not become unsupported in pfree/pused modes if the inode count equals to zero, which can be the case for file systems with dynamic inodes (e.g. btrfs). Instead the pfree/pused values for such file systems will be reported as "100" and "0" respectively.<br><br>Example:<br>=> vfs.fs.inode[/,pfree] |
| <b>vfs.fs.size</b> [fs,<mode>]<br>Disk space in bytes or in percentage from total. | Integer - for bytes<br><br>Float - for percentage  | <b>fs</b> - filesystem<br><b>mode</b> - possible values:<br><i>total</i> (default), <i>free</i> , <i>used</i> , <i>pfree</i> (free, percentage), <i>pused</i> (used, percentage) | If the filesystem is not mounted, returns the size of a local filesystem where the mount point is located.<br><br>Example:<br>=> vfs.fs.size[/tmp,free]<br><br>Reserved space of a file system is taken into account and not included when using the <i>free</i> mode.   |

#### Virtual memory data

| Item key  |   |  |   |
|---|---|--|---|
| Description   | Return value                                      | Parameters   | Comments  |
| <b>vm.memory.size</b> [<mode>]<br>Memory size in bytes or in percentage from total. | Integer - for bytes<br><br>Float - for percentage | <b>mode</b> - possible values:<br><i>total</i> (default), <i>active</i> , <i>anon</i> , <i>buffers</i> , <i>cached</i> , <i>exec</i> , <i>file</i> , <i>free</i> , <i>inactive</i> , <i>pinned</i> , <i>shared</i> , <i>slab</i> , <i>wired</i> , <i>used</i> , <i>pused</i> (used, percentage), <i>available</i> , <i>pavailable</i> (available, percentage)<br>See also <a href="#">platform-specific</a> support and <a href="#">additional details</a> for this parameter. | This item accepts three categories of parameters:<br><br>1) <i>total</i> - total amount of memory;<br>2) platform-specific memory types: <i>active</i> , <i>anon</i> , <i>buffers</i> , <i>cached</i> , <i>exec</i> , <i>file</i> , <i>free</i> , <i>inactive</i> , <i>pinned</i> , <i>shared</i> , <i>slab</i> , <i>wired</i> ;<br>3) user-level estimates on how much memory is used and available: <i>used</i> , <i>pused</i> , <i>available</i> , <i>pavailable</i> . |

#### Web monitoring data

| Item key                                 |              |            |          |
|--|--------------|------------|----------|
| Description                              | Return value | Parameters | Comments |
| <b>web.page.get</b> [host,<path>,<port>] |              |            |          |

| Item key  |   |  |   |
|---|---|--|---|
| Get content of web page.  | Web page source as text (including headers)       | <p><b>host</b> - hostname or URL (as <code>scheme://host:port/path</code>, where only <code>host</code> is mandatory).<br/> Allowed URL schemes: <i>http, https</i><sup>4</sup>.<br/> Missing scheme will be treated as <i>http</i>. If URL is specified <code>path</code> and <code>port</code> must be empty. Specifying user name/password when connecting to servers that require authentication, for example:<br/> <code>http://user:password@www.example.com</code><br/> is only possible with cURL support <sup>4</sup>.<br/> Punycode is supported in hostnames.</p> <p><b>path</b> - path to HTML document (default is /)</p> <p><b>port</b> - port number (default is 80 for HTTP)</p> | <p>This item turns unsupported if the resource specified in <code>host</code> does not exist or is unavailable.</p> <p><code>host</code> can be hostname, domain name, IPv4 or IPv6 address. But for IPv6 address Zabbix agent must be compiled with IPv6 support enabled.</p> <p>Examples:<br/> =&gt;<br/> <code>web.page.get[www.example.com,index.php,80]</code><br/> =&gt;<br/> <code>web.page.get[https://www.example.com]</code><br/> =&gt;<br/> <code>web.page.get[https://blog.example.com/?s=zabbix]</code><br/> =&gt; <code>web.page.get[localhost:80]</code><br/> =&gt; <code>web.page.get[ "::1]/server-status"]</code></p> |
| <b>web.page.perf</b> [host,<path>,<port>]                           | Loading time of full web page (in seconds). Float | <p><b>host</b> - hostname or URL (as <code>scheme://host:port/path</code>, where only <code>host</code> is mandatory).<br/> Allowed URL schemes: <i>http, https</i><sup>4</sup>.<br/> Missing scheme will be treated as <i>http</i>. If URL is specified <code>path</code> and <code>port</code> must be empty. Specifying user name/password when connecting to servers that require authentication, for example:<br/> <code>http://user:password@www.example.com</code><br/> is only possible with cURL support <sup>4</sup>.<br/> Punycode is supported in hostnames.</p> <p><b>path</b> - path to HTML document (default is /)</p> <p><b>port</b> - port number (default is 80 for HTTP)</p> | <p>This item turns unsupported if the resource specified in <code>host</code> does not exist or is unavailable.</p> <p><code>host</code> can be hostname, domain name, IPv4 or IPv6 address. But for IPv6 address Zabbix agent must be compiled with IPv6 support enabled.</p> <p>Examples:<br/> =&gt;<br/> <code>web.page.perf[www.example.com,index.php,80]</code><br/> =&gt;<br/> <code>web.page.perf[https://www.example.com]</code></p>  |
| <b>web.page.regex</b> [host,<path>,<port>,regexp,<length>,<output>] |   |  |   |

| Item key                   |  |  |  |
|----------------------------|--|--|--|
| Find string on a web page. | The matched string, or as specified by the optional output parameter | <p><b>host</b> - hostname or URL (as <code>scheme://host:port/path</code>, where only <code>host</code> is mandatory).<br/>Allowed URL schemes: <code>http</code>, <code>https</code><sup>4</sup>.<br/>Missing scheme will be treated as <code>http</code>. If URL is specified <code>path</code> and <code>port</code> must be empty. Specifying user name/password when connecting to servers that require authentication, for example:<br/><code>http://user:password@www.example.com</code> is only possible with cURL support <sup>4</sup>.<br/><a href="#">Punycode</a> is supported in hostnames.</p> <p><b>path</b> - path to HTML document (default is /)</p> <p><b>port</b> - port number (default is 80 for HTTP)</p> <p><b>regexp</b> - regular <b>expression</b> describing the required pattern</p> <p><b>length</b> - maximum number of characters to return</p> <p><b>output</b> - an optional output formatting template. The <code>\0</code> escape sequence is replaced with the matched part of text (from the first character where match begins until the character where match ends) while an <code>\N</code> (where <code>N=1...9</code>) escape sequence is replaced with Nth matched group (or an empty string if the <code>N</code> exceeds the number of captured groups).</p> | <p>This item turns unsupported if the resource specified in <code>host</code> does not exist or is unavailable.</p> <p><code>host</code> can be hostname, domain name, IPv4 or IPv6 address. But for IPv6 address Zabbix agent must be compiled with IPv6 support enabled.</p> <p>Content extraction using the <code>output</code> parameter takes place on the agent.</p> <p>The <code>output</code> parameter is supported from version 2.2.</p> <p>Examples:<br/>=&gt;<br/><code>web.page.regexp[www.example.com,index.php,80,OK,2]</code><br/>=&gt;<br/><code>web.page.regexp[https://www.example.com,,,OK,2]</code></p> |

## Zabbix metrics

| Item key  |  |            |   |
|---|--|------------|---|
| Description   | Return value                               | Parameters | Comments  |
| <b>agent.hostmetadata</b><br>Agent host metadata.                                 | String                                     |            | <p>Returns the value of HostMetadata or HostMetadataItem parameters, or empty string if none are defined.</p> <p>Supported since Zabbix 6.0.</p>  |
| <b>agent.hostname</b><br>Agent host name.   | String                                     |            | <p>Returns:<br/>As passive check - the name of the first host listed in the Hostname parameter of the agent configuration file;<br/>As active check - the name of the current hostname.</p> |
| <b>agent.ping</b><br>Agent availability check.                                    | Nothing - unavailable<br><br>1 - available |            | <p>Use the <b>nodata()</b> trigger function to check for host unavailability.</p>   |
| <b>agent.variant</b><br>Variant of Zabbix agent (Zabbix agent or Zabbix agent 2). | Integer                                    |            | <p>Examples of returned value:<br/>1 - Zabbix agent<br/>2 - Zabbix agent 2</p>  |
| <b>agent.version</b><br>Version of Zabbix agent.                                  | String                                     |            | <p>Example of returned value:<br/>6.0.3</p>   |

| Item key  |             |   |   |
|---|-------------|---|---|
| <b>zabbix.stats[&lt;ip&gt;,&lt;port&gt;]</b>  |             |   |   |
| Return a set of Zabbix server or proxy internal metrics remotely.                                   | JSON object | <b>ip</b> - IP/DNS/network mask list of servers/proxies to be remotely queried (default is 127.0.0.1)<br><b>port</b> - port of server/proxy to be remotely queried (default is 10051)   | <p>Note that the stats request will only be accepted from the addresses listed in the 'StatsAllowedIP' <a href="#">server/proxy</a> parameter on the target instance.</p> <p>A selected set of internal metrics is returned by this item. For details, see <a href="#">Remote monitoring of Zabbix stats</a>.</p> |
| <b>zabbix.stats[&lt;ip&gt;,&lt;port&gt;,queue,&lt;from&gt;,&lt;to&gt;]</b>                          |             |   |   |
| Return number of monitored items in the queue which are delayed on Zabbix server or proxy remotely. | JSON object | <b>ip</b> - IP/DNS/network mask list of servers/proxies to be remotely queried (default is 127.0.0.1)<br><b>port</b> - port of server/proxy to be remotely queried (default is 10051)<br><b>queue</b> - constant (to be used as is)<br><b>from</b> - delayed by at least (default is 6 seconds)<br><b>to</b> - delayed by at most (default is infinity) | <p>Note that the stats request will only be accepted from the addresses listed in the 'StatsAllowedIP' <a href="#">server/proxy</a> parameter on the target instance.</p>   |

## Footnotes

<sup>1</sup>A Linux-specific note. Zabbix agent must have read-only access to filesystem */proc*. Kernel patches from [www.grsecurity.org](http://www.grsecurity.org) limit access rights of non-privileged users.

<sup>2</sup> `vfs.dev.read[]`, `vfs.dev.write[]`: Zabbix agent will terminate "stale" device connections if the item values are not accessed for more than 3 hours. This may happen if a system has devices with dynamically changing paths or if a device gets manually removed. Note also that these items, if using an update interval of 3 hours or more, will always return '0'.

<sup>3</sup> `vfs.dev.read[]`, `vfs.dev.write[]`: If default *all* is used for the first parameter then the key will return summary statistics, including all block devices like `sda`, `sdb` and their partitions (`sda1`, `sda2`, `sdb3`...) and multiple devices (MD raid) based on those block devices/partitions and logical volumes (LVM) based on those block devices/partitions. In such cases returned values should be considered only as relative value (dynamic in time) but not as absolute values.

<sup>4</sup> SSL (HTTPS) is supported only if agent is compiled with cURL support. Otherwise the item will turn unsupported.

## Encoding settings

To make sure that the acquired data are not corrupted you may specify the correct encoding for processing the check (e.g. 'vfs.file.contents') in the `encoding` parameter. The list of supported encodings (code page identifiers) may be found in documentation for [libiconv](#) (GNU Project) or in Microsoft Windows SDK documentation for "Code Page Identifiers".

If no encoding is specified in the `encoding` parameter the following resolution strategies are applied:

- If encoding is not specified (or is an empty string) it is assumed to be UTF-8, the data is processed "as-is";
- BOM analysis - applicable for items 'vfs.file.contents', 'vfs.file.regexp', 'vfs.file.regmatch'. An attempt is made to determine the correct encoding by using the byte order mark (BOM) at the beginning of the file. If BOM is not present - standard resolution (see above) is applied instead.

## Troubleshooting agent items

- If used with the passive agent, *Timeout* value in server configuration may need to be higher than *Timeout* in the agent configuration file. Otherwise the item may not get any value because the server request to agent timed out first.

## 1 Item keys specific to agent 2

Zabbix agent 2 supports all item keys supported for Zabbix agent on [Unix](#) and [Windows](#). This page provides details on the additional item keys, which you can use with Zabbix agent 2 only, grouped by the plugin they belong to.

See also:

- [Built-in plugins](#)
- [Loadable plugins](#)

**Note:**

Parameters without angle brackets are mandatory. Parameters marked with angle brackets < > are optional.

## Ceph

Key

| Description  | Return value  | Parameters  | Comments |
|--|---|---|----------|
| ceph.df.details[connString,<user>,<apikey>]<br>Cluster's data usage and distribution among pools.                  | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |
| ceph.osd.stats[connString,<user>,<apikey>]<br>Aggregated and per OSD statistics.                                   | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |
| ceph.osd.discovery[connString,<user>,<apikey>]<br>List of discovered OSDs. Used for <b>low-level discovery</b> .   | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |
| ceph.osd.dump[connString,<user>,<apikey>]<br>Usage thresholds and statuses of OSDs.                                | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |
| ceph.ping[connString,<user>,<apikey>]<br>Tests whether a connection to Ceph can be established.                    | 0 - connection is broken (if there is any error presented including AUTH and configuration issues)<br><br>1 - connection is successful. | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |
| ceph.pool.discovery[connString,<user>,<apikey>]<br>List of discovered pools. Used for <b>low-level discovery</b> . | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |
| ceph.status[connString,<user>,<apikey>]<br>Overall cluster's status.   | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Ceph login credentials. |          |

## Docker

Key

| Description                        | Return value | Parameters | Comments |
|------------------------------------|--------------|------------|----------|
| docker.container_info[<ID>,<info>] |              |            |          |

| Key  |   |  |  |
|--|---|--|--|
| Low-level information about a container.   | An output of the <a href="#">Container-Inspect</a> API call serialized as JSON                        | <b>ID</b> - ID or name of the container.<br><b>info</b> - the amount of information returned.<br>Supported values: <i>short</i> (default) or <i>full</i> .   | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.container_stats[<ID>]<br>Container resource usage statistics.   | An output of the <a href="#">Container-Stats</a> API call and CPU usage percentage serialized as JSON | <b>ID</b> - ID or name of the container.   | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.containers<br>A list of containers.   | An output of the <a href="#">ContainerList</a> API call serialized as JSON                            | -  | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.containers.discovery[<options>]<br>A list of containers. Used for <a href="#">low-level discovery</a> . | JSON object   | <b>options</b> - specifies whether all or only running containers should be discovered.<br>Supported values:<br><i>true</i> - return all containers;<br><i>false</i> - return only running containers (default). | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.data_usage<br>Information about current data usage.   | An output of the <a href="#">System-DataUsage</a> API call serialized as JSON                         | -  | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.images<br>A list of images.   | An output of the <a href="#">ImageList</a> API call serialized as JSON                                | -  | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.images.discovery<br>A list of images. Used for <a href="#">low-level discovery</a> .                    | JSON object   | -  | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.info<br>System information.   | An output of the <a href="#">SystemInfo</a> API call serialized as JSON                               | -  | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |
| docker.ping<br>Test if a Docker daemon is alive or not.  | 1 - connection is alive<br><br>0 - connection is broken   | -  | The Agent2 user ('zabbix') must be added to the 'docker' <a href="#">group</a> for sufficient privileges. Otherwise the check will fail. |

---

Key

| Description   | Return value | Parameters   | Comments |
|---|--------------|--|----------|
| ember.get[<uri>,<path>]<br>Returns the result of the required device. | JSON object  | <b>uri</b> - Ember+ device URI. Default: 127.0.0.1:9998<br><b>path</b> - OID path to device. Empty by default, returns root collection data. |          |

## Memcached

---

Key

| Description   | Return value  | Parameters  | Comments |
|---|---|---|----------|
| memcached.ping[connString,<user>,<password>]<br>Test if a connection is alive or not.         | 1 - connection is alive<br><br>0 - connection is broken (if there is any error presented including AUTH and configuration issues) | <b>connString</b> - URI or session name.<br><b>user, password</b> - Memcached login credentials.  |          |
| memcached.stats[connString,<user>,<password>,<type>]<br>Gets the output of the STATS command. | JSON - output is serialized as JSON   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Memcached login credentials.<br><b>type</b> - stat type to be returned: <i>items</i> , <i>sizes</i> , <i>slabs</i> or <i>settings</i> (empty by default, returns general statistics). |          |

## MongoDB

---

Key

| Description   | Return value | Parameters  | Comments |
|---|--------------|---|----------|
| mongodb.collection.stats[connString,<user>,<password>,<database>,collection]<br>Returns a variety of storage statistics for a given collection.   | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><b>database</b> - database name (default: admin).<br><b>collection</b> — collection name. |          |
| mongodb.collections.discovery[connString,<user>,<password>]<br>Returns a list of discovered collections.<br>Used for <b>low-level discovery</b> . | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.  |          |
| mongodb.collections.usage[connString,<user>,<password>]<br>Returns usage statistics for collections.  | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.  |          |
| mongodb.connpool.stats[connString,<user>,<password>]  |              |   |          |

---

## Key

---

|  |  |   |
|--|--|---|
| Returns information regarding the open outgoing connections from the current database instance to other members of the sharded cluster or replica set. | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><br>mongodb.db.stats[connString,<user>,<password>,<database>]   |
| Returns statistics reflecting a given database system state.   | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><b>database</b> - database name (default: admin).<br><br>mongodb.db.discovery[connString,<user>,<password>] |
| Returns a list of discovered databases.  | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.  |
| Used for <b>low-level discovery</b> .  |  |   |
|  |  | mongodb.jumbo_chunks.count[connString,<user>,<password>]  |
| Returns count of jumbo chunks.   | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><br>mongodb.oplog.stats[connString,<user>,<password>]   |
| Returns a status of the replica set, using data polled from the oplog.   | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><br>mongodb.ping[connString,<user>,<password>]  |
| Tests if a connection is alive or not.   | 1 - connection is alive<br><br>0 - connection is broken (if there is any error presented including AUTH and configuration issues). | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><br>mongodb.rs.config[connString,<user>,<password>]   |
| Returns a current configuration of the replica set.  | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials.<br><br>mongodb.rs.status[connString,<user>,<password>]   |

| Key   |             |  |
|---|-------------|--|
| Returns a replica set status from the point of view of the member where the method is run.<br>mongodb.server.status[connString,<user>,<password>] | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials. |
| Returns database state.<br>mongodb.sh.discovery[connString,<user>,<password>]   | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials. |
| Returns a list of discovered shards present in the cluster.<br>mongodb.version[connString,<user>,<password>]                                      | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials. |
| Returns the database server version.  | String      | <b>connString</b> - URI or session name.<br><b>user, password</b> - MongoDB login credentials. |

## MQTT

| Key  |  |   |   |
|--|--|---|---|
| Description  | Return value   | Parameters  | Comments  |
| mqtt.get[<broker_url>,topic,<username>,<password>]<br>Subscribes to a specific topic or topics (with wildcards) of the provided broker and waits for publications. | Depending on topic content.<br><br>If wildcards are used, returns topic content as JSON. | <b>broker_url</b> - MQTT broker URL (if empty, <i>localhost</i> with port 1883 is used).<br><b>topic</b> - MQTT topic (mandatory).<br>Wildcards (+,#) are supported.<br><b>username,password</b> - authentication credentials (if required) | The item must be configured as an <b>active check</b> ('Zabbix agent (active)' item type).<br><br>TLS encryption certificates can be used by saving them into a default location (e.g. <i>/etc/ssl/certs/</i> directory for Ubuntu). For TLS, use the <i>tls://</i> scheme. |

## MSSQL

| Key   |              |  |  |
|---|--------------|--|--|
| Description   | Return value | Parameters   | Comments   |
| mssql.availability.group.get[URI,<user>,<password>]<br>Returns availability groups. | JSON object  | <b>URI</b> - MSSQL server URI (the only supported schema is <i>sqlserver://</i> ). Embedded credentials will be ignored. Since Zabbix 6.0.36, it is possible to specify an instance name as part of the URI, i.e.: <i>sqlserver://localhost/InstanceName</i> (no port). If port is specified, the instance name is ignored;<br><b>user, password</b> - username, password to send to protected MSSQL server. | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.custom.query[URI,<user>,<password>,queryName,<args...>]                       |              |  |  |

| Key   |             |  |  |
|---|-------------|--|--|
| Returns the result of a custom query.   | JSON object | <b>URI</b> - MSSQL server URI (the only supported schema is <code>sqlserver://</code> ). Embedded credentials will be ignored. Since Zabbix 6.0.36, it is possible to specify an instance name as part of the URI, i.e.: <code>sqlserver://localhost/InstanceName</code> (no port). If port is specified, the instance name is ignored;<br><b>user, password</b> - username, password to send to protected MSSQL server;<br><b>queryName</b> - name of a custom query configured in <code>Plugins.MSSQL.CustomQueriesDir</code> without the <code>.sql</code> extension;<br><b>args</b> - one or several comma-separated arguments to pass to a query. | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| <code>mssql.db.get</code><br>Returns all available MSSQL databases.   | JSON object |  | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| <code>mssql.job.status.get</code><br>Returns the status of jobs.  | JSON object |  | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| <code>mssql.last.backup.get</code><br>Returns the last backup time for all databases.   | JSON object |  | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| <code>mssql.local.db.get</code><br>Returns databases that are participating in an Always On availability group and replica (primary or secondary) and are located on the server that the connection was established to. | JSON object |  | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| <code>mssql.mirroring.get</code><br>Returns mirroring info.   | JSON object |  | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| <code>mssql.nonlocal.db.get</code>  |             |  |  |

| Key  |                             |  |
|--|-----------------------------|--|
| Returns databases that are participating in an Always On availability group and replica (primary or secondary) located on other servers (the database is not local to the SQL Server instance that the connection was established to). | JSON object                 | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.perfcounter.get<br>Returns the performance counters.   | JSON object                 | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.ping<br>Ping the database.<br>Test if connection is correctly configured.  | 1 - alive,<br>0 - not alive | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.quorum.get<br>Returns the quorum info.   | JSON object                 | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.quorum.members.get<br>Returns the quorum members.  | JSON object                 | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.replica.get<br>Returns the replicas.   | JSON object                 | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |
| mssql.version<br>Returns the MSSQL version.  | String                      | Supported since Zabbix 6.0.27. For more information see the <a href="#">MSSQL plugin</a> readme. |

## MySQL

| Key                |              |  |          |
|--------------------|--------------|--|----------|
| Description        | Return value | Parameters   | Comments |
| mysql.custom.query | String       | [connString,<username>,<password>,<queryName>,<args...>] |          |

| Key   |  |   |  |
|---|--|---|--|
| Returns the result of a custom query.   | JSON object  | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.<br><b>queryName</b> - name of a custom query, must match SQL file name without an extension.<br><b>args</b> - one or several comma-separated arguments to pass to a query. | Supported since Zabbix 6.0.21. For more information see the <a href="#">MySQL plugin</a> readme. |
| mysql.db.discovery[connString,<username>,<password>]                              |  |   |  |
| List of MySQL databases.  | Result of the "show databases"   | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.  |  |
| Used for <b>low-level discovery</b> .   | SQL query in LLD JSON format.  |   |  |
| mysql.db.size[connString,<username>,<password>,dbName]                            |  |   |  |
| Database size in bytes.   | Result of the "select coalesce(sum(data_length + index_length),0) as size from information_schema.tables where table_schema=?" SQL query for specific database in bytes. | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.<br><b>dbName</b> - Database name.  |  |
| mysql.get_status_variables[connString,<username>,<password>]                      |  |   |  |
| Values of global status variables.  | Result of the "show global status" SQL query in JSON format.   | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.  |  |
| mysql.ping[connString,<username>,<password>]                                      |  |   |  |
| Test if a connection is alive or not.   | 1 - connection is alive<br><br>0 - connection is broken (if there is any error presented including AUTH and configuration issues).                                       | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.  |  |
| mysql.replication.discovery[connString,<username>,<password>]                     |  |   |  |
| List of MySQL replications.   | Result of the "show slave status" SQL query in LLD JSON format.  | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.  |  |
| Used for <b>low-level discovery</b> .   |  |   |  |
| mysql.replication.get_slave_status[connString,<username>,<password>,<masterHost>] |  |   |  |

| Key                 |   |  |
|---------------------|---|--|
| Replication status. | Result of the "show slave status" SQL query in JSON format. | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.<br><b>masterHost</b> - Replication master host name. If none found, an error is returned. If this parameter is not specified, all hosts are returned.<br>Note that before Zabbix 6.0.23, the "masterHost" parameter is ignored and always the first master host is returned.<br>mysql.version[connString,<username>,<password>] |
| MySQL version.      | String with MySQL instance version.                         | <b>connString</b> - URI or session name.<br><b>username, password</b> - MySQL login credentials.   |

## Oracle

| Key   |              |   |   |
|---|--------------|---|---|
| Description   | Return value | Parameters  | Comments  |
| oracle.diskgroups.stats[connString,<user>,<password>,<service>,<diskgroup>]     |              |   |   |
| Automatic Storage Management (ASM) disk groups statistics.                      | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>diskgroup</b> - name of the ASM disk group to query.   | <b>user</b> parameter allows to append one of the login options as sysdba, as sysoper, or as sysasm in the format user as sysdba (login option is case-insensitive; must not contain a trailing space). |
| oracle.diskgroups.discovery[connString,<user>,<password>,<service>]             |              |   |   |
| List of ASM disk groups. Used for <b>low-level discovery</b> .                  | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.  | <b>user</b> parameter allows to append one of the login options as sysdba, as sysoper, or as sysasm in the format user as sysdba (login option is case-insensitive; must not contain a trailing space). |
| oracle.archive.info[connString,<user>,<password>,<service>,<destination>]       |              |   |   |
| Archive logs statistics.  | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>destination</b> - name of the destination to query.  | <b>user</b> parameter allows to append one of the login options as sysdba, as sysoper, or as sysasm in the format user as sysdba (login option is case-insensitive; must not contain a trailing space). |
| oracle.cdb.info[connString,<user>,<password>,<service>,<database>]              |              |   |   |
| Container Databases (CDBs) information.   | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>database</b> - name of the database to query.  | <b>user</b> parameter allows to append one of the login options as sysdba, as sysoper, or as sysasm in the format user as sysdba (login option is case-insensitive; must not contain a trailing space). |
| oracle.custom.query[connString,<user>,<password>,<service>,queryName,<args...>] |              |   |   |
| Result of a custom query.   | JSON object  | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>queryName</b> — name of a custom query, must match SQL file name without an extension.<br><b>args</b> - one or several comma-separated arguments to pass to a query. | <b>user</b> parameter allows to append one of the login options as sysdba, as sysoper, or as sysasm in the format user as sysdba (login option is case-insensitive; must not contain a trailing space). |
| oracle.datafiles.stats[connString,<user>,<password>,<service>]                  |              |   |   |

| Key  |   |  |   |
|--|---|--|---|
| Data files statistics.   | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.db.discovery[connString,<user>,<password>,<service>]<br>List of databases.<br>Used for <b>low-level discovery</b> . | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.fra.stats[connString,<user>,<password>,<service>]<br>Fast Recovery Area (FRA) statistics.                           | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.instance.info[connString,<user>,<password>,<service>]<br>Instance statistics.                                       | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.pdb.info[connString,<user>,<password>,<service>,<database>]<br>Pluggable Databases (PDBs) information.              | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>database</b> - name of the database to query. | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.pdb.discovery[connString,<user>,<password>,<service>]<br>List of PDBs.<br>Used for <b>low-level discovery</b> .     | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.pga.stats[connString,<user>,<password>,<service>]<br>Program Global Area (PGA) statistics.                          | JSON object   | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.ping[connString,<user>,<password>,<service>]<br>Tests whether a connection to Oracle can be established.            | 0 - connection is broken (if there is any error presented including AUTH and configuration issues)<br>1 - connection is successful. | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.proc.stats[connString,<user>,<password>,<service>]  |   |  |   |

## Key

---

|   |             |   |   |
|---|-------------|---|---|
| Processes statistics.   | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.  | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.redolog.info[connString,<user>,<password>,<service>]                 |             |   |   |
| Log file information from the control file.                                 | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.  | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.sga.stats[connString,<user>,<password>,<service>]                    |             |   |   |
| System Global Area (SGA) statistics.  | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.  | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.sessions.stats[connString,<user>,<password>,<service>,<lockMaxTime>] |             |   |   |
| Sessions statistics.  | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>lockMaxTime</b> - maximum session lock duration in seconds to count the session as a prolongedly locked. Default: 600 seconds.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.sys.metrics[connString,<user>,<password>,<service>,<duration>]       |             |   |   |
| A set of system metric values.  | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>duration</b> - capturing interval (in seconds) of system metric values. Possible values: <code>60</code> — long duration (default), <code>15</code> — short duration.  | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.sys.params[connString,<user>,<password>,<service>]                   |             |   |   |
| A set of system parameter values.   | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.  | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.ts.stats[connString,<user>,<password>,<service>,<tablespace>,<type>] |             |   |   |
| Tablespaces statistics.   | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>tablespace</b> - name of the tablespace to query. Default (if left empty and <b>type</b> is set):<br>- "TEMP" (if <b>type</b> is set to "TEMPORARY");<br>- "USERS" (if <b>type</b> is set to "PERMANENT").<br><b>type</b> - type of the tablespace to query. Default (if <b>tablespace</b> is set): "PERMANENT". | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.ts.discovery[connString,<user>,<password>,<service>]                 |             |   |   |

| Key   |             |  |   |
|---|-------------|--|---|
| List of tablespaces.<br>Used for <b>low-level discovery</b> .   | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.user.info[connString,<user>,<password>,<service>,<username>]<br>Returns Oracle user information. | JSON object | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.<br><b>username</b> - a username, for which the information is needed. Lowercase usernames are not supported. Default: current user. | <b>user</b> parameter allows to append one of the login options as <code>sysdba</code> , as <code>sysoper</code> , or as <code>sysasm</code> in the format <code>user as sysdba</code> (login option is case-insensitive; must not contain a trailing space). |
| oracle.version[connString,<user>,<password>,<service>]<br>Returns the database server version.          | String      | <b>connString</b> - URI or session name.<br><b>user, password</b> - Oracle login credentials.<br><b>service</b> - Oracle service name.   |   |

## PostgreSQL

| Key  |              |  |          |
|--|--------------|--|----------|
| Description  | Return value | Parameters   | Comments |
| pgsql.autovacuum.count[uri,<username>,<password>,<dbName>]<br>The number of autovacuum workers.  | Integer      | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name. |          |
| pgsql.archive[uri,<username>,<password>,<dbName>]<br>Information about archived files.   | JSON object  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name. |          |
| pgsql.bgwriter[uri,<username>,<password>,<dbName>]<br>Combined number of checkpoints for the database cluster, broken down by checkpoint type. | JSON object  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name. |          |
| pgsql.cache.hit[uri,<username>,<password>,<dbName>]<br>PostgreSQL buffer cache hit rate.   | Float        | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name. |          |
| pgsql.connections[uri,<username>,<password>,<dbName>]<br>Connections by type.  | JSON object  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name. |          |
| pgsql.custom.query[uri,<username>,<password>,queryName,<args...>]  |              |  |          |

---

## Key

---

|  |             |   |
|--|-------------|---|
| Returns result of a custom query.                            | JSON object | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>queryName</b> - name of a custom query, must match SQL file name without an extension.<br><b>args</b> - one or several comma-separated arguments to pass to a query. |
| pgsql.dbstat[uri,<username>,<password>,<dbName>]             |             |   |
| Collects statistics per database.                            | JSON object | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.  |
| Used for <b>low-level discovery</b> .                        |             | <b>dbName</b> - Database name.  |
| pgsql.dbstat.sum[uri,<username>,<password>,<dbName>]         |             |   |
| Summarized data for all databases in a cluster.              | JSON object | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.  |
| pgsql.db.age[uri,<username>,<password>,<dbName>]             |             |   |
| Age of the oldest FrozenXID of the database.                 | Integer     | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.  |
| pgsql.db.bloating_tables[uri,<username>,<password>,<dbName>] |             |   |
| The number of bloating tables per database.                  | Integer     | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.  |
| pgsql.db.discovery[uri,<username>,<password>,<dbName>]       |             |   |
| List of the PostgreSQL databases.                            | JSON object | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.  |
| Used for <b>low-level discovery</b> .                        |             | <b>dbName</b> - Database name.  |
| pgsql.db.size[uri,<username>,<password>,<dbName>]            |             |   |
| Database size in bytes.                                      | Integer     | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.  |
| pgsql.locks[uri,<username>,<password>,<dbName>]              |             |   |
| Information about granted locks per database.                | JSON object | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.  |
| Used for <b>low-level discovery</b> .                        |             |   |
| pgsql.oldest.xid[uri,<username>,<password>,<dbName>]         |             |   |
| Age of the oldest XID.                                       | Integer     | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.  |
| pgsql.ping[uri,<username>,<password>,<dbName>]               |             |   |

| Key  |  |  |   |
|--|--|--|---|
| Tests whether a connection is alive or not.  | 1 - connection is alive<br><br>0 - connection is broken (if there is any error presented including AUTH and configuration issues). | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.   |   |
| pgsql.queries[uri,<username>,<password>,<dbName>,timePeriod]<br>Measures query execution time.                       | JSON object  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.<br><b>timePeriod</b> - execution time limit for count of slow queries (must be a positive integer). | This item is supported since Zabbix 6.0.3 |
| pgsql.replication.count[uri,<username>,<password>]<br>The number of standby servers.                                 | Integer  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.replication.process[uri,<username>,<password>]<br>Flush lag, write lag and replay lag per each sender process. | JSON object  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.replication.process.discovery[uri,<username>,<password>]<br>Replication process name discovery.                | JSON object  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.replication.recovery_role[uri,<username>,<password>]<br>Recovery status.                                       | 0 - master mode<br>1 - recovery is still in progress (standby mode)  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.replication.status[uri,<username>,<password>]<br>The status of replication.                                    | 0 - streaming is down<br>1 - streaming is up<br>2 - master mode  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.replication_lag.b[uri,<username>,<password>]<br>Replication lag in bytes.                                      | Integer  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.replication_lag.sec[uri,<username>,<password>]<br>Replication lag in seconds.                                  | Integer  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.   |   |
| pgsql.uptime[uri,<username>,<password>,<dbName>]<br>PostgreSQL uptime in milliseconds.                               | Float  | <b>uri</b> - URI or session name.<br><b>username, password</b> - PostgreSQL credentials.<br><b>dbName</b> - Database name.   |   |

| Key  |             |   |
|--|-------------|---|
| pgsql.version[uri,<username>,<password>,<dbName>]  |             |   |
| Returns  | String      | <b>uri</b> - URI or session name.                   |
| PostgreSQL version.                                |             | <b>username, password</b> - PostgreSQL credentials. |
|  |             | <b>dbName</b> - Database name.                      |
| pgsql.wal.stat[uri,<username>,<password>,<dbName>] |             |   |
| WAL statistics.                                    | JSON object | <b>uri</b> - URI or session name.                   |
|  |             | <b>username, password</b> - PostgreSQL credentials. |
|  |             | <b>dbName</b> - Database name.                      |

## Redis

| Key   |   |  |          |
|---|---|--|----------|
| Description   | Return value  | Parameters   | Comments |
| redis.config[connString,<password>,<pattern>]                                 |   |  |          |
| Gets the configuration parameters of a Redis instance that match the pattern. | JSON - if a glob-style pattern was used<br><br>single value - if a pattern did not contain any wildcard character                 | <b>connString</b> - URI or session name.<br><b>password</b> - Redis password.<br><b>pattern</b> - glob-style pattern (* by default).                                   |          |
| redis.info[connString,<password>,<section>]                                   |   |  |          |
| Gets the output of the INFO command.  | JSON - output is serialized as JSON   | <b>connString</b> - URI or session name.<br><b>password</b> - Redis password.<br><b>section</b> - <a href="#">section</a> of information ( <i>default</i> by default). |          |
| redis.ping[connString,<password>]   |   |  |          |
| Test if a connection is alive or not.   | 1 - connection is alive<br><br>0 - connection is broken (if there is any error presented including AUTH and configuration issues) | <b>connString</b> - URI or session name.<br><b>password</b> - Redis password.  |          |
| redis.slowlog.count[connString,<password>]                                    |   |  |          |
| The number of slow log entries since Redis was started.                       | Integer   | <b>connString</b> - URI or session name.<br><b>password</b> - Redis password.  |          |

## S.M.A.R.T.

| Key                       |              |            |          |
|---------------------------|--------------|------------|----------|
| Description               | Return value | Parameters | Comments |
| smart.attribute.discovery |              |            |          |

| Key   |             |  |
|---|-------------|--|
| Returns a list of S.M.A.R.T. device attributes.         | JSON object | The following macros and their values are returned: {#NAME}, {#DISKTYPE}, {#ID}, {#ATTRNAME}, {#THRESH}. HDD, SSD and NVME drive types are supported. Drives can be alone or combined in a RAID. {#NAME} will have an add-on in case of RAID, e.g: {"{#NAME}": "/dev/sda cciss,2"}   |
| smart.disk.discovery                                    |             |  |
| Returns a list of S.M.A.R.T. devices.                   | JSON object | The following macros and their values are returned: {#NAME}, {#DISKTYPE}, {#MODEL}, {#SN}, {#PATH}, {#ATTRIBUTES}, {#RAIDTYPE}. HDD, SSD and NVME drive types are supported. If a drive does not belong to a RAID, {#RAIDTYPE} will be empty. {#NAME} will have an add-on in case of RAID, e.g: {"{#NAME}": "/dev/sda cciss,2"}  |
| smart.disk.get[<path>,<raid_type>]                      |             |  |
| Returns all available properties of S.M.A.R.T. devices. | JSON object | <p><b>path</b> (since Zabbix 6.0.4) - disk path, the {#PATH} macro may be used as a value</p> <p><b>raid_type</b> (since Zabbix 6.0.4) - RAID type, the {#RAID} macro may be used as a value</p> <p>HDD, SSD and NVME drive types are supported. Drives can be alone or combined in a RAID.</p> <p>The data includes smartctl version and call arguments, and additional fields:</p> <p><i>disk_name</i> - holds the name with the required add-ons for RAID discovery, e.g: {"disk_name": "/dev/sda cciss,2"}</p> <p><i>disk_type</i> - holds the disk type HDD, SSD, or NVME, e.g: {"disk_type": "ssd"}</p> <p>If no parameters are specified, the item will return information about all disks.</p> |

## Systemd

| Key   |              |  |   |
|---|--------------|--|---|
| Description   | Return value | Parameters   | Comments  |
| systemd.unit.get[unit name,<interface>]             |              |  |   |
| Returns all properties of a systemd unit.           | JSON object  | <p><b>unit name</b> - unit name (you may want to use the {#UNIT.NAME} macro in item prototype to discover the name)</p> <p><b>interface</b> - unit interface type, possible values: <i>Unit</i> (default), <i>Service</i>, <i>Socket</i>, <i>Device</i>, <i>Mount</i>, <i>Automount</i>, <i>Swap</i>, <i>Target</i>, <i>Path</i></p> | <p>This item is supported on Linux platform only.</p> <p>LoadState, ActiveState and UnitFileState for Unit interface are returned as text and integer:</p> <p>"ActiveState":{"state":1,"text":"active"}</p> |
| systemd.unit.info[unit name,<property>,<interface>] |              |  |   |

| Key  |             |   |  |
|--|-------------|---|--|
| Systemd unit information.  | String      | <b>unit name</b> - unit name (you may want to use the {#UNIT.NAME} macro in item prototype to discover the name)<br><b>property</b> - unit property (e.g. ActiveState (default), LoadState, Description)<br><b>interface</b> - unit interface type (e.g. Unit (default), Socket, Service) | <p>This item allows to retrieve a specific property from specific type of interface as described in <a href="#">dbus API</a>.</p> <p>This item is supported on Linux platform only.</p> <p>Examples:</p> <pre>=&gt; systemd.unit.info["{#UNIT.NAME}"] - collect active state (active, reloading, inactive, failed, activating, deactivating) info on discovered systemd units =&gt; sys- temd.unit.info["{#UNIT.NAME}",LoadState] - collect load state info on discovered systemd units =&gt; systemd.unit.info[mysql.service,Id] - retrieve service technical name (mysql.service) =&gt; sys- temd.unit.info[mysql.service,Description] - retrieve service description (MySQL Server) =&gt; sys- temd.unit.info[mysql.service,ActiveEnterTimestamp] - retrieve the last time the service entered the active state (1562565036283903) =&gt; sys- temd.unit.info[dbus.socket,NConnections,Socket] - collect the number of connections from this socket unit</pre> <p>This item is supported on Linux platform only.</p> |
| systemd.unit.discovery[<type>]<br>List of systemd units and their details. Used for <b>low-level discovery</b> . | JSON object | <b>type</b> - possible values: <i>all, automount, device, mount, path, service</i> (default), <i>socket, swap, target</i>   | This item is supported on Linux platform only.   |

## Web certificate

| Key  |              |            |          |
|--|--------------|------------|----------|
| Description                                    | Return value | Parameters | Comments |
| web.certificate.get[hostname,<port>,<address>] |              |            |          |

| Key   |             |   |  |
|---|-------------|---|--|
| Validates certificates and returns certificate details. | JSON object | <p><b>hostname</b> - can be either IP or DNS. May contain the URL scheme (<i>https</i> only), path (it will be ignored), and port. If a port is provided in both the first and the second parameters, their values must match. If address (the 3rd parameter) is specified, the hostname is only used for SNI and hostname verification.</p> <p><b>port</b> - port number (default is 443 for HTTPS).</p> <p><b>address</b> - can be either IP or DNS. If specified, it will be used for connection, and hostname (the 1st parameter) will be used for SNI, and host verification. In case, the 1st parameter is an IP and the 3rd parameter is DNS, the 1st parameter will be used for connection, and the 3rd parameter will be used for SNI and host verification.</p> | <p>This item turns unsupported if the resource specified in <code>host</code> does not exist or is unavailable or if TLS handshake fails with any error except an invalid certificate.</p> <p>Currently, AIA (Authority Information Access) X.509 extension, CRLs and OCSP (including OCSP stapling), Certificate Transparency, and custom CA trust store are not supported.</p> |

## 2 Windows-specific item keys

### Item keys

The table provides details on the item keys that you can use with Zabbix Windows agent only.

See also: [Minimum permission level for Windows agent items](#)

| Key   |              |            |          |
|---|--------------|------------|----------|
| Description   | Return value | Parameters | Comments |
| eventlog[name,<regexp>,<severity>,<source>,<eventid>,<maxlines>,<mode>] |              |            |          |

|   |   |  |   |
|---|---|--|---|
| Event log monitoring.   | Log   | <p><b>name</b> - name of event log</p> <p><b>regexp</b> - regular expression describing the required pattern</p> <p><b>severity</b> - regular expression describing severity (case-insensitive). This parameter accepts a regular expression based on the following values: "Information", "Warning", "Error", "Critical", "Verbose" (since Zabbix 2.2.0 running on Windows Vista or newer)</p> <p><b>source</b> - regular expression describing source identifier (case-insensitive; regular expression is supported since Zabbix 2.2.0)</p> <p><b>eventid</b> - regular expression describing the event identifier(s)</p> <p><b>maxlines</b> - maximum number of new lines per second the agent will send to Zabbix server or proxy. This parameter overrides the value of 'MaxLinesPerSecond' in <code>zabbix_agentd.conf</code></p> <p><b>mode</b> - possible values:<br/> <i>all</i> (default), <i>skip</i> - skip processing of older data (affects only newly created items).</p> | <p>The item must be configured as an <b>active check</b>.</p> <p>Examples:<br/> =&gt; eventlog[Application]<br/> =&gt; eventlog[Security,"Failure Audit",,"^(529 680)\$]<br/> =&gt; eventlog[System,"Warning Error"]<br/> =&gt; eventlog[System,,,,^1\$]<br/> =&gt; eventlog[System,,,,@TWOSHORT] - here a <b>custom regular expression</b> named TWOSHORT is referenced (defined as a <i>Result is TRUE</i> type, the expression itself being <code>^1\$\ ^70\$</code>).</p> <p>Note that the agent is unable to send in events from the "Forwarded events" log.</p> <p>The <code>mode</code> parameter is supported since Zabbix 2.0.0.<br/> "Windows Eventing 6.0" is supported since Zabbix 2.2.0.</p> <p>Note that selecting a non-Log <b>type of information</b> for this item will lead to the loss of local timestamp, as well as log severity and source information.</p> <p>See also additional information on <b>log monitoring</b>.</p> |
| net.if.list<br>Network interface list (includes interface type, status, IPv4 address, description). | Text  |  | <p>Supported since Zabbix agent version 1.8.1. Multi-byte interface names supported since Zabbix agent version 1.8.6. Disabled interfaces are not listed.</p> <p>Note that enabling/disabling some components may change their ordering in the Windows interface name.</p> <p>Some Windows versions (for example, Server 2008) might require the latest updates installed to support non-ASCII characters in interface names.</p>   |
| perf_counter[counter,<interval>]<br>Value of any Windows performance counter.                       | Integer, float, string or text (depending on the request) | <p><b>counter</b> - path to the counter</p> <p><b>interval</b> - last N seconds for storing the average value.</p> <p>The <code>interval</code> must be between 1 and 900 seconds (included) and the default value is 1.</p>   | <p>Performance Monitor can be used to obtain list of available counters. Until version 1.6 this parameter will return correct value only for counters that require just one sample (like \System\Threads). It will not work as expected for counters that require more than one sample - like CPU utilization. Since 1.6, <code>interval</code> is used, so the check returns an average value for last "interval" seconds every time.</p> <p>See also: <b>Windows performance counters</b>.</p>  |
| perf_counter_en[counter,<interval>]   |   |  |   |

| Key   |   |  |  |
|---|---|--|--|
| Value of any Windows performance counter in English.  | Integer, float, string or text (depending on the request) | <b>counter</b> - path to the counter in English<br><b>interval</b> - last N seconds for storing the average value.<br>The <code>interval</code> must be between 1 and 900 seconds (included) and the default value is 1. | This item is only supported on <b>Windows Server 2008/Vista</b> and above.<br><br>You can find the list of English strings by viewing the following registry key:<br>HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib\009.<br><br>Supported since Zabbix agent versions 4.0.13 and 4.2.7. |
| perf_instance.discovery[object]<br>List of object instances of Windows performance counters.<br>Used for <b>low-level discovery</b> .   | JSON object   | <b>object</b> - object name (localized)  | Supported since Zabbix agent version 5.0.1.  |
| perf_instance_en.discovery[object]<br>List of object instances of Windows performance counters, discovered using object names in English. Used for <b>low-level discovery</b> . | JSON object   | <b>object</b> - object name (in English)   | Supported since Zabbix agent version 5.0.1.  |
| proc_info[process,<attribute>,<type>]   |   |  |  |

| Key  |             |   |  |
|--|-------------|---|--|
| Various information about specific process(es).  | Float       | <p><b>process</b> - process name</p> <p><b>attribute</b> - requested process attribute</p> <p><b>type</b> - representation type (meaningful when more than one process with the same name exists)</p> | <p>The following attributes are supported:</p> <p><i>vmsize</i> (default) - size of process virtual memory in Kbytes</p> <p><i>wkset</i> - size of process working set (amount of physical memory used by process) in Kbytes</p> <p><i>pf</i> - number of page faults</p> <p><i>ktime</i> - process kernel time in milliseconds</p> <p><i>utime</i> - process user time in milliseconds</p> <p><i>io_read_b</i> - number of bytes read by process during I/O operations</p> <p><i>io_read_op</i> - number of read operation performed by process</p> <p><i>io_write_b</i> - number of bytes written by process during I/O operations</p> <p><i>io_write_op</i> - number of write operation performed by process</p> <p><i>io_other_b</i> - number of bytes transferred by process during operations other than read and write operations</p> <p><i>io_other_op</i> - number of I/O operations performed by process, other than read and write operations</p> <p><i>gdiobj</i> - number of GDI objects used by process</p> <p><i>userobj</i> - number of USER objects used by process</p> <p>Valid types are:</p> <p><i>avg</i> (default) - average value for all processes named &lt;process&gt;</p> <p><i>min</i> - minimum value among all processes named &lt;process&gt;</p> <p><i>max</i> - maximum value among all processes named &lt;process&gt;</p> <p><i>sum</i> - sum of values for all processes named &lt;process&gt;</p> <p>Examples:</p> <p>=&gt; <code>proc_info[iexplore.exe,wkset,sum]</code> - to get the amount of physical memory taken by all Internet Explorer processes</p> <p>=&gt; <code>proc_info[iexplore.exe,pf,avg]</code> - to get the average number of page faults for Internet Explorer processes</p> <p>Note that on a 64-bit system, a 64-bit Zabbix agent is required for this item to work correctly.</p> <p>Supported since Zabbix agent version 3.0.</p> |
| service.discovery                                |             |   |  |
| List of Windows services.                        | JSON object |   |  |
| Used for low-level discovery.                    |             |   |  |
| <code>service.info[service,&lt;param&gt;]</code> |             |   |  |

| Key   |   |   |  |
|---|---|---|--|
| Information about a service.                          | <p>Integer - with <code>param</code> as <i>state, startup</i></p> <p>String - with <code>param</code> as <i>displayname, path, user</i></p> <p>Text - with <code>param</code> as <i>description</i></p> <p>Specifically for <i>state</i>:<br/> 0 - running,<br/> 1 - paused,<br/> 2 - start pending,<br/> 3 - pause pending,<br/> 4 - continue pending,<br/> 5 - stop pending,<br/> 6 - stopped,<br/> 7 - unknown,<br/> 255 - no such service</p> <p>Specifically for <i>startup</i>:<br/> 0 - automatic,<br/> 1 - automatic delayed,<br/> 2 - manual,<br/> 3 - disabled,<br/> 4 - unknown,<br/> 5 - automatic trigger start,<br/> 6 - automatic delayed trigger start,<br/> 7 - manual trigger start</p> | <p><b>service</b> - a real service name or its display name as seen in MMC Services snap-in</p> <p><b>param</b> - <i>state</i> (default), <i>displayname</i>, <i>path</i>, <i>user</i>, <i>startup</i> or <i>description</i></p>  | <p>Examples:</p> <p>=&gt; <code>service.info[SNMPTRAP]</code> - state of the SNMPTRAP service</p> <p>=&gt; <code>service.info[SNMP Trap]</code> - state of the same service, but with display name specified</p> <p>=&gt; <code>service.info[EventLog,startup]</code> - startup type of the EventLog service</p> <p>Items <code>service.info[service,state]</code> and <code>service.info[service]</code> will return the same information.</p> <p>Note that only with <code>param</code> as <i>state</i> this item returns a value for non-existing services (255).</p> <p>This item is supported since Zabbix 3.0.0. It should be used instead of the deprecated <code>service_state[service]</code> item.</p> |
| Listing of services.                                  | <p>0 - if empty</p> <p>Text - list of services separated by a newline</p>   | <p><b>type</b> - <i>all</i> (default), <i>automatic</i>, <i>manual</i> or <i>disabled</i></p> <p><b>state</b> - <i>all</i> (default), <i>stopped</i>, <i>started</i>, <i>start_pending</i>, <i>stop_pending</i>, <i>running</i>, <i>continue_pending</i>, <i>pause_pending</i> or <i>paused</i></p> <p><b>exclude</b> - services to exclude from the result. Excluded services should be listed in double quotes, separated by comma, without spaces.</p> | <p>Examples:</p> <p>=&gt; <code>services[,started]</code> - list of started services</p> <p>=&gt; <code>services[automatic, stopped]</code> - list of stopped services, that should be run</p> <p>=&gt; <code>services[automatic, stopped, "service1,service2,service3"]</code> - list of stopped services, that should be run, excluding services with names <code>service1</code>, <code>service2</code> and <code>service3</code></p> <p>The <code>exclude</code> parameter is supported since Zabbix 1.8.1.</p>  |
| <code>wmi.get[&lt;namespace&gt;,&lt;query&gt;]</code> |   |   |  |

| Key  |   |  |  |
|--|---|--|--|
| Execute WMI query and return the first selected object.  | Integer, float, string or text (depending on the request) | <b>namespace</b> - WMI namespace<br><b>query</b> - WMI query returning a single object   | WMI queries are performed with <a href="#">WQL</a> .<br><br>Example:<br>=> wmi.get[root\cimv2,select status from Win32_DiskDrive where Name like '%PHYSICALDRIVE0%'] - returns the status of the first physical disk<br><br>This key is supported since Zabbix 2.2.0.  |
| wmi.getall[<namespace>,<query>]<br>Execute WMI query and return the whole response.<br><br>Can be used for <a href="#">low-level discovery</a> . | JSON object   | <b>namespace</b> - WMI namespace<br><b>query</b> - WMI query   | WMI queries are performed with <a href="#">WQL</a> .<br><br>Example:<br>=> wmi.getall[root\cimv2,select * from Win32_DiskDrive where Name like '%PHYSICALDRIVE%'] - returns status information of physical disks<br><br>JSONPath <a href="#">preprocessing</a> can be used to point to more specific values in the returned JSON.<br><br>This key is supported since Zabbix 4.4.0.   |
| vm.vmemory.size[<type>]<br>Virtual memory size in bytes or in percentage from total.   | Integer - for bytes<br><br>Float - for percentage         | <b>type</b> - possible values:<br><i>available</i> (available virtual memory), <i>pavailable</i> (available virtual memory, in percent), <i>pused</i> (used virtual memory, in percent), <i>total</i> (total virtual memory, default), <i>used</i> (used virtual memory) | Example:<br>=> vm.vmemory.size[pavailable] → available virtual memory, in percentage<br><br>Monitoring of virtual memory statistics is based on:<br>* Total virtual memory on Windows (total physical + page file size);<br>* The maximum amount of memory Zabbix agent can commit;<br>* The current committed memory limit for the system or Zabbix agent, whichever is smaller.<br><br>This key is supported since Zabbix 3.0.7 and 3.2.3. |

## Monitoring Windows services

This tutorial provides step-by-step instructions for setting up the monitoring of Windows services. It is assumed that Zabbix server and agent are configured and operational.

### Step 1

Get the service name.

You can get the service name by going to the MMC Services snap-in and bringing up the properties of the service. In the *General* tab you should see a field called "Service name". The value that follows is the name you will use when setting up an item for monitoring. For example, if you wanted to monitor the "workstation" service, then your service might be: **lanmanworkstation**.

### Step 2

[Configure an item](#) for monitoring the service.

The item `service.info[service,<param>]` retrieves information about a particular service. Depending on the information you need, specify the `param` option which accepts the following values: *displayname*, *state*, *path*, *user*, *startup* or *description*. The default value is *state* if `param` is not specified (`service.info[service]`).

The type of return value depends on chosen `param`: integer for *state* and *startup*; character string for *displayname*, *path* and *user*; text for *description*.

Example:

- Key: `service.info[lanmanworkstation]`
- Type of information: Numeric (unsigned)

The item `service.info[lanmanworkstation]` will retrieve information about the state of the service as a numerical value. To map a numerical value to a text representation in the frontend ("0" as "Running", "1" as "Paused", etc.), you can configure **value mapping** on the host on which the item is configured. To do this, either **link the template *Windows services by Zabbix agent*** or ***Windows services by Zabbix agent active*** to the host, or configure on the host a new value map that is based on the *Windows service state* value map configured on the mentioned templates.

Note that both of the mentioned templates have a discovery rule configured that will discover services automatically. If you do not want this, you can **disable the discovery rule** on the host level once the template has been linked to the host.

Discovery of Windows services

**Low-level discovery** provides a way to automatically create items, triggers, and graphs for different entities on a computer. Zabbix can automatically start monitoring Windows services on your machine, without the need to know the exact name of a service or create items for each service manually. A filter can be used to generate real items, triggers, and graphs only for services of interest.

## 2 SNMP agent

Overview

You may want to use SNMP monitoring on devices such as printers, network switches, routers or UPS that usually are SNMP-enabled and on which it would be impractical to attempt setting up complete operating systems and Zabbix agents.

To be able to retrieve data provided by SNMP agents on these devices, Zabbix server must be **initially configured** with SNMP support by specifying the `--with-net-snmp` flag.

SNMP checks are performed over the UDP protocol only.

Zabbix server and proxy daemons query SNMP devices for multiple values in a single request. This affects all kinds of SNMP items (regular SNMP items, SNMP items with dynamic indexes, and SNMP low-level discovery) and should make SNMP processing much more efficient. See the **bulk processing** section for technical details on how it works internally. Bulk requests can also be disabled for devices that cannot handle them properly using the "Use bulk requests" setting for each interface.

Zabbix server and proxy daemons log lines similar to the following if they receive an incorrect SNMP response:

SNMP response from host "gateway" does not contain all of the requested variable bindings

While they do not cover all the problematic cases, they are useful for identifying individual SNMP devices for which bulk requests should be disabled.

Zabbix server/proxy will always retry at least one time after an unsuccessful query attempt: either through the SNMP library's retrying mechanism or through the internal **bulk processing** mechanism.

### Warning:

If monitoring SNMPv3 devices, make sure that `msgAuthoritativeEngineID` (also known as `snmpEngineID` or "Engine ID") is never shared by two devices. According to [RFC 2571](#) (section 3.1.1.1) it must be unique for each device.

### Warning:

RFC3414 requires the SNMPv3 devices to persist their engineBoots. Some devices do not do that, which results in their SNMP messages being discarded as outdated after being restarted. In such situation, SNMP cache needs to be manually cleared on a server/proxy (by using `-R snmp_cache_reload`) or the server/proxy needs to be restarted.

Configuring SNMP monitoring

To start monitoring a device through SNMP, the following steps have to be performed:

Step 1

Find out the SNMP string (or OID) of the item you want to monitor.

To get a list of SNMP strings, use the **snmpwalk** command (part of [net-snmp](#) software which you should have installed as part of the Zabbix installation) or equivalent tool:

```
snmpwalk -v 2c -c public <host IP> .
```

As '2c' here stands for SNMP version, you may also substitute it with '1', to indicate SNMP Version 1 on the device.

This should give you a list of SNMP strings and their last value. If it doesn't then it is possible that the SNMP 'community' is different from the standard 'public' in which case you will need to find out what it is.

You can then go through the list until you find the string you want to monitor, e.g. if you wanted to monitor the bytes coming in to your switch on port 3 you would use the IF-MIB::ifHCInOctets.3 string from this line:

```
IF-MIB::ifHCInOctets.3 = Counter64: 3409739121
```

You may now use the **snmpget** command to find out the numeric OID for 'IF-MIB::ifHCInOctets.3':

```
snmpget -v 2c -c public -On <host IP> IF-MIB::ifHCInOctets.3
```

Note that the last number in the string is the port number you are looking to monitor. See also: [Dynamic indexes](#).

This should give you something like the following:

```
.1.3.6.1.2.1.31.1.1.1.6.3 = Counter64: 3472126941
```

Again, the last number in the OID is the port number.

**Note:**

Some of the most used SNMP OIDs are **translated automatically to a numeric representation** by Zabbix.

In the last example above value type is "Counter64", which internally corresponds to ASN\_COUNTER64 type. The full list of supported types is ASN\_COUNTER, ASN\_COUNTER64, ASN\_INTEGER, ASN\_UNSIGNED64, ASN\_INTEGER64, ASN\_FLOAT, ASN\_DOUBLE, ASN\_TIMETICKS, ASN\_GAUGE, ASN\_IPADDRESS, ASN\_OCTET\_STR and ASN\_OBJECT\_ID. These types roughly correspond to "Counter32", "Counter64", "UInteger32", "INTEGER", "Float", "Double", "Timeticks", "Gauge32", "IpAddress", "OCTET STRING", "OBJECT IDENTIFIER" in **snmpget** output, but might also be shown as "STRING", "Hex-STRING", "OID" and other, depending on the presence of a display hint.

Step 2

Create a **host** corresponding to a device.

| Host   | Templates  | IPMI     | Tags | Macros | Inventory | Encryption | Value mapping |      |            |          |       |           |  |      |           |  |
|--|------------|----------|------|--------|-----------|------------|---------------|------|------------|----------|-------|-----------|--|------|-----------|--|
| <div><div>* Host name</div><div>SNMP device host</div></div>   |            |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| <div><div>Visible name</div><div>SNMP device host</div></div>  |            |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| <div><div>* Groups</div><div>Discovered hosts X</div><div>type here to search</div></div>  |            |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| <div><div>Interfaces</div><table><thead><tr><th>Type</th><th>IP address</th><th>DNS name</th></tr></thead><tbody><tr><td>Agent</td><td>127.0.0.1</td><td></td></tr><tr><td>SNMP</td><td>127.0.0.1</td><td></td></tr></tbody></table></div> |            |          |      |        |           |            |               | Type | IP address | DNS name | Agent | 127.0.0.1 |  | SNMP | 127.0.0.1 |  |
| Type   | IP address | DNS name |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| Agent  | 127.0.0.1  |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| SNMP   | 127.0.0.1  |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| <div><div>* SNMP version</div><div>SNMPv2</div></div>  |            |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| <div><div>* SNMP community</div><div>{SNMP_COMMUNITY}</div></div>  |            |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |
| <div><div><input checked="" type="checkbox"/> Use bulk requests</div></div>  |            |          |      |        |           |            |               |      |            |          |       |           |  |      |           |  |

Add an SNMP interface for the host:

- Enter the IP address/DNS name and port number

- Select the *SNMP version* from the dropdown
- Add interface credentials depending on the selected SNMP version:
  - SNMPv1, v2 require only the community (usually 'public')
  - SNMPv3 requires more specific options (see below)
- Leave the *Use bulk requests* checkbox marked to allow bulk processing of SNMP requests

| SNMPv3 parameter                 | Description  |
|----------------------------------|--|
| <i>Context name</i>              | Enter context name to identify item on SNMP subnet.<br><i>Context name</i> is supported for SNMPv3 items since Zabbix 2.2.<br>User macros are resolved in this field.  |
| <i>Security name</i>             | Enter security name.<br>User macros are resolved in this field.  |
| <i>Security level</i>            | Select security level:<br><b>noAuthNoPriv</b> - no authentication nor privacy protocols are used<br><b>AuthNoPriv</b> - authentication protocol is used, privacy protocol is not<br><b>AuthPriv</b> - both authentication and privacy protocols are used   |
| <i>Authentication protocol</i>   | Select authentication protocol - <i>MD5</i> , <i>SHA1</i> , <i>SHA224</i> , <i>SHA256</i> , <i>SHA384</i> or <i>SHA512</i> .   |
| <i>Authentication passphrase</i> | Enter authentication passphrase.<br>User macros are resolved in this field.  |
| <i>Privacy protocol</i>          | Select privacy protocol - <i>DES</i> , <i>AES128</i> , <i>AES192</i> , <i>AES256</i> , <i>AES192C</i> (Cisco) or <i>AES256C</i> (Cisco).<br>Note that:<br>- on some older systems net-snmp may not support AES256;<br>- on some newer systems (for example, RHEL9) support of DES may be dropped for the net-snmp package. |
| <i>Privacy passphrase</i>        | Enter privacy passphrase.<br>User macros are resolved in this field.   |

In case of wrong SNMPv3 credentials (security name, authentication protocol/passphrase, privacy protocol):

- Zabbix receives an ERROR from net-snmp, except for wrong *Privacy passphrase* in which case Zabbix receives a TIMEOUT error from net-snmp;
- (since Zabbix 6.0.13) SNMP interface availability will switch to red (unavailable).

#### Warning:

Changes in *Authentication protocol*, *Authentication passphrase*, *Privacy protocol* or *Privacy passphrase*, made without changing the *Security name*, will take effect only after the cache on a server/proxy is manually cleared (by using **-R snmp\_cache\_reload**) or the server/proxy is restarted. In cases, where *Security name* is also changed, all parameters will be updated immediately.

You can use one of the provided SNMP templates (*Template SNMP Device* and others) that will automatically add a set of items. However, the template may not be compatible with the host. Click on *Add* to save the host.

### Step 3

Create an item for monitoring.

So, now go back to Zabbix and click on *Items* for the SNMP host you created earlier. Depending on whether you used a template or not when creating your host, you will have either a list of SNMP items associated with your host or just an empty list. We will work on the assumption that you are going to create the item yourself using the information you have just gathered using *snmpwalk* and *snmpget*, so click on *Create item*. In the new item form:

- Enter the item name
- Change the 'Type' field to 'SNMP agent'
- Enter the 'Key' as something meaningful
- Make sure the 'Host interface' field has your switch/router in it
- Enter the textual or numeric OID that you retrieved earlier into the 'SNMP OID' field, for example: .1.3.6.1.2.1.31.1.1.1.6.3
- Set the 'Type of information' to *Numeric (unsigned)*
- Enter an 'Update interval' and 'History storage' period if you want them to be different from the default
- In the *Preprocessing* tab, add a *Change per second* step (important, otherwise you will get cumulative values from the SNMP device instead of the latest change). Choose a custom multiplier if you want one.

| Item                | Tags                            | Preprocessing |
|---------------------|---------------------------------|---------------|
| * Name              | Interface wlp3s0: Bits received |               |
| Type                | SNMP agent                      |               |
| * Key               | net.if.in[ifHCInOctets.3]       |               |
| Type of information | Numeric (unsigned)              |               |
| * Host interface    | 127.0.0.1:161                   |               |
| * SNMP OID          | 1.3.6.1.2.1.31.1.1.1.6.3        |               |
| Units               | bps                             |               |
| * Update interval   | 3m                              |               |

All mandatory input fields are marked with a red asterisk.

Now save the item and go to *Monitoring > Latest data* for your SNMP data!

Example 1

General example:

| Parameter  | Description   |
|------------|---|
| <b>OID</b> | 1.2.3.45.6.7.8.0 (or .1.2.3.45.6.7.8.0)   |
| <b>Key</b> | <Unique string to be used as reference to triggers><br>For example, "my_param". |

Note that OID can be given in either numeric or string form. However, in some cases, string OID must be converted to numeric representation. Utility `snmpget` may be used for this purpose:

```
snmpget -On localhost public enterprises.ucdavis.memory.memTotalSwap.0
```

Example 2

Monitoring of uptime:

| Parameter                                    | Description      |
|--|------------------|
| <b>OID</b>                                   | MIB::sysUpTime.0 |
| <b>Key</b>                                   | router.uptime    |
| <b>Value type</b>                            | Float            |
| <b>Units</b>                                 | uptime           |
| <b>Preprocessing step: Custom multiplier</b> | 0.01             |

Internal workings of bulk processing

Zabbix server and proxy query SNMP devices for multiple values in a single request. This affects several types of SNMP items:

- regular SNMP items
- SNMP items **with dynamic indexes**
- SNMP **low-level discovery rules**

All SNMP items on a single interface with identical parameters are scheduled to be queried at the same time. The first two types of items are taken by pollers in batches of at most 128 items, whereas low-level discovery rules are processed individually, as before.

On the lower level, there are two kinds of operations performed for querying values: getting multiple specified objects and walking an OID tree.

For "getting", a GetRequest-PDU is used with at most 128 variable bindings. For "walking", a GetNextRequest-PDU is used for SNMPv1 and GetBulkRequest with "max-repetitions" field of at most 128 is used for SNMPv2 and SNMPv3.

Thus, the benefits of bulk processing for each SNMP item type are outlined below:

- regular SNMP items benefit from "getting" improvements;
- SNMP items with dynamic indexes benefit from both "getting" and "walking" improvements: "getting" is used for index verification and "walking" for building the cache;
- SNMP low-level discovery rules benefit from "walking" improvements.

However, there is a technical issue that not all devices are capable of returning 128 values per request. Some always return a proper response, but others either respond with a "tooBig(1)" error or do not respond at all once the potential response is over a certain limit.

In order to find an optimal number of objects to query for a given device, Zabbix uses the following strategy. It starts cautiously with querying 1 value in a request. If that is successful, it queries 2 values in a request. If that is successful again, it queries 3 values in a request and continues similarly by multiplying the number of queried objects by 1.5, resulting in the following sequence of request sizes: 1, 2, 3, 4, 6, 9, 13, 19, 28, 42, 63, 94, 128.

However, once a device refuses to give a proper response (for example, for 42 variables), Zabbix does two things.

First, for the current item batch it halves the number of objects in a single request and queries 21 variables. If the device is alive, then the query should work in the vast majority of cases, because 28 variables were known to work and 21 is significantly less than that. However, if that still fails, then Zabbix falls back to querying values one by one. If it still fails at this point, then the device is definitely not responding and request size is not an issue.

The second thing Zabbix does for subsequent item batches is it starts with the last successful number of variables (28 in our example) and continues incrementing request sizes by 1 until the limit is hit. For example, assuming the largest response size is 32 variables, the subsequent requests will be of sizes 29, 30, 31, 32, and 33. The last request will fail and Zabbix will never issue a request of size 33 again. From that point on, Zabbix will query at most 32 variables for this device.

If large queries fail with this number of variables, it can mean one of two things. The exact criteria that a device uses for limiting response size cannot be known, but we try to approximate that using the number of variables. So the first possibility is that this number of variables is around the device's actual response size limit in the general case: sometimes response is less than the limit, sometimes it is greater than that. The second possibility is that a UDP packet in either direction simply got lost. For these reasons, if Zabbix gets a failed query, it reduces the maximum number of variables to try to get deeper into the device's comfortable range, but (starting from 2.2.8) only up to two times.

In the example above, if a query with 32 variables happens to fail, Zabbix will reduce the count to 31. If that happens to fail, too, Zabbix will reduce the count to 30. However, Zabbix will not reduce the count below 30, because it will assume that further failures are due to UDP packets getting lost, rather than the device's limit.

If, however, a device cannot handle bulk requests properly for other reasons and the heuristic described above does not work, since Zabbix 2.4 there is a "Use bulk requests" setting for each interface that allows to disable bulk requests for that device.

## 1 Dynamic indexes

### Overview

While you may find the required index number (for example, of a network interface) among the SNMP OIDs, sometimes you may not completely rely on the index number always staying the same.

Index numbers may be dynamic - they may change over time and your item may stop working as a consequence.

To avoid this scenario, it is possible to define an OID which takes into account the possibility of an index number changing.

For example, if you need to retrieve the index value to append to **ifInOctets** that corresponds to the **GigabitEthernet0/1** interface on a Cisco device, use the following OID:

```
ifInOctets["index","ifDescr","GigabitEthernet0/1"]
```

The syntax

A special syntax for OID is used:

<OID of data>["index", "<base OID of index>", "<string to search for>"]

| Parameter            | Description   |
|----------------------|---|
| OID of data          | Main OID to use for data retrieval on the item.   |
| index                | Method of processing. Currently one method is supported:<br><b>index</b> – search for index and append it to the data OID |
| base OID of index    | This OID will be looked up to get the index value corresponding to the string.  |
| string to search for | The string to use for an exact match with a value when doing lookup. Case sensitive.                                      |

#### Example

Getting memory usage of *apache* process.

If using this OID syntax:

```
HOST-RESOURCES-MIB::hrSWRunPerfMem["index", "HOST-RESOURCES-MIB::hrSWRunPath", "/usr/sbin/apache2"]
```

the index number will be looked up here:

```
...
HOST-RESOURCES-MIB::hrSWRunPath.5376 = STRING: "/sbin/getty"
HOST-RESOURCES-MIB::hrSWRunPath.5377 = STRING: "/sbin/getty"
HOST-RESOURCES-MIB::hrSWRunPath.5388 = STRING: "/usr/sbin/apache2"
HOST-RESOURCES-MIB::hrSWRunPath.5389 = STRING: "/sbin/sshd"
...
```

Now we have the index, 5388. The index will be appended to the data OID in order to receive the value we are interested in:

```
HOST-RESOURCES-MIB::hrSWRunPerfMem.5388 = INTEGER: 31468 KBytes
```

#### Index lookup caching

When a dynamic index item is requested, Zabbix retrieves and caches whole SNMP table under base OID for index, even if a match would be found sooner. This is done in case another item would refer to the same base OID later - Zabbix would look up index in the cache, instead of querying the monitored host again. Note that each poller process uses separate cache.

In all subsequent value retrieval operations only the found index is verified. If it has not changed, value is requested. If it has changed, cache is rebuilt - each poller that encounters a changed index walks the index SNMP table again.

## 2 Special OIDs

Some of the most used SNMP OIDs are translated automatically to a numeric representation by Zabbix. For example, **ifIndex** is translated to **1.3.6.1.2.1.2.2.1.1**, **ifIndex.0** is translated to **1.3.6.1.2.1.2.2.1.1.0**.

The table contains list of the special OIDs.

| Special OID   | Identifier           | Description   |
|---------------|----------------------|---|
| ifIndex       | 1.3.6.1.2.1.2.2.1.1  | A unique value for each interface.  |
| ifDescr       | 1.3.6.1.2.1.2.2.1.2  | A textual string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the hardware interface. |
| ifType        | 1.3.6.1.2.1.2.2.1.3  | The type of interface, distinguished according to the physical/link protocol(s) immediately 'below' the network layer in the protocol stack.                                      |
| ifMtu         | 1.3.6.1.2.1.2.2.1.4  | The size of the largest datagram which can be sent / received on the interface, specified in octets.  |
| ifSpeed       | 1.3.6.1.2.1.2.2.1.5  | An estimate of the interface's current bandwidth in bits per second.  |
| ifPhysAddress | 1.3.6.1.2.1.2.2.1.6  | The interface's address at the protocol layer immediately 'below' the network layer in the protocol stack.  |
| ifAdminStatus | 1.3.6.1.2.1.2.2.1.7  | The current administrative state of the interface.  |
| ifOperStatus  | 1.3.6.1.2.1.2.2.1.8  | The current operational state of the interface.   |
| ifInOctets    | 1.3.6.1.2.1.2.2.1.10 | The total number of octets received on the interface, including framing characters.   |
| ifInUcastPkts | 1.3.6.1.2.1.2.2.1.11 | The number of subnetwork-unicast packets delivered to a higher-layer protocol.  |

| Special OID       | Identifier           | Description   |
|-------------------|----------------------|---|
| ifInNUcastPkts    | 1.3.6.1.2.1.2.2.1.12 | The number of non-unicast (i.e., subnetwork- broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol.   |
| ifInDiscards      | 1.3.6.1.2.1.2.2.1.13 | The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. |
| ifInErrors        | 1.3.6.1.2.1.2.2.1.14 | The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.  |
| ifInUnknownProtos | 1.3.6.1.2.1.2.2.1.15 | The number of packets received via the interface which were discarded because of an unknown or unsupported protocol.  |
| ifOutOctets       | 1.3.6.1.2.1.2.2.1.16 | The total number of octets transmitted out of the interface, including framing characters.  |
| ifOutUcastPkts    | 1.3.6.1.2.1.2.2.1.17 | The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.                                    |
| ifOutNUcastPkts   | 1.3.6.1.2.1.2.2.1.18 | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.  |
| ifOutDiscards     | 1.3.6.1.2.1.2.2.1.19 | The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.                           |
| ifOutErrors       | 1.3.6.1.2.1.2.2.1.20 | The number of outbound packets that could not be transmitted because of errors.   |
| ifOutQLen         | 1.3.6.1.2.1.2.2.1.21 | The length of the output packet queue (in packets).   |

### 3 MIB files

#### Introduction

MIB stands for the Management Information Base. MIB files allow to use textual representation of an OID (Object Identifier). It is possible to use raw OIDs when monitoring SNMP devices with Zabbix, but if you feel more comfortable using textual representation, you need to install MIB files.

For example,

`ifHCOutOctets`

is textual representation of the OID

`1.3.6.1.2.1.31.1.1.1.10`

#### Installing MIB files

On Debian-based systems:

```
apt install snmp-mibs-downloader
download-mibs
```

On RedHat-based systems:

```
dnf install net-snmp-libs
```

#### Enabling MIB files

On RedHat-based systems, MIB files should be enabled by default. On Debian-based systems, you have to edit the file `/etc/snmp/snmp.conf` and comment out the line that says `mibs` :

```
# As the snmp packages come without MIB files due to license reasons, loading
# of MIBs is disabled by default. If you added the MIBs you can re-enable
# loading them by commenting out the following line.
mibs :
```

## Testing MIB files

Testing SNMP MIBs can be done using `snmpwalk` utility. If you don't have it installed, use the following instructions.

On Debian-based systems:

```
apt install snmp
```

On RedHat-based systems:

```
dnf install net-snmp-utils
```

After that, the following command must not give error when you query a network device:

```
$ snmpwalk -v 2c -c public <NETWORK DEVICE IP> ifInOctets
IF-MIB::ifInOctets.1 = Counter32: 176137634
IF-MIB::ifInOctets.2 = Counter32: 0
IF-MIB::ifInOctets.3 = Counter32: 240375057
IF-MIB::ifInOctets.4 = Counter32: 220893420
[...]
```

## Using MIBs in Zabbix

The most important to keep in mind is that Zabbix processes do not get informed of the changes made to MIB files. So after every change you must restart Zabbix server or proxy, e. g.:

```
systemctl restart zabbix-server
```

After that, the changes made to MIB files are in effect.

## Using custom MIB files

There are standard MIB files coming with every GNU/Linux distribution. But some device vendors provide their own.

Let's say, you would like to use **CISCO-SMI** MIB file. The following instructions will download and install it:

```
wget ftp://ftp.cisco.com/pub/mibs/v2/CISCO-SMI.my -P /tmp
mkdir -p /usr/local/share/snmp/mibs
grep -q '^mibdirs +/usr/local/share/snmp/mibs' /etc/snmp/snmp.conf 2>/dev/null || echo "mibdirs +/usr/local/share/snmp/mibs" >> /etc/snmp/snmp.conf
cp /tmp/CISCO-SMI.my /usr/local/share/snmp/mibs
```

Now you should be able to use it. Try to translate the name of the object *ciscoProducts* from the MIB file to OID:

```
snmptranslate -IR -On CISCO-SMI::ciscoProducts
.1.3.6.1.4.1.9.1
```

If you receive errors instead of the OID, ensure all the previous commands did not return any errors.

The object name translation worked, you are ready to use custom MIB file. Note the MIB name prefix (*CISCO-SMI::*) used in the query. You will need this when using command-line tools as well as Zabbix.

Don't forget to restart Zabbix server/proxy before using this MIB file in Zabbix.

### Attention:

Keep in mind that MIB files can have dependencies. That is, one MIB may require another. In order to satisfy these dependencies you have to install all the affected MIB files.

## 3 SNMP traps

### Overview

Receiving SNMP traps is the opposite to querying SNMP-enabled devices.

In this case, the information is sent from an SNMP-enabled device and is collected or "trapped" by Zabbix.

Usually, traps are sent upon some condition change and the agent connects to the server on port 162 (as opposed to port 161 on the agent side that is used for queries). Using traps may detect some short problems that occur amidst the query interval and may be missed by the query data.

Receiving SNMP traps in Zabbix is designed to work with **snmptrapd** and one of the mechanisms for passing the traps to Zabbix - either a Bash or Perl script or SNMPPTT.

**Note:**

The simplest way to set up trap monitoring after configuring Zabbix is to use the Bash script solution, because Perl and SNMPPTT are often missing in modern distributions and require more complex configuration. However, this solution uses a script configured as `traphandle`. For better performance on production systems, use the embedded Perl solution (either script with `do_perl` option or SNMPPTT).

The workflow of receiving a trap:

1. `snmptrapd` receives a trap
2. `snmptrapd` passes the trap to the receiver script (Bash, Perl) or SNMPPTT
3. The receiver parses, formats and writes the trap to a file
4. Zabbix SNMP trapper reads and parses the trap file
5. For each trap Zabbix finds all "SNMP trapper" items with host interfaces matching the received trap address. Note that only the selected "IP" or "DNS" in host interface is used during the matching.
6. For each found item, the trap is compared to `regex` in `snmptrap[regex]`. The trap is set as the value of **all** matched items. If no matching item is found and there is an `snmptrap.fallback` item, the trap is set as the value of that.
7. If the trap was not set as the value of any item, Zabbix by default logs the unmatched trap. (This is configured by "Log unmatched SNMP traps" in Administration > General > Other.)

Configuring SNMP traps

This item type requires the following frontend configuration.

1. Create an SNMP interface for your host

- In *Configuration > Hosts*, create/edit the host, and in the *Interfaces* field, add the interface type "SNMP", specifying the IP or DNS address.<br><br>The address from each received trap will be compared to the IP and DNS addresses of all SNMP interfaces to find the corresponding hosts.

2. Configure the item

- In *Configuration > Hosts*, create/edit the necessary item.
- In the *Key* field, use one of the SNMP trap keys:

| Key   |              |  |
|---|--------------|--|
| Description   | Return value | Comments   |
| <b>snmptrap[regex]</b><br>Catches all SNMP traps that match the <b>regular expression</b> specified in <b>regex</b> . If <code>regex</code> is unspecified, catches any trap. | SNMP trap    | This item can be set only for SNMP interfaces. User macros and global regular expressions are supported in the parameter of this item key. |
| <b>snmptrap.fallback</b><br>Catches all SNMP traps that were not caught by any of the <code>snmptrap[]</code> items for that interface.                                       | SNMP trap    | This item can be set only for SNMP interfaces.   |

**Note:**

Multiline regular expression matching is not supported at this time.

- Set the *Type of information* to "Log" for the timestamps to be parsed. Other formats such as "Numeric" are also acceptable but might require a custom trap handler.

Setting up SNMP trap monitoring

Configuring Zabbix server/proxy

To read the traps, Zabbix server or proxy must be configured to start the SNMP trapper process and point to the trap file that is being written by SNMPPTT or a Bash/Perl trap receiver. To do that, edit the configuration file (`zabbix_server.conf` or `zabbix_proxy.conf`):

```
StartSNMPTrapper=1
SNMPTrapperFile=[TRAP FILE]
```

**Warning:**

If systemd parameter **PrivateTmp** is used, this file is unlikely to work in `/tmp`.

## Configuring Bash trap receiver

Requirements: only snmptrapd.

A Bash trap receiver [script](#) can be used to pass traps to Zabbix server directly from snmptrapd. To configure it, add the `traphandle` option to snmptrapd configuration file (`snmptrapd.conf`), see [example](#).

## Configuring Perl trap receiver

Requirements: Perl, Net-SNMP compiled with `--enable-embedded-perl` (done by default since Net-SNMP 5.4)

A Perl trap receiver (look for `misc/snmptrap/zabbix_trap_receiver.pl`) can be used to pass traps to Zabbix server directly from snmptrapd. To configure it:

- add the Perl script to the snmptrapd configuration file (`snmptrapd.conf`), e.g.:

```
perl do "[FULL PATH TO PERL RECEIVER SCRIPT]";
```

- configure the receiver, e.g:

```
$SNMPTrapperFile = '[TRAP FILE]';
$DateTimeFormat = '[DATE TIME FORMAT]';
```

**Note:**

If the script name is not quoted, snmptrapd will refuse to start up with messages, similar to these:<br><br>

Regex modifiers `/l` and `/a` are mutually exclusive at (eval 2) line 1, at end of line  
 Regex modifier `/l` may not appear twice at (eval 2) line 1, at end of line

## Configuring SNMPPTT

At first, snmptrapd should be configured to use SNMPPTT.

**Note:**

For the best performance, SNMPPTT should be configured as a daemon using **snmpthandler-embedded** to pass the traps to it. See instructions for [configuring SNMPPTT](#).

When SNMPPTT is configured to receive the traps, configure `snmpptt.ini`:

1. enable the use of the Perl module from the NET-SNMP package:

```
net_snmp_perl_enable = 1
```

2. log traps to the trap file which will be read by Zabbix:

```
log_enable = 1
log_file = [TRAP FILE]
```

3. set the date-time format:

```
date_time_format = %H:%M:%S %Y/%m/%d
```

**Warning:**

The "net-snmp-perl" package has been removed in RHEL 8.0-8.2; re-added in RHEL 8.3. For more information, see the [known issues](#).

Now format the traps for Zabbix to recognize them (edit `snmpptt.conf`):

1. Each `FORMAT` statement should start with `"ZBXTRAP [address]"`, where `[address]` will be compared to IP and DNS addresses of SNMP interfaces on Zabbix. E.g.:

```
EVENT coldStart .1.3.6.1.6.3.1.1.5.1 "Status Events" Normal
FORMAT ZBXTRAP $aA Device reinitialized (coldStart)
```

2. See more about SNMP trap format below.

**Attention:**

Do not use unknown traps - Zabbix will not be able to recognize them. Unknown traps can be handled by defining a general event in `snmptrapd.conf`: `<br><br>`

```
EVENT general .* "General event" Normal
```

**SNMP trap format**

All customized Perl trap receivers and SNMPPTT trap configuration must format the trap in the following way:

```
[timestamp] [the trap, part 1] ZBXTRAP [address] [the trap, part 2]
```

where

- [timestamp] - the timestamp used for log items
- ZBXTRAP - header that indicates that a new trap starts in this line
- [address] - IP address used to find the host for this trap

Note that "ZBXTRAP" and "[address]" will be cut out from the message during processing. If the trap is formatted otherwise, Zabbix might parse the traps unexpectedly.

Example trap:

```
11:30:15 2011/07/27 .1.3.6.1.6.3.1.1.5.3 Normal "Status Events" localhost - ZBXTRAP 192.168.1.1 Link down
```

This will result in the following trap for SNMP interface with IP=192.168.1.1:

```
11:30:15 2011/07/27 .1.3.6.1.6.3.1.1.5.3 Normal "Status Events"
localhost - Link down on interface 2. Admin state: 1. Operational state: 2
```

**System requirements****Large file support**

Zabbix has large file support for SNMP trapper files. The maximum file size that Zabbix can read is  $2^{63}$  (8 EiB). Note that the filesystem may impose a lower limit on the file size.

**Log rotation**

Zabbix does not provide any log rotation system - that should be handled by the user. The log rotation should first rename the old file and only later delete it so that no traps are lost:

1. Zabbix opens the trap file at the last known location and goes to step 3
2. Zabbix checks if the currently opened file has been rotated by comparing the inode number to the defined trap file's inode number. If there is no opened file, Zabbix resets the last location and goes to step 1.
3. Zabbix reads the data from the currently opened file and sets the new location.
4. The new data are parsed. If this was the rotated file, the file is closed and goes back to step 2.
5. If there was no new data, Zabbix sleeps for 1 second and goes back to step 2.

**File system**

Because of the trap file implementation, Zabbix needs the file system to support inodes to differentiate files (the information is acquired by a `stat()` call).

**Setup examples using different SNMP protocol versions**

This example uses `snmptrapd` and a Bash receiver script to pass traps to Zabbix server.

Setup:

1. Configure Zabbix to start SNMP trapper and set the trap file. Add to `zabbix_server.conf`:

```
StartSNMPTrapper=1
SNMPTrapperFile=/var/lib/zabbix/snmptraps/snmptraps.log
```

2. Download the Bash script to `/usr/sbin/zabbix_trap_handler.sh`:

```
curl -o /usr/sbin/zabbix_trap_handler.sh https://raw.githubusercontent.com/zabbix/zabbix-docker/6.0/Docker
```

If necessary, adjust the `ZABBIX_TRAPS_FILE` variable in the script. To use the default value, create the parent directory first:

```
mkdir -p /var/lib/zabbix/snmptraps
```

3. Add the following to `snmptrapd.conf` (refer to working [example](#))

```
traphandle default /bin/bash /usr/sbin/zabbix_trap_handler.sh
```

4. **Create** an SNMP item TEST (keep in mind the initial **configuration requirements**):

Type: SNMP trap  
Type of information: Log Host interface: SNMP 127.0.0.1  
Key: `snmptrap["linkUp"]`  
Log time format: `yyyyMMdd.hhmmss`

5. Next we will configure `snmptrapd` for our chosen SNMP protocol version and send test traps using the `snmptrap` utility.

#### SNMPv1, SNMPv2

SNMPv1 and SNMPv2 protocols rely on "community string" authentication. In the example below we will use "secret" as community string. It must be set to the same value on SNMP trap senders.

Please note that while still widely used in production environments, SNMPv2 doesn't offer any encryption and real sender authentication. The data is sent as plain text and therefore these protocol versions should only be used in secure environments such as private network and should never be used over any public or third-party network.

SNMP version 1 isn't really used these days since it doesn't support 64-bit counters and is considered a legacy protocol.

To enable accepting SNMPv1 or SNMPv2 traps you should add the following line to `snmptrapd.conf`. Replace "secret" with the SNMP community string configured on SNMP trap senders:

```
authCommunity log,execute,net secret
```

Next we can send a test trap using `snmptrap`. We will use the common "link up" OID in this example:

```
snmptrap -v 2c -c secret localhost 0 linkUp.0
```

#### SNMPv3

SNMPv3 addresses SNMPv1/v2 security issues and provides authentication and encryption. You can use the MD5 or multiple SHA authentication methods and DES/multiple AES as cipher.

To enable accepting SNMPv3 add the following lines to `snmptrapd.conf`:

```
createUser -e 0x8000000001020304 traptest SHA mypassword AES  
authuser log,execute traptest
```

#### Attention:

Please note the "execute" keyword that allows to execute scripts for this user security model.

```
snmptrap -v 3 -n "" -a SHA -A mypassword -x AES -X mypassword -l authPriv -u traptest -e 0x8000000001020304
```

#### Warning:

If you wish to use strong encryption methods such as AES192 or AES256, please use `net-snmp` starting with version 5.8. You might have to recompile it with configure option: `--enable-blumenthal-aes`. Older versions of `net-snmp` do not support AES192/AES256. See also: [Strong Authentication or Encryption](#).

#### Verification

In both examples you will see similar lines in your `/var/lib/zabbix/snmptraps/snmptraps.log`:

```
20220805.102235 ZBXTRAP 127.0.0.1  
UDP: [127.0.0.1]:35736->[127.0.0.1]:162  
DISMAN-EVENT-MIB::sysUpTimeInstance = 0:0:00:00.00  
SNMPv2-MIB::snmpTrapOID.0 = IF-MIB::linkUp.0
```

The item value in Zabbix will be:

```
2022-08-05 10:22:352022-08-05 10:22:33  
  
20220805.102233 UDP: [127.0.0.1]:35736->[127.0.0.1]:162  
DISMAN-EVENT-MIB::sysUpTimeInstance = 0:0:00:00.00  
SNMPv2-MIB::snmpTrapOID.0 = IF-MIB::linkUp.0
```

## 4 IPMI checks

### Overview

You can monitor the health and availability of Intelligent Platform Management Interface (IPMI) devices in Zabbix. To perform IPMI checks Zabbix server must be initially **configured** with IPMI support.

IPMI is a standardized interface for remote "lights-out" or "out-of-band" management of computer systems. It allows to monitor hardware status directly from the so-called "out-of-band" management cards, independently from the operating system or whether the machine is powered on at all.

Zabbix IPMI monitoring works only for devices having IPMI support (HP iLO, DELL DRAC, IBM RSA, Sun SSP, etc).

Since Zabbix 3.4, a new IPMI manager process has been added to schedule IPMI checks by IPMI pollers. Now a host is always polled by only one IPMI poller at a time, reducing the number of open connections to BMC controllers. With those changes it's safe to increase the number of IPMI pollers without worrying about BMC controller overloading. The IPMI manager process is automatically started when at least one IPMI poller is started.

See also **known issues** for IPMI checks.

### Configuration

#### Host configuration

A host must be configured to process IPMI checks. An IPMI interface must be added, with the respective IP and port numbers, and IPMI authentication parameters must be defined.

See the **configuration of hosts** for more details.

#### Server configuration

By default, the Zabbix server is not configured to start any IPMI pollers, thus any added IPMI items won't work. To change this, open the Zabbix server configuration file (**zabbix\_server.conf**) as root and look for the following line:

```
# StartIPMIPollers=0
```

Uncomment it and set poller count to, say, 3, so that it reads:

```
StartIPMIPollers=3
```

Save the file and restart zabbix\_server afterwards.

#### Item configuration

When **configuring an item** on a host level:

- Select 'IPMI agent' as the *Type*
- Enter an item **key** that is unique within the host (say, ipmi.fan.rpm)
- For *Host interface* select the relevant IPMI interface (IP and port). Note that an IPMI interface must exist on the host.
- Specify the *IPMI sensor* (for example 'FAN MOD 1A RPM' on Dell Poweredge) to retrieve the metric from. By default, the sensor ID should be specified. It is also possible to use prefixes before the value:
  - **id**: - to specify sensor ID;
  - **name**: - to specify sensor full name. This can be useful in situations when sensors can only be distinguished by specifying the full name.
- Select the respective type of information ('Numeric (float)' in this case; for discrete sensors - 'Numeric (unsigned)'), units (most likely 'rpm') and any other required item attributes

### Supported checks

IPMI agent supports the built-in item **ipmi.get**.

| Item key |                                  |              |  |
|----------|----------------------------------|--------------|--|
| ▲        | Description                      | Return value | Comments   |
| ipmi.get | IPMI-sensor related information. | JSON object  | This item can be used for the <b>discovery of IPMI sensors</b> . Supported since Zabbix 5.0.0. |

## Timeout and session termination

IPMI message timeouts and retry counts are defined in OpenIPMI library. Due to the current design of OpenIPMI, it is not possible to make these values configurable in Zabbix, neither on interface nor item level.

IPMI session inactivity timeout for LAN is 60 +/-3 seconds. Currently it is not possible to implement periodic sending of Activate Session command with OpenIPMI. If there are no IPMI item checks from Zabbix to a particular BMC for more than the session timeout configured in BMC then the next IPMI check after the timeout expires will time out due to individual message timeouts, retries or receive error. After that a new session is opened and a full rescan of the BMC is initiated. If you want to avoid unnecessary rescans of the BMC it is advised to set the IPMI item polling interval below the IPMI session inactivity timeout configured in BMC.

## Notes on IPMI discrete sensors

To find sensors on a host start Zabbix server with **DebugLevel=4** enabled. Wait a few minutes and find sensor discovery records in Zabbix server logfile:

```
$ grep 'Added sensor' zabbix_server.log
8358:20130318:111122.170 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:7 id:'CATERR' reading_type:
8358:20130318:111122.170 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:15 id:'CPU Therm Trip' read
8358:20130318:111122.171 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:17 id:'System Event Log' re
8358:20130318:111122.171 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:17 id:'PhysicalSecurity' re
8358:20130318:111122.171 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:14 id:'IPMI Watchdog' readi
8358:20130318:111122.171 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:16 id:'Power Unit Stat' rea
8358:20130318:111122.171 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:16 id:'P1 Therm Ctrl %' rea
8358:20130318:111122.172 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:16 id:'P1 Therm Margin' rea
8358:20130318:111122.172 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:13 id:'System Fan 2' readin
8358:20130318:111122.172 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:13 id:'System Fan 3' readin
8358:20130318:111122.172 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:14 id:'P1 Mem Margin' readi
8358:20130318:111122.172 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:17 id:'Front Panel Temp' re
8358:20130318:111122.173 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:15 id:'Baseboard Temp' read
8358:20130318:111122.173 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:9 id:'BB +5.0V' reading_typ
8358:20130318:111122.173 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:14 id:'BB +3.3V STBY' readi
8358:20130318:111122.173 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:9 id:'BB +3.3V' reading_typ
8358:20130318:111122.173 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:17 id:'BB +1.5V P1 DDR3' re
8358:20130318:111122.173 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:17 id:'BB +1.1V P1 Vccp' re
8358:20130318:111122.174 Added sensor: host:'192.168.1.12:623' id_type:0 id_sz:14 id:'BB +1.05V PCH' readi
```

To decode IPMI sensor types and states, a copy of [IPMI 2.0 specifications](#) is available (please note that [no further updates](#) to the IPMI specification are planned).

The first parameter to start with is "reading\_type". Use "Table 42-1, Event/Reading Type Code Ranges" from the specifications to decode "reading\_type" code. Most of the sensors in our example have "reading\_type:0x1" which means "threshold" sensor. "Table 42-3, Sensor Type Codes" shows that "type:0x1" means temperature sensor, "type:0x2" - voltage sensor, "type:0x4" - Fan etc. Threshold sensors sometimes are called "analog" sensors as they measure continuous parameters like temperature, voltage, revolutions per minute.

Another example - a sensor with "reading\_type:0x3". "Table 42-1, Event/Reading Type Code Ranges" says that reading type codes 02h-0Ch mean "Generic Discrete" sensor. Discrete sensors have up to 15 possible states (in other words - up to 15 meaningful bits). For example, for sensor 'CATERR' with "type:0x7" the "Table 42-3, Sensor Type Codes" shows that this type means "Processor" and the meaning of individual bits is: 00h (the least significant bit) - IERR, 01h - Thermal Trip etc.

There are few sensors with "reading\_type:0x6f" in our example. For these sensors the "Table 42-1, Event/Reading Type Code Ranges" advises to use "Table 42-3, Sensor Type Codes" for decoding meanings of bits. For example, sensor 'Power Unit Stat' has type "type:0x9" which means "Power Unit". Offset 00h means "PowerOff/Power Down". In other words if the least significant bit is 1, then server is powered off. To test this bit, the **bitand** function with mask '1' can be used. The trigger expression could be like

```
bitand(last(/www.example.com/Power Unit Stat,#1),1)=1
```

to warn about a server power off.

## Notes on discrete sensor names in OpenIPMI-2.0.16, 2.0.17, 2.0.18 and 2.0.19

Names of discrete sensors in OpenIPMI-2.0.16, 2.0.17 and 2.0.18 often have an additional "0" (or some other digit or letter) appended at the end. For example, while ipmitool and OpenIPMI-2.0.19 display sensor names as "PhysicalSecurity" or "CATERR", in OpenIPMI-2.0.16, 2.0.17 and 2.0.18 the names are "PhysicalSecurity0" or "CATERR0", respectively.

When configuring an IPMI item with Zabbix server using OpenIPMI-2.0.16, 2.0.17 and 2.0.18, use these names ending with "0" in the *IPMI sensor* field of IPMI agent items. When your Zabbix server is upgraded to a new Linux distribution, which uses OpenIPMI-2.0.19 (or later), items with these IPMI discrete sensors will become "NOT SUPPORTED". You have to change their *IPMI sensor* names (remove the '0' in the end) and wait for some time before they turn "Enabled" again.

## Notes on threshold and discrete sensor simultaneous availability

Some IPMI agents provide both a threshold sensor and a discrete sensor under the same name. In Zabbix versions prior to 2.2.8 and 2.4.3, the first provided sensor was chosen. Since versions 2.2.8 and 2.4.3, preference is always given to the threshold sensor.

## Notes on connection termination

If IPMI checks are not performed (by any reason: all host IPMI items disabled/notsupported, host disabled/deleted, host in maintenance etc.) the IPMI connection will be terminated from Zabbix server or proxy in 3 to 4 hours depending on the time when Zabbix server/proxy was started.

## 5 Simple checks

### Overview

Simple checks are normally used for remote agent-less checks of services.

Note that Zabbix agent is not needed for simple checks. Zabbix server/proxy is responsible for the processing of simple checks (making external connections, etc).

Examples of using simple checks:

```
net.tcp.service[ftp,,155]
net.tcp.service[http]
net.tcp.service.perf[http,,8080]
net.udp.service.perf[ntp]
```

#### Note:

*User name* and *Password* fields in simple check item configuration are used for VMware monitoring items; ignored otherwise.

### Supported simple checks

List of supported simple checks:

See also:

- [VMware monitoring item keys](#)

#### Key

| Description   | Return value                                    | Parameters  | Comments  |
|---|---|---|---|
| <b>icmping</b> [<target>,<packets>,<interval>,<size>,<timeout>]           |   |   |   |
| Host accessibility by ICMP ping.  | 0 - ICMP ping fails<br>1 - ICMP ping successful | <b>target</b> - host IP or DNS name<br><b>packets</b> - number of packets<br><b>interval</b> - time between successive packets in milliseconds<br><b>size</b> - packet size in bytes<br><b>timeout</b> - timeout in milliseconds  | Example:<br>=> icmping[,4] → if at least one packet of the four is returned, the item will return 1.<br><br>See also: table of <a href="#">default values</a> .   |
| <b>icmpingloss</b> [<target>,<packets>,<interval>,<size>,<timeout>]       | Float.  | <b>target</b> - host IP or DNS name<br><b>packets</b> - number of packets<br><b>interval</b> - time between successive packets in milliseconds<br><b>size</b> - packet size in bytes<br><b>timeout</b> - timeout in milliseconds  | See also: table of <a href="#">default values</a> .   |
| <b>icmpingsec</b> [<target>,<packets>,<interval>,<size>,<timeout>,<mode>] | Float.  | <b>target</b> - host IP or DNS name<br><b>packets</b> - number of packets<br><b>interval</b> - time between successive packets in milliseconds<br><b>size</b> - packet size in bytes<br><b>timeout</b> - timeout in milliseconds<br><b>mode</b> - possible values: <i>min</i> , <i>max</i> , <i>avg</i> (default) | Packets which are lost or timed out are not used in the calculation.<br><br>If host is not available (timeout reached), the item will return 0.<br>If the return value is less than 0.0001 seconds, the value will be set to 0.0001 seconds.<br><br>See also: table of <a href="#">default values</a> . |

**net.tcp.service**[service,<ip>,<port>]

Checks if service is running and accepting TCP connections. 0 - service is down 1 - service is running

**service** - possible values: *ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet* (see [details](#))

**ip** - IP address or DNS name (by default host IP/DNS is used)

**port** - port number (by default standard service port number is used).

Example:

=> `net.tcp.service[ftp,,45]` → can be used to test the availability of FTP server on TCP port 45.

Note that with *tcp* service indicating the port is mandatory.

These checks may result in additional messages in system daemon logfiles (SMTP and SSH sessions being logged usually).

Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use `net.tcp.service[tcp,<ip>,<port>]` for checks like these.

*https* and *telnet* services are supported since Zabbix 2.0.

**net.tcp.service.perf**[service,<ip>,<port>]

Checks performance of TCP service. Float. 0.000000 - service is down

seconds - the number of seconds spent while connecting to the service

**service** - possible values: *ssh, ldap, smtp, ftp, http, pop, nntp, imap, tcp, https, telnet* (see [details](#))

**ip** - IP address or DNS name (by default, host IP/DNS is used)

**port** - port number (by default standard service port number is used).

Example:

=> `net.tcp.service.perf[ssh]` → can be used to test the speed of initial response from SSH server.

Note that with *tcp* service indicating the port is mandatory.

Checking of encrypted protocols (like IMAP on port 993 or POP on port 995) is currently not supported. As a workaround, please use `net.tcp.service.perf[tcp,<ip>,<port>]` for checks like these.

*https* and *telnet* services are supported since Zabbix 2.0.

Called `tcp_perf` before Zabbix 2.0.

**net.udp.service**[service,<ip>,<port>]

Checks if service is running and responding to UDP requests. 0 - service is down 1 - service is running

**service** - possible values: *ntp* (see [details](#))

**ip** - IP address or DNS name (by default host IP/DNS is used)

**port** - port number (by default standard service port number is used).

Example:

=> `net.udp.service[ntp,,45]` → can be used to test the availability of NTP service on UDP port 45.

This item is supported since Zabbix 3.0, but *ntp* service was available for `net.tcp.service[]` item in prior versions.

**net.udp.service.perf**[service,<ip>,<port>]

Checks performance of UDP service. Float. 0.000000 - service is down

seconds - the number of seconds spent waiting for response from the service

**service** - possible values: *ntp* (see [details](#))

**ip** - IP address or DNS name (by default, host IP/DNS is used)

**port** - port number (by default standard service port number is used).

Example:

=> `net.udp.service.perf[ntp]` → can be used to test response time from NTP service.

This item is supported since Zabbix 3.0, but *ntp* service was available for `net.tcp.service[]` item in prior versions.

**Attention:**

For SourceIP support in LDAP simple checks (e.g. `net.tcp.service[ldap]`), OpenLDAP version 2.6.1 or above is required. SourceIP is supported in LDAP simple checks since Zabbix 6.0.1.

## Timeout processing

Zabbix will not process a simple check longer than the Timeout seconds defined in the Zabbix server/proxy configuration file. For `icmping*` items, the timeout and retries are specified directly in the item key, and are not influenced by the global Timeout parameter.

## ICMP pings

Zabbix uses external utility **fping** for processing of ICMP pings.

The utility is not part of Zabbix distribution and has to be additionally installed. If the utility is missing, has wrong permissions or its location does not match the location set in the Zabbix server/proxy configuration file ('FpingLocation' parameter), ICMP pings (**icmping**, **icmpingloss**, **icmpingsec**) will not be processed.

See also: [known issues](#)

**fping** must be executable by the user Zabbix daemons run as and setuid root. Run these commands as user **root** in order to set up correct permissions:

```
chown root:zabbix /usr/sbin/fping
chmod 4710 /usr/sbin/fping
```

After performing the two commands above check ownership of the **fping** executable. In some cases the ownership can be reset by executing the `chmod` command.

Also check, if user `zabbix` belongs to group `zabbix` by running:

```
groups zabbix
```

and if it's not add by issuing:

```
usermod -a -G zabbix zabbix
```

Defaults, limits and description of values for ICMP check parameters:

| Parameter | Unit        | Description   | Fping's flag | Defaults set by   |               | Allowed limits by Zabbix |            |
|-----------|-------------|---|--------------|---|---------------|--------------------------|------------|
|           |             |   |              | <b>fping</b>  | <b>Zabbix</b> | <b>min</b>               | <b>max</b> |
| packets   | number      | number of request packets to a target   | -C           |   | 3             | 1                        | 10000      |
| interval  | millisecond | time to wait between successive packets   | -p           | 1000  |               | 20                       | unlimited  |
| size      | bytes       | packet size in bytes<br>56 bytes on x86, 68 bytes on x86_64   | -b           | 56 or 68  |               | 24                       | 65507      |
| timeout   | millisecond | <b>fping v3.x</b> - timeout to wait after last packet sent, affected by -C flag<br><b>fping v4.x</b> - individual timeout for each packet | -t           | <b>fping v3.x</b> - 500<br><b>fping v4.x</b> - inherited from -p flag, but not more than 2000 |               | 50                       | unlimited  |

In addition Zabbix uses `fping` options `-i interval ms` (do not mix up with the item parameter `interval` mentioned in the table above, which corresponds to `fping` option `-p`) and `-S source IP address` (or `-I` in older `fping` versions). Those options are auto-detected by running checks with different option combinations. Zabbix tries to detect the minimal value in milliseconds that `fping` allows to use with `-i` by trying 3 values: 0, 1 and 10. The value that first succeeds is then used for subsequent ICMP checks. This process is done by each **ICMP pinger** process individually.

Auto-detected fping options are invalidated every hour and detected again on the next attempt to perform ICMP check. Set DebugLevel>=4 in order to view details of this process in the server or proxy log file.

### Warning:

Warning: fping defaults can differ depending on platform and version - if in doubt, check fping documentation.

Zabbix writes IP addresses to be checked by any of three *icmping\** keys to a temporary file, which is then passed to **fping**. If items have different key parameters, only ones with identical key parameters are written to a single file.

All IP addresses written to the single file will be checked by fping in parallel, so Zabbix icmp pinger process will spend fixed amount of time disregarding the number of IP addresses in the file.

## 1 VMware monitoring item keys

### Item keys

The table provides details on the simple checks that can be used to monitor **VMware environments**.

Parameters without angle brackets are mandatory. Parameters marked with angle brackets < > are optional.

| Key   | Description  | Return value  | Parameters  | Comments  |
|---|--|---|---|---|
| vmware.cl.perfcounter[url,id,path,<instance>] | VMware cluster performance counter metrics.                            | Integer   | <b>url</b> - VMware service URL<br><b>id</b> - VMware cluster ID<br><b>path</b> - performance counter path <sup>1</sup><br><b>instance</b> - performance counter instance | id can be received from vmware.cluster.discovery[] as {#CLUSTER.ID} |
| vmware.cluster.discovery[url]                 | Discovery of VMware clusters.  | JSON object   | <b>url</b> - VMware service URL   |   |
| vmware.cluster.status[url,name]               | VMware cluster status.   | Integer:<br>0 - gray;<br>1 - green;<br>2 - yellow;<br>3 - red | <b>url</b> - VMware service URL<br><b>name</b> - VMware cluster name  |   |
| vmware.datastore.discovery[url]               | Discovery of VMware datastores.  | JSON object   | <b>url</b> - VMware service URL   |   |
| vmware.datastore.hv.list[url,datastore]       | List of datastore hypervisors.   | JSON object   | <b>url</b> - VMware service URL<br><b>datastore</b> - datastore name  |   |
| vmware.datastore.read[url,datastore,<mode>]   | Amount of time for a read operation from the datastore (milliseconds). | Integer <sup>2</sup>  | <b>url</b> - VMware service URL<br><b>datastore</b> - datastore name<br><b>mode</b> - latency (average value, default), maxlatency (maximum value)                        |   |
| vmware.datastore.size[url,datastore,<mode>]   | VMware datastore space in bytes or in percentage from total.           | Integer - for bytes<br>Float - for percentage                 | <b>url</b> - VMware service URL<br><b>datastore</b> - datastore name<br><b>mode</b> - possible values: total (default), free, pfree (free, percentage), uncommitted       |   |
| vmware.datastore.write[url,datastore,<mode>]  | Amount of time for a write operation to the datastore (milliseconds).  | Integer <sup>2</sup>  | <b>url</b> - VMware service URL<br><b>datastore</b> - datastore name<br><b>mode</b> - latency (average value, default), maxlatency (maximum value)                        |   |

| Key   |   |                      |  |  |
|---|---|----------------------|--|--|
| vmware.dc.discovery[url]  | Discovery of VMware datacenters.  | JSON object          | <b>url</b> - VMware service URL  |  |
| vmware.eventlog[url,<mode>]                                       | VMware event log.   | Log                  | <b>url</b> - VMware service URL<br><b>mode</b> - <i>all</i> (default), <i>skip</i> - skip processing of older data   | There must be only one vmware.eventlog[] item key per URL.<br><br>See also: <a href="#">example of filtering</a> VMware event log records. |
| vmware.fullname[url]  | VMware service full name.   | String               | <b>url</b> - VMware service URL  |  |
| vmware.hv.cluster.name[url,uuid]                                  | VMware hypervisor cluster name.   | String               | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.cpu.usage[url,uuid]                                     | VMware hypervisor processor usage (Hz).   | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.cpu.usage.perf[url,uuid]                                | VMware hypervisor processor usage as a percentage during the interval.                                    | Float                | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.cpu.utilization[url,uuid]                               | VMware hypervisor processor usage as a percentage during the interval, depends on power management or HT. | Float                | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.datacenter.name[url,uuid]                               | VMware hypervisor datacenter name.  | String               | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.datastore.discovery[url,uuid]                           | Discovery of VMware hypervisor datastores.  | JSON object          | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.datastore.list[url,uuid]                                | List of VMware hypervisor datastores.   | JSON object          | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier  |  |
| vmware.hv.datastore.multipath[url,uuid,<datastore>,<partitionid>] | Number of available datastore paths.  | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>datastore</b> - datastore UUID or name<br><b>partitionid</b> - internal ID of physical device from vmware.hv.datastore.discovery |  |
| vmware.hv.datastore.read[url,uuid,datastore,<mode>]               | Average amount of time for a read operation from the datastore (milliseconds).                            | Integer <sup>2</sup> | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>datastore</b> - datastore UUID or name<br><b>mode</b> - latency (default)  |  |
| vmware.hv.datastore.size[url,uuid,datastore,<mode>]               |   |                      |  |  |

| Key  |   |   |   |  |
|--|---|---|---|--|
|  | VMware datastore space in bytes or in percentage from total.                  | Integer - for bytes<br>Float - for percentage | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>datastore</b> - datastore UUID or name<br><b>mode</b> - possible values: total (default), free, pfree (free, percentage), uncommitted |  |
| vmware.hv.datastore.write[url,uuid,datastore,<mode>] | Average amount of time for a write operation to the datastore (milliseconds). | Integer <sup>2</sup>                          | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>datastore</b> - datastore UUID or name<br><b>mode</b> - latency (default)   |  |
| vmware.hv.discovery[url]                             | Discovery of VMware hypervisors.  | JSON object                                   | <b>url</b> - VMware service URL   |  |
| vmware.hv.fullname[url,uuid]                         | VMware hypervisor name.   | String  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.cpu.freq[url,uuid]                      | VMware hypervisor processor frequency (Hz).                                   | Integer                                       | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.cpu.model[url,uuid]                     | VMware hypervisor processor model.  | String  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.cpu.num[url,uuid]                       | Number of processor cores on VMware hypervisor.                               | Integer                                       | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.cpu.threads[url,uuid]                   | Number of processor threads on VMware hypervisor.                             | Integer                                       | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.memory[url,uuid]                        | VMware hypervisor total memory size (bytes).                                  | Integer                                       | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.model[url,uuid]                         | VMware hypervisor model.  | String  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.uuid[url,uuid]                          | VMware hypervisor BIOS UUID.  | String  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.hw.vendor[url,uuid]                        | VMware hypervisor vendor name.  | String  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.maintenance[url,uuid]                      | VMware hypervisor maintenance status.   | Integer                                       | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   | Returns '0' - not in maintenance or '1' - in maintenance |
| vmware.hv.memory.size.ballooned[url,uuid]            | VMware hypervisor ballooned memory size (bytes).                              | Integer                                       | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |

| Key   |   |   |   |  |
|---|---|---|---|--|
| vmware.hv.memory.used[url,uuid]                 | VMware hypervisor used memory size (bytes).                     | Integer   | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.network.in[url,uuid,<mode>]           | VMware hypervisor network input statistics (bytes per second).  | Integer <sup>2</sup>  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>mode</b> - bps (default)  |  |
| vmware.hv.network.out[url,uuid,<mode>]          | VMware hypervisor network output statistics (bytes per second). | Integer <sup>2</sup>  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>mode</b> - bps (default)  |  |
| vmware.hv.perfcounter[url,uuid,path,<instance>] | VMware hypervisor performance counter value.                    | Integer <sup>2</sup>  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>path</b> - performance counter path <sup>1</sup><br><b>instance</b> - performance counter instance. Use empty instance for aggregate values (default) |  |
| vmware.hv.power[url,uuid,<max>]                 | VMware hypervisor power usage (W).                              | Integer   | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier<br><b>max</b> - maximum allowed power usage   |  |
| vmware.hv.sensor.health.state[url,uuid]         | VMware hypervisor health state rollup sensor.                   | Integer:<br>0 - gray;<br>1 - green;<br>2 - yellow;<br>3 - red | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   | The item might not work in the VMware vSphere 6.5 and newer, because VMware has deprecated the <i>VMware Rollup Health State</i> sensor. |
| vmware.hv.sensors.get[url,uuid]                 | VMware hypervisor HW vendor state sensors.                      | JSON  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.status[url,uuid]                      | VMware hypervisor status.                                       | Integer:<br>0 - gray;<br>1 - green;<br>2 - yellow;<br>3 - red | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   | Uses the host system overall status property.  |
| vmware.hv.uptime[url,uuid]                      | VMware hypervisor uptime (seconds).                             | Integer   | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.version[url,uuid]                     | VMware hypervisor version.                                      | String  | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.hv.vm.num[url,uuid]                      | Number of virtual machines on VMware hypervisor.                | Integer   | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware hypervisor global unique identifier   |  |
| vmware.version[url]                             | VMware service version.   | String  | <b>url</b> - VMware service URL   |  |
| vmware.vm.cluster.name[url,uuid]                |   |   |   |  |

| Key   |   |                      |  |
|---|---|----------------------|--|
|   | VMware virtual machine name.  | String               | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.cpu.latency[url,uuid]               | Percentage of time the virtual machine is unable to run because it is contending for access to the physical CPU(s).   | Float                | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.cpu.num[url,uuid]                   | Number of processors on VMware virtual machine.   | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.cpu.readiness[url,uuid,<instance>]  | Percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.  | Float                | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier<br><b>instance</b> - CPU instance |
| vmware.vm.cpu.ready[url,uuid]                 | Time (in milliseconds) that the virtual machine was ready, but could not get scheduled to run on the physical CPU. CPU ready time is dependent on the number of virtual machines on the host and their CPU loads (%). | Integer <sup>2</sup> | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.cpu.swapwait[url,uuid,<instance>]   | Percentage of CPU time spent waiting for swap-in.   | Float                | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier<br><b>instance</b> - CPU instance |
| vmware.vm.cpu.usage[url,uuid]                 | VMware virtual machine processor usage (Hz).  | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.cpu.usage.perf[url,uuid]            | VMware virtual machine processor usage as a percentage during the interval.   | Float                | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.datacenter.name[url,uuid]           | VMware virtual machine datacenter name.   | String               | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.discovery[url]                      | Discovery of VMware virtual machines.   | JSON object          | <b>url</b> - VMware service URL  |
| vmware.vm.guest.memory.size.swapped[url,uuid] | Amount of guest physical memory that is swapped out to the swap space (KB).   | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.guest.osuptime[url,uuid]            | Total time elapsed since the last operating system boot-up (in seconds).  | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.hv.name[url,uuid]                   | VMware virtual machine hypervisor name.   | String               | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |
| vmware.vm.memory.size[url,uuid]               | VMware virtual machine total memory size (bytes).   | Integer              | <b>url</b> - VMware service URL<br><b>uuid</b> - VMware virtual machine global unique identifier                                   |

#### Footnotes

<sup>1</sup> See [Creating custom performance counter names for VMware](#).

<sup>2</sup> The value of these items is obtained from VMware performance counters and the VMwarePerfFrequency [parameter](#) is used to refresh their data in Zabbix VMware cache:

- vmware.hv.datastore.read
- vmware.hv.datastore.write
- vmware.hv.network.in
- vmware.hv.network.out
- vmware.hv.perfcounter
- vmware.vm.cpu.ready
- vmware.vm.net.if.in
- vmware.vm.net.if.out
- vmware.vm.perfcounter
- vmware.vm.vfs.dev.read
- vmware.vm.vfs.dev.write

#### More info

See [Virtual machine monitoring](#) for detailed information how to configure Zabbix to monitor VMware environments.

## 6 Log file monitoring

### Overview

Zabbix can be used for centralized monitoring and analysis of log files with/without log rotation support.

Notifications can be used to warn users when a log file contains certain strings or string patterns.

To monitor a log file you must have:

- Zabbix agent running on the host

- log monitoring item set up

### Attention:

The size limit of a monitored log file depends on [large file support](#).

## Configuration

### Verify agent parameters

Make sure that in the [agent configuration file](#):

- 'Hostname' parameter matches the host name in the frontend
- Servers in the 'ServerActive' parameter are specified for the processing of active checks

## Item configuration

Configure a log monitoring [item](#).

| Item                     | Tags   | Preprocessing |      |          |        |     |  |  |
|--------------------------|--|---------------|------|----------|--------|-----|--|--|
| * Name                   | Log item   |               |      |          |        |     |  |  |
| Type                     | Zabbix agent (active) ▼  |               |      |          |        |     |  |  |
| * Key                    | log[/var/log/syslog,error]   |               |      |          |        |     |  |  |
| Type of information      | Log ▼  |               |      |          |        |     |  |  |
| * Update interval        | 30s  |               |      |          |        |     |  |  |
| Custom intervals         | <table border="1"> <thead> <tr> <th>Type</th> <th>Interval</th> <th>Period</th> </tr> </thead> <tbody> <tr> <td>Add</td> <td></td> <td></td> </tr> </tbody> </table> |               | Type | Interval | Period | Add |  |  |
| Type                     | Interval   | Period        |      |          |        |     |  |  |
| Add                      |  |               |      |          |        |     |  |  |
| * History storage period | <div>Do not keep history</div> <div>Storage period 3600</div>  |               |      |          |        |     |  |  |
| Log time format          | ppppddphh:mm:ss  |               |      |          |        |     |  |  |

All mandatory input fields are marked with a red asterisk.

Specifically for log monitoring items you enter:

|                          |   |
|--------------------------|---|
| Type                     | Select <b>Zabbix agent (active)</b> here.   |
| Key                      | Use one of the following item keys:<br><b>log[]</b> or <b>logrt[]</b> :<br>These two item keys allow to monitor logs and filter log entries by the content regexp, if present. For example: <code>log[/var/log/syslog,error]</code> . Make sure that the file has read permissions for the 'zabbix' user otherwise the item status will be set to 'unsupported'.<br><b>log.count[]</b> or <b>logrt.count[]</b> :<br>These two item keys allow to return the number of matching lines only. See supported <a href="#">Zabbix agent item</a> key section for details on using these item keys and their parameters. |
| Type of information      | Prefilled automatically:<br>For log[] or logrt[] items - Log;<br>For log.count[] or logrt.count[] items - Numeric (unsigned).<br>If optionally using the output parameter, you may manually select the appropriate type of information other than Log.<br>Note that choosing a non-Log type of information will lead to the loss of local timestamp.  |
| Update interval (in sec) | The parameter defines how often Zabbix agent will check for any changes in the log file. Setting it to 1 second will make sure that you get new records as soon as possible.  |

---

|                        |  |
|------------------------|--|
| <i>Log time format</i> | <p>In this field you may optionally specify the pattern for parsing the log line timestamp. Supported placeholders:</p> <ul style="list-style-type: none"> <li>* <b>y</b>: Year (1970-2038)</li> <li>* <b>M</b>: Month (01-12)</li> <li>* <b>d</b>: Day (01-31)</li> <li>* <b>h</b>: Hour (00-23)</li> <li>* <b>m</b>: Minute (00-59)</li> <li>* <b>s</b>: Second (00-59)</li> </ul> <p>If left blank, the timestamp will be set to 0 in Unix time, representing January 1, 1970.</p> <p>For example, consider the following line from the Zabbix agent log file:</p> <pre>" 23480:20100328:154718.045 Zabbix agent started. Zabbix 1.8.2 (revision 11211)."</pre> <p>It begins with six character positions for PID, followed by date, time, and the rest of the message. The log time format for this line would be "pppppp:yyyyMMdd:hhmmss".</p> <p>Note that "p" and ":" characters are placeholders and can be any character except "yMdhms".</p> |
|------------------------|--|

---

## Important notes

- The server and agent keep the trace of a monitored log's size and last modification time (for logrt) in two counters. Additionally:
  - The agent also internally uses inode numbers (on UNIX/GNU/Linux), file indexes (on Microsoft Windows) and MD5 sums of the first 512 log file bytes for improving decisions when logfiles get truncated and rotated.
  - On UNIX/GNU/Linux systems it is assumed that the file systems where log files are stored report inode numbers, which can be used to track files.
  - On Microsoft Windows Zabbix agent determines the file system type the log files reside on and uses:
    - \* On NTFS file systems 64-bit file indexes.
    - \* On ReFS file systems (only from Microsoft Windows Server 2012) 128-bit file IDs.
    - \* On file systems where file indexes change (e.g. FAT32, exFAT) a fall-back algorithm is used to take a sensible approach in uncertain conditions when log file rotation results in multiple log files with the same last modification time.
  - The inode numbers, file indexes and MD5 sums are internally collected by Zabbix agent. They are not transmitted to Zabbix server and are lost when Zabbix agent is stopped.
  - Do not modify the last modification time of log files with 'touch' utility, do not copy a log file with later restoration of the original name (this will change the file inode number). In both cases the file will be counted as different and will be analyzed from the start, which may result in duplicated alerts.
  - If there are several matching log files for logrt[] item and Zabbix agent is following the most recent of them and this most recent log file is deleted, a warning message "there are no files matching "<regexp mask>" in "<directory>" is logged. Zabbix agent ignores log files with modification time less than the most recent modification time seen by the agent for the logrt[] item being checked.
- The agent starts reading the log file from the point it stopped the previous time.
- The number of bytes already analyzed (the size counter) and last modification time (the time counter) are stored in the Zabbix database and are sent to the agent to make sure the agent starts reading the log file from this point in cases when the agent is just started or has received items which were previously disabled or not supported. However, if the agent has received a non-zero size counter from server, but the logrt[] or logrt.count[] item is unable to find matching files, the size counter is reset to 0 to analyze from the start if the files appear later.
- Whenever the log file becomes smaller than the log size counter known by the agent, the counter is reset to zero and the agent starts reading the log file from the beginning taking the time counter into account.
- If there are several matching files with the same last modification time in the directory, then the agent tries to correctly analyze all log files with the same modification time and avoid skipping data or analyzing the same data twice, although it cannot be guaranteed in all situations. The agent does not assume any particular log file rotation scheme nor determines one. When presented multiple log files with the same last modification time, the agent will process them in a lexicographically descending order. Thus, for some rotation schemes the log files will be analyzed and reported in their original order. For other rotation schemes the original log file order will not be honored, which can lead to reporting matched log file records in altered order (the problem does not happen if log files have different last modification times).
- Zabbix agent processes new records of a log file once per *Update interval* seconds.
- Zabbix agent does not send more than **maxlines** of a log file per second. The limit prevents overloading of network and CPU resources and overrides the default value provided by **MaxLinesPerSecond** parameter in the **agent configuration file**.
- To find the required string Zabbix will process 10 times more new lines than set in MaxLinesPerSecond. Thus, for example, if a log[] or logrt[] item has *Update interval* of 1 second, by default the agent will analyze no more than 200 log file records and will send no more than 20 matching records to Zabbix server in one check. By increasing **MaxLinesPerSecond** in the agent configuration file or setting **maxlines** parameter in the item key, the limit can be increased up to 10000 analyzed log file records and 1000 matching records sent to Zabbix server in one check. If the *Update interval* is set to 2 seconds the limits for one check would be set 2 times higher than with *Update interval* of 1 second.

- Additionally, log and log.count values are always limited to 50% of the agent send buffer size, even if there are no non-log values in it. So for the **maxlines** values to be sent in one connection (and not in several connections), the agent **BufferSize** parameter must be at least maxlines x 2. Zabbix agent can upload data during log gathering and thus free the buffer, whereas Zabbix agent 2 will stop log gathering until the data is uploaded and the buffer is freed, which is performed asynchronously.
- In the absence of log items all agent buffer size is used for non-log values. When log values come in they replace the older non-log values as needed, up to the designated 50%.
- For log file records longer than 256kB, only the first 256kB are matched against the regular expression and the rest of the record is ignored. However, if Zabbix agent is stopped while it is dealing with a long record the agent internal state is lost and the long record may be analyzed again and differently after the agent is started again.
- Special note for “\” path separators: if file\_format is “file.log”, then there should not be a “file” directory, since it is not possible to unambiguously define whether “.” is escaped or is the first symbol of the file name.
- Regular expressions for logrt are supported in filename only, directory regular expression matching is not supported.
- On UNIX platforms a logrt [] item becomes NOTSUPPORTED if a directory where the log files are expected to be found does not exist.
- On Microsoft Windows, if a directory does not exist the item will not become NOTSUPPORTED (for example, if directory is misspelled in item key).
- An absence of log files for logrt [] item does not make it NOTSUPPORTED. Errors of reading log files for logrt [] item are logged as warnings into Zabbix agent log file but do not make the item NOTSUPPORTED.
- Zabbix agent log file can be helpful to find out why a log [] or logrt [] item became NOTSUPPORTED. Zabbix can monitor its agent log file, except when at DebugLevel=4 or DebugLevel=5.
- Searching for a question mark using a regular expression, e.g. \? may result in false positives if the text file contains NUL symbols, as those are replaced with “?” by Zabbix to continue processing the line until the newline character.

#### Extracting matching part of regular expression

Sometimes we may want to extract only the interesting value from a target file instead of returning the whole line when a regular expression match is found.

Since Zabbix 2.2.0, log items have the ability to extract desired values from matched lines. This is accomplished by the additional **output** parameter in log and logrt items.

Using the ‘output’ parameter allows to indicate the “capturing group” of the match that we may be interested in.

So, for example

```
log[/path/to/the/file,"large result buffer allocation.*Entries: ([0-9]+)",,,,\1]
```

should allow returning the entry count as found in the content of:

```
Fr Feb 07 2014 11:07:36.6690 */ Thread Id 1400 (GLEWF) large result
buffer allocation - /Length: 437136/Entries: 5948/Client Ver: >=10/RPC
ID: 41726453/User: AUser/Form: CFG:ServiceLevelAgreement
```

Only the number will be returned because \1 refers to the first and only capturing group: **([0-9]+)**.

And, with the ability to extract and return a number, the value can be used to define triggers.

Using maxdelay parameter

The ‘maxdelay’ parameter in log items allows ignoring some older lines from log files in order to get the most recent lines analyzed within the ‘maxdelay’ seconds.

#### Warning:

Specifying ‘maxdelay’ > 0 may lead to **ignoring important log file records and missed alerts**. Use it carefully at your own risk only when necessary.

By default items for log monitoring follow all new lines appearing in the log files. However, there are applications which in some situations start writing an enormous number of messages in their log files. For example, if a database or a DNS server is unavailable, such applications flood log files with thousands of nearly identical error messages until normal operation is restored. By default, all those messages will be dutifully analyzed and matching lines sent to server as configured in log and logrt items.

Built-in protection against overload consists of a configurable ‘maxlines’ parameter (protects server from too many incoming matching log lines) and a 10\*‘maxlines’ limit (protects host CPU and I/O from overloading by agent in one check). Still, there are 2 problems with the built-in protection. First, a large number of potentially not-so-informative messages are reported to server and consume space in the database. Second, due to the limited number of lines analyzed per second the agent may lag behind the newest log records for hours. Quite likely, you might prefer to be sooner informed about the current situation in the log files instead of crawling through old records for hours.

The solution to both problems is using the 'maxdelay' parameter. If 'maxdelay' > 0 is specified, during each check the number of processed bytes, the number of remaining bytes and processing time is measured. From these numbers the agent calculates an estimated delay - how many seconds it would take to analyze all remaining records in a log file.

If the delay does not exceed 'maxdelay' then the agent proceeds with analyzing the log file as usual.

If the delay is greater than 'maxdelay' then the agent **ignores a chunk of a log file by "jumping" over it** to a new estimated position so that the remaining lines could be analyzed within 'maxdelay' seconds.

Note that agent does not even read ignored lines into buffer, but calculates an approximate position to jump to in a file.

The fact of skipping log file lines is logged in the agent log file like this:

```
14287:20160602:174344.206 item:"logrt["/home/zabbix32/test[0-9].log",ERROR,,1000,,120.0]"
logfile:"/home/zabbix32/test1.log" skipping 679858 bytes
(from byte 75653115 to byte 76332973) to meet maxdelay
```

The "to byte" number is approximate because after the "jump" the agent adjusts the position in the file to the beginning of a log line which may be further in the file or earlier.

Depending on how the speed of growing compares with the speed of analyzing the log file you may see no "jumps", rare or often "jumps", large or small "jumps", or even a small "jump" in every check. Fluctuations in the system load and network latency also affect the calculation of delay and hence, "jumping" ahead to keep up with the "maxdelay" parameter.

Setting 'maxdelay' < 'update interval' is not recommended (it may result in frequent small "jumps").

Notes on handling 'copytruncate' log file rotation

logrt with the copytruncate option assumes that different log files have different records (at least their timestamps are different), therefore MD5 sums of initial blocks (up to the first 512 bytes) will be different. Two files with the same MD5 sums of initial blocks means that one of them is the original, another - a copy.

logrt with the copytruncate option makes effort to correctly process log file copies without reporting duplicates. However, things like producing multiple log file copies with the same timestamp, log file rotation more often than logrt[] item update interval, frequent restarting of agent are not recommended. The agent tries to handle all these situations reasonably well, but good results cannot be guaranteed in all circumstances.

Notes on persistent files for log\*[] items

Purpose of persistent files

When Zabbix agent is started it receives a list of active checks from Zabbix server or proxy. For log\*[] metrics it receives the processed log size and the modification time for finding where to start log file monitoring from. Depending on the actual log file size and modification time reported by file system the agent decides either to continue log file monitoring from the processed log size or re-analyze the log file from the beginning.

A running agent maintains a larger set of attributes for tracking all monitored log files between checks. This in-memory state is lost when the agent is stopped.

The new optional parameter **persistent\_dir** specifies a directory for storing this state of log[], log.count[], logrt[] or logrt.count[] item in a file. The state of log item is restored from the persistent file after the Zabbix agent is restarted.

The primary use-case is monitoring of log file located on a mirrored file system. Until some moment in time the log file is written to both mirrors. Then mirrors are split. On the active copy the log file is still growing, getting new records. Zabbix agent analyzes it and sends processed logs size and modification time to server. On the passive copy the log file stays the same, well behind the active copy. Later the operating system and Zabbix agent are rebooted from the passive copy. The processed log size and modification time the Zabbix agent receives from server may not be valid for situation on the passive copy. To continue log file monitoring from the place the agent left off at the moment of file system mirror split the agent restores its state from the persistent file.

Agent operation with persistent file

On startup Zabbix agent knows nothing about persistent files. Only after receiving a list of active checks from Zabbix server (proxy) the agent sees that some log items should be backed by persistent files under specified directories.

During agent operation the persistent files are opened for writing (with fopen(filename, "w")) and overwritten with the latest data. The chance of losing persistent file data if the overwriting and file system mirror split happen at the same time is very small, no special handling for it. Writing into persistent file is NOT followed by enforced synchronization to storage media (fsync() is not called).

Overwriting with the latest data is done after successful reporting of matching log file record or metadata (processed log size and modification time) to Zabbix server. That may happen as often as every item check if log file keeps changing.

No special actions during agent shutdown.

After receiving a list of active checks the agent marks obsolete persistent files for removal. A persistent file becomes obsolete if: 1) the corresponding log item is no longer monitored, 2) a log item is reconfigured with a different **persistent\_dir** location than before.

Removing is done with delay 24 hours because log files in NOTSUPPORTED state are not included in the list of active checks but they may become SUPPORTED later and their persistent files will be useful.

If the agent is stopped before 24 hours expire, then the obsolete files will not be deleted as Zabbix agent is not getting info about their location from Zabbix server anymore.

**Warning:**

Reconfiguring a log item's **persistent\_dir** back to the old **persistent\_dir** location while the agent is stopped, without deleting the old persistent file by user - will cause restoring the agent state from the old persistent file resulting in missed messages or false alerts.

#### Naming and location of persistent files

Zabbix agent distinguishes active checks by their keys. For example, `logrt[/home/zabbix/test.log]` and `logrt[/home/zabbix/test.log,,10]` are different items. Modifying the item `logrt[/home/zabbix/test.log,,10]` in frontend to `logrt[/home/zabbix/test.log,,20]` will result in deleting the item `logrt[/home/zabbix/test.log,,10]` from the agent's list of active checks and creating `logrt[/home/zabbix/test.log,,20]` item (some attributes are carried across modification in frontend/server, not in agent).

The file name is composed of MD5 sum of item key with item key length appended to reduce possibility of collisions. For example, the state of `logrt[/home/zabbix50/test.log,,,,,]/home/zabbix50/agent_private]` item will be kept in persistent file `c963ade4008054813bbc0a650bb8e09266`.

Multiple log items can use the same value of **persistent\_dir**.

**persistent\_dir** is specified by taking into account specific file system layouts, mount points and mount options and storage mirroring configuration - the persistent file should be on the same mirrored filesystem as the monitored log file.

If **persistent\_dir** directory cannot be created or does not exist, or access rights for Zabbix agent does not allow to create/write/read/delete files the log item becomes NOTSUPPORTED.

If access rights to persistent storage files are removed during agent operation or other errors occur (e.g. disk full) then errors are logged into the agent log file but the log item does not become NOTSUPPORTED.

#### Load on I/O

Item's persistent file is updated after successful sending of every batch of data (containing item's data) to server. For example, default 'BufferSize' is 100. If a log item has found 70 matching records then the first 50 records will be sent in one batch, persistent file will be updated, then remaining 20 records will be sent (maybe with some delay when more data is accumulated) in the 2nd batch, and the persistent file will be updated again.

#### Actions if communication fails between agent and server

Each matching line from `log[]` and `logrt[]` item and a result of each `log.count[]` and `logrt.count[]` item check requires a free slot in the designated 50% area in the agent send buffer. The buffer elements are regularly sent to server (or proxy) and the buffer slots are free again.

While there are free slots in the designated log area in the agent send buffer and communication fails between agent and server (or proxy) the log monitoring results are accumulated in the send buffer. This helps to mitigate short communication failures.

During longer communication failures all log slots get occupied and the following actions are taken:

- `log[]` and `logrt[]` item checks are stopped. When communication is restored and free slots in the buffer are available the checks are resumed from the previous position. No matching lines are lost, they are just reported later.
- `log.count[]` and `logrt.count[]` checks are stopped if `maxdelay = 0` (default). Behavior is similar to `log[]` and `logrt[]` items as described above. Note that this can affect `log.count[]` and `logrt.count[]` results: for example, one check counts 100 matching lines in a log file, but as there are no free slots in the buffer the check is stopped. When communication is restored the agent counts the same 100 matching lines and also 70 new matching lines. The agent now sends `count = 170` as if they were found in one check.
- `log.count[]` and `logrt.count[]` checks with `maxdelay > 0`: if there was no "jump" during the check, then behavior is similar to described above. If a "jump" over log file lines took place then the position after "jump" is kept and the counted result is discarded. So, the agent tries to keep up with a growing log file even in case of communication failure.

#### Handling of regular expression compilation and runtime errors

If a regular expression used in `log[]`, `logrt[]`, `log.count[]` or `logrt.count[]` item cannot be compiled by PCRE or PCRE2 library then the item goes into NOTSUPPORTED state with an error message. To continue monitoring the log item, the regular expression should be fixed.

If the regular expression compiles successfully, but fails at runtime (on some or on all log records), then the log item remains supported and monitoring continues. The runtime error is logged in the Zabbix agent log file (without the log file record).

Note that the logging of regular expression runtime errors is supported since Zabbix 6.0.21.

The logging rate is limited to one runtime error per check to allow Zabbix agent to monitor its own log file. For example, if 10 records are analyzed and 3 records fail with a regexp runtime error, one record is produced in the agent log.

Exception: if MaxLinesPerSecond=1 and update interval=1 (only 1 record is allowed to analyze per check) then regexp runtime errors are not logged.

zabbix\_agentd logs the item key in case of a runtime error, zabbix\_agent2 logs the item ID to help identify which log item has runtime errors. It is recommended to redesign the regular expression in case of runtime errors.

## 7 Calculated items

### Overview

With calculated items it is possible to create calculations based on the values of other items.

Calculations may use both:

- single values of individual items
- complex filters to select multiple items for aggregations (see [aggregate calculations](#) for details)

Thus, calculated items are a way of creating virtual data sources. All calculations are done by Zabbix server only. The values are periodically calculated based on the arithmetical expression used.

The resulting data is stored in the Zabbix database as for any other item; both history and trend values are stored and graphs can be generated.

#### Note:

If the calculation result is a float value it will be trimmed to an integer if the calculated item type of information is *Numeric (unsigned)*.

Calculated items share their syntax with trigger [expressions](#). Comparison to strings is allowed in calculated items. Calculated items may be referenced by macros or other entities same as any other item type.

To use calculated items, choose the item type **Calculated**.

### Configurable fields

The **key** is a unique item identifier (per host). You can create any key name using supported symbols.

Calculation definition should be entered in the **Formula** field. There is virtually no connection between the formula and the key. The key parameters are not used in the formula in any way.

The syntax of a simple formula is:

```
function(/host/key,<parameter1>,<parameter2>,...)
```

where:

|                     |  |
|---------------------|--|
| <i>function</i>     | One of the <a href="#">supported functions</a> : last, min, max, avg, count, etc   |
| <i>host</i>         | Host of the item that is used for calculation.<br>The current host can be omitted (i.e. as in <code>function(/key,parameter,...)</code> ). |
| <i>key</i>          | Key of the item that is used for calculation.  |
| <i>parameter(s)</i> | Parameters of the function, if required.   |

#### Attention:

User macros in the formula will be expanded if used to reference a function parameter, item filter parameter, or a constant. User macros will NOT be expanded if referencing a function, host name, item key, item key parameter or operator.

A more complex formula may use a combination of functions, operators and brackets. You can use all functions and [operators](#) supported in trigger expressions. The logic and operator precedence are exactly the same.

Unlike trigger expressions, Zabbix processes calculated items according to the item update interval, not upon receiving a new value.

All items that are referenced by history functions in the calculated item formula must exist and be collecting data. Also, if you change the item key of a referenced item, you have to manually update any formulas using that key.

A calculated item may become unsupported in several cases:

- referenced item(s)
  - is not found
  - is disabled
  - belongs to a disabled host
  - is not supported (except with `nodata()` function and **operators** with unknown values)
- no data to calculate a function
- division by zero
- incorrect syntax used

Usage examples

Example 1

Calculating percentage of free disk space on '/'.

Use of function **last**:

```
100*last(/vfs.fs.size[/,free])/last(/vfs.fs.size[/,total])
```

Zabbix will take the latest values for free and total disk spaces and calculate percentage according to the given formula.

Example 2

Calculating a 10-minute average of the number of values processed by Zabbix.

Use of function **avg**:

```
avg(/Zabbix Server/zabbix[wcache,values],10m)
```

Note that extensive use of calculated items with long time periods may affect performance of Zabbix server.

Example 3

Calculating total bandwidth on eth0.

Sum of two functions:

```
last(/net.if.in[eth0,bytes])+last(/net.if.out[eth0,bytes])
```

Example 4

Calculating percentage of incoming traffic.

More complex expression:

```
100*last(/net.if.in[eth0,bytes])/(last(/net.if.in[eth0,bytes])+last(/net.if.out[eth0,bytes]))
```

See also: [Examples of aggregate calculations](#)

1 Aggregate calculations

## Overview

Aggregate calculations are a **calculated item** type allowing to collect information from several items by Zabbix server and then calculate an aggregate, depending on the aggregate function used.

Only unsigned integer and float values (type of information) are supported for aggregate calculation items.

Aggregate calculations do not require any agent running on the host being monitored.

## Syntax

To retrieve aggregates, you may:

- list several items for aggregation:

```
aggregate_function(function(/host/key,parameter),function(/host2/key2,parameter),...)
```

Note that `function` here must be a history/trend function.

- use the **foreach** function, as the only parameter, and its item filter to select the required items:

```
aggregate_function(foreach_function(/host/key?[group="host_group"],timeperiod))
```

Aggregate function is one of the supported **aggregate functions**: avg, max, min, sum, etc.

A **foreach** function (e.g. *avg\_foreach*, *count\_foreach*, etc.) returns one aggregate value for each selected item. Items are selected by using the item filter (/host/key?[group="host\_group"]), from item history.

If some of the items have no data for the requested period, they are ignored in the calculation. If no items have data, the function will return an error.

For more details, see **foreach functions**.

**Note:**

If the aggregate results in a float value it will be trimmed to an integer if the aggregated item type of information is *Numeric (unsigned)*.

User macros and low-level discovery macros are supported in:

- item key parameters
- function parameters
- filter conditions (host group name and tag name)
- expression constants

An aggregate calculation may become unsupported if:

- none of the referenced items is found (which may happen if the item key is incorrect, none of the items exists or all included groups are incorrect)
- no data to calculate a function

Usage examples

Examples of keys for aggregate calculations.

Example 1

Total disk space of host group 'MySQL Servers'.

```
sum(last_foreach(/*/vfs.fs.size[/,total]?[group="MySQL Servers"]))
```

Example 2

Sum of latest values of all items matching net.if.in[\*] on the host.

```
sum(last_foreach(/host/net.if.in[*]))
```

Example 3

Average processor load of host group 'MySQL Servers'.

```
avg(last_foreach(/*/system.cpu.load[,avg1]?[group="MySQL Servers"]))
```

Example 4

5-minute average of the number of queries per second for host group 'MySQL Servers'.

```
avg(avg_foreach(/*/mysql.qps?[group="MySQL Servers"],5m))
```

Example 5

Average CPU load on all hosts in multiple host groups that have the specific tags.

```
avg(last_foreach(/*/system.cpu.load?[(group="Servers A" or group="Servers B" or group="Servers C") and (tag="tag1")]))
```

Example 6

Calculation used on the latest item value sums of a whole host group.

```
sum(last_foreach(/*/net.if.out[eth0,bytes]?[group="video"])) / sum(last_foreach(/*/nginx_stat.sh[active]?[group="video"]))
```

Example 7

The total number of unsupported items in host group 'Zabbix servers'.

```
sum(last_foreach(/*/zabbix[host,,items_unsupported]?[group="Zabbix servers"]))
```

## Examples of correct/incorrect syntax

Expressions (including function calls) cannot be used as history, trend, or foreach **function** parameters. However, those functions themselves can be used in other (non-historical) function parameters.

| Expression | Example  |
|------------|--|
| Valid      | <code>avg(last(/host/key1),last(/host/key2)*10,last(/host/key1)*100)</code><br><code>max(avg(avg_foreach(/system.cpu.load?[group="Servers A"],5m)),avg(avg_foreach(/system.cpu.load?[group="Servers B"],5m)),avg(avg_foreach(/system.cpu.load?[group="Servers C"],5m)))</code> |
| Invalid    | <code>sum(/host/key,10+2)</code><br><code>sum(/host/key, avg(10,2))</code><br><code>sum(/host/key,last(/host/key2))</code>   |

Note that in an expression like:

```
sum(sum_foreach(/resptime[*],5m))/sum(count_foreach(/resptime[*],5m))
```

it cannot be guaranteed that both parts of the equation will always have the same set of values. While one part of the expression is evaluated, a new value for the requested period may arrive and then the other part of the expression will have a different set of values.

## 8 Internal checks

### Overview

Internal checks allow to monitor the internal processes of Zabbix. In other words, you can monitor what goes on with Zabbix server or Zabbix proxy.

Internal checks are calculated:

- on Zabbix server - if the host is monitored by server
- on Zabbix proxy - if the host is monitored by proxy

Internal checks are processed by server or proxy regardless of host maintenance status.

To use this item, choose the **Zabbix internal** item type.

#### Note:

Internal checks are processed by Zabbix pollers.

### Performance

Using some internal items may negatively affect performance. These items are:

- `zabbix[host,,items]`
- `zabbix[host,,items_unsupported]`
- `zabbix[hosts]`
- `zabbix[items]`
- `zabbix[items_unsupported]`
- `zabbix[queue,,]`
- `zabbix[requiredperformance]`
- `zabbix[stats,,,queue,,]`
- `zabbix[triggers]`

The **System information** and **Queue** frontend sections are also affected.

### Supported checks

- Parameters without angle brackets are mandatory and must be used as *is* (for example, "host" and "available" in `zabbix[host,<type>,available]`).
- Parameters with angle brackets `< >` must be replaced with a valid value. If a parameter has a default value, it can be omitted.
- Values for items and item parameters labeled "not supported on proxy" can only be retrieved if the host is monitored by server. Conversely, values "not supported on server" can only be retrieved if the host is monitored by proxy.

| Key                             |   |              |   |
|---------------------------------|---|--------------|---|
|                                 | Description   | Return value | Comments  |
| zabbix[boottime]                | Startup time of Zabbix server or Zabbix proxy process in seconds. | Integer.     |   |
| zabbix[cluster,discovery,nodes] | Discover <b>high availability cluster</b> nodes.                  | JSON.        | This item can be used in low-level discovery.   |
| zabbix[history]                 | Number of values stored in the HISTORY table.                     | Integer.     | This item is deprecated since Zabbix 6.0. Do not use if MySQL InnoDB, Oracle or PostgreSQL is used! ( <i>not supported on proxy</i> ) |
| zabbix[history_log]             |   |              |   |

| Key                  |   |   |
|----------------------|---|---|
|                      | Number of values stored in the HISTORY_LOG table. | Integer.  |

| zabbix[java,,<param>]     |  |  |   |

| Key   |   |   |
|---|---|---|
| Information about Zabbix Java gateway.  | <p>If &lt;param&gt; is <i>ping</i>, "1" is returned. Can be used to check Java gateway availability using <code>nodata()</code> trigger function.</p> <p>If &lt;param&gt; is <i>version</i>, version of Java gateway is returned. Example: "2.0.0".</p> | <p>Valid values for <b>param</b> are: <i>ping</i>, <i>version</i></p> <p>Second parameter must be empty and is reserved for future use.</p> |
| <b>zabbix[lld_queue]</b><br>Count of values enqueued in the low-level discovery processing queue. | Integer.  | <p>This item can be used to monitor the low-level discovery processing queue length.</p> <p>This item is supported since Zabbix 4.2.0.</p>  |
| <b>zabbix[preprocessing_queue]</b>  |   |   |

| Key  |          |  |
|--|----------|--|
| Count of values enqueued in the preprocessing queue. | Integer. | This item can be used to monitor the preprocessing queue length. |
| zabbix[process,<type>,<mode>,<state>]                |          | This item is supported since Zabbix 3.4.0.                       |

Time a particular Zabbix process or a group of processes (identified by <type> and <mode>) spent in <state> in percentage. It is calculated for the last minute only. Specifying <type> is **mandatory**.

If <mode> is Zabbix process number that is not running (for example, with 5 pollers running <mode> is specified to be 6), such an item will turn into unsupported state. Minimum and maximum refers to the usage percentage for a single process. So if in a group of 3 pollers usage percentages per process were 2, 18 and 66, min would return 2 and max would return 66. Processes report what they are doing in shared memory and the self-monitoring process summarizes that data each second. State changes (busy/idle) are registered upon change - thus a process that becomes busy registers as such and doesn't change or update the state until it becomes idle. This ensures that even fully hung processes will be correctly registered as 100% busy. Currently, "busy" means "not sleeping", but in the future additional states might be introduced - waiting for locks, performing database queries, etc.

On Linux and most other systems, resolution is 1/100 of a second.

Percentage of time.  
Float.

|       | used               | Size of used trend buffer.                  | Integer |   |

| Key |      |                                  |        |  |
|-----|------|----------------------------------|--------|--|
|     | used | Percentage of used trend buffer. | Float. | (not supported on proxy)                   |
|     |      |                                  |        | used mode is supported since Zabbix 4.0.0. |

## 9 SSH checks

### Overview

SSH checks are performed as agent-less monitoring. Zabbix agent is not needed for SSH checks.

To perform SSH checks Zabbix server must be initially **configured** with SSH2 support (libssh or libssh2). See also: **Requirements**.

#### Attention:

Starting with RHEL 8, only libssh is supported. For other distributions, libssh is suggested over libssh2.

### Configuration

#### Passphrase authentication

SSH checks provide two authentication methods - a user/password pair and key-file based.

If you do not intend to use keys, no additional configuration is required, besides linking libssh or libssh2 to Zabbix, if you're building from source.

#### Key file authentication

To use key based authentication for SSH items, certain changes to the server configuration are required.

Open the Zabbix server configuration file (*zabbix\_server.conf*) as root and look for the following line:

```
##### SSHKeyLocation=
```

Uncomment it and set the full path to the folder where the public and private keys will be located:

```
SSHKeyLocation=/home/zabbix/.ssh
```

Save the file and restart Zabbix server afterwards.

The path */home/zabbix* here is the home directory for the *zabbix* user account, and *.ssh* is a directory where by default public and private keys will be generated by an *ssh-keygen* command inside the home directory.

Usually installation packages of Zabbix server from different OS distributions create the *zabbix* user account with a home directory elsewhere, for example, */var/lib/zabbix* (as for system accounts).

Before generating the keys, you could reallocate the home directory to */home/zabbix*, so that it corresponds with the *SSHKeyLocation* Zabbix server configuration parameter mentioned above.

#### Note:

The following steps can be skipped if *zabbix* account has been added manually according to the **installation section**. In such a case the home directory for the *zabbix* account is most likely already */home/zabbix*.

To change the home directory of the *zabbix* user account, all working processes which are using it have to be stopped:

```
systemctl stop zabbix-agent
systemctl stop zabbix-server
```

To change the home directory location with an attempt to move it (if it exists) the following command should be executed:

```
usermod -m -d /home/zabbix zabbix
```

It is also possible that a home directory did not exist in the old location, so it should be created at the new location. A safe attempt to do that is:

```
test -d /home/zabbix || mkdir /home/zabbix
```

To be sure that all is secure, additional commands could be executed to set permissions to the home directory:

```
chown zabbix:zabbix /home/zabbix
```

```
chmod 700 /home/zabbix
```

Previously stopped processes can now be started again:

```
systemctl start zabbix-agent
```

```
systemctl start zabbix-server
```

Now, the steps to generate the public and private keys can be performed with the following commands (for better readability, command prompts are commented out):

```
sudo -u zabbix ssh-keygen -t rsa
##### Generating public/private rsa key pair.
##### Enter file in which to save the key (/home/zabbix/.ssh/id_rsa):
/home/zabbix/.ssh/id_rsa
##### Enter passphrase (empty for no passphrase):
<Leave empty>
##### Enter same passphrase again:
<Leave empty>
##### Your identification has been saved in /home/zabbix/.ssh/id_rsa.
##### Your public key has been saved in /home/zabbix/.ssh/id_rsa.pub.
##### The key fingerprint is:
##### 90:af:e4:c7:e3:f0:2e:5a:8d:ab:48:a2:0c:92:30:b9 zabbix@it0
##### The key's randomart image is:
##### +--[ RSA 2048 ]-----+
##### |                      |
##### |      .                |
##### |      o                |
##### | .      o              |
##### | +      . S           |
##### | .+    o =            |
##### | E .    * =           |
##### | =o .  . . * .        |
##### | ... oo.o+           |
##### +-----+
#####
```

#### Note:

The public and private keys (*id\_rsa.pub* and *id\_rsa*) have been generated by default in the */home/zabbix/.ssh* directory, which corresponds to the Zabbix server *SSHKeyLocation* configuration parameter.

#### Attention:

Key types other than "rsa" may be supported by the *ssh-keygen* tool and SSH servers but they may not be supported by *libssh2* used by Zabbix.

Shell configuration form

This step should be performed only once for every host that will be monitored by SSH checks.

By using the following commands, the **public** key file can be installed on a remote host *10.10.10.10*, so that the SSH checks can be performed with a *root* account (for better readability, command prompts are commented out):

```
sudo -u zabbix ssh-copy-id root@10.10.10.10
##### The authenticity of host '10.10.10.10 (10.10.10.10)' can't be established.
##### RSA key fingerprint is 38:ba:f2:a4:b5:d9:8f:52:00:09:f7:1f:75:cc:0b:46.
##### Are you sure you want to continue connecting (yes/no)?
yes
```

```
##### Warning: Permanently added '10.10.10.10' (RSA) to the list of known hosts.
##### root@10.10.10.10's password:
<Enter root password>
##### Now try logging into the machine, with "ssh 'root@10.10.10.10'",
##### and check to make sure that only the key(s) you wanted were added.
```

Now it is possible to check the SSH login using the default private key (/home/zabbix/.ssh/id\_rsa) for the zabbix user account:

```
sudo -u zabbix ssh root@10.10.10.10
```

If the login is successful, then the configuration part in the shell is finished and the remote SSH session can be closed.

#### Item configuration

Actual command(s) to be executed must be placed in the *Executed script* field in the item configuration. Multiple commands can be executed one after another by placing them on a new line. In this case returned values will also be formatted as multilined.

All mandatory input fields are marked with a red asterisk.

The fields that require specific information for SSH items are:

| Parameter | Description                   | Comments |
|-----------|-------------------------------|----------|
| Type      | Select <b>SSH agent</b> here. |          |

| Parameter                         | Description  | Comments  |
|-----------------------------------|--|---|
| <i>Key</i>                        | Unique (per host) item key in the format <b>ssh.run[unique short description,&lt;ip&gt;,&lt;port&gt;,&lt;encoding&gt;,&lt;ssh options&gt;]</b> | <p><b>unique short description</b> is required and should be unique for each SSH item per host.</p> <p>Default port is 22, not the port specified in the interface to which this item is assigned.</p> <p><b>ssh options</b> (supported since version 6.0.25; require libssh of version 0.9.0 and higher or libssh2) allow passing additional SSH options in the format <i>key1=value1;key2=value2,value3</i>. Multiple values for one key can be passed separated by comma (in this case, the parameter must be <b>quoted</b>); multiple option keys can be passed separated by semicolon.</p> <p>The following option keys are supported: KexAlgorithms, HostkeyAlgorithms, Ciphers, MACs. Option key and value support depends on the SSH library; if an option is not supported, an error will be returned, and the item will become unsupported.</p> <p>Note that "+" sign for appending cipher settings and "!" for disabling specific cipher settings (as in GnuTLS and OpenSSL) are not supported.</p> <p>Examples:</p> <pre>=&gt; ssh.run[KexAlgorithms,127.0.0.1,,,Ciphers=aes128] =&gt; ssh.run[KexAlgorithms,,,,"KexAlgorithms=diffie-hellman"]</pre> |
| <i>Authentication method</i>      | One of the "Password" or "Public key".   |   |
| <i>User name</i>                  | User name to authenticate on remote host. Required.  |   |
| <i>Public key file</i>            | File name of public key if <i>Authentication method</i> is "Public key". Required.   | Example: <i>id_rsa.pub</i> - default public key file name generated by a command <a href="#">ssh-keygen</a> .   |
| <i>Private key file</i>           | File name of private key if <i>Authentication method</i> is "Public key". Required.  | Example: <i>id_rsa</i> - default private key file name.   |
| <i>Password or Key passphrase</i> | Password to authenticate or Passphrase <b>if</b> it was used for the private key.  | <p>Leave the <i>Key passphrase</i> field empty if passphrase was not used.</p> <p>See also <b>known issues</b> regarding passphrase usage.</p>  |
| <i>Executed script</i>            | Executed shell command(s) using SSH remote session.  | <p>The return value of the executed shell command(s) is limited to 16MB (including trailing whitespace that is truncated); <b>database limits</b> also apply.</p> <p>Note that the libssh2 library may truncate executable scripts to ~32kB.</p> <p>Examples:</p> <pre>date +%s systemctl status mysql-server ps auxww   grep httpd   wc -l</pre>   |

## 10 Telnet checks

### Overview

Telnet checks are performed as agent-less monitoring. Zabbix agent is not needed for Telnet checks.

## Configurable fields

Actual command(s) to be executed must be placed in the **Executed script** field in the item configuration.

Multiple commands can be executed one after another by placing them on a new line. In this case returned value also will be formatted as multiline.

Supported characters that the shell prompt can end with:

- \$
- #
- >
- %

### Note:

A telnet prompt line which ended with one of these characters will be removed from the returned value, but only for the first command in the commands list, i.e. only at a start of the telnet session.

| Key  | Description  |
|--|--|
| <b>telnet.run[&lt;unique short descrip-<br/>tion&gt;,&lt;ip&gt;,&lt;port&gt;,&lt;encoding&gt;]</b> | Run a command on a remote device using telnet connection |

### Attention:

If a telnet check returns a value with non-ASCII characters and in non-UTF8 encoding then the *<encoding>* parameter of the key should be properly specified. See [encoding of returned values](#) page for more details.

## 11 External checks

### Overview

External check is a check executed by Zabbix server by **running a shell script** or a binary. However, when hosts are monitored by a Zabbix proxy, the external checks are executed by the proxy.

External checks do not require any agent running on a host being monitored.

The syntax of the item key is:

```
script[<parameter1>,<parameter2>,...]
```

Where:

| ARGUMENT            | DEFINITION                          |
|---------------------|-------------------------------------|
| <b>script</b>       | Name of a shell script or a binary. |
| <b>parameter(s)</b> | Optional command line parameters.   |

If you don't want to pass any parameters to the script you may use:

```
script[] or  
script
```

Zabbix server or proxy will search the directory specified for external scripts and execute the command (see `ExternalScripts` parameter in Zabbix [server/proxy](#) configuration file). The command will be executed under the same user as Zabbix server/proxy, so any access permissions or environment variables should be handled in a wrapper script, if necessary. Permissions on the command should also allow that user to execute it. Only commands in the specified directory are available for execution.

### Warning:

Do not overuse external checks, as each script requires starting a fork process by Zabbix server/proxy, and running many scripts can significantly decrease Zabbix performance.

### Usage example

Executing the script **check\_oracle.sh** with the first parameters '-h'. The second parameter will be replaced by IP address or DNS name, depending on the selection in the host properties.

```
check_oracle.sh["-h","{HOST.CONN}"]
```

Assuming host is configured to use IP address, Zabbix server/proxy will execute:

```
check_oracle.sh '-h' '192.168.1.4'
```

External check result

The return value of an external check is a standard output together with a standard error produced by the check.

**Attention:**  
An item that returns text (character, log, or text type of information) will not become unsupported in case of a standard error output.

The return value is limited to 16MB (including trailing whitespace that is truncated); **database limits** also apply.

If the requested script is not found or Zabbix server/proxy has no permissions to execute it, the item will become unsupported and a corresponding error message will be displayed.

In case of a timeout, the item will become unsupported, a corresponding error message will be displayed, and the process forked for the script will be terminated.

12 Trapper items

Overview

Trapper items accept incoming data instead of querying for it.

It is useful for any data you might want to "push" into Zabbix.

To use a trapper item you must:

- have a trapper item set up in Zabbix
- send in the data into Zabbix

Configuration

Item configuration

To configure a trapper item:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item*
- Enter parameters of the item in the form

ItemTagsPreprocessing

\* Name

Trapper item

Type

Zabbix trapper

\* Key

trap

Type of information

Text

\* History storage period

Do not keep historyStorage period3600

All mandatory input fields are marked with a red asterisk.

The fields that require specific information for trapper items are:

|                     |  |
|---------------------|--|
| Type                | Select <b>Zabbix trapper</b> here.   |
| Key                 | Enter a key that will be used to recognize the item when sending in data.                    |
| Type of information | Select the type of information that will correspond the format of data that will be sent in. |

|                      |   |
|----------------------|---|
| <b>Allowed hosts</b> | <p>List of comma delimited IP addresses, optionally in CIDR notation, or DNS names.</p> <p>If specified, incoming connections will be accepted only from the hosts listed here.</p> <p>If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address.</p> <p>'0.0.0.0/0' can be used to allow any IPv4 address.</p> <p>Note that "IPv4-compatible IPv6 addresses" (0000::/96 prefix) are supported but deprecated by <a href="#">RFC4291</a>.</p> <p>Example: 127.0.0.1, 192.168.1.0/24, 192.168.3.1-255, 192.168.1-10.1-255, ::1,2001:db8::/32, mysqlserver1, zabbix.example.com, {HOST.HOST}</p> <p>Spaces and <b>user macros</b> are allowed in this field since Zabbix 2.2.0.</p> <p>Host macros {HOST.HOST}, {HOST.NAME}, {HOST.IP}, {HOST.DNS}, {HOST.CONN} are allowed in this field since Zabbix 4.0.2.</p> |
|----------------------|---|

#### Note:

You may have to wait up to 60 seconds after saving the item until the server picks up the changes from a configuration cache update, before you can send in values.

### Sending in data

In the simplest of cases, we may use **zabbix\_sender** utility to send in some 'test value':

```
zabbix_sender -z <server IP address> -p 10051 -s "New host" -k trap -o "test value"
```

To send in the value we use these keys:

- z - to specify Zabbix server IP address
- p - to specify Zabbix server port number (10051 by default)
- s - to specify the host (make sure to use the 'technical' **host name** here, instead of the 'visible' name)
- k - to specify the key of the item we just defined
- o - to specify the actual value to send

#### Attention:

Zabbix trapper process does not expand macros used in the item key in attempt to check corresponding item key existence for targeted host.

### Display

This is the result in *Monitoring* → *Latest data*:

☰ Latest data

| Subfilter affects only filtered data                   |                              |            |            |        |
|--|------------------------------|------------|------------|--------|
| HOSTS  |                              |            |            |        |
| <a href="#">New host 1</a>                             |                              |            |            |        |
| DATA   |                              |            |            |        |
| <a href="#">With data</a> <a href="#">Without data</a> |                              |            |            |        |
| <input type="checkbox"/> Host                          | Name ▲                       | Last check | Last value | Change |
| <input type="checkbox"/> New host                      | <a href="#">Trapper item</a> | 2m 27s     | test value |        |

Note that if a single numeric value is sent in, the data graph will show a horizontal line to the left and to the right of the time point of the value.

## 13 JMX monitoring

### Overview

JMX monitoring can be used to monitor JMX counters of a Java application.

JMX monitoring has native support in Zabbix in the form of a Zabbix daemon called "Zabbix Java gateway", introduced since Zabbix 2.0.

To retrieve the value of a particular JMX counter on a host, Zabbix server queries the Zabbix **Java gateway**, which in turn uses the [JMX management API](#) to query the application of interest remotely.

For more details and setup see the [Zabbix Java gateway](#) section.

**Warning:**

Communication between Java gateway and the monitored JMX application should not be firewalled.

#### Enabling remote JMX monitoring for Java application

A Java application does not need any additional software installed, but it needs to be started with the command-line options specified below to have support for remote JMX monitoring.

As a bare minimum, if you just wish to get started by monitoring a simple Java application on a local host with no security enforced, start it with these options:

```
java \
-Dcom.sun.management.jmxremote \
-Dcom.sun.management.jmxremote.port=12345 \
-Dcom.sun.management.jmxremote.authenticate=false \
-Dcom.sun.management.jmxremote.ssl=false \
-Dcom.sun.management.jmxremote.registry.ssl=false \
-jar /usr/share/doc/openjdk-6-jre-headless/demo/jfc/Notepad/Notepad.jar
```

This makes Java listen for incoming JMX connections on port 12345, from local host only, and tells it not to require authentication or SSL.

If you want to allow connections on another interface, set the `-Djava.rmi.server.hostname` parameter to the IP of that interface.

If you wish to be more stringent about security, there are many other Java options available to you. For instance, the next example starts the application with a more versatile set of options and opens it to a wider network, not just local host.

```
java \
-Djava.rmi.server.hostname=192.168.3.14 \
-Dcom.sun.management.jmxremote \
-Dcom.sun.management.jmxremote.port=12345 \
-Dcom.sun.management.jmxremote.authenticate=true \
-Dcom.sun.management.jmxremote.password.file=/etc/java-6-openjdk/management/jmxremote.password \
-Dcom.sun.management.jmxremote.access.file=/etc/java-6-openjdk/management/jmxremote.access \
-Dcom.sun.management.jmxremote.ssl=true \
-Dcom.sun.management.jmxremote.registry.ssl=true \
-Djavax.net.ssl.keyStore=$YOUR_KEY_STORE \
-Djavax.net.ssl.keyStorePassword=$YOUR_KEY_STORE_PASSWORD \
-Djavax.net.ssl.trustStore=$YOUR_TRUST_STORE \
-Djavax.net.ssl.trustStorePassword=$YOUR_TRUST_STORE_PASSWORD \
-Dcom.sun.management.jmxremote.ssl.need.client.auth=true \
-jar /usr/share/doc/openjdk-6-jre-headless/demo/jfc/Notepad/Notepad.jar
```

Most (if not all) of these settings can be specified in `/etc/java-6-openjdk/management/management.properties` (or wherever that file is on your system).

Note that if you wish to use SSL, you have to modify `startup.sh` script by adding `-Djavax.net.ssl.*` options to Java gateway, so that it knows where to find key and trust stores.

See [Monitoring and Management Using JMX](#) for a detailed description.

#### Configuring JMX interfaces and items in Zabbix frontend

With Java gateway running, server knowing where to find it and a Java application started with support for remote JMX monitoring, it is time to configure the interfaces and items in Zabbix GUI.

##### Configuring JMX interface

You begin by creating a JMX-type interface on the host of interest.

Host
Templates
IPMI
Tags
Macros
Inventory
Encryption
Value mapping

\* Host name

JMX host

Visible name

JMX host

\* Groups

Java (new) X

type here to search

Select

Interfaces

| Type  | IP address | DNS name | Connect to | Port  |
|-------|------------|----------|------------|-------|
| Agent | 127.0.0.1  |          | IP DNS     | 10050 |
| JMX   | 127.0.0.1  |          | IP DNS     | 12345 |

Add

All mandatory input fields are marked with a red asterisk.

Adding JMX agent item

For each JMX counter you are interested in you add **JMX agent** item attached to that interface.

The key in the screenshot below says `jmx["java.lang:type=Memory","HeapMemoryUsage.used"]`.

Item
Tags
Preprocessing

\* Name

Used heap memory

Type

JMX agent

\* Key

jmx["java.lang:type=Memory","HeapMemoryUsage.used"]

Type of information

Numeric (unsigned)

\* Host interface

127.0.0.1:12345

\* JMX endpoint

service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi

User name

{JMX\_USERNAME}

Password

{JMX\_PASSWORD}

Units

All mandatory input fields are marked with a red asterisk.

The fields that require specific information for JMX items are:

|              |   |
|--------------|---|
| Type         | Set <b>JMX agent</b> here.  |
| Key          | <p>The <code>jmx[]</code> item key contains three parameters:</p> <p><b>object name</b> - the object name of an MBean</p> <p><b>attribute name</b> - an MBean attribute name with optional composite data field names separated by dots</p> <p><b>unique short description</b> - a unique description that allows multiple JMX items with the same object name and attribute name on the host (optional)</p> <p>See below for more detail on JMX item keys.</p> <p>Since Zabbix 3.4, you may discover MBeans and MBean attributes using a <code>jmx.discovery[]</code> <b>low-level discovery</b> item.</p> |
| JMX endpoint | <p>You may specify a custom JMX endpoint. Make sure that JMX endpoint connection parameters match the JMX interface. This can be achieved by using <code>{HOST.*}</code> macros as done in the default JMX endpoint.</p> <p>This field is supported since 3.4.0. <code>{HOST.*}</code> <b>macros</b> and user macros are supported.</p>   |

|                  |   |
|------------------|---|
| <i>User name</i> | Specify the user name, if you have configured authentication on your Java application. User macros are supported. |
| <i>Password</i>  | Specify the password, if you have configured authentication on your Java application. User macros are supported.  |

If you wish to monitor a Boolean counter that is either "true" or "false", then you specify type of information as "Numeric (unsigned)" and select "Boolean to decimal" preprocessing step in the Preprocessing tab. Server will store Boolean values as 1 or 0, respectively.

JMX item keys in more detail

Simple attributes

An MBean object name is nothing but a string which you define in your Java application. An attribute name, on the other hand, can be more complex. In case an attribute returns primitive data type (an integer, a string etc.) there is nothing to worry about, the key will look like this:

```
jmx[com.example:Type=Hello,weight]
```

In this example the object name is "com.example:Type=Hello", the attribute name is "weight", and the returned value type should probably be "Numeric (float)".

Attributes returning composite data

It becomes more complicated when your attribute returns composite data. For example: your attribute name is "apple" and it returns a hash representing its parameters, like "weight", "color" etc. Your key may look like this:

```
jmx[com.example:Type=Hello,apple.weight]
```

This is how an attribute name and a hash key are separated, by using a dot symbol. Same way, if an attribute returns nested composite data the parts are separated by a dot:

```
jmx[com.example:Type=Hello,fruits.apple.weight]
```

Attributes returning tabular data

Tabular data attributes consist of one or multiple composite attributes. If such an attribute is specified in the attribute name parameter then this item value will return the complete structure of the attribute in JSON format. The individual element values inside the tabular data attribute can be retrieved using preprocessing.

Tabular data attribute example:

```
jmx[com.example:type=Hello,foodinfo]
```

Item value:

```
[
  {
    "a": "apple",
    "b": "banana",
    "c": "cherry"
  },
  {
    "a": "potato",
    "b": "lettuce",
    "c": "onion"
  }
]
```

Problem with dots

So far so good. But what if an attribute name or a hash key contains dot symbol? Here is an example:

```
jmx[com.example:Type=Hello,all.fruits.apple.weight]
```

That's a problem. How to tell Zabbix that attribute name is "all.fruits", not just "all"? How to distinguish a dot that is part of the name from the dot that separates an attribute name and hash keys?

Before **2.0.4** Zabbix Java gateway was unable to handle such situations and users were left with UNSUPPORTED items. Since 2.0.4 this is possible, all you need to do is to escape the dots that are part of the name with a backslash:

```
jmx[com.example:Type=Hello,all\.fruits.apple.weight]
```

Same way, if your hash key contains a dot you escape it:

```
jmx[com.example:Type=Hello,all\.fruits.apple.total\.weight]
```

Other issues

A backslash character in an attribute name should be escaped:

```
jmx[com.example:type=Hello,c:\\documents]
```

For handling any other special characters in JMX item key, please see the [item key format section](#).

This is actually all there is to it. Happy JMX monitoring!

Non-primitive data types

Since Zabbix 4.0.0 it is possible to work with custom MBeans returning non-primitive data types, which override the **toString()** method.

Using custom endpoint with JBoss EAP 6.4

Custom endpoints allow working with different transport protocols other than the default RMI.

To illustrate this possibility, let's try to configure JBoss EAP 6.4 monitoring as an example. First, let's make some assumptions:

- You have already installed Zabbix Java gateway. If not, then you can do it in accordance with the [documentation](#).
- Zabbix server and Java gateway are installed with the prefix `/usr/local/`
- JBoss is already installed in `/opt/jboss-eap-6.4/` and is running in standalone mode
- We shall assume that all these components work on the same host
- Firewall and SELinux are disabled (or configured accordingly)

Let's make some simple settings in `zabbix_server.conf`:

```
JavaGateway=127.0.0.1
```

```
StartJavaPollers=5
```

And in the `zabbix_java/settings.sh` configuration file (or `zabbix_java_gateway.conf`):

```
START_POLLERS=5
```

Check that JBoss listens to its standard management port:

```
$ netstat -natp | grep 9999
```

```
tcp        0      0 127.0.0.1:9999          0.0.0.0:*               LISTEN      10148/java
```

Now let's create a host with JMX interface 127.0.0.1:9999 in Zabbix.

The screenshot shows the Zabbix web interface for creating a new host. The 'Host' tab is selected. The 'Host name' field is set to 'jboss'. The 'Visible name' field is also set to 'jboss'. The 'Groups' section shows 'Java (new)' selected. Below this, there is a table for 'Interfaces'.

| Interfaces | Type | IP address | DNS name | Connect to | Port  |
|------------|------|------------|----------|------------|-------|
| Agent      |      | 127.0.0.1  |          | IP DNS     | 10050 |
| JMX        |      | 127.0.0.1  |          | IP DNS     | 9999  |

At the bottom of the interface, there is a blue 'Add' button.

As we know that this version of JBoss uses the JBoss Remoting protocol instead of RMI, we may mass update the JMX endpoint parameter for items in our JMX template accordingly:

```
service:jmx:remoting-jmx://{HOST.CONN}:{HOST.PORT}
```

## Mass update

Item

Tags

Preprocessing

Type ☐ Original

JMX endpoint ☒

service:jmx:remoting-jmx://{HOST.CONN}:{HOST.PORT}

Let's update the configuration cache:

```
/usr/local/sbin/zabbix_server -R config_cache_reload
```

Note that you may encounter an error first.

```

```

"Unsupported protocol: remoting-jmx" means that Java gateway does not know how to work with the specified protocol. That can be fixed by creating a `~/needed_modules.txt` file with the following content:

```
jboss-as-remoting
jboss-logging
jboss-logmanager
jboss-marshalling
jboss-remoting
jboss-sasl
jcl-over-slf4j
jul-to-slf4j-stub
log4j-jboss-logmanager
remoting-jmx
slf4j-api
xnio-api
xnio-nio
```

and then executing the command:

```
for i in $(cat ~/needed_modules.txt); do find /opt/jboss-eap-6.4 -iname "${i}*.jar" -exec cp '{}' /usr/local/lib/;
```

Thus, Java gateway will have all the necessary modules for working with jmx-remoting. What's left is to restart the Java gateway, wait a bit and if you did everything right, see that JMX monitoring data begin to arrive in Zabbix (see also: [Latest data](#)).

## 14 ODBC monitoring

### Overview

ODBC monitoring corresponds to the *Database monitor* item type in the Zabbix frontend.

ODBC is a C programming language middle-ware API for accessing database management systems (DBMS). The ODBC concept was developed by Microsoft and later ported to other platforms.

Zabbix may query any database, which is supported by ODBC. To do that, Zabbix does not directly connect to the databases, but uses the ODBC interface and drivers set up in ODBC. This function allows for more efficient monitoring of different databases for multiple purposes - for example, checking specific database queues, usage statistics and so on. Zabbix supports unixODBC, which is one of the most commonly used open source ODBC API implementations.

#### Attention:

See also the [known issues](#) for ODBC checks.

### Installing unixODBC

The suggested way of installing unixODBC is to use the Linux operating system default package repositories. In the most popular Linux distributions unixODBC is included in the package repository by default. If it's not available, it can be obtained at the unixODBC homepage: <http://www.unixodbc.org/download.html>.

Installing unixODBC on Ubuntu/Debian systems using the *apt* package manager:

```
apt install unixodbc unixodbc-dev
```

Installing unixODBC on RedHat/Fedora-based systems using the *dnf* package manager:

```
dnf install unixODBC unixODBC-devel
```

Installing unixODBC on SUSE-based systems using the *zypper* package manager:

```
zypper in unixODBC-devel
```

#### Note:

The `unixodbc-dev` or `unixODBC-devel` package is needed to compile Zabbix with unixODBC support.

### Installing unixODBC drivers

A unixODBC database driver should be installed for the database, which will be monitored. unixODBC has a list of supported databases and drivers: <http://www.unixodbc.org/drivers.html>. In some Linux distributions database drivers are included in package repositories.

Installing MySQL database driver on Ubuntu/Debian systems using the *apt* package manager:

```
apt install odbc-mariadb
```

Installing MySQL database driver on RedHat/Fedora-based systems using the *dnf* package manager:

```
dnf install mariadb-connector-odbc
```

Installing MySQL database driver on SUSE-based systems using the *zypper* package manager:

```
zypper in mariadb-connector-odbc
```

### Configuring unixODBC

ODBC configuration is done by editing the **odbcinst.ini** and **odbc.ini** files. To verify the configuration file location, type:

```
odbcinst -j
```

**odbcinst.ini** is used to list the installed ODBC database drivers:

```
[mysql]
Description = ODBC for MySQL
Driver       = /usr/lib/libmyodbc5.so
```

Parameter details:

| Attribute          | Description                  |
|--------------------|------------------------------|
| <i>mysql</i>       | Database driver name.        |
| <i>Description</i> | Database driver description. |

| Attribute     | Description                       |
|---------------|-----------------------------------|
| <i>Driver</i> | Database driver library location. |

**odbc.ini** is used to define data sources:

```
[test]
Description = MySQL test database
Driver      = mysql
Server      = 127.0.0.1
User        = root
Password    =
Port        = 3306
Database    = zabbix
```

Parameter details:

| Attribute          | Description   |
|--------------------|---|
| <i>test</i>        | Data source name (DSN).                             |
| <i>Description</i> | Data source description.                            |
| <i>Driver</i>      | Database driver name - as specified in odbcinst.ini |
| <i>Server</i>      | Database server IP/DNS.                             |
| <i>User</i>        | Database user for connection.                       |
| <i>Password</i>    | Database user password.                             |
| <i>Port</i>        | Database connection port.                           |
| <i>Database</i>    | Database name.                                      |

To verify if ODBC connection is working successfully, a connection to database should be tested. That can be done with the **isql** utility (included in the unixODBC package):

```
isql test
+-----+
| Connected! |
|           |
| sql-statement |
| help [tablename] |
| quit      |
|           |
+-----+
```

Compiling Zabbix with ODBC support

To enable ODBC support, Zabbix should be compiled with the following flag:

```
--with-unixodbc[=ARG] # Use ODBC driver against unixODBC package.
```

**Note:**

See more about Zabbix installation from the [source code](#).

Item configuration in Zabbix frontend

Configure a database monitoring [item](#).

| Item                | Tags                                    | Preprocessing |
|---------------------|---|---------------|
| * Name              | MySQL host count                        |               |
| Type                | Database monitor ▼                      |               |
| * Key               | db.odbc.select[mysql-simple-check,test] |               |
| Type of information | Numeric (unsigned) ▼                    |               |
| User name           | zabbix                                  |               |
| Password            |   |               |
| * SQL query         | select count(*) from hosts              |               |

All mandatory input fields are marked with a red asterisk.

Specifically for database monitoring items you must enter:

|           |  |
|-----------|--|
| Type      | Select <i>Database monitor</i> here.   |
| Key       | <p>Enter one of the supported item keys:</p> <p><b>db.odbc.select</b>[&lt;unique short description&gt;,&lt;dsn&gt;,&lt;connection string&gt;] - this item is designed to return one value, i.e. the first column of the first row of the SQL query result. If a query returns more than one column, only the first column is read. If a query returns more than one line, only the first line is read.</p> <p><b>db.odbc.get</b>[&lt;unique short description&gt;,&lt;dsn&gt;,&lt;connection string&gt;] - this item is capable of returning multiple rows/columns in JSON format. Thus it may be used as a master item that collects all data in one system call, while JSONPath preprocessing may be used in dependent items to extract individual values. For more information, see an <a href="#">example</a> of the returned format, used in low-level discovery. This item is supported since Zabbix 4.4.</p> <p>The unique description will serve to identify the item in triggers, etc.</p> <p>Although <code>dsn</code> and <code>connection string</code> are optional parameters, at least one of them should be present. If both data source name (DSN) and connection string are defined, the DSN will be ignored.</p> <p>The data source name, if used, must be set as specified in <code>odbc.ini</code>.</p> <p>The connection string may contain driver-specific arguments.</p> <p><b>db.odbc.discovery</b>[&lt;unique short description&gt;,&lt;dsn&gt;,&lt;connection string&gt;] - this item returns <a href="#">low-level discovery</a> data.</p> <p>Example (connection for MySQL ODBC driver 5):</p> <pre>=&gt; db.odbc.get[MySQL exam- ple,,"Driver=/usr/local/lib/libmyodbc5a.so;Database=master;Server=127.0.0.1;Port=3306"]</pre> |
| User name | <p>Enter the database user name</p> <p>This parameter is optional if user is specified in <code>odbc.ini</code>.</p> <p>If connection string is used, and <i>User name</i> field is not empty, it is appended to the connection string as <code>UID=&lt;user&gt;</code></p>  |

|                            |   |
|----------------------------|---|
| <i>Password</i>            | <p>Enter the database user password</p> <p>This parameter is optional if password is specified in <code>odbc.ini</code>.</p> <p>If connection string is used, and <i>Password</i> field is not empty, it is appended to the connection string as <code>PWD=&lt;password&gt;</code>.</p> <p>Since Zabbix 6.0.34, special characters are supported in this field.</p> <p>Before Zabbix 6.0.34, if the password contains a semicolon, it should be wrapped in curly brackets, for example, <code>{P?;}*word</code>. After 6.0.34, wrapping the password in this case is still supported, but not required. The password will be appended to connection string after the username as <code>UID=&lt;username&gt;;PWD={P?;}*word</code>. To test the resulting string, you can run the following command:</p> <pre>isql -v -k 'Driver=libmaodbc.so;Database=zabbix;UID=zabbix;PWD={P?;}*word'</pre> |
| <i>SQL query</i>           | <p>Enter the SQL query.</p> <p>Note that with the <code>db.odbc.select[]</code> item the query must return one value only.</p>  |
| <i>Type of information</i> | <p>It is important to know what type of information will be returned by the query, so that it is selected correctly here. With an incorrect <i>type of information</i> the item will turn unsupported.</p>  |

#### Important notes

- Database monitoring items will become unsupported if no *odbc poller* processes are started in the server or proxy configuration. To activate ODBC pollers, set *StartODBCPollers* parameter in Zabbix **server** configuration file or, for checks performed by proxy, in Zabbix **proxy** configuration file.
- Zabbix does not limit the query execution time. It is up to the user to choose queries that can be executed in a reasonable amount of time.
- The **Timeout** parameter value from Zabbix server is used as the ODBC login timeout (note that depending on ODBC drivers the login timeout setting might be ignored).
- The SQL command must return a result set like any query with `select ...`. The query syntax will depend on the RDBMS which will process them. The syntax of request to a storage procedure must be started with `call` keyword.

#### Error messages

ODBC error messages are structured into fields to provide detailed information. For example, an error message might look like this:

```
Cannot execute ODBC query: [SQL_ERROR]:[42601][7][ERROR: syntax error at or near ";"; Error while executing
```

- "Cannot execute ODBC query" - Zabbix message
- "[SQL\_ERROR]" - ODBC return code
- "[42601]" - SQLState
- "[7]" - Native error code
- "[ERROR: syntax error at or near ";"; Error while executing the query]" - Native error message

Note that the error message length is limited to 2048 bytes, so the message can be truncated. If there is more than one ODBC diagnostic record Zabbix tries to concatenate them (separated with `|`) as far as the length limit allows.

#### 1 Recommended UnixODBC settings for MySQL

#### Installation

- Red Hat Enterprise Linux:**

```
dnf install mariadb-connector-odbc
```

- Debian/Ubuntu:**

Please refer to [MySQL documentation](#) (for `mysql-connector-odbc`), or [MariaDB documentation](#) (for `mariadb-connector-odbc`) to download necessary database driver for the corresponding platform.

For some additional information please refer to: [installing unixODBC](#).

#### Configuration

ODBC configuration is done by editing **odbcinst.ini** and **odbc.ini** files. These configuration files can be found in `/etc` folder. The file **odbcinst.ini** may be missing and in this case it is necessary to create it manually.

#### **odbcinst.ini**

```
[mysql]
Description = General ODBC for MySQL
Driver      = /usr/lib64/libmyodbc5.so
Setup       = /usr/lib64/libodbcmyS.so
FileUsage   = 1
```

Please consider the following examples of **odbc.ini** configuration parameters.

- An example with a connection through an IP:

```
[TEST_MYSQL]
Description = MySQL database 1
Driver      = mysql
Port        = 3306
Server      = 127.0.0.1
```

- An example with a connection through an IP and with the use of credentials. A Zabbix database is used by default:

```
[TEST_MYSQL_FILLED_CRED]
Description = MySQL database 2
Driver      = mysql
User        = root
Port        = 3306
Password    = zabbix
Database    = zabbix
Server      = 127.0.0.1
```

- An example with a connection through a socket and with the use of credentials. A Zabbix database is used by default:

```
[TEST_MYSQL_FILLED_CRED_SOCKET]
Description = MySQL database 3
Driver      = mysql
User        = root
Password    = zabbix
Socket      = /var/run/mysqld/mysqld.sock
Database    = zabbix
```

All other possible configuration parameter options can be found in [MySQL official documentation](#) web page.

## 2 Recommended UnixODBC settings for PostgreSQL

### Installation

- **Red Hat Enterprise Linux:**

```
dnf install postgresql-odbc
```

- **Debian/Ubuntu:**

Please refer to [PostgreSQL documentation](#) to download necessary database driver for the corresponding platform.

For some additional information please refer to: [installing unixODBC](#).

### Configuration

ODBC configuration is done by editing the **odbcinst.ini** and **odbc.ini** files. These configuration files can be found in */etc* folder. The file **odbcinst.ini** may be missing and in this case it is necessary to create it manually.

Please consider the following examples:

#### **odbcinst.ini**

```
[postgresql]
Description = General ODBC for PostgreSQL
Driver      = /usr/lib64/libodbcpsql.so
Setup       = /usr/lib64/libodbcpsqlS.so
FileUsage   = 1
# Since 1.6 if the driver manager was built with thread support you may add another entry to each driver e
# This entry alters the default thread serialization level.
Threading   = 2
```

## odbc.ini

```
[TEST_PSQL]
Description = PostgreSQL database 1
Driver      = postgresql
#CommLog    = /tmp/sql.log
Username    = zbx_test
Password    = zabbix
# Name of Server. IP or DNS
Servername  = 127.0.0.1
# Database name
Database    = zabbix
# Postmaster listening port
Port        = 5432
# Database is read only
# Whether the datasource will allow updates.
ReadOnly    = No
# PostgreSQL backend protocol
# Note that when using SSL connections this setting is ignored.
# 7.4+: Use the 7.4(V3) protocol. This is only compatible with 7.4 and higher backends.
Protocol    = 7.4+
# Includes the OID in SQLColumns
ShowOidColumn = No
# Fakes a unique index on OID
FakeOidIndex  = No
# Row Versioning
# Allows applications to detect whether data has been modified by other users
# while you are attempting to update a row.
# It also speeds the update process since every single column does not need to be specified in the where clause.
RowVersioning = No
# Show SystemTables
# The driver will treat system tables as regular tables in SQLTables. This is good for Access so you can see them.
ShowSystemTables = No
# If true, the driver automatically uses declare cursor/fetch to handle SELECT statements and keeps 100 rows in cache.
Fetch       = Yes
# Booleans as Char
# Booleans are mapped to SQL_CHAR, otherwise to SQL_BIT.
BooleansAsChar = Yes
# SSL mode
SSLmode     = Require
# Send to backend on connection
ConnSettings =

3 Recommended UnixODBC settings for Oracle
```

## Installation

Please refer to [Oracle documentation](#) for all the necessary instructions.

For some additional information please refer to: [Installing unixODBC](#).

## 4 Recommended UnixODBC settings for MSSQL

## Installation

- **Red Hat Enterprise Linux** ([EPEL](#) packages):

```
dnf install epel-release
dnf install freetds
```

- **Debian/Ubuntu:**

Please refer to [FreeTDS user guide](#) to download necessary database driver for the corresponding platform.

For some additional information please refer to: [installing unixODBC](#).

## Configuration

ODBC configuration is done by editing the **odbcinst.ini** and **odbc.ini** files. These configuration files can be found in */etc* folder. The file **odbcinst.ini** may be missing and in this case it is necessary to create it manually.

Please consider the following examples:

### **odbcinst.ini**

```
vi /etc/odbcinst.ini
[FreeTDS]
Driver = /usr/lib64/libtdsodbc.so.0
```

### **odbc.ini**

```
vi /etc/odbc.ini
[sql1]
Driver = FreeTDS
Server = <SQL server 1 IP>
PORT = 1433
TDS_Version = 8.0
```

## 15 Dependent items

### Overview

There are situations when one item gathers multiple metrics at a time or it even makes more sense to collect related metrics simultaneously, for example:

- CPU utilization of individual cores
- Incoming/outgoing/total network traffic

To allow for bulk metric collection and simultaneous use in several related items, Zabbix supports dependent items. Dependent items depend on the master item that collects their data simultaneously, in one query. A new value for the master item automatically populates the values of the dependent items. Dependent items cannot have a different update interval than the master item.

Zabbix preprocessing options can be used to extract the part that is needed for the dependent item from the master item data.

Preprocessing is managed by a `preprocessing manager` process, which has been added in Zabbix 3.4, along with workers that perform the preprocessing steps. All values (with or without preprocessing) from different data gatherers pass through the preprocessing manager before being added to the history cache. Socket-based IPC communication is used between data gatherers (pollers, trappers, etc) and the preprocessing process.

Zabbix server or Zabbix proxy (if host is monitored by proxy) are performing preprocessing steps and processing dependent items.

Item of any type, even dependent item, can be set as master item. Additional levels of dependent items can be used to extract smaller parts from the value of an existing dependent item.

### Limitations

- Only same host (template) dependencies are allowed
- An item prototype can depend on another item prototype or regular item from the same host
- Maximum count of dependent items for one master item is limited to 29999 (regardless of the number of dependency levels)
- Maximum 3 dependency levels allowed
- Dependent item on a host with master item from template will not be exported to XML

### Item configuration

A dependent item depends on its master item for data. That is why the **master item** must be configured (or exist) first:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item*
- Enter parameters of the item in the form

Item
Tags
Preprocessing

\*

Name

Apache server status

Type

Zabbix agent

\*

Key

web.page.get[127.0.0.1/server-status]

Type of information

Text

\*

Host interface

127.0.0.1:1050

\*

Update interval

30s

All mandatory input fields are marked with a red asterisk.

Click on *Add* to save the master item.

Then you can configure a **dependent item**.

Master item

Apache: Apache server status

All mandatory input fields are marked with a red asterisk.

The fields that require specific information for dependent items are:

|                     |   |
|---------------------|---|
| Type                | Select <b>Dependent item</b> here.  |
| Key                 | Enter a key that will be used to recognize the item.  |
| Master item         | Select the master item. Master item value will be used to populate dependent item value.    |
| Type of information | Select the type of information that will correspond the format of data that will be stored. |

You may use item value **preprocessing** to extract the required part of the master item value.

Without preprocessing, the dependent item value will be exactly the same as the master item value.

Click on *Add* to save the dependent item.

A shortcut to creating a dependent item quicker can be accessed by clicking on the **...** button in the item list and selecting *Create dependent item*.

## Display

In the item list dependent items are displayed with their master item name as prefix.

| <input type="checkbox"/> | Name ▲   | Triggers | Key                                   |
|--------------------------|--|----------|---------------------------------------|
| <input type="checkbox"/> | ... Apache server status                       |          | web.page.get[127.0.0.1/server-status] |
| <input type="checkbox"/> | ... Apache server status: Apache server uptime |          | apache.server.uptime                  |

If a master item is deleted, so are all its dependent items.

## 16 HTTP agent

### Overview

This item type allows data polling using the HTTP/HTTPS protocol. Trapping is also possible using Zabbix sender or Zabbix sender protocol.

HTTP item check is executed by Zabbix server. However, when hosts are monitored by a Zabbix proxy, HTTP item checks are executed by the proxy.

HTTP item checks do not require any agent running on a host being monitored.

HTTP agent supports both HTTP and HTTPS. Zabbix will optionally follow redirects (see the *Follow redirects* option below). Maximum number of redirects is hard-coded to 10 (using cURL option CURLOPT\_MAXREDIRS).

### Attention:

Zabbix server/proxy must be initially configured with cURL (libcurl) support.

### Configuration

To configure an HTTP item:

- Go to: *Configuration* → *Hosts*
- Click on *Items* in the row of the host
- Click on *Create item*
- Enter parameters of the item in the form

The fields that require specific information for HTTP items are:

| Parameter           | Description   |
|---------------------|---|
| <i>Type</i>         | Select <b>HTTP agent</b> here.  |
| <i>Key</i>          | Enter a unique item key.  |
| <i>URL</i>          | <p>URL to connect to and retrieve data. For example:</p> <p>https://www.example.com</p> <p>http://www.example.com/download</p> <p>Domain names can be specified in Unicode characters. They are automatically punycode-converted to ASCII when executing the HTTP check.</p> <p>The <i>Parse</i> button can be used to separate optional query fields (like ?name=Admin&amp;password=mypassword) from the URL, moving the attributes and values into <i>Query fields</i> for automatic URL-encoding.</p> <p>Limited to 2048 characters.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_URL</a> CURL option.</p> |
| <i>Query fields</i> | <p>Variables for the URL (see above).</p> <p>Specified as attribute and value pairs.</p> <p>Values are URL-encoded automatically. Values from macros are resolved and then URL-encoded automatically.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_URL</a> CURL option.</p>   |
| <i>Request type</i> | Select request method type: <i>GET</i> , <i>POST</i> , <i>PUT</i> or <i>HEAD</i>  |

| Parameter                    | Description   |
|------------------------------|---|
| <i>Timeout</i>               | <p>Zabbix will not spend more than the set amount of time on processing the URL (1-60 seconds). Actually this parameter defines the maximum time for making a connection to the URL and maximum time for performing an HTTP request. Therefore, Zabbix will not spend more than 2 x Timeout seconds on one check.</p> <p>Time suffixes are supported, e.g. 30s, 1m.</p> <p>Supported macros: user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_TIMEOUT</a> cURL option.</p>   |
| <i>Request body type</i>     | <p>Select the request body type:</p> <p><b>Raw data</b> - custom HTTP request body, macros are substituted but no encoding is performed</p> <p><b>JSON data</b> - HTTP request body in JSON format. Macros can be used as string, number, true and false; macros used as strings must be enclosed in double quotes. Values from macros are resolved and then escaped automatically. If "Content-Type" is not specified in headers then it will default to "Content-Type: application/json"</p> <p><b>XML data</b> - HTTP request body in XML format. Macros can be used as a text node, attribute or CDATA section. Values from macros are resolved and then escaped automatically in a text node and attribute. If "Content-Type" is not specified in headers then it will default to "Content-Type: application/xml"</p> <p><i>Note that selecting XML data requires libxml2.</i></p> |
| <i>Request body</i>          | <p>Enter the request body.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG}, user macros, low-level discovery macros.</p>  |
| <i>Headers</i>               | <p>Custom HTTP headers that will be sent when performing a request.</p> <p>Specified as attribute and value pairs.</p> <p>Supported macros: {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG}, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_HTTPHEADER</a> cURL option.</p>   |
| <i>Required status codes</i> | <p>List of expected HTTP status codes. If Zabbix gets a code which is not in the list, the item will become unsupported. If empty, no check is performed.</p> <p>For example: 200,201,210-299</p> <p>Supported macros in the list: user macros, low-level discovery macros.</p> <p>This uses the <a href="#">CURLINFO_RESPONSE_CODE</a> cURL option.</p>  |
| <i>Follow redirects</i>      | <p>Mark the checkbox to follow HTTP redirects.</p>  |
| <i>Retrieve mode</i>         | <p>This sets the <a href="#">CURLOPT_FOLLOWLOCATION</a> cURL option.</p> <p>Select the part of response that must be retrieved:</p> <p><b>Body</b> - body only</p> <p><b>Headers</b> - headers only</p> <p><b>Body and headers</b> - body and headers</p>   |
| <i>Convert to JSON</i>       | <p>Headers are saved as attribute and value pairs under the "header" key.</p> <p>If 'Content-Type: application/json' is encountered then body is saved as an object, otherwise it is stored as string, for example:</p> <pre>{   "header": {     "&lt;key&gt;": "&lt;value&gt;",     "&lt;key2&gt;": "&lt;value&gt;"   },   "body": &lt;body&gt; }</pre>  |

| Parameter                   | Description   |
|-----------------------------|---|
| <i>HTTP proxy</i>           | <p>You can specify an HTTP proxy to use, using the format <code>[protocol://][username[:password]@]proxy.example.com[:port]</code>.</p> <p>The optional <code>protocol://</code> prefix may be used to specify alternative proxy protocols (e.g. <code>https</code>, <code>socks4</code>, <code>socks5</code>; see <a href="#">documentation</a>; the protocol prefix support was added in cURL 7.21.7). With no protocol specified, the proxy will be treated as an HTTP proxy. If you specify the wrong protocol, the connection will fail and the item will become unsupported.</p> <p>By default, 1080 port will be used.</p> <p>If specified, the proxy will overwrite proxy related environment variables like <code>http_proxy</code>, <code>HTTPS_PROXY</code>. If not specified, the proxy will not overwrite proxy-related environment variables.</p> <p>The entered value is passed on "as is", no sanity checking takes place.</p> <p><i>Note</i> that only simple authentication is supported with HTTP proxy.</p> <p>Supported macros: <code>{HOST.IP}</code>, <code>{HOST.CONN}</code>, <code>{HOST.DNS}</code>, <code>{HOST.HOST}</code>, <code>{HOST.NAME}</code>, <code>{ITEM.ID}</code>, <code>{ITEM.KEY}</code>, <code>{ITEM.KEY.ORIG}</code>, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_PROXY</a> cURL option.</p> |
| <i>HTTP authentication</i>  | <p>Authentication type:</p> <p><b>None</b> - no authentication used.</p> <p><b>Basic</b> - basic authentication is used.</p> <p><b>NTLM</b> - NTLM (<a href="#">Windows NT LAN Manager</a>) authentication is used.</p> <p><b>Kerberos</b> - Kerberos authentication is used. See also: <a href="#">Configuring Kerberos with Zabbix</a>.</p> <p><b>Digest</b> - Digest authentication is used.</p> <p>Selecting an authentication method will provide two additional fields for entering a user name and password, where user macros and low-level discovery macros are supported.</p> <p>This sets the <a href="#">CURLOPT_HTTPAUTH</a> cURL option.</p>  |
| <i>SSL verify peer</i>      | <p>Mark the checkbox to verify the SSL certificate of the web server. The server certificate will be automatically taken from system-wide certificate authority (CA) location. You can override the location of CA files using Zabbix server or proxy configuration parameter <code>SSLCALocation</code>.</p> <p>This sets the <a href="#">CURLOPT_SSL_VERIFYPEER</a> cURL option.</p>  |
| <i>SSL verify host</i>      | <p>Mark the checkbox to verify that the Common Name field or the Subject Alternate Name field of the web server certificate matches.</p> <p>This sets the <a href="#">CURLOPT_SSL_VERIFYHOST</a> cURL option.</p>   |
| <i>SSL certificate file</i> | <p>Name of the SSL certificate file used for client authentication. The certificate file must be in PEM<sup>1</sup> format. If the certificate file contains also the private key, leave the SSL key file field empty. If the key is encrypted, specify the password in SSL key password field. The directory containing this file is specified by Zabbix server or proxy configuration parameter <code>SSLCertLocation</code>.</p> <p>Supported macros: <code>{HOST.IP}</code>, <code>{HOST.CONN}</code>, <code>{HOST.DNS}</code>, <code>{HOST.HOST}</code>, <code>{HOST.NAME}</code>, <code>{ITEM.ID}</code>, <code>{ITEM.KEY}</code>, <code>{ITEM.KEY.ORIG}</code>, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_SSLCERT</a> cURL option.</p>   |
| <i>SSL key file</i>         | <p>Name of the SSL private key file used for client authentication. The private key file must be in PEM<sup>1</sup> format. The directory containing this file is specified by Zabbix server or proxy configuration parameter <code>SSLKeyLocation</code>.</p> <p>Supported macros: <code>{HOST.IP}</code>, <code>{HOST.CONN}</code>, <code>{HOST.DNS}</code>, <code>{HOST.HOST}</code>, <code>{HOST.NAME}</code>, <code>{ITEM.ID}</code>, <code>{ITEM.KEY}</code>, <code>{ITEM.KEY.ORIG}</code>, user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_SSLKEY</a> cURL option.</p>   |
| <i>SSL key password</i>     | <p>SSL private key file password.</p> <p>Supported macros: user macros, low-level discovery macros.</p> <p>This sets the <a href="#">CURLOPT_KEYPASSWD</a> cURL option.</p>   |
| <i>Enable trapping</i>      | <p>With this checkbox marked, the item will also function as <b>trapper item</b> and will accept data sent to this item by Zabbix sender or using Zabbix sender protocol.</p>   |
| <i>Allowed hosts</i>        | <p>Visible only if <i>Enable trapping</i> checkbox is marked.</p> <p>List of comma delimited IP addresses, optionally in CIDR notation, or DNS names.</p> <p>If specified, incoming connections will be accepted only from the hosts listed here.</p> <p>If IPv6 support is enabled then <code>'127.0.0.1'</code>, <code>'::127.0.0.1'</code>, <code>'::ffff:127.0.0.1'</code> are treated equally and <code>'::/0'</code> will allow any IPv4 or IPv6 address.</p> <p><code>'0.0.0.0/0'</code> can be used to allow any IPv4 address.</p> <p><i>Note</i> that "IPv4-compatible IPv6 addresses" (0000::&lt;96 prefix) are supported but deprecated by <a href="#">RFC4291</a>.</p> <p>Example: <code>127.0.0.1, 192.168.1.0/24, 192.168.3.1-255, 192.168.1-10.1-255, ::1, 2001:db8::/32, mysqlserver1, zabbix.example.com, {HOST.HOST}</code></p> <p>Spaces and <b>user macros</b> are allowed in this field.</p> <p>Host macros: <code>{HOST.HOST}</code>, <code>{HOST.NAME}</code>, <code>{HOST.IP}</code>, <code>{HOST.DNS}</code>, <code>{HOST.CONN}</code> are allowed in this field.</p>  |

**Note:**

If the *HTTP proxy* field is left empty, another way for using an HTTP proxy is to set proxy-related environment variables. For HTTP - set the `http_proxy` environment variable for the Zabbix server user. For example:  
`http_proxy=http://proxy_ip:proxy_port`.  
 For HTTPS - set the `HTTPS_PROXY` environment variable. For example:  
`HTTPS_PROXY=http://proxy_ip:proxy_port`. More details are available by running a shell command: `# man curl`.

**Attention:**

[1] Zabbix supports certificate and private key files in PEM format only. In case you have your certificate and private key data in PKCS #12 format file (usually with extension \*.p12 or \*.pfx) you may generate the PEM file from it using the following commands:

```
openssl pkcs12 -in ssl-cert.p12 -clcerts -nokeys -out ssl-cert.pem
openssl pkcs12 -in ssl-cert.p12 -nocerts -nodes -out ssl-cert.key
```

**Examples****Example 1**

Send simple GET requests to retrieve data from services such as Elasticsearch:

- Create a GET item with URL: `localhost:9200/?pretty`
- Notice the response:

```
{
  "name" : "YQ2VAY-",
  "cluster_name" : "elasticsearch",
  "cluster_uuid" : "kH4CYqh5QfqgeTsjh2F9zg",
  "version" : {
    "number" : "6.1.3",
    "build_hash" : "af51318",
    "build_date" : "2018-01-26T18:22:55.523Z",
    "build_snapshot" : false,
    "lucene_version" : "7.1.0",
    "minimum_wire_compatibility_version" : "5.6.0",
    "minimum_index_compatibility_version" : "5.0.0"
  },
  "tagline" : "You know, for search"
}
```

- Now extract the version number using a JSONPath preprocessing step: `$.version.number`

**Example 2**

Send simple POST requests to retrieve data from services such as Elasticsearch:

- Create a POST item with URL: `http://localhost:9200/str/values/_search?scroll=10s`
- Configure the following POST body to obtain the processor load (1 min average per core)

```
{
  "query": {
    "bool": {
      "must": [{
        "match": {
          "itemid": 28275
        }
      }],
      "filter": [{
        "range": {
          "clock": {
            "gt": 1517565836,
            "lte": 1517566137
          }
        }
      }]
    }
  }
}
```

```

}

• Received:

{
  "_scroll_id": "DnF1ZXJ5VGhlbkZldGNoBQAAAAAAAAAAkF1lRMlZBWS1UU1pxTmdEeGVwQjRBTfEAAAAAAAAAAJRZZUTJWQVktVFN",
  "took": 18,
  "timed_out": false,
  "_shards": {
    "total": 5,
    "successful": 5,
    "skipped": 0,
    "failed": 0
  },
  "hits": {
    "total": 1,
    "max_score": 1.0,
    "hits": [{
      "_index": "dbl",
      "_type": "values",
      "_id": "dqX9VWEBV6sEKSMYk6sw",
      "_score": 1.0,
      "_source": {
        "itemid": 28275,
        "value": "0.138750",
        "clock": 1517566136,
        "ns": 25388713,
        "ttl": 604800
      }
    }]
  }
}

```

- Now use a JSONPath preprocessing step to get the item value: `$.hits.hits[0]._source.value`

### Example 3

#### Example 4

Retrieving weather information by connecting to the Openweathermap public service.

- Configure a master item for bulk data collection in a single JSON:

Item
Tags
Preprocessing

\* Name

Type

\* Key

Type of information

\* URL

Query fields

| Name  | Value                |
|-------|----------------------|
| units | metric               |
| lat   | { \$LAT }            |
| lon   | { \$LON }            |
| APPID | { \$WEATHER_APIKEY } |
| lang  | { \$WEATHER_LANG }   |

Add

Request type

\* Timeout

Request body type

Request body

Note the usage of macros in query fields. Refer to the [Openweathermap API](#) for how to fill them.

Sample JSON returned in response to HTTP agent:

```
{
  "body": {
    "coord": {
      "lon": 40.01,
```

```

    "lat": 56.11
  },
  "weather": [{
    "id": 801,
    "main": "Clouds",
    "description": "few clouds",
    "icon": "02n"
  }],
  "base": "stations",
  "main": {
    "temp": 15.14,
    "pressure": 1012.6,
    "humidity": 66,
    "temp_min": 15.14,
    "temp_max": 15.14,
    "sea_level": 1030.91,
    "grnd_level": 1012.6
  },
  "wind": {
    "speed": 1.86,
    "deg": 246.001
  },
  "clouds": {
    "all": 20
  },
  "dt": 1526509427,
  "sys": {
    "message": 0.0035,
    "country": "RU",
    "sunrise": 1526432608,
    "sunset": 1526491828
  },
  "id": 487837,
  "name": "Stavrovo",
  "cod": 200
}
}

```

The next task is to configure dependent items that extract data from the JSON.

- Configure a sample dependent item for humidity:

| Item | Tags | Preprocessing  |
|------|------|--|
|      |      | <p><b>* Name</b> <input type="text" value="Humidity"/></p> <p><b>Type</b> <input type="text" value="Dependent item"/></p> <p><b>* Key</b> <input type="text" value="humidity"/></p> <p><b>Type of information</b> <input type="text" value="Numeric (float)"/></p> <p><b>* Master item</b> <input type="text" value="Apache: Get weather"/></p> <p><b>Units</b> <input type="text"/></p> |

Other weather metrics such as 'Temperature' are added in the same manner.

- Sample dependent item value preprocessing with JSONPath:

JSON data
XML data

Sample Nginx stub status output:

Active connections: 1 Active connections:  
 server accepts handled requests  
 52 52 52  
 Reading: 0 Writing: 1 Waiting: 0

The next task is to configure dependent items that extract data.

- Configure a sample dependent item for requests per second:

The screenshot shows the Zabbix item configuration interface. The 'Preprocessing' tab is active. The configuration is as follows:

- Name:** Client requests per second
- Type:** Dependent item
- Key:** nginx\_requests\_rps
- Type of information:** Numeric (unsigned)
- Master item:** Nginx by HTTP: Nginx: Get stub status page

- Sample dependent item value preprocessing with regular expression `server accepts handled requests\s+([0-9]+) ([0-9]+) ([0-9]+)`:

The screenshot shows the 'Preprocessing steps' configuration for the item. It lists two steps:

- Step 1:** Regular expression. Parameters: `requests\s+([0-9]+) ([0-9]+) ([0-9]+)`. The result of the expression is shown as `\3`.
- Step 2:** Change per second.

An 'Add' button is visible at the bottom of the list.

- Check the complete result from stub module in *Latest data*:

| <input type="checkbox"/> Host             | Name ▲                         | Last check          | Last value            |

## 17 Prometheus checks

### Overview

Zabbix can query metrics exposed in the Prometheus line format.

Two steps are required to start gathering Prometheus data:

- an **HTTP master item** pointing to the appropriate data endpoint, e.g. `https://<prometheus host>/metrics`
- dependent items using a Prometheus preprocessing option to query required data from the metrics gathered by the master item

There are two Prometheus data preprocessing options:

- *Prometheus pattern* - used in normal items to query Prometheus data

- *Prometheus to JSON* - used in normal items and for low-level discovery. In this case queried Prometheus data are returned in a JSON format.

## Bulk processing

Bulk processing is supported for dependent items. To enable caching and indexing, the *Prometheus pattern* preprocessing must be the **first** preprocessing step. When *Prometheus pattern* is first preprocessing step then the parsed Prometheus data is cached and indexed by the first `<label>==<value>` condition in the *Prometheus pattern* preprocessing step. This cache is reused when processing other dependent items in this batch. For optimal performance, the first label should be the one with most different values.

If there is other preprocessing to be done before the first step, it should be moved either to the master item or to a new dependent item which would be used as the master item for the dependent items.

## Configuration

Providing you have the HTTP master item configured, you need to create a **dependent item** that uses a Prometheus preprocessing step:

- Enter general dependent item parameters in the configuration form
- Go to the Preprocessing tab
- Select a Prometheus preprocessing option (*Prometheus pattern* or *Prometheus to JSON*)

The following parameters are specific to the *Prometheus pattern* preprocessing option:

| Parameter      | Description  | Examples   |
|----------------|--|--|
| <i>Pattern</i> | <p>To define the required data pattern you may use a query language that is similar to Prometheus query language (see <a href="#">comparison table</a>), e.g.:</p> <p><code>&lt;metric name&gt;</code> - select by metric name</p> <p><code>{__name__="&lt;metric name&gt;"}</code> - select by metric name</p> <p><code>{__name__=~"&lt;regex&gt;"}</code> - select by metric name matching a regular expression</p> <p><code>{&lt;label name&gt;="&lt;label value&gt;","..."}</code> - select by label name</p> <p><code>{&lt;label name&gt;=~"&lt;regex&gt;","..."}</code> - select by label name matching a regular expression</p> <p><code>{__name__=~".*" }==&lt;value&gt;</code> - select by metric value</p> <p>Or a combination of the above:</p> <p><code>&lt;metric name&gt;{&lt;label1 name&gt;="&lt;label1 value&gt;",&lt;label2 name&gt;=~"&lt;regex&gt;","..." }==&lt;value&gt;</code></p> <p>Label value can be any sequence of UTF-8 characters, but the backslash, double-quote and line feed characters have to be escaped as <code>\\</code>, <code>\"</code> and <code>\n</code> respectively; other characters shall not be escaped.</p> | <pre>wmi_os_physical_memory_free_bytes cpu_usage_system{cpu="cpu-total"} cpu_usage_system{cpu=~".*"} cpu_usage_system{cpu="cpu-total",host=~".*"} wmi_service_state{name="dhcp"}==1 wmi_os_timezone{timezone=~".*"}==1</pre> |

| Parameter                | Description   | Examples                                     |
|--------------------------|---|--|
| <i>Result processing</i> | Specify whether to return the value, the label or apply the appropriate function (if the pattern matches several lines and the result needs to be aggregated):<br><b>value</b> - return metric value (error if multiple lines matched)<br><b>label</b> - return value of the label specified in the <i>Label</i> field (error if multiple metrics are matched)<br><b>sum</b> - return the sum of values<br><b>min</b> - return the minimum value<br><b>max</b> - return the maximum value<br><b>avg</b> - return the average value<br><b>count</b> - return the count of values<br>This field is only available for the <i>Prometheus pattern</i> option. | See also examples of using parameters below. |
| <i>Output</i>            | Define label name (optional). In this case the value corresponding to the label name is returned.<br>This field is only available for the <i>Prometheus pattern</i> option, if 'Label' is selected in the <i>Result processing</i> field.   |  |

## Examples of using parameters

1. The most common use case is to return the **value**. To return the value of `/var/db` from:

```
node_disk_usage_bytes{path="/var/cache"} 2.1766144e+09<br>node_disk_usage_bytes{path="/var/db"} 20480<br>node_disk_usage_bytes{path="/var/dpkg"} 8192<br>node_disk_usage_bytes{path="/var/empty"} 4096
```

use the following parameters:

- *Pattern* - `node_disk_usage_bytes{path="/var/db"}`
- *Result processing* - select 'value'

2. You may also be interested in the **average** value of all `node_disk_usage_bytes` parameters:

- *Pattern* - `node_disk_usage_bytes`
- *Result processing* - select 'avg'

3. While Prometheus supports only numerical data, it is popular to use a workaround that allows to return the relevant textual description as well. This can be accomplished with a filter and specifying the label. So, to return the value of the 'color' label from

```
elasticsearch_cluster_health_status{cluster="elasticsearch",color="green"} 1<br>elasticsearch_cluster_health_status{cluster="elasticsearch",color="yellow"} 0
```

use the following parameters:

- *Pattern* - `elasticsearch_cluster_health_status {cluster="elasticsearch"} == 1`
- *Result processing* - select 'label'
- *Label* - specify 'color'

The filter (based on the numeric value '1') will match the appropriate row, while the label will return the health status description (currently 'green'; but potentially also 'red' or 'yellow').

Prometheus to JSON

Data from Prometheus can be used for low-level discovery. In this case data in JSON format are needed and the *Prometheus to JSON* preprocessing option will return exactly that.

For more details, see [Discovery using Prometheus data](#).

Query language comparison

The following table lists differences and similarities between PromQL and Zabbix Prometheus preprocessing query language.

| PromQL instant vector selector | Zabbix Prometheus preprocessing |
|--------------------------------|---------------------------------|
| <b>Differences</b>             |                                 |

| PromQL instant vector selector                                  |  | Zabbix Prometheus preprocessing  |
|---|--|--|
| Query target  | Prometheus server                              | Plain text in Prometheus exposition format   |
| Returns   | Instant vector                                 | Metric or label value (Prometheus pattern)<br>Array of metrics for single value in JSON (Prometheus to JSON) |
| Label matching operators  | =, !=, =~, !~                                  | =, !=, =~, !~  |
| Regular expression used in label or metric name matching        | RE2  | PCRE   |
| Comparison operators  | See <a href="#">list</a>                       | Only == (equal) is supported for value filtering   |
| <b>Similarities</b>   |  |  |
| Selecting by metric name that equals string                     | <metric name> or<br>{__name__="<metric name>"} | <metric name> or<br>{__name__="<metric name>"}   |
| Selecting by metric name that matches regular expression        | {__name__=~"<regex>"}                          | {__name__=~"<regex>"}  |
| Selecting by <label name> value that equals string              | {<label name>="<label value>","...}"}          | {<label name>="<label value>","...}"}  |
| Selecting by <label name> value that matches regular expression | {<label name>=~"<regex>","...}"}               | {<label name>=~"<regex>","...}"}   |
| Selecting by value that equals string                           | {__name__=~".*"} == <value>                    | {__name__=~".*"} == <value>  |

## 18 Script items

### Overview

Script items can be used to collect data by executing a user-defined JavaScript code with the ability to retrieve data over HTTP/HTTPS. In addition to the script, an optional list of parameters (pairs of name and value) and timeout can be specified.

This item type may be useful in data collection scenarios that require multiple steps or complex logic. As an example, a Script item can be configured to make an HTTP call, then process the data received in the first step in some way, and pass transformed value to the second HTTP call.

Script items are processed by Zabbix server or proxy pollers.

### Configuration

In the *Type* field of **item configuration form** select Script then fill out required fields.

Item

Tags

Preprocessing

\* Name

Data collector script

Type

Script

\* Key

script.data.collector

Type of information

Text

Parameters

| Name     | Value        | Action |
|----------|--------------|--------|
| host     | {HOST.CONN}  | Remove |
| endpoint | {\$ENDPOINT} | Remove |
| Add      |              |        |

\* Script

var request = new HttpRequest();...

\* Timeout

3s

All mandatory input fields are marked with a red asterisk.

The fields that require specific information for Script items are:

| Field      | Description   |
|------------|---|
| Key        | Enter a unique key that will be used to identify the item.  |
| Parameters | Specify the variables to be passed to the script as the attribute and value pairs.<br><b>Built-in macros</b> {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG} and <b>user macros</b> are supported.   |
| Script     | Enter JavaScript code in the block that appears when clicking in the parameter field (or on the view/edit button next to it). This code must provide the logic for returning the metric value.<br>The code has access to all parameters, it may perform HTTP GET, POST, PUT and DELETE requests and has control over HTTP headers and request body.<br>See also: <a href="#">Additional JavaScript objects</a> , <a href="#">JavaScript Guide</a> . |
| Timeout    | JavaScript execution timeout (1-60s, default 3s); exceeding it will return error.<br>Time suffixes are supported, e.g. 30s, 1m.<br>Depending on the script it might take longer for the timeout to trigger.   |

## Examples

### Simple data collection

Collect the content of [https://www.example.com/release\\_notes](https://www.example.com/release_notes):

- Create an item with type "Script".
- In the *Script* field, enter:

```
var request = new HttpRequest();
return request.get("https://www.example.com/release_notes");
```

### Data collection with parameters

Collect the content of a specific page and make use of parameters:

- Create an item with type "Script" and two parameters:
  - **url** : **{ \$DOMAIN }** (the user macro { \$DOMAIN } should be defined, preferably on the host level)
  - **subpage** : **/release\_notes**

Item

\* Key

Select

Type of information

Text

Parameters

| Name                                 | Value                                       | Action                 |
|--------------------------------------|---|------------------------|
| <input type="text" value="url"/>     | <input type="text" value="{ \$DOMAIN }"/>   | <a href="#">Remove</a> |
| <input type="text" value="subpage"/> | <input type="text" value="/release_notes"/> | <a href="#">Remove</a> |
| <a href="#">Add</a>                  |   |                        |

\* Script

- In the *Script* field, enter:

```
var obj = JSON.parse(value);
var url = obj.url;
var subpage = obj.subpage;
var request = new HttpRequest();
return request.get(url + subpage);
```

### Multiple HTTP requests

Collect the content of both <https://www.example.com> and [https://www.example.com/release\\_notes](https://www.example.com/release_notes):

- Create an item with type "Script".
- In the *Script* field, enter:

```
var request = new HttpRequest();
return request.get("https://www.example.com") + request.get("https://www.example.com/release_notes");
```

#### Logging

Add the "Log test" entry to the Zabbix server log and receive the item value "1" in return:

- Create an item with type "Script".
- In the *Script* field, enter:

```
Zabbix.log(3, 'Log test');
return 1;
```

## 4 History and trends

### Overview

History and trends are the two ways of storing collected data in Zabbix.

Whereas history keeps each collected value, trends keep averaged information on hourly basis and therefore are less resource-hungry.

### Keeping history

You can set for how many days history will be kept:

- in the item properties **form**
- when mass-updating items
- when **setting up** housekeeper tasks

Any older data will be removed by the housekeeper.

The general strong advice is to keep history for the smallest possible number of days and that way not to overload the database with lots of historical values.

Instead of keeping a long history, you can keep longer data of trends. For example, you could keep history for 14 days and trends for 5 years.

You can get a good idea of how much space is required by history versus trends data by referring to the **database sizing page**.

While keeping shorter history, you will still be able to review older data in graphs, as graphs will use trend values for displaying older data.

#### Attention:

If history is set to '0', the item will update only dependent items and inventory. No trigger functions will be evaluated because trigger evaluation is based on history data only.

#### Note:

As an alternative way to preserve history consider to use **history export** functionality of loadable modules.

### Keeping trends

Trends is a built-in historical data reduction mechanism which stores minimum, maximum, average and the total number of values per every hour for numeric data types.

You can set for how many days trends will be kept:

- in the item properties **form**
- when mass-updating items
- when setting up Housekeeper tasks

Trends usually can be kept for much longer than history. Any older data will be removed by the housekeeper.

Zabbix server accumulates trend data in runtime in the trend cache, as the data flows in. Server flushes **previous hour** trends of every item into the database (where frontend can find them) in these situations:

- server receives the first current hour value of the item
- 5 or less minutes of the current hour left and still no current hour values of the item
- server stops

To see trends on a graph you need to wait at least to the beginning of the next hour (if item is updated frequently) and at most to the end of the next hour (if item is updated rarely), which is 2 hours maximum.

When server flushes trend cache and there are already trends in the database for this hour (for example, server has been restarted mid-hour), server needs to use update statements instead of simple inserts. Therefore on a bigger installation if restart is needed it is desirable to stop server in the end of one hour and start in the beginning of the next hour to avoid trend data overlap.

History tables do not participate in trend generation in any way.

**Attention:**

If trends are set to '0', Zabbix server does not calculate or store trends at all.

**Note:**

The trends are calculated and stored with the same data type as the original values. As a result the average value calculations of unsigned data type values are rounded and the less the value interval is the less precise the result will be. For example if item has values 0 and 1, the average value will be 0, not 0.5. Also restarting server might result in the precision loss of unsigned data type average value calculations for the current hour.

## 5 User parameters

### Overview

Sometimes you may want to run an agent check that does not come predefined with Zabbix. This is where user parameters come to help.

You may write a command that retrieves the data you need and include it in the user parameter in the **agent configuration file** ('UserParameter' configuration parameter).

A user parameter has the following syntax:

`UserParameter=<key>,<command>`

As you can see, a user parameter also contains a key. The key will be necessary when configuring an item. Enter a key of your choice that will be easy to reference (it must be unique within a host).

Restart the agent or use the agent **runtime control** option to pick up the new parameter, e. g.:

```
zabbix_agentd -R userparameter_reload
```

Then, when **configuring an item**, enter the key to reference the command from the user parameter you want executed.

User parameters are commands executed by Zabbix agent. Note that up to 16MB of data can be returned before **item value preprocessing** steps.

**/bin/sh** is used as a command line interpreter under UNIX operating systems. User parameters obey the agent check timeout; if timeout is reached the forked user parameter process is terminated.

See also:

- **Step-by-step tutorial** on making use of user parameters
- **Command execution**

### Examples of simple user parameters

A simple command:

```
UserParameter=ping,echo 1
```

The agent will always return '1' for an item with 'ping' key.

A more complex example:

```
UserParameter=mysql.ping,mysqladmin -uroot ping | grep -c alive
```

The agent will return '1', if MySQL server is alive, '0' - otherwise.

### Flexible user parameters

Flexible user parameters accept parameters with the key. This way a flexible user parameter can be the basis for creating several items.

Flexible user parameters have the following syntax:

UserParameter=key[\*],command

| Parameter      | Description  |
|----------------|--|
| <b>Key</b>     | Unique item key. The [*] defines that this key accepts parameters within the brackets. Parameters are given when configuring the item.   |
| <b>Command</b> | Command to be executed to evaluate value of the key.<br><i>For flexible user parameters only:</i><br>You may use positional references \$1...\$9 in the command to refer to the respective parameter in the item key.<br>Zabbix parses the parameters enclosed in [ ] of the item key and substitutes \$1,...,\$9 in the command accordingly.<br>\$0 will be substituted by the original command (prior to expansion of \$0,...,\$9) to be run.<br>Positional references are interpreted regardless of whether they are enclosed between double (") or single (') quotes.<br>To use positional references unaltered, specify a double dollar sign - for example, awk '{print \$\$2}'. In this case \$\$2 will actually turn into \$2 when executing the command. |

**Attention:**

Positional references with the \$ sign are searched for and replaced by Zabbix agent only for flexible user parameters. For simple user parameters, such reference processing is skipped and, therefore, any \$ sign quoting is not necessary.

**Attention:**

Certain symbols are not allowed in user parameters by default. See [UnsafeUserParameters](#) documentation for a full list.

Example 1

Something very simple:

UserParameter=ping[\*],echo \$1

We may define unlimited number of items for monitoring all having format ping[something].

- ping[0] - will always return '0'
- ping[aaa] - will always return 'aaa'

Example 2

Let's add more sense!

UserParameter=mysql.ping[\*],mysqladmin -u\$1 -p\$2 ping | grep -c alive

This parameter can be used for monitoring availability of MySQL database. We can pass user name and password:

mysql.ping[zabbix,our\_password]

Example 3

How many lines matching a regular expression in a file?

UserParameter=wc[\*],grep -c "\$2" \$1

This parameter can be used to calculate number of lines in a file.

wc[/etc/passwd,root]

wc[/etc/services,zabbix]

Command result

The return value of the command is a standard output together with a standard error produced by the command.

**Attention:**

An item that returns text (character, log, or text type of information) will not become unsupported in case of a standard error output.

The return value is limited to 16MB (including trailing whitespace that is truncated); [database limits](#) also apply.

User parameters that return text (character, log, or text type of information) can also return a whitespace. In case of an invalid result, the item will become unsupported.

## 1 Extending Zabbix agents

This tutorial provides step-by-step instructions on how to extend the functionality of Zabbix agent with the use of a [user parameter](#).

### Step 1

Write a script or command line to retrieve required parameter.

For example, we may write the following command in order to get total number of queries executed by a MySQL server:

```
mysqladmin -uroot status | cut -f4 -d":" | cut -f1 -d"S"
```

When executed, the command returns total number of SQL queries.

### Step 2

Add the command to `zabbix_agentd.conf`:

```
UserParameter=mysql.questions,mysqladmin -uroot status | cut -f4 -d":" | cut -f1 -d"S"
```

**mysql.questions** is a unique identifier. It can be any valid key identifier, for example, *queries*.

Test this parameter by using Zabbix agent with `-t` flag (if running under root, however, note that the agent may have different permissions when launched as a daemon):

```
zabbix_agentd -t mysql.questions
```

### Step 3

Reload user parameters from the configuration file by running:

```
zabbix_agentd -R userparameter_reload
```

You may also restart the agent instead of the runtime control command.

Test the parameter by using [zabbix\\_get](#) utility.

### Step 4

Add new item with `Key=mysql.questions` to the monitored host. Type of the item must be either Zabbix Agent or Zabbix Agent (active).

Be aware that type of returned values must be set correctly on Zabbix server. Otherwise Zabbix won't accept them.

## 6 Loadable modules

### 1 Overview

Loadable modules offer a performance-minded option for extending Zabbix functionality.

There already are ways of extending Zabbix functionality by way of:

- [user parameters](#) (agent metrics)
- [external checks](#) (agent-less monitoring)
- `system.run []` Zabbix [agent item](#).

They work very well, but have one major drawback, namely `fork()`. Zabbix has to fork a new process every time it handles a user metric, which is not good for performance. It is not a big deal normally, however it could be a serious issue when monitoring embedded systems, having a large number of monitored parameters or heavy scripts with complex logic or long startup time.

Support of loadable modules offers ways for extending Zabbix agent, server and proxy without sacrificing performance.

A loadable module is basically a shared library used by Zabbix daemon and loaded on startup. The library should contain certain functions, so that a Zabbix process may detect that the file is indeed a module it can load and work with.

Loadable modules have a number of benefits. Great performance and ability to implement any logic are very important, but perhaps the most important advantage is the ability to develop, use and share Zabbix modules. It contributes to trouble-free maintenance and helps to deliver new functionality easier and independently of the Zabbix core code base.

Module licensing and distribution in binary form is governed by the GPL license (modules are linking with Zabbix in runtime and are using Zabbix headers; currently the whole Zabbix code is licensed under GPL license). Binary compatibility is not guaranteed by Zabbix.

Module API stability is guaranteed during one Zabbix LTS (Long Term Support) [release](#) cycle. Stability of Zabbix API is not guaranteed (technically it is possible to call Zabbix internal functions from a module, but there is no guarantee that such modules will work).

## 2 Module API

In order for a shared library to be treated as a Zabbix module, it should implement and export several functions. There are currently six functions in the Zabbix module API, only one of which is mandatory and the other five are optional.

### 2.1 Mandatory interface

The only mandatory function is **zbx\_module\_api\_version()**:

```
int zbx_module_api_version(void);
```

This function should return the API version implemented by this module and in order for the module to be loaded this version must match module API version supported by Zabbix. Version of module API supported by Zabbix is ZBX\_MODULE\_API\_VERSION. So this function should return this constant. Old constant ZBX\_MODULE\_API\_VERSION\_ONE used for this purpose is now defined to equal ZBX\_MODULE\_API\_VERSION to preserve source compatibility, but it's usage is not recommended.

### 2.2 Optional interface

The optional functions are **zbx\_module\_init()**, **zbx\_module\_item\_list()**, **zbx\_module\_item\_timeout()**, **zbx\_module\_history\_write\_cbs()** and **zbx\_module\_uninit()**:

```
int zbx_module_init(void);
```

This function should perform the necessary initialization for the module (if any). If successful, it should return ZBX\_MODULE\_OK. Otherwise, it should return ZBX\_MODULE\_FAIL. In the latter case Zabbix will not start.

```
ZBX_METRIC *zbx_module_item_list(void);
```

This function should return a list of items supported by the module. Each item is defined in a ZBX\_METRIC structure, see the section below for details. The list is terminated by a ZBX\_METRIC structure with "key" field of NULL.

```
void zbx_module_item_timeout(int timeout);
```

If module exports **zbx\_module\_item\_list()** then this function is used by Zabbix to specify the timeout settings in Zabbix configuration file that the item checks implemented by the module should obey. Here, the "timeout" parameter is in seconds.

```
ZBX_HISTORY_WRITE_CBS zbx_module_history_write_cbs(void);
```

This function should return callback functions Zabbix server will use to export history of different data types. Callback functions are provided as fields of ZBX\_HISTORY\_WRITE\_CBS structure, fields can be NULL if module is not interested in the history of certain type.

```
int zbx_module_uninit(void);
```

This function should perform the necessary uninitialization (if any) like freeing allocated resources, closing file descriptors, etc.

All functions are called once on Zabbix startup when the module is loaded, with the exception of zbx\_module\_uninit(), which is called once on Zabbix shutdown when the module is unloaded.

### 2.3 Defining items

Each item is defined in a ZBX\_METRIC structure:

```
typedef struct
{
    char      *key;
    unsigned   flags;
    int       (*function)();
    char      *test_param;
}
ZBX_METRIC;
```

Here, **key** is the item key (e.g., "dummy.random"), **flags** is either CF\_HAVEPARAMS or 0 (depending on whether the item accepts parameters or not), **function** is a C function that implements the item (e.g., "zbx\_module\_dummy\_random"), and **test\_param** is the parameter list to be used when Zabbix agent is started with the "-p" flag (e.g., "1,1000", can be NULL). An example definition may look like this:

```
static ZBX_METRIC keys[] =
{
    { "dummy.random", CF_HAVEPARAMS, zbx_module_dummy_random, "1,1000" },
    { NULL }
}
```

Each function that implements an item should accept two pointer parameters, the first one of type AGENT\_REQUEST and the second one of type AGENT\_RESULT:

```
int zbx_module_dummy_random(AGENT_REQUEST *request, AGENT_RESULT *result)
{
    ...

    SET_UI64_RESULT(result, from + rand() % (to - from + 1));

    return SYSINFO_RET_OK;
}
```

These functions should return SYSINFO\_RET\_OK, if the item value was successfully obtained. Otherwise, they should return SYSINFO\_RET\_FAIL. See example "dummy" module below for details on how to obtain information from AGENT\_REQUEST and how to set information in AGENT\_RESULT.

## 2.4 Providing history export callbacks

### Attention:

History export via module is no longer supported by Zabbix proxy since Zabbix 4.0.0.

Module can specify functions to export history data by type: Numeric (float), Numeric (unsigned), Character, Text and Log:

```
typedef struct
{
    void (*history_float_cb)(const ZBX_HISTORY_FLOAT *history, int history_num);
    void (*history_integer_cb)(const ZBX_HISTORY_INTEGER *history, int history_num);
    void (*history_string_cb)(const ZBX_HISTORY_STRING *history, int history_num);
    void (*history_text_cb)(const ZBX_HISTORY_TEXT *history, int history_num);
    void (*history_log_cb)(const ZBX_HISTORY_LOG *history, int history_num);
}
ZBX_HISTORY_WRITE_CB;
```

Each of them should take "history" array of "history\_num" elements as arguments. Depending on history data type to be exported, "history" is an array of the following structures, respectively:

```
typedef struct
{
    zbx_uint64_t itemid;
    int clock;
    int ns;
    double value;
}
ZBX_HISTORY_FLOAT;
```

```
typedef struct
{
    zbx_uint64_t itemid;
    int clock;
    int ns;
    zbx_uint64_t value;
}
ZBX_HISTORY_INTEGER;
```

```
typedef struct
{
    zbx_uint64_t itemid;
    int clock;
    int ns;
    const char *value;
}
ZBX_HISTORY_STRING;
```

```
typedef struct
{
```

```

    zbx_uint64_t    itemid;
    int            clock;
    int            ns;
    const char     *value;
}
ZBX_HISTORY_TEXT;

typedef struct
{
    zbx_uint64_t    itemid;
    int            clock;
    int            ns;
    const char     *value;
    const char     *source;
    int            timestamp;
    int            logeventid;
    int            severity;
}
ZBX_HISTORY_LOG;

```

Callbacks will be used by Zabbix server history syncer processes in the end of history sync procedure after data is written into Zabbix database and saved in value cache.

#### Attention:

In case of internal error in history export module it is recommended that module is written in such a way that it does not block whole monitoring until it recovers but discards data instead and allows Zabbix server to continue running.

## 2.5 Building modules

Modules are currently meant to be built inside Zabbix source tree, because the module API depends on some data structures that are defined in Zabbix headers.

The most important header for loadable modules is **include/module.h**, which defines these data structures. Other necessary system headers that help **include/module.h** to work properly are **stdlib.h** and **stdint.h**.

With this information in mind, everything is ready for the module to be built. The module should include **stdlib.h**, **stdint.h** and **module.h**, and the build script should make sure that these files are in the include path. See example "dummy" module below for details.

Another useful header is **include/log.h**, which defines **zabbix\_log()** function, which can be used for logging and debugging purposes.

## 3 Configuration parameters

Zabbix agent, server and proxy support two **parameters** to deal with modules:

- LoadModulePath – full path to the location of loadable modules
- LoadModule – module(s) to load at startup. The modules must be located in a directory specified by LoadModulePath or the path must precede the module name. If the preceding path is absolute (starts with '/') then LoadModulePath is ignored. It is allowed to include multiple LoadModule parameters.

For example, to extend Zabbix agent we could add the following parameters:

```

LoadModulePath=/usr/local/lib/zabbix/agent/
LoadModule=mariadb.so
LoadModule=apache.so
LoadModule=kernel.so
LoadModule=/usr/local/lib/zabbix/dummy.so

```

Upon agent startup it will load the mariadb.so, apache.so and kernel.so modules from the /usr/local/lib/zabbix/agent directory while dummy.so will be loaded from /usr/local/lib/zabbix. The agent will fail to start if a module is missing, in case of bad permissions or if a shared library is not a Zabbix module.

## 4 Frontend configuration

Loadable modules are supported by Zabbix agent, server and proxy. Therefore, item type in Zabbix frontend depends on where the module is loaded. If the module is loaded into the agent, then the item type should be "Zabbix agent" or "Zabbix agent (active)". If the module is loaded into server or proxy, then the item type should be "Simple check".

History export through Zabbix modules does not need any frontend configuration. If the module is successfully loaded by server and provides **zbx\_module\_history\_write\_cbs()** function which returns at least one non-NULL callback function then history export will be enabled automatically.

## 5 Dummy module

Zabbix includes a sample module written in C language. The module is located under `src/modules/dummy`:

```
alex@alex:~trunk/src/modules/dummy$ ls -l
-rw-rw-r-- 1 alex alex 9019 Apr 24 17:54 dummy.c
-rw-rw-r-- 1 alex alex  67 Apr 24 17:54 Makefile
-rw-rw-r-- 1 alex alex 245 Apr 24 17:54 README
```

The module is well documented, it can be used as a template for your own modules.

After `./configure` has been run in the root of Zabbix source tree as described above, just run **make** in order to build **dummy.so**.

}

/*****
 *
 * Function: zbx_module_history_write_cbs
 *
 * Purpose: returns a set of module functions Zabbix will call to export
 *          different types of historical data
 *
 * Return value: structure with callback function pointers (can be NULL if
 *              module is not interested in data of certain types)
 *
 *****/
ZBX_HISTORY_WRITE_CBS    zbx_module_history_write_cbs(void)
{
    static ZBX_HISTORY_WRITE_CBS    dummy_callbacks =
    {
        dummy_history_float_cb,
        dummy_history_integer_cb,
        dummy_history_string_cb,
        dummy_history_text_cb,
        dummy_history_log_cb,
    };

    return dummy_callbacks;
}

```

The module exports three new items:

- `dummy.ping` - always returns '1'
- `dummy.echo[param1]` - returns the first parameter as it is, for example, `dummy.echo[ABC]` will return ABC
- `dummy.random[param1, param2]` - returns a random number within the range of param1-param2, for example, `dummy.random[1,1000000]`

## 6 Limitations

Support of loadable modules is implemented for the Unix platform only. It means that it does not work for Windows agents.

In some cases a module may need to read module-related configuration parameters from `zabbix_agentd.conf`. It is not supported currently. If you need your module to use some configuration parameters you should probably implement parsing of a module-specific configuration file.

## 7 Windows performance counters

### Overview

You can effectively monitor Windows performance counters using the `perf_counter[]` key.

For example:

```
perf_counter["\Processor(0)\Interrupts/sec"]
```

or

```
perf_counter["\Processor(0)\Interrupts/sec", 10]
```

For more information on using this key or its English-only equivalent `perf_counter_en`, see [Windows-specific item keys](#).

In order to get a full list of performance counters available for monitoring, you may run:

```
typeperf -qx
```

You may also use low-level discovery to discover multiple [object instances](#) of Windows performance counters and automate the creation of `perf_counter` items for multiple instance objects.

### Numeric representation

Windows maintains numeric representations (indexes) for object and performance counter names. Zabbix supports these numeric representations as parameters to the `perf_counter`, `perf_counter_en` item keys and in `PerfCounter`, `PerfCounterEn` configuration parameters.

However, it's not recommended to use them unless you can guarantee your numeric indexes map to correct strings on specific hosts. If you need to create portable items that work across different hosts with various localized Windows versions, you can use the `perf_counter_en` key or `PerfCounterEn` configuration parameter which allow to use English names regardless of system locale.

To find out the numeric equivalents, run **regedit**, then find `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib\00000000`

The registry entry contains information like this:

```
1
1847
2
System
4
Memory
6
% Processor Time
10
File Read Operations/sec
12
File Write Operations/sec
14
File Control Operations/sec
16
File Read Bytes/sec
18
File Write Bytes/sec
....
```

Here you can find the corresponding numbers for each string part of the performance counter, like in '`\System\% Processor Time`':

System → 2

% Processor Time → 6

Then you can use these numbers to represent the path in numbers:

\2\6

Performance counter parameters

You can deploy some PerfCounter parameters for the monitoring of Windows performance counters.

For example, you can add these to the Zabbix agent configuration file:

```
PerfCounter=UserPerfCounter1,"\Memory\Page Reads/sec",30
or
PerfCounter=UserPerfCounter2,"4\24",30
```

With such parameters in place, you can then simply use *UserPerfCounter1* or *UserPerfCounter2* as the keys for creating the respective items.

Remember to restart Zabbix agent after making changes to the configuration file.

## 8 Mass update

Overview

Sometimes you may want to change some attribute for a number of items at once. Instead of opening each individual item for editing, you may use the mass update function for that.

Using mass update

To mass-update some items, do the following:

- Mark the checkboxes of the items to update in the list
- Click on *Mass update* below the list
- Navigate to the tab with required attributes (*Item*, *Tags* or *Preprocessing*)
- Mark the checkboxes of the attributes to update
- Enter new values for the attributes

Add

The *Tags* option allows to:

- *Add* - add specified tags to the items (tags with the same name, but different values are not considered 'duplicates' and can be added to the same item).
- *Replace* - remove the specified tags and add tags with new values
- *Remove* - remove specified tags from the items

User macros, {INVENTORY.\*} macros, {HOST.HOST}, {HOST.NAME}, {HOST.CONN}, {HOST.DNS}, {HOST.IP}, {HOST.PORT} and {HOST.ID} macros are supported in tags.

Add

The *Preprocessing* option allows to **replace** the existing preprocessing steps on the items with the steps that are specified here. When done, click on *Update*.

## 9 Value mapping

### Overview

Value mapping allows configuring a more user-friendly representation of received values using mappings between numeric/string values and string representations.

For example, when an item's value is "0" or "1," value mappings can be used to represent these values in a more user-friendly manner:

- 0 → Not Available
- 1 → Available

Value mappings for data backup types could be configured as follows:

- F → Full
- D → Differential

- I → Incremental

Value ranges for voltage could be configured as follows:

- <=209 → Low
- 210-230 → OK
- >=231 → High

Value mapping is used in Zabbix frontend and notifications sent by media types.

**Attention:**

Substitution of the received value with the configured representation is performed both in Zabbix frontend and server; however, the server handles substitution only in the following cases:<br><br>

- when populating **host inventory**;
- when expanding **supported macros** {ITEM.VALUE}, {ITEM.LASTVALUE}, and {EVENT.OPDATA}.

Value mappings are set up on templates or hosts. Once configured, they are available for all items within the respective template or host. When **configuring items**, specify the name of a previously configured value mapping in the *Value mapping* parameter.

**Note:**

There is no value map inheritance - hosts and templates do not inherit value mappings from linked templates. Template items on a host will continue to use the value mappings configured on the template.

**Note:**

Value mappings can be used with items having *Numeric (unsigned)*, *Numeric (float)*, and *Character* types of information.

Value mappings are exported/imported with the respective template or host. They can also be mass-updated using the **host** and **template** mass update forms.

Configuration

To configure a value mapping, follow these steps:

1. Open the host or template configuration form.
2. In the *Value mapping* tab, click **Add** to add a new value mapping, or click on the name of an existing mapping to edit it.

### Value mapping

\* Name

\* Mappings

| Type  | Value                          | Mapped to  |
|---|--------------------------------|--|
| <div>⋮</div> <div>equals</div> <div>▼</div> | <input type="text" value="0"/> | <div>⇒</div> <input type="text" value="gray"/>   |
| <div>⋮</div> <div>equals</div> <div>▼</div> | <input type="text" value="1"/> | <div>⇒</div> <input type="text" value="green"/>  |
| <div>⋮</div> <div>equals</div> <div>▼</div> | <input type="text" value="2"/> | <div>⇒</div> <input type="text" value="yellow"/> |
| <div>⋮</div> <div>equals</div> <div>▼</div> | <input type="text" value="3"/> | <div>⇒</div> <input type="text" value="red"/>    |

Add

⋮

Update

Parameters of a value mapping:

| Parameter   | Description                                |
|-------------|--|
| <i>Name</i> | Unique name for the set of value mappings. |

| Parameter        | Description   |
|------------------|---|
| <i>Mappings</i>  | Individual rules for mapping numeric/string values to string representations.   |
| <i>Type</i>      | <p>Mapping is applied in the order of the rules that can be reordered by dragging.</p> <p>Mapping type:</p> <p><b>equals</b> - equal values will be mapped;</p> <p><b>is greater than or equals</b> - equal or greater values will be mapped;</p> <p><b>is less than or equals</b> - equal or smaller values will be mapped;</p> <p><b>in range</b> - values in range will be mapped; the range is expressed as &lt;number1&gt;-&lt;number2&gt; or &lt;number&gt;; multiple ranges are supported (for example, 1-10,101-110,201);</p> <p><b>regexp</b> - values corresponding to the <b>regular expression</b> will be mapped (global regular expressions are not supported);</p> <p><b>default</b> - all outstanding values will be mapped, other than those with specific mappings.</p> <p>For mapping ranges, only numeric value types (<i>is greater than or equals</i>, <i>is less than or equals</i>, <i>in range</i>) are supported.</p> |
| <i>Value</i>     | Incoming value (may contain a range or regular expression, depending on the mapping type).  |
| <i>Mapped to</i> | String representation (up to 64 characters) for the incoming value.   |

All mandatory input fields are marked with a red asterisk.

When viewing the value mapping in the list, only the first three mappings are visible, with three dots indicating that more mappings exist.

Template

Linked templates

Tags

Macros 4

Value mapping 1

| Name          | Value  |
|---------------|--|
| VMware status | <div>=0 ⇒ gray</div> <div>=1 ⇒ green</div> <div>=2 ⇒ yellow</div> <div>...</div> |

Add

Value mapping example

One of the predefined agent items *Zabbix agent ping* uses a template-level value mapping "Zabbix agent ping status" to display its values.

### Value mapping

\* Name

\* Mappings

| Type   | Value                          | Mapped to                         |
|--|--------------------------------|-----------------------------------|
| <div>⋮</div> <input type="text" value="equals"/> | <input type="text" value="1"/> | ⇒ <input type="text" value="Up"/> |

In the item **configuration form**, you can find a reference to this value mapping in the *Value mapping* field:

Value mapping

×

Select

This mapping is used in the *Monitoring* → *Latest data* section to display "Up" (with the raw value in parentheses).

| ▼ <input type="checkbox"/> Host ▲ | Name                      | Last check             | Last value |
|-----------------------------------|---------------------------|------------------------|------------|
| ▼ Zabbix server                   | Monitoring agent (1 item) |                        |            |
| <input type="checkbox"/>          | Zabbix agent ping ?       | 02/23/2021 04:27:07 PM | Up (1)     |

**Note:**

In the *Latest data* section, displayed values are shortened to 20 symbols. If value mapping is used, this shortening is not applied to the mapped value but only to the raw value (displayed in parentheses).

Without a predefined value mapping, you would only see "1", which might be challenging to understand.

| ▼ <input type="checkbox"/> Host ▲ | Name                      | Last check             | Last value |
|-----------------------------------|---------------------------|------------------------|------------|
| ▼ Zabbix server                   | Monitoring agent (1 item) |                        |            |
| <input type="checkbox"/>          | Zabbix agent ping ?       | 02/23/2021 06:00:07 PM | 1          |

## 10 Queue

### Overview

The queue displays items that are waiting for a refresh. The queue is just a **logical** representation of data. There is no IPC queue or any other queue mechanism in Zabbix.

Items monitored by proxies are also included in the queue - they will be counted as queued for the proxy history data update period.

Only items with scheduled refresh times are displayed in the queue. This means that the following item types are excluded from the queue:

- log, logrt and event log active Zabbix agent items
- SNMP trap items
- trapper items
- web monitoring items
- dependent items

Statistics shown by the queue is a good indicator of the performance of Zabbix server.

The queue is retrieved directly from Zabbix server using JSON protocol. The information is available only if Zabbix server is running.

**Attention:**

Items are not counted in the queue if the item interface becomes unavailable due to connection problems or agent not working properly.

### Reading the queue

To read the queue, go to *Administration* → *Queue*.

| Queue overview ▼      |           |            |            |          |           |                      |
|-----------------------|-----------|------------|------------|----------|-----------|----------------------|
| Items                 | 5 seconds | 10 seconds | 30 seconds | 1 minute | 5 minutes | More than 10 minutes |
| Zabbix agent          | 1         | 11         | 1          | 0        | 0         | 0                    |
| Zabbix agent (active) | 0         | 0          | 0          | 0        | 0         | 0                    |
| Simple check          | 0         | 0          | 0          | 0        | 0         | 0                    |
| SNMPv1 agent          | 0         | 0          | 0          | 0        | 0         | 0                    |
| SNMPv2 agent          | 0         | 0          | 0          | 0        | 0         | 0                    |
| SNMPv3 agent          | 0         | 0          | 0          | 0        | 0         | 0                    |
| Zabbix internal       | 0         | 0          | 0          | 0        | 0         | 0                    |
| Zabbix aggregate      | 0         | 0          | 0          | 0        | 0         | 0                    |
| External check        | 0         | 0          | 0          | 0        | 0         | 0                    |
| Database monitor      | 0         | 0          | 0          | 0        | 0         | 0                    |
| HTTP agent            | 0         | 0          | 0          | 0        | 0         | 0                    |

The picture here is generally "ok" so we may assume that the server is doing fine.

The queue shows some items waiting up to 30 seconds. It would be great to know what items these are. To do just that, select *Queue details* in the title dropdown. Now you can see a list of those delayed items.

☰ Queue details ▾

| Scheduled check     | Delayed by | Host    | Name               | Proxy        |
|---------------------|------------|---------|--------------------|--------------|
| 2019-09-02 11:46:40 | 58s        | My host | CPU idle time      | Remote proxy |
| 2019-09-02 11:46:41 | 57s        | My host | CPU interrupt time | Remote proxy |
| 2019-09-02 11:46:42 | 56s        | My host | CPU iowait time    | Remote proxy |
| 2019-09-02 11:46:43 | 55s        | My host | CPU nice time      | Remote proxy |
| 2019-09-02 11:46:44 | 54s        | My host | CPU softirq time   | Remote proxy |
| 2019-09-02 11:46:45 | 53s        | My host | CPU steal time     | Remote proxy |
| 2019-09-02 11:46:46 | 52s        | My host | CPU system time    | Remote proxy |

With these details provided it may be possible to find out why these items might be delayed. With one or two delayed items there perhaps is no cause for alarm. They might get updated in a second. However, if you see a bunch of items getting delayed for too long, there might be a more serious problem.

**See also:** Aligning time zones when using [scheduling intervals](#).

Queue item

A special internal item **zabbix[queue,<from>,<to>]** can be used to monitor the health of the queue in Zabbix. It will return the number of items delayed by the set amount of time. For more information see [Internal items](#).

11 Value cache

Overview

To make the calculation of trigger expressions, calculated items and some macros much faster, a value cache option is supported by the Zabbix server.

This in-memory cache can be used for accessing historical data, instead of making direct SQL calls to the database. If historical values are not present in the cache, the missing values are requested from the database and the cache updated accordingly.

To enable the value cache functionality, an optional **ValueCacheSize** parameter is supported by the Zabbix server [configuration](#) file.

Two internal items are supported for monitoring the value cache: **zabbix[vcache,buffer,<mode>]** and **zabbix[vcache,cache,<parameter>]**. See more details with [internal items](#).

12 Execute now

Overview

Checking for a new item value in Zabbix is a cyclic process that is based on configured update intervals. While for many items the update intervals are quite short, there are others (including low-level discovery rules) for which the update intervals are quite long, so in real-life situations there may be a need to check for a new value quicker - to pick up changes in discoverable resources, for example. To accommodate such a necessity, it is possible to reschedule a passive check and retrieve a new value immediately.

This functionality is supported for **passive** checks only. The following item types are supported:

- Zabbix agent (passive)
- SNMPv1/v2/v3 agent
- IPMI agent
- Simple check
- Zabbix internal
- External check
- Database monitor
- JMX agent
- SSH agent
- Telnet
- Calculated
- HTTP agent
- Script

**Attention:**

The check must be present in the configuration cache in order to get executed; for more information see [CacheUpdateFrequency](#). Before executing the check, the configuration cache is **not** updated, thus very recent changes to item/discovery rule configuration will not be picked up. Therefore, it is also not possible to check for a new value for an item/rule that is being created or has been created just now; use the *Test* option while configuring an item for that.

## Configuration

To execute a passive check immediately:

- click on *Execute now* in an existing item (or discovery rule) configuration form:

- click on *Execute now* for selected items/rules in the list of items/discovery rules:

In the latter case several items/rules can be selected and "executed now" at once.

## 13 Restricting agent checks

### Overview

It is possible to restrict checks on the agent side by creating an item blacklist, a whitelist, or a combination of whitelist/blacklist.

To do that use a combination of two agent [configuration](#) parameters:

- AllowKey=<pattern> - which checks are allowed; <pattern> is specified using a wildcard (\*) expression
- DenyKey=<pattern> - which checks are denied; <pattern> is specified using a wildcard (\*) expression

Note that:

- All `system.run[*]` items (remote commands, scripts) are disabled by default, even when no deny keys are specified;
- Since Zabbix 5.0.2 the `EnableRemoteCommands` agent parameter is:
  - deprecated by Zabbix agent
  - unsupported by Zabbix agent2

Therefore, to allow remote commands, specify an `AllowKey=system.run[<command>,*]` for each allowed command, `*` stands for wait and nowait mode. It is also possible to specify `AllowKey=system.run[*]` parameter to allow all commands with wait and nowait modes. To disallow specific remote commands, add `DenyKey` parameters with `system.run[]` commands before the `AllowKey=system.run[*]` parameter.

Important rules

- A whitelist without a deny rule is only allowed for `system.run[*]` items. For all other items, `AllowKey` parameters are not allowed without a `DenyKey` parameter; in this case Zabbix agent **will not start** with only `AllowKey` parameters.
- The order matters. The specified parameters are checked one by one according to their appearance order in the configuration file:
  - As soon as an item key matches an allow/deny rule, the item is either allowed or denied; and rule checking stops. So if an item matches both an allow rule and a deny rule, the result will depend on which rule comes first.
  - The order affects also `EnableRemoteCommands` parameter (if used).
- Unlimited numbers of `AllowKey`/`DenyKey` parameters is supported.
- `AllowKey`, `DenyKey` rules do not affect `HostnameItem`, `HostMetadataItem`, `HostInterfaceItem` configuration parameters.
- Key pattern is a wildcard expression where the wildcard (`*`) character matches any number of any characters in certain position. It might be used in both the key name and parameters.
- If a specific item key is disallowed in the agent configuration, the item will be reported as unsupported (no hint is given as to the reason);
- Zabbix agent with `--print (-p)` command line option will not show keys that are not allowed by configuration;
- Zabbix agent with `--test (-t)` command line option will return "Unsupported item key." status for keys that are not allowed by configuration;
- Denied remote commands will not be logged in the agent log (if `LogRemoteCommands=1`).

Use cases

Deny specific check

- Blacklist a specific check with `DenyKey` parameter. Matching keys will be disallowed. All non-matching keys will be allowed, except `system.run[]` items.

For example:

```
# Deny secure data access
DenyKey=vfs.file.contents[/etc/passwd,*]
```

**Attention:**

A blacklist may not be a good choice, because a new Zabbix version may have new keys that are not explicitly restricted by the existing configuration. This could cause a security flaw.

Deny specific command, allow others

- Blacklist a specific command with `DenyKey` parameter. Whitelist all other commands, with the `AllowKey` parameter.

```
# Disallow specific command
DenyKey=system.run[ls -l /]
```

```
# Allow other scripts
AllowKey=system.run[*]
```

Allow specific check, deny others

- Whitelist specific checks with `AllowKey` parameters, deny others with `DenyKey=*`

For example:

```
# Allow reading logs:
AllowKey=vfs.file.*[/var/log/*]
```

```
# Allow localtime checks
AllowKey=system.localtime[*]
```

# Deny all other keys

DenyKey=\*

Pattern examples

| Pattern  | Description   | Matches  | No match  |
|--|---|--|---|
| *  | Matches all possible keys with or without parameters.   | Any  | None  |
| <i>vfs.file.contents</i>                                 | Matches <i>vfs.file.contents</i> without parameters.  | <i>vfs.file.contents</i>   | <i>vfs.file.contents[/etc/passwd]</i>   |
| <i>vfs.file.contents[]</i>                               | Matches <i>vfs.file.contents</i> with empty parameters.   | <i>vfs.file.contents[]</i>   | <i>vfs.file.contents</i>  |
| <i>vfs.file.contents[*]</i>                              | Matches <i>vfs.file.contents</i> with any parameters; will not match <i>vfs.file.contents</i> without square brackets.  | <i>vfs.file.contents[]</i><br><i>vfs.file.contents[/path/to/file]</i>  | <i>vfs.file.contents</i>  |
| <i>vfs.file.contents[/etc/passwd]</i>                    | Matches <i>vfs.file.contents</i> with first parameters matching <i>/etc/passwd</i> and all other parameters having any value (also empty).                                      | <i>vfs.file.contents[/etc/passwd]</i><br><i>vfs.file.contents[/etc/passwd,utf8]</i>  | <i>vfs.file.contents[/etc/passwd]</i><br><i>vfs.file.contents[/var/log/zabbix_...]</i><br><i>vfs.file.contents[]</i>      |
| <i>vfs.file.contents[*passwd]</i>                        | Matches <i>vfs.file.contents</i> with first parameter matching <i>*passwd*</i> and no other parameters.   | <i>vfs.file.contents[/etc/passwd]</i><br><i>vfs.file.contents[/etc/passwd,utf8]</i>  | <i>vfs.file.contents[/etc/passwd,]</i><br><i>vfs.file.contents[/etc/passwd,utf8]</i>                                      |
| <i>vfs.file.contents[*passwd*]</i>                       | Matches <i>vfs.file.contents</i> with only first parameter matching <i>*passwd*</i> and all following parameters having any value (also empty).                                 | <i>vfs.file.contents[/etc/passwd]</i><br><i>vfs.file.contents[/etc/passwd,utf8]</i><br><i>vfs.file.contents[/tmp/test]</i> | <i>vfs.file.contents[/etc/passwd]</i><br><i>vfs.file.contents[/etc/passwd,utf8]</i>                                       |
| <i>vfs.file.contents[/var/log/zabbix_server.log,abc]</i> | Matches <i>vfs.file.contents</i> with first parameter matching <i>/var/log/zabbix_server.log</i> , third parameter matching <i>'abc'</i> and any (also empty) second parameter. | <i>vfs.file.contents[/var/log/zabbix_server.log,log]</i><br><i>vfs.file.contents[/var/log/zabbix_server.log,utf8,abc]</i>  | <i>vfs.file.contents[/var/log/zabbix_server.log,log]</i><br><i>vfs.file.contents[/var/log/zabbix_server.log,utf8,abc]</i> |
| <i>vfs.file.contents[/etc/passwd,utf8]</i>               | Matches <i>vfs.file.contents</i> with first parameter matching <i>/etc/passwd</i> , second parameter matching <i>'utf8'</i> and no other arguments.                             | <i>vfs.file.contents[/etc/passwd,utf8]</i><br><i>vfs.file.contents[/etc/passwd,]</i>                                       | <i>vfs.file.contents[/etc/passwd,]</i><br><i>vfs.file.contents[/etc/passwd,utf1]</i>                                      |
| <i>vfs.file.*</i>  | Matches any keys starting with <i>vfs.file.</i> without any parameters.   | <i>vfs.file.contents</i><br><i>vfs.file.size</i>   | <i>vfs.file.contents[]</i><br><i>vfs.file.size[/var/log/zabbix_server.log]</i>  |
| <i>vfs.file.*[*]</i>                                     | Matches any keys starting with <i>vfs.file.</i> with any parameters.  | <i>vfs.file.size.bytes[]</i><br><i>vfs.file.size[/var/log/zabbix_server.log,utf8]</i>                                      | <i>vfs.file.size.bytes</i><br><i>vfs.file.size[/var/log/zabbix_server.log,utf8]</i>                                       |
| <i>vfs.*.contents</i>                                    | Matches any key starting with <i>vfs.</i> and ending with <i>.contents</i> without any parameters.  | <i>vfs.mount.point.file.contents</i><br><i>vfs..contents</i>   | <i>vfs..contents</i>  |

system.run and AllowKey

A hypothetical script like 'myscript.sh' may be executed on a host via Zabbix agent in several ways:

1. As an item key in a passive or active check, for example:

- system.run[myscript.sh]
- system.run[myscript.sh,wait]
- system.run[myscript.sh.nowait]

Here the user may add "wait", "nowait" or omit the 2nd argument to use its default value in system.run[.].

2. As a global script (initiated by user in frontend or API).

A user configures this script in *Administration* → *Scripts*, sets "Execute on: Zabbix agent" and puts "myscript.sh" into the script's "Commands" input field. When invoked from frontend or API the Zabbix server sends to agent:

- system.run[myscript.sh,wait] - up to Zabbix 5.0.4
- system.run[myscript.sh] - since 5.0.5

Here the user does not control the "wait"/"nowait" parameters.

3. As a remote command from an action. The Zabbix server sends to agent:

- system.run[myscript.sh,nowait]

Here again the user does not control the "wait"/"nowait" parameters.

What that means is if we set AllowKey like:

AllowKey=system.run[myscript.sh]

then

- system.run[myscript.sh] - will be allowed

- `system.run[myscript.sh,wait]`, `system.run[myscript.sh,nowait]` will not be allowed - the script will not be run if invoked as a step of action

To allow all described variants you may add:

```
AllowKey=system.run[myscript.sh,*]
DenyKey=system.run[*]
```

to the `agent/agent2` parameters.

## 14 Plugins

### Overview

Plugins provide an option to extend the monitoring capabilities of Zabbix. Plugins are written in Go programming language and are supported by Zabbix agent 2 only.

Plugins provide an alternative to **loadable modules** (written in C), and other methods for extending Zabbix functionality, such as **user parameters** (agent metrics), **external checks** (agent-less monitoring), and `system.run[]` Zabbix **agent item**.

The following features are specific to Zabbix agent 2 and its plugins:

- support of scheduled and flexible intervals for both passive and active checks;
- task queue management with respect to schedule and task concurrency;
- plugin-level timeouts;
- compatibility check of Zabbix agent 2 and its plugin on start up.

Since Zabbix 6.0.0, plugins don't have to be integrated into the agent 2 directly and can be added as loadable plugins, thus making the creation process of additional plugins for gathering new monitoring metrics easier.

This page lists Zabbix native and loadable plugins, and describes plugin configuration principles from the user perspective. For instructions about writing your own plugins, see [Plugin development guidelines](#). For more information on the communication process between Zabbix agent 2 and a loadable plugin, as well as the metrics collection process, see [Connection diagram](#).

### Configuring plugins

This section provides common plugin configuration principles and best practices.

All plugins are configured using `Plugins.*` parameter, which can either be part of the Zabbix agent 2 **configuration file** or a plugin's own **configuration file**. If a plugin uses a separate configuration file, path to this file should be specified in the `Include` parameter of Zabbix agent 2 configuration file.

A typical plugin parameter has the following structure:

```
Plugins.<PluginName>.<Parameter>=<Value>
```

Additionally, there are two specific groups of parameters:

- `Plugins.<PluginName>.Default.<Parameter>=<Value>` used for defining **default parameter values**.
- `Plugins.<PluginName>.<SessionName>.<Parameter>=<Value>` used for defining separate sets of parameters for different monitoring targets via **named sessions**.

All parameter names should adhere to the following requirements:

- it is recommended to capitalize the names of your plugins;
- the parameter should be capitalized;
- special characters are not allowed;
- nesting isn't limited by a maximum level;
- the number of parameters is not limited.

### Default values

Since Zabbix 6.0.18, you can set default values for the connection-related parameters (URI, username, password, etc.) in the configuration file in the format:

```
Plugins.<PluginName>.Default.<Parameter>=<Value>
```

For example, `Plugins.Mysql.Default.Username=zabbix`, `Plugins.MongoDB.Default.Uri=tcp://127.0.0.1:27017`, etc.

If a value for such parameter is not provided in an item key or in the **named session** parameters, the plugin will use the default value. If a default parameter is also undefined, hardcoded defaults will be used.

**Note:**

If an item key does not have any parameters, Zabbix agent 2 will attempt to collect the metric using values defined in the default parameters section.

### Named sessions

Named sessions represent an additional level of plugin parameters and can be used to specify separate sets of authentication parameters for each of the instances being monitored. Each named session parameter should have the following structure:

*Plugins.<PluginName>.Sessions.<SessionName>.<Parameter>=<Value>*

A session name can be used as a connString item key parameter instead of specifying a URI, username, and/or password separately.

In item keys, the first parameter can be either a connString or a URI. If the first key parameter doesn't match any session name, it will be treated as a URI. Note that embedding credentials into a URI is not supported, use named session parameters instead.

The list of available **named session parameters** depends on the plugin.

*In Zabbix versions before 6.0.17*, when providing a connString (session name) in key parameters, item key parameters for username and password must be empty. The values will be taken from the session parameters. If an authentication parameter is not specified for the named session, a hardcoded default value will be used.

*Since Zabbix 6.0.17*, it is possible to override session parameters by specifying new values in the item key parameters (see [example](#)).

*Since Zabbix 6.0.18*, if a parameter is not defined for the named session, Zabbix agent 2 will use the value defined in the **default plugin parameter**.

### Parameter priority

*Since version 6.0.18*, Zabbix agent 2 plugins search for connection-related parameter values in the following order:

1. The first item key parameter is compared to session names. If no match is found it is treated as an actual value; in this case, step 3 will be skipped. If a match is found, the parameter value (usually, a URI) must be defined in the named session.
2. Other parameters will be taken from the item key if defined.
3. If an item key parameter (for example, password) is empty, plugin will look for the corresponding named session parameter.
4. If the session parameter is also not specified, the value defined in the corresponding **default parameter** will be used.
5. If all else fails, the plugin will use the hardcoded default value.

### Example 1

Monitoring of two instances "MySQL1" and "MySQL2".

Configuration parameters:

```
Plugins.Mysql.Sessions.MySQL1.Uri=tcp://127.0.0.1:3306
Plugins.Mysql.Sessions.MySQL1.User=mysql1_user
Plugins.Mysql.Sessions.MySQL1.Password=unique_password
Plugins.Mysql.Sessions.MySQL2.Uri=tcp://192.0.2.0:3306
```

```
Plugins.MySQL.Sessions.MySQL2.User=mysql2_user
Plugins.MySQL.Sessions.MySQL2.Password=different_password
```

As a result of this configuration, each session name may be used as a connString in an **item key**, e.g., `mysql.ping[MySQL1]` or `mysql.ping[MySQL2]`.

#### Example 2

Providing some of the parameters in the item key (supported since Zabbix 6.0.17).

Configuration parameters:

```
Plugins.PostgreSQL.Sessions.Session1.Uri=tcp://192.0.2.234:5432
Plugins.PostgreSQL.Sessions.Session1.User=old_username
Plugins.PostgreSQL.Sessions.Session1.Password=session_password
```

**Item key:** `pgsql.ping[session1,new_username,,postgres]`

As a result of this configuration, the agent will connect to PostgreSQL using the following parameters:

- URI from session parameter: `192.0.2.234:5432`
- Username from the item key: `new_username`
- Password from session parameter (since it is omitted in the item key): `session_password`
- Database name from the item key: `postgres`

#### Example 3

Collecting a metric using default configuration parameters.

Configuration parameters:

```
Plugins.PostgreSQL.Default.Uri=tcp://192.0.2.234:5432
Plugins.PostgreSQL.Default.User=zabbix
Plugins.PostgreSQL.Default.Password=password
```

**Item key:** `pgsql.ping[,,,postgres]`

As a result of this configuration, the agent will connect to PostgreSQL using the parameters:

- Default URI: `192.0.2.234:5432`
- Default username: `zabbix`
- Default password: `password`
- Database name from the item key: `postgres`

#### Connections

Some plugins support gathering metrics from multiple instances simultaneously. Both local and remote instances can be monitored. TCP and Unix-socket connections are supported.

It is recommended to configure plugins to keep connections to instances in an open state. The benefits are reduced network congestion, latency, and CPU and memory usage due to the lower number of connections. The client library takes care of this.

##### Note:

Time period for which unused connections should remain open can be determined by `Plugins.<PluginName>.KeepAlive` parameter.

Example: `Plugins.Memcached.KeepAlive`

#### Plugins

All metrics supported by Zabbix agent 2 are collected by plugins.

##### Built-in

The following plugins for Zabbix agent 2 are available out-of-the-box. Click on the plugin name to go to the plugin repository with additional information.

| Plugin name | Description                             | Supported item keys                             | Comments  |
|-------------|---|---|---|
| Agent       | Metrics of the Zabbix agent being used. | agent.hostname,<br>agent.ping,<br>agent.version | Supported keys have the same parameters as Zabbix agent <b>keys</b> . |

| Plugin name               | Description  | Supported item keys  | Comments   |
|---------------------------|--|--|--|
| <a href="#">Ceph</a>      | Ceph monitoring.   | ceph.df.details,<br>ceph.osd.stats,<br>ceph.osd.discovery,<br>ceph.osd.dump,<br>ceph.ping,<br>ceph.pool.discovery,<br>ceph.status  |  |

See also: [Building loadable plugins](#).

#### Footnotes

<sup>1</sup> - Since Zabbix 6.0.13, loadable plugins started using the same versioning system as Zabbix itself. As a result, MongoDB plugin version has changed from 1.2.0 to 6.0.13 and PostgreSQL plugin version has changed from 1.2.1 to 6.0.13.

## 1 Building loadable plugins

### Overview

This page provides the steps required to build a loadable plugin binary from the sources.

If the source tarball is downloaded, it is possible to build the plugin offline, i.e. without the internet connection.

The PostgreSQL plugin is used as an example. Other loadable plugins can be built in a similar way.

### Steps

1. Download the plugin sources from [Zabbix Cloud Images and Appliances](#). The official download page will be available soon.
2. Transfer the archive to the machine where you are going to build the plugin.
3. Unarchive the tarball, e.g.:

```
tar xvf zabbix-agent2-plugin-postgresql-6.0.13.tar.gz
```

Make sure to replace "zabbix-agent2-plugin-postgresql-6.0.13.tar.gz" with the name of the downloaded archive.

4. Enter the extracted directory:

```
cd <path to directory>
```

5. Run:

```
make
```

6. The plugin executable may be placed anywhere as long as it is loadable by Zabbix agent 2. Specify the path to the plugin binary in the plugin configuration file, e.g. in postgresql.conf for the PostgreSQL plugin:

```
Plugins.PostgreSQL.System.Path=/path/to/executable/zabbix-agent2-plugin-postgresql
```

7. Path to the plugin configuration file must be specified in the Include parameter of the Zabbix agent 2 configuration file:

Include=/path/to/plugin/configuration/file/postgresql.conf

Makefile targets

Loadable plugins provided by Zabbix have simple makefiles with the following targets:

| Target      | Description  |
|-------------|--|
| make        | Build plugin.  |
| make clean  | Delete all files that are normally created by building the plugin.   |
| make check  | Perform self-tests. A real PostgreSQL database is required.  |
| make style  | Check Go code style with 'golangci-lint'.  |
| make format | Format Go code with 'go fmt'.  |
| make dist   | Create an archive containing the plugin sources and sources of all packages needed to build the plugin and its self-tests. |

### 3 Triggers

Overview

Triggers are logical expressions that "evaluate" data gathered by items and represent the current system state.

While items are used to gather system data, it is highly impractical to follow these data all the time waiting for a condition that is alarming or deserves attention. The job of "evaluating" data can be left to trigger expressions.

Trigger expressions allow to define a threshold of what state of data is "acceptable". Therefore, should the incoming data surpass the acceptable state, a trigger is "fired" - or changes its status to PROBLEM.

A trigger may have the following status:

| Status  | Description  |
|---------|--|
| OK      | This is a normal trigger status.   |
| Problem | Something has happened. For example, the processor load is too high.         |
| Unknown | The trigger value cannot be calculated. See <a href="#">Unknown status</a> . |

In a simple trigger we may want to set a threshold for a five-minute average of some data, for example, the CPU load. This is accomplished by defining a trigger expression where:

- the 'avg' function is applied to the value received in the item key
- a five minute period for evaluation is used
- a threshold of '2' is set

avg(/host/key,5m)>2

This trigger will "fire" (become PROBLEM) if the five-minute average is over 2.

In a more complex trigger, the expression may include a **combination** of multiple functions and multiple thresholds. See also: [Trigger expression](#).

#### Note:

After enabling a trigger (changing its configuration status from *Disabled* to *Enabled*), the trigger expression is evaluated as soon as an item in it receives a value or the time to handle [date and time](#) and/or [nodata\(\)](#) functions comes.

Most trigger functions are evaluated based on item value [history](#) data, while some trigger functions for long-term analytics, e.g. **trendavg()**, **trendcount()**, etc, use trend data.

Calculation time

A trigger is recalculated every time Zabbix server receives a new value that is part of the expression. When a new value is received, each function that is included in the expression is recalculated (not just the one that received the new value).

Additionally, a trigger is recalculated each time when a new value is received **and** every 30 seconds if [date and time](#) and/or [nodata\(\)](#) functions are used in the expression.

**Date and time** and/or `nodata()` functions are recalculated every 30 seconds by the Zabbix history syncer process.

Triggers that reference trend functions **only** are evaluated once per the smallest time period in the expression. See also **trend functions**.

#### Evaluation period

An evaluation period is used in functions referencing the item history. It allows to specify the interval we are interested in. It can be specified as time period (30s, 10m, 1h) or as a value range (#5 - for five latest values).

The evaluation period is measured up to "now" - where "now" is the latest recalculation time of the trigger (see **Calculation time** above); "now" is not the "now" time of the server.

The evaluation period specifies either:

- To consider all values between "now-time period" and "now" (or, with time shift, between "now-time shift-time period" and "now-time\_shift")
- To consider no more than the num count of values from the past, up to "now"
  - If there are 0 available values for the time period or num count specified - then the trigger or calculated item that uses this function becomes unsupported

Note that:

- If only a single function (referencing data history) is used in the trigger, "now" is always the latest received value. For example, if the last value was received an hour ago, the evaluation period will be regarded as up to the latest value an hour ago.
- A new trigger is calculated as soon as the first value is received (history functions); it will be calculated within 30 seconds for **date and time** and `nodata()` functions. Thus the trigger will be calculated even though perhaps the set evaluation period (for example, one hour) has not yet passed since the trigger was created. The trigger will also be calculated after the first value, even though the evaluation range was set, for example, to ten latest values.

#### Unknown status

It is possible that an unknown operand appears in a trigger expression if:

- an unsupported item is used
- the function evaluation for a supported item results in an error

In this case a trigger generally evaluates to "unknown" (although there are some exceptions). For more details, see **Expressions with unknown operands**.

It is possible to **get notified** on unknown triggers.

## 1 Configuring a trigger

### Overview

To configure a trigger, do the following:

- Go to: *Configuration* → *Hosts*
- Click on *Triggers* in the row of the host
- Click on *Create trigger* to the right (or on the trigger name to edit an existing trigger)
- Enter parameters of the trigger in the form

See also **general information** on triggers and their calculation times.

### Configuration

The **Trigger** tab contains all the essential trigger attributes.

| Parameter         | Description   |
|-------------------|---|
| <i>Name</i>       | <p>Trigger name.</p> <p>Supported <b>macros</b> are: {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {HOST.CONN}, {HOST.DNS}, {HOST.IP}, {ITEM.VALUE}, {ITEM.LASTVALUE}, {ITEM.LOG.*} and {MACRO} user macros.</p> <p><b>\$1, \$2...\$9</b> macros can be used to refer to the first, second...ninth constant of the expression.</p> <p><i>Note:</i> \$1-\$9 macros will resolve correctly if referring to constants in relatively simple, straightforward expressions. For example, the name "Processor load above \$1 on {HOST.NAME}" will automatically change to "Processor load above 5 on New host" if the expression is last(/New host/system.cpu.load[percpu,avg1])&gt;5</p> |
| <i>Event name</i> | <p>If defined, this name will be used to create the problem event name, instead of the trigger name. The event name may be used to build meaningful alerts containing problem data (see <b>example</b>). The same set of macros is supported as in the trigger name, plus {TIME} and {EXPRESSION} expression macros.</p> <p>Supported since Zabbix 5.2.0.</p>   |

| Parameter                            | Description   |
|--------------------------------------|---|
| <i>Operational data</i>              | Operational data allow to define arbitrary strings along with macros. The macros will resolve dynamically to real time data in <i>Monitoring</i> → <i>Problems</i> . While macros in the trigger name (see above) will resolve to their values at the moment of a problem happening and will become the basis of a static problem name, the macros in the operational data maintain the ability to display the very latest information dynamically. If no operational data is configured on a trigger level, the latest values of all items from the expression will be displayed.<br>The same set of macros is supported as in the trigger name. |
| <i>Severity</i>                      | Set the required trigger <b>severity</b> by clicking the buttons.   |
| <i>Expression</i>                    | Logical <b>expression</b> used to define the conditions of a problem.<br>A problem is created after all the conditions included in the expression are met, i.e. the expression evaluates to TRUE. The problem will be resolved as soon as the expression evaluates to FALSE, unless additional recovery conditions are specified in <i>Recovery expression</i> .  |
| <i>OK event generation</i>           | OK event generation options:<br><b>Expression</b> - OK events are generated based on the same expression as problem events;<br><b>Recovery expression</b> - OK events are generated if the problem expression evaluates to FALSE and the recovery expression evaluates to TRUE;<br><b>None</b> - in this case the trigger will never return to an OK state on its own.  |
| <i>Recovery expression</i>           | Logical <b>expression</b> (optional) defining additional conditions that have to be met before the problem is resolved, after the original problem expression has already been evaluated as FALSE. Recovery expression is useful for trigger <b>hysteresis</b> . It is <b>not</b> possible to resolve a problem by recovery expression alone if the problem expression is still TRUE.<br>This field is only available if 'Recovery expression' is selected for <i>OK event generation</i> .   |
| <i>PROBLEM event generation mode</i> | Mode for generating problem events:<br><b>Single</b> - a single event is generated when a trigger goes into the 'Problem' state for the first time;<br><b>Multiple</b> - an event is generated upon every 'Problem' evaluation of the trigger.  |
| <i>OK event closes</i>               | Select if OK event closes:<br><b>All problems</b> - all problems of this trigger<br><b>All problems if tag values match</b> - only those trigger problems with matching event tag values  |
| <i>Tag for matching</i>              | Enter event tag name to use for event correlation.<br>This field is displayed if 'All problems if tag values match' is selected for the <i>OK event closes</i> property and is mandatory in this case.  |
| <i>Allow manual close</i>            | Check to allow <b>manual closing</b> of problem events generated by this trigger. Manual closing is possible when acknowledging problem events.   |
| <i>URL</i>                           | If not empty, the URL entered here is available as a link in several frontend locations, e.g. when clicking on the problem name in <i>Monitoring</i> → <i>Problems</i> (URL option in the <i>Trigger</i> menu) and <i>Problems</i> dashboard widget.<br>The same set of macros is supported as in the trigger name, plus {EVENT.ID}, {HOST.ID} and {TRIGGER.ID}. Note that user macros with secret values will not be resolved in the URL.  |
| <i>Description</i>                   | Text field used to provide more information about this trigger. May contain instructions for fixing specific problem, contact detail of responsible staff, etc.   |
| <i>Enabled</i>                       | The same set of macros is supported as in the trigger name.<br>Unchecking this box will disable the trigger if required.<br>Problems of a disabled trigger are no longer displayed in the frontend, but are not deleted.  |

The **Tags** tab allows you to define trigger-level **tags**. All problems of this trigger will be tagged with the values entered here.

Trigger
Tags
Dependencies

Trigger tags
Inherited and trigger tags

| Name | Value | Action | Parent |
|------|-------|--------|--------|
| App  | MySQL | Remove | Templa |
| tag  | value | Remove |        |

Add

In addition the *Inherited and trigger tags* option allows to view tags defined on template level, if the trigger comes from that template. If there are multiple templates with the same tag, these tags are displayed once and template names are separated with commas. A trigger does not "inherit" and display host-level tags.

| Parameter  | Description   |
|------------|---|
| Name/Value | <p>Set custom tags to mark trigger events.</p> <p>Tags are a pair of tag name and value. You can use only the name or pair it with a value. A trigger may have several tags with the same name, but different values.</p> <p>User macros, user macros with context, low-level discovery macros and macro <b>functions</b> with <code>{{ITEM.VALUE}}</code>, <code>{{ITEM.LASTVALUE}}</code> and low-level discovery macros are supported in event tags. Low-level discovery macros can be used inside macro context.</p> <p><code>{TRIGGER.ID}</code> macro is supported in trigger tag values. It may be useful for identifying triggers created from trigger prototypes and, for example, suppressing problems from these triggers during maintenance.</p> <p>If the total length of expanded value exceeds 255, it will be cut to 255 characters.</p> <p>See all <b>macros</b> supported for event tags.</p> <p><b>Event tags</b> can be used for event correlation, in action conditions and will also be seen in <i>Monitoring → Problems</i> or the <i>Problems</i> widget.</p> |

The **Dependencies** tab contains all the **dependencies** of the trigger.

Click on *Add* to add a new dependency.

Note:

You can also configure a trigger by opening an existing one, pressing the *Clone* button and then saving under a different name.

Testing expressions

It is possible to test the configured trigger expression as to what the expression result would be depending on the received value.

The following expression from an official template is taken as an example:

```
avg(/Cisco IOS SNMPv2/sensor.temp.value[ciscoEnvMonTemperatureValue.{#SNMPINDEX}],5m)>{$TEMP_WARN}  
or  
last(/Cisco IOS SNMPv2/sensor.temp.status[ciscoEnvMonTemperatureState.{#SNMPINDEX}])={$TEMP_WARN_STATUS}
```

To test the expression, click on *Expression constructor* under the expression field.

Trigger

Tags

Dependencies

\* Name

Cisco IOS SNMPv2: Temperatur is too high

Event name

Cisco IOS SNMPv2: Temperatur is too high

Operational data

Severity

Not classified

Information

Warning

Average

High

Disaster

\* Expression

avg(/Cisco IOS  
SNMPv2/sensor.temp.value[ciscoEnvMonTemperature  
Value.{#SNMPINDEX}],5m)>{\$TEMP\_WARN}  
or  
last(/Cisco IOS  
SNMPv2/sensor.temp.status[ciscoEnvMonTemperatur  
eState.{#SNMPINDEX}])={\$TEMP\_WARN\_STATUS}

Add

Expression constructor

In the Expression constructor, all individual expressions are listed. To open the testing window, click on **Test** below the expression list.

Target Expression

☒ Or

☐ A `avg(/Cisco IOS SNMPv2/sensor.temp.value[ciscoEnvMonTemperatureValue.{#SNMPINDEX}],5m)>{$TEMP_WARN}`

☐ B `last(/Cisco IOS SNMPv2/sensor.temp.status[ciscoEnvMonTemperatureState.{#SNMPINDEX}])={$TEMP_WARN_STATUS}`

[Test](#)

In the testing window you can enter sample values ('80', '70', '0', '1' in this example) and then see the expression result, by clicking on the **Test** button.

Test

| Expression Variable Elements   | Result type       | Value |
|--|-------------------|-------|
| <code>avg(/Cisco IOS SNMPv2/sensor.temp.value[ciscoEnvMonTemperatureValue.{#SNMPINDEX}],5m)</code> | Numeric (float)   | 80    |
| <code>{\$TEMP_WARN}</code>   | Any               | 70    |
| <code>last(/Cisco IOS SNMPv2/sensor.temp.status[ciscoEnvMonTemperatureState.{#SNMPINDEX}])</code>  | Numeric (integer) | 0     |
| <code>{\$TEMP_WARN_STATUS}</code>  | Any               | 1     |

| Expression  | Result | Error |
|---|--------|-------|
| Or  | TRUE   |       |
| A <code>avg(/Cisco IOS SNMPv2/sensor.temp.value[ciscoEnvMonTemperatureValue.{#SNMPINDEX}],...</code>  | TRUE   |       |
| B <code>last(/Cisco IOS SNMPv2/sensor.temp.status[ciscoEnvMonTemperatureState.{#SNMPINDEX}]...</code> | FALSE  |       |
| A or B  | TRUE   |       |

[Test](#) [Cancel](#)

The result of the individual expressions as well as the whole expression can be seen.

"TRUE" means that the specified expression is correct. In this particular case A, "80" is greater than the `{$TEMP_WARN}` specified value, "70" in this example. As expected, a "TRUE" result appears.

"FALSE" means that the specified expression is incorrect. In this particular case B, `{$TEMP_WARN_STATUS}` "1" needs to be equal with specified value, "0" in this example. As expected, a "FALSE" result appears.

The chosen expression type is "OR". If at least one of the specified conditions (A or B in this case) is TRUE, the overall result will be TRUE as well. Meaning that the current value exceeds the warning value and a problem has occurred.

## 2 Trigger expression

### Overview

The expressions used in **triggers** are very flexible. You can use them to create complex logical tests regarding monitored statistics.

A simple expression uses a **function** that is applied to the item with some parameters. The function returns a result that is compared to the threshold, using an operator and a constant.

The syntax of a simple useful expression is `function(/host/key,parameter)<operator><constant>`.

For example:

```
min(/Zabbix_server/net.if.in[eth0,bytes],5m)>100K
```

will trigger if the number of received bytes during the last five minutes was always over 100 kilobytes.

While the syntax is exactly the same, from the functional point of view there are two types of trigger expressions:

- problem expression - defines the conditions of the problem
- recovery expression (optional) - defines additional conditions of the problem resolution

When defining a problem expression alone, this expression will be used both as the problem threshold and the problem recovery threshold. As soon as the problem expression evaluates to TRUE, there is a problem. As soon as the problem expression evaluates to FALSE, the problem is resolved.

When defining both problem expression and the supplemental recovery expression, problem resolution becomes more complex: not only the problem expression has to be FALSE, but also the recovery expression has to be TRUE. This is useful to create **hysteresis** and avoid trigger flapping.

**Note:**

It is unproductive to use the {TRIGGER.VALUE} macro in a recovery expression because this expression is only evaluated when the trigger is in the "Problem" state. Consequently, {TRIGGER.VALUE} will always resolve to "1" (which indicates a "Problem" state) while evaluating the expression.

## Functions

Functions allow to calculate the collected values (average, minimum, maximum, sum), find strings, reference current time and other factors.

A complete list of **supported functions** is available.

Typically functions return numeric values for comparison. When returning strings, comparison is possible with the = and <> operators (see **example**).

### Function parameters

Function parameters allow to specify:

- host and item key (functions referencing the host item history only)
- function-specific parameters
- other expressions (not available for functions referencing the host item history, see **other expressions** for examples)

The host and item key can be specified as /host/key. The referenced item must be in a supported state (except for **nodata()** function, which is calculated for unsupported items as well).

While other trigger expressions as function parameters are limited to non-history functions in triggers, this limitation does not apply in **calculated items**.

### Function-specific parameters

Function-specific parameters are placed after the item key and are separated from the item key by a comma. See the **supported functions** for a complete list of these parameters.

Most of numeric functions accept time as a parameter. You may use seconds or **time suffixes** to indicate time. Preceded by a hash mark, the parameter has a different meaning:

| Expression                | Description                           |
|---------------------------|---------------------------------------|
| <b>sum(/host/key,10m)</b> | Sum of values in the last 10 minutes. |
| <b>sum(/host/key,#10)</b> | Sum of the last ten values.           |

Parameters with a hash mark have a different meaning with the function **last** - they denote the Nth previous value, so given the values 30, 70, 20, 60, 50 (from the most recent to the least recent):

- last(/host/key,#2) would return '70'
- last(/host/key,#5) would return '50'

### Time shift

An optional time shift is supported with time or value count as the function parameter. This parameter allows to reference data from a period of time in the past.

Time shift starts with now - specifying the current time, and is followed by +N<time unit> or -N<time unit> - to add or subtract N time units.

For example, avg(/host/key,1h:now-1d) will return the average value for an hour one day ago.

**Attention:**

Time shift specified in months (M) and years (y) is only supported for **trend functions**. Other functions support seconds (s), minutes (m), hours (h), days (d), and weeks (w).

### Time shift with absolute time periods

Absolute time periods are supported in the time shift parameter, for example, midnight to midnight for a day, Monday-Sunday for a week, first day-last day of the month for a month.

Time shift for absolute time periods starts with `now` - specifying the current time, and is followed by any number of time operations: `/<time unit>` - defines the beginning and end of the time unit, for example, midnight to midnight for a day, `+N<time unit>` or `-N<time unit>` - to add or subtract N time units.

Please note that the value of time shift can be greater or equal to 0, while the time period minimum value is 1.

| Parameter                | Description |
|--------------------------|-------------|
| <code>1d:now/d</code>    | Yesterday   |
| <code>1d:now/d+1d</code> | Today       |
| <code>2d:now/d+1d</code> | Last 2 days |
| <code>1w:now/w</code>    | Last week   |
| <code>1w:now/w+1w</code> | This week   |

#### Other expressions

Function parameters may contain other expressions, as in the following syntax:

```
min(min(/host/key,1h),min(/host2/key2,1h)*10)
```

Note that other expressions may not be used, if the function references item history. For example, the following syntax is not allowed:

```
min(/host/key,#5*10)
```

#### Operators

The following operators are supported for triggers **(in descending priority of execution)**:

| Priority | Operator     | Definition   | Notes for unknown values   | Force cast operand to float <sup>1</sup> |
|----------|--------------|--|--|--|
| <b>1</b> | <b>-</b>     | Unary minus  | -Unknown → Unknown   | Yes                                      |
| <b>2</b> | <b>not</b>   | Logical NOT  | <b>not</b> Unknown → Unknown   | Yes                                      |
| <b>3</b> | <b>*</b>     | Multiplication   | 0 * Unknown → Unknown<br>(yes, Unknown, not 0 - to not lose Unknown in arithmetic operations)<br>1.2 * Unknown → Unknown | Yes                                      |
|          | <b>/</b>     | Division   | Unknown / 0 → error<br>Unknown / 1.2 → Unknown<br>0.0 / Unknown → Unknown  | Yes                                      |
| <b>4</b> | <b>+</b>     | Arithmetical plus  | 1.2 + Unknown → Unknown  | Yes                                      |
|          | <b>-</b>     | Arithmetical minus   | 1.2 - Unknown → Unknown  | Yes                                      |
| <b>5</b> | <b>&lt;</b>  | Less than. The operator is defined as:<br><br>$A < B \Leftrightarrow (A < B - 0.000001)$                   | 1.2 < Unknown → Unknown  | Yes                                      |
|          | <b>&lt;=</b> | Less than or equal to. The operator is defined as:<br><br>$A \leq B \Leftrightarrow (A \leq B + 0.000001)$ | Unknown <= Unknown → Unknown   | Yes                                      |
|          | <b>&gt;</b>  | More than. The operator is defined as:<br><br>$A > B \Leftrightarrow (A > B + 0.000001)$                   |  | Yes                                      |

| Priority | Operator        | Definition  | Notes for unknown values   | Force cast operand to float <sup>1</sup> |
|----------|-----------------|---|--|--|
|          | <b>&gt;=</b>    | More than or equal to. The operator is defined as:<br><br>$A \geq B \Leftrightarrow (A \geq B - 0.000001)$                    |  | Yes                                      |
| <b>6</b> | <b>=</b>        | Is equal. The operator is defined as:<br><br>$A = B \Leftrightarrow (A \geq B - 0.000001) \text{ and } (A \leq B + 0.000001)$ |  | No <sup>1</sup>                          |
|          | <b>&lt;&gt;</b> | Not equal. The operator is defined as:<br><br>$A <> B \Leftrightarrow (A < B - 0.000001) \text{ or } (A > B + 0.000001)$      |  | No <sup>1</sup>                          |
| <b>7</b> | <b>and</b>      | Logical AND   | 0 <b>and</b> Unknown → 0<br>1 <b>and</b> Unknown → Unknown<br>Unknown <b>and</b> Unknown → Unknown | Yes                                      |
| <b>8</b> | <b>or</b>       | Logical OR  | 1 <b>or</b> Unknown → 1<br>0 <b>or</b> Unknown → Unknown<br>Unknown <b>or</b> Unknown → Unknown    | Yes                                      |

<sup>1</sup> String operand is still cast to numeric if:

- another operand is numeric
- operator other than = or <> is used on an operand

(If the cast fails - numeric operand is cast to a string operand and both operands get compared as strings.)

**not**, **and** and **or** operators are case-sensitive and must be in lowercase. They also must be surrounded by spaces or parentheses.

All operators, except unary - and **not**, have left-to-right associativity. Unary - and **not** are non-associative (meaning **-(1)** and **not (not 1)** should be used instead of **--1** and **not not 1**).

Evaluation result:

- **<**, **<=**, **>**, **>=**, **=**, **<>** operators shall yield '1' in the trigger expression if the specified relation is true and '0' if it is false. If at least one operand is Unknown the result is Unknown;
- **and** for known operands shall yield '1' if both of its operands compare unequal to '0'; otherwise, it yields '0'; for unknown operands **and** yields '0' only if one operand compares equal to '0'; otherwise, it yields 'Unknown';
- **or** for known operands shall yield '1' if either of its operands compare unequal to '0'; otherwise, it yields '0'; for unknown operands **or** yields '1' only if one operand compares unequal to '0'; otherwise, it yields 'Unknown';
- The result of the logical negation operator **not** for a known operand is '0' if the value of its operand compares unequal to '0'; '1' if the value of its operand compares equal to '0'. For unknown operand **not** yields 'Unknown'.

Value caching

Values required for trigger evaluation are cached by Zabbix server. Because of this trigger evaluation causes a higher database load for some time after the server restarts. The value cache is not cleared when item history values are removed (either manually or by housekeeper), so the server will use the cached values until they are older than the time periods defined in trigger functions or server is restarted.

Examples of triggers

Example 1

The processor load is too high on Zabbix server.

```
last(/Zabbix server/system.cpu.load[all,avg1])>5
```

By using the function 'last()', we are referencing the most recent value. /Zabbix server/system.cpu.load[all,avg1] gives a short name of the monitored parameter. It specifies that the host is 'Zabbix server' and the key being monitored is 'system.cpu.load[all,avg1]'. Finally, >5 means that the trigger is in the PROBLEM state whenever the most recent processor load measurement from Zabbix server is greater than 5.

#### Example 2

www.example.com is overloaded.

```
last(/www.example.com/system.cpu.load[all,avg1])>5 or min(/www.example.com/system.cpu.load[all,avg1],10m)>2
```

The expression is true when either the current processor load is more than 5 or the processor load was more than 2 during last 10 minutes.

#### Example 3

/etc/passwd has been changed.

```
last(/www.example.com/vfs.file.cksum[/etc/passwd],#1)<>last(/www.example.com/vfs.file.cksum[/etc/passwd],#1)
```

The expression is true when the previous value of /etc/passwd checksum differs from the most recent one.

Similar expressions could be useful to monitor changes in important files, such as /etc/passwd, /etc/inetd.conf, /kernel, etc.

#### Example 4

Someone is downloading a large file from the Internet.

Use of function min:

```
min(/www.example.com/net.if.in[eth0,bytes],5m)>100K
```

The expression is true when number of received bytes on eth0 is more than 100 KB within last 5 minutes.

#### Example 5

Both nodes of clustered SMTP server are down.

Note use of two different hosts in one expression:

```
last(/smtp1.example.com/net.tcp.service[smtp])=0 and last(/smtp2.example.com/net.tcp.service[smtp])=0
```

The expression is true when both SMTP servers are down on both smtp1.example.com and smtp2.example.com.

#### Example 6

Zabbix agent needs to be upgraded.

Use of function find():

```
find(/example.example.com/agent.version,,"like","beta8")=1
```

The expression is true if Zabbix agent has version beta8.

#### Example 7

Server is unreachable.

```
count(/example.example.com/icmpping,30m,,"0")>5
```

The expression is true if host "example.example.com" is unreachable more than 5 times in the last 30 minutes.

#### Example 8

No heartbeats within last 3 minutes.

Use of function nodata():

```
nodata(/example.example.com/tick,3m)=1
```

To make use of this trigger, 'tick' must be defined as a Zabbix **trapper** item. The host should periodically send data for this item using zabbix\_sender. If no data is received within 180 seconds, the trigger value becomes PROBLEM.

*Note* that 'nodata' can be used for any item type.

#### Example 9

CPU activity at night time.

Use of function time():

```
min(/Zabbix server/system.cpu.load[all,avg1],5m)>2 and time()<060000
```

The trigger may change its state to problem only at night time (00:00 - 06:00).

#### Example 10

CPU activity at any time with exception.

Use of function time() and **not** operator:

```
min(/zabbix/system.cpu.load[all,avg1],5m)>2
and not (dayofweek()=7 and time()>230000)
and not (dayofweek()=1 and time()<010000)
```

The trigger may change its state to problem at any time, except for 2 hours on a week change (Sunday, 23:00 - Monday, 01:00).

#### Example 11

Check if client local time is in sync with Zabbix server time.

Use of function fuzzytime():

```
fuzzytime(/MySQL_DB/system.localtime,10s)=0
```

The trigger will change to the problem state in case when local time on server MySQL\_DB and Zabbix server differs by more than 10 seconds. Note that 'system.localtime' must be configured as a **passive check**.

#### Example 12

Comparing average load today with average load of the same time yesterday (using time shift as now-1d).

```
avg(/server/system.cpu.load,1h)/avg(/server/system.cpu.load,1h:now-1d)>2
```

This trigger will fire if the average load of the last hour tops the average load of the same hour yesterday more than two times.

#### Example 13

Using the value of another item to get a trigger threshold:

```
last(/Template PfSense/hrStorageFree[{#SNMPVALUE}])<last(/Template PfSense/hrStorageSize[{#SNMPVALUE}])*0.1
```

The trigger will fire if the free storage drops below 10 percent.

#### Example 14

Using **evaluation result** to get the number of triggers over a threshold:

```
(last(/server1/system.cpu.load[all,avg1])>5) + (last(/server2/system.cpu.load[all,avg1])>5) + (last(/server3/system.cpu.load[all,avg1])>5)>2
```

The trigger will fire if at least two of the triggers in the expression are in a problem state.

#### Example 15

Comparing string values of two items - operands here are functions that return strings.

Problem: create an alert if Ubuntu version is different on different hosts

```
last(/NY Zabbix server/vfs.file.contents[/etc/os-release])<>last(/LA Zabbix server/vfs.file.contents[/etc/os-release])
```

#### Example 16

Comparing two string values - operands are:

- a function that returns a string
- a combination of macros and strings

Problem: detect changes in the DNS query

The item key is:

```
net.dns.record[8.8.8.8,{ $WEBSITE_NAME }, { $DNS_RESOURCE_RECORD_TYPE }, 2, 1]
```

with macros defined as

```
{ $WEBSITE_NAME } = example.com
{ $DNS_RESOURCE_RECORD_TYPE } = MX
```

and normally returns:

```
example.com          MX          0 mail.example.com
```

So our trigger expression to detect if the DNS query result deviated from the expected result is:

```
last(/Zabbix server/net.dns.record[8.8.8.8,{ $WEBSITE_NAME},{ $DNS_RESOURCE_RECORD_TYPE},2,1])<>"{$WEBSITE_NAME}
```

Notice the quotes around the second operand.

Example 17

Comparing two string values - operands are:

- a function that returns a string
- a string constant with special characters \ and "

Problem: detect if the /tmp/hello file content is equal to:

```
\ " //hello ?\"
```

Option 1) write the string directly

```
last(/Zabbix server/vfs.file.contents[/tmp/hello])="\ \" //hello ?\""
```

Notice how \ and " characters are escaped when the string gets compared directly.

Option 2) use a macro

```
{ $HELLO_MACRO} = \ " //hello ?\"
```

in the expression:

```
last(/Zabbix server/vfs.file.contents[/tmp/hello])={ $HELLO_MACRO}
```

Example 18

Comparing long-term periods.

Problem: Load of Exchange server increased by more than 10% last month

```
trendavg(/Exchange/system.cpu.load,1M:now/M)>1.1*trendavg(/Exchange/system.cpu.load,1M:now/M-1M)
```

You may also use the **Event name** field in trigger configuration to build a meaningful alert message, for example to receive something like

```
"Load of Exchange server increased by 24% in July (0.69) comparing to June (0.56)"
```

the event name must be defined as:

```
Load of { $HOST.HOST} server increased by {{ ?100*trendavg(/system.cpu.load,1M:now/M)/trendavg(/system.cpu.load,1M:now/M-1M)}}
```

It is also useful to allow manual closing in trigger configuration for this kind of problem.

Hysteresis

Sometimes an interval is needed between problem and recovery states, rather than a simple threshold. For example, if we want to define a trigger that reports a problem when server room temperature goes above 20°C and we want it to stay in the problem state until the temperature drops below 15°C, a simple trigger threshold at 20°C will not be enough.

Instead, we need to define a trigger expression for the problem event first (temperature above 20°C). Then we need to define an additional recovery condition (temperature below 15°C). This is done by defining an additional *Recovery expression* parameter when **defining** a trigger.

In this case, problem recovery will take place in two steps:

- First, the problem expression (temperature above 20°C) will have to evaluate to FALSE
- Second, the recovery expression (temperature below 15°C) will have to evaluate to TRUE

The recovery expression will be evaluated only when the problem event is resolved first.

**Warning:**

The recovery expression being TRUE alone does not resolve a problem if the problem expression is still TRUE!

Example 1

Temperature in server room is too high.

Problem expression:

```
last(/server/temp)>20
```

Recovery expression:

```
last(/server/temp)<=15
```

#### Example 2

Free disk space is too low.

Problem expression: it is less than 10GB for last 5 minutes

```
max(/server/vfs.fs.size[/,free],5m)<10G
```

Recovery expression: it is more than 40GB for last 10 minutes

```
min(/server/vfs.fs.size[/,free],10m)>40G
```

#### Expressions with unknown operands

Generally an unknown operand (such as an unsupported item) in the expression will immediately render the trigger value to `Unknown`.

However, in some cases unknown operands (unsupported items, function errors) are admitted into expression evaluation:

- The `nodata()` function is evaluated regardless of whether the referenced item is supported or not.
- Logical expressions with OR and AND can be evaluated to known values in two cases regardless of unknown operands:
  - **Case 1:** "1 or some\_function(unsupported\_item1) or some\_function(unsupported\_item2) or ..." can be evaluated to known result ('1' or "Problem"),
  - **Case 2:** "0 and some\_function(unsupported\_item1) and some\_function(unsupported\_item2) and ..." can be evaluated to known result ('0' or "OK").Zabbix tries to evaluate such logical expressions by taking unsupported items as unknown operands. In the two cases above a known value will be produced ("Problem" or "OK", respectively); in **all other** cases the trigger will evaluate to `Unknown`.
- If the function evaluation for a supported item results in error, the function value becomes `Unknown` and it takes part as unknown operand in further expression evaluation.

Note that unknown operands may "disappear" only in logical expressions as described above. In arithmetic expressions unknown operands always lead to the result `Unknown` (except division by 0).

#### Attention:

An expression that results in `Unknown` does not change the trigger state ("Problem/OK"). So, if it was "Problem" (see Case 1), it stays in the same problem state even if the known part is resolved ('1' becomes '0'), because the expression is now evaluated to `Unknown` and that does not change the trigger state.

If a trigger expression with several unsupported items evaluates to `Unknown` the error message in the frontend refers to the last unsupported item evaluated.

## 3 Trigger dependencies

### Overview

Sometimes the availability of one host depends on another. A server that is behind a router will become unreachable if the router goes down. With triggers configured for both, you might get notifications about two hosts down - while only the router was the guilty party.

This is where some dependency between hosts might be useful. With dependency set, notifications of the dependents could be withheld and only the notification on the root problem sent.

While Zabbix does not support dependencies between hosts directly, they may be defined with another, more flexible method - trigger dependencies. A trigger may have one or more triggers it depends on.

So in our simple example we open the server trigger configuration form and set that it depends on the respective trigger of the router. With such dependency, the server trigger will not change its state as long as the trigger it depends on is in the 'PROBLEM' state - and thus no dependent actions will be taken and no notifications sent.

If both the server and the router are down and dependency is there, Zabbix will not execute actions for the dependent trigger.

While the parent trigger is in the PROBLEM state, its dependents may report values that cannot be trusted. Therefore dependent triggers will not be re-evaluated until the parent trigger (the router in the example above):

- goes back from 'PROBLEM' to 'OK' state;
- changes its state from 'PROBLEM' to 'UNKNOWN';
- is closed manually, by correlation or with the help of **date and time** and/or `nodata()` functions;
- is resolved by a value of an item not involved in the dependent trigger;

- is disabled, has a disabled item or a disabled item host

In all of the cases mentioned above, the dependent trigger (server) will be re-evaluated only when a new metric for it is received. This means that the dependent trigger may not be updated immediately.

Also:

- Trigger dependency may be added from any host trigger to any other host trigger, as long as it doesn't result in a circular dependency.
- Trigger dependency may be added from one template to another. If some trigger from template A depends on some trigger from template B, template A may only be linked to a host (or another template) together with template B, but template B may be linked to a host (or another template) alone.
- Trigger dependency may be added from a template trigger to a host trigger. In this case, linking such a template to a host will create a host trigger that depends on the same trigger template that the trigger was depending on. This allows to, for example, have a template where some triggers depend on the router (host) triggers. All hosts linked to this template will depend on that specific router.
- Trigger dependency may not be added from a host trigger to a template trigger.
- Trigger dependency may be added from a trigger prototype to another trigger prototype (within the same low-level discovery rule) or a real trigger. A trigger prototype may not depend on a trigger prototype from a different LLD rule or on a trigger created from trigger prototype. A host trigger prototype cannot depend on a trigger from a template.

## Configuration

To define a dependency, open the Dependencies tab in the trigger **configuration form**. Click on *Add* in the 'Dependencies' block and select one or more triggers that the trigger will depend on.

| Trigger  | Tags | Dependencies 1 |
|--|------|----------------|
| <div> <div>Dependencies</div> <div> <div>Name</div> <div>My host: Load average is too high (per CPU load over { \$LOAD_AVG_PER_CPU.MAX.WARN } for 5m)</div> <div>Add</div> </div> </div> |      |                |

Click *Update*. Now the trigger has the indication of its dependency in the list.

Template Module Linux CPU by Zabbix agent: High CPU utilization  
(over { \$CPU.UTIL.CRIT }% for 5m)  
**Depends on:**  
My host: Load average is too high (per CPU load over  
{ \$LOAD\_AVG\_PER\_CPU.MAX.WARN } for 5m)

## Example of several dependencies

For example, the Host is behind the Router2 and the Router2 is behind the Router1.

Zabbix - Router1 - Router2 - Host

If the Router1 is down, then obviously the Host and the Router2 are also unreachable, yet receiving three notifications about the Host, the Router1 and the Router2 all being down is excessive.

So in this case we define two dependencies:

the 'Host is down' trigger depends on the 'Router2 is down' trigger  
the 'Router2 is down' trigger depends on the 'Router1 is down' trigger

Before changing the status of the 'Host is down' trigger, Zabbix will check for the corresponding trigger dependencies. If such are found and one of those triggers is in the 'Problem' state, then the trigger status will not be changed, the actions will not be executed and no notifications will be sent.

Zabbix performs this check recursively. If the Router1 or the Router2 is unreachable, the Host trigger won't be updated.

## 4 Trigger severity

Trigger severity represents the level of importance of a trigger.

Severity Not classified Information Warning Average High Disaster

Zabbix supports the following default trigger severities.

| Severity       | Color      | Description   |
|----------------|------------|---|
| Not classified | Gray       | Can be used where the severity level of an event is unknown, has not been determined, is not part of the regular monitoring scope, etc., for example, during initial configuration, as a placeholder for future assessment, or as part of an integration process. |
| Information    | Light blue | Can be used for informational events that do not require immediate attention, but can still provide valuable insights.  |
| Warning        | Yellow     | Can be used to indicate a potential issue that might require investigation or action, but that is not critical.   |
| Average        | Orange     | Can be used to indicate a significant issue that should be addressed relatively soon to prevent further problems.   |
| High           | Light red  | Can be used to indicate critical issues that need immediate attention to avoid significant disruptions.   |
| Disaster       | Red        | Can be used to indicate a severe incident that requires immediate action to prevent, for example, system outages or data loss.  |

**Note:**

Trigger severity names and colors can be **customized**.

Trigger severities are used for:

- visual representation of triggers - different colors for different severities;
- audio in global alarms - different audio for different severities;
- user media - different media (notification channel) for different severities (for example, SMS for triggers of *High* and *Disaster* severity, and Email for triggers of other severities);
- limiting actions by conditions against trigger severities.

## 5 Customizing trigger severities

Trigger severity names and colors for severity related GUI elements can be configured in *Administration* → *General* → *Trigger displaying options*. Colors are shared among all GUI themes.

Translating customized severity names

**Attention:**

If Zabbix frontend translations are used, custom severity names will override translated names by default.

Default trigger severity names are available for translation in all locales. If a severity name is changed, a custom name is used in all locales and additional manual translation is needed.

Custom severity name translation procedure:

- set required custom severity name, for example, 'Important'
- edit `<frontend_dir>/locale/<required_locale>/LC_MESSAGES/frontend.po`
- add 2 lines:

```
msgid "Important"
msgstr "<translation string>"
```

and save file.

- create .mo files as described in `<frontend_dir>/locale/README`

Here **msgid** should match the new custom severity name and **msgstr** should be the translation for it in the specific language.

This procedure should be performed after each severity name change.

## 6 Mass update

### Overview

With mass update you may change some attribute for a number of triggers at once, saving you the need to open each individual trigger for editing.

### Using mass update

To mass-update some triggers, do the following:

- Mark the checkboxes of the triggers you want to update in the list
- Click on *Mass update* below the list
- Navigate to the tab with required attributes (*Trigger*, *Tags* or *Dependencies*)
- Mark the checkboxes of any attribute to update

### Mass update

[Trigger](#) [Tags](#) [Dependencies](#)

Severity ☒ Not classified Information Warning Average High Disaster

Allow manual close ☐ Original

### Mass update

[Trigger](#) [Tags](#) [Dependencies](#)

Tags ☒ Add Replace Remove

Name

Value

tag

value

Add

The following options are available when selecting the respective button for tag update:

- *Add* - allows to add new tags for the triggers;
- *Replace* - will remove any existing tags from the trigger and replace them with the one(s) specified below;
- *Remove* - will remove specified tags from triggers.

Note that tags with the same name but different values are not considered 'duplicates' and can be added to the same trigger.

### Mass update

Zabbix server: Lack of available memory ( < 20M of 7.72 GB)

Add

*Replace dependencies* - will remove any existing dependencies from the trigger and replace them with the one(s) specified.

Click on *Update* to apply the changes.

7 Predictive trigger functions

Overview

Sometimes there are signs of the upcoming problem. These signs can be spotted so that actions may be taken in advance to prevent or at least minimize the impact of the problem.

Zabbix has tools to predict the future behavior of the monitored system based on historic data. These tools are realized through predictive trigger functions.

Functions

Before setting a trigger, it is necessary to define what a problem state is and how much time is needed to take action. Then there are two ways to set up a trigger signaling about a potential unwanted situation. First: the trigger must fire when the system is expected to be in a problem state after the "time to act". Second: the trigger must fire when the system is going to reach the problem state in less than "time to act". Corresponding trigger functions to use are **forecast** and **timeleft**. Note that underlying statistical analysis is basically identical for both functions. You may set up a trigger whichever way you prefer with similar results.

Parameters

Both functions use almost the same set of parameters. Use the list of [supported functions](#) for reference.

Time interval

First of all, you should specify the historic period Zabbix should analyze to come up with the prediction. You do it in a familiar way by means of the `time period` parameter and optional time shift like you do it with **avg**, **count**, **delta**, **max**, **min** and **sum** functions.

Forecasting horizon

(**forecast** only)

Parameter `time` specifies how far in the future Zabbix should extrapolate dependencies it finds in historic data. No matter if you use `time_shift` or not, `time` is always counted starting from the current moment.

Threshold to reach

(**timeleft** only)

Parameter `threshold` specifies a value the analyzed item has to reach, no difference if from above or from below. Once we have determined  $f(t)$  (see below), we should solve equation  $f(t) = \text{threshold}$  and return the root which is closer to now and to the right from now or 9999999999.9999 if there is no such root.

**Note:**  
When item values approach the threshold and then cross it, **timeleft** assumes that intersection is already in the past and therefore switches to the next intersection with `threshold` level, if any. Best practice should be to use predictions as a complement to ordinary problem diagnostics, not as a substitution.<sup>1</sup>

Fit functions

Default `fit` is the *linear* function. But if your monitored system is more complicated you have more options to choose from.

| fit                      | $x = f(t)$  |
|--------------------------|---|
| linear                   | $x = a + b \cdot t$   |
| polynomialN <sup>2</sup> | $x = a_0 + a_1 \cdot t + a_2 \cdot t^2 + \dots + a_n \cdot t^n$ |
| exponential              | $x = a \cdot \exp(b \cdot t)$                                   |
| logarithmic              | $x = a + b \cdot \log(t)$                                       |
| power                    | $x = a \cdot t^b$   |

Modes

(**forecast** only)

Every time a trigger function is evaluated, it gets data from the specified history period and fits a specified function to the data. So, if the data is slightly different, the fitted function will be slightly different. If we simply calculate the value of the fitted function at a specified time in the future, you will know nothing about how the analyzed item is expected to behave between now and that moment in the future. For some `fit` options (like *polynomial*) a simple value from the future may be misleading.

| mode  | <b>forecast</b> result        |
|-------|-------------------------------|
| value | $f(\text{now} + \text{time})$ |

| mode         | forecast result   |
|--------------|---|
| <i>max</i>   | $\max_{\text{now} \leq t \leq \text{now} + \text{time}} f(t)$   |
| <i>min</i>   | $\min_{\text{now} \leq t \leq \text{now} + \text{time}} f(t)$   |
| <i>delta</i> | $\text{max} - \text{min}$   |
| <i>avg</i>   | average of $f(t)$ ( $\text{now} \leq t \leq \text{now} + \text{time}$ ) according to <a href="#">definition</a> |

## Details

To avoid calculations with huge numbers, we consider the timestamp of the first value in specified period plus 1 ns as a new zero-time (current epoch time is of order  $10^9$ , epoch squared is  $10^{18}$ , double precision is about  $10^{-16}$ ). 1 ns is added to provide all positive time values for *logarithmic* and *power* fits which involve calculating  $\log(t)$ . Time shift does not affect *linear*, *polynomial*, *exponential* (apart from easier and more precise calculations) but changes the shape of *logarithmic* and *power* functions.

## Potential errors

Functions return -1 in such situations:

- specified evaluation period contains no data;
- result of mathematical operation is not defined<sup>3</sup>;
- numerical complications (unfortunately, for some sets of input data range and precision of double-precision floating-point format become insufficient)<sup>4</sup>.

### Note:

No warnings or errors are flagged if chosen fit poorly describes provided data or there is just too few data for accurate prediction.

## Examples and dealing with errors

To get a warning when you are about to run out of free disk space on your host, you may use a trigger expression like this:

```
timeleft(/host/vfs.fs.size[/,free],1h,0)<1h
```

However, error code -1 may come into play and put your trigger in a problem state. Generally it's good because you get a warning that your predictions don't work correctly and you should look at them more thoroughly to find out why. But sometimes it's bad because -1 can simply mean that there was no data about the host free disk space obtained in the last hour. If you are getting too many false positive alerts, consider using more complicated trigger expression<sup>5</sup>:

```
timeleft(/host/vfs.fs.size[/,free],1h,0)<1h and timeleft(/host/vfs.fs.size[/,free],1h,0)<>-1
```

The situation is a bit more difficult with **forecast**. First of all, -1 may or may not put the trigger in a problem state depending on whether you have expression like `forecast(/host/item,...)<...` or like `forecast(/host/item,...)>...`

Furthermore, -1 may be a valid forecast if it's normal for the item value to be negative. But probability of this situation in the real world situation is negligible (see [how](#) the operator = works). So add `... or forecast(/host/item,...)=-1` or `... and forecast(/host/item,...)<>-1` if you want or don't want to treat -1 as a problem respectively.

## Footnotes

<sup>1</sup> For example, a simple trigger like `timeleft(/host/item,1h,X) < 1h` may go into problem state when the item value approaches X and then suddenly recover once value X is reached. If the problem is item value being below X, use: `last(/host/item) < X` or `timeleft(/host/item,1h,X) < 1h` If the problem is item value being above X, use: `last(/host/item) > X` or `timeleft(/host/item,1h,X) < 1h`

<sup>2</sup> Polynomial degree can be from 1 to 6, *polynomial1* is equivalent to *linear*. However, use higher degree polynomials [with caution](#). If the evaluation period contains less points than needed to determine polynomial coefficients, polynomial degree will be lowered (e.g., *polynomial5* is requested, but there are only 4 points, therefore *polynomial3* will be fitted).

<sup>3</sup> For example, fitting *exponential* or *power* functions involves calculating  $\log()$  of item values. If data contains zeros or negative numbers, you will get an error since  $\log()$  is defined for positive values only.

<sup>4</sup> For *linear*, *exponential*, *logarithmic* and *power* fits all necessary calculations can be written explicitly. For *polynomial* only *value* can be calculated without any additional steps. Calculating *avg* involves computing polynomial antiderivative (analytically). Computing *max*, *min* and *delta* involves computing polynomial derivative (analytically) and finding its roots (numerically). Solving  $f(t) = 0$  involves finding polynomial roots (numerically).

<sup>5</sup> But in this case -1 can cause your trigger to recover from the problem state. To be fully protected use: `timeleft(/host/vfs.fs.size[/,free],1h,0)<1h and ({TRIGGER.VALUE}=0 and timeleft(/host/vfs.fs.size[/,free],1h,0)<>-1 or {TRIGGER.VALUE}=1)`

## 4 Events

### Overview

There are several types of events generated in Zabbix:

- trigger events - whenever a trigger changes its status (*OK*→*PROBLEM*→*OK*)
- service events - whenever a service changes its status (*OK*→*PROBLEM*→*OK*)
- discovery events - when hosts or services are detected
- autoregistration events - when active agents are auto-registered by server
- internal events - when an item/low-level discovery rule becomes unsupported or a trigger goes into an unknown state

#### Note:

Internal events are supported starting with Zabbix 2.2 version.

Events are time-stamped and can be the basis of actions such as sending notification e-mail etc.

To view details of events in the frontend, go to *Monitoring* → *Problems*. There you can click on the event date and time to view details of an event.

More information is available on:

- [trigger events](#)
- [other event sources](#)

### 1 Trigger event generation

#### Overview

Change of trigger status is the most frequent and most important source of events. Each time the trigger changes its state, an event is generated. The event contains details of the trigger state's change - when it happened and what the new state is.

Two types of events are created by triggers - Problem and OK.

#### Problem events

A problem event is created:

- when a trigger expression evaluates to TRUE if the trigger is in OK state;
- each time a trigger expression evaluates to TRUE if multiple problem event generation is enabled for the trigger.

#### OK events

An OK event closes the related problem event(s) and may be created by 3 components:

- triggers - based on 'OK event generation' and 'OK event closes' settings;
- event correlation
- task manager - when an event is **manually closed**

#### Triggers

Triggers have an 'OK event generation' setting that controls how OK events are generated:

- *Expression* - an OK event is generated for a trigger in problem state when its expression evaluates to FALSE. This is the simplest setting, enabled by default.
- *Recovery expression* - an OK event is generated for a trigger in problem state when its expression evaluates to FALSE and the recovery expression evaluates to TRUE. This can be used if trigger recovery criteria is different from problem criteria.
- *None* - an OK event is never generated. This can be used in conjunction with multiple problem event generation to simply send a notification when something happens.

Additionally triggers have an 'OK event closes' setting that controls which problem events are closed:

- *All problems* - an OK event will close all open problems created by the trigger
- *All problems if tag values match* - an OK event will close open problems created by the trigger and having at least one matching tag value. The tag is defined by 'Tag for matching' trigger setting. If there are no problem events to close then OK event is not generated. This is often called trigger level event correlation.

## Event correlation

Event correlation (also called global event correlation) is a way to set up custom event closing (resulting in OK event generation) rules.

The rules define how the new problem events are paired with existing problem events and allow to close the new event or the matched events by generating corresponding OK events.

However, event correlation must be configured very carefully, as it can negatively affect event processing performance or, if misconfigured, close more events than intended (in the worst case even all problem events could be closed). A few configuration tips:

1. always reduce the correlation scope by setting a unique tag for the control event (the event that is paired with old events) and use the 'new event tag' correlation condition
2. don't forget to add a condition based on the old event when using 'close old event' operation, or all existing problems could be closed
3. avoid using common tag names used by different correlation configurations

## Task manager

If the 'Allow manual close' setting is enabled for trigger, then it's possible to manually close problem events generated by the trigger. This is done in the frontend when **updating a problem**. The event is not closed directly – instead a 'close event' task is created, which is handled by the task manager shortly. The task manager will generate a corresponding OK event and the problem event will be closed.

## 2 Other event sources

### Service events

Service events are generated only if service actions for these events are enabled. In this case, each service status change creates a new event:

- Problem event - when service status is changed from OK to PROBLEM
- OK event - when service status is changed from PROBLEM to OK

The event contains details of the service state change - when it happened and what the new state is.

### Discovery events

Zabbix periodically scans the IP ranges defined in network discovery rules. Frequency of the check is configurable for each rule individually. Once a host or a service is discovered, a discovery event (or several events) are generated.

Zabbix generates the following events:

| Event              | When generated  |
|--------------------|---|
| Service Up         | Every time Zabbix detects active service.                               |
| Service Down       | Every time Zabbix cannot detect service.                                |
| Host Up            | If at least one of the services is UP for the IP.                       |
| Host Down          | If all services are not responding.                                     |
| Service Discovered | If the service is back after downtime or discovered for the first time. |
| Service Lost       | If the service is lost after being up.                                  |
| Host Discovered    | If host is back after downtime or discovered for the first time.        |
| Host Lost          | If host is lost after being up.   |

### Active agent autoregistration events

Active agent autoregistration creates events in Zabbix.

If configured, active agent autoregistration event is created when a previously unknown active agent asks for checks or if the host metadata has changed. The server adds a new auto-registered host, using the received IP address and port of the agent.

For more information, see the **active agent autoregistration** page.

### Internal events

Internal events happen when:

- an item changes state from 'normal' to 'unsupported'
- an item changes state from 'unsupported' to 'normal'
- a low-level discovery rule changes state from 'normal' to 'unsupported'

- a low-level discovery rule changes state from 'unsupported' to 'normal'
- a trigger changes state from 'normal' to 'unknown'
- a trigger changes state from 'unknown' to 'normal'

Internal events are supported since Zabbix 2.2. The aim of introducing internal events is to allow users to be notified when any internal event takes place, for example, an item becomes unsupported and stops gathering data.

Internal events are only created when internal actions for these events are enabled. To stop generation of internal events (for example, for items becoming unsupported), disable all actions for internal events in Configuration → Actions → Internal actions.

**Note:**

If internal actions are disabled, while an object is in the 'unsupported' state, recovery event for this object will still be created.

If internal actions are enabled, while an object is in the 'unsupported' state, recovery event for this object will be created, even though 'problem event' has not been created for the object.

See also: [Receiving notification on unsupported items](#)

### 3 Manual closing of problems

#### Overview

While generally problem events are resolved automatically when trigger status goes from 'Problem' to 'OK', there may be cases when it is difficult to determine if a problem has been resolved by means of a trigger expression. In such cases, the problem needs to be resolved manually.

For example, *syslog* may report that some kernel parameters need to be tuned for optimal performance. In this case the issue is reported to Linux administrators, they fix it and then close the problem manually.

Problems can be closed manually only for triggers with the *Allow manual close* option enabled.

When a problem is "manually closed", Zabbix generates a new internal task for Zabbix server. Then the *task manager* process executes this task and generates an OK event, therefore closing problem event.

A manually closed problem does not mean that the underlying trigger will never go into a 'Problem' state again. The trigger expression is re-evaluated and may result in a problem:

- When new data arrive for any item included in the trigger expression (note that the values discarded by a throttling preprocessing step are not considered as received and will not cause trigger expression to be re-evaluated);
- When **date and time** and/or `nodata()` functions are used in the expression.

#### Configuration

Two steps are required to close a problem manually.

#### Trigger configuration

In trigger configuration, enable the *Allow manual close* option.

**Allow manual close** ☒

#### Problem update window

If a problem arises for a trigger with the *Manual close* flag, you can open the **problem update** popup window of that problem and close the problem manually.

To close the problem, check the *Close problem* option in the form and click on *Update*.

Update problem

Update

Cancel

All mandatory input fields are marked with a red asterisk.

The request is processed by Zabbix server. Normally it will take a few seconds to close the problem. During that process *CLOSING* is displayed in *Monitoring* → *Problems* as the status of the problem.

#### Verification

It can be verified that a problem has been closed manually:

- in event details, available through *Monitoring* → *Problems*;
- by using the {EVENT.UPDATE.HISTORY} macro in notification messages that will provide this information.

## 5 Event correlation

### Overview

Event correlation allows to correlate problem events to their resolution in a manner that is very precise and flexible.

Event correlation can be defined:

- **on trigger level** - one trigger may be used to relate separate problems to their solution
- **globally** - problems can be correlated to their solution from a different trigger/polling method using global correlation rules

### 1 Trigger-based event correlation

#### Overview

Trigger-based event correlation allows to correlate separate problems reported by one trigger.

While generally an OK event can close all problem events created by one trigger, there are cases when a more detailed approach is needed. For example, when monitoring log files you may want to discover certain problems in a log file and close them individually rather than all together.

This is the case with triggers that have *PROBLEM event generation mode* parameter set to *Multiple*. Such triggers are normally used for log monitoring, trap processing, etc.

It is possible in Zabbix to relate problem events based on **tagging**. Tags are used to extract values and create identification for problem events. Taking advantage of that, problems can also be closed individually based on matching tag.

In other words, the same trigger can create separate events identified by the event tag. Therefore problem events can be identified one-by-one and closed separately based on the identification by the event tag.

How it works

In log monitoring you may encounter lines similar to these:

```
Line1: Application 1 stopped
Line2: Application 2 stopped
Line3: Application 1 was restarted
Line4: Application 2 was restarted
```

The idea of event correlation is to be able to match the problem event from Line1 to the resolution from Line3 and the problem event from Line2 to the resolution from Line4, and close these problems one by one:

```
Line1: Application 1 stopped
Line3: Application 1 was restarted #problem from Line 1 closed
```

```
Line2: Application 2 stopped
Line4: Application 2 was restarted #problem from Line 2 closed
```

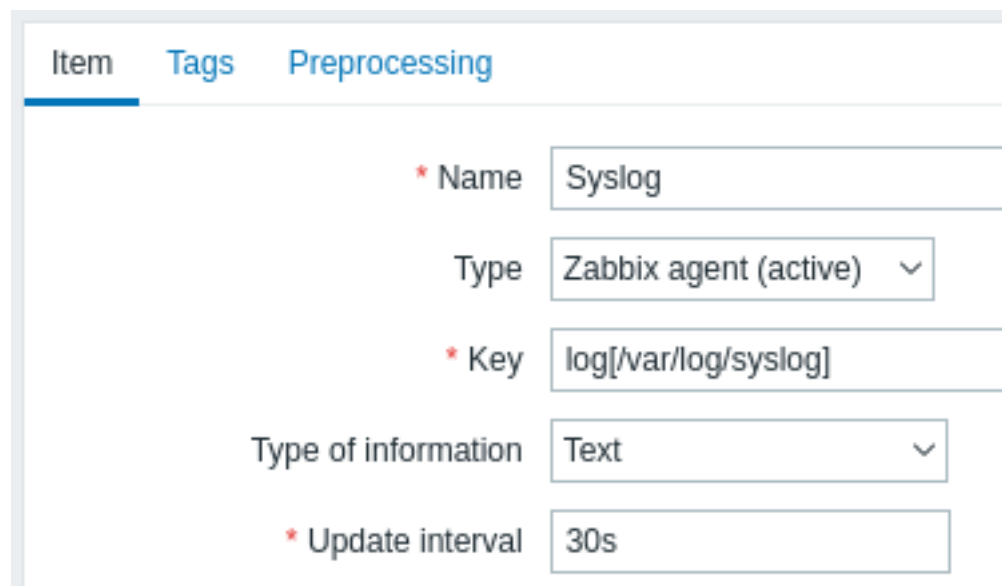

To do this you need to tag these related events as, for example, "Application 1" and "Application 2". That can be done by applying a regular expression to the log line to extract the tag value. Then, when events are created, they are tagged "Application 1" and "Application 2" respectively and problem can be matched to the resolution.

Configuration

Item

To begin with, you may want to set up an item that monitors a log file, for example:

```
log[/var/log/syslog]
```

The screenshot shows the Zabbix Item configuration form. The 'Item' tab is selected. The form contains the following fields:

- Name:** Syslog
- Type:** Zabbix agent (active) (dropdown menu)
- Key:** log[/var/log/syslog]
- Type of information:** Text (dropdown menu)
- Update interval:** 30s

With the item set up, wait a minute for the configuration changes to be picked up and then go to **Latest data** to make sure that the item has started collecting data.

Trigger

With the item working you need to configure the **trigger**. It's important to decide what entries in the log file are worth paying attention to. For example, the following trigger expression will search for a string like 'Stopping' to signal potential problems:

```
find(/My host/log[/var/log/syslog],,"regex","Stopping")=1
```

**Attention:**

To make sure that each line containing the string "Stopping" is considered a problem also set the *Problem event generation mode* in trigger configuration to 'Multiple'.

Then define a recovery expression. The following recovery expression will resolve all problems if a log line is found containing the string "Starting":

```
find(/My host/log[/var/log/syslog],,"regexp","Starting")=1
```

Since we do not want that it's important to make sure somehow that the corresponding root problems are closed, not just all problems. That's where tagging can help.

Problems and resolutions can be matched by specifying a tag in the trigger configuration. The following settings have to be made:

- *Problem event generation mode*: Multiple
- *OK event closes*: All problems if tag values match
- Enter the name of the tag for event matching

### Warning:

Because misconfiguration is possible, when similar event tags may be created for **unrelated** problems, please review the cases outlined below!

- With two applications writing error and recovery messages to the same log file a user may decide to use two *Application* tags in the same trigger with different tag values by using separate regular expressions in the tag values to extract the names of, say, application A and application B from the {ITEM.VALUE} macro (e.g. when the message formats differ). However, this may not work as planned if there is no match to the regular expressions. Non-matching regexps will yield empty tag values and a single empty tag value in both problem and OK events is enough to correlate them. So a recovery message from application A may accidentally close an error message from application B.
- Actual tags and tag values only become visible when a trigger fires. If the regular expression used is invalid, it is silently replaced with an \*UNKNOWN\* string. If the initial problem event with an \*UNKNOWN\* tag value is missed, there may appear subsequent OK events with the same \*UNKNOWN\* tag value that may close problem events which they shouldn't have closed.
- If a user uses the {ITEM.VALUE} macro without macro functions as the tag value, the 255-character limitation applies. When log messages are long and the first 255 characters are non-specific, this may also result in similar event tags for unrelated problems.

## 2 Global event correlation

### Overview

Global event correlation allows to reach out over all metrics monitored by Zabbix and create correlations.

It is possible to correlate events created by completely different triggers and apply the same operations to them all. By creating intelligent correlation rules it is actually possible to save yourself from thousands of repetitive notifications and focus on root causes of a problem!

Global event correlation is a powerful mechanism, which allows you to untie yourself from one-trigger based problem and resolution logic. So far, a single problem event was created by one trigger and we were dependent on that same trigger for the problem resolution. We could not resolve a problem created by one trigger with another trigger. But with event correlation based on event tagging, we can.

For example, a log trigger may report application problems, while a polling trigger may report the application to be up and running. Taking advantage of event tags you can tag the log trigger as *Status: Down* while tag the polling trigger as *Status: Up*. Then, in a global correlation rule you can relate these triggers and assign an appropriate operation to this correlation such as closing the old events.

In another use, global correlation can identify similar triggers and apply the same operation to them. What if we could get only one problem report per network port problem? No need to report them all. That is also possible with global event correlation.

Global event correlation is configured in **correlation rules**. A correlation rule defines how the new problem events are paired with existing problem events and what to do in case of a match (close the new event, close matched old events by generating corresponding OK events). If a problem is closed by global correlation, it is reported in the *Info* column of *Monitoring* → *Problems*.

Configuring global correlation rules is available to Super Admin level users only.

### Attention:

Event correlation must be configured very carefully, as it can negatively affect event processing performance or, if misconfigured, close more events than was intended (in the worst case even all problem events could be closed).

To configure global correlation **safely**, observe the following important tips:

- Reduce the correlation scope. Always set a unique tag for the new event that is paired with old events and use the *New event tag* correlation condition;
- Add a condition based on the old event when using the *Close old event* operation (or else all existing problems could be closed);

- Avoid using common tag names that may end up being used by different correlation configurations;
- Keep the number of correlation rules limited to the ones you really need.

See also: [known issues](#).

## Configuration

To configure event correlation rules globally:

- Go to *Configuration* → *Event correlation*
- Click on *Create correlation* to the right (or on the correlation name to edit an existing rule)
- Enter parameters of the correlation rule in the form

\* Name

Close old events

Type of calculation

And

▼

A and (B and C) and D

\* Conditions

| Label               | Name   |
|---------------------|--|
| A                   | Value of old event tag <i>Application</i> equals value of new event tag <i>Application</i> |
| B                   | Value of old event tag <i>Application</i> equals <i>ABC</i>                                |
| C                   | Value of old event tag <i>State</i> equals <i>Down</i>                                     |
| D                   | Value of new event tag <i>State</i> equals <i>Up</i>                                       |
| <a href="#">Add</a> |  |

Description

Close old events for application ABC if an event with State=Up happens.

Operations

☒ Close old events  
☐ Close new event

\* At least one operation must be selected.

Enabled

☒

All mandatory input fields are marked with a red asterisk.

| Parameter                  | Description  |
|----------------------------|--|
| <i>Name</i>                | Unique correlation rule name.  |
| <i>Type of calculation</i> | <p>The following options of calculating conditions are available:</p> <p><b>And</b> - all conditions must be met</p> <p><b>Or</b> - enough if one condition is met</p> <p><b>And/Or</b> - AND with different condition types and OR with the same condition type</p> <p><b>Custom expression</b> - a user-defined calculation formula for evaluating action conditions. It must include all conditions (represented as uppercase letters A, B, C, ...) and may include spaces, tabs, brackets ( ), <b>and</b> (case sensitive), <b>or</b> (case sensitive), <b>not</b> (case sensitive).</p> |
| <i>Conditions</i>          | List of conditions. See below for details on configuring a condition.  |
| <i>Description</i>         | Correlation rule description.  |

| Parameter         | Description   |
|-------------------|---|
| <i>Operations</i> | <p>Mark the checkbox of the operation to perform when event is correlated. The following operations are available:</p> <p><b>Close old events</b> - close old events when a new event happens. Always add a condition based on the old event when using the <i>Close old events</i> operation or all existing problems could be closed.</p> <p><b>Close new event</b> - close the new event when it happens</p> |
| <i>Enabled</i>    | If you mark this checkbox, the correlation rule will be enabled.  |

To configure details of a new condition, click on [Add](#) in the Conditions block. A popup window will open where you can edit the condition details.

| Parameter            | Description  |
|----------------------|--|
| <i>New condition</i> | <p>Select a condition for correlating events.</p> <p><i>Note</i> that if no old event condition is specified, all old events may be matched and closed. Similarly if no new event condition is specified, all new events may be matched and closed. The following conditions are available:</p> <p><b>Old event tag</b> - specify the old event tag for matching.</p> <p><b>New event tag</b> - specify the new event tag for matching.</p> <p><b>New event host group</b> - specify the new event host group for matching.</p> <p><b>Event tag pair</b> - specify new event tag and old event tag for matching. In this case there will be a match if the <b>values</b> of the tags in both events match. Tag <i>names</i> need not match. This option is useful for matching runtime values, which may not be known at the time of configuration (see also <a href="#">Example 1</a>).</p> <p><b>Old event tag value</b> - specify the old event tag name and value for matching, using the following operators:</p> <p><i>equals</i> - has the old event tag value</p> <p><i>does not equal</i> - does not have the old event tag value</p> <p><i>contains</i> - has the string in the old event tag value</p> <p><i>does not contain</i> - does not have the string in the old event tag value</p> <p><b>New event tag value</b> - specify the new event tag name and value for matching, using the following operators:</p> <p><i>equals</i> - has the new event tag value</p> <p><i>does not equal</i> - does not have the new event tag value</p> <p><i>contains</i> - has the string in the new event tag value</p> <p><i>does not contain</i> - does not have the string in the new event tag value</p> |

**Warning:**

Because misconfiguration is possible, when similar event tags may be created for **unrelated** problems, please review the cases outlined below!

- Actual tags and tag values only become visible when a trigger fires. If the regular expression used is invalid, it is silently replaced with an *\*UNKNOWN\** string. If the initial problem event with an *\*UNKNOWN\** tag value is missed, there may appear subsequent OK events with the same *\*UNKNOWN\** tag value that may close problem events which they shouldn't have closed.
- If a user uses the {ITEM.VALUE} macro without macro functions as the tag value, the 255-character limitation applies. When log messages are long and the first 255 characters are non-specific, this may also result in similar event tags for unrelated problems.

Example

Stop repetitive problem events from the same network port.

|                     |  |  |
|---------------------|--|--|
| * Name              | Correlate network port problems  |  |
| Type of calculation | And  | A and B  |
| * Conditions        | Label  | Name   |
|                     | A  | Value of old event tag <i>Port</i> equals value of new event tag <i>Port</i> |
|                     | B  | Value of old event tag <i>Host</i> equals value of new event tag <i>Host</i> |
|                     | <a href="#">Add</a>  |  |
| Description         | Keep only one problem per port. No need to report all of them.                                   |  |
| Operations          | <input type="checkbox"/> Close old events<br><input checked="" type="checkbox"/> Close new event |  |
|                     | * At least one operation must be selected.   |  |
| Enabled             | <input checked="" type="checkbox"/>  |  |
|                     | <a href="#">Add</a>  | <a href="#">Cancel</a>   |

This global correlation rule will correlate problems if *Host* and *Port* tag values exist on the trigger and they are the same in the original event and the new one.

The operation will close new problem events on the same network port, keeping only the original problem open.

## 6 Tagging

Overview

There is an option to tag various entities in Zabbix. Tags can be defined for:

- templates
- hosts
- items
- web scenarios

- triggers
- services
- template items and triggers
- host, item and trigger prototypes

Tags have several uses, most notably, to mark events. If entities are tagged, the corresponding new events get marked accordingly:

- with tagged templates - any host problems created by relevant entities (items, triggers, etc) from this template will be marked
- with tagged hosts - any problem of the host will be marked
- with tagged items, web scenarios - any data/problem of this item or web scenario will be marked
- with tagged triggers - any problem of this trigger will be marked

A problem event inherits all tags from the whole chain of templates, hosts, items, web scenarios, triggers. Completely identical tag:value combinations (after resolved macros) are merged into one rather than being duplicated, when marking the event.

Having custom event tags allows for more flexibility. Importantly, events can be **correlated** based on event tags. In other uses, actions can be defined based on tagged events. Item problems can be grouped based on tags. Problem tags can also be used to map problems to **services**.

Tagging is realized as a pair of *tag name* and *value*. You can use only the name or pair it with a value:

MySQL, Service:MySQL, Services, Services:Customer, Applications, Application:Java, Priority:High

An entity (template, host, item, web scenario, trigger or event) may be tagged with the same name, but different values - these tags will not be considered 'duplicates'. Similarly, a tag without value and the same tag with value can be used simultaneously.

Use cases

Some use cases for this functionality are as follows:

1. Mark trigger events in the frontend:
  - Define a tag at the trigger level, for example `scope:performance`;
  - All problems created by this trigger will be marked with this tag.
2. Mark all template-inherited problems:
  - Define a tag at the template level, for example `target:MySQL`;
  - All host problems created by triggers from this template will be marked with this tag.
3. Mark all host problems:
  - Define a tag at the host level, for example `service:Jira`;
  - All problems of the host triggers will be marked with this tag.
4. Group related items:
  - Define a tag at the item level, for example `component:cpu`;
  - In the *Latest data* section, use the tag filter to view all items tagged as `component:cpu`.
5. Identify problems in a log file and close them separately:
  - Define tags in the log trigger that will identify events using value extraction by the `{{ITEM.VALUE<N>}}.regsub()` macro;
  - In the trigger configuration, set multiple problem event generation mode;
  - In the trigger configuration, use **event correlation**: select the option that OK event closes only matching events and choose the tag for matching;
  - See problem events created with a tag and closed individually.
6. Use it to filter notifications:
  - Define tags at the trigger level to mark events by different tags;
  - Use tag filtering in action conditions to receive notifications only on the events that match tag data.
7. Use information extracted from item value as tag value:
  - Use an `{{ITEM.VALUE<N>}}.regsub()` macro in the tag value;
  - See tag values in *Monitoring* → *Problems* as extracted data from the item value.
8. Identify problems better in notifications:
  - Define tags at the trigger level;
  - Use an `{EVENT.TAGS}` macro in the problem notification;
  - Easier identify which application/service the notification belongs to.
9. Simplify configuration tasks by using tags at the template level:
  - Define tags at the template trigger level;
  - See these tags on all triggers created from template triggers.
10. Create triggers with tags from low-level discovery (LLD):
  - Define tags on trigger prototypes;
  - Use LLD macros in the tag name or value;
  - See these tags on all triggers created from trigger prototypes.
11. Match services using **service tags**:

- Define **service actions** for services with matching tags;
  - Use service tags to map a service to an SLA for **SLA calculations**.
- Map services to problems using **problem tags**:
    - In the service configuration, specify **problem tag**, for example `target:MySQL`;
    - Problems with the matching tag will be automatically correlated to the service;
    - Service status will change to the status of the problem with the highest severity.
  - Suppress problems when a host is in maintenance mode:
    - Define tags in **Maintenance periods** to suppress only problems with matching tags.
  - Grant access to user groups:
    - Specify tags in the **user group** configuration to allow viewing only problems with matching tags.

## Configuration

Tags can be entered in a dedicated tab, for example, in trigger configuration:

| Name      | Value                                    | Action                 |
|-----------|--|------------------------|
| Cloud     | value                                    | <a href="#">Remove</a> |
| Service   | MySQL                                    | <a href="#">Remove</a> |
| Customers | value                                    | <a href="#">Remove</a> |
| Host      | {{ITEM.VALUE2}.iregsub(pattern, output)} | <a href="#">Remove</a> |

[Add](#)

## Macro support

Built-in and user macros in tags are resolved at the time of the event. Until the event has occurred these macros will be shown in Zabbix frontend unresolved. Low-level discovery macros are resolved during discovery process.

The following macros may be used in trigger tags:

- `{ITEM.VALUE}`, `{ITEM.LASTVALUE}`, `{HOST.HOST}`, `{HOST.NAME}`, `{HOST.CONN}`, `{HOST.DNS}`, `{HOST.IP}`, `{HOST.PORT}` and `{HOST.ID}` macros can be used to populate the tag name or tag value.
- `{INVENTORY.*}` **macros** can be used to reference host inventory values from one or several hosts in a trigger expression.
- **User macros** and user macros with context are supported for the tag name/value; context may include low-level discovery macros.
- Low-level discovery macros can be used for the tag name/value in trigger prototypes.

The following macros may be used in trigger-based notifications:

- `{EVENT.TAGS}` and `{EVENT.RECOVERY.TAGS}` macros will resolve to a comma separated list of event tags or recovery event tags
- `{EVENT.TAGSJSON}` and `{EVENT.RECOVERY.TAGSJSON}` macros will resolve to a JSON array containing event tag **objects** or recovery event tag objects

The following macros may be used in template, host, item and web scenario tags:

- `{HOST.HOST}`, `{HOST.NAME}`, `{HOST.CONN}`, `{HOST.DNS}`, `{HOST.IP}`, `{HOST.PORT}` and `{HOST.ID}` macros
- `{INVENTORY.*}` **macros**
- **User macros**
- Low-level discovery macros can be used in item prototype tags

The following macros may be used in host prototype tags:

- `{HOST.HOST}`, `{HOST.NAME}`, `{HOST.CONN}`, `{HOST.DNS}`, `{HOST.IP}`, `{HOST.PORT}` and `{HOST.ID}` macros
- `{INVENTORY.*}` **macros**
- **User macros**
- **Low-level discovery macros** will be resolved during discovery process and then added to the discovered host

## Substring extraction in trigger tags

Substring extraction is supported for populating the tag name or tag value, using a macro **function** - applying a regular expression to the value obtained by the {ITEM.VALUE}, {ITEM.LASTVALUE} macro or a low-level discovery macro. For example:

```
{{ITEM.VALUE}.regsub(pattern, output)}  
{{ITEM.VALUE}.iregsub(pattern, output)}
```

```
{{#LLDMACRO}.regsub(pattern, output)}  
{{#LLDMACRO}.iregsub(pattern, output)}
```

Tag name and value will be cut to 255 characters if their length exceeds 255 characters after macro resolution.

See also: Using macro functions in **low-level discovery macros** for event tagging.

## Viewing event tags

Tagging, if defined, can be seen with new events in:

- *Monitoring → Problems*
- *Monitoring → Problems → Event details*
- *Monitoring → Dashboard → Problems widget*

Only the first three tag entries can be displayed. If there are more than three tag entries, it is indicated by three dots. If you roll your mouse over these three dots, all tag entries are displayed in a pop-up window.

Note that the order in which tags are displayed is affected by tag filtering and the *Tag display priority* option in the filter of *Monitoring → Problems* or the *Problems* dashboard widget.

## 7 Visualization

### 1 Graphs

#### Overview

With lots of data flowing into Zabbix, it becomes much easier for the users if they can look at a visual representation of what is going on rather than only numbers.

This is where graphs come in. Graphs allow to grasp the data flow at a glance, correlate problems, discover when something started or make a presentation of when something might turn into a problem.

Zabbix provides users with:

- built-in **simple graphs** of one item data
- the possibility to create more complex **customized graphs**
- access to a comparison of several items quickly in **ad-hoc graphs**
- modern customizable **vector graphs**

#### 1 Simple graphs

#### Overview

Simple graphs are provided for the visualization of data gathered by items.

No configuration effort is required on the user part to view simple graphs. They are freely made available by Zabbix.

Just go to *Monitoring → Latest data* and click on the Graph link for the respective item and a graph will be displayed.

#### Note:

Simple graphs are provided for all numeric items. For textual items, a link to History is available in *Monitoring* → *Latest data*.

#### Time period selector

Take note of the time period selector above the graph. It allows to select often required periods with one mouse click.

Note that such options as *Today*, *This week*, *This month*, *This year* display the whole period, including the hours/days in the future. *Today so far*, in contrast, only displays the hours passed.

Once a period is selected, it can be moved back and forth in time by clicking on the  arrow buttons. The *Zoom out* button allows to zoom out the period two times or by 50% in each direction. Zoom out is also possible by double-clicking in the graphs. The whole time period selector can be collapsed by clicking on the tab label containing the selected period string.

The *From/To* fields display the selected period in either:

- absolute time syntax in format `Y-m-d H:i:s`
- relative time syntax, e.g.: `now-1d`

A date in **relative** format can contain one or several mathematical operations (- or +), e.g. `now-1d` or `now-1d-2h+5m`. For relative time the following abbreviations are supported:

- `now`
- `s` (seconds)
- `m` (minutes)
- `h` (hours)
- `d` (days)
- `w` (weeks)
- `M` (months)
- `y` (years)

**Precision** is supported in the time filter (e. g., an expression like `now-1d/M`). Details of precision:

| Precision | From                        | To                          |
|-----------|-----------------------------|-----------------------------|
| <i>m</i>  | Y-m-d H:m:00                | Y-m-d H:m:59                |
| <i>h</i>  | Y-m-d H:00:00               | Y-m-d H:59:59               |
| <i>d</i>  | Y-m-d 00:00:00              | Y-m-d 23:59:59              |
| <i>w</i>  | Monday of the week 00:00:00 | Sunday of the week 23:59:59 |

| Precision | From                                | To                                    |
|-----------|-------------------------------------|---------------------------------------|
| <i>M</i>  | First day of the month 00:00:00     | Last day of the month 23:59:59        |
| <i>y</i>  | 1st of January of the year 00:00:00 | 31st of December of the year 23:59:59 |

For example:

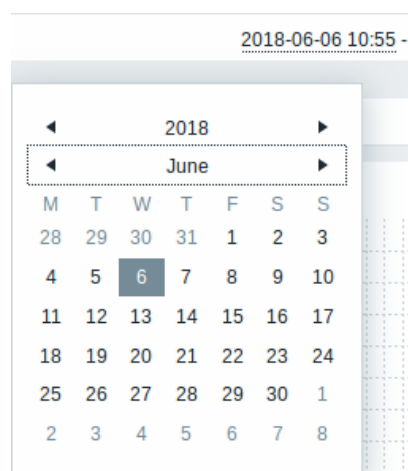

| From            | To              | Selected period  |
|-----------------|-----------------|--|
| <i>now/d</i>    | <i>now/d</i>    | 00:00 - 23:59 today  |
| <i>now/d</i>    | <i>now/d+1d</i> | 00:00 today - 23:59 tomorrow                               |
| <i>now/w</i>    | <i>now/w</i>    | Monday 00:00:00 - Sunday 23:59:59 this week                |
| <i>now-1y/w</i> | <i>now-1y/w</i> | The week of Monday 00:00:00 - Sunday 23:59:59 one year ago |

#### Attention:

Using "*now/M+1M*" for the *To* parameter may add 31 days, which can result in the date shifting by 1-3 days depending on the number of days in the month. For example, if used in January, the result may be 02 March instead of the expected 28 February. To avoid this issue, use "*now/M-3d+1M/M*", which adjusts for month length accurately. Similarly, if configuring *From* to go backward, use "*now/M+3d-1M/M*".

#### Date picker

It is possible to pick a specific start/end date by clicking on the calendar icon next to the *From/To* fields. In this case, the date picker pop up will open.

Within the date picker, it is possible to navigate between the blocks of year/month/date using Tab and Shift+Tab. Keyboard arrows or arrow buttons allow to select the desired value. Pressing Enter (or clicking on the desired value) activates the choice.

Another way of controlling the displayed time is to highlight an area in the graph with the left mouse button. The graph will zoom into the highlighted area once you release the left mouse button.

In case no time value is specified or field is left blank, time value will be set to "00:00:00". This doesn't apply to today's date selection: in that case time will be set to current value.

#### Recent data vs longer periods

For very recent data a **single** line is drawn connecting each received value. The single line is drawn as long as there is at least one horizontal pixel available for one value.

For data that show a longer period **three lines** are drawn - a dark green one shows the average, while a light pink and a light green line shows the maximum and minimum values at that point in time. The space between the highs and the lows is filled with yellow background.

Working time (working days) is displayed in graphs as a white background, while non-working time is displayed in gray (with the *Original blue* default frontend theme).

Working time is always displayed in simple graphs, whereas displaying it in **custom graphs** is a user preference.

Working time is not displayed if the graph shows more than 3 months.

### Trigger lines

Simple triggers are displayed as lines with black dashes over trigger severity color -- take note of the blue line on the graph and the trigger information displayed in the legend. Up to 3 trigger lines can be displayed on the graph; if there are more triggers then the triggers with lower severity are prioritized. Triggers are always displayed in simple graphs, whereas displaying them in **custom graphs** is a user preference.

Generating from history/trends

Graphs can be drawn based on either item **history** or **trends**.

For the users who have frontend **debug mode** activated, a gray, vertical caption is displayed at the bottom right of a graph indicating where the data come from.

Several factors influence whether history of trends is used:

- longevity of item history. For example, item history can be kept for 14 days. In that case, any data older than the fourteen days will be coming from trends.
- data congestion in the graph. If the amount of seconds to display in a horizontal graph pixel exceeds 3600/16, trend data are displayed (even if item history is still available for the same period).

- if trends are disabled, item history is used for graph building - if available for that period. This is supported starting with Zabbix 2.2.1 (before, disabled trends would mean an empty graph for the period even if item history was available).

#### Absence of data

For items with a regular update interval, nothing is displayed in the graph if item data are not collected.

However, for trapper items and items with a scheduled update interval (and regular update interval set to 0), a straight line is drawn leading up to the first collected value and from the last collected value to the end of graph; the line is on the level of the first/last value respectively.

#### Switching to raw values

A dropdown on the upper right allows to switch from the simple graph to the *Values/500 latest values* listings. This can be useful for viewing the numeric values making up the graph.

The values represented here are raw, i.e. no units or postprocessing of values is used. Value mapping, however, is applied.

#### Known issues

See [known issues](#) for graphs.

## 2 Custom graphs

### Overview

Custom graphs, as the name suggests, offer customization capabilities.

While simple graphs are good for viewing data of a single item, they do not offer configuration capabilities.

Thus, if you want to change graph style or the way lines are displayed or compare several items, for example, incoming and outgoing traffic in a single graph, you need a custom graph.

Custom graphs are configured manually.

They can be created for a host or several hosts or for a single template.

### Configuring custom graphs

To create a custom graph, do the following:

- Go to *Configuration* → *Hosts (or Templates)*
- Click on *Graphs* in the row next to the desired host or template
- In the Graphs screen click on *Create graph*
- Edit graph attributes

Graph attributes:

| Parameter                      | Description   |
|--------------------------------|---|
| <i>Name</i>                    | Unique graph name.<br>Expression <b>macros</b> are supported in this field, but only with avg, last, min and max functions, with time as parameter (for example, {?avg(/host/key,1h)}).<br>{HOST.HOST<1-9>} macros are supported for the use within this macro, referencing the first, second, third, etc. host in the graph, for example {?avg(/{HOST.HOST2}/key,1h)}. Note that referencing the first host with this macro is redundant, as the first host can be referenced implicitly, for example {?avg(/key,1h)}. |
| <i>Width</i>                   | Graph width in pixels (for preview and pie/exploded graphs only).   |
| <i>Height</i>                  | Graph height in pixels.   |
| <i>Graph type</i>              | Graph type:<br><b>Normal</b> - normal graph, values displayed as lines<br><b>Stacked</b> - stacked graph, filled areas displayed<br><b>Pie</b> - pie graph<br><b>Exploded</b> - "exploded" pie graph, portions displayed as "cut out" of the pie  |
| <i>Show legend</i>             | Checking this box will set to display the graph legend.   |
| <i>Show working time</i>       | If selected, non-working hours will be shown with a gray background. This parameter is not available for pie and exploded pie graphs.   |
| <i>Show triggers</i>           | If selected, simple triggers will be displayed as lines with black dashes over trigger severity color. This parameter is not available for pie and exploded pie graphs.   |
| <i>Percentile line (left)</i>  | Display percentile for left Y-axis. If, for example, 95% percentile is set, then the percentile line will be at the level where 95 percent of the values fall under. Displayed as a bright green line. Only available for normal graphs.  |
| <i>Percentile line (right)</i> | Display percentile for right Y-axis. If, for example, 95% percentile is set, then the percentile line will be at the level where 95 percent of the values fall under. Displayed as a bright red line. Only available for normal graphs.   |
| <i>Y axis MIN value</i>        | Minimum value of Y-axis:<br><b>Calculated</b> - Y axis minimum value will be automatically calculated.<br><b>Fixed</b> - fixed minimum value for Y-axis.<br><b>Item</b> - last value of the selected item will be the minimum value.  |
| <i>Y axis MAX value</i>        | This parameter is not available for pie and exploded pie graphs.<br>Maximum value of Y-axis:<br><b>Calculated</b> - Y axis maximum value will be automatically calculated.<br><b>Fixed</b> - fixed maximum value for Y-axis.<br><b>Item</b> - last value of the selected item will be the maximum value   |
| <i>3D view</i>                 | This parameter is not available for pie and exploded pie graphs.<br>Enable 3D style. For pie and exploded pie graphs only.  |
| <i>Items</i>                   | Items, data of which are to be displayed in this graph. Click on <i>Add</i> to select items. You can also select various displaying options (function, draw style, left/right axis display, color).   |
| <i>Sort order (0→100)</i>      | Draw order. 0 will be processed first. Can be used to draw lines or regions behind (or in front of) another.<br>You can drag and drop items using the icon at the beginning of a line to set the sort order or which item is displayed in front of the other.   |
| <i>Name</i>                    | Name of the selected item is displayed as a link. Clicking on the link opens the list of other available items.   |
| <i>Type</i>                    | Type (only available for pie and exploded pie graphs):<br><b>Simple</b> - the value of the item is represented proportionally on the pie<br><b>Graph sum</b> - the value of the item represents the whole pie<br>Note that coloring of the "graph sum" item will only be visible to the extent that it is not taken up by "proportional" items.   |

| Parameter          | Description   |
|--------------------|---|
| <i>Function</i>    | Select what values will be displayed when more than one value exists per vertical graph pixel for an item:<br><b>all</b> - display all possible values (minimum, maximum, average) in the graph. Note that for shorter periods this setting has no effect; only for longer periods, when data congestion in a vertical graph pixel increases, 'all' starts displaying minimum, maximum, and average values. This function is only available for <i>Normal</i> graph type. See also: <a href="#">Generating graphs from history/trends</a> .<br><b>avg</b> - display the average values<br><b>last</b> - display the latest values. This function is only available if either <i>Pie/Exploded pie</i> is selected as graph type.<br><b>max</b> - display the maximum values<br><b>min</b> - display the minimum values |
| <i>Draw style</i>  | Select the draw style (only available for normal graphs; for stacked graphs filled region is always used) to apply to the item data - <i>Line, Bold line, Filled region, Dot, Dashed line, Gradient line</i> .  |
| <i>Y axis side</i> | Select the Y axis side to show the item data - <i>Left, Right</i> .   |
| <i>Color</i>       | Select the color to apply to the item data.   |

## Graph preview

In the *Preview* tab, a preview of the graph is displayed so you can immediately see what you are creating.

Note that the preview will not show any data for template items.

In this example, pay attention to the dashed bold line displaying the trigger level and the trigger information displayed in the

legend.

**Note:**

No more than 3 trigger lines can be displayed. If there are more triggers then the triggers with lower severity are prioritized for display.

If graph height is set as less than 120 pixels, no trigger will be displayed in the legend.

3 Ad-hoc graphs

Overview

While a **simple graph** is great for accessing data of one item and **custom graphs** offer customization options, none of the two allow to quickly create a comparison graph for multiple items with little effort and no maintenance.

To address this issue, since Zabbix 2.4 it is possible to create ad-hoc graphs for several items in a very quick way.

Configuration

To create an ad-hoc graph, do the following:

- Go to *Monitoring* → *Latest data*
- Use filter to display items that you want
- Mark checkboxes of the items you want to graph
- Click on *Display stacked graph* or *Display graph* buttons

Latest data

| <input type="checkbox"/>            | Host ▲        | Name                   | Last check            | Last value |
|-------------------------------------|---------------|------------------------|-----------------------|------------|
| <input checked="" type="checkbox"/> | New host      | CPU load average       | 05/24/2021 10:46:5... | 0.86       |
| <input type="checkbox"/>            | Zabbix server | Load average (1m avg)  | 05/24/2021 10:47:1... | 0.73       |
| <input type="checkbox"/>            | Zabbix server | Load average (15m avg) | 05/24/2021 10:47:1... | 0.93       |
| <input checked="" type="checkbox"/> | Zabbix server | Load average (5m avg)  | 05/24/2021 10:47:1... | 0.93       |

2 selected

Display stacked graph

Display graph

Your graph is created instantly:

Note that to avoid displaying too many lines in the graph, only the average value for each item is displayed (min/max value lines are not displayed). Triggers and trigger information is not displayed in the graph.

In the created graph window you have the **time period selector** available and the possibility to switch from the "normal" line graph to a stacked one (and back).

## 4 Aggregation in graphs

### Overview

The aggregation functions, available in the graph widget of the dashboard, allow displaying an aggregated value for the chosen interval (5 minutes, an hour, a day), instead of all values.

The aggregation options are as follows:

- min
- max
- avg
- count
- sum
- first (first value displayed)
- last (last value displayed)

The most exciting use of data aggregation is the possibility to create nice side-by-side comparisons of data for some period:

When hovering over a point in time in the graph, date and time is displayed, in addition to items and their aggregated values. Items are displayed in parentheses, prefixed by the aggregation function used. Note that this is the date and time of the point in the graph, not of the actual values.

## Configuration

The options for aggregation are available in data set settings when configuring a **graph widget**.

Missing data:

Y-axis:

Time shift:

Aggregation function:

Aggregation interval:

Aggregate:

You may pick the aggregation function and the time interval. As the data set may comprise several items, there is also another option allowing to show aggregated data for each item separately or for all data set items as one aggregated value.

### Use cases

#### Average request count to Nginx server

View the average request count per second per day to the Nginx server:

- add the request count per second item to the data set
- select the aggregate function `avg` and specify interval `1d`
- a bar graph is displayed, where each bar represents the average number of requests per second per day

#### Minimum weekly disk space among clusters

View the lowest disk space among clusters over a week.

- add to the data set: hosts `cluster*`, key `"Free disk space on /data"`
- select the aggregate function `min` and specify interval `1w`
- a bar graph is displayed, where each bar represents the minimum disk space per week for each `/data` volume of the cluster

## 2 Network maps

### Overview

If you have a network to look after, you may want to have an overview of your infrastructure somewhere. For that purpose, you can create maps in Zabbix - of networks and of anything you like.

All users can create network maps. The maps can be public (available to all users) or private (available to selected users).

Proceed to **configuring a network map**.

### 1 Configuring a network map

#### Overview

Configuring a map in Zabbix requires that you first create a map by defining its general parameters and then you start filling the actual map with elements and their links.

You can populate the map with elements that are a host, a host group, a trigger, an image, or another map.

Icons are used to represent map elements. You can define the information that will be displayed with the icons and set that recent problems are displayed in a special way. You can link the icons and define information to be displayed on the links.

You can add custom URLs to be accessible by clicking on the icons. Thus you may link a host icon to host properties or a map icon to another map.

Maps are managed in *Monitoring* → *Maps*, where they can be configured, managed and viewed. In the monitoring view, you can click on the icons and take advantage of the links to some scripts and URLs.

Network maps are based on vector graphics (SVG) since Zabbix 3.4.

#### Public and private maps

All users in Zabbix (including non-admin users) can create network maps. Maps have an owner - the user who created them. Maps can be made public or private.

- *Public* maps are visible to all users, although to see it the user must have read access to at least one map element. Public maps can be edited in case a user/ user group has read-write permissions for this map and at least read permissions to all elements of the corresponding map including triggers in the links.
- *Private* maps are visible only to their owner and the users/user groups the map is *shared* with by the owner. Regular (non-Super admin) users can only share with the groups and users they are members of. Admin level users can see private maps regardless of being the owner or belonging to the shared user list. Private maps can be edited by the owner of the map and in case a user/ user group has read-write permissions for this map and at least read permissions to all elements of the corresponding map including triggers in the links.

Map elements that the user does not have read permission to are displayed with a grayed-out icon and all textual information on the element is hidden. However, the trigger label is visible even if the user has no permission to the trigger.

To add an element to the map the user must also have at least read permission to the element.

#### Creating a map

To create a map, do the following:

- Go to *Monitoring* → *Maps*
- Go to the view with all maps
- Click on *Create map*

You can also use the *Clone* and *Full clone* buttons in the configuration form of an existing map to create a new map. Clicking on *Clone* will retain general layout attributes of the original map, but no elements. *Full clone* will retain both the general layout attributes and all elements of the original map.

The **Map** tab contains general map attributes:

Map

All mandatory input fields are marked with a red asterisk.

General map attributes:

| Parameter                                     | Description   |
|---|---|
| <i>Owner</i>                                  | Name of map owner.  |
| <i>Name</i>                                   | Unique map name.  |
| <i>Width</i>                                  | Map width in pixels.  |
| <i>Height</i>                                 | Map height in pixels.   |
| <i>Background image</i>                       | Use background image:<br><b>No image</b> - no background image (white background)<br><b>Image</b> - selected image to be used as a background image. No scaling is performed. You may use a geographical map or any other image to enhance your map.  |
| <i>Automatic icon mapping</i>                 | You can set to use an automatic icon mapping, configured in <i>Administration</i> → <i>General</i> → <i>Icon mapping</i> . Icon mapping allows mapping certain icons against certain host inventory fields.   |
| <i>Icon highlight</i>                         | If you check this box, map elements will be highlighted.<br>Elements with an active trigger will receive a round background, in the same color as the highest severity trigger. Moreover, a thick green line will be displayed around the circle, if all problems are acknowledged.<br>Elements with "disabled" or "in maintenance" status will get a square background, gray and orange respectively.<br>See also: <a href="#">Viewing maps</a>  |
| <i>Mark elements on trigger status change</i> | A recent change of trigger status (recent problem or resolution) will be highlighted with markers (inward-pointing red triangles) on the three sides of the element icon that are free of the label. Markers are displayed for 30 minutes.  |
| <i>Display problems</i>                       | Select how problems are displayed with a map element:<br><b>Expand single problem</b> - if there is only one problem, the problem name is displayed. Otherwise, the total number of problems is displayed.<br><b>Number of problems</b> - the total number of problems is displayed<br><b>Number of problems and expand most critical one</b> - the name of the most critical problem and the total number of problems is displayed.<br>'Most critical' is determined based on problem severity and, if equal, problem event ID (higher ID or later problem displayed first). For a <i>trigger map element</i> it is based on problem severity and if equal, trigger position in the trigger list. In case of multiple problems of the same trigger, the most recent one will be displayed. |
| <i>Advanced labels</i>                        | If you check this box you will be able to define separate label types for separate element types.   |
| <i>Map element label type</i>                 | Label type used for map elements:<br><b>Label</b> - map element label<br><b>IP address</b> - IP address<br><b>Element name</b> - element name (for example, host name)<br><b>Status only</b> - status only (OK or PROBLEM)<br><b>Nothing</b> - no labels are displayed  |
| <i>Map element label location</i>             | Label location in relation to the map element:<br><b>Bottom</b> - beneath the map element<br><b>Left</b> - to the left<br><b>Right</b> - to the right<br><b>Top</b> - above the map element   |
| <i>Problem display</i>                        | Display problem count as:<br><b>All</b> - full problem count will be displayed<br><b>Separated</b> - unacknowledged problem count will be displayed separated as a number of the total problem count<br><b>Unacknowledged only</b> - only the unacknowledged problem count will be displayed  |
| <i>Minimum trigger severity</i>               | Problems below the selected minimum severity level will not be displayed on the map. For example, with <i>Warning</i> selected, changes with <i>Information</i> and <i>Not classified</i> level triggers will not be reflected in the map.<br>This parameter is supported starting with Zabbix 2.2.   |
| <i>Show suppressed problems</i>               | Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.   |
| <i>URLs</i>                                   | URLs for each element type can be defined (with a label). These will be displayed as links when a user clicks on the element in the map viewing mode.<br>Macros can be used in map URL names and values. For a full list, see <a href="#">supported macros</a> and search for 'map URL names and values'.   |

## Sharing

The **Sharing** tab contains the map type as well as sharing options (user groups, users) for private maps:

Map
Sharing ●

Type
Private Public

List of user group shares

User groups
MySQL administrators
Add
Permissions
Read-only Read-write

List of user shares

Users
Admin (Zabbix Administrator)
Add
Permissions
Read-only Read-write

| Parameter                 | Description   |
|---------------------------|---|
| Type                      | Select map type:<br><b>Private</b> - map is visible only to selected user groups and users<br><b>Public</b> - map is visible to all |
| List of user group shares | Select user groups that the map is accessible to.<br>You may allow read-only or read-write access.                                  |
| List of user shares       | Select users that the map is accessible to.<br>You may allow read-only or read-write access.  |

When you click on *Add* to save this map, you have created an empty map with a name, dimensions, and certain preferences. Now you need to add some elements. For that, click on *Constructor* in the map list to open the editable area.

#### Adding elements

To add an element, click on *Add* next to Map element. The new element will appear at the top left corner of the map. Drag and drop it wherever you like.

Note that with the Grid option "On", elements will always align to the grid (you can pick various grid sizes from the dropdown, also hide/show the grid). If you want to put elements anywhere without alignment, turn the option to "Off". (You can align random elements to the grid later, by clicking on *Align map elements*.)

Now that you have some elements in place, you may want to start differentiating them by giving names, etc. By clicking on the element, a form is displayed and you can set the element type, give a name, choose a different icon, etc.

| <i>Type</i>           | <p>Type of the element:</p> <p><b>Host</b> - icon representing status of all triggers of the selected host</p> <p><b>Map</b> - icon representing status of all elements of a map</p> <p><b>Trigger</b> - icon representing status of one or more triggers</p> <p><b>Host group</b> - icon representing status of all triggers of all hosts belonging to the selected group</p> <p><b>Image</b> - an icon, not linked to any resource</p> |
| <i>Label</i>          | <p>Icon label, any string.</p> <p>Macros and multiline strings can be used.</p> <p>Expression <b>macros</b> are supported in this field, but only with <code>avg</code>, <code>last</code>, <code>min</code> and <code>max</code> functions, with time as parameter (for example, <code>{?avg(/host/key,1h)}</code>).</p> <p>For a full list of supported macros, see <b>supported macros</b> and search for 'map element labels'.</p>   |
| <i>Label location</i> | <p>Label location in relation to the icon:</p> <p><b>Default</b> - map's default label location</p> <p><b>Bottom</b> - beneath the icon</p> <p><b>Left</b> - to the left</p> <p><b>Right</b> - to the right</p> <p><b>Top</b> - above the icon</p>   |

| Parameter                                       | Description  |
|---|--|
| <i>Host</i>                                     | Enter the host if the element type is 'Host'. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts. Scroll down to select. Click on 'x' to remove the selected.  |
| <i>Map</i>                                      | Select the map if the element type is 'Map'.<br>This field is auto-complete so starting to type the name of a map will offer a dropdown of matching maps. Scroll down to select. Click on 'x' to remove the selected.  |
| <i>Triggers</i>                                 | If the element type is 'Trigger', select one or more triggers in the <i>New triggers</i> field below and click on <i>Add</i> .<br>The order of selected triggers can be changed, but only within the same severity of triggers. Multiple trigger selection also affects {HOST.*} macro resolution both in the construction and view modes.<br>// 1 In construction mode// the first displayed {HOST.*} macros will be resolved depending on the first trigger in the list (based on trigger severity).<br>// 2 View mode// depends on the <b>Display problems</b> parameter in General map attributes.<br>* If <i>Expand single problem</i> mode is chosen the first displayed {HOST.*} macros will be resolved depending on the latest detected problem trigger (not mattering the severity) or the first trigger in the list (in case no problem detected);<br>* If <i>Number of problems and expand most critical one</i> mode is chosen the first displayed {HOST.*} macros will be resolved depending on the trigger severity.  |
| <i>Host group</i>                               | Enter the host group if the element type is 'Host group'. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. Scroll down to select. Click on 'x' to remove the selected.  |
| <i>Tags</i>                                     | Specify tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met<br>This field is available for host and host group element types. |
| <i>Automatic icon selection</i><br><i>Icons</i> | In this case an icon mapping will be used to determine which icon to display.<br>You can choose to display different icons for the element in these cases: default, problem, maintenance, disabled.  |
| <i>Coordinate X</i>                             | X coordinate of the map element.   |
| <i>Coordinate Y</i>                             | Y coordinate of the map element.   |
| <i>URLs</i>                                     | Element-specific URLs can be set for the element. These will be displayed as links when a user clicks on the element in the map viewing mode. If the element has its own URLs and there are map level URLs for its type defined, they will be combined in the same menu.<br>Macros can be used in map element names and values. For a full list, see <b>supported macros</b> and search for 'map URL names and values'.  |

#### Attention:

Added elements are not automatically saved. If you navigate away from the page, all changes may be lost. Therefore it is a good idea to click on the **Update** button in the top right corner. Once clicked, the changes are saved regardless of what you choose in the following popup.  
Selected grid options are also saved with each map.

#### Selecting elements

To select elements, select one and then hold down *Ctrl* to select the others.

You can also select multiple elements by dragging a rectangle in the editable area and selecting all elements in it.

Once you select more than one element, the element property form shifts to the mass-update mode so you can change attributes of selected elements in one go. To do so, mark the attribute using the checkbox and enter a new value for it. You may use macros here (for example, {HOST.NAME} for the element label).

| Parameter    | Description  |
|--------------|--|
| <i>Label</i> | <p>Label that will be rendered on top of the link.</p> <p>Expression <b>macros</b> are supported in this field, but only with <code>avg</code>, <code>last</code>, <code>min</code> and <code>max</code> functions, with time as parameter (for example, <code>{?avg(/host/key,1h)}</code>).</p> |

| Parameter               | Description   |
|-------------------------|---|
| Connect to<br>Type (OK) | The element that the link connects to.<br>Default link style:<br><b>Line</b> - single line<br><b>Bold line</b> - bold line<br><b>Dot</b> - dots<br><b>Dashed line</b> - dashed line |
| Color (OK)              | Default link color.   |
| Link indicators         | List of triggers linked to the link. In case a trigger has status PROBLEM, its style is applied to the link.  |

### Moving and copy-pasting elements

Several selected elements can be **moved** to another place in the map by clicking on one of the selected elements, holding down the mouse button, and moving the cursor to the desired location.

One or more elements can be **copied** by selecting the elements, then clicking on a selected element with the right mouse button and selecting *Copy* from the menu.

To paste the elements, click on a map area with the right mouse button and select *Paste* from the menu. The *Paste without external links* option will paste the elements retaining only the links that are between the selected elements.

Copy-pasting works within the same browser window. Keyboard shortcuts are not supported.

### Adding shapes

In addition to map elements, it is also possible to add some shapes. Shapes are not map elements; they are just a visual representation. For example, a rectangle shape can be used as a background to group some hosts. Rectangle and ellipse shapes can be added.

To add a shape, click on *Add* next to Shape. The new shape will appear at the top left corner of the map. Drag and drop it wherever you like.

A new shape is added with default colors. By clicking on the shape, a form is displayed and you can customize the way a shape looks, add text, etc.

To select shapes, select one and then hold down *Ctrl* to select the others. With several shapes selected, common properties can be mass updated, similarly as with elements.

Text can be added in the shapes. Expression **macros** are supported in the text, but only with `avg`, `last`, `min` and `max` functions, with time as parameter (for example, `{?avg(/host/key, 1h)}`).

To display text only the shape can be made invisible by removing the shape border (select 'None' in the *Border* field). For example, take note of how the `{MAP.NAME}` macro, visible in the screenshot above, is actually a rectangle shape with text, which can be seen when clicking on the macro:

{MAP.NAME} resolves to the configured map name when viewing the map.

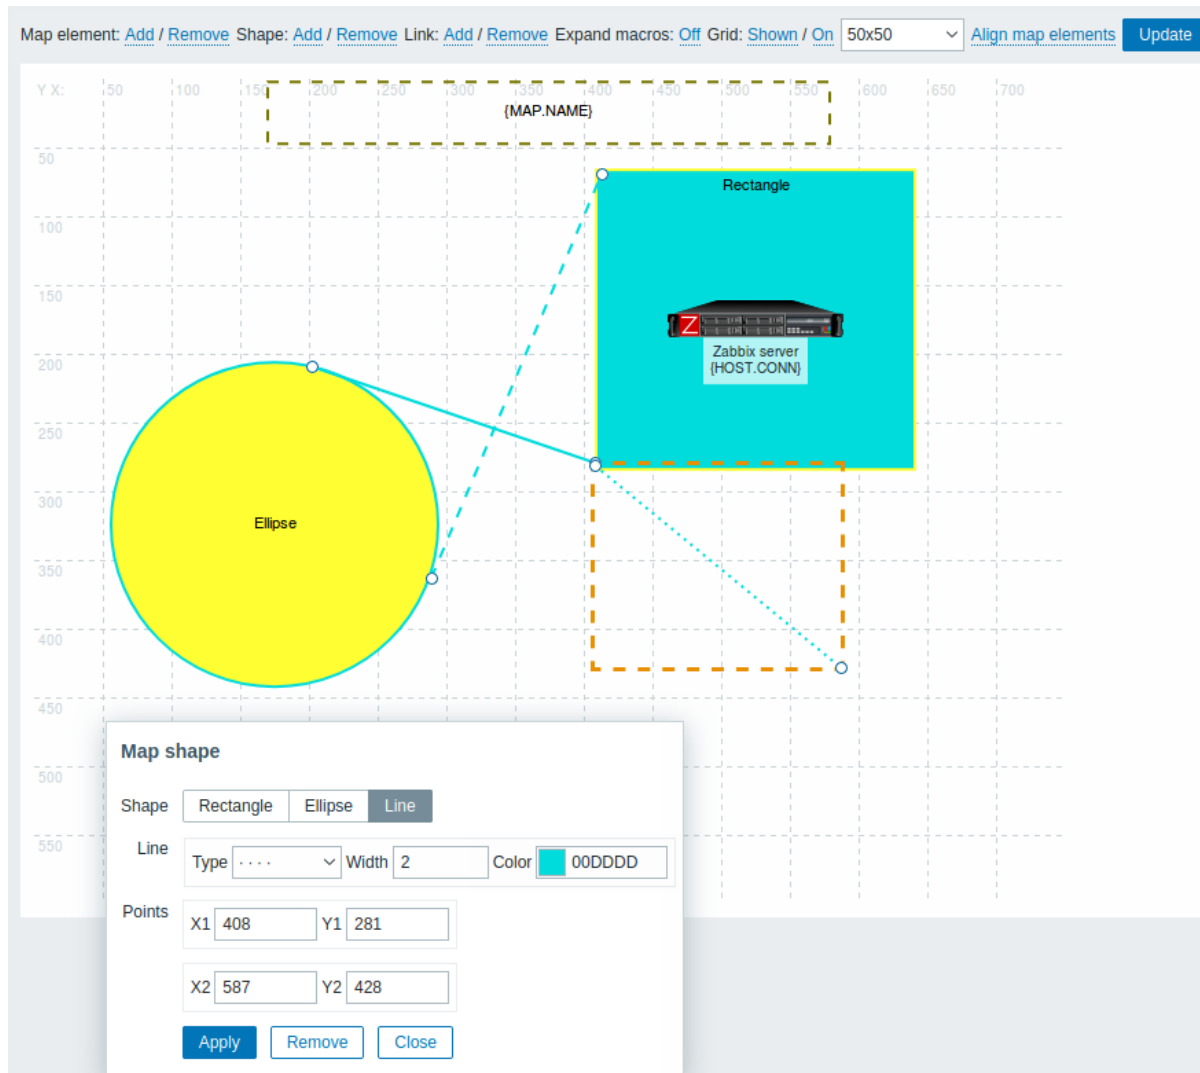

If hyperlinks are used in the text, they become clickable when viewing the map.

Line wrapping for text is always "on" within shapes. However, within an ellipse, the lines are wrapped as though the ellipse were a rectangle. Word wrapping is not implemented, so long words (words that do not fit the shape) are not wrapped, but are masked (constructor page) or clipped (other pages with maps).

#### Adding lines

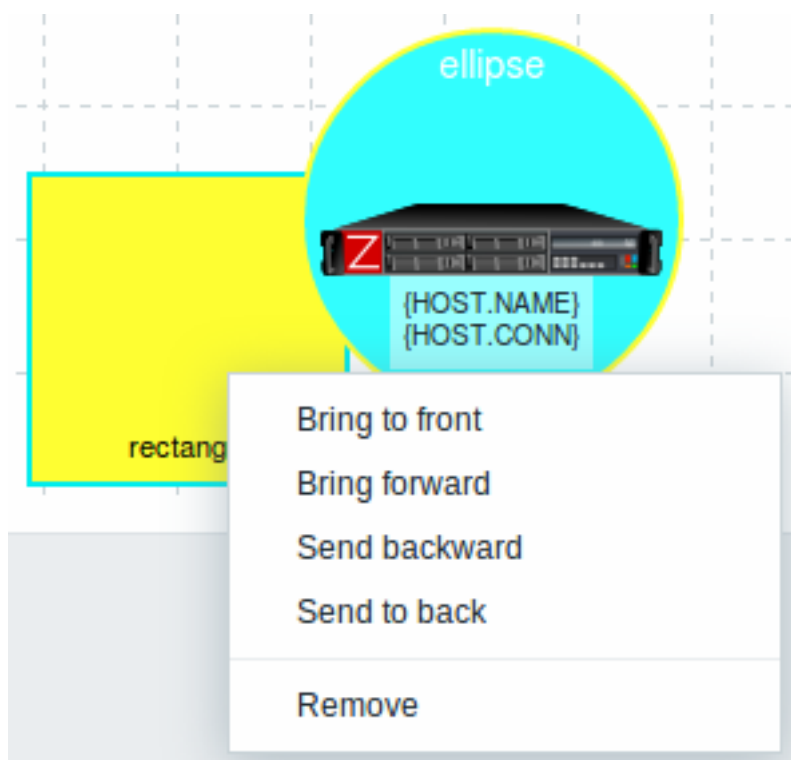

In addition to shapes, it is also possible to add some lines. Lines can be used to link elements or shapes in a map.

To add a line, click on *Add* next to Shape. A new shape will appear at the top left corner of the map. Select it and click on *Line* in the editing form to change the shape into a line. Then adjust line properties, such as line type, width, color, etc.

### Ordering shapes and lines

To bring one shape in front of the other (or vice versa) click on the shape with the right mouse button bringing up the map shape menu.

2 Host group elements

Overview

This section explains how to add a “Host group” type element when configuring a **network map**.

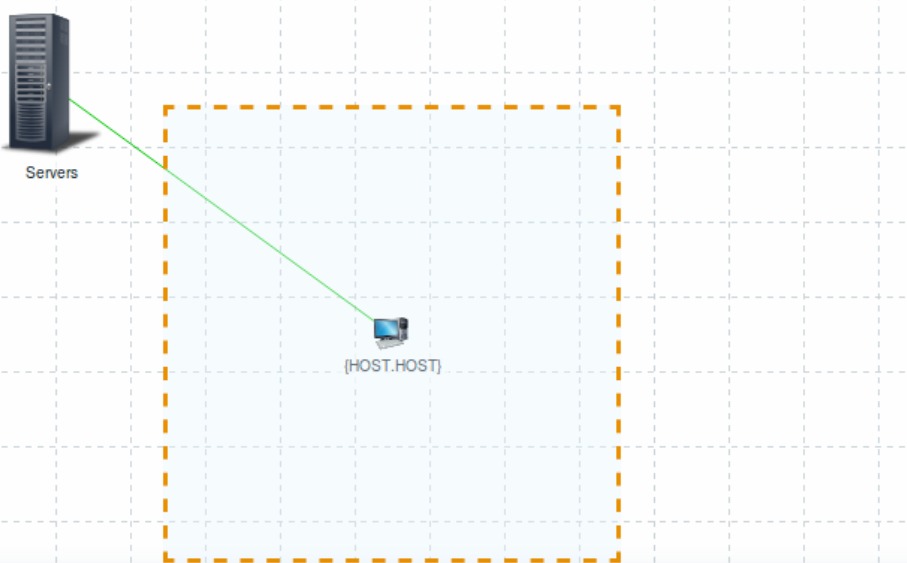

Configuration

Map element: [Add](#) / [Remove](#) Shape: [Add](#) / [Remove](#) Link: [Add](#) / [Remove](#) Expand macros: [Off](#) Grid: [Shown](#) / [On](#) 50x50 [Align map elements](#)

Application 

Select

All mandatory input fields are marked with a red asterisk.

This table consists of parameters typical for *Host group* element type:

| Parameter | Description  |
|-----------|--|
| Type      | Select Type of the element:<br><b>Host group</b> - icon representing the status of all triggers of all hosts belonging to the selected group   |
| Show      | Show options:<br><b>Host group</b> - selecting this option will result as one single icon displaying corresponding information about the certain host group<br><b>Host group elements</b> - selecting this option will result as multiple icons displaying corresponding information about every single element (host) of the certain host group |

478

| Parameter         | Description   |
|-------------------|---|
| Area type         | This setting is available if the “Host group elements” parameter is selected:<br><b>Fit to map</b> - all host group elements are equally placed within the map<br><b>Custom size</b> - a manual setting of the map area for all the host group elements to be displayed   |
| Area size         | This setting is available if “Host group elements” parameter and “Area type” parameter are selected:<br><b>Width</b> - numeric value to be entered to specify map area width<br><b>Height</b> - numeric value to be entered to specify map area height  |
| Placing algorithm | <b>Grid</b> - only available option of displaying all the host group elements   |
| Label             | Icon label, any string.<br><b>Macros</b> and multiline strings can be used in labels.<br>If the type of the map element is “Host group” specifying certain macros has an impact on the map view displaying corresponding information about every single host. For example, if {HOST.IP} macro is used, the edit map view will only display the macro {HOST.IP} itself while map view will include and display each host’s unique IP address |

Viewing host group elements

This option is available if the “Host group elements” show option is chosen. When selecting “Host group elements” as the *show* option, you will at first see only one icon for the host group. However, when you save the map and then go to the map view, you will see that the map includes all the elements (hosts) of the certain host group:

Notice how the {HOST.NAME} macro is used. In map editing, the macro name is unresolved, while in map view all the unique names of the hosts are displayed.

3 Link indicators

Overview

You can assign some triggers to a **link** between elements in a network map. When these triggers go into a problem state, the link can reflect that.

When you configure a link, you set the default link type and color. When you assign triggers to a link, you can assign different link types and colors with these triggers.

Should any of these triggers go into a problem state, their link style and color will be displayed on the link. So maybe your default link was a green line. Now, with the trigger in the problem state, your link may become bold red (if you have defined it so).

## Configuration

To assign triggers as link indicators, do the following:

- select a map element
- click on *Edit* in the *Links* section for the appropriate link
- click on *Add* in the *Link indicators* block and select one or more triggers

### Network maps

| Zabbix server | New host (former tech name: Server4): Trap trigger |

Label:

Connect to: Zabbix server

Type (OK): Bold line

Color (OK): 00CC00

Link indicators

| Trigger  | Type              | Color               |
|--|-------------------|---------------------|
| New host (former tech name: Server4): Trap trigger | <span>Line</span> | <span>DD0000</span> |

[Add](#)

Apply Remove Close

All mandatory input fields are marked with a red asterisk.

Added triggers can be seen in the *Link indicators* list.

You can set the link type and color for each trigger directly from the list. When done, click on *Apply*, close the form and click on *Update* to save the map changes.

## Display

In *Monitoring* → *Maps* the respective color will be displayed on the link if the trigger goes into a problem state.

#### Note:

If multiple triggers go into a problem state, the problem with the highest severity will determine the link style and color. If multiple triggers with the same severity are assigned to the same map link, the one with the lowest ID takes precedence. Note also that:

1. *Minimum trigger severity* and *Show suppressed problem* settings from map configuration affect which problems are taken into account.
2. In the case of triggers with multiple problems (multiple problem generation), each problem may have a severity that differs from trigger severity (changed manually), may have different tags (due to macros), and may be suppressed.

### 3 Dashboards

**Dashboards** and their widgets provide a strong visualization platform with such tools as modern graphs, maps, slideshows, and many more.

### 4 Host dashboards

## Overview

Host dashboards look similar to [global dashboards](#), however, host dashboards display data about the host only. Host dashboards have no owner.

Host dashboards are configured on the [template](#) level and then are generated for a host, once the template is linked to the host. Widgets of host dashboards can only be copied to host dashboards of the same template. Widgets from global dashboards cannot be copied onto host dashboards.

Host dashboards *cannot* be configured or directly accessed in the *Monitoring* → *Dashboard* section, which is reserved for global dashboards. The ways to access host dashboards are listed below in this section.

### Zabbix server health

When viewing host dashboards you may switch between the configured dashboards using the dropdown in the upper right corner. To switch to *Monitoring→Hosts* section, click *All hosts* navigation link below the dashboard name in the upper left corner.

Widgets of the host dashboards cannot be edited.

Note that host dashboards used to be host screens before Zabbix 5.2. When importing an older template containing screens, the screen import will be ignored.

### Accessing host dashboards

Access to host dashboards is provided:

- From the [host menu](#) that is available in many frontend locations:
  - click on the host name and then select *Dashboards* from the drop-down menu

- When searching for a host name in **global search**:
  - click on the *Dashboards* link provided in search results
- When clicking on a host name in *Inventory* → **Hosts**:
  - click on the *Dashboards* link provided

## 8 Templates

### Overview

A template is a set of entities that can be conveniently applied to multiple hosts.

The entities may be:

- items
- triggers
- graphs
- dashboards
- low-level discovery rules
- web scenarios

As many hosts in real life are identical or fairly similar so it naturally follows that the set of entities (items, triggers, graphs,...) you have created for one host, may be useful for many. Of course, you could copy them to each new host, but that would be a lot of manual work. Instead, with templates you can copy them to one template and then apply the template to as many hosts as needed.

When a template is linked to a host, all entities (items, triggers, graphs,...) of the template are added to the host. Templates are assigned to each individual host directly (and not to a host group).

Templates are often used to group entities for particular services or applications (like Apache, MySQL, PostgreSQL, Postfix...) and then applied to hosts running those services.

Another benefit of using templates is when something has to be changed for all the hosts. Changing something on the template level once will propagate the change to all the linked hosts.

Thus, the use of templates is an excellent way of reducing one's workload and streamlining the Zabbix configuration.

Proceed to **creating and configuring a template**.

## 9 Templates out of the box

### Overview

Zabbix strives to provide a growing list of useful out-of-the-box **templates**. Out-of-the-box templates come preconfigured and thus are a useful way for speeding up the deployment of monitoring jobs.

The templates are available:

- In new installations - in *Configuration* → *Templates*;
- If you are upgrading Zabbix, the upgraded installation might lack newer templates. You can find them in the Zabbix [Git repository](#) - select the version you upgraded to. To add a new template, download the template file, open Zabbix frontend, go to *Configuration* → *Templates*, and import the file.

Please use the sidebar to access information about specific template types and operation requirements.

See also:

- [Template import](#)
- [Linking a template](#)
- [Known issues](#)

### 1 Zabbix agent template operation

Steps to ensure correct operation of templates that collect metrics with **Zabbix agent**:

1. Make sure that Zabbix agent is installed on the host. For active checks, also make sure that the host is added to the 'ServerActive' parameter of the agent **configuration file**.
2. [Link](#) the template to a target host (if the template is not available in your Zabbix installation, you may need to import the template's .xml file first - see [Templates out-of-the-box](#) section for instructions).
3. If necessary, adjust the values of template macros.
4. Configure the instance being monitored to allow sharing data with Zabbix.

A detailed description of a template, including the full list of macros, items and triggers, is available in the template's Readme.md file (accessible by clicking on a template name).

The following templates are available:

- [Apache by Zabbix agent](#)
- [HAProxy by Zabbix agent](#)
- [IIS by Zabbix agent](#)
- [IIS by Zabbix agent active](#)
- [Microsoft Exchange Server 2016 by Zabbix agent](#)
- [Microsoft Exchange Server 2016 by Zabbix agent active](#)
- [MySQL by Zabbix agent](#)
- [Nginx by Zabbix agent](#)
- [PHP-FPM by Zabbix agent](#)
- [PostgreSQL by Zabbix agent](#)
- [RabbitMQ cluster by Zabbix agent](#)

### 2 Zabbix agent 2 template operation

Steps to ensure correct operation of templates that collect metrics with **Zabbix agent 2**:

1. Make sure that agent 2 is installed on the host and that the installed version contains the required plugin. In some cases, you may need to **upgrade** agent 2 first.
2. [Link](#) the template to a target host (if the template is not available in your Zabbix installation, you may need to import the template's import file first - see [Templates out-of-the-box](#) section for instructions).
3. If necessary, adjust the values of template macros. Note that user macros can be used to override configuration parameters.
4. Configure the instance being monitored to allow sharing data with Zabbix.

**Attention:**

Zabbix agent 2 templates work in conjunction with the plugins. While the basic configuration can be done by simply adjusting user macros, the deeper customization can be achieved by **configuring the plugin** itself. For example, if a plugin supports named sessions, it is possible to monitor several entities of the same kind (e.g., MySQL1 and MySQL2) by specifying named session with own URI, username and password for each entity in the configuration file.

A detailed description of a template, including the full list of macros, items and triggers, is available in the template's Readme.md file (accessible by clicking on a template name).

The following templates are available:

- [Ceph by Zabbix agent 2](#)
- [Docker](#)
- [Memcached](#)
- [MongoDB cluster by Zabbix agent 2](#)
- [MongoDB node by Zabbix agent 2](#)
- [MySQL by Zabbix agent 2](#)
- [Oracle by Zabbix agent 2](#)
- [PostgreSQL by Zabbix agent 2](#)
- [Redis](#)
- [SMART by Zabbix agent 2](#)
- [SMART by Zabbix agent 2 active](#)
- [Systemd by Zabbix agent 2](#)
- [Website certificate by Zabbix agent 2](#)

### 3 HTTP template operation

Steps to ensure correct operation of templates that collect metrics with **HTTP agent**:

1. Create a host in Zabbix and specify an IP address or DNS name of the monitoring target as the main interface. This is needed for the {HOST.CONN} macro to resolve properly in the template items.
2. [Link](#) the template to the host created in step 1 (if the template is not available in your Zabbix installation, you may need to import the template's .xml file first - see [Templates out-of-the-box](#) section for instructions).
3. If necessary, adjust the values of template macros.
4. Configure the instance being monitored to allow sharing data with Zabbix.

A detailed description of a template, including the full list of macros, items and triggers, is available in the template's Readme.md file (accessible by clicking on a template name).

The following templates are available:

- [Acronis Cyber Protect Cloud by HTTP](#)
- [Apache by HTTP](#)
- [Asterisk by HTTP](#)
- [AWS by HTTP](#)
- [AWS Cost Explorer by HTTP](#)
- [AWS EC2 by HTTP](#)

- [NGINX Plus by HTTP](#)
- [Nutanix Prism Element by HTTP](#)
- [OpenStack by HTTP](#)
- [OpenWeatherMap by HTTP](#)
- [Oracle Cloud by HTTP](#)
- [PHP-FPM by HTTP](#)
- [Proxmox VE by HTTP](#)
- [RabbitMQ cluster by HTTP](#)
- [TiDB by HTTP](#)
- [TiDB PD by HTTP](#)
- [TiDB TiKV by HTTP](#)
- [Travis CI by HTTP](#)
- [Veeam Backup Enterprise Manager by HTTP](#)
- [Veeam Backup and Replication by HTTP](#)
- [VMware SD-WAN VeloCloud by HTTP](#)
- [YugabyteDB by HTTP](#)
- [ZooKeeper by HTTP](#)

#### 4 IPMI template operation

IPMI templates do not require any specific setup. To start monitoring, [link](#) the template to a target host (if the template is not available in your Zabbix installation, you may need to import the template's .xml file first - see [Templates out-of-the-box](#) section for instructions).

A detailed description of a template, including the full list of macros, items and triggers, is available in the template's Readme.md file (accessible by clicking on a template name).

Available template:

- [Chassis by IPMI](#)

## 5 JMX template operation

Steps to ensure correct operation of templates that collect metrics by **JMX**:

1. Make sure Zabbix **Java gateway** is installed and set up properly.
2. [Link](#) the template to the target host. The host should have JMX interface set up.

If the template is not available in your Zabbix installation, you may need to import the template's .xml file first - see [Templates out-of-the-box](#) section for instructions.

3. If necessary, adjust the values of template macros.
4. Configure the instance being monitored to allow sharing data with Zabbix.

A detailed description of a template, including the full list of macros, items, and triggers, is available in the template's Readme.md file (accessible by clicking on a template name).

The following templates are available:

- [Apache ActiveMQ by JMX](#)
- [Apache Cassandra by JMX](#)
- [Apache Kafka by JMX](#)
- [Apache Tomcat by JMX](#)
- [GridGain by JMX](#)
- [Ignite by JMX](#)
- [Jira Data Center by JMX](#)
- [WildFly Domain by JMX](#)
- [WildFly Server by JMX](#)

## 6 ODBC template operation

Steps to ensure correct operation of templates that collect metrics via **ODBC monitoring**:

1. Make sure that required ODBC driver is installed on Zabbix server or proxy.
2. [Link](#) the template to a target host (if the template is not available in your Zabbix installation, you may need to import the template's .xml file first - see [Templates out-of-the-box](#) section for instructions).
3. If necessary, adjust the values of template macros.
4. Configure the instance being monitored to allow sharing data with Zabbix.

A detailed description of a template, including the full list of macros, items and triggers, is available in the template's Readme.md file (accessible by clicking on a template name).

The following templates are available:

- [MSSQL by ODBC](#)
- [MySQL by ODBC](#)
- [Oracle by ODBC](#)
- [PostgreSQL by ODBC](#)

## 7 Standardized templates for network devices

### Overview

In order to provide monitoring for network devices such as switches and routers, we have created two so-called models: for the network device itself (its chassis basically) and for network interface.

Since Zabbix 3.4 templates for many families of network devices are provided. All templates cover (where possible to get these items from the device):

- Chassis fault monitoring (power supplies, fans and temperature, overall status)
- Chassis performance monitoring (CPU and memory items)
- Chassis inventory collection (serial numbers, model name, firmware version)
- Network interface monitoring with IF-MIB and EtherLike-MIB (interface status, interface traffic load, duplex status for Ethernet)

These templates are available:

- In new installations - in *Configuration* → *Templates*;

- If you are upgrading from previous versions, you can find these templates in the *zabbix/templates* directory of the downloaded latest Zabbix version. While in *Configuration → Templates* you can import them manually from this directory.

If you are importing the new out-of-the-box templates, you may want to also update the `@Network` interfaces for discovery global regular expression to:

```
Result is FALSE: ^Software Loopback Interface
Result is FALSE: ^(?In)?[lL]oop[bB]ack[0-9._]*$
Result is FALSE: ^NULL[0-9._]*$
Result is FALSE: ^[lL]o[0-9._]*$
Result is FALSE: ^[sS]ystem$
Result is FALSE: ^Nu[0-9._]*$
```

to filter out loopbacks and null interfaces on most systems.

## Devices

List of device families for which templates are available:

| Template name                                       | Vendor           | Device family                     | Known models   | OS    | MIBs used   | Tags              |
|---|------------------|-----------------------------------|--|-------|---|-------------------|
| <i>Alcatel Timetra TIMOS SNMP</i>                   | Alcatel          | Alcatel Timetra                   | ALCATEL SR 7750  | TIMOS | TIMETRA-SYSTEM-MIB, TIMETRA-CHASSIS-MIB   | Certified         |

## Template design

Templates were designed with the following in mind:

- User macros are used as much as possible so triggers can be tuned by the user;
- Low-level discovery is used as much as possible to minimize the number of unsupported items;
- All templates depend on Template ICMP Ping so all devices are also checked by ICMP;
- Items don't use any MIBs - SNMP OIDs are used in items and low-level discoveries. So it's not necessary to load any MIBs into Zabbix for templates to work;
- Loopback network interfaces are filtered when discovering as well as interfaces with ifAdminStatus = down(2);
- 64bit counters are used from IF-MIB::ifXTable where possible. If it is not supported, default 32bit counters are used instead.

All discovered network interfaces have a trigger that monitors its operational status (link), for example:

```
{$IFCONTROL:"{#IFNAME}"}=1 and last(/Alcatel Timetra TiMOS SNMP/net.if.status[ifOperStatus.{#SNMPINDEX}])
```

- If you do not want to monitor this condition for a specific interface create a user macro with context with the value 0. For example:

The screenshot shows the Zabbix web interface with the 'Macros' tab selected. Under the 'Host macros' section, there is a table with two columns: 'Macro' and 'Value'. A macro is listed with the name '{\$IFCONTROL: "Gi0/0"}' and a value of '0'.

where Gi0/0 is {#IFNAME}. That way the trigger is not used any more for this specific interface.

- You can also change the default behavior for all triggers not to fire and activate this trigger only to limited number of interfaces like uplinks:

Host
Templates
IPMI
**Macros**
Host inventory
Encryption

Host macros
Inherited and host macros

| Macro                 | Value |
|-----------------------|-------|
| {SIFCONTROL}          | ⇒ 0   |
| {SIFCONTROL: "Gi0/0"} | ⇒ 1   |
| {SIFCONTROL: "Gi0/1"} | ⇒ 1   |

## Tags

- Performance – device family MIBs provide a way to monitor CPU and memory items;
- Fault - device family MIBs provide a way to monitor at least one temperature sensor;
- Inventory – device family MIBs provide a way to collect at least the device serial number and model name;
- Certified – all three main categories above are covered.

## 10 Notifications upon events

### Overview

Assuming that we have configured some items and triggers and now are getting some events happening as a result of triggers changing state, it is time to consider some actions.

To begin with, we would not want to stare at the triggers or events list all the time. It would be much better to receive notification if something significant (such as a problem) has happened. Also, when problems occur, we would like to see that all the people concerned are informed.

That is why sending notifications is one of the primary actions offered by Zabbix. Who and when should be notified upon a certain event can be defined.

To be able to send and receive notifications from Zabbix you have to:

- **define some media**
- **configure an action** that sends a message to one of the defined media

Actions consist of *conditions* and *operations*. Basically, when conditions are met, operations are carried out. The two principal operations are sending a message (notification) and executing a remote command.

For discovery and autoregistration created events, some additional operations are available. Those include adding or removing a host, linking a template etc.

### 1 Media types

#### Overview

Media are the delivery channels used for sending notifications and alerts from Zabbix.

You can configure several media types:

- **Email**
- **SMS**
- **Custom alertscripts**
- **Webhook**

Media types are configured in *Administration* → *Media types*.

Media types

Filter

| <input type="checkbox"/> | Name ▲     | Type    | Status  | Used in actions                          | Details   | Action |
|--------------------------|------------|---------|---------|--|---|--------|
| <input type="checkbox"/> | E-mail     | Email   | Enabled | Report problems to Zabbix administrators | SMTP server: "mail.example.com", SMTP helo: "example.com", SMTP email: "zabbix@example.com" | Test   |
| <input type="checkbox"/> | Jira       | Webhook | Enabled |  |   | Test   |
| <input type="checkbox"/> | Mattermost | Webhook | Enabled |  |   | Test   |
| <input type="checkbox"/> | Opsgenie   | Webhook | Enabled |  |   | Test   |
| <input type="checkbox"/> | Pushover   | Webhook | Enabled |  |   | Test   |
| <input type="checkbox"/> | Slack      | Webhook | Enabled |  |   | Test   |
| <input type="checkbox"/> | SMS        | SMS     | Enabled |  | GSM modem: "/dev/ttyS0"   | Test   |
| <input type="checkbox"/> | Test THROW | Webhook | Enabled |  |   | Test   |
| <input type="checkbox"/> | Zendesk    | Webhook | Enabled |  |   | Test   |

Some media types come pre-defined in the default dataset. You just need to finetune their parameters to get them working.

It is possible to test if a configured media type works, by clicking on *Test* in the last column (see [Media type testing](#) for more details).

To create a new media type, click on the *Create media type* button. A media type configuration form is opened.

Common parameters

Some parameters are common for all media types.

Media type

In the **Media type** tab the common general attributes are:

| Parameter   | Description                                 |
|-------------|---|
| Name        | Name of the media type.                     |
| Type        | Select the type of media.                   |
| Description | Enter a description.                        |
| Enabled     | Mark the checkbox to enable the media type. |

See the individual pages of media types for media-specific parameters.

The **Message templates** tab allows to set default notification messages for all or some of the following event types:

- Problem
- Problem recovery

- Problem update
- Service
- Service recovery
- Service update
- Discovery
- Autoregistration
- Internal problem
- Internal problem recovery

Message template parameters:

| Parameter           | Description  |
|---------------------|--|
| <i>Message type</i> | Type of an event for which the default message should be used.<br>Only one default message can be defined for each event type.   |
| <i>Subject</i>      | Subject of the default message. The subject may contain macros. It is limited to 255 characters.<br>Subject is not available for SMS media type.   |
| <i>Message</i>      | The default message. It is limited to certain amount of characters depending on the database type (see <a href="#">Sending messages</a> for more information).<br>The message may contain supported <b>macros</b> .<br>In problem and problem update messages, expression macros are supported (for example, <code>{?avg(/host/key, 1h)}</code> ). |

To make changes to an existing message template: In the *Actions* column click on [Edit](#) to edit the template or click on [Remove](#) to delete the message template.

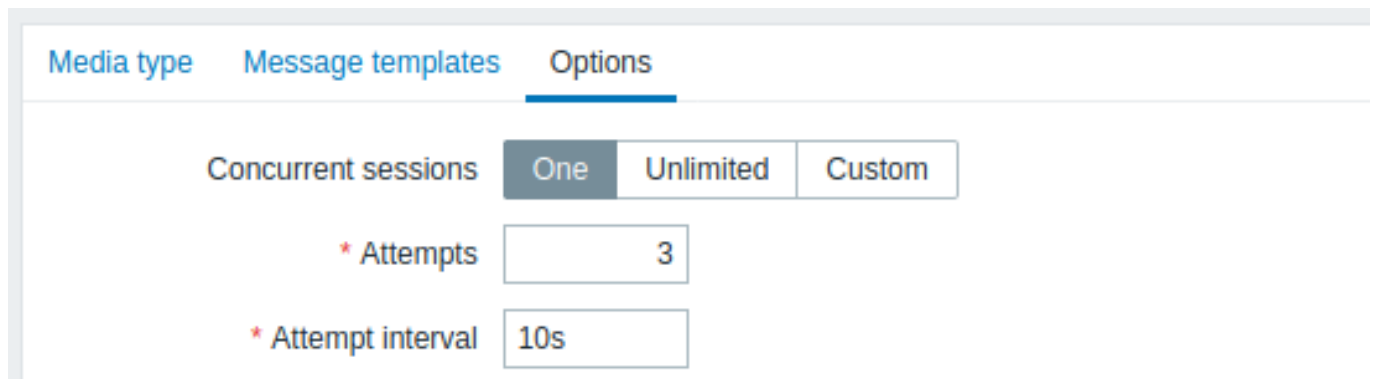

It is possible to define a custom message template for a specific action (see [action operations](#) for details). Custom messages defined in the action configuration will override default media type message template.

**Warning:**

Defining message templates is mandatory for all media types, including webhooks or custom alert scripts that do not use default messages for notifications. For example, an action "Send message to Pushover webhook" will fail to send problem notifications, if the Problem message for the Pushover webhook is not defined.

The **Options** tab contains alert processing settings. The same set of options is configurable for each media type.

All media types are processed in parallel. While the maximum number of concurrent sessions is configurable per media type, the total number of alerter processes on the server can only be limited by the `StartAlerters` [parameter](#). Alerts generated by one trigger are processed sequentially. So multiple notifications may be processed simultaneously only if they are generated by multiple triggers.

| Parameter                  | Description   |
|----------------------------|---|
| <i>Concurrent sessions</i> | Select the number of parallel alerter sessions for the media type:<br><b>One</b> - one session<br><b>Unlimited</b> - unlimited number of sessions<br><b>Custom</b> - select a custom number of sessions<br>Unlimited/high values mean more parallel sessions and increased capacity for sending notifications. Unlimited/high values should be used in large environments where lots of notifications may need to be sent simultaneously.<br>If more notifications need to be sent than there are concurrent sessions, the remaining notifications will be queued; they will not be lost. |
| <i>Attempts</i>            | Number of attempts for trying to send a notification. Up to 100 attempts can be specified; the default value is '3'. If '1' is specified Zabbix will send the notification only once and will not retry if the sending fails.   |
| <i>Attempt interval</i>    | Frequency of trying to resend a notification in case the sending failed, in seconds (0-3600). If '0' is specified, Zabbix will retry immediately.<br>Time suffixes are supported, e.g. 5s, 3m, 1h.  |

## Media type testing

It is possible to test if a configured media type works.

### Email

For example, to test an email media type:

- Locate the relevant email in the **list** of media types
- Click on *Test* in the last column of the list (a testing window will open)
- Enter a *Send to* recipient address and with body and optional subject
- Send a test message by clicking on *Test*

Test success or failure message will be displayed in the same window:

### Test media type

 Media type test successful.

\* Send to

address@domain.com

Subject

Test subject

\* Message

This is the test message from Zabbix

Test

### Webhook

To test a webhook media type:

- Locate the relevant webhook in the **list** of media types
- Click on *Test* in the last column of the list (a testing window will open)
- Edit the webhook parameter values, if needed
- Click on *Test*

By default, webhook tests are performed with parameters entered during configuration. However, it is possible to change attribute values for testing. Replacing or deleting values in the testing window affects the test procedure only, the actual webhook attribute values will remain unchanged.

If the webhook test is successful

- "Media type test successful." message is displayed
- Server response appears in the gray *Response* field
- Response type (JSON or String) is specified below the *Response* field

If the webhook test fails

- "Media type test failed." message is displayed, followed by additional failure details.

User media

To receive notifications of a media type, a medium (email address/phone number/webhook user ID etc) for this media type must be defined in the user profile. For example, an action sending messages to user "Admin" using webhook "X" will always fail to send anything if the webhook "X" medium is not defined in the user profile.

To define user media:

- Go to your user profile, or go to *Administration* → *Users* and open the user properties form
- In the Media tab, click on [Add](#)

Media

Type

Email

\*

Send to

example@company.com

Remove

example recipient <example2@company.com>

User media attributes:

| Parameter | Description  |
|-----------|--|
| Type      | The drop-down list contains names of all configured media types.   |
| Send to   | Provide required contact information where to send messages.<br><br>For an email media type it is possible to add several addresses by clicking on <a href="#">Add</a> below the address field. In this case, the notification will be sent to all email addresses provided. It is also possible to specify recipient name in the <i>Send to</i> field of the email recipient in a format 'Recipient name <address1@company.com>'. Note that if a recipient name is provided, an email address should be wrapped in angle brackets (<>). UTF-8 characters in the name are supported, quoted pairs and comments are not. For example: <i>John Abercroft &lt;manager@nycdatcenter.com&gt;</i> and <i>manager@nycdatcenter.com</i> are both valid formats. Incorrect examples: <i>John Doe zabbix@company.com</i> , <i>%%"Zabbix\@ &lt;H(comment)Q &gt;" zabbix@company.com</i> %%.<br><br><i>When active</i><br>You can limit the time when messages are sent, for example, set the working days only (1-5,09:00-18:00). Note that this limit is based on the user <b>time zone</b> . If the user time zone is changed and is different from the system time zone this limit may need to be adjusted accordingly so as not to miss important messages.<br><br><i>Use if severity</i><br>See the <b>Time period specification</b> page for description of the format.<br>Mark the checkboxes of trigger severities that you want to receive notifications for. Note that the default severity ('Not classified') <b>must be</b> checked if you want to receive notifications for non-trigger <b>events</b> .<br>After saving, the selected trigger severities will be displayed in the corresponding severity colors, while unselected ones will be grayed out. |

| Parameter     | Description  |
|---------------|--|
| <i>Status</i> | Status of the user media.<br><b>Enabled</b> - is in use.<br><b>Disabled</b> - is not being used. |

## 1 E-mail

### Overview

To configure e-mail as the delivery channel for messages, you need to configure e-mail as the media type and assign specific addresses to users.

#### Note:

Multiple notifications for single event will be grouped together on the same email thread.

### Configuration

To configure e-mail as the media type:

- Go to *Administration* → *Media types*
- Click on *Create media type* (or click on *E-mail* in the list of pre-defined media types).

The **Media type** tab contains general media type attributes:

Media type
Message templates 5
Options

\* Name

Email

Type

Email

\* SMTP server

mail.example.com

SMTP server port

25

\* SMTP helo

example.com

\* SMTP email

Zabbix\_info <zabbix@example.com>

Connection security

None
STARTTLS
SSL/TLS

Authentication

None
Username and password

Message format

HTML
Plain text

Description

Enabled

☒

All mandatory input fields are marked with a red asterisk.

The following parameters are specific for the e-mail media type:

| Parameter                  | Description   |
|----------------------------|---|
| <i>SMTP server</i>         | Set an SMTP server to handle outgoing messages.   |
| <i>SMTP server port</i>    | Set the SMTP server port to handle outgoing messages.<br>This option is supported <i>starting with Zabbix 3.0</i> .   |
| <i>SMTP helo</i>           | Set a correct SMTP helo value, normally a domain name.  |
| <i>SMTP email</i>          | The address entered here will be used as the <b>From</b> address for the messages sent.<br>Adding a sender display name (like "Zabbix_info" in <i>Zabbix_info &lt;zabbix@company.com&gt;</i> in the screenshot above) with the actual e-mail address is supported since Zabbix 2.2 version.<br>There are some restrictions on display names in Zabbix emails in comparison to what is allowed by RFC 5322, as illustrated by examples:<br>Valid examples:<br><i>zabbix@company.com</i> (only email address, no need to use angle brackets)<br><i>Zabbix_info &lt;zabbix@company.com&gt;</i> (display name and email address in angle brackets)<br><i>Ω-monitoring &lt;zabbix@company.com&gt;</i> (UTF-8 characters in display name)<br>Invalid examples:<br><i>Zabbix HQ zabbix@company.com</i> (display name present but no angle brackets around email address)<br><i>"Zabbix\@ &lt;H(comment)Q &gt;" &lt;zabbix@company.com&gt;</i> (although valid by RFC 5322, quoted pairs and comments are not supported in Zabbix emails) |
| <i>Connection security</i> | Select the level of connection security:<br><b>None</b> - do not use the <a href="#">CURLOPT_USE_SSL</a> option<br><b>STARTTLS</b> - use the <a href="#">CURLOPT_USE_SSL</a> option with <a href="#">CURLUSESSL_ALL</a> value<br><b>SSL/TLS</b> - use of <a href="#">CURLOPT_USE_SSL</a> is optional<br>This option is supported <i>starting with Zabbix 3.0</i> .  |
| <i>SSL verify peer</i>     | Mark the checkbox to verify the SSL certificate of the SMTP server.<br>The value of "SSLCALocation" server configuration directive should be put into <a href="#">CURLOPT_CAPATH</a> for certificate validation.<br>This sets cURL option <a href="#">CURLOPT_SSL_VERIFYPEER</a> .<br>This option is supported <i>starting with Zabbix 3.0</i> .  |
| <i>SSL verify host</i>     | Mark the checkbox to verify that the <i>Common Name</i> field or the <i>Subject Alternate Name</i> field of the SMTP server certificate matches.<br>This sets cURL option <a href="#">CURLOPT_SSL_VERIFYHOST</a> .<br>This option is supported <i>starting with Zabbix 3.0</i> .  |
| <i>Authentication</i>      | Select the level of authentication:<br><b>None</b> - no cURL options are set<br>(since 3.4.2) <b>Username and password</b> - implies "AUTH=*" leaving the choice of authentication mechanism to cURL<br>(until 3.4.2) <b>Normal password</b> - <a href="#">CURLOPT_LOGIN_OPTIONS</a> is set to "AUTH=PLAIN"<br>This option is supported <i>starting with Zabbix 3.0</i> .   |
| <i>Username</i>            | User name to use in authentication.<br>This sets the value of <a href="#">CURLOPT_USERNAME</a> .<br>This option is supported <i>starting with Zabbix 3.0</i> .<br><b>User macros</b> supported as of Zabbix 6.0.30.   |
| <i>Password</i>            | Password to use in authentication.<br>This sets the value of <a href="#">CURLOPT_PASSWORD</a> .<br>This option is supported <i>starting with Zabbix 3.0</i> .<br><b>User macros</b> supported as of Zabbix 6.0.30.  |
| <i>Message format</i>      | Select message format:<br><b>HTML</b> - send as HTML<br><b>Plain text</b> - send as plain text  |

#### Attention:

To enable SMTP authentication options, Zabbix server must be both compiled with the `--with-libcurl` **compilation** option (with cURL 7.20.0 or higher) and use the `libcurl-full` packages during runtime.

See also **common media type parameters** for details on how to configure default messages and alert processing options.

User media

Once the e-mail media type is configured, go to the *Administration* → *Users* section and edit user profile to assign e-mail media to

the user. Steps for setting up user media, being common for all media types, are described on the [Media types](#) page.

## 2 SMS

### Overview

Zabbix supports the sending of SMS messages using a serial GSM modem connected to Zabbix server's serial port.

Make sure that:

- The speed of the serial device (normally /dev/ttyS0 under Linux) matches that of the GSM modem. Zabbix does not set the speed of the serial link. It uses default settings.
- The 'zabbix' user has read/write access to the serial device. Run the command `ls -l /dev/ttyS0` to see current permissions of the serial device.
- The GSM modem has PIN entered and it preserves it after power reset. Alternatively you may disable PIN on the SIM card. PIN can be entered by issuing command `AT+CPIN="NNNN"` (NNNN is your PIN number, the quotes must be present) in a terminal software, such as Unix minicom or Windows HyperTerminal.

Zabbix has been tested with these GSM modems:

- Siemens MC35
- Teltonika ModemCOM/G10

To configure SMS as the delivery channel for messages, you also need to configure SMS as the media type and enter the respective phone numbers for the users.

### Configuration

To configure SMS as the media type:

- Go to *Administration* → *Media types*
- Click on *Create media type* (or click on *SMS* in the list of pre-defined media types).

The following parameters are specific for the SMS media type:

| Parameter        | Description                                  |
|------------------|--|
| <i>GSM modem</i> | Set the serial device name of the GSM modem. |

See [common media type parameters](#) for details on how to configure default messages and alert processing options. Note that parallel processing of sending SMS notifications is not possible.

### User media

Once the SMS media type is configured, go to the *Administration* → *Users* section and edit user profile to assign SMS media to the user. Steps for setting up user media, being common for all media types, are described on the [Media types](#) page.

## 3 Custom alert scripts

### Overview

If you are not satisfied with the existing media types for sending alerts, there is an alternative way to do that. You can create a script that will handle the notification your way.

Alert scripts are executed on Zabbix server. These scripts must be located in the directory specified in the server [configuration file](#) `AlertScriptsPath` parameter.

Here is an example of a custom alert script:

```
#####!/bin/bash

to=$1
subject=$2
body=$3

cat <<EOF | mail -s "$subject" "$to"
$body
EOF
```

**Attention:**

Starting from version 3.4 Zabbix checks for the exit code of the executed commands and scripts. Any exit code which is different from **0** is considered as a **command execution** error. In such case Zabbix will try to repeat failed execution.

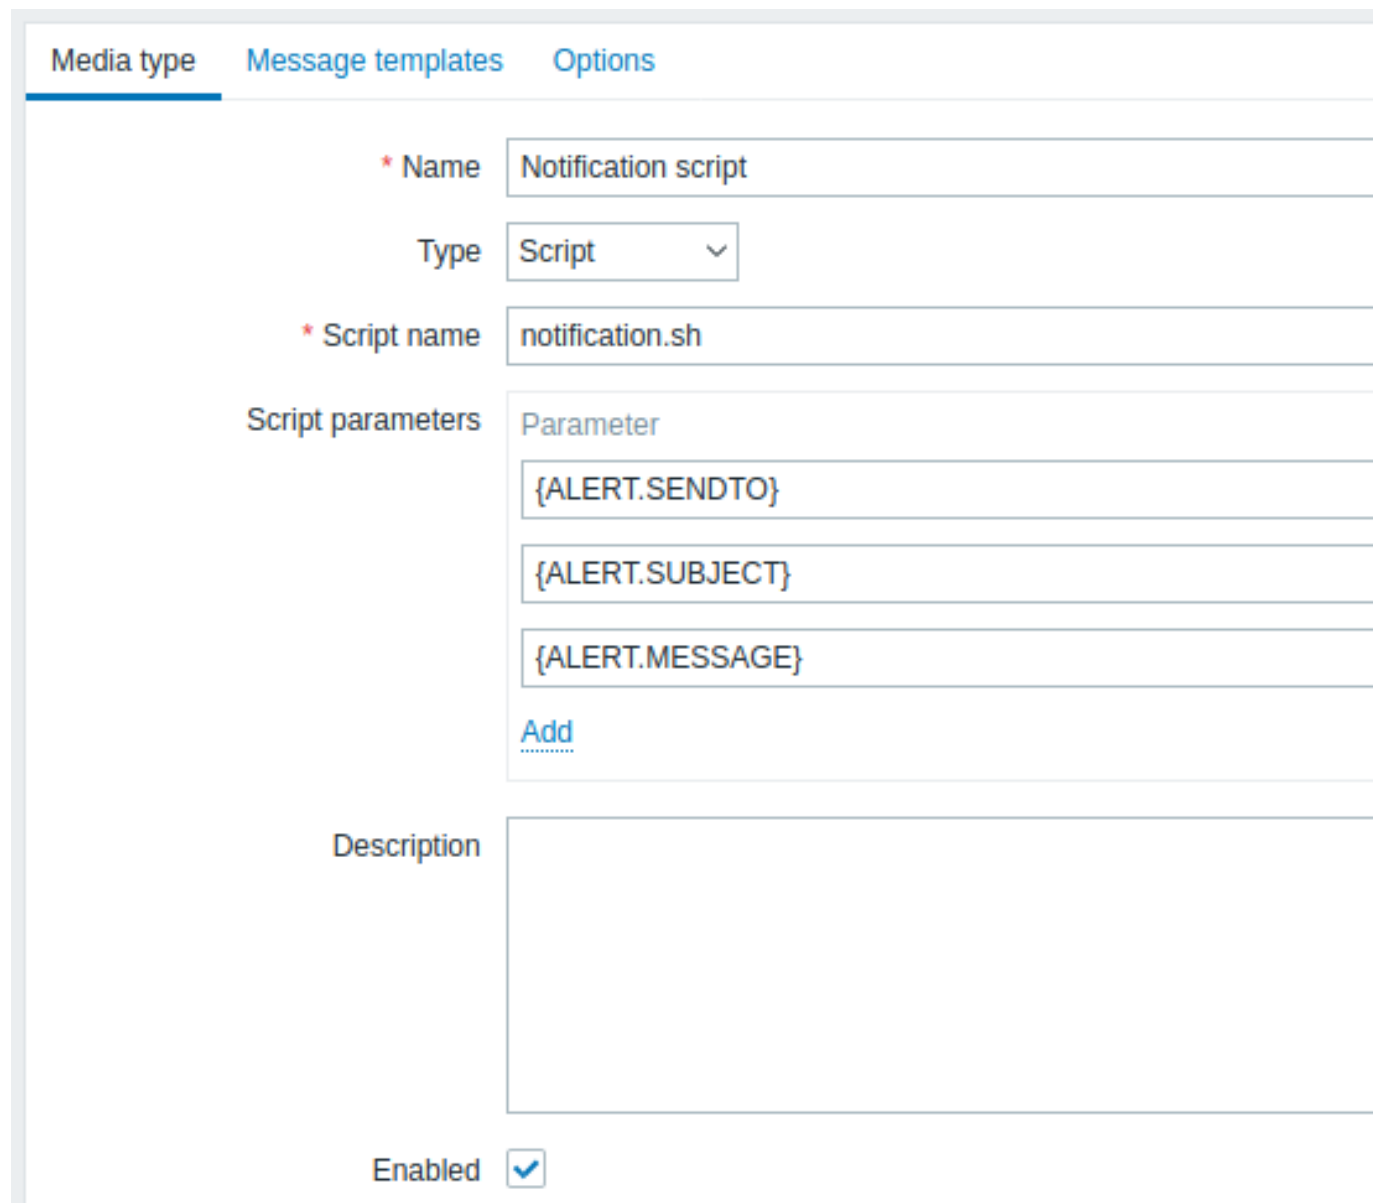

Environment variables are not preserved or created for the script, so they should be handled explicitly.

**Configuration**

To configure custom alert scripts as the media type:

- Go to *Administration* → *Media types*
- Click on *Create media type*

The **Media type** tab contains general media type attributes:

The screenshot shows the Zabbix 'Media type' configuration interface. It has three tabs: 'Media type' (selected), 'Message templates', and 'Options'. The 'Media type' tab contains the following fields:

- Name:** Notification script (marked with a red asterisk as mandatory).
- Type:** Script (selected from a dropdown menu).
- Script name:** notification.sh (marked with a red asterisk as mandatory).
- Script parameters:** A section with a 'Parameter' label and a list of parameters: {ALERT.SENDTO}, {ALERT.SUBJECT}, and {ALERT.MESSAGE}. There is an 'Add' button below the list.
- Description:** A large empty text area.
- Enabled:** A checkbox that is checked.

All mandatory input fields are marked with a red asterisk.

The following parameters are specific for the script media type:

| Parameter                | Description   |
|--------------------------|---|
| <i>Script name</i>       | Enter the name of the script file (e.g., notification.sh) that is located in the directory specified in the server <b>configuration file</b> <code>AlertScriptsPath</code> parameter.                               |
| <i>Script parameters</i> | Add command-line parameters to the script.<br>{ALERT.SENDTO}, {ALERT.SUBJECT} and {ALERT.MESSAGE} <b>macros</b> are supported in script parameters.<br>Customizing script parameters is supported since Zabbix 3.0. |

See [common media type parameters](#) for details on how to configure default messages and alert processing options.

**Warning:**

Even if an alert script doesn't use default messages, message templates for operation types used by this media type must still be defined, otherwise a notification will not be sent.

**Attention:**

As parallel processing of media types is implemented since Zabbix 3.4.0, it is important to note that with more than one script media type configured, these scripts may be processed in parallel by alerter processes. The total number of alerter processes is limited by the `StartAlerters` [parameter](#).

## User media

Once the media type is configured, go to the *Administration* → *Users* section and edit user profile to assign media of this type to the user. Steps for setting up user media, being common for all media types, are described on the [Media types](#) page.

Note that when defining a user media, the *Send to* field cannot be empty. If this field is not used in the alert script, enter any combination of supported characters to bypass validation requirements.

## 4 Webhook

### Overview

The webhook media type is useful for making HTTP calls using custom JavaScript code for straightforward integration with external software such as helpdesk systems, chats, or messengers. You may choose to import an integration provided by Zabbix or create a custom integration from scratch.

### Integrations

The following integrations are available, allowing predefined webhook media types to be used for pushing Zabbix notifications to:

- [brevis.one](#)
- [Discord](#)
- [Event-Driven Ansible](#)
- [Express.ms messenger](#)
- [Github issues](#)
- [GLPi](#)
- [iLert](#)
- [iTop](#)
- [Jira](#)
- [Jira Service Desk](#)
- [ManageEngine ServiceDesk](#)
- [Mantis Bug Tracker](#)
- [Mattermost](#)
- [Microsoft Teams](#)
- [MS Teams Workflows](#)
- [LINE](#)
- [Opsgenie](#)
- [OTRS](#)
- [Pagerduty](#)
- [Pushover](#)
- [Redmine](#)
- [Rocket.Chat](#)
- [ServiceNow](#)
- [SIGNL4](#)
- [Slack](#)
- [SolarWinds](#)
- [SysAid](#)
- [Telegram](#)
- [TOPdesk](#)
- [VictorOps](#)
- [Zammad](#)
- [Zendesk](#)

**Note:**

In addition to the services listed here, Zabbix can be integrated with **Spiceworks** (no webhook is required). To convert Zabbix notifications into Spiceworks tickets, create an **email media type** and enter Spiceworks helpdesk email address (e.g. [help@zabbix.on.spiceworks.com](mailto:help@zabbix.on.spiceworks.com)) in the profile settings of a designated Zabbix user.

## Configuration

To start using a webhook integration:

1. Locate required .xml file in the `templates/media` directory of the downloaded Zabbix version or download it from [Zabbix git repository](#)
2. **Import** the file into your Zabbix installation. The webhook will appear in the list of media types.
3. Configure the webhook according to instructions in the *Readme.md* file (you may click on a webhook's name above to quickly access *Readme.md*).

To create a custom webhook from scratch:

- Go to *Administration* → *Media types*
- Click on *Create media type*

The **Media type** tab contains various attributes specific for this media type:

Media type
Message templates 5
Options

\* Name

Express.ms

Type

Webhook

Parameters

| Name                | Value                 |

All mandatory input fields are marked with a red asterisk.

The following parameters are specific for the webhook media type:

| Parameter                       | Description  |
|---------------------------------|--|
| <i>Parameters</i>               | <p>Specify the webhook variables as the attribute and value pairs.</p> <p>For preconfigured webhooks, a list of parameters varies, depending on the service. Check the webhook's <i>Readme.md</i> file for parameter description.</p> <p>For new webhooks, several common variables are included by default (URL:&lt;empty&gt;, HTTPProxy:&lt;empty&gt;, To:{ALERT.SENDTO}, Subject:{ALERT.SUBJECT}, Message:{ALERT.MESSAGE}), feel free to keep or remove them.</p> <p>All <b>macros</b> that are supported in problem notifications are supported in the parameters.</p> <p>If you specify an HTTP proxy, the field supports the same functionality as in the item configuration <b>HTTP proxy</b> field. The proxy string may be prefixed with [scheme] :// to specify which kind of proxy is used (e.g. https, socks4, socks5; see <a href="#">documentation</a>).</p>   |
| <i>Script</i>                   | <p>Enter JavaScript code in the block that appears when clicking in the parameter field (or on the view/edit button next to it). This code will perform the webhook operation.</p> <p>The script is a function code that accepts parameter - value pairs. The values should be converted into JSON objects using JSON.parse() method, for example: <code>var params = JSON.parse(value);</code>.</p> <p>The code has access to all parameters, it may perform HTTP GET, POST, PUT and DELETE requests and has control over HTTP headers and request body.</p> <p>The script must contain a return operator, otherwise it will not be valid. It may return OK status along with an optional list of tags and tag values (see <i>Process tags</i> option) or an error string.</p> <p>Note that the script is executed only after an alert is created. If the script is configured to return and process tags, these tags will not get resolved in {EVENT.TAGS} and {EVENT.RECOVERY.TAGS} macros in the initial problem message and recovery messages because the script has not had the time to run yet.</p> <p><i>Note:</i> Using local variables instead of global ones is recommended to make sure that each script operates on its own data and that there are no collisions between simultaneous calls (see <a href="#">known issues</a>).</p> <p>See also: <a href="#">Webhook development guidelines</a>, <a href="#">Webhook script examples</a>, <a href="#">Additional JavaScript objects</a>.</p> |
| <i>Timeout</i>                  | <p>JavaScript execution timeout (1-60s, default 30s).</p> <p>Time suffixes are supported, e.g. 30s, 1m.</p>  |
| <i>Process tags</i>             | <p>Mark the checkbox to process returned JSON property values as tags. These tags are added to any existing problem tags.</p> <p>Note that when using <a href="#">webhook tags</a>, the webhook must return a JSON object containing at least an empty tags object: <code>var result = {tags: {}};</code></p> <p>Examples of tags that can be returned: <i>Jira ID: PROD-1234, Responsible: John Smith, Processed:&lt;no value&gt;</i></p>   |
| <i>Include event menu entry</i> | <p>Mark the checkbox to include an entry in the <b>event menu</b> linking to a created external ticket.</p> <p>An entry will be included for each webhook that is enabled and has this checkbox marked. Note that if the <i>Menu entry name</i> and <i>Menu entry URL</i> parameters contain any {EVENT.TAGS.&lt;tag name&gt;} macros, an entry will be included only if these macros can be resolved (that is, the event has these tags defined).</p> <p>If marked, the webhook should not be used for sending notifications to different users (consider creating a <b>dedicated user</b> instead) and should not be used in multiple alert actions <b>for a single problem event</b>.</p>   |
| <i>Menu entry name</i>          | <p>Specify the menu entry name.</p> <p>{EVENT.TAGS.&lt;tag name&gt;} macro is supported.</p>   |
| <i>Menu entry URL</i>           | <p>This field is only mandatory if <i>Include event menu entry</i> is marked.</p> <p>Specify the underlying URL of the menu entry.</p> <p>{EVENT.TAGS.&lt;tag name&gt;} macro is supported.</p> <p>This field is only mandatory if <i>Include event menu entry</i> is marked.</p>  |

See [common media type parameters](#) for details on how to configure default messages and alert processing options.

**Warning:**

Even if a webhook doesn't use default messages, message templates for operation types used by this webhook must still be defined.

## User media

Once the media type is configured, go to the *Administration* → *Users* section and assign the webhook media to an existing user or create a new user to represent the webhook. Steps for setting up user media for an existing user, being common for all media types, are described on the [Media types](#) page.

If a webhook uses tags to store ticket\message ID, avoid assigning the same webhook as a media to different users as doing so may cause webhook errors (applies to the majority of webhooks that utilize *Include event menu entry* option). In this case, the best practice is to create a dedicated user to represent the webhook:

1. After configuring the webhook media type, go to the *Administration* → *Users* section and create a dedicated Zabbix user to represent the webhook - for example, with a username *Slack* for the Slack webhook. All settings, except media, can be left at their defaults as this user will not be logging into Zabbix.
2. In the user profile, go to a tab *Media* and **add a webhook** with the required contact information. If the webhook does not use a *Send to* field, enter any combination of supported characters to bypass validation requirements.
3. Grant this user at least read **permissions** to all hosts for which it should send the alerts.

When configuring alert action, add this user in the *Send to users* field in Operation details - this will tell Zabbix to use the webhook for notifications from this action.

## Configuring alert actions

Actions determine which notifications should be sent via the webhook. Steps for **configuring actions** involving webhooks are the same as for all other media types with these exceptions:

- If a webhook uses **webhook tags** to store ticket\message ID and handle update\resolve operations, avoid using the same webhook in multiple alert actions for a single problem event. If {EVENT.TAGS.<tag name>} exists and gets updated in the webhook, its resulting value will be undefined. To avoid this, use a new tag name in the webhook for storing updated values. This applies to Jira, Jira Service Desk, Mattermost, Opsgenie, OTRS, Redmine, ServiceNow, Slack, Zammad, and Zendesk webhooks provided by Zabbix and to most webhooks utilizing the *Include event menu entry* option. Note, however, that a single webhook can be used in multiple operations or escalation steps of the same action, as well as in different actions that will not be triggered by the same problem event due to different **conditions**.
- When using a webhook in actions for **internal events**, ensure to mark the *Custom message* checkbox and define a custom message in the action operation configuration. Otherwise, a notification will not be sent.

## 1 Webhook script examples

### Overview

Though Zabbix offers a large number of webhook integrations available out-of-the-box, you may want to create your own webhooks instead. This section provides examples of custom webhook scripts (used in the *Script* parameter). See **webhook** section for description of other webhook parameters.

### Jira webhook (custom)

Media type Message templates 5 Options

\* Name Jira webhook

Type Webhook

Parameters

| Name      | Value           |
|-----------|-----------------|
| HTTPProxy |                 |
| Message   | {ALERT.MESSAGE} |
| Subject   | {ALERT.SUBJECT} |
| To        | {ALERT.SENDTO}  |
| URL       |                 |

Add

\* Script try {...

\* Timeout 30s

Process tags ☒

Include event menu entry ☒

\* Menu entry name {EVENT.tags.issue\_key}

\* Menu entry URL https://tsupport.zabbix.lan/browse/{EVENT.tags.issue\_key}

Description Creating a JIRA issue.

Enabled ☒

This script will create a JIRA issue and return some info on the created issue.

```
try {
  Zabbix.log(4, '[ Jira webhook ] Started with params: ' + value);

  var result = {
    'tags': {
      'endpoint': 'jira'
    }
  },
  params = JSON.parse(value),
  req = new HttpRequest(),
  fields = {},
  resp;

  if (params.HTTPProxy) {
    req.setProxy(params.HTTPProxy);
  }
}
```

```

req.addHeader('Content-Type: application/json');
req.addHeader('Authorization: Basic ' + params.authentication);

fields.summary = params.summary;
fields.description = params.description;
fields.project = {key: params.project_key};
fields.issuetype = {id: params.issue_id};

resp = req.post('https://jira.example.com/rest/api/2/issue/',
    JSON.stringify({"fields": fields})
);

if (req.getStatus() != 201) {
    throw 'Response code: ' + req.getStatus();
}

resp = JSON.parse(resp);
result.tags.issue_id = resp.id;
result.tags.issue_key = resp.key;

return JSON.stringify(result);
}
catch (error) {
    Zabbix.log(4, '[ Jira webhook ] Issue creation failed json : ' + JSON.stringify({"fields": fields}));
    Zabbix.log(3, '[ Jira webhook ] issue creation failed : ' + error);

    throw 'Failed with error: ' + error;
}

```

Slack webhook (custom)

This webhook will forward notifications from Zabbix to a Slack channel.

| Media type  | Message templates | Options |      |       |     |  |           |  |         |                |      |                 |          |     |
|---|-------------------|---------|------|-------|-----|--|-----------|--|---------|----------------|------|-----------------|----------|-----|
| <div> <div>* Name</div> <div>Slack chat bot</div> </div>  |                   |         |      |       |     |  |           |  |         |                |      |                 |          |     |
| <div> <div>Type</div> <div>Webhook ▼</div> </div>   |                   |         |      |       |     |  |           |  |         |                |      |                 |          |     |
| <div> <div>Parameters</div> <table border="1"> <thead> <tr> <th>Name</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>URL</td> <td></td> </tr> <tr> <td>HTTPProxy</td> <td></td> </tr> <tr> <td>channel</td> <td>{ALERT.SENDTO}</td> </tr> <tr> <td>text</td> <td>{ALERT.SUBJECT}</td> </tr> <tr> <td>username</td> <td>bot</td> </tr> </tbody> </table> <div>Add</div> </div> |                   |         | Name | Value | URL |  | HTTPProxy |  | channel | {ALERT.SENDTO} | text | {ALERT.SUBJECT} | username | bot |
| Name  | Value             |         |      |       |     |  |           |  |         |                |      |                 |          |     |

| channel   | {ALERT.SENDTO}    |         |      |       |     |  |           |  |         |                |      |                 |          |     |
| text  | {ALERT.SUBJECT}   |         |      |       |     |  |           |  |         |                |      |                 |          |     |
| username  | bot               |         |      |       |     |  |           |  |         |                |      |                 |          |     |
| <div> <div>* Script</div> <div>try {...</div> </div>  |                   |         |      |       |     |  |           |  |         |                |      |                 |          |     |

```

try {
    var params = JSON.parse(value),
        req = new HttpRequest(),
        response;

    if (params.HTTPProxy) {

```

```

    req.setProxy(params.HTTPProxy);
}

req.addHeader('Content-Type: application/x-www-form-urlencoded');

Zabbix.log(4, '[ Slack webhook ] Webhook request with value=' + value);

response = req.post(params.hook_url, 'payload=' + encodeURIComponent(value));
Zabbix.log(4, '[ Slack webhook ] Responded with code: ' + req.getStatus() + '. Response: ' + response);

try {
    response = JSON.parse(response);
}
catch (error) {
    if (req.getStatus() < 200 || req.getStatus() >= 300) {
        throw 'Request failed with status code ' + req.getStatus();
    }
    else {
        throw 'Request success, but response parsing failed.';
    }
}

if (req.getStatus() !== 200 || !response.ok || response.ok === 'false') {
    throw response.error;
}

return 'OK';
}
catch (error) {
    Zabbix.log(3, '[ Slack webhook ] Sending failed. Error: ' + error);

    throw 'Failed with error: ' + error;
}

```

## 2 Actions

### Overview

If you want some operations taking place as a result of events (for example, notifications sent), you need to configure actions.

Actions can be defined in response to events of all supported types:

- Trigger actions - for events when trigger status changes from *OK* to *PROBLEM* and back
- Service actions - for events when service status changes from *OK* to *PROBLEM* and back
- Discovery actions - for events when network discovery takes place
- Autoregistration actions - for events when new active agents auto-register (or host metadata changes for registered ones)
- Internal actions - for events when items become unsupported or triggers go into an unknown state

### Configuring an action

To configure an action, do the following:

- Go to *Configuration -> Actions* and select the required action type from the submenu (you can switch to another type later, using the title dropdown)
- Click on *Create action*
- Name the action
- Choose **conditions** upon which operations are carried out
- Choose the **operations** to carry out

Note that service actions can be configured in the **service action** section.

General action attributes:

| <i>Type of calculation</i> | Select the evaluation <b>option</b> for action conditions (with more than one condition):<br><b>And</b> - all conditions must be met<br><b>Or</b> - enough if one condition is met<br><b>And/Or</b> - combination of the two: AND with different condition types and OR with the same condition type<br><b>Custom expression</b> - a user-defined calculation formula for evaluating action conditions. |
| <i>Conditions</i>          | List of action conditions.<br>Click on <i>Add</i> to add a new <b>condition</b> .<br>If no conditions are configured, the action will run for every event that corresponds to the <b>action type</b> being configured.  |
| <i>Enabled</i>             | Mark the checkbox to enable the action. Otherwise, it will be disabled.   |

## 1 Conditions

### Overview

It is possible to define that an action is executed only if the event matches a defined set of conditions. Conditions are set when configuring the **action**.

Condition matching is case-sensitive.

### Trigger actions

The following conditions can be used in trigger-based actions:

| Condition type    | Supported operators      | Description   |
|-------------------|--------------------------|---|
| <i>Host group</i> | equals<br>does not equal | Specify host groups or host groups to exclude.<br><b>equals</b> - event belongs to this host group.<br><b>does not equal</b> - event does not belong to this host group.<br>Specifying a parent host group implicitly selects all nested host groups.<br>To specify the parent group only, all nested groups have to be additionally set with the <b>does not equal</b> operator. |
| <i>Template</i>   | equals<br>does not equal | Specify templates or templates to exclude.<br><b>equals</b> - event belongs to a trigger inherited from this template.<br><b>does not equal</b> - event does not belong to a trigger inherited from this template.  |
| <i>Host</i>       | equals<br>does not equal | Specify hosts or hosts to exclude.<br><b>equals</b> - event belongs to this host.<br><b>does not equal</b> - event does not belong to this host.  |

| Condition type               | Supported operators   | Description  |
|------------------------------|---|--|
| <i>Tag name</i>              | equals<br>does not equal<br>contains<br>does not contain                        | Specify event tag or event tag to exclude.<br><b>equals</b> - event has this tag<br><b>does not equal</b> - event does not have this tag<br><b>contains</b> - event has a tag containing this string<br><b>does not contain</b> - event does not have a tag containing this string   |
| <i>Tag value</i>             | equals<br>does not equal<br>contains<br>does not contain                        | Specify event tag and value combination or tag and value combination to exclude.<br><b>equals</b> - event has this tag and value<br><b>does not equal</b> - event does not have this tag and value<br><b>contains</b> - event has a tag and value containing these strings<br><b>does not contain</b> - event does not have a tag and value containing these strings   |
| <i>Trigger</i>               | equals<br>does not equal  | Specify triggers or triggers to exclude.<br><b>equals</b> - event is generated by this trigger.<br><b>does not equal</b> - event is generated by any other trigger, except this one.   |
| <i>Event name</i>            | contains<br>does not contain  | Specify a string in the name of the event generated by the trigger or a string to exclude. By default, the event name matches the trigger name unless a custom event name is specified in <a href="#">trigger configuration</a> .<br><b>contains</b> - event name contains this string.<br><b>does not contain</b> - this string is excluded from the event name.<br><i>Note:</i> Entered value will be compared to event name with all macros expanded. |
| <i>Trigger severity</i>      | equals<br>does not equal<br>is greater than or equals<br>is less than or equals | Specify trigger severity.<br><b>equals</b> - equal to trigger severity<br><b>does not equal</b> - not equal to trigger severity<br><b>is greater than or equals</b> - more or equal to trigger severity<br><b>is less than or equals</b> - less or equal to trigger severity   |
| <i>Time period</i>           | in<br>not in  | Specify a time period or a time period to exclude.<br><b>in</b> - event time is within the time period.<br><b>not in</b> - event time is not within the time period.<br>See the <a href="#">time period specification</a> page for description of the format.<br><b>User macros</b> are supported, since Zabbix 3.4.0.   |
| <i>Problem is suppressed</i> | no<br>yes   | Specify if the problem is suppressed (not shown) because of host maintenance.<br><b>no</b> - problem is not suppressed.<br><b>yes</b> - problem is suppressed.   |

## Discovery actions

The following conditions can be used in discovery-based events:

| Condition type | Supported operators      | Description   |
|----------------|--------------------------|---|
| <i>Host IP</i> | equals<br>does not equal | Specify an IP address range or a range to exclude for a discovered host.<br><b>equals</b> - host IP is in the range.<br><b>does not equal</b> - host IP is not in the range.<br>It may have the following formats:<br>Single IP: 192.168.1.33<br>Range of IP addresses: 192.168.1-10.1-254<br>IP mask: 192.168.4.0/24<br>List: 192.168.1.1-254, 192.168.2.1-100, 192.168.2.200, 192.168.4.0/24<br>Support for spaces in the list format is provided since Zabbix 3.0.0. |

| Condition type          | Supported operators   | Description   |
|-------------------------|---|---|
| <i>Service type</i>     | equals<br>does not equal  | Specify a service type of a discovered service or a service type to exclude.<br><b>equals</b> - matches the discovered service.<br><b>does not equal</b> - does not match the discovered service.<br>Available service types: SSH, LDAP, SMTP, FTP, HTTP, HTTPS ( <i>available since Zabbix 2.2 version</i> ), POP, NNTP, IMAP, TCP, Zabbix agent, SNMPv1 agent, SNMPv2 agent, SNMPv3 agent, ICMP ping, telnet ( <i>available since Zabbix 2.2 version</i> ).   |
| <i>Service port</i>     | equals<br>does not equal  | Specify a TCP port range of a discovered service or a range to exclude.<br><b>equals</b> - service port is in the range.<br><b>does not equal</b> - service port is not in the range.   |
| <i>Discovery rule</i>   | equals<br>does not equal  | Specify a discovery rule or a discovery rule to exclude.<br><b>equals</b> - using this discovery rule.<br><b>does not equal</b> - using any other discovery rule, except this one.  |
| <i>Discovery check</i>  | equals<br>does not equal  | Specify a discovery check or a discovery check to exclude.<br><b>equals</b> - using this discovery check.<br><b>does not equal</b> - using any other discovery check, except this one.  |
| <i>Discovery object</i> | equals  | Specify the discovered object.<br><b>equals</b> - equal to discovered object (a device or a service).   |
| <i>Discovery status</i> | equals  | <b>Up</b> - matches 'Host Up' and 'Service Up' events<br><b>Down</b> - matches 'Host Down' and 'Service Down' events<br><b>Discovered</b> - matches 'Host Discovered' and 'Service Discovered' events<br><b>Lost</b> - matches 'Host Lost' and 'Service Lost' events  |
| <i>Uptime/Downtime</i>  | is greater than or equals<br>is less than or equals   | Uptime for 'Host Up' and 'Service Up' events. Downtime for 'Host Down' and 'Service Down' events.<br><b>is greater than or equals</b> - is more or equal to. Parameter is given in seconds.<br><b>is less than or equals</b> - is less or equal to. Parameter is given in seconds.  |
| <i>Received value</i>   | equals<br>does not equal<br>is greater than or equals<br>is less than or equals<br>contains<br>does not contain | Specify the value received from an agent (Zabbix, SNMP) check in a discovery rule. String comparison. If several Zabbix agent or SNMP checks are configured for a rule, received values for each of them are checked (each check generates a new event which is matched against all conditions).<br><b>equals</b> - equal to the value.<br><b>does not equal</b> - not equal to the value.<br><b>is greater than or equals</b> - more or equal to the value.<br><b>is less than or equals</b> - less or equal to the value.<br><b>contains</b> - contains the substring. Parameter is given as a string.<br><b>does not contain</b> - does not contain the substring. Parameter is given as a string. |
| <i>Proxy</i>            | equals<br>does not equal  | Specify a proxy or a proxy to exclude.<br><b>equals</b> - using this proxy.<br><b>does not equal</b> - using any other proxy except this one.   |

**Note:**

Service checks in a discovery rule, which result in discovery events, do not take place simultaneously. Therefore, if **multiple** values are configured for *Service type*, *Service port* or *Received value* conditions in the action, they will be compared to one discovery event at a time, but **not** to several events simultaneously. As a result, actions with multiple values for the same check types may not be executed correctly.

Autoregistration actions

The following conditions can be used in actions based on active agent autoregistration:

| Condition type       | Supported operators                                       | Description  |
|----------------------|---|--|
| <i>Host metadata</i> | contains<br>does not contain<br>matches<br>does not match | Specify host metadata or host metadata to exclude.<br><b>contains</b> - host metadata contains the string.<br><b>does not contain</b> - host metadata does not contain the string.<br>Host metadata can be specified in an <b>agent configuration file</b> .<br><b>matches</b> - host metadata matches regular expression.<br><b>does not match</b> - host metadata does not match regular expression. |
| <i>Host name</i>     | contains<br>does not contain<br>matches<br>does not match | Specify a host name or a host name to exclude.<br><b>contains</b> - host name contains the string.<br><b>does not contain</b> - host name does not contain the string.<br><b>matches</b> - host name matches regular expression.<br><b>does not match</b> - host name does not match regular expression.   |
| <i>Proxy</i>         | equals<br>does not equal                                  | Specify a proxy or a proxy to exclude.<br><b>equals</b> - using this proxy.<br><b>does not equal</b> - using any other proxy except this one.  |

#### Internal event actions

The following conditions can be set for actions based on internal events:

| Condition type    | Supported operators                                      | Description   |
|-------------------|--|---|
| <i>Event type</i> | equals   | <b>Item in "not supported" state</b> - matches events where an item goes from a 'normal' to 'not supported' state<br><b>Low-level discovery rule in "not supported" state</b> - matches events where a low-level discovery rule goes from a 'normal' to 'not supported' state<br><b>Trigger in "unknown" state</b> - matches events where a trigger goes from a 'normal' to 'unknown' state |
| <i>Host group</i> | equals<br>does not equal                                 | Specify host groups or host groups to exclude.<br><b>equals</b> - event belongs to this host group.<br><b>does not equal</b> - event does not belong to this host group.  |
| <i>Tag name</i>   | equals<br>does not equal<br>contains<br>does not contain | Specify event tag or event tag to exclude.<br><b>equals</b> - event has this tag<br><b>does not equal</b> - event does not have this tag<br><b>contains</b> - event has a tag containing this string<br><b>does not contain</b> - event does not have a tag containing this string  |
| <i>Tag value</i>  | equals<br>does not equal<br>contains<br>does not contain | Specify event tag and value combination or tag and value combination to exclude.<br><b>equals</b> - event has this tag and value<br><b>does not equal</b> - event does not have this tag and value<br><b>contains</b> - event has a tag and value containing these strings<br><b>does not contain</b> - event does not have a tag and value containing these strings                        |
| <i>Template</i>   | equals<br>does not equal                                 | Specify templates or templates to exclude.<br><b>equals</b> - event belongs to an item/trigger/low-level discovery rule inherited from this template.<br><b>does not equal</b> - event does not belong to an item/trigger/low-level discovery rule inherited from this template.  |
| <i>Host</i>       | equals<br>does not equal                                 | Specify hosts or hosts to exclude.<br><b>equals</b> - event belongs to this host.<br><b>does not equal</b> - event does not belong to this host.  |

#### Type of calculation

The following options of calculating conditions are available:

- **And** - all conditions must be met

Note that using "And" calculation is disallowed between several triggers when they are selected as a Trigger= condition. Actions can only be executed based on the event of one trigger.

- **Or** - enough if one condition is met
- **And/Or** - combination of the two: AND with different condition types and OR with the same condition type, for example:

*Host group* equals Oracle servers  
*Host group* equals MySQL servers  
*Event name* contains 'Database is down'  
*Event name* contains 'Database is unavailable'

is evaluated as

(Host group equals Oracle servers **or** Host group equals MySQL servers) **and** (Event name contains 'Database is down' **or** Event name contains 'Database is unavailable')

- **Custom expression** - a user-defined calculation formula for evaluating action conditions. It must include all conditions (represented as uppercase letters A, B, C, ...) and may include spaces, tabs, brackets ( ), **and** (case sensitive), **or** (case sensitive), **not** (case sensitive).

While the previous example with **And/Or** would be represented as (A or B) and (C or D), in a custom expression you may as well have multiple other ways of calculation:

(A and B) and (C or D)  
(A and B) or (C and D)  
((A or B) and C) or D  
(not (A or B) and C) or not D  
etc.

Actions disabled due to deleted objects

If a certain object (host, template, trigger, etc.) used in an action condition/operation is deleted, the condition/operation is removed and the action is disabled to avoid incorrect execution of the action. The action can be re-enabled by the user.

This behavior takes place when deleting:

- host groups ("host group" condition, "remote command" operation on a specific host group);
- hosts ("host" condition, "remote command" operation on a specific host);
- templates ("template" condition, "link to template" and "unlink from template" operations);
- triggers ("trigger" condition);
- discovery rules (when using "discovery rule" and "discovery check" conditions).

*Note:* If a remote command has many target hosts, and we delete one of them, only this host will be removed from the target list, the operation itself will remain. But, if it's the only host, the operation will be removed, too. The same goes for "link to template" and "unlink from template" operations.

Actions are not disabled when deleting a user or user group used in a "send message" operation.

## 2 Operations

Overview

You can define the following operations for all events:

- send a message
- execute a remote command

### Attention:

Zabbix server does not create alerts if access to the host is explicitly "denied" for the user defined as action operation recipient or if the user has no rights defined to the host at all.

For discovery and autoregistration events, there are additional operations available:

- **add host**
- remove host
- enable host
- disable host
- add to host group
- remove from host group
- link to template
- unlink from template
- set host inventory mode

Configuring an operation

To configure an operation, go to the *Operations* tab in **action** configuration.

More operations are available for discovery and autoregistration based events (see above).</p>   |
| Steps                          | <p>Select the step(s) to assign the operation to in an <b>escalation</b> schedule:</p> <p><b>From</b> - execute starting with this step</p> <p><b>To</b> - execute until this step (0=infinity, execution will not be limited)</p>  |
| Step duration                  | <p>Custom duration for these steps (0=use default step duration).</p> <p><b>Time suffixes</b> are supported, e.g. 60s, 1m, 2h, 1d, since Zabbix 3.4.0.</p> <p><b>User macros</b> are supported, since Zabbix 3.4.0.</p>   |
| Operation type: send message   | <p>Several operations can be assigned to the same step. If these operations have different step duration defined, the shortest one is taken into account and applied to the step.</p>   |
| Send to user groups            | <p>Click on <i>Add</i> to select user groups to send the message to.</p> <p>The user group must have at least "read" <b>permissions</b> to the host in order to be notified.</p>  |
| Send to users                  | <p>Click on <i>Add</i> to select users to send the message to.</p> <p>The user must have at least "read" <b>permissions</b> to the host in order to be notified.</p>  |
| Send only to Custom message    | <p>Send message to all defined media types or a selected one only.</p> <p>If selected, the custom message can be configured.</p>  |
| Subject                        | <p>For notifications about internal events via <b>webhooks</b>, custom message is mandatory.</p> <p>Subject of the custom message. The subject may contain macros. It is limited to 255 characters.</p>   |
| Message                        | <p>The custom message. The message may contain macros. It is limited to certain amount of characters depending on the type of database (see <b>Sending message</b> for more information).</p>   |
| Operation type: remote command |   |
| Target list                    | <p>Select targets to execute the command on:</p> <p><b>Current host</b> - command is executed on the host of the trigger that caused the problem event. This option will not work if there are multiple hosts in the trigger.</p> <p><b>Host</b> - select host(s) to execute the command on.</p> <p><b>Host group</b> - select host group(s) to execute the command on. Specifying a parent host group implicitly selects all nested host groups. Thus the remote command will also be executed on hosts from nested groups.</p> <p>A command on a host is executed only once, even if the host matches more than once (e.g. from several host groups; individually and from a host group).</p> <p>The target list is meaningless if a custom script is executed on Zabbix server. Selecting more targets in this case only results in the script being executed on the server more times.</p> <p>Note that for global scripts, the target selection also depends on the <i>Host group</i> setting in global script <b>configuration</b>.</p> <p><i>Target list</i> option is not available for <i>Service actions</i> because in this case remote commands are always executed on Zabbix server.</p> |
| Conditions                     | <p>Condition for performing the operation:</p> <p><b>Not ack</b> - only when the event is unacknowledged</p> <p><b>Ack</b> - only when the event is acknowledged.</p> <p><i>Conditions</i> option is not available for <i>Service actions</i>.</p>  |

When done, click on *Add* to add the operation to the list of *Operations*.

## 1 Sending message

## Overview

Sending a message is one of the best ways of notifying people about a problem. That is why it is one of the primary actions offered by Zabbix.

## Configuration

To be able to send and receive notifications from Zabbix you have to:

- **define the media** to send a message to

If the operation takes place outside of the **When active** time period defined for the selected media in the user configuration, the message will not be sent.

The default trigger severity ('Not classified') **must be** checked in user media **configuration** if you want to receive notifications for non-trigger events such as discovery, active agent autoregistration or internal events.

- **configure an action operation** that sends a message to one of the defined media

### Attention:

Zabbix sends notifications only to those users that have at least 'read' permissions to the host that generated the event. At least one host of a trigger expression must be accessible.

You can configure custom scenarios for sending messages using **escalations**.

To successfully receive and read e-mails from Zabbix, e-mail servers/clients must support standard 'SMTP/MIME e-mail' format since Zabbix sends UTF-8 data (If the subject contains ASCII characters only, it is not UTF-8 encoded.). The subject and the body of the message are base64-encoded to follow 'SMTP/MIME e-mail' format standard.

Message limit after all macros expansion is the same as message limit for **Remote commands**.

## Tracking messages

You can view the status of messages sent in *Monitoring → Problems*.

In the *Actions* column you can see summarized information about actions taken. In there green numbers represent messages sent, red ones - failed messages. *In progress* indicates that an action is initiated. *Failed* informs that no action has executed successfully.

If you click on the event time to view event details, you will be able to see the details of messages sent (or not sent) due to the event in the *Actions* block.

In *Reports → Action log* you will see details of all actions taken for those events that have an action configured.

## 2 Remote commands

## Overview

With remote commands you can define that a certain pre-defined command is automatically executed on the monitored host upon some condition.

Thus remote commands are a powerful mechanism for smart pro-active monitoring.

In the most obvious uses of the feature you can try to:

- Automatically restart some application (web server, middleware, CRM) if it does not respond
- Use IPMI 'reboot' command to reboot some remote server if it does not answer requests
- Automatically free disk space (removing older files, cleaning /tmp) if running out of disk space
- Migrate a VM from one physical box to another depending on the CPU load
- Add new nodes to a cloud environment upon insufficient CPU (disk, memory, whatever) resources

Configuring an action for remote commands is similar to that for sending a message, the only difference being that Zabbix will execute a command instead of sending a message.

Remote commands can be executed by Zabbix server, proxy or agent. Remote commands on Zabbix agent can be executed directly by Zabbix server or through Zabbix proxy. Both on Zabbix agent and Zabbix proxy remote commands are disabled by default. They can be enabled by:

- adding an `AllowKey=system.run[*]` parameter in agent configuration;
- setting the `EnableRemoteCommands` parameter to '1' in proxy configuration.

Remote commands executed by Zabbix server are run as described in [Command execution](#) including exit code checking.

Remote commands are executed even if the target host is in maintenance.

Remote command limit

Remote command limit after resolving all macros depends on the type of database and character set (non-ASCII characters require more than one byte to be stored):

| Database                   | Limit in characters | Limit in bytes |
|----------------------------|---------------------|----------------|
| MySQL                      | 65535               | 65535          |
| Oracle Database            | 2048                | 4000           |
| PostgreSQL                 | 65535               | not limited    |
| SQLite (only Zabbix proxy) | 65535               | not limited    |

Remote command execution output (return value) is limited to 16MB (including trailing whitespace that is truncated). [IPMI remote command](#) limit is based on the installed IPMI library. Note that [database limits](#) apply to all remote commands.

Configuration

Those remote commands that are executed on Zabbix agent (custom scripts) must be first enabled in the agent [configuration](#).

Make sure that the `AllowKey=system.run[<command>,*]` parameter is added for each allowed command in agent configuration to allow specific command with nowait mode. Restart agent daemon if changing this parameter.

**Attention:**

Remote commands do not work with active Zabbix agents.

Then, when configuring a new action in *Configuration* → *Actions*:

- Define the appropriate conditions. In this example, set that the action is activated upon any disaster problems with one of Apache applications:

The screenshot shows the Zabbix Configuration interface for the 'Actions' section, specifically the 'Operations' tab. The 'Name' field is set to 'Serious problem with Apache'. The 'Type of calculation' is set to 'And'. The 'Conditions' table lists three conditions: A (Problem is not suppressed), B (Application contains Apache), and C (Trigger severity is greater than or equals Disaster). The 'Add' button is visible. The 'Enabled' checkbox is checked.

- In the *Operations* tab, click on Add in the Operations/Recovery operations/Update operations block
- From the Operation dropdown field select one of the predefined scripts

The screenshot shows a web interface titled 'Operation details'. On the left, there are labels 'Operation' and 'Steps'. To the right of 'Operation' is a dropdown menu currently showing 'Restart webserver'. Below this, under the 'Steps' label, is a list box containing two items: 'Send message' and 'Restart webserver', with the latter being highlighted in blue.

- Select the target list for the script

#### Predefined scripts

All scripts (webhook, script, SSH, Telnet, IPMI) that are available for action operations are defined in [global scripts](#).

For example:

```
sudo /etc/init.d/apache restart
```

In this case, Zabbix will try to restart an Apache process. With this command, make sure that the command is executed on Zabbix agent (click the *Zabbix agent* button against *Execute on*).

#### Attention:

Note the use of **sudo** - Zabbix user does not have permissions to restart system services by default. See below for hints on how to configure **sudo**.

#### Note:

Zabbix agent should run on the remote host and accept incoming connections. Zabbix agent executes commands in background.

Remote commands on Zabbix agent are executed without timeout by the `system.run[,nowait]` key and are not checked for execution results. On Zabbix server and Zabbix proxy, remote commands are executed with timeout as set in the `TrapperTimeout` parameter of `zabbix_server.conf` or `zabbix_proxy.conf` file and are **checked** for execution results.

#### Access permissions

Make sure that the 'zabbix' user has execute permissions for configured commands. One may be interested in using **sudo** to give access to privileged commands. To configure access, execute as root:

```
visudo
```

Example lines that could be used in *sudoers* file:

```
# allows 'zabbix' user to run all commands without password.
zabbix ALL=NOPASSWD: ALL
```

```
# allows 'zabbix' user to restart apache without password.
zabbix ALL=NOPASSWD: /etc/init.d/apache restart
```

#### Note:

On some systems *sudoers* file will prevent non-local users from executing commands. To change this, comment out **requiretty** option in */etc/sudoers*.

#### Remote commands with multiple interfaces

If the target system has multiple interfaces of the selected type (Zabbix agent or IPMI), remote commands will be executed on the default interface.

It is possible to execute remote commands via SSH and Telnet using another interface than the Zabbix agent one. The available interface to use is selected in the following order:

- Zabbix agent default interface
- SNMP default interface
- JMX default interface
- IPMI default interface

## IPMI remote commands

For IPMI remote commands the following syntax should be used:

`<command> [<value>]`

where

- `<command>` - one of IPMI commands without spaces
- `<value>` - 'on', 'off' or any unsigned integer. `<value>` is an optional parameter.

Examples

Examples of **global scripts** that may be used as remote commands in action operations.

### Example 1

Restart of Windows on certain condition.

In order to automatically restart Windows upon a problem detected by Zabbix, define the following script:

| Script parameter | Value                                  |
|------------------|--|
| <i>Scope</i>     | 'Action operation'                     |
| <i>Type</i>      | 'Script'                               |
| <i>Command</i>   | c:\windows\system32\shutdown.exe -r -f |

### Example 2

Restart the host by using IPMI control.

| Script parameter | Value              |
|------------------|--------------------|
| <i>Scope</i>     | 'Action operation' |
| <i>Type</i>      | 'IPMI'             |
| <i>Command</i>   | reset              |

### Example 3

Power off the host by using IPMI control.

| Script parameter | Value              |
|------------------|--------------------|
| <i>Scope</i>     | 'Action operation' |
| <i>Type</i>      | 'IPMI'             |
| <i>Command</i>   | power off          |

## 3 Additional operations

### Overview

In this section you may find some details of **additional operations** for discovery/autoregistration events.

#### Adding host

Hosts are added during the discovery process, as soon as a host is discovered, rather than at the end of the discovery process.

#### Note:

As network discovery can take some time due to many unavailable hosts/services having patience and using reasonable IP ranges is advisable.

When adding a host, its name is decided by the standard **gethostbyname** function. If the host can be resolved, resolved name is used. If not, the IP address is used. Besides, if IPv6 address must be used for a host name, then all ":" (colons) are replaced by "\_" (underscores), since colons are not allowed in host names.

**Attention:**

If performing discovery by a proxy, currently hostname lookup still takes place on Zabbix server.

**Attention:**

If a host already exists in Zabbix configuration with the same name as a newly discovered one, versions of Zabbix prior to 1.8 would add another host with the same name. Zabbix 1.8.1 and later adds **\_N** to the hostname, where **N** is increasing number, starting with 2.

## 4 Using macros in messages

### Overview

In message subjects and message text you can use macros for more efficient problem reporting.

In addition to a number of built-in macros, **user macros** and **expression macros** are also supported. A **full list of macros** supported by Zabbix is available.

### Examples

Examples here illustrate how you can use macros in messages.

#### Example 1

Message subject:

Problem: {TRIGGER.NAME}

When you receive the message, the message subject will be replaced by something like:

Problem: Processor load is too high on Zabbix server

#### Example 2

Message:

Processor load is: {?last(/zabbix.zabbix.com/system.cpu.load[,avg1])}

When you receive the message, the message will be replaced by something like:

Processor load is: 1.45

#### Example 3

Message:

Latest value: {?last(/{HOST.HOST}/{ITEM.KEY})}

MAX for 15 minutes: {?max(/{HOST.HOST}/{ITEM.KEY},15m)}

MIN for 15 minutes: {?min(/{HOST.HOST}/{ITEM.KEY},15m)}

When you receive the message, the message will be replaced by something like:

Latest value: 1.45

MAX for 15 minutes: 2.33

MIN for 15 minutes: 1.01

#### Example 4

Message:

[http://<server\\_ip\\_or\\_name>/zabbix/tr\\_events.php?triggerid={TRIGGER.ID}&eventid={EVENT.ID}](http://<server_ip_or_name>/zabbix/tr_events.php?triggerid={TRIGGER.ID}&eventid={EVENT.ID})

When you receive the message, it will contain a link to the *Event details* page, which provides information about the event, its trigger, and a list of latest events generated by the same trigger.

#### Example 5

Informing about values from several hosts in a trigger expression.

Message:

Problem name: {TRIGGER.NAME}

Trigger expression: {TRIGGER.EXPRESSION}

1. Item value on {HOST.NAME1}: {ITEM.VALUE1} ({ITEM.NAME1})
2. Item value on {HOST.NAME2}: {ITEM.VALUE2} ({ITEM.NAME2})

When you receive the message, the message will be replaced by something like:

Problem name: Processor load is too high on a local host

Trigger expression: last(/Myhost/system.cpu.load[percpu,avg1])>5 or last(/Myotherhost/system.cpu.load[percpu,avg1])>5

1. Item value on Myhost: 0.83 (Processor load (1 min average per core))
2. Item value on Myotherhost: 5.125 (Processor load (1 min average per core))

Example 6

Receiving details of both the problem event and recovery event in a **recovery** message:

Message:

Problem:

Event ID: {EVENT.ID}  
 Event value: {EVENT.VALUE}  
 Event status: {EVENT.STATUS}  
 Event time: {EVENT.TIME}  
 Event date: {EVENT.DATE}  
 Event age: {EVENT.AGE}  
 Event acknowledgment: {EVENT.ACK.STATUS}  
 Event update history: {EVENT.UPDATE.HISTORY}

Recovery:

Event ID: {EVENT.RECOVERY.ID}  
 Event value: {EVENT.RECOVERY.VALUE}  
 Event status: {EVENT.RECOVERY.STATUS}  
 Event time: {EVENT.RECOVERY.TIME}  
 Event date: {EVENT.RECOVERY.DATE}  
 Operational data: {EVENT.OPDATA}

When you receive the message, the macros will be replaced by something like:

Problem:

Event ID: 21874  
 Event value: 1  
 Event status: PROBLEM  
 Event time: 13:04:30  
 Event date: 2018.01.02  
 Event age: 5m  
 Event acknowledgment: Yes  
 Event update history: 2018.01.02 13:05:51 "John Smith (Admin)"  
 Actions: acknowledged.

Recovery:

Event ID: 21896  
 Event value: 0  
 Event status: OK  
 Event time: 13:10:07  
 Event date: 2018.01.02  
 Operational data: Current value is 0.83

#### Attention:

Separate notification macros for the original problem event and recovery event are supported since Zabbix 2.2.0.

### 3 Recovery operations

## Overview

Recovery operations allow you to be notified when problems are resolved.

Both messages and remote commands are supported in recovery operations. While several operations can be added, escalation is not supported - all operations are assigned to a single step and therefore will be performed simultaneously.

## Use cases

Some use cases for recovery operations are as follows:

1. Notify on a recovery all users that were notified on the problem:
  - Select *Notify all involved* as operation type.
2. Have multiple operations upon recovery: send a notification and execute a remote command:
  - Add operation types for sending a message and executing a command.
3. Open a ticket in external helpdesk/ticketing system and close it when the problem is resolved:
  - Create an external script that communicates with the helpdesk system.
  - Create an action having operation that executes this script and thus opens a ticket.
  - Have a recovery operation that executes this script with other parameters and closes the ticket.
  - Use the {EVENT.ID} macro to reference the original problem.

## Configuring a recovery operation

To configure a recovery operation, go to the *Operations* tab in **action** configuration.

Three operation types are available for recovery events:

- **Send message** - send recovery message to specified user;
- **Notify all involved** - send recovery message to all users who were notified on the problem event;
- **<remote command name>** - execute a remote command. Commands are available for execution if previously defined in **global scripts** with *Action operation* selected as its scope.

Parameters for each operation type are described below. All mandatory input fields are marked with a red asterisk. When done, click on *Add* to add operation to the list of *Recovery operations*.

**Note:**

Note that if the same recipient is defined in several operation types without specified *Custom message*, duplicate notifications are not sent.

Operation type: **send message**

| Parameter                  | Description  |
|----------------------------|--|
| <i>Send to user groups</i> | Click on <i>Add</i> to select user groups to send the recovery message to.<br>The user group must have at least "read" <b>permissions</b> to the host in order to be notified. |
| <i>Send to users</i>       | Click on <i>Add</i> to select users to send the recovery message to.<br>The user must have at least "read" <b>permissions</b> to the host in order to be notified.             |
| <i>Send only to</i>        | Send default recovery message to all defined media types or a selected one only.   |
| <i>Custom message</i>      | If selected, a custom message can be defined.  |
| <i>Subject</i>             | Subject of the custom message. The subject may contain macros.   |
| <i>Message</i>             | The custom message. The message may contain macros.  |

Operation type: **remote command**

| Parameter          | Description   |
|--------------------|---|
| <i>Target list</i> | <p>Select targets to execute the command on:</p> <p><b>Current host</b> - command is executed on the host of the trigger that caused the problem event. This option will not work if there are multiple hosts in the trigger.</p> <p><b>Host</b> - select host(s) to execute the command on.</p> <p><b>Host group</b> - select host group(s) to execute the command on. Specifying a parent host group implicitly selects all nested host groups. Thus the remote command will also be executed on hosts from nested groups.</p> <p>A command on a host is executed only once, even if the host matches more than once (e.g. from several host groups; individually and from a host group).</p> <p>The target list is meaningless if the command is executed on Zabbix server. Selecting more targets in this case only results in the command being executed on the server more times.</p> <p>Note that for global scripts, the target selection also depends on the <i>Host group</i> setting in global script <a href="#">configuration</a>.</p> |

Operation type: notify all involved

| Parameter             | Description  |
|-----------------------|--|
| <i>Custom message</i> | If selected, a custom message can be defined.                  |
| <i>Subject</i>        | Subject of the custom message. The subject may contain macros. |
| <i>Message</i>        | The custom message. The message may contain macros.            |

## 4 Update operations

### Overview

Update operations are available in actions with the following event sources:

- *Triggers* - when problems are **updated** by other users, i.e. commented upon, acknowledged, severity has been changed, closed (manually);
- *Services* - when the severity of a service has changed but the service is still not recovered.

Both messages and remote commands are supported in update operations. While several operations can be added, escalation is not supported - all operations are assigned to a single step and therefore will be performed simultaneously.

### Configuring an update operation

To configure an update operation go to the *Operations* tab in action [configuration](#).

Action
Operations 2

\* Default operation step duration

## 5 Escalations

## Overview

With escalations you can create custom scenarios for sending notifications or executing remote commands.

In practical terms it means that:

- Users can be informed about new problems immediately
- Notifications can be repeated until the problem is resolved
- Sending a notification can be delayed
- Notifications can be escalated to another "higher" user group
- Remote commands can be executed immediately or when a problem is not resolved for a lengthy period

Actions are escalated based on the **escalation step**. Each step has a duration in time.

You can define both the default duration and a custom duration of an individual step. The minimum duration of one escalation step is 60 seconds.

You can start actions, such as sending notifications or executing commands, from any step. Step one is for immediate actions. If you want to delay an action, you can assign it to a later step. For each step, several actions can be defined.

The number of escalation steps is not limited.

Escalations are defined when **configuring an operation**. Escalations are supported for problem operations only, not recovery.

Miscellaneous aspects of escalation behavior

Let's consider what happens in different circumstances if an action contains several escalation steps.

| Situation  | Behavior  |
|--|---|
| <i>The host in question goes into maintenance after the initial problem notification is sent</i>   | Depending on the <i>Pause operations for suppressed problems</i> setting in action <b>configuration</b> , all remaining escalation steps are executed either with a delay caused by the maintenance period or without delay. A maintenance period does not cancel operations.   |
| <i>The time period defined in the <b>Time period</b> action condition ends after the initial notification is sent</i>  | All remaining escalation steps are executed. The <i>Time period</i> condition cannot stop operations; it has effect with regard to when actions are started/not started, not operations.  |
| <i>A problem starts during maintenance and continues (is not resolved) after maintenance ends</i>  | Depending on the <i>Pause operations for suppressed problems</i> setting in action <b>configuration</b> , all escalation steps are executed either from the moment maintenance ends or immediately.   |
| <i>A problem starts during a no-data maintenance and continues (is not resolved) after maintenance ends</i>  | It must wait for the trigger to fire, before all escalation steps are executed.   |
| <i>Different escalations follow in close succession and overlap</i>  | The execution of each new escalation supersedes the previous escalation, but for at least one escalation step that is always executed on the previous escalation. This behavior is relevant in actions upon events that are created with EVERY problem evaluation of the trigger.   |
| <i>During an escalation in progress (like a message being sent), based on any type of event:&lt;br&gt;- the action is disabled&lt;br&gt;Based on trigger event:&lt;br&gt;- the trigger is disabled&lt;br&gt;- the host or item is disabled&lt;br&gt;Based on internal event about triggers:&lt;br&gt;- the trigger is disabled&lt;br&gt;Based on internal event about items/low-level discovery rules:&lt;br&gt;- the item is disabled&lt;br&gt;- the host is disabled</i> | The message in progress is sent and then one more message on the escalation is sent. The follow-up message will have the cancellation text at the beginning of the message body ( <i>NOTE: Escalation canceled</i> ) naming the reason (for example, <i>NOTE: Escalation canceled: action '&lt;Action name&gt;' disabled</i> ). This way the recipient is informed that the escalation is canceled and no more steps will be executed. This message is sent to all who received the notifications before. The reason of cancellation is also logged to the server log file (starting from <b>Debug Level 3=Warning</b> ). |
|  | Note that the <i>Escalation canceled</i> message is also sent if operations are finished, but recovery operations are configured and are not executed yet.  |

| Situation   | Behavior  |
|---|---|
| <i>During an escalation in progress (like a message being sent) the action is deleted</i> | No more messages are sent. The information is logged to the server log file (starting from <b>Debug Level 3=Warning</b> ), for example: <code>escalation canceled: action id:334 deleted</code> |

## Escalation examples

### Example 1

Sending a repeated notification once every 30 minutes (5 times in total) to a 'MySQL Administrators' group. To configure:

- in Operations tab, set the *Default operation step duration* to '30m' (30 minutes)
- Set the escalation steps to be *From '1' To '5'*
- Select the 'MySQL Administrators' group as recipients of the message

The screenshot shows the 'Operations 1' tab in Zabbix. The 'Default operation step duration' is set to 30m. The checkbox 'Pause operations for suppressed problems' is checked. Below, the 'Operations' section contains a table with one step: '1 - 5 Send message to user groups: MySQL Administrators via Email'. The 'Start in' column shows 'Immediately' and the 'Duration' column shows 'Default'. There is an 'Add' button below the table.

Notifications will be sent at 0:00, 0:30, 1:00, 1:30, 2:00 hours after the problem starts (unless, of course, the problem is resolved sooner).

If the problem is resolved and a recovery message is configured, it will be sent to those who received at least one problem message within this escalation scenario.

#### Note:

If the trigger that generated an active escalation is disabled, Zabbix sends an informative message about it to all those that have already received notifications.

### Example 2

Sending a delayed notification about a long-standing problem. To configure:

- In Operations tab, set the *Default operation step duration* to '10h' (10 hours)
- Set the escalation steps to be *From '2' To '2'*

The screenshot shows the 'Operations 1' tab in Zabbix. The 'Default operation step duration' is set to 10h. The checkbox 'Pause operations for suppressed problems' is checked. Below, the 'Operations' section contains a table with one step: '2 Send message to user groups: Managers via SMS'. The 'Start in' column shows '10:00:00' and the 'Duration' column shows 'Default'. There is an 'Add' button below the table.

A notification will only be sent at Step 2 of the escalation scenario, or 10 hours after the problem starts.

You can customize the message text to something like 'The problem is more than 10 hours old'.

### Example 3

Escalating the problem to the Boss.

In the first example above we configured periodical sending of messages to MySQL administrators. In this case, the administrators will get four messages before the problem will be escalated to the Database manager. Note that the manager will get a message only in case the problem is not acknowledged yet, supposedly no one is working on it.

Update

Cancel

Note the use of {ESC.HISTORY} macro in the customized message. The macro will contain information about all previously executed steps on this escalation, such as notifications sent and commands executed.

#### Example 4

A more complex scenario. After multiple messages to MySQL administrators and escalation to the manager, Zabbix will try to restart the MySQL database. It will happen if the problem exists for 2:30 hours and it hasn't been acknowledged.

If the problem still exists, after another 30 minutes Zabbix will send a message to all guest users.

If this does not help, after another hour Zabbix will reboot server with the MySQL database (second remote command) using IPMI commands.

Pause operations for suppressed problems

☒

Operations

| Steps | Details  | Start in    | Duration |
|-------|--|-------------|----------|
| 1 - 4 | Send message to user groups: MySQL Administrators via Email  | Immediately | Default  |
| 5 - 6 | Send message to users: Database Manager (J S) via all media  | 02:00:00    | 1h       |
| 5 - 7 | Send message to user groups: Zabbix administrators via Email | 02:00:00    | 10m      |
| 11    | Send message to user groups: Guests via Email                | 04:00:00    | Default  |

Add

Notifications will be sent as follows:

- to MySQL administrators at 0:00, 0:30, 1:00, 1:30 after the problem starts
- to Database manager at 2:00 and 2:10 (and not at 3:00; seeing that steps 5 and 6 overlap with the next operation, the shorter custom step duration of 10 minutes in the next operation overrides the longer step duration of 1 hour tried to set here)
- to Zabbix administrators at 2:00, 2:10, 2:20 after the problem starts (the custom step duration of 10 minutes working)
- to guest users at 4:00 hours after the problem start (the default step duration of 30 minutes returning between steps 8 and 11)

3 Receiving notification on unsupported items

Overview

Receiving notifications on unsupported items is supported since Zabbix 2.2.

It is part of the concept of internal events in Zabbix, allowing users to be notified on these occasions. Internal events reflect a change of state:

- when items go from 'normal' to 'unsupported' (and back)
- when triggers go from 'normal' to 'unknown' (and back)
- when low-level discovery rules go from 'normal' to 'unsupported' (and back)

This section presents a how-to for receiving notification when an item turns unsupported.

Configuration

Overall, the process of setting up the notification should feel familiar to those who have set up alerts in Zabbix before.

### Step 1

Configure **some media**, such as e-mail, SMS, or script to use for the notifications. Refer to the corresponding sections of the manual to perform this task.

#### Attention:

For notifying on internal events the default severity ('Not classified') is used, so leave it checked when configuring **user media** if you want to receive notifications for internal events.

### Step 2

Go to *Configuration* → *Actions* and select *Internal actions* from the third level menu (or page title dropdown).

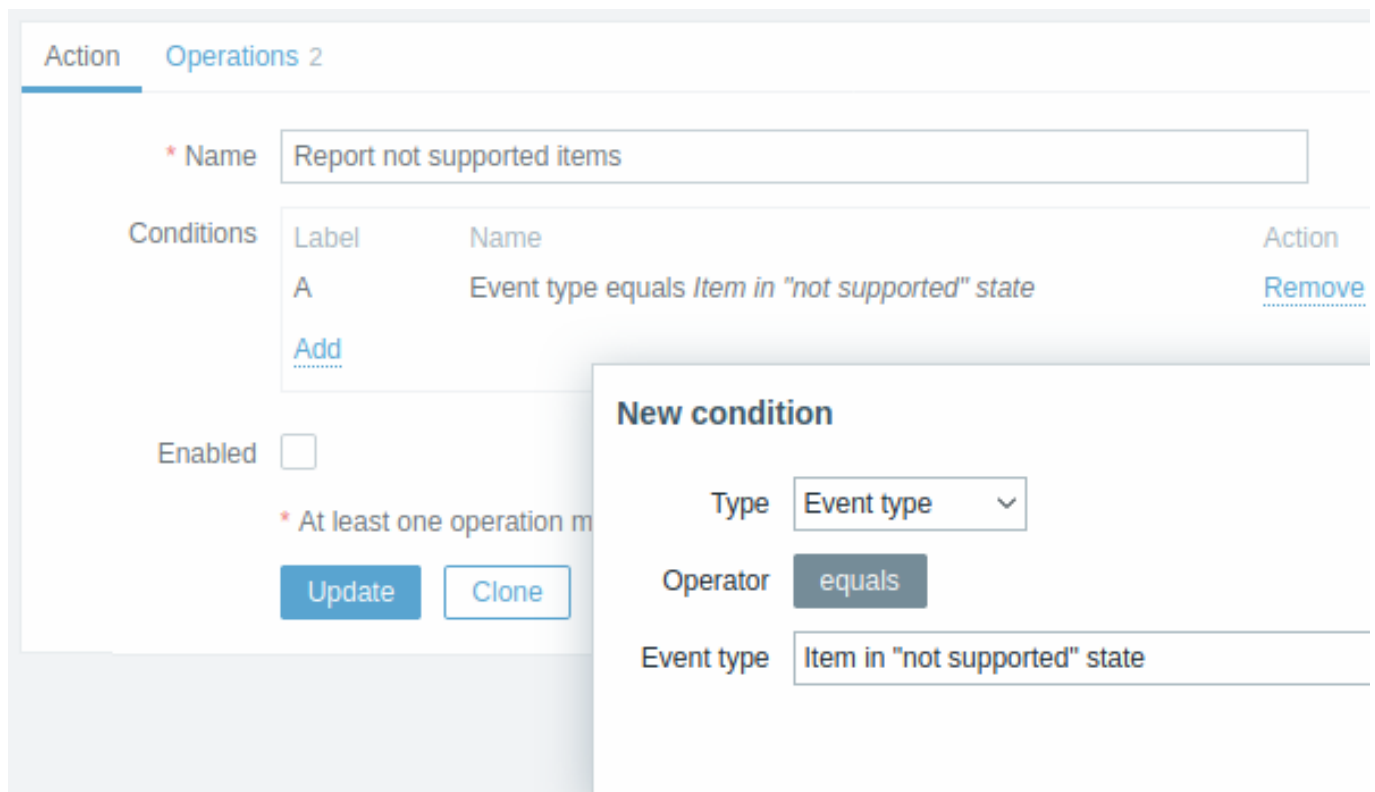

Click on *Create action* to the right to open an action configuration form.

### Step 3

In the **Action** tab enter a name for the action. Then click on *Add* in the condition block to add a new condition.

In the new condition popup window select *Event type* as the condition type and then select *Item in "not supported" state* as the event type value.

Don't forget to click on *Add* to actually list the condition in the *Conditions* block.

### Step 4

In the **Operations** tab, click on *Add* in the *Operations* block and select some recipients of the message (user groups/users) and the media types (or 'All') to use for delivery.

Select *Custom message* checkbox if you wish to enter the custom subject/content of the problem message.

Custom message ☒

Subject

Message

Host: {HOST.NAME}  
Item: {ITEM.NAME}  
Key: {ITEM.KEY}  
State: {ITEM.STATE}

Click on *Add* to actually list the operation in the *Operations* block.

If you wish to receive more than one notification, set the operation step duration (interval between messages sent) and add another step.

#### Step 5

The **Recovery operations** block allows to configure a recovery notification when an item goes back to the normal state. Click on *Add* in the *Recovery operations* block, select the operation type, the recipients of the message (user groups/users) and the media types (or 'All') to use for delivery.

Select *Custom message* checkbox if you wish to enter the custom subject/content of the problem message.

The screenshot shows the Zabbix configuration interface. At the top, there are tabs for 'Action' and 'Operations 2'. Below the 'Operations 2' tab, there is a section for 'Default operation step duration' set to '1h'. Below this, there are two sections: 'Operations' and 'Recovery operations'. The 'Operations' section has a table with one row labeled '1' and 'Send m', and an 'Add' button. The 'Recovery operations' section has a table with one row labeled 'Notify all invol' and an 'Add' button. Below these sections, there is a note '\* At least one op' and two buttons: 'Add' and 'Cancel'. An 'Operation details' popup window is open, showing the following fields: 'Operation type' set to 'Notify all involved', 'Custom message' checked, 'Subject' set to '{ITEM.STATE}: {HOST.NAME}:{ITEM.NAME}', and 'Message' set to 'Host: {HOST.NAME}\nItem: {ITEM.NAME}\nKey: {ITEM.KEY}\nState: {ITEM.STATE}'.

Click on *Add* in the *Operation details* popup window to actually list the operation in the *Recovery operations* block.

#### Step 6

When finished, click on the **Add** button at the bottom of the form.

And that's it, you're done! Now you can look forward to receiving your first notification from Zabbix if some item turns unsupported.

## 11 Macros

### Overview

Zabbix supports a number of built-in macros which may be used in various situations. These macros are variables, identified by a specific syntax:

{MACRO}

Macros resolve to a specific value depending on the context.

Effective use of macros allows to save time and make Zabbix configuration more transparent.

In one of typical uses, a macro may be used in a template. Thus a trigger on a template may be named "Processor load is too high on {HOST.NAME}". When the template is applied to the host, such as Zabbix server, the name will resolve to "Processor load is too high on Zabbix server" when the trigger is displayed in the Monitoring section.

Macros may be used in item key parameters. A macro may be used for only a part of the parameter, for example `item.key[server_{HOST.HOST}_local]`. Double-quoting the parameter is not necessary as Zabbix will take care of any ambiguous special symbols, if present in the resolved macro.

There are other types of macros in Zabbix.

Zabbix supports the following macros:

- {MACRO} - built-in macro (see [full list](#))
- {<macro>.<func>(<params>)} - macro **functions**

- `{${MACRO}}` - **user-defined macro**, optionally **with context**
- `{#MACRO}` - macro for **low-level discovery**
- `{?EXPRESSION}` - **expression macro**

## 1 Macro functions

### Overview

Macro functions offer the ability to customize **macro** values.

Sometimes a macro may resolve to a value that is not necessarily easy to work with. It may be long or contain a specific substring of interest that you would like to extract. This is where macro functions can be useful.

The syntax of a macro function is:

```
{<macro>.<func>(<params>)}
```

where:

- `<macro>` - the macro to customize (for example `{ITEM.VALUE}` or `{#LLDMACRO}`)
- `<func>` - the function to apply
- `<params>` - a comma-delimited list of function parameters

Parameters must be quoted if they:

- start with a space or double quotes
- contain closing parentheses or a comma

For example:

```
{{TIME}}.fmttime(format,time_shift)}
{{ITEM.VALUE}}.regsub(pattern, output)}
{{#LLDMACRO}}.regsub(pattern, output)}
```

A single function per macro is supported; multiple macro functions in chain are not supported.

#### Note:

Please see **escaping examples** for cases when macro functions are used inside other contexts (function, item key, another macro, etc).

### Supported macro functions

Optional function parameters are indicated by `< >`.

| FUNCTION  |  |   |
|---|--|---|
| Description   | Parameters   | Supported for   |
| <b>fmtnum</b><br>(digits)<br>Number formatting to control the number of digits printed after the decimal point. | <b>digits</b> - the number of digits after decimal point. Valid range: 0-20 (since Zabbix 6.0.21). No trailing zeros will be produced. | {ITEM.VALUE}<br>{ITEM.LASTVALUE}<br>Expression macros |
| <b>fmttime</b><br>(format,<time_shift>)   |  |   |

---

**FUNCTION**

---

|   |  |   |
|---|--|---|
| Time formatting.  | <p><b>format</b> - mandatory format string, compatible with strftime function formatting</p> <p><b>time_shift</b> - the time shift applied to the time before formatting; should start with</p> <p>-&lt;N&gt;&lt;time_unit&gt; or</p> <p>+&lt;N&gt;&lt;time_unit&gt;, where</p> <p>N - the number of time units to add or subtract;</p> <p>time_unit - h (hour), d (day), w (week), M (month) or y (year).</p> <p>Since Zabbix 5.4, time_shift parameter supports multi-step time operations and may include /&lt;time_unit&gt; for shifting to the beginning of the time unit (/d - midnight, /w - 1st day of the week (Monday), /M - 1st day of the month, etc.). Examples:</p> <p>-1w - exactly 7 days back;</p> <p>-1w/w - Monday of the previous week;</p> <p>-1w/w+1d - Tuesday of the previous week.</p> <p>Note that time operations are calculated from left to right without priorities. For example, -1M/d+1h/w will be parsed as ((-1M/d)+1h)/w.</p> | {TIME}  |
| <p><b>iregsub</b><br/>(pat-tern,output)</p> <p>Substring extraction by a regular expression match (case insensitive).</p> | <p><b>pattern</b> - the regular expression to match</p> <p><b>output</b> - the output options. \1 - \9 placeholders are supported to capture groups. \0 returns the matched text.</p>  | <p>{ITEM.VALUE}</p> <p>{ITEM.LASTVALUE}</p> <p>Low-level discovery macros (except in low-level discovery rule filter)</p> |
| <p><b>regsub</b><br/>(pat-tern,output)</p> <p>Substring extraction by a regular expression match (case sensitive).</p>    | <p><b>pattern</b> - the regular expression to match</p> <p><b>output</b> - the output options. \1 - \9 placeholders are supported to capture groups. \0 returns the matched text.</p>  | <p>{ITEM.VALUE}</p> <p>{ITEM.LASTVALUE}</p> <p>Low-level discovery macros (except in low-level discovery rule filter)</p> |

---

If a function is used in a **supported location**, but applied to a macro not supporting macro functions, then the macro evaluates to 'UNKNOWN'.

If pattern is not a correct regular expression then the macro evaluates to 'UNKNOWN' (excluding low-level discovery macros where the function will be ignored in that case and macro will remain unexpanded)

Examples

The ways in which macro functions can be used to customize macro values is illustrated in the following examples on received values:

| Received value | Macro                    | Output |
|----------------|--------------------------|--------|
| 24.3413523     | {{ITEM.VALUE}.fmtnum(2)} | 24.34  |
| 24.3413523     | {{ITEM.VALUE}.fmtnum(0)} | 24     |

| Received value          | Macro  | Output      |
|-------------------------|--|-------------|
| 12:36:01                | {{TIME}.fmttime(%B)}   | October     |
| 12:36:01                | {{TIME}.fmttime(%d %B,-1M/M)}  | 1 September |
| 123Log line             | {{ITEM.VALUE}.regsub("[0-9]+", Problem))}  | Problem     |
| 123 Log line            | {{ITEM.VALUE}.regsub("^([0-9]+)"Problem "Problem"))}   |             |
| 123 Log line            | {{ITEM.VALUE}.regsub("^([0-9]+)"Problem ID: 123 Problem ID: \1)}                                       |             |
| Log line                | {{ITEM.VALUE}.regsub(".*", "Problem ID: " "Problem ID: \1")}   |             |
| MySQL crashed errno 123 | {{ITEM.VALUE}.regsub("^(\w+).*?("[Problem ID: MySQL_123 " " Problem ID: \1_\2 ")}                      |             |
| 123 Log line            | {{ITEM.VALUE}.regsub("([1-9]+", *UNKNOWN* (invalid regular expression) "Problem ID: \1")}              |             |
| customername_1          | {{#IFALIAS}.regsub("(.*)_([0-9]+)"customername \1)}  |             |
| customername_1          | {{#IFALIAS}.regsub("(.*)_([0-9]+)"", \2)}  |             |
| customername_1          | {{#IFALIAS}.regsub("(.*)_([0-9]+)"{{#IFALIAS}.regsub("(.*)_([0-9]+", \1)} (invalid regular expression) |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`customername` \1)}"}                                  |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`\1)`", \2)}"}   |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`{{#IFALIAS}.regsub(`(``.*)_([0-9]+\`, \1)}"}          |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`\1)}"}  |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`customername` \1)}\`"}                                |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`\1)`\`, \2)}\`"}                                      |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`{{#IFALIAS}.regsub(`(``.*)_([0-9]+\`, \1)}\`"}        |             |
| customername_1          | `\${MACRO}`:{{#IFALIAS}.regsub(`(``\${MACRO}`-9)`\1)}\`"}  |             |

## Seeing full item values

Long values of resolved {ITEM.VALUE} and {ITEM.LASTVALUE} macros for text/log items are truncated to 20 characters in some frontend locations. To see the full values of these macros you may use macro functions, e.g.:

```
{{ITEM.VALUE}.regsub("(.*)", \1)}<br> {{ITEM.LASTVALUE}.regsub("(.*)", \1)}
```

See also: {ITEM.VALUE} and {ITEM.LASTVALUE} [macro details](#).

## 2 User macros

### Overview

User macros are supported in Zabbix for greater flexibility, in addition to the macros [supported](#) out-of-the-box.

User macros can be defined on global, template and host level. These macros have a special syntax:

```
`${MACRO}`
```

Zabbix resolves macros according to the following precedence:

1. host level macros (checked first)
2. macros defined for first level templates of the host (i.e., templates linked directly to the host), sorted by template ID
3. macros defined for second level templates of the host, sorted by template ID
4. macros defined for third level templates of the host, sorted by template ID, etc.
5. global macros (checked last)

In other words, if a macro does not exist for a host, Zabbix will try to find it in the host templates of increasing depth. If still not found, a global macro will be used, if exists.

**Warning:**

If a macro with the **same name** exists on multiple linked templates of the same level, the macro from the template with the lowest ID will be used. Thus having macros with the same name in multiple templates is a configuration risk.

If Zabbix is unable to find a macro, the macro will not be resolved.

**Attention:**

Macros (including user macros) are left unresolved in the Configuration section (for example, in the trigger list) by design to make complex configuration more transparent.

User macros can be used in:

- item key parameter
- item update intervals and flexible intervals
- trigger name and description
- trigger expression parameters and constants (see [examples](#))
- many other locations - see the [full list](#)

Common use cases of global and host macros

- use a global macro in several locations; then change the macro value and apply configuration changes to all locations with one click
- take advantage of templates with host-specific attributes: passwords, port numbers, file names, regular expressions, etc.

Configuration

To define user macros, go to the corresponding location in the frontend:

- for global macros, visit *Administration* → *General* → *Macros*
- for host and template level macros, open host or template properties and look for the *Macros* tab

**Note:**

If a user macro is used in items or triggers in a template, it is suggested to add that macro to the template even if it is defined on a global level. That way, if the macro type is *text* exporting the template to XML and importing it in another system will still allow it to work as expected. Values of secret macros are not **exported**.

A user macro has the following attributes:

| Macro  | Value   |   | Description  |
|--|---|---|--|
| <input data-bbox="204 1330 635 1368" type="text" value="{MYSQL_PASSWORD}"/>  | <input data-bbox="651 1330 1098 1368" type="password" value="*****"/>               |  | <input data-bbox="1185 1330 1305 1368" type="text" value="description"/> |
| <input data-bbox="204 1391 635 1429" type="text" value="{MYSQL_USERNAME}"/>  | <input data-bbox="651 1391 1098 1429" type="password" value="*****"/>               |  | <input data-bbox="1185 1391 1305 1429" type="text" value="description"/> |
| <input data-bbox="204 1451 635 1489" type="text" value="{SECRET_PASSWORD}"/> | <input data-bbox="651 1451 1098 1489" type="text" value="path/to/secret:password"/> |  | <input data-bbox="1185 1451 1305 1489" type="text" value="description"/> |
| <input data-bbox="204 1512 635 1550" type="text" value="{SECRET_USERNAME}"/> | <input data-bbox="651 1512 1098 1550" type="text" value="path/to/secret:username"/> |  | <input data-bbox="1185 1512 1305 1550" type="text" value="description"/> |
| <input data-bbox="204 1572 635 1610" type="text" value="{SNMP_COMMUNITY}"/>  | <input data-bbox="651 1572 1098 1610" type="text" value="public"/>                  |  | <input data-bbox="1185 1572 1305 1610" type="text" value="description"/> |
| <input data-bbox="204 1632 635 1671" type="text" value="{WORKING_HOURS}"/>   | <input data-bbox="651 1632 1098 1671" type="text" value="1-5,09:00-18:00"/>         |  | <input data-bbox="1185 1632 1305 1671" type="text" value="description"/> |

[Add](#)

| Parameter | Description   |
|-----------|---|
| Macro     | Macro name. The name must be wrapped in curly brackets and start with a dollar sign. Example: {\$FRONTEND_URL}. The following characters are allowed in the macro names: <b>A-Z</b> (uppercase only) , <b>0-9</b> , <b>_</b> , <b>.</b> |

| Parameter   | Description  |
|-------------|--|
| Value       | <p>Macro value. Three value types are supported:</p> <p><b>Text</b> (default) - plain-text value</p> <p><b>Secret text</b> - the value is masked with asterisks, which could be useful to protect sensitive information such as passwords or shared keys.</p> <p><b>Vault secret</b> - the value contains a reference path (as 'path:key', for example "secret/zabbix:password") to a <b>Vault secret</b></p> <p><i>Note</i> that while the value of a secret macro is hidden from sight, the value can be revealed through the use in items. For example, in an external script an 'echo' statement referencing a secret macro may be used to reveal the macro value to the frontend because Zabbix server has access to the real macro value.</p> <p>To select the value type click on the button at the end of the value input field:</p> <div>  icon indicates a text macro;         <br/>  icon indicates a secret text macro. Upon hovering, the value field transforms into a         <div> <div>Set new value</div>   button, which allows to enter a new value of the macro (to exit without saving a new value, click the backwards arrow (↶)).         </div> <br/>  icon indicates a secret Vault macro.       </div> <p>Maximum length of a user macro value is 2048 characters (255 characters in versions before 5.2.0).</p> |
| Description | Text field used to provide more information about this macro.  |

**Note:**

URLs that contain a secret macro will not work as the macro in them will be resolved as "\*\*\*\*\*".

**Attention:**

In trigger expressions user macros will resolve if referencing a parameter or constant. They will NOT resolve if referencing a host, item key, function, operator or another trigger expression. Secret macros cannot be used in trigger expressions.

## Examples

### Example 1

Use of host-level macro in the "Status of SSH daemon" item key:

```
net.tcp.service[ssh,{SSH_PORT}]
```

This item can be assigned to multiple hosts, providing that the value of **{SSH\_PORT}** is defined on those hosts.

### Example 2

Use of host-level macro in the "CPU load is too high" trigger:

```
last(/ca_001/system.cpu.load[,avg1])>{$MAX_CPULOAD}
```

Such a trigger would be created on the template, not edited in individual hosts.

**Note:**

If you want to use the amount of values as the function parameter (for example, **max(/host/key,#3)**), include hash mark in the macro definition like this: **SOME\_PERIOD => #3**

### Example 3

Use of two macros in the "CPU load is too high" trigger:

```
min(/ca_001/system.cpu.load[,avg1],{$CPULOAD_PERIOD})>{$MAX_CPULOAD}
```

Note that a macro can be used as a parameter of trigger function, in this example function **min()**.

#### Example 4

Synchronize the agent unavailability condition with the item update interval:

- define `{ $INTERVAL }` macro and use it in the item update interval;
- use `{ $INTERVAL }` as parameter of the agent unavailability trigger:

```
nodata(/ca_001/agent.ping,{ $INTERVAL })=1
```

#### Example 5

Centralize configuration of working hours:

- create a global `{ $WORKING_HOURS }` macro equal to 1-5, 09:00-18:00;
- use it in the *Working time* field in *Administration* → *General* → *GUI*;
- use it in the *When active* field in *Administration* → *Users* → *Media*;
- use it to set up more frequent item polling during working hours:

Update interval

| Custom intervals |            | Type | Interval  | Period   |
|------------------|------------|------|---|--|
| Flexible         | Scheduling |      | <input type="text" value="{ \$SHORT_INTERVAL }"/> | <input type="text" value="{ \$WORKING_HOURS }"/> |

- use it in the *Time period* action condition;
- adjust the working time in *Administration* → *General* → *Macros*, if needed.

#### Example 6

Use host prototype macro to configure items for discovered hosts:

- on a host prototype define user macro `{ $SNMPVALUE }` with `{ #SNMPVALUE }` **low-level discovery** macro as a value:

Host prototype macros **Inherited and host prototype macros**

| Macro  | Value  |
|--|--|
| <input type="text" value="{ \$SNMPVALUE }"/> | <input type="text" value="{ #SNMPVALUE }"/> <span>T ▾</span> |

Add

- assign *Generic SNMPv2* template to the host prototype;
- use `{ $SNMPVALUE }` in the *SNMP OID* field of *Generic SNMPv2* template items.

User macro context

See **user macros with context**.

### 3 User macros with context

#### Overview

An optional context can be used in **user macros**, allowing to override the default value with a context-specific one.

The context is appended to the macro name; the syntax depends on whether the context is a static text value:

```
{ $MACRO:"static text" }
```

or a regular expression:

```
{ $MACRO:regex:"regular expression" }
```

Note that a macro with regular expression context can only be defined in user macro configuration. If the `regex:` prefix is used elsewhere as user macro context, like in a trigger expression, it will be treated as static context.

Context quoting is optional (see also [important notes](#)).

Macro context examples:

| Example   | Description  |
|---|--|
| <code>{\$LOW_SPACE_LIMIT}</code>                        | User macro without context.  |
| <code>{\$LOW_SPACE_LIMIT:/tmp}</code>                   | User macro with context (static string).   |
| <code>{\$LOW_SPACE_LIMIT:regex:"~/tmp\$"}</code>        | User macro with context (regular expression). Same as <code>{\$LOW_SPACE_LIMIT:/tmp}</code> .            |
| <code>{\$LOW_SPACE_LIMIT:regex:"~/var/log/.*\$"}</code> | User macro with context (regular expression). Matches all strings prefixed with <code>/var/log/</code> . |

## Use cases

User macros with context can be defined to accomplish more flexible thresholds in trigger expressions (based on the values retrieved by low-level discovery). For example, you may define the following macros:

- `{$LOW_SPACE_LIMIT} = 10`
- `{$LOW_SPACE_LIMIT:/home} = 20`
- `{$LOW_SPACE_LIMIT:regex:"^[a-z]+$" = 30`

Then a low-level discovery macro may be used as macro context in a trigger prototype for mounted file system discovery:

```
last(/host/vfs.fs.size[{#FSNAME},pfree])<{$LOW_SPACE_LIMIT:"{#FSNAME}"}
```

After the discovery different low-space thresholds will apply in triggers depending on the discovered mount points or file system types. Problem events will be generated if:

- `/home` folder has less than 20% of free disk space
- folders that match the regexp pattern (like `/etc`, `/tmp` or `/var`) have less than 30% of free disk space
- folders that don't match the regexp pattern and are not `/home` have less than 10% of free disk space

## Important notes

- If more than one user macro with context exists, Zabbix will try to match the simple context macros first and then context macros with regular expressions in an undefined order.

### Warning:

Do not create different context macros matching the same string to avoid undefined behavior.

- If a macro with its context is not found on host, linked templates or globally, then the macro without context is searched for.
- Only low-level discovery macros are supported in the context. Any other macros are ignored and treated as plain text.

Technically, macro context is specified using rules similar to [item key](#) parameters, except macro context is not parsed as several parameters if there is a `,` character:

- Macro context must be quoted with `"` if the context contains a `}` character or starts with a `"` character. Quotes inside quoted context must be escaped with the `\` character.
- The `\` character itself is not escaped, which means it's impossible to have a quoted context ending with the `\` character - the macro `{$MACRO:"a:b\\c"}` is invalid.
- The leading spaces in context are ignored, the trailing spaces are not:
  - For example `{$MACRO:A}` is the same as `{$MACRO: A}`, but not `{$MACRO:A }`.
- All spaces before leading quotes and after trailing quotes are ignored, but all spaces inside quotes are not:
  - Macros `{$MACRO:"A"}`, `{$MACRO: "A"}`, `{$MACRO:"A" }` and `{$MACRO: "A" }` are the same, but macros `{$MACRO:"A" }` and `{$MACRO:" A "}` are not.

The following macros are all equivalent, because they have the same context: `{$MACRO:A}`, `{$MACRO: A}` and `{$MACRO:"A"}`. This is in contrast with item keys, where `'key[a]'`, `'key[ a]'` and `'key["a"]'` are the same semantically, but different for uniqueness purposes.

## 4 Low-level discovery macros

### Overview

There is a type of macro used within the [low-level discovery](#) (LLD) function:

{#MACRO}

It is a macro that is used in an LLD rule and returns real values of the file system name, network interface, SNMP OID, etc.

These macros can be used for creating item, trigger and graph *prototypes*. Then, when discovering real file systems, network interfaces etc., these macros are substituted with real values and are the basis for creating real items, triggers and graphs.

These macros are also used in creating host and host group *prototypes* in virtual machine **discovery**.

Some low-level discovery macros come "pre-packaged" with the LLD function in Zabbix - {#FSNAME}, {#FSTYPE}, {#IFNAME}, {#SNMPINDEX}, {#SNMPVALUE}. However, adhering to these names is not compulsory when creating a **custom** low-level discovery rule. Then you may use any other LLD macro name and refer to that name.

Supported locations

LLD macros can be used:

- in the low-level discovery rule filter
- for item prototypes in
  - name
  - key parameters
  - unit
  - update interval<sup>1</sup>
  - history storage period<sup>1</sup>
  - trend storage period<sup>1</sup>
  - item value preprocessing steps
  - SNMP OID
  - IPMI sensor field
  - calculated/aggregate item expression, in:
    - \* expression constants and function parameters
    - \* item key parameters
  - aggregate item filter conditions (host group name and tag name)
  - SSH script and Telnet script
  - database monitoring SQL query
  - JMX item endpoint field
  - description
  - HTTP agent URL field
  - HTTP agent HTTP query fields field
  - HTTP agent request body field
  - HTTP agent required status codes field
  - HTTP agent headers field key and value
  - HTTP agent HTTP authentication username field
  - HTTP agent HTTP authentication password field
  - HTTP agent HTTP proxy field
  - HTTP agent HTTP SSL certificate file field
  - HTTP agent HTTP SSL key file field
  - HTTP agent HTTP SSL key password field
  - HTTP agent HTTP timeout<sup>1</sup> field
  - tags
- for trigger prototypes in
  - name
  - operational data
  - expression (only in constants and function parameters)
  - URL
  - description
  - tags
- for graph prototypes in
  - name
- for host prototypes in
  - name
  - visible name
  - custom interface fields: IP, DNS, port, SNMP v1/v2 community, SNMP v3 context name, SNMP v3 security name, SNMP v3 authentication passphrase, SNMP v3 privacy passphrase
  - host group prototype name
  - host tag value
  - host macro value

- (see the [full list](#))

In all those places, except the low-level discovery rule filter, LLD macros can be used inside static user **macro context**.

Using macro functions

Macro functions are supported with low-level discovery macros (except in low-level discovery rule filter), allowing to extract a certain part of the macro value using a regular expression.

For example, you may want to extract the customer name and interface number from the following LLD macro for the purposes of event tagging:

```
{#IFALIAS}=customername_1
```

To do so, the `regsub` macro function can be used with the macro in the event tag value field of a trigger prototype:

| Tags      |   |                        |
|-----------|---|------------------------|
| Customer  | <code>{{#IFALIAS}.regsub("(.*)_([0-9]+)", \1)}</code> | <a href="#">Remove</a> |
| Interface | <code>{{#IFALIAS}.regsub("(.*)_([0-9]+)", \2)}</code> | <a href="#">Remove</a> |

Note that commas are not allowed in unquoted item **key parameters**, so the parameter containing a macro function has to be quoted. The backslash (\) character should be used to escape double quotes inside the parameter. Example:

```
net.if.in["{{#IFALIAS}.regsub(\"(.*)_([0-9]+)\", \1)}", bytes]
```

For more information on macro function syntax, see: [Macro functions](#)

Macro functions are supported in low-level discovery macros since Zabbix 4.0.

Footnotes

<sup>1</sup> In the fields marked with <sup>1</sup> a single macro has to fill the whole field. Multiple macros in a field or macros mixed with text are not supported.

## 5 Expression macros

Overview

Expression macros are useful for formula calculations. They are calculated by expanding all macros inside and evaluating the resulting expression.

Expression macros have a special syntax:

```
{?EXPRESSION}
```

The syntax in EXPRESSION is the same as in [trigger expressions](#) (see usage limitations below).

`{HOST.HOST<1-9>}` and `{ITEM.KEY<1-9>}` macros are supported inside expression macros. `{ITEM.KEY<1-9>}` macros are supported in expression macros since Zabbix 6.0.9.

Usage

In the following locations:

- graph names
- map element labels
- map shape labels
- map link labels

only a **single** function, from the following set: `avg`, `last`, `max`, `min`, is allowed as an expression macro, e.g.:

```
{?avg(/{HOST.HOST}/{ITEM.KEY},1h)}
```

Expressions such as `{?last(/host/item1)/last(/host/item2)}`, `{?count(/host/item1,5m)}` and `{?last(/host/item1)*10}` are incorrect in these locations.

However, in:

- trigger event names
- trigger-based notifications and commands
- problem update notifications and commands

**complex** expressions are allowed, e.g.:

```
{?trendavg(/host/item1,1M:now/M)/trendavg(/host/item1,1M:now/M-1y)*100}
```

**Note:**

When using expression macros in templates please do not specify the template name but rather use {HOST.HOST<N>}, because template names are not substituted with hosts during linkage. You can also omit host reference altogether for the first host, e.g. {?avg(/item1,1h)}

See also:

- [Supported macros](#) for a list of supported locations of the expression macro
- [Example](#) of using an expression macro in the event name

## 12 Users and user groups

### Overview

All users in Zabbix access the Zabbix application through the web-based frontend. Each user is assigned a unique login name and a password.

All user passwords are encrypted and stored in the Zabbix database. Users cannot use their user id and password to log directly into the UNIX server unless they have also been set up accordingly to UNIX. Communication between the web server and the user browser can be protected using SSL.

With a flexible [user permission schema](#) you can restrict and differentiate rights to:

- access administrative Zabbix frontend functions
- perform certain actions in the frontend
- access monitored hosts in hostgroups
- use specific API methods

### 1 Configuring a user

#### Overview

The initial Zabbix installation has two predefined users:

- *Admin* - a Zabbix [superuser](#) with full permissions;
- *guest* - a special Zabbix [user](#). The 'guest' user is disabled by default. If you add it to the Guests user group, you may log in with this user and access monitoring pages in Zabbix. (Note that, before Zabbix 6.0.28, automatic guest login was possible.) By default, 'guest' has no permissions on Zabbix objects.

To configure a new user:

- Go to *Administration* → *Users*
- Click on *Create user* (or on the user name to edit an existing user)
- Edit user attributes in the form

#### General attributes

The *User* tab contains general user attributes:

| Parameter        | Description   |
|------------------|---|
| <i>Username</i>  | Unique username, used as the login name.  |
| <i>Name</i>      | User first name (optional).   |
| <i>Last name</i> | If not empty, visible in acknowledgment information and notification recipient information.   |
| <i>Groups</i>    | User last name (optional).  |
| <i>Password</i>  | If not empty, visible in acknowledgment information and notification recipient information.   |
| <i>Language</i>  | Select <b>user groups</b> the user belongs to. Starting with Zabbix 3.4.3 this field is auto-complete so starting to type the name of a user group will offer a dropdown of matching groups. Scroll down to select. Alternatively, click on <i>Select</i> to add groups. Click on 'x' to remove the selected. |
| <i>Time zone</i> | Adherence to user groups determines what host groups and hosts the user will have <b>access to</b> .  |
| <i>Theme</i>     | Two fields for entering the user password.  |
|                  | With an existing password, contains a <i>Password</i> button, clicking on which opens the password fields.  |
|                  | Note that passwords longer than 72 characters will be truncated.  |
|                  | Language of the Zabbix frontend.  |
|                  | The php gettext extension is required for the translations to work.   |
|                  | Select the time zone to override global <b>time zone</b> on user level or select <b>System default</b> to use global time zone settings.  |
|                  | Defines how the frontend looks like:  |
|                  | <b>System default</b> - use default system settings   |
|                  | <b>Blue</b> - standard blue theme   |
|                  | <b>Dark</b> - alternative dark theme  |
|                  | <b>High-contrast light</b> - light theme with high contrast   |
|                  | <b>High-contrast dark</b> - dark theme with high contrast   |

| Parameter                | Description  |
|--------------------------|--|
| <i>Auto-login</i>        | Mark this checkbox to make Zabbix remember the user and log the user in automatically for 30 days. Browser cookies are used for this.  |
| <i>Auto-logout</i>       | With this checkbox marked the user will be logged out automatically, after the set amount of seconds (minimum 90 seconds, maximum 1 day).<br><b>Time suffixes</b> are supported, e.g. 90s, 5m, 2h, 1d.<br>Note that this option will not work:<br>* If the "Show warning if Zabbix server is down" global configuration option is enabled and Zabbix frontend is kept open;<br>* When Monitoring menu pages perform background information refreshes;<br>* If logging in with the <i>Remember me for 30 days</i> option checked. |
| <i>Refresh</i>           | Set the refresh rate used for graphs, plain text data, etc. Can be set to 0 to disable.  |
| <i>Rows per page</i>     | You can determine how many rows per page will be displayed in lists.   |
| <i>URL (after login)</i> | You can make Zabbix transfer the user to a specific URL after successful login, for example, to Problems page.   |

## User media

The *Media* tab contains a listing of all media defined for the user. Media are used for sending notifications. Click on *Add* to assign media to the user.

See the **Media types** section for details on configuring user media.

## Permissions

The *Permissions* tab contains information on:

- The user role. Users cannot change their own role.
- The user type (User, Admin, Super Admin) that is defined in the role configuration.
- Host groups the user has access to. Users of type 'User' and 'Admin' do not have access to any host groups and hosts by default. To get the access they need to be included in user groups that have access to respective host groups and hosts.
- Access rights to sections and elements of Zabbix frontend, modules, and API methods. Elements to which access is allowed are displayed in green color. Light gray color means that access to the element is denied.
- Rights to perform certain actions. Actions that are allowed are displayed in green color. Light gray color means that a user does not have the rights to perform this action.

See the **User permissions** page for details.

## 2 Permissions

### Overview

You can differentiate user permissions in Zabbix by defining the respective user role. Then the unprivileged users need to be included in user groups that have access to host group data.

### User role

The user role defines which parts of UI, which API methods, and which actions are available to the user. The following roles are pre-defined in Zabbix:

| User type               | Description   |
|-------------------------|---|
| <i>Guest role</i>       | The user has access to the Monitoring, Inventory, and Reports menu sections, but without the rights to perform any actions.   |
| <i>User role</i>        | The user has access to the Monitoring, Inventory, and Reports menu sections. The user has no access to any resources by default. Any permissions to host groups must be explicitly assigned.              |
| <i>Admin role</i>       | The user has access to the Monitoring, Inventory, Reports and Configuration menu sections. The user has no access to any host groups by default. Any permissions to host groups must be explicitly given. |
| <i>Super Admin role</i> | The user has access to all menu sections. The user has a read-write access to all host groups. Permissions cannot be revoked by denying access to specific host groups.                                   |

**User roles** are configured in the *Administration→User roles* section. Super Admins can modify or delete pre-defined roles and create more roles with custom sets of permissions.

To assign a role to the user, go to the Permissions tab in the user configuration form, locate the *Role* field and select a role. Once a role is selected a list of associated permissions will be displayed below.

#### Permissions to host groups

Access to any host data in Zabbix is granted to **user groups** on the host group level only.

That means that an individual user cannot be directly granted access to a host (or host group). It can only be granted access to a host by being part of a user group that is granted access to the host group that contains the host.

### 3 User groups

#### Overview

User groups allow to group users both for organizational purposes and for assigning permissions to data. Permissions to monitoring data of host groups are assigned to user groups, not individual users.

It may often make sense to separate what information is available for one group of users and what - for another. This can be

accomplished by grouping users and then assigning varied permissions to host groups.

A user can belong to any number of groups.

Configuration

To configure a user group:

- Go to *Administration* → *User groups*
- Click on *Create user group* (or on the group name to edit an existing group)
- Edit group attributes in the form

The **User group** tab contains general group attributes:

User groupPermissionsTag filter

\* Group name

☐ Include subgroups

Add

Current permissions to host groups are displayed in the *Permissions* block.

If current permissions of the host group are inherited by all nested host groups, this is indicated after the host group name ("*including subgroups*"). Note that a *Super admin* user can enforce nested host groups to have the same level of permissions as the parent host group; this can be done in the host group *configuration* form.

You may change the level of access to a host group:

- **Read-write** - read-write access to a host group;
- **Read** - read-only access to a host group;
- **Deny** - access to a host group denied;
- **None** - no permissions are set.

Use the selection field below to select host groups and the level of access to them. This field is auto-complete so starting to type the name of a host group will offer a dropdown of matching host groups. If you wish to see all host groups, click on *Select*. If you wish to include nested host groups, mark the *Include subgroups* checkbox. Click on *Add* to add the selected host groups to the list of host group permissions.

#### Attention:

Adding a parent host group with the *Include subgroups* checkbox marked will override (and remove from the list) previously configured permissions of all related nested host groups. Adding a host group with *None* as the level of access selected will remove the host group from the list if the host group is already in the list.

The **Tag filter** tab allows you to set tag-based permissions for user groups to see problems filtered by tag name and its value:

User group
Permissions
Tag filter

Permissions

| Host group          | Tags           | Action |
|---------------------|----------------|--------|
| Templates/Databases | Service: MySQL | Remove |

Select
tag

☐ Include subgroups

Add

To select a host group to apply a tag filter for, click *Select* to get the complete list of existing host groups or start to type the name of a host group to get a dropdown of matching groups. If you want to apply tag filters to nested host groups, mark the *Include subgroups* checkbox.

Tag filter allows to separate the access to host group from the possibility to see problems.

For example, if a database administrator needs to see only "MySQL" database problems, it is required to create a user group for database administrators first, then specify "Service" tag name and "MySQL" value.

Templates/Databases X  
type here to search

Select

Service

MySQL

If "Service" tag name is specified and value field is left blank, corresponding user group will see all problems for selected host group with tag name "Service". If both tag name and value fields are left blank but host group selected, corresponding user group will see all problems for selected host group. Make sure a tag name and tag value are correctly specified otherwise a corresponding user group will not see any problems.

Let's review an example when a user is a member of several user groups selected. Filtering in this case will use OR condition for tags.

| User group A        |          |           | User group B        |          |           | Visible result<br>for a user<br>(member) of<br>both groups |
|---------------------|----------|-----------|---------------------|----------|-----------|--|
| Tag filter          |          |           | Tag filter          |          |           |  |
| Host group          | Tag name | Tag value | Host group          | Tag name | Tag value |  |
| Templates/Databases | Service  | MySQL     | Templates/Databases | Service  | Oracle    | Service:<br>MySQL or<br>Oracle<br>problems<br>visible      |
| Templates/Databases | blank    | blank     | Templates/Databases | Service  | Oracle    | All problems<br>visible                                    |
| not selected        | blank    | blank     | Templates/Databases | Service  | Oracle    | Service:Oracle<br>problems<br>visible                      |

**Attention:**  
Adding a filter (for example, all tags in a certain host group "Templates/Databases") results in not being able to see the problems of other host groups.

Host access from several user groups

A user may belong to any number of user groups. These groups may have different access permissions to hosts.

Therefore, it is important to know what hosts an unprivileged user will be able to access as a result. For example, let us consider how access to host **X** (in Hostgroup 1) will be affected in various situations for a user who is in user groups A and B.

- If Group A has only *Read* access to Hostgroup 1, but Group B *Read-write* access to Hostgroup 1, the user will get **Read-write** access to 'X'.

**Attention:**  
"Read-write" permissions have precedence over "Read" permissions starting with Zabbix 2.2.

- In the same scenario as above, if 'X' is simultaneously also in Hostgroup 2 that is **denied** to Group A or B, access to 'X' will be **unavailable**, despite a *Read-write* access to Hostgroup 1.
- If Group A has no permissions defined and Group B has a *Read-write* access to Hostgroup 1, the user will get **Read-write** access to 'X'.
- If Group A has *Deny* access to Hostgroup 1 and Group B has a *Read-write* access to Hostgroup 1, the user will get access to 'X' **denied**.

Other details

- An Admin level user with *Read-write* access to a host will not be able to link/unlink templates, if he has no access to the *Templates* group. With *Read* access to *Templates* group he will be able to link/unlink templates to the host, however, will not see any templates in the template list and will not be able to operate with templates in other places.

- An Admin level user with *Read* access to a host will not see the host in the configuration section host list; however, the host triggers will be accessible in IT service configuration.
- Any non-Super Admin user (including 'guest') can see network maps as long as the map is empty or has only images. When hosts, host groups or triggers are added to the map, permissions are respected.
- Zabbix server will not send notifications to users defined as action operation recipients if access to the concerned host is explicitly "denied".

### 13 Storage of secrets

#### Overview

It is possible to store some sensitive information secretly in HashiCorp Vault KV Secrets Engine - Version 2. Secrets can be saved for:

- user macro values
- database access credentials

Zabbix provides read-only access to the secrets in Vault, assuming that secrets are managed by someone else.

#### User macro values

It is possible to store user macro values secretly in Vault.

A "**Vault secret**" value of a user macro contains a reference path (as 'path:key', for example "secret/zabbix:password").

The following commands may be used to set the value for the path mentioned in example:

```
# Enable "secret/" mount point if not already enabled, note that "kv-v2" must be used
vault secrets enable -path=secret/ kv-v2
```

```
# Put new secret with key password under mount point "secret/" and path "secret/zabbix"
vault kv put secret/zabbix password=<password>
```

```
# Test that secret is successfully added
vault kv get secret/zabbix
```

```
# Finally test with Curl, note that "data" need to be manually added after mount point and "/v1" before the path
curl --header "X-Vault-Token: <VaultToken>" https://127.0.0.1:8200/v1/secret/data/zabbix
```

The secret value is retrieved by Zabbix server on every refresh of configuration data and is stored in configuration cache. The authentication token for a read-only access to the reference paths must be provided in server configuration ('VaultToken' parameter). If the macro value cannot be retrieved successfully the corresponding item using the value will turn unsupported.

It is also possible to trigger refresh of secret values from Vault, using a 'secrets\_reload' command line **option**.

Zabbix proxy never communicates with Vault to get any secrets other than database credentials. Secret values on Zabbix proxy are retrieved from Zabbix server on each configuration sync and stored in configuration cache the same way as on Zabbix server.

That means a Zabbix proxy cannot start data collection after a restart until it receives the configuration data update from Zabbix server for the first time. Encryption must be enabled between Zabbix server and proxy; otherwise a server warning message is logged.

#### Database credentials

It is supported to store database credentials used by Zabbix server, proxies and frontend secretly in Vault:

- Vault-related parameters for retrieving database credentials can be optionally entered in the frontend **installation wizard**.

Database credentials retrieved from Vault will be cached by the frontend. Note that the filesystem temporary file directory is used for database credential caching in frontend. You may use the ZBX\_DATA\_CACHE\_TTL **constant** to control how often the data cache is refreshed/invalidated.

- For server/proxy the VaultDBPath configuration parameter may be used to specify the path from where credentials for database will be retrieved by keys 'password' and 'username' (for example: secret/zabbix/database).

The following commands may be used to set the values for the path mentioned in example:

```
# Enable "secret/" mount point if not already enabled, note that "kv-v2" must be used
vault secrets enable -path=secret/ kv-v2
```

```
# Put new secrets with keys username and password under mount point "secret/" and path "secret/zabbix/data"
vault kv put secret/zabbix/database username=zabbix password=<password>

# Test that secret is successfully added
vault kv get secret/zabbix/database

# Finally test with Curl, note that "data" need to be manually added after mount point and "/v1" before the path
curl --header "X-Vault-Token: <VaultToken>" https://127.0.0.1:8200/v1/secret/data/zabbix/database
```

#### Configuration parameters

For Zabbix server/proxy new configuration parameters have been added for Vault authentication and retrieving database credentials:

- VaultToken - Vault authentication token (see Zabbix [server/proxy](#) configuration file for details)
- VaultURL - Vault server HTTP[S] URL
- VaultDBPath - Vault path from where credentials for database will be retrieved by keys 'password' and 'username' (for example: secret/zabbix/database)

Zabbix server and Zabbix proxy read the Vault-related configuration parameters from zabbix\_server.conf and zabbix\_proxy.conf upon startup.

Zabbix server and Zabbix proxy will additionally read "VAULT\_TOKEN" environment variable once during startup and unset it so that it would not be available through forked scripts; it is an error if both VaultToken and VAULT\_TOKEN contain value.

#### Note:

Forward slash and colon are reserved symbols. Forward slash can only be used to separate mount point from path (e.g. secret/zabbix where mount point is "secret" and "zabbix" is path) and, in case of Vault macros, colon can only be used to separate path from key. It is possible to URL-encode "/" and ":" if there is need to create mount point with name that is separated by forward slash (e.g. foo/bar/zabbix where mount point is "foo/bar" and path is "zabbix" as "foo%2Fbar/zabbix") and if mount point name or path needs to contain colon.

#### Configuring TLS

Certificate signed by a certificate authority (CA) should be added to the default CA store. Alternatively a custom CA store location can be specified using the SSLCALocation configuration parameter; note that in this case the certificate directory must be prepared using the openssl c\_rehash utility, for example configure SSLCALocation and copy "ca.pem" inside that directory, then run the following command:

```
c_rehash .
```

## 14 Scheduled reports

### Overview

With the *Scheduled reports* feature, you can set up a PDF version of a given dashboard to be sent to specified recipients at recurring intervals.

### Attention:

Currently the support of scheduled reports is experimental.

### Note:

For multi-page dashboards, only the first page is included in the PDF report.

### Pre-requisites:

- Zabbix web service must be installed and configured correctly to enable scheduled report generation - see [Setting up scheduled reports](#) for instructions.
- A user must have a **user role** of type *Admin* or *Super admin* with the following permissions:
  - *Scheduled reports* in the *Access to UI elements* block (to view reports)
  - *Manage scheduled reports* in the *Access to actions* block (to create/edit reports)

To create a scheduled report in Zabbix frontend, do the following:

- Go to: *Reports* → *Scheduled reports*
- Click *Create report* in the upper right corner of the screen
- Enter parameters of the report in the form

You can also create a report by opening an existing one, clicking the *Clone* button, and then saving it under a different name.

### Configuration

The *Scheduled reports* tab contains general report attributes.

All mandatory input fields are marked with a red asterisk.

557

| Parameter            | Description   |
|----------------------|---|
| <i>Repeat on</i>     | Days of the week when the report will be sent. This field is available only if <i>Cycle</i> is set to "Weekly".   |
| <i>Start date</i>    | Date when regular report generation should be started.  |
| <i>End date</i>      | Date when regular report generation should be stopped.  |
| <i>Subject</i>       | Subject of the report email. Supports {TIME} macro.   |
| <i>Message</i>       | Body of the report email. Supports {TIME} macro.  |
| <i>Subscriptions</i> | <p>List of report recipients. By default, includes only the report owner. Any Zabbix user with configured email media may be specified as a report recipient.</p> <p>Click <i>Add user</i> or <i>Add user group</i> to add more recipients.</p> <p>Click the username to edit settings:</p> <p><i>Generate report by</i> - whether the report data should be generated based on the dashboard permissions of the current user or the recipient.</p> <p><i>Status</i> - select "Include" to send the report to the user or "Exclude" to prevent sending the report to this user. At least one user must have the "Include" status. The "Exclude" status can be used to exclude specific users from a user group that is included.</p> <p>Note that users with insufficient permissions (that is, users with a role based on the <i>Admin</i> user type who are not members of the same user group as the recipient or report owner) will see "Inaccessible user" or "Inaccessible user group" instead of the actual names in the fields <i>Recipient</i> and <i>Generate report by</i>; the fields <i>Status</i> and <i>Action</i> will be displayed as read-only.</p> |
| <i>Enabled</i>       | Report status. Clearing this checkbox will disable the report.  |
| <i>Description</i>   | An optional description of the report. This description is for internal use and will not be sent to report recipients.  |

#### Form buttons

Buttons at the bottom of the form allow to perform several operations.

|               |  |
|---------------|--|
| <b>Add</b>    | Add a report. This button is only available for new reports.                     |
| <b>Update</b> | Update the properties of a report.   |
| <b>Clone</b>  | Create another report based on the properties of the current report.             |
| <b>Test</b>   | Test if report configuration is correct by sending a report to the current user. |
| <b>Delete</b> | Delete the report.   |
| <b>Cancel</b> | Cancel the editing of report properties.   |

#### Testing

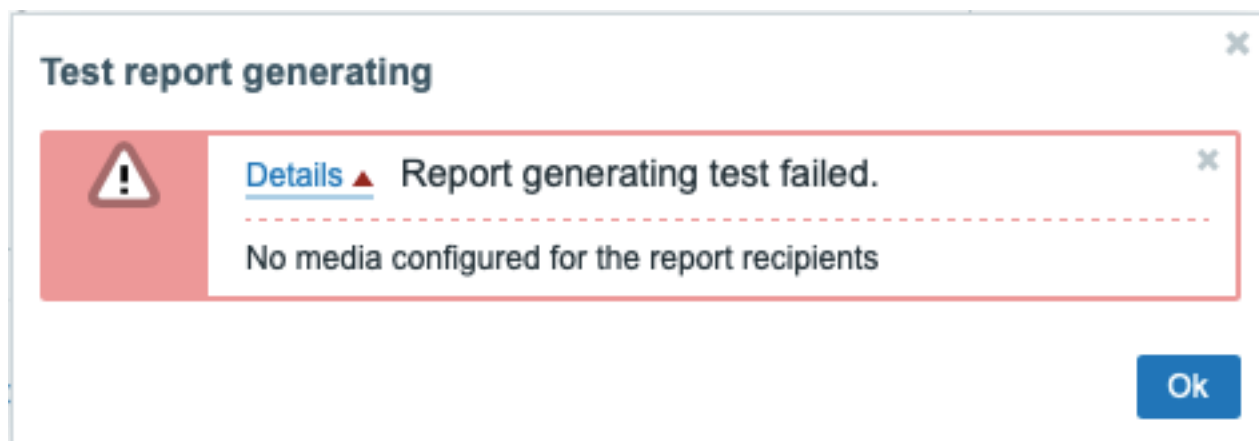

To test a report, click the *Test* button at the bottom of the report configuration form.

##### Note:

The *Test* button is not available if the report configuration form has been opened from the dashboard **action menu**.

If the configuration is correct, the test report is sent immediately to the current user. For test reports, subscribers and *Generate report by* user settings are ignored.

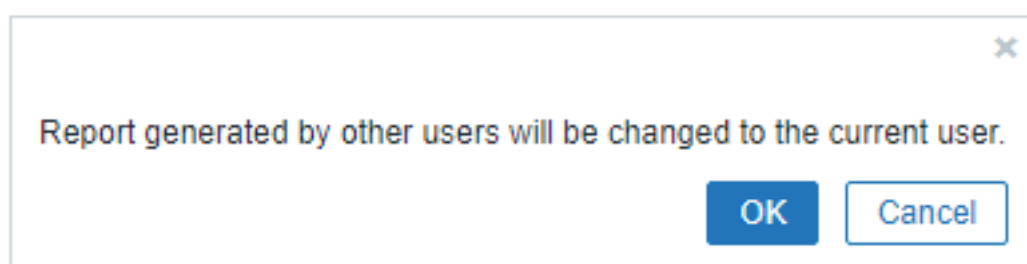

If the configuration is incorrect, an error message is displayed describing the possible cause.

#### Updating a report

To update an existing report, click the report name, make the required configuration changes, and then click the *Update* button.

If an existing report is updated by another user and this user changes the Dashboard, upon clicking the *Update* button, a warning message "Report generated by other users will be changed to the current user" will be displayed.

Clicking *OK* at this step will lead to the following changes:

- *Generate report by* settings will be updated to display the user who edited the report last (unless *Generate report by* is set to the recipient).
- Users that have been displayed as "Inaccessible user" or "Inaccessible user group" will be deleted from the list of report subscribers.

Clicking *Cancel* will close the configuration form and cancel the report update.

#### Cloning a report

To quickly clone an existing report, click the *Clone* button at the bottom of an existing report configuration form. When cloning a report created by another user, the current user becomes the owner of the new report.

Report settings will be copied to the new report configuration form with respect to user permissions:

- If the user who clones a report has no permissions to a dashboard, the *Dashboard* field will be cleared.
- If the user who clones a report has no permissions to some users or user groups in the *Subscriptions* list, inaccessible recipients will not be cloned.
- *Generate report by* settings will be updated to display the current user (unless *Generate report by* is set to the recipient).

Change the required settings and the report name, then click *Add*.

## 8 Service monitoring

**Overview** Service monitoring is a business-level monitoring that can be used to get an overview of the entire IT infrastructure service tree, identify weak places of the infrastructure, calculate SLA of various IT services, and check out other information at a higher level. Service monitoring focuses on the overall availability of a service instead of low-level details, such as the lack of disk space, high processor load, etc. Since Zabbix 6.0, service monitoring also provides functionality to find the root cause of a problem if a service is not performing as expected.

Service monitoring allows to create a hierarchy representation of monitored data.

A very simple service structure may look like:

```

Service
|
|-Workstations
| |
| |-Workstation1
| |
| |-Workstation2
|
|-Servers

```

Each node of the structure has attribute status. The status is calculated and propagated to upper levels according to the selected algorithm. The status of individual nodes is affected by the status of the mapped problems. Problem mapping is accomplished with [tagging](#).

Zabbix can send notifications or automatically execute a script on the Zabbix server in case service status change is detected. It is possible to define flexible rules whether a parent service should go into a 'Problem state' based on the statuses of child services. Services problem data can then be used to calculate SLA and send SLA reports based on the flexible set of conditions.

Service monitoring is configured in the Services menu, which consists of the following sections:

- [Services](#)

Services section allows to build a hierarchy of your monitored infrastructure by adding parent services, and then - child services to the parent services.

In addition to configuring service tree, this section provides an overview of the whole infrastructure and allows to quickly identify the problems that led to a service status change.

- [Service actions](#)

In this section you can configure service actions. Service actions are optional and allow to: - send a notification that a service is down; - execute a remote command on a Zabbix server upon a service status change; - send a recovery notification when a service is up again.

- [SLA](#)

In this section you can define service level agreements and set service level objectives for specific services.

- [SLA report](#)

In this section you can view SLA reports.

#### See also:

- SLA monitoring configuration [example](#)
- Notes about [upgrading services](#) from Zabbix versions below 6.0

## 1 Service tree

Service tree is configured in the *Services->Services* menu section. In the upper right corner, switch from [View](#) to the Edit mode.

Services
?
Create service
View
Edit

| <input type="checkbox"/> | Name                 | Status  | Root cause                             | Created at | Tags   |       |
|--------------------------|----------------------|---------|--|------------|--------|-------|
| <input type="checkbox"/> | Load balancer 5      | OK      |  | 2000-01-01 | SLA: 1 | + ↗ × |
| <input type="checkbox"/> | Video surveillance 2 | Warning | Hikvision camera: Error receiving data | 2000-01-01 | SLA: 2 | + ↗ × |

To [configure](#) a new service, click on the *Create service* button in the top right-hand corner.

To quickly add a child service, you can alternatively press a plus icon next to the parent service. This will open the same service configuration form, but the Parent services parameter will be pre-filled.

**Service configuration** In the **Service** tab, specify required service parameters:

Weight

0

| Parameter                      | Description  |
|--------------------------------|--|
| <b>Additional rules</b>        | Click on <i>Add</i> to define additional status calculation rules.   |
| <i>Set status to</i>           | Set service status to either <i>OK</i> (default), <i>Not classified</i> , <i>Information</i> , <i>Warning</i> , <i>Average</i> , <i>High</i> or <i>Disaster</i> in case of a condition match.  |
| <i>Condition</i>               | <p>Select the condition for direct child services:</p> <p><b>if at least (N) child services have (Status) status or above</b></p> <p><b>if at least (N%) of child services have (Status) status or above</b></p> <p><b>if less than (N) child services have (Status) status or below</b></p> <p><b>if less than (N%) of child services have (Status) status or below</b></p> <p><b>if weight of child services with (Status) status or above is at least (W)</b></p> <p><b>if weight of child services with (Status) status or above is at least (N%)</b></p> <p><b>if weight of child services with (Status) status or below is less than (W)</b></p> <p><b>if weight of child services with (Status) status or below is less than (N%)</b></p> <p>If several conditions are specified and the situation matches more than one condition, the highest severity will be set.</p> |
| <i>N (W)</i>                   | Set the value of N or W (1-100000), or N% (1-100) in the condition.  |
| <i>Status</i>                  | Select the value of <i>Status</i> in the condition: <i>OK</i> (default), <i>Not classified</i> , <i>Information</i> , <i>Warning</i> , <i>Average</i> , <i>High</i> or <i>Disaster</i> .   |
| <b>Status propagation rule</b> | Rule for propagating the service status to the parent service:   |
| <b>rule</b>                    | <p><b>As is</b> - the status is propagated without change</p> <p><b>Increase by</b> - you may increase the propagated status by 1 to 5 severities</p> <p><b>Decrease by</b> - you may decrease the propagated status by 1 to 5 severities</p> <p><b>Ignore this service</b> - the status is not propagated to the parent service at all</p> <p><b>Fixed status</b> - the status is propagated statically, i.e. as always the same</p>  |
| <b>Weight</b>                  | Weight of the service (integer in the range from 0 (default) to 1000000).  |

#### Note:

Additional status calculation rules can only be used to increase severity level over the level calculated according to the main *Status calculation rule* parameter. If according to additional rules the status should be *Warning*, but according to the *Status calculation rule* the status is *Disaster* - the service will have status *Disaster*.

The **Tags** tab contains **service-level tags**. Service-level tags are used to identify a service. Tags of this type are not used to map problems to the service (for that, use **Problem tags** from the first tab).

The **Child services** tab allows to specify dependant services. Click on *Add* to add a service from the list of existing services. If you want to add a new child service, save this service first, then click on a plus icon next to the service that you have just created.

**Tags** There are two different types of tags in services:

- Service tags
- Problem tags

#### Service tags

Service tags are used to match services with **service actions** and **SLAs**. These tags are specified at the *Tags* service configuration tab. For mapping SLAs, *OR* logic is used: a service will be mapped to an SLA if it has at least one matching tag. In service actions, mapping rules are configurable and can use either *AND*, *OR*, or *AND/OR* logic.

| Name     | Value      |
|----------|------------|
| internal | monitoring |
| tag      | value      |

Add

### Problem tags

Problem tags are used to match problems and services. These tags are specified at the primary service configuration tab.

Only child services of the lowest hierarchy level may have problem tags defined and be directly correlated to problems. If problem tags match, the service status will change to the same status as the problem has. In case of several problems, a service will have the status of the most severe one. Status of a parent service is then calculated based on child services statuses according to Status calculation rules.

If several tags are specified, *AND* logic is used: a problem must have all tags specified in the service configuration to be mapped to the service.

| Name     | Operation | Value  | Action |
|----------|-----------|--------|--------|
| Database | Equals    | MySQL  | Remove |
| Type     | Contains  | Server | Remove |

Add

#### Note:

A problem in Zabbix inherits tags from the whole chain of templates, hosts, items, web scenarios, and triggers. Any of these tags can be used for matching problems to services.

### Example:

Problem *Web camera 3 is down* has tags `type:video` `surveillance`, `floor:1st` and `name:webcam 3` and status *Warning*

The service **Web camera 3** has the only problem tag specified: `name:webcam 3`

| Name | Operation | Value    | Action |
|------|-----------|----------|--------|
| name | Equals    | webcam 3 | Remove |

Add

Service status will change from *OK* to *Warning* when this problem is detected.

If the service **Web camera 3** had problem tags `name:webcam 3` and `floor:2nd`, its status would not be changed, when the problem is detected, because the conditions are only partially met.

#### Note:

The buttons described below are visible only when *Services* section is in the Edit mode.

### Modifying existing services

To edit an existing service, press the pencil icon next to the service.

To clone an existing service, press the pencil icon to open its configuration and then press Clone button. When a service is cloned, its parent links are preserved, while the child links are not.

To delete a service, press on the x icon next to it. When you delete a parent service, its child services will not be deleted and will move one level higher in the service tree (1st level children will get the same level as the deleted parent service).

Two buttons below the list of services offer some mass-editing options:

- *Mass update* - mass update service properties
- *Delete* - delete the services

To use these options, mark the checkboxes before the respective services, then click on the required button.

## 2 Service actions

**Overview** In this section you can view and configure service **actions**.

Service actions are useful if you want some operations taking place as a result of service status change (OK ↔ PROBLEM), for example:

- send message
- restart webserver

Service actions are functionally similar to other action types in Zabbix (for example, trigger actions).

**Configuration** To create a new service action, go to the *Service actions* subsection of the *Services* menu, then click on *Create action* in the upper right corner.

Service actions are configured in the same way as other types of actions in Zabbix. For more details, see configuring **actions**.

The key differences are:

- User access to service actions depends on access rights to services granted by user's **role**.
- Service actions support different set of **conditions**.

**Conditions** The following conditions can be used in service actions:

| Condition type           | Supported operators                                      | Description   |
|--------------------------|--|---|
| <i>Service</i>           | equals<br>does not equal                                 | Specify a service or a service to exclude.<br><b>equals</b> - event belongs to this service.<br><b>does not equal</b> - event does not belong to this service.<br>Specifying a parent service implicitly selects all child services. To specify the parent service only, all nested services have to be additionally set with the <b>does not equal</b> operator.   |
| <i>Service name</i>      | contains<br>does not contain                             | Specify a string in the service name or a string to exclude.<br><b>contains</b> - event is generated by a service, containing this string in the name.<br><b>does not contain</b> - this string cannot be found in the service name.  |
| <i>Service tag name</i>  | equals<br>does not equal<br>contains<br>does not contain | Specify an event tag or an event tag to exclude. Service event tags can be defined in the service configuration section <i>Tags</i> .<br><b>equals</b> - event has this tag and value<br><b>does not equal</b> - event does not have this tag and value<br><b>contains</b> - event has a tag and value containing these strings<br><b>does not contain</b> - event does not have a tag and value containing these strings. |

### Attention:

Make sure to define **message templates** for Service actions in the *Administration->Media types* menu. Otherwise, the notifications will not be sent.

3 SLA

**Overview** Once the **services** are created, you can start monitoring whether their performance is on track with service level agreement (SLA).

*Services->SLA* menu section allows to configure SLAs for various services. An SLA in Zabbix defines service level objective (SLO), expected uptime schedule and planned downtimes.

SLAs and services are matched by **service tags**. The same SLA may be applied to multiple services - performance will be measured for each matching service separately. A single service may have multiple SLAs assigned - data for each of the SLAs will be displayed separately.

In SLA reports Zabbix provides Service level indicator (SLI) data, which measures real service availability. Whether a service meets the SLA targets is determined by comparing SLO (expected availability in %) with SLI (real-life availability in %).

**Configuration** To create a new SLA, click on the *Create SLA* button.

The **SLA** tab allows to specify general SLA parameters.

Click on *Add* to configure excluded downtimes, then enter the period name, start date and duration.

**SLA reports** How a service performs compared to an SLA is visible in the **SLA report**. SLA reports can be viewed:

- from the *SLA* section by clicking on the SLA report hyperlink;
- from the *Services* section by clicking on the SLA name in the info tab;
- in the Dashboard **widget SLA report**.

Once an SLA is configured, the *Info* tab in the services section will also display some information about service performance.

## 4 Setup example

**Overview** This section describes a simple setup for monitoring Zabbix high availability cluster as a service.

**Pre-requisites** Prior to configuring service monitoring, you need to have the hosts configured:

- *HA node 1* with at least one trigger and a tag (preferably set on a trigger level) **component:HA node 1**
- *HA node 2* with at least one trigger and a tag (preferably set on a trigger level) **component:HA node 2**

**Service tree** The next step is to build the service tree. In this example, the infrastructure is very basic and consists of three services: *Zabbix cluster* (parent) and two child services *Zabbix server node 1* and *Zabbix server node 2*.

```

Zabbix cluster
|
|- Zabbix server node 1
|- Zabbix server node 2

```

At the Services page, turn on *Edit* mode and press Create service:

Create service
View
Edit

In the service configuration window, enter name *Zabbix cluster* and mark the checkbox *Advanced configuration*.

Set status to  ▼

Condition  ▼

N

Status  ▼

Zabbix cluster will have two child services - one for each of the HA nodes. If both HA nodes have problems of at least *Warning* status, parent service status should be set to *Disaster*. To achieve this, additional rule should be configured as:

- Set status to: Disaster
- Condition: If at least N child services have Status status or above
- N: 2
- Status: Warning

Switch to the *Tags* tab and add a tag `Zabbix:server`. This tag will be used later for service actions and SLA reports.

## New service

Switch to the *Tags* tab and add a service tag: `Zabbix server:node 1`. This tag will be used later for service actions and SLA reports.

Service **Tags 1** Child services

| Tags | Name          | Value  | Action |
|------|---------------|--------|--------|
|      | Zabbix server | node 1 | Remove |
|      | Add           |        |        |

Add

Cancel

Save the new service.

Create another child service of Zabbix cluster with name "Zabbix server node 2".

Set the Problem tags as:

- Name: component
- Operation: Equals
- Value: HA node 2

Switch to the *Tags* tab and add a service tag: Zabbix server:node 2.

Save the new service.

**SLA** In this example, expected Zabbix cluster performance is 100% excluding semi-annual one hour maintenance period.

First, you need to add a new service level agreement.

Go to the *Services->SLA* menu section and press Create SLA. Enter name *Zabbix cluster performance* and set the SLO to 100%.

The service Zabbix cluster has a service tag Zabbix:server. To use this SLA for measuring performance of Zabbix cluster, in the *Service tags* parameter, specify:

- Name: Zabbix
- Operation: Equals
- Value: server

## 9 Web monitoring

**Overview** With Zabbix you can check several availability aspects of web sites.

### Attention:

To perform web monitoring Zabbix server must be initially **configured** with cURL (libcurl) support.

To activate web monitoring you need to define web scenarios. A web scenario consists of one or several HTTP requests or "steps". The steps are periodically executed by Zabbix server in a pre-defined order. If a host is monitored by proxy, the steps are executed by the proxy.

Web scenarios are attached to hosts/templates in the same way as items, triggers, etc. That means that web scenarios can also be created on a template level and then applied to multiple hosts in one move.

The following information is collected in any web scenario:

- average download speed per second for all steps of whole scenario
- number of the step that failed
- last error message

The following information is collected in any web scenario step:

- download speed per second
- response time
- response code

For more details, see [web monitoring items](#).

Data collected from executing web scenarios is kept in the database. The data is automatically used for graphs, triggers and notifications.

Zabbix can also check if a retrieved HTML page contains a pre-defined string. It can execute a simulated login and follow a path of simulated mouse clicks on the page.

Zabbix web monitoring supports both HTTP and HTTPS. When running a web scenario, Zabbix will optionally follow redirects (see option *Follow redirects* below). Maximum number of redirects is hard-coded to 10 (using cURL option [CURLOPT\\_MAXREDIRS](#)). All cookies are preserved during the execution of a single scenario.

**Configuring a web scenario** To configure a web scenario:

- Go to: *Configuration* → *Hosts* (or *Templates*)
- Click on *Web* in the row of the host/template
- Click on *Create web scenario* to the right (or on the scenario name to edit an existing scenario)

- Enter parameters of the scenario in the form

The **Scenario** tab allows you to configure the general parameters of a web scenario.

Scenario parameters:

| Parameter              | Description   |
|------------------------|---|
| <i>Name</i>            | Unique scenario name.<br><b>User macros</b> are supported. <i>Note</i> that if user macros are used, these macros will be left unresolved in <b>web monitoring item</b> names.  |
| <i>Update interval</i> | How often the scenario will be executed.<br><b>Time suffixes</b> are supported, e.g. 30s, 1m, 2h, 1d.<br><b>User macros</b> are supported. <i>Note</i> that if a user macro is used and its value is changed (e.g. 5m → 30s), the next check will be executed according to the previous value (farther in the future with the example values).  |
| <i>Attempts</i>        | The number of attempts for executing web scenario steps. In case of network problems (timeout, no connectivity, etc) Zabbix can repeat executing a step several times. The figure set will equally affect each step of the scenario. Up to 10 attempts can be specified, default value is 1.<br><i>Note:</i> Zabbix will not repeat a step because of a wrong response code or the mismatch of a required string. |
| <i>Agent</i>           | Select a client agent.<br>Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers.<br>User macros can be used in this field.   |

| Parameter         | Description   |
|-------------------|---|
| <i>HTTP proxy</i> | <p>You can specify an HTTP proxy to use, using the format <code>[protocol://] [username[:password]@]proxy.example.com[:port]</code>. This sets the <a href="#">CURLOPT_PROXY</a> cURL option.</p> <p>The optional <code>protocol://</code> prefix may be used to specify alternative proxy protocols (the protocol prefix support was added in cURL 7.21.7). With no protocol specified, the proxy will be treated as an HTTP proxy.</p> <p>By default, 1080 port will be used.</p> <p>If specified, the proxy will overwrite proxy related environment variables like <code>http_proxy</code>, <code>HTTPS_PROXY</code>. If not specified, the proxy will not overwrite proxy-related environment variables. The entered value is passed on "as is", no sanity checking takes place.</p> <p>You may also enter a SOCKS proxy address. If you specify the wrong protocol, the connection will fail and the item will become unsupported.</p> <p><i>Note</i> that only simple authentication is supported with HTTP proxy.</p> <p>User macros can be used in this field.</p>   |
| <i>Variables</i>  | <p>Variables that may be used in scenario steps (URL, post variables). They have the following format:</p> <pre>{macro1}=value1 {macro2}=value2 {macro3}=regex:&lt;regular expression&gt;</pre> <p>For example:</p> <pre>{username}=Alexei {password}=kj3h5kj34bd {hostid}=regex:hostid is ([0-9]+)</pre> <p>The macros can then be referenced in the steps as <code>{username}</code>, <code>{password}</code> and <code>{hostid}</code>. Zabbix will automatically replace them with actual values. Note that variables with <code>regex:</code> need one step to get the value of the regular expression so the extracted value can only be applied to the step after.</p> <p>If the value part starts with <code>regex:</code> then the part after it is treated as a regular expression that searches the web page and, if found, stores the match in the variable. At least one subgroup must be present so that the matched value can be extracted.</p> <p>User macros and <code>{HOST.*}</code> <b>macros</b> are supported.</p> <p>Variables are automatically URL-encoded when used in query fields or form data for post variables, but must be URL-encoded manually when used in raw post or directly in URL.</p> |
| <i>Headers</i>    | <p>HTTP Headers are used when performing a request. Default and custom headers can be used. Headers will be assigned using default settings depending on the Agent type selected from a drop-down list on a scenario level, and will be applied to all the steps, unless they are custom defined on a step level.</p> <p><b>It should be noted that defining the header on a step level automatically discards all the previously defined headers, except for a default header that is assigned by selecting the 'User-Agent' from a drop-down list on a scenario level.</b></p> <p>However, even the 'User-Agent' default header can be overridden by specifying it on a step level. To unset the header on a scenario level, the header should be named and attributed with no value on a step level.</p> <p>Headers should be listed using the same syntax as they would appear in the HTTP protocol, optionally using some additional features supported by the <a href="#">CURLOPT_HTTPHEADER</a> cURL option.</p> <p>For example:</p> <pre>Accept-Charset=utf-8 Accept-Language=en-US Content-Type=application/xml; charset=utf-8</pre> <p>User macros and <code>{HOST.*}</code> <b>macros</b> are supported.</p>       |
| <i>Enabled</i>    | <p>The scenario is active if this box is checked, otherwise - disabled.</p>   |

Note that when editing an existing scenario, two extra buttons are available in the form:

|  |   |
|--|---|
| <a href="#">Clone</a>                    | Create another scenario based on the properties of the existing one.  |
| <a href="#">Clear history and trends</a> | Delete history and trend data for the scenario. This will make the server perform the scenario immediately after deleting the data. |

**Note:**

If *HTTP proxy* field is left empty, another way for using an HTTP proxy is to set proxy related environment variables.

For HTTP checks - set the **http\_proxy** environment variable for the Zabbix server user. For example, `http_proxy=http://proxy_ip:proxy_port`.

For HTTPS checks - set the **HTTPS\_PROXY** environment variable. For example, `HTTPS_PROXY=http://proxy_ip:proxy_port`. More details are available by running a shell command: `# man curl`.

The **Steps** tab allows you to configure the web scenario steps. To add a web scenario step, click on *Add* in the *Steps* block.

## Configuring steps

Step parameters:

| Parameter   | Description  |
|-------------|--|
| <i>Name</i> | Unique step name.<br><i>User macros</i> are supported. <i>Note</i> that if user macros are used, these macros will be left unresolved in <i>web monitoring item</i> names. |

| Parameter               | Description  |
|-------------------------|--|
| <i>URL</i>              | <p>URL to connect to and retrieve data. For example:<br/> <a href="https://www.example.com">https://www.example.com</a><br/> <a href="http://www.example.com/download">http://www.example.com/download</a></p> <p>Domain names can be specified in Unicode characters. They are automatically punycode-converted to ASCII when executing the web scenario step.</p> <p>The <i>Parse</i> button can be used to separate optional query fields (like ?name=Admin&amp;password=mypassword) from the URL, moving the attributes and values into <i>Query fields</i> for automatic URL-encoding.</p> <p>Variables can be used in the URL, using the {macro} syntax. Variables can be URL-encoded manually using a {{macro}}.urlencode() syntax.</p> <p>User macros and {HOST.*} <b>macros</b> are supported.</p> <p>Limited to 2048 characters.</p>   |
| <i>Query fields</i>     | <p>HTTP GET variables for the URL.</p> <p>Specified as attribute and value pairs.</p> <p>Values are URL-encoded automatically. Values from scenario variables, user macros or {HOST.*} macros are resolved and then URL-encoded automatically. Using a {{macro}}.urlencode() syntax will double URL-encode them.</p> <p>User macros and {HOST.*} <b>macros</b> are supported.</p>  |
| <i>Post</i>             | <p>HTTP POST variables.</p> <p>In <b>Form data</b> mode, specified as attribute and value pairs.</p> <p>Values are URL-encoded automatically. Values from scenario variables, user macros or {HOST.*} macros are resolved and then URL-encoded automatically.</p> <p>In <b>Raw data</b> mode, attributes/values are displayed on a single line and concatenated with a &amp; symbol.</p> <p>Raw values can be URL-encoded/decoded manually using a {{macro}}.urlencode() or {{macro}}.urldecode() syntax.</p> <p>For example: id=2345&amp;userid={user}</p> <p>If {user} is defined as a variable of the web scenario, it will be replaced by its value when the step is executed. If you wish to URL-encode the variable, substitute {user} with {{user}}.urlencode().</p> <p>User macros and {HOST.*} <b>macros</b> are supported.</p>   |
| <i>Variables</i>        | <p>Step-level variables that may be used for GET and POST functions.</p> <p>Specified as attribute and value pairs.</p> <p>Step-level variables override scenario-level variables or variables from the previous step.</p> <p>However, the value of a step-level variable only affects the step after (and not the current step).</p> <p>They have the following format:</p> <p><b>{macro}=value</b><br/> <b>{macro}=regex:&lt;regular expression&gt;</b></p> <p>For more information see variable description on the <b>scenario</b> level.</p> <p>Variables are automatically URL-encoded when used in query fields or form data for post variables, but must be URL-encoded manually when used in raw post or directly in URL.</p>  |
| <i>Headers</i>          | <p>Custom HTTP headers that will be sent when performing a request.</p> <p>Specified as attribute and value pairs.</p> <p>A header defined on a step level will be used for that particular step.</p> <p><b>It should be noted that defining the header on a step level automatically discards all the previously defined headers, except for a default header that is assigned by selecting the 'User-Agent' from a drop-down list on a scenario level.</b></p> <p>However, even the 'User-Agent' default header can be overridden by specifying it on a step level. For example, assigning the name to a header, but setting no value will unset the default header on a scenario level.</p> <p>User macros and {HOST.*} macros are supported.</p> <p>This sets the <a href="#">CURLOPT_HTTPHEADER</a> cURL option.</p> <p>Specifying custom headers is supported <i>starting with Zabbix 2.4</i>.</p> |
| <i>Follow redirects</i> | <p>Mark the checkbox to follow HTTP redirects.</p> <p>This sets the <a href="#">CURLOPT_FOLLOWLOCATION</a> cURL option.</p>  |
| <i>Retrieve mode</i>    | <p>Select the retrieve mode:</p> <p><b>Body</b> - retrieve only body from the HTTP response</p> <p><b>Headers</b> - retrieve only headers from the HTTP response</p> <p><b>Body and headers</b> - retrieve body and headers from the HTTP response</p>   |

| Parameter                    | Description   |
|------------------------------|---|
| <i>Timeout</i>               | Zabbix will not spend more than the set amount of time on processing the URL (from one second to maximum of 1 hour). Actually this parameter defines the maximum time for making connection to the URL and maximum time for performing an HTTP request. Therefore, Zabbix will not spend more than <b>2 x Timeout</b> seconds on the step.<br><b>Time suffixes</b> are supported, e.g. 30s, 1m, 1h. <b>User macros</b> are supported. |
| <i>Required string</i>       | Required regular expression pattern.<br>Unless retrieved content (HTML) matches the required pattern the step will fail. If empty, no check on required string is performed.<br>For example:<br>Homepage of Zabbix<br>Welcome.*admin<br><b>Note:</b> Referencing <b>regular expressions</b> created in the Zabbix frontend is not supported in this field.<br>User macros and {HOST:*} <b>macros</b> are supported.                   |
| <i>Required status codes</i> | List of expected HTTP status codes. If Zabbix gets a code which is not in the list, the step will fail. If empty, no check on status codes is performed.<br>For example: 200,201,210-299<br>User macros are supported.  |

**Note:**

Any changes in web scenario steps will only be saved when the whole scenario is saved.

See also a [real-life example](#) of how web monitoring steps can be configured.

**Configuring tags** The **Tags** tab allows to define scenario-level **tags**.

The screenshot shows the 'Tags' tab in the Zabbix web scenario configuration. At the top, there are tabs for 'Scenario', 'Steps 2', 'Tags 1', and 'Authentication'. Below the tabs, there are two buttons: 'Scenario tags' (active) and 'Inherited and scenario tags'. The main area contains a table with the following data:

| Name        | Value      | Action |
|-------------|------------|--------|
| Application | Web checks | Remove |

Below the table, there is an 'Add' button.

Tagging allows to filter web scenarios and web monitoring **items**.

**Configuring authentication** The **Authentication** tab allows you to configure scenario authentication options. A green dot next to the tab name indicates that some type of HTTP authentication is enabled.

SSL key password

Authentication parameters:

| Parameter                   | Description   |
|-----------------------------|---|
| <i>Authentication</i>       | <p>Authentication options.</p> <p><b>None</b> - no authentication used.</p> <p><b>Basic</b> - basic authentication is used.</p> <p><b>NTLM</b> - NTLM (<a href="#">Windows NT LAN Manager</a>) authentication is used.</p> <p><b>Kerberos</b> - Kerberos authentication is used. See also: <a href="#">Configuring Kerberos with Zabbix</a>.</p> <p><b>Digest</b> - Digest authentication is used.</p> <p>Selecting an authentication method will provide two additional fields for entering a user name and password.</p>  |
| <i>SSL verify peer</i>      | <p>User macros can be used in user and password fields.</p> <p>Mark the checkbox to verify the SSL certificate of the web server.</p> <p>The server certificate will be automatically taken from system-wide certificate authority (CA) location. You can override the location of CA files using Zabbix server or proxy configuration parameter <a href="#">SSLCALocation</a>.</p>   |
| <i>SSL verify host</i>      | <p>This sets the <a href="#">CURLOPT_SSL_VERIFYHOST</a> cURL option.</p> <p>Mark the checkbox to verify that the <i>Common Name</i> field or the <i>Subject Alternate Name</i> field of the web server certificate matches.</p>   |
| <i>SSL certificate file</i> | <p>This sets the <a href="#">CURLOPT_SSL_VERIFYHOST</a> cURL option.</p> <p>Name of the SSL certificate file used for client authentication. The certificate file must be in PEM<sup>1</sup> format. If the certificate file contains also the private key, leave the <i>SSL key file</i> field empty. If the key is encrypted, specify the password in <i>SSL key password</i> field. The directory containing this file is specified by Zabbix server or proxy configuration parameter <a href="#">SSLCertLocation</a>.</p> <p>HOST.* macros and user macros can be used in this field.</p> |
| <i>SSL key file</i>         | <p>This sets the <a href="#">CURLOPT_SSLCERT</a> cURL option.</p> <p>Name of the SSL private key file used for client authentication. The private key file must be in PEM<sup>1</sup> format. The directory containing this file is specified by Zabbix server or proxy configuration parameter <a href="#">SSLKeyLocation</a>.</p> <p>HOST.* macros and user macros can be used in this field.</p>   |
| <i>SSL key password</i>     | <p>This sets the <a href="#">CURLOPT_SSLKEY</a> cURL option.</p> <p>SSL private key file password.</p> <p>User macros can be used in this field.</p> <p>This sets the <a href="#">CURLOPT_KEYPASSWD</a> cURL option.</p>  |

#### Attention:

[1] Zabbix supports certificate and private key files in PEM format only. In case you have your certificate and private key data in PKCS #12 format file (usually with extension \*.p12 or \*.pfx) you may generate the PEM file from it using the following commands:

```
openssl pkcs12 -in ssl-cert.p12 -clcerts -nokeys -out ssl-cert.pem
openssl pkcs12 -in ssl-cert.p12 -nocerts -nodes -out ssl-cert.key
```

**Note:**

Zabbix server picks up changes in certificates without a restart.

**Note:**

If you have client certificate and private key in a single file just specify it in a "SSL certificate file" field and leave "SSL key file" field empty. The certificate and key must still be in PEM format. Combining certificate and key is easy:

```
cat client.crt client.key > client.pem
```

**Display** To view web scenarios configured for a host, go to *Monitoring* → *Hosts*, locate the host in the list and click on the *Web* hyperlink in the last column. Click on the scenario name to get detailed information.

**Details of web scenario: Zabbix frontend**

An overview of web scenarios can also be displayed in *Monitoring* → *Dashboard* by a Web monitoring widget.

Recent results of the web scenario execution are available in the *Monitoring* → *Latest data* section.

**Extended monitoring** Sometimes it is necessary to log received HTML page content. This is especially useful if some web scenario step fails. Debug level 5 (trace) serves that purpose. This level can be set in *server* and *proxy* configuration files or using a runtime control option (-R log\_level\_increase="http poller,N", where N is the process number). The following examples demonstrate how extended monitoring can be started provided debug level 4 is already set:

```
# Increase log level of all http pollers:
```

```
zabbix_server -R log_level_increase="http poller"
```

```
# Increase log level of second http poller:  
zabbix_server -R log_level_increase="http poller,2"
```

If extended web monitoring is not required it can be stopped using the `-R log_level_decrease` option.

## 1 Web monitoring items

### Overview

Some new items are automatically added for monitoring when web scenarios are created.

All items inherit tags from the web scenario.

### Scenario items

As soon as a scenario is created, Zabbix automatically adds the following items for monitoring.

| Item  | Description   |
|---|---|
| <i>Download speed for scenario</i><br><Scenario>    | This item will collect information about the download speed (bytes per second) of the whole scenario, i.e. average for all steps.<br>Item key: <code>web.test.in[Scenario,,bps]</code><br>Type: <i>Numeric(float)</i>                                     |
| <i>Failed step of scenario</i><br><Scenario>        | This item will display the number of the step that failed on the scenario. If all steps are executed successfully, 0 is returned.<br>Item key: <code>web.test.fail[Scenario]</code><br>Type: <i>Numeric(unsigned)</i>                                     |
| <i>Last error message of scenario</i><br><Scenario> | This item returns the last error message text of the scenario. A new value is stored only if the scenario has a failed step. If all steps are ok, no new value is collected.<br>Item key: <code>web.test.error[Scenario]</code><br>Type: <i>Character</i> |

The actual scenario name will be used instead of "Scenario".

#### Note:

If the scenario name contains **user macros**, these macros will be left unresolved in web monitoring item names. <br><br>If the scenario name starts with a doublequote or contains a comma or a square bracket, it will be properly quoted in item keys. In other cases no additional quoting will be performed.

#### Note:

Web monitoring items are added with a 30 day history and a 90 day trend retention period.

These items can be used to create triggers and define notification conditions.

### Example 1

To create a "Web scenario failed" trigger, you can define a trigger expression:

```
last(/host/web.test.fail[Scenario])>0
```

Make sure to replace 'Scenario' with the real name of your scenario.

### Example 2

To create a "Web scenario failed" trigger with a useful problem description in the trigger name, you can define a trigger with name:

```
Web scenario "Scenario" failed: {ITEM.VALUE}
```

and trigger expression:

```
length(last(/host/web.test.error[Scenario]))>0 and last(/host/web.test.fail[Scenario])>0
```

Make sure to replace 'Scenario' with the real name of your scenario.

### Example 3

To create a "Web application is slow" trigger, you can define a trigger expression:

```
last(/host/web.test.in[Scenario,,bps])<10000
```

Make sure to replace 'Scenario' with the real name of your scenario.

#### Scenario step items

As soon as a step is created, Zabbix automatically adds the following items for monitoring.

| Item   | Description   |
|--|---|
| <i>Download speed for step &lt;Step&gt; of scenario &lt;Scenario&gt;</i> | This item will collect information about the download speed (bytes per second) of the step.<br>Item key: web.test.in[Scenario,Step,bps]<br>Type: <i>Numeric(float)</i>  |
| <i>Response time for step &lt;Step&gt; of scenario &lt;Scenario&gt;</i>  | This item will collect information about the response time of the step in seconds. Response time is counted from the beginning of the request until all information has been transferred.<br>Item key: web.test.time[Scenario,Step,resp]<br>Type: <i>Numeric(float)</i> |
| <i>Response code for step &lt;Step&gt; of scenario &lt;Scenario&gt;</i>  | This item will collect response codes of the step.<br>Item key: web.test.rspcode[Scenario,Step]<br>Type: <i>Numeric(unsigned)</i>   |

Actual scenario and step names will be used instead of "Scenario" and "Step" respectively.

#### Note:

Web monitoring items are added with a 30 day history and a 90 day trend retention period.

#### Note:

If scenario name starts with a doublequote or contains comma or square bracket, it will be properly quoted in item keys. In other cases no additional quoting will be performed.

These items can be used to create triggers and define notification conditions. For example, to create a "Zabbix GUI login is too slow" trigger, you can define a trigger expression:

```
last(/zabbix/web.test.time[ZABBIX GUI,Login,resp])>3
```

## 2 Real-life scenario

### Overview

This section presents a step-by-step real-life example of how web monitoring can be used.

Let's use Zabbix web monitoring to monitor the web interface of Zabbix. We want to know if it is available, provides the right content and how quickly it works. To do that we also must log in with our user name and password.

### Scenario

#### Step 1

Add a new web scenario.

We will add a scenario to monitor the web interface of Zabbix. The scenario will execute a number of steps.

Go to *Configuration* → *Hosts*, pick a host and click on *Web* in the row of that host. Then click on *Create web scenario*.

Enabled
☒

Add
Cancel

All mandatory input fields are marked with a red asterisk.

In the new scenario form we will name the scenario as *Zabbix frontend*. We will also create two variables: {user} and {password}. You may also want to add a new *Application:Zabbix frontend* tag in the Tags tab.

## Step 2

Define steps for the scenario.

Click on *Add* button in the *Steps* tab to add individual steps.

### Web scenario step 1

We start by checking that the first page responds correctly, returns with HTTP response code 200 and contains text "Zabbix SIA".

#### Attention:

Note that Zabbix frontend uses JavaScript redirect when logging in, thus first we must log in, and only in further steps we may check for logged-in features. Additionally, the login step must use full URL to **index.php** file.

Take note also of how we are getting the content of the {sid} variable (session ID) using a variable syntax with regular expression: `regex:name="csrf-token" content="([0-9a-z]{16})"`. This variable will be required in step 4.

Web scenario step 3

584

Being logged in, we should now verify the fact. To do so, we check for a string that is only visible when logged in - for example, **Administration**.

### Step 3

Save the finished web monitoring scenario.

The scenario will be added to a host. To view web scenario information go to *Monitoring* → *Hosts*, locate the host in the list and click on the Web hyperlink in the last column.

| Web monitoring          |                 |                 |            |        |                            |
|-------------------------|-----------------|-----------------|------------|--------|----------------------------|
| Host                    | Name            | Number of steps | Last check | Status | Tags                       |

Click on the scenario name to see more detailed statistics:

Details of web scenario: Zabbix frontend

10 Virtual machine monitoring

**Overview** Support of monitoring VMware environments is available in Zabbix starting with version 2.2.0.

Zabbix can use low-level discovery rules to automatically discover VMware hypervisors and virtual machines and create hosts to monitor them, based on pre-defined host prototypes.

The default dataset in Zabbix offers several ready-to-use templates for monitoring VMware vCenter or ESX hypervisor.

The minimum required VMware vCenter or vSphere version is 5.1.

**Details** The virtual machine monitoring is done in two steps. First, virtual machine data is gathered by *vmware collector* Zabbix processes. Those processes obtain necessary information from VMware web services over the SOAP protocol, pre-process it and store into Zabbix server shared memory. Then, this data is retrieved by pollers using Zabbix simple check **VMware keys**.

Starting with Zabbix version 2.4.4 the collected data is divided into 2 types: VMware configuration data and VMware performance counter data. Both types are collected independently by *vmware collectors*. Because of this it is recommended to enable more collectors than the monitored VMware services. Otherwise retrieval of VMware performance counter statistics might be delayed by the retrieval of VMware configuration data (which takes a while for large installations).

Currently only datastore, network interface and disk device statistics and custom performance counter items are based on the VMware performance counter information.

**Configuration** For virtual machine monitoring to work, Zabbix should be **compiled** with the `--with-libxml2` and `--with-libcurl` compilation options.

The following configuration file options can be used to tune the Virtual machine monitoring:

- **StartVMwareCollectors** - the number of pre-forked vmware collector instances.  
This value depends on the number of VMware services you are going to monitor. For the most cases this should be:  
 $servicenum < StartVMwareCollectors < (servicenum * 2)$   
where *servicenum* is the number of VMware services. E. g. if you have 1 VMware service to monitor set `StartVMwareCollectors` to 2, if you have 3 VMware services, set it to 5. Note that in most cases this value should not be less than 2 and should not be 2 times greater than the number of VMware services that you monitor. Also keep in mind that this value also depends on your VMware environment size and *VMwareFrequency* and *VMwarePerfFrequency* configuration parameters (see below).
- **VMwareCacheSize**
- **VMwareFrequency**
- **VMwarePerfFrequency**
- **VMwareTimeout**

For more details, see the configuration file pages for Zabbix **server** and **proxy**.

**Attention:**

To support datastore capacity metrics Zabbix requires VMware configuration `vpzd.stats.maxQueryMetrics` parameter to be at least 64. See also the VMware knowledge base [article](#).

**Discovery** Zabbix can use a low-level discovery rule to automatically discover VMware hypervisors and virtual machines.

The discovery rule key in the above screenshot is `vmware.hv.discovery[{$VMWARE.URL}]`.

**Host prototypes** Host prototypes can be created with the low-level discovery rule. When virtual machines are discovered, these prototypes are the basis for generating real hosts. Prototypes, before becoming discovered, cannot have their own items and triggers, other than those from the linked templates.

Discovery rules

| <input type="checkbox"/> VMware   | Discover VMware VMs         | Item prototypes   | Trigger prototypes | Graph prototypes | Host prototypes 1 |               |

In order for hosts created from a prototype to have unique host names, the *Host name* field must contain at least one **low-level discovery macro**.

Since Zabbix 5.2, discovered hosts may be configured with custom interfaces or inherit the IP of a host the discovery rule belongs to (default). To add one or more custom interface, switch the *Interface* selector from *Inherit* to *Custom* mode, then press [Add](#).

and select the required interface type from the drop-down menu that appears. All supported types of interfaces can be defined for a host prototype: Zabbix agent, SNMP, JMX, IPMI. Interface fields support low-level discovery macros and **user macros**. If several custom interfaces are specified - use the *Default* column to specify the primary interface.

Notes:

- If *Custom* is selected, but no interfaces have been specified the hosts will be created without interfaces.
- If *Inherit* is selected for a host prototype that belongs to a template, discovered hosts will inherit the interface of a host to which the template is linked to.

**Warning:**  
A host will not be created, if the host interface contains incorrect data

Monitored by proxy

(no proxy)

Create enabled

☒

Discover

☒

LLD macros can also be used for the visible name, host group prototype fields, tag values, or values of host prototype user macros.

Other options that can be specified for a host prototype are:

- Linkage to existing host groups
- Template linkage
- Encryption

If *Create enabled* is checked, the host will be added in an enabled state. If unchecked, the host will be added, but in a disabled state.

If *Discover* is checked (default), the host will be created. If unchecked, the host will not be created, unless this setting is overridden in the **discovery rule**. This functionality provides additional flexibility when creating discovery rules.

Discovered hosts are prefixed with the name of the discovery rule that created them, in the host list. Discovered hosts can be manually deleted. Discovered hosts will also be automatically deleted, based on the *Keep lost resources period (in days)* value of

the discovery rule. Most of the configuration options are read-only, except for enabling/disabling the host and host inventory.

**Note:**

Zabbix does not support nested host prototypes, i.e. host prototypes are not supported on hosts that are discovered by low-level discovery rule.

**Ready-to-use templates** The default dataset in Zabbix offers several ready-to-use templates for monitoring VMware vCenter or directly ESX hypervisor. These templates contain pre-configured LLD rules as well as a number of built-in checks for monitoring virtual installations.

Templates for VMware vCenter and ESX hypervisor monitoring:

- *VMware* - uses UUID data for corresponding macros;
- *VMware FQDN* - uses FQDN data for corresponding macros.

**Note:**

In order for the *VMware FQDN* template to work correctly each monitored VM should have a unique OS name compliant with FQDN rules and VMware Tools/Open Virtual Machine Tools must be installed on every machine. If these conditions are met, it is recommended to use *VMware FQDN* template. The creation of *VMware FQDN* template became possible after introducing the ability to create hosts with custom interfaces in Zabbix 5.2.

A classic *VMware* template is still available and can be used if FQDN requirements cannot be met. Please keep in mind, that the *VMware* template has a known issue. Hosts for discovered virtual machines will be created with the names saved in the vCenter (for example, VM1, VM2, etc.). If Zabbix agent active is installed on these hosts later with autoregistration enabled, the autoregistration process will read host names as they have been registered upon launch (for example, vm1.example.com, vm2.example.com, etc.) and create new hosts since no name matches have been found. As a result there will be two duplicate hosts for each machine with different names.

Please note:

- The template *VMware Hypervisor* can be manually linked to a host as well as used in discovery;
- The template *VMware Guest* should not be manually linked to a host and can only be used in discovery.

## ≡ Templates

| <input type="checkbox"/> Name ▲                          | Hosts | Items    | Triggers   | Graphs | Dashboards | Discovery   | Web |
|--|-------|----------|------------|--------|------------|-------------|-----|
| <input type="checkbox"/> VMware                          | Hosts | Items 3  | Triggers   | Graphs | Dashboards | Discovery 4 | Web |
| <input type="checkbox"/> VMware FQDN                     | Hosts | Items 3  | Triggers   | Graphs | Dashboards | Discovery 4 | Web |
| <input type="checkbox"/> VMware Guest                    | Hosts | Items 27 | Triggers 1 | Graphs | Dashboards | Discovery 3 | Web |
| <input type="checkbox"/> VMware Hypervisor               | Hosts | Items 26 | Triggers 4 | Graphs | Dashboards | Discovery 2 | Web |
| <input type="checkbox"/> VMWare SD-WAN VeloCloud by HTTP | Hosts | Items 7  | Triggers 5 | Graphs | Dashboards | Discovery 5 | Web |

**Host configuration** To use VMware simple checks the host must have the following user macros defined:

- **{ \$VMWARE.URL }** - VMware service (vCenter or ESX hypervisor) SDK URL (<https://servername/sdk>)
- **{ \$VMWARE.USERNAME }** - VMware service user name
- **{ \$VMWARE.PASSWORD }** - VMware service { \$VMWARE.USERNAME } user password

**Example** The following example demonstrates how to quickly setup VMware monitoring on Zabbix:

- make sure that Zabbix server has been compiled with the required options (`--with-libxml2` and `--with-libcurl`): the log file must contain "VMware monitoring: YES" during server startup.
- set the `StartVMwareCollectors` option in Zabbix server configuration file to 2 or more
- create a new host
- set the host macros required for VMware authentication:

Host macros

Inherited and host macros

| Macro      | Value      |   |
|------------|------------|---|
| {PASSWORD} | *****      |  |
| {URL}      | <url>      | T   |
| {USERNAME} | <username> | T   |

[Add](#)

- link the host to the VMware service template:

Linked templates

Name

Action

Link new templates

VMware X

type here to search

- click on the **Add** button to save the host.

**Extended logging** The data gathered by VMware collector can be logged for detailed debugging using debug level 5. This level can be set in **server** and **proxy** configuration files or using a runtime control option (`-R log_level_increase="vmware collector,N"`, where N is a process number). The following examples demonstrate how extended logging can be started provided debug level 4 is already set:

```
# Increase log level of all vmware collectors:
zabbix_server -R log_level_increase="vmware collector"
```

```
# Increase log level of second vmware collector:
zabbix_server -R log_level_increase="vmware collector,2"
```

If extended logging of VMware collector data is not required it can be stopped using the `-R log_level_decrease` option.

## Troubleshooting

- In case of unavailable metrics, please make sure if they are not made unavailable or turned off by default in recent VMware vSphere versions or if some limits are not placed on performance-metric database queries. See [ZBX-12094](#) for additional details.
- In case of `'config.vpxd.stats.maxQueryMetrics' is invalid or exceeds the maximum number of characters permitted**` error, add a `config.vpxd.stats.maxQueryMetrics` parameter to the vCenter Server settings. The value of this parameter should be the same as the value of `maxQuerysize` in VMware's `web.xml`. See this VMware knowledge base [article](#) for details.

## 1 Virtual machine discovery key fields

The following table lists fields returned by virtual machine related discovery keys.

---

**Item key**

---

| Description  | Field   | Retrieved content  |
|--|---|--|
| vmware.cluster.discovery<br>Performs cluster discovery.  | {#CLUSTER.ID}<br>{#CLUSTER.NAME}  | Cluster identifier.<br>Cluster name.   |
| vmware.datastore.discovery<br>Performs datastore discovery.  | {#DATASTORE}<br>{#DATASTORE.EXTENT}   | Datastore name.<br>JSON object with an array of {instanceName:partitionId}.  |
| vmware.dc.discovery<br>Performs datacenter discovery.  | {#DATACENTER}<br><br>{#DATACENTERID}  | Datacenter name.<br><br>Datacenter ID.   |
| vmware.hv.discovery<br>Performs hypervisor discovery.  | {#HV.UUID}<br><br>{#HV.ID}<br>{#HV.NAME}<br>{#HV.NETNAME}<br>{#HV.IP}   | Unique hypervisor identifier.<br><br>Hypervisor identifier (HostSystem managed object name).<br>Hypervisor name.<br>Hypervisor network host name.<br>Hypervisor IP address, might be empty.<br>In case of an HA configuration with multiple net interfaces, the following selection priority for interface is observed:<br>- prefer the IP which shares the IP-subnet with the vCenter IP<br>- prefer the IP from IP-subnet with default gateway<br>- prefer the IP from interface with the lowest ID<br>This field is supported since Zabbix 5.2.2. |
|  | {#CLUSTER.NAME}<br>{#DATACENTER.NAME}<br>{#PARENT.NAME}   | Cluster name, might be empty.<br>Datacenter name.<br>Name of container that stores the hypervisor.<br>Supported since Zabbix 4.0.3.  |
|  | {#PARENT.TYPE}  | Type of container in which the hypervisor is stored. The values could be Datacenter, Folder, ClusterComputeResource, VMware, where 'VMware' stands for unknown container type.<br>Supported since Zabbix 4.0.3.  |
| vmware.hv.datastore.discovery<br>Performs hypervisor datastore discovery. Note that multiple hypervisors can use the same datastore. | {#DATASTORE}<br><br>{#MULTIPATH.COUNT}<br>{#MULTIPATH.PARTITION.COUNT}  | Datastore name.<br><br>Registered number of datastore paths.<br>Number of available disk partitions.   |
| vmware.vm.discovery<br>Performs virtual machine discovery.   | {#VM.UUID}<br><br>{#VM.ID}<br><br>{#VM.NAME}<br>{#HV.NAME}<br>{#DATACENTER.NAME}<br>{#CLUSTER.NAME}<br>{#VM.IP} | Unique virtual machine identifier.<br><br>Virtual machine identifier (VirtualMachine managed object name).<br>Virtual machine name.<br>Hypervisor name.<br>Datacenter name.<br>Cluster name, might be empty.<br>Virtual machine IP address, might be empty.<br>Supported since Zabbix 5.2.2.   |
|  | {#VM.DNS}   | Virtual machine DNS name, might be empty.<br>Supported since Zabbix 5.2.2.   |
|  | {#VM.GUESTFAMILY}   | Guest virtual machine OS family, might be empty.<br>Supported since Zabbix 5.2.2.  |
|  | {#VM.GUESTFULLNAME}   | Full guest virtual machine OS name, might be empty.<br>Supported since Zabbix 5.2.2.   |
|  | {#VM.FOLDER}  | The chain of virtual machine parent folders, can be used as value for nested groups; folder names are combined with "/". Might be empty.<br>Supported since Zabbix 5.4.2.  |

---

**Item key**

---

|   |             |                         |
|---|-------------|-------------------------|
| vmware.vm.net.if.discovery                            |             |                         |
| Performs virtual machine network interface discovery. | {#IFNAME}   | Network interface name. |
| vmware.vm.vfs.dev.discovery                           |             |                         |
| Performs virtual machine disk device discovery.       | {#DISKNAME} | Disk device name.       |
| vmware.vm.vfs.fs.discovery                            |             |                         |
| Performs virtual machine file system discovery.       | {#FSNAME}   | File system name.       |

---

## 11 Maintenance

**Overview** You can define maintenance periods for hosts and host groups in Zabbix.

Furthermore, it is possible to define maintenance only for a single trigger (or subset of triggers) by specifying trigger tags. In this case maintenance will be activated only for those triggers; all other triggers of the host or host group will not be in maintenance.

There are two maintenance types - with data collection and with no data collection.

During a maintenance "with data collection" triggers are processed as usual and events are created when required. However, problem escalations are paused for hosts/triggers in maintenance, if the *Pause operations for suppressed problems* option is checked in action configuration. In this case, escalation steps that may include sending notifications or remote commands will be ignored for as long as the maintenance period lasts. Note that problem recovery and update operations are not suppressed during maintenance, only escalations.

For example, if escalation steps are scheduled at 0, 30 and 60 minutes after a problem start, and there is a half-hour long maintenance lasting from 10 minutes to 40 minutes after a real problem arises, steps two and three will be executed a half-hour later, or at 60 minutes and 90 minutes (providing the problem still exists). Similarly, if a problem arises during the maintenance, the escalation will start after the maintenance.

To receive problem notifications during the maintenance normally (without delay), you have to uncheck the *Pause operations for suppressed problems* option in action configuration.

**Note:**

If at least one host (used in the trigger expression) is not in maintenance mode, Zabbix will send a problem notification.

Zabbix server must be running during maintenance. Timer processes are responsible for switching host status to/from maintenance at 0 seconds of every minute. Note that when a host enters maintenance, Zabbix server timer processes will read all open problems to check if it is required to suppress those. This may have a performance impact if there are many open problems. Zabbix server will also read all open problems upon startup, even if there are no maintenances configured at the time.

Note that the Zabbix server (or proxy) always collects data regardless of the maintenance type (including "no data" maintenance). The data is later ignored by the server if 'no data collection' is set.

When "no data" maintenance ends, triggers using `nodata()` function will not fire before the next check during the period they are checking.

If a log item is added while a host is in maintenance and the maintenance ends, only new logfile entries since the end of the maintenance will be gathered.

If a timestamped value is sent for a host that is in a "no data" maintenance type (e.g. using **Zabbix sender**) then this value will be dropped however it is possible to send a timestamped value in for an expired maintenance period and it will be accepted.

If maintenance period, hosts, groups or tags are changed by the user, the changes will only take effect after configuration cache synchronization.

**Attention:**

When creating a maintenance period, the **time zone** of the user who creates it is used. However, when recurring maintenance periods (*Daily*, *Weekly*, *Monthly*) are scheduled, the time zone of the Zabbix server is used. To ensure predictable behavior of recurring maintenance periods, it is required to use a common time zone for all parts of Zabbix.

**Configuration** To configure a maintenance period:

- Go to: *Configuration* → *Maintenance*
- Click on *Create maintenance period* (or on the name of an existing maintenance period)
- Enter maintenance parameters in the form

**\* Name**

Maintenance type ☒ With data collection ☐ No data collection

**\* Active since**  

**\* Active till**  

| Period type         | Schedule         | Period | Action                                      |

**Description**

All mandatory input fields are marked with a red asterisk.

| Parameter               | Description  |
|-------------------------|--|
| <i>Name</i>             | Name of the maintenance period.  |
| <i>Maintenance type</i> | Two types of maintenance can be set:<br><b>With data collection</b> - data will be collected by the server during maintenance, triggers will be processed<br><b>No data collection</b> - data will not be collected by the server during maintenance |
| <i>Active since</i>     | The date and time when executing maintenance periods becomes active.<br><i>Note:</i> Setting this time alone does not activate a maintenance period; maintenance periods must be configured in <i>Periods</i> (see below).                           |
| <i>Active till</i>      | The date and time when executing maintenance periods stops being active.   |

| Parameter          | Description  |
|--------------------|--|
| <i>Periods</i>     | This block allows you to define the exact days and hours when the maintenance takes place.<br>Clicking on <a href="#">Add</a> opens a popup window with a flexible <i>Maintenance period</i> form where you can define maintenance schedule. See <a href="#">Maintenance periods</a> for a detailed description.   |
| <i>Host groups</i> | Select host groups that the maintenance will be activated for. The maintenance will be activated for all hosts from the specified host group(s). This field is auto-complete, so starting to type in it will display a dropdown of all available host groups.<br>Specifying a parent host group implicitly selects all nested host groups. Thus the maintenance will also be activated on hosts from nested groups.  |
| <i>Hosts</i>       | Select hosts that the maintenance will be activated for. This field is auto-complete, so starting to type in it will display a dropdown of all available hosts.  |
| <i>Tags</i>        | If maintenance tags are specified, maintenance for the selected hosts will be activated, but only problems with matching tags will be suppressed (i.e. no actions will be taken).<br>In case of multiple tags, they are calculated as follows:<br><b>And/Or</b> - all tags must correspond; however tags with the same tag name are calculated by the Or condition<br><b>Or</b> - enough if one tag corresponds<br>There are two ways of matching the tag value:<br><b>Contains</b> - case-sensitive substring match (tag value contains the entered string)<br><b>Equals</b> - case-sensitive string match (tag value equals the entered string)<br>Tags can be specified only if <i>With data collection</i> mode is selected. |
| <i>Description</i> | Description of maintenance period.   |

#### Maintenance periods

The maintenance period window is for scheduling time for a recurring or a one-time maintenance. The form is dynamic with available fields changing based on the *Period type* selected.

| Period type          | Description  |
|----------------------|--|
| <i>One time only</i> | Define the date and time, and the length of the maintenance period.  |
| <i>Daily</i>         | <i>Every day(s)</i> - maintenance frequency: 1 (default) - every day, 2 - every two days, etc.<br><i>At (hour:minute)</i> - time of the day when maintenance starts.<br><i>Maintenance period length</i> - for how long the maintenance will be active.  |
| <i>Weekly</i>        | <i>Every week(s)</i> - maintenance frequency: 1 (default) - every week, 2 - every two weeks, etc.<br><i>Day of week</i> - on which day the maintenance should take place.<br><i>At (hour:minute)</i> - time of the day when maintenance starts.<br><i>Maintenance period length</i> - for how long the maintenance will be active. |

| Period type | Description  |
|-------------|--|
| Monthly     | <p><i>Month</i> - select all months during which the regular maintenance is carried out.</p> <p><i>Date: <b>Day of month</b></i> - Select this option if the maintenance takes place on the same date each month (for example, every 1st day of the month). Then, select the required day in the new field that appears.</p> <p><i>Date: <b>Day of week</b></i> - Select this option if the maintenance takes place only on certain days (for example, every first Monday of the month). Then, in the drop-down select the required week of the month (first, second, third, fourth, or last) and mark the checkboxes for maintenance day(s).</p> <p><i>At (hour:minute)</i> - time of the day when maintenance starts.</p> <p><i>Maintenance period length</i> - for how long the maintenance will be active.</p> |

When done, press *Add* to add the maintenance period to the *Periods* block.

Notes:

- When *Every day/Every week* parameter is greater than 1, the starting day or week is the day/week that the *Active since* time falls on. For example:
  - with *Active since* set to January 1 at 12:00 and a one-hour maintenance set for every two days at 23:00 will result in the first maintenance period starting on January 1 at 23:00, while the second maintenance period will start on January 3 at 23:00;
  - with the same *Active since* time and a one-hour maintenance set for every two days at 01:00, the first maintenance period will start on January 3 at 01:00, while the second maintenance period will start on January 5 at 01:00.
- Daylight Saving Time (**DST**) changes do not affect how long the maintenance will be. -Let's say we have a two-hour maintenance that usually starts at 01:00 and finishes at 03:00:
  - If after one hour of maintenance (at 02:00) a DST change happens and current time changes from 02:00 to 03:00, the maintenance will continue for one more hour till 04:00;
  - If after two hours of maintenance (at 03:00) a DST change happens and current time changes from 03:00 to 02:00, the maintenance will stop because two hours have passed.
  - If a maintenance period is set to 1 day it usually starts at 00:00 and finishes at 00:00 the next day:
  - Since Zabbix calculates days in hours, the actual period of the maintenance is 24 hours. -If current time changes forward one hour, the maintenance will stop at 01:00 the next day. -If current time changes back one hour, the maintenance will stop at 23:00 that day. -If a maintenance period starts during the hour, skipped by DST change: -The maintenance will not start.

## Display Displaying hosts in maintenance

An orange wrench icon  next to the host name indicates that this host is in maintenance in:

- *Monitoring* → *Dashboard*
- *Monitoring* → *Problems*
- *Inventory* → *Hosts* → *Host inventory details*
- *Configuration* → *Hosts* (See 'Status' column)

Maintenance details are displayed when the mouse pointer is positioned over the icon.

Additionally, hosts in maintenance get an orange background in *Monitoring* → *Maps*.

## Displaying suppressed problems

Normally problems for hosts in maintenance are suppressed, i.e. not displayed in the frontend. However, it is also possible to configure that suppressed problems are shown, by selecting the *Show suppressed problems* option in these locations:

- *Monitoring* → *Dashboard* (in *Problem hosts*, *Problems*, *Problems by severity*, *Trigger overview* widget configuration)
- *Monitoring* → *Problems* (in the filter)
- *Monitoring* → *Maps* (in map configuration)

- Global **notifications** (in user profile configuration)

When suppressed problems are displayed, the following icon is displayed: . Rolling a mouse over the icon displays more details:

## 12 Regular expressions

**Overview** [Perl Compatible Regular Expressions](#) (PCRE, PCRE2) are supported in Zabbix.

There are two ways of using regular expressions in Zabbix:

- manually entering a regular expression
- using a global regular expression created in Zabbix

**Regular expressions** You may manually enter a regular expression in supported places. Note that the expression may not start with @ because that symbol is used in Zabbix for referencing global regular expressions.

### Warning:

It's possible to run out of stack when using regular expressions. See the [pcrestack man page](#) for more information.

Note that in multiline matching, the ^ and \$ anchors match at the beginning/end of each line respectively, instead of the beginning/end of the entire string.

See also examples for **correct escaping** in various contexts.

**Global regular expressions** There is an advanced editor for creating and testing complex regular expressions in Zabbix frontend.

Once a regular expression has been created this way, it can be used in several places in the frontend by referring to its name, prefixed with @, for example, @mycustomregexp.

To create a global regular expression:

- Go to: *Administration* → *General*
- Select *Regular expressions* from the dropdown
- Click on *New regular expression*

The **Expressions** tab allows to set the regular expression name and add subexpressions.

Expressions

Test

\* Name

Network interfaces for discovery

\* Expressions

| Expression type | Expression                     | Delimiter | Case s                              |
|-----------------|--------------------------------|-----------|-------------------------------------|
| Result is FALSE | ^Software Loopback Interface   |           | <input checked="" type="checkbox"/> |
| Result is FALSE | ^(In)?[Ll]oop[Bb]ack[0-9._]*\$ |           | <input checked="" type="checkbox"/> |
| Result is FALSE | ^NULL[0-9.]*\$                 |           | <input checked="" type="checkbox"/> |
| Result is FALSE | ^[Ll]o[0-9.]*\$                |           | <input checked="" type="checkbox"/> |
| Result is FALSE | ^[Ss]ystem\$                   |           | <input checked="" type="checkbox"/> |
| Result is FALSE | ^Nu[0-9.]*\$                   |           | <input checked="" type="checkbox"/> |

Add

All mandatory input fields are marked with a red asterisk.

| Parameter              | Description   |
|------------------------|---|
| <i>Name</i>            | Set the regular expression name. Any Unicode characters are allowed.  |
| <i>Expressions</i>     | Click on <i>Add</i> in the Expressions block to add a new subexpression.  |
| <i>Expression type</i> | Select expression type:<br><b>Character string included</b> - match the substring<br><b>Any character string included</b> - match any substring from a delimited list. The delimited list includes a comma (,), a dot (.) or a forward slash (/).<br><b>Character string not included</b> - match any string except the substring<br><b>Result is TRUE</b> - match the regular expression<br><b>Result is FALSE</b> - do not match the regular expression |
| <i>Expression</i>      | Enter substring/regular expression.   |
| <i>Delimiter</i>       | A comma (,), a dot (.) or a forward slash (/) to separate text strings in a regular expression. This parameter is active only when "Any character string included" expression type is selected.   |
| <i>Case sensitive</i>  | A checkbox to specify whether a regular expression is sensitive to capitalization of letters.   |

A forward slash (/) in the expression is treated literally, rather than a delimiter. This way it is possible to save expressions containing a slash, without errors.

#### Attention:

A custom regular expression name in Zabbix may contain commas, spaces, etc. In those cases where that may lead to misinterpretation when referencing (for example, a comma in the parameter of an item key) the whole reference may be put in quotes like this: "@My custom regexp for purpose1, purpose2".

Regular expression names must not be quoted in other locations (for example, in LLD rule properties).

In the **Test** tab the regular expression and its subexpressions can be tested by providing a test string.

Expressions

Test

Test string

Test expressions

Result

| Expression type | Expression                     | Result |
|-----------------|--------------------------------|--------|
| Result is FALSE | ^Software Loopback Interface   | TRUE   |
| Result is FALSE | ^(In)?[Ll]oop[Bb]ack[0-9._]*\$ | TRUE   |
| Result is FALSE | ^NULL[0-9.]*\$                 | TRUE   |
| Result is FALSE | ^[Ll]o[0-9.]*\$                | FALSE  |
| Result is FALSE | ^[Ss]ystem\$                   | TRUE   |
| Result is FALSE | ^Nu[0-9.]*\$                   | TRUE   |
| Combined result |                                | FALSE  |

Results show the status of each subexpression and total custom expression status.

Total custom expression status is defined as *Combined result*. If several sub expressions are defined Zabbix uses AND logical operator to calculate *Combined result*. It means that if at least one Result is False *Combined result* has also False status.

**Default global regular expressions** Zabbix comes with several global regular expression in its default dataset.

| Name                                | Expression  | Matches  |
|-------------------------------------|---|--|
| File systems for discovery          | ^(btrfs ext2 ext3 ext4 jfs reiser xfs ffs ufs gfs jfs2 vxfs hfs ext3 ext4 jfs fat32 zfs)\$  | "reiser" or "xfs" or "ffs" or "ufs" or "jfs" or "jfs2" or "vxfs" or "hfs" or "refs" or "apfs" or "ntfs" or "fat32" or "zfs"  |
| Network interfaces for discovery    | ^Software Loopback Interface  | Strings starting with "Software Loopback Interface".   |
|                                     | ^lo\$   | "lo"   |
|                                     | ^(In)?[Ll]oop[Bb]ack[0-9._]*\$  | Strings that optionally start with "In", then have "L" or "l", then "oop", then "B" or "b", then "ack", which can be optionally followed by any number of digits, dots or underscores. |
|                                     | ^NULL[0-9.]*\$  | Strings starting with "NULL" optionally followed by any number of digits or dots.  |
|                                     | ^[Ll]o[0-9.]*\$   | Strings starting with "Lo" or "lo" and optionally followed by any number of digits or dots.  |
|                                     | ^[Ss]ystem\$  | "System" or "system"   |
|                                     | ^Nu[0-9.]*\$  | Strings starting with "Nu" optionally followed by any number of digits or dots.  |
| Storage devices for SNMP discovery  | ^(Physical memory Virtual memory Memory buffers Cached memory Swap space)\$   | "Physical memory" or "Virtual memory" or "Memory buffers" or "Cached memory" or "Swap space"   |
| Windows service names for discovery | ^(MMCSS gupdate SysmonLog clr_optimization_v2.0.50727_32 CLR_SysmonLog CLR_SysmonLog_v2.0.50727_32 CLR_SysmonLog_v4.0.30319_32)\$ | like "clr_optimization_v2.0.50727_32" and "clr_optimization_v4.0.30319_32" where instead of dots you can put any character except newline.   |

| Name   | Expression                       | Matches                            |
|--|----------------------------------|------------------------------------|
| Windows service startup states for discovery | ^(automatic automatic delayed)\$ | "automatic" or "automatic delayed" |

## Examples Example 1

Use of the following expression in low-level discovery to discover databases except a database with a specific name:

^TESTDATABASE\$

Test string

TESTDATABASE

Test expressions

| Result | Expression type | Expression    | Result |
|--------|-----------------|---------------|--------|
|        | Result is FALSE | ^TESTDATABASE | FALSE  |
|        | Combined result |               | FALSE  |

Chosen *Expression type*: "Result is FALSE". Doesn't match name, containing string "TESTDATABASE".

Example with an inline regex modifier

Use of the following regular expression including an inline modifier (?i) to match the characters "error":

(?i)error

Test string

Sometexthere1345Error1357

Test expressions

| Result | Expression type | Expression | Result |
|--------|-----------------|------------|--------|
|        | Result is TRUE  | (?i)error  | TRUE   |
|        | Combined result |            | TRUE   |

Chosen *Expression type*: "Result is TRUE". Characters "error" are matched.

Another example with an inline regex modifier

Use of the following regular expression including multiple inline modifiers to match the characters after a specific line:

(?<=match (?i)everything(?-i) after this line\n)(?sx).\*# we add s modifier to allow . match newline character

Test string

Some text here for your consideration  
1235kfd345  
match eveRything after this line  
Continuation

Test expressions

Result

| Expression type | Expression   | Result |
|-----------------|--|--------|
| Result is TRUE  | (?<=match (?i)everything(?-i) after this line\n)(?sx).*# we add s modifier to allow . match newline characters | TRUE   |
| Combined result |  | TRUE   |

Chosen Expression type: "Result is TRUE". Characters after a specific line are matched.

Attention:

g modifier can't be specified in line. The list of available modifiers can be found in [pcreyntax man page](#). For more information about PCRE syntax please refer to [PCRE HTML documentation](#).

Regular expression support by location

| Location                  | Regular expression | Global regular expression | Multiline matching | Comments   |
|---------------------------|--------------------|---------------------------|--------------------|--|
| <b>Agent items</b>        |                    |                           |                    |  |
| eventlog[]                | Yes                | Yes                       | Yes                | regex, severity, source, eventid parameters  |
| log[]                     |                    |                           |                    | regex parameter  |
| log.count[]               |                    |                           |                    |  |
| logrt[]                   |                    | Yes/No                    |                    | regex parameter supports both, file_regex parameter supports non-global expressions only |
| logrt.count[]             |                    |                           |                    |  |
| proc.cpu.util[]           |                    | No                        | No                 | cmdline parameter  |
| proc.mem[]                |                    |                           |                    |  |
| proc.num[]                |                    |                           |                    |  |
| sensor[]                  |                    |                           |                    | device and sensor parameters on Linux 2.4  |
| system.hw.macaddr[]       |                    |                           |                    | interface parameter  |
| system.sw.packages[]      |                    |                           |                    | package parameter  |
| vfs.dir.count[]           |                    |                           |                    | regex_incl, regex_excl, regex_excl_dir parameters  |
| vfs.dir.get[]             |                    |                           |                    | regex_incl, regex_excl, regex_excl_dir parameters  |
| vfs.dir.size[]            |                    |                           |                    | regex_incl, regex_excl, regex_excl_dir parameters  |
| vfs.file.regex[]          |                    |                           | Yes                | regex parameter  |
| vfs.file.regmatch[]       |                    |                           |                    |  |
| web.page.regex[]          |                    |                           |                    |  |
| <b>SNMP traps</b>         |                    |                           |                    |  |
| snmptrap[]                | Yes                | Yes                       | No                 | regex parameter  |
| Item value pre-processing | Yes                | No                        | No                 | pattern parameter  |

| Location                                       | Regular expression | Global regular expression | Multiline matching | Comments   |
|--|--------------------|---------------------------|--------------------|--|
| <b>Functions for triggers/calculated items</b> |                    |                           |                    |  |
| count()  | Yes                | Yes                       | Yes                | pattern parameter if operator parameter is <i>regexp</i> or <i>iregexp</i>   |
| countunique()                                  | Yes                | Yes                       |                    |  |
| find()   | Yes                | Yes                       |                    |  |
| logeventid()                                   | Yes                | Yes                       | No                 | pattern parameter  |
| logsource()                                    |                    |                           |                    |  |
| <b>Low-level discovery</b>                     |                    |                           |                    |  |
| Filters  | Yes                | Yes                       | No                 | <i>Regular expression</i> field  |
| Overrides                                      | Yes                | No                        |                    | In <i>matches</i> , does not match options for <i>Operation</i> conditions   |
| <b>Action conditions</b>                       | Yes                | No                        | No                 | In <i>matches</i> , does not match options for <i>Host name</i> and <i>Host metadata</i> autoregistration conditions |
| <b>Web monitoring</b>                          | Yes                | No                        | Yes                | Variables with a <b>regex:</b> prefix<br><i>Required string</i> field  |
| <b>User macro context</b>                      | Yes                | No                        | No                 | In macro context with a <b>regex:</b> prefix   |
| <b>Macro functions</b>                         |                    |                           |                    |  |
| regsub()                                       | Yes                | No                        | No                 | pattern parameter  |
| iregsub()                                      |                    |                           |                    |  |
| <b>Icon mapping</b>                            | Yes                | Yes                       | No                 | <i>Expression</i> field  |
| <b>Value mapping</b>                           | Yes                | No                        | No                 | <i>Value</i> field if mapping type is <i>regexp</i>  |

## 13 Problem acknowledgment

**Overview** Problem events in Zabbix can be acknowledged by users.

If a user gets notified about a problem event, they can go to Zabbix frontend, open the problem update popup window of that problem using one of the ways listed below and acknowledge the problem. When acknowledging, they can enter their comment for it, saying that they are working on it or whatever else they may feel like saying about it.

This way, if another system user spots the same problem, they immediately see if it has been acknowledged and the comments so far.

This way the workflow of resolving problems with more than one system user can take place in a coordinated way.

Acknowledgment status is also used when defining **action operations**. You can define, for example, that a notification is sent to a higher level manager only if an event is not acknowledged for some time.

To acknowledge events and comment on them, a user must have at least read permissions to the corresponding triggers. To change problem severity or close problem, a user must have read-write permissions to the corresponding triggers.

There are **several** ways to access the problem update popup window, which allows acknowledging a problem.

- You may select problems in *Monitoring → Problems* and then click on *Mass update* below the list
- You can click in the *Ack* column showing the acknowledgment status of problems in:
  - *Monitoring → Dashboard (Problems and Problems by severity widgets)*
  - *Monitoring → Problems*
  - *Monitoring → Problems → Event details*

The *Ack* column contains either a 'Yes' or a 'No' link, indicating an acknowledged or an unacknowledged problem respectively. Clicking on the links will take you to the problem update popup window.

- You can click on an unresolved problem cell in:
  - *Monitoring → Dashboard (Trigger overview widget)*

The popup menu contains an *Acknowledge* option that will take you to the problem update window.

**Updating problems** The problem update popup allows to:

- comment on the problem
- view comments and actions so far
- change problem severity
- acknowledge/unacknowledge problem
- manually close problem

Update problem

All mandatory input fields are marked with a red asterisk.

| Parameter      | Description   |
|----------------|---|
| <i>Problem</i> | If only one problem is selected, the problem name is displayed.<br>If several problems are selected, <i>N problems selected</i> is displayed. |
| <i>Message</i> | Enter text to comment on the problem (maximum 2048 characters).   |

| Parameter              | Description   |
|------------------------|---|
| <i>History</i>         | Previous activities and comments on the problem are listed, along with the time and user details.<br>For the meaning of icons used to denote user actions see the <a href="#">event detail</a> page.<br>Note that history is displayed if only one problem is selected for the update.  |
| <i>Scope</i>           | Define the scope of such actions as changing severity, acknowledging or manually closing problems:<br><b>Only selected problem</b> - will affect this event only<br><b>Selected and all other problems of related triggers</b> - in case of acknowledgment/closing problem, will affect this event and all other problems that are not acknowledged/closed so far. If the scope contains problems already acknowledged or closed, these problems will not be acknowledged/closed repeatedly. On the other hand, the number of message and severity change operations are not limited. |
| <i>Change severity</i> | Mark the checkbox and click on the severity button to update problem severity.<br>The checkbox for changing severity is available if read-write permissions exist for at least one of the selected problems. Only those problems that are read-writable will be updated when clicking on <i>Update</i> .<br>If read-write permissions exist for none of the selected triggers, the checkbox is disabled.  |
| <i>Acknowledge</i>     | Mark the checkbox to acknowledge the problem.<br>This checkbox is available if there is at least one unacknowledged problem among the selected. It is not possible to add another acknowledgment for an already acknowledged problem (it is possible to add another comment though).  |
| <i>Unacknowledge</i>   | Mark the checkbox to unacknowledge the problem.<br>This checkbox is available if there is at least one acknowledged problem among the selected.   |
| <i>Close problem</i>   | Mark the checkbox to manually close the selected problem(s).<br>The checkbox for closing a problem is available if the <i>Allow manual close</i> option is checked in <a href="#">trigger configuration</a> for at least one of the selected problems. Only those problems will be closed that are allowed to be closed when clicking on <i>Update</i> .<br>If no problem is manually closeable, the checkbox is disabled.<br>Already closed problems will not be closed repeatedly.  |

**Display** Based on acknowledgment information it is possible to configure how the problem count is displayed in the dashboard or maps. To do that, you have to make selections in the *Problem display* option, available in both [map configuration](#) and the *Problems by severity dashboard widget*. It is possible to display all problem count, unacknowledged problem count as separated from the total or unacknowledged problem count only.

Based on problem update information (acknowledgment, etc.), it is possible to configure update operations - send a message or execute remote commands.

## 14 Configuration export/import

**Overview** Zabbix export/import functionality makes it possible to exchange various configuration entities between one Zabbix system and another.

Typical use cases for this functionality:

- share templates or network maps - Zabbix users may share their configuration parameters
- upload a template to [Zabbix Community templates](#). Then others can download the template and import the file into Zabbix.
- integrate with third-party tools - universal YAML, XML and JSON formats make integration and data import/export possible with third-party tools and applications

What can be exported/imported

Objects that can be exported/imported are:

- [host groups](#) (through Zabbix API only)
- [templates](#)
- [hosts](#)
- [network maps](#)
- [media types](#)
- [images](#)

Export format

Data can be exported using the Zabbix web frontend or [Zabbix API](#). Supported export formats are YAML, XML and JSON.

### Details about export

- All supported elements are exported in one file.
- Host and template entities (items, triggers, graphs, discovery rules) that are inherited from linked templates are not exported. Any changes made to those entities on a host level (such as changed item interval, modified regular expression or added prototypes to the low-level discovery rule) will be lost when exporting; when importing, all entities from linked templates are re-created as on the original linked template.
- Entities created by low-level discovery and any entities depending on them are not exported. For example, a trigger created for an LLD-rule generated item will not be exported.

### Details about import

- Import stops at the first error.
- When updating existing images during image import, "imagetype" field is ignored, i.e. it is impossible to change image type via import.
- When importing hosts/templates using the "Delete missing" option, host/template macros not present in the import file will be deleted from the host/template after the import.
- Empty tags for items, triggers, graphs, discoveryRules, itemPrototypes, triggerPrototypes, graphPrototypes are meaningless i.e. it's the same as if it was missing.
- Import supports YAML, XML and JSON, the import file must have a correct file extension: .yaml and .yml for YAML, .xml for XML and .json for JSON. See [compatibility information](#) about supported XML versions.
- Import supports configuration files only in UTF-8 encoding (with or without [BOM](#)); other encodings (UTF16LE, UTF16BE, UTF32LE, UTF32BE, etc.) will result in an import conversion error.

**YAML base format** The YAML export format contains the following nodes:

- Root node for Zabbix YAML export
- Export version
- Date when export was created in ISO 8601 long format

```
zabbix_export:
  version: '6.0'
  date: '2020-04-22T06:20:11Z'
```

Other nodes are dependent on exported objects.

**XML format** The XML export format contains the following tags:

- Default header for XML documents
- Root tag for Zabbix XML export
- Export version
- Date when export was created in ISO 8601 long format

```
<?xml version="1.0" encoding="UTF-8"?>
<zabbix_export>
  <version>6.0</version>
  <date>2020-04-22T06:20:11Z</date>
</zabbix_export>
```

Other tags are dependent on exported objects.

**JSON format** The JSON export format contains the following objects:

- Root object for Zabbix JSON export
- Export version
- Date when export was created in ISO 8601 long format

```
{
  "zabbix_export": {
    "version": "6.0",
    "date": "2020-04-22T06:20:11Z"
  }
}
```

Other objects are dependent on exported objects.

## 1 Host groups

In the frontend host groups can be **exported** only with host or template export. When a host or template is exported all groups it belongs to are exported with it automatically.

API allows to export host groups independently from hosts or templates.

Export format

```
groups:
  - name: 'Zabbix servers'
```

groups/group

| Parameter | Type          | Description | Details |
|-----------|---------------|-------------|---------|
| name      | <i>string</i> | Group name. |         |

## 2 Templates

Overview

Templates are **exported** with many related objects and object relations.

Template export contains:

- linked host groups
- template data
- linkage to other templates
- linkage to host groups
- directly linked items
- directly linked triggers
- directly linked graphs
- directly linked dashboards
- directly linked discovery rules with all prototypes
- directly linked web scenarios
- value maps

Exporting

To export templates, do the following:

- Go to: *Configuration* → *Templates*
- Mark the checkboxes of the templates to export
- Click on *Export* below the list

## ≡ Templates

Depending on the selected format, templates are exported to a local file with a default name:

- `zabbix_export_templates.yaml` - in YAML export (default option for export)
- `zabbix_export_templates.xml` - in XML export
- `zabbix_export_templates.json` - in JSON export

### Importing

To import templates, do the following:

- Go to: *Configuration* → *Templates*
- Click on *Import* to the right
- Select the import file
- Mark the required options in import rules
- Click on *Import*

Import

\* Import file

Choose file

template\_power\_apc\_ups\_snmp.xml

| Rules               | Update existing                     | Create new                          | Delete missing           |
|---------------------|-------------------------------------|-------------------------------------|--------------------------|
| Groups              | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |                          |
| Templates           | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |                          |
| Value mappings      | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Template dashboards | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Template linkage    |                                     | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Items               | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |

Import

Cancel

All mandatory input fields are marked with a red asterisk.

Import rules:

| Rule                   | Description   |
|------------------------|---|
| <i>Update existing</i> | Existing elements will be updated with data taken from the import file. Otherwise, they will not be updated.  |
| <i>Create new</i>      | The import will add new elements using data from the import file. Otherwise, it will not add them.  |
| <i>Delete missing</i>  | <p>The import will remove existing elements not present in the import file. Otherwise, it will not remove them.</p> <p>If <i>Delete missing</i> is marked for template linkage, existing template linkage not present in the import file will be unlinked. Since Zabbix 6.0.13, entities (items, triggers, graphs, etc.) inherited from the unlinked templates will not be removed (unless the <i>Delete missing</i> option is selected for each entity as well).</p> |

On the next screen, you will be able to view the content of a template being imported. If this is a new template all elements will be listed in green. If updating an existing template, new template elements are highlighted in green; removed template elements are highlighted in red; elements that have not changed are listed on a gray background.

## Templates

▼ Updated

▼ Templates

VMware

```
templates:
  template: VMware
- name: VMware
+ name: 'VMware alternative'
- description: "You can discuss this template or leave feedback on our forum"
+ description: "You can discuss this fabulous template or leave feedback on our forum"
groups:
  - name: Templates/Applications
tags:
  - tag: class
    value: software
  - tag: target
    value: vmware
macros:
  - macro: '${VMWARE.PASSWORD}'
    description: 'VMware service {USERNAME} user password'
  - macro: '${VMWARE.URL}'
    description: 'VMware service (vCenter or ESX hypervisor) SDK URL (https://...)'
  - macro: '${VMWARE.USERNAME}'
    description: 'VMware service user name'
```

The menu on the left can be used to navigate through the list of changes. Section *Updated* highlights all changes made to existing template elements. Section *Added* lists new template elements. The elements in each section are grouped by element type; press on the gray arrow down to expand or collapse the group of elements.

## Element tags

Element tag values are explained in the table below.

## Template tags

| Element   | Element property | Required | Type   | Range  | Description   |
|-----------|------------------|----------|--------|--|---|
| templates | uuid             | x        | string |  | Root element for templates.<br>Unique identifier for this template. |
|           | template         | x        | string |  | Unique template name.   |
|           | name             | -        | string |  | Visible template name.  |
|           | description      | -        | text   |  | Template description.   |
| groups    |                  | x        |        |  | Root element for template host groups.                              |
|           | uuid             | x        | string |  | Unique identifier for this host group.                              |
| templates | name             | x        | string |  | Host group name.  |
|           |                  | -        |        |  | Root element for linked templates.                                  |
| tags      | name             | x        | string |  | Template name.  |
|           | tag              | x        | string |  | Root element for template tags.<br>Tag name.                        |
|           | value            | -        | string |  | Tag value.  |
| macros    |                  | -        |        |  | Root element for template user macros.                              |
|           | macro            | x        | string |  | User macro name.  |
|           | type             | -        | string | 0 - TEXT (default)<br>1 - SECRET_TEXT<br>2 - VAULT | Type of the macro.  |
|           | value            | -        | string |  | User macro value.   |
| valuemaps | description      | -        | string |  | User macro description.   |
|           |                  | -        |        |  | Root element for template value maps.                               |
|           | uuid             | x        | string |  | Unique identifier for this value map.                               |
|           | name             | x        | string |  | Value map name.   |
|           | mapping          | -        |        |  | Root element for mappings.  |

| Element | Element property | Required | Type   | Range | Description             |
|---------|------------------|----------|--------|-------|-------------------------|
|         | value            | x        | string |       | Value of a mapping.     |
|         | newvalue         | x        | string |       | New value of a mapping. |

#### Template item tags

| Element | Element property | Required | Type   | Range <sup>1</sup>  | Description  |
|---------|------------------|----------|--------|---|--|
| items   |                  | -        |        |   | Root element for items.  |
|         | uuid             | x        | string |   | Unique identifier for the item.  |
|         | name             | x        | string |   | Item name.   |
|         | type             | -        | string | 0 - ZABBIX_PASSIVE (default)<br>2 - TRAP<br>3 - SIMPLE<br>5 - INTERNAL<br>7 - ZABBIX_ACTIVE<br>10 - EXTERNAL<br>11 - ODBC<br>12 - IPMI<br>13 - SSH<br>14 - TELNET<br>15 - CALCULATED<br>16 - JMX<br>17 - SNMP_TRAP<br>18 - DEPENDENT<br>19 - HTTP_AGENT<br>20 - SNMP_AGENT<br>21 - ITEM_TYPE_SCRIPT | Item type.   |
|         | snmp_oid         | -        | string |   | SNMP object ID.  |
|         | key              | x        | string |   | Required by SNMP items.<br>Item key.   |
|         | delay            | -        | string | Default: 1m   | Update interval of the item.   |
|         |                  |          |        |   | Accepts seconds or a time unit with suffix (30s, 1m, 2h, 1d).<br>Optionally one or more <b>custom intervals</b> can be specified either as flexible intervals or scheduling.<br>Multiple intervals are separated by a semicolon.<br>User macros may be used. A single macro has to fill the whole field. Multiple macros in a field or macros mixed with text are not supported.<br>Flexible intervals may be written as two macros separated by a forward slash (e.g. {\$FLEX_INTERVAL}/{FLEX_PERIOD}). |
|         | history          | -        | string | Default: 90d  | Time period of how long the history data should be stored. A time period using the time suffix, a user macro or LLD macro.   |
|         | trends           | -        | string | Default: 365d   | Time period of how long the trends data should be stored. A time period using the time suffix, a user macro or LLD macro.  |
|         | status           | -        | string | 0 - ENABLED (default)<br>1 - DISABLED   | Item status.   |

| Element | Element<br>property | Required | Type   | Range <sup>1</sup>   | Description  |
|---------|---------------------|----------|--------|--|--|
|         | value_type          | -        | string | 0 - FLOAT<br>1 - CHAR<br>2 - LOG<br>3 - UNSIGNED (default)<br>4 - TEXT                   | Received value type.   |
|         | allowed_hosts       | -        | string |  | List of IP addresses (comma delimited) of hosts allowed sending data for the item.   |
|         | units               | -        | string |  | Used by trapper and HTTP agent items.<br>Units of returned values (bps, B, etc).   |
|         | params              | -        | text   |  | Additional parameters depending on the type of the item:<br>- executed script for Script, SSH and Telnet items;<br>- SQL query for database monitor items;<br>- formula for calculated items.  |
|         | ipmi_sensor         | -        | string |  | IPMI sensor.   |
|         | authtype            | -        | string | Authentication type for SSH agent items:<br>0 - PASSWORD (default)<br>1 - PUBLIC_KEY     | Used only by IPMI items.<br>Authentication type.   |
|         |                     |          |        | Authentication type for HTTP agent items:<br>0 - NONE (default)<br>1 - BASIC<br>2 - NTLM | Used only by SSH and HTTP agent items.   |
|         | username            | -        | string |  | Username for authentication.<br>Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent items.   |
|         | password            | -        | string |  | Required by SSH and Telnet items.<br>When used by JMX agent, password should also be specified together with the username or both properties should be left blank.<br>Password for authentication.<br>Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent items. |
|         | publickey           | -        | string |  | When used by JMX agent, username should also be specified together with the password or both properties should be left blank.<br>Name of the public key file.  |
|         | privatekey          | -        | string |  | Required for SSH agent items.<br>Name of the private key file.   |
|         | port                | -        | string |  | Required for SSH agent items.<br>Custom port monitored by the item.<br>Can contain user macros.  |
|         | description         | -        | text   |  | Used only by SNMP items.<br>Item description.  |

| Element | Element property | Required | Type   | Range <sup>1</sup>  | Description  |
|---------|------------------|----------|--------|---|--|
|         | inventory_link   | -        | string | 0 - NONE<br><br>Capitalized host inventory field name.<br>For example:<br>4 - ALIAS<br>6 - OS_FULL<br>14 - HARDWARE<br>etc. | Host inventory field that is populated by the item.<br><br>Refer to the <a href="#">host inventory page</a> for a list of supported host inventory fields and their IDs. |
|         | logtimefmt       | -        | string |   | Format of the time in log entries.<br>Used only by log items.  |
|         | jmx_endpoint     | -        | string |   | JMX endpoint.  |
|         | url              | -        | string |   | Used only by JMX agent items.<br>URL string.   |
|         | allow_traps      | -        | string | 0 - NO (default)<br>1 - YES   | Required only for HTTP agent items.<br>Allow to populate value as in a trapper item.   |
|         | follow_redirects | -        | string | 0 - NO<br>1 - YES (default)   | Used only by HTTP agent items.<br>Follow HTTP response redirects while polling data.   |
|         | headers          | -        |        |   | Used only by HTTP agent items.<br>Root element for HTTP(S) request headers, where header name is used as key and header value as value.                                  |
|         | name             | x        | string |   | Used only by HTTP agent items.<br>Header name.   |
|         | value            | x        | string |   | Header value.  |
|         | http_proxy       | -        | string |   | HTTP(S) proxy connection string.   |
|         | output_format    | -        | string | 0 - RAW (default)<br>1 - JSON   | Used only by HTTP agent items.<br>How to process response.   |
|         | post_type        | -        | string | 0 - RAW (default)<br>2 - JSON<br>3 - XML  | Used only by HTTP agent items.<br>Type of post data body.  |
|         | posts            | -        | string |   | Used only by HTTP agent items.<br>HTTP(S) request body data.   |
|         | query_fields     | -        |        |   | Used only by HTTP agent items.<br>Root element for query parameters.   |
|         | name             | x        | string |   | Used only by HTTP agent items.<br>Parameter name.  |
|         | value            | -        | string |   | Parameter value.   |
|         | request_method   | -        | string | 0 - GET (default)<br>1 - POST<br>2 - PUT<br>3 - HEAD  | Request method.  |
|         | retrieve_mode    | -        | string | 0 - BODY (default)<br>1 - HEADERS<br>2 - BOTH   | Used only by HTTP agent items.<br>What part of response should be stored.  |
|         | ssl_cert_file    | -        | string |   | Used only by HTTP agent items.<br>Public SSL Key file path.  |
|         | ssl_key_file     | -        | string |   | Used only by HTTP agent items.<br>Private SSL Key file path.   |
|         |                  |          |        |   | Used only by HTTP agent items.   |
|         |                  |          |        |   |  |

| Element       | Element<br>property | Required | Type   | Range <sup>1</sup>          | Description   |
|---------------|---------------------|----------|--------|-----------------------------|---|
|               | ssl_key_password    |          | string |                             | Password for SSL Key file.  |
|               | status_codes        | -        | string |                             | Used only by HTTP agent items.<br>Ranges of required HTTP status codes separated by commas. Supports user macros.<br>Example: 200,200-{\$M},{M},200-400 |
|               | timeout             | -        | string |                             | Used only by HTTP agent items.<br>Item data polling request timeout. Supports user macros.  |
|               | verify_host         | -        | string | 0 - NO (default)<br>1 - YES | Used by HTTP agent and Script items.<br>Whether to validate that the host name for the connection matches the one in the host's certificate.            |
|               | verify_peer         | -        | string | 0 - NO (default)<br>1 - YES | Used only by HTTP agent items.<br>Whether to validate that the host's certificate is authentic.   |
| parameters    |                     | -        |        |                             | Used only by HTTP agent items.<br>Root element for user-defined parameters.   |
|               | name                | x        | string |                             | Used only by Script items.<br>Parameter name.   |
|               | value               | -        | string |                             | Used only by Script items.<br>Parameter value.  |
| value map     |                     | -        |        |                             | Used only by Script items.<br>Value map.  |
|               | name                | x        | string |                             | Name of the value map to use for the item.  |
| preprocessing |                     | -        |        |                             | Root element for item value preprocessing.  |
| step          |                     | -        |        |                             | Individual item value preprocessing step.   |

| Element     | Element property     | Required | Type   | Range <sup>1</sup>  | Description   |
|-------------|----------------------|----------|--------|---|---|
|             | type                 | x        | string | 1 - MULTIPLIER<br>2 - RTRIM<br>3 - LTRIM<br>4 - TRIM<br>5 - REGEX<br>6 - BOOL_TO_DECIMAL<br>7 - OCTAL_TO_DECIMAL<br>8 - HEX_TO_DECIMAL<br>9 - SIMPLE_CHANGE<br>(calculated as<br>(received<br>value-previous value))<br>10 -<br>CHANGE_PER_SECOND<br>(calculated as<br>(received<br>value-previous<br>value)/(time now-time<br>of last check))<br>11 - XMLPATH<br>12 - JSONPATH<br>13 - IN_RANGE<br>14 - MATCHES_REGEX<br>15 -<br>NOT_MATCHES_REGEX<br>16 -<br>CHECK_JSON_ERROR<br>17 -<br>CHECK_XML_ERROR<br>18 -<br>CHECK_REGEX_ERROR<br>19 -<br>DISCARD_UNCHANGED<br>20 - DIS-<br>CARD_UNCHANGED_HEARTBEAT<br>21 - JAVASCRIPT<br>22 -<br>PROMETHEUS_PATTERN<br>23 -<br>PROMETHEUS_TO_JSON<br>24 - CSV_TO_JSON<br>25 - STR_REPLACE<br>26 -<br>CHECK_NOT_SUPPORTED | Type of the item value preprocessing step.                        |
|             | parameters           | -        |        |   | Root element for parameters of the item value preprocessing step. |
|             | parameter            | x        | string |   | Individual parameter of the item value preprocessing step.        |
|             | error_handler        | -        | string | 0 - ORIGINAL_ERROR<br>(default)<br>1 - DISCARD_VALUE<br>2 - CUSTOM_VALUE<br>3 - CUSTOM_ERROR  | Action type used in case of preprocessing step failure.           |
|             | error_handler_params |          | string |   | Error handler parameters used with 'error_handler'.               |
| master_item |                      | -        |        |   | Individual item master item.                                      |
|             |                      |          |        |   | Required by dependent items.                                      |

| Element  | Element property  | Required | Type   | Range <sup>1</sup> | Description   |
|----------|---|----------|--------|--------------------|---|
|          | key   | x        | string |                    | Dependent item master item key value.   |
| triggers | <i>For trigger element tag values, see template trigger tags.</i> | -        |        |                    | Recursion up to 3 dependent items and maximum count of dependent items equal to 29999 are allowed.<br>Root element for simple triggers. |
| tags     |   | -        |        |                    | Root element for item tags.   |
|          | tag   | x        | string |                    | Tag name.   |
|          | value   | -        | string |                    | Tag value.  |

#### Template low-level discovery rule tags

| Element         | Element property   | Required | Type   | Range   | Description  |
|-----------------|--|----------|--------|---|--|
| discovery_rules | <i>For most of the element tag values, see element tag values for a regular item. Only the tags that are specific to low-level discovery rules, are described below.</i> | -        |        |   | Root element for low-level discovery rules.  |
|                 | type   | -        | string | 0 - ZABBIX_PASSIVE (default)<br>2 - TRAP<br>3 - SIMPLE<br>5 - INTERNAL<br>7 - ZABBIX_ACTIVE<br>10 - EXTERNAL<br>11 - ODBC<br>12 - IPMI<br>13 - SSH<br>14 - TELNET<br>16 - JMX<br>18 - DEPENDENT<br>19 - HTTP_AGENT<br>20 - SNMP_AGENT | Item type.   |
|                 | lifetime   | -        | string | Default: 30d  | Time period after which items that are no longer discovered will be deleted. Seconds, time unit with suffix or user macro. |
| filter          |  |          |        |   | Individual filter.   |

| Element            | Element property  | Required | Type      | Range  | Description  |
|--------------------|---|----------|-----------|--|--|
| conditions         | evaltype  | -        | string    | 0 - AND_OR (default)<br>1 - AND<br>2 - OR<br>3 - FORMULA | Logic to use for checking low-level discovery rule filter conditions.  |
|                    | formula   | -        | string    |  | Custom calculation formula for filter conditions.  |
|                    |   | -        |           |  | Root element for filter conditions.  |
|                    | macro   | x        | string    |  | Low-level discovery macro name.  |
|                    | value   | -        | string    |  | Filter value: regular expression or global regular expression.   |
|                    | operator  | -        | string    | 8 - MATCHES_REGEX (default)<br>9 - NOT_MATCHES_REGEX     | Condition operator.  |
|                    | formulaid   | x        | character |  | Arbitrary unique ID that is used to reference a condition from the custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| lld_macro_paths    |   | -        |           |  | Root element for LLD macro paths.  |
|                    | lld_macro   | x        | string    |  | Low-level discovery macro name.  |
|                    | path  | x        | string    |  | Selector for value which will be assigned to the corresponding macro.  |
| preprocessing step |   | -        |           |  | LLD rule value preprocessing.  |
|                    |   | -        |           |  | Individual LLD rule value preprocessing step.  |
|                    | <p><i>For most of the element tag values, see element tag values for a template item value preprocessing. Only the tags that are specific to template low-level discovery value preprocessing, are described below.</i></p> |          |           |  |  |

| Element            | Element property   | Required | Type   | Range  | Description  |
|--------------------|--|----------|--------|--|--|
|                    | type   | x        | string | 5 - REGEX<br>11 - XMLPATH<br>12 - JSONPATH<br>15 -<br>NOT_MATCHES_REGEX<br>16 -<br>CHECK_JSON_ERROR<br>17 -<br>CHECK_XML_ERROR<br>20 - DIS-<br>CARD_UNCHANGED_HEARTBEAT<br>21 - JAVASCRIPT<br>23 -<br>PROMETHEUS_TO_JSON<br>24 - CSV_TO_JSON<br>25 - STR_REPLACE | Type of the item value preprocessing step.   |
| trigger_prototypes | <i>For trigger prototype element tag values, see regular <b>template trigger</b> tags.</i> | -        |        |  | Root element for trigger prototypes.   |
| graph_prototypes   | <i>For graph prototype element tag values, see regular <b>template graph</b> tags.</i>     | -        |        |  | Root element for graph prototypes.   |
| host_prototypes    | <i>For host prototype element tag values, see regular <b>host</b> tags.</i>                | -        |        |  | Root element for host prototypes.  |
| item_prototypes    | <i>For item prototype element tag values, see regular <b>template item</b> tags.</i>       | -        |        |  | Root element for item prototypes.  |
| master_item        | key  | x        | string |  | Individual item prototype master item/item prototype data.<br>Dependent item prototype master item/item prototype key value.<br><br>Required for a dependent item. |

Template trigger tags

| Element      | Element property    | Required | Type   | Range <sup>1</sup>   | Description  |
|--------------|---------------------|----------|--------|--|--|
| triggers     | -                   | -        | -      | -  | Root element for triggers.   |
|              | uuid                | x        | string | -  | Unique identifier for this trigger.                                      |
|              | expression          | x        | string | -  | Trigger expression.  |
|              | recovery_mode       | -        | string | 0 - EXPRESSION (default)<br>1 - RECOVERY_EXPRESSION<br>2 - NONE                                    | Basis for generating OK events.  |
|              | recovery_expression | -        | string | -  | Trigger recovery expression.   |
|              | correlation_mode    | -        | string | 0 - DISABLED (default)<br>1 - TAG_VALUE  | Correlation mode (no event correlation or event correlation by tag).     |
|              | correlation_tag     | -        | string | -  | The tag name to be used for event correlation.                           |
|              | name                | x        | string | -  | Trigger name.  |
|              | event_name          | -        | string | -  | Event name.  |
|              | opdata              | -        | string | -  | Operational data.  |
|              | url                 | -        | string | -  | URL associated with the trigger.   |
|              | status              | -        | string | 0 - ENABLED (default)<br>1 - DISABLED  | Trigger status.  |
|              | priority            | -        | string | 0 - NOT_CLASSIFIED (default)<br>1 - INFO<br>2 - WARNING<br>3 - AVERAGE<br>4 - HIGH<br>5 - DISASTER | Trigger severity.  |
|              | description         | -        | text   | -  | Trigger description.   |
|              | type                | -        | string | 0 - SINGLE (default)<br>1 - MULTIPLE   | Event generation type (single problem event or multiple problem events). |
|              | manual_close        | -        | string | 0 - NO (default)<br>1 - YES  | Manual closing of problem events.  |
| dependencies | -                   | -        | -      | -  | Root element for dependencies.   |
|              | name                | x        | string | -  | Dependency trigger name.   |
|              | expression          | x        | string | -  | Dependency trigger expression.   |
| tags         | recovery_expression | -        | string | -  | Dependency trigger recovery expression.                                  |
|              | -                   | -        | -      | -  | Root element for trigger tags.   |
|              | tag                 | x        | string | -  | Tag name.  |
|              | value               | -        | string | -  | Tag value.   |

#### Template graph tags

| Element | Element property | Required | Type    | Range <sup>1</sup>          | Description  |
|---------|------------------|----------|---------|-----------------------------|--|
| graphs  | -                | -        | -       | -                           | Root element for graphs.   |
|         | uuid             | x        | string  | -                           | Unique identifier for this graph.                                      |
|         | name             | x        | string  | -                           | Graph name.  |
|         | width            | -        | integer | 20-65535 (default: 900)     | Graph width, in pixels. Used for preview and for pie/exploded graphs.  |
|         | height           | -        | integer | 20-65535 (default: 200)     | Graph height, in pixels. Used for preview and for pie/exploded graphs. |
|         | yaxismin         | -        | double  | Default: 0                  | Value of Y axis minimum.   |
|         | yaxismax         | -        | double  | Default: 0                  | Used if 'ymin_type_1' is FIXED.<br>Value of Y axis maximum.            |
|         | show_work_period | -        | string  | 0 - NO<br>1 - YES (default) | Used if 'ymax_type_1' is FIXED.<br>Highlight non-working hours.        |
|         | -                | -        | -       | -                           | Used by normal and stacked graphs.                                     |
|         | -                | -        | -       | -                           | -  |

| Element     | Element property | Required | Type    | Range <sup>1</sup>   | Description   |
|-------------|------------------|----------|---------|--|---|
|             | show_triggers    | -        | string  | 0 - NO<br>1 - YES (default)  | Display simple trigger values as a line.  |
|             | type             | -        | string  | 0 - NORMAL (default)<br>1 - STACKED<br>2 - PIE<br>3 - EXPLODED   | Used by normal and stacked graphs.<br>Graph type.   |
|             | show_legend      | -        | string  | 0 - NO<br>1 - YES (default)  | Display graph legend.   |
|             | show_3d          | -        | string  | 0 - NO (default)<br>1 - YES  | Enable 3D style.  |
|             | percent_left     | -        | double  | Default:0  | Used by pie and exploded pie graphs.<br>Show the percentile line for left axis.   |
|             | percent_right    | -        | double  | Default:0  | Used only for normal graphs.<br>Show the percentile line for right axis.  |
|             | ymin_type_1      | -        | string  | 0 - CALCULATED (default)<br>1 - FIXED<br>2 - ITEM  | Used only for normal graphs.<br>Minimum value of Y axis.  |
|             | ymin_item_1      | -        |         |  | Used by normal and stacked graphs.<br>Individual item details.  |
|             | ymax_type_1      | -        | string  | 0 - CALCULATED (default)<br>1 - FIXED<br>2 - ITEM  | Maximum value of Y axis.  |
|             | ymax_item_1      | -        |         |  | Used by normal and stacked graphs.<br>Individual item details.  |
| graph_items | host             | x        | string  |  | Required if 'ymin_type_1' is ITEM.<br>Item host.  |
|             | key              | x        | string  |  | Item key.   |
|             | sortorder        | -        | integer |  | Individual item details.  |
|             | drawtype         | -        | string  | 0 - SINGLE_LINE (default)<br>1 - FILLED_REGION<br>2 - BOLD_LINE<br>3 - DOTTED_LINE<br>4 - DASHED_LINE<br>5 - GRADIENT_LINE | Required if 'ymax_type_1' is ITEM.<br>Item host.<br>Item key.<br>Root element for graph items.<br>Draw order. The smaller value is drawn first.<br>Can be used to draw lines or regions behind (or in front of) another.<br>Draw style of the graph item. |
|             | color            | -        | string  |  | Used only by normal graphs.   |
|             | yaxisside        | -        | string  | 0 - LEFT (default)<br>1 - RIGHT  | Element color (6 symbols, hex).<br>Side of the graph where the graph item's Y scale will be drawn.  |
|             |                  |          |         |  | Used by normal and stacked graphs.  |

| Element | Element property | Required | Type   | Range <sup>1</sup>   | Description   |
|---------|------------------|----------|--------|--|---|
| item    | calc_fnc         | -        | string | 1 - MIN<br>2 - AVG (default)<br>4 - MAX<br>7 - ALL (minimum, average and maximum; used only by simple graphs)<br>9 - LAST (used only by pie and exploded pie graphs) | Data to draw if more than one value exists for an item. |
|         | type             | -        | string | 0 - SIMPLE (default)<br>2 - GRAPH_SUM (value of the item represents the whole pie; used only by pie and exploded pie graphs)   | Graph item type.  |
|         | host             | x        | string |  | Individual item.  |
|         | key              | x        | string |  | Item host.<br>Item key.                                 |

#### Template web scenario tags

| Element   | Element property | Required | Type    | Range <sup>1</sup>                          | Description  |
|-----------|------------------|----------|---------|---|--|
| httptests |                  | -        |         |   | Root element for web scenarios.  |
|           | uuid             | x        | string  |   | Unique identifier for this web scenario.   |
|           | name             | x        | string  |   | Web scenario name.   |
|           | delay            | -        | string  | Default: 1m                                 | Frequency of executing the web scenario.<br>Seconds, time unit with suffix or user macro.  |
|           | attempts         | -        | integer | 1-10 (default: 1)                           | The number of attempts for executing web scenario steps.   |
|           | agent            | -        | string  | Default: Zabbix                             | Client agent. Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers.                        |
| variables | http_proxy       | -        | string  |   | Specify an HTTP proxy to use, using the format:<br><code>http://[username[:password]@]proxy.example.com</code>   |
|           |                  | -        |         |   | Root element for scenario-level variables (macros) that may be used in scenario steps.   |
|           | name             | x        | string  |   | Variable name.   |
| headers   | value            | x        | text    |   | Variable value.  |
|           |                  | -        |         |   | Root element for HTTP headers that will be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol. |
|           | name             | x        | string  |   | Header name.   |
|           | value            | x        | text    |   | Header value.  |
|           | status           | -        | string  | 0 - ENABLED (default)<br>1 - DISABLED       | Web scenario status.   |
|           | authentication   | -        | string  | 0 - NONE (default)<br>1 - BASIC<br>2 - NTLM | Authentication method.   |
|           | http_user        | -        | string  |   | User name used for basic, HTTP or NTLM authentication.   |
|           | http_password    | -        | string  |   | Password used for basic, HTTP or NTLM authentication.  |
|           | verify_peer      | -        | string  | 0 - NO (default)<br>1 - YES                 | Whether to validate that the host's certificate is authentic.  |

| Element      | Element property | Required | Type   | Range <sup>1</sup>                            | Description  |
|--------------|------------------|----------|--------|---|--|
|              | verify_host      | -        | string | 0 - NO (default)<br>1 - YES                   | Whether to validate that the host name for the connection matches the one in the host's certificate.   |
|              | ssl_cert_file    | -        | string |   | Name of the SSL certificate file used for client authentication (must be in PEM format).   |
|              | ssl_key_file     | -        | string |   | Name of the SSL private key file used for client authentication (must be in PEM format).   |
|              | ssl_key_password |          | string |   | SSL private key file password.   |
|              | steps            | x        |        |   | Root element for web scenario steps.   |
|              | name             | x        | string |   | Web scenario step name.  |
|              | url              | x        | string |   | URL for monitoring.  |
| query_fields |                  | -        |        |   | Root element for query fields - an array of HTTP fields that will be added to the URL when performing a request.   |
|              | name             | x        | string |   | Query field name.  |
|              | value            | -        | string |   | Query field value.   |
|              | posts            | -        |        |   | HTTP POST variables as a string (raw post data) or as an array of HTTP fields (form field data).   |
|              | name             | x        | string |   | Post field name.   |
|              | value            | x        | string |   | Post field value.  |
| variables    |                  | -        |        |   | Root element of step-level variables (macros) that should be applied after this step.  |
|              |                  |          |        |   | If the variable value has a 'regex:' prefix, then its value is extracted from the data returned by this step according to the regular expression pattern following the 'regex:' prefix |
|              | name             | x        | string |   | Variable name.   |
|              | value            | x        | text   |   | Variable value.  |
| headers      |                  | -        |        |   | Root element for HTTP headers that will be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol.                   |
|              | name             | x        | string |   | Header name.   |
|              | value            | x        | text   |   | Header value.  |
|              | follow_redirects |          | string | 0 - NO<br>1 - YES (default)                   | Follow HTTP redirects.   |
|              | retrieve_mode    | -        | string | 0 - BODY (default)<br>1 - HEADERS<br>2 - BOTH | HTTP response retrieve mode.   |
|              | timeout          | -        | string | Default: 15s                                  | Timeout of step execution. Seconds, time unit with suffix or user macro.   |
|              | required         | -        | string |   | Text that must be present in the response. Ignored if empty.   |
|              | status_codes     | -        | string |   | A comma delimited list of accepted HTTP status codes. Ignored if empty. For example: 200-201,210-299   |
|              | tags             | -        |        |   | Root element for web scenario tags.  |
|              | tag              | x        | string |   | Tag name.  |
|              | value            | -        | string |   | Tag value.   |

#### Template dashboard tags

| Element    | Element property | Required | Type | Range <sup>1</sup> | Description                           |
|------------|------------------|----------|------|--------------------|---------------------------------------|
| dashboards |                  | -        |      |                    | Root element for template dashboards. |

| Element | Element property | Required | Type    | Range <sup>1</sup>  | Description   |
|---------|------------------|----------|---------|---|---|
| pages   | uuid             | x        | string  |   | Unique identifier for this dashboard.                             |
|         | name             | x        | string  |   | Template dashboard name.  |
|         | display period   | -        | integer |   | Display period of dashboard pages.                                |
|         | auto_start       | -        | string  | 0 - no<br>1 - yes   | Slideshow auto start.   |
|         |                  | -        |         |   | Root element for template dashboard pages.                        |
|         | name             | -        | string  |   | Page name.  |
|         | display period   | -        | integer |   | Page display period.  |
|         | sortorder        | -        | integer |   | Page sorting order.   |
|         |                  | -        |         |   | Root element for template dashboard widgets.                      |
|         | type             | x        | string  |   | Widget type.  |
| widgets | name             | -        | string  |   | Widget name.  |
|         | x                | -        | integer | 0-23  | Horizontal position from the left side of the template dashboard. |
|         | y                | -        | integer | 0-62  | Vertical position from the top of the template dashboard.         |
|         | width            | -        | integer | 1-24  | Widget width.   |
|         | height           | -        | integer | 2-32  | Widget height.  |
|         | hide_header      | -        | string  | 0 - no<br>1 - yes   | Hide widget header.   |
|         |                  | -        |         |   | Root element for the template dashboard widget fields.            |
|         | type             | x        | string  | 0 - INTEGER<br>1 - STRING<br>3 - HOST<br>4 - ITEM<br>5 - ITEM_PROTOTYPE<br>6 - GRAPH<br>7 - GRAPH_PROTOTYPE | Widget field type.  |
|         | name             | x        | string  |   | Widget field name.  |
|         | value            | x        | mixed   |   | Widget field value, depending on the field type.                  |

#### Footnotes

<sup>1</sup> For string values, only the string will be exported (e.g. "ZABBIX\_ACTIVE") without the numbering used in this table. The numbers for range values (corresponding to the API values) in this table is used for ordering only.

### 3 Hosts

#### Overview

Hosts are **exported** with many related objects and object relations.

Host export contains:

- linked host groups
- host data
- template linkage
- host group linkage
- host interfaces
- directly linked items
- directly linked triggers
- directly linked graphs
- directly linked discovery rules with all prototypes
- directly linked web scenarios
- host macros

- host inventory data
- value maps

## Exporting

To export hosts, do the following:

- Go to: *Configuration* → *Hosts*
- Mark the checkboxes of the hosts to export
- Click on *Export* below the list

## ≡ Hosts

| <input type="checkbox"/>            | Name ▲  | Items | Triggers | Graphs | Discovery | Web |
|-------------------------------------|---------|-------|----------|--------|-----------|-----|
| <input checked="" type="checkbox"/> | Server1 | Items | Triggers | Graphs | Discovery | Web |

1 selected

Enable
Disable
Export

YAML
XML
JSON

Mass update
Delete

Depending on the selected format, hosts are exported to a local file with a default name:

- *zabbix\_export\_hosts.yaml* - in YAML export (default option for export)
- *zabbix\_export\_hosts.xml* - in XML export
- *zabbix\_export\_hosts.json* - in JSON export

## Importing

To import hosts, do the following:

- Go to: *Configuration* → *Hosts*
- Click on *Import* to the right
- Select the import file
- Mark the required options in import rules
- Click on *Import*

Import

\* Import file

Choose file

zbx\_export\_hosts.yaml

| Rules            | Update existing                     | Create new                          | Delete missing           |
|------------------|-------------------------------------|-------------------------------------|--------------------------|
| Groups           | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |                          |
| Hosts            | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |                          |
| Value mappings   | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Template linkage |                                     | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Items            | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Discovery rules  | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Triggers         | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Graphs           | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Web scenarios    | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |

Import

Cancel

A success or failure message of the import will be displayed in the frontend.

Import rules:

| Rule                   | Description  |
|------------------------|--|
| <i>Update existing</i> | Existing elements will be updated with data taken from the import file. Otherwise they will not be updated.  |
| <i>Create new</i>      | The import will add new elements using data from the import file. Otherwise it will not add them.  |
| <i>Delete missing</i>  | <p>The import will remove existing elements not present in the import file. Otherwise it will not remove them.</p> <p>If <i>Delete missing</i> is marked for template linkage, existing template linkage not present in the import file will be unlinked. Since Zabbix 6.0.13, entities (items, triggers, graphs, etc.) inherited from the unlinked templates will not be removed (unless the <i>Delete missing</i> option is selected for each entity as well).</p> |

Export format

Export format in YAML:

```

zabbix_export:
  version: '6.0'
  date: '2023-05-03T11:24:04Z'
  groups:
    - uuid: dc579cd7a1a34222933f24f52a68bcd8
      name: 'Linux servers'
  hosts:
    - host: Example_host
      name: Example_host
      templates:
        - name: 'Zabbix server health'
      groups:
        - name: 'Linux servers'

```

```

items:
- name: Test_item1
  type: ZABBIX_ACTIVE
  key: kernel.maxproc
inventory_mode: DISABLED

```

## Element tags

Element tag values are explained in the table below.

## Host tags

| Element    | Element property | Required | Type   | Range <sup>1</sup>   | Description  |
|------------|------------------|----------|--------|--|--|
| groups     |                  | x        |        |  | Root element for host groups.  |
|            | name             | x        | string |  | Host group name.   |
| hosts      |                  | -        |        |  | Root element for hosts.  |
|            | host             | x        | string |  | Unique host name.  |
|            | name             | -        | string |  | Visible host name.   |
|            | description      | -        | text   |  | Host description.  |
|            | status           | -        | string | 0 - ENABLED (default)<br>1 - DISABLED  | Host status.   |
|            | ipmi_auth        | -        | string | -1 - DEFAULT (default)<br>0 - NONE<br>1 - MD2<br>2 - MD5<br>4 - STRAIGHT<br>5 - OEM<br>6 - RMCP_PLUS | IPMI session authentication type.  |
|            | ipmi_privilege   | -        | string | 1 - CALLBACK<br>2 - USER (default)<br>3 - OPERATOR<br>4 - ADMIN<br>5 - OEM                           | IPMI session privilege level.  |
|            | ipmi_username    | -        | string |  | Username for IPMI checks.  |
|            | ipmi_password    | -        | string |  | Password for IPMI checks.  |
| proxy      |                  | -        |        |  | Proxy.   |
|            | name             | x        | string |  | Name of the proxy (if any) that monitors the host.   |
| templates  |                  | -        |        |  | Root element for linked templates.   |
|            | name             | x        | string |  | Template name.   |
| interfaces |                  | -        |        |  | Root element for host interfaces.  |
|            | default          | -        | string | 0 - NO<br>1 - YES (default)  | Whether this is the primary host interface. There can be only one primary interface of one type on a host. |
|            | type             | -        | string | 1 - ZABBIX (default)<br>2 - SNMP<br>3 - IPMI<br>4 - JMX  | Interface type.  |
|            | useip            | -        | string | 0 - NO<br>1 - YES (default)  | Whether to use IP as the interface for connecting to the host (if not, DNS will be used).                  |
|            | ip               | -        | string |  | IP address, can be either IPv4 or IPv6.  |
|            | dns              | -        | string |  | Required if the connection is made via IP. DNS name.   |
|            | port             | -        | string |  | Required if the connection is made via DNS. Port number. Supports user macros.                             |
|            | interface_ref    | x        | string | Format: if<N>  | Interface reference name to be used in items.  |
| details    |                  | -        |        |  | Root element for interface details.  |
|            | version          | -        | string | 1 - SNMPV1<br>2 - SNMP_V2C (default)<br>3 - SNMP_V3  | Use this SNMP version.   |

| Element        | Element property  | Required | Type   | Range <sup>1</sup>  | Description   |
|----------------|---|----------|--------|---|---|
|                | community   | -        | string |   | SNMP community.   |
|                | contextname   | -        | string |   | Required by SNMPv1 and SNMPv2 items.<br>SNMPv3 context name.  |
|                | securityname  | -        | string |   | Used only by SNMPv3 items.<br>SNMPv3 security name.   |
|                | securitylevel   | -        | string | 0 - NOAUTHNOPRIV (default)<br>1 - AUTHNOPRIV<br>2 - AUTHPRIV                              | Used only by SNMPv3 items.<br>SNMPv3 security level.  |
|                | authprotocol  | -        | string | 0 - MD5 (default)<br>1 - SHA1<br>2 - SHA224<br>3 - SHA256<br>4 - SHA384<br>5 - SHA512     | SNMPv3 authentication protocol.   |
|                | authpassphrase  |          | string |   | Used only by SNMPv3 items.<br>SNMPv3 authentication passphrase.   |
|                | privprotocol  | -        | string | 0 - DES (default)<br>1 - AES128<br>2 - AES192<br>3 - AES256<br>4 - AES192C<br>5 - AES256C | Used only by SNMPv3 items.<br>SNMPv3 privacy protocol.  |
|                | privpassphrase  |          | string |   | Used only by SNMPv3 items.<br>SNMPv3 privacy passphrase.  |
|                | bulk  | -        | string | 0 - NO<br>1 - YES (default)   | Used only by SNMPv3 items.<br>Use bulk requests for SNMP.   |
|                | items   | -        |        |   | Root element for items.   |
|                | <i>For item element tag values, see host item tags.</i> |          |        |   |   |
| tags           |   | -        |        |   | Root element for host tags.   |
|                | tag   | x        | string |   | Tag name.   |
|                | value   | -        | string |   | Tag value.  |
| macros         |   | -        |        |   | Root element for macros.  |
|                | macro   | x        |        |   | User macro name.  |
|                | type  | -        | string | 0 - TEXT (default)<br>1 - SECRET_TEXT<br>2 - VAULT  | Type of the macro.  |
|                | value   | -        | string |   | User macro value.   |
|                | description   | -        | string |   | User macro description.   |
| inventory      |   | -        |        |   | Root element for host inventory.  |
|                | <inventory_property>                                    |          |        |   | Individual inventory property.  |
|                |   |          |        |   | All available inventory properties are listed under the respective tags, e.g. <type>, <name>, <os> (see example above). |
| inventory_mode |   | -        | string | -1 - DISABLED<br>0 - MANUAL (default)<br>1 - AUTOMATIC                                    | Inventory mode.   |
| valuemaps      |   | -        |        |   | Root element for host value maps.   |
|                | name  | x        | string |   | Value map name.   |
|                | mapping   | -        |        |   | Root element for mappings.  |

| Element | Element property | Required | Type   | Range <sup>1</sup> | Description             |
|---------|------------------|----------|--------|--------------------|-------------------------|
|         | value            | x        | string |                    | Value of a mapping.     |
|         | newvalue         | x        | string |                    | New value of a mapping. |

#### Host item tags

| Element | Element property | Required | Type   | Range <sup>1</sup>  | Description  |
|---------|------------------|----------|--------|---|--|
| items   |                  | -        |        |   | Root element for items.  |
|         | name             | x        | string |   | Item name.   |
|         | type             | -        | string | 0 - ZABBIX_PASSIVE (default)<br>2 - TRAP<br>3 - SIMPLE<br>5 - INTERNAL<br>7 - ZABBIX_ACTIVE<br>10 - EXTERNAL<br>11 - ODBC<br>12 - IPMI<br>13 - SSH<br>14 - TELNET<br>15 - CALCULATED<br>16 - JMX<br>17 - SNMP_TRAP<br>18 - DEPENDENT<br>19 - HTTP_AGENT<br>20 - SNMP_AGENT<br>21 - ITEM_TYPE_SCRIPT | Item type.   |
|         | snmp_oid         | -        | string |   | SNMP object ID.  |
|         | key              | x        | string |   | Required by SNMP items.<br>Item key.   |
|         | delay            | -        | string | Default: 1m   | Update interval of the item.   |
|         |                  |          |        |   | Note that <code>delay</code> will be always '0' for trapper items.   |
|         |                  |          |        |   | Accepts seconds or a time unit with suffix (30s, 1m, 2h, 1d).<br>Optionally one or more <b>custom intervals</b> can be specified either as flexible intervals or scheduling.<br>Multiple intervals are separated by a semicolon.<br>User macros may be used. A single macro has to fill the whole field. Multiple macros in a field or macros mixed with text are not supported.<br>Flexible intervals may be written as two macros separated by a forward slash (e.g. <code>{FLEX_INTERVAL}/{FLEX_PERIOD}</code> ). |
|         | history          | -        | string | Default: 90d  | Time period of how long the history data should be stored. A time period using the time suffix, a user macro or LLD macro.   |
|         | trends           | -        | string | Default: 365d   | Time period of how long the trends data should be stored. A time period using the time suffix, a user macro or LLD macro.  |
|         | status           | -        | string | 0 - ENABLED (default)<br>1 - DISABLED   | Item status.   |

| Element | Element property | Required | Type   | Range <sup>1</sup>  | Description  |
|---------|------------------|----------|--------|---|--|
|         | value_type       | -        | string | 0 - FLOAT<br>1 - CHAR<br>2 - LOG<br>3 - UNSIGNED (default)<br>4 - TEXT                                      | Received value type.   |
|         | allowed_hosts    | -        | string |   | List of IP addresses (comma delimited) of hosts allowed sending data for the item.   |
|         | units            | -        | string |   | Used by trapper and HTTP agent items.<br>Units of returned values (bps, B, etc).   |
|         | params           | -        | text   |   | Additional parameters depending on the type of the item:<br>- executed script for Script, SSH and Telnet items;<br>- SQL query for database monitor items;<br>- formula for calculated items.  |
|         | ipmi_sensor      | -        | string |   | IPMI sensor.   |
|         | authtype         | -        | string | Authentication type for SSH agent items:<br>0 - PASSWORD (default)<br>1 - PUBLIC_KEY                        | Used only by IPMI items.<br>Authentication type.   |
|         |                  |          |        | Authentication type for HTTP agent items:<br>0 - NONE (default)<br>1 - BASIC<br>2 - NTLM                    | Used only by SSH and HTTP agent items.   |
|         | username         | -        | string |   | Username for authentication.<br>Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent items.   |
|         | password         | -        | string |   | Required by SSH and Telnet items.<br>When used by JMX agent, password should also be specified together with the username or both properties should be left blank.<br>Password for authentication.<br>Used by simple check, SSH, Telnet, database monitor, JMX and HTTP agent items. |
|         | publickey        | -        | string |   | When used by JMX agent, username should also be specified together with the password or both properties should be left blank.<br>Name of the public key file.  |
|         | privatekey       | -        | string |   | Required for SSH agent items.<br>Name of the private key file.   |
|         | description      | -        | text   |   | Required for SSH agent items.<br>Item description.   |
|         | inventory_link   | -        | string | 0 - NONE  | Host inventory field that is populated by the item.  |
|         |                  |          |        | Capitalized host inventory field name.<br>For example:<br>4 - ALIAS<br>6 - OS_FULL<br>14 - HARDWARE<br>etc. | Refer to the <a href="#">host inventory page</a> for a list of supported host inventory fields and their IDs.  |

| Element | Element property | Required | Type   | Range <sup>1</sup>                                   | Description   |
|---------|------------------|----------|--------|--|---|
|         | logtimefmt       | -        | string |  | Format of the time in log entries.<br>Used only by log items.   |
|         | interface_ref    | -        | string | Format: if<N>  | Reference to the host interface.  |
|         | jmx_endpoint     | -        | string |  | JMX endpoint.   |
|         | url              | -        | string |  | Used only by JMX agent items.<br>URL string.  |
|         | allow_traps      | -        | string | 0 - NO (default)<br>1 - YES                          | Required only for HTTP agent items.<br>Allow to populate value as in a trapper item.  |
|         | follow_redirects |          | string | 0 - NO<br>1 - YES (default)                          | Used only by HTTP agent items.<br>Follow HTTP response redirects while polling data.  |
|         | headers          | -        |        |  | Used only by HTTP agent items.<br>Root element for HTTP(S) request headers, where header name is used as key and header value as value.                 |
|         | name             | x        | string |  | Used only by HTTP agent items.<br>Header name.  |
|         | value            | x        | string |  | Header value.   |
|         | http_proxy       | -        | string |  | HTTP(S) proxy connection string.  |
|         | output_format    | -        | string | 0 - RAW (default)<br>1 - JSON                        | Used only by HTTP agent items.<br>How to process response.  |
|         | post_type        | -        | string | 0 - RAW (default)<br>2 - JSON<br>3 - XML             | Used only by HTTP agent items.<br>Type of post data body.   |
|         | posts            | -        | string |  | Used only by HTTP agent items.<br>HTTP(S) request body data.  |
|         | query_fields     | -        |        |  | Used only by HTTP agent items.<br>Root element for query parameters.  |
|         | name             | x        | string |  | Used only by HTTP agent items.<br>Parameter name.   |
|         | value            | -        | string |  | Parameter value.  |
|         | request_method   |          | string | 0 - GET (default)<br>1 - POST<br>2 - PUT<br>3 - HEAD | Request method.   |
|         | retrieve_mode    | -        | string | 0 - BODY (default)<br>1 - HEADERS<br>2 - BOTH        | Used only by HTTP agent items.<br>What part of response should be stored.   |
|         | ssl_cert_file    | -        | string |  | Used only by HTTP agent items.<br>Public SSL Key file path.   |
|         | ssl_key_file     | -        | string |  | Used only by HTTP agent items.<br>Private SSL Key file path.  |
|         | ssl_key_password |          | string |  | Used only by HTTP agent items.<br>Password for SSL Key file.  |
|         | status_codes     | -        | string |  | Used only by HTTP agent items.<br>Ranges of required HTTP status codes separated by commas. Supports user macros.<br>Example: 200,200-{\$M},{M},200-400 |
|         |                  |          |        |  | Used only by HTTP agent items.  |

| Element       | Element<br>property | Required | Type   | Range <sup>1</sup>          | Description  |
|---------------|---------------------|----------|--------|-----------------------------|--|
|               | timeout             | -        | string |                             | Item data polling request timeout. Supports user macros.   |
|               | verify_host         | -        | string | 0 - NO (default)<br>1 - YES | Used by HTTP agent and Script items.<br>Whether to validate that the host name for the connection matches the one in the host's certificate. |
|               | verify_peer         | -        | string | 0 - NO (default)<br>1 - YES | Used only by HTTP agent items.<br>Whether to validate that the host's certificate is authentic.  |
| parameters    |                     | -        |        |                             | Used only by HTTP agent items.<br>Root element for user-defined parameters.  |
|               | name                | x        | string |                             | Used only by Script items.<br>Parameter name.  |
|               | value               | -        | string |                             | Used only by Script items.<br>Parameter value.   |
| value map     |                     | -        |        |                             | Used only by Script items.<br>Value map.   |
|               | name                | x        | string |                             | Name of the value map to use for the item.   |
| preprocessing |                     | -        |        |                             | Root element for item value preprocessing.   |
| step          |                     | -        |        |                             | Individual item value preprocessing step.  |

| Element     | Element property     | Required | Type   | Range <sup>1</sup>  | Description   |
|-------------|----------------------|----------|--------|---|---|
|             | type                 | x        | string | 1 - MULTIPLIER<br>2 - RTRIM<br>3 - LTRIM<br>4 - TRIM<br>5 - REGEX<br>6 - BOOL_TO_DECIMAL<br>7 - OCTAL_TO_DECIMAL<br>8 - HEX_TO_DECIMAL<br>9 - SIMPLE_CHANGE<br>(calculated as<br>(received<br>value-previous value))<br>10 -<br>CHANGE_PER_SECOND<br>(calculated as<br>(received<br>value-previous<br>value)/(time now-time<br>of last check))<br>11 - XMLPATH<br>12 - JSONPATH<br>13 - IN_RANGE<br>14 - MATCHES_REGEX<br>15 -<br>NOT_MATCHES_REGEX<br>16 -<br>CHECK_JSON_ERROR<br>17 -<br>CHECK_XML_ERROR<br>18 -<br>CHECK_REGEX_ERROR<br>19 -<br>DISCARD_UNCHANGED<br>20 - DIS-<br>CARD_UNCHANGED_HEARTBEAT<br>21 - JAVASCRIPT<br>22 -<br>PROMETHEUS_PATTERN<br>23 -<br>PROMETHEUS_TO_JSON<br>24 - CSV_TO_JSON<br>25 - STR_REPLACE<br>26 -<br>CHECK_NOT_SUPPORTED<br>27 - XML_TO_JSON | Type of the item value preprocessing step.                        |
|             | parameters           | -        |        |   | Root element for parameters of the item value preprocessing step. |
|             | parameter            | x        | string |   | Individual parameter of the item value preprocessing step.        |
|             | error_handler        | -        | string | 0 - ORIGINAL_ERROR<br>(default)<br>1 - DISCARD_VALUE<br>2 - CUSTOM_VALUE<br>3 - CUSTOM_ERROR  | Action type used in case of preprocessing step failure.           |
|             | error_handler_params |          | string |   | Error handler parameters used with 'error_handler'.               |
| master_item |                      | -        |        |   | Individual item master item.                                      |
|             |                      |          |        |   | Required by dependent items.                                      |

| Element  | Element property  | Required | Type   | Range <sup>1</sup> | Description   |
|----------|---|----------|--------|--------------------|---|
|          | key   | x        | string |                    | Dependent item master item key value.   |
| triggers |   | -        |        |                    | Recursion up to 3 dependent items and maximum count of dependent items equal to 29999 are allowed.<br>Root element for simple triggers. |
|          | <i>For trigger element tag values, see host trigger tags.</i> |          |        |                    |   |
| tags     |   | -        |        |                    | Root element for item tags.   |
|          | tag   | x        | string |                    | Tag name.   |
|          | value   | -        | string |                    | Tag value.  |

#### Host low-level discovery rule tags

| Element         | Element property   | Required | Type   | Range <sup>1</sup>  | Description  |
|-----------------|--|----------|--------|---|--|
| discovery_rules |  | -        |        |   | Root element for low-level discovery rules.  |
|                 | <i>For most of the element tag values, see element tag values for a regular item. Only the tags that are specific to low-level discovery rules, are described below.</i> |          |        |   |  |
|                 | type   | -        | string | 0 - ZABBIX_PASSIVE (default)<br>2 - TRAP<br>3 - SIMPLE<br>5 - INTERNAL<br>7 - ZABBIX_ACTIVE<br>10 - EXTERNAL<br>11 - ODBC<br>12 - IPMI<br>13 - SSH<br>14 - TELNET<br>16 - JMX<br>18 - DEPENDENT<br>19 - HTTP_AGENT<br>20 - SNMP_AGENT | Item type.   |
|                 | lifetime   | -        | string | Default: 30d  | Time period after which items that are no longer discovered will be deleted. Seconds, time unit with suffix or user macro. |
| filter          |  |          |        |   | Individual filter.   |

| Element            | Element property  | Required | Type      | Range <sup>1</sup>                                       | Description  |
|--------------------|---|----------|-----------|--|--|
| conditions         | evaltype  | -        | string    | 0 - AND_OR (default)<br>1 - AND<br>2 - OR<br>3 - FORMULA | Logic to use for checking low-level discovery rule filter conditions.  |
|                    | formula   | -        | string    |  | Custom calculation formula for filter conditions.  |
|                    |   | -        |           |  | Root element for filter conditions.  |
|                    | macro   | x        | string    |  | Low-level discovery macro name.  |
|                    | value   | -        | string    |  | Filter value: regular expression or global regular expression.   |
|                    | operator  | -        | string    | 8 - MATCHES_REGEX (default)<br>9 - NOT_MATCHES_REGEX     | Condition operator.  |
|                    | formulaid   | x        | character |  | Arbitrary unique ID that is used to reference a condition from the custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| lld_macro_paths    |   | -        |           |  | Root element for LLD macro paths.  |
|                    | lld_macro   | x        | string    |  | Low-level discovery macro name.  |
|                    | path  | x        | string    |  | Selector for value which will be assigned to the corresponding macro.  |
| preprocessing step |   | -        |           |  | LLD rule value preprocessing.  |
|                    |   | -        |           |  | Individual LLD rule value preprocessing step.  |
|                    | <i>For most of the element tag values, see element tag values for a host item value preprocessing. Only the tags that are specific to low-level discovery value preprocessing, are described below.</i> |          |           |  |  |

| Element            | Element<br>property   | Required | Type   | Range <sup>1</sup>   | Description   |
|--------------------|---|----------|--------|--|---|
|                    | type  | x        | string | 5 - REGEX<br>11 - XMLPATH<br>12 - JSONPATH<br>15 -<br>NOT_MATCHES_REGEX<br>16 -<br>CHECK_JSON_ERROR<br>17 -<br>CHECK_XML_ERROR<br>20 - DIS-<br>CARD_UNCHANGED_HEARTBEAT<br>21 - JAVASCRIPT<br>23 -<br>PROMETHEUS_TO_JSON<br>24 - CSV_TO_JSON<br>25 - STR_REPLACE<br>27 - XML_TO_JSON | Type of the item value preprocessing step.                        |
| trigger_prototypes | <i>For trigger<br/>prototype<br/>element<br/>tag values,<br/>see regular<br/>host trigger<br/>tags.</i> | -        |        |  | Root element for trigger prototypes.                              |
| graph_prototypes   | <i>For graph<br/>prototype<br/>element<br/>tag values,<br/>see regular<br/>host graph<br/>tags.</i>     | -        |        |  | Root element for graph prototypes.                                |
| host_prototypes    | <i>For host<br/>prototype<br/>element<br/>tag values,<br/>see regular<br/>host tags.</i>                | -        |        |  | Root element for host prototypes.                                 |
| item_prototypes    | <i>For item<br/>prototype<br/>element<br/>tag values,<br/>see regular<br/>host item<br/>tags.</i>       | -        |        |  | Root element for item prototypes.                                 |
| master_item        |   | -        |        |  | Individual item prototype master item/item<br>prototype data.     |
|                    | key   | x        | string |  | Dependent item prototype master item/item<br>prototype key value. |
|                    |   |          |        |  | Required for a dependent item.                                    |

Host trigger tags

| Element      | Element property    | Required | Type   | Range <sup>1</sup>   | Description  |
|--------------|---------------------|----------|--------|--|--|
| triggers     | -                   | -        | -      | -  | Root element for triggers.   |
|              | expression          | x        | string | -  | Trigger expression.  |
|              | recovery_mode       | -        | string | 0 - EXPRESSION (default)<br>1 - RECOVERY_EXPRESSION<br>2 - NONE                                    | Basis for generating OK events.  |
|              | recovery_expression | -        | string | -  | Trigger recovery expression.   |
|              | correlation_mode    | -        | string | 0 - DISABLED (default)<br>1 - TAG_VALUE  | Correlation mode (no event correlation or event correlation by tag).     |
|              | correlation_tag     | -        | string | -  | The tag name to be used for event correlation.                           |
|              | name                | x        | string | -  | Trigger name.  |
|              | event_name          | -        | string | -  | Event name.  |
|              | opdata              | -        | string | -  | Operational data.  |
|              | url                 | -        | string | -  | URL associated with the trigger.   |
|              | status              | -        | string | 0 - ENABLED (default)<br>1 - DISABLED  | Trigger status.  |
|              | priority            | -        | string | 0 - NOT_CLASSIFIED (default)<br>1 - INFO<br>2 - WARNING<br>3 - AVERAGE<br>4 - HIGH<br>5 - DISASTER | Trigger severity.  |
|              | description         | -        | text   | -  | Trigger description.   |
|              | type                | -        | string | 0 - SINGLE (default)<br>1 - MULTIPLE   | Event generation type (single problem event or multiple problem events). |
|              | manual_close        | -        | string | 0 - NO (default)<br>1 - YES  | Manual closing of problem events.  |
| dependencies | -                   | -        | -      | -  | Root element for dependencies.   |
|              | name                | x        | string | -  | Dependency trigger name.   |
|              | expression          | x        | string | -  | Dependency trigger expression.   |
| tags         | recovery_expression | -        | string | -  | Dependency trigger recovery expression.                                  |
|              | -                   | -        | -      | -  | Root element for event tags.   |
|              | tag                 | x        | string | -  | Tag name.  |
|              | value               | -        | string | -  | Tag value.   |

#### Host graph tags

| Element | Element property | Required | Type    | Range <sup>1</sup>          | Description  |
|---------|------------------|----------|---------|-----------------------------|--|
| graphs  | -                | -        | -       | -                           | Root element for graphs.   |
|         | name             | x        | string  | -                           | Graph name.  |
|         | width            | -        | integer | 20-65535 (default: 900)     | Graph width, in pixels. Used for preview and for pie/exploded graphs.  |
|         | height           | -        | integer | 20-65535 (default: 200)     | Graph height, in pixels. Used for preview and for pie/exploded graphs. |
|         | yaxismin         | -        | double  | Default: 0                  | Value of Y axis minimum.   |
|         | yaxismax         | -        | double  | Default: 0                  | Used if 'ymin_type_1' is FIXED.<br>Value of Y axis maximum.            |
|         | show_work_period | -        | string  | 0 - NO<br>1 - YES (default) | Used if 'ymax_type_1' is FIXED.<br>Highlight non-working hours.        |
|         | -                | -        | -       | -                           | Used by normal and stacked graphs.                                     |

| Element     | Element property | Required | Type    | Range <sup>1</sup>   | Description   |
|-------------|------------------|----------|---------|--|---|
|             | show_triggers    | -        | string  | 0 - NO<br>1 - YES (default)  | Display simple trigger values as a line.  |
|             | type             | -        | string  | 0 - NORMAL (default)<br>1 - STACKED<br>2 - PIE<br>3 - EXPLODED   | Used by normal and stacked graphs.<br>Graph type.   |
|             | show_legend      | -        | string  | 0 - NO<br>1 - YES (default)  | Display graph legend.   |
|             | show_3d          | -        | string  | 0 - NO (default)<br>1 - YES  | Enable 3D style.  |
|             | percent_left     | -        | double  | Default:0  | Used by pie and exploded pie graphs.<br>Show the percentile line for left axis.   |
|             | percent_right    | -        | double  | Default:0  | Used only for normal graphs.<br>Show the percentile line for right axis.  |
|             | ymin_type_1      | -        | string  | 0 - CALCULATED (default)<br>1 - FIXED<br>2 - ITEM  | Used only for normal graphs.<br>Minimum value of Y axis.  |
|             | ymin_item_1      | -        |         |  | Used by normal and stacked graphs.<br>Individual item details.  |
|             | ymax_type_1      | -        | string  | 0 - CALCULATED (default)<br>1 - FIXED<br>2 - ITEM  | Maximum value of Y axis.  |
|             | ymax_item_1      | -        |         |  | Used by normal and stacked graphs.<br>Individual item details.  |
| graph_items | host             | x        | string  |  | Required if 'ymin_type_1' is ITEM.<br>Item host.  |
|             | key              | x        | string  |  | Item key.   |
|             | sortorder        | -        | integer |  | Individual item details.  |
|             | drawtype         | -        | string  | 0 - SINGLE_LINE (default)<br>1 - FILLED_REGION<br>2 - BOLD_LINE<br>3 - DOTTED_LINE<br>4 - DASHED_LINE<br>5 - GRADIENT_LINE | Required if 'ymax_type_1' is ITEM.<br>Item host.<br>Item key.<br>Root element for graph items.<br>Draw order. The smaller value is drawn first.<br>Can be used to draw lines or regions behind (or in front of) another.<br>Draw style of the graph item. |
|             | color            | -        | string  |  | Used only by normal graphs.   |
|             | yaxisside        | -        | string  | 0 - LEFT (default)<br>1 - RIGHT  | Element color (6 symbols, hex).<br>Side of the graph where the graph item's Y scale will be drawn.  |
|             |                  |          |         |  | Used by normal and stacked graphs.  |

| Element | Element property | Required | Type   | Range <sup>1</sup>   | Description   |
|---------|------------------|----------|--------|--|---|
| item    | calc_fnc         | -        | string | 1 - MIN<br>2 - AVG (default)<br>4 - MAX<br>7 - ALL (minimum, average and maximum; used only by simple graphs)<br>9 - LAST (used only by pie and exploded pie graphs) | Data to draw if more than one value exists for an item. |
|         | type             | -        | string | 0 - SIMPLE (default)<br>2 - GRAPH_SUM (value of the item represents the whole pie; used only by pie and exploded pie graphs)   | Graph item type.  |
|         |                  | x        |        |  | Individual item.  |
|         | host             | x        | string |  | Item host.  |
|         | key              | x        | string |  | Item key.   |

#### Host web scenario tags

| Element    | Element property | Required | Type    | Range <sup>1</sup>                          | Description  |
|------------|------------------|----------|---------|---|--|
| httpstests |                  | -        |         |   | Root element for web scenarios.  |
|            | name             | x        | string  |   | Web scenario name.   |
|            | delay            | -        | string  | Default: 1m                                 | Frequency of executing the web scenario. Seconds, time unit with suffix or user macro.   |
|            | attempts         | -        | integer | 1-10 (default: 1)                           | The number of attempts for executing web scenario steps.   |
|            | agent            | -        | string  | Default: Zabbix                             | Client agent. Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers.                        |
|            | http_proxy       | -        | string  |   | Specify an HTTP proxy to use, using the format:<br><code>http://[username[:password]@]proxy.example.com</code>   |
| variables  |                  | -        |         |   | Root element for scenario-level variables (macros) that may be used in scenario steps.   |
|            | name             | x        | text    |   | Variable name.   |
|            | value            | x        | text    |   | Variable value.  |
| headers    |                  | -        |         |   | Root element for HTTP headers that will be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol. |
|            | name             | x        | text    |   | Header name.   |
|            | value            | x        | text    |   | Header value.  |
|            | status           | -        | string  | 0 - ENABLED (default)<br>1 - DISABLED       | Web scenario status.   |
|            | authentication   | -        | string  | 0 - NONE (default)<br>1 - BASIC<br>2 - NTLM | Authentication method.   |
|            | http_user        | -        | string  |   | User name used for basic, HTTP or NTLM authentication.   |
|            | http_password    | -        | string  |   | Password used for basic, HTTP or NTLM authentication.  |
|            | verify_peer      | -        | string  | 0 - NO (default)<br>1 - YES                 | Whether to validate that the host's certificate is authentic.  |

| Element | Element property | Required | Type   | Range <sup>1</sup>                            | Description  |
|---------|------------------|----------|--------|---|--|
|         | verify_host      | -        | string | 0 - NO (default)<br>1 - YES                   | Whether to validate that the host name for the connection matches the one in the host's certificate.   |
|         | ssl_cert_file    | -        | string |   | Name of the SSL certificate file used for client authentication (must be in PEM format).   |
|         | ssl_key_file     | -        | string |   | Name of the SSL private key file used for client authentication (must be in PEM format).   |
|         | ssl_key_password |          | string |   | SSL private key file password.   |
|         | steps            | x        |        |   | Root element for web scenario steps.   |
|         | name             | x        | string |   | Web scenario step name.  |
|         | url              | x        | string |   | URL for monitoring.  |
|         | query_fields     | -        |        |   | Root element for query fields - an array of HTTP fields that will be added to the URL when performing a request.   |
|         | name             | x        | string |   | Query field name.  |
|         | value            | -        | string |   | Query field value.   |
|         | posts            | -        |        |   | HTTP POST variables as a string (raw post data) or as an array of HTTP fields (form field data).   |
|         | name             | x        | string |   | Post field name.   |
|         | value            | x        | string |   | Post field value.  |
|         | variables        | -        |        |   | Root element of step-level variables (macros) that should be applied after this step.  |
|         |                  |          |        |   | If the variable value has a 'regex:' prefix, then its value is extracted from the data returned by this step according to the regular expression pattern following the 'regex:' prefix |
|         | name             | x        | string |   | Variable name.   |
|         | value            | x        | string |   | Variable value.  |
|         | headers          | -        |        |   | Root element for HTTP headers that will be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol.                   |
|         | name             | x        | string |   | Header name.   |
|         | value            | x        | string |   | Header value.  |
|         | follow_redirects |          | string | 0 - NO<br>1 - YES (default)                   | Follow HTTP redirects.   |
|         | retrieve_mode    | -        | string | 0 - BODY (default)<br>1 - HEADERS<br>2 - BOTH | HTTP response retrieve mode.   |
|         | timeout          | -        | string | Default: 15s                                  | Timeout of step execution. Seconds, time unit with suffix or user macro.   |
|         | required         | -        | string |   | Text that must be present in the response. Ignored if empty.   |
|         | status_codes     | -        | string |   | A comma delimited list of accepted HTTP status codes. Ignored if empty. For example: 200-201,210-299   |
|         | tags             | -        |        |   | Root element for web scenario tags.  |
|         | tag              | x        | string |   | Tag name.  |
|         | value            | -        | string |   | Tag value.   |

#### Footnotes

<sup>1</sup> For string values, only the string will be exported (e.g. "ZABBIX\_ACTIVE") without the numbering used in this table. The numbers for range values (corresponding to the API values) in this table is used for ordering only.

## 4 Network maps

### Overview

Network map **export** contains:

- all related images
- map structure - all map settings, all contained elements with their settings, map links and map link status indicators

#### **Warning:**

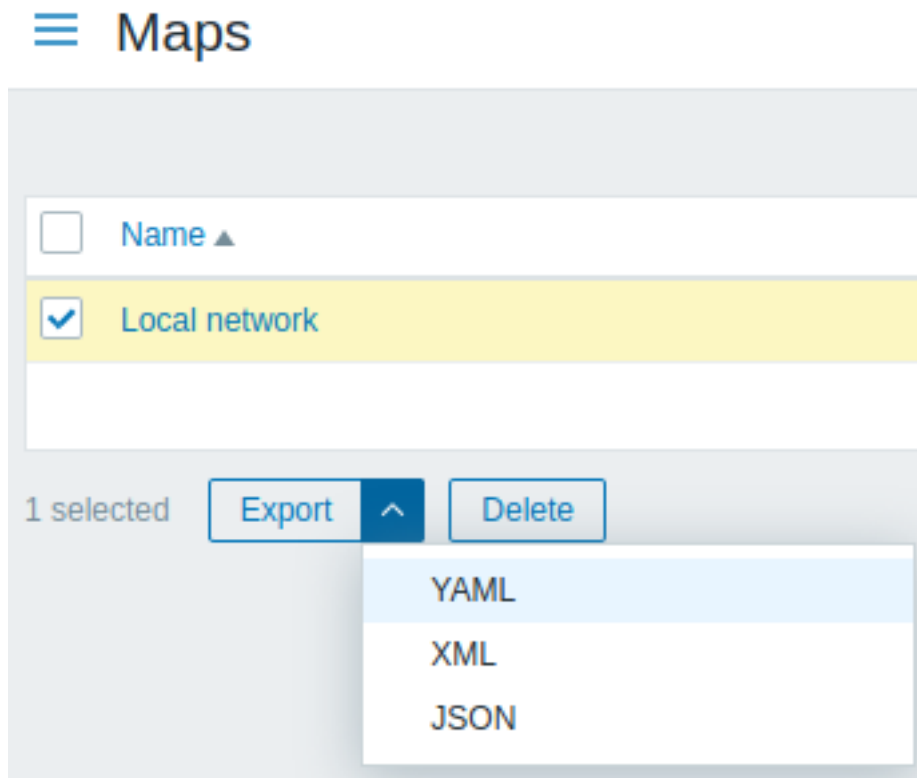

Any host groups, hosts, triggers, other maps or other elements that may be related to the exported map are not exported. Thus, if at least one of the elements the map refers to is missing, importing it will fail.

Network map export/import is supported since Zabbix 1.8.2.

### Exporting

To export network maps, do the following:

- Go to: *Monitoring* → *Maps*
- Mark the checkboxes of the network maps to export
- Click on *Export* below the list

Depending on the selected format, maps are exported to a local file with a default name:

- *zabbix\_export\_maps.yaml* - in YAML export (default option for export)
- *zabbix\_export\_maps.xml* - in XML export
- *zabbix\_export\_maps.json* - in JSON export

### Importing

To import network maps, do the following:

- Go to: *Monitoring* → *Maps*
- Click on *Import* to the right
- Select the import file
- Mark the required options in import rules
- Click on *Import*

Import

\* Import file

Choose file

zbx\_export\_sysmaps.yaml

Rules

Update existing

Create new

Delete missing

☒
☒

Images

☐
☒

Import

Cancel

All mandatory input fields are marked with a red asterisk.

A success or failure message of the import will be displayed in the frontend.

Import rules:

| Rule                   | Description   |
|------------------------|---|
| <i>Update existing</i> | Existing maps will be updated with data taken from the import file. Otherwise they will not be updated. |
| <i>Create new</i>      | The import will add new maps using data from the import file. Otherwise it will not add them.           |

If you uncheck both map options and check the respective options for images, images only will be imported. Image importing is only available to Super Admin users.

#### Warning:

If replacing an existing image, it will affect all maps that are using this image.

Export format

Export to YAML:

```
zabbix_export:
  version: '6.0'
  date: '2021-08-31T12:55:10Z'
  images:
    - name: Zabbix_server_3D_(128)

## Element tags

Element tag values are explained in the table below.

| Element | Element property | Type | Range | Description              |
|---------|------------------|------|-------|--------------------------|
| images  |                  |      |       | Root element for images. |

| Element | Element property     | Type    | Range   | Description   |
|---------|----------------------|---------|---|---|
| maps    | name                 | string  |   | Unique image name.  |
|         | imagetype            | integer | 1 - image<br>2 - background   | Image type.   |
|         | encodedImage         |         |   | Base64 encoded image.<br>Root element for maps.   |
|         | name                 | string  |   | Unique map name.  |
|         | width                | integer |   | Map width, in pixels.   |
|         | height               | integer |   | Map height, in pixels.  |
|         | label_type           | integer | 0 - label<br>1 - host IP address<br>2 - element name<br>3 - status only<br>4 - nothing  | Map element label type.   |
|         | label_location       | integer | 0 - bottom<br>1 - left<br>2 - right<br>3 - top  | Map element label location by default.  |
|         | highlight            | integer | 0 - no<br>1 - yes   | Enable icon highlighting for active triggers and host statuses.                               |
|         | expandproblem        | integer | 0 - no<br>1 - yes   | Display problem trigger for elements with a single problem.                                   |
|         | markelements         | integer | 0 - no<br>1 - yes   | Highlight map elements that have recently changed their status.                               |
|         | show_unack           | integer | 0 - count of all problems<br>1 - count of unacknowledged problems<br>2 - count of acknowledged and unacknowledged problems separately | Problem display.  |
|         | severity_min         | integer | 0 - not classified<br>1 - information<br>2 - warning<br>3 - average<br>4 - high<br>5 - disaster                                       | Minimum trigger severity to show on the map by default.                                       |
|         | show_suppressed      | integer | 0 - no<br>1 - yes   | Display problems which would otherwise be suppressed (not shown) because of host maintenance. |
|         | grid_size            | integer | 20, 40, 50, 75 or 100   | Cell size of a map grid in pixels, if "grid_show=1"   |
|         | grid_show            | integer | 0 - yes<br>1 - no   | Display a grid in map configuration.  |
|         | grid_align           | integer | 0 - yes<br>1 - no   | Automatically align icons in map configuration.   |
|         | label_format         | integer | 0 - no<br>1 - yes   | Use advanced label configuration.   |
|         | label_type_host      | integer | 0 - label<br>1 - host IP address<br>2 - element name<br>3 - status only<br>4 - nothing<br>5 - custom label                            | Display as host label, if "label_format=1"  |
|         | label_type_hostgroup | integer | 0 - label<br>2 - element name<br>3 - status only<br>4 - nothing<br>5 - custom label   | Display as host group label, if "label_format=1"  |

| Element   | Element property       | Type    | Range   | Description  |
|-----------|------------------------|---------|---|--|
| urls      | label_type_trigger     | integer | 0 - label<br>2 - element name<br>3 - status only<br>4 - nothing<br>5 - custom label | Display as trigger label, if "label_format=1"  |
|           | label_type_map         | integer | 0 - label<br>2 - element name<br>3 - status only<br>4 - nothing<br>5 - custom label | Display as map label, if "label_format=1"  |
|           | label_type_image       | integer | 0 - label<br>2 - element name<br>4 - nothing<br>5 - custom label                    | Display as image label, if "label_format=1"  |
|           | label_string_host      | string  |   | Custom label for host elements, if "label_type_host=5"                                     |
|           | label_string_hostgroup | string  |   | Custom label for host group elements, if "label_type_hostgroup=5"                          |
|           | label_string_trigger   | string  |   | Custom label for trigger elements, if "label_type_trigger=5"                               |
|           | label_string_map       | string  |   | Custom label for map elements, if "label_type_map=5"                                       |
|           | label_string_image     | string  |   | Custom label for image elements, if "label_type_image=5"                                   |
|           | expand_macros          | integer | 0 - no<br>1 - yes   | Expand macros in labels in map configuration.  |
|           | background             | id      |   | ID of the background image (if any), if "imagetype=2"                                      |
|           | iconmap                | id      |   | ID of the icon mapping (if any).<br>Used by maps or each map element.                      |
|           | name                   | string  |   | Link name.   |
|           | url                    | string  |   | Link URL.  |
|           | elementtype            | integer | 0 - host<br>1 - map<br>2 - trigger<br>3 - host group<br>4 - image                   | Map item type the link belongs to.   |
| selements | elementtype            | integer | 0 - host<br>1 - map<br>2 - trigger<br>3 - host group<br>4 - image                   | Map element type.  |
|           | label                  | string  |   | Icon label.  |
|           | label_location         | integer | -1 - use map default<br>0 - bottom<br>1 - left<br>2 - right<br>3 - top              |  |
|           | x                      | integer |   | Location on the X axis.  |
|           | y                      | integer |   | Location on the Y axis.  |
|           | elementsubtype         | integer | 0 - single host group<br>1 - all host groups  | Element subtype, if "elementtype=3"  |
|           | areatype               | integer | 0 - same as whole map<br>1 - custom size  | Area size, if "elementsubtype=1"   |
|           | width                  | integer |   | Width of area, if "areatype=1"   |
|           | height                 | integer |   | Height of area, if "areatype=1"  |
|           | viewtype               | integer | 0 - place evenly in the area  | Area placement algorithm, if "elementsubtype=1"  |
|           | use_iconmap            | integer | 0 - no<br>1 - yes   | Use icon mapping for this element. Relevant only if iconmapping is activated on map level. |

| Element          | Element property | Type    | Range   | Description   |
|------------------|------------------|---------|---|---|
| tags             | selementid       | id      |   | Unique element record ID.   |
|                  | evaltype         | integer |   | Evaluation type for tags.   |
|                  |                  |         |   | Problem tags (for host and host group elements). If tags are given, only problems with these tags will be displayed on the map. |
| elements         | tag              | string  |   | Tag name.   |
|                  | value            | string  |   | Tag value.  |
|                  | operator         | integer |   | Operator.   |
|                  |                  |         |   | Zabbix entities that are represented on the map (host, host group, map etc).  |
| icon_off         | host             |         |   | Image to use when element is in 'OK' status.  |
| icon_on          |                  |         |   | Image to use when element is in 'Problem' status.   |
| icon_disabled    |                  |         |   | Image to use when element is disabled.  |
| icon_maintenance |                  |         |   | Image to use when element is in maintenance.  |
| shapes           | name             | string  |   | Unique image name.  |
|                  | type             | integer | 0 - rectangle<br>1 - ellipse  | Shape type.   |
|                  | x                | integer |   | X coordinates of the shape in pixels.   |
|                  | y                | integer |   | Y coordinates of the shape in pixels.   |
|                  | width            | integer |   | Shape width.  |
|                  | height           | integer |   | Shape height.   |
|                  | border_type      | integer | 0 - none<br>1 - bold line<br>2 - dotted line<br>3 - dashed line   | Type of the border for the shape.   |
|                  | border_width     | integer |   | Width of the border in pixels.  |
|                  | border_color     | string  |   | Border color represented in hexadecimal code.   |
|                  | text             | string  |   | Text inside of shape.   |
|                  | font             | integer | 0 - Georgia, serif<br>1 - "Palatino Linotype",<br>"Book Antiqua",<br>Palatino, serif<br>2 - "Times New Roman",<br>Times, serif<br>3 - Arial, Helvetica,<br>sans-serif<br>4 - "Arial Black",<br>Gadget, sans-serif<br>5 - "Comic Sans MS",<br>cursive, sans-serif<br>6 - Impact, Charcoal,<br>sans-serif<br>7 - "Lucida Sans<br>Unicode", "Lucida<br>Grande", sans-serif<br>8 - Tahoma, Geneva,<br>sans-serif<br>9 - "Trebuchet MS",<br>Helvetica, sans-serif<br>10 - Verdana, Geneva,<br>sans-serif<br>11 - "Courier New",<br>Courier, monospace<br>12 - "Lucida Console",<br>Monaco, monospace | Text font style.  |
|                  | font_size        | integer |   | Font size in pixels.  |
|                  | font_color       | string  |   | Font color represented in hexadecimal code.   |

| Element      | Element property    | Type    | Range   | Description   |
|--------------|---------------------|---------|---|---|
| lines        | text_halign         | integer | 0 - center<br>1 - left<br>2 - right                             | Horizontal alignment of text.   |
|              | text_valign         | integer | 0 - middle<br>1 - top<br>2 - bottom                             | Vertical alignment of text.   |
|              | background_color    | string  |   | Background (fill) color represented in hexadecimal code.                      |
|              | zindex              | integer |   | Value used to order all shapes and lines (z-index).                           |
|              | x1                  | integer |   | X coordinates of the line point 1 in pixels.                                  |
|              | y1                  | integer |   | Y coordinates of the line point 1 in pixels.                                  |
|              | x2                  | integer |   | X coordinates of the line point 2 in pixels.                                  |
|              | y2                  | integer |   | Y coordinates of the line point 2 in pixels.                                  |
|              | line_type           | integer | 0 - none<br>1 - bold line<br>2 - dotted line<br>3 - dashed line | Line type.  |
|              | line_width          | integer |   | Line width in pixels.   |
| links        | line_color          | string  |   | Line color represented in hexadecimal code.                                   |
|              | zindex              | integer |   | Value used to order all shapes and lines (z-index).                           |
| linktriggers | drawtype            | integer | 0 - line<br>2 - bold line<br>3 - dotted line<br>4 - dashed line | Links between map elements.<br>Link style.                                    |

|              | recovery_expression | string  |   | Trigger recovery expression.  |

## 5 Media types

### Overview

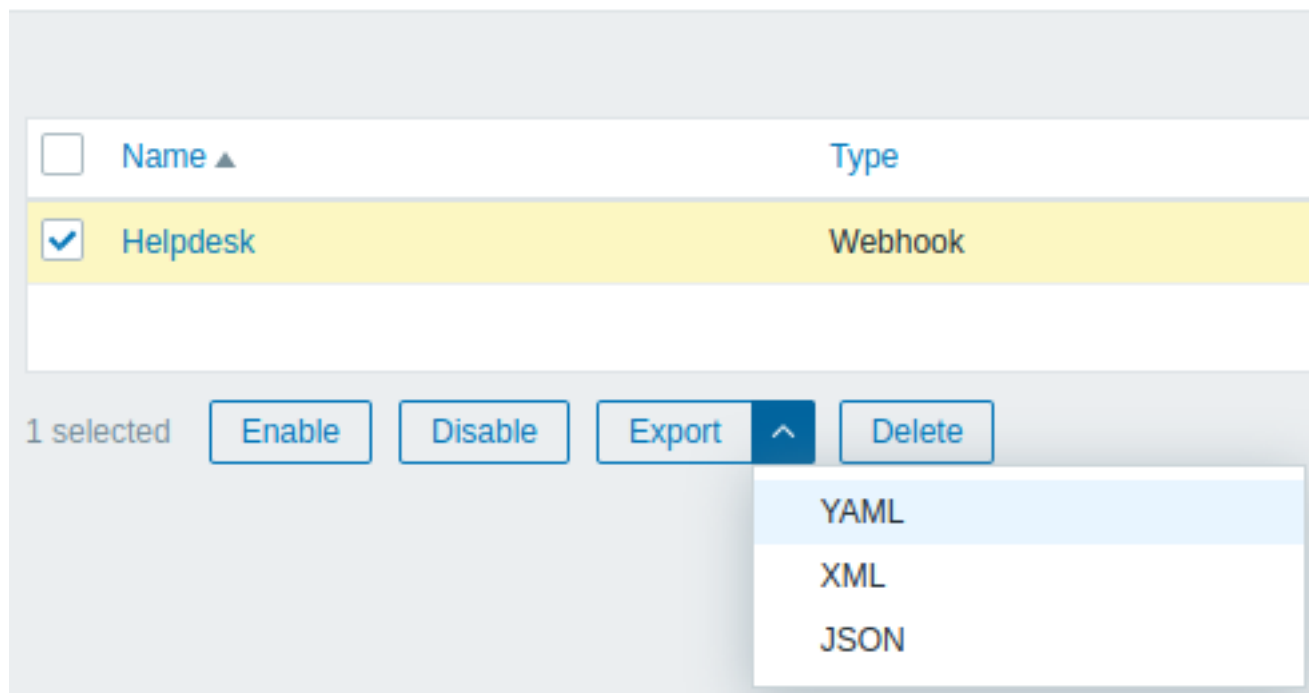

Media types are **exported** with all related objects and object relations.

### Exporting

To export media types, do the following:

- Go to: *Administration* → *Media types*
- Mark the checkboxes of the media types to export
- Click on *Export* below the list

## Media types

| <input type="checkbox"/>            | Name ▲   | Type    |
|-------------------------------------|----------|---------|
| <input checked="" type="checkbox"/> | Helpdesk | Webhook |

1 selected

Enable Disable Export ^ Delete

- YAML
- XML
- JSON

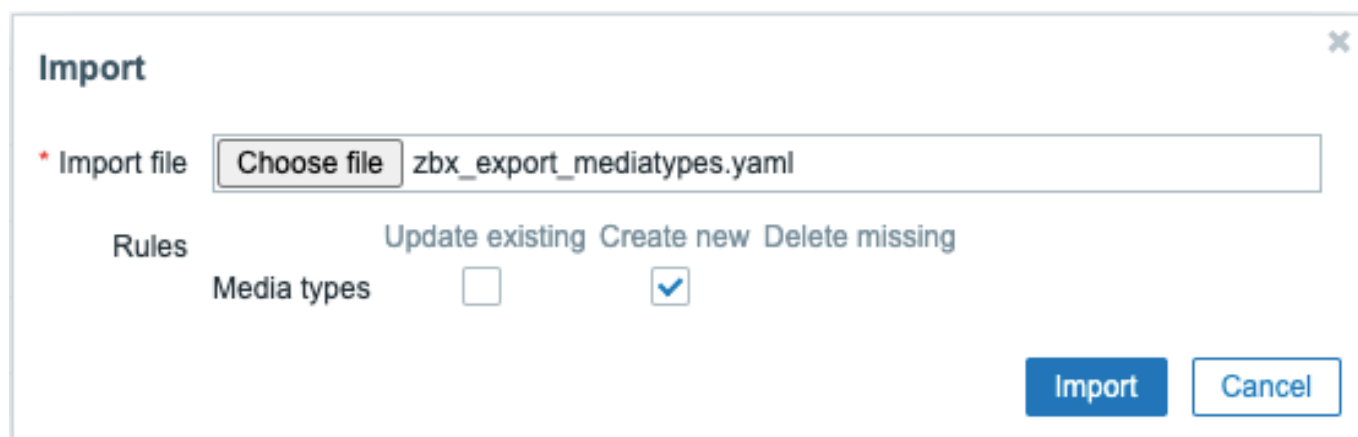

Depending on the selected format, media types are exported to a local file with a default name:

- `zabbix_export_mediatypes.yaml` - in YAML export (default option for export)
- `zabbix_export_mediatypes.xml` - in XML export
- `zabbix_export_mediatypes.json` - in JSON export

### Importing

To import media types, do the following:

- Go to: *Administration* → *Media types*
- Click on *Import* to the right
- Select the import file
- Mark the required options in import rules
- Click on *Import*

**Import**

\* Import file

Rules

Update existing ☐ Create new ☒ Delete missing ☐

Media types

A success or failure message of the import will be displayed in the frontend.

Import rules:

| Rule            | Description   |
|-----------------|---|
| Update existing | Existing elements will be updated with data taken from the import file. Otherwise they will not be updated. |
| Create new      | The import will add new elements using data from the import file. Otherwise it will not add them.           |

| Rule                  | Description   |
|-----------------------|---|
| <i>Delete missing</i> | The import will remove existing elements not present in the import file. Otherwise it will not remove them. |

## Export format

### Export to YAML:

```
zabbix_export:
  version: '6.0'
  date: '2021-08-31T13:34:17Z'
  media_types:
    - name: Pushover
      type: WEBHOOK
      parameters:
        - name: endpoint

## Element tags

Element tag values are explained in the table below.

| Element     | Element property | Required | Type   | Range <sup>1</sup>                                | Description                        |
|-------------|------------------|----------|--------|---|------------------------------------|
| media_types | -                | -        | -      | -   | Root element for media_types.      |
|             | name             | x        | string | -   | Media type name.                   |
|             | type             | x        | string | 0 - EMAIL<br>1 - SMS<br>2 - SCRIPT<br>4 - WEBHOOK | Transport used by the media type.  |
|             | status           | -        | string | 0 - ENABLED (default)<br>1 - DISABLED             | Whether the media type is enabled. |

| Element                         | Element property    | Required | Type    | Range <sup>1</sup>  | Description  |
|---------------------------------|---------------------|----------|---------|---|--|
| Used only by email media type   | max_sessions        | -        | integer | Possible values for SMS: 1 - (default)<br><br>Possible values for other media types: 0-100, 0 - unlimited | The maximum number of alerts that can be processed in parallel.                |
|                                 | attempts            | -        | integer | 1-10 (default: 3)   | The maximum number of attempts to send an alert.                               |
|                                 | attempt_interval    | -        | string  | 0-60s (default: 10s)  | The interval between retry attempts.   |
|                                 | description         | -        | string  |   | Accepts seconds and time unit with suffix. Media type description.             |
|                                 | message_templates   | -        |         |   | Root element for media type message templates.                                 |
|                                 | event_source        | x        | string  | 0 - TRIGGERS<br>1 - DISCOVERY<br>2 -<br>AUTOREGISTRATION<br>3 - INTERNAL<br>4 - SERVICE                   | Event source.  |
|                                 | operation_mode      | -        | string  | 0 - PROBLEM<br>1 - RECOVERY<br>2 - UPDATE   | Operation mode.  |
|                                 | subject             | -        | string  |   | Message subject.   |
|                                 | message             | -        | string  |   | Message body.  |
|                                 | smtp_server         | x        | string  |   | SMTP server.   |
|                                 | smtp_port           | -        | integer | Default: 25   | SMTP server port to connect to.  |
|                                 | smtp_helo           | x        | string  |   | SMTP helo.   |
|                                 | smtp_email          | x        | string  |   | Email address from which notifications will be sent.                           |
| Used only by SMS media type     | smtp_security       | -        | string  | 0 - NONE (default)<br>1 - STARTTLS<br>2 - SSL_OR_TLS  | SMTP connection security level to use.   |

| Used only by webhook media type | script              | x        | string  |   | Script.  |

| Element    | Element property | Required | Type   | Range <sup>1</sup>          | Description  |
|------------|------------------|----------|--------|-----------------------------|--|
|            | timeout          | -        | string | 1-60s (default: 30s)        | Javascript script HTTP request timeout interval.   |
|            | process_tags     | -        | string | 0 - NO (default)<br>1 - YES | Whether to process returned tags.  |
|            | show_event_menu  |          | string | 0 - NO (default)<br>1 - YES | If {EVENT.TAGS.*} were successfully resolved in event_menu_url and event_menu_name fields, this field indicates presence of entry in the event menu. |
|            | event_menu_url   |          | string |                             | URL of the event menu entry. Supports {EVENT.TAGS.*} macro.  |
|            | event_menu_name  |          | string |                             | Name of the event menu entry. Supports {EVENT.TAGS.*} macro.   |
| parameters |                  | -        |        |                             | Root element for webhook media type parameters.  |
|            | name             | x        | string |                             | Webhook parameter name.  |
|            | value            | -        | string |                             | Webhook parameter value.   |

#### Footnotes

<sup>1</sup> For string values, only the string will be exported (e.g. "EMAIL") without the numbering used in this table. The numbers for range values (corresponding to the API values) in this table is used for ordering only.

## 15 Discovery

Please use the sidebar to access content in the Discovery section.

### 1 Network discovery

#### Overview

Zabbix offers automatic network discovery functionality that is effective and very flexible.

With network discovery properly set up you can:

- speed up Zabbix deployment
- simplify administration
- use Zabbix in rapidly changing environments without excessive administration

Zabbix network discovery is based on the following information:

- IP ranges
- Availability of external services (FTP, SSH, WEB, POP3, IMAP, TCP, etc)
- Information received from Zabbix agent (only unencrypted mode is supported)
- Information received from SNMP agent

It does NOT provide:

- Discovery of network topology

Network discovery basically consists of two phases: discovery and actions.

#### Discovery

Zabbix periodically scans the IP ranges defined in **network discovery rules**. The frequency of the check is configurable for each rule individually.

Note that one discovery rule will always be processed by a single discoverer process. The IP range will not be split between multiple discoverer processes.

Each rule has a set of service checks defined to be performed for the IP range.

**Note:**

Discovery checks are processed independently from the other checks. If any checks do not find a service (or fail), other checks will still be processed.

Every check of a service and a host (IP) performed by the network discovery module generates a discovery event.

| Event                     | Check of service result   |
|---------------------------|---|
| <i>Service Discovered</i> | The service is 'up' after it was 'down' or when discovered for the first time.  |
| <i>Service Up</i>         | The service is 'up', after it was already 'up'.   |
| <i>Service Lost</i>       | The service is 'down' after it was 'up'.  |
| <i>Service Down</i>       | The service is 'down', after it was already 'down'.   |
| <i>Host Discovered</i>    | At least one service of a host is 'up' after all services of that host were 'down' or a service is discovered which belongs to a not registered host. |
| <i>Host Up</i>            | At least one service of a host is 'up', after at least one service was already 'up'.  |
| <i>Host Lost</i>          | All services of a host are 'down' after at least one was 'up'.  |
| <i>Host Down</i>          | All services of a host are 'down', after they were already 'down'.  |

## Actions

Discovery events can be the basis of relevant **actions**, such as:

- Sending notifications
- Adding/removing hosts
- Enabling/disabling hosts
- Adding hosts to a group
- Removing hosts from a group
- Linking hosts to/unlinking from a template
- Executing remote scripts

These actions can be configured with respect to the device type, IP, status, uptime/downtime, etc. For full details on configuring actions for network-discovery based events, see action **operation** and **conditions** pages.

Since network discovery actions are event-based, they will be triggered both when a discovered host is online and when it is offline. It is highly recommended to add an action **condition** *Discovery status: up* to avoid such actions as *Add host* being triggered upon *Service Lost/Service Down* events. Otherwise, if a discovered host is manually removed, it will still generate *Service Lost/Service Down* events and will be recreated during the next discovery cycle.

**Note:**

Linking a discovered host to templates will fail collectively if any of the linkable templates has a unique entity (e.g. item key) that is the same as a unique entity (e.g. item key) already existing on the host or on another of the linkable templates.

## Host creation

A host is added if the *Add host* operation is selected. A host is also added, even if the *Add host* operation is missing, if you select operations resulting in actions on a host. Such operations are:

- enable host
- disable host
- add host to a host group
- link template to a host

Created hosts are added to the *Discovered hosts* group (by default, configurable in *Administration* → *General* → *Other*). If you wish hosts to be added to another group, add a *Remove from host groups* operation (specifying "Discovered hosts") and also add an *Add to host groups* operation (specifying another host group), because a host must belong to a host group.

The IP address of the discovered device is the criterion for finding a host in the system. If a host with that IP address and interface type already exists, that host will be the target for performing operations.

If the IP address of the discovered host is changed or the interface is deleted, a new host will be created upon the next discovery.

## Host naming

When adding hosts, a host name is the result of reverse DNS lookup or IP address if reverse lookup fails. Lookup is performed from the Zabbix server or Zabbix proxy, depending on which is doing the discovery. If lookup fails on the proxy, it is not retried on the server. If the host with such a name already exists, the next host would get **\_2** appended to the name, then **\_3** and so on.

It is also possible to override DNS/IP lookup and instead use an item value for host name, for example:

- You may discover multiple servers with Zabbix agent running using a Zabbix agent item for discovery and assign proper names to them automatically, based on the string value returned by this item
- You may discover multiple SNMP network devices using an SNMP agent item for discovery and assign proper names to them automatically, based on the string value returned by this item

If the host name has been set using an item value, it is not updated during the following discovery checks. If it is not possible to set host name using an item value, default value (DNS name) is used.

If a host already exists with the discovered IP address, a new host is not created. However, if the discovery action contains operations (link template, add to host group, etc), they are performed on the existing host.

#### Host removal

Hosts discovered by a network discovery rule are removed automatically from *Monitoring* → *Discovery* if a discovered entity is not in the rule's IP range any more. Hosts are removed immediately.

#### Interface creation when adding hosts

When hosts are added as a result of network discovery, they get interfaces created according to these rules:

- the services detected - for example, if an SNMP check succeeded, an SNMP interface will be created
- if a host responded both to Zabbix agent and SNMP requests, both types of interfaces will be created
- if uniqueness criteria are Zabbix agent or SNMP-returned data, the first interface found for a host will be created as the default one. Other IP addresses will be added as additional interfaces. Action's conditions (such as Host IP) do not impact adding interfaces. *Note* that this will work if all interfaces are discovered by the same discovery rule. If a different discovery rule discovers a different interface of the same host, an additional host will be added.
- if a host responded to agent checks only, it will be created with an agent interface only. If it would start responding to SNMP later, additional SNMP interfaces would be added.
- if 3 separate hosts were initially created, having been discovered by the "IP" uniqueness criteria, and then the discovery rule is modified so that hosts A, B and C have identical uniqueness criteria result, B and C are created as additional interfaces for A, the first host. The individual hosts B and C remain. In *Monitoring* → *Discovery* the added interfaces will be displayed in the "Discovered device" column, in black font and indented, but the "Monitored host" column will only display A, the first created host. "Uptime/Downtime" is not measured for IPs that are considered to be additional interfaces.

#### Changing proxy setting

The hosts discovered by different proxies are always treated as different hosts. While this allows to perform discovery on matching IP ranges used by different subnets, changing proxy for an already monitored subnet is complicated because the proxy changes must be also applied to all discovered hosts.

For example the steps to replace proxy in a discovery rule:

1. disable discovery rule
2. sync proxy configuration
3. replace the proxy in the discovery rule
4. replace the proxy for all hosts discovered by this rule
5. enable discovery rule

## 1 Configuring a network discovery rule

### Overview

To configure a network discovery rule used by Zabbix to discover hosts and services:

- Go to *Configuration* → *Discovery*
- Click on *Create rule* (or on the rule name to edit an existing one)
- Edit the discovery rule attributes

### Rule attributes

| Parameter                         | Description   |
|-----------------------------------|---|
| <i>Name</i>                       | Unique name of the rule. For example, "Local network".  |
| <i>Discovery by proxy</i>         | What performs discovery:<br><b>no proxy</b> - Zabbix server is doing discovery<br><b>&lt;proxy name&gt;</b> - this proxy performs discovery   |
| <i>IP range</i>                   | The range of IP addresses for discovery. It may have the following formats:<br>Single IP: 192.168.1.33<br>Range of IP addresses: 192.168.1-10.1-255. The range is limited by the total number of covered addresses (less than 64K).<br>IP mask: 192.168.4.0/24<br>supported IP masks:<br>/16 - /30 for IPv4 addresses<br>/112 - /128 for IPv6 addresses<br>List: 192.168.1.1-255, 192.168.2.1-100, 192.168.2.200, 192.168.4.0/24<br>Since Zabbix 3.0.0 this field supports spaces, tabulation and multiple lines.   |
| <i>Update interval</i>            | This parameter defines how often Zabbix will execute the rule.<br>The interval is measured after the execution of previous discovery instance ends so there is no overlap.<br><b>Time suffixes</b> are supported, e.g. 30s, 1m, 2h, 1d, since Zabbix 3.4.0.<br><b>User macros</b> are supported, since Zabbix 3.4.0.<br><i>Note</i> that if a user macro is used and its value is changed (e.g. 1w → 1h), the next check will be executed according to the previous value (far in the future with the example values).  |
| <i>Checks</i>                     | Zabbix will use this list of checks for discovery. Click on <a href="#">Add</a> to configure a new check in a popup window.<br>Supported checks: SSH, LDAP, SMTP, FTP, HTTP, HTTPS, POP, NNTP, IMAP, TCP, Telnet, Zabbix agent, SNMPv1 agent, SNMPv2 agent, SNMPv3 agent, ICMP ping.<br>A protocol-based discovery uses the <b>net.tcp.service[]</b> functionality to test each host, except for SNMP which queries an SNMP OID. Zabbix agent is tested by querying an item in unencrypted mode. Please see <b>agent items</b> for more details.<br>The 'Ports' parameter may be one of following:<br>Single port: 22<br>Range of ports: 22-45<br>List: 22-45,55,60-70    |
| <i>Device uniqueness criteria</i> | Uniqueness criteria may be:<br><b>IP address</b> - do not process multiple single-IP devices. If a device with the same IP already exists it will be considered already discovered and a new host will not be added.<br><b>&lt;discovery check&gt;</b> - either Zabbix agent or SNMP agent check.<br><i>Note</i> that uniqueness criteria used during discovery is not the same as host identification in the system when performing actions. Uniqueness criteria during discovery define whether two or more discovered devices are the same (or different), whereas only the IP address is the criterion for host identification in Zabbix (see <b>Host creation</b> ). |
| <i>Host name</i>                  | Set the technical host name of a created host using:<br><b>DNS name</b> - DNS name (default)<br><b>IP address</b> - IP address<br><b>&lt;discovery check&gt;</b> - received string value of the discovery check (e.g. Zabbix agent, SNMP agent check)<br>See also: <b>Host naming</b> .   |
| <i>Visible name</i>               | This option is supported since 4.2.0.<br>Set the visible host name of a created host using:<br><b>Host name</b> - technical host name (default)<br><b>DNS name</b> - DNS name<br><b>IP address</b> - IP address<br><b>&lt;discovery check&gt;</b> - received string value of the discovery check (e.g. Zabbix agent, SNMP agent check)<br>See also: <b>Host naming</b> .  |
| <i>Enabled</i>                    | This option is supported since 4.2.0.<br>With the check-box marked the rule is active and will be executed by Zabbix server.<br>If unmarked, the rule is not active. It won't be executed.  |

#### A real life scenario

In this example, we would like to set up network discovery for the local network having an IP range of 192.168.1.1-192.168.1.254.

In our scenario we want to:

- discover those hosts that have Zabbix agent running
- run discovery every 10 minutes
- add a host to monitoring if the host uptime is more than 1 hour
- remove hosts if the host downtime is more than 24 hours
- add Linux hosts to the "Linux servers" group
- add Windows hosts to the "Windows servers" group
- use the template *Linux* for Linux hosts
- use the template *Windows* for Windows hosts

#### Step 1

Defining a network discovery rule for our IP range.

| * Name                      | Local network  |  |      |         |                             |   |                     |  |
|-----------------------------|--|--|------|---------|-----------------------------|---|---------------------|--|
| Discovery by proxy          | No proxy   |  |      |         |                             |   |                     |  |
| * IP range                  | 192.168.1.1-254  |  |      |         |                             |   |                     |  |
| * Update interval           | 10m  |  |      |         |                             |   |                     |  |
| * Checks                    | <table><thead><tr><th>Type</th><th>Actions</th></tr></thead><tbody><tr><td>Zabbix agent "system.uname"</td><td><a href="#">Edit</a> <a href="#">Remove</a></td></tr><tr><td><a href="#">Add</a></td><td></td></tr></tbody></table> |  | Type | Actions | Zabbix agent "system.uname" | <a href="#">Edit</a> <a href="#">Remove</a> | <a href="#">Add</a> |  |
| Type                        | Actions  |  |      |         |                             |   |                     |  |
| Zabbix agent "system.uname" | <a href="#">Edit</a> <a href="#">Remove</a>  |  |      |         |                             |   |                     |  |
| <a href="#">Add</a>         |  |  |      |         |                             |   |                     |  |
| Device uniqueness criteria  | <input checked="" type="radio"/> IP address<br><input type="radio"/> Zabbix agent "system.uname"   |  |      |         |                             |   |                     |  |
| Host name                   | <input type="radio"/> DNS name<br><input type="radio"/> IP address<br><input checked="" type="radio"/> Zabbix agent "system.uname"   |  |      |         |                             |   |                     |  |
| Visible name                | <input checked="" type="radio"/> Host name<br><input type="radio"/> DNS name<br><input type="radio"/> IP address<br><input type="radio"/> Zabbix agent "system.uname"  |  |      |         |                             |   |                     |  |
| Enabled                     | <input checked="" type="checkbox"/>  |  |      |         |                             |   |                     |  |

Zabbix will try to discover hosts in the IP range of 192.168.1.1-192.168.1.254 by connecting to Zabbix agents and getting the value from the **system.uname** key. The value received from the agent can be used to name the hosts and also to apply different actions

for different operating systems. For example, link Windows servers to the template *Windows*, Linux servers to the template *Linux*.

The rule will be executed every 10 minutes.

When this rule is added, Zabbix will automatically start the discovery and generation of the discovery-based events for further processing.

## Step 2

Defining a discovery **action** for adding the discovered Linux servers to the respective group/template.

| Action              | Operations  |       |      |   |                                      |   |                                   |   |   |   |  |
|---------------------|---|-------|------|---|--------------------------------------|---|-----------------------------------|---|---|---|--|
| * Name              | Add discovered Linux servers  |       |      |   |                                      |   |                                   |   |   |   |  |
| Type of calculation | And <span>▼</span> A and B and C and D  |       |      |   |                                      |   |                                   |   |   |   |  |
| Conditions          | <table><thead><tr><th>Label</th><th>Name</th></tr></thead><tbody><tr><td>A</td><td>Received value contains <i>Linux</i></td></tr><tr><td>B</td><td>Discovery status equals <i>Up</i></td></tr><tr><td>C</td><td>Service type equals <i>Zabbix agent</i></td></tr><tr><td>D</td><td>Uptime/Downtime is greater than or equals 3600</td></tr></tbody></table> <a href="#">Add</a> | Label | Name | A | Received value contains <i>Linux</i> | B | Discovery status equals <i>Up</i> | C | Service type equals <i>Zabbix agent</i> | D | Uptime/Downtime is greater than or equals 3600 |
| Label               | Name  |       |      |   |                                      |   |                                   |   |   |   |  |
| A                   | Received value contains <i>Linux</i>  |       |      |   |                                      |   |                                   |   |   |   |  |
| B                   | Discovery status equals <i>Up</i>   |       |      |   |                                      |   |                                   |   |   |   |  |
| C                   | Service type equals <i>Zabbix agent</i>   |       |      |   |                                      |   |                                   |   |   |   |  |
| D                   | Uptime/Downtime is greater than or equals 3600  |       |      |   |                                      |   |                                   |   |   |   |  |

The action will be activated if:

- the "Zabbix agent" service is "up"
- the value of system.uname (the Zabbix agent key we used in rule definition) contains "Linux"
- Uptime is 1 hour (3600 seconds) or more

| Action          | Operations  |
|-----------------|---|
| Default subject | Discovery: {DISCOVERY.DEVICE.STATUS}, {DISCOVERY.DEVICE.IPADDRESS}  |
| Default message | Discovery rule: {DISCOVERY.RULE.NAME}<br><br>Device IP: {DISCOVERY.DEVICE.IPADDRESS}<br>Device DNS: {DISCOVERY.DEVICE.DNS}<br>Device status: {DISCOVERY.DEVICE.STATUS}<br>Device uptime: {DISCOVERY.DEVICE.UPTIME}<br><br>Device service name: {DISCOVERY.SERVICE.NAME} |
| Operations      | <a href="#">Details</a><br><b>Add to host groups:</b> Linux servers<br><b>Link to templates:</b> Linux<br><a href="#">Add</a>   |

The action will execute the following operations:

- add the discovered host to the "Linux servers" group (and also add host if it wasn't added previously)

- link host to the *Linux* template. Zabbix will automatically start monitoring the host using items and triggers from the "Linux" template.

### Step 3

Defining a discovery action for adding the discovered Windows servers to the respective group/template.

| Action              | Operations  |       |      |   |  |   |                                   |   |   |   |  |
|---------------------|---|-------|------|---|--|---|-----------------------------------|---|---|---|--|
| * Name              | Add discovered Windows servers  |       |      |   |  |   |                                   |   |   |   |  |
| Type of calculation | And <span>▼</span> A and B and C and D  |       |      |   |  |   |                                   |   |   |   |  |
| Conditions          | <table border="1"> <thead> <tr> <th>Label</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>Received value contains <i>Windows</i></td> </tr> <tr> <td>B</td> <td>Discovery status equals <i>Up</i></td> </tr> <tr> <td>C</td> <td>Service type equals <i>Zabbix agent</i></td> </tr> <tr> <td>D</td> <td>Uptime/Downtime is greater than or equals 3600</td> </tr> </tbody> </table> <a href="#">Add</a> | Label | Name | A | Received value contains <i>Windows</i> | B | Discovery status equals <i>Up</i> | C | Service type equals <i>Zabbix agent</i> | D | Uptime/Downtime is greater than or equals 3600 |
| Label               | Name  |       |      |   |  |   |                                   |   |   |   |  |
| A                   | Received value contains <i>Windows</i>  |       |      |   |  |   |                                   |   |   |   |  |
| B                   | Discovery status equals <i>Up</i>   |       |      |   |  |   |                                   |   |   |   |  |
| C                   | Service type equals <i>Zabbix agent</i>   |       |      |   |  |   |                                   |   |   |   |  |
| D                   | Uptime/Downtime is greater than or equals 3600  |       |      |   |  |   |                                   |   |   |   |  |

| Action          | Operations  |
|-----------------|---|
| Default subject | Discovery: {DISCOVERY.DEVICE.STATUS}, {DISCOVERY.DEVICE.IPADDRESS}  |
| Default message | Discovery rule: {DISCOVERY.RULE.NAME}<br><br>Device IP: {DISCOVERY.DEVICE.IPADDRESS}<br>Device DNS: {DISCOVERY.DEVICE.DNS}<br>Device status: {DISCOVERY.DEVICE.STATUS}<br>Device uptime: {DISCOVERY.DEVICE.UPTIME}<br><br>Device service name: {DISCOVERY.SERVICE.NAME} |
| Operations      | Details<br><b>Add to host groups:</b> Windows servers<br><br><b>Link to templates:</b> Windows<br><br><a href="#">Add</a>   |

### Step 4

Defining a discovery action for removing lost servers.

| Action              | Operations  |       |      |   |   |   |                              |   |                                  |
|---------------------|---|-------|------|---|---|---|------------------------------|---|----------------------------------|
| * Name              | Remove lost servers   |       |      |   |   |   |                              |   |                                  |
| Type of calculation | And <span>▼</span> A and B and C  |       |      |   |   |   |                              |   |                                  |

A server will be removed if "Zabbix agent" service is 'down' for more than 24 hours (86400 seconds).

## 2 Active agent autoregistration

### Overview

It is possible to allow active Zabbix agent autoregistration, after which the server can start monitoring them. This way new hosts can be added for monitoring without configuring them manually on the server.

Autoregistration can happen when a previously unknown active agent asks for checks.

The feature might be very handy for automatic monitoring of new Cloud nodes. As soon as you have a new node in the Cloud Zabbix will automatically start the collection of performance and availability data of the host.

Active agent autoregistration also supports the monitoring of added hosts with passive checks. When the active agent asks for checks, providing it has the 'ListenIP' or 'ListenPort' configuration parameters defined in the configuration file, these are sent along to the server. (If multiple IP addresses are specified, the first one is sent to the server.)

Server, when adding the new autoregistered host, uses the received IP address and port to configure the agent. If no IP address value is received, the one used for the incoming connection is used. If no port value is received, 10050 is used.

It is possible to specify that the host should be autoregistered with a **DNS name** as the default agent interface.

Autoregistration is rerun:

- if host **metadata** information changes:
  - due to HostMetadata changed and agent restarted
  - due to value returned by HostMetadataItem changed
- for manually created hosts with metadata missing
- if a host is manually changed to be monitored by another Zabbix proxy
- if autoregistration for the same host comes from a new Zabbix proxy

## Configuration

### Specify server

Make sure you have the Zabbix server identified in the agent **configuration file** - `zabbix_agentd.conf`

`ServerActive=10.0.0.1`

Unless you specifically define a *Hostname* in `zabbix_agentd.conf`, the system hostname of agent location will be used by server for naming the host. The system hostname in Linux can be obtained by running the 'hostname' command.

If *Hostname* is defined in Zabbix agent configuration as a comma-delimited list of hosts, hosts will be created for all listed host-names.

Restart the agent after making any changes to the configuration file.

### Action for active agent autoregistration

When server receives an autoregistration request from an agent it calls an **action**. An action of event source "Autoregistration" must be configured for agent autoregistration.

#### Note:

Setting up **network discovery** is not required to have active agents autoregister.

In the Zabbix frontend, go to *Configuration* → *Actions*, select *Autoregistration actions* and click on *Create action*:

- In the Action tab, give your action a name
- Optionally specify **conditions**. You can do a substring match or regular expression match in the conditions for host name/host metadata. If you are going to use the "Host metadata" condition, see the next section.
- In the Operations tab, add relevant operations, such as - 'Add host', 'Add to host group' (for example, *Discovered hosts*), 'Link to templates', etc.

#### Note:

If the hosts that will be autoregistering are likely to be supported for active monitoring only (such as hosts that are firewalled from your Zabbix server) then you might want to create a specific template like *Template\_Linux-active* to link to.

Created hosts are added to the *Discovered hosts* group (by default, configurable in *Administration* → *General* → **Other**). If you wish hosts to be added to another group, add a *Remove from host group* operation (specifying "Discovered hosts") and also add an *Add to host group* operation (specifying another host group), because a host must belong to a host group.

### Secure autoregistration

A secure way of autoregistration is possible by configuring PSK-based authentication with encrypted connections.

The level of encryption is configured globally in *Administration* → *General* → **Autoregistration**. It is possible to select no encryption, TLS encryption with PSK authentication or both (so that some hosts may register without encryption while others through encryption).

Authentication by PSK is verified by Zabbix server before adding a host. If successful, the host is added and **Connections from/to host** are set to 'PSK' only with identity/pre-shared key the same as in the global autoregistration setting.

#### Attention:

To ensure security of autoregistration on installations using proxies, encryption between Zabbix server and proxy should be enabled.

### Using DNS as default interface

HostInterface and HostInterfaceItem **configuration parameters** allow to specify a custom value for the host interface during autoregistration.

More specifically, they are useful if the host should be autoregistered with a DNS name as the default agent interface rather than its IP address. In that case the DNS name should be specified or returned as the value of either HostInterface or HostInterfaceItem

parameters. Note that if the value of one of the two parameters changes, the autoregistered host interface is updated. So it is possible to update the default interface to another DNS name or update it to an IP address. For the changes to take effect though, the agent has to be restarted.

**Note:**

If `HostInterface` or `HostInterfaceItem` parameters are not configured, the `listen_dns` parameter is resolved from the IP address. If such resolving is configured incorrectly, it may break autoregistration because of invalid hostname.

#### Using host metadata

When agent is sending an autoregistration request to the server it sends its hostname. In some cases (for example, Amazon cloud nodes) a hostname is not enough for Zabbix server to differentiate discovered hosts. Host metadata can be optionally used to send other information from an agent to the server.

Host metadata is configured in the agent **configuration file** - `zabbix_agentd.conf`. There are 2 ways of specifying host metadata in the configuration file:

`HostMetadata`

`HostMetadataItem`

See the description of the options in the link above.

**Attention:**

An autoregistration attempt happens every time an active agent sends a request to refresh active checks to the server. The delay between requests is specified in the **RefreshActiveChecks** parameter of the agent. The first request is sent immediately after the agent is restarted.

#### Example 1

Using host metadata to distinguish between Linux and Windows hosts.

Say you would like the hosts to be autoregistered by the Zabbix server. You have active Zabbix agents (see "Configuration" section above) on your network. There are Windows hosts and Linux hosts on your network and you have "Linux by Zabbix agent" and "Windows by Zabbix agent" templates available in your Zabbix frontend. So at host registration, you would like the appropriate Linux/Windows template to be applied to the host being registered. By default, only the hostname is sent to the server at autoregistration, which might not be enough. In order to make sure the proper template is applied to the host you should use host metadata.

#### Frontend configuration

The first thing to do is to configure the frontend. Create 2 actions. The first action:

- Name: Linux host autoregistration
- Conditions: Host metadata contains *Linux*
- Operations: Link to templates: Linux

**Note:**

You can skip an "Add host" operation in this case. Linking to a template requires adding a host first so the server will do that automatically.

The second action:

- Name: Windows host autoregistration
- Conditions: Host metadata contains *Windows*
- Operations: Link to templates: Windows

#### Agent configuration

Now you need to configure the agents. Add the next line to the agent configuration files:

```
HostMetadataItem=system.uname
```

This way you make sure host metadata will contain "Linux" or "Windows" depending on the host an agent is running on. An example of host metadata in this case:

```
Linux: Linux server3 3.2.0-4-686-pae #1 SMP Debian 3.2.41-2 i686 GNU/Linux
```

```
Windows: Windows WIN-OPXGGSTYNH0 6.0.6001 Windows Server 2008 Service Pack 1 Intel IA-32
```

Do not forget to restart the agent after making any changes to the configuration file.

#### Example 2

## Step 1

Using host metadata to allow some basic protection against unwanted hosts registering.

### Frontend configuration

Create an action in the frontend, using some hard-to-guess secret code to disallow unwanted hosts:

- Name: Autoregistration action Linux
- Conditions:
  - Type of calculation: AND
  - Condition (A): Host metadata contains //Linux//
  - Condition (B): Host metadata contains //21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae//
- Operations:
  - Send message to users: Admin via all media
  - Add to host groups: Linux servers
  - Link to templates: Linux

Please note that this method alone does not provide strong protection because data is transmitted in plain text. Configuration cache reload is required for changes to have an immediate effect.

### Agent configuration

Add the next line to the agent configuration file:

```
HostMetadata=Linux 21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
```

where "Linux" is a platform, and the rest of the string is the hard-to-guess secret text.

Do not forget to restart the agent after making any changes to the configuration file.

## Step 2

It is possible to add additional monitoring for an already registered host.

### Frontend configuration

Update the action in the frontend:

- Name: Autoregistration action Linux
- Conditions:
  - Type of calculation: AND
  - Condition (A): Host metadata contains Linux
  - Condition (B): Host metadata contains 21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
- Operations:
  - Send message to users: Admin via all media
  - Add to host groups: Linux servers
  - Link to templates: Linux
  - Link to templates: MySQL by Zabbix Agent

### Agent configuration

Update the next line in the agent configuration file:

```
HostMetadata=MySQL on Linux 21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
```

Do not forget to restart the agent after making any changes to the configuration file.

## 3 Low-level discovery

**Overview** Low-level discovery provides a way to automatically create items, triggers, and graphs for different entities on a computer. For instance, Zabbix can automatically start monitoring file systems or network interfaces on your machine, without the need to create items for each file system or network interface manually. Additionally, it is possible to configure Zabbix to remove unneeded entities automatically based on actual results of periodically performed discovery.

A user can define their own types of discovery, provided they follow a particular JSON protocol.

The general architecture of the discovery process is as follows.

First, a user creates a discovery rule in "Configuration" → "Templates" → "Discovery" column. A discovery rule consists of (1) an item that discovers the necessary entities (for instance, file systems or network interfaces) and (2) prototypes of items, triggers, and graphs that should be created based on the value of that item.

An item that discovers the necessary entities is like a regular item seen elsewhere: the server asks a Zabbix agent (or whatever the type of the item is set to) for a value of that item, the agent responds with a textual value. The difference is that the value the agent responds with should contain a list of discovered entities in a JSON format. While the details of this format are only important for implementers of custom discovery checks, it is necessary to know that the returned value contains a list of macro → value pairs. For instance, item "net.if.discovery" might return two pairs: "{#IFNAME}" → "lo" and "{#IFNAME}" → "eth0".

These macros are used in names, keys and other prototype fields where they are then substituted with the received values for creating real items, triggers, graphs or even hosts for each discovered entity. See the full list of [options](#) for using LLD macros.

When the server receives a value for a discovery item, it looks at the macro → value pairs and for each pair generates real items, triggers, and graphs, based on their prototypes. In the example with "net.if.discovery" above, the server would generate one set of items, triggers, and graphs for the loopback interface "lo", and another set for interface "eth0".

Note that since **Zabbix 4.2**, the format of the JSON returned by low-level discovery rules has been changed. It is no longer expected that the JSON will contain the "data" object. Low-level discovery will now accept a normal JSON containing an array, in order to support new features such as the item value preprocessing and custom paths to low-level discovery macro values in a JSON document.

Built-in discovery keys have been updated to return an array of LLD rows at the root of JSON document. Zabbix will automatically extract a macro and value if an array field uses the {#MACRO} syntax as a key. Any new native discovery checks will use the new syntax without the "data" elements. When processing a low-level discovery value first the root is located (array at \$. or \$.data).

While the "data" element has been removed from all native items related to discovery, for backward compatibility Zabbix will still accept the JSON notation with a "data" element, though its use is discouraged. If the JSON contains an object with only one "data" array element, then it will automatically extract the content of the element using JSONPath \$.data. Low-level discovery now accepts optional user-defined LLD macros with a custom path specified in JSONPath syntax.

**Warning:**  
As a result of the changes above, newer agents no longer will be able to work with an older Zabbix server.

See also: [Discovered entities](#)

**Configuring low-level discovery** We will illustrate low-level discovery based on an example of file system discovery.

To configure the discovery, do the following:

- Go to: *Configuration* → *Templates* or *Hosts*
- Click on *Discovery* in the row of an appropriate template/host

## Templates

| <input type="checkbox"/> Name ▲         | Hosts | Items    | Triggers    | Graphs   | Dashboards   | Discovery   |
|---|-------|----------|-------------|----------|--------------|-------------|
| <input type="checkbox"/> Linux OS agent | Hosts | Items 43 | Triggers 15 | Graphs 8 | Dashboards 3 | Discovery 3 |

- Click on *Create discovery rule* in the upper right corner of the screen
- Fill in the discovery rule form with the required details

### Discovery rule

The discovery rule form contains five tabs, representing, from left to right, the data flow during discovery:

- *Discovery rule* - specifies, most importantly, the built-in item or custom script to retrieve discovery data
- *Preprocessing* - applies some preprocessing to the discovered data
- *LLD macros* - allows to extract some macro values to use in discovered items, triggers, etc
- *Filters* - allows to filter the discovered values
- *Overrides* - allows to modify items, triggers, graphs or host prototypes when applying to specific discovered objects

The **Discovery rule** tab contains the item key to use for discovery (as well as some general discovery rule attributes):

| Parameter               | Description   |
|-------------------------|---|
| <i>Name</i>             | Name of discovery rule.   |
| <i>Type</i>             | The type of check to perform discovery.<br>In this example we are using a <i>Zabbix agent</i> item type.<br>The discovery rule can also be a <b>dependent item</b> , depending on a regular item. It cannot depend on another discovery rule. For a dependent item, select the respective type ( <i>Dependent item</i> ) and specify the master item in the 'Master item' field. The master item must exist.  |
| <i>Key</i>              | Enter the discovery item key (up to 2048 characters).<br>For example, you may use the built-in "vfs.fs.discovery" item key to return a JSON with the list of file systems present on the computer and their types.<br>Note that another option for filesystem discovery is using discovery results by the "vfs.fs.get" agent key, supported since Zabbix 4.4.5 (see <b>example</b> ).   |
| <i>Update interval</i>  | This field specifies how often Zabbix performs discovery. In the beginning, when you are just setting up file system discovery, you might wish to set it to a small interval, but once you know it works you can set it to 30 minutes or more, because file systems usually do not change very often.<br><b>Time suffixes</b> are supported, e.g. 30s, 1m, 2h, 1d, since Zabbix 3.4.0.<br><b>User macros</b> are supported, since Zabbix 3.4.0.<br><i>Note:</i> The update interval can only be set to '0' if custom intervals exist with a non-zero value. If set to '0', and a custom interval (flexible or scheduled) exists with a non-zero value, the item will be polled during the custom interval duration.<br><i>Note</i> that for an existing discovery rule the discovery can be performed immediately by pushing the <b>Check now</b> button. |
| <i>Custom intervals</i> | You can create custom rules for checking the item:<br><b>Flexible</b> - create an exception to the <i>Update interval</i> (interval with different frequency)<br><b>Scheduling</b> - create a custom polling schedule.<br>For detailed information see <b>Custom intervals</b> . Scheduling is supported since Zabbix 3.0.0.  |

| Parameter                         | Description  |
|-----------------------------------|--|
| <i>Keep lost resources period</i> | This field allows you to specify the duration for how long the discovered entity will be retained (won't be deleted) once its discovery status becomes "Not discovered anymore" (between 1 hour to 25 years; or "0").<br><b>Time suffixes</b> are supported, e.g. 2h, 1d, since Zabbix 3.4.0.<br><b>User macros</b> are supported, since Zabbix 3.4.0.<br><i>Note:</i> If set to "0", entities will be deleted immediately. Using "0" is not recommended, since just wrongly editing the filter may end up in the entity being deleted with all the historical data. |
| <i>Description</i>                | Enter a description.   |
| <i>Enabled</i>                    | If checked, the rule will be processed.  |

**Note:**

Discovery rule history is not preserved.

## Preprocessing

The **Preprocessing** tab allows to define transformation rules to apply to the result of discovery. One or several transformations are possible in this step. Transformations are executed in the order in which they are defined. All preprocessing is done by Zabbix server.

| <i>XML XPath</i>                         | <p>Extract value or fragment from XML data using XPath functionality.</p> <p>For this option to work, Zabbix server must be compiled with libxml support.</p> <p>Examples:</p> <p><code>number(/document/item/value)</code> will extract 10 from<br/> <code>&lt;document&gt;&lt;item&gt;&lt;value&gt;10&lt;/value&gt;&lt;/item&gt;&lt;/document&gt;</code></p> <p><code>number(/document/item/@attribute)</code> will extract 10 from <code>&lt;document&gt;&lt;item attribute="10"&gt;&lt;/item&gt;&lt;/document&gt;</code></p> <p><code>/document/item</code> will extract <code>&lt;item&gt;&lt;value&gt;10&lt;/value&gt;&lt;/item&gt;</code> from<br/> <code>&lt;document&gt;&lt;item&gt;&lt;value&gt;10&lt;/value&gt;&lt;/item&gt;&lt;/document&gt;</code></p> <p>Note that namespaces are not supported.</p> <p>Supported since 4.4.0.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.</p> |
| <i>CSV to JSON</i>                       | <p>Convert CSV file data into JSON format.</p> <p>For more information, see: <a href="#">CSV to JSON preprocessing</a>.</p> <p>Supported since 4.4.0.</p>   |
| <i>XML to JSON</i>                       | <p>Convert data in XML format to JSON.</p> <p>For more information, see: <a href="#">Serialization rules</a>.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.</p>  |
| Custom scripts                           |   |
| <i>JavaScript</i>                        | <p>Enter JavaScript code in the block that appears when clicking in the parameter field or on the pencil icon.</p> <p>Note that available JavaScript length depends on the <a href="#">database used</a>.</p> <p>For more information, see: <a href="#">Javascript preprocessing</a></p>  |
| Validation                               |   |
| <i>Does not match regular expression</i> | <p>Specify a regular expression that a value must not match.</p> <p>E.g. <code>Error: (.*)\.</code></p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.</p>  |
| <i>Check for error in JSON</i>           | <p>Check for an application-level error message located at JSONPath. Stop processing if succeeded and message is not empty; otherwise continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to user as is, without adding preprocessing step information.</p> <p>E.g. <code>\$.errors</code>. If a JSON like <code>{"errors": "e1"}</code> is received, the next preprocessing step will not be executed.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.</p>   |
| <i>Check for error in XML</i>            | <p>Check for an application-level error message located at xpath. Stop processing if succeeded and message is not empty; otherwise continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to user as is, without adding preprocessing step information.</p> <p>No error will be reported in case of failing to parse invalid XML.</p> <p>Supported since 4.4.0.</p> <p>If you mark the <i>Custom on fail</i> checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.</p>  |
| Throttling                               |   |
| <i>Discard unchanged with heartbeat</i>  | <p>Discard a value if it has not changed within the defined time period (in seconds).</p> <p>Positive integer values are supported to specify the seconds (minimum - 1 second). Time suffixes can be used in this field (e.g. 30s, 1m, 2h, 1d). User macros and low-level discovery macros can be used in this field.</p> <p>Only one throttling option can be specified for a discovery item.</p> <p>E.g. 1m. If identical text is passed into this rule twice within 60 seconds, it will be discarded.</p> <p><i>Note:</i> Changing item prototypes does not reset throttling. Throttling is reset only when preprocessing steps are changed.</p>   |

| Type  |
|---|
| Prometheus  |
| <i>Prometheus to JSON</i> Convert required Prometheus metrics to JSON.<br>See <a href="#">Prometheus checks</a> for more details. |

Note that if the discovery rule has been applied to the host via template then the content of this tab is read-only.

Custom macros

The **LLD macros** tab allows to specify custom low-level discovery macros.

Custom macros are useful in cases when the returned JSON does not have the required macros already defined. So, for example:

- The native `vfs.fs.discovery` key for filesystem discovery returns a JSON with some pre-defined LLD macros such as `{#FSNAME}`, `{#FSTYPE}`. These macros can be used in item, trigger prototypes (see subsequent sections of the page) directly; defining custom macros is not needed;
- The `vfs.fs.get` agent item also returns a JSON with **filesystem data**, but without any pre-defined LLD macros. In this case you may define the macros yourself, and map them to the values in the JSON using JSONPath:

Discovery rule   Preprocessing   **LLD macros 2**   Filters   Overrides

LLD macros

LLD macro

JSONPath

{#FSNAME}

\$.fsname

{#FSTYPE}

\$.fstype

Add

The extracted values can be used in discovered items, triggers, etc. Note that values will be extracted from the result of discovery and any preprocessing steps so far.

| Parameter | Description   |
|-----------|---|
| LLD macro | Name of the low-level discovery macro, using the following syntax: <code>{#MACRO}</code> .  |
| JSONPath  | Path that is used to extract LLD macro value from an LLD row, using JSONPath syntax.<br>The values extracted from the returned JSON are used to replace the LLD macros in item, trigger, etc. prototype fields.<br>JSONPath can be specified using the dot notation or the bracket notation. Bracket notation should be used in case of any special characters and Unicode, like <code>\$['unicode + special chars #1']</code> [ <code>'unicode + special chars #2'</code> ].<br><br>For example, <code>\$.foo</code> will extract "bar" and "baz" from this JSON: <code>[{"foo": "bar"}, {"foo": "baz"}]</code><br>Note that <code>\$.foo</code> will extract "bar" and "baz" also from this JSON: <code>{"data": [{"foo": "bar"}, {"foo": "baz"}]}</code> because a single "data" object is processed automatically (for <b>backwards compatibility</b> with the low-level discovery implementation in Zabbix versions before 4.2). |

Filter

A filter can be used to generate real items, triggers, and graphs only for entities that match the criteria. The **Filters** tab contains discovery rule filter definitions allowing to filter discovery values:

Discovery rule   Preprocessing   LLD macros   **Filters 4**   Overrides

Type of calculation

And   (A and B) and (C and D)

Filters

does not match

{\$VFS.FS.FSTYPE.NOT\_MATCHES}

Add

| Parameter                  | Description  |
|----------------------------|--|
| <i>Type of calculation</i> | <p>The following options for calculating filters are available:</p> <p><b>And</b> - all filters must be passed;</p> <p><b>Or</b> - enough if one filter is passed;</p> <p><b>And/Or</b> - uses <i>And</i> with different macro names and <i>Or</i> with the same macro name;</p> <p><b>Custom expression</b> - offers the possibility to define a custom calculation of filters. The formula must include all filters in the list. Limited to 255 symbols.</p>   |
| <i>Filters</i>             | <p>The following filter condition operators are available: <i>matches</i>, <i>does not match</i>, <i>exists</i>, <i>does not exist</i>.</p> <p><i>Matches</i> and <i>does not match</i> operators expect a <a href="#">Perl Compatible Regular Expression</a> (PCRE). For instance, if you are only interested in C:, D:, and E: file systems, you could put {#FSNAME} into "Macro" and "^C ^D ^E" regular expression into "Regular expression" text fields. Filtering is also possible by file system types using {#FSTYPE} macro (e.g. "^ext ^reiserfs") and by drive types (supported only by Windows agent) using {#FSDRIVETYPE} macro (e.g., "fixed"). You can enter a regular expression or reference a global <a href="#">regular expression</a> in "Regular expression" field.</p> <p>In order to test a regular expression you can use "grep -E", for example: <code>for f in ext2 nfs reiserfs smbfs; do echo \$f   grep -E '^ext ^reiserfs'    echo "SKIP: \$f"; done</code></p> <p>{#FSDRIVETYPE} macro on Windows is supported since Zabbix <b>3.0.0</b>.</p> <p><i>Exists</i> and <i>does not exist</i> operators allow to filter entities based on the presence or absence of the specified LLD macro in the response (supported since version 5.4.0). Defining several filters is supported since Zabbix <b>2.4.0</b>.</p> <p>Note that if a macro from the filter is missing in the response, the found entity will be ignored, unless a "does not exist" condition is specified for this macro.</p> <p>A warning will be displayed, if the absence of a macro affects the expression result. For example, if {#B} is missing in:</p> <p>{#A} matches 1 and {#B} matches 2 - will give a warning</p> <p>{#A} matches 1 or {#B} matches 2 - no warning.</p> <p>This flexible warning logic is supported since Zabbix 6.0.11.</p> |

#### Warning:

A mistake or a typo in the regular expression used in the LLD rule (for example, an incorrect "File systems for discovery" regular expression) may cause deletion of thousands of configuration elements, historical values, and events for many hosts.

#### Attention:

Zabbix database in MySQL must be created as case-sensitive if file system names that differ only by case are to be discovered correctly.

## Override

The **Override** tab allows setting rules to modify the list of item, trigger, graph and host prototypes or their attributes for discovered objects that meet given criteria.

| Discovery rule | Preprocessing | LLD macros                           | Filters         | Overrides 1            |
|----------------|---------------|--------------------------------------|-----------------|------------------------|
| Overrides      |               |                                      |                 |                        |
|                |               | Name                                 | Stop processing | Action                 |
|                |               | 1: Set trigger with threshold of 50% | Yes             | <a href="#">Remove</a> |
|                |               | <a href="#">Add</a>                  |                 |                        |

Overrides (if any) are displayed in a reorderable drag-and-drop list and executed in the order in which they are defined. To configure details of a new override, click on [Add](#) in the *Overrides* block. To edit an existing override, click on the override name. A popup

window will open allowing to edit the override rule details.

| <i>Condition</i>  | Allows filtering entities to which the operation should be applied.   |
| <i>Operator</i>   | Supported operators:<br><b>equals</b> - apply to this prototype<br><b>does not equal</b> - apply to all prototypes, except this<br><b>contains</b> - apply, if prototype name contains this string<br><b>does not contain</b> - apply, if prototype name does not contain this string<br><b>matches</b> - apply, if prototype name matches regular expression<br><b>does not match</b> - apply, if prototype name does not match regular expression |
| <i>Pattern</i>  | A <b>regular expression</b> or a string to search for.  |
| <i>Object:</i><br><i>Item</i><br><i>pro-</i><br><i>to-</i><br><i>type</i> |   |
| <i>Create enabled</i>   | When the checkbox is marked, the buttons will appear, allowing to override original item prototype settings:<br><i>Yes</i> - the item will be added in an enabled state.<br><i>No</i> - the item will be added to a discovered entity but in a disabled state.  |
| <i>Discover</i>   | When the checkbox is marked, the buttons will appear, allowing to override original item prototype settings:<br><i>Yes</i> - the item will be added.<br><i>No</i> - the item will not be added.   |
| <i>Update interval</i>  | When the checkbox is marked, two options will appear, allowing to set different interval for the item:<br><i>Delay</i> - Item update interval. <b>User macros</b> and <b>time suffixes</b> (e.g. 30s, 1m, 2h, 1d) are supported. Should be set to 0 if <i>Custom interval</i> is used.<br><i>Custom interval</i> - click <a href="#">Add</a> to specify flexible/scheduling intervals. For detailed information see <b>Custom intervals</b> .       |
| <i>History storage period</i>   | When the checkbox is marked, the buttons will appear, allowing to set different history storage period for the item:<br><i>Do not keep history</i> - if selected, the history will not be stored.<br><i>Storage period</i> - if selected, an input field for specifying storage period will appear to the right. <b>User macros</b> and <b>LLD macros</b> are supported.  |

| Parameter                           | Description  |
|-------------------------------------|--|
| <i>Trend storage period</i>         | When the checkbox is marked, the buttons will appear, allowing to set different trend storage period for the item:<br><i>Do not keep trends</i> - if selected, the trends will not be stored.<br><i>Storage period</i> - if selected, an input field for specifying storage period will appear to the right. <b>User macros</b> and <b>LLD macros</b> are supported. |
| <i>Tags</i>                         | When the checkbox is marked, a new block will appear, allowing to specify tag-value pairs.<br>These tags will be appended to the tags specified in the item prototype, even if the tag names match.  |
| Object:<br><i>Trigger prototype</i> |  |
| <i>Create enabled</i>               | When the checkbox is marked, the buttons will appear, allowing to override original trigger prototype settings:<br><i>Yes</i> - the trigger will be added in an enabled state.<br><i>No</i> - the trigger will be added to a discovered entity, but in a disabled state.   |
| <i>Discover</i>                     | When the checkbox is marked, the buttons will appear, allowing to override original trigger prototype settings:<br><i>Yes</i> - the trigger will be added.<br><i>No</i> - the trigger will not be added.   |
| <i>Severity</i>                     | When the checkbox is marked, trigger severity buttons will appear, allowing to modify trigger severity.  |
| <i>Tags</i>                         | When the checkbox is marked, a new block will appear, allowing to specify tag-value pairs.<br>These tags will be appended to the tags specified in the trigger prototype, even if the tag names match.   |
| Object:<br><i>Graph prototype</i>   |  |
| <i>Discover</i>                     | When the checkbox is marked, the buttons will appear, allowing to override original graph prototype settings:<br><i>Yes</i> - the graph will be added.<br><i>No</i> - the graph will not be added.   |
| Object:<br><i>Host prototype</i>    |  |
| <i>Create enabled</i>               | When the checkbox is marked, the buttons will appear, allowing to override original host prototype settings:<br><i>Yes</i> - the host will be created in an enabled state.<br><i>No</i> - the host will be created in a disabled state.  |
| <i>Discover</i>                     | When the checkbox is marked, the buttons will appear, allowing to override original host prototype settings:<br><i>Yes</i> - the host will be discovered.<br><i>No</i> - the host will not be discovered.  |
| <i>Link templates</i>               | When the checkbox is marked, an input field for specifying templates will appear. Start typing the template name or click on <i>Select</i> next to the field and select templates from the list in a popup window.<br>All templates linked to a host prototype will be replaced by templates from this override.   |
| <i>Tags</i>                         | When the checkbox is marked, a new block will appear, allowing to specify tag-value pairs.<br>These tags will be appended to the tags specified in the host prototype, even if the tag names match.  |

| Parameter             | Description  |
|-----------------------|--|
| <i>Host inventory</i> | When the checkbox is marked, the buttons will appear, allowing to select different inventory <b>mode</b> for the host prototype:<br><i>Disabled</i> - do not populate host inventory<br><i>Manual</i> - provide details manually<br><i>Automated</i> - auto-fill host inventory data based on collected metrics. |

Form buttons

Buttons at the bottom of the form allow to perform several operations.

|                    |   |
|--------------------|---|
| <b>Add</b>         | Add a discovery rule. This button is only available for new discovery rules.  |
| <b>Update</b>      | Update the properties of a discovery rule. This button is only available for existing discovery rules.  |
| <b>Clone</b>       | Create another discovery rule based on the properties of the current discovery rule.  |
| <b>Execute now</b> | Perform discovery based on the discovery rule immediately. The discovery rule must already exist. See <b>more details</b> .<br>Note that when performing discovery immediately, configuration cache is not updated, thus the result will not reflect very recent changes to discovery rule configuration. |
| <b>Test</b>        | Test the discovery rule configuration. Use this button to verify the configuration settings (such as connectivity and parameter correctness) without permanently applying any changes.  |
| <b>Delete</b>      | Delete the discovery rule.  |
| <b>Cancel</b>      | Cancel the editing of discovery rule properties.  |

**Discovered entities** The screenshots below illustrate how discovered items, triggers, and graphs look like in the host’s configuration. Discovered entities are prefixed with an orange link to a discovery rule they come from.

Items

| All hosts / Zabbix server   Enabled <b>ZBX</b> SNMP   IPMI   JMX <b>Items 140</b> Triggers 77   Graphs 14   Discovery rules 6   Web scenarios |   |            |                                 |          |
|---|---|------------|---------------------------------|----------|
| <input type="checkbox"/>  | Name ▲  | Triggers   | Key                             | Interval |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">Get filesystems</a> : FS [/]: Get data            |            | vfs.fs.dependent[/,data]        |          |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">FS [/]: Get data</a> : FS [/]: Inodes: Free, in % | Triggers 2 | vfs.fs.dependent.inode[/,pfree] |          |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">FS [/]: Get data</a> : FS [/]: Option: Read-only  | Triggers 1 | vfs.fs.dependent[/,readonly]    |          |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">FS [/]: Get data</a> : FS [/]: Space: Available   |            | vfs.fs.dependent.size[/,free]   |          |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">FS [/]: Get data</a> : FS [/]: Space: Total       |            | vfs.fs.dependent.size[/,total]  |          |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">FS [/]: Get data</a> : FS [/]: Space: Used        |            | vfs.fs.dependent.size[/,used]   |          |
| <input type="checkbox"/>  | ... Mounted filesystem discovery: <a href="#">FS [/]: Get data</a> : FS [/]: Space: Used, in %  | Triggers 2 | vfs.fs.dependent.size[/,pused]  |          |

Note that discovered entities will not be created in case there are already existing entities with the same uniqueness criteria, for example, an item with the same key or graph with the same name. An error message is displayed in this case in the frontend that the low-level discovery rule could not create certain entities. The discovery rule itself, however, will not turn unsupported because some entity could not be created and had to be skipped. The discovery rule will go on creating/updating other entities.

Items (similarly, triggers and graphs) created by a low-level discovery rule will be deleted automatically if a discovered entity (file system, interface, etc) stops being discovered (or does not pass the filter anymore). In this case the items, triggers and graphs will be deleted after the days defined in the *Keep lost resources period* field pass.

When discovered entities become 'Not discovered anymore', a lifetime indicator is displayed in the item list. Move your mouse pointer over it and a message will be displayed indicating how many days are left until the item is deleted.

1m
7d
1y
Zabbix agent
Enabled

The item is not discovered anymore and will be deleted in 29d 23h 44m (on 2015-08-31 at 23:27).

If entities were marked for deletion, but were not deleted at the expected time (disabled discovery rule or item host), they will be deleted the next time the discovery rule is processed.

Entities containing other entities, which are marked for deletion, will not update if changed on the discovery rule level. For example, LLD-based triggers will not update if they contain items that are marked for deletion.

**Other types of discovery** More detail and how-tos on other types of out-of-the-box discovery is available in the following sections:

- discovery of **network interfaces**;
- discovery of **CPUs and CPU cores**;
- discovery of **SNMP OIDs**;
- discovery of **JMX objects**;
- discovery using **ODBC SQL queries**;
- discovery of **Windows services**;
- discovery of **host interfaces** in Zabbix.

For more detail on the JSON format for discovery items and an example of how to implement your own file system discoverer as a Perl script, see [creating custom LLD rules](#).

### 1 Item prototypes

Once a rule is created, go to the items for that rule and press "Create item prototype" to create an item prototype.

Note how the {#FSNAME} macro is used where a file system name is required. The use of a low-level discovery macro is mandatory in the item key to make sure that the discovery is processed correctly. When the discovery rule is processed, this macro will be substituted with the discovered file system.

Low-level discovery macros and user macros are supported in item prototype configuration and item value preprocessing parameters. Note that when used in update intervals, a single macro has to fill the whole field. Multiple macros in one field or macros mixed with text are not supported.

Note:

Context-specific escaping of low-level discovery macros is performed for safe use in regular expression and XPath preprocessing parameters.

Attributes that are specific for item prototypes:

| Parameter      | Description   |
|----------------|---|
| Create enabled | If checked the item will be added in an enabled state.<br>If unchecked, the item will be added to a discovered entity, but in a disabled state. |

| Parameter       | Description   |
|-----------------|---|
| <i>Discover</i> | If checked (default) the item will be added to a discovered entity.<br>If unchecked, the item will not be added to a discovered entity, unless this setting is <b>overridden</b> in the discovery rule. |

We can create several item prototypes for each file system metric we are interested in:

## ≡ Item prototypes

[Create disabled](#)
[Mass update](#)
[Delete](#)

Click on the three-dot icon to open the menu for the specific item prototype with these options:

- *Create trigger prototype* - create a trigger prototype based on this item prototype
- *Trigger prototypes* - click to see a list with links to already-configured trigger prototypes of this item prototype
- *Create dependent item* - create a dependent item for this item prototype

**Mass update** option is available if you want to update properties of several item prototypes at once.

## 2 Trigger prototypes

We create trigger prototypes in a similar way as item prototypes:

Trigger prototype      Dependencies

|        |  |
|--------|--|
| * Name | Free disk space is less than 20% on volume {#FSNAME} |
|--------|--|

|          |                |             |         |         |      |          |
|----------|----------------|-------------|---------|---------|------|----------|
| Severity | Not classified | Information | Warning | Average | High | Critical |
|----------|----------------|-------------|---------|---------|------|----------|

|              |   |
|--------------|---|
| * Expression | {Template OS Linux:vfs.fs.size[{#FSNAME},pfree].last(0)}<20 |
|--------------|---|

## Expression constructor

Add

Cancel

| Parameter             | Description   |
|-----------------------|---|
| <i>Create enabled</i> | If checked the trigger will be added in an enabled state.<br>If unchecked, the trigger will be added to a discovered entity, but in a disabled state. |

| Parameter       | Description   |
|-----------------|---|
| <i>Discover</i> | If checked (default) the trigger will be added to a discovered entity.<br>If unchecked, the trigger will not be added to a discovered entity, unless this setting is <b>overridden</b> in the discovery rule. |

When real triggers are created from the prototypes, there may be a need to be flexible as to what constant ('20' in our example) is used for comparison in the expression. See how **user macros with context** can be useful to accomplish such flexibility.

You can define **dependencies** between trigger prototypes as well (supported since Zabbix 3.0). To do that, go to the *Dependencies* tab. A trigger prototype may depend on another trigger prototype from the same low-level discovery (LLD) rule or on a regular trigger. A trigger prototype may not depend on a trigger prototype from a different LLD rule or on a trigger created from trigger prototype. Host trigger prototype cannot depend on a trigger from a template.

## Trigger prototypes

[All templates](#) / [Template OS Linux](#)
[Discovery list](#) / [Mounted filesystem discovery](#)
[Item prototypes](#) 5

| <input type="checkbox"/> | SEVERITY | NAME ▲   | EXPRESSION   |

*Note:* For configuring host prototypes, see the section about [host prototype](#) configuration in virtual machine monitoring.

## 4 Notes on low-level discovery

Using LLD macros in user macro contexts

LLD macros may be used inside user macro context, for example, in [trigger prototypes](#).

Multiple LLD rules for the same item

Since Zabbix agent version 3.2 it is possible to define several low-level discovery rules with the same discovery item.

To do that you need to define the Alias agent [parameter](#), allowing to use altered discovery item keys in different discovery rules, for example `vfs.fs.discovery[foo]`, `vfs.fs.discovery[bar]`, etc.

Data limits for return values

There is no limit for low-level discovery rule JSON data if it is received directly by Zabbix server. This is because the return values are processed without being stored in a database.

There is also no limit for custom low-level discovery rules. However, if custom low-level discovery rule data is retrieved using a user parameter, the user parameter [return value limit](#) applies.

If data has to go through Zabbix proxy, it has to store this data in the database. In such a case, [database limits](#) apply.

## 5 Discovery rules

Please use the sidebar to see discovery rule configuration examples for various cases.

### 1 Discovery of mounted filesystems

Overview

It is possible to discover mounted filesystems and their properties (mountpoint name, filesystem type, filesystem size and inode statistics).

To do that, you may use a combination of:

- the `vfs.fs.get` agent item as the master item
- dependent low-level discovery rule and item prototypes

Configuration

Master item

Create a Zabbix agent item using the following key:

`vfs.fs.get`

| Item  | Tags | Preprocessing |
|---|------|---------------|
| <div> <div>* Name</div> <div>vfs.fs.get item</div> </div>             |      |               |
| <div> <div>Type</div> <div>Zabbix agent</div> </div>                  |      |               |
| <div> <div>* Key</div> <div>vfs.fs.get</div> </div>                   |      |               |
| <div> <div>* Host interface</div> <div>127.0.0.1 : 10050</div> </div> |      |               |
| <div> <div>Type of information</div> <div>Text</div> </div>           |      |               |

Set the type of information to "Text" for possibly big JSON data.

The data returned by this item will contain something like the following for a mounted filesystem:

```
{
  "fsname": "/",
  "fstype": "rootfs",
  "bytes": {
    "total": 1000,
    "free": 500,
    "used": 500,
    "pfree": 50.00,
    "pused": 50.00
  },
  "inodes": {
    "total": 1000,
    "free": 500,
    "used": 500,
    "pfree": 50.00,
    "pused": 50.00
  }
}
```

Dependent LLD rule

Create a low-level discovery rule as "Dependent item" type:

| Discovery rule  | Preprocessing | LLD macros | Filters | Overrides |
|---|---------------|------------|---------|-----------|
| <div> <div>* Name</div> <div>Discovery rule for vfs.fs.get</div> </div>         |               |            |         |           |
| <div> <div>Type</div> <div>Dependent item</div> </div>                          |               |            |         |           |
| <div> <div>* Key</div> <div>fs.mountpoint.discovery</div> </div>                |               |            |         |           |
| <div> <div>* Master item</div> <div>Zabbix server: vfs.fs.get item</div> </div> |               |            |         |           |
| <div> <div>* Keep lost resources period</div> <div>30d</div> </div>             |               |            |         |           |

As master item select the `vfs.fs.get` item we created.

In the "LLD macros" tab define custom macros with the corresponding JSONPath:

| Discovery rule         | Preprocessing | LLD macros 2           | Filters | Overrides |
|------------------------|---------------|------------------------|---------|-----------|
| LLD macros             |               |                        |         |           |
| LLD macro              |               | JSONPath               |         |           |
| <code>{#FSNAME}</code> |               | <code>\$.fsname</code> |         |           |
| <code>{#FSTYPE}</code> |               | <code>\$.fstype</code> |         |           |
| <a href="#">Add</a>    |               |                        |         |           |

Dependent item prototype

Create an item prototype with "Dependent item" type in this LLD rule. As master item for this prototype select the `vfs.fs.get` item we created.

| Item prototype  | Tags | Preprocessing |
|---|------|---------------|
| * Name <code>Free disk space on {#FSNAME}, type: {#FSTYPE}</code> |      |               |
| Type <code>Dependent item</code>                                  |      |               |
| * Key <code>free[{#FSNAME}]</code>                                |      |               |
| * Master item <code>Zabbix server: vfs.fs.get item</code>         |      |               |
| Type of information <code>Numeric (unsigned)</code>               |      |               |

Note the use of custom macros in the item prototype name and key:

- Name: Free disk space on `{#FSNAME}`, type: `{#FSTYPE}`
- Key: Free`[{#FSNAME}]`

As type of information, use:

- *Numeric (unsigned)* for metrics like 'free', 'total', 'used'
- *Numeric (float)* for metrics like 'pfree', 'pused' (percentage)

In the item prototype "Preprocessing" tab select JSONPath and use the following JSONPath expression as parameter:

```
$. [?(@.fsname=='{#FSNAME}')].bytes.free.first()
```

| Item prototype   | Tags | Preprocessing 1 |
|--|------|-----------------|
| Preprocessing steps  |      |                 |
| Name   |      |                 |
| Parameters   |      |                 |
| 1: <code>JSONPath</code>                                       |      |                 |
| <code>\$. [?(@.fsname=='{#FSNAME}')].bytes.free.first()</code> |      |                 |
| <a href="#">Add</a>  |      |                 |

When discovery starts, one item per each mountpoint will be created. This item will return the number of free bytes for the given mountpoint.

## 2 Discovery of network interfaces

In a similar way as **file systems** are discovered, it is possible to also discover network interfaces.

Item key

The item key to use in the **discovery rule** is

`net.if.discovery`

This item is supported since Zabbix agent 2.0.

Supported macros

You may use the `{#IFNAME}` macro in the discovery rule **filter** and prototypes of items, triggers and graphs.

Examples of item prototypes that you might wish to create based on "net.if.discovery":

- "net.if.in[{#IFNAME},bytes]",
- "net.if.out[{#IFNAME},bytes]".

Note that on Windows `{#IFGUID}` is also returned.

## 3 Discovery of CPUs and CPU cores

In a similar way as **file systems** are discovered, it is possible to also discover CPUs and CPU cores.

Item key

The item key to use in the **discovery rule** is

`system.cpu.discovery`

This item is supported since Zabbix agent 2.4.

Supported macros

This discovery key returns two macros - `{#CPU.NUMBER}` and `{#CPU.STATUS}` identifying the CPU order number and status respectively. It enumerates processors from 0 to N - 1, where N is total processor count.

```
[
  {
    "{#CPU.NUMBER}": 0,
    "{#CPU.STATUS}": "online"
  },
  {
    "{#CPU.NUMBER}": 1,
    "{#CPU.STATUS}": "offline"
  },
  {
    "{#CPU.NUMBER}": 2,
    "{#CPU.STATUS}": "unknown" /* "unknown" is only on Windows */
  },
  {
    "{#CPU.NUMBER}": 3,
    "{#CPU.STATUS}": "online"
  }
]
```

Note that a clear distinction cannot be made between actual, physical processors, cores and hyperthreads. `{#CPU.STATUS}` on Linux, UNIX and BSD systems returns the status of the processor, which can be either "online" or "offline". On Windows systems, this same macro may represent a third value - "unknown" - which indicates that a processor has been detected, but no information has been collected for it yet.

CPU discovery relies on the agent's collector process to remain consistent with the data provided by the collector and save resources on obtaining the data. This has the effect of this item key not working with the test (-t) command line flag of the agent binary, which will return a NOT\_SUPPORTED status and an accompanying message indicating that the collector process has not been started.

Item prototypes that can be created based on CPU discovery include, for example:

- `system.cpu.util[{#CPU.NUMBER},<type>,<mode>]`
- `system.hw.cpu[{#CPU.NUMBER},<info>]`

For detailed item key description, see [Zabbix agent item keys](#).

Notes on discovered performance counter items on NUMA systems

Some [Windows performance counters](#) might be not available for some of the logical processors at NUMA systems.

For example, items discovered with an item prototype with the key below might work only for the first NUMA node. Items for the other NUMA nodes might be in unsupported state.

```
perf_counter[\\Processor({#CPU.NUMBER})\\% Processor Time,60]
```

Also, a discovery rule with key "system.cpu.discovery" does not provide any low-level discovery macro values to substitute into such performance counters as:

```
perf_counter["\\Processor Information(<NUMA node index>,<CPU index in NUMA node>)\\% Processor Time",60]
```

While `system.cpu.util` items rely on different performance counters to monitor CPU utilization percentage depending on the processor group count and processor count. Also, there is a rare bug related to [processor groups on Windows](#).

## 4 Discovery of SNMP OIDs

Overview

In this section we will perform an [SNMP discovery](#) on a switch.

Item key

Unlike with file system and network interface discovery, the item does not necessarily has to have an "snmp.discovery" key - item type of SNMP agent is sufficient.

To configure the discovery rule, do the following:

- Go to: *Configuration* → *Templates*
- Click on *Discovery* in the row of an appropriate template

### ≡ Templates

| <input type="checkbox"/> | Name ▲          | Hosts | Items | Triggers | Graphs | Dashboards   | Discovery   |
|--------------------------|-----------------|-------|-------|----------|--------|--------------|-------------|
| <input type="checkbox"/> | Interfaces SNMP | Hosts | Items | Triggers | Graphs | Dashboards 1 | Discovery 1 |

- Click on *Create discovery rule* in the upper right corner of the screen
- Fill in the discovery rule form with the required details as in the screenshot below

Discovery rule
Preprocessing

|          |            | 1-7,00:00-24:00 |

Add

\* Keep lost resources period

30d

Description

Discovering interfaces from IF-MIB.

All mandatory input fields are marked with a red asterisk.

The OIDs to discover are defined in SNMP OID field in the following format: `discovery[#{#MACRO1}, oid1, #{#MACRO2}, oid2, ...,]`

where `{#MACRO1}`, `{#MACRO2}` ... are valid lld macro names and `oid1`, `oid2`... are OIDs capable of generating meaningful values for these macros. A built-in macro `{#SNMPINDEX}` containing index of the discovered OID is applied to discovered entities. The discovered entities are grouped by `{#SNMPINDEX}` macro value.

To understand what we mean, let us perform few snmpwalks on our switch:

```
$ snmpwalk -v 2c -c public 192.168.1.1 IF-MIB::ifDescr
IF-MIB::ifDescr.1 = STRING: WAN
IF-MIB::ifDescr.2 = STRING: LAN1
IF-MIB::ifDescr.3 = STRING: LAN2
```

```
$ snmpwalk -v 2c -c public 192.168.1.1 IF-MIB::ifPhysAddress
IF-MIB::ifPhysAddress.1 = STRING: 8:0:27:90:7a:75
IF-MIB::ifPhysAddress.2 = STRING: 8:0:27:90:7a:76
IF-MIB::ifPhysAddress.3 = STRING: 8:0:27:2b:af:9e
```

And set SNMP OID to: `discovery[#{#IFDESCR}, ifDescr, #{#IFPHYSADDRESS}, ifPhysAddress]`

Now this rule will discover entities with `{#IFDESCR}` macros set to **WAN**, **LAN1** and **LAN2**, `{#IFPHYSADDRESS}` macros set to **8:0:27:90:7a:75**, **8:0:27:90:7a:76**, and **8:0:27:2b:af:9e**, `{#SNMPINDEX}` macros set to the discovered OIDs indexes **1**, **2** and **3**:

```
[
  {
    "#{#SNMPINDEX}": "1",
    "#{#IFDESCR}": "WAN",
    "#{#IFPHYSADDRESS}": "8:0:27:90:7a:75"
  },
  {
    "#{#SNMPINDEX}": "2",
    "#{#IFDESCR}": "LAN1",
    "#{#IFPHYSADDRESS}": "8:0:27:90:7a:76"
  },
  {
    "#{#SNMPINDEX}": "3",
    "#{#IFDESCR}": "LAN2",
```

```

    "{#IFPHYSADDRESS}": "8:0:27:2b:af:9e"
  }
]

```

If an entity does not have the specified OID, then the corresponding macro will be omitted for this entity. For example if we have the following data:

```

ifDescr.1 "Interface #1"
ifDescr.2 "Interface #2"
ifDescr.4 "Interface #4"

```

```

ifAlias.1 "eth0"
ifAlias.2 "eth1"
ifAlias.3 "eth2"
ifAlias.5 "eth4"

```

Then in this case SNMP discovery `discovery[{#IFDESCR}, ifDescr, {#IFALIAS}, ifAlias]` will return the following structure:

```

[
  {
    "{#SNMPINDEX}": 1,
    "{#IFDESCR}": "Interface #1",
    "{#IFALIAS}": "eth0"
  },
  {
    "{#SNMPINDEX}": 2,
    "{#IFDESCR}": "Interface #2",
    "{#IFALIAS}": "eth1"
  },
  {
    "{#SNMPINDEX}": 3,
    "{#IFALIAS}": "eth2"
  },
  {
    "{#SNMPINDEX}": 4,
    "{#IFDESCR}": "Interface #4"
  },
  {
    "{#SNMPINDEX}": 5,
    "{#IFALIAS}": "eth4"
  }
]

```

#### Item prototypes

The following screenshot illustrates how we can use these macros in item prototypes:

Item prototype   Tags   Preprocessing 2

\* Name

Interface {#IFNAME}({#IFALIAS}): Bits received

Type

SNMP agent

\* Key

net.if.in[ifHCInOctets.{#SNMPINDEX}]

Type of information

Numeric (unsigned)

\* SNMP OID

1.3.6.1.2.1.31.1.1.1.6.{#SNMPINDEX}

Units

bps

\* Update interval

3m

You can create as many item prototypes as needed:

## Item prototypes

## Discovered entities

When server runs, it will create real items, triggers and graphs based on the values the SNMP discovery rule returns. In the host configuration they are prefixed with an orange link to a discovery rule they come from.

## Items

## 5 Discovery of JMX objects

Overview

It is possible to **discover** all JMX MBeans or MBean attributes or to specify a pattern for the discovery of these objects.

It is mandatory to understand the difference between an MBean and MBean attributes for discovery rule configuration. An MBean is an object which can represent a device, an application, or any resource that needs to be managed.

For example, there is an MBean which represents a web server. Its attributes are connection count, thread count, request timeout, http file cache, memory usage, etc. Expressing this thought in human comprehensive language we can define a coffee machine as an MBean which has the following attributes to be monitored: water amount per cup, average consumption of water for a certain period of time, number of coffee beans required per cup, coffee beans and water refill time, etc.

Item key

In **discovery rule** configuration, select **JMX agent** in the *Type* field.

Two item keys are supported for JMX object discovery - `jmx.discovery[]` and `jmx.get[]`:

| Item key   | Return value   | Parameters   | Comment  |
|--|--|--|--|
| <b>jmx.discovery</b> [<discovery mode>,<object name>,<unique short de-scrip-tion>] | This item returns a JSON array with LLD macros describing MBean objects or their attributes. | <b>discovery mode</b> - one of the following: <i>attributes</i> (retrieve JMX MBean attributes, default) or <i>beans</i> (retrieve JMX MBeans)<br><b>object name</b> - object name pattern (see <a href="#">documentation</a> ) identifying the MBean names to be retrieved (empty by default, retrieving all registered beans)<br><b>unique short description</b> - a unique description that allows multiple JMX items with the same discovery mode and object name on the host (optional) | Examples:<br>→ <code>jmx.discovery</code> - retrieve all JMX MBean attributes<br>→ <code>jmx.discovery[beans]</code> - retrieve all JMX MBeans<br>→<br><code>jmx.discovery[attributes,"*:type=GarbageCollector,name=*</code><br>- retrieve all garbage collector attributes<br>→<br><code>jmx.discovery[beans,"*:type=GarbageCollector,name=*</code><br>- retrieve all garbage collectors<br><br>There are some <b>limitations</b> to what MBean properties this item can return based on limited characters that are supported in macro name generation (supported characters can be described by the following regular expression: <code>A-Z0-9_\. \</code> ). So, for example, to discover MBean properties with a hyphenated word or non-ASCII characters, you need to use <code>jmx.get []</code> .<br><br>Supported since Zabbix Java gateway 3.4. |
| <b>jmx.get</b> [<discovery mode>,<object name>,<unique short de-scrip-tion>]       |  |  |  |

| Item key  |  |   |
|---|--|---|
| This item returns a JSON array with MBean objects or their attributes.  | <b>discovery mode</b> - one of the following: <i>attributes</i> (retrieve JMX MBean attributes, default) or <i>beans</i> (retrieve JMX MBeans)   | When using this item, it is needed to define custom low-level discovery macros, pointing to values extracted from the returned JSON using JSONPath. |
| Compared to <code>jmx.discovery[]</code> it does not define LLD macros. | <b>object name</b> - object name pattern (see <a href="#">documentation</a> ) identifying the MBean names to be retrieved (empty by default, retrieving all registered beans)<br><b>unique short description</b> - a unique description that allows multiple JMX items with the same discovery mode and object name on the host (optional) | Supported since Zabbix Java gateway 4.4.  |

#### Attention:

If no parameters are passed, all MBean attributes from JMX are requested. Not specifying parameters for JMX discovery or trying to receive all attributes for a wide range like `*:type=*,name=*` may lead to potential performance problems.

Using `jmx.discovery`

This item returns a JSON object with low-level discovery macros describing MBean objects or attributes. For example, in the discovery of MBean attributes (reformatted for clarity):

```
[
  {
    "{#JMXVALUE}": "0",
    "{#JMXTYPE}": "java.lang.Long",
    "{#JMXOBJ}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "{#JMXDESC}": "java.lang:type=GarbageCollector,name=PS Scavenge,CollectionCount",
    "{#JMXATTR}": "CollectionCount"
  },
  {
    "{#JMXVALUE}": "0",
    "{#JMXTYPE}": "java.lang.Long",
    "{#JMXOBJ}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "{#JMXDESC}": "java.lang:type=GarbageCollector,name=PS Scavenge,CollectionTime",
    "{#JMXATTR}": "CollectionTime"
  },
  {
    "{#JMXVALUE}": "true",
    "{#JMXTYPE}": "java.lang.Boolean",
    "{#JMXOBJ}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "{#JMXDESC}": "java.lang:type=GarbageCollector,name=PS Scavenge,Valid",
    "{#JMXATTR}": "Valid"
  },
  {
    "{#JMXVALUE}": "PS Scavenge",
    "{#JMXTYPE}": "java.lang.String",
    "{#JMXOBJ}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "{#JMXDESC}": "java.lang:type=GarbageCollector,name=PS Scavenge,Name",
    "{#JMXATTR}": "Name"
  },
  {
    "{#JMXVALUE}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "{#JMXTYPE}": "javax.management.ObjectName",
    "{#JMXOBJ}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "{#JMXDESC}": "java.lang:type=GarbageCollector,name=PS Scavenge,ObjectName",
    "{#JMXATTR}": "ObjectName"
  }
]
```

```
]
```

In the discovery of MBeans (reformatted for clarity):

```
[
  {
    "#{JMXDOMAIN}": "java.lang",
    "#{JMXTYPE}": "GarbageCollector",
    "#{JMXOBJ}": "java.lang:type=GarbageCollector,name=PS Scavenge",
    "#{JMXNAME}": "PS Scavenge"
  }
]
```

Supported macros

The following macros are supported for use in the discovery rule **filter** and prototypes of items, triggers and graphs:

| Macro                         | Description  |
|-------------------------------|--|
| Discovery of MBean attributes |  |
| {#JMXVALUE}                   | Attribute value.   |
| {#JMXTYPE}                    | Attribute type.  |
| {#JMXOBJ}                     | Object name.   |
| {#JMXDESC}                    | Object name including attribute name.  |
| {#JMXATTR}                    | Attribute name.  |
| Discovery of MBeans           |  |
| {#JMXDOMAIN}                  | MBean domain. ( <i>Zabbix reserved name</i> )                                  |
| {#JMXOBJ}                     | Object name. ( <i>Zabbix reserved name</i> )                                   |
| {#JMX<key property>}          | MBean properties (like {#JMXTYPE}, {#JMXNAME}) (see <b>Limitations</b> below). |

Limitations

There are some limitations associated with the algorithm of creating LLD macro names from MBean property names:

- attribute names are changed to uppercase
- attribute names are ignored (no LLD macros are generated) if they consist of unsupported characters for LLD macro names. Supported characters can be described by the following regular expression: A-Z0-9\_\..
- if an attribute is called "obj" or "domain" they will be ignored because of the overlap with the values of the reserved Zabbix properties {#JMXOBJ} and {#JMXDOMAIN} (supported since Zabbix 3.4.3.)

Please consider this jmx.discovery (with "beans" mode) example. MBean has the following properties defined (some of which will be ignored; see below):

```
name=test
=Type
attributes []=1,2,3
Name=NameOfTheTest
domAin=some
```

As a result of JMX discovery, the following LLD macros will be generated:

- {#JMXDOMAIN} - Zabbix internal, describing the domain of MBean
- {#JMXOBJ} - Zabbix internal, describing MBean object
- {#JMXNAME} - created from "name" property

Ignored properties are:

- тип : its name contains unsupported characters (non-ASCII)
- attributes[] : its name contains unsupported characters (square brackets are not supported)
- Name : it's already defined (name=test)
- domAin : it's a Zabbix reserved name

Examples

Let's review two more practical examples of an LLD rule creation with the use of MBean. To understand the difference between an LLD rule collecting MBeans and an LLD rule collecting MBean attributes better please take a look at following table:

| MBean1           | MBean2           | MBean3           |
|------------------|------------------|------------------|
| MBean1Attribute1 | MBean2Attribute1 | MBean3Attribute1 |

|                  |                  |                  |
|------------------|------------------|------------------|
| MBean1Attribute2 | MBean2Attribute2 | MBean3Attribute2 |
| MBean1Attribute3 | MBean2Attribute3 | MBean3Attribute3 |

Example 1: Discovering MBeans

This rule will return 3 objects: the top row of the column: MBean1, MBean2, MBean3.

For more information about objects please refer to [supported macros](#) table, *Discovery of MBeans* section.

Discovery rule configuration collecting MBeans (without the attributes) looks like the following:

Discovery rule

Preprocessing

LLD macros

Filters

Overrides

\* Name

JMX garbage collectors

Type

JMX agent

\* Key

jmx.discovery[beans,"\*:type=GarbageCollector,name=\*"]

\* Host interface

127.0.0.1 : 12345

The key used here:

```
jmx.discovery[beans,"*:type=GarbageCollector,name=*"]
```

All the garbage collectors without attributes will be discovered. As Garbage collectors have the same attribute set, we can use desired attributes in item prototypes the following way:

## Item prototypes

All hosts / JMX

Enabled

JMX

Discovery list / JMX garbage collectors

Item prototypes

Trigger p

| <input type="checkbox"/> Name ▲                        | Key                            |
|--|--------------------------------|
| <input type="checkbox"/> GC {#JMXNAME} CollectionCount | jmx[{#JMXOBJ},CollectionCount] |
| <input type="checkbox"/> GC {#JMXNAME} CollectionTime  | jmx[{#JMXOBJ},CollectionTime]  |
| <input type="checkbox"/> GC {#JMXNAME} Valid           | jmx[{#JMXOBJ},Valid]           |

The keys used here:

```
jmx[{#JMXOBJ},CollectionCount]
jmx[{#JMXOBJ},CollectionTime]
jmx[{#JMXOBJ},Valid]
```

LLD discovery rule will result in something close to this (items are discovered for two Garbage collectors):

|                          |   |          | Filter ▼   |
|--------------------------|---|----------|--|
| <input type="checkbox"/> | Name ▲  | Triggers | Key  |
| <input type="checkbox"/> | ... JMX garbage collectors: GC PS MarkSweep CollectionCount |          | jmx["java.lang:type=GarbageCollector,name=PS MarkSweep",CollectionCount] |
| <input type="checkbox"/> | ... JMX garbage collectors: GC PS MarkSweep CollectionTime  |          | jmx["java.lang:type=GarbageCollector,name=PS MarkSweep",CollectionTime]  |
| <input type="checkbox"/> | ... JMX garbage collectors: GC PS MarkSweep Valid           |          | jmx["java.lang:type=GarbageCollector,name=PS MarkSweep",Valid]           |
| <input type="checkbox"/> | ... JMX garbage collectors: GC PS Scavenge CollectionCount  |          | jmx["java.lang:type=GarbageCollector,name=PS Scavenge",CollectionCount]  |
| <input type="checkbox"/> | ... JMX garbage collectors: GC PS Scavenge CollectionTime   |          | jmx["java.lang:type=GarbageCollector,name=PS Scavenge",CollectionTime]   |
| <input type="checkbox"/> | ... JMX garbage collectors: GC PS Scavenge Valid            |          | jmx["java.lang:type=GarbageCollector,name=PS Scavenge",Valid]            |

## Example 2: Discovering MBean attributes

This rule will return 9 objects with the following fields: MBean1Attribute1, MBean2Attribute1, MBean3Attribute1, MBean1Attribute2, MBean2Attribute2, MBean3Attribute2, MBean1Attribute3, MBean2Attribute3, MBean3Attribute3.

For more information about objects please refer to [supported macros](#) table, *Discovery of MBean attributes* section.

Discovery rule configuration collecting MBean attributes looks like the following:

Discovery rule
Preprocessing
LLD macros
Filters
Overrides

\* Name

JMX garbage collectors

Type

JMX agent

\* Key

jmx.discovery[attributes,"\*:type=GarbageCollector,name=\*"]

\* Host interface

127.0.0.1 : 12345

The key used here:

```
jmx.discovery[attributes,"*:type=GarbageCollector,name=*"]
```

All the garbage collectors with a single item attribute will be discovered.

## Item prototypes

All hosts / JMX
Enabled
JMX
Discovery list / JMX garbage collectors
Item prototypes
Trigger

| <input type="checkbox"/> | Name ▲               | Key                       |
|--------------------------|----------------------|---------------------------|
| <input type="checkbox"/> | {#JMXOBJ} {#JMXATTR} | jmx[{#JMXOBJ},{#JMXATTR}] |

In this particular case an item will be created from prototype for every MBean attribute. The main drawback of this configuration is that trigger creation from trigger prototypes is impossible as there is only one item prototype for all attributes. So this setup can be used for data collection, but is not recommended for automatic monitoring.

Using `jmx.get`

`jmx.get []` is similar to the `jmx.discovery []` item, but it does not turn Java object properties into low-level discovery macro names and therefore can return values without [limitations](#) that are associated with LLD macro name generation such as hyphens or non-ASCII characters.

When using `jmx.get []` for discovery, low-level discovery macros can be defined separately in the custom [LLD macro](#) tab of the discovery rule configuration, using JSONPath to point to the required values.

Discovering MBeans

Discovery item: `jmx.get[beans,"com.example:type=*,*"]`

Response:

```
[
  {
    "object": "com.example:type=Hello,data-src=data-base, = ",
    "domain": "com.example",
    "properties": {
      "data-src": "data-base",
      " ": " ",
      "type": "Hello"
    }
  },
  {
    "object": "com.example:type=Atomic",
    "domain": "com.example",
    "properties": {
      "type": "Atomic"
    }
  }
]
```

Discovering MBean attributes

Discovery item: `jmx.get[attributes,"com.example:type=*,*"]`

Response:

```
[
  {
    "object": "com.example:type=*",
    "domain": "com.example",
    "properties": {
      "type": "Simple"
    }
  },
  {
    "object": "com.zabbix:type=yes,domain=zabbix.com,data-source=/dev/rand, = ,obj=true",
    "domain": "com.zabbix",
    "properties": {
      "type": "Hello",
      "domain": "com.example",
      "data-source": "/dev/rand",
      " ": " ",
      "obj": true
    }
  }
]
```

## 6 Discovery of IPMI sensors

Overview

It is possible to automatically discover IPMI sensors.

To do that, you may use a combination of:

- the `ipmi.get` IPMI item (supported since Zabbix **5.0.0**) as the master item
- dependent low-level discovery rule and item prototypes

Configuration

Master item

Create an IPMI item using the following key:

`ipmi.get`

| Item                | Tags            | Preprocessing |
|---------------------|-----------------|---------------|
| * Name              | IPMI get item   |               |
| Type                | IPMI agent      |               |
| * Key               | ipmi.get        |               |
| * Host interface    | 127.0.0.1 : 623 |               |
| IPMI sensor         |                 |               |
| Type of information | Text            |               |

Set the type of information to "Text" for possibly big JSON data.

Dependent LLD rule

Create a low-level discovery rule as "Dependent item" type:

| Discovery rule | Preprocessing                  | LLD macros | Filters | Overrides |
|----------------|--------------------------------|------------|---------|-----------|
| * Name         | Discovery rule for ipmi.get    |            |         |           |
| Type           | Dependent item                 |            |         |           |
| * Key          | ipmi.sensor.discovery          |            |         |           |
| * Master item  | Zabbix server: IPMI get item X |            |         |           |

As master item select the `ipmi.get` item we created.

In the "LLD macros" tab define a custom macro with the corresponding JSONPath:

| Discovery rule | Preprocessing | LLD macros 1 | Filters | Overrides |
|----------------|---------------|--------------|---------|-----------|
| LLD macros     |               |              |         |           |
| LLD macro      |               | JSONPath     |         |           |
| {#SENSOR_ID}   |               | \$.id        |         |           |
| Add            |               |              |         |           |

Dependent item prototype

Create an item prototype with "Dependent item" type in this LLD rule. As master item for this prototype select the `ipmi.get` item we created.

Item prototype

Tags

Preprocessing

\* Name

IPMI value for sensor {#SENSOR\_ID}

Type

Dependent item

\* Key

ipmi\_sensor[{#SENSOR\_ID}]

\* Master item

Zabbix server: IPMI get item

Type of information

Numeric (unsigned)

Note the use of the `{#SENSOR ID}` macro in the item prototype name and key:

- *Name*: IPMI value for sensor {#SENSOR\_ID}
- *Key*: ipmi sensor[{#SENSOR ID}]

As type of information, *Numeric (unsigned)*.

In the item prototype "Preprocessing" tab select JSONPath and use the following JSONPath expression as parameter:

```
$.['?(@.id=='{#SENSOR ID}')'].value.first()
```

Item prototype

Tags

Preprocessing 1

| Preprocessing steps                 | Name                | Parameters   |
|-------------------------------------|---------------------|--|
| <div><div></div><div>1:</div></div> | <div>JSONPath</div> | <div><code>\$.[?(@.id=='#SENSOR_ID')].value.first()</code></div> |

Add

When discovery starts, one item per each IPMI sensor will be created. This item will return the integer value of the given sensor.

## 7 Discovery of systemd services

## Overview

It is possible to **discover** systemd units (services, by default) with Zabbix.

Item key

The item to use in the **discovery rule** is the

systemd.unit.discovery

**Attention:**

This **item** key is only supported in Zabbix agent 2.

This item returns a JSON with information about systemd units, for example:

```
[{
  "{#UNIT.NAME}": "mysqld.service",
  "{#UNIT.DESRIPTION}": "MySQL Server",
  "{#UNIT.LOADSTATE}": "loaded",
  "{#UNIT.ACTIVESTATE}": "active",
  "{#UNIT.SUBSTATE}": "running",
  "{#UNIT.FOLLOWED}": "",
  "{#UNIT.PATH}": "/org/freedesktop/systemd1/unit/mysqld_2eservice",
```

```

    "{#UNIT.JOBID}": 0,
    "{#UNIT.JOBTYP}": "",
    "{#UNIT.JOBPATH}": "/",
    "{#UNIT.UNITFILESTATE}": "enabled"
  }, {
    "{#UNIT.NAME}": "systemd-journald.socket",
    "{#UNIT.DESCRPTION}": "Journal Socket",
    "{#UNIT.LOADSTATE}": "loaded",
    "{#UNIT.ACTIVESTATE}": "active",
    "{#UNIT.SUBSTATE}": "running",
    "{#UNIT.FOLLOWED}": "",
    "{#UNIT.PATH}": "/org/freedesktop/systemd1/unit/systemd_2djournald_2socket",
    "{#UNIT.JOBID}": 0,
    "{#UNIT.JOBTYP}": "",
    "{#UNIT.JOBPATH}": "/",
    "{#UNIT.UNITFILESTATE}": "enabled"
  }
}]

```

Discovery of disabled systemd units

Since Zabbix 6.0.1 it is also possible to discover **disabled** systemd units. In this case three macros are returned in the resulting JSON:

- {#UNIT.PATH}
- {#UNIT.ACTIVESTATE}
- {#UNIT.UNITFILESTATE}.

#### Attention:

To have items and triggers created from prototypes for disabled systemd units, make sure to adjust (or remove) prohibiting LLD filters for {#UNIT.ACTIVESTATE} and {#UNIT.UNITFILESTATE}.

Supported macros

The following macros are supported for use in the discovery rule **filter** and prototypes of items, triggers and graphs:

| Macro                 | Description  |
|-----------------------|--|
| {#UNIT.NAME}          | Primary unit name.   |
| {#UNIT.DESCRPTION}    | Human readable description.  |
| {#UNIT.LOADSTATE}     | Load state (i.e. whether the unit file has been loaded successfully)   |
| {#UNIT.ACTIVESTATE}   | Active state (i.e. whether the unit is currently started or not)   |
| {#UNIT.SUBSTATE}      | Sub state (a more fine-grained version of the active state that is specific to the unit type, which the active state is not) |
| {#UNIT.FOLLOWED}      | Unit that is being followed in its state by this unit, if there is any; otherwise an empty string.                           |
| {#UNIT.PATH}          | Unit object path.  |
| {#UNIT.JOBID}         | Numeric job ID if there is a job queued for the job unit; 0 otherwise.   |
| {#UNIT.JOBTYP}        | Job type.  |
| {#UNIT.JOBPATH}       | Job object path.   |
| {#UNIT.UNITFILESTATE} | The install state of the unit file.  |

Item prototypes

Item prototypes that can be created based on systemd service discovery include, for example:

- Item name: {#UNIT.DESCRPTION} active state info; item key: systemd.unit.info["{#UNIT.NAME}"]
- Item name: {#UNIT.DESCRPTION} load state info; item key: systemd.unit.info["{#UNIT.NAME}",LoadState]

systemd.unit.info **agent items** are supported since Zabbix 4.4.

## 8 Discovery of Windows services

Overview

In a similar way as **file systems** are discovered, it is possible to also discover Windows services.

Item key

The item to use in the **discovery rule** is

`service.discovery`

This item is supported since Zabbix Windows agent 3.0.

Supported macros

The following macros are supported for use in the discovery rule **filter** and prototypes of items, triggers and graphs:

| Macro                                  | Description   |
|--|---|
| <code>{#SERVICE.NAME}</code>           | Service name.   |
| <code>{#SERVICE.DISPLAYNAME}</code>    | Displayed service name.   |
| <code>{#SERVICE.DESRIPTION}</code>     | Service description.  |
| <code>{#SERVICE.STATE}</code>          | Numerical value of the service state.<br>See the <b>service.info</b> item for details.  |
| <code>{#SERVICE.STATENAME}</code>      | Name of the service state.<br>See the <b>service.info</b> item for details.   |
| <code>{#SERVICE.PATH}</code>           | Service path.   |
| <code>{#SERVICE.USER}</code>           | Service user.   |
| <code>{#SERVICE.STARTUP}</code>        | Numerical value of the service startup type.<br>See the <b>service.info</b> item for details.   |
| <code>{#SERVICE.STARTUPNAME}</code>    | Name of the service startup type.<br>See the <b>service.info</b> item for details.  |
| <code>{#SERVICE.STARTUPTRIGGER}</code> | Numerical value to indicate if the service startup type has:<br>0 - no startup triggers<br>1 - has startup triggers<br>This macro is supported since Zabbix 3.4.4. It is useful to discover such service startup types as <i>Automatic (trigger start)</i> , <i>Automatic delayed (trigger start)</i> and <i>Manual (trigger start)</i> . |

Based on Windows service discovery you may create an **item** prototype like

```
service.info[{#SERVICE.NAME},<param>]
```

where `param` accepts the following values: *state*, *displayname*, *path*, *user*, *startup* or *description*.

For example, to acquire the display name of a service you may use a "service.info[{#SERVICE.NAME},displayname]" item. If `param` value is not specified ("service.info[{#SERVICE.NAME}]"), the default *state* parameter is used.

## 9 Discovery of Windows performance counter instances

Overview

It is possible to discover object instances of Windows performance counters. This is useful for multi-instance performance counters.

Item key

To configure the **discovery rule**, use the following item:

- `perf_instance.discovery[object]`

Note that the object name may be localized. For example:

```
perf_instance.discovery[Processor] # The object name is in English.  
perf_instance.discovery[Processador] # The object name is in Portuguese.
```

Alternatively, to ensure that the object name is provided in English, independent of OS localization, use the following item:

- `perf_instance_en.discovery[object]`

For example:

```
perf_instance_en.discovery[Processor]  
perf_instance_en.discovery[Memory]
```

These items are supported since Zabbix Windows agent 5.0.1.

Supported macros

The discovery process will return all instances of the specified object in the `{#INSTANCE}` macro:

```
[
  {"{#INSTANCE}": "0"},
  {"{#INSTANCE}": "1"},
  {"{#INSTANCE}": "_Total"}
]
```

This macro may be used in the prototypes of `perf_counter[]` and `perf_counter_en[]` items.

For example, if the item key used in the discovery rule is `perf_instance.discovery[Processor]`, you may create the following item prototype:

```
perf_counter["\\Processor({#INSTANCE})\\% Processor Time"]
```

Note:

- If the specified object is not found or does not support variable instances, the discovery item will become NOTSUPPORTED.
- If the specified object supports variable instances but currently does not have any instances, an empty JSON array will be returned.
- Duplicate instances will be skipped.

## 10 Discovery using WMI queries

Overview

[WMI](#) is a powerful interface in Windows that can be used for retrieving various information about Windows components, services, state and software installed.

It can be used for physical disk discovery and their performance data collection, network interface discovery, Hyper-V guest discovery, monitoring Windows services and many other things in Windows OS.

This type of low-level **discovery** is done using WQL queries whose results get automatically transformed into a JSON object suitable for low-level discovery.

Item key

The item to use in the **discovery rule** is

```
wmi.getall[<namespace>,<query>]
```

This **item** transforms the query result into a JSON array. For example:

```
select * from Win32_DiskDrive where Name like '%PHYSICALDRIVE%'
```

may return something like this:

```
[
  {
    "DeviceID" : "\\.\PHYSICALDRIVE0",
    "BytesPerSector" : 512,
    "Capabilities" : [
      3,
      4
    ],
    "CapabilityDescriptions" : [
      "Random Access",
      "Supports Writing"
    ],
    "Caption" : "VBOX HARDDISK ATA Device",
    "ConfigManagerErrorCode" : "0",
    "ConfigManagerUserConfig" : "false",
    "CreationClassName" : "Win32_DiskDrive",
    "Description" : "Disk drive",
    "FirmwareRevision" : "1.0",
    "Index" : 0,
    "InterfaceType" : "IDE"
  }
]
```

```

},
{
  "DeviceID" : "\\.\PHYSICALDRIVE1",
  "BytesPerSector" : 512,
  "Capabilities" : [
    3,
    4
  ],
  "CapabilityDescriptions" : [
    "Random Access",
    "Supports Writing"
  ],
  "Caption" : "VBOX HARDDISK ATA Device",
  "ConfigManagerErrorCode" : "0",
  "ConfigManagerUserConfig" : "false",
  "CreationClassName" : "Win32_DiskDrive",
  "Description" : "Disk drive",
  "FirmwareRevision" : "1.0",
  "Index" : 1,
  "InterfaceType" : "IDE"
}
]

```

This item is supported since Zabbix Windows agent 4.4.

Low-level discovery macros

Even though no low-level discovery macros are created in the returned JSON, these macros can be defined by the user as an additional step, using the [custom LLD macro](#) functionality with JSONPath pointing to the discovered values in the returned JSON.

The macros then can be used to create item, trigger, etc prototypes.

## 11 Discovery using ODBC SQL queries

Overview

This type of low-level [discovery](#) is done using SQL queries, whose results get automatically transformed into a JSON object suitable for low-level discovery.

Item key

SQL queries are performed using a "Database monitor" item type. Therefore, most of the instructions on [ODBC monitoring](#) page apply in order to get a working "Database monitor" discovery rule.

Two item keys may be used in "Database monitor" discovery rules:

- **db.odbc.discovery**[<unique short description>,<dsn>,<connection string>] - this item transforms the SQL query result into a JSON array, turning the column names from the query result into low-level discovery macro names paired with the discovered field values. These macros can be used in creating item, trigger, etc prototypes. See also: [Using db.odbc.discovery](#).
- **db.odbc.get**[<unique short description>,<dsn>,<connection string>] - this item transforms the SQL query result into a JSON array, keeping the original column names from the query result as a field name in JSON paired with the discovered values. Compared to `db.odbc.discovery[]`, this item does not create low-level discovery macros in the returned JSON, therefore there is no need to check if the column names can be valid macro names. The low-level discovery macros can be defined as an additional step as required, using the [custom LLD macro](#) functionality with JSONPath pointing to the discovered values in the returned JSON. See also: [Using db.odbc.get](#).

Using db.odbc.discovery

As a practical example to illustrate how the SQL query is transformed into JSON, let us consider low-level discovery of Zabbix proxies by performing an ODBC query on Zabbix database. This is useful for automatic creation of "zabbix[proxy,<name>,lastaccess]" [internal items](#) to monitor which proxies are alive.

Let us start with discovery rule configuration:

| Discovery rule    | Preprocessing   | LLD macros | Filters | Overrides |
|-------------------|---|------------|---------|-----------|
| * Name            | Proxy discovery   |            |         |           |
| Type              | Database monitor  |            |         |           |
| * Key             | db.odbc.discovery[proxies,{SDSN}]   |            |         |           |
| User name         |   |            |         |           |
| Password          |   |            |         |           |
| * SQL query       | SELECT h1.host, COUNT(h2.host) AS count FROM hosts h1 LEFT JOIN hosts h2 ON h1.hostid = h2.proxy_hostid WHERE h1.status IN (5, 6) GROUP BY h1.host; |            |         |           |
| * Update interval | 30s   |            |         |           |

All mandatory input fields are marked with a red asterisk.

Here, the following direct query on Zabbix database is used to select all Zabbix proxies, together with the number of hosts they are monitoring. The number of hosts can be used, for instance, to filter out empty proxies:

```
mysql> SELECT h1.host, COUNT(h2.host) AS count FROM hosts h1 LEFT JOIN hosts h2 ON h1.hostid = h2.proxy_hostid
```

```
+-----+-----+
| host   | count |
+-----+-----+
| Japan 1 |    5 |
| Japan 2 |   12 |
| Latvia  |    3 |
+-----+-----+
```

```
3 rows in set (0.01 sec)
```

By the internal workings of "db.odbc.discovery[,{\$DSN}]" item, the result of this query gets automatically transformed into the following JSON:

```
[
  {
    "{#HOST}": "Japan 1",
    "{#COUNT}": "5"
  },
  {
    "{#HOST}": "Japan 2",
    "{#COUNT}": "12"
  },
  {
    "{#HOST}": "Latvia",
    "{#COUNT}": "3"
  }
]
```

It can be seen that column names become macro names and selected rows become the values of these macros.

#### Note:

If it is not obvious how a column name would be transformed into a macro name, it is suggested to use column aliases like "COUNT(h2.host) AS count" in the example above.

In case a column name cannot be converted into a valid macro name, the discovery rule becomes not supported, with the error message detailing the offending column number. If additional help is desired, the obtained column names are provided under DebugLevel=4 in Zabbix server log file:

```
$ grep db.odbc.discovery /tmp/zabbix_server.log
```

```
...
```

```
23876:20150114:153410.856 In db_odbc_discovery() query:'SELECT h1.host, COUNT(h2.host) FROM hosts h1 I
```

```
23876:20150114:153410.860 db_odbc_discovery() column[1]:'host'
```

```
23876:20150114:153410.860 db_odbc_discovery() column[2]:'COUNT(h2.host)'
```

```
23876:20150114:153410.860 End of db_odbc_discovery():NOTSUPPORTED
```

```
23876:20150114:153410.860 Item [Zabbix server:db.odbc.discovery[proxies,{ $DSN}]] error: Cannot convert
```

Now that we understand how a SQL query is transformed into a JSON object, we can use {#HOST} macro in item prototypes:

| Item prototype           | Tags                              | Preprocessing |
|--------------------------|-----------------------------------|---------------|
| <b>* Name</b>            | Last access time of proxy {#HOST} |               |
| Type                     | Zabbix internal                   |               |
| <b>* Key</b>             | zabbix[proxy,{#HOST},lastaccess]  |               |
| Type of information      | Numeric (unsigned)                |               |
| Units                    | unixtime                          |               |
| <b>* Update interval</b> | 60s                               |               |

Once discovery is performed, an item will be created for each proxy:

| <input type="checkbox"/> | Name   | Triggers | Key ▲                          |
|--------------------------|--|----------|--------------------------------|
| <input type="checkbox"/> | ... <b>Proxy discovery:</b> Last access time of proxy Japan1 |          | zabbix[proxy,Japan1,lastacce   |
| <input type="checkbox"/> | ... <b>Proxy discovery:</b> Last access time of proxy Japan2 |          | zabbix[proxy,Japan2,lastacce   |
| <input type="checkbox"/> | ... <b>Proxy discovery:</b> Last access time of proxy Latvia |          | zabbix[proxy,Latvia,lastaccess |

Using db.odbc.get

Using db.odbc.get[,{\$DSN}] and the following SQL example:

```
mysql> SELECT h1.host, COUNT(h2.host) AS count FROM hosts h1 LEFT JOIN hosts h2 ON h1.hostid = h2.proxy_ho
```

```
+-----+-----+
```

```
| host      | count |
```

```
+-----+-----+
```

```
| Japan 1 |      5 |
```

```
| Japan 2 |     12 |
```

```
| Latvia  |      3 |
```

```
+-----+-----+
```

```
3 rows in set (0.01 sec)
```

this JSON will be returned:

```
[  
  {
```

```

    "host": "Japan 1",
    "count": "5"
  },
  {
    "host": "Japan 2",
    "count": "12"
  },
  {
    "host": "Latvia",
    "count": "3"
  }
]

```

As you can see, there are no low-level discovery macros there. However, custom low-level discovery macros can be created in the **LLD macros** tab of a discovery rule using JSONPath, for example:

{#HOST} → \$.host

Now this {#HOST} macro may be used in item prototypes:

| Item prototype      | Tags                              | Preprocessing |
|---------------------|-----------------------------------|---------------|
| * Name              | Last access time of proxy {#HOST} |               |
| Type                | Zabbix internal                   |               |
| * Key               | zabbix[proxy,{#HOST},lastaccess]  |               |
| Type of information | Numeric (unsigned)                |               |
| Units               | unixtime                          |               |
| * Update interval   | 60s                               |               |

## 12 Discovery using Prometheus data

### Overview

Data provided in Prometheus line format can be used for low-level discovery.

See **Prometheus checks** for details how Prometheus data querying is implemented in Zabbix.

### Configuration

The low-level discovery rule should be created as a **dependent item** to the HTTP master item that collects Prometheus data.

### Prometheus to JSON

In the discovery rule, go to the Preprocessing tab and select the *Prometheus to JSON* preprocessing option. Data in JSON format are needed for discovery and the *Prometheus to JSON* preprocessing option will return exactly that, with the following attributes:

- metric name
- metric value
- help (if present)
- type (if present)
- labels (if present)
- raw line

For example, querying `wmi_logical_disk_free_bytes`:

Discovery rule
Preprocessing 1
LLD macros
Filters
Overrides

| Preprocessing steps | Name               | Parameters   |
|---------------------|--------------------|--|
| 1:                  | Prometheus to JSON | wmi_logical_disk_free_bytes{volume=~".*"}<br><a href="#">Add</a> |

from these Prometheus lines:

```
# HELP wmi_logical_disk_free_bytes Free space in bytes (LogicalDisk.PercentFreeSpace)
# TYPE wmi_logical_disk_free_bytes gauge
wmi_logical_disk_free_bytes{volume="C:"} 3.5180249088e+11
wmi_logical_disk_free_bytes{volume="D:"} 2.627731456e+09
wmi_logical_disk_free_bytes{volume="HarddiskVolume4"} 4.59276288e+08
```

will return:

```
[
  {
    "name": "wmi_logical_disk_free_bytes",
    "help": "Free space in bytes (LogicalDisk.PercentFreeSpace)",
    "type": "gauge",
    "labels": {
      "volume": "C:"
    },
    "value": "3.5180249088e+11",
    "line_raw": "wmi_logical_disk_free_bytes{volume=\"C:\"} 3.5180249088e+11"
  },
  {
    "name": "wmi_logical_disk_free_bytes",
    "help": "Free space in bytes (LogicalDisk.PercentFreeSpace)",
    "type": "gauge",
    "labels": {
      "volume": "D:"
    },
    "value": "2.627731456e+09",
    "line_raw": "wmi_logical_disk_free_bytes{volume=\"D:\"} 2.627731456e+09"
  },
  {
    "name": "wmi_logical_disk_free_bytes",
    "help": "Free space in bytes (LogicalDisk.PercentFreeSpace)",
    "type": "gauge",
    "labels": {
      "volume": "HarddiskVolume4"
    },
    "value": "4.59276288e+08",
    "line_raw": "wmi_logical_disk_free_bytes{volume=\"HarddiskVolume4\"} 4.59276288e+08"
  }
]
```

#### Mapping LLD macros

Next you have to go to the LLD macros tab and make the following mappings:

```
{#VOLUME}=${labels['volume']}
{#METRIC}=${['name']}
{#HELP}=${['help']}
```

#### Item prototype

You may want to create an item prototype like this:

Item prototype
Tags
Preprocessing

\* Name
Free bytes on {#VOLUME}

Type
Dependent item

\* Key
wmi[{#METRIC},{#VOLUME}]
Select

\* Master item
My host: HTTP master item

1:
Prometheus pattern
{#METRIC}{volume="{#VOLUME}"}

Add

### 13 Discovery of block devices

In a similar way as **file systems** are discovered, it is possible to also discover block devices and their type.

Item key

The item key to use in the **discovery rule** is

`vfs.dev.discovery`

This item is supported on Linux platforms only, since Zabbix agent 4.4.

You may create discovery rules using this discovery item and:

- filter: **{#DEVNAME}** matches `sd[\D]$` - to discover devices named "sd0", "sd1", "sd2", ...
- filter: **{#DEVTYPE}** matches `disk` AND **{#DEVNAME}** does not match `^loop.*` - to discover disk type devices whose name does not start with "loop"

Supported macros

This discovery key returns two macros - `{#DEVNAME}` and `{#DEVTYPE}` identifying the block device name and type respectively, e.g.:

```
[
  {
    "{#DEVNAME}": "loop1",
    "{#DEVTYPE}": "disk"
  },
  {
    "{#DEVNAME}": "dm-0",
    "{#DEVTYPE}": "disk"
  },
  {
    "{#DEVNAME}": "sda",
    "{#DEVTYPE}": "disk"
  },
  {
    "{#DEVNAME}": "sda1",
    "{#DEVTYPE}": "partition"
  }
]
```

Block device discovery allows to use `vfs.dev.read[]` and `vfs.dev.write[]` items to create item prototypes using the `{#DEVNAME}` macro, for example:

- `"vfs.dev.read[{#DEVNAME},sps]"`
- `"vfs.dev.write[{#DEVNAME},sps]"`

`{#DEVTYPE}` is intended for device filtering.

## 14 Discovery of host interfaces in Zabbix

### Overview

It is possible to **discover** all interfaces configured in Zabbix frontend for a host.

### Item key

The item to use in the **discovery rule** is the

`zabbix[host,discovery,interfaces]`

internal item. This item is supported since Zabbix server 3.4.

This item returns a JSON with the description of interfaces, including:

- IP address/DNS hostname (depending on the "Connect to" host setting)
- Port number
- Interface type (Zabbix agent, SNMP, JMX, IPMI)
- If it is the default interface or not
- If the bulk request feature is enabled - for SNMP interfaces only.

For example:

```
[{"{#IF.CONN}": "192.168.3.1", "{#IF.IP}": "192.168.3.1", "{#IF.DNS}": "", "{#IF.PORT}": "10050", "{#IF.TYPE}": "AG"}
```

With multiple interfaces their records in JSON are ordered by:

- Interface type,
- Default - the default interface is put before non-default interfaces,
- Interface ID (in ascending order).

### Supported macros

The following macros are supported for use in the discovery rule **filter** and prototypes of items, triggers and graphs:

| Macro           | Description   |
|-----------------|---|
| {#IF.CONNN}     | Interface IP address or DNS host name.  |
| {#IF.IP}        | Interface IP address.   |
| {#IF.DNS}       | Interface DNS host name.  |
| {#IF.PORT}      | Interface port number.  |
| {#IF.TYPE}      | Interface type ("AGENT", "SNMP", "JMX", or "IPMI").   |
| {#IF.DEFAULT}   | Default status for the interface:<br>0 - not default interface<br>1 - default interface   |
| {#IF.SNMP.BULK} | SNMP bulk processing status for the interface:<br>0 - disabled<br>1 - enabled<br>This macro is returned only if interface type is "SNMP". |

## 6 Custom LLD rules

### Overview

It is also possible to create a completely custom LLD rule, discovering any type of entities - for example, databases on a database server.

To do so, a custom item should be created that returns JSON, specifying found objects and optionally - some properties of them. The amount of macros per entity is not limited - while the built-in discovery rules return either one or two macros (for example, two for filesystem discovery), it is possible to return more.

### Example

The required JSON format is best illustrated with an example. Suppose we are running an old Zabbix 1.8 agent (one that does not support "vfs.fs.discovery"), but we still need to discover file systems. Here is a simple Perl script for Linux that discovers mounted file systems and outputs JSON, which includes both file system name and type. One way to use it would be as a UserParameter with key "vfs.fs.discovery\_perl":

```
####!/usr/bin/perl

$first = 1;

print "[\n";

for (`cat /proc/mounts`)
{
    ($fsname, $fstype) = m/\S+ (\S+) (\S+)/;

    print "\t,\n" if not $first;
    $first = 0;

    print "\t{\n";
    print "\t\t\"{#FSNAME}\" : \"$fsname\", \n";
    print "\t\t\"{#FSTYPE}\" : \"$fstype\" \n";
    print "\t}\n";
}

print "]\n";
```

#### Attention:

Allowed symbols for LLD macro names are **0-9** , **A-Z** , **\_** , **.** . Lowercase letters are not supported in the names.

An example of its output (reformatted for clarity) is shown below. JSON for custom discovery checks has to follow the same format.

```
[
  { "{#FSNAME}": "/",           "{#FSTYPE}": "rootfs" },
  { "{#FSNAME}": "/sys",        "{#FSTYPE}": "sysfs"  },
  { "{#FSNAME}": "/proc",       "{#FSTYPE}": "proc"   },
  { "{#FSNAME}": "/dev",        "{#FSTYPE}": "devtmpfs"},
  { "{#FSNAME}": "/dev/pts",    "{#FSTYPE}": "devpts" },
```

```

{ "{#FSNAME}":"/lib/init/rw",           "{#FSTYPE}":"tmpfs"    },
{ "{#FSNAME}":"/dev/shm",             "{#FSTYPE}":"tmpfs"    },
{ "{#FSNAME}":"/home",                "{#FSTYPE}":"ext3"     },
{ "{#FSNAME}":"/tmp",                 "{#FSTYPE}":"ext3"     },
{ "{#FSNAME}":"/usr",                 "{#FSTYPE}":"ext3"     },
{ "{#FSNAME}":"/var",                 "{#FSTYPE}":"ext3"     },
{ "{#FSNAME}":"/sys/fs/fuse/connections", "{#FSTYPE}":"fusectl"  }
]

```

In the previous example it is required that the keys match the LLD macro names used in prototypes, the alternative is to extract LLD macro values using JSONPath `{#FSNAME} → $.fsname` and `{#FSTYPE} → $.fstype`, thus making such script possible:

```

####!/usr/bin/perl

$first = 1;

print "[\n";

for (`cat /proc/mounts`)
{
    ($fsname, $fstype) = m/\S+ (\S+) (\S+)/;

    print "\t,\n" if not $first;
    $first = 0;

    print "\t{\n";
    print "\t\t\"fsname\": \"$fsname\", \n";
    print "\t\t\"fstype\": \"$fstype\" \n";
    print "\t}\n";
}

print "]\n";

```

An example of its output (reformatted for clarity) is shown below. JSON for custom discovery checks has to follow the same format.

```

[
  { "fsname": "/",           "fstype": "rootfs"    },
  { "fsname": "/sys",       "fstype": "sysfs"     },
  { "fsname": "/proc",     "fstype": "proc"      },
  { "fsname": "/dev",      "fstype": "devtmpfs"   },
  { "fsname": "/dev/pts",  "fstype": "devpts"   },
  { "fsname": "/lib/init/rw", "fstype": "tmpfs"    },
  { "fsname": "/dev/shm",  "fstype": "tmpfs"    },
  { "fsname": "/home",    "fstype": "ext3"     },
  { "fsname": "/tmp",     "fstype": "ext3"     },
  { "fsname": "/usr",     "fstype": "ext3"     },
  { "fsname": "/var",     "fstype": "ext3"     },
  { "fsname": "/sys/fs/fuse/connections", "fstype": "fusectl"  }
]

```

Then, in the discovery rule's "Filter" field, we could specify "{#FSTYPE}" as a macro and "rootfs|ext3" as a regular expression.

#### Note:

You don't have to use macro names FSNAME/FSTYPE with custom LLD rules, you are free to use whatever names you like. In case JSONPath is used then LLD row will be an array element that can be an object, but it can be also another array or a value.

Note that, if using a user parameter, the return value is limited to 16MB. For more details, see [data limits for LLD return values](#).

## 16 Distributed monitoring

**Overview** Zabbix provides an effective and reliable way of monitoring a distributed IT infrastructure using Zabbix proxies.

Proxies can be used to collect data locally on behalf of a centralized Zabbix server and then report the data to the server.

Proxy features

When making a choice of using/not using a proxy, several considerations must be taken into account.

|                             | Proxy            |
|-----------------------------|------------------|
| Lightweight                 | Yes              |
| GUI                         | No               |
| Works independently         | Yes              |
| Easy maintenance            | Yes              |
| Automatic DB creation       | Yes <sup>1</sup> |
| Local administration        | No               |
| Ready for embedded hardware | Yes              |
| One way TCP connections     | Yes              |
| Centralized configuration   | Yes              |
| Generates notifications     | No               |

<sup>1</sup> Automatic DB creation feature works only with SQLite. Other databases require manual setup.

1 Proxies

**Overview** A Zabbix proxy can collect performance and availability data on behalf of the Zabbix server. This way, a proxy can take on itself some of the load of collecting data and offload the Zabbix server.

Also, using a proxy is the easiest way of implementing centralized and distributed monitoring, when all agents and proxies report to one Zabbix server and all data is collected centrally.

A Zabbix proxy can be used to:

- Monitor remote locations
- Monitor locations having unreliable communications
- Offload the Zabbix server when monitoring thousands of devices
- Simplify the maintenance of distributed monitoring

The proxy requires only one TCP connection to the Zabbix server. This way it is easier to get around a firewall as you only need to configure one firewall rule.

**Attention:**

Zabbix proxy must use a separate database. Pointing it to the Zabbix server database will break the configuration.

All data collected by the proxy is stored locally before transmitting it over to the server. This way no data is lost due to any temporary communication problems with the server. The *ProxyLocalBuffer* and *ProxyOfflineBuffer* parameters in the proxy configuration file control for how long the data are kept locally.

**Attention:**

It may happen that a proxy, which receives the latest configuration changes directly from Zabbix server database, has a more up-to-date configuration than Zabbix server whose configuration may not be updated as fast due to the value of **CacheUpdateFrequency**. As a result, proxy may start gathering data and send them to Zabbix server that ignores these data.

Zabbix proxy is a data collector. It does not calculate triggers, process events or send alerts. For an overview of what proxy functionality is, review the following table:

| Function                            | Supported by proxy      |
|-------------------------------------|-------------------------|
| Items                               |                         |
| <i>Zabbix agent checks</i>          | <b>Yes</b>              |
| <i>Zabbix agent checks (active)</i> | <b>Yes</b> <sup>1</sup> |
| <i>Simple checks</i>                | <b>Yes</b>              |
| <i>Trapper items</i>                | <b>Yes</b>              |
| <i>SNMP checks</i>                  | <b>Yes</b>              |
| <i>SNMP traps</i>                   | <b>Yes</b>              |
| <i>IPMI checks</i>                  | <b>Yes</b>              |
| <i>JMX checks</i>                   | <b>Yes</b>              |
| <i>Log file monitoring</i>          | <b>Yes</b>              |
| <i>Internal checks</i>              | <b>Yes</b>              |
| <i>SSH checks</i>                   | <b>Yes</b>              |
| <i>Telnet checks</i>                | <b>Yes</b>              |
| <i>External checks</i>              | <b>Yes</b>              |
| <i>Dependent items</i>              | <b>Yes</b>              |
| <i>Script items</i>                 | <b>Yes</b>              |
| Built-in web monitoring             | <b>Yes</b>              |
| Item value preprocessing            | <b>Yes</b>              |
| Network discovery                   | <b>Yes</b>              |
| Active agent autoregistration       | <b>Yes</b>              |
| Low-level discovery                 | <b>Yes</b> <sup>2</sup> |
| Remote commands                     | <b>Yes</b>              |
| Calculating triggers                | <i>No</i>               |
| Processing events                   | <i>No</i>               |
| Event correlation                   | <i>No</i>               |
| Sending alerts                      | <i>No</i>               |

**Note:**

[1] To make sure that an agent asks the proxy (and not the server) for active checks, the proxy must be listed in the **ServerActive** parameter in the agent configuration file.  
 [2] For LLD, Zabbix proxy only collects and preprocesses the data and then sends it to Zabbix server for further processing.

## Protection from overloading

If Zabbix server was down for some time, and proxies have collected a lot of data, and then the server starts, it may get overloaded (history cache usage stays at 95-100% for some time). This overload could result in a performance hit, where checks are processed slower than they should. Protection from this scenario was implemented to avoid problems that arise due to overloading history cache.

When Zabbix server history cache is full the history cache write access is being throttled, stalling server data gathering processes. The most common history cache overload case is after server downtime when proxies are uploading gathered data. To avoid this proxy throttling was added (currently it cannot be disabled).

Zabbix server will stop accepting data from proxies when history cache usage reaches 80%. Instead those proxies will be put on a throttling list. This will continue until the cache usage falls down to 60%. Now server will start accepting data from proxies one by one, defined by the throttling list. This means the first proxy that attempted to upload data during the throttling period will be served first and until it's done the server will not accept data from other proxies.

This throttling mode will continue until either cache usage hits 80% again or falls down to 20% or the throttling list is empty. In the first case the server will stop accepting proxy data again. In the other two cases the server will start working normally, accepting data from all proxies.

The above information can be illustrated in the following table:

| History write<br>cache usage | Zabbix server mode | Zabbix server action  |
|------------------------------|--------------------|---|
| Reaches 80%                  | Wait               | Stops accepting proxy data, but maintains a <i>throttling list</i> (prioritized list of proxies to be contacted later). |
| Drops to 60%                 | Throttled          | Starts processing throttling list, but still not accepting proxy data.  |
| Drops to 20%                 | Normal             | Drops the throttling list and starts accepting proxy data normally.   |

You may use the `zabbix[wcache,history,pused]` internal item to correlate this behavior of Zabbix server with a metric.

**Configuration** Once you have **installed** and **configured** a proxy, it is time to configure it in the Zabbix frontend.

Adding proxies

To configure a proxy in Zabbix frontend:

- Go to: *Administration* → *Proxies*
- Click on *Create proxy*

Proxy

| Parameter            | Description   |
|----------------------|---|
| <i>Proxy name</i>    | Enter the proxy name. It must be the same name as in the <i>Hostname</i> parameter in the proxy configuration file.   |
| <i>Proxy mode</i>    | Select the proxy mode.<br><b>Active</b> - the proxy will connect to the Zabbix server and request configuration data<br><b>Passive</b> - Zabbix server connects to the proxy<br><i>Note</i> that without encrypted communications (sensitive) proxy configuration data may become available to parties having access to the Zabbix server trapper port when using an active proxy. This is possible because anyone may pretend to be an active proxy and request configuration data if authentication does not take place or proxy addresses are not limited in the <i>Proxy address</i> field. |
| <i>Proxy address</i> | If specified then active proxy requests are only accepted from this list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of active Zabbix proxy. This field is only available if an active proxy is selected in the <i>Proxy mode</i> field. Macros are not supported.   |
| <i>Interface</i>     | This option is supported since Zabbix 4.0.0.  |
|                      | Enter interface details for the passive proxy.  |
|                      | This field is only available if a passive proxy is selected in the <i>Proxy mode</i> field.   |
| <i>IP address</i>    | IP address of the passive proxy (optional).   |
| <i>DNS name</i>      | DNS name of the passive proxy (optional).   |
| <i>Connect to</i>    | Clicking the respective button will tell Zabbix server what to use to retrieve data from proxy:<br><b>IP</b> - Connect to the proxy IP address (recommended)<br><b>DNS</b> - Connect to the proxy DNS name  |

| Parameter          | Description  |
|--------------------|--|
| <i>Port</i>        | TCP port number of the passive proxy (10051 by default). |
| <i>Description</i> | Enter the proxy description.                             |

The **Encryption** tab allows you to require encrypted connections with the proxy.

| Parameter                     | Description  |
|-------------------------------|--|
| <i>Connections to proxy</i>   | How the server connects to the passive proxy: no encryption (default), using PSK (pre-shared key) or certificate.  |
| <i>Connections from proxy</i> | Select what type of connections are allowed from the active proxy. Several connection types can be selected at the same time (useful for testing and switching to other connection type). Default is "No encryption".  |
| <i>Issuer</i>                 | Allowed issuer of certificate. Certificate is first validated with CA (certificate authority). If it is valid, signed by the CA, then the <i>Issuer</i> field can be used to further restrict allowed CA. This field is optional, intended to use if your Zabbix installation uses certificates from multiple CAs. |
| <i>Subject</i>                | Allowed subject of certificate. Certificate is first validated with CA. If it is valid, signed by the CA, then the <i>Subject</i> field can be used to allow only one value of <i>Subject</i> string. If this field is empty then any valid certificate signed by the configured CA is accepted.                   |
| <i>PSK identity</i>           | Pre-shared key identity string.<br>Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.   |
| <i>PSK</i>                    | Pre-shared key (hex-string). Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library. Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952   |

### Host configuration

You can specify that an individual host should be monitored by a proxy in the **host configuration** form, using the *Monitored by proxy* field.

Monitored by proxy

(no proxy) ▾

(no proxy)

Remote proxy

Enabled

Host **mass update** is another way of specifying that hosts should be monitored by a proxy.

## 17 Encryption

**Overview** Zabbix supports encrypted communications between Zabbix components using Transport Layer Security (TLS) protocol v.1.2 and 1.3 (depending on the crypto library). Certificate-based and pre-shared key-based encryption is supported.

Encryption can be configured for connections:

- Between Zabbix server, Zabbix proxy, Zabbix agent, Zabbix web service, zabbix\_sender and zabbix\_get utilities
- To Zabbix database **from Zabbix frontend and server/proxy**

Encryption is optional and configurable for individual components:

- Some proxies and agents can be configured to use certificate-based encryption with the server, while others can use pre-shared key-based encryption, and yet others continue with unencrypted communications (as before)
- Server (proxy) can use different encryption configurations for different hosts

Zabbix daemon programs use one listening port for encrypted and unencrypted incoming connections. Adding an encryption does not require opening new ports on firewalls.

## Limitations

- Private keys are stored in plain text in files readable by Zabbix components during startup
- Pre-shared keys are entered in Zabbix frontend and stored in Zabbix database in plain text
- Built-in encryption does not protect communications:
  - Between the web server running Zabbix frontend and user web browser
  - Between Zabbix frontend and Zabbix server
- Currently each encrypted connection opens with a full TLS handshake, no session caching and tickets are implemented
- Adding encryption increases the time for item checks and actions, depending on network latency:
  - For example, if packet delay is 100ms then opening a TCP connection and sending unencrypted request takes around 200ms. With encryption about 1000 ms are added for establishing the TLS connection;
  - Timeouts may need to be increased, otherwise some items and actions running remote scripts on agents may work with unencrypted connections, but fail with timeout with encrypted.
- Encryption is not supported by **network discovery**. Zabbix agent checks performed by network discovery will be unencrypted and if Zabbix agent is configured to reject unencrypted connections such checks will not succeed.

**Compiling Zabbix with encryption support** To support encryption Zabbix must be compiled and linked with one of the supported crypto libraries:

- GnuTLS - from version 3.1.18
- OpenSSL - versions 1.0.1, 1.0.2, 1.1.0, 1.1.1, 3.0.x. Note that 3.0.x is supported since Zabbix 6.0.4.
- LibreSSL - tested with versions 2.7.4, 2.8.2:
  - LibreSSL 2.6.x is not supported
  - LibreSSL is supported as a compatible replacement of OpenSSL; the new `tls_*`() LibreSSL-specific API functions are not used. Zabbix components compiled with LibreSSL will not be able to use PSK, only certificates can be used.

### Note:

You can find out more about setting up SSL for Zabbix frontend by referring to these **best practices**.

The library is selected by specifying the respective option to "configure" script:

- `--with-gnutls [=DIR]`
- `--with-openssl [=DIR]` (also used for LibreSSL)

For example, to configure the sources for server and agent with *OpenSSL* you may use something like:

```
./configure --enable-server --enable-agent --with-mysql --enable-ipv6 --with-net-snmp --with-libcurl --with-
```

Different Zabbix components may be compiled with different crypto libraries (e.g. a server with *OpenSSL*, an agent with *GnuTLS*).

### Attention:

If you plan to use pre-shared keys (PSK), consider using *GnuTLS* or *OpenSSL 1.1.0* (or newer) libraries in Zabbix components using PSKs. *GnuTLS* and *OpenSSL 1.1.0* libraries support PSK ciphersuites with **Perfect Forward Secrecy**. Older versions of the *OpenSSL* library (1.0.1, 1.0.2c) also support PSKs, but available PSK ciphersuites do not provide Perfect Forward Secrecy.

**Connection encryption management** Connections in Zabbix can use:

- no encryption (default)
- **RSA certificate-based encryption**
- **PSK-based encryption**

There are two important parameters used to specify encryption between Zabbix components:

- **TLSCConnect** - specifies what encryption to use for outgoing connections (unencrypted, PSK or certificate)
- **TLSCAccept** - specifies what types of connections are allowed for incoming connections (unencrypted, PSK or certificate). One or more values can be specified.

**TLSCConnect** is used in the configuration files for Zabbix proxy (in active mode, specifies only connections to server) and Zabbix agent (for active checks). In Zabbix frontend the **TLSCConnect** equivalent is the *Connections to host* field in *Configuration* → *Hosts* → *<some host>* → *Encryption* tab and the *Connections to proxy* field in *Administration* → *Proxies* → *<some proxy>* → *Encryption* tab. If the configured encryption type for connection fails, no other encryption types will be tried.

**TLSCAccept** is used in the configuration files for Zabbix proxy (in passive mode, specifies only connections from server) and Zabbix agent (for passive checks). In Zabbix frontend the **TLSCAccept** equivalent is the *Connections from host* field in *Configuration* → *Hosts* → *<some host>* → *Encryption* tab and the *Connections from proxy* field in *Administration* → *Proxies* → *<some proxy>* → *Encryption* tab.

Normally you configure only one type of encryption for incoming connections. But you may want to switch the encryption type, e.g. from unencrypted to certificate-based with minimum downtime and rollback possibility. To achieve this:

- Set `TLSAccept=unencrypted`, `cert` in the agent configuration file and restart Zabbix agent
- Test connection with `zabbix_get` to the agent using certificate. If it works, you can reconfigure encryption for that agent in Zabbix frontend in the *Configuration* → *Hosts* → *<some host>* → *Encryption* tab by setting *Connections to host* to "Certificate".
- When server configuration cache gets updated (and proxy configuration is updated if the host is monitored by proxy) then connections to that agent will be encrypted
- If everything works as expected you can set `TLSAccept=cert` in the agent configuration file and restart Zabbix agent. Now the agent will be accepting only encrypted certificate-based connections. Unencrypted and PSK-based connections will be rejected.

In a similar way it works on server and proxy. If in Zabbix frontend in host configuration *Connections from host* is set to "Certificate" then only certificate-based encrypted connections will be accepted from the agent (active checks) and `zabbix_sender` (trapper items).

Most likely you will configure incoming and outgoing connections to use the same encryption type or no encryption at all. But technically it is possible to configure it asymmetrically, e.g. certificate-based encryption for incoming and PSK-based for outgoing connections.

Encryption configuration for each host is displayed in the Zabbix frontend, in *Configuration* → *Hosts* in the *Agent encryption* column. For example:

| Example                                  | Connections to host          | Allowed connections from host                   | Rejected connections from host                 |
|--|------------------------------|---|--|
| <b>NONE</b>                              | Unencrypted                  | Unencrypted                                     | Encrypted, certificate and PSK-based encrypted |
| <b>CERT</b> <small>NONE PSK CERT</small> | Encrypted, certificate-based | Encrypted, certificate-based                    | Unencrypted and PSK-based encrypted            |
| <b>PSK</b> <small>NONE PSK CERT</small>  | Encrypted, PSK-based         | Encrypted, PSK-based                            | Unencrypted and certificate-based encrypted    |
| <b>PSK</b> <small>NONE PSK CERT</small>  | Encrypted, PSK-based         | Unencrypted and PSK-based encrypted             | Certificate-based encrypted                    |
| <b>CERT</b> <small>NONE PSK CERT</small> | Encrypted, certificate-based | Unencrypted, PSK or certificate-based encrypted | -  |

#### Attention:

Connections are unencrypted by default. Encryption must be configured for each host and proxy individually.

**zabbix\_get and zabbix\_sender with encryption** See `zabbix_get` and `zabbix_sender` manpages for using them with encryption.

**Ciphersuites** Ciphersuites by default are configured internally during Zabbix startup and, before Zabbix 4.0.19, 4.4.7, are not user-configurable.

Since Zabbix 4.0.19, 4.4.7 also user-configured ciphersuites are supported for GnuTLS and OpenSSL. Users may **configure** ciphersuites according to their security policies. Using this feature is optional (built-in default ciphersuites still work).

For crypto libraries compiled with default settings Zabbix built-in rules typically result in the following ciphersuites (in order from higher to lower priority):

| Library               | Certificate ciphersuites         | PSK ciphersuites                 |
|-----------------------|----------------------------------|----------------------------------|
| <i>GnuTLS 3.1.18</i>  | TLS_ECDHE_RSA_AES_128_GCM_SHA256 | TLS_ECDHE_PSK_AES_128_CBC_SHA256 |
|                       | TLS_ECDHE_RSA_AES_128_CBC_SHA256 | TLS_ECDHE_PSK_AES_128_CBC_SHA1   |
|                       | TLS_ECDHE_RSA_AES_128_CBC_SHA1   | TLS_PSK_AES_128_GCM_SHA256       |
|                       | TLS_RSA_AES_128_GCM_SHA256       | TLS_PSK_AES_128_CBC_SHA256       |
|                       | TLS_RSA_AES_128_CBC_SHA256       | TLS_PSK_AES_128_CBC_SHA1         |
|                       | TLS_RSA_AES_128_CBC_SHA1         |                                  |
| <i>OpenSSL 1.0.2c</i> | ECDHE-RSA-AES128-GCM-SHA256      | PSK-AES128-CBC-SHA               |
|                       | ECDHE-RSA-AES128-SHA256          |                                  |
|                       | ECDHE-RSA-AES128-SHA             |                                  |
|                       | AES128-GCM-SHA256                |                                  |
|                       | AES128-SHA256                    |                                  |
|                       | AES128-SHA                       |                                  |

| Library               | Certificate ciphersuites  | PSK ciphersuites   |
|-----------------------|---|--|
| <i>OpenSSL 1.1.0</i>  | ECDHE-RSA-AES128-GCM-SHA256<br>ECDHE-RSA-AES128-SHA256<br>ECDHE-RSA-AES128-SHA<br>AES128-GCM-SHA256<br>AES128-CCM8<br>AES128-CCM<br>AES128-SHA256<br>AES128-SHA   | ECDHE-PSK-AES128-CBC-SHA256<br>ECDHE-PSK-AES128-CBC-SHA<br>PSK-AES128-GCM-SHA256<br>PSK-AES128-CCM8<br>PSK-AES128-CCM<br>PSK-AES128-CBC-SHA256<br>PSK-AES128-CBC-SHA   |
| <i>OpenSSL 1.1.1d</i> | TLS_AES_256_GCM_SHA384<br>TLS_CHACHA20_POLY1305_SHA256<br>TLS_AES_128_GCM_SHA256<br>ECDHE-RSA-AES128-GCM-SHA256<br>ECDHE-RSA-AES128-SHA256<br>ECDHE-RSA-AES128-SHA<br>AES128-GCM-SHA256<br>AES128-CCM8<br>AES128-CCM<br>AES128-SHA256<br>AES128-SHA | TLS_CHACHA20_POLY1305_SHA256<br>TLS_AES_128_GCM_SHA256<br>ECDHE-PSK-AES128-CBC-SHA256<br>ECDHE-PSK-AES128-CBC-SHA<br>PSK-AES128-GCM-SHA256<br>PSK-AES128-CCM8<br>PSK-AES128-CCM<br>PSK-AES128-CBC-SHA256<br>PSK-AES128-CBC-SHA |

**User-configured ciphersuites** The built-in ciphersuite selection criteria can be overridden with user-configured ciphersuites.

**Attention:**

User-configured ciphersuites is a feature intended for advanced users who understand TLS ciphersuites, their security and consequences of mistakes, and who are comfortable with TLS troubleshooting.

The built-in ciphersuite selection criteria can be overridden using the following parameters:

| Override scope                                    | Parameter       | Value   | Description  |
|---|-----------------|---|--|
| Ciphersuite selection for certificates            | TLSCipherCert13 | Valid OpenSSL 1.1.1 <a href="#">cipher strings</a> for TLS 1.3 protocol (their values are passed to the OpenSSL function <code>SSL_CTX_set_ciphersuites()</code> ).   | Certificate-based ciphersuite selection criteria for TLS 1.3<br><br>Only OpenSSL 1.1.1 or newer. |
|   | TLSCipherCert   | Valid OpenSSL <a href="#">cipher strings</a> for TLS 1.2 or valid GnuTLS <a href="#">priority strings</a> . Their values are passed to the <code>SSL_CTX_set_cipher_list()</code> or <code>gnutls_priority_init()</code> functions, respectively. | Certificate-based ciphersuite selection criteria for TLS 1.2/1.3 (GnuTLS), TLS 1.2 (OpenSSL)     |
| Ciphersuite selection for PSK                     | TLSCipherPSK13  | Valid OpenSSL 1.1.1 <a href="#">cipher strings</a> for TLS 1.3 protocol (their values are passed to the OpenSSL function <code>SSL_CTX_set_ciphersuites()</code> ).   | PSK-based ciphersuite selection criteria for TLS 1.3<br><br>Only OpenSSL 1.1.1 or newer.         |
|   | TLSCipherPSK    | Valid OpenSSL <a href="#">cipher strings</a> for TLS 1.2 or valid GnuTLS <a href="#">priority strings</a> . Their values are passed to the <code>SSL_CTX_set_cipher_list()</code> or <code>gnutls_priority_init()</code> functions, respectively. | PSK-based ciphersuite selection criteria for TLS 1.2/1.3 (GnuTLS), TLS 1.2 (OpenSSL)             |
| Combined ciphersuite list for certificate and PSK | TLSCipherAll13  | Valid OpenSSL 1.1.1 <a href="#">cipher strings</a> for TLS 1.3 protocol (their values are passed to the OpenSSL function <code>SSL_CTX_set_ciphersuites()</code> ).   | Ciphersuite selection criteria for TLS 1.3<br><br>Only OpenSSL 1.1.1 or newer.                   |
|   |                 |   |  |

| Override scope | Parameter    | Value   | Description  |
|----------------|--------------|---|--|
|                | TLSCipherAll | Valid OpenSSL <a href="#">cipher strings</a> for TLS 1.2 or valid GnuTLS <a href="#">priority strings</a> . Their values are passed to the <code>SSL_CTX_set_cipher_list()</code> or <code>gnutls_priority_init()</code> functions, respectively. | Ciphersuite selection criteria for TLS 1.2/1.3 (GnuTLS), TLS 1.2 (OpenSSL) |

To override the ciphersuite selection in `zabbix_get` and `zabbix_sender` utilities - use the command-line parameters:

- `--tls-cipher13`
- `--tls-cipher`

The new parameters are optional. If a parameter is not specified, the internal default value is used. If a parameter is defined it cannot be empty.

If the setting of a `TLSCipher*` value in the crypto library fails then the server, proxy or agent will not start and an error is logged.

It is important to understand when each parameter is applicable.

Outgoing connections

The simplest case is outgoing connections:

- For outgoing connections with certificate - use `TLSCipherCert13` or `TLSCipherCert`
- For outgoing connections with PSK - use `TLSCipherPSK13` or `TLSCipherPSK`
- In case of `zabbix_get` and `zabbix_sender` utilities the command-line parameters `--tls-cipher13` or `--tls-cipher` can be used (encryption is unambiguously specified with a `--tls-connect` parameter)

Incoming connections

It is a bit more complicated with incoming connections because rules are specific for components and configuration.

For Zabbix **agent**:

| Agent connection setup          | Cipher configuration                                      |
|---------------------------------|---|
| <code>TLSCConnect=cert</code>   | <code>TLSCipherCert</code> , <code>TLSCipherCert13</code> |
| <code>TLSCConnect=psk</code>    | <code>TLSCipherPSK</code> , <code>TLSCipherPSK13</code>   |
| <code>TLSAccept=cert</code>     | <code>TLSCipherCert</code> , <code>TLSCipherCert13</code> |
| <code>TLSAccept=psk</code>      | <code>TLSCipherPSK</code> , <code>TLSCipherPSK13</code>   |
| <code>TLSAccept=cert,psk</code> | <code>TLSCipherAll</code> , <code>TLSCipherAll13</code>   |

For Zabbix **server** and **proxy**:

| Connection setup  | Cipher configuration                                    |
|---|---|
| Outgoing connections using PSK                              | <code>TLSCipherPSK</code> , <code>TLSCipherPSK13</code> |
| Incoming connections using certificates                     | <code>TLSCipherAll</code> , <code>TLSCipherAll13</code> |
| Incoming connections using PSK if server has no certificate | <code>TLSCipherPSK</code> , <code>TLSCipherPSK13</code> |
| Incoming connections using PSK if server has certificate    | <code>TLSCipherAll</code> , <code>TLSCipherAll13</code> |

Some pattern can be seen in the two tables above:

- `TLSCipherAll` and `TLSCipherAll13` can be specified only if a combined list of certificate- **and** PSK-based ciphersuites is used. There are two cases when it takes place: server (proxy) with a configured certificate (PSK ciphersuites are always configured on server, proxy if crypto library supports PSK), agent configured to accept both certificate- and PSK-based incoming connections
- in other cases `TLSCipherCert*` and/or `TLSCipherPSK*` are sufficient

The following tables show the `TLSCipher*` built-in default values. They could be a good starting point for your own custom values.

| Parameter     | GnuTLS 3.6.12  |
|---------------|--|
| TLSCipherCert | NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509                 |
| TLSCipherPSK  | NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL                              |
| TLSCipherAll  | NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509 |

| Parameter       | OpenSSL 1.1.1d <sup>1</sup>                                    |
|-----------------|--|
| TLSCipherCert13 |  |
| TLSCipherCert   | EECDH+aRSA+AES128:RSA+aRSA+AES128                              |
| TLSCipherPSK13  | TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256            |
| TLSCipherPSK    | kECDHEPSK+AES128:kPSK+AES128                                   |
| TLSCipherAll13  |  |
| TLSCipherAll    | EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128 |

<sup>1</sup> Default values are different for older OpenSSL versions (1.0.1, 1.0.2, 1.1.0), for LibreSSL and if OpenSSL is compiled without PSK support.

### Examples of user-configured ciphersuites

See below the following examples of user-configured ciphersuites:

- [Testing cipher strings and allowing only PFS ciphersuites](#)
- [Switching from AES128 to AES256](#)

Testing cipher strings and allowing only PFS ciphersuites

To see which ciphersuites have been selected you need to set 'DebugLevel=4' in the configuration file, or use the `-vv` option for `zabbix_sender`.

Some experimenting with `TLSCipher*` parameters might be necessary before you get the desired ciphersuites. It is inconvenient to restart Zabbix server, proxy or agent multiple times just to tweak `TLSCipher*` parameters. More convenient options are using `zabbix_sender` or the `openssl` command. Let's show both.

#### 1. Using `zabbix_sender`.

Let's make a test configuration file, for example, `/home/zabbix/test.conf`, with the syntax of a `zabbix_agentd.conf` file:

```

Hostname=nonexisting
ServerActive=nonexisting

TLSConnect=cert
TLSCAFile=/home/zabbix/ca.crt
TLSCertFile=/home/zabbix/agent.crt
TLSKeyFile=/home/zabbix/agent.key
TLSPSKIdentity=nonexisting
TLSPSKFile=/home/zabbix/agent.psk

```

You need valid CA and agent certificates and PSK for this example. Adjust certificate and PSK file paths and names for your environment.

If you are not using certificates, but only PSK, you can make a simpler test file:

```

Hostname=nonexisting
ServerActive=nonexisting

TLSConnect=psk
TLSPSKIdentity=nonexisting
TLSPSKFile=/home/zabbix/agentd.psk

```

The selected ciphersuites can be seen by running `zabbix_sender` (example compiled with OpenSSL 1.1.d):

```

$ zabbix_sender -vv -c /home/zabbix/test.conf -k nonexistent_item -o 1 2>&1 | grep ciphersuites
zabbix_sender [41271]: DEBUG: zbx_tls_init_child() certificate ciphersuites: TLS_AES_256_GCM_SHA384 TLS_
zabbix_sender [41271]: DEBUG: zbx_tls_init_child() PSK ciphersuites: TLS_CHACHA20_POLY1305_SHA256 TLS_AE
zabbix_sender [41271]: DEBUG: zbx_tls_init_child() certificate and PSK ciphersuites: TLS_AES_256_GCM_SHA

```

Here you see the ciphersuites selected by default. These default values are chosen to ensure interoperability with Zabbix agents running on systems with older OpenSSL versions (from 1.0.1).

With newer systems you can choose to tighten security by allowing only a few ciphersuites, e.g. only ciphersuites with PFS (Perfect Forward Secrecy). Let's try to allow only ciphersuites with PFS using `TLSCipher*` parameters.

**Attention:**

The result will not be interoperable with systems using OpenSSL 1.0.1 and 1.0.2, if PSK is used. Certificate-based encryption should work.

Add two lines to the `test.conf` configuration file:

```
TLSCipherCert=EECDH+aRSA+AES128
TLSCipherPSK=kECDHEPSK+AES128
```

and test again:

```
$ zabbix_sender -vv -c /home/zabbix/test.conf -k nonexistent_item -o 1 2>&1 | grep ciphersuites
zabbix_sender [42892]: DEBUG: zbx_tls_init_child() certificate ciphersuites: TLS_AES_256_GCM_SHA384 TLS_AES_128_GCM_SHA256
zabbix_sender [42892]: DEBUG: zbx_tls_init_child() PSK ciphersuites: TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256
zabbix_sender [42892]: DEBUG: zbx_tls_init_child() certificate and PSK ciphersuites: TLS_AES_256_GCM_SHA384 TLS_AES_128_GCM_SHA256
```

The "certificate ciphersuites" and "PSK ciphersuites" lists have changed - they are shorter than before, only containing TLS 1.3 ciphersuites and TLS 1.2 ECDHE-\* ciphersuites as expected.

2. `TLSCipherAll` and `TLSCipherAll13` cannot be tested with `zabbix_sender`; they do not affect "certificate and PSK ciphersuites" value shown in the example above. To tweak `TLSCipherAll` and `TLSCipherAll13` you need to experiment with the agent, proxy or server.

So, to allow only PFS ciphersuites you may need to add up to three parameters

```
TLSCipherCert=EECDH+aRSA+AES128
TLSCipherPSK=kECDHEPSK+AES128
TLSCipherAll=EECDH+aRSA+AES128:kECDHEPSK+AES128
```

to `zabbix_agentd.conf`, `zabbix_proxy.conf` and `zabbix_server.conf` if each of them has a configured certificate and agent has also PSK.

If your Zabbix environment uses only PSK-based encryption and no certificates, then only one:

```
TLSCipherPSK=kECDHEPSK+AES128
```

Now that you understand how it works you can test the ciphersuite selection even outside of Zabbix, with the `openssl` command. Let's test all three `TLSCipher*` parameter values:

```
$ openssl ciphers EECDH+aRSA+AES128 | sed 's:/ /g'
TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-RSA-AES128-GCM-SHA256 ECDHE-PSK-AES128-CBC-SHA256
$ openssl ciphers kECDHEPSK+AES128 | sed 's:/ /g'
TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-PSK-AES128-CBC-SHA256 ECDHE-RSA-AES128-GCM-SHA256
$ openssl ciphers EECDH+aRSA+AES128:kECDHEPSK+AES128 | sed 's:/ /g'
TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-RSA-AES128-GCM-SHA256 ECDHE-PSK-AES128-CBC-SHA256
```

You may prefer `openssl ciphers` with option `-V` for a more verbose output:

```
$ openssl ciphers -V EECDH+aRSA+AES128:kECDHEPSK+AES128
0x13,0x02 - TLS_AES_256_GCM_SHA384 TLSv1.3 Kx=any Au=any Enc=AESGCM(256) Mac=AEAD
0x13,0x03 - TLS_CHACHA20_POLY1305_SHA256 TLSv1.3 Kx=any Au=any Enc=CHACHA20/POLY1305(256) Mac=AEAD
0x13,0x01 - TLS_AES_128_GCM_SHA256 TLSv1.3 Kx=any Au=any Enc=AESGCM(128) Mac=AEAD
0xC0,0x2F - ECDHE-RSA-AES128-GCM-SHA256 TLSv1.2 Kx=ECDH Au=RSA Enc=AESGCM(128) Mac=AEAD
0xC0,0x27 - ECDHE-RSA-AES128-SHA256 TLSv1.2 Kx=ECDH Au=RSA Enc=AES(128) Mac=SHA256
0xC0,0x13 - ECDHE-RSA-AES128-SHA TLSv1 Kx=ECDH Au=RSA Enc=AES(128) Mac=SHA1
0xC0,0x37 - ECDHE-PSK-AES128-CBC-SHA256 TLSv1 Kx=ECDHEPSK Au=PSK Enc=AES(128) Mac=SHA256
0xC0,0x35 - ECDHE-PSK-AES128-CBC-SHA TLSv1 Kx=ECDHEPSK Au=PSK Enc=AES(128) Mac=SHA1
```

Similarly, you can test the priority strings for GnuTLS:

```
$ gnutls-cli -l --priority=NONE:+VERS-TLS1.2:+ECDHE-RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+CURVE-ALL:+COMP-ALL
Cipher suites for NONE:+VERS-TLS1.2:+ECDHE-RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+CURVE-ALL:+COMP-ALL
TLS_ECDHE_RSA_AES_128_GCM_SHA256 0xc0, 0x2f TLS1.2
TLS_ECDHE_RSA_AES_128_CBC_SHA256 0xc0, 0x27 TLS1.2
```

```

Protocols: VERS-TLS1.2
Ciphers: AES-128-GCM, AES-128-CBC
MACs: AEAD, SHA256
Key Exchange Algorithms: ECDHE-RSA
Groups: GROUP-SECP256R1, GROUP-SECP384R1, GROUP-SECP521R1, GROUP-X25519, GROUP-X448, GROUP-FFDHE2048, GROUP-FFDHE3072
PK-signatures: SIGN-RSA-SHA256, SIGN-RSA-PSS-SHA256, SIGN-RSA-PSS-RSAE-SHA256, SIGN-ECDSA-SHA256, SIGN-ECDSA-SHA384, SIGN-ECDSA-SHA512

```

Switching from AES128 to AES256

Zabbix uses AES128 as the built-in default for data. Let’s assume you are using certificates and want to switch to AES256, on OpenSSL 1.1.1.

This can be achieved by adding the respective parameters in `zabbix_server.conf`:

```

TLSCAFile=/home/zabbix/ca.crt
TLSCertFile=/home/zabbix/server.crt
TLSKeyFile=/home/zabbix/server.key
TLSCipherCert13=TLS_AES_256_GCM_SHA384
TLSCipherCert=EECDH+aRSA+AES256:-SHA1:-SHA384
TLSCipherPSK13=TLS_CHACHA20_POLY1305_SHA256
TLSCipherPSK=kECDHEPSK+AES256:-SHA1
TLSCipherAll13=TLS_AES_256_GCM_SHA384
TLSCipherAll=EECDH+aRSA+AES256:-SHA1:-SHA384

```

**Attention:**

Although only certificate-related ciphersuites will be used, `TLSCipherPSK*` parameters are defined as well to avoid their default values which include less secure ciphers for wider interoperability. PSK ciphersuites cannot be completely disabled on server/proxy.

And in `zabbix_agentd.conf`:

```

TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/ca.crt
TLSCertFile=/home/zabbix/agent.crt
TLSKeyFile=/home/zabbix/agent.key
TLSCipherCert13=TLS_AES_256_GCM_SHA384
TLSCipherCert=EECDH+aRSA+AES256:-SHA1:-SHA384

```

1 Using certificates

Overview

Zabbix can use RSA certificates in PEM format, signed by a public or an in-house certificate authority (CA).

Certificate verification is performed against a pre-configured CA certificate. Optionally, [Certificate Revocation Lists \(CRL\)](#) can be used.

Each Zabbix component can have only one certificate configured.

For more information on setting up and operating an internal CA, generating and signing certificate requests, and revoking certificates, refer to tutorials such as the [OpenSSL PKI Tutorial v2.0](#).

Carefully consider and test your certificate extensions. For more details, see [Limitations on using X.509 v3 certificate extensions](#).

Certificate configuration parameters

The following configuration parameters are supported for setting up certificates on Zabbix components.

| Parameter        | Mandatory | Description  |
|------------------|-----------|--|
| <i>TLSCAFile</i> | yes       | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.<br><br>If using a certificate chain with multiple members, order the certificates with lower level CA(s) certificates first, followed by higher level CA(s) certificates.<br><br>Certificates from multiple CAs can be included in a single file. |

| Parameter                   | Mandatory | Description   |
|-----------------------------|-----------|---|
| <i>TLSCRLFile</i>           | no        | Full pathname of a file containing <b>Certificate Revocation Lists (CRL)</b> .  |
| <i>TLSCertFile</i>          | yes       | Full pathname of a file containing the certificate.<br>If using a certificate chain with multiple members, order the certificates with the server, proxy, or agent certificate first, followed by lower level CA(s) certificates, and concluded by higher level CA(s) certificates. |
| <i>TLSKeyFile</i>           | yes       | Full pathname of a file containing the private key.<br>Ensure that this file is readable only by the <b>Zabbix user</b> by setting appropriate access rights.   |
| <i>TLSServerCertIssuer</i>  | no        | Allowed server certificate issuer.  |
| <i>TLSServerCertSubject</i> | no        | Allowed server certificate subject.   |

## Configuration examples

After setting up the necessary certificates, configure Zabbix components to use certificate-based encryption.

Below are detailed steps for configuring:

- **Zabbix server**
- **Zabbix proxy**
- **Zabbix agent**

### Zabbix server

#### 1. Prepare the CA certificate file.

In order to verify peer certificates, Zabbix server must have access to the file containing the top-level, self-signed root CA certificates. For example, if certificates from two independent root CAs are needed, place them into a file at `/home/zabbix/zabbix_ca_file.crt`.

Certificate:

```
Data:
  Version: 3 (0x2)
  Serial Number: 1 (0x1)
Signature Algorithm: sha1WithRSAEncryption
Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
...
Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
Subject Public Key Info:
  Public Key Algorithm: rsaEncryption
  Public-Key: (2048 bit)
...
X509v3 extensions:
  X509v3 Key Usage: critical
    Certificate Sign, CRL Sign
  X509v3 Basic Constraints: critical
    CA:TRUE
...
```

-----BEGIN CERTIFICATE-----

```
MIID2jCCAsKgAwIBAgIBATANBgkqhkiG9w0BAQUFADB+MRMwEQYKCZImiZPyLGGQ
```

....

```
9wEzdN8uTrqoyU78gi12npLj08LegRKjb5hFTVm0
```

-----END CERTIFICATE-----

Certificate:

```
Data:
  Version: 3 (0x2)
  Serial Number: 1 (0x1)
Signature Algorithm: sha1WithRSAEncryption
Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root2 CA
...
Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root2 CA
Subject Public Key Info:
  Public Key Algorithm: rsaEncryption
  Public-Key: (2048 bit)
....
X509v3 extensions:
```

```

        X509v3 Key Usage: critical
            Certificate Sign, CRL Sign
        X509v3 Basic Constraints: critical
            CA:TRUE
        ....
-----BEGIN CERTIFICATE-----
MIID3DCCAsSgAwIBAgIBATANBgkqhkiG9w0BAQUFADB/MRMwEQYKCZImiZPyLGGQ
...
vdGNYoSfvu41GQAR5Vj5FnRJRzv5XQOZ3B6894GY1zY=
-----END CERTIFICATE-----

```

2. Place the Zabbix server certificate/certificate chain into a file, for example, at `/home/zabbix/zabbix_server.crt`. The first certificate is the Zabbix server certificate, followed by the intermediate CA certificate:

```

Certificate:
  Data:
    Version: 3 (0x2)
    Serial Number: 1 (0x1)
  Signature Algorithm: sha1WithRSAEncryption
    Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
    ...
    Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Zabbix server
  Subject Public Key Info:
    Public Key Algorithm: rsaEncryption
    Public-Key: (2048 bit)
    ...
  X509v3 extensions:
    X509v3 Key Usage: critical
      Digital Signature, Key Encipherment
    X509v3 Basic Constraints:
      CA:FALSE
    ...
-----BEGIN CERTIFICATE-----
MIIECDCCAvCgAwIBAgIBATANBgkqhkiG9w0BAQUFADCBgTETMBEGCgmSJomT8ixk
...
h02u1GHIy46GI+xfR3LsPwFKlkTaaLaL/6aaoQ==
-----END CERTIFICATE-----
Certificate:
  Data:
    Version: 3 (0x2)
    Serial Number: 2 (0x2)
  Signature Algorithm: sha1WithRSAEncryption
    Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
    ...
    Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
  Subject Public Key Info:
    Public Key Algorithm: rsaEncryption
    Public-Key: (2048 bit)
    ...
  X509v3 extensions:
    X509v3 Key Usage: critical
      Certificate Sign, CRL Sign
    X509v3 Basic Constraints: critical
      CA:TRUE, pathlen:0
    ...
-----BEGIN CERTIFICATE-----
MIID4TCCAsmgAwIBAgIBAjANBgkqhkiG9w0BAQUFADB+MRMwEQYKCZImiZPyLGGQ
...
dyCeWnvL7u5sd6ffo8iRny0QzbHKmQt/wUtcVIvWXdMIFJMOHw==
-----END CERTIFICATE-----

```

**Note:**

Use only the attributes mentioned above for both client and server certificates to avoid affecting the certificate verification process. For example, OpenSSL might fail to establish an encrypted connection if *X509v3 Subject Alternative Name* or *Netscape Cert Type* extensions are used. For more information, see [Limitations on using X.509 v3 certificate extensions](#).

3. Place the Zabbix server private key into a file, for example, at `/home/zabbix/zabbix_server.key`:

```
-----BEGIN PRIVATE KEY-----
MIIEwAIBADANBgkqhkiG9w0BAQEFAASCBAKowggSmAgEAAoIBAQC9tIXIJ0VnNXDl
...
IJLkhbybBYEf47MLhffWa7XvZTY=
-----END PRIVATE KEY-----
```

4. Edit the TLS configuration parameters in the **Zabbix server configuration file**:

```
TLSCAFile=/home/zabbix/zabbix_ca_file
TLSCertFile=/home/zabbix/zabbix_server.crt
TLSKeyFile=/home/zabbix/zabbix_server.key
```

### Zabbix proxy

1. Prepare files with the top-level CA certificates, the Zabbix proxy certificate/certificate chain, and the private key as described in the **Zabbix server** section. Then, edit the `TLSCAFile`, `TLSCertFile`, and `TLSKeyFile` parameters in the **Zabbix proxy configuration file** accordingly.

2. Edit additional TLS parameters in the **Zabbix proxy configuration file**:

- For active proxy: `TLSConnect=cert`
- For passive proxy: `TLSAccept=cert`

**Note:**

To improve proxy security, you can also set the `TLSServerCertIssuer` and `TLSServerCertSubject` parameters. For more information, see [Restricting allowed certificate issuer and subject](#).

TLS parameters in the final proxy configuration file may look as follows:

```
TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSCertFile=/home/zabbix/zabbix_proxy.crt
TLSKeyFile=/home/zabbix/zabbix_proxy.key
```

3. Configure encryption for this proxy in Zabbix frontend:

- Go to: *Administration* → *Proxies*.
- Select the proxy and click the *Encryption* tab.

In the examples below, the *Issuer* and *Subject* fields are filled in. For more information on why and how to use these fields, see [Restricting allowed certificate issuer and subject](#).

For active proxy:

Proxy
Encryption

Connections to proxy
No encryption
PSK
Certificate

Connections from proxy
☐ No encryption
☐ PSK
☒ Certificate

Issuer
CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com

Subject
CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com

Update
Clone
Delete
Cancel

For passive proxy:

Proxy

Connections to proxy
No encryption
PSK
Certificate

Connections from proxy
☒ No encryption
☐ PSK
☐ Certificate

Issuer
CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com

Subject
CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com

Update
Clone
Delete
Cancel

## Zabbix agent

1. Prepare files with the top-level CA certificates, the Zabbix agent certificate/certificate chain, and the private key as described in the [Zabbix server](#) section. Then, edit the `TLSCAFile`, `TLSCertFile`, and `TLSKeyFile` parameters in the [Zabbix agent configuration file](#) accordingly.
2. Edit additional TLS parameters in the [Zabbix agent configuration file](#):
  - For active agent: `TLSConnect=cert`
  - For passive agent: `TLSAccept=cert`

### Note:

To improve agent security, you can set the `TLSServerCertIssuer` and `TLSServerCertSubject` parameters. For more information, see [Restricting allowed certificate issuer and subject](#).

The TLS parameters in the final agent configuration file may look as follows. Note that the example assumes that the host is monitored by a proxy, hence it is specified as the certificate Subject:

```

TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSCertFile=/home/zabbix/zabbix_agentd.crt
TLSKeyFile=/home/zabbix/zabbix_agentd.key

```

3. Configure encryption in Zabbix frontend for the host monitored by this agent.

- Go to: *Configuration* → *Hosts*.

- Select the host and click the *Encryption* tab.

In the example below, the *Issuer* and *Subject* fields are filled in. For more information on why and how to use these fields, see [Restricting allowed certificate issuer and subject](#).

#### Zabbix web service

1. Prepare files with the top-level CA certificates, the Zabbix web service certificate/certificate chain, and the private key as described in the [Zabbix server](#) section. Then, edit the `TLSCAFile`, `TLSCertFile`, and `TLSKeyFile` parameters in the [Zabbix web service configuration file](#) accordingly.
2. Edit an additional TLS parameter in the [Zabbix web service configuration file](#): `TLSAccept=cert`

TLS parameters in the final web service configuration file may look as follows:

```

TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file
TLSCertFile=/home/zabbix/zabbix_web_service.crt
TLSKeyFile=/home/zabbix/zabbix_web_service.key

```

3. Configure Zabbix server to connect to the TLS-configured Zabbix web service by editing the `WebServiceURL` parameter in the [Zabbix server configuration file](#):

```

WebServiceURL=https://example.com

```

#### Restricting allowed certificate issuer and subject

When two Zabbix components (for example, server and agent) establish a TLS connection, they validate each other's certificates. If a peer certificate is signed by a trusted CA (with a pre-configured top-level certificate in `TLSCAFile`), is valid, has not expired, and passes other checks, then the communication between components can proceed. In this simplest case, the certificate issuer and subject are not verified.

However, this presents a risk: anyone with a valid certificate can impersonate anyone else (for example, a host certificate could be used to impersonate a server). While this may be acceptable in small environments where certificates are signed by a dedicated in-house CA and the risk of impersonation is low, it may not be sufficient in larger or more security-sensitive environments.

If your top-level CA issues certificates that should not be accepted by Zabbix or if you want to reduce the risk of impersonation, you can restrict allowed certificates by specifying their issuer and subject.

For example, in the Zabbix proxy configuration file, you could specify:

```

TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com

```

With these settings, an active proxy will not communicate with a Zabbix server whose certificate has a different issuer or subject. Similarly, a passive proxy will not accept requests from such a server.

#### Rules for matching Issuer and Subject strings

The rules for matching Issuer and Subject strings are as follows:

- Issuer and Subject strings are checked independently. Both are optional.
- An unspecified string means that any string is accepted.
- Strings are compared as *is* and must match exactly.

- UTF-8 characters are supported. However, wildcards (\*) or regular expressions are not supported.
- The following [RFC 4514](#) requirements are implemented - characters that require escaping (with a '\' backslash, U+005C):
  - anywhere in the string: '"' (U+0022), '+' (U+002B), ',' (U+002C), ';' (U+003B), '<' (U+003C), '>' (U+003E), '\\' (U+005C);
  - at the beginning of the string: space (' ', U+0020) or number sign ('#', U+0023);
  - at the end of the string: space (' ', U+0020).
- Null characters (U+0000) are not supported. If a null character is encountered, the matching will fail.
- [RFC 4517](#) and [RFC 4518](#) standards are not supported.

For example, if Issuer and Subject organization (O) strings contain trailing spaces and the Subject organizational unit (OU) string contains double quotes, these characters must be escaped:

```
TLSServerCertIssuer=CN=Signing CA,OU=Development head,O=\ Example SIA\ ,DC=example,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group \"5\",O=\ Example SIA\ ,DC=example,DC=com
```

#### Field order and formatting

Zabbix follows the recommendations of [RFC 4514](#), which specifies a “reverse” order for these fields, starting with the lowest-level fields (CN), proceeding to the mid-level fields (OU, O), and concluding with the highest-level fields (DC).

```
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

In contrast, OpenSSL by default displays the Issuer and Subject strings in top-level to low-level order. In the following example, Issuer and Subject fields start with the top-level (DC) and end with the low-level (CN) field. The formatting with spaces and field separators also varies based on the options used, and thus will not match the format required by Zabbix.

```
$ openssl x509 -noout -in /home/zabbix/zabbix_proxy.crt -issuer -subject
issuer= /DC=com/DC=zabbix/O=Zabbix SIA/OU=Development group/CN=Signing CA
subject= /DC=com/DC=zabbix/O=Zabbix SIA/OU=Development group/CN=Zabbix proxy

$ openssl x509 -noout -text -in /home/zabbix/zabbix_proxy.crt
Certificate:
    ...
    Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
    ...
    Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Zabbix proxy
```

To format *Issuer* and *Subject* strings correctly for Zabbix, invoke OpenSSL with the following options:

```
$ openssl x509 -noout -issuer -subject \
  -nameopt esc_2253,esc_ctrl,utf8,dump_nostr,dump_unknown,dump_der,sep_comma_plus,dn_rev,sname\
  -in /home/zabbix/zabbix_proxy.crt
```

The output will then be in reverse order, comma-separated, and usable in Zabbix configuration files and frontend:

```
issuer= CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
subject= CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

#### Limitations on using X.509 v3 certificate extensions

When implementing X.509 v3 certificates within Zabbix, certain extensions may not be fully supported or could result in inconsistent behavior.

#### Subject Alternative Name extension

Zabbix does not support the *Subject Alternative Name* extension, which is used to specify alternative DNS names such as IP addresses or email addresses. Zabbix can only validate the value in the *Subject* field of the certificate (see [Restricting Allowed Certificate Issuer and Subject](#)). If certificates include the *subjectAltName* field, the outcome of certificate validation may vary depending on the specific crypto toolkits used to compile Zabbix components. As a result, Zabbix may either accept or reject certificates based on these combinations.

#### Extended Key Usage extension

Zabbix supports the *Extended Key Usage* extension. However, if used, it is generally required that both *clientAuth* (for TLS WWW client authentication) and *serverAuth* (for TLS WWW server authentication) attributes are specified. For example:

- In passive checks, where Zabbix agent operates as a TLS server, the *serverAuth* attribute must be included in the agent's certificate.
- For active checks, where the agent operates as a TLS client, the *clientAuth* attribute must be included in the agent's certificate.

While GnuTLS may issue a warning for key usage violations, it typically allows communication to proceed despite these warnings.

**Name Constraints extension**

Support for the *Name Constraints* extension varies among crypto toolkits. Ensure that your chosen toolkit supports this extension. This extension may restrict Zabbix from loading CA certificates if this section is marked as critical, depending on the specific toolkit in use.

Certificate Revocation Lists (CRL)

If a certificate is compromised, the Certificate Authority (CA) can revoke it by including the certificate in a Certificate Revocation List (CRL). CRLs are managed through configuration files and can be specified using the `TLSCRLFile` parameter in server, proxy, and agent configuration files. For example:

```
TLSCRLFile=/home/zabbix/zabbix_crl_file.crt
```

In this case, `zabbix_crl_file.crt` may contain CRLs from multiple CAs, and could look like this:

```
-----BEGIN X509 CRL-----
MIIB/DCB5QIBATANBgqhkiG9w0BAQUFADCBgTETMBEGCgmSJomT8ixkARkWA2Nv
...
treZeUPjb7LSmZ3K2hpbZN7So0ZcAoHQ3Gwd9npuctg=
-----END X509 CRL-----
-----BEGIN X509 CRL-----
MIIB+TCB4gIBATANBgqhkiG9w0BAQUFADB/MRMwEQYKCZImiZPyLQGGBGRYDY29t
...
CAEebS2CND3ShBedZ8YSil5906JvaDP611R5lNs=
-----END X509 CRL-----
```

The CRL file is loaded only when Zabbix starts. To update the CRL, restart Zabbix.

**Attention:**  
If Zabbix components are compiled with OpenSSL and CRLs are used, ensure that each top-level and intermediate CA in the certificate chains has a corresponding CRL (even if it is empty) included in the `TLSCRLFile`.

**2 Using pre-shared keys**

Overview

Each pre-shared key (PSK) in Zabbix actually is a pair of:

- non-secret PSK identity string,
- secret PSK string value.

PSK identity string is a non-empty UTF-8 string. For example, "PSK ID 001 Zabbix agentd". It is a unique name by which this specific PSK is referred to by Zabbix components. Do not put sensitive information in PSK identity string - it is transmitted over the network unencrypted.

PSK value is a hard to guess string of hexadecimal digits, for example, "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327b".

Size limits

There are size limits for PSK identity and value in Zabbix, in some cases a crypto library can have lower limit:

| Component                   | PSK identity max size                    | PSK value min size                                      | PSK value max size   |
|-----------------------------|--|---|--|
| <i>Zabbix</i>               | 128 UTF-8 characters                     | 128-bit (16-byte PSK, entered as 32 hexadecimal digits) | 2048-bit (256-byte PSK, entered as 512 hexadecimal digits) |
| <i>GnuTLS</i>               | 128 bytes (may include UTF-8 characters) | -   | 2048-bit (256-byte PSK, entered as 512 hexadecimal digits) |
| <i>OpenSSL 1.0.x, 1.1.0</i> | 127 bytes (may include UTF-8 characters) | -   | 2048-bit (256-byte PSK, entered as 512 hexadecimal digits) |
| <i>OpenSSL 1.1.1</i>        | 127 bytes (may include UTF-8 characters) | -   | 512-bit (64-byte PSK, entered as 128 hexadecimal digits)   |

| Component                       | PSK identity max size                    | PSK value min size | PSK value max size   |
|---------------------------------|--|--------------------|--|
| <i>OpenSSL 1.1.1a and later</i> | 127 bytes (may include UTF-8 characters) | -                  | 2048-bit (256-byte PSK, entered as 512 hexadecimal digits) |

#### Attention:

Zabbix frontend allows configuring up to 128-character long PSK identity string and 2048-bit long PSK regardless of crypto libraries used.

If some Zabbix components support lower limits, it is the user's responsibility to configure PSK identity and value with allowed length for these components.

Exceeding length limits results in communication failures between Zabbix components.

Before Zabbix server connects to agent using PSK, the server looks up the PSK identity and PSK value configured for that agent in database (actually in configuration cache). Upon receiving a connection the agent uses PSK identity and PSK value from its configuration file. If both parties have the same PSK identity string and PSK value the connection may succeed.

#### Attention:

Each PSK identity must be paired with only one value. It is the user's responsibility to ensure that there are no two PSKs with the same identity string but different values. Failing to do so may lead to unpredictable errors or disruptions of communication between Zabbix components using PSKs with this PSK identity string.

### Generating PSK

For example, a 256-bit (32 bytes) PSK can be generated using the following commands:

- with *OpenSSL*:

```
$ openssl rand -hex 32
af8ced32dfe8714e548694e2d29e1a14ba6fa13f216cb35c19d0feb1084b0429
```

- with *GnuTLS*:

```
$ psktool -u psk_identity -p database.psk -s 32
Generating a random key for user 'psk_identity'
Key stored to database.psk
```

```
$ cat database.psk
psk_identity:9b8eafedfaae00cece62e85d5f4792c7d9c9bcc851b23216a1d300311cc4f7cb
```

Note that "psktool" above generates a database file with a PSK identity and its associated PSK. Zabbix expects just a PSK in the PSK file, so the identity string and colon (':') should be removed from the file.

### Configuring PSK for server-agent communication (example)

On the agent host, write the PSK value into a file, for example, `/home/zabbix/zabbix_agentd.psk`. The file must contain PSK in the first text string, for example:

```
1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952
```

Set access rights to PSK file - it must be readable only by Zabbix user.

Edit TLS parameters in agent configuration file `zabbix_agentd.conf`, for example, set:

```
TLSConnect=psk
TLSAccept=psk
TLSPSKFile=/home/zabbix/zabbix_agentd.psk
TLSPSKIdentity=PSK 001
```

The agent will connect to server (active checks) and accept from server and `zabbix_get` only connections using PSK. PSK identity will be "PSK 001".

Restart the agent. Now you can test the connection using `zabbix_get`, for example:

```
zabbix_get -s 127.0.0.1 -k "system.cpu.load[all,avg1]" --tls-connect=psk --tls-psk-identity="PSK 001" --tl
```

(To minimize downtime see how to change connection type in [Connection encryption management](#)).

Configure PSK encryption for this agent in Zabbix frontend:

- Go to: *Configuration → Hosts*

- Select host and click on **Encryption** tab

Example:

The screenshot shows the Zabbix web interface for configuring encryption. The 'Encryption' tab is active. The 'Connections to host' section has three buttons: 'No encryption', 'PSK' (which is highlighted), and 'Certificate'. The 'Connections from host' section has three checkboxes: 'No encryption' (unchecked), 'PSK' (checked), and 'Certificate' (unchecked). Below these, there are two mandatory fields marked with a red asterisk: '\* PSK identity' with the value 'PSK 001' and '\* PSK' with a long hexadecimal string. At the bottom, there are five buttons: 'Update' (in blue), 'Clone', 'Full clone', 'Delete', and 'Cancel'.

All mandatory input fields are marked with a red asterisk.

When configuration cache is synchronized with database the new connections will use PSK. Check server and agent logfiles for error messages.

Configuring PSK for server - active proxy communication (example)

On the proxy, write the PSK value into a file, for example, `/home/zabbix/zabbix_proxy.psk`. The file must contain PSK in the first text string, for example:

```
e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9
```

Set access rights to PSK file - it must be readable only by Zabbix user.

Edit TLS parameters in proxy configuration file `zabbix_proxy.conf`, for example, set:

```
TLSCConnect=psk
TLSPSKFile=/home/zabbix/zabbix_proxy.psk
TLSPSKIdentity=PSK 002
```

The proxy will connect to server using PSK. PSK identity will be "PSK 002".

(To minimize downtime see how to change connection type in [Connection encryption management](#)).

Configure PSK for this proxy in Zabbix frontend. Go to *Administration*→*Proxies*, select the proxy, go to "Encryption" tab. In "Connections from proxy" mark PSK. Paste into "PSK identity" field "PSK 002" and "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9" into "PSK" field. Click "Update".

Restart proxy. It will start using PSK-based encrypted connections to server. Check server and proxy logfiles for error messages.

For a passive proxy the procedure is very similar. The only difference - set `TLSAccept=psk` in proxy configuration file and set "Connections to proxy" in Zabbix frontend to PSK.

### 3 Troubleshooting

#### General recommendations

- Start with understanding which component acts as a TLS client and which one acts as a TLS server in problem case. Zabbix server, proxies and agents, depending on interaction between them, all can work as TLS servers and clients. For example, Zabbix server connecting to agent for a passive check, acts as a TLS client. The agent is in role of TLS server. Zabbix agent, requesting a list of active checks from proxy, acts as a TLS client. The proxy is in role of TLS server. `zabbix_get` and `zabbix_sender` utilities always act as TLS clients.
- Zabbix uses mutual authentication. Each side verifies its peer and may refuse connection.

For example, Zabbix server connecting to agent can close connection immediately if agent's certificate is invalid. And vice versa - Zabbix agent accepting a connection from server can close connection if server is not trusted by agent.

- Examine logfiles in both sides - in TLS client and TLS server.

The side which refuses connection may log a precise reason why it was refused. Other side often reports rather general error (e.g. "Connection closed by peer", "connection was non-properly terminated").

- Sometimes misconfigured encryption results in confusing error messages in no way pointing to real cause.

In subsections below we try to provide a (far from exhaustive) collection of messages and possible causes which could help in troubleshooting.

Please note that different crypto toolkits (OpenSSL, GnuTLS) often produce different error messages in same problem situations.

Sometimes error messages depend even on particular combination of crypto toolkits on both sides.

## 1 Connection type or permission problems

Server is configured to connect with PSK to agent but agent accepts only unencrypted connections

In server or proxy log (with *GnuTLS* 3.3.16)

```
Get value from agent failed: zbx_tls_connect(): gnutls_handshake() failed: \
-110 The TLS connection was non-properly terminated.
```

In server or proxy log (with *OpenSSL* 1.0.2c)

```
Get value from agent failed: TCP connection successful, cannot establish TLS to [[127.0.0.1]:10050]: \
Connection closed by peer. Check allowed connection types and access rights
```

One side connects with certificate but other side accepts only PSK or vice versa

In any log (with *GnuTLS*):

```
failed to accept an incoming connection: from 127.0.0.1: zbx_tls_accept(): gnutls_handshake() failed:\
-21 Could not negotiate a supported cipher suite.
```

In any log (with *OpenSSL* 1.0.2c):

```
failed to accept an incoming connection: from 127.0.0.1: TLS handshake returned error code 1:\
file .\ssl\s3_srvr.c line 1411: error:1408A0C1:SSL routines:ssl3_get_client_hello:no shared cipher:\
TLS write fatal alert "handshake failure"
```

Attempting to use Zabbix sender compiled with TLS support to send data to Zabbix server/proxy compiled without TLS

In connecting-side log:

Linux:

```
...In zbx_tls_init_child()
...OpenSSL library (version OpenSSL 1.1.1 11 Sep 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK test sender"
...End of zbx_tls_connect():FAIL error:'connection closed by peer'
...send value error: TCP successful, cannot establish TLS to [[localhost]:10051]: connection closed by peer
```

Windows:

```
...OpenSSL library (version OpenSSL 1.1.1a 20 Nov 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK test sender"
...zbx_psk_client_cb() requested PSK identity "PSK test sender"
...End of zbx_tls_connect():FAIL error:'SSL_connect() I/O error: [0x00000000] The operation completed successfully'
...send value error: TCP successful, cannot establish TLS to [[192.168.1.2]:10051]: SSL_connect() I/O error: [0] Success
```

In accepting-side log:

```
...failed to accept an incoming connection: from 127.0.0.1: support for TLS was not compiled in
```

One side connects with PSK but other side uses LibreSSL or has been compiled without encryption support

LibreSSL does not support PSK.

In connecting-side log:

```
...TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() I/O error: [0] Success
```

In accepting-side log:

```
...failed to accept an incoming connection: from 192.168.1.2: support for PSK was not compiled in
```

In Zabbix frontend:

```
Get value from agent failed: TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect()
```

One side connects with PSK but other side uses OpenSSL with PSK support disabled

In connecting-side log:

```
...TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() set result code to SSL_ERROR_SSL
```

In accepting-side log:

```
...failed to accept an incoming connection: from 192.168.1.2: TLS handshake set result code to 1: file ssl
```

## 2 Certificate problems

OpenSSL used with CRLs and for some CA in the certificate chain its CRL is not included in TLSCRLFile

In TLS server log in case of *OpenSSL* peer:

```
failed to accept an incoming connection: from 127.0.0.1: TLS handshake with 127.0.0.1 returned error code
file s3_srvr.c line 3251: error:14089086: SSL routines:ssl3_get_client_certificate:certificate verify
TLS write fatal alert "unknown CA"
```

In TLS server log in case of *GnuTLS* peer:

```
failed to accept an incoming connection: from 127.0.0.1: TLS handshake with 127.0.0.1 returned error code
file rsa_pk1.c line 103: error:0407006A: rsa routines:RSA_padding_check_PKCS1_type_1:\
block type is not 01 file rsa_eay.c line 705: error:04067072: rsa routines:RSA_EAY_PUBLIC_DECRYPT:padding
```

CRL expired or expires during server operation

*OpenSSL*, in server log:

- before expiration:

```
cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004]
SSL_connect() returned SSL_ERROR_SSL: file s3_clnt.c line 1253: error:14090086:\
SSL routines:ssl3_get_server_certificate:certificate verify failed:\
TLS write fatal alert "certificate revoked"
```

- after expiration:

```
cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004]
SSL_connect() returned SSL_ERROR_SSL: file s3_clnt.c line 1253: error:14090086:\
SSL routines:ssl3_get_server_certificate:certificate verify failed:\
TLS write fatal alert "certificate expired"
```

The point here is that with valid CRL a revoked certificate is reported as "certificate revoked". When CRL expires the error message changes to "certificate expired" which is quite misleading.

*GnuTLS*, in server log:

- before and after expiration the same:

```
cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004]
invalid peer certificate: The certificate is NOT trusted. The certificate chain is revoked.
```

Self-signed certificate, unknown CA

*OpenSSL*, in log:

```
error:'self signed certificate: SSL_connect() set result code to SSL_ERROR_SSL: file ../ssl/statem/statem_
line 1924: error:1416F086:SSL routines:tls_process_server_certificate:certificate verify failed:\
TLS write fatal alert "unknown CA"'
```

This was observed when server certificate by mistake had the same Issuer and Subject string, although it was signed by CA. Issuer and Subject are equal in top-level CA certificate, but they cannot be equal in server certificate. (The same applies to proxy and agent certificates.)

### 3 PSK problems

PSK contains an odd number of hex-digits

Proxy or agent does not start, message in the proxy or agent log:

```
invalid PSK in file "/home/zabbix/zabbix_proxy.psk"
```

PSK identity string longer than 128 bytes is passed to GnuTLS

In TLS client side log:

```
gnutls_handshake() failed: -110 The TLS connection was non-properly terminated.
```

In TLS server side log.

```
gnutls_handshake() failed: -90 The SRP username supplied is illegal.
```

Too long PSK value used with OpenSSL 1.1.1

In connecting-side log:

```
...OpenSSL library (version OpenSSL 1.1.1 11 Sep 2018) initialized
```

```
...
```

```
...In zbx_tls_connect(): psk_identity:"PSK 1"
```

```
...zbx_psk_client_cb() requested PSK identity "PSK 1"
```

```
...End of zbx_tls_connect():FAIL error:'SSL_connect() set result code to SSL_ERROR_SSL: file ssl\statem\ex
```

In accepting-side log:

```
...Message from 123.123.123.123 is missing header. Message ignored.
```

This problem typically arises when upgrading OpenSSL from 1.0.x or 1.1.0 to 1.1.1 and if the PSK value is longer than 512-bit (64-byte PSK, entered as 128 hexadecimal digits).

See also: [Value size limits](#)

## 18 Web interface

**Overview** For an easy access to Zabbix from anywhere and from any platform, the web-based interface is provided.

### Note:

If using more than one frontend instance make sure that the locales and libraries (LDAP, SAML etc.) are installed and configured identically for all frontends.

### 1 Menu

Overview

A vertical menu in a sidebar provides access to various Zabbix frontend sections.

The menu is dark blue in the default theme.

**ZABBIX** << [icon]

Global view

All dashboards / Global view

Page 1 ... Page 2 Stop slideshow

**System information**

| Parameter                          | Value | Details         |
|------------------------------------|-------|-----------------|
| Zabbix server is running           | Yes   | localhost:10051 |
| Number of hosts (enabled/disabled) | 5     | 4 / 1           |
| Number of templates                | 140   |                 |

**Problems**

| Time                | Info     | Host | Problem        |
|---------------------|----------|------|----------------|
| 2021-12-06 15:08:12 | New host |      | Nodata trigger |
| 2021-12-06 14:13:11 | New host |      | Nodata trigger |
| 2021-12-06 14:07:45 | New      |      | Abs trigger    |

Working with the menu

A **global search** box is located below the Zabbix logo.

The menu can be collapsed or hidden completely:

- To collapse, click on [icon] next to Zabbix logo
- To hide, click on [icon] next to Zabbix logo

**Global view**

All dashboards / Global view

**System information**

Collapsed menu with only the icons visible.

Hidden menu.

Collapsed menu

When the menu is collapsed to icons only, a full menu reappears as soon as the mouse cursor is placed upon it. Note that it reappears over page content; to move page content to the right you have to click on the expand button. If the mouse cursor again is placed outside the full menu, the menu will collapse again after two seconds.

You can also make a collapsed menu reappear fully by hitting the Tab key. Hitting the Tab key repeatedly will allow to focus on the next menu element.

## Hidden menu

Even when the menu is hidden completely, a full menu is just one mouse click away, by clicking on the burger icon. Note that it reappears over page content; to move page content to the right you have to unhide the menu by clicking on the show sidebar button.

## 2 Frontend sections

Please use the sidebar to access content in the Frontend sections section.

### 1 Monitoring

#### Overview

The Monitoring menu is all about displaying data. Whatever information Zabbix is configured to gather, visualize and act upon, it will be displayed in the various sections of the Monitoring menu.

#### View mode buttons

The following buttons located in the top right corner are common for every section:

Display page in kiosk mode. In this mode only page content is displayed.

To exit kiosk mode, move the mouse cursor until the exit button appears and click on it. You will be taken back to normal mode.

### 1 Dashboard

#### Overview

The *Monitoring* → *Dashboard* section is designed to display summaries of all the important information in a **dashboard**.

While only one dashboard can be displayed at one time, it is possible to configure several dashboards. Each dashboard may contain one or several pages that can be rotated in a slideshow.

A dashboard page consists of widgets and each widget is designed to display information of a certain kind and source, which can be a summary, a map, a graph, the clock, etc.

Access to hosts in the widgets depends on host **permissions**.

Pages and widgets are added to the dashboard and edited in the dashboard editing mode. Pages can be viewed and rotated in the dashboard viewing mode.

The time period that is displayed in graph widgets is controlled by the **time period selector** located above the widgets. The time period selector label, located to the right, displays the currently selected time period. Clicking the tab label allows expanding and collapsing the time period selector.

Note that when the dashboard is displayed in kiosk mode and widgets only are displayed, it is possible to zoom out the graph period by double-clicking in the graph.

### Dashboard size

The minimum width of a dashboard is 1200 pixels. The dashboard will not shrink below this width; instead a horizontal scrollbar is displayed if the browser window is smaller than that.

The maximum width of a dashboard is the browser window width. Dashboard widgets stretch horizontally to fit the window. At the same time, a dashboard widget cannot be stretched horizontally beyond the window limits.

Technically the dashboard consists of 12 horizontal columns of always equal width that stretch/shrink dynamically (but not to less than 1200 pixels total).

Vertically the dashboard may contain a maximum of 64 rows. Each row has a fixed height of 70 pixels. A widget may be up to 32 rows high.

### Viewing dashboards

To view all configured dashboards, click on *All dashboards* just below the section title.

Filter

| <input type="checkbox"/> Name ▲                 |                                     |
|---|-------------------------------------|
| <input type="checkbox"/> Apache info            | <span>My</span> <span>Shared</span> |
| <input type="checkbox"/> Global view            | <span>My</span> <span>Shared</span> |
| <input type="checkbox"/> HyperV (John's custom) | <span>My</span>                     |
| <input type="checkbox"/> Problems (quick view)  | <span>My</span>                     |
| <input type="checkbox"/> Zabbix server          | <span>My</span> <span>Shared</span> |
| <input type="checkbox"/> Zabbix server health   | <span>My</span> <span>Shared</span> |

Dashboards are displayed with a sharing tag:

- *My* - indicates a private dashboard
- *Shared* - indicates a public dashboard or a private dashboard shared with any user or user group

The filter located to the right above the list allows to filter dashboards by name and by those created by the current user.

To delete one or several dashboards, mark the checkboxes of the respective dashboards and click on *Delete* below the list.

Viewing and editing a dashboard

To view a single dashboard, click on its name in the list of dashboards.

When **viewing** a dashboard, the following options are available:

Edit dashboard

Switch to the dashboard **editing** mode.

The editing mode is also opened when a new dashboard is being created and when you click on the edit button of a widget.

Open the action menu (see action descriptions below).

| ACTIONS              |
|----------------------|
| Sharing              |
| Create new           |
| Clone                |
| Delete               |
| Create new report    |
| View related reports |

*Sharing* - edit sharing preferences for the dashboard. Dashboards can be made public or private. Public dashboards are visible to all users. Private dashboards are visible only to their owner.

Private dashboards can be shared by the owner with other users and user groups. For details on configuring sharing, see the map [configuration](#) section.

*Create new* - [create](#) a new dashboard.

*Clone* - create a new dashboard by copying properties of the existing one. First you are prompted to enter dashboard parameters. Then, the new dashboard opens in editing mode with all the widgets of the original dashboard.

*Delete* - delete the dashboard.

*Create new report* - open a pop-up window with report [configuration form](#). Disabled if the user does not have permission to manage scheduled reports.

*View related reports* - open a pop-up window with a list of existing reports based on the current dashboard. Disabled if there are no related reports or the user does not have permission to view scheduled reports.

Display only page content (**kiosk mode**).

Kiosk mode can also be accessed with the following URL parameters:

`/zabbix.php?action=dashboard.view&kiosk=1`.

To exit to normal mode: `/zabbix.php?action=dashboard.view&kiosk=0`

When **editing** a dashboard, the following options are available:

|              |
|--------------|
| Add widget   |
| Add page     |
| Paste widget |
| Paste page   |

Edit general dashboard **parameters**.

Add a new widget.

Clicking on the arrow button will open the action menu (see action descriptions below).

*Add widget* - add a new widget

*Add page* - add a new page

*Paste widget* - paste a copied widget. This option is grayed out if no widget has been copied. Only one entity (widget or page) can be copied at one time.

*Paste page* - paste a copied page. This option is grayed out if no page has been copied.

Save dashboard changes.

Cancel dashboard changes.

## Creating a dashboard

It is possible to create a new dashboard in two ways:

- Click on *Create dashboard*, when viewing all dashboards
- Select *Create new* from the action menu, when viewing a single dashboard

You will be first asked to enter general dashboard parameters:

### Dashboard properties

\* Owner

Admin (Zabbix Administrator) X

Select

\* Name

New dashboard

Default page display period

30 seconds

▼

Start slideshow automatically

☒

Apply

Cancel

| Parameter                     | Description   |
|-------------------------------|---|
| Owner                         | Select system user that will be the dashboard owner.  |
| Name                          | Enter dashboard name.   |
| Default page display period   | Select period for how long a dashboard page is displayed before rotating to the next page in a <b>slideshow</b> . |
| Start slideshow automatically | Mark this checkbox to run a slideshow automatically one more than one dashboard page exists.                      |

When you click on *Apply*, an empty dashboard is opened:

Add a new widget

To populate the dashboard, you can add widgets and pages.

Click on the *Save changes* button to save the dashboard. If you click on *Cancel*, the dashboard will not be created.

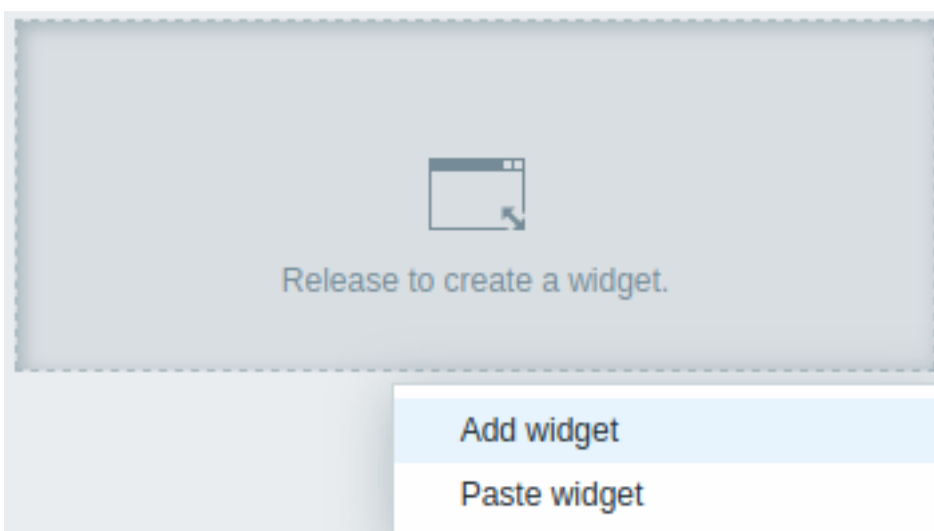

### Adding widgets

To add a widget to a dashboard:

- Click on the + Add ▼ button or the *Add widget* option in the action menu that can be opened by clicking on the arrow. Fill the widget configuration form. The widget will be created in its default size and placed after the existing widgets (if any);

Or

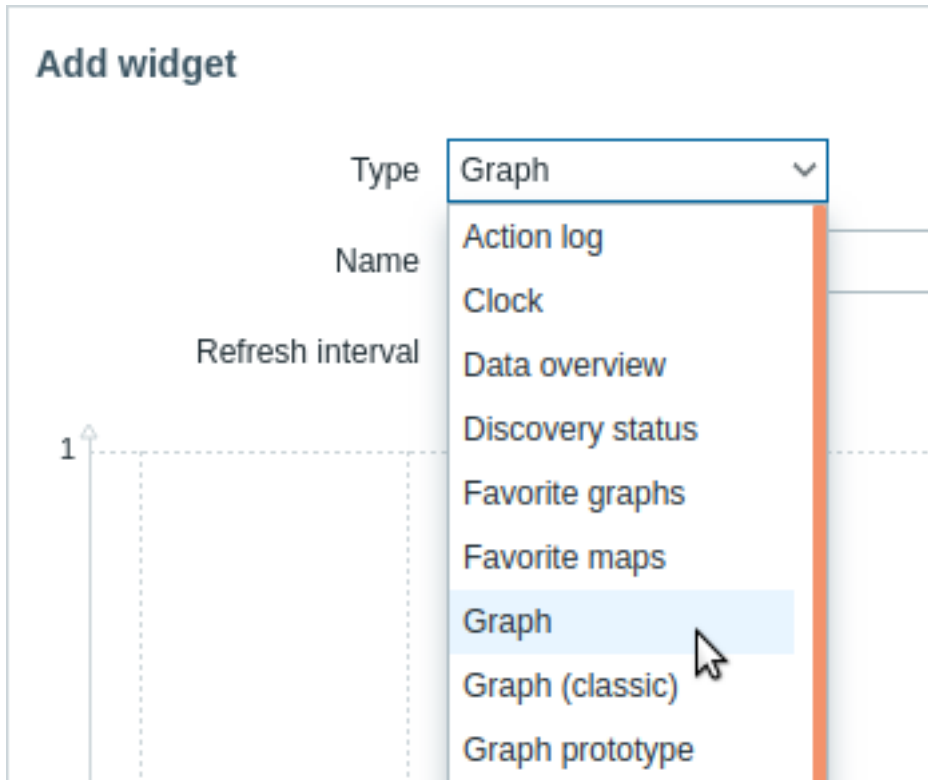

- Move your mouse to the desired empty spot for the new widget. Notice how a placeholder appears, on mouseover, on any empty slot on the dashboard. Then click to open the widget configuration form. After filling the form the widget will be created in its default size or, if its default size is bigger than is available, take up the available space. Alternatively, you may click and drag the placeholder to the desired widget size, then release, and then fill the widget configuration form. (Note that when there is a widget copied onto the clipboard, you will be first prompted to select between *Add widget* and *Paste widget* options to create a widget.)

In the widget configuration form:

- Select the *Type* of widget
- Enter widget parameters
- Click on *Add*

#### Widgets

A wide variety of **widgets** (e.g. **Clock**, **Host availability** or **Trigger overview**) can be added to a dashboard: these can be resized and moved around the dashboard in dashboard editing mode by clicking on the widget title bar and dragging it to a new location. Also, you can click on the following buttons in the top-right corner of the widget to:

- - edit a widget;
- - access the **widget menu**

Click on *Save changes* for the dashboard to make any changes to the widgets permanent.

#### Copying/pasting widgets

Dashboard widgets can be copied and pasted, allowing to create a new widget with the properties of an existing one. They can be copy-pasted within the same dashboard, or between dashboards opened in different tabs.

A widget can be copied using the **widget menu**. To paste the widget:

- click on the arrow next to the *Add* button and selecting the *Paste widget* option, when editing the dashboard
- use the *Paste widget* option when adding a new widget by selecting some area in the dashboard (a widget must be copied first for the paste option to become available)

A copied widget can be used to paste over an existing widget using the *Paste* option in the **widget menu**.

#### Creating a slideshow

A slideshow will run automatically if the dashboard contains two or more pages (see **Adding pages**) and if one of the following is true:

- The *Start slideshow automatically* option is marked in dashboard properties
- The dashboard URL contains a `slideshow=1` parameter

The pages rotate according to the intervals given in the properties of the dashboard and individual pages. Click on:

- *Stop slideshow* - to stop the slideshow
- *Start slideshow* - to start the slideshow

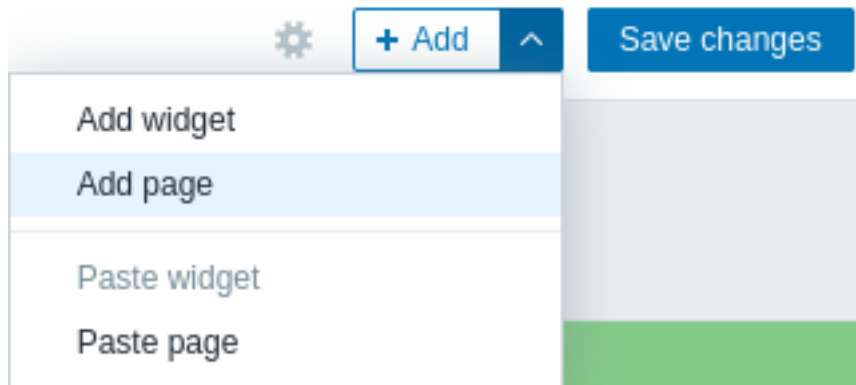

Slideshow-related controls are also available in **kiosk mode** (where only the page content is shown):

-  - stop slideshow
-  - start slideshow
-  - go back one page
-  - go to the next page

#### Adding pages

To add a new page to a dashboard:

- Make sure the dashboard is in the **editing mode**
- Click on the arrow next to the *Add* button and select the *Add page* option

- Fill the general page parameters and click on *Apply*. If you leave the name empty, the page will be added with a Page N name where 'N' is the incremental number of the page. The page display period allows to customize how long a page is displayed in a slideshow.

Dashboard page properties

Name

Page display period

Default (30 seconds) ▾

Apply

Cancel

A new page will be added, indicated by a new tab (*Page 2*).

The pages can be reordered by dragging-and-dropping the page tabs. Reordering maintains the original page naming. It is always possible to go to each page by clicking on its tab.

When a new page is added, it is empty. You can add widgets to it as described above.

#### Copying/pasting pages

Dashboard pages can be copied and pasted, allowing to create a new page with the properties of an existing one. They can be pasted from the same dashboard or a different dashboard.

To paste an existing page to the dashboard, first copy it, using the **page menu**:

To paste the copied page:

- Make sure the dashboard is in the **editing mode**
- Click on the arrow next to the *Add* button and select the *Paste page* option

Page menu

The page menu can be opened by clicking on the three dots  next to the page name:

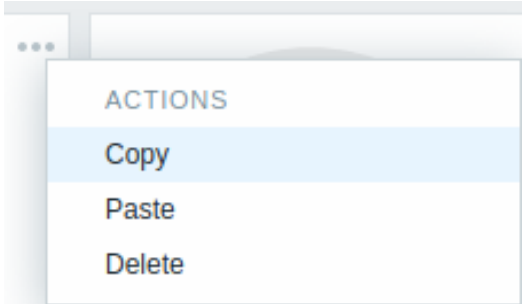

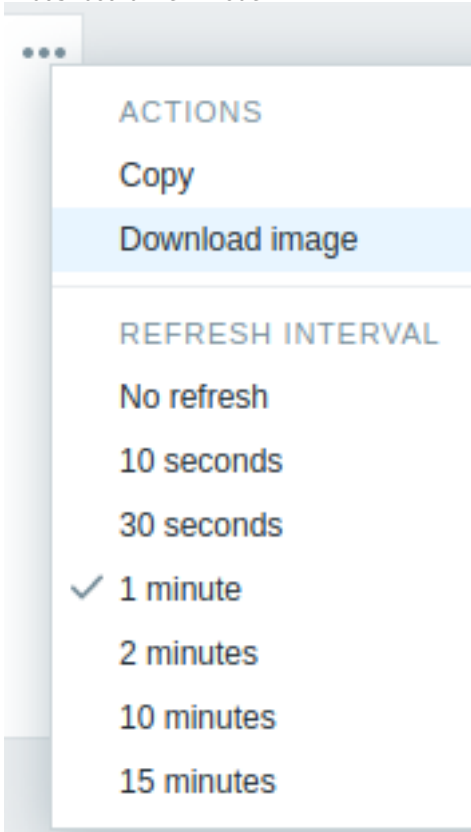

It contains the following options:

- *Copy* - copy the page
- *Delete* - delete the page (pages can only be deleted in the dashboard editing mode)
- *Properties* - customize the page parameters (the name and the page display period in a slideshow)

Widget menu

The widget menu contains different options based on whether the dashboard is in the edit or view mode:

| Widget menu  | Options  |
|--|--|
| <p>In dashboard edit mode:</p>  | <p><i>Copy</i> - copy the widget</p> <p><i>Paste</i> - paste a copied widget over this widget<br/>This option is grayed out if no widget has been copied.</p> <p><i>Delete</i> - delete the widget</p> |

| Widget menu   | Options  |
|---|--|
| <p>In dashboard view mode:</p>  | <p><i>Copy</i> - copy the widget</p> <p><i>Download image</i> - download the widget as a PNG image (only available for <b>graph/classic graph</b> widgets)</p> <p><i>Refresh interval</i> - select the frequency of refreshing the widget contents</p> |

## Dynamic widgets

When **configuring** some of the widgets:

- Classic graph
- Graph prototype
- Item value
- Plain text
- URL

there is an extra option called *Dynamic item*. You can check this box to make the widget dynamic - i.e. capable of displaying different content based on the selected host.

Now, when saving the dashboard, you will notice that a new host selection field has appeared atop the dashboard for selecting the host (while the *Select* button allows selecting the host group in a popup):

Thus you have a widget, which can display content that is based on the data from the host that is selected. The benefit of this is that you do not need to create extra widgets just because, for example, you want to see the same graphs containing data from various hosts.

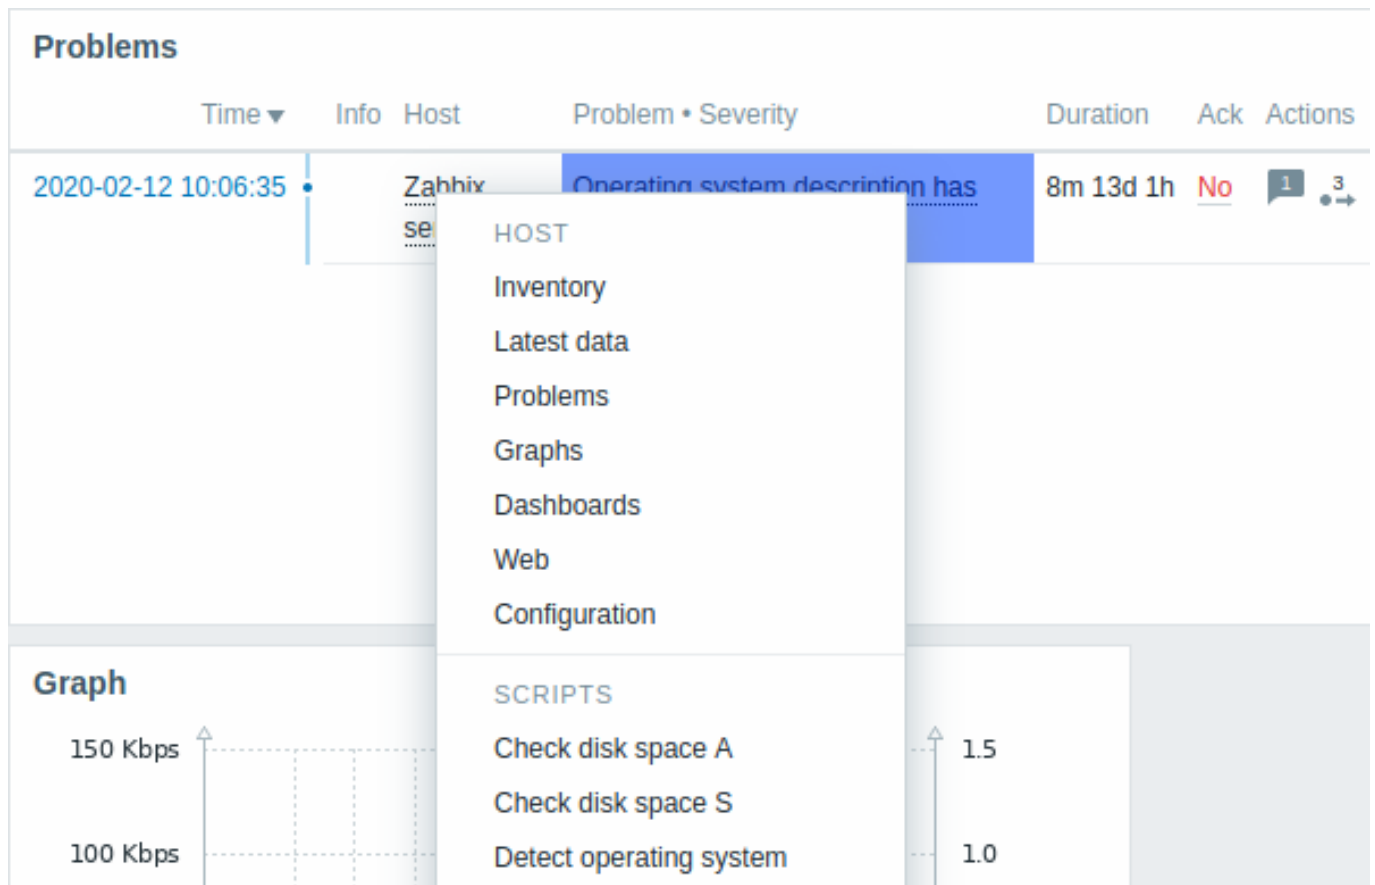

## Permissions to dashboards

Permissions to dashboards for regular users and users of 'Admin' type are limited in the following way:

- They can see and clone a dashboard if they have at least READ rights to it;
- They can edit and delete dashboard only if they have READ/WRITE rights to it;
- They cannot change the dashboard owner.

## Host menu

Clicking on a host in the *Problems* widget brings up the host menu. It includes links to host inventory, latest data, problems, graphs, dashboards, web scenarios and configuration. Note that host configuration is available for Admin and Superadmin users only.

Global scripts can also be run from the host menu. These scripts need to have their scope defined as 'Manual host action' to be available in the host menu.

The host menu is accessible by clicking on a host in several other frontend sections:

- Monitoring → Problems
- Monitoring → Problems → Event details
- Monitoring → Hosts
- Monitoring → Hosts → Web Monitoring
- Monitoring → Latest data
- Monitoring → Maps
- Reports → Triggers top 100

#### Problem event popup

The problem event popup includes the list of problem events for this trigger and, if defined, the trigger description and a clickable URL.

| Problems               | Time                   | Info     | Host      | Problem • Severity                          | Duration   |
|------------------------|------------------------|----------|-----------|---|------------|
| 05/07/2020 11:27:12 AM |                        |          | Server3   | /: Disk space is critically low (>90% used) | 10m 22d 23 |
| 04/17/2020 01:07:52 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 0m  | Yes   |            |
| 04/17/2020 01:05:16 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 8m  | Yes   |            |
| 04/17/2020 01:02:34 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 11m | Yes   |            |
| 04/17/2020 12:47:56 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 26m | Yes   |            |
| 04/17/2020 12:45:48 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 28m | Yes   |            |

To bring up the problem event popup:

- roll a mouse over the problem duration in the *Duration* column of the *Problems* widget. The popup disappears once you remove the mouse from the duration.
- click on the duration in the *Duration* column of the *Problems* widget. The popup disappears only if you click on the duration again.

#### 1 Dashboard widgets

#### Overview

This section provides the details of parameters that are common for dashboard widgets.

## Common parameters

The following parameters are common for every single widget:

|                         |   |
|-------------------------|---|
| <i>Name</i>             | Enter a widget name.  |
| <i>Refresh interval</i> | Configure default refresh interval. Default refresh intervals for widgets range from <i>No refresh</i> to <i>15 minutes</i> depending on the type of widget. For example: <i>No refresh</i> for URL widget, <i>1 minute</i> for action log widget, <i>15 minutes</i> for clock widget.        |
| <i>Show header</i>      | Mark the checkbox to show the header permanently.<br>When unchecked the header is hidden to save space and only slides up and becomes visible again when the mouse is positioned over the widget, both in view and edit modes. It is also semi-visible when dragging a widget to a new place. |

Refresh intervals for a widget can be set to a default value for all the corresponding users and also each user can set his own refresh interval value:

- To set a default value for all the corresponding users switch to editing mode (click the *Edit dashboard* button, find the right widget, click the *Edit* button opening the editing form of a widget), and choose the required refresh interval from the dropdown list.
- Setting a unique refresh interval for each user separately is possible in view mode by clicking the  button for a certain widget.

Unique refresh interval set by a user has priority over the widget setting and once it's set it's always preserved when the widget's setting is modified.

To see **specific parameters** for each widget, go to individual widget pages for:

- Action log
- Clock
- Data overview
- Discovery status
- Favorite graphs
- Favorite maps
- Geomap
- Graph
- Graph (classic)
- Graph prototype
- Host availability
- Item value
- Map
- Map navigation tree
- Plain text
- Problem hosts
- Problems
- SLA report
- System information
- Problems by severity
- Top hosts
- Trigger overview
- URL
- Web monitoring

Deprecated widgets:

- Data overview

### Attention:

Deprecated widgets will be removed in the upcoming major release.

## 1 Action log

## Overview

In the action log widget, you can display details of action operations (notifications, remote commands). It replicates information from *Reports* → *Action log*.

Configuration

To configure, select *Action log* as type:

Add widget

Type

Action log

Show header

☒

Name

Action log

Refresh interval

Default (1 minute)

Sort entries by

Time (descending)

\* Show lines

25

Add

Cancel

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                 |  |
|-----------------|--|
| Sort entries by | Sort entries by:<br><b>Time</b> (descending or ascending)<br><b>Type</b> (descending or ascending)<br><b>Status</b> (descending or ascending)<br><b>Recipient</b> (descending or ascending). |
| Show lines      | Set how many action log lines will be displayed in the widget.   |

2 Clock

Overview

In the clock widget, you may display local, server, or specified host time.

Configuration

To configure, select *Clock* as type:

Add widget

Type

Clock

Show header

☒

Name

Local time

Refresh interval

Default (15 minutes)

Time type

Local time

Add

Cancel

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                  |   |
|------------------|---|
| <i>Time type</i> | Select local, server, or specified host time.<br>Server time will be identical to the time zone set globally or for the Zabbix user.  |
| <i>Item</i>      | Select the item for displaying time. To display host time, use the <code>system.localtime[local] item</code> . This item must exist on the host.<br>This field is available only when <i>Host time</i> is selected. |

### 3 Data overview

#### Attention:

This widget is deprecated and will be removed in the upcoming major release. Consider using the *Top hosts* widget instead.

#### Overview

In the data overview widget, you can display the latest data for a group of hosts.

The color of problem items is based on the problem severity color, which can be adjusted in the *problem update* screen.

By default, only values that fall within the last 24 hours are displayed. This limit has been introduced with the aim of improving initial loading times for large pages of latest data. This limit is configurable in *Administration* → *General* → *GUI*, using the *Max history display period* option.

Clicking on a piece of data offers links to some predefined graphs or latest values.

Note that 50 records are displayed by default (configurable in *Administration* → *General* → *GUI*, using the *Max number of columns and rows in overview tables* option). If more records exist than are configured to display, a message is displayed at the bottom of the table, asking to provide more specific filtering criteria. There is no pagination. Note that this limit is applied first, before any further filtering of data, for example, by tags.

#### Configuration

To configure, select *Data overview* as type:

×

Add widget

All configuration parameters are **common** for all widgets.

5 Favorite graphs

Overview

This widget contains shortcuts to the most needed graphs, sorted alphabetically.

The list of shortcuts is populated when you view a graph in Monitoring -> Latest data -> Graphs, and then click on its  **Add to favorites** button.

All configuration parameters are **common** for all widgets.

## 6 Favorite maps

### Overview

This widget contains shortcuts to the most needed maps, sorted alphabetically.

The list of shortcuts is populated when you **view** a map and then click on its  **Add to favorites** button.

All configuration parameters are **common** for all widgets.

## 7 Geomap

### Overview

Geomap widget displays hosts as markers on a geographical map using open-source JavaScript interactive maps library Leaflet.

#### Note:

Zabbix offers multiple predefined map tile service providers and an option to add a custom tile service provider or even host tiles themselves (configurable in the *Administration* → *General* → *Geographical maps* **menu section**).

By default, the widget displays all enabled hosts with valid geographical coordinates defined in the host configuration. It is possible to configure host filtering in the widget parameters.

The valid host coordinates are:

- Latitude: from -90 to 90 (can be integer or float number)
- Longitude: from -180 to 180 (can be integer or float number)

### Configuration

To add the widget, select *Geomap* as type.

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                     |  |
|---------------------|--|
| <i>Host groups</i>  | <p>Select host groups to be displayed on the map. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. Scroll down to select. Click on 'x' to remove selected groups.</p> <p>If nothing is selected in both <i>Host groups</i> and <i>Hosts</i> fields, all hosts with valid coordinates will be displayed.</p>   |
| <i>Hosts</i>        | <p>Select hosts to be displayed all the map. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts. Scroll down to select. Click on 'x' to remove selected hosts.</p> <p>If nothing is selected in both <i>Host groups</i> and <i>Hosts</i> fields, all hosts with valid coordinates will be displayed.</p>   |
| <i>Tags</i>         | <p>Specify tags to limit the number of hosts displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p><b>Exists</b> - include the specified tag names</p> <p><b>Equals</b> - include the specified tag names and values (case-sensitive)</p> <p><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p><b>Does not exist</b> - exclude the specified tag names</p> <p><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)</p> <p><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)</p> <p>There are two calculation types for conditions:</p> <p><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition</p> <p><b>Or</b> - enough if one condition is met</p> |
| <i>Initial view</i> | <p>Comma-separated center coordinates and an optional zoom level to display when the widget is initially loaded in the format &lt;latitude&gt;,&lt;longitude&gt;,&lt;zoom&gt;</p> <p>If initial zoom is specified, the Geomap widget is loaded at the given zoom level. Otherwise, initial zoom is calculated as half of the <b>max zoom</b> for the particular tile provider.</p> <p>The initial view is ignored if the default view is set (see below).</p> <p>Examples:</p> <p>=&gt; 40.6892494,-74.0466891,14</p> <p>=&gt; 40.6892494,-122.0466891</p>   |

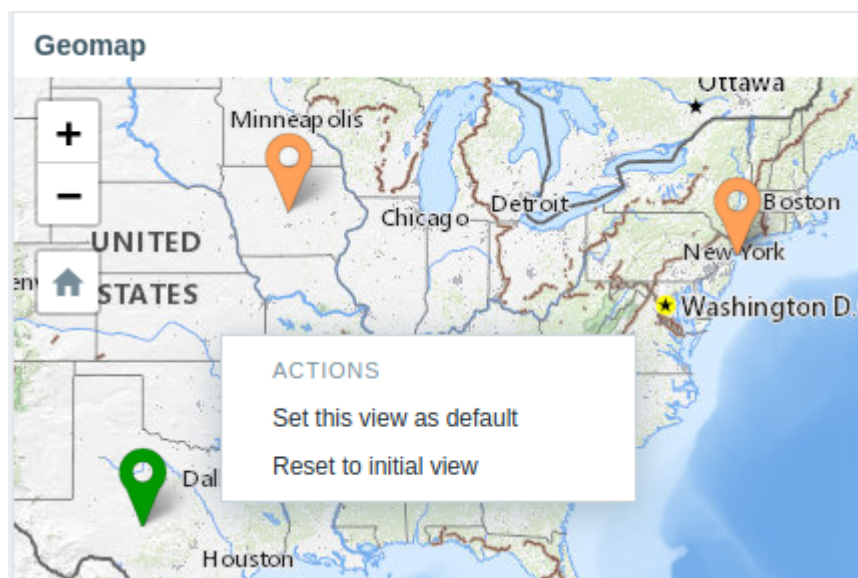

Host markers displayed on the map have the color of the host's most serious problem and green color if a host has no problems. Clicking on a host marker allows viewing the host's visible name and the number of unresolved problems grouped by severity. Clicking on the visible name will open [host menu](#).

Hosts displayed on the map can be filtered by problem severity. Press on the filter icon in the widget's upper right corner and mark the required severities.

It is possible to zoom in and out the map by using the plus and minus buttons in the widget's upper left corner or by using the mouse scroll wheel or touchpad. To set the current view as default, right-click anywhere on the map and select *Set this view as default*. This setting will override *Initial view* widget parameter for the current user. To undo this action, right-click anywhere on the map again and select *Reset the initial view*.

When *Initial view* or *Default view* is set, you can return to this view at any time by pressing on the home icon on the left.

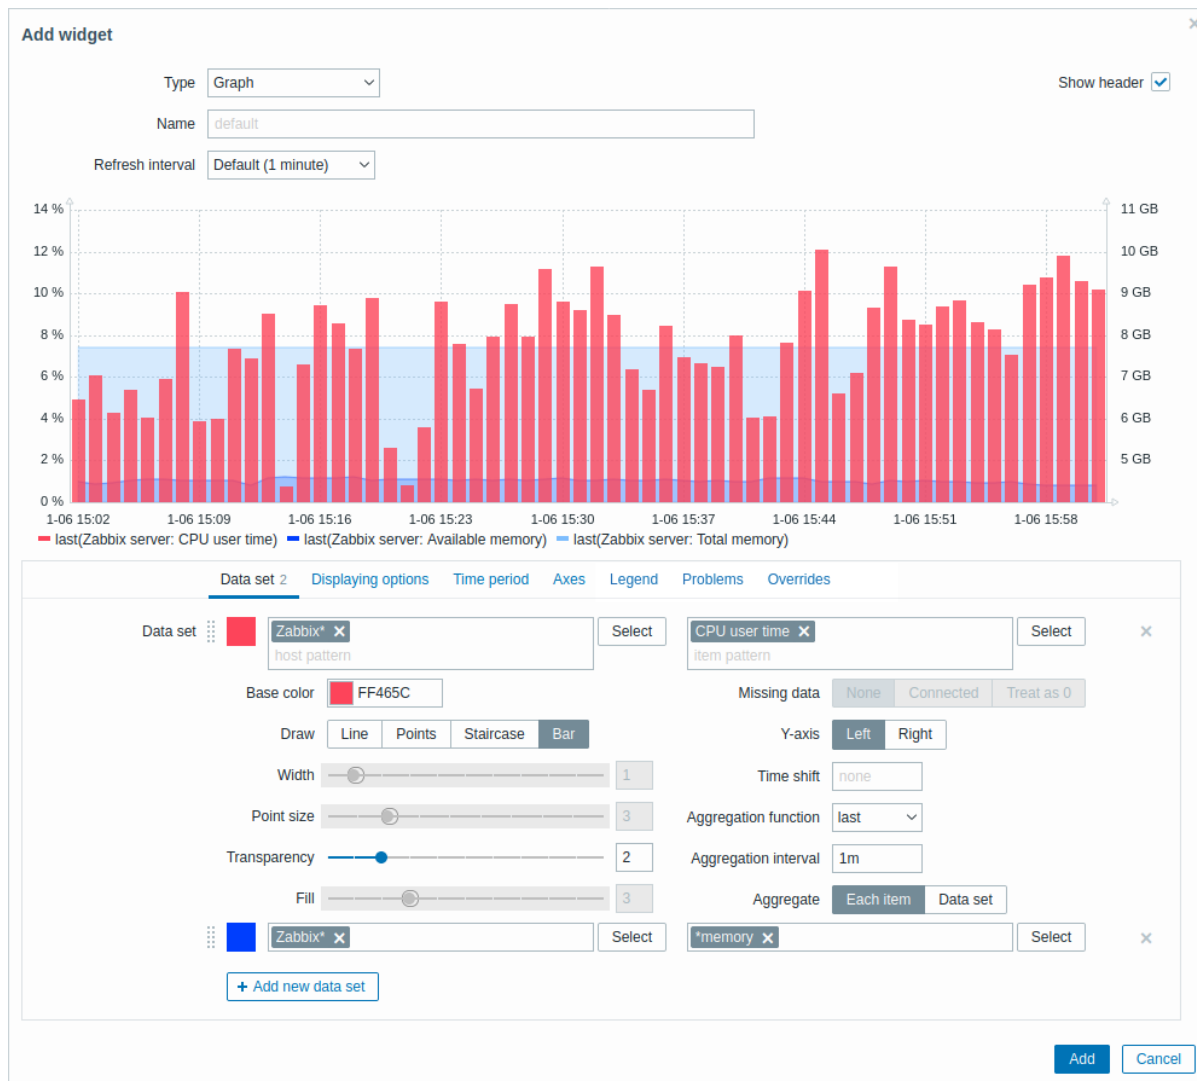

## 8 Graph

### Overview

The graph widget provides a modern and versatile way of visualizing data collected by Zabbix using a vector image drawing technique. This graph widget is supported since Zabbix 4.0. Note that the graph widget supported before Zabbix 4.0 can still be used as [Graph \(classic\)](#).

### Configuration

To configure, select *Graph* as type:

The **Data set** tab allows to add data sets and define their visual representation:

#### Data set

Select hosts and items to display on the graph. Alternatively, you may enter host and item patterns. Wildcard patterns may be used (for example, \* will return results that match zero or more characters). To specify a wildcard pattern, just enter the string manually and press *Enter*. While you are typing, note how all matching hosts are displayed in the dropdown. Up to 50 items may be displayed in the graph.

Host pattern and item pattern fields are mandatory.

The wildcard symbol is always interpreted, therefore it is not possible to add, for example, an item named "item\*" individually, if there are other matching items (e.g. item2, item3).

#### Base color

Adjust base color, either from the color picker or manually. The base color is used to calculate different colors for each item of the data set. Base color input field is mandatory.

#### Draw

Choose the draw type of the metric. Possible draw types are *Line* (set by default), *Points*, *Staircase* and *Bar*.

Note that if there's only one data point in the line/staircase graph it is drawn as a point regardless of the draw type. The point size is calculated from the line width, but it cannot be smaller than 3 pixels, even if the line width is less.

#### Width

Set the line width. This option is available when *Line* or *Staircase* draw type is selected.

#### Point size

Set the point size. This option is available when *Points* draw type is selected.

#### Transparency

Set the transparency level.

#### Fill

Set the fill level. This option is available when *Line* or *Staircase* draw type is selected.

#### Missing data

Select the option for displaying missing data:

**None** - the gap is left empty

**Connected** - two border values are connected

**Treat as 0** - the missing data is displayed as 0 values

Not applicable for the *Points* and *Bar* draw type.

#### Y-axis

Select the side of the graph where the Y-axis will be displayed.

|                             |  |
|-----------------------------|--|
| <i>Time shift</i>           | Specify time shift if required. You may use <b>time suffixes</b> in this field. Negative values are allowed.   |
| <i>Aggregation function</i> | Specify which aggregation function to use:<br><b>min</b> - display the smallest value<br><b>max</b> - display the largest value<br><b>avg</b> - display the average value<br><b>sum</b> - display the sum of values<br><b>count</b> - display the count of values<br><b>first</b> - display the first value<br><b>last</b> - display the last value<br><b>none</b> - display all values (no aggregation)<br>Aggregation allows to display an aggregated value for the chosen interval (5 minutes, an hour, a day), instead of all values. See also: <b>Aggregation in graphs</b> .<br>This option is supported since Zabbix 4.4. |
| <i>Aggregation interval</i> | Specify the interval for aggregating values. You may use <b>time suffixes</b> in this field. A numeric value without a suffix will be regarded as seconds.<br>This option is supported since Zabbix 4.4.   |
| <i>Aggregate</i>            | Specify whether to aggregate:<br><b>Each item</b> - each item in the dataset will be aggregated and displayed separately.<br><b>Data set</b> - all dataset items will be aggregated and displayed as one value.<br>This option is supported since Zabbix 4.4.  |

Existing data sets are displayed in a list. You may:

-  - click on this button to add a new data set
-  - click on the color icon to expand/collapse data set details
-  - click on the move icon and drag a data set to a new place in the list

The **Displaying options** tab allows to define history data selection:

|                     |  |
|---------------------|--|
| Show problems       | Mark this checkbox to enable problem displaying on the graph (unmarked, i.e. disabled by default).   |
| Selected items only | Mark this checkbox to include problems for the selected items only to be displayed on the graph.   |
| Problem hosts       | Select the problem hosts to be displayed on the graph. Wildcard patterns may be used (for example, * will return results that match zero or more characters). To specify a wildcard pattern, just enter the string manually and press <i>Enter</i> . While you are typing, note how all matching hosts are displayed in the dropdown.  |
| Severity            | Mark problem severities to filter problems to be displayed on the graph.<br>If no severities are marked, all problems will be displayed.   |
| Problem             | Specify the problem's name to be displayed on the graph.   |
| Tags                | Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met |

The **Overrides** tab allows to add custom overrides for data sets:

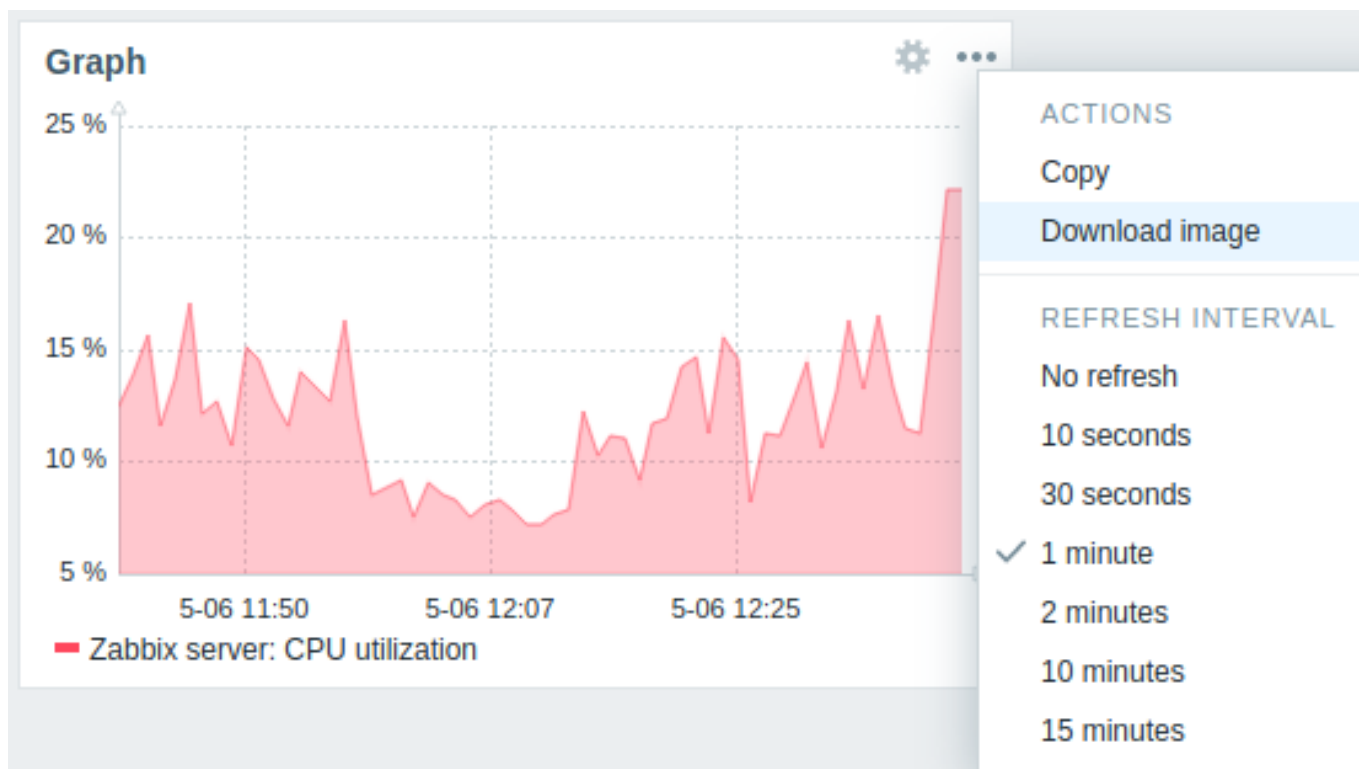

Overrides are useful when several items are selected for a data set using the \* wildcard and you want to change how the items are displayed by default (e.g. default base color or any other property).

Existing overrides (if any) are displayed in a list. To add a new override:

- Click on the **+ Add new override** button
- Select hosts and items for the override. Alternatively, you may enter host and item patterns. Wildcard patterns may be used (for example, \* will return results that match zero or more characters). To specify a wildcard pattern, just enter the string manually and press *Enter*. While you are typing, note how all matching hosts are displayed in the dropdown. The wildcard symbol is always interpreted, therefore it is not possible to add, for example, an item named "item\*" individually if there are other matching items (e.g. item2, item3). Host pattern and item pattern fields are mandatory.
- Click on **+**, to select override parameters. At least one override parameter should be selected. For parameter descriptions, see the *Data set* tab above.

Information displayed by the graph widget can be downloaded as a .png image using the **widget menu**:

A screenshot of the widget will be saved to the Downloads folder.

9 Graph (classic)

Overview

In the classic graph widget, you can display a single custom graph or simple graph.

Configuration

To configure, select *Graph (classic)* as type:

Add widget

Type

Graph (classic)

Cancel

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|              |  |
|--------------|--|
| Source       | Select graph type:<br><b>Graph</b> - custom graph<br><b>Simple graph</b> - simple graph                                    |
| Graph        | Select the custom graph to display.<br>This option is available if 'Graph' is selected as <i>Source</i> .                  |
| Item         | Select the item to display in a simple graph.<br>This option is available if 'Simple graph' is selected as <i>Source</i> . |
| Show legend  | Unmark this checkbox to hide the legend on the graph (marked by default).  |
| Dynamic item | Set graph to display different data depending on the selected host.  |

Information displayed by the classic graph widget can be downloaded as .png image using the **widget menu**:

A screenshot of the widget will be saved to the Downloads folder.

10 Graph prototype

#### Overview

In the graph prototype widget, you can display a grid of graphs created from either a graph prototype or an item prototype by low-level discovery.

#### Configuration

To configure, select *Graph prototype* as widget type:

Add widget

Type
Graph prototype

Show header
☒

Name
Graph prototype

Refresh interval
Default (1 minute)

Source
Graph prototype
Simple graph prototype

\* Graph prototype
Zabbix server: Interface {#IFNAME}: Network traffic
Select

Show legend
☒

Dynamic item
☐

\* Columns
2

\* Rows
1

Add
Cancel

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                        |  |
|------------------------|--|
| <i>Source</i>          | Select source: either a <b>Graph prototype</b> or a <b>Simple graph prototype</b> .  |
| <i>Graph prototype</i> | Select a graph prototype to display discovered graphs of the graph prototype.<br>This option is available if 'Graph prototype' is selected as Source.                            |
| <i>Item prototype</i>  | Select an item prototype to display simple graphs based on discovered items of an item prototype.<br>This option is available if 'Simple graph prototype' is selected as Source. |
| <i>Show legend</i>     | Mark this checkbox to show the legend on the graphs (marked by default).   |
| <i>Dynamic item</i>    | Set graphs to display different data depending on the selected host.   |
| <i>Columns</i>         | Enter the number of columns of graphs to display within a graph prototype widget.  |
| <i>Rows</i>            | Enter the number of rows of graphs to display within a graph prototype widget.   |

While the *Columns* and *Rows* settings allow fitting more than one graph in the widget, there still may be more discovered graphs than there are columns/rows in the widget. In this case paging becomes available in the widget and a slide-up header allows to switch between pages using the left and right arrows.

## 11 Host availability

### Overview

In the host availability widget, high-level statistics about host availability are displayed in four colored columns/lines.

Horizontal display (columns).

Vertical display (lines).

Host availability in each column/line is counted as follows:

- *Available* - hosts with all interfaces available
- *Not available* - hosts with at least one interface unavailable
- *Unknown* - hosts with at least one interface unknown (none unavailable)
- *Total* - total of all hosts

#### Configuration

To configure, select *Host availability* as type:

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                                  |   |
|----------------------------------|---|
| <i>Host groups</i>               | Select host group(s). This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. Scroll down to select. Click on 'x' to remove the selected. |
| <i>Interface type</i>            | Select which host interfaces you want to see availability data for.<br>Availability of all interfaces is displayed by default if nothing is selected.   |
| <i>Layout</i>                    | Select horizontal display (columns) or vertical display (lines).  |
| <i>Show hosts in maintenance</i> | Include hosts that are in maintenance in the statistics.  |

## 12 Item value

### Overview

This widget is useful for displaying the value of a single item prominently.

Besides the value itself, additional elements can be displayed, if desired:

- time of the metric
- item description
- change indicator for the value
- item unit

The widget can display numeric and string values. String values are displayed on a single line and truncated, if needed. "No data" is displayed, if there is no value for the item.

Clicking on the value leads to an ad-hoc graph for numeric items or latest data for string items.

The widget and all elements in it can be visually fine-tuned using **advanced configuration** options, allowing to create a wide variety of visual styles:

#### Configuration

To configure, select *Item value* as the widget type:

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                               |  |
|-------------------------------|--|
| <b>Item</b>                   | Select the item.   |
| <b>Show</b>                   | Mark the checkbox to display the respective element (description, value, time, change indicator).<br>Unmark to hide.<br>At least one element must be selected. |
| <b>Advanced configuration</b> | Mark the checkbox to display <b>advanced configuration</b> options.  |
| <b>Dynamic item</b>           | Mark the checkbox to display a different value depending on the selected host.   |

#### Advanced configuration

Advanced configuration options become available if the *Advanced configuration* checkbox is marked (see screenshot) and only for those elements that are selected in the *Show* field (see above).

Additionally, advanced configuration allows to change the background color for the whole widget.

### Description

Enter the item description. This description may override the default item name. Multiline descriptions are supported. A combination of text and supported macros is possible. {HOST.\*}, {ITEM.\*}, {INVENTORY.\*} and user macros are supported.

Horizontal position

Select horizontal position of the item description - left, right or center.

Vertical position

Select vertical position of the item description - top, bottom or middle.

Size

Enter font size height for the item description (in percent relative to total widget height).

Bold

Mark the checkbox to display item description in bold type.

Color

Select the item description color from the color picker.

D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.

### Value

Decimal places

Select how many decimal places will be displayed with the value. This value will affect only float items. For items with units set to "s", if this value is greater than 0 (the default is 2), the widget rounds the most significant time unit and displays a numeric value (e.g. "10.43m") instead of converting the value into a full time string. When set to 0, the seconds are converted to a human-readable time string (for example, "4h 56m 30s").

Size

Enter font size height for the decimal places (in percent relative to total widget height).

Horizontal position

Select horizontal position of the item value - left, right or center.

|                            |  |
|----------------------------|--|
| <i>Vertical position</i>   | Select vertical position of the item value - top, bottom or middle.  |
| <i>Size</i>                | Enter font size height for the item value (in percent relative to total widget height).<br><i>Note</i> that the size of item value is prioritised; other elements have to concede space for the value. With the change indicator though, if the value is too large, it will be truncated to show the change indicator.   |
| <i>Bold</i>                | Mark the checkbox to display item value in bold type.  |
| <i>Color</i>               | Select the item value color from the color picker.<br>D stands for default color (depends on the frontend theme). To return to the default value, click the <i>Use default</i> button in the color picker.   |
| <i>Units</i>               | Mark the checkbox to display units with the item value. If you enter a unit name, it will override the unit from item configuration.   |
| <i>Position</i>            | Select the item unit position - above, below, before or after the value.   |
| <i>Size</i>                | Enter font size height for the item unit (in percent relative to total widget height).   |
| <i>Bold</i>                | Mark the checkbox to display item unit in bold type.   |
| <i>Color</i>               | Select the item unit color from the color picker.<br>D stands for default color (depends on the frontend theme). To return to the default value, click the <i>Use default</i> button in the color picker.  |
| <b>Time</b>                | Time is the clock value from item history.   |
| <i>Horizontal position</i> | Select horizontal position of the time - left, right or center.  |
| <i>Vertical position</i>   | Select vertical position of the time - top, bottom or middle.  |
| <i>Size</i>                | Enter font size height for the time (in percent relative to total widget height).  |
| <i>Bold</i>                | Mark the checkbox to display time in bold type.  |
| <i>Color</i>               | Select the time color from the color picker.<br>D stands for default color (depends on the frontend theme). To return to the default value, click the <i>Use default</i> button in the color picker.   |
| <b>Change indicator</b>    | Select the color of change indicators from the color picker. The change indicators are as follows:<br>↑ - item value is up (for numeric items)<br>↓ - item value is down (for numeric items)<br>⇕ - item value has changed (for string items and items with value mapping)<br>D stands for default color (depends on the frontend theme). To return to the default value, click the <i>Use default</i> button in the color picker.<br>Vertical size of the change indicator is equal to the size of the value (integer part of the value for numeric items).<br><i>Note</i> that up and down indicators are not shown with just one value. |
| <b>Background color</b>    | Select the background color for the whole widget from the color picker.<br>D stands for default color (depends on the frontend theme). To return to the default value, click the <i>Use default</i> button in the color picker.  |

*Note* that multiple elements cannot occupy the same space; if they are placed in the same space, an error message will be displayed.

## 13 Map

### Overview

In the map widget you can display either:

- a single configured network map;
- one of the configured network maps in the **map navigation tree** (when clicking on the map name in the tree).

### Configuration

## 14 Map navigation tree

### Overview

This widget allows building a hierarchy of existing maps while also displaying problem statistics with each included map and map group.

It becomes even more powerful if you link the *Map* widget to the navigation tree. In this case, clicking on a map name in the navigation tree displays the map in full in the *Map* widget.

Statistics with the top-level map in the hierarchy display a sum of problems of all submaps and their own problems.

### Configuration

To configure, select *Map navigation tree* as type:

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

|                              |   |
|------------------------------|---|
| <i>Show unavailable maps</i> | <p>Mark this checkbox to display maps that the user does not have read permission to. Unavailable maps in the navigation tree will be displayed with a grayed-out icon.</p> <p>Note that if this checkbox is marked, available <b>submaps</b> are displayed even if the parent level map is unavailable. If unmarked, available submaps to an unavailable parent map will not be displayed at all.</p> <p>Problem count is calculated based on available maps and available map elements.</p> |
|------------------------------|---|

Navigation tree elements are displayed in a list. You can:

- drag an element (including its child elements) to a new place in the list;
- expand or collapse an element to display or hide its child elements;
- add a child element (with or without a linked map) to an element;
- add multiple child elements (with linked maps) to an element;
- edit an element;
- remove an element (including its child elements).

You can limit how many problems are displayed in the widget in various ways - by problem status, problem name, severity, host group, host, event tag, acknowledgment status, etc.

#### Show

Filter by problem status:

**Recent problems** - unresolved and recently resolved problems are displayed (default)

**Problems** - unresolved problems are displayed

**History** - history of all events is displayed

#### Host groups

Enter host groups to display problems of in the widget. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups.

Specifying a parent host group implicitly selects all nested host groups.

Problems from these host groups will be displayed in the widget. If no host groups are entered, problems from all host groups will be displayed.

#### Exclude host groups

Enter host groups to hide problems of from the widget. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups.

Specifying a parent host group implicitly selects all nested host groups.

Problems from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to *show* Group A and *exclude* Group B at the same time, only problems from host 001 will be displayed in the widget.

#### Hosts

Enter hosts to display problems of in the widget. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts.

If no hosts are entered, problems of all hosts will be displayed.

|                                 |   |
|---------------------------------|---|
| <i>Problem</i>                  | You can limit the number of problems displayed by their name. If you enter a string here, only those problems whose name contains the entered string will be displayed. Macros are not expanded.  |
| <i>Severity</i>                 | Mark problem severities to filter problems to be displayed in the widget.<br>If no severities are marked, all problems will be displayed.   |
| <i>Tags</i>                     | Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.<br>There are several operators available for each condition:<br><b>Exists</b> - include the specified tag names<br><b>Equals</b> - include the specified tag names and values (case-sensitive)<br><b>Contains</b> - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br><b>Does not exist</b> - exclude the specified tag names<br><b>Does not equal</b> - exclude the specified tag names and values (case-sensitive)<br><b>Does not contain</b> - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)<br>There are two calculation types for conditions:<br><b>And/Or</b> - all conditions must be met, conditions having the same tag name will be grouped by the Or condition<br><b>Or</b> - enough if one condition is met<br>When filtered, the tags specified here will be displayed first with the problem, unless overridden by the <i>Tag display priority</i> (see below) list. |
| <i>Show tags</i>                | Select the number of displayed tags:<br><b>None</b> - no <i>Tags</i> column in <i>Monitoring</i> → <i>Problems</i><br><b>1</b> - <i>Tags</i> column contains one tag<br><b>2</b> - <i>Tags</i> column contains two tags<br><b>3</b> - <i>Tags</i> column contains three tags<br>To see all tags for the problem roll your mouse over the three dots icon.   |
| <i>Tag name</i>                 | Select tag name display mode:<br><b>Full</b> - tag names and values are displayed in full<br><b>Shortened</b> - tag names are shortened to 3 symbols; tag values are displayed in full<br><b>None</b> - only tag values are displayed; no names   |
