You can limit how many problems are displayed in the widget in various ways - by problem status, problem name, severity, host group, host, event tag, acknowledgment status, etc.

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

Show

Filter by problem status:

Recent problems - unresolved and recently resolved problems are displayed (default);

Problems - unresolved problems are displayed;

History - history of all events is displayed.

Host groups

Select host groups to display problems of in the widget.

Alternatively, select a compatible widget as the **data source** for host groups.

This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups.

Specifying a parent host group implicitly selects all nested host groups.

Problems from these host groups will be displayed in the widget; if no host groups are entered, problems from all host groups will be displayed.

This parameter is not available when configuring the widget on a **template dashboard**.

| | |
|------------------------------|--|
| <i>Exclude host groups</i> | <p>Select host groups to hide problems of from the widget.</p> <p>This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups.</p> <p>Specifying a parent host group implicitly selects all nested host groups.</p> <p>Problems from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to <i>show</i> Group A and <i>exclude</i> Group B at the same time, only problems from host 001 will be displayed in the widget.</p> <p>This parameter is not available when configuring the widget on a template dashboard.</p> |
| <i>Hosts</i> | <p>Select hosts to display problems of in the widget.</p> <p>Alternatively, select a compatible widget or the dashboard as the data source for hosts.</p> <p>This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts.</p> <p>If no hosts are entered, problems of all hosts will be displayed.</p> <p>This parameter is not available when configuring the widget on a template dashboard.</p> |
| <i>Problem</i> | <p>You can limit the number of problems displayed by their name.</p> <p>If you enter a string here, only those problems whose name contains the entered string will be displayed.</p> <p>Macros are not expanded.</p> |
| <i>Severity</i> | <p>Mark problem severities to filter problems to be displayed in the widget.</p> <p>If no severities are marked, all problems will be displayed.</p> |
| <i>Problem tags</i> | <p>Specify problem tags to limit the number of problems displayed in the widget.</p> <p>It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p>Exists - include the specified tag names;</p> <p>Equals - include the specified tag names and values (case-sensitive);</p> <p>Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive);</p> <p>Does not exist - exclude the specified tag names;</p> <p>Does not equal - exclude the specified tag names and values (case-sensitive);</p> <p>Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive).</p> <p>There are two calculation types for conditions:</p> <p>And/Or - all conditions must be met, conditions having the same tag name will be grouped by the <i>Or</i> condition;</p> <p>Or - enough if one condition is met.</p> <p>When filtered, the tags specified here will be displayed first with the problem, unless overridden by the <i>Tag display priority</i> (see below) list.</p> |
| <i>Show tags</i> | <p>Select the number of displayed tags:</p> <p>None - no <i>Tags</i> column;</p> <p>1 - <i>Tags</i> column contains one tag;</p> <p>2 - <i>Tags</i> column contains two tags;</p> <p>3 - <i>Tags</i> column contains three tags.</p> <p>To see all tags for the problem roll your mouse over the three dots icon.</p> |
| <i>Tag name</i> | <p>Select tag name display mode:</p> <p>Full - tag names and values are displayed in full;</p> <p>Shortened - tag names are shortened to 3 symbols, but tag values are displayed in full;</p> <p>None - only tag values are displayed; no names.</p> |
| <i>Tag display priority</i> | <p>Enter tag display priority for a problem, as a comma-separated list of tags.</p> <p>Only tag names should be used, no values.</p> <p>Example: <code>Services,Applications,Application</code></p> <p>The tags of this list will always be displayed first, overriding the natural ordering by alphabet.</p> |
| <i>Show operational data</i> | <p>Select the mode for displaying operational data:</p> <p>None - no operational data is displayed;</p> <p>Separately - operational data is displayed in a separate column;</p> <p>With problem name - append operational data to the problem name, using parentheses for the operational data.</p> |
| <i>Show symptoms</i> | <p>Mark the checkbox to display in its own line problems classified as symptoms.</p> |

| | |
|--------------------------|--|
| Show suppressed problems | Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance or single problem suppression . |
| Acknowledgement status | Filter to display all problems, unacknowledged problems only, or acknowledged problems only. Mark the additional checkbox to filter out those problems ever acknowledged by you. |
| Sort entries by | Sort entries by: Time (descending or ascending); Severity (descending or ascending); Problem name (descending or ascending); Host (descending or ascending). |
| | Sorting entries by Host (descending or ascending) is not available when configuring the widget on a template dashboard . |
| Show timeline | Mark the checkbox to display a visual timeline. |
| Show lines | Specify the number of problem lines to display. |

Problems widget offers quick access to additional information:

- Click on the problem date (in the Time column) or the recovery date (in the Recovery Time column) to view **event details**.
- If the Info field is not empty, hover over the displayed icon to view additional details.
- Click on the host name to open the **host menu**.
- Click on the problem name to open the **event menu**.
- Hover over or click on the problem duration to view **problem event popup**.
- Pressing Update opens an **Update problem** window.
- Hover over or press on the gray arrow icon in Actions column to view list of executed actions.

Problem event popup

The problem event popup includes the list of problem events for this trigger and, if defined, the trigger description and a clickable URL.

| Problems | | | | |
|------------------------|------|---------|--|-------------|
| Time | Info | Host | Problem • Severity | Duration |
| 05/07/2020 11:27:12 AM | | Server3 | !/: Disk space is critically low (>90% used) | 10m 22d 23h |

| | | | | |
|------------------------|------------------------|----------|-----------|-----|
| 04/17/2020 01:07:32 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 0m | Yes |
| 04/17/2020 01:05:16 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 8m | Yes |
| 04/17/2020 01:02:34 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 11m | Yes |
| 04/17/2020 12:47:56 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 26m | Yes |
| 04/17/2020 12:45:48 PM | 04/20/2020 02:14:12 PM | RESOLVED | 3d 1h 28m | Yes |

To bring up the problem event popup:

- Roll a mouse over the problem duration in the *Duration* column of the *Problems* widget. The popup disappears once you remove the mouse from the duration.
- Click on the duration in the *Duration* column of the *Problems* widget. The popup disappears only if you click on the duration again.

23 Problems by severity

Overview

In this widget, you can display the problem count by severity. You can limit what hosts and triggers are displayed in the widget and define how the problem count is displayed.

The problem count is displayed only for cause problems.

|------------------------------------|--|
| Show | Select what to display: System stats - display a summary of key Zabbix server and system data; High availability nodes - display the status of high availability nodes (if high availability cluster is enabled). |
| Show software update check details | Mark the checkbox to display Zabbix software update check details. This option is only available if software update check is enabled in Zabbix server configuration and "System stats" is selected in the <i>Show</i> field. |

26 Top hosts

Overview

The Top hosts widget provides a way to create custom tables for displaying data for multiple hosts and can be utilized for creating *Top N*-like reports and progress-bar reports useful for capacity planning. The type of data to display is customizable and can include CPU usage, memory availability, or any other collected values in the numeric, text, or binary format, as well as static text strings. Data can be presented in various formats such as bars, indicators, or sparkline charts.

The maximum number of hosts that can be displayed is 1000.

Supported parameters:

| | |
|-----------------------|---|
| Name | Name of the column. |
| Data | Data type to display in the column, select Item value . |
| Item name | Select the item. When configuring the widget on a template dashboard , only items configured on the template can be selected. |
| Base color | Background color of the column; fill color if <i>Item value</i> data is displayed as bar/indicators. The default color can be overridden by custom color, if the item value is over one of the specified thresholds. |
| Display item value as | Format for displaying the item value: Numeric , Text , or Binary . The selected option determines which additional parameters will be available. Refer to the parameter list for each format below. |

803

Advanced configuration

Aggregation function

Specify which aggregation function to use:

- min** - display the smallest value;
- max** - display the largest value;
- avg** - display the average value;
- count** - display the count of values;
- sum** - display the sum of values;
- first** - display the first value;
- last** - display the last value;
- not used** - display the most recent value (no aggregation).

Aggregation allows to display an aggregated value for the chosen interval (5 minutes, an hour, a day), instead of the most recent value.

Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric.

Time period

Specify the time period to use for aggregating values:

- Dashboard** - use time period of the dashboard;
- Widget** - use time period of the specified widget;
- Custom** - use a custom time period.

This parameter will not be displayed if *Aggregation function* is set to "not used".

Widget

Select the widget.

This parameter will only be displayed if *Time period* is set to "Widget".

From

Select the time period from (default value `now-1h`). See [relative time syntax](#).

This parameter will only be displayed if *Time period* is set to "Custom".

To

Select the time period to (default value `now`). See [relative time syntax](#).

This parameter will only be displayed if *Time period* is set to "Custom".

History data

Take data from history or trends:

- Auto** - automatic selection;
- History** - take history data;
- Trends** - take trend data.

This parameter is available only for numeric item values. For text and binary values data will always be taken from history.

Numeric item value parameters:

Display

Define how the value should be displayed:

- As is** - as regular text;
- Bar** - as solid, color-filled bar;
- Indicators** - as segmented, color-filled bar;
- Sparkline** - mini line graph.

Thresholds

Specify threshold values when the background/fill color should change.

The list will be sorted in ascending order when saved.

For sparklines, thresholds are applied only to the item last value.

Decimal places

Specify how many decimal places will be displayed with the value.

Bar/Indicators

Min

Minimum value.

Max

Maximum value.

Sparkline

Width

Set the graph line thickness by using the slider or manually entering a value in the range from 0 to 10.

Color

Select line and fill color.

Fill

Set fill color transparency level by using the slider or manually entering a value in the range from 0 to 10.

Time period

Specify the time period for values to be included into the sparkline chart:

- Dashboard** - use time period of the dashboard;
- Widget** - use time period of the specified widget;
- Custom** - use a custom time period.

Note that the time period affects only the sparkline chart. The value displayed next to the sparkline represents the last value of the item, not the last value in the selected time period.

| | |
|---------------------|---|
| <i>Widget</i> | Select the widget. This parameter will only be displayed if <i>Time period</i> is set to "Widget". |
| <i>From</i> | Select the time period from (default value now-1h). See relative time syntax . This parameter will only be displayed if <i>Time period</i> is set to "Custom". |
| <i>To</i> | Select the time period to (default value now). See relative time syntax . This parameter will only be displayed if <i>Time period</i> is set to "Custom". |
| <i>History data</i> | Take data from history or trends: Auto - automatic selection; History - take history data; Trends - take trend data. |

Text item value parameters:

| | |
|-------------------|--|
| <i>Highlights</i> | Specify the regular expressions upon matching which the background/fill color should change. |
|-------------------|--|

Binary item value parameters:

| | |
|-----------------------|--|
| <i>Show thumbnail</i> | Specify whether to create and display a thumbnail for the image containing binary data or to display a hyperlink <i>Show</i> leading to the full-size image in the value column. |
|-----------------------|--|

27 Top items

Overview

In the *Top items* widget, you can display top (or bottom) values for a group of items.

| Top items | | |
|---------------------|------------------------|---------|
| Items | Zabbix server | |
| CPU idle time | <div><div></div></div> | 74.45 % |
| CPU utilization | <div><div></div></div> | 25.55 % |
| CPU system time | <div><div></div></div> | 12.93 % |
| CPU user time | <div><div></div></div> | 8.56 % |
| CPU softirq time | <div><div></div></div> | 2.15 % |
| CPU iowait time | <div><div></div></div> | 1.02 % |
| CPU guest nice time | <div><div></div></div> | 0.00 % |

It is possible to select items directly or by pattern, customize column ordering and highlighting.

The color of problem items is based on the problem severity color, which can be adjusted in the [problem update](#) screen.

By default, only values that fall within the last 24 hours are displayed. This limit has been introduced with the aim of improving initial loading times for large pages of latest data. This limit is configurable in *Administration* → *General* → *GUI*, using the *Max history display period* option.

Clicking on item value opens the [item menu](#).

Column parameters for text values:

| | |
|-------------------|--|
| <i>Highlights</i> | Specify the regular expressions upon matching which the background/fill color should change. |
|-------------------|--|

28 Top triggers

Overview

In the *Top triggers* widget, you can see the triggers with the highest number of problems.

| Top triggers | | | |
|---------------|---|----------|--------------------|
| Host | Trigger | Severity | Number of problems |
| Zabbix server | Interface enp0s3: Link down | Average | 2 |
| Zabbix server | Load average is too high | Average | 2 |
| Zabbix server | Zabbix agent is not available | Average | 2 |
| Zabbix server | Zabbix server: More than 100 items having missing data for more than 10 minutes | Warning | 2 |
| Zabbix server | Zabbix server: Utilization of escalator processes is high | Average | 2 |

The maximum number of triggers that can be shown is 1000. When viewing the widget on a dashboard, it is possible to select the time period for displaying the data.

The information on top triggers is also available in the *Reports* → *Top 100 triggers* menu section.

Configuration

To configure, select *Top triggers* as widget type:

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

| | |
|--------------------|--|
| <i>Host groups</i> | <p>Select host groups to display problems of in the widget.</p> <p>This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups.</p> <p>Specifying a parent host group implicitly selects all nested host groups.</p> <p>Problems from these host groups will be displayed in the widget; if no host groups are entered, problems from all host groups will be displayed.</p> |
| <i>Hosts</i> | <p>This parameter is not available when configuring the widget on a template dashboard.</p> <p>Select hosts to display problems of in the widget.</p> <p>This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts.</p> <p>If no hosts are entered, problems of all hosts will be displayed.</p> |
| <i>Problem</i> | <p>This parameter is not available when configuring the widget on a template dashboard.</p> <p>You can view the triggers for particular problems only. For this, enter the string to be matched in the problem name.</p> |
| <i>Severity</i> | <p>Macros are not expanded.</p> <p>Mark trigger severities to filter triggers to be displayed in the widget.</p> <p>If no severities are marked, all triggers will be displayed.</p> |

| | |
|----------------------|---|
| <i>Problem tags</i> | <p>Specify the tags of the problems to be displayed in the widget.</p> <p>It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p>Exists - include the specified tag names;</p> <p>Equals - include the specified tag names and values (case-sensitive);</p> <p>Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive);</p> <p>Does not exist - exclude the specified tag names;</p> <p>Does not equal - exclude the specified tag names and values (case-sensitive);</p> <p>Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive).</p> <p>There are two calculation types for conditions:</p> <p>And/Or - all conditions must be met, conditions having the same tag name will be grouped by the <i>Or</i> condition;</p> <p>Or - enough if one condition is met.</p> |
| <i>Time period</i> | <p>Select the data source for the time period:</p> <p>Dashboard - set the <i>Time period</i> selector as the data source;</p> <p>Widget - set a compatible widget specified in the <i>Widget</i> parameter as the data source;</p> <p>Custom - set the time period specified in the <i>From</i> and <i>To</i> parameters as the data source; if set, a clock icon will be displayed in the top right corner of the widget, indicating the set time on mouseover.</p> |
| <i>Widget</i> | <p>Enter or select a compatible widget (<i>Graph</i>, <i>Graph (classic)</i>, <i>Graph prototype</i>) as the data source for the time period.</p> |
| <i>From</i> | <p>This parameter is available if <i>Time period</i> is set to "Widget".</p> <p>Enter or select the start of the time period.</p> <p>Relative time syntax (<i>now</i>, <i>now/d</i>, <i>now/w-1w</i>, etc.) is supported.</p> |
| <i>To</i> | <p>This parameter is available if <i>Time period</i> is set to "Custom".</p> <p>Enter or select the end of the time period.</p> <p>Relative time syntax (<i>now</i>, <i>now/d</i>, <i>now/w-1w</i>, etc.) is supported.</p> |
| <i>Trigger limit</i> | <p>This parameter is available if <i>Time period</i> is set to "Custom".</p> <p>Set the number of triggers to be displayed. Possible value range: 1-1000.</p> |

29 Trigger overview

Overview

In the trigger overview widget, you can display the trigger states for a group of hosts.

- The trigger states are displayed as colored blocks (the color of the blocks for PROBLEM triggers depends on the problem severity color, which can be adjusted in the **problem update** screen). Note that recent trigger state changes (within the last 2 minutes) will be displayed as blinking blocks.
- Gray up and down arrows indicate triggers that have dependencies. On mouseover, dependency details are revealed.
- A checkbox icon indicates acknowledged problems. All problems or resolved problems of the trigger must be acknowledged for this icon to be displayed.

Clicking on a trigger block provides context-dependent links to problem events of the trigger, the problem acknowledgment screen, trigger configuration, trigger URL or a simple graph/latest values list.

Note that 50 records are displayed by default (configurable in *Administration* → *General* → **GUI**, using the *Max number of columns and rows in overview tables* option). If more records exist than are configured to display, a message is displayed at the bottom of the table, asking to provide more specific filtering criteria. There is no pagination. Note that this limit is applied first, before any further filtering of data, for example, by tags.

Note:

In cases when a user does not have permission to access certain widget elements, that element's name will appear as *Inaccessible* during the widget's configuration. This results in *Inaccessible Item*, *Inaccessible Host*, *Inaccessible Group*, *Inaccessible Map*, and *Inaccessible Graph* appearing instead of the "real" name of the element.

In addition to the parameters that are **common** for all widgets, you may set the following specific options:

| | |
|-------------|--|
| Host groups | Select host groups to display in the widget. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will be displayed in the widget; if no host groups are entered, all host groups will be displayed. This parameter is not available when configuring the widget on a template dashboard . |
|-------------|--|

| | |
|----------------------------------|--|
| <i>Exclude host groups</i> | <p>Select host groups to hide from the widget.</p> <p>This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups.</p> <p>Specifying a parent host group implicitly selects all nested host groups.</p> <p>Host data from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to <i>show</i> Group A and <i>exclude</i> Group B at the same time, only data from host 001 will be displayed in the dashboard.</p> <p>This parameter is not available when configuring the widget on a template dashboard.</p> |
| <i>Hosts</i> | <p>Select hosts to display in the widget.</p> <p>Alternatively, select a compatible widget or the dashboard as the data source for hosts.</p> <p>This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts.</p> <p>If no hosts are entered, all hosts will be displayed.</p> <p>This parameter is not available when configuring the widget on a template dashboard.</p> |
| <i>Scenario tags</i> | <p>Specify tags to limit the number of web scenarios displayed in the widget.</p> <p>It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p>Exists - include the specified tag names;</p> <p>Equals - include the specified tag names and values (case-sensitive);</p> <p>Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive);</p> <p>Does not exist - exclude the specified tag names;</p> <p>Does not equal - exclude the specified tag names and values (case-sensitive);</p> <p>Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive).</p> <p>There are two calculation types for conditions:</p> <p>And/Or - all conditions must be met, conditions having the same tag name will be grouped by the <i>Or</i> condition;</p> <p>Or - enough if one condition is met.</p> |
| <i>Show hosts in maintenance</i> | <p>Include hosts that are in maintenance in the statistics.</p> <p>This parameter is labeled <i>Show data in maintenance</i> when configuring the widget on a template dashboard.</p> |

Web monitoring widget

Once you have completed the configuration, you might like to see the widget with the data it displays. To do it, go to *Dashboards*, click on the name of a dashboard where you created the widget.

In this example, you can see the widget named "Zabbix frontend" displaying the status of the web monitoring for three host groups: "Internal network," "Linux servers," and "Web servers."

Zabbix frontend

| Host group ▲ | Ok | Failed | Unknown |
|------------------|----|--------|---------|
| Internal network | 1 | | |
| Linux servers | | 1 | |
| Web servers | | | 1 |

A web monitoring widget displays the following information:

- a name of a widget; below it, there are four columns:
 - *Host group* - displays a list of host groups that contain hosts having web scenarios configured;

- *Ok* - displays a number of web scenarios (in green color) when two conditions are observed:
 - * Zabbix has collected the latest data for a web scenario(s);
 - * all steps that were configured in a **web scenario** are in "Ok" *Status*.
- *Failed* - displays a number of web scenarios (in red color), which have some failed steps:
 - * click on the host name, and it will open a new window; the *Status* column provides detailed information (in red color) on the step where Zabbix failed to collect the data; and also,
 - * gives a hint for the parameter that has to be corrected in the **configuration form**.

Web monitoring

| Host | Name ▲ | Number of steps | Last check | Status | Tags |
|------------------------|---------------|-----------------|------------|--|------|
| Internal documentation | Internal Wiki | 2 | 38s | Step "Configuration page" [2 of 2] failed: required pattern "winter" was not found on http://localhost/index.php | |

Displaying 1 of 1 found

- *Unknown* - displays a number of web scenarios (in grey color) for which Zabbix has neither collected data, nor has an information about the failed steps.

Web monitoring

| Host | Name ▲ | Number of steps | Last check | Status | Tags |
|-------------|-------------|-----------------|------------|--------|------|
| Zabbix site | Zabbix site | 1 | | | |

Displaying 1 of 1 found

Viewing the status and data

Clickable links in the widget allow to easily navigate and quickly acquire a full information on each web scenario. Thus, to view:

- the *Status* of a web scenario, click on the name of a host group.
- more detailed statistics, click on the scenario name. In this example it is "Zabbix frontend".
- the details in the case of *Failed* status, click on a host group name; in the window that opens, click on a web scenario name in the *Name* column; it will open more detailed information on the configured steps for which Zabbix failed to collect the data.

Details of web scenario: Internal Wiki

| Step | Speed | Response time | Response code | Status |
|--------------------|------------|-----------------|---------------|--|
| First page | 95.94 KBps | 256.75ms | 200 | OK |
| Configuration page | 40.46 KBps | 33.5ms | 200 | Error: required pattern "winter" was not found on http://localhost/index.php |
| TOTAL | | 290.25ms | | Error: required pattern "winter" was not found on http://localhost/index.php |

Now, you can return to the **web scenario configuration form** and correct your settings.

To view the details in the case of *Unknown* status, you can repeat the same steps as explained for *Failed*.

Attention:

At the first monitoring instance, a web scenario is always displayed in *Unknown* state, which is switched to *Failed* or *Ok* state right after the first check. In the case when a host is monitored by the proxy, the status change occurs in accordance with the data collection frequency configured on the proxy.

2 Monitoring

Overview

The Monitoring menu is all about displaying data. Whatever information Zabbix is configured to gather, visualize and act upon, it will be displayed in the various sections of the Monitoring menu.

View mode buttons

The following buttons located in the top right corner are common for every section:

Display page in kiosk mode. In this mode only page content is displayed.

To exit kiosk mode, move the mouse cursor until the exit button appears and click on it. You will be taken back to normal mode.

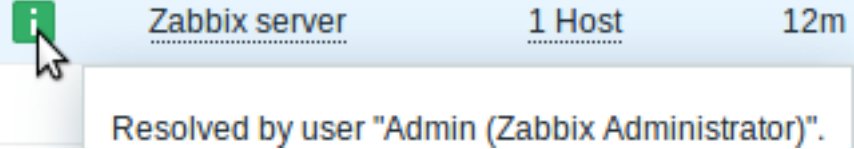

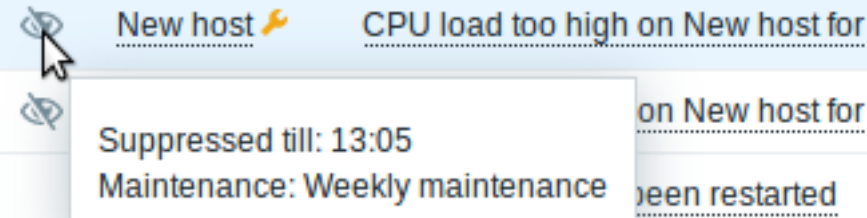

1 Problems

Overview

In *Monitoring* → *Problems* you can see what problems you currently have. Problems are those triggers that are in the "Problem" state.

By default all new problems are classified as cause problems. It is possible to manually reclassify certain problems as symptom problem of the cause problem. For more details, see [cause and symptom events](#).

| Column | Description |
|---------------|---|
| Checkbox | Checkboxes for problem selection are displayed. Icons, next to the checkboxes, have the following meaning:  - the number of symptom events for the cause problem;  - expand to show symptom events;  - collapse to hide symptom events;  - this is a symptom event. |
| Time | Problem start time is displayed. |
| Severity | Problem severity is displayed. Problem severity is originally based on the severity of the underlying problem trigger, however, after the event has happened it can be updated using the <i>Update problem screen</i> . Color of the problem severity is used as cell background during problem time. |
| Recovery time | Problem resolution time is displayed. |
| Status | Problem status is displayed: Problem - unresolved problem Resolved - recently resolved problem. You can hide recently resolved problems using the filter. New and recently resolved problems blink for 2 minutes. Resolved problems are displayed for 5 minutes in total. Both of these values are configurable in <i>Administration</i> → <i>General</i> → <i>Trigger displaying options</i> . |
| Info | A green information icon is displayed if a problem is closed by global correlation or manually when updating the problem. Rolling a mouse over the icon will display more details:  The following icon is displayed if a suppressed problem is being shown (see <i>Show suppressed problems</i> option in the filter). Rolling a mouse over the icon will display more details:  |
| Host | Problem host is displayed. Clicking on the host name brings up the <i>host menu</i> . |

| Column | Description |
|-------------------------|---|
| <i>Problem</i> | <p>Problem name is displayed.</p> <p>Problem name is based on the name of the underlying problem trigger.</p> <p>Macros in the trigger name are resolved at the time of the problem happening and the resolved values do not update any more.</p> <p><i>Note</i> that it is possible to append the problem name with operational data showing some latest item values.</p> <p>Clicking on the problem name brings up the event menu.</p> <p>Hovering on the  icon after the problem name will bring up the trigger description (for those problems that have it).</p> |
| <i>Operational data</i> | <p>Operational data are displayed containing latest item values.</p> <p>Operational data can be a combination of text and item value macros if configured on a trigger level. If no operational data is configured on a trigger level, the latest values of all items from the expression are displayed.</p> <p>This column is only displayed if <i>Separately</i> is selected for <i>Show operational data</i> in the filter.</p> |
| <i>Duration</i> | <p>Problem duration is displayed.</p> <p>See also: Negative problem duration</p> |
| <i>Update</i> | <p>Click on the <i>Update</i> link to go to the problem update screen where various actions can be taken on the problem, including commenting and acknowledging the problem.</p> |
| <i>Actions</i> | <p>History of activities about the problem is displayed using symbolic icons:</p> <ul style="list-style-type: none">  - problem has been acknowledged. This icon is always displayed first.  - comments have been made. The number of comments is also displayed.  - problem severity has been increased (e.g. Information → Warning)  - problem severity has been decreased (e.g. Warning → Information)  - problem severity has been changed, but returned to the original level (e.g. Warning → Information → Warning)  - actions have been taken. The number of actions is also displayed.  - actions have been taken, at least one is in progress. The number of actions is also displayed.  - actions have been taken, at least one has failed. The number of actions is also displayed. <p>When rolling the mouse over the icons, popups with details about the activity are displayed. See viewing details to learn more about icons used in the popup for actions taken.</p> |
| <i>Tags</i> | <p>Tags are displayed (if any).</p> <p>In addition, tags from an external ticketing system may also be displayed (see the <i>Process tags</i> option when configuring webhooks).</p> |

Operational data of problems

It is possible to display operational data for current problems, i.e. the latest item values as opposed to the item values at the time of the problem.

Operational data display can be configured in the filter of *Monitoring* → *Problems* or in the configuration of the respective **dashboard widget**, by selecting one of the three options:

- *None* - no operational data is displayed
- *Separately* - operational data is displayed in a separate column

| Time | <input type="checkbox"/> Severity | Recovery time | Status | Info | Host ▲ | Problem | Operational data | Duration |
|----------|-----------------------------------|---------------|---------|------|---------------|--|----------------------|-----------|
| 09:28:35 | <input type="checkbox"/> Average | | PROBLEM | | Zabbix server | Zabbix discoverer processes more than 75% busy | Current value: 100 % | 3h 32m 8s |

- *With problem name* - operational data is appended to the problem name and in parentheses. Operational data are appended to the problem name only if the *Operational data* field is non-empty in the trigger configuration.

| Time | <input type="checkbox"/> Severity | Recovery time | Status | Info | Host ▲ | Problem | Duration |
|----------|-----------------------------------|---------------|---------|------|---------------|---|------------|
| 09:28:35 | <input type="checkbox"/> Average | | PROBLEM | | Zabbix server | Zabbix discoverer processes more than 75% busy (Current value: 100 %) | 3h 29m 34s |

The content of operational data can be configured with each **trigger**, in the *Operational data* field. This field accepts an arbitrary string with macros, most importantly, the `{ITEM.LASTVALUE<1-9>}` macro.

`{ITEM.LASTVALUE<1-9>}` in this field will always resolve to the latest values of items in the trigger expression. `{ITEM.VALUE<1-9>}` in this field will resolve to the item values at the moment of trigger status change (i.e. change into problem, change into OK, being closed manually by a user or being closed by correlation).

Note that closing the problem manually does not produce a new value so the resolved value of `{ITEM.LASTVALUE<1-9>}` or `{ITEM.VALUE<1-9>}` will still show the value from the problem time.

`{ITEM.LASTVALUE<1-9>}` or `{ITEM.VALUE<1-9>}` will resolve to `*UNKNOWN*` if the latest history value has been collected more than the *Max history display period* time ago (see [Administration → General](#)).

Negative problem duration

It is actually possible in some common situations to have negative problem duration i.e. when the problem resolution time is earlier than problem creation time, e. g.:

- If some host is monitored by proxy and a network error happens, leading to no data received from the proxy for a while, the `nodata(/host/key)` trigger will be fired by the server. When the connection is restored, the server will receive item data from the proxy having a time from the past. Then, the `nodata(/host/key)` problem will be resolved and it will have a negative problem duration;
- When item data that resolve the problem event are sent by Zabbix sender and contain a timestamp earlier than the problem creation time, a negative problem duration will also be displayed.

Note:

Negative problem duration is not affecting **SLA calculation** or **Availability report** of a particular trigger in any way; it neither reduces nor expands problem time.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Mass update* - update the selected problems by navigating to the **problem update** screen

To use this option, mark the checkboxes before the respective problems, then click on the *Mass update* button.

Buttons

The button to the right offers the following option:

View mode buttons, being common for all sections, are described on the **Monitoring** page.

Using filter

You can use the filter to display only the problems you are interested in. For better search performance, data is searched with macros unresolved.

The filter is located above the table. Favorite filter settings can be saved as tabs and then quickly accessed by clicking on the **tabs above the filter**.

The screenshot shows the 'Problems' tab in the Monitoring interface. On the left, there are filter sections for 'Show' (Recent problems, Problems, History), 'Host groups' (type here to search), 'Hosts' (Zabbix server), 'Triggers' (type here to search), 'Problem' (type here to search), 'Severity' (Not classified, Warning, High, Information, Average, Disaster), 'Age less than' (14 days), 'Show symptoms' (checkbox), 'Show suppressed problems' (checked), and 'Acknowledgement status' (All, Unacknowledged, Acknowledged, By me). On the right, there are sections for 'Host inventory' (Type dropdown), 'Tags' (And/Or, Or, tag, Contains, value, Remove), 'Show tags' (None, 1, 2, 3, Tag name: Full, Shortened, None), 'Tag display priority' (comma-separated list), 'Show operational data' (None, Separately, With problem name), 'Compact view' (checkbox), 'Show details' (checkbox), and 'Show timeline' (checked). At the bottom are 'Save as', 'Apply', and 'Reset' buttons.

| Parameter | Description |
|---------------------------------|--|
| <i>Show</i> | Filter by problem status: Recent problems - unresolved and recently resolved problems are displayed (default) Problems - unresolved problems are displayed History - history of all events is displayed |
| <i>Host groups</i> | Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. |
| <i>Hosts</i> | Filter by one or more hosts. |
| <i>Triggers</i> | Filter by one or more triggers. |
| <i>Problem</i> | Filter by problem name. |
| <i>Severity</i> | Filter by trigger (problem) severity. |
| <i>Age less than</i> | Filter by how old the problem is. |
| <i>Show symptoms</i> | Mark the checkbox to display in its own line problems classified as symptoms. |
| <i>Show suppressed problems</i> | Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance or single problem suppression . |
| <i>Acknowledgement status</i> | Filter to display all problems, unacknowledged problems only, or acknowledged problems only. Mark the additional checkbox to filter out those problems ever acknowledged by you. |
| <i>Host inventory</i> | Filter by inventory type and value. |
| <i>Tags</i> | Filter by event tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: Exists - include the specified tag names Equals - include the specified tag names and values (case-sensitive) Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) Does not exist - exclude the specified tag names Does not equal - exclude the specified tag names and values (case-sensitive) Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition Or - enough if one condition is met When filtered, the tags specified here will be displayed first with the problem, unless overridden by the <i>Tag display priority</i> (see below) list. |
| <i>Show tags</i> | Select the number of displayed tags: None - no <i>Tags</i> column in <i>Monitoring</i> → <i>Problems</i> 1 - <i>Tags</i> column contains one tag 2 - <i>Tags</i> column contains two tags 3 - <i>Tags</i> column contains three tags |
| <i>Tag name</i> | To see all tags for the problem roll your mouse over the three dots icon. Select tag name display mode: Full - tag names and values are displayed in full Shortened - tag names are shortened to 3 symbols; tag values are displayed in full None - only tag values are displayed; no names |
| <i>Tag display priority</i> | Enter tag display priority for a problem, as a comma-separated list of tags (for example: customer , scope , component). Tag names only should be used, no values. The tags of this list will always be displayed first, overriding the natural ordering by alphabet. |

| Parameter | Description |
|------------------------------|--|
| <i>Show operational data</i> | Select the mode for displaying operational data : None - no operational data is displayed Separately - operational data is displayed in a separate column With problem name - append operational data to the problem name, using parentheses for the operational data |
| <i>Compact view</i> | Mark the checkbox to enable compact view. |
| <i>Show details</i> | Mark the checkbox to display underlying trigger expressions of the problems. Disabled if <i>Compact view</i> checkbox is marked. |
| <i>Show timeline</i> | Mark the checkbox to display the visual timeline and grouping. Disabled if <i>Compact view</i> checkbox is marked. |
| <i>Highlight whole row</i> | Mark the checkbox to highlight the full line for unresolved problems. The problem severity color is used for highlighting. Enabled only if the <i>Compact view</i> checkbox is marked in the standard blue and dark themes. <i>Highlight whole row</i> is not available in the high-contrast themes. |

Tabs for favorite filters

Frequently used sets of filter parameters can be saved in tabs.

To save a new set of filter parameters, open the main tab, and configure the filter settings, then press the *Save as* button. In a new popup window, define *Filter properties*.

Filter properties

* Name

Servers

Show number of records

☒

Set custom time period

☒

From

To

now

Delete

Save

Cancel

| Parameter | Description |
|--------------------------------------|---|
| <i>Name</i> | The name of the filter to display in the tab list. |
| <i>Show number of records</i> | Check, if you want the number of problems to be displayed next to the tab name. |
| <i>Override time period selector</i> | Check to set specific default time period for this filter set. If set, you will only be able to change the time period for this tab by updating filter settings. For tabs without a custom time period, the time range can be changed by pressing the time selector button in the top right corner (button name depends on selected time interval: This week, Last 30 minutes, Yesterday, etc.). This option is available only for filters in <i>Monitoring→Problems</i> . |
| <i>From/To</i> | Time period start and end in absolute (Y-m-d H:i:s) or relative time syntax (now-1d). Available if <i>Set custom time period</i> is checked. |

When saved, the filter is created as a named filter tab and immediately activated.

To edit the filter properties of an existing filter, press the gear symbol next to the active tab name.

Notes:

- To hide the filter area, click on the name of the current tab. Click on the active tab name again to open the filter area again.

- Keyboard navigation is supported: use arrows to switch between tabs, press *Enter* to open.
- The left/right buttons above the filter may be used to switch between saved filters. Alternatively, the downward pointing button opens a drop-down menu with all saved filters and you can click on the one you need.
- Filter tabs can be re-arranged by dragging and dropping.
- If the settings of a saved filter have been changed (but not saved), a green dot is displayed after the filter name. To update the filter according to the new settings, click on the *Update* button, which is displayed instead of the *Save as* button.
- Current filter settings are remembered in the user profile. When the user opens the page again, the filter settings will have stayed the same.

Note:

To share filters, copy and send to others a URL of an active filter. After opening this URL, other users will be able to save this set of parameters as a permanent filter in their Zabbix account.

See also: [Page parameters](#).

Filter buttons

| | |
|---|--|
|  | Apply specified filtering criteria (without saving). |
|  | Reset current filter and return to saved parameters of the current tab. On the main tab, this will clear the filter. |
|  | Save current filter parameters in a new tab. Only available on the main tab. |
|  | Replace tab parameters with currently specified parameters. Not available on the main tab. |

Viewing details

The times for problem start and recovery in *Monitoring* → *Problems* are links. Clicking on them opens more details of the event.

Event details

Trigger details

Host: Zabbix server
Trigger: Interface wlp3s0: Link down
Severity: Average
Problem expression: 1=1 and last(Zabbix server/vfs.file.contents["/sys/class/net/wlp3s0/operstate"])=2 and (last(Zabbix server/vfs.file.contents["/sys/class/net/wlp3s0/operstate"],#1)<>last(Zabbix server/vfs.file.contents["/sys/class/net/wlp3s0/operstate"],#2))
Recovery expression: last(Zabbix server/vfs.file.contents["/sys/class/net/wlp3s0/operstate"])<2 or 1=0
Event generation: Normal
Allow manual close: Yes
Enabled: Yes

Event details

Event: Interface wlp3s0: Link down
Operational data: Current state: down (2)
Severity: Average
Time: 2023-01-24 14:15:51
Acknowledged: No
Tags: class: os component: network interface: wlp3s0 ...
Description: This trigger expression works as follows:
1. Can be triggered if operations status is down.
2. 1=1 - user can redefine Context macro to value - 0. That marks this interface as not important. No new trigger will be fired if this interface is down.
3. (TEMPLATE_NAME:MTRIC.diff())=1) - trigger fires only if operational status was up(1) sometime before. (So, do not fire 'eternal off' interfaces.)
WARNING: if closed manually - won't fire again on next poll, because of .diff.
Rank: Cause

Note that the problem severity may differ for the trigger and the problem event - if it has been updated for the problem event using the *Update problem* screen.

In the action list, the following icons are used to denote the activity type:

-  - problem event generated

-  - message has been sent
-  - problem event acknowledged
-  - problem event unacknowledged
-  - a comment has been added
-  - problem severity has been increased (e.g. Information → Warning)
-  - problem severity has been decreased (e.g. Warning → Information)
-  - problem severity has been changed, but returned to the original level (e.g. Warning → Information → Warning)
-  - a remote command has been executed
-  - problem event has recovered
-  - the problem has been closed manually
-  - the problem has been suppressed
-  - the problem has been unsuppressed
-  - the problem has been converted to a symptom problem
-  - the problem has been converted to a cause problem

1 Cause and symptom problems

Overview

By default all new problems are classified as cause problems. It is possible to manually reclassify certain problems as symptom problems of the cause problem.

For example, power outage may be the actual root cause why some host is unreachable or some service is down. In this case, "host is unreachable" and "service is down" problems must be classified as symptom problems of "power outage" - the cause problem.

The cause-symptom hierarchy supports only two levels. A problem that is already a symptom cannot be assigned "subordinate" symptom problems; any problems assigned as symptoms to a symptom problem will become symptoms of the same cause problem.

Only cause problems are counted in problem totals in maps, dashboard widgets such as *Problems by severity* or *Problem hosts*, etc. However, problem ranking does not affect services.

A symptom problem can be linked to only one cause problem. Symptom problems are not automatically resolved, if the cause problem is resolved or closed.

Configuration

To reclassify a problem as symptom problem, first select it in the list of **problems**. One or several problems can be selected.

Then go to the cause problem, and in its context menu click on the *Mark selected as symptoms* option.

Problems

| <input type="checkbox"/> | Time ▼ | Severity | Recovery time | Status | Info | Host | Problem | Duration |
|-------------------------------------|---------------------|----------------|---------------|---------|------|---------------|---------------------------------|----------|
| <input checked="" type="checkbox"/> | 18:15:01 | Not classified | | | | Zabbix server | Application unavailable on (23) | 1m 4s |
| <input checked="" type="checkbox"/> | 18:15:01 | Not classified | | | | Zabbix server | Host (23) unavailable | 1m 4s |
| <input type="checkbox"/> | 18:15:01 | Not classified | | | | Zabbix server | Power outage on (23) | 1m 4s |
| Today | | | | | | | | |
| <input type="checkbox"/> | 2022-10-17 10:38:52 | Average | | PROBLEM | | Zabbix server | Interface e | 13d 8h |
| October | | | | | | | | |
| <input type="checkbox"/> | 2022-09-16 12:38:25 | Not classified | | PROBLEM | | Zabbix server | A class: trigge | 14d 6h |
| <input type="checkbox"/> | 2022-09-16 12:12:47 | Not classified | | PROBLEM | | Zabbix server | A class: trigge | 14d 7h |
| <input type="checkbox"/> | 2022-09-16 12:09:28 | Not classified | | PROBLEM | | Zabbix server | A class: trigge | 14d 7h |
| <input type="checkbox"/> | 2022-09-16 12:04:06 | Not classified | | PROBLEM | | Zabbix server | A class: trigge | 14d 7h |
| <input type="checkbox"/> | 2022-09-16 11:59:30 | Not classified | | PROBLEM | | Zabbix server | A class: trigge | 14d 7h |

After that, the selected problems will be updated by the server to symptom problems of the cause problem.

While the status of the problem is being updated, it is displayed in one of two ways:

- A blinking "UPDATING" status is displayed in the Status column;
- A blinking  or  icon in the Info column (this is in effect if *Problems* only are selected in the filter and thus the Status column is not shown).

Display

Symptom problems are displayed below the cause problem and marked accordingly in *Monitoring -> Problems* (and the *Problems* dashboard widget) - with an icon, smaller font and different background.

| Current problems | | | | | | | | |
|------------------|----------|------|---------------|---------------------------------|----------|--------|---------|------|
| | Time ▼ | Info | Host | Problem • Severity | Duration | Update | Actions | Tags |
| 2 ^ | 13:57:04 | | Zabbix server | Power outage on (23) | 3m 34s | Update | ✓ 2 | |
| ↳ | 13:57:04 | | Zabbix server | Application unavailable on (23) | 3m 34s | Update | ↑ 3 | |
| ↳ | 13:57:04 | | Zabbix server | Host (23) unavailable | 3m 34s | Update | ↑ 3 | |

In collapsed view, only the cause problem is seen; the existence of symptom problems is indicated by the number in the beginning of the line and the icon for expanding the view.

| Current problems | | | | | | | | |
|------------------|----------|------|---------------|----------------------|----------|--------|---------|------|
| | Time ▼ | Info | Host | Problem • Severity | Duration | Update | Actions | Tags |
| 2 v | 13:57:04 | | Zabbix server | Power outage on (23) | 3m 34s | Update | ✓ 2 | |

It is also possible to additionally display symptom problems in normal font and in their own line. For that select *Show symptoms* in the filter settings or the widget configuration.

Reverting to cause problem

A symptom problem can be reverted back to a cause problem. To do that, either:

- click on the *Mark as cause* option in the context menu of the symptom problem;
- mark the *Convert to cause* option in to the **problem update** screen and click on *Update* (this option will also work if several problems are selected).

2 Hosts

Overview

The *Monitoring* → *Hosts* section displays a full list of monitored hosts with detailed information about host interface, availability, tags, current problems, status (enabled/disabled), and links to easily navigate to the host’s latest data, problem history, graphs, dashboards and web scenarios.

Hosts

?

Create host

| Column | Description |
|-----------|--|
| Name | <p>The visible host name. Clicking on the name brings up the host menu.</p> <p>An orange wrench icon  after the name indicates that this host is in maintenance.</p> <p>Click on the column header to sort hosts by name in ascending or descending order.</p> |
| Interface | <p>The main interface of the host is displayed.</p> |

| Column | Description |
|--------------|--|
| Availability | <p>Host availability per configured interface is displayed.</p> <p>Availability icons represent host interface current status on Zabbix server. Therefore, if you disable a host in the frontend, its availability will update after Zabbix server has synchronized the configuration changes. Similarly, if you enable a host, its availability will update after Zabbix server has synchronized the configuration changes and polled the host.</p> <p>Availability icons represent only those interface types (Agent, SNMP, IPMI, JMX) that are configured.</p> <p>Hovering over the icon displays a pop-up with a list of all interfaces of the same type with details, status, and errors. For Agent interface, the pop-up displays interfaces (passive) and active checks. If a host has active checks only, the Agent interface icon is displayed even if the host does not have an Agent interface configured.</p> <p>The column is empty for hosts with no interfaces.</p> <p>The status of a single host interface is determined by the connection between an enabled item using the interface and the host. The status can be:</p> <p>Available - the connection to the host was successful;</p> <p>Not available - the connection to the host was unsuccessful (timeout, firewall issues, etc.);</p> <p>Unknown - the connection to the host has not been attempted or the result is unknown.</p> <p>For additional details on how Zabbix server determines interface status, see Unknown interface status and Unreachable/unavailable host interface settings.</p> <p>The status of all host interfaces of a single type (Agent, SNMP, IPMI, JMX) is determined by those interfaces that are used by at least one enabled item. The status is indicated by the icon color:</p> <p>Green - all interfaces are available;</p> <p>Yellow - at least one interface is not available, and at least one is available or unknown;</p> <p>Red - all interfaces are not available;</p> <p>Gray - at least one interface is unknown, but none are not available.</p> <p>Before Zabbix 7.2.4, this status is determined by all interfaces of the same type, regardless of whether any items use them.</p> <p>Active check availability. If at least one active check is enabled on the host, active checks also affect the total Agent interface availability as described above. To determine active check availability, heartbeat messages are sent in the agent active check thread. The frequency of heartbeat messages is controlled by the <code>HeartbeatFrequency</code> parameter in Zabbix agent or agent 2 configuration (default 60 seconds, range 0-3600). Active checks are considered not available when the active check heartbeat is older than 2 x <code>HeartbeatFrequency</code> seconds.</p> <p>Note: Zabbix agents older than version 6.2.x do not send active check heartbeats, so the availability of their hosts remains unknown.</p> <p>Tags of the host and all linked templates, with macros unresolved.</p> <p>Host status - <i>Enabled</i> or <i>Disabled</i>.</p> <p>Click on the column header to sort hosts by status in ascending or descending order.</p> <p>Clicking on the link will open the <i>Monitoring - Latest data</i> page with all the latest data collected from the host.</p> <p>The number of items with latest data is displayed in gray.</p> <p>The number of open host problems sorted by severity. The color of the square indicates problem severity. The number on the square means the number of problems for the given severity. Clicking on the icon will open <i>Monitoring - Problems</i> page for the current host.</p> <p>If a host has no problems, a link to the <i>Problems</i> section for this host is displayed as text. Use the filter to select whether suppressed problems should be included (not included by default).</p> <p>Clicking on the link will display graphs configured for the host. The number of graphs is displayed in gray.</p> <p>If a host has no graphs, the link is disabled (gray text) and no number is displayed.</p> <p>Clicking on the link will display dashboards configured for the host. The number of dashboards is displayed in gray.</p> <p>If a host has no dashboards, the link is disabled (gray text) and no number is displayed.</p> <p>Clicking on the link will display web scenarios configured for the host. The number of web scenarios is displayed in gray.</p> <p>If a host has no web scenarios, the link is disabled (gray text) and no number is displayed.</p> |

Buttons

Create host allows to create a new host. This button is available for Admin and Super Admin users only.

View mode buttons being common for all sections are described on the Monitoring page.

Using filter

You can use the filter to display only the hosts you are interested in. For better search performance, data is searched with macros unresolved.

The filter is located above the table. It is possible to filter hosts by name, host group, IP or DNS, interface port, tags, problem severity, status (enabled/disabled/any); you can also select whether to display suppressed problems and hosts that are currently in maintenance.

| Parameter | Description |
|---------------------------|--|
| Name | Filter by visible host name. |
| Host groups | Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. |
| IP | Filter by IP address. |
| DNS | Filter by DNS name. |
| Port | Filter by port number. |
| Severity | Filter by problem severity. By default problems of all severities are displayed. Problems are displayed if not suppressed. |
| Status | Filter by host status. |
| Tags | Filter by host tag name and value. Hosts can be filtered by host-level tags as well as tags from all linked templates, including nested templates. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: Exists - include the specified tag names Equals - include the specified tag names and values (case-sensitive) Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) Does not exist - exclude the specified tag names Does not equal - exclude the specified tag names and values (case-sensitive) Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition Or - enough if one condition is met |
| Show hosts in maintenance | Mark the checkbox to display hosts that are in maintenance (displayed by default). |
| Show suppressed problems | Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance or single problem suppression. |

Saving filter

Favorite filter settings can be saved as tabs and then quickly accessed by clicking on the respective tab above the filter.

See more details about saving filters.

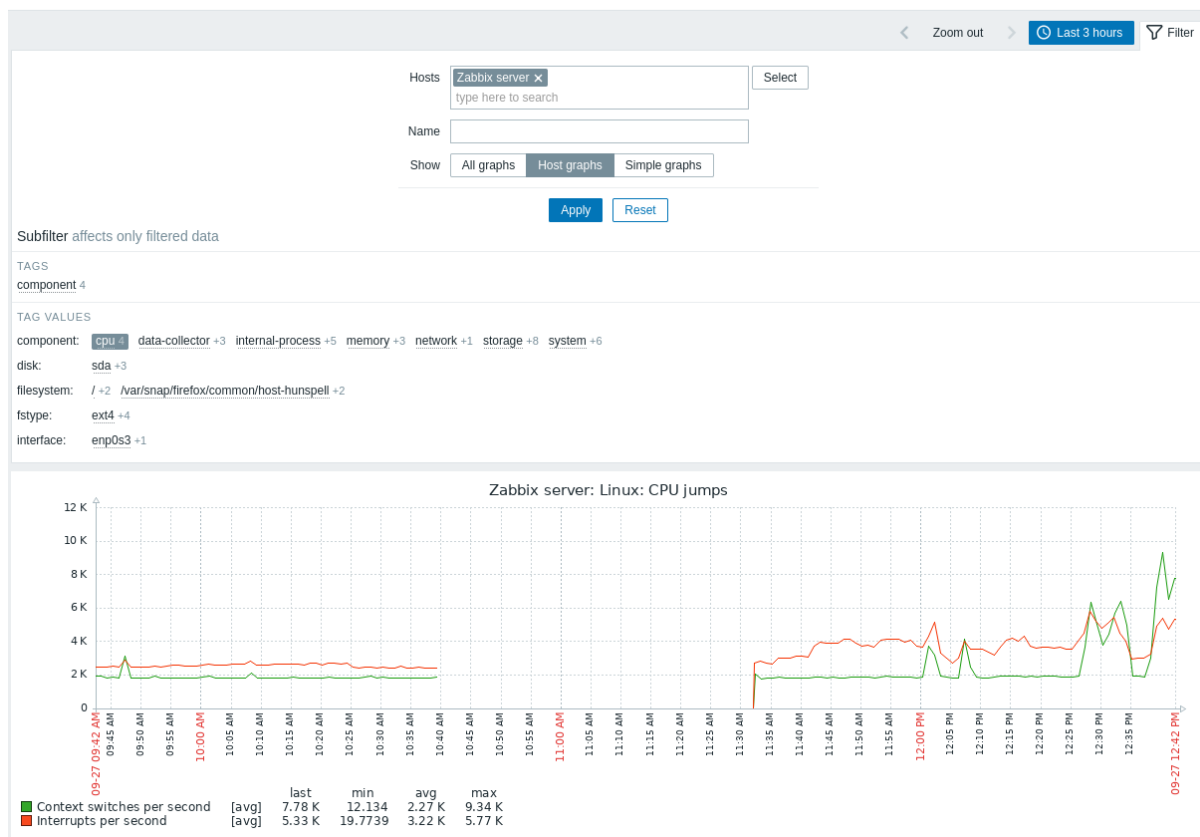

1 Graphs

Overview

Host graphs can be accessed from *Monitoring* → *Hosts* by clicking on Graphs for the respective host.

Any **custom graph** that has been configured for the host can be displayed, as well as any **simple graph**.

Graphs

Graphs are sorted by:

- graph name (custom graphs)
- item name (simple graphs)

Graphs for disabled hosts are also accessible.

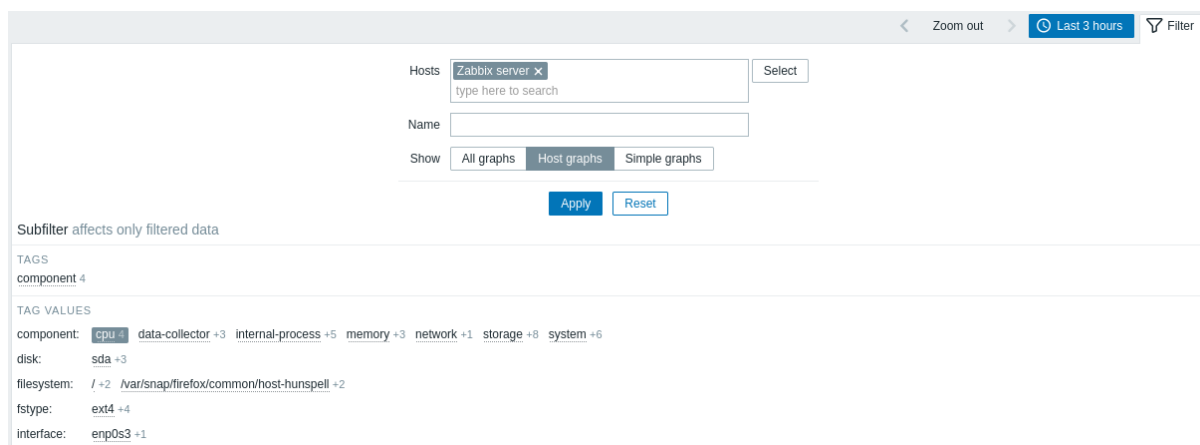

Time period selector

Take note of the time period selector above the graph. It allows selecting often required periods with one mouse click.

See also: *Time period selector*

Using filter

To view a specific graph, select it in the filter. The filter allows to specify the host, the graph name and the *Show* option (all/host graphs/simple graphs).

If no host is selected in the filter, no graphs are displayed.

Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related graphs. Graphs are related by common entity - tag name or value. When a tag name/value is clicked, it is highlighted with a gray background, and graphs are immediately filtered (no need to click *Apply* in the main filter). Clicking another tag name/value adds it to the filtered results. Clicking the tag name/value again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration -> General -> GUI*).

Unlike the main filter, the subfilter is updated together with each table refresh request to always get up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable. Vertical lists (such as tags with their values) are limited to 20 entries. If there are more, a three-dot icon is displayed; it is not clickable.

A number next to each clickable entity indicates the number of graphs it has in the results of the main filter.

Once one entity is selected, the numbers with other available entities are displayed with a plus sign indicating how many graphs may be added to the current selection.

Buttons

View mode buttons, being common for all sections, are described on the [Monitoring](#) page.

2 Host dashboards

Overview

Host dashboards look similar to [global dashboards](#); however, host dashboards lack an [owner](#) and display data only for the selected host.

When viewing host dashboards, you can switch between the configured dashboards by clicking:

- the dashboard tabs;
- the   arrow buttons under the header;
- the  arrow button under the header, which will display the full list of host dashboards available.

To switch to the *Monitoring* → *Hosts* section, click the *All hosts* navigation link under the header in the upper left corner.

Configuration

Host dashboards are configured at the **template** level. Once a template is linked to a host, host dashboards are generated for that host. Note that host dashboards *cannot* be configured in the *Dashboards* section, which is reserved for global dashboards.

Widgets of host dashboards can also be configured only at the **template** level, except for changing the **refresh interval**. Moreover, widgets of host dashboards can only be copied to other host dashboards within the same template. Note that widgets from global dashboards *cannot* be copied to host dashboards.

Note:

Host dashboards used to be host screens before Zabbix 5.2. When importing an older template that contains screens, the screen import will be ignored.

Access

Host dashboards can be accessed:

- after searching for a host name in **global search** (click the *Dashboards* link provided in the search results);
- after clicking a host name in *Inventory* → *Hosts* (click the *Dashboards* link provided in the host overview);
- from the **host menu** by clicking *Dashboards*.

Note that host dashboards *cannot* be directly accessed in the *Dashboards* section, which is reserved for global dashboards.

3 Web scenarios

Overview

Host **web scenario** information can be accessed from *Monitoring* → *Hosts* by clicking on *Web* for the respective host.

Web monitoring

| Host | Name ▲ | Number of steps | Last check | Status | Tags |
|-----------------|----------------|-----------------|------------|--------|------------------------|
| Zabbix frontend | Frontend check | 5 | 17s | OK | component: web-scen... |

Displaying 1 of 1 found

Clicking on the host name brings up the **host menu**. Data of disabled hosts is also accessible. The name of a disabled host is listed in red.

The maximum number of scenarios displayed per page depends on the *Rows per page* user profile **setting**.

By default, only values that fall within the last 24 hours are displayed. This limit has been introduced with the aim of improving initial loading times for large pages of latest data. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration* → *General* → *GUI* menu section.

The scenario name is link to more detailed statistics about it:

| Step | Speed | Response time | Response code | Status |
|---------------|------------|-----------------|---------------|-----------|
| First page | 31.18 KBps | 64.81ms | 200 | OK |
| Log in | 44.64 KBps | 258.36ms | 200 | OK |
| Log in Check | 74.16 KBps | 155.53ms | 200 | OK |
| Log out | 19.03 KBps | 106.17ms | 200 | OK |
| Log out check | 42.13 KBps | 47.96ms | 200 | OK |
| TOTAL | | 632.82ms | | OK |

Last 1 year Previous year This month so far Last 6 hours
Last 2 years This year Last 12 hours
This year so far Last 1 day

Using filter

The page shows a list of all web scenarios of the selected host. To view web scenarios for another host or host group without returning to the *Monitoring* → *Hosts* page, select that host or group in the filter. You may also filter scenarios based on tags.

Buttons

View mode buttons being common for all sections are described on the *Monitoring* page.

3 Latest data

Overview

The *Monitoring* → *Latest data* section displays the latest values gathered by items.

This section contains the following elements:

- Filter
- Subfilter
- Item list

Note:

The subfilter and item list is displayed only if the filter is set and there are results to display.

Latest data

Subfilter affects only filtered data

Clicking a tag enables in the subfilter, making the item list display only items containing this tag (and any other tags previously selected in the subfilter). Note that once items have been filtered this way, tags in the item list are no longer clickable. Further modification based on tags (for example, to remove tags or specify other filters) must be done in the subfilter.</p> |
| Graph/History | <p>Link to simple graph/history of item values.</p> |
| Info | <p>Additional information about the item.</p> <p>If an item has errors (for example, has become unsupported), an information  icon is displayed. Hover over the icon for details.</p> |

Buttons

View mode buttons being common for all sections are described on the [Monitoring](#) page.

Mass actions

Buttons below the list offer mass actions with one or several selected items:

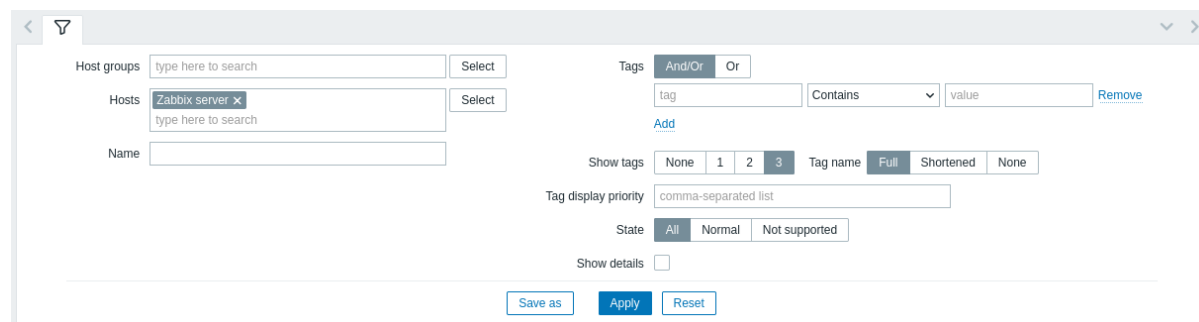

- *Display stacked graph* - display a stacked [ad-hoc graph](#).
- *Display graph* - display a simple [ad-hoc graph](#).
- *Execute now* - execute a check for new item values immediately. Supported for **passive** checks only (see [more details](#)). This option is available only for hosts with read-write access. Accessing this option for hosts with read-only permissions depends on the [user role](#) option called *Invoke "Execute now" on read-only hosts*.

To use these options, mark the checkboxes before the respective items, then click on the required button.

Using filter

You can use the filter to display only the items you are interested in. For better search performance, data is searched with macros unresolved.

The filter  icon is located above the item list and the subfilter. Click it to expand the filter.

The filter allows to narrow the item list by host group, host, item name, tag, state and other settings. Specifying a parent host group in the filter implicitly selects all nested host groups. See [Monitoring](#) → [Problems](#) for details on filtering by tags.

The *Show details* filter option allows to extend the information displayed for the items. Mark it to display such details as the item refresh interval, history and trends settings, item type, and item errors (fine/unsupported).

Saving filter

Favorite filter settings can be saved as tabs and then quickly accessed by clicking on the respective tab above the filter.

See more details about [saving filters](#).

Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - host, tag name or value, item state, or data status. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

| | |

| DATA | |
| With data Without data | |

Subfilters are generated based on the filtered data, which is limited to 1000 records. If there are 20 hosts each having 100 items (so 2000 records in total), only half of the hosts will be visible in the subfilter. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration -> General -> GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.

For each entity group (hosts, tags, tag values, etc.), up to 10 rows of entities are displayed. If there are more entities, this list can be expanded to display a maximum of 1000 entries (the value of SUBFILTER_VALUES_PER_GROUP in *frontend definitions*) by clicking the three-dot **...** icon at the end of the list. For *Tag values*, the list can be expanded to display a maximum of 200 tag names with their corresponding values. Note that once fully expanded, the list cannot be collapsed.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

Graphs and history

The *Graph/History* column in the item list offers the following links:

- **History** - for all textual items, leading to listings (*Values/500 latest values*) displaying the history of previous item values.
- **Graph** - for all numeric items, leading to a *simple graph*. Note that when the graph is displayed, a dropdown on the upper right offers a possibility to switch to *Values/500 latest values* as well.

The values displayed in this list are raw, that is, no postprocessing is applied.

Note:

The total amount of values displayed is defined by the value of *Limit for search and filter results* parameter, set in *Administration -> General -> GUI*.

4 Maps

Overview

In the *Monitoring -> Maps* section you can configure, manage and view *network maps*.

When you open this section, you will either see the last map you accessed or a listing of all maps you have access to.

All maps can be either public or private. Public maps are available to all users, while private maps are accessible only to their owner and the users the map is shared with.

Map listing

Maps

Create map Import

Filter

| Name | Width | Height | Actions |
|---|-------|--------|-----------------|
| <input type="checkbox"/> Local network | 680 | 200 | Properties Edit |
| <input type="checkbox"/> Local network2 | 600 | 400 | Properties Edit |

0 selected Export Delete

Displaying 2 of 2 found

Displayed data:

| Column | Description |
|----------------|---|
| <i>Name</i> | Name of the map. Click on the name to view the map. |
| <i>Width</i> | Map width is displayed. |
| <i>Height</i> | Map height is displayed. |
| <i>Actions</i> | Two actions are available: Properties - set general map properties Edit - access the grid for adding map elements |

To **configure** a new map, click on the *Create map* button in the top right-hand corner. To import a map from a YAML, XML, or JSON file, click on the *Import* button in the top right-hand corner. The user who imports the map will be set as its owner.

Two buttons below the list offer some mass-editing options:

- *Export* - export the maps to a YAML, XML, or JSON file
- *Delete* - delete the maps

To use these options, mark the checkboxes before the respective maps, then click on the required button.

Using filter

You can use the filter to display only the maps you are interested in. For better search performance, data is searched with macros unresolved.

Viewing maps

To view a map, click on its name in the list of all maps.

You can use the drop-down in the map title bar to select the lowest severity level of the problem triggers to display. The severity marked as *default* is the level set in the map configuration. If the map contains a sub-map, navigating to the sub-map will retain the higher-level map severity (except if it is *Not classified*, in this case, it will not be passed to the sub-map).

Icon highlighting

If a map element is in problem status, it is highlighted with a round circle. The fill color of the circle corresponds to the severity color of the problem. Only problems on or above the selected severity level will be displayed with the element. If all problems are acknowledged, a thick green border around the circle is displayed.

Additionally:

- a host in **maintenance** is highlighted with an orange, filled square. Note that maintenance highlighting has priority over the problem severity highlighting, if the map element is host.
- a disabled (not-monitored) host is highlighted with a gray, filled square.

Highlighting is displayed if the *Icon highlighting* check-box is marked in map **configuration**.

Recent change markers

Inward pointing red triangles around an element indicate a recent trigger status change - one that's happened within the last 30 minutes. These triangles are shown if the *Mark elements on trigger status change* check-box is marked in map [configuration](#).

Links

Clicking on a map element opens a menu with some available links. Clicking on the host name brings up the [host menu](#).

Buttons

Buttons to the right offer the following options:

| | |
|---|---|
|  | Go to editing of the map content. |
|  | Add map to the favorites widget in Dashboards . |
|  | The map is in the favorites widget in Dashboards . Click to remove map from the favorites widget. |

View mode buttons being common for all sections are described on the [Monitoring](#) page.

Readable summary in maps

A hidden "aria-label" property is available allowing map information to be read with a screen reader. Both general map description and individual element description is available, in the following format:

- for map description: <Map name>, <* of * items in problem state>, <* problems in total>.
- for describing one element with one problem: <Element type>, Status <Element status>, <Element name>, <Problem description>.
- for describing one element with multiple problems: <Element type>, Status <Element status>, <Element name>, <* problems>.
- for describing one element without problems: <Element type>, Status <Element status>, <Element name>.

For example, this description is available:

'Local network, 1 of 6 elements in problem state, 1 problem in total. Host, Status problem, My host, Free disk space is less than 20% on volume /

for the following map:

Referencing a network map

Network maps can be referenced by both `sysmapid` and `mapname` GET parameters. For example, `http://zabbix/zabbix/zabbix.php?action=map.view&mapname=Local%20network` will open the map with that name (Local network).

If both `sysmapid` (map ID) and `mapname` (map name) are specified, `mapname` has higher priority.

5 Discovery

Overview

In the *Monitoring* → *Discovery* section results of **network discovery** are shown. Discovered devices are sorted by the discovery rule.

| Discovered device ▼ | Monitored host | Uptime/Downtime |
|---------------------------------------|--|-----------------------------|
| Local network (14 devices) | | |
| 192.168.3.114 (radix-ilo.zabbix.lan) | Integrated Lights-Out 4 2.61 | 1d 2h 47m |
| 192.168.3.72 (winxp.zabbix.lan) | Linux zeus 4.8.6.5-smp 2 SMP Sun Nov 13 14:58:11 CDT | 7 days, 20:37:53 7d 20h 37m |
| 192.168.3.70 (win2008i386.zabbix.lan) | Hardware: x86 Family 6 Model 23 Stepping 6 AT AT COMPATIBLE - Software: Windows Version 6.0 Build 6001 Multiprocessor Free | 2 days, 02:23:47 2d 2h 23m |

Displayed data:

| Column | Description |
|-------------------|--|
| Discovered device | Discovered devices are listed, grouped by the discovery rule. Clicking on the discovery rule brings up the rule menu containing the link to the discovery rule configuration form . |
| Monitored host | If a device is already monitored, the host name will be listed in this column. Clicking on the host name brings up the host menu . |
| Uptime/Downtime | The duration of the device being discovered or lost after previous discovery is displayed in this column. |
| Discovery check | The state of the individual service (discovery check) for each discovered device is displayed. A red cell shows that the service is down. Service uptime or downtime is included within the cell. This column is displayed only if the service has been found on at least one discovered device. |

Buttons

View mode buttons being common for all sections are described on the **Monitoring** page.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

With nothing selected in the filter, all enabled discovery rules are displayed. To select a specific discovery rule for display, start typing its name in the filter. All matching enabled discovery rules will be listed for selection. More than one discovery rule can be selected.

3 Services

Overview

The Services menu is for the **service monitoring** functions of Zabbix.

1 Services

Overview

In this section you can see a high-level status of whole services that have been configured in Zabbix, based on your infrastructure.

A service may be a hierarchy consisting of several levels of other services, called "child" services, which are attributes to the overall status of the service (see also an overview of the [service monitoring](#) functionality.)

The main categories of service status are *OK* or *Problem*, where the *Problem* status is expressed by the corresponding problem severity name and color.

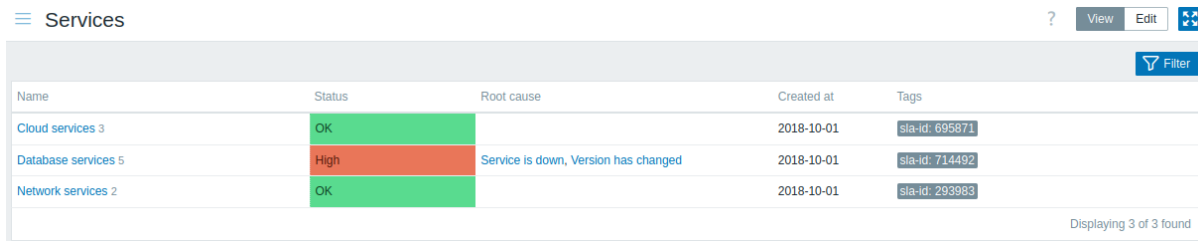

While the view mode allows to monitor services with their status and other details, you can also [configure](#) the service hierarchy in this section (add/edit services, child services) by switching to the edit mode.

To switch from the view to the edit mode (and back) click on the respective button in the upper right corner:

-  - view services
-  - add/edit services, and child services

Note that access to editing depends on [user role](#) settings.

Viewing services

| Name | Status | Root cause | Created at | Tags |
|---------------------|--------|--------------------------------------|------------|----------------|
| Cloud services 3 | OK | | 2018-10-01 | sla-id: 695871 |
| Database services 5 | High | Service is down, Version has changed | 2018-10-01 | sla-id: 714492 |
| Network services 2 | OK | | 2018-10-01 | sla-id: 293983 |

A list of the existing services is displayed.

Displayed data:

| Parameter | Description |
|-------------------|--|
| <i>Name</i> | Service name. The service name is a link to service details . |
| <i>Status</i> | The number after the name indicates how many child services the service has. Service status: OK - no problems <problem color and severity> - indicates a problem and its severity. In case of multiple problems, the color and severity of the most critical problem are displayed. |
| <i>Root cause</i> | Underlying problems that directly or indirectly affect the service status are listed. The same problems are listed as returned by the {SERVICE.ROOTCAUSE} macro . Click on the problem name to see more details about it in <i>Monitoring</i> → <i>Problems</i> . Problems that do not affect the service status are not in the list. |
| <i>Created at</i> | The time when the service was created is displayed. |
| <i>Tags</i> | Tags of the service are displayed. Tags are used to identify a service in service actions and SLAs . |

Buttons

View mode buttons being common for all sections are described on the [Monitoring](#) page.

Using filter

You can use the filter to display only the services you are interested in.

Editing services

Click on the *Edit* button to access the edit mode. When in edit mode, the listing is complemented with checkboxes before the entries and also these additional options:

-  - add a child service to this service

-  - edit this service
-  - delete this service

Displaying 5 of 5 found

0 selected [Mass update](#) [Delete](#)

To access the info box, click on the *Info* tab. The info box contains the following entries:

- Names of parent services (if any)
- Current status of this service
- Current SLA(s) of this service, in the format `SLA name:service level indicator`. 'SLA name' is also a link to the SLA report for this service. If you position the mouse on the info box next to the service-level indicator (SLI), a pop-up info list is displayed with SLI details. The service-level indicator displays the current service level, in percentage.
- Service tags

The info box also contains a link to the **service configuration**.

To use the filter for child services, click on the *Filter* tab.

When in edit mode, the child service listing is complemented with additional editing options:

-  - add a child service to this service
-  - edit this service
-  - delete this service

2 SLA

Overview

This section allows to view and **configure** SLAs.

| 2021-02 | 100% | 100 | 28d | 0 | 0 | |

Note that **negative problem duration** does not affect SLA calculation or reporting.

4 Inventory

Overview

The Inventory menu features sections providing an overview of host inventory data by a chosen parameter as well as the ability to view host inventory details.

1 Overview

Overview

The *Inventory* → *Overview* section provides ways of having an overview of **host inventory** data.

For an overview to be displayed, choose host groups (or none) and the inventory field by which to display data. The number of hosts corresponding to each entry of the chosen field will be displayed.

| Filter | |
|---|------------|
| <div> <div>Host groups: type here to search Select</div> <div>Grouping by: Type ⌵</div> </div> <div> Apply Reset </div> | |
| Type | Host count |
| Server | 4 |
| Zabbix server | 1 |

The completeness of an overview depends on how much inventory information is maintained with the hosts.

Numbers in the *Host count* column are links; they lead to these hosts being filtered out in the *Host Inventories* table.

| Filter | | | | | | |
|--|----------------|------------|---------------|--|---------------|-----|

Cancel

The completeness of inventory data depends on how much inventory information is maintained with the host. If no information is maintained, the *Details* tab is disabled.

5 Reports

Overview

The Reports menu features several sections that contain a variety of predefined and user-customizable reports focused on displaying an overview of such parameters as system information, triggers and gathered data.

1 System information

Overview

In *Reports* → *System information*, a summary of key Zabbix server and system data is displayed. System data is collected using **internal items**.

Note that in a high availability setup, it is possible to redirect the system information source (server instance). To do this, edit the *zabbix.conf.php* file - uncomment and set `$ZBX_SERVER` or both `$ZBX_SERVER` and `$ZBX_SERVER_PORT` to a server other than the one shown active. Note that when setting `$ZBX_SERVER` only, a default value (10051) for `$ZBX_SERVER_PORT` will be used.

With the high availability setup enabled, a separate block is displayed below the system stats with details of high availability nodes. This block is visible to Zabbix *Super Admin* users only.

System information is also available as a dashboard **widget**.

System stats

System information

?

| Parameter | Value | Details |
|--|------------|-------------------------------|
| Zabbix server is running | Yes | 192.168.8.103:10051 |
| Zabbix server version | 7.0.0 | Up to date |
| Zabbix frontend version | 7.0.0 | Up to date |
| Software update last checked | 2024-06-15 | |
| Latest release | 7.0.0 | Release notes |
| Number of hosts (enabled/disabled) | 2 | 2 / 0 |
| Number of templates | 303 | |
| Number of items (enabled/disabled/not supported) | 229 | 201 / 0 / 28 |
| Number of triggers (enabled/disabled [problem/ok]) | 108 | 107 / 1 [14 / 93] |
| Number of users (online) | 10 | 1 |
| Required server performance, new values per second | 2.65 | |
| High availability cluster | Enabled | Fail-over delay: 1 minute |

| Name | Address | Last access | Status |
|-------|---------------------|-------------|---------|
| base | 192.168.8.103:10051 | 2s | Active |
| base2 | localhost:10051 | 5m 11s | Stopped |

Displayed data:

| Parameter | Value | Details |
|---------------------------------|---|-------------------------------------|
| <i>Zabbix server is running</i> | Status of Zabbix server: Yes - server is running No - server is not running <i>Note:</i> To display the rest of the information the web, frontend needs the server to be running and there must be at least one trapper process started on the server (StartTrappers parameter in <i>zabbix_server.conf</i> file > 0). | Location and port of Zabbix server. |

| Parameter | Value | Details |
|-------------------------------------|---|---|
| <i>Zabbix server version</i> | Current server version number is displayed. <i>Note:</i> It is only displayed when Zabbix server is running. | Server version status is displayed: Up to date - using the latest version; New update available - a more up-to-date version is available; Outdated - the full support period for this version has expired. This information is only available if software update check is enabled in Zabbix server configuration . Nothing is displayed if the last software update check was performed more than a week ago or no data exist about the current version. |
| <i>Zabbix frontend version</i> | Zabbix frontend version number is displayed. | Zabbix frontend version status is displayed: Up to date - using the latest version; New update available - a more up-to-date version is available; Outdated - the full support period for this version has expired. This information is only available if software update check is enabled in Zabbix server configuration . Nothing is displayed if the last software update check was performed more than a week ago or no data exist about the current version. |
| <i>Software update last checked</i> | The date of the last Zabbix software update check is displayed. This information is only available if software update check is enabled in Zabbix server configuration . | |
| <i>Latest release</i> | The number of a newer release (if available) for the current Zabbix version is displayed. This information is only available if software update check is enabled in Zabbix server configuration . Nothing is displayed if the last software update check was performed more than a week ago or no data exist about the current version. | A link to the release notes of the latest available Zabbix release is displayed. |
| <i>Number of hosts</i> | Total number of hosts configured is displayed. | Number of monitored hosts/not monitored hosts. |
| <i>Number of templates</i> | Total number of templates is displayed. | |
| <i>Number of items</i> | Total number of items is displayed. | Number of monitored/disabled/unsupported host-level items. Items on disabled hosts are counted as disabled. |
| <i>Number of triggers</i> | Total number of triggers is displayed. | Number of enabled/disabled host-level triggers; split of the enabled triggers according to "Problem"/"OK" states. Triggers listed under the "OK" state include triggers with the status "Unknown". Triggers dependent on disabled items or assigned to disabled hosts are counted as disabled. |
| <i>Number of users</i> | Total number of users configured is displayed. | Number of users online. |

| Parameter | Value | Details |
|---|---|--|
| <i>Required server performance, new values per second</i> | The expected number of new values processed by Zabbix server per second is displayed. | <p><i>Required server performance</i> is an estimate and can be useful as a guideline. For precise numbers of values processed, use the <code>zabbix[wcache,values,all]</code> internal item.</p> <p>Enabled items from monitored hosts are included in the calculation. Log items are counted as one value per item update interval. Regular interval values are counted; flexible and scheduling interval values are not. The calculation is not adjusted during a "nodata" maintenance period. Trapper items are not counted.</p> |
| <i>Global scripts on Zabbix server</i> | Disabled will be displayed in this field if global scripts are disabled on Zabbix server by setting <code>EnableGlobalScripts=0</code> in server configuration. | |
| <i>High availability cluster</i> | <p>Status of high availability cluster for Zabbix server:</p> <p>Disabled - standalone server</p> <p>Enabled - at least one high availability node exists</p> | If enabled, the failover delay is displayed. |

System information will also display an error message in the following conditions:

- The database used does not have the required character set or collation (UTF-8).
- The version of the database is below or above the [supported range](#) (available only to users with the *Super admin role* type).
- [Housekeeping](#) for [TimescaleDB](#) is incorrectly configured (history or trend tables contain compressed chunks, but *Override item history period* or *Override item trend period* options are disabled).

High availability nodes

If [high availability cluster](#) is enabled, then another block of data is displayed with the status of each high availability node.

| Name | Address | Last access | Status |
|-------------|--------------------|--------------------------------------|-------------|
| node-active | 192.168.1.13:10051 | 12s | Active |
| node6 | 192.168.1.10:10053 | 1h 2m 40s | Unavailable |
| node7 | 192.168.1.11:10053 | 3m 40s | Unavailable |
| node4 | 192.168.1.8:10052 | 1h 34m 29s | Stopped |
| node5 | 192.168.1.9:10053 | 1h 9m 51s | Stopped |
| node8 | 192.168.1.12:10051 | 21m 16s | Stopped |
| node1 | 192.168.1.5:10051 | 17s | Standby |
| node2 | 192.168.1.6:10051 | 16s | Standby |
| node3 | 192.168.1.7:10052 | 16s 2021-10-20 17:58:47 | Standby |

Displayed data:

| Column | Description |
|--------------------|---|
| <i>Name</i> | Node name, as defined in server configuration. |
| <i>Address</i> | Node IP address and port. |
| <i>Last access</i> | Time of node last access. |
| <i>Status</i> | <p>Hovering over the cell shows the timestamp of last access in long format.</p> <p>Node status. Table rows are sorted by these statuses in this priority order:</p> <p>Active - node is up and working</p> <p>Unavailable - node hasn't been seen for more than failover delay (you may want to find out why)</p> <p>Stopped - node has been stopped or couldn't start (you may want to start it or delete it)</p> <p>Standby - node is up and waiting</p> |

2 Scheduled reports

Overview

In *Reports → Scheduled reports*, users with sufficient permissions can configure scheduled generation of PDF versions of the dashboards, which will be sent by email to specified recipients.

Scheduled reports?Create report

| <input type="checkbox"/> | Name ▲ | Owner | Repeats | Period | Last sent | Status | Info |
|--------------------------|-------------------|------------------------------|---------|--------------|-----------|---------|------|
| <input type="checkbox"/> | Global view daily | Admin (Zabbix Administrator) | Daily | Previous day | Never | Enabled | |

Displaying 1 of 1 found

The opening screen displays information about scheduled reports, which can be filtered out for easy navigation - see [Using filter](#) section below.

Displayed data:

| Column | Description |
|-----------|---|
| Name | Name of the report. Clicking it opens the report configuration form . |
| Owner | User who created the report. |
| Repeats | Report generation frequency (daily/weekly/monthly/yearly). |
| Period | Period for which the report is prepared. |
| Last sent | The date and time when the latest report has been sent. |
| Status | Current status of the report (enabled/disabled/expired). Users with sufficient permissions can change the status by clicking it - from "Enabled" to "Disabled" (and back); from "Expired" to "Disabled" (and back). For users with insufficient rights, the status is not clickable. |
| Info | Displays informative icons: A red icon indicates that report generation has failed; hovering over it will display a tooltip with the error information. A yellow icon indicates that a report was generated, but sending to some (or all) recipients has failed or that a report is expired; hovering over it will display a tooltip with additional information. |

Using filter

You may use the filter to narrow down the list of reports. For better search performance, data is searched with macros unresolved.

The following filtering options are available:

- Name - partial name match is allowed
- Show - created by current user or all reports
- Status - select between "Any" (show all reports), "Enabled", "Disabled", or "Expired"

The filter is located below the *Scheduled reports* section name. It can be opened and collapsed by clicking the *Filter* tab in the upper right corner.

Mass update

Sometimes you may want to delete or change the status of a number of reports at once. Instead of opening each individual report for editing, you may use the mass update function for that.

To mass-update some reports, do the following:

- Mark the checkboxes of the reports to update in the list
- Click the required button below the list to make the changes (*Enable*, *Disable*, or *Delete*)

3 Availability report

Overview

In *Reports → Availability report*, you can see what proportion of time each trigger has been in the problem/OK state.

For each state, a percentage of time is displayed, making it easy to determine the availability of various elements on your system.

| Host | Name | Problems | Ok | Graph |
|---------------|--|----------|-----------|-------|
| Zabbix server | /etc/passwd has been changed | | 100.0000% | Show |
| Zabbix server | Configured max number of open filedescriptors is too low | | 100.0000% | Show |
| Zabbix server | Configured max number of processes is too low | | 100.0000% | Show |
| Zabbix server | Getting closer to process limit | | 100.0000% | Show |
| Zabbix server | has been restarted | | 100.0000% | Show |
| Zabbix server | High CPU utilization | | 100.0000% | Show |

The name of the trigger is a link to the latest events of that trigger.

Using filter

The filter can help narrow down the number of hosts and/or triggers displayed. For better search performance, data is searched with macros unresolved.

The filter is located below the *Availability report* section name. It can be opened and collapsed by clicking on the *Filter* tab on the right.

Filtering by trigger template

In *By trigger template* mode, results can be filtered by one or several of the parameters listed below.

| Parameter | Description |
|-------------------------|---|
| <i>Template group</i> | Filter hosts by triggers that are inherited from templates belonging to the selected template group. Specifying a parent template group implicitly selects all nested template groups. |
| <i>Template</i> | Filter hosts by triggers that are inherited from the selected template, including nested templates. If a nested template has its own triggers, those triggers will not be displayed. |
| <i>Template trigger</i> | Filter hosts by the selected trigger. Other triggers of the filtered hosts will not be displayed. |
| <i>Host group</i> | Filter hosts belonging to the selected host group. |

Filtering by host

In *By host* mode, results can be filtered by host or host group. Specifying a parent host group implicitly selects all nested host groups.

Time period selector

The **time period selector** allows to select commonly used time periods with one click. The selector can be expanded and collapsed by clicking the *Time period* tab next to the filter.

Clicking *Show* in the *Graph* column displays availability information in a bar graph where each bar represents a passed week of the current year.

Availability report graph

The green of a bar stands for OK time and red - for problem time.

4 Top 100 triggers

Overview

In *Reports* → *Top 100 triggers*, you can see the triggers with the highest number of problems detected during the selected period.

Top 100 triggers

Host groups: Select

Hosts: Select

Problem:

Severity: ☐ Not classified ☒ Warning ☒ High ☐ Information ☒ Average ☒ Disaster

Problem tags: And/Or Or

Contains Remove

[Add](#)

| Host | Trigger | Severity | Number of problems |
|-------------------------------|---|----------|--------------------|
| Zabbix server | Interface enp0s3: Link down | Average | 2 |
| Zabbix server | Load average is too high | Average | 2 |
| Zabbix server | Zabbix agent is not available | Average | 2 |
| Zabbix server | Zabbix server: More than 100 items having missing data for more than 10 minutes | Warning | 2 |
| Zabbix server | Zabbix server: Utilization of escalator processes is high | Average | 2 |

Both host and trigger column entries are links that offer some useful options:

- for host - clicking on the host name brings up the **host menu**
- for trigger - clicking on the trigger name brings up links to the latest events, simple graph for each trigger item, and the configuration forms of the trigger itself and each trigger item

Using filter

You may use the filter to display triggers by host group, host, problem name, tags, or trigger severity. Specifying a parent host group implicitly selects all nested host groups. For better search performance, data is searched with macros unresolved.

The filter is located below the *Top 100 triggers* section name. It can be opened and collapsed by clicking on the *Filter* tab on the right.

Time period selector

The **Time period selector** allows to select often required periods with one mouse click. The *Time period* selector can be expanded and collapsed by clicking the *Time period* tab next to the filter.

5 Audit log

Overview

In the *Reports* → *Audit log* section, the records of user and system activity can be viewed.

Note:

For audit records to be collected and displayed, the *Enable audit logging* checkbox has to be marked in the *Administration* → *Audit log* section. Without this setting enabled, the history of activities will not be recorded in the database and will not be shown in the audit log.

Audit log

Zoom out

Last 3 months

Filter

| Time | User | IP | Resource | ID | Action | Recordset ID | Details |
|---------------------|-------|-----------|----------|----|--------------|---------------------------|--|
| 2022-05-30 12:07:34 | Admin | 127.0.0.1 | User | 4 | Update | cl3sicbqq0000z8ep87xz41zs | Description: Database manager user.lang: default => en_GB |
| 2022-05-30 12:07:13 | Admin | 127.0.0.1 | User | 1 | Login | cl3sibvqn0000z8ep40q8w1k | |
| 2022-05-30 12:07:13 | guest | 127.0.0.1 | User | 2 | Failed login | cl3sibvqn0000z8ep40q8w1k | |
| 2022-05-30 12:07:12 | guest | 127.0.0.1 | User | 2 | Failed login | cl3sibvem0000z8epv1m1xizi | |

Audit log displays the following data:

| Column | Description |
|--------------|--|
| Time | Timestamp of the audit record. |
| User | User who performed the activity. |
| IP | IP from which the activity was initiated. |
| Resource | Clicking on the hyperlink will result in filtering audit log records by this IP. |
| ID | Type of the affected resource (<i>API token</i> , <i>Action</i> , <i>Authentication</i> , <i>Autoregistration</i> , etc.). |
| Action | ID of the affected resource. |
| Recordset ID | Clicking on the hyperlink will result in filtering audit log records by this resource ID. |
| Details | Type of the activity (<i>Add</i> , <i>Configuration refresh</i> , <i>Delete</i> , <i>Execute</i> , <i>Failed login</i> , <i>History clear</i> , <i>Login</i> , <i>Logout</i> , <i>Push</i> , <i>Update</i>). |
| | Shared ID for all audit log records created as a result of the same operation. |
| | For example, when linking a template to a host, a separate audit log record is created for each inherited template entity (item, trigger, etc.) - all these records will have the same <i>Recordset ID</i> . |
| | Clicking on the hyperlink will result in filtering audit log records by this <i>Recordset ID</i> . |
| | Description of the resource and detailed information about the performed activity. |
| | If a record contains more than two rows, an additional <i>Details</i> link will be displayed. Click on this link to view the full list of changes. |

Note:

When a *trapper item* or an *HTTP agent item* (with trapping enabled) has received some data, an entry in the audit log will be added only if the data was sent using the *history.push* API method, and not the *Zabbix sender* utility.

Using filter

The filter is located below the *Audit log* bar. It can be opened and collapsed by clicking the *Filter* tab in the upper right corner.

Displayed data:

| Column | Description |
|------------|---|
| Time | Timestamp of the operation. |
| Action | Name of the action causing operations. |
| Media type | Media type (e.g. Email, Jira, etc.) used for sending a notification. |
| Recipient | For operations that executed remote commands, this column will be empty. Information about the notification recipient - username, name and surname (in parentheses), and additional information depending on the media type (email, username, etc.). |
| Message | For operations that executed remote commands, this column will be empty. The content of the message, remote command or global script name. A remote command is separated from the target host with a colon symbol: <host>:<command>. For example, if the remote command was executed on Zabbix server, then the information will have the following format: Zabbix server:<command>. |
| Status | Operation status: In progress - operation for sending a notification is in progress (the remaining number of times the server will try to send the notification is also displayed) Sent - notification has been sent Executed - remote command has been executed Failed - operation has not been completed |
| Info | Error information (if any) regarding the operation execution. |

Buttons

The button at the top right corner of the page offers the following option:

| | |
|---------------|--|
| Export to CSV | Export action log records from all pages to a CSV file. If a filter is applied, only the filtered records will be exported. In the exported CSV file the columns "Recipient" and "Message" are divided into several columns - "Recipient's Zabbix username", "Recipient's name", "Recipient's surname", "Recipient", and "Subject", "Message", "Command". |
|---------------|--|

Using filter

The filter is located below the *Action log* bar. It can be opened and collapsed by clicking on the *Filter* tab at the top right corner of the page.

Displayed data:

| Column | Description |
|------------------|---|
| <i>Item menu</i> | Click on the three-dot icon to open the item menu . |
| <i>Template</i> | Template the item belongs to. Clicking on the template name opens the template configuration form . |
| <i>Name</i> | This column is displayed only if multiple templates or no templates are selected in the filter. Name of the item displayed as a blue link to item details. Clicking on the item name link opens the item configuration form . If the item is inherited from another template, the template name is displayed before the item name as a gray link. Clicking on the template link opens the item list on that template level. |
| <i>Triggers</i> | Moving the mouse over Triggers will display an infobox displaying the triggers associated with the item. The number of the triggers is displayed in gray. |
| <i>Key</i> | Item key is displayed. |
| <i>Interval</i> | Frequency of the check is displayed. |
| <i>History</i> | How many days item data history will be kept is displayed. |
| <i>Trends</i> | How many days item trends history will be kept is displayed. |
| <i>Type</i> | Item type is displayed (Zabbix agent, SNMP agent, simple check, etc). |
| <i>Status</i> | Item status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it - from Enabled to Disabled (and back). |
| <i>Tags</i> | Item tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows to see all tags on mouseover. |

To configure a new item, click on the *Create item* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change item status to *Enabled*.
- *Disable* - change item status to *Disabled*.
- *Copy* - copy the items to other hosts or templates.
- *Mass update* - **update several properties** for a number of items at once.
- *Delete* - delete the items.

To use these options, mark the checkboxes before the respective items, then click on the required button.

Using filter

The item list may contain a lot of items. By using the filter, you can filter out some of them to quickly locate the items you're looking for. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter | Description |
|------------------------|--|
| <i>Template groups</i> | Filter by one or more template groups. |
| <i>Templates</i> | Specifying a parent template group implicitly selects all nested groups. |
| <i>Name</i> | Filter by item name. |

| Parameter | Description |
|----------------------------|---|
| <i>Key</i> | Filter by item key. |
| <i>Value mapping</i> | Filter by the value map used. This parameter is not displayed if the <i>Templates</i> option is empty. |
| <i>Type</i> | Filter by item type (Zabbix agent, SNMP agent, etc.). |
| <i>Type of information</i> | Filter by type of information (Numeric unsigned, float, etc.). |
| <i>History</i> | Filter by how long item history is kept. |
| <i>Trends</i> | Filter by how long item trends are kept. |
| <i>Update interval</i> | Filter by item update interval. |
| <i>Tags</i> | Specify tags to limit the number of items displayed. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: Exists - include the specified tag names Equals - include the specified tag names and values (case-sensitive) Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) Does not exist - exclude the specified tag names Does not equal - exclude the specified tag names and values (case-sensitive) Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition Or - enough if one condition is met |
| <i>Status</i> | Filter by item status - <i>Enabled</i> or <i>Disabled</i> . |
| <i>Triggers</i> | Filter items with (or without) triggers. |
| <i>Inherited</i> | Filter items inherited (or not inherited) from linked templates. |

Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - tag, item type, item update interval, etc. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

| | |
|--------------------------------------|--|
| Subfilter affects only filtered data | |
| TAGS | component: application 1 component: cpu 17 component: environment 1 component: memory 7 component: os 3 component: raw 1 component: security 1 |
| TYPES | Zabbix agent 40 Zabbix internal 1 Dependent item 2 |
| TYPE OF INFORMATION | Numeric (float) 19 Character 7 Numeric (unsigned) 16 Text 1 |
| WITH TRIGGERS | Without triggers 23 With triggers 20 |
| HISTORY | 0 1 1w 42 |
| TRENDS | 0 1 52w 1d 34 |
| INTERVAL | 30s 1 1m 29 15m 3 1h 8 |

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration* -> *General* -> *GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

2 Triggers

Overview

The trigger list for a template can be accessed from *Data collection* → *Templates* by clicking on *Triggers* for the respective template.

Triggers

Create trigger

All templates / Linux OS agent Items 42 Triggers 14 Graphs 8 Dashboards 1 Discovery rules 3 Web scenarios

Filter

| Severity | Name | Operational data | Expression | Status | Tags |

Displayed data:

| Column | Description |
|------------------|--|
| Severity | Severity of the trigger is displayed by both name and cell background color. |
| Template | Template the trigger belongs to. Clicking on the template name opens the template configuration form . |
| Name | This column is displayed only if multiple templates or no templates are selected in the filter. Name of the trigger displayed as a blue link to trigger details. Clicking on the trigger name link opens the trigger configuration form . If the trigger is inherited from another template, the template name is displayed before the trigger name as a gray link. Clicking on the template link opens the trigger list on that template level. |
| Operational data | Operational data definition of the trigger, containing arbitrary strings and macros that will resolve dynamically in <i>Monitoring</i> → <i>Problems</i> . |
| Expression | Trigger expression is displayed. The template-item part of the expression is displayed as a link, leading to the item configuration form. |
| Status | Trigger status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it - from Enabled to Disabled (and back). |
| Tags | If a trigger contains tags, tag name and value are displayed in this column. |

To configure a new trigger, click on the *Create trigger* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change trigger status to *Enabled*
- *Disable* - change trigger status to *Disabled*
- *Copy* - copy the triggers to other hosts or templates
- *Mass update* - update several properties for a number of triggers at once
- *Delete* - delete the triggers

To use these options, mark the checkboxes before the respective triggers, then click on the required button.

Using filter

You can use the filter to display only the triggers you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter | Description |
|-------------------|---|
| Template groups | Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups. |
| Templates | Filter by one or more templates. If template groups are already selected above, template selection is limited to those groups. |
| Name | Filter by trigger name. |
| Severity | Select to filter by one or several trigger severities. |
| Status | Filter by trigger status. |
| Tags | Filter by trigger tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: Exists - include the specified tag names Equals - include the specified tag names and values (case-sensitive) Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) Does not exist - exclude the specified tag names Does not equal - exclude the specified tag names and values (case-sensitive) Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition Or - enough if one condition is met Macros and macro functions are supported in tag name and tag value fields. |
| Inherited | Filter triggers inherited (or not inherited) from linked templates. |
| With dependencies | Filter triggers with (or without) dependencies. |

3 Graphs

Overview

The custom graph list for a template can be accessed from *Data collection* → *Templates* by clicking on *Graphs* for the respective template.

A list of existing graphs is displayed.

Displayed data:

| Column | Description |
|-------------------|--|
| <i>Template</i> | Template the graph belongs to. Clicking on the template name opens the template configuration form . |
| <i>Name</i> | This column is displayed only if multiple templates or no templates are selected in the filter. Name of the custom graph, displayed as a blue link to graph details. Clicking on the graph name link opens the graph configuration form . If the graph is inherited from another template, the template name is displayed before the graph name as a gray link. Clicking on the template link opens the graph list on that template level. |
| <i>Width</i> | Graph width is displayed. |
| <i>Height</i> | Graph height is displayed. |
| <i>Graph type</i> | Graph type is displayed - <i>Normal</i> , <i>Stacked</i> , <i>Pie</i> or <i>Exploded</i> . |

To configure a new graph, click on the *Create graph* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click on the required button.

Using filter

You can filter graphs by template group and template. For better search performance, data is searched with macros unresolved.

4 Discovery rules

Overview

The list of low-level discovery rules for a template can be accessed from *Data collection* → *Templates* by clicking on *Discovery* for the respective template.

A list of existing low-level discovery rules is displayed. It is also possible to see all discovery rules independently of the template, or all discovery rules of a specific template group by changing the filter settings.

Discovery rules

?

Create discovery rule

Displayed data:

| Column | Description |
|-----------------|--|
| <i>Template</i> | The template discovery rule belongs to. Clicking on the template name opens the template configuration form . |
| <i>Name</i> | Name of the rule, displayed as a blue link. Clicking on the rule name opens the low-level discovery rule configuration form . If the discovery rule is inherited from another template, the template name is displayed before the rule name as a gray link. Clicking on the template link opens the discovery rule list on that template level. |
| <i>Items</i> | A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in gray. |

| Column | Description |
|-----------------|---|
| <i>Triggers</i> | A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in gray. |
| <i>Graphs</i> | A link to the list of graph prototypes displayed. The number of existing graph prototypes is displayed in gray. |
| <i>Hosts</i> | A link to the list of host prototypes displayed. The number of existing host prototypes is displayed in gray. |
| <i>Key</i> | The item key used for discovery is displayed. |
| <i>Interval</i> | The frequency of performing discovery is displayed. |
| <i>Type</i> | The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc). |
| <i>Status</i> | Discovery rule status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it - from Enabled to Disabled (and back). |

To configure a new low-level discovery rule, click on the *Create discovery rule* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the low-level discovery rule status to *Enabled*
- *Disable* - change the low-level discovery rule status to *Disabled*
- *Delete* - delete the low-level discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria such as template, discovery rule name, item key, item type, etc.

| Parameter | Description |
|-------------------------------|--|
| <i>Template groups</i> | Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups. |
| <i>Templates</i> | Filter by one or more templates. |
| <i>Name</i> | Filter by discovery rule name. |
| <i>Key</i> | Filter by discovery item key. |
| <i>Type</i> | Filter by discovery item type. |
| <i>Update interval</i> | Filter by update interval. Not available for Zabbix trapper and dependent items. |
| <i>Delete lost resources</i> | Filter by <i>Delete lost resources</i> period. |
| <i>Disable lost resources</i> | Filter by <i>Disable lost resources</i> period. |
| <i>Status</i> | Filter by discovery rule status (All/Enabled/Disabled). |

1 Item prototypes

Overview

In this section the configured item prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, item prototypes will become the basis of creating real host **items** during low-level discovery.

Displayed data:

| Column | Description |
|----------------|--|
| Name | Name of the item prototype, displayed as a blue link. Clicking on the name opens the item prototype configuration form. If the item prototype belongs to a linked template, the template name is displayed before the item prototype name as a gray link. Clicking on the template link opens the item prototype list on the linked template level. If the item prototype is of the "Dependent item" type, the master item name is displayed before the item prototype name in green (as in the case of item prototypes on the host level). |
| Key | Key of the item prototype is displayed. |
| Interval | Frequency of the check is displayed. |
| History | How many days to keep item data history is displayed. |
| Trends | How many days to keep item trends history is displayed. |
| Type | Type of the item prototype is displayed (Zabbix agent, SNMP agent, simple check, etc). |
| Create enabled | Create the item based on this prototype as: Yes - enabled No - disabled. You can switch between 'Yes' and 'No' by clicking on them. |
| Discover | Discover the item based on this prototype: Yes - discover No - do not discover. You can switch between 'Yes' and 'No' by clicking on them. |
| Tags | Tags of the item prototype is displayed. |

To configure a new item prototype, click on the *Create item prototype* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these items as *Enabled*
- *Create disabled* - create these items as *Disabled*
- *Mass update* - mass update these item prototypes
- *Delete* - delete these item prototypes

To use these options, mark the checkboxes before the respective item prototypes, then click on the required button.

2 Trigger prototypes

Overview

In this section the configured trigger prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, trigger prototypes will become the basis of creating real host **triggers** during low-level discovery.

All templates / Template Module Linux filesystems... Discovery list / Mounted filesystem discovery

Displayed data:

| Column | Description |
|---|---|
| <i>Name</i> | Name of the template. Clicking on the template name opens the template configuration form . |
| <i>Hosts</i> | Number of editable hosts to which the template is linked; read-only hosts are not included. Clicking on <i>Hosts</i> will open the host list with only those hosts filtered that are linked to the template. |
| <i>Entities (Items, Triggers, Graphs, Dashboards, Discovery, Web)</i> | Number of the respective entities in the template (displayed in gray). Clicking on the entity name will, in the whole listing of that entity, filter out those that belong to the template. |
| <i>Linked templates</i> | Templates that are linked to the template. |
| <i>Linked to templates</i> | Templates that the template is linked to. |
| <i>Vendor, Version</i> | Template vendor and version; displayed if the template configuration contains such information, and only for out-of-the-box templates , imported templates , or templates modified through the Template API . For out-of-the-box templates, version is displayed as follows: major version of Zabbix, delimiter (" - "), revision number (increased with each new version of the template, and reset with each major version of Zabbix). For example, 7.0-0, 7.0-3, 7.2-0, 7.2-3. |
| <i>Tags</i> | Tags of the template, with macros unresolved. |

To **configure a new template**, click on the *Create template* button in the top right-hand corner.

To **import a template** from a YAML, XML, or JSON file, click on the *Import* button in the top right-hand corner.

Using filter

You can use the filter to display only the templates you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available below *Create template* and *Import* buttons. If you click on it, a filter becomes available where you can filter templates by template group, linked templates, name and tags.

| Parameter | Description |
|-------------------------|--|
| <i>Template groups</i> | Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups. |
| <i>Linked templates</i> | Filter by directly linked templates. |
| <i>Name</i> | Filter by template name. |
| <i>Vendor</i> | Filter by template vendor. |
| <i>Version</i> | Filter by template version. |

| Parameter | Description |
|-------------|---|
| <i>Tags</i> | <p>Filter by template tag name and value.</p> <p>Filtering is possible only by template-level tags (not inherited ones). It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p>Exists - include the specified tag names;</p> <p>Equals - include the specified tag names and values (case-sensitive);</p> <p>Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive);</p> <p>Does not exist - exclude the specified tag names;</p> <p>Does not equal - exclude the specified tag names and values (case-sensitive);</p> <p>Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive).</p> <p>There are two calculation types for conditions:</p> <p>And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition;</p> <p>Or - enough if one condition is met.</p> |

Mass editing options

Buttons below the list offer some mass-editing options:

- *Export* - export the template to a YAML, XML or JSON file;
- *Mass update* - **update several properties** for a number of templates at once;
- *Delete* - delete the template while leaving its linked entities (items, triggers etc.) with the hosts;
- *Delete and clear* - delete the template and its linked entities from the hosts.

To use these options, mark the checkboxes before the respective templates, then click on the required button.

4 Hosts

Overview

In the *Data collection* → *Hosts* section users can configure and maintain hosts.

A listing of existing hosts with their details is displayed.

Displayed data:

| Column | Description |
|---|--|
| <i>Name</i> | <p>Name of the host.</p> <p>Clicking on the host name opens the host configuration form.</p> |
| <i>Entities (Items, Triggers, Graphs, Discovery, Web)</i> | <p>Clicking on the entity name will display items, triggers, etc., of the host.</p> |
| <i>Interface</i> | <p>The number of the respective entities is displayed in gray.</p> <p>The main interface of the host is displayed.</p> |

| Column | Description |
|---------------------|--|
| <i>Proxy</i> | <p>Assigned proxies are displayed in this column:</p> <p><Proxy name> - host is monitored by standalone proxy (even if the proxy is part of proxy group);</p> <p><Proxy group name: proxy name> - host is monitored by proxy group, and Zabbix server has assigned a proxy to monitor the host;</p> <p><Proxy group name> - host is monitored by proxy group without any proxies, or if Zabbix server has not assigned a proxy to monitor the host;</p> <p>Nothing - host is not monitored by either proxy or proxy group.</p> <p>This column is only displayed if the <i>Monitored by</i> filter option is set to 'Any', 'Proxy', or 'Proxy group'.</p> |
| <i>Templates</i> | <p>The templates linked to the host are displayed.</p> <p>If other templates are contained in the linked template, those are displayed in parentheses, separated by a comma.</p> <p>Clicking on a template name will open its configuration form.</p> |
| <i>Status</i> | <p>Host status is displayed - <i>Enabled</i> or <i>Disabled</i>.</p> <p>By clicking on the status you can change it manually.</p> <p>An orange wrench icon  before the host status indicates that this host is in maintenance. Maintenance details are displayed when the mouse pointer is positioned on the icon.</p> <p>Discovered hosts that have been lost are marked with an info icon. The tooltip text provides details on their status.</p> |
| <i>Availability</i> | <p>Host availability per configured interface is displayed.</p> <p>Availability icons represent host interface current status on Zabbix server. Therefore, if you disable a host in the frontend, its availability will update after Zabbix server has synchronized the configuration changes. Similarly, if you enable a host, its availability will update after Zabbix server has synchronized the configuration changes and polled the host.</p> <p>Availability icons represent only those interface types (Agent, SNMP, IPMI, JMX) that are configured.</p> <p>Hovering over the icon displays a pop-up with a list of all interfaces of the same type with details, status, and errors. For Agent interface, the pop-up displays interfaces (passive) and active checks. If a host has active checks only, the Agent interface icon is displayed even if the host does not have an Agent interface configured.</p> <p>The column is empty for hosts with no interfaces.</p> <p>The status of a single host interface is determined by the connection between an enabled item using the interface and the host. The status can be:</p> <p>Available - the connection to the host was successful;</p> <p>Not available - the connection to the host was unsuccessful (timeout, firewall issues, etc.);</p> <p>Unknown - the connection to the host has not been attempted or the result is unknown.</p> <p>For additional details on how Zabbix server determines interface status, see Unknown interface status and Unreachable/unavailable host interface settings.</p> <p>The status of all host interfaces of a single type (Agent, SNMP, IPMI, JMX) is determined by those interfaces that are used by at least one enabled item. The status is indicated by the icon color:</p> <p>Green - all interfaces are available;</p> <p>Yellow - at least one interface is not available, and at least one is available or unknown;</p> <p>Red - all interfaces are not available;</p> <p>Gray - at least one interface is unknown, but none are not available.</p> <p>Before Zabbix 7.2.4, this status is determined by all interfaces of the same type, regardless of whether any items use them.</p> <p>Active check availability. If at least one active check is enabled on the host, active checks also affect the total Agent interface availability as described above. To determine active check availability, heartbeat messages are sent in the agent active check thread. The frequency of heartbeat messages is controlled by the <code>HeartbeatFrequency</code> parameter in Zabbix agent or agent 2 configuration (default 60 seconds, range 0-3600). Active checks are considered not available when the active check heartbeat is older than 2 x <code>HeartbeatFrequency</code> seconds.</p> <p>Note: Zabbix agents older than version 6.2.x do not send active check heartbeats, so the availability of their hosts remains unknown.</p> |

| Column | Description |
|-------------------------|---|
| <i>Agent encryption</i> | Encryption status for connections to the host is displayed: None - no encryption; PSK - using pre-shared key; Cert - using certificate. |
| <i>Info</i> | Error information (if any) regarding the host is displayed. |
| <i>Tags</i> | Tags of the host with macros unresolved. |

To configure a new host, click on the *Create host* button in the top right-hand corner. To import a host from a YAML, XML, or JSON file, click on the *Import* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass editing options:

- *Enable* - change host status to *Monitored*;
- *Disable* - change host status to *Not monitored*;
- *Export* - export the hosts to a YAML, XML or JSON file;
- *Mass update* - **update several properties** for a number of hosts at once;
- *Delete* - delete the hosts.

To use these options, mark the checkboxes before the respective hosts, then click on the required button.

Using filter

You can use the filter to display only the hosts you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter | Description |
|---------------------|---|
| <i>Host groups</i> | Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. |
| <i>Templates</i> | Filter by linked templates. |
| <i>Name</i> | Filter by visible host name. |
| <i>DNS</i> | Filter by DNS name. |
| <i>IP</i> | Filter by IP address. |
| <i>Port</i> | Filter by port number. |
| <i>Status</i> | Filter by host status. |
| <i>Monitored by</i> | Filter hosts that are monitored by Zabbix server, proxy, or proxy group. |
| <i>Proxies</i> | Filter hosts that are monitored by the proxies specified here. This field is only available if "Proxy" is selected in the <i>Monitored by</i> field. |
| <i>Proxy groups</i> | Filter hosts that are monitored by the proxy groups specified here. This field is only available if "Proxy group" is selected in the <i>Monitored by</i> field. |

| Parameter | Description |
|-------------|---|
| <i>Tags</i> | <p>Filter by host tag name and value.</p> <p>It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive.</p> <p>There are several operators available for each condition:</p> <p>Exists - include the specified tag names;</p> <p>Equals - include the specified tag names and values (case-sensitive);</p> <p>Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive);</p> <p>Does not exist - exclude the specified tag names;</p> <p>Does not equal - exclude the specified tag names and values (case-sensitive);</p> <p>Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive).</p> <p>There are two calculation types for conditions:</p> <p>And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition;</p> <p>Or - enough if one condition is met.</p> |

Unknown interface status

Zabbix server displays the "Unknown" status for a host interface (Agent, SNMP, IPMI, JMX) in the following cases:

- Host is disabled.
- Host is set to be monitored by proxy, different proxy, or server if it was previously monitored by proxy.
- Host is monitored by a proxy that appears to be offline (no updates received from the proxy during the maximum heartbeat interval - 1 hour).
- All host items with that interface type are disabled.
- No pollers for that interface type have been configured (for example, the `StartAgentPollers` or `StartSNMPPollers` server configuration parameter is set to 0).

Interface availability is set to "Unknown" after Zabbix server configuration cache synchronization.

Interface availability (Available/Not available) on hosts monitored by proxies is restored after proxy configuration cache synchronization.

1 Items

Overview

The item list for a host can be accessed from *Data collection* → *Hosts* by clicking on *Items* for the respective host.

Displayed data:

| Column | Description |
|------------------|--|
| <i>Item menu</i> | Click on the three-dot icon to open the item menu . |

| Column | Description |
|-----------------|--|
| <i>Host</i> | Host of the item. Clicking on the host name opens the host configuration form . |
| <i>Name</i> | This column is displayed only if multiple hosts or no hosts are selected in the filter. Name of the item displayed as a blue link to item details. Clicking on the item name link opens the item configuration form . If the host item belongs to a template, the template name is displayed before the item name as a gray link. Clicking on the template link will open the item list on the template level. If the item has been created from an item prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking on the discovery rule name will open the item prototype list. |
| <i>Triggers</i> | Moving the mouse over Triggers will display an infobox displaying the triggers associated with the item. The number of the triggers is displayed in gray. |
| <i>Key</i> | Item key is displayed. |
| <i>Interval</i> | Frequency of the check is displayed. <i>Note</i> that passive items can also be checked immediately by pushing the <i>Execute now</i> button . |
| <i>History</i> | How many days item data history will be kept is displayed. |
| <i>Trends</i> | How many days item trends history will be kept is displayed. |
| <i>Type</i> | Item type is displayed (Zabbix agent, SNMP agent, simple check, etc). |
| <i>Status</i> | Item status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Not supported</i> . You can change the status manually by clicking on it - from Enabled to Disabled (and back); from Not supported to Disabled (and back). Discovered items that have been lost are marked with an info icon. The tooltip text provides details on their status. |
| <i>Tags</i> | Item tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows to see all tags on mouseover. |
| <i>Info</i> | If the item is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description. |

To configure a new item, click on the *Create item* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change item status to *Enabled*
- *Disable* - change item status to *Disabled*
- *Execute now* - execute a check for new item values immediately. Supported for **passive** checks only (see [more details](#)).
Note that when checking for values immediately, configuration cache is not updated, thus the values will not reflect very recent changes to item configuration.
- *Clear history and trends* - delete history and trend data for items.
- *Copy* - copy the items to other hosts or templates.
- *Mass update* - [update several properties](#) for a number of items at once.
- *Delete* - delete the items.

To use these options, mark the checkboxes before the respective items, then click on the required button.

Using filter

You can use the filter to display only the items you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter | Description |
|----------------------------|---|
| <i>Host groups</i> | Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. Host groups containing templates only cannot be selected. |
| <i>Hosts</i> | Filter by one or more hosts. |
| <i>Name</i> | Filter by item name. |
| <i>Key</i> | Filter by item key. |
| <i>Value mapping</i> | Filter by the value map used. |
| <i>Type</i> | This parameter is not displayed if the <i>Hosts</i> option is empty. Filter by item type (Zabbix agent, SNMP agent, etc.). |
| <i>Type of information</i> | Filter by type of information (Numeric unsigned, float, etc.). |
| <i>History</i> | Filter by how long item history is kept. |
| <i>Trends</i> | Filter by how long item trends are kept. |
| <i>Update interval</i> | Filter by item update interval. |
| <i>Tags</i> | Specify tags to limit the number of items displayed. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: Exists - include the specified tag names Equals - include the specified tag names and values (case-sensitive) Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) Does not exist - exclude the specified tag names Does not equal - exclude the specified tag names and values (case-sensitive) Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition Or - enough if one condition is met |
| <i>State</i> | Filter by item state - <i>Normal</i> or <i>Not supported</i> . |
| <i>Status</i> | Filter by item status - <i>Enabled</i> or <i>Disabled</i> . |
| <i>Triggers</i> | Filter items with (or without) triggers. |
| <i>Inherited</i> | Filter items inherited (or not inherited) from a template. |
| <i>Discovery</i> | Filter items discovered (or not discovered) by low-level discovery. |

Using subfilter

The subfilter allows to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - tag, item type, item state, item

update interval, etc. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration -> General -> GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

2 Triggers

Overview

The trigger list for a host can be accessed from *Data collection -> Hosts* by clicking on *Triggers* for the respective host.

Displayed data:

| Column | Description |
|---------------------------------|---|
| <i>Severity</i> <i>Value</i> | Severity of the trigger is displayed by both name and cell background color. Trigger value is displayed: OK - the trigger is in the OK state PROBLEM - the trigger is in the Problem state |
| <i>Host</i> | Host of the trigger. Clicking on the host name opens the host configuration form . |
| <i>Name</i> | This column is displayed only if multiple hosts or no hosts are selected in the filter. Name of the trigger, displayed as a blue link to trigger details. Clicking on the trigger name link opens the trigger configuration form . If the host trigger belongs to a template, the template name is displayed before the trigger name as a gray link. Clicking on the template link opens the trigger list on the template level. If the trigger has been created from a trigger prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking on the discovery rule name will open the trigger prototype list. |
| <i>Operational data</i> | Operational data definition of the trigger, containing arbitrary strings and macros that will resolve dynamically in <i>Monitoring</i> → <i>Problems</i> . |
| <i>Expression</i> | Trigger expression is displayed. The host-item part of the expression is displayed as a link, leading to the item configuration form. |
| <i>Status</i> | Trigger status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Unknown</i> . By clicking on the status you can manually change it - from Enabled to Disabled (and back); from Unknown to Disabled (and back). Problems of a disabled trigger are no longer displayed in the frontend, but are not deleted. Discovered triggers that have been lost are marked with an info icon. The tooltip text provides details on their status. |
| <i>Info</i> | If everything is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description. |
| <i>Tags</i> | If a trigger contains tags, tag name and value are displayed in this column. |

To configure a new trigger, click on the *Create trigger* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change trigger status to *Enabled*.
- *Disable* - change trigger status to *Disabled*.
- *Copy* - copy the triggers to other hosts or templates.
- *Mass update* - update several properties for a number of triggers at once.
- *Delete* - delete the triggers.

To use these options, mark the checkboxes before the respective triggers, then click on the required button.

Using filter

You can use the filter to display only the triggers you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the top right corner. Clicking on it will open a filter where you can specify the desired filtering criteria.

| Parameter | Description |
|--------------------|--|
| <i>Host groups</i> | Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. Host groups containing templates only cannot be selected. |
| <i>Hosts</i> | Filter by one or more hosts. If host groups are already selected above, host selection is limited to those groups. |

| Parameter | Description |
|--------------------------|--|
| <i>Name</i> | Filter by trigger name. |
| <i>Severity</i> | Select to filter by one or several trigger severities. |
| <i>State</i> | Filter by trigger state. |
| <i>Status</i> | Filter by trigger status. |
| <i>Value</i> | Filter by trigger value. |
| <i>Tags</i> | Filter by trigger tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: Exists - include the specified tag names Equals - include the specified tag names and values (case-sensitive) Contains - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) Does not exist - exclude the specified tag names Does not equal - exclude the specified tag names and values (case-sensitive) Does not contain - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: And/Or - all conditions must be met, conditions having the same tag name will be grouped by the Or condition Or - enough if one condition is met Macros and macro functions are supported both in tag name and tag value fields. |
| <i>Inherited</i> | Filter triggers inherited (or not inherited) from a template. |
| <i>Discovered</i> | Filter triggers discovered (or not discovered) by low-level discovery. |
| <i>With dependencies</i> | Filter triggers with (or without) dependencies. |

3 Graphs

Overview

The custom graph list for a host can be accessed from *Data collection* → *Hosts* by clicking on *Graphs* for the respective host.

A list of existing graphs is displayed.

| <div> <div>Graphs</div> <div> <div>?</div> <div>Create graph</div> </div> </div> | | | | |
|---|-------|--------|------------|--------------|
| <div> <div>All hosts / Zabbix server</div> <div>Enabled</div> <div>ZBX</div> <div>SNMP</div> <div>IPMI</div> <div>JMX</div> <div>Items 151</div> <div>Triggers 68</div> <div>Graphs 30</div> <div>Discovery rules 3</div> <div>Web scenarios 1</div> <div>Filter</div> </div> | | | | |

| <input type="checkbox"/> Block devices discovery: sda: Disk average waiting time | 900 | 200 | Normal | |
| <input type="checkbox"/> Block devices discovery: sda: Disk read/write rates | 900 | 200 | Normal | |

Displayed data:

| Column | Description |
|-------------|---|
| <i>Host</i> | Host of the graph. Clicking on the host name opens the host configuration form . This column is displayed only if multiple hosts or no hosts are selected in the filter. |

| Column | Description |
|-------------------|---|
| <i>Name</i> | Name of the custom graph, displayed as a blue link to graph details. Clicking on the graph name link opens the graph configuration form . If the host graph belongs to a template, the template name is displayed before the graph name as a gray link. Clicking on the template link opens the graph list on the template level. If the graph has been created from a graph prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking on the discovery rule name will open the graph prototype list. |
| <i>Width</i> | Graph width is displayed. |
| <i>Height</i> | Graph height is displayed. |
| <i>Graph type</i> | Graph type is displayed - <i>Normal</i> , <i>Stacked</i> , <i>Pie</i> or <i>Exploded</i> . |
| <i>Info</i> | If the graph is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description. |

To configure a new graph, click on the *Create graph* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click on the required button.

Using filter

You can filter graphs by host group and host. For better search performance, data is searched with macros unresolved.

4 Discovery rules

Overview

The list of low-level discovery rules for a host can be accessed from *Data collection* → *Hosts* by clicking on *Discovery* for the respective host.

A list of existing low-level discovery rules is displayed. It is also possible to see all discovery rules independently of the host, or all discovery rules of a specific host group by changing the filter settings.

| | | | | | | | | | |
|---|---------------|--|--------------------|----------------------|--------------------|-----------------|----------------------------|----------|------------------------|

| 0 selected Enable Disable Execute now Delete | | | | | | | | | |

Displayed data:

| Column | Description |
|-----------------|--|
| <i>Host</i> | The visible host name is displayed. Clicking on the host name opens the host configuration form . In the absence of a visible host name, the technical host name is displayed. |
| <i>Name</i> | Name of the rule, displayed as a blue link. Clicking on the rule name opens the low-level discovery rule configuration form . If the discovery rule belongs to a template, the template name is displayed before the rule name as a gray link. Clicking on the template link opens the rule list on the template level. |
| <i>Items</i> | A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in gray. |
| <i>Triggers</i> | A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in gray. |

| Column | Description |
|-----------------|---|
| <i>Graphs</i> | A link to the list of graph prototypes is displayed. The number of existing graph prototypes is displayed in gray. |
| <i>Hosts</i> | A link to the list of host prototypes is displayed. The number of existing host prototypes is displayed in gray. |
| <i>Key</i> | The item key used for discovery is displayed. |
| <i>Interval</i> | The frequency of performing discovery is displayed. <i>Note</i> that discovery can also be performed immediately by pushing the <i>Execute now</i> button below the list. |
| <i>Type</i> | The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc). |
| <i>Status</i> | Discovery rule status is displayed - <i>Enabled</i> , <i>Disabled</i> or <i>Not supported</i> . By clicking on the status you can change it - from Enabled to Disabled (and back); from Not supported to Disabled (and back). |
| <i>Info</i> | If everything is fine, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description. |

To configure a new low-level discovery rule, click on the *Create discovery rule* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the low-level discovery rule status to *Enabled*.
- *Disable* - change the low-level discovery rule status to *Disabled*.
- *Execute now* - perform discovery based on the discovery rules immediately. See [more details](#). Note that when performing discovery immediately, the configuration cache is not updated, thus the result will not reflect very recent changes to discovery rule configuration.
- *Delete* - delete the low-level discovery rules.

To use these options, mark the checkboxes before the respective discovery rules, then click on the required button.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of discovery rules. If you click on it, a filter becomes available where you can filter discovery rules by host group, host, name, item key, item type, and other parameters.

| Parameter | Description |
|-------------------------------|---|
| <i>Host groups</i> | Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. |
| <i>Hosts</i> | Filter by one or more hosts. |
| <i>Name</i> | Filter by discovery rule name. |
| <i>Key</i> | Filter by discovery item key. |
| <i>Type</i> | Filter by discovery item type. |
| <i>Update interval</i> | Filter by update interval. Not available for Zabbix trapper and dependent items. |
| <i>Delete lost resources</i> | Filter by <i>Delete lost resources</i> period. |
| <i>Disable lost resources</i> | Filter by <i>Disable lost resources</i> period. |
| <i>SNMP OID</i> | Filter by SNMP OID. Only available if <i>SNMP agent</i> is selected as type. |
| <i>State</i> | Filter by discovery rule state (All/Normal/Not supported). |
| <i>Status</i> | Filter by discovery rule status (All/Enabled/Disabled). |

1 Item prototypes

Overview

In this section the item prototypes of a low-level discovery rule on the host are displayed. Item prototypes are the basis of real host **items** that are created during low-level discovery.

Displaying 9 of 9 found

Displayed data:

| Column | Description |
|----------------|--|
| Name | Name of the item prototype, displayed as a blue link. Clicking on the name opens the item prototype configuration form . If the item prototype belongs to a template, the template name is displayed before the rule name as a gray link. Clicking on the template link opens the item prototype list on the template level. If the item prototype is of the "Dependent item" type, the master item name is displayed before the item prototype name in green. |
| Key | Key of the item prototype is displayed. |
| Interval | Frequency of the check is displayed. |
| History | How many days to keep item data history is displayed. |
| Trends | How many days to keep item trends history is displayed. |
| Type | Type of the item prototype is displayed (Zabbix agent, SNMP agent, simple check, etc). |
| Create enabled | Create the item based on this prototype as: Yes - enabled No - disabled. You can switch between 'Yes' and 'No' by clicking on them. |
| Discover | Discover the item based on this prototype: Yes - discover No - do not discover. You can switch between 'Yes' and 'No' by clicking on them. |
| Tags | Tags of the item prototype are displayed. |

To configure a new item prototype, click on the *Create item prototype* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these items as *Enabled*
- *Create disabled* - create these items as *Disabled*
- *Mass update* - mass update these item prototypes
- *Delete* - delete these item prototypes

To use these options, mark the checkboxes before the respective item prototypes, then click on the required button.

|------------------------|--|
| <i>Name</i> | Name of the web scenario. Clicking on the web scenario name opens the web scenario configuration form . If the host web scenario belongs to a template, the template name is displayed before the web scenario name as a gray link. Clicking on the template link will open the web scenario list on the template level. |
| <i>Number of steps</i> | The number of steps the scenario contains. |
| <i>Update interval</i> | How often the scenario is performed. |
| <i>Attempts</i> | How many attempts for executing web scenario steps are performed. |
| <i>Authentication</i> | Authentication method is displayed - Basic, NTLM, or None. |
| <i>HTTP proxy</i> | Displays HTTP proxy or 'No' if not used. |
| <i>Status</i> | Web scenario status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it. |
| <i>Tags</i> | Web scenario tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows to see all tags on mouseover. |
| <i>Info</i> | If everything is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description. |

To configure a new web scenario, click on the *Create web scenario* button at the top right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the scenario status to *Enabled*
- *Disable* - change the scenario status to *Disabled*
- *Clear history and trends* - clear history and trend data for the scenarios
- *Delete* - delete the web scenarios

To use these options, mark the checkboxes before the respective web scenarios, then click on the required button.

Using filter

You can use the filter to display only the scenarios you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of web scenarios. If you click on it, a filter becomes available where you can filter scenarios by host group, host, status and tags.

5 Maintenance

Overview

In the *Data collection* → *Maintenance* section users can configure and maintain maintenance periods for hosts.

A listing of existing maintenance periods with their details is displayed.

Displayed data:

| Column | Description |
|---------------------|--|
| <i>Name</i> | Name of the maintenance period. Clicking on the maintenance period name opens the maintenance period configuration form . |
| <i>Type</i> | The type of maintenance is displayed: <i>With data collection</i> or <i>No data collection</i> |
| <i>Active since</i> | The date and time when executing maintenance periods becomes active. Note: This time does not activate a maintenance period; maintenance periods need to be set separately. |
| <i>Active till</i> | The date and time when executing maintenance periods stops being active. |
| <i>State</i> | The state of the maintenance period: Approaching - will become active soon Active - is active Expired - is not active any more |
| <i>Description</i> | Description of the maintenance period is displayed. |

To configure a new maintenance period, click on the *Create maintenance period* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the maintenance periods

To use this option, mark the checkboxes before the respective maintenance periods and click on *Delete*.

Using filter

You can use the filter to display only the maintenance periods you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of maintenance periods. If you click on it, a filter becomes available where you can filter maintenance periods by host group, name and state.

Attention:
The Zabbix proxy is not aware of maintenance periods; see [Calculation of queues during maintenance](#) for details.

6 Event correlation

Overview

In the *Data collection* → *Event correlation* section users can configure and maintain **global correlation** rules for Zabbix events.

Event correlation?[Create event correlation](#)

Name

Status Any Enabled Disabled

7 Alerts

Overview

This menu features sections that are related to configuring alerts in Zabbix.

1 Actions

Overview

In the *Alerts* → *Actions* section users can configure and maintain actions.

The actions displayed are actions assigned to the selected event source (trigger, services, discovery, autoregistration, internal actions).

To switch to a different event source, click on *Actions* in the *Alerts* menu section. It is also possible to switch between sources by using the title dropdown in the top left corner.

Trigger actions

Displayed data:

| Column | Description |
|------------|---|
| Name | Name of the action. Clicking on the action name opens the action configuration form. |
| Conditions | Action conditions are displayed. |
| Operations | Action operations are displayed. The operation list also displays the media type (email, SMS or script) used for notification as well as the name and surname (in parentheses after the username) of a notification recipient. Action operation can both be a notification or a remote command depending on the selected type of operation. |
| Status | Action status is displayed - Enabled or Disabled. By clicking on the status you can change it. See the Escalations section for more details as to what happens if an action is disabled during an escalation in progress. |
| Info | If everything is working correctly, no icon is displayed in this column. In case of errors, such as missing action operations or conditions after upgrade/low-level discovery, a warning icon is displayed. Hover over the icon to see a tooltip with the error description. This column is displayed since Zabbix 7.2.4. |

To configure a new action, click on the *Create action* button in the top right-hand corner.

For users without Super admin rights actions are displayed according to the permission settings. That means in some cases a user without Super admin rights isn't able to view the complete action list because of certain permission restrictions. An action is displayed to the user without Super admin rights if the following conditions are fulfilled:

- The user has read-write access to host groups, hosts, templates, and triggers in action conditions
- The user has read-write access to host groups, hosts, and templates in action operations, recovery operations, and update operations
- The user has read access to user groups and users in action operations, recovery operations, and update operations

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the action status to *Enabled*
- *Disable* - change the action status to *Disabled*
- *Delete* - delete the actions

To use these options, mark the checkboxes before the respective actions, then click on the required button.

Using filter

You can use the filter to display only the actions you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of actions. If you click on it, a filter becomes available where you can filter actions by name and status.

Displayed data:

| Column | Description |
|-----------------|--|
| Name | Name of the media type. Clicking on the name opens the media type configuration form. |
| Type | Type of the media (email, SMS, etc) is displayed. |
| Status | Media type status is displayed - Enabled or Disabled. By clicking on the status you can change it. |
| Used in actions | Actions where the media type is used are displayed, preceded by the total number of these actions. Clicking on the action name opens the action configuration form. If the user has no permissions to the action, the name is not clickable. |
| Details | Detailed information of the media type is displayed. |
| Actions | The following action is available: Test - click to open a testing form where you can enter media type parameters (e.g. a recipient address with test subject and body) and send a test message to verify that the configured media type works. See also: Media type testing for Email, Webhook, or Script. |

To configure a new media type, click on the *Create media type* button in the top right-hand corner.

To import a media type, click on the *Import* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the media type status to *Enabled*
- *Disable* - change the media type status to *Disabled*
- *Export* - export the media types to a YAML, XML or JSON file
- *Delete* - delete the media types

To use these options, mark the checkboxes before the respective media types, then click on the required button.

Using filter

You can use the filter to display only the media types you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of media types. If you click on it, a filter becomes available where you can filter media types by name and status. Additionally, you can use the filter to display actions in the *Used in actions* column based on the scope of their media type usage (defined by the *Send to media type* parameter in action **operation details**).

3 Scripts

Overview

In the *Alerts* → *Scripts* section user-defined global scripts can be configured and maintained.

Global scripts, depending on the configured scope and also user permissions, are available for execution:

- from the **host menu** in various frontend locations (*Dashboard*, *Problems*, *Latest data*, *Maps*, etc.)
- from the **event menu**
- can be run as an action operation

The scripts are executed on Zabbix agent, Zabbix server (proxy) or Zabbix server only. See also **Command execution**.

Both on Zabbix agent and Zabbix proxy remote scripts are disabled by default. They can be enabled by:

- For remote commands executed on Zabbix agent:
 - adding an AllowKey=system.run[<command>,*] parameter for each allowed command in agent configuration, * stands for wait and nowait mode;
- For remote commands executed on Zabbix proxy:
 - **Warning: It is not required to enable remote commands on Zabbix proxy if remote commands are executed on Zabbix agent that is monitored by Zabbix proxy.** If, however, it is required to execute remote commands on Zabbix proxy, set *EnableRemoteCommands* parameter to '1' in the proxy configuration.

Global script execution on Zabbix server can be disabled by setting EnableGlobalScripts=0 in server configuration. For new installations, since Zabbix 7.0, global script execution on Zabbix server is disabled by default.

A listing of existing scripts with their details is displayed.

Scripts

Displaying 4 of 4 found

Displayed data:

| Column | Description |
|------------------------|--|
| <i>Name</i> | Name of the script. Clicking on the script name opens the script configuration form . |
| <i>Scope</i> | Scope of the script - action operation, manual host action or manual event action. This setting determines where the script is available. |
| <i>Used in actions</i> | All actions where the script is used are displayed, preceded by the total number of these actions. Clicking on the action name opens the action configuration form. If the user has no permissions to the action, the name is not clickable. |
| <i>Type</i> | Script type is displayed - <i>URL</i> , <i>Webhook</i> , <i>Script</i> , <i>SSH</i> , <i>Telnet</i> or <i>IPMI</i> command. |
| <i>Execute on</i> | It is displayed whether the script will be executed on Zabbix agent, Zabbix proxy or server, or Zabbix server only. |
| <i>Commands</i> | All commands to be executed within the script are displayed. |
| <i>User group</i> | Nothing is displayed here for webhooks. The user group that the script is available to is displayed (or <i>All</i> for all user groups). |

| Column | Description |
|--------------------|--|
| <i>Host group</i> | The host group that the script is available for is displayed (or <i>All</i> for all host groups). |
| <i>Host access</i> | The permission level for the host group is displayed - <i>Read</i> or <i>Write</i> . Only users with the required permission level will have access to executing the script. |

To configure a new script, click on the *Create script* button in the top right-hand corner.

Mass editing options

A button below the list offers one mass-editing option:

- *Delete* - delete the scripts

To use this option, mark the checkboxes before the respective scripts and click on *Delete*.

Using filter

You can use the filter to display only the scripts you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of scripts. If you click on it, a filter becomes available where you can filter scripts by name and scope.

Configuring a global script

Script attributes:

| Parameter | Description |
|-------------|--|
| <i>Name</i> | Unique name of the script. E.g. Clear /tmp filesystem |

| Parameter | Description |
|---|---|
| Scope | <p>Scope of the script - action operation, manual host action or manual event action. This setting determines where the script can be used - in remote commands of action operations, from the host menu or from the event menu respectively.</p> <p>Setting the scope to 'Action operation' makes the script available for all users with access to <i>Alerts → Actions</i>.</p> <p>If a script is actually used in an action, its scope cannot be changed away from 'action operation'.</p> <p>Macro support</p> <p>The scope affects the range of available macros. For example, user-related macros ({USER.*}) are supported in scripts to allow passing information about the user that launched the script. However, they are not supported if the script scope is action operation, as action operations are executed automatically.</p> <p>A {MANUALINPUT} macro allows to specify manual input at script execution time. It is supported for manual host action and manual event action scripts.</p> <p>To find out which other macros are supported, do a search for 'Trigger-based notifications and commands/Trigger-based commands', 'Manual host action scripts' and 'Manual event action scripts' in the supported macro table. Note that if a macro may resolve to a value with spaces (for example, host name), don't forget to quote as needed.</p> |
| Menu path | <p>The desired menu path to the script. For example, Default or Default/, will display the script in the respective directory. Menus can be nested, e.g. Main menu/Sub menu1/Sub menu2. When accessing scripts through the host/event menu in monitoring sections, they will be organized according to the given directories.</p> <p>This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i>.</p> |
| Type | <p>Click the respective button to select script type:</p> <p>URL, Webhook, Script, SSH, Telnet or IPMI command.</p> <p>The type URL is available only when 'Manual host action' or 'Manual event action' is selected as <i>Scope</i>.</p> |
| Script type: URL URL | <p>Specify the URL for quick access from the host menu or event menu.</p> <p>Macros and custom user macros are supported. Macro support depends on the scope of the script (see <i>Scope</i> above).</p> <p>Use the {MANUALINPUT} macro in this field to be able to specify manual input at script execution time, for example:</p> <p><code>http://{MANUALINPUT}/zabbix/zabbix.php?action=dashboard.view</code></p> <p>Macro values must not be URL-encoded.</p> |
| Open in new window | Determines whether the URL should be opened in a new or the same browser tab. |
| Script type: Webhook Parameters | <p>Specify the webhook variables as attribute-value pairs.</p> <p>See also: Webhook media configuration.</p> <p>Macros and custom user macros are supported in parameter values. Macro support depends on the scope of the script (see <i>Scope</i> above).</p> |
| Script | <p>Enter the JavaScript code in the modal editor that opens when clicking in the parameter field or on the pencil icon next to it.</p> <p>Macro support depends on the scope of the script (see <i>Scope</i> above).</p> <p>See also: Webhook media configuration, Additional Javascript objects.</p> |
| Timeout | <p>JavaScript execution timeout (1-60s, default 30s).</p> <p>Time suffixes are supported, e.g. 30s, 1m.</p> |
| Script type: Script Execute on | <p>Click the respective button to execute the shell script on:</p> <p>Zabbix agent - the script will be executed by Zabbix agent (if the system.run item is allowed) on the host</p> <p>Zabbix proxy or server - the script will be executed by Zabbix proxy or server - depending on whether the host is monitored by proxy or server.</p> <p>It will be executed on the proxy if enabled by EnableRemoteCommands.</p> <p>It will be executed on the server if global scripts are enabled by the EnableGlobalScripts server parameter.</p> <p>Zabbix server - the script will be executed by Zabbix server only.</p> <p>This option will not be available if global scripts are disabled by the EnableGlobalScripts server parameter.</p> |

| Parameter | Description |
|----------------------------------|---|
| <i>Commands</i> | Enter full path to the commands to be executed within the script. Macro support depends on the scope of the script (see <i>Scope</i> above). Custom user macros are supported. |
| Script type: SSH | |
| <i>Authentication method</i> | Select authentication method - password or public key. |
| <i>Username</i> | Enter the username. |
| <i>Password</i> | Enter the password. This field is available if 'Password' is selected as the authentication method. |
| <i>Public key file</i> | Enter the path to the public key file. This field is available if 'Public key' is selected as the authentication method. |
| <i>Private key file</i> | Enter the path to the private key file. This field is available if 'Public key' is selected as the authentication method. |
| <i>Passphrase</i> | Enter the passphrase. This field is available if 'Public key' is selected as the authentication method. |
| <i>Port</i> | Enter the port. |
| <i>Commands</i> | Enter the commands. Macro support depends on the scope of the script (see <i>Scope</i> above). Custom user macros are supported. |
| Script type: Telnet | |
| <i>Username</i> | Enter the username. |
| <i>Password</i> | Enter the password. |
| <i>Port</i> | Enter the port. |
| <i>Commands</i> | Enter the commands. Macro support depends on the scope of the script (see <i>Scope</i> above). Custom user macros are supported. |
| Script type: IPMI | |
| <i>Command</i> | Enter the IPMI command. Macro support depends on the scope of the script (see <i>Scope</i> above). Custom user macros are supported. |
| <i>Description</i> | Enter a description for the script. |
| <i>Host group</i> | Select the host group that the script will be available for (or <i>All</i> for all host groups). |
| <i>User group</i> | Select the user group that the script will be available to (or <i>All</i> for all user groups). This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> . |
| <i>Required host permissions</i> | Select the permission level for the host group - <i>Read</i> or <i>Write</i> . Only users with the required permission level will have access to executing the script. This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> . |
| <i>Advanced configuration</i> | Click on the <i>Advanced configuration</i> label to display advanced configuration options. This field is displayed only if 'Manual host action' or 'Manual event action' is selected as <i>Scope</i> . |

Advanced configuration

Advanced configuration options are available in a collapsible *Advanced configuration* section:

Test confirmation

Add
Cancel

| Parameter | Description |
|------------------------------|---|
| <i>Enable user input</i> | Mark the checkbox to enable manual user input before executing the script. Manual user input will replace the {MANUALINPUT} macro value in the script. See also: Manual user input . |
| <i>Input prompt</i> | Enter custom text prompting for custom user input. This text will be displayed above the input field in the <i>Manual input</i> popup. To see a preview of the <i>Manual input</i> popup, click on <i>Test user input</i> . The preview also allows to test if the input string complies with the input validation rule (see parameters below). Macro and user macro support depends on the scope of the script (see <i>Scope</i> in general script configuration parameters). |
| <i>Input type</i> | Select the manual input type: String - single string; Dropdown - value is selected from multiple dropdown options. |
| <i>Dropdown options</i> | Enter unique values for the user input dropdown in a comma-delimited list. To include an empty option in the dropdown, add an extra comma at the beginning, middle, or end of the list. This field is displayed only if 'Dropdown' is selected as <i>Input type</i> . |
| <i>Default input string</i> | Enter the default string for user input (or none). This field will be validated against the regular expression provided in the <i>Input validation rule</i> field. The value entered here will be displayed by default in the <i>Manual input</i> popup. |
| <i>Input validation rule</i> | This field is displayed only if 'String' is selected as <i>Input type</i> . Enter a regular expression to validate the user input string. Global regular expressions are supported. This field is displayed only if 'String' is selected as <i>Input type</i> . |
| <i>Enable confirmation</i> | Mark the checkbox to display a confirmation message before executing the script. This feature might be especially useful with potentially dangerous operations (like a reboot script) or ones that might take a long time. |
| <i>Confirmation text</i> | Enter custom confirmation text for the confirmation popup enabled with the checkbox above (for example, <i>Remote system will be rebooted. Are you sure?</i>). To see how the text will look like, click on <i>Test confirmation</i> next to the field. Macros and custom user macros are supported. <i>Note:</i> the macros will not be expanded when testing the confirmation message. |

If both manual user input and a confirmation message are configured, they will be displayed in consecutive popup windows.

Manual user input

Manual user input allows to supply a custom parameter on each execution of the script. This saves the necessity to create multiple similar user scripts with only a single parameter difference.

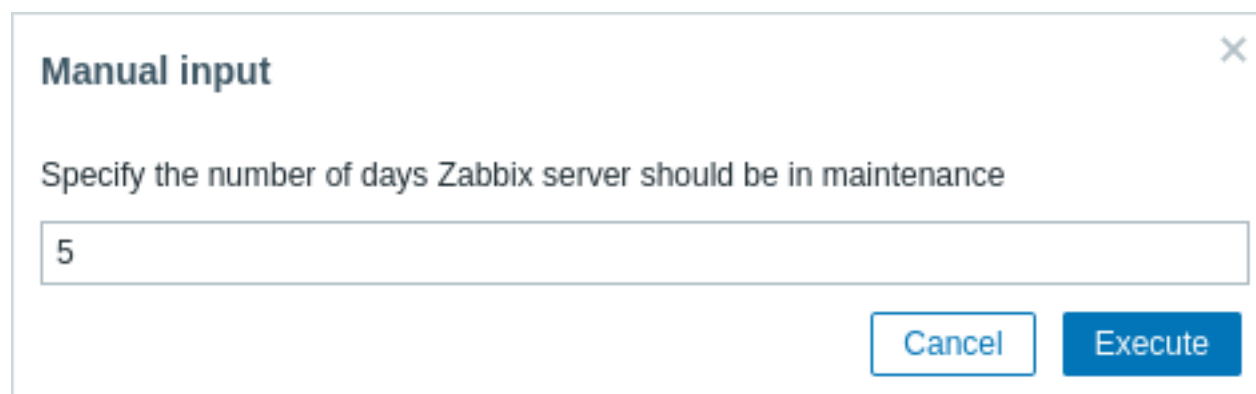

For example, you may want to supply a different integer or a different URL address to the script during execution.

To enable manual user input:

- use the {MANUALINPUT} macro in the script (commands, script, script parameter) where required; or in the URL field of URL scripts;
- in **advanced script configuration**, enable manual user input and configure input options.

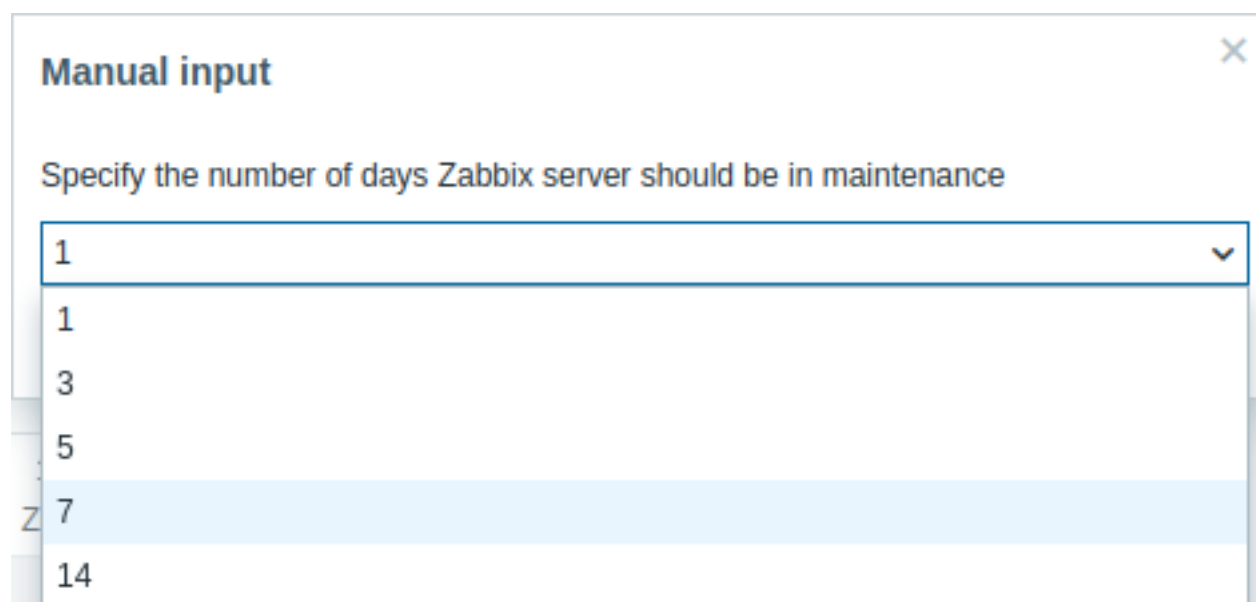

With user input enabled, before script execution, a *Manual input* popup will appear to the user asking to supply a custom value. The supplied value will replace {MANUALINPUT} in the script.

Depending on the configuration, the user will be asked to enter a string value:

The dialog box is titled "Manual input" and contains the instruction "Specify the number of days Zabbix server should be in maintenance". Below the instruction is a text input field containing the number "5". At the bottom right are two buttons: "Cancel" and "Execute".

Or select the value from a dropdown of pre-determined options:

The dialog box is titled "Manual input" and contains the instruction "Specify the number of days Zabbix server should be in maintenance". Below the instruction is a dropdown menu. The dropdown is open, showing a list of options: 1, 3, 5, 7, and 14. The option "7" is currently selected and highlighted in blue.

Manual user input is available only for scripts where the scope is 'Manual host action' or 'Manual event action'.

Script execution and result

Scripts run by Zabbix server are executed in the order described in the [command execution page](#).

The script result is displayed in a pop-up window that appears after the script is run. The return value of the script is a standard output:

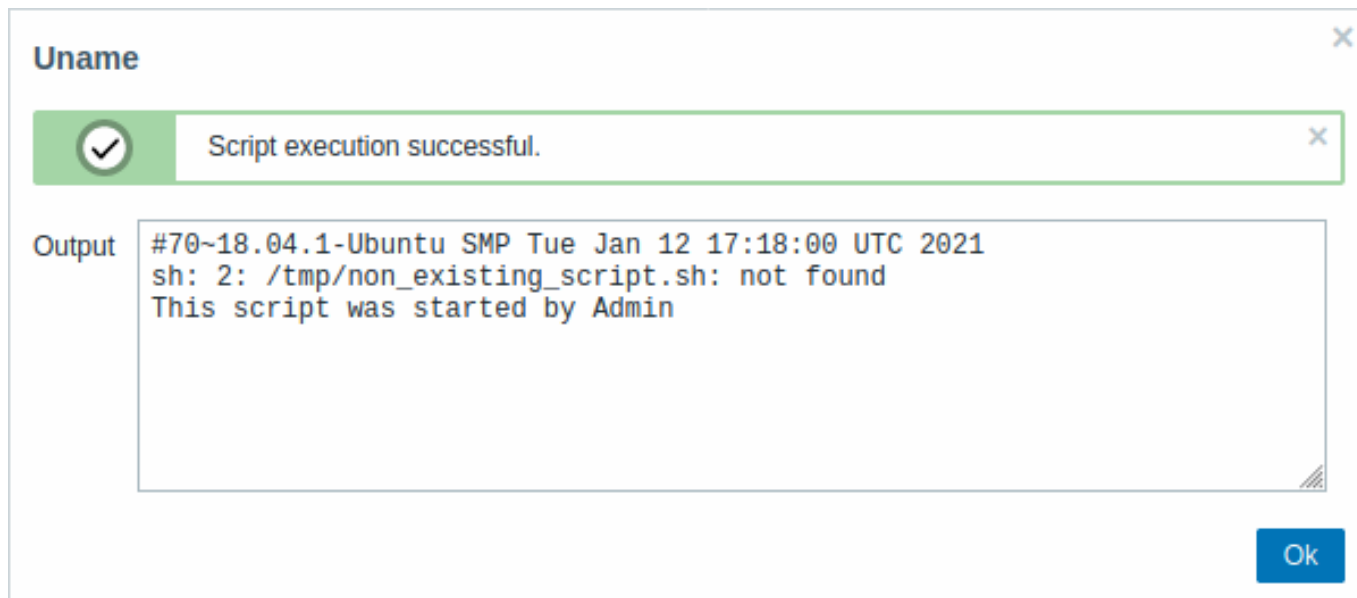

- If the script finishes successfully (**exit code 0**), the return value is limited to 16MB (including trailing whitespace that is truncated).
- If the script exits with an error (non-zero exit code), the return value is a standard error limited to 2KB.

Zabbix does not store extended script output by default. To preserve full output details, you can implement logging within the script itself (e.g., redirect output to a local log file).

Note that for scripts executed either on Zabbix server or Zabbix proxy, [database limits](#) also apply.

Below is an example of a script and the result window:

```
uname -v
/tmp/non_existing_script.sh
echo "This script was started by {USER.USERNAME}"
```

The script result does not display the script itself.

Script timeout

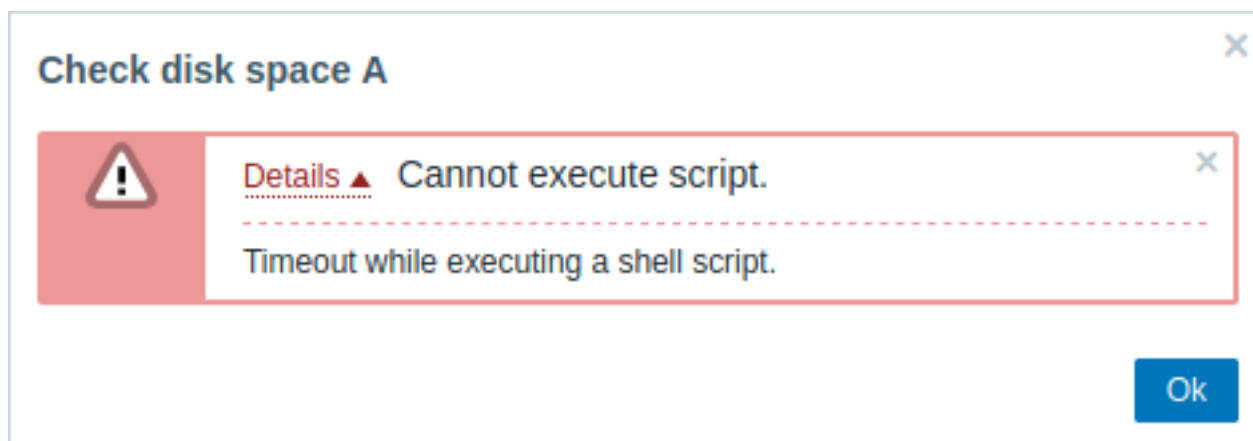

Zabbix agent

You may encounter a situation when a timeout occurs while executing a script.

See an example of a script running on Zabbix agent and the result window below:

```
sleep 5
```

```
df -h
```

The error message, in this case, is the following:

Timeout while executing a shell script.

To avoid such situations, it is advised to optimize the script itself (in the example above, "5") instead of adjusting the Timeout parameter in [Zabbix agent configuration](#) and [Zabbix server configuration](#). However, for Zabbix agent in active mode, the Timeout parameter in [Zabbix server configuration](#) should be at least several seconds longer than the RefreshActiveChecks parameter in [Zabbix agent configuration](#). This ensures that the server has enough time to receive the active check results from the agent. Note that script execution on an active agent is supported since Zabbix agent 7.0.

In case the Timeout parameter has been changed in [Zabbix agent configuration](#), the following error message will appear:

```
Get value from agent failed: ZBX_TCP_READ() timed out.
```

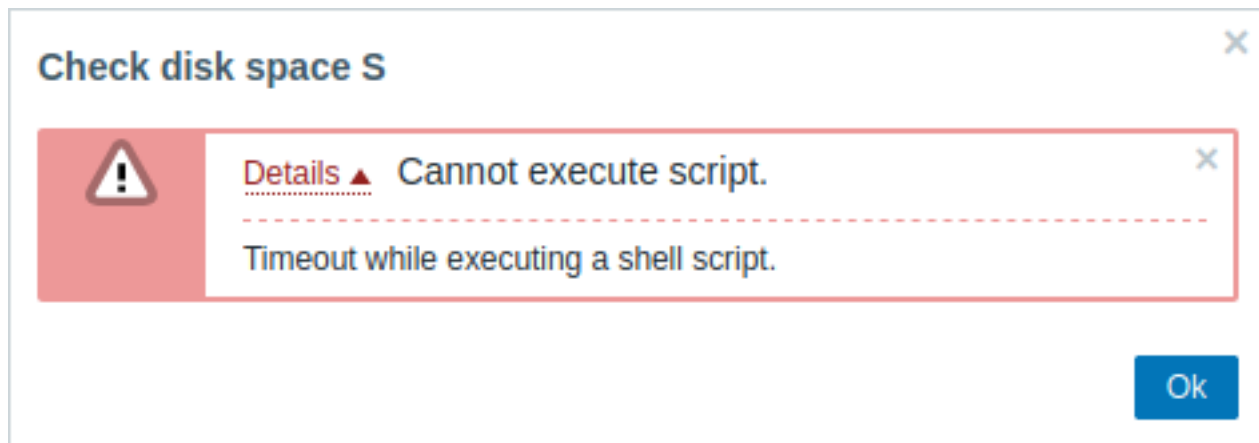

It means that the modification has been made in [Zabbix agent configuration](#), but it is required to modify the Timeout parameter in [Zabbix server configuration](#) as well.

Zabbix server/proxy

See an example of a script running on Zabbix server and the result window below:

```
sleep 11
```

```
df -h
```

It is also advised to optimize the script itself (instead of adjusting TrapperTimeout parameter to a corresponding value (in our case, > 11) by modifying the **Zabbix server configuration**).

8 Users

Overview

This menu features sections that are related to configuring users in Zabbix. This menu is available to **SuperAdmin** user type users only.

1 User groups

Overview

In the *Users* → *User groups* section user groups of the system are maintained.

User groups

A listing of existing user groups with their details is displayed.

Displaying 5 of 5 found

Displayed data:

| Column | Description |
|------------------------|--|
| <i>Name</i> | Name of the user group. Clicking on the user group name opens the user group configuration form . |
| <i>#</i> | The number of users in the group. Clicking on <i>Users</i> will display the respective users filtered out in the user list. |
| <i>Members</i> | Usernames of individual users in the user group (with name and surname in parentheses). Clicking on the username will open the user configuration form. Users from disabled groups are displayed in red. |
| <i>Frontend access</i> | Frontend access level is displayed: System default - users are authenticated by Zabbix, LDAP or HTTP (depending on the authentication method set globally); Internal - users are authenticated by Zabbix; ignored if HTTP authentication is the global default; LDAP - users are authenticated by LDAP; ignored if HTTP authentication is the global default; Disabled - access to Zabbix frontend is forbidden for this group. By clicking on the current level, you can change it. |

| Column | Description |
|-------------------|--|
| <i>Debug mode</i> | Debug mode status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it. |
| <i>Status</i> | User group status is displayed - <i>Enabled</i> or <i>Disabled</i> . By clicking on the status you can change it. |

To configure a new user group, click on the *Create user group* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable* - change the user group status to *Enabled*
- *Disable* - change the user group status to *Disabled*
- *Enable debug mode* - enable debug mode for the user groups
- *Disable debug mode* - disable debug mode for the user groups
- *Delete* - delete the user groups

To use these options, mark the checkboxes before the respective user groups, then click on the required button.

Using filter

You can use the filter to display only the user groups you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of user groups. If you click on it, a filter becomes available where you can filter user groups by name and status.

2 User roles

Overview

In the *Users* → *User roles* section you may create user roles.

User roles allow to create fine-grained permissions based on the initially selected user type (*User*, *Admin*, *Super admin*).

Upon selecting a user type, all available permissions for this user type are granted (checked by default).

Permissions can only be revoked from the subset that is available for the user type; they cannot be extended beyond what is available for the user type.

Checkboxes for unavailable permissions are grayed out; users will not be able to access the element even by entering a direct URL to this element into the browser.

User roles can be assigned to system users. Each user may have only one role assigned.

Default user roles

By default, Zabbix is configured with four user roles, which have a pre-defined set of permissions:

- Guest role
- User role
- Admin role
- Super admin role

These are based on the main user types in Zabbix. The list of all users assigned the respective role is displayed. The users included in disabled groups are stated in red. The *Guest role* is a user-type role with the only permissions to view some frontend sections.

Note:

The default *Super admin role* cannot be modified or deleted, because at least one Super admin user with unlimited privileges must exist in Zabbix. Users of type *Super admin* can modify settings of their own role, but not the user type.

Configuration

To create a new role, click on the *Create user role* button at the top right corner. To update an existing role, click on the role name to open the configuration form.

Available permissions are displayed. To revoke a certain permission, unmark its checkbox.

Available permissions along with the defaults for each pre-configured user role in Zabbix are described below.

Default permissions

Access to UI elements

The default access to menu sections depends on the user type. See the Permissions page for [details](#).

Access to other options

| Parameter | Description | Default user roles | | | |
|--|---|--------------------|------------|-----------|------------|
| | | Super admin role | Admin role | User role | Guest role |
| Default access to new UI elements | This option specifies how new menu sections will be accessible after a Zabbix upgrade. Existing menu sections of modules remain unaffected. | Yes | Yes | Yes | Yes |
| Access to services | | | | | |
| Read-write access to services | Select read-write access to services: None - no access at all All - access to all services is read-write Service list - select services for read-write access | All | All | None | None |
| Read-write access to services with tag | The read-write access, if granted, takes precedence over the read-only access settings and is dynamically inherited by the child services. Specify tag name and, optionally, value to additionally grant read-write access to services matching the tag. This option is available if 'Service list' is selected in the <i>Read-write access to services</i> parameter. The read-write access, if granted, takes precedence over the read-only access settings and is dynamically inherited by the child services. | | | | |
| Read-only access to services | Select read-only access to services: None - no access at all All - access to all services is read-only Service list - select services for read-only access | | | All | All |
| Read-only access to services with tag | The read-only access does not take precedence over the read-write access and is dynamically inherited by the child services. Specify tag name and, optionally, value to additionally grant read-only access to services matching the tag. This option is available if 'Service list' is selected in the <i>Read-only access to services</i> parameter. The read-only access does not take precedence over the read-write access and is dynamically inherited by the child services. | | | | |
| Access to modules | | | | | |

| | | | | | |
|---|--|-----|-----|-----|-----|
| <Module name> | Allow/deny access to a specific module. Only enabled modules are shown in this section. It is not possible to grant or restrict access to a module that is currently disabled. | Yes | Yes | Yes | Yes |
| Default access to new modules | This option specifies how new modules and widgets will be accessible after a Zabbix upgrade. It also applies to modules and widgets added in the <i>Administration > General > Modules</i> section. | | | | |
| Access to API | | | | | |
| Enabled | Enable/disable access to API. | Yes | Yes | Yes | No |
| API methods | <p>Select either <i>Allow list</i> to allow, or <i>Deny list</i> to deny the API methods specified in the search field. Note that it is not possible to allow some API methods and deny others.</p> <p>In the search field, start typing the method name, then select the method from the auto-complete list. You can also press the Select button and select methods from the full list available for this user type. Note that if certain action from the Access to actions block is unchecked, users will not be able to use API methods related to this action.</p> <p>Wildcards are supported. Examples: <code>dashboard.*</code> (all methods of 'dashboard.' API service) <code>*</code> (any method), <code>*.export</code> (methods with '.export' name from all API services).</p> <p>If no methods have been specified the <i>Allow/Deny list</i> rule will be ignored.</p> | | | | |
| Access to actions | | | | | |
| Create and edit dashboards | Clearing this checkbox will also revoke the rights to use <code>.create</code> , <code>.update</code> and <code>.delete</code> API methods for the corresponding elements. | Yes | Yes | Yes | No |
| Create and edit maps | | | | | |
| Create and edit maintenance | | | | No | |
| Add problem comments | Clearing this checkbox will also revoke the rights to perform corresponding action via <code>event.acknowledge</code> API method. | | | Yes | |
| Change severity | | | | | |
| Acknowledge problems | | | | | |
| Suppress problems | | | | | |
| Close problems | | | | | |
| Execute scripts | Clearing this checkbox will also revoke the rights to use the <code>script.execute</code> API method. | | | | |
| Manage API tokens | Clearing this checkbox will also revoke the rights to use all <code>token.</code> API methods. | | | | |
| Manage scheduled reports | Clearing this checkbox will also revoke the rights to use all <code>report.</code> API methods. | | | No | |
| Manage SLA | Enable/disable the rights to manage SLA . | | | | |
| Invoke "Execute now" on read-only hosts | Allow to use the "Execute now" option in latest data for items of read-only hosts. | | | Yes | |

| | |
|-------------------------------|--|
| Change problem ranking | Allow to change the problem ranking from cause to symptom, and vice versa. |
| Default access to new actions | This option specifies how new actions will be accessible after a Zabbix upgrade. |

Displayed data:

| Column | Description |
|------------------------|---|
| <i>Username</i> | Username for logging into Zabbix. Clicking on the username opens the user configuration form . |
| <i>Name</i> | First name of the user. |
| <i>Last name</i> | Second name of the user. |
| <i>User role</i> | User role is displayed. |
| <i>Groups</i> | Groups that the user is a member of are listed. Clicking on the user group name opens the user group configuration form. Disabled groups are displayed in red. |
| <i>Is online?</i> | The on-line status of the user is displayed - <i>Yes</i> or <i>No</i> . The time of last user activity is displayed in parentheses. |
| <i>Login</i> | The login status of the user is displayed - <i>Ok</i> or <i>Blocked</i> . A user can become temporarily blocked upon exceeding the number of unsuccessful login attempts set in the Administration → General → Other section (five by default). By clicking on <i>Blocked</i> you can unblock the user. |
| <i>Frontend access</i> | Frontend access level is displayed - <i>System default</i> , <i>Internal</i> , <i>LDAP</i> , or <i>Disabled</i> , depending on the one set for the whole user group. |
| <i>API access</i> | API access status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the user role. |
| <i>Debug mode</i> | Debug mode status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the whole user group. |
| <i>Status</i> | User status is displayed - <i>Enabled</i> or <i>Disabled</i> , depending on the one set for the whole user group. |
| <i>Provisioned</i> | The date when the user was last provisioned is displayed. |
| <i>Info</i> | Used for users created by JIT provisioning from LDAP/SAML. Information about errors is displayed. A yellow warning is displayed for users without user groups. A red warning is displayed for users without roles, and for users without roles and user groups. |

To configure a new user, click on the *Create user* button in the top right-hand corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Provision now* - update user information from LDAP (this option is only enabled if an [LDAP](#) user is selected)
- *Reset TOTP secret* - reset user TOTP secrets for all TOTP methods and delete the user session (this option is only enabled if [MFA](#) is enabled; for users without TOTP secrets, their session will not be deleted)

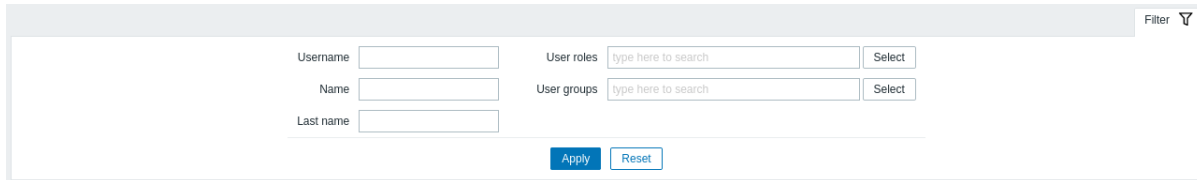

- *Unblock* - re-enable system access to blocked users
- *Delete* - delete the users

To use these options, mark the check-boxes before the respective users, then click on the required button.

Using filter

You can use the filter to display only the users you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of users. If you click on it, a filter becomes available where you can filter users by username, name, last name, user role and user group.

Filter 

Username User roles

4 API tokens

Overview

This section allows to create and manage API tokens.

API tokens ?

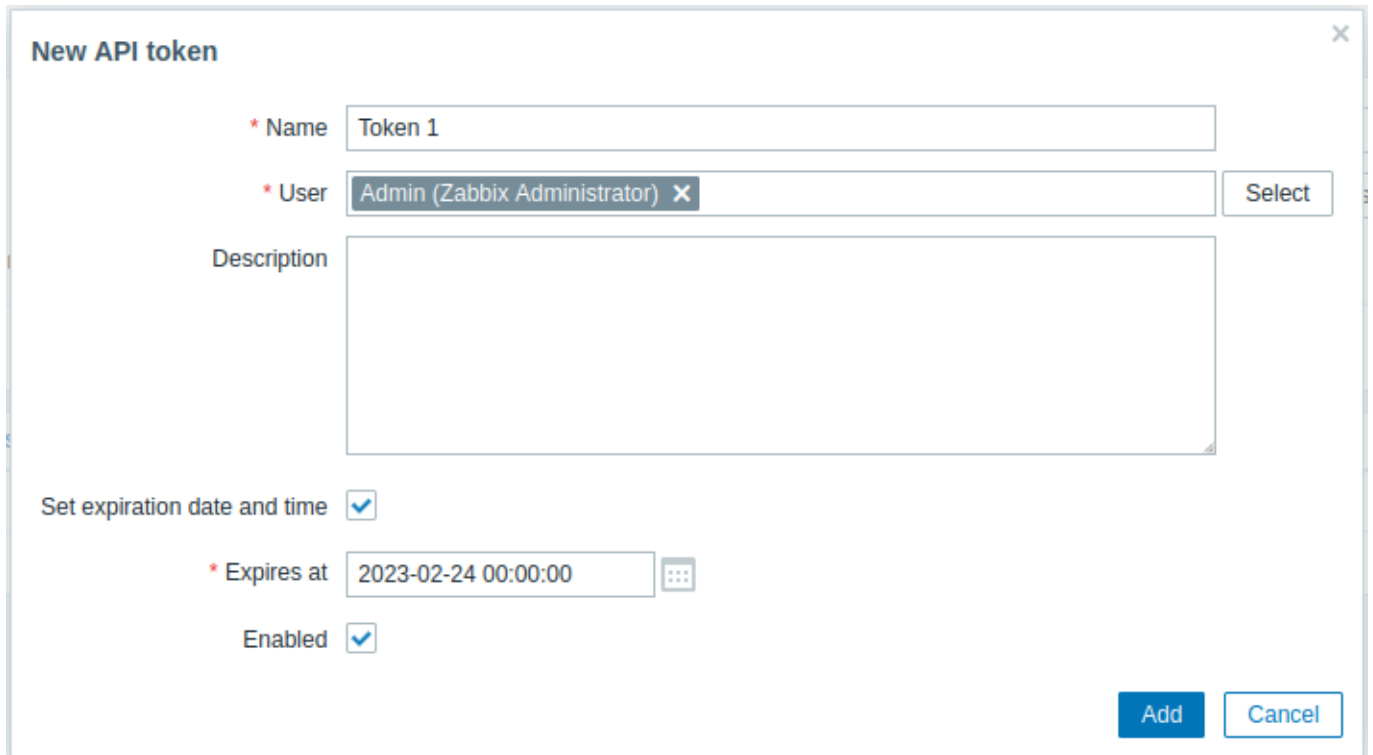

| <input type="checkbox"/> | Name | User | Expires at | Created at | Created by user | Last accessed at | Status |
|--------------------------|---------|------------------------------|---------------------|---------------------|------------------------------|------------------|---------|
| <input type="checkbox"/> | Token | Admin (Zabbix Administrator) | 2023-09-31 00:00:00 | 2022-08-24 14:57:11 | Admin (Zabbix Administrator) | Never | Enabled |
| <input type="checkbox"/> | Token 2 | guest | 2023-09-31 00:00:00 | 2022-08-24 14:57:50 | Admin (Zabbix Administrator) | Never | Enabled |

0 selected Displaying 2 of 2 found

You may filter API tokens by name, users to whom the tokens are assigned, expiry date, users that created tokens, or status (enabled/disabled). Click on the token status in the list to quickly enable/disable a token. You may also mass enable/disable tokens by selecting them in the list and then clicking on the *Enable/Disable* buttons below the list.

To create a new token, press *Create API token* button at the top right corner, then fill out the required fields in the token configuration screen:

New API token 

* Name

* User 

Description

Set expiration date and time ☒

* Expires at 

Enabled ☒

| Parameter | Description |
|-----------|-----------------------|
| Name | Token's visible name. |

| Parameter | Description |
|------------------------------|--|
| User | User the token should be assigned to. To quickly select a user, start typing the username, first or last name, then select the required user from the auto-complete list. Alternatively, you can press the <i>Select</i> button and select a user from the full user list. A token can be assigned only to one user. |
| Description | Optional token description. |
| Set expiration date and time | Unmark this checkbox if a token should not have an expiry date. |
| Expiry date | Click on the calendar icon to select token expiry date or enter the date manually in a format YYYY-MM-DD hh:mm:ss |
| Enabled | Unmark this checkbox if you need to create a token in a disabled state. |

Press Add to create a token. On the next screen, copy and save in a safe place *Auth token* value **before closing the page**, then press Close. The token will appear in the list.

Warning:

Auth token value cannot be viewed again later. It is only available immediately after creating a token. If you lose a saved token you will have to regenerate it and doing so will create a new authorization string.

Click on the token name to edit the name, description, expiry date settings, or token status. Note that it is not possible to change to which user the token is assigned. Press *Update* button to save changes. If a token has been lost or exposed, you may press *Regenerate* button to generate new token value. A confirmation dialog box will appear, asking you to confirm this operation since after proceeding the previously generated token will become invalid.

Users without access to the *Administration* menu section can see and modify details of tokens assigned to them in the *User profile* → *API tokens* **section** only if *Manage API tokens* is allowed in their **user role** permissions.

5 Authentication

Overview

The *Users* → *Authentication* section allows to specify the user authentication method for Zabbix and internal password requirements.

The available authentication methods are internal, HTTP, LDAP, SAML, and MFA authentication.

Default authentication

By default, Zabbix uses **internal** Zabbix authentication for all users.

It is possible to change the default authentication method to **LDAP** system-wide. To do so, navigate to the *LDAP* tab and configure LDAP parameters, then return to the *Authentication* tab and switch the *Default authentication* selector to LDAP.

Note that the authentication method can be fine-tuned on the **user group** level. Even if LDAP authentication is set globally, some user groups can still be authenticated by Zabbix. These groups must have **frontend access** set to Internal.

It is also possible to enable LDAP authentication only for specific user groups, if internal authentication is used globally. In this case LDAP authentication details can be specified and used for specific user groups whose **frontend access** must then be set to LDAP. If a user is included into at least one user group with LDAP authentication, this user will not be able to use the internal authentication method.

HTTP, SAML 2.0, and MFA authentication methods can be used in addition to the default authentication method.

Zabbix supports just-in-time (JIT) provisioning that allows to create user accounts in Zabbix the first time an external user authenticates and provision these user accounts. JIT provisioning is supported for LDAP and SAML.

See also:

- **HTTP authentication**
- **LDAP authentication**
- **SAML authentication**
- **MFA authentication**

Configuration

The *Authentication* tab allows to set the default authentication method, specify a group for deprovisioned users and set password complexity requirements for Zabbix users.

☒ a digit
☒ a special character

Avoid easy-to-guess passwords
?
☒

Configuration parameters:

| Parameter | Description |
|--------------------------------------|--|
| <i>Default authentication</i> | Select the default authentication method for Zabbix - <i>Internal</i> or <i>LDAP</i> . |
| <i>Deprovisioned users group</i> | Specify a user group for deprovisioned users. This setting is required only for JIT provisioning, regarding users that were created in Zabbix from LDAP or SAML systems, but no longer need to be provisioned. A disabled user group must be specified. |
| <i>Minimum password length</i> | By default, the minimum password length is set to 8. Supported range: 1-70. Note that passwords longer than 72 characters will be truncated. |
| <i>Password must contain</i> | Mark one or several checkboxes to require usage of specified characters in a password: <ul style="list-style-type: none"> - an uppercase and a lowercase Latin letter - a digit - a special character |
| <i>Avoid easy-to-guess passwords</i> | <p>Hover over the question mark to see a hint with the list of characters for each option.</p> <p>If marked, a password will be checked against the following requirements:</p> <ul style="list-style-type: none"> - must not contain user's name, surname, or username - must not be one of the common or context-specific passwords. <p>The list of common and context-specific passwords is generated automatically from the list of NCSC "Top 100k passwords", the list of SecLists "Top 1M passwords" and the list of Zabbix context-specific passwords. Internal users will not be allowed to set passwords included in this list as such passwords are considered weak due to their common use.</p> |

Changes in password complexity requirements will not affect existing user passwords, but if an existing user chooses to change a password, the new password will have to meet current requirements. A hint with the list of requirements will be displayed next to the *Password* field in the *user profile* and in the *user configuration form* accessible from the *Users* → *Users* menu.

1 HTTP

Overview

HTTP or web server-based *authentication* (for example: BasicAuthentication, NTLM/Kerberos) can be used to check user names and passwords. Note that a user must exist in Zabbix as well, however its Zabbix password will not be used.

Attention:

Be careful! Make sure that web server authentication is configured and works properly before switching it on.

HTTP authentication can be disabled in the frontend by configuring the corresponding option on the *HTTP settings* tab in the *Users* > *Authentication* section. When HTTP authentication is disabled, the tab with HTTP authentication options will not be displayed in the

frontend. Note that reinstalling the frontend (running setup.php) will reset authentication settings, including HTTP authentication configuration.

Configuration

Authentication

HTTP settings

LDAP settings

SAML settings

MFA settings

Enable HTTP authentication

Default login form

HTTP login form

Remove domain name

comp, any

Case-sensitive login

Configuration parameters:

| Parameter | Description |
|----------------------------|---|
| Enable HTTP authentication | Mark the checkbox to enable HTTP authentication. Hovering the mouse over <div></div> will bring up a hint box warning that in the case of web server authentication, all users (even with frontend access set to LDAP/Internal) will be authenticated by the web server, not by Zabbix. |
| Default login form | Specify whether to direct non-authenticated users to: Zabbix login form - standard Zabbix login page. HTTP login form - HTTP login page. It is recommended to enable web-server based authentication for the index_http.php page only. If Default login form is set to 'HTTP login page' the user will be logged in automatically if web server authentication module will set valid user login in the \$_SERVER variable. Supported \$_SERVER keys are PHP_AUTH_USER, REMOTE_USER, AUTH_USER. |
| Remove domain name | A comma-delimited list of domain names that should be removed from the username. E.g. comp,any - if username is 'Admin@any', 'comp\Admin', user will be logged in as 'Admin'; if username is 'notacompany\Admin', login will be denied. |
| Case-sensitive login | Unmark the checkbox to disable case-sensitive login for usernames (enabled by default). Disabling case-sensitive login allows, for example, to log in as "admin" even if the Zabbix user is "Admin" or "ADMIN". Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: "Authentication failed: supplied credentials are not unique." |

Note:

For internal users who are unable to log in using HTTP credentials (with HTTP login form set as default) leading to the 401 error, you may want to add a ErrorDocument 401 /index.php?form=default line to basic authentication directives, which will redirect to the regular Zabbix login form.

2 LDAP

Overview

External LDAP authentication can be used to check user names and passwords.

Zabbix LDAP authentication works at least with Microsoft Active Directory and OpenLDAP.

If only LDAP sign-in is configured, then the user must also exist in Zabbix, however, its Zabbix password will not be used. If authentication is successful, then Zabbix will match a local username with the username attribute returned by LDAP.

User provisioning

It is possible to configure JIT (just-in-time) **user provisioning** for LDAP users. In this case, it is not required that a user already exists in Zabbix. The user account can be created when the user logs into Zabbix for the first time.

When an LDAP user enters their LDAP login and password, Zabbix checks the default LDAP server if this user exists. If the user exists and does not have an account in Zabbix yet, a new user is created in Zabbix and the user is able to log in.

Attention:

If JIT provisioning is enabled, a user group for deprovisioned users must be specified in the *Authentication* tab.

JIT provisioning also allows to update provisioned user accounts based on changes in LDAP. For example, if a user is moved from one LDAP group to another, the user will also be moved from one group to another in Zabbix; if a user is removed from an LDAP group, the user will also be removed from the group in Zabbix and, if not belonging to any other group, added to the user group for deprovisioned users. Note that provisioned user accounts are updated based on the configured **provisioning period** or when the user logs into Zabbix.

LDAP JIT provisioning is available only when LDAP is configured to use "anonymous" or "special user" for binding. For direct user binding, provisioning will be made only for user login action, because logging in user password is used for such type of binding.

Multiple servers

Several LDAP servers can be defined, if necessary. For example, a different server can be used to authenticate a different user group. Once LDAP servers are configured, in **user group** configuration it becomes possible to select the required LDAP server for the respective user group.

If a user is in multiple user groups and multiple LDAP servers, the first server in the list of LDAP servers sorted by name in ascending order will be used for authentication.

| Parameter | Description |
|-------------|--|
| <i>Name</i> | Name of the LDAP server in Zabbix configuration. |

| Parameter | Description |
|--|--|
| <i>Host</i> | <p>Hostname, IP or URI of the LDAP server. Examples: ldap.example.com, 127.0.0.1, ldap://ldap.example.com</p> <p>For secure LDAP server, use <i>ldaps</i> protocol and hostname. Example: ldaps://ldap.example.com</p> <p>With OpenLDAP 2.x.x and later, a full LDAP URI of the form ldap://hostname:port or ldaps://hostname:port may be used.</p> |
| <i>Port</i> | <p>Port of the LDAP server. Default is 389.</p> <p>For secure LDAP connection port number is normally 636.</p> <p>Not used when using full LDAP URIs.</p> |
| <i>Base DN</i> | <p>Base path to user accounts in LDAP server:</p> <p>ou=Users,ou=system (for OpenLDAP),</p> <p>DC=company,DC=com (for Microsoft Active Directory)</p> <p>uid=%{user},dc=example,dc=com (for direct user binding, see a note below)</p> |
| <i>Search attribute</i> | <p>LDAP account attribute used for search:</p> <p>uid (for OpenLDAP),</p> <p>sAMAccountName (for Microsoft Active Directory)</p> |
| <i>Bind DN</i> | <p>LDAP account for binding and searching over the LDAP server, examples:</p> <p>uid=ldap_search,ou=system (for OpenLDAP),</p> <p>CN=ldap_search,OU=user_group,DC=company,DC=com (for Microsoft Active Directory)</p> <p>Anonymous binding is also supported. Note that anonymous binding potentially opens up domain configuration to unauthorized users (information about users, computers, servers, groups, services, etc.). For security reasons, disable anonymous binds on LDAP hosts and use authenticated access instead.</p> |
| <i>Bind password</i> | LDAP password of the account for binding and searching over the LDAP server. |
| <i>Description</i> | Description of the LDAP server. |
| <i>Configure JIT provisioning</i> | Mark this checkbox to show options related to JIT provisioning. |
| <i>Group configuration</i> | <p>Select the group configuration method:</p> <p>memberOf - by searching users and their group membership attribute</p> <p>groupOfNames - by searching groups through the member attribute</p> <p>Note that memberOf is preferable as it is faster; use groupOfNames if your LDAP server does not support memberOf or group filtering is required.</p> |
| <i>Group name attribute</i> | <p>Specify the attribute to get the group name from all objects in the memberOf attribute (see the <i>User group membership attribute</i> field)</p> <p>The group name is necessary for user group mapping.</p> |
| <i>User group membership attribute</i> | <p>Specify the attribute that contains information about the groups that the user belongs to (e.g. memberOf).</p> <p>For example, the memberOf attribute may hold information like this:</p> <p>memberOf=cn=zabbix-admin,ou=Groups,dc=example,dc=com</p> <p>This field is available only for the memberOf method.</p> |
| <i>User name attribute</i> | Specify the attribute that contains the user's first name. |
| <i>User last name attribute</i> | Specify the attribute that contains the user's last name. |
| <i>User group mapping</i> | <p>Map an LDAP user group pattern to Zabbix user group and user role.</p> <p>This is required to determine what user group/role the provisioned user will get in Zabbix.</p> <p>Click on <i>Add</i> to add a mapping.</p> <p>The <i>LDAP group pattern</i> field supports wildcards. The group name must match an existing group. If an LDAP user matches several Zabbix user groups, the user becomes a member of all of them. If a user matches several Zabbix user roles, the user will get the one with the highest permission level among them.</p> |
| <i>Media type mapping</i> | Map the user's LDAP media attributes (e.g. email) to Zabbix user media for sending notifications. |
| <i>Advanced configuration</i> | Click on the <i>Advanced configuration</i> label to display advanced configuration options (see below). |
| <i>StartTLS</i> | <p>Mark the checkbox to use the StartTLS operation when connecting to LDAP server. The connection will fail if the server doesn't support StartTLS.</p> <p>StartTLS cannot be used with servers that use the <i>ldaps</i> protocol.</p> |
| <i>Search filter</i> | <p>Define a custom string when authenticating a user in LDAP. The following placeholders are supported:</p> <p>%{attr} - search attribute name (uid, sAMAccountName)</p> <p>%{user} - user username value to authenticate</p> <p>For example, to carry out a case-sensitive search within the case-insensitive LDAP or Microsoft Active Directory environment, the string can be defined as follows:</p> <p>(%{attr}:caseExactMatch=%{user}).</p> <p>If the filter is not customized, LDAP will use the default: (%{attr}=%{user}).</p> |

Note:

To configure an LDAP server for **direct user binding**, append an attribute `uid=%{user}` to the *Base DN* parameter (for example, `uid=%{user},dc=example,dc=com`) and leave *BindDN* and *Bind password* parameters empty. When authenticating, a placeholder `%{user}` will be replaced by the username entered during login.

The following fields are specific to "groupOfNames" as the *Group configuration* method:

Group configuration ? memberOf groupOfNames

Group base DN

Group name attribute

Group member attribute

Reference attribute ?

Group filter

| Parameter | Description |
|-------------------------------|--|
| <i>Group base DN</i> | Base path to the groups in LDAP server. |
| <i>Group name attribute</i> | Specify the attribute to get the group name in the specified base path to groups. The group name is necessary for user group mapping. |
| <i>Group member attribute</i> | Specify the attribute that contains information about the members of the group in LDAP (e.g. <code>member</code>). |
| <i>Reference attribute</i> | Specify the reference attribute for the group filter (see the <i>Group filter</i> field). Then use <code>%{ref}</code> in the group filter to get values for the attribute specified here. |
| <i>Group filter</i> | Specify the filter to retrieve the group that the user is member of. For example, <code>(member=uid=%{ref},ou=Users,dc=example,dc=com)</code> will match "User1" if the member attribute of the group is <code>uid=User1,ou=Users,dc=example,dc=com</code> and will return the group that "User1" is a member of. |

Warning:

In case of trouble with certificates, to make a secure LDAP connection (ldaps) work you may need to add a `TLS_REQCERT allow` line to the `/etc/openldap/ldap.conf` configuration file. It may decrease the security of connection to the LDAP catalog.

Note:

It is recommended to create a separate LDAP account (*Bind DN*) to perform binding and searching over the LDAP server with minimal privileges in the LDAP instead of using real user accounts (used for logging in the Zabbix frontend). Such an approach provides more security and does not require changing the *Bind password* when the user changes his own password in the LDAP server.
In the table above it's the *ldap_search* account name.

Testing access

The *Test* button allows to test user access:

| Parameter | Description |
|----------------------|--|
| <i>Login</i> | LDAP user name to test (prefilled with the current user name from Zabbix frontend). This user name must exist in the LDAP server. Zabbix will not activate LDAP authentication if it is unable to authenticate the test user. |
| <i>User password</i> | LDAP user password to test. |

3 SAML

Overview

SAML 2.0 **authentication** can be used to sign in to Zabbix.

If only SAML sign-in is configured, then the user must also exist in Zabbix, however, its Zabbix password will not be used. If authentication is successful, then Zabbix will match a local username with the username attribute returned by SAML.

User provisioning

It is possible to configure JIT (just-in-time) **user provisioning** for SAML users. In this case, it is not required that a user already exists in Zabbix. The user account can be created when the user logs into Zabbix for the first time.

Attention:

If JIT provisioning is enabled, a user group for deprovisioned users must be specified in the *Authentication* tab.

On top of JIT provisioning it is also possible to enable and configure SCIM (System for Cross-domain Identity Management) provisioning - *continuous* user account management for those users that have been created by user provisioning. SCIM provisioning requires a Zabbix **API token** (with Super admin permissions) for authentication into Zabbix.

For example, if a user is moved from one SAML group to another, the user will also be moved from one group to another in Zabbix; if a user is removed from a SAML group, the user will also be removed from the group in Zabbix and, if not belonging to any other group, added to the user group for deprovisioned users.

If SCIM is enabled and configured, a SAML user will be provisioned at the moment the user logs into Zabbix and continuously updated based on changes in SAML. Already existing SAML users will not be provisioned, and only provisioned users will be updated. Note that only valid media will be added to a user when the user is provisioned or updated.

If SCIM is not enabled, a SAML user will be provisioned (and later updated) at the moment the user logs into Zabbix.

Note:

If SAML authentication is enabled, users will be able to choose between logging in locally or via SAML single sign-on. If JIT provisioning is used, then only single sign-on is possible.

Setting up identity provider

In order to work with Zabbix, a SAML identity provider (onelogin.com, auth0.com, okta.com, etc.) needs to be configured in the following way:

- *Assertion Consumer URL* should be set to `<path_to_zabbix_ui>/index_sso.php?acs`
- *Single Logout URL* should be set to `<path_to_zabbix_ui>/index_sso.php?sls`

`<path_to_zabbix_ui>` examples: `https://example.com/zabbix/ui`, `http://another.example.com/zabbix`, `http://<any_public_ip_address>/zabbix`

Setting up Zabbix

Attention:

It is required to install php-openssl if you want to use SAML authentication in the frontend.

To use SAML authentication Zabbix should be configured in the following way:

1. Private key and certificate should be stored in the `ui/conf/certs/`, unless custom paths are provided in `zabbix.conf.php`.

By default, Zabbix will look in the following locations:

- `ui/conf/certs/sp.key` - SP private key file
- `ui/conf/certs/sp.crt` - SP cert file
- `ui/conf/certs/idp.crt` - IDP cert file

2. All of the most important settings can be configured in the Zabbix frontend. However, it is possible to specify additional settings in the **configuration file**.

☒

Configuration parameters, available in the Zabbix frontend:

| Parameter | Description |
|-----------------------------------|---|
| <i>Enable SAML authentication</i> | Mark the checkbox to enable SAML authentication. |
| <i>Enable JIT provisioning</i> | Mark the checkbox to enable JIT user provisioning. |
| <i>IDP entity ID</i> | The unique entity identifier within the SAML identity provider. |
| <i>SSO service URL</i> | The URL users will be redirected to when logging in. |

909

| Parameter | Description |
|-----------------------------------|---|
| <i>SLO service URL</i> | The URL users will be redirected to when logging out. If left empty, the SLO service will not be used. |
| <i>Username attribute</i> | <p>SAML attribute to be used as a username when logging into Zabbix.</p> <p>The list of supported values is determined by the identity provider.</p> <p>Examples:</p> <p>uid</p> <p>userprincipalname</p> <p>samaccountname</p> <p>username</p> <p>userusername</p> <p>urn:oid:0.9.2342.19200300.100.1.1</p> <p>urn:oid:1.3.6.1.4.1.5923.1.1.1.13</p> <p>urn:oid:0.9.2342.19200300.100.1.44</p> |
| <i>SP entity ID</i> | <p>The unique service provider identifier (if not matching, the operation will be rejected).</p> <p>It is possible to specify a URL or any string of data.</p> |
| <i>SP name ID format</i> | <p>Request a particular name ID format in the response.</p> <p>Examples:</p> <p>urn:oasis:names:tc:SAML:2.0:nameid-format:persistent</p> <p>urn:oasis:names:tc:SAML:2.0:nameid-format:unspecified</p> <p>urn:oasis:names:tc:SAML:2.0:nameid-format:transient</p> |
| <i>Sign</i> | <p>Mark the checkboxes to select entities for which SAML signature should be enabled:</p> <p><i>Messages</i></p> <p><i>Assertions</i></p> <p><i>AuthN requests</i></p> <p><i>Logout requests</i></p> <p><i>Logout responses</i></p> |
| <i>Encrypt</i> | <p>Mark the checkboxes to select entities for which SAML encryption should be enabled:</p> <p><i>Name ID</i></p> <p><i>Assertions</i></p> |
| <i>Case-sensitive login</i> | <p>Unmark the checkbox to disable case-sensitive login for usernames (enabled by default). Disabling case-sensitive login allows, for example, to log in as "admin" even if the Zabbix user is "Admin" or "ADMIN".</p> <p>Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: "Authentication failed: supplied credentials are not unique."</p> |
| <i>Configure JIT provisioning</i> | <p>Mark this checkbox to show options related to JIT user provisioning.</p> |
| <i>Group name attribute</i> | Specify the group name attribute for JIT user provisioning. |
| <i>User name attribute</i> | Specify the user name attribute for JIT user provisioning. |
| <i>User last name attribute</i> | Specify the user last name attribute for JIT user provisioning. |
| <i>User group mapping</i> | <p>Map a SAML user group pattern to Zabbix user group and user role.</p> <p>This is required to determine what user group/role the provisioned user will get in Zabbix.</p> <p>Click on <i>Add</i> to add a mapping.</p> <p>The <i>SAML group pattern</i> field supports wildcards. The group name must match an existing group. If a SAML user matches several Zabbix user groups, the user becomes a member of all of them. If a user matches several Zabbix user roles, the user will get the highest permission level among them.</p> |
| <i>Media type mapping</i> | Map the user's SAML media attributes (e.g. email) to Zabbix user media for sending notifications. |
| <i>Enable SCIM provisioning</i> | Mark this checkbox to enable SCIM 2.0 provisioning. |

See examples of configuring SAML identity providers for sign-in and user provisioning into Zabbix with:

- [Microsoft Azure AD](#)
- [Okta](#)
- [Onelogin](#)

Notes on SCIM provisioning

For SCIM provisioning specify the path to the Zabbix frontend and append `api_scim.php` to it, on the identity provider side, i.e.:

`https://<path-to-zabbix-ui>/api_scim.php`

User attributes that are used in Zabbix (username, user name, user lastname and media attributes) need to be added as custom attributes and, if necessary, external namespace should be the same as user schema: `urn:ietf:params:scim:schemas:core:2.0:User`.

Advanced settings

Additional SAML parameters can be configured in the Zabbix frontend configuration file (`zabbix.conf.php`):

- `$SSO['SP_KEY'] = '<path to the SP private key file>';`
- `$SSO['SP_CERT'] = '<path to the SP cert file>';`
- `$SSO['IDP_CERT'] = '<path to the IDP cert file>';`
- `$SSO['SETTINGS']`

Note:

Zabbix uses [OneLogin's SAML PHP Toolkit](#) library (version 3.4.1). The structure of `$SSO['SETTINGS']` section should be similar to the structure used by the library. For the description of configuration options, see official library [documentation](#).

Only the following options can be set as part of `$SSO['SETTINGS']`:

- *strict*
- *baseurl*
- *compress*
- *contactPerson*
- *organization*
- *sp* (only options specified in this list)
 - *attributeConsumingService*
 - *x509certNew*
- *idp* (only options specified in this list)
 - *singleLogoutService* (only one option)
 - * *responseUrl*
 - *certFingerprint*
 - *certFingerprintAlgorithm*
 - *x509certMulti*
- *security* (only options specified in this list)
 - *signMetadata*
 - *wantNameld*
 - *requestedAuthnContext*
 - *requestedAuthnContextComparison*
 - *wantXMLValidation*
 - *relaxDestinationValidation*
 - *destinationStrictlyMatches*
 - *rejectUnsolicitedResponsesWithInResponseTo*
 - *signatureAlgorithm*
 - *digestAlgorithm*
 - *lowercaseUrlencoding*

All other options will be taken from the database and cannot be overridden. The *debug* option will be ignored.

In addition, if Zabbix UI is behind a proxy or a load balancer, the custom *use_proxy_headers* option can be used:

- *false* (default) - ignore the option;
- *true* - use X-Forwarded-* HTTP headers for building the base URL.

If using a load balancer to connect to Zabbix instance, where the load balancer uses TLS/SSL and Zabbix does not, you must indicate 'baseurl', 'strict' and 'use_proxy_headers' parameters as follows:

```
$SSO['SETTINGS'] = [  
    'strict' => false,  
    'baseurl' => 'https://zabbix.example.com/zabbix/',  
    'use_proxy_headers' => true  
];
```

Configuration example:

```
$SSO['SETTINGS'] = [  
    'security' => [  
        'signatureAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#rsa-sha384'
```

```

        'digestAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#sha384',
        // ...
    ],
    // ...
];

```

Frontend configuration with Kerberos/ADFS

The Zabbix frontend configuration file (*zabbix.conf.php*) can be used to configure SSO with Kerberos authentication and ADFS:

```

$SSO['SETTINGS'] = [
    'security' => [
        'requestedAuthnContext' => [
            'urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos',
        ],
        'requestedAuthnContextComparison' => 'exact'
    ]
];

```

In this case, in the SAML configuration *SP name ID* field set:

urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified

4 MFA

Overview

Multi-factor **authentication** (MFA) can be used to sign in to Zabbix, providing an additional layer of security beyond just a username and password.

With MFA, the user must exist in Zabbix, must provide Zabbix credentials when logging in, and must also prove their identity by other means, usually, a code generated by an authenticator app on the user's phone.

Multiple MFA methods are available, allowing users to choose the option that best fits their security requirements and preferences. These methods are Time-Based One-Time Password (TOTP) and Duo Universal Prompt.

Configuration

Configuration parameters:

| Parameter | Description |
|---|--|
| <i>Enable multi-factor authentication</i> | Mark the checkbox to enable multi-factor authentication. |
| <i>Methods</i> | Click <i>Add</i> to configure an MFA method (see method configuration below). |

Method configuration

Method configuration parameters:

| Parameter | Description |
|----------------------|---|
| <i>Type</i> | Select the type of MFA method: TOTP - use an authenticator app to generate time-based one-time passwords; Duo Universal Prompt - use the Duo authentication service to provide multi-factor authentication. |
| <i>Name</i> | Enter a name that is displayed as the account name to all MFA users in authenticator apps (for example, "Zabbix"). |
| <i>Hash function</i> | Select the hash function (SHA-1, SHA-256, or SHA-512) for generating TOTP codes. This parameter is available if the MFA method type is set to "TOTP". Note that choosing SHA-256 or SHA-512 may significantly limit compatibility, as many applications currently do not support these functions. |
| <i>Code length</i> | Select the verification code length (6 or 8). This parameter is available if MFA method type is set to "TOTP". |
| <i>API hostname</i> | Enter the API hostname provided by the Duo authentication service. This parameter is available if MFA method type is set to "Duo Universal Prompt". |
| <i>Client ID</i> | Enter the client ID provided by the Duo authentication service. This parameter is available if MFA method type is set to "Duo Universal Prompt". |
| <i>Client secret</i> | Enter the client secret provided by the Duo authentication service. This parameter is available if MFA method type is set to "Duo Universal Prompt". |

Configuration examples

This section provides examples of configuring MFA using **Time-Based One-Time Password (TOTP)** and **Duo Universal Prompt**.

TOTP

For TOTP, users must verify their identity using an authenticator app (for example, the [Google Authenticator](#) app).

- Go to the MFA settings in Zabbix under *Users* → *Authentication* and enable multi-factor authentication.
- Add a new MFA **method** with the following configuration:
 - Type: TOTP
 - Name: Zabbix TOTP
 - Hash function: SHA-1
 - Code length: 6
- Click the *Add* button and then the *Update* button.
- Go to *Users* → *User groups* and create a new user group with the following **configuration**:
 - Group name: TOTP group
 - Users: Admin
 - Multi-factor authentication: Default (or "Zabbix TOTP" if it is not set as default)
- Log out of Zabbix and log back in using your credentials. Upon successful login, you will be prompted to enroll in MFA, displaying a QR code and a secret key.

Scan this QR code

Please scan and get your verification code displayed in your authenticator app.

Unable to scan? You can use SHA1 secret key to manually configure your authenticator app:
5XYFXAPPPND23DQ77CBFRJMASULEW2MT

Verification code

Sign in

6. Scan the QR code or enter the secret key into the Google Authenticator app. The app will generate a verification code which you should enter to complete the login process.

7. For subsequent logins, retrieve the verification code from the Google Authenticator app and enter it during login.

Duo Universal Prompt

For Duo Universal Prompt, users must verify their identity using the [Duo Mobile](#) authenticator app.

Attention:

The Duo Universal Prompt MFA method requires the installation of the **php-curl** extension, access to Zabbix over HTTPS, and permission for outbound connections to Duo servers. Moreover, if you have **enabled Content Security Policy (CSP) on the web server**, make sure to add "duo.com" to the CSP directive in your virtual host's configuration file.

1. Signup for a free Duo admin account at [Duo Signup](#).
2. Open the Duo Admin Panel, go to *Applications* → *Protect an Application*, search for the *Web SDK* application, and click *Protect*.
3. Note the credentials (Client ID, Client secret, API hostname) required for configuring the MFA method in Zabbix.
4. Go to MFA settings in Zabbix under *Users* → *Authentication* and enable multi-factor authentication.
5. Add a new MFA **method** with the following configuration:
 - Type: Duo Universal Prompt
 - Name: Zabbix Duo
 - API hostname: (use API hostname from Duo)
 - Client ID: (use Client ID from Duo)
 - Client secret: (use Client secret from Duo)
6. Click the *Add* button and then the *Update* button.
7. Go to *Users* → *User groups* and create a new user group with the following **configuration**:
 - Group name: Duo group
 - Users: Admin
 - Multi-factor authentication: Default (or "Zabbix Duo" if it is not set as default)
8. Log out of Zabbix and log back in using your credentials. Upon successful login, you will be prompted to enroll in MFA and redirected to Duo. Complete the Duo setup and verify your user with your phone's Duo app to log in.
9. For subsequent logins, use the appropriate MFA method provided by the Duo app (such as retrieving a verification code, responding to push notifications, or using hard keys), and enter the required information during login.

9 Administration

Overview

The Administration menu is for administrative functions of Zabbix. This menu is available to **SuperAdmin** user type users only.

1 General

Overview

The *Administration* → *General* section contains a number of subsections for setting frontend-related defaults and customizing Zabbix.

The list of available subsections appears upon pressing on *General* in the *Administration* menu section. It is also possible to switch between subsections by using the title dropdown in the top left corner.

GUI

This section provides customization of several frontend-related defaults.

Configuration parameters:

| Parameter | Description |
|---|--|
| <i>Default language</i> | Default language for users who have not specified a language in their profiles and guest users. For more information, see Installation of additional frontend languages . |
| <i>Default time zone</i> | Default time zone for users who have not specified a time zone in their profiles and guest users. |
| <i>Default theme</i> | Default theme for users who have not specified a theme in their profiles and guest users. |
| <i>Limit for search and filter results</i> | Maximum amount of elements (rows) that will be displayed in a web-interface list, for example, in <i>Data collection > Hosts</i> . Note: If set to, for example, '50', only the first 50 elements will be displayed in all affected frontend lists. If some list contains more than fifty elements, the indication of that will be the '+' sign in <i>"Displaying 1 to 50 of 50+ found"</i> . Also, if filtering is used and still there are more than 50 matches, only the first 50 will be displayed. Note that increasing the value of this parameter may lead to decreased performance and increased memory consumption on the web server side. |
| <i>Max number of columns and rows in overview tables</i> | Maximum number of columns and rows to display in the <i>Trigger overview</i> dashboard widget. The same limit applies to both columns and rows. If more rows and/or columns than shown exist, the system will display a warning at the bottom of the table: "Not all results are displayed. Please provide more specific search criteria." |
| <i>Max count of elements to show inside table cell</i> | For entries that are displayed in a single table cell, no more than configured here will be shown. |
| <i>Show warning if Zabbix server is down</i> | This parameter enables a warning message to be displayed in a browser window if the Zabbix server cannot be reached (possibly down). The message remains visible even if the user scrolls down the page. When hovered over, the message is temporarily hidden to reveal the contents underneath it. |
| <i>Working time</i> | This system-wide parameter defines working hours. In graphs, working time is displayed as a white background and non-working time is displayed as gray. See Time period specification page for description of the time format. User macros are supported. |

| Parameter | Description |
|-------------------------------------|---|
| <i>Show technical errors</i> | If checked, all registered users will be able to see technical errors (PHP/SQL). If unchecked, the information is only available to Zabbix Super Admins and users belonging to the user groups with enabled debug mode . |
| <i>Max history display period</i> | Maximum time period for which to display historical data in <i>Monitoring > Latest data</i> , host web scenario information in <i>Monitoring > Hosts</i> , and in the <i>Top items</i> dashboard widget. Allowed range: 24 hours (default) - 1 week. Time suffixes , e.g. 1w (one week), 36h (36 hours), are supported. |
| <i>Time filter default period</i> | Time period to be used in graphs and dashboards by default. Allowed range: 1 minute - 10 years (default: 1 hour). Time suffixes , e.g. 10m (ten minutes), 5w (five weeks), are supported. Note: when a user changes the time period while viewing a graph, this time period is stored as user preference, replacing the global default or a previous user selection. |
| <i>Max period for time selector</i> | Maximum available time period for graphs and dashboards. Users will not be able to visualize older data. Allowed range: 1 year - 10 years (default: 2 years). Time suffixes , e.g. 1y (one year), 365w (365 weeks), are supported. |

Autoregistration

In this section, you can configure the encryption level for active agent autoregistration.

Parameters marked with an asterisk are mandatory.

Configuration parameters:

| Parameter | Description |
|-------------------------|--|
| <i>Encryption level</i> | Select one or both options for encryption level: No encryption - unencrypted connections are allowed PSK - TLS encrypted connections with a pre-shared key are allowed |
| <i>PSK identity</i> | Enter the pre-shared key identity string. This field is only available if 'PSK' is selected as <i>Encryption level</i> . Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use. |
| <i>PSK</i> | Enter the pre-shared key (an even number of hexadecimal characters). Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library. Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952 This field is only available if 'PSK' is selected as <i>Encryption level</i> . |

Timeouts

In this section, it is possible to set global item-type timeouts and network timeouts. All fields in this form are mandatory.

Timeouts for item types

| | |
|--------------------|----------------------------------|
| * Zabbix agent | <input type="text" value="3s"/> |
| * Simple check | <input type="text" value="3s"/> |
| * SNMP agent | <input type="text" value="3s"/> |
| * External check | <input type="text" value="3s"/> |
| * Database monitor | <input type="text" value="3s"/> |
| * HTTP agent | <input type="text" value="3s"/> |
| * SSH agent | <input type="text" value="3s"/> |
| * TELNET agent | <input type="text" value="3s"/> |
| * Script | <input type="text" value="3s"/> |
| * Browser | <input type="text" value="60s"/> |

Network timeouts for UI

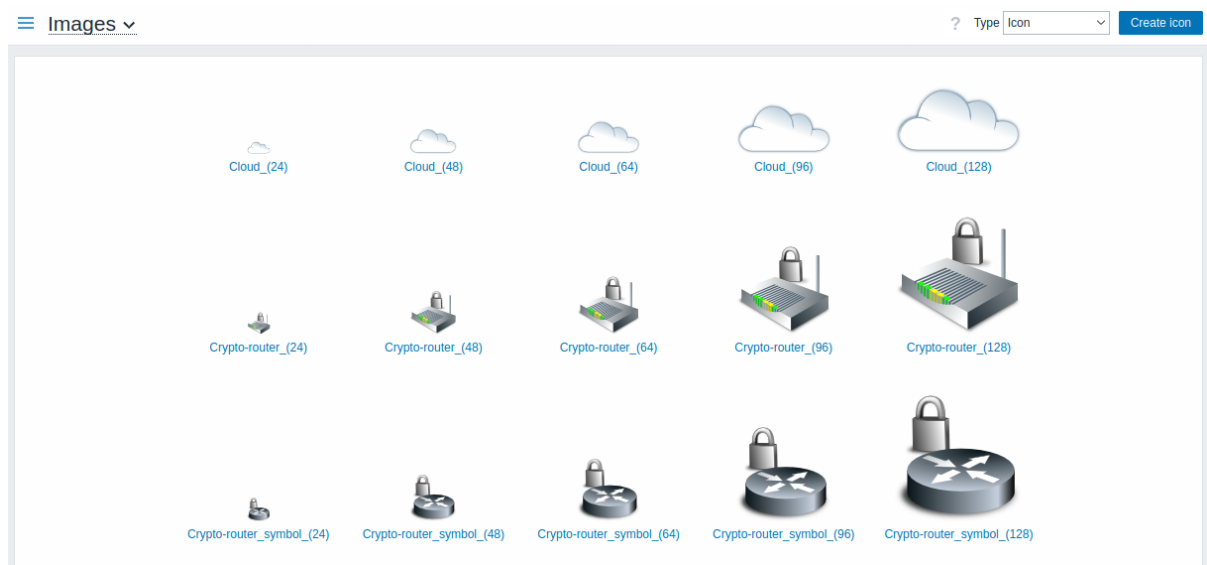

| | |
|-------------------------|----------------------------------|
| * Communication | <input type="text" value="3s"/> |
| * Connection | <input type="text" value="3s"/> |
| * Media type test | <input type="text" value="65s"/> |
| * Script execution | <input type="text" value="60s"/> |
| * Item test | <input type="text" value="60s"/> |
| * Scheduled report test | <input type="text" value="60s"/> |

| Parameter | Description |
|-------------------------|---|
| Timeouts for item types | <p>How many seconds to wait for a response from a monitored item (based on its type). Allowed range: 1 - 600s (default: 3s; default for Browser item type: 60s). Time suffixes, e.g. 30s, 1m, and user macros are supported.</p> <p>Supported item types:</p> <ul style="list-style-type: none"> - Zabbix agent (both passive and active checks) - Simple check (except icmping*, vmware.* items) - SNMP agent (only for SNMP walk[OID] and get[OID] items) - External check - Database monitor - HTTP agent - SSH agent - TELNET agent - Script - Browser <p>Note that if a proxy is used and has timeouts configured, the timeout settings of the proxy will override the global ones. If there are timeouts set for specific items, they will override the proxy and global settings.</p> |
| Network timeouts for UI | |

| Parameter | Description |
|------------------------------|--|
| <i>Communication</i> | How many seconds to wait before closing an idle socket (if a connection to Zabbix server has been established earlier, but frontend cannot finish data reading/sending operation during this time, the connection will be dropped). Allowed range: 1 - 300s (default: 3s). |
| <i>Connection</i> | How many seconds to wait before stopping an attempt to connect to Zabbix server. Allowed range: 1 - 30s (default: 3s). |
| <i>Media type test</i> | How many seconds to wait for a response when testing a media type. Allowed range: 1 - 300s (default: 65s). |
| <i>Script execution</i> | How many seconds to wait for a response when executing a script. Allowed range: 1 - 300s (default: 60s). |
| <i>Item test</i> | How many seconds to wait for returned data when testing an item. Allowed range: 1 - 600s (default: 60s). |
| <i>Scheduled report test</i> | How many seconds to wait for returned data when testing a scheduled report. Allowed range: 1 - 300s (default: 60s). |

Images

The Images section displays all the images available in Zabbix. Images are stored in the database.

The *Type* dropdown allows you to switch between icon and background images:

- Icons are used to display **network map** elements
- Backgrounds are used as background images of network maps

Adding image

You can add your own image by clicking on the *Create icon* or *Create background* button in the top right corner.

Image attributes:

| Parameter | Description |
|-------------|--------------------------|
| <i>Name</i> | Unique name of an image. |

| Parameter | Description |
|---------------|---|
| <i>Upload</i> | Select the file (PNG, JPEG, GIF) from a local system to be uploaded to Zabbix. <i>Note</i> that it may be possible to upload other formats that will be converted to PNG during upload. GD library is used for image processing, therefore formats that are supported depend on the library version used (2.0.28 or higher is required by Zabbix). |

Note:

Maximum size of the upload file is limited by the value of ZBX_MAX_IMAGE_SIZE that is 1024x1024 bytes or 1 MB.

The upload of an image may fail if the image size is close to 1 MB and the `max_allowed_packet` MySQL configuration parameter is at a default of 1MB. In this case, increase the [max_allowed_packet](#) parameter.

Icon mapping

This section allows creating the mapping of certain hosts with certain icons. Host inventory field information is used to create the mapping.

The mappings can then be used in [network map configuration](#) to assign appropriate icons to matching hosts automatically.

To create a new icon map, click on *Create icon map* in the top right corner.

Configuration parameters:

| Parameter | Description |
|------------------------|---|
| <i>Name</i> | Unique name of icon map. |
| <i>Mappings</i> | A list of mappings. The order of mappings determines which one will have priority. You can move mappings up and down the list with drag-and-drop. |
| <i>Inventory field</i> | Host inventory field that will be looked into to seek a match. |
| <i>Expression</i> | Regular expression describing the match. |
| <i>Icon</i> | Icon to use if a match for the expression is found. |
| <i>Default</i> | Default icon to use. |

Regular expressions

This section allows creating custom regular expressions that can be used in several places in the frontend. See [Regular expressions](#) section for details.

Trigger displaying options

This section allows customizing how trigger status is displayed in the frontend and [trigger severity](#) names and colors.

Use custom event status colors ☒

* Unacknowledged PROBLEM events ☒ blinking

* Acknowledged PROBLEM events ☒ blinking

* Unacknowledged RESOLVED events ☒ blinking

* Acknowledged RESOLVED events ☒ blinking

* Display OK triggers for

* On status change triggers blink for

* Not classified

* Information

* Warning

* Average

* High

* Disaster

| Parameter | Description |
|---|---|
| <i>Use custom event status colors</i> | Checking this parameter turns on the customization of colors for acknowledged/unacknowledged problems. |
| <i>Unacknowledged PROBLEM events, Acknowledged PROBLEM events, Unacknowledged RESOLVED events, Acknowledged RESOLVED events</i> | Enter new color code or click on the color to select a new one from the provided palette. If <i>blinking</i> checkbox is marked, triggers will blink for some time upon the status change to become more visible. |
| <i>Display OK triggers for</i> | Time period for displaying OK triggers. Allowed range: 0 - 24 hours. Time suffixes , e.g. 5m, 2h, 1d, are supported. |
| <i>On status change triggers blink for</i> | Length of trigger blinking. Allowed range: 0 - 24 hours. Time suffixes , e.g. 5m, 2h, 1d, are supported. |
| <i>Not classified, Information, Warning, Average, High, Disaster</i> | Custom severity names and/or colors to display instead of system default. Enter new color code or click on the color to select a new one from the provided palette. Note that custom severity names entered here will be used in all locales. If you need to translate them to other languages for certain users, see Customizing trigger severities page. |

This section allows selecting geographical map tile service provider and configuring service provider settings for the Geomap **dashboard widget**. To provide visualization using the geographical maps, Zabbix uses open-source JavaScript interactive maps library Leaflet. Please note that Zabbix has no control over the quality of images provided by third-party tile providers, including the predefined tile providers.

* Tile provider

* Tile URL

* Max zoom level

| Parameter | Description |
|------------------|--|
| Tile provider | Select one of the available tile service providers or select <i>Other</i> to add another tile provider or self-hosted tiles (see Using a custom tile service provider). |
| Tile URL | The URL template (up to 2048 characters) for loading and displaying the tile layer on geographical maps. This field is editable only if <i>Tile provider</i> is set to <i>Other</i> . The following placeholders are supported: {s} represents one of the available subdomains; {z} represents zoom level parameter in the URL; {x} and {y} represent tile coordinates; {r} can be used to add "@2x" to the URL to load retina tiles. Example: https://{s}.example.com/{z}/{x}/{y}{r}.png |
| Attribution text | Tile provider attribution text to be displayed in a small text box on the map. This field is visible only if <i>Tile provider</i> is set to <i>Other</i> . |
| Max zoom level | Maximum zoom level of the map. This field is editable only if <i>Tile provider</i> is set to <i>Other</i> . |

Using a custom tile service provider

The Geomap widget is capable to load raster tile images from a custom self-hosted or a third-party tile provider service. To use a custom third-party tile provider service or a self-hosted tile folder or server, select *Other* in the *Tile provider* field and specify the custom URL in the *Tile URL* field using proper placeholders.

Modules

This section allows to administer custom, as well as built-in **frontend modules**.

≡ Modules

| <input type="checkbox"/> Name ▲ | Version | Author | Description | Status |
|---|---------|-------------|---|---------|
| <input type="checkbox"/> Action log | 1.0 | Zabbix | Displays records about executed action operations (notifications, remote commands). | Enabled |
| <input type="checkbox"/> Clock | 1.0 | Zabbix | Displays local, server, or specified host time. | Enabled |
| <input type="checkbox"/> Custom module | 2.0 | Example.com | Short description of the module. | Enabled |
| <input type="checkbox"/> Data overview | 1.0 | Zabbix | Displays the latest item data and current status of each item for selected hosts. | Enabled |
| <input type="checkbox"/> Discovery status | 1.0 | Zabbix | Displays the status summary of the active network discovery rules. | Enabled |

Click on *Scan directory* to register/unregister any custom modules. Registered modules will appear in the list; unregistered modules will be removed from the list.

Click on the module status in the list to enable/disable a module. You may also mass enable/disable modules by selecting them in the list and then clicking on the *Enable/Disable* buttons below the list.

Click on the module name in the list to view its **details** in a pop-up window.

Update

Reset defaults

| Parameter | Description |
|---|---|
| <i>Frontend URL</i> | URL (up to 2048 characters) to Zabbix web interface. This parameter is used by Zabbix web service for communication with frontend and should be specified to enable scheduled reports. |
| <i>Group for discovered hosts</i> | Hosts discovered by network discovery and agent autoregistration will be automatically placed in the host group, selected here. |
| <i>Default host inventory mode</i> | Default mode for host inventory. It will be followed whenever a new host or host prototype is created by server or frontend unless overridden during host discovery/autoregistration by the <i>Set host inventory mode</i> operation. |
| <i>User group for database down message</i> | User group for sending alarm message or 'None'. Zabbix server depends on the availability of the backend database. It cannot work without a database. If the database is down, selected users can be notified by Zabbix. Notifications will be sent to the user group set here using the enabled user media entries. Notifications are transmitted using the following media types (when enabled): email; SMS; custom alert scripts. Even if a webhook media entry is configured and enabled, it will not trigger notifications. Zabbix server will not stop; it will wait until the database is back again to continue processing. Notification consists of the following content: [MySQL PostgreSQL] database <DB Name> [on <DB Host>:<DB Port>] is not available: <error message depending on the type of DBMS (database)> <DB Host> is not added to the message if it is defined as an empty value and <DB Port> is not added if it is the default value ("0"). The alert manager (a special Zabbix server process) tries to establish a new connection to the database every 10 seconds. If the database is still down the alert manager repeats sending alerts, but not more often than every 15 minutes. |
| <i>Log unmatched SNMP traps</i> | Log SNMP trap if no corresponding SNMP interfaces have been found. |

Authorization

| Parameter | Description |
|--------------------------------|--|
| <i>Login attempts</i> | Number of unsuccessful login attempts before the possibility to log in gets blocked. |
| <i>Login blocking interval</i> | Period of time for which logging in will be prohibited when <i>Login attempts</i> limit is exceeded. Allowed range: 0 - 3600 seconds. Time suffixes , e.g. 90s, 5m, 1h, are supported. |

Storage of secrets

Vault provider parameter allows selecting secret management software for storing **user macro** values. Supported options:

- *HashiCorp Vault* (default)
- *CyberArk Vault*

See also: [Storage of secrets](#).

Security

| Parameter | Description |
|--|---|
| <i>Validate URI schemes</i> | Unmark this checkbox to disable URI scheme validation (enabled by default). If marked, you can specify a comma-separated list of allowed URI schemes (default: http,https,ftp,file,mailto,tel,ssh). Applies to all fields in the frontend where URIs are used (for example, map element URLs). |
| <i>Use X-Frame-Options HTTP header</i> | Unmark this checkbox to disable the HTTP X-Frame-options header (not recommended). If marked, you can specify the value of the HTTP X-Frame-options header. Supported values: SAMEORIGIN (default) or 'self' (must be single-quoted) - the page can only be displayed in a frame on the same origin as the page itself; DENY or 'none' (must be single-quoted) - the page cannot be displayed in a frame, regardless of the site attempting to do so; a string of space-separated hostnames ; adding 'self' (must be single-quoted) to the list allows the page to be displayed in a frame on the same origin as the page itself. Note that using 'self' or 'none' without single quotes will result in them being regarded as hostnames. |
| <i>Use iframe sandboxing</i> | Unmark this checkbox to disable putting the retrieved URL content into sandbox (not recommended). If marked, you can specify the iframe sandboxing exceptions; unspecified restrictions will still be applied. If this field is empty, all sandbox attribute restrictions apply. For more information, see the description of the sandbox attribute. |

2 Audit log

Overview

This section allows configuring audit log settings.

Enable audit logging ☒

Log system actions ☒

Enable internal housekeeping ☒

* Data storage period

Update

Reset defaults

The following parameters are available:

| Parameter | Description |
|-------------------------------------|--|
| <i>Enable audit logging</i> | Enable (default) or disable audit logging. |
| <i>Log system actions</i> | Enable (default) or disable audit logging of low-level discovery, network discovery and autoregistration activities performed by the server (System user). |
| <i>Enable internal housekeeping</i> | Enable (default) or disable internal housekeeping for audit log records. |
| <i>Data storage period</i> | Amount of days audit log records should be kept before being removed by the housekeeper. Mandatory if housekeeping is enabled. Default: 31 days. |

The audit log compression parameters are available in the *Administration > Housekeeping* section, within the *History, trends and audit log compression* block, which becomes visible when **TimescaleDB** is used.

3 Housekeeping

Overview

The housekeeper is a periodical process, executed by Zabbix server. The process removes outdated information and information deleted by user.

Audit log

[Audit settings](#)

Update

Reset defaults

In this section housekeeping tasks can be enabled or disabled on a per-task basis separately for: events and alerts/IT services/user sessions/history/trends. Audit housekeeping settings are available in a separate [menu section](#).

If housekeeping is enabled, it is possible to set for how many days data records will be kept before being removed by the housekeeper.

Deleting an item/trigger will also delete problems generated by that item/trigger.

926

Also, an event will only be deleted by the housekeeper if it is not associated with a problem in any way. This means that if an event is either a problem or recovery event, it will not be deleted until the related problem record is removed. The housekeeper will delete problems first and events after, to avoid potential problems with stale events or problem records.

For history and trends an additional option is available: *Override item history period* and *Override item trend period*. This option allows setting globally for how many days item history/trends will be stored (1 hour to 25 years; or "0"), overriding the respective *Store up to* values set for individual items in the **item configuration** form. Note that the storage period will not be overridden for items that have configuration option *Do not store* enabled.

It is possible to override the history/trend storage period even if internal housekeeping is disabled. Thus, when using an external housekeeper, the history storage period could be set using the history *Data storage period* field.

The *History, trends and audit log compression* block appears if using **TimescaleDB**.

Attention:
If using TimescaleDB, in order to take full advantage of TimescaleDB automatic partitioning of history and trends tables, *Override item history period* and *Override item trend period* options must be enabled as well as *Enable internal house-keeping* option for history and trends. Otherwise, data kept in these tables will still be stored in partitions, however, the housekeeper will not drop outdated partitions, and warnings about incorrect configuration will be displayed. When dropping of outdated partitions is enabled, Zabbix server and frontend will no longer keep track of deleted items, and history for deleted items will be cleared when an outdated partition is deleted.

Time suffixes are supported in the period fields, e.g., 1d (one day), 1w (one week). The minimum is 1 day (1 hour for history), the maximum - 25 years.

The *Reset defaults* button allows reverting any changes made.

4 Proxies

Overview

In the *Administration* → *Proxies* section proxies for **distributed monitoring** can be configured in the Zabbix frontend.

Proxies

A listing of existing proxies with their details is displayed.

6 Macros

Overview

This section allows to define system-wide **user macros** as name-value pairs. Note that macro values can be kept as plain text, secret text or Vault secret. Adding a description is also supported.

| Macro | Value | | Description |
|--|---|--|--|
| <input data-bbox="215 1680 636 1720" type="text" value="{MYSQL_PASSWORD}"/> | <input data-bbox="652 1680 1074 1720" type="text" value="*****"/> | <input data-bbox="1098 1680 1153 1720" type="button" value="🔍"/> | <input data-bbox="1169 1680 1278 1720" type="text" value="description"/> |
| <input data-bbox="215 1742 636 1783" type="text" value="{MYSQL_USERNAME}"/> | <input data-bbox="652 1742 1074 1783" type="text" value="*****"/> | <input data-bbox="1098 1742 1153 1783" type="button" value="🔍"/> | <input data-bbox="1169 1742 1278 1783" type="text" value="description"/> |
| <input data-bbox="215 1805 636 1845" type="text" value="{SECRET_PASSWORD}"/> | <input data-bbox="652 1805 1074 1845" type="text" value="path/to/secret:password"/> | <input data-bbox="1098 1805 1153 1845" type="button" value="🔒"/> | <input data-bbox="1169 1805 1278 1845" type="text" value="description"/> |
| <input data-bbox="215 1868 636 1908" type="text" value="{SECRET_USERNAME}"/> | <input data-bbox="652 1868 1074 1908" type="text" value="path/to/secret:username"/> | <input data-bbox="1098 1868 1153 1908" type="button" value="🔒"/> | <input data-bbox="1169 1868 1278 1908" type="text" value="description"/> |
| <input data-bbox="215 1930 636 1971" type="text" value="{SNMP_COMMUNITY}"/> | <input data-bbox="652 1930 1074 1971" type="text" value="public"/> | <input data-bbox="1098 1930 1153 1971" type="button" value="T"/> | <input data-bbox="1169 1930 1278 1971" type="text" value="description"/> |
| <input data-bbox="215 1993 636 2033" type="text" value="{WORKING_HOURS}"/> | <input data-bbox="652 1993 1074 2033" type="text" value="1-5,09:00-18:00"/> | <input data-bbox="1098 1993 1153 2033" type="button" value="T"/> | <input data-bbox="1169 1993 1278 2033" type="text" value="description"/> |

Add

7 Queue

Overview

In the *Administration* → *Queue* section items that are waiting to be updated are displayed.

Ideally, when you open this section it should all be “green” meaning no items in the queue. If all items are updated without delay, there are none waiting. However, due to lacking server performance, some items may get delayed and the information is displayed in this section. For more details, see the [Queue](#) section.

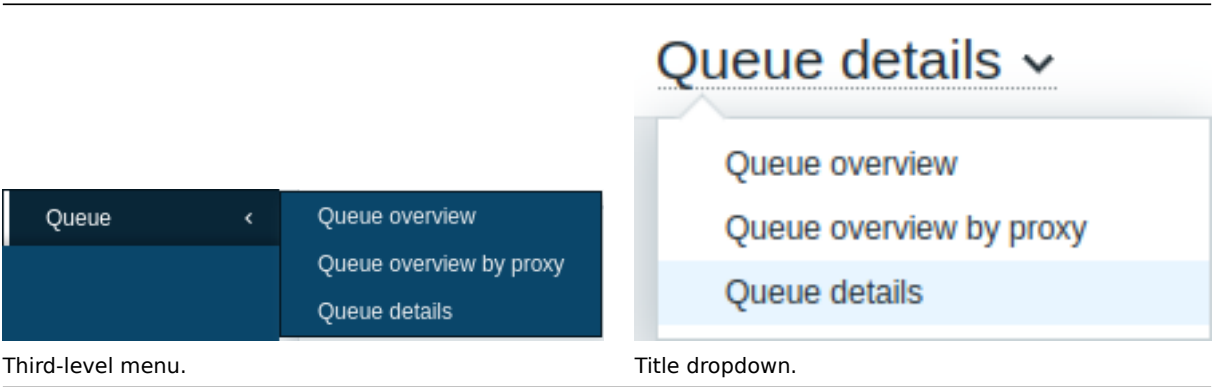

Note:
The Zabbix proxy is not aware of maintenance periods; see [Calculation of queues during maintenance](#) for details.

Note:
The queue is available only if Zabbix server is running. Items are not counted in the queue if the item interface becomes unavailable due to connection problems or agent not working properly.

The *Administration* → *Queue* section contains the following pages:

- Queue overview — displays queue by item type;
- Queue overview by proxy — displays queue by proxy;
- Queue details — displays a list of delayed items.

The list of available pages appears upon pressing on *Queue* in the *Administration* menu section. It is also possible to switch between pages by using a title dropdown in the top left corner.

Overview by item type

In this screen it is easy to locate if the problem is related to one or several item types.

| Queue overview | | | | | | |
|-----------------------|-----------|------------|------------|----------|-----------|----------------------|
| Items | 5 seconds | 10 seconds | 30 seconds | 1 minute | 5 minutes | More than 10 minutes |
| Zabbix agent | 1 | 11 | 1 | 0 | 0 | 0 |
| Zabbix agent (active) | 0 | 0 | 0 | 0 | 0 | 0 |
| Simple check | 0 | 0 | 0 | 0 | 0 | 0 |
| SNMPv1 agent | 0 | 0 | 0 | 0 | 0 | 0 |
| SNMPv2 agent | 0 | 0 | 0 | 0 | 0 | 0 |
| SNMPv3 agent | 0 | 0 | 0 | 0 | 0 | 0 |
| Zabbix internal | 0 | 0 | 0 | 0 | 0 | 0 |
| Zabbix aggregate | 0 | 0 | 0 | 0 | 0 | 0 |
| External check | 0 | 0 | 0 | 0 | 0 | 0 |
| Database monitor | 0 | 0 | 0 | 0 | 0 | 0 |
| HTTP agent | 0 | 0 | 0 | 0 | 0 | 0 |

Each line contains an item type. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

Overview by proxy

In this screen it is easy to locate if the problem is related to one of the proxies or the server.

Queue overview by proxy

| Proxy | 5 seconds | 10 seconds | 30 seconds | 1 minute | 5 minutes | More than 10 minutes |
|--------------|-----------|------------|------------|----------|-----------|----------------------|
| Remote proxy | 0 | 8 | 11 | 0 | 0 | 0 |
| Server | 0 | 0 | 0 | 0 | 0 | 0 |
| Total: 2 | | | | | | |

Each line contains a proxy, with the server last in the list. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

List of waiting items

In this screen, each waiting item is listed.

Queue details

| Scheduled check | Delayed by | Host | Name | Proxy |
|---------------------|------------|---------|--------------------|--------------|
| 2019-09-02 11:46:40 | 58s | My host | CPU idle time | Remote proxy |
| 2019-09-02 11:46:41 | 57s | My host | CPU interrupt time | Remote proxy |
| 2019-09-02 11:46:42 | 56s | My host | CPU iowait time | Remote proxy |
| 2019-09-02 11:46:43 | 55s | My host | CPU nice time | Remote proxy |
| 2019-09-02 11:46:44 | 54s | My host | CPU softirq time | Remote proxy |
| 2019-09-02 11:46:45 | 53s | My host | CPU steal time | Remote proxy |
| 2019-09-02 11:46:46 | 52s | My host | CPU system time | Remote proxy |

Displayed data:

| Column | Description |
|------------------------|---|
| <i>Scheduled check</i> | The time when the check was due is displayed. |
| <i>Delayed by</i> | The length of the delay is displayed. |
| <i>Host</i> | Host of the item is displayed. |
| <i>Name</i> | Name of the waiting item is displayed. |
| <i>Proxy</i> | The proxy name is displayed, if the host is monitored by proxy. |

Possible error messages

You may encounter a situation when no data is displayed and the following error message appears:

Details

Cannot display item queue.

Permission denied.

Error message in this case is the following:

Cannot display item queue. Permission denied

This happens when the PHP configuration parameters in the *zabbix.conf.php* file - `$ZBX_SERVER` or both `$ZBX_SERVER` and `$ZBX_SERVER_PORT` - point to an existing Zabbix server that uses a different database.

3 User settings

Overview

Depending on user role permissions, the *User settings* section may contain the following pages:

- *Profile* or *User profile* - for customizing certain Zabbix frontend features.
- *API tokens* - for managing API tokens assigned to the current user.

The list of available pages appears upon clicking the  user icon near the bottom of the Zabbix menu (not available for the *guest* user). It is also possible to switch between pages by using the title dropdown in the top left corner.

Third-level menu.

Title dropdown.

User profile

The **User profile** section provides options to set a custom interface language, color theme, number of rows displayed in the lists, etc. The changes made here will be applied to the current user only.

The **User** tab allows you to set various user preferences.

| Parameter | Description |
|------------------|--|
| <i>Password</i> | Click on the <i>Change password</i> button to open three fields: <i>Old password</i> , <i>New password</i> , <i>New password (once again)</i> . On a successful password change, the user will be logged out of all active sessions. |
| <i>Language</i> | Note that the password can only be changed for users using Zabbix internal authentication . Select the interface language of your choice or select System default to use default system settings. Selecting <i>English (en_US)</i> will also enable the US time/date format in the frontend. |
| <i>Time zone</i> | For more information, see Installation of additional frontend languages . Select the time zone to override the global time zone on the user level or select System default to use global time zone settings. |
| <i>Theme</i> | Select a color theme specifically for your profile: System default - use default system settings; Blue - standard blue theme; Dark - alternative dark theme; High-contrast light - light theme with high contrast; High-contrast dark - dark theme with high contrast. |

| Parameter | Description |
|--------------------------|--|
| <i>Auto-login</i> | <p>Mark this checkbox to make Zabbix remember you and log you in automatically for 30 days.</p> <p>When logging in with <i>Remember for 30 days</i> enabled:</p> <ul style="list-style-type: none"> - Auto-logout timer is reset (session persists until the 30-day period ends). - Auto-login is enabled on subsequent visits within 30 days. <p>When logging in without <i>Remember for 30 days</i>:</p> <ul style="list-style-type: none"> - Auto-login parameter is cleared. - Auto-logout follows the configured timeout as usual. <p>Browser cookies are used for this.</p> |
| <i>Auto-logout</i> | <p>With this checkbox marked, you will be logged out automatically after the set amount of seconds (minimum 90 seconds, maximum 1 day).</p> <p>Note, that if logging in with <i>Remember for 30 days</i> enabled, the auto-logout timer is overridden, keeping your session active for the full period.</p> <p><i>Time suffixes</i> are supported, for example: 90s, 5m, 2h, 1d.</p> <p>Note that this option will not work in the following cases:</p> <ul style="list-style-type: none"> * When the <i>Monitoring</i> menu pages perform background information refreshes. In case pages that are refreshing data in a specific time interval (dashboards, graphs, latest data, etc.) are left open, the session lifetime is extended, respectively disabling the auto-logout feature. * If logging in with the <i>Remember me for 30 days</i> option checked. <p><i>Auto-logout</i> can also accept "0", meaning that the auto-logout feature becomes disabled after profile settings update.</p> |
| <i>Refresh</i> | <p>Set how often the information on the <i>Monitoring</i> menu pages will be refreshed (minimum 0 seconds, maximum 1 hour).</p> <p><i>Time suffixes</i> are supported, for example: 30s, 90s, 1m, 1h.</p> |
| <i>Rows per page</i> | <p>Set how many rows will be displayed per page in the lists. Fewer rows (and fewer records to display) result in faster loading times.</p> |
| <i>URL (after login)</i> | <p>Set a specific URL to be displayed after login. Instead of the default <i>Dashboards</i>, it can be, for example, the URL of <i>Monitoring</i> → <i>Triggers</i>.</p> |

The **Media** tab allows you to specify *media details* for the user, such as media types and addresses to use and when to use them to deliver notifications.

If the media type has been disabled:

- a yellow info icon is displayed after the name;
- "Disabled" is displayed in the *Status* column.

Note:

Only *Admin* and *Super admin* type *users* can change their own media details.

Note that for provisioned users:

- provisioned user media cannot be deleted;
- provisioned user media can be disabled/enabled;
- such provisioned user media fields as *When active*, *Use if severity* and *Enabled* can be manually edited;
- additional user media can be added (for example, additional email addresses) for provisioned users manually;
- manually added user media can be deleted.

The **Frontend notifications** tab allows you to set *global notifications*.

API tokens

The *API tokens* section allows you to view tokens assigned to the user, edit token details and *create new tokens*. This section is available to a user only if the *Manage API tokens* action is allowed in the *user role* settings.

| | | | | | Filter  |
|--------------------------|---------|---------------------|---------------------|------------------|--|
| <input type="checkbox"/> | Name ▲ | Expires at | Created at | Last accessed at | Status |
| <input type="checkbox"/> | Token 1 | Never | 2021-01-22 18:58:11 | Never | Enabled |
| <input type="checkbox"/> | Token 2 | 2021-01-26 00:00:00 | 2021-01-22 16:13:03 | Never | Enabled |
| | | | | | Displaying 2 of 2 found |

You can filter API tokens by name, expiry date, or status (*Enabled/Disabled*). Click on the token status in the list to quickly enable/disable a token. You can also enable/disable multiple tokens at once by selecting them in the list and then clicking on the *Enable/Disable* buttons below the list.

Attention:

Users cannot view the *Auth token* value of the tokens assigned to them in Zabbix. The *Auth token* value is displayed only once - immediately after creating a token. If the token has been lost, it has to be regenerated.

1 Global notifications

Overview

Global notifications provide a way to display real-time issues directly on your current screen within Zabbix frontend.

Without global notifications, when working outside the *Problems* or *Dashboard* sections, you would not receive any information about current issues. Global notifications ensure that this information is displayed, regardless of your current location within the Zabbix frontend.

Global notifications include both **displaying a message** and **playing a sound**.

Attention:

The autoplay of sounds might be disabled (by default) in recent browser versions. In such cases, you need to enable this setting manually.

Configuration

Global notifications can be enabled per user in the **Frontend notifications** tab of **profile configuration**.

Frontend notifications ☒

Message timeout

Play sound

Trigger severity
☒ Recovery
☒ Not classified
☒ Information
☒ Warning
☒ Average
☒ High
☒ Disaster

Show suppressed problems ☐

| Parameter | Description |
|---------------------------------|---|
| <i>Frontend notifications</i> | Mark the checkbox to enable global notifications. |
| <i>Message timeout</i> | Set the duration for which the message will be displayed. By default, messages remain on the screen for 60 seconds. Time suffixes are supported, for example: 30s, 5m, 2h, 1d. |
| <i>Play sound</i> | Set the duration for which the sound will be played. Once - sound is played once and fully; 10 seconds - sound is repeated for 10 seconds; Message timeout - sound is repeated while the message is visible. |
| <i>Trigger severity</i> | Set the trigger severities for which global notifications and sounds will be activated. You can also select sounds appropriate for various severities. If no severity is marked, no messages will be displayed. Additionally, recovery messages will only be displayed for marked severities. For instance, if <i>Recovery</i> and <i>Disaster</i> are marked, global notifications will be displayed for problems and recoveries of <i>Disaster</i> severity triggers. |
| <i>Show suppressed problems</i> | Mark the checkbox to display notifications for problems that would otherwise be suppressed (not shown) due to host maintenance. |

Global messages displayed

As messages arrive, they are displayed in a floating section on the right-hand side. You can freely reposition this section by dragging the section header.

For this section, several controls are available:

-  **Snooze** button silences the currently active alarm sound;
-  **Mute/Unmute** button switches between playing and not playing the alarm sounds at all.

2 Sound in browsers

Overview

Sound is used in [global notifications](#).

For the sounds to be played in Zabbix frontend, *Frontend notifications* must be enabled in the user profile's *Frontend notifications* tab, with all trigger severities checked. Additionally, sounds should be enabled in the global notification pop-up window.

If, for any reason, audio cannot be played on the device, the  button in the global notification pop-up window will remain permanently in the "mute" state, accompanied by the message "Cannot support notification audio for this device" upon hovering over the  button.

Sounds, including the default audio clips, are supported in MP3 format only.

The sounds of Zabbix frontend have been successfully tested in recent Firefox and Opera browsers on Linux, and in Chrome, Firefox, Microsoft Edge, and Opera browsers on Windows.

Attention:

The autoplay of sounds might be disabled (by default) in recent browser versions. In such cases, you need to enable this setting manually.

4 Global search

It is possible to search Zabbix frontend for hosts, host groups, templates and template groups.

The search input box is located below the Zabbix logo in the menu. The search can be started by pressing *Enter* or clicking on the  search icon.

If there is a host that contains the entered string in any part of the name, a dropdown will appear, listing all such hosts (with the matching part highlighted in orange). The dropdown will also list a host if that host's visible name is a match to the technical name entered as a search string; the matching host will be listed, but without any highlighting.

Searchable attributes

Hosts can be searched by the following properties:

- Host name
- Visible name
- IP address
- DNS name

Templates can be searched by name or visible name. If you search by a name that is different from the visible name (of a template/host), in the search results it is displayed below the visible name in parentheses.

Host and template groups can be searched by name. Specifying a parent group implicitly selects all nested groups.

Search results

Search results consist of four separate blocks for hosts, host groups, templates and template groups.

No data found

It is possible to collapse/expand each individual block. The entry count is displayed at the bottom of each block, for example, *Displaying 13 of 13 found*. If there are no entries, the entry count is not displayed. Total entries displayed within one block are limited to 100.

Each entry provides links to monitoring and configuration data. See the **full list** of links.

For all configuration data (such as items, triggers, graphs) the amount of entities found is displayed by a number next to the entity name, in gray. **Note** that if there are zero entities, no number is displayed.

Enabled hosts are displayed in blue, disabled hosts in red.

Links available

For each entry the following links are available:

5 Frontend maintenance mode

Overview

It is possible to temporarily disable Zabbix frontend to restrict access. This is useful for protecting Zabbix database from user-initiated changes, preserving its integrity.

While Zabbix frontend is in maintenance mode, you can safely stop the database and perform maintenance tasks.

Users from defined IP addresses will be able to interact with the frontend normally during maintenance mode.

Configuration

To enable maintenance mode, open the `maintenance.inc.php` file (located in `/conf` of the Zabbix HTML document directory on the web server) and uncomment the following lines:

```
// Maintenance mode.
define('ZBX_DENY_GUI_ACCESS', 1);

// Array of IP addresses, which are allowed to connect to frontend (optional).
$ZBX_GUI_ACCESS_IP_RANGE = array('127.0.0.1');

// Message shown on warning screen (optional).
$ZBX_GUI_ACCESS_MESSAGE = 'We are upgrading MySQL database till 15:00. Stay tuned...';
```

Note:

In most cases, the `maintenance.inc.php` file is located in `/conf` of the Zabbix HTML document directory on the web server. However, some operating systems and web servers may use a different location.

For example, the location for:

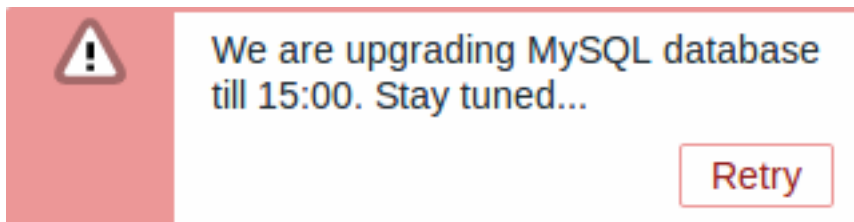

- SUSE and RedHat is `/etc/zabbix/web/maintenance.inc.php`.
- Debian-based systems is `/usr/share/zabbix/conf/`.

See also [Copying PHP files](#).

| Parameter | Details |
|--------------------------------|---|
| ZBX_DENY_GUI_ACCESS | If defined with any value, maintenance mode will be enabled. To disable maintenance mode, comment out or delete. |
| ZBX_GUI_ACCESS_IP_RANGE | Array of IP addresses, which are allowed to connect to the frontend (optional). For example: <code>array('192.168.1.1', '192.168.1.2')</code> |
| ZBX_GUI_ACCESS_MESSAGE | Message to inform users about the maintenance (optional). If undefined, the default message <i>'Zabbix is under maintenance'</i> will be used. |

Display

Users will see the following screen when trying to access Zabbix frontend while in maintenance mode. The screen is refreshed every 30 seconds in order to return to a normal state without user intervention when the maintenance is over.

IP addresses defined in `ZBX_GUI_ACCESS_IP_RANGE` will be able to access the frontend as usual.

6 Page parameters**Overview**

Most Zabbix web interface pages support various HTTP GET parameters that control what will be displayed. They may be passed by specifying `parameter=value` pairs after the URL, separated from the URL by a question mark (?) and from each other by ampersands (&).

Monitoring > Problems

The following parameters are supported:

| Parameter | Description | Example |
|-------------------|--|--------------------------------|
| <code>show</code> | Filter option <i>Show</i> . Possible values: 1 - recent problems; 2 - all; 3 - in problem state. | <code>show=1</code> |
| <code>name</code> | Filter option <i>Problem</i> : freeform string. | <code>name=Zabbix agent</code> |

| Parameter | Description | Example |
|-------------------------------------|---|--|
| <i>severities</i> | Filter option <i>Severity</i> : array of selected severities in the format <i>severities[*]=*</i> (replace * with severity level). Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. | <i>severities[3]=3</i> |
| <i>inventory</i> <i>evaltype</i> | Filter option <i>Host inventory</i> : array of inventory fields <i>[field]</i> , <i>[value]</i> Filter option <i>Tags</i> , tag filtering strategy. Possible values: 0 - and/or; 2 - or. | <i>inventory[0][field]=type&inventory[0][evaltype]=0</i> |
| <i>tags</i> | Filter option <i>Tags</i> : array of defined tags <i>[tag]</i> , <i>[operator]</i> , <i>[value]</i> Possible operator values: 0 - contains; 1 - equals; 2 - does not contain; 3 - does not equal; 4 - exists; 5 - does not exist. | <i>tags[0][tag]=target&tags[0][operator]=0</i> |
| <i>show_tags</i> | Filter option <i>Show tags</i> . Possible values: 0 - none; 1 - one; 2 - two; 3 - three. | <i>show_tags=3</i> |
| <i>tag_name_format</i> | Filter option <i>Tag name</i> . Possible values: 0 - full name; 1 - shortened name; 2 - none. | <i>tag_name_format=1</i> |
| <i>tag_priority</i> | Filter option <i>Tag display priority</i> : comma-separated string of tag display priority | <i>tag_priority=customer, target</i> |
| <i>show_suppressed</i> | Filter option <i>Show suppressed problems</i> . Possible values: 1 - show; 2 - do not show. | <i>show_suppressed=1</i> |
| <i>acknowledgement_status</i> | Filter option <i>Acknowledgement status</i> . Possible values: 0 - all; 1 - unacknowledged; 2 - acknowledged. | <i>acknowledgement_status=0</i> |
| <i>acknowledged_by_me</i> | Filter option <i>By me</i> ; supported only with <i>acknowledgement_status=2</i> . | <i>acknowledged_by_me=1</i> |
| <i>compact_view</i> | Filter option <i>Compact view</i> . Possible values: 0 - disabled; 1 - enabled. | <i>compact_view=1</i> |

| Parameter | Description | Example |
|----------------------------|---|------------------------------------|
| <i>highlight_row</i> | Filter option <i>Highlight whole row</i> ; supported only with <code>compact_view=1</code> . | <code>highlight_row=1</code> |
| <i>filter_name</i> | Possible values: 0 - disabled; 1 - enabled. Filter properties option <i>Name</i> : freeform string | <code>filter_name=Databases</code> |
| <i>filter_show_counter</i> | Filter properties option <i>Show number of records</i> . | <code>filter_show_counter=1</code> |
| <i>filter_custom_time</i> | Possible values: 0 - disabled; 1 - enabled. Filter properties option <i>Set custom time period</i> . | <code>filter_custom_time=1</code> |
| <i>sort</i> | Possible values: 0 - disabled; 1 - enabled. Column to sort by. | <code>sort=clock</code> |
| <i>sortorder</i> | Possible values: clock - sort by <i>Time</i> column; host - sort by <i>Host</i> column; severity - sort by <i>Severity</i> column; name - sort by <i>Problem</i> column. Sort order of results. | <code>sortorder=DESC</code> |
| <i>age_state</i> | Possible values: DESC - descending; ASC - ascending. Filter option <i>Age less than</i> ; supported only with <code>show=3</code> . | <code>age_state=1</code> |
| <i>age</i> | Possible values: 0 - disable age parameter; 1 - enable age parameter. Filter option <i>Age less than</i> : integer, number of days; supported only with <code>age_state=1</code> and <code>show=3</code> . | <code>age=7</code> |
| <i>groupids</i> | Filter option <i>Host groups</i> : array of host group IDs. | <code>groupids[]=4</code> |
| <i>hostids</i> | Filter option <i>Hosts</i> : array of host IDs | <code>hostids[]=10084</code> |
| <i>triggerids</i> | Filter option <i>Triggers</i> : array of trigger IDs | <code>triggerids[]=22382</code> |
| <i>show_timeline</i> | Filter option <i>Show timeline</i> ; not supported with <code>compact_view=1</code> . | <code>show_timeline=1</code> |
| <i>details</i> | Possible values: 0 - do not show; 1 - show. Filter option <i>Show details</i> . | <code>details=1</code> |
| <i>from</i> | Possible values: 0 - do not show; 1 - show. Date range start, can be relative (e.g., <code>now-1m</code>); supported only with <code>filter_custom_time=1</code> | <code>from=now-2h</code> |
| <i>to</i> | Date range end, can be relative (e.g., <code>now-1m</code>); supported only with <code>filter_custom_time=1</code> | <code>to=now</code> |

See also: Problems page [filter options](#).

Kiosk mode

The kiosk mode in supported frontend pages can be activated using URL parameters. For example, in dashboards:

- `/zabbix.php?action=dashboard.view&kiosk=1` - activate kiosk mode
- `/zabbix.php?action=dashboard.view&kiosk=0` - activate normal mode

Slideshow

It is possible to activate a slideshow in the dashboard:

- `/zabbix.php?action=dashboard.view&slideshow=1` - activate slideshow

7 Definitions

Overview

While many things in the frontend can be configured using the frontend itself, some customizations are currently only possible by editing a definitions file.

This file is `defines.inc.php` located in `/include` of the Zabbix HTML document directory.

Parameters

Parameters in this file that could be of interest to users:

- `ZBX_MIN_PERIOD`

Minimum graph period, in seconds. One minute by default.

- `GRAPH_YAXIS_SIDE_DEFAULT`

Default location of Y axis in simple graphs and default value for drop down box when adding items to custom graphs. Possible values: 0 - left, 1 - right.

Default: 0

- `ZBX_SESSION_NAME`

String used as the name of the Zabbix frontend session cookie.

Default: `zbx_sessionid`

- `ZBX_DATA_CACHE_TTL`

TTL timeout in seconds used to invalidate data cache of **Vault response**. Set 0 to disable Vault response caching.

Default: 60

- `SUBFILTER_VALUES_PER_GROUP`

Number of subfilter values per group (For example, in the **latest data** subfilter).

Default: 1000

- `ZBX_MAX_WIDGET_LINES`

Maximum number of widget lines to display.

Default: 1000

8 Creating your own theme

Overview

By default, Zabbix provides a number of predefined themes. You may follow the step-by-step procedure provided here in order to create your own. Feel free to share the result of your work with Zabbix community if you created something nice.

Step 1

To define your own theme you'll need to create a CSS file and save it in the `assets/styles/` folder (for example, *custom-theme.css*). You can either copy the files from a different theme and create your theme based on it or start from scratch.

Step 2

Add your theme to the list of themes returned by the `APP::getThemes()` method. You can do this by overriding the `ZBase::getThemes()` method in the APP class. This can be done by adding the following code before the closing brace in `include/classes/core/APP.php`:

```
public static function getThemes() {
    return array_merge(parent::getThemes(), [
        'custom-theme' => _('Custom theme')
    ]);
}
```

Attention:

Note that the name you specify within the first pair of quotes must match the name of the theme file without extension.

To add multiple themes, just list them under the first theme, for example:

```
public static function getThemes() {
    return array_merge(parent::getThemes(), [
        'custom-theme' => _('Custom theme'),
        'anothertheme' => _('Another theme'),
        'onemoretheme' => _('One more theme')
    ]);
}
```

Note that every theme except the last one must have a trailing comma.

Note:

To change graph colors, the entry must be added in the *graph_theme* database table.

Step 3

Activate the new theme.

In Zabbix frontend, you may either set this theme to be the default one or change your theme in the user profile.

Enjoy the new look and feel!

9 Debug mode

Overview

Debug mode may be used to diagnose performance problems with frontend pages.

Configuration

Debug mode can be activated for individual users who belong to a user group:

- when configuring a **user group**;
- when viewing configured **user groups**.

When *Debug mode* is enabled for a user group, its users will see a *Debug* button in the lower right corner of the browser window:

Clicking on the *Debug* button opens a new window below the page contents which contains the SQL statistics of the page, along with a list of API calls and individual SQL statements:

***** Script profiler *****

Total time: 0.249825

Total SQL time: 0.139814

SQL count: 143 (selects: 117 | executes: 26)

Peak memory usage: 6M

Memory limit: 128M

1. **hostgroup.get** [latest.php:124]

Parameters:

Array

(

[output] => Array

(

[0] => groupid

Result:

Array

(

[4] => Array

(

[groupid] => 4

Hide debug

In case of performance problems with the page, this window may be used to search for the root cause of the problem.

Warning:

Enabled *Debug mode* negatively affects frontend performance.

10 Cookies used by Zabbix

Overview

This page provides a list of cookies used by Zabbix.

| Name | Description | Values | Expires/Max-Age | HttpOnly ¹ | Secure ² |
|----------------------|---|--------------------|---|-----------------------|---------------------|
| ZBX_SESSION_NAME | Stores frontend session data, stored as JSON encoded by base64 | | Session (expires when the browsing session ends) | + | + |
| tab | Active tab number; this cookie is only used on pages with multiple tabs (e.g. <i>Host</i> , <i>Trigger</i> or <i>Action</i> configuration page) and is created, when a user navigates from a primary tab to another tab (such as <i>Tags</i> or <i>Dependencies</i> tab). 0 is used for the primary tab. | Example: 1 | Session (expires when the browsing session ends) | - | - |
| browserwarningignore | Whether a warning about using an outdated browser should be ignored. | yes | Session (expires when the browsing session ends) | - | - |
| system-message-ok | A message to show as soon as page is reloaded. | Plain text message | Session (expires when the browsing session ends) or as soon as page is reloaded | + | - |
| system-message-error | An error message to show as soon as page is reloaded. | Plain text message | Session (expires when the browsing session ends) or as soon as page is reloaded | + | - |

Note:

Forcing 'HttpOnly' flag on Zabbix cookies by a webserver directive is not supported.

Footnotes

¹ When `HttpOnly` is 'true' the cookie will be made accessible only through the HTTP protocol. This means that the cookie won't be accessible by scripting languages, such as JavaScript. This setting can effectively help to reduce identity theft through XSS attacks (although it is not supported by all browsers).

² Secure indicates that the cookie should only be transmitted over a secure HTTPS connection from the client. When set to 'true', the cookie will only be set if a secure connection exists.

11 Time zones

Overview

The frontend time zone can be set globally in the frontend and adjusted for individual users.

If *System* is selected, the web server time zone will be used for the frontend (including the value of 'date.timezone' of php.ini, if set), while Zabbix server will use the time zone of the machine it is running on.

Note:

Zabbix server will only use the specified global/user time zone when expanding macros in notifications (e.g. {EVENT.TIME} can expand to a different time zone per user) and for the time limit when notifications are sent (see "When active" setting in user [media configuration](#)).

The choice of time zone does not affect the frontend time/date format. Instead, you may adjust the interface language (either at installation or under [user settings](#)) - selecting *English (en_US)* will also enable the US time/date format in the frontend.

Configuration

The global time zone:

- can be set manually when [installing](#) the frontend
- can be modified in *Administration* → *General* → *GUI*

User-level time zone:

- can be set when [configuring/updating](#) a user
- can be set by each user in their [user profile](#)

See also: [Aligning time zones when using scheduling intervals](#).

12 Resetting password

Overview This section describes the steps for resetting user passwords in Zabbix.

Steps Turn to your Zabbix administrator if you have forgotten your Zabbix password and cannot log in.

A Super administrator user can change passwords for all users in the user **configuration form**.

If a Super administrator has forgotten their password and cannot log in, the following SQL query must be run to apply the default password to the Super admin user (replace 'Admin' with the appropriate Super admin username):

```
UPDATE users SET passwd = '$2a$10$ZXIvHAEP2ZM.dLXTm6uPHOMV1ARXX7cqjbhM6Fn0cANzkCQBWpMrS' WHERE username =
```

After running this query, the user password will be set to *zabbix*. Make sure to change the default password on the first login.

13 Time period selector

Overview

The *Time period* selector allows to select often required periods with one mouse click. It can be expanded or collapsed by clicking the *Time period* tab in the top right corner.

Options such as *Today*, *This week*, etc., display the whole period, including the hours/days in the future. Options such as *Today so far*, *This week so far*, etc., display only the hours passed.

Once a period is selected, it can be moved back and forth in time by clicking the   arrow buttons. The *Zoom out* button allows to zoom out the period by 50% in each direction.

Note:

For **graphs**, selecting the displayed time period is also possible by highlighting an area in the graph with the left mouse button. Once you release the left mouse button, the graph will zoom into the highlighted area. Zooming out is also possible by double-clicking in the graph.

The *From/To* fields display the selected period in either absolute time syntax (in format Y-m-d H:i:s) or relative time syntax. A relative time period can contain one or several mathematical operations (- or +), for example, *now-1d* or *now-1d-2h+5m*.

The following relative time abbreviations are supported:

- *now*
- *s* (seconds)
- *m* (minutes)
- *h* (hours)
- *d* (days)
- *w* (weeks)
- *M* (months)
- *y* (years)

Precision is supported in the *Time period* selector (for example, /M in *now-1d/M*). Details of precision:

| Precision | From | To |
|-----------|----------------|----------------|
| m | Y-m-d H:m:00 | Y-m-d H:m:59 |
| h | Y-m-d H:00:00 | Y-m-d H:59:59 |
| d | Y-m-d 00:00:00 | Y-m-d 23:59:59 |

| Precision | From | To |
|-----------|-------------------------------------|---------------------------------------|
| w | Monday of the week 00:00:00 | Sunday of the week 23:59:59 |
| M | First day of the month 00:00:00 | Last day of the month 23:59:59 |
| y | 1st of January of the year 00:00:00 | 31st of December of the year 23:59:59 |

It is also possible to select a time period using the *Date picker*. To open it, click the calendar icon next to the *From*/*To* fields.

Note:

Within the date picker, you can navigate between year/month/date using Tab, Shift+Tab, and keyboard arrow buttons. Pressing Enter confirms the selection.

Examples

| From | To | Selected period |
|----------|----------|--|
| now/d | now/d | 00:00 - 23:59 today |
| now/d | now/d+1d | 00:00 today - 23:59 tomorrow |
| now/w | now/w | Monday 00:00:00 - Sunday 23:59:59 this week |
| now-1y/w | now-1y/w | The week of Monday 00:00:00 - Sunday 23:59:59 one year ago |

Attention:

Using "now/M+1M" for the *To* parameter may add 31 days, which can result in the date shifting by 1-3 days depending on the number of days in the month. For example, if used in January, the result may be 02 March instead of the expected 28 February. To avoid this issue, use "now/M-3d+1M/M", which adjusts for month length accurately. Similarly, if configuring *From* to go backward, use "now/M+3d-1M/M".

19 Best practices

Overview This section outlines best practices for setting up Zabbix.

While these practices are not mandatory for Zabbix to operate, implementing them is highly recommended for optimal and secure usage experience.

1 Security best practices

Overview

This section contains best practices for setting up Zabbix in a secure way.

The practices in this section are not required for the functioning of Zabbix but are recommended for better system security.

UTF-8 encoding

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings.

Windows installer paths

When using Windows installers, it is recommended to use the default paths provided by the installer. Using custom paths without proper permissions could compromise the security of the installation.

Zabbix Security Advisories and CVE database

See [Zabbix Security Advisories and CVE database](#).

1 Access control

Overview

This section contains best practices for setting up access control in a secure way.

Principle of least privilege

User accounts, at all times, should run with as few privileges as possible. This means that user accounts in Zabbix frontend, database users, or the user for Zabbix server/proxy/agent processes should only have the privileges that are essential for performing the intended functions.

Attention:

Giving extra privileges to the 'zabbix' user will allow it to access configuration files and execute operations that can compromise the infrastructure security.

When configuring user account privileges, Zabbix **frontend user types** should be considered. Note that although the *Admin* user type has fewer privileges than the *Super Admin* user type, it can still manage configuration and execute custom scripts.

Note:

Some information is available even for non-privileged users. For example, while *Alerts* → *Scripts* is available only for *Super Admin* users, scripts can also be retrieved through Zabbix API. In this case, limiting script permissions and excluding sensitive information from scripts (for example, access credentials) can help avoid exposing sensitive information available in global scripts.

Secure user for Zabbix agent

By default, Zabbix server and Zabbix agent processes share one 'zabbix' user. To ensure that Zabbix agent cannot access sensitive details in the server configuration (for example, database login information), the agent should be run as a different user:

1. Create a secure user.
2. Specify this user in the agent configuration file **User** parameter.
3. Restart the agent with administrator privileges. Privileges will be dropped to the specified user.

Revoke write access to SSL configuration (Windows)

If you have compiled Zabbix agent on Windows, with OpenSSL located in an unprotected directory (e.g., c:\openssl-64bit, C:\OpenSSL-Win64-111-static, or C:\dev\openssl), make sure to revoke write access from non-administrator users to this directory. Otherwise, the agent loads SSL settings from a path that can be modified by unprivileged users, resulting in a potential security vulnerability.

Hardening security of Zabbix components

Some functionality can be switched off to harden the security of Zabbix components:

- global script execution on Zabbix server can be disabled by setting `EnableGlobalScripts=0` in server configuration;

- global script execution on Zabbix proxy is disabled by default (can be enabled by setting `EnableRemoteCommands=1` in proxy configuration);
- global script execution on Zabbix agents is disabled by default (can be enabled by adding an `AllowKey=system.run[<command>,*]` parameter for each allowed command in agent configuration);
- user HTTP authentication can be disabled by setting `$ALLOW_HTTP_AUTH=false` in the frontend configuration file (`zabbix.conf.php`). Note that reinstalling the frontend (running `setup.php`) will remove this parameter.

1 Securing MySQL/MariaDB

Overview

This section contains best practices for securing a MySQL/MariaDB database.

Note:

For a basic setup, see the default [MySQL/MariaDB database creation](#) instructions, which include creating the 'zabbix' user with full privileges on the Zabbix database. This user is the database owner that also has the necessary privileges for modifying the database structure when [upgrading](#) Zabbix.

To improve security, creating additional database roles and users with minimal privileges is recommended. These roles and users should be configured based on the [principle of least privilege](#), that is, they should only have privileges that are essential for performing the intended functions.

Creating user roles

Create the following roles with the corresponding privileges:

- **zbx_srv** - role for running Zabbix server and proxy:

```
CREATE ROLE 'zbx_srv';
GRANT DELETE, INSERT, SELECT, UPDATE ON zabbix.* TO 'zbx_srv';
FLUSH PRIVILEGES;
```

- **zbx_web** - role for running Zabbix frontend and API:

```
CREATE ROLE 'zbx_web';
GRANT DELETE, INSERT, SELECT, UPDATE ON zabbix.* TO 'zbx_web';
FLUSH PRIVILEGES;
```

- **zbx_bckp** - role for table backup:

```
CREATE ROLE 'zbx_bckp';
GRANT LOCK TABLES, TRIGGER, SELECT ON zabbix.* TO 'zbx_bckp';
GRANT process ON *.* TO 'zbx_bckp';
FLUSH PRIVILEGES;
```

Note:

Table restoration and upgrade should be performed by the database owner.

- **zbx_part** - role with a reduced set of privileges for database partitioning; note that this role can be created only after the database has been created, as it grants privileges on specific database tables:

```
CREATE ROLE 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_uint TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_str TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_text TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_log TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.trends TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.trends_uint TO 'zbx_part';
-- For MariaDB: skip the next line (GRANT session_variables_admin ON *.* TO 'zbx_part');
GRANT session_variables_admin ON *.* TO 'zbx_part';
GRANT SELECT ON zabbix.dbversion TO 'zbx_part';
GRANT SELECT, DELETE ON zabbix.housekeeper TO 'zbx_part';
FLUSH PRIVILEGES;
```

After creating roles, they can be assigned to users.

Assigning user roles

To assign the created user roles, create users and assign the relevant roles to them. Replace <user>, <host>, <role>, and <password> as necessary.

```
CREATE USER '<user>'@'<host>' IDENTIFIED BY '<password>';
GRANT '<role>' TO '<user>'@'<host>';
SET DEFAULT ROLE '<role>' TO '<user>'@'<host>';
-- For MariaDB: SET DEFAULT ROLE '<role>' FOR '<user>'@'<host>'
FLUSH PRIVILEGES;
```

For example, to create and assign the role for running Zabbix server and proxy:

```
CREATE USER 'usr_srv'@'localhost' IDENTIFIED BY 'password';
GRANT 'zbx_srv' TO 'usr_srv'@'localhost';
SET DEFAULT ROLE ALL TO 'usr_srv'@'localhost';
FLUSH PRIVILEGES;
```

2 Securing PostgreSQL/TimescaleDB

Overview

This section contains best practices for securing a PostgreSQL database.

Note:

For a basic setup, see the default **PostgreSQL database creation** instructions, which include creating the 'zabbix' user with full privileges on the Zabbix database. This user is the database owner that also has the necessary privileges for modifying the database structure when **upgrading** Zabbix.

To improve security, configuring a secure schema usage pattern, as well as creating additional database roles and users with minimal privileges is recommended. These roles and users should be configured based on the **principle of least privilege**, that is, they should only have privileges that are essential for performing the intended functions.

Database setup

Create the user that will be the database owner, and create the Zabbix database; the database owner is the user that is specified on database creation:

```
createuser -U postgres -h localhost --pwprompt usr_owner
createdb -U postgres -h localhost -O usr_owner -E Unicode -T template0 zabbix
```

Note:

A clean install or upgrade of the database has to be performed by the database owner. This is because the right to drop a database object or alter its definition is a privilege that is inherent to the database owner and cannot be granted or revoked.

Attention:

The following commands on this page must be executed while the connection to PostgreSQL is made specifically to the zabbix database.

Create the zabbix schema and set the database owner (usr_owner) to be the owner of this schema:

```
CREATE SCHEMA zabbix AUTHORIZATION usr_owner;
```

Configure a secure schema **usage pattern**:

```
REVOKE CREATE ON SCHEMA public FROM PUBLIC;
REVOKE ALL ON DATABASE zabbix FROM PUBLIC;
-- Note: search_path should point to the "zabbix" schema:
ALTER ROLE ALL IN DATABASE zabbix SET search_path = "zabbix";
```

After setting up the database, proceed to creating user roles.

Creating user roles

Create the following roles with the corresponding privileges:

- **zbx_srv** - role for running Zabbix server and proxy:

```
CREATE ROLE zbx_srv;
GRANT CONNECT ON DATABASE zabbix TO zbx_srv;
GRANT USAGE ON SCHEMA zabbix TO zbx_srv;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT DELETE, INSERT, SELECT, UPDATE ON TABLES TO zbx_srv;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT, UPDATE, USAGE ON SEQUENCES TO zbx_srv;
```

- **zbx_web** - role for running Zabbix frontend and API:

```
CREATE ROLE zbx_web;
GRANT CONNECT ON DATABASE zabbix TO zbx_web;
GRANT USAGE ON SCHEMA zabbix TO zbx_web;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT DELETE, INSERT, SELECT, UPDATE ON TABLES TO zbx_web;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT, UPDATE, USAGE ON SEQUENCES TO zbx_web;
```

- **zbx_bckp** - role for table backup:

```
CREATE ROLE zbx_bckp;
GRANT CONNECT ON DATABASE zabbix TO zbx_bckp;
GRANT USAGE ON SCHEMA zabbix TO zbx_bckp;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT ON TABLES TO zbx_bckp;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT, UPDATE, USAGE ON SEQUENCES TO zbx_bckp;
```

Note:

Table restoration is possible only by the database owner.

After creating roles, they can be assigned to users.

Assigning user roles

To assign the created user roles, create users and assign the relevant roles to them. Replace <user>, <role>, and <password> as necessary.

```
CREATE USER <user> WITH ENCRYPTED password '<password>';
GRANT <role> TO <user>;
```

For example, to create and assign the role for running Zabbix server and proxy:

```
CREATE USER usr_srv WITH ENCRYPTED password 'password';
GRANT zbx_srv TO usr_srv;
```

Database partitioning with TimescaleDB

Database partitioning is facilitated by TimescaleDB. To utilize TimescaleDB, Zabbix server requires database owner privileges.

If the PostgreSQL zabbix schema has already been created in the zabbix database, you can enable TimescaleDB with the following command:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb WITH SCHEMA zabbix CASCADE;" | sudo -u postgres psql zabbix
```

2 Cryptography

Overview

This section contains best practices for setting up cryptography in a secure way.

Setting up SSL for Zabbix frontend

On RHEL-based systems, install the mod_ssl package:

```
dnf install mod_ssl
```

Create a directory for SSL keys:

```
mkdir -p /etc/httpd/ssl/private
chmod 700 /etc/httpd/ssl/private
```

Create the SSL certificate:

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout /etc/httpd/ssl/private/apache-selfsigned.key -out /etc/httpd/ssl/private/apache-selfsigned.crt
```

Fill out the prompts appropriately. The most important line is the one that requests the Common Name. You must enter the domain name you want to be associated with your server. You can enter the public IP address instead if you do not have a domain name.

```
Country Name (2 letter code) [XX]:
State or Province Name (full name) []:
Locality Name (eg, city) [Default City]:
Organization Name (eg, company) [Default Company Ltd]:
Organizational Unit Name (eg, section) []:
Common Name (eg, your name or your server's hostname) []:example.com
Email Address []:
```

Edit the Apache SSL configuration file (/etc/httpd/conf.d/ssl.conf):

```
DocumentRoot "/usr/share/zabbix"
ServerName example.com:443
SSLCertificateFile /etc/httpd/ssl/apache-selfsigned.crt
SSLCertificateKeyFile /etc/httpd/ssl/private/apache-selfsigned.key
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

3 Web server

Overview

This section contains best practices for setting up the web server in a secure way.

Enabling Zabbix on root directory of URL

On RHEL-based systems, add a virtual host to Apache configuration (/etc/httpd/conf/httpd.conf) and set a permanent redirect for document root to Zabbix SSL URL. Note that `example.com` should be replaced with the actual name of the server.

Add lines:

```
<VirtualHost *:*>
    ServerName example.com
    Redirect permanent / https://example.com
</VirtualHost>
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Enabling HTTP Strict Transport Security (HSTS) on the web server

To protect Zabbix frontend against protocol downgrade attacks, we recommend enabling the [HSTS](#) policy on the web server.

To enable the HSTS policy for your Zabbix frontend in Apache configuration, follow these steps:

1. Locate your virtual host's configuration file:

- /etc/httpd/conf/httpd.conf on RHEL-based systems
- /etc/apache2/sites-available/000-default.conf on Debian/Ubuntu

2. Add the following directive to your virtual host's configuration file:

```
<VirtualHost *:*>
    Header set Strict-Transport-Security "max-age=31536000"
</VirtualHost>
```

3. Restart the Apache service to apply the changes:

On RHEL-based systems:

```
systemctl restart httpd.service
```

On Debian/Ubuntu

```
systemctl restart apache2.service
```

Enforcing Secure and SameSite session cookies in Zabbix

When configuring Zabbix, it is essential to enforce secure and SameSite attributes for session cookies to enhance security and prevent cross-site request forgery (CSRF) attacks. However, enforcing SameSite=Strict may cause issues in certain scenarios, such as:

- Dashboard URL widgets displaying “user not logged in” when embedding same-domain iframes.
- Users accessing the dashboard via HTTP instead of HTTPS may face login issues.
- Inability to share URLs to specific Zabbix menu sections or hosts.

To mitigate these issues, users should have a way to adjust the SameSite policy.

1. Secure cookies

Setting the secure flag ensures that cookies are only transmitted over HTTPS, preventing exposure over unencrypted connections.

To enable secure cookies in Zabbix, add or modify the following setting in the web server configuration:

For Apache:

```
Header always edit Set-Cookie ^(.*)$ $1;Secure
```

For Nginx:

```
proxy_cookie_path / "/; Secure";
```

Ensure that your Zabbix frontend is accessed via HTTPS; otherwise, cookies with the Secure flag will not be sent.

2. Configuring the SameSite attribute

Web server settings can also enforce the SameSite attribute:

For Apache:

```
<IfModule mod_headers.c>
    Header onsuccess edit Set-Cookie (.*) "$1; SameSite=Strict"
</IfModule>
```

For Nginx (version 1.19.3+):

```
proxy_cookie_flags ~ samesite=Strict; # Replace ~ with 'zbx_session' for specificity
```

Enabling Content Security Policy (CSP) on the web server

To protect Zabbix frontend against Cross Site Scripting (XSS), data injection, and similar attacks, we recommend enabling Content Security Policy on the web server. To do so, configure the web server to return the [HTTP header](#).

Attention:

The following CSP header configuration is only for the default Zabbix frontend installation and for cases when all content originates from the site's domain (excluding subdomains). A different CSP header configuration may be required if you are, for example, configuring the [URL](#) widget to display content from the site's subdomains or external domains, switching from *OpenStreetMap* to another map engine, or adding external CSS or widgets. If you're using the Duo Universal Prompt [multi-factor authentication](#) method, make sure to add “duo.com” to the CSP directive in your virtual host's configuration file.

To enable CSP for your Zabbix frontend in Apache configuration, follow these steps:

1. Locate your virtual host's configuration file:

- /etc/httpd/conf/httpd.conf on RHEL-based systems
- /etc/apache2/sites-available/000-default.conf on Debian/Ubuntu

2. Add the following directive to your virtual host's configuration file:

```
<VirtualHost *:*>
    Header set Content-Security-Policy: "default-src 'self' *.openstreetmap.org; script-src 'self' 'unsafe-inline' 'unsafe-eval'"
</VirtualHost>
```

3. Restart the Apache service to apply the changes:

```
#### On RHEL-based systems:
systemctl restart httpd.service
```

```
#### On Debian/Ubuntu
systemctl restart apache2.service
```

Disabling web server information exposure

To improve security, disabling all web server signatures is recommended.

By default, the web server is exposing the software signature:

▼ **Response Headers** [view source](#)

```
Cache-Control: no-store, no-cache, must-revalidate
Connection: Keep-Alive
Content-Encoding: gzip
Content-Length: 1160
Content-Type: text/html; charset=UTF-8
Keep-Alive: timeout=5, max=100
Pragma: no-cache
Server: Apache/2.4.18 (Ubuntu)
```

The signature can be disabled by adding the following parameters to the Apache configuration file:

```
ServerSignature Off
ServerTokens Prod
```

PHP signature (X-Powered-By HTTP header) can be disabled by changing the `php.ini` configuration file (by default, the signature is disabled):

```
expose_php = Off
```

Web server restart is required for configuration file changes to be applied.

For additional security, you can use the `mod_security` tool with Apache (package `libapache2-mod-security2`). This tool allows removing the server signature instead of removing only the version from the server signature. The server signature can be changed to any value by setting "SecServerSignature" to any desired value after installing `mod_security`.

Please refer to the documentation of your web server to find help on how to remove/change software signatures.

Disabling web server default error pages

To avoid information exposure, disabling the default error pages is recommended.

By default, a web server uses built-in error pages:

Not Found

The requested URL /custom-text was not found on this server.

Apache/2.4.18 (Ubuntu) Server at localhost Port 80

These default error pages should be replaced/removed. For example, the "ErrorDocument" directive can be used to define a custom error page/text for the Apache web server.

Please refer to the documentation of your web server to find help on how to replace/remove default error pages.

Removing web server test page

To avoid information exposure, removing the web server test page is recommended.

By default, the Apache web server webroot contains the `index.html` test page:

Apache2 Ubuntu Default Page

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should replace this file (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Please refer to the documentation of your web server to find help on how to remove default test pages.

Set X-Frame-Options HTTP response header

By default, Zabbix is configured with the *Use X-Frame-Options HTTP header* parameter set to `SAMEORIGIN`. This means that content can only be loaded in a frame that has the same origin as the page itself.

Zabbix frontend elements that pull content from external URLs (namely, the URL **dashboard widget**) display retrieved content in a sandbox with all sandboxing restrictions enabled.

These settings enhance the security of the Zabbix frontend and provide protection against XSS and clickjacking attacks. *Super admin* users can **modify** the *Use iframe sandboxing* and *Use X-Frame-Options HTTP header* parameters as needed. Please carefully weigh the risks and benefits before changing default settings. Turning iframe sandboxing or X-Frame-Options HTTP header off completely is not recommended.

Hiding the file with list of common passwords

To increase the complexity of password brute force attacks, limiting access to the `ui/data/top_passwords.txt` file is recommended. This file contains a list of the most common and context-specific passwords and prevents users from setting such passwords (if the *Avoid easy-to-guess passwords* parameter is enabled in the **password policy**).

To limit access to the `top_passwords.txt` file, modify your web server configuration.

On Apache, file access can be limited using the `.htaccess` file:

```
<Files "top_passwords.txt">
    Order Allow,Deny
    Deny from all
</Files>
```

On NGINX, file access can be limited using the `location` directive:

```
location = /data/top_passwords.txt {
    deny all;
    return 404;
}
```

2 Configuration best practices

Overview This section outlines best practices for configuring Zabbix to achieve optimal performance and ease of use. The recommendations are based on the advice of Zabbix developers and practical experience of Zabbix trainers and support engineers.

Every Zabbix installation is unique and some of these guidelines might not be suitable for your specific configuration. However, it is recommended to try to adhere to these guidelines as much as possible to avoid common potential issues.

Note:

If you believe this page could be improved, we'd love to hear from you! Please highlight the text in question and press **ctrl+Enter** to report a mistake or share your feedback.

Hosts and items Defining a host

A host in Zabbix is not a physical machine or device, but a logical entity. For monitoring purposes, you can create separate hosts for a database or, for example, a virtual machine. Alternatively, you can create a generic host *John's laptop* and monitor all metrics under that host.

The best practice is to create a separate host for each independent instance such as a virtual machine, a database, a container, or a network switch. By utilizing this approach, you will:

1. Avoid clutter in the monitoring data by having separate items, triggers, and alert notifications for each host.
2. Fine-tune user-access levels. You can configure **user-roles** to grant access to viewing and/or configuring only specific hosts. See also **the principle of least privilege**.

Hosts with duplicated items

If you have several similar hosts, such as *Network switch 1* and *Network switch 2*, Zabbix provides multiple ways to quickly recreate the host. You can simply clone a host with all of its metrics by pressing the Clone button, but in this case, to update an item later, you will need to do it manually on each host.

The best practice is to create a template with all of the required metrics, for example, *Network switch template*. Then group the similar hosts into a host group, for the example above it could be *Network switches*. Now, in the *Data Collection -> Hosts* section you can filter all hosts by host group and use the *Mass update* button to link the template to all of your network switches.

Dependent items

To minimize the number of requests to the target entity, Zabbix allows the creation of master and dependent items. In this case, the master item collects a large set of information in a single request. Then dependent items can be configured to extract specific pieces of data from that collection via preprocessing and store them as individual metrics.

For example, the master item might collect a JSON or XML response containing multiple metrics or execute a database query that returns multiple columns of data (e.g., number of open connections, aborted connections, maximum allowed simultaneous connections, and total cumulative connections since startup), and dependent items will parse and store each required value separately.

The best practice for this configuration is to discard master item's history right after collection and only keep the dependent items data.

Servers and proxies If all hosts are in the same local network as the Zabbix server and there are no scalability or performance concerns, you may not need a proxy. In larger or more complex environments, directly monitoring hosts with the Zabbix server may not be sufficient. Adding a proxy and assigning part of the hosts to that proxy allows for a more even load distribution.

The best practice is to add a Zabbix proxy when:

1. You are monitoring multiple hosts using various metric collection methods behind a firewall. The proxy will gather data from the hosts and forward it to the Zabbix server, reducing the need for opening multiple firewall ports.
2. You are monitoring remote locations, branches, and/or networks. In case of a network interruption between the Zabbix server and your remote locations, the Zabbix proxies deployed in the remote locations will continue data collection and send the collected data back to the Zabbix server whenever the network connection is restored.
3. You have a large-scale deployment and want to reduce the load on Zabbix server and improve performance. The definition of a large-scale deployment is very broad and depends not only on the number of hosts, but also on the number of values collected per second.

20 API

Overview The Zabbix API allows you to programmatically retrieve and modify configuration of Zabbix and provides access to historical data. It is widely used to:

- create new applications to work with Zabbix;
- integrate Zabbix into a third-party software;
- automate routine tasks.

The Zabbix API is an HTTP-based API, and it is shipped as a part of the web frontend. It uses the JSON-RPC 2.0 protocol, which means two things:

- the API consists of a set of separate methods;
- requests and responses between the clients and the API are encoded using the JSON format.

For more information about the protocol and JSON, see the [JSON-RPC 2.0 specification](#) and the [JSON format homepage](#).

For more information about integrating Zabbix functionality into your Python applications, see the [zabbix_utils](#) Python library for Zabbix API.

Structure The API consists of a number of methods that are nominally grouped into separate APIs. Each of the methods performs one specific task. For example, the `host.create` method belongs to the `host` API and is used to create new hosts. Historically, APIs are sometimes referred to as “classes”.

Note:

Most APIs contain at least four methods: `get`, `create`, `update` and `delete` for retrieving, creating, updating and deleting data respectively, but some APIs may provide a totally different set of methods.

Performing requests Once you have set up the frontend, you can use remote HTTP requests to call the API. To do that, you need to send HTTP POST requests to the `api_jsonrpc.php` file located in the frontend directory. For example, if your Zabbix frontend is installed under `https://example.com/zabbix`, an HTTP request to call the `apiinfo.version` method may look like this:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"apiinfo.version","params":{},"id":1}'
```

The request must have the `Content-Type` header set to one of these values: `application/json-rpc`, `application/json` or `application/jsonrequest`.

The request object contains the following properties:

- `jsonrpc` - the version of the JSON-RPC protocol used by the API (Zabbix API implements JSON-RPC version 2.0);
- `method` - the API method being called;
- `params` - the parameters that will be passed to the API method;
- `id` - an arbitrary identifier of the request.

If the request is correct, the response returned by the API should look like this:

```
{
  "jsonrpc": "2.0",
  "result": "7.2.0",
  "id": 1
}
```

The response object, in turn, contains the following properties:

- `jsonrpc` - the version of the JSON-RPC protocol;
- `result` - the data returned by the method;
- `id` - an identifier of the corresponding request.

Example workflow The following section will walk you through some examples of usage in a greater detail.

Authentication To access any data in Zabbix, you need to either:

- use an existing **API token** (created in Zabbix frontend or using the **Token API**);
- use an authentication token obtained with the **user.login** method.

For example, if you wanted to obtain a new authentication token by logging in as a standard *Admin* user, then a JSON request would look like this:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"user.login","params":{"username":"Admin","password":"zabbix"},"id":1}'
```

If you provided the credentials correctly, the response returned by the API should contain the user authentication token:

```
{
  "jsonrpc": "2.0",
  "result": "0424bd59b807674191e7d77572075f33",
}
```

```
    "id": 1
}
```

Authorization methods By "Authorization" header

All API requests require an authentication or an API token. You can provide the credentials by using the Authorization header in the request:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer 0424bd59b807674191e7d77572075f33'
```

Attention:

If you are experiencing authentication issues, see [Authorization header forwarding](#).

Since Zabbix 7.2.1, the Authorization header is supported in cross-origin requests ([CORS](#)). Since Zabbix 7.2.5, Zabbix API accepts headers in a case-insensitive way (e.g., authorization, Authorization, and AUTHORIZATION are treated the same).

By Zabbix cookie

A "zbx_session" cookie is used to authorize an API request from Zabbix UI performed using JavaScript (from a module or a custom widget).

Retrieving hosts Now you have a valid user authentication token that can be used to access the data in Zabbix. For example, you can use the `host.get` method to retrieve the IDs, host names and interfaces of all the configured **hosts**:

Request:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data @data.json
```

Note:

data.json is a file that contains a JSON query. Instead of a file, you can pass the query in the `--data` argument.

data.json

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": [
      "hostid",
      "host"
    ],
    "selectInterfaces": [
      "interfaceid",
      "ip"
    ]
  },
  "id": 2
}
```

The response object will contain the requested data about the hosts:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "host": "Zabbix server",
      "interfaces": [
        {
          "interfaceid": "1",
```

```

        "ip": "127.0.0.1"
    }
    ],
    "id": 2
}

```

Note:

For performance reasons it is always recommended to list the object properties you want to retrieve. Thus, you will avoid retrieving everything.

Creating a new item Now, create a new **item** on the host “Zabbix server” using the data you have obtained from the previous `host.get` request. This can be done using the `item.create` method:

```

curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc": "2.0", "method": "item.create", "params": {"name": "Free disk space on /home/joe/", "key_":

```

A successful response will contain the ID of the newly created item, which can be used to reference the item in the following requests:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "24759"
    ]
  },
  "id": 3
}

```

Note:

The `item.create` method as well as other *create methods* can also accept arrays of objects and create multiple items with one API call.

Creating multiple triggers Thus, if *create methods* accept arrays, you can add multiple **triggers**, for example, this one:

```

curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc": "2.0", "method": "trigger.create", "params": [{"description": "Processor load is too high

```

The successful response will contain the IDs of the newly created triggers:

```

{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "17369",
      "17370"
    ]
  },
  "id": 4
}

```

Updating an item Enable an item by setting its status to “0”:

```

curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \

```

```
--header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
--header 'Content-Type: application/json-rpc' \
--data '{"jsonrpc":"2.0","method":"item.update","params":{"itemid":"10092","status":0},"id":5}'
```

The successful response will contain the ID of the updated item:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10092"
    ]
  },
  "id": 5
}
```

Note:

The `item.update` method as well as other *update methods* can also accept arrays of objects and update multiple items with one API call.

Updating multiple triggers Enable multiple triggers by setting their status to "0":

```
curl --request POST \
--url 'https://example.com/zabbix/api_jsonrpc.php' \
--header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
--header 'Content-Type: application/json-rpc' \
--data '{"jsonrpc":"2.0","method":"trigger.update","params":[{"triggerid":"13938","status":0},{triggerid":"13939","status":0}],"id":6}'
```

The successful response will contain the IDs of the updated triggers:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938",
      "13939"
    ]
  },
  "id": 6
}
```

Note:

This is the preferred method of updating. Some API methods, such as the `host.massupdate` allow to write a simpler code. However, it is not recommended to use these methods as they will be removed in the future releases.

Error handling Up to the present moment, everything you have tried has worked fine. But what would happen if you tried making an incorrect call to the API? Try to create another host by calling `host.create` but omitting the mandatory `groups` parameter:

```
curl --request POST \
--url 'https://example.com/zabbix/api_jsonrpc.php' \
--header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
--header 'Content-Type: application/json-rpc' \
--data '{"jsonrpc":"2.0","method":"host.create","params":{"host":"Linux server","interfaces":[{"type":1,"name":"eth0"}]},"id":7}'
```

The response will then contain an error message:

```
{
  "jsonrpc": "2.0",
  "error": {
    "code": -32602,
    "message": "Invalid params.",
    "data": "No groups for host \"Linux server\"."
  },
  "id": 7
}
```

```
"id": 7  
}
```

If an error has occurred, instead of the `result` property, the response object will contain the `error` property with the following data:

- `code` - an error code;
- `message` - a short error summary;
- `data` - a more detailed error message.

Errors can occur in various cases, such as, using incorrect input values, a session timeout or trying to access non-existing objects. Your application should be able to gracefully handle these kinds of errors.

API versions To simplify API versioning, since Zabbix 2.0.4, the version of the API matches the version of Zabbix itself. You can use the `apiinfo.version` method to find out the version of the API you are working with. This can be useful for adjusting your application to use version-specific features.

Zabbix guarantees feature backward compatibility inside a major version. When making backward incompatible changes between major releases, Zabbix usually leaves the old features as deprecated in the next release, and only removes them in the release after that. Occasionally, Zabbix may remove features between major releases without providing any backward compatibility. It is important that you never rely on any deprecated features and migrate to newer alternatives as soon as possible.

Note:

You can follow all the changes made to the API in the [API changelog](#).

Further reading Now, you have enough knowledge to start working with the Zabbix API, however, do not stop here. For further reading you are advised to have a look at the [list of available APIs](#).

Method reference

This section provides an overview of the functions provided by the Zabbix API and will help you find your way around the available classes and methods.

Monitoring The Zabbix API allows you to access history and other data gathered during monitoring.

Dashboards

Manage dashboards and make scheduled reports based on them.

[Dashboard API](#) | [Template dashboard API](#) | [Report API](#)

High availability cluster

Retrieve a list of server nodes and their status.

[High availability cluster API](#)

History

Retrieve historical values gathered by Zabbix monitoring processes for presentation or further processing.

[History API](#)

Trends

Retrieve trend values calculated by Zabbix server for presentation or further processing.

[Trend API](#)

Events

Retrieve events generated by triggers, network discovery and other Zabbix systems for more flexible situation management or third-party tool integration.

[Event API](#)

Problems

Retrieve problems according to the given parameters.

Problem API

Maps

Configure maps to create detailed dynamic representations of your IT infrastructure.

Map API

Tasks

Interact with Zabbix server task manager, creating tasks and retrieving response.

Task API

Services The Zabbix API allows you to access data gathered during service monitoring.

Service Level Agreement

Define Service Level Objectives (SLO), retrieve detailed Service Level Indicators (SLI) information about service performance.

SLA API

Services

Manage services for service-level monitoring and retrieve detailed SLA information about any service.

Service API

Data collection The Zabbix API allows you to manage the configuration of your monitoring system.

Hosts and host groups

Manage host groups, hosts and everything related to them, including host interfaces, host macros and maintenance periods.

[Host API](#) | [Host group API](#) | [Host interface API](#) | [User macro API](#) | [Value map API](#) | [Maintenance API](#)

Items

Define items to monitor.

Item API

Triggers

Configure triggers to notify you about problems in your system. Manage trigger dependencies.

Trigger API

Graphs

Edit graphs or separate graph items for better presentation of the gathered data.

[Graph API](#) | [Graph item API](#)

Templates and template groups

Manage templates and link them to hosts or other templates.

[Template API](#) | [Template group API](#) | [Value map API](#)

Low-level discovery

Configure low-level discovery rules as well as item, trigger and graph prototypes to monitor dynamic entities.

[LLD rule API](#) | [Item prototype API](#) | [Trigger prototype API](#) | [Graph prototype API](#) | [Host prototype API](#)

Event correlation

Create custom event correlation rules.

Correlation API

Network discovery

Manage network-level discovery rules to automatically find and monitor new hosts. Gain full access to information about discovered services and hosts.

[Discovery rule API](#) | [Discovery check API](#) | [Discovered host API](#) | [Discovered service API](#)

Export and import

Export and import Zabbix configuration data for configuration backups, migration or large-scale configuration updates.

Configuration API

Web monitoring

Configure web scenarios to monitor your web applications and services.

Web scenario API

Alerts The Zabbix API allows you to manage the actions and alerts of your monitoring system.

Actions and alerts

Define actions and operations to notify users about certain events or automatically execute remote commands. Gain access to information about generated alerts and their receivers.

Action API | Alert API

Media types

Configure media types and multiple ways users will receive alerts.

Media type API

Scripts

Configure and execute scripts to help you with your daily tasks.

Script API

Users The Zabbix API allows you to manage users of your monitoring system.

Users and user groups

Add users that will have access to Zabbix, assign them to user groups and grant permissions. Make roles for granular management of user rights.

User API | User group API | User directory API | User role API

API Tokens

Manage authorization tokens.

Token API

Authentication

Change authentication configuration options.

Authentication API

Administration With the Zabbix API you can change administration settings of your monitoring system.

General

Change certain global configuration options.

Autoregistration API | Icon map API | Image API | Settings API | Regular expression API | Module API | Connector API

Audit log

Track configuration changes each user has done.

Audit log API

Housekeeping

Configure housekeeping.

Housekeeping API

Proxies and proxy groups

Manage the proxies used in your distributed monitoring setup.

Proxy API | Proxy group API

Macros

Manage macros.

User macro API

API information Retrieve the version of the Zabbix API so that your application could use version-specific features.

API info API

Action

This class is designed to work with actions.

Object references:

- Action
- Action operation
 - Action operation message
 - Action operation condition
- Action recovery operation
- Action update operation
- Action filter
 - Action filter condition

Available methods:

- `action.create` - create new actions
- `action.delete` - delete actions
- `action.get` - retrieve actions
- `action.update` - update actions

Action object

The following objects are directly related to the `action` API.

Action

The action object has the following properties.

| Property | Type | Description |
|-------------|---------|---|
| actionid | ID | ID of the action. |
| esc_period | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations <p>Default operation step duration. Must be at least 60 seconds. Accepts seconds, time unit with suffix, or a user macro.</p> |
| eventsource | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>supported</i> if <code>eventsources</code> is set to "event created by a trigger", "internal event", or "event created on service status update" <p>Type of events that the action will handle.</p> <p>Refer to the event source property for a list of supported event types.</p> |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>constant</i>- <i>required</i> for create operations <p>Name of the action.</p> |
| status | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Whether the action is enabled or disabled.</p> <p>Possible values:</p> <ul style="list-style-type: none">0 - (<i>default</i>) enabled;1 - disabled. |

| Property | Type | Description |
|--------------------|---------|--|
| pause_symptoms | integer | Whether to pause escalation if event is a symptom event. Possible values: 0 - Don't pause escalation for symptom problems; 1 - <i>(default)</i> Pause escalation for symptom problems. Property behavior: - <i>supported</i> if eventsource is set to "event created by a trigger" |
| pause_suppressed | integer | Whether to pause escalation during maintenance periods or not. Possible values: 0 - Don't pause escalation; 1 - <i>(default)</i> Pause escalation. Property behavior: - <i>supported</i> if eventsource is set to "event created by a trigger" |
| notify_if_canceled | integer | Whether to notify when escalation is canceled. Possible values: 0 - Don't notify when escalation is canceled; 1 - <i>(default)</i> Notify when escalation is canceled. Property behavior: - <i>supported</i> if eventsource is set to "event created by a trigger" |

Action operation

The action operation object defines an operation that will be performed when an action is executed. It has the following properties.

| Property | Type | Description |
|---------------|---------|--|
| operationtype | integer | Type of operation. Possible values: 0 - send message; 1 - global script; 2 - add host; 3 - remove host; 4 - add to host group; 5 - remove from host group; 6 - link template; 7 - unlink template; 8 - enable host; 9 - disable host; 10 - set host inventory mode; 13 - add host tags; 14 - remove host tags. Possible values if eventsource of Action object is set to "event created by a trigger" or "event created on service status update": 0 - "send message"; 1 - "global script". Possible values if eventsource of Action object is set to "internal event": 0 - "send message". Property behavior: - <i>required</i> |

| Property | Type | Description |
|---------------|---------|--|
| esc_period | string | <p>Duration of an escalation step in seconds. Must be greater than 60 seconds. Accepts seconds, time unit with suffix, or a user macro. If set to 0 or 0s, the default action escalation period will be used.</p> <p>Default: 0s.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if eventsource of Action object is set to "event created by a trigger", "internal event", or "event created on service status update" |
| esc_step_from | integer | <p>Step to start escalation from.</p> <p>Default: 1.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if eventsource of Action object is set to "event created by a trigger", "internal event", or "event created on service status update" |
| esc_step_to | integer | <p>Step to end escalation at.</p> <p>Default: 1.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if eventsource of Action object is set to "event created by a trigger", "internal event", or "event created on service status update" |
| evaltype | integer | <p>Operation condition evaluation method.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (default) AND / OR; 1 - AND; 2 - OR. |
| opcommand | object | <p>Global script to execute.</p> <p>The global script must have the scriptid property defined.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if operationtype is set to "global script" |
| opcommand_grp | array | <p>Host groups to run global scripts on.</p> <p>The host groups must have the groupid property defined.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if operationtype is set to "global script" and opcommand_hst is not set |
| opcommand_hst | array | <p>Host to run global scripts on.</p> <p>The hosts must have the hostid property defined.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if operationtype is set to "global script" and opcommand_grp is not set |
| opconditions | array | <p>Operation conditions used for trigger actions.</p> |
| opgroup | array | <p>The operation condition object is described in detail below.</p> <p>Host groups to add hosts to.</p> <p>The host groups must have the groupid property defined.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if operationtype is set to "add to host group" or "remove from host group" |

| Property | Type | Description |
|---------------|--------|--|
| opmessage | object | Object containing the data about the message sent by the operation. The operation message object is described in detail below . |
| opmessage_grp | array | Property behavior: - <i>required</i> if operationtype is set to "send message" User groups to send messages to. The user groups must have the usrgrpuid property defined. Property behavior: - <i>required</i> if operationtype is set to "send message" and opmessage_usr is not set |
| opmessage_usr | array | Users to send messages to. The users must have the userid property defined. Property behavior: - <i>required</i> if operationtype is set to "send message" and opmessage_grp is not set |
| optemplate | array | Templates to link to the hosts. The templates must have the templateid property defined. Property behavior: - <i>required</i> if operationtype is set to "link template" or "unlink template" |
| opinventory | object | Inventory mode set host to. The inventory must have the inventory_mode property defined. Property behavior: - <i>required</i> if operationtype is set to "set host inventory mode" |
| optag | array | Host tags to add or remove. Tags must have tag property defined. The value property is optional. Property behavior: - <i>supported</i> if operationtype is set to "add host tags" or "remove host tags". |

Action operation message

The operation message object contains data about the message that will be sent by the operation. It has the following properties.

| Property | Type | Description |
|-------------|---------|---|
| default_msg | integer | Whether to use the default action message text and subject. Possible values: 0 - use the data from the operation; 1 - (<i>default</i>) use the data from the media type. |
| mediatypeid | ID | ID of the media type that will be used to send the message. Property behavior: - <i>supported</i> if operationtype of Action operation object , Action recovery operation object , or Action update operation object is set to "send message", or if operationtype of Action update operation object is set to "notify all involved" |

| Property | Type | Description |
|----------|--------|---|
| message | string | Operation message text. |
| subject | string | <p>Property behavior: - <i>supported</i> if default_msg is set to "use the data from the operation"</p> <p>Operation message subject.</p> <p>Property behavior: - <i>supported</i> if default_msg is set to "use the data from the operation"</p> |

Action operation condition

The action operation condition object defines a condition that must be met to perform the current operation. It has the following properties.

| Property | Type | Description |
|---------------|---------|---|
| conditiontype | integer | Type of condition. |
| | | Possible values: 14 - event acknowledged. |
| value | string | <p>Property behavior: - <i>required</i></p> <p>Value to compare with.</p> <p>Property behavior: - <i>required</i></p> |
| operator | integer | <p>Condition operator.</p> <p>Possible values: 0 - (default) =</p> |

The following operators and values are supported for each operation condition type.

| Condition | Condition name | Supported operators | Expected value |
|-----------|--------------------|---------------------|--|
| 14 | Event acknowledged | = | Whether the event is acknowledged. |
| | | | Possible values: 0 - not acknowledged; 1 - acknowledged. |

Action recovery operation

The action recovery operation object defines an operation that will be performed when a problem is resolved. Recovery operations are possible **only** for trigger, internal and service actions. It has the following properties.

| Property | Type | Description |
|---------------|---------|--|
| operationtype | integer | <p>Type of operation.</p> <p>Possible values if eventsource of Action object is set to "event created by a trigger" or "event created on service status update":</p> <p>0 - send message; 1 - global script; 11 - notify all involved.</p> <p>Possible values if eventsource of Action object is set to "internal event":</p> <p>0 - send message; 11 - notify all involved.</p> <p>Property behavior:</p> <p>- <i>required</i></p> |
| opcommand | object | <p>Global script to execute.</p> <p>The global script must have the scriptid property defined.</p> <p>Property behavior:</p> <p>- <i>required</i> if operationtype is set to "global script"</p> |
| opcommand_grp | array | <p>Host groups to run global scripts on.</p> <p>The host groups must have the groupid property defined.</p> <p>Property behavior:</p> <p>- <i>required</i> if eventsource of Action object is set to "event created by a trigger", and operationtype is set to "global script", and opcommand_hst is not set</p> |
| opcommand_hst | array | <p>Host to run global scripts on.</p> <p>The hosts must have the hostid property defined.</p> <p>Property behavior:</p> <p>- <i>required</i> if eventsource of Action object is set to "event created by a trigger", and operationtype is set to "global script", and opcommand_grp is not set</p> |
| opmessage | object | <p>Object containing the data about the message sent by the recovery operation.</p> <p>The operation message object is described in detail above.</p> <p>Property behavior:</p> <p>- <i>required</i> if operationtype is set to "send message"</p> |
| opmessage_grp | array | <p>User groups to send messages to.</p> <p>The user groups must have the usrgrpuid property defined.</p> <p>Property behavior:</p> <p>- <i>required</i> if operationtype is set to "send message" and opmessage_usr is not set</p> |
| opmessage_usr | array | <p>Users to send messages to.</p> <p>The users must have the userid property defined.</p> <p>Property behavior:</p> <p>- <i>required</i> if operationtype is set to "send message" and opmessage_grp is not set</p> |

The action update operation object defines an operation that will be performed when a problem is updated (commented upon, acknowledged, severity changed, or manually closed). Update operations are possible **only** for trigger and service actions. It has the following properties.

| Property | Type | Description |
|---------------|---------|---|
| operationtype | integer | Type of operation. Possible values: 0 - send message; 1 - global script; 12 - notify all involved. |
| opcommand | object | Property behavior: - <i>required</i> Global script to execute. The global script must have the scriptid property defined. |
| opcommand_grp | array | Property behavior: - <i>required</i> if operationtype is set to "global script" Host groups to run global scripts on. The host groups must have the groupid property defined. |
| opcommand_hst | array | Property behavior: - <i>required</i> if eventsource of Action object is set to "event created by a trigger", and operationtype is set to "global script", and opcommand_grp is not set Host to run global scripts on. The hosts must have the hostid property defined. |
| opmessage | object | Property behavior: - <i>required</i> if eventsource of Action object is set to "event created by a trigger", and operationtype is set to "global script", and opcommand_grp is not set Object containing the data about the message sent by the update operation. |
| opmessage_grp | array | The operation message object is described in detail above . User groups to send messages to. The user groups must have the usrgrp property defined. |
| opmessage_usr | array | Property behavior: - <i>required</i> if operationtype is set to "send message" and opmessage_usr is not set Users to send messages to. The users must have the userid property defined. |
| | | Property behavior: - <i>required</i> if operationtype is set to "send message" and opmessage_grp is not set |

Action filter

The action filter object defines a set of conditions that must be met to perform the configured action operations. It has the following properties.

| Property | Type | Description |
|--------------|---------|--|
| conditions | array | Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. |
| evaltype | integer | <p>Property behavior: - <i>required</i> Filter condition evaluation method.</p> <p>Possible values: 0 - and/or; 1 - and; 2 - or; 3 - custom expression.</p> |
| eval_formula | string | <p>Property behavior: - <i>required</i> Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its <code>formulaid</code>. The value of <code>eval_formula</code> is equal to the value of <code>formula</code> for filters with a custom expression.</p> |
| formula | string | <p>Property behavior: - <i>read-only</i> User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its <code>formulaid</code>. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted.</p> <p>Property behavior: - <i>required</i> if <code>evaltype</code> is set to "custom expression"</p> |

Action filter condition

The action filter condition object defines a specific condition that must be checked before running the action operations.

| Property | Type | Description |
|---------------|---------|--|
| conditiontype | integer | <p>Type of condition.</p> <p>Possible values if eventsource of Action object is set to "event created by a trigger":</p> <ul style="list-style-type: none"> 0 - host group; 1 - host; 2 - trigger; 3 - event name; 4 - trigger severity; 6 - time period; 13 - host template; 16 - problem is suppressed; 25 - event tag; 26 - event tag value. <p>Possible values if eventsource of Action object is set to "event created by a discovery rule":</p> <ul style="list-style-type: none"> 7 - host IP; 8 - discovered service type; 9 - discovered service port; 10 - discovery status; 11 - uptime or downtime duration; 12 - received value; 18 - discovery rule; 19 - discovery check; 20 - proxy; 21 - discovery object. <p>Possible values if eventsource of Action object is set to "event created by active agent autoregistration":</p> <ul style="list-style-type: none"> 20 - proxy; 22 - host name; 24 - host metadata. <p>Possible values if eventsource of Action object is set to "internal event":</p> <ul style="list-style-type: none"> 0 - host group; 1 - host; 13 - host template; 23 - event type; 25 - event tag; 26 - event tag value. <p>Possible values if eventsource of Action object is set to "event created on service status update":</p> <ul style="list-style-type: none"> 25 - event tag; 26 - event tag value; 27 - service; 28 - service name. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| value | string | <p>Value to compare with.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |

| Property | Type | Description |
|-----------|---------|--|
| value2 | string | Secondary value to compare with. |
| | | Property behavior: <ul style="list-style-type: none"> - <i>required</i> if <code>eventsources</code> of Action object is set to "event created by a trigger", <code>conditiontype</code> is set to any possible value for trigger actions, and the type of condition (see below) is "26" - <i>required</i> if <code>eventsources</code> of Action object is set to "internal event", <code>conditiontype</code> is set to any possible value for internal actions, and the type of condition (see below) is "26" - <i>required</i> if <code>eventsources</code> of Action object is set to "event created on service status update", <code>conditiontype</code> is set to any possible value for service actions, and the type of condition (see below) is "26" |
| formulaid | string | Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| operator | integer | Condition operator. |
| | | Possible values: 0 - (default) equals; 1 - does not equal; 2 - contains; 3 - does not contain; 4 - in; 5 - is greater than or equals; 6 - is less than or equals; 7 - not in; 8 - matches; 9 - does not match; 10 - Yes; 11 - No. |

Note:

To better understand how to use filters with various types of expressions, see examples on the [action.get](#) and [action.create](#) method pages.

The following operators and values are supported for each condition type.

| Condition | Condition name | Supported operators | Expected value |
|-----------|------------------|--|---|
| 0 | Host group | equals, does not equal | Host group ID. |
| 1 | Host | equals, does not equal | Host ID. |
| 2 | Trigger | equals, does not equal | Trigger ID. |
| 3 | Event name | contains, does not contain | Event name. |
| 4 | Trigger severity | equals, does not equal, is greater than or equals, is less than or equals | Trigger severity. Refer to the trigger severity property for a list of supported trigger severities. |
| 5 | Trigger value | equals | Trigger value. Refer to the trigger value property for a list of supported trigger values. |
| 6 | Time period | in, not in | Time when the event was triggered as a time period . |
| 7 | Host IP | equals, does not equal | One or several IP ranges to check, separated by commas. Refer to the network discovery configuration section for more information on supported formats of IP ranges. |

| Condition | Condition name | Supported operators | Expected value |
|-----------|-----------------------------|--|---|
| 8 | Discovered service type | equals, does not equal | Type of discovered service. The type of service matches the type of the discovery check used to detect the service. Refer to the discovery check type property for a list of supported types. |
| 9 | Discovered service port | equals, does not equal | One or several port ranges, separated by commas. |
| 10 | Discovery status | equals | Status of a discovered object. Possible values: 0 - host or service up; 1 - host or service down; 2 - host or service discovered; 3 - host or service lost. |
| 11 | Uptime or downtime duration | is greater than or equals, is less than or equals | Time indicating how long has the discovered object been in the current status in seconds. |
| 12 | Received values | equals, does not equal, is greater than or equals, is less than or equals, contains, does not contain | Value returned when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check. |
| 13 | Host template | equals, does not equal | Linked template ID. |
| 16 | Problem is suppressed | Yes, No | No value required: using the "Yes" operator means that problem must be suppressed, "No" - not suppressed. |
| 18 | Discovery rule | equals, does not equal | ID of the discovery rule. |
| 19 | Discovery check | equals, does not equal | ID of the discovery check. |
| 20 | Proxy | equals, does not equal | ID of the proxy. |
| 21 | Discovery object | equals | Type of object that triggered the discovery event. Possible values: 1 - discovered host; 2 - discovered service. |
| 22 | Host name | contains, does not contain, matches, does not match | Host name. Using a regular expression is supported for operators <i>matches</i> and <i>does not match</i> in autoregistration conditions. |
| 23 | Event type | equals | Specific internal event. Possible values: 0 - item in "not supported" state; 1 - item in "normal" state; 2 - LLD rule in "not supported" state; 3 - LLD rule in "normal" state; 4 - trigger in "unknown" state; 5 - trigger in "normal" state. |
| 24 | Host metadata | contains, does not contain, matches, does not match | Metadata of the auto-registered host. Using a regular expression is supported for operators <i>matches</i> and <i>does not match</i> . |
| 25 | Tag | equals, does not equal, contains, does not contain | Event tag. |

| Condition | Condition name | Supported operators | Expected value |
|-----------|----------------|---|------------------|
| 26 | Tag value | equals, does not equal, contains, does not contain | Event tag value. |
| 27 | Service | equals, does not equal | Service ID. |
| 28 | Service name | equals, does not equal | Service name. |

action.create

Description

object action.create(object/array actions)

This method allows to create new actions.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Actions to create.

Additionally to the [standard action properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---------------------|--------|--|
| filter | object | Action filter object for the action. |
| operations | array | Action operations to create for the action. |
| recovery_operations | array | Action recovery operations to create for the action. |
| update_operations | array | Action update operations to create for the action. |

Return values

(object) Returns an object containing the IDs of the created actions under the `actionids` property. The order of the returned IDs matches the order of the passed actions.

Examples

Create a trigger action

Create a trigger action that will begin once a trigger (with the word "memory" in its name) from host "10084" goes into a PROBLEM state. The action will have 4 configured operations. The first and immediate operation will send a message to all users in user group "7" via media type "1". If the event is not resolved in 30 minutes, the second operation will run [script "5"](#) (script with scope "Action operation") on all hosts in group "2". If the event is resolved, a recovery operation will notify all users who received any messages regarding the problem. If the event is updated, an acknowledge/update operation will notify (with a custom subject and message) all users who received any messages regarding the problem.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Trigger action",
    "eventsources": 0,
    "esc_period": "30m",
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
          "conditiontype": 1,
```

```

        "operator": 0,
        "value": "10084"
    },
    {
        "conditiontype": 3,
        "operator": 2,
        "value": "memory"
    }
]
},
"operations": [
    {
        "operationtype": 0,
        "esc_step_from": 1,
        "esc_step_to": 1,

            "default_msg": 0,
            "message": "Custom update operation message body",
            "subject": "Custom update operation message subject"
        }
    }
]

```

```

    }
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "17"
    ]
  },
  "id": 1
}

```

Create a discovery action

Create a discovery action that will link template "10001" to discovered hosts.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Discovery action",
    "eventsources": 1,
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
          "conditiontype": 21,
          "operator": 0,
          "value": "1"
        },
        {
          "conditiontype": 10,
          "operator": 0,
          "value": "2"
        }
      ]
    },
    "operations": [
      {
        "operationtype": 6,
        "optemplate": [
          {
            "templateid": "10001"
          }
        ]
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "18"
    ]
  }
}

```

```

    ],
    },
    "id": 1
}

```

Using a custom expression filter

Create a trigger action that uses a custom expression - "A and (B or C)" - for evaluating action conditions. Once a trigger with a severity higher or equal to "Warning" from host "10084" or host "10106" goes into a PROBLEM state, the action will send a message to all users in user group "7" via media type "1". The formula IDs "A", "B" and "C" have been chosen arbitrarily.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Trigger action",
    "eventsources": 0,
    "esc_period": "15m",
    "filter": {
      "evaltype": 3,
      "formula": "A and (B or C)",
      "conditions": [
        {
          "conditiontype": 4,
          "operator": 5,
          "value": "2",
          "formulaid": "A"
        },
        {
          "conditiontype": 1,
          "operator": 0,
          "value": "10084",
          "formulaid": "B"
        },
        {
          "conditiontype": 1,
          "operator": 0,
          "value": "10106",
          "formulaid": "C"
        }
      ]
    },
    "operations": [
      {
        "operationtype": 0,
        "esc_step_from": 1,
        "esc_step_to": 1,
        "opmessage_grp": [
          {
            "usrgrp": "7"
          }
        ],
        "opmessage": {
          "default_msg": 1,
          "mediatypeid": "1"
        }
      }
    ]
  },
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "18"
    ]
  },
  "id": 1
}
```

Create agent autoregistration rule

Create an autoregistration action that adds a host to host group "2" when the host name contains "SRV" or metadata contains "AlmaLinux".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Register Linux servers",
    "eventsources": "2",
    "filter": {
      "evaltype": "2",
      "conditions": [
        {
          "conditiontype": "22",
          "operator": "2",
          "value": "SRV"
        },
        {
          "conditiontype": "24",
          "operator": "2",
          "value": "AlmaLinux"
        }
      ]
    },
    "operations": [
      {
        "operationtype": "4",
        "opgroup": [
          {
            "groupid": "2"
          }
        ]
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      19
    ]
  },
  "id": 1
}
```

Create agent autoregistration rule with host tags

Create an autoregistration action that adds a host to host group "2" and adds two host tags.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.create",
  "params": {
    "name": "Register Linux servers with tags",
    "eventsource": "2",
    "operations": [
      {
        "operationtype": "4",
        "opgroup": [
          {
            "groupid": "2"
          }
        ]
      },
      {
        "operationtype": "13",
        "optag": [
          {
            "tag": "location",
            "value": "office"
          },
          {
            "tag": "city",
            "value": "Riga"
          }
        ]
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      20
    ]
  },
  "id": 1
}
```

action.delete

Description

object action.delete(array actionIds)

This method allows to delete actions.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the actions to delete.

Return values

(object) Returns an object containing the IDs of the deleted actions under the `actionids` property.

Examples**Delete multiple actions**

Delete two actions.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.delete",
  "params": [
    "17",
    "18"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "17",
      "18"
    ]
  },
  "id": 1
}
```

Source

CAction::delete() in `ui/include/classes/api/services/CAction.php`.

action.get**Description**

integer/array action.get(object parameters)

The method allows to retrieve actions according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------|----------|--|
| actionids | ID/array | Return only actions with the given IDs. |
| groupids | ID/array | Return only actions that use the given host groups in action conditions. |
| hostids | ID/array | Return only actions that use the given hosts in action conditions. |

| Parameter | Type | Description |
|--------------------------|--------------|--|
| triggerids | ID/array | Return only actions that use the given triggers in action conditions. |
| mediatypeids | ID/array | Return only actions that use the given media types to send messages. |
| usrgrpids | ID/array | Return only actions that are configured to send messages to the given user groups. |
| userid | ID/array | Return only actions that are configured to send messages to the given users. |
| scriptids | ID/array | Return only actions that are configured to run the given scripts. |
| selectFilter | query | Return a filter property with the action condition filter. |
| selectOperations | query | Return an operations property with action operations. |
| selectRecoveryOperations | query | Return a recovery_operations property with action recovery operations. |
| selectUpdateOperations | query | Return an update_operations property with action update operations. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: actionid, name, status. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve trigger actions

Retrieve all configured trigger actions together with action conditions and operations.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.get",
  "params": {
    "output": "extend",
    "selectOperations": "extend",
    "selectRecoveryOperations": "extend",
    "selectUpdateOperations": "extend",
    "selectFilter": "extend",
    "filter": {
      "eventsources": 0
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
```

```

Retrieve discovery actions

Retrieve all configured discovery actions together with action conditions and operations. The filter uses the "and" evaluation type, so the formula property is empty and eval_formula is generated automatically.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "action.get",
  "params": {
    "output": "extend",
    "selectOperations": "extend",
    "selectFilter": "extend",
    "filter": {
      "eventsources": 1
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [

```

```

{
  "actionid": "2",
  "name": "Auto discovery. Linux servers.",
  "eventsources": "1",
  "status": "1",
  "esc_period": "0s",
  "pause_suppressed": "1",
  "filter": {
    "evaltype": "0",
    "formula": "",
    "conditions": [
      {
        "conditiontype": "10",
        "operator": "0",
        "value": "0",
        "value2": "",
        "formulaid": "B"
      },
      {
        "conditiontype": "8",
        "operator": "0",
        "value": "9",
        "value2": "",

Source

CAction::get() in `ui/include/classes/api/services/CAction.php`.

action.update

Description

object action.update(object/array actions)

This method allows to update existing actions.

Note:
 This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Action properties to be updated.

The `actionid` property must be defined for each action, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard action properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|--|--------|---|
| filter | object | Action filter object to replace the current filter. |
| operations | array | Action operations to replace existing operations. |
| recovery_operations | array | Action recovery operations to replace existing recovery operations. |
| Parameter behavior: - <i>supported</i> if <code>eventsource</code> of Action object is set to "event created by a trigger", "internal event", or "event created on service status update" | | |
| update_operations | array | Action update operations to replace existing update operations. |
| Parameter behavior: - <i>supported</i> if <code>eventsource</code> of Action object is set to "event created by a trigger" or "event created on service status update" | | |

Return values

(object) Returns an object containing the IDs of the updated actions under the `actionids` property.

Examples

Disable action

Disable an action, that is, set its status to "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "action.update",
  "params": {
    "actionid": "2",
    "status": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "actionids": [
      "2"
    ]
  },
  "id": 1
}
```

Alert

This class is designed to work with alerts.

Object references:

- [Alert](#)

Available methods:

- [alert.get](#) - retrieve alerts

Alert object

The following objects are directly related to the alert API.

Alert

Note:

Alerts are created by Zabbix server and cannot be modified via the API.

The alert object contains information about whether certain action operations have been executed successfully. It has the following properties.

| Property | Type | Description |
|-----------|-----------|--|
| alertid | ID | ID of the alert. |
| actionid | ID | ID of the action that generated the alert. |
| alerttype | integer | Alert type. Possible values: 0 - message; 1 - remote command. |
| clock | timestamp | Time when the alert was generated. |
| error | string | Error text if there are problems sending a message or running a command. |

| Property | Type | Description |
|---|---------|--|
| esc_step | integer | Action escalation step during which the alert was generated. |
| eventid | ID | ID of the event that triggered the action. |
| mediatypeid | ID | ID of the media type that was used to send the message. |
| message | text | Message text. |
| Property behavior: | | |
| - <i>supported</i> if alerttype is set to "message" | | |
| retries | integer | Number of times Zabbix tried to send the message. |
| sendto | string | Address, user name or other identifier of the recipient. |
| Property behavior: | | |
| - <i>supported</i> if alerttype is set to "message" | | |
| status | integer | Status indicating whether the action operation has been executed successfully. |
| Possible values if alerttype is set to "message": | | |
| 0 - message not sent; | | |
| 1 - message sent; | | |
| 2 - failed after a number of retries; | | |
| 3 - new alert is not yet processed by alert manager. | | |
| Possible values if alerttype is set to "remote command": | | |
| 0 - command not run; | | |
| 1 - command run; | | |
| 2 - tried to run the command on Zabbix agent, but it was unavailable. | | |
| subject | string | Message subject. |
| Property behavior: | | |
| - <i>supported</i> if alerttype is set to "message" | | |
| userid | ID | ID of the user that the message was sent to. |
| p_eventid | ID | ID of problem event, which generated the alert. |
| acknowledgeid | ID | ID of acknowledgment, which generated the alert. |

alert.get

Description

integer/array alert.get(object parameters)

The method allows to retrieve alerts according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------|----------|---|
| alertids | ID/array | Return only alerts with the given IDs. |
| actionids | ID/array | Return only alerts generated by the given actions. |
| eventids | ID/array | Return only alerts generated by the given events. |
| groupids | ID/array | Return only alerts generated by objects from the given host groups. |
| hostids | ID/array | Return only alerts generated by objects from the given hosts. |
| mediatypeids | ID/array | Return only message alerts that used the given media types. |
| objectids | ID/array | Return only alerts generated by the given objects |
| userid | ID/array | Return only message alerts that were sent to the given users. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| eventobject | integer | Return only alerts generated by events related to objects of the given type. See event object for a list of supported object types. |
| eventsources | integer | Default: 0 - trigger. Return only alerts generated by events of the given type. See event source for a list of supported event types. |
| time_from | timestamp | Default: 0 - trigger events. Return only alerts that have been generated after the given time. |
| time_till | timestamp | Return only alerts that have been generated before the given time. |
| selectHosts | query | Return a hosts property with data of hosts that triggered the action operation. |
| selectMediatypes | query | Return a mediatypes property with an array of the media types that were used for the message alert. |
| selectUsers | query | See mediatype.get for restrictions based on user type. Return a users property with an array of the users that the message was addressed to. |
| sortfield | string/array | See user.get for restrictions based on user type. Sort the result by the given properties. Possible values: alertid, clock, eventid, mediatypeid, sendto, status. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Note:

In Zabbix 7.2.3, *Admin* and *User* type users may retrieve "message" (0) type alert data only about their own user.

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve alerts by action ID

Retrieve all alerts generated by action "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "alert.get",
  "params": {
    "output": "extend",
```

```

        "actionids": "3"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "alertid": "1",
            "actionid": "3",
            "eventid": "21243",
            "userid": "1",
            "clock": "1362128008",
            "mediatypeid": "1",
            "sendto": "support@company.com",
            "subject": "PROBLEM: Zabbix agent on Linux server is unreachable for 5 minutes: ",
            "message": "Trigger: Zabbix agent on Linux server is unreachable for 5 minutes: \nTrigger stat",
            "status": "0",
            "retries": "3",
            "error": "",
            "esc_step": "1",
            "alerttype": "0",
            "p_eventid": "0",
            "acknowledgeid": "0"
        }
    ],
    "id": 1
}

```

API info

This class is designed to retrieve meta information about the API.

Available methods:

- `apiinfo.version` - retrieve the version of Zabbix API

apiinfo.version

Description

`string apiinfo.version(array)`

This method allows to retrieve the version of the Zabbix API.

Attention:

This method is only available to unauthenticated users.

Parameters

(array) The method accepts an empty array.

Return values

(string) Returns the version of the Zabbix API.

Note:
Starting from Zabbix 2.0.4 the version of the API matches the version of Zabbix.

Examples

Retrieving the version of the API

Retrieve the version of the Zabbix API.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "apiinfo.version",
  "params": [],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "7.2.0",
  "id": 1
}
```

CAPInfo::version() in *ui/include/classes/api/services/CAPInfo.php*.

Audit log

This class is designed to work with audit log.

Object references:

- [Audit log](#)

Available methods:

- [auditlog.get](#) - retrieve audit log records

Audit log object

The following objects are directly related to the auditlog API.

Audit log

The audit log object contains information about user actions. It has the following properties.

| Property | Type | Description |
|----------|-----------|--|
| auditid | ID | ID of audit log entry. Generated using CUID algorithm. |
| userid | ID | Audit log entry author userid. |
| username | string | Audit log entry author username. |
| clock | timestamp | Audit log entry creation timestamp. |
| ip | string | Audit log entry author IP address. |

| Property | Type | Description |
|--------------|---------|---|
| action | integer | <p>Audit log entry action.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Add; 1 - Update; 2 - Delete; 4 - Logout; 7 - Execute; 8 - Login; 9 - Failed login; 10 - History clear; 11 - Config refresh; 12 - Push. |
| resourcetype | integer | <p>Audit log entry resource type.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - User; 3 - Media type; 4 - Host; 5 - Action; 6 - Graph; 11 - User group; 13 - Trigger; 14 - Host group; 15 - Item; 16 - Image; 17 - Value map; 18 - Service; 19 - Map; 22 - Web scenario; 23 - Discovery rule; 25 - Script; 26 - Proxy; 27 - Maintenance; 28 - Regular expression; 29 - Macro; 30 - Template; 31 - Trigger prototype; 32 - Icon mapping; 33 - Dashboard; 34 - Event correlation; 35 - Graph prototype; 36 - Item prototype; 37 - Host prototype; 38 - Autoregistration; 39 - Module; 40 - Settings; 41 - Housekeeping; 42 - Authentication; 43 - Template dashboard; 44 - User role; 45 - API token; 46 - Scheduled report; 47 - High availability node; 48 - SLA; 49 - User directory; 50 - Template group; 51 - Connector; 52 - LLD rule; 53 - History. |
| resourceid | ID | Audit log entry resource identifier. |

| Property | Type | Description |
|--------------|--------|--|
| resourcename | string | Audit log entry resource human readable name. |
| recordsetid | ID | Audit log entry recordset ID. The audit log records created during the same operation will have the same recordset ID. Generated using CUID algorithm. |
| details | text | <p>Audit log entry details. The details are stored as a JSON object, where each property name is a path to the property or nested object in which the change occurred, and where each value contains the data (in array format) about the change in this property or nested object.</p> <p>Possible value formats:</p> <p>["add"] - Nested object has been added;</p> <p>["add", "<value>"] - The property of the added object equals <value>;</p> <p>["update"] - Nested object has been updated;</p> <p>["update", "<new value>", "<old value>"] - The property of the updated object was changed from <old value> to <new value>;</p> <p>["delete"] - Nested object has been deleted.</p> |

auditlog.get

Description

`integer/array auditlog.get(object parameters)`

The method allows to retrieve audit log records according to the given parameters.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|--|
| auditids | ID/array | Return only audit log with the given IDs. |
| userids | ID/array | Return only audit log that were created by the given users. |
| time_from | timestamp | Returns only audit log entries that have been created after or at the given time. |
| time_till | timestamp | Returns only audit log entries that have been created before or at the given time. |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | boolean | <p>Possible values: auditid, userid, clock.</p> <p>These parameters are described in the reference commentary.</p> |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;

Object references:

- **Authentication**

Available methods:

- **authentication.get** - retrieve authentication settings
- **authentication.update** - update authentication settings

Authentication object

The following objects are directly related to the authentication API.

Authentication

The authentication object has the following properties.

| Property | Type | Description |
|---------------------|---------|---|
| authentication_type | integer | Default authentication. Possible values: 0 - <i>(default)</i> Internal; 1 - LDAP. |
| http_auth_enabled | integer | HTTP authentication. Possible values: 0 - <i>(default)</i> Disabled; 1 - Enabled. Property behavior: - <i>supported</i> if \$ALLOW_HTTP_AUTH is enabled in the frontend configuration file (<i>zabbix.conf.php</i>). |
| http_login_form | integer | Default login form. Possible values: 0 - <i>(default)</i> Zabbix login form; 1 - HTTP login form. Property behavior: - <i>supported</i> if \$ALLOW_HTTP_AUTH is enabled in the frontend configuration file (<i>zabbix.conf.php</i>). |
| http_strip_domains | string | Domain name to remove. Property behavior: - <i>supported</i> if \$ALLOW_HTTP_AUTH is enabled in the frontend configuration file (<i>zabbix.conf.php</i>). |
| http_case_sensitive | integer | HTTP case-sensitive login. Possible values: 0 - Off; 1 - <i>(default)</i> On. Property behavior: - <i>supported</i> if \$ALLOW_HTTP_AUTH is enabled in the frontend configuration file (<i>zabbix.conf.php</i>). |
| ldap_auth_enabled | integer | LDAP authentication. Possible values: 0 - <i>(default)</i> Disabled; 1 - Enabled. |

| Property | Type | Description |
|------------------------|---------|---|
| ldap_case_sensitive | integer | LDAP case-sensitive login. Possible values: 0 - Off; 1 - <i>(default)</i> On. |
| ldap_userdirectoryid | ID | ID of the default user directory for LDAP authentication. Used for user groups with gui_access set to LDAP or System default. Property behavior: - <i>required</i> if ldap_auth_enabled is set to "Enabled" |
| saml_auth_enabled | integer | SAML authentication. Possible values: 0 - <i>(default)</i> Disabled; 1 - Enabled. |
| saml_case_sensitive | integer | SAML case-sensitive login. Possible values: 0 - Off; 1 - <i>(default)</i> On. |
| passwd_min_length | integer | Password minimal length requirement. Possible values range from 1 to 70. |
| passwd_check_rules | integer | Default: 8. Password checking rules. Possible bitmap values: 0 - Check password length; 1 - Check if password uses uppercase and lowercase Latin letters; 2 - Check if password uses digits; 4 - Check if password uses special characters; 8 - <i>(default)</i> Check if password is not in the list of commonly used passwords and does not contain derivations of word "Zabbix" or user's name, last name, or username. |
| ldap_jit_status | integer | This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 15 for checking all rules). Status of LDAP provisioning. Possible values: 0 - Disabled for configured LDAP IdPs; 1 - Enabled for configured LDAP IdPs. |
| saml_jit_status | integer | Status of SAML provisioning. Possible values: 0 - Disabled for configured SAML IdPs; 1 - Enabled for configured SAML IdPs. |
| jit_provision_interval | string | Time interval between JIT provision requests for logged-in user. Accepts seconds and time unit with suffix with month and year support (3600s,60m,1h,1d,1M,1y). Minimum value: 1h. Default: 1h. Available only for LDAP provisioning. |

| Property | Type | Description |
|-------------------|---------|---|
| disabled_usrgrpid | ID | ID of the user group to assign the deprovisioned user to. The user group must be disabled and cannot be enabled or deleted when configured. |
| mfa_status | integer | Property behavior: - <i>required</i> if ldap_jit_status is set to "Enabled for configured LDAP IdPs", or saml_jit_status is set to "Enabled for configured SAML IdPs" Multi-factor authentication. Possible values: 0 - Disabled (for all configured MFA methods); 1 - Enabled (for all configured MFA methods). Default MFA method for user groups with MFA enabled. |
| mfaid | ID | Property behavior: - <i>required</i> if mfa_status is set to "Enabled" |

authentication.get

Description

object authentication.get(object parameters)

The method allows to retrieve authentication object according to the given parameters.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type | Description |
|-----------|-------|--|
| output | query | This parameter is described in the reference commentary . |

Return values

(object) Returns authentication object.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "authentication.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "authentication_type": "0",
    "http_auth_enabled": "0",

```

```

        "http_login_form": "0",
        "http_strip_domains": "",
        "http_case_sensitive": "1",
        "ldap_auth_enabled": "0",
        "ldap_case_sensitive": "1",
        "ldap_userdirectoryid": "0",
        "saml_auth_enabled": "0",
        "saml_case_sensitive": "0",
        "passwd_min_length": "8",
        "passwd_check_rules": "15",
        "jit_provision_interval": "1h",
        "saml_jit_status": "0",
        "ldap_jit_status": "0",
        "disabled_usrgrpid": "9",
        "mfa_status": "0",
        "mfaid": "0"
    },
    "id": 1
}

```

Source

CAuthentication::get() in *ui/include/classes/api/services/CAuthentication.php*.

authentication.update

Description

object authentication.update(object authentication)

This method allows to update existing authentication settings.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) **Authentication properties** to be updated.

Return values

(array) Returns an array with the names of updated parameters.

Examples

Request:

```

{
    "jsonrpc": "2.0",
    "method": "authentication.update",
    "params": {
        "http_auth_enabled": 1,
        "http_case_sensitive": 0,
        "http_login_form": 1
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        "http_auth_enabled",
        "http_case_sensitive",
        "http_login_form"
    ]
}

```

```
],
  "id": 1
}
```

Autoregistration

This class is designed to work with autoregistration.

Object references:

- [Autoregistration](#)

Available methods:

- [autoregistration.get](#) - retrieve autoregistration
- [autoregistration.update](#) - update autoregistration

Autoregistration object

The following objects are directly related to the autoregistration API.

Autoregistration

The autoregistration object has the following properties.

| Property | Type | Description |
|------------------|---------|---|
| tls_accept | integer | Type of allowed incoming connections for autoregistration. Possible values: 1 - allow unencrypted connections; 2 - allow TLS with PSK; 3 - allow both unencrypted and TLS with PSK connections. |
| tls_psk_identity | string | PSK identity; must be paired with only one PSK (across autoregistration , hosts , and proxies). Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. Property behavior: - <i>write-only</i> |
| tls_psk | string | Pre-shared key (PSK); must be at least 32 hex digits. Property behavior: - <i>write-only</i> |

autoregistration.get

Description

`object autoregistration.get(object parameters)`

The method allows to retrieve autoregistration object according to the given parameters.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type | Description |
|-----------|-------|---|
| output | query | This parameter is described in the reference commentary . |

Return values

(object) Returns autoregistration object.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "autoregistration.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tls_accept": "3"
  },
  "id": 1
}
```

Source

CAutoregistration::get() in *ui/include/classes/api/services/CAutoregistration.php*.

autoregistration.update

Description

object autoregistration.update(object autoregistration)

This method allows to update existing autoregistration.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) **Autoregistration properties** to be updated.

Return values

(boolean) Returns boolean true as result on successful update.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "autoregistration.update",
  "params": {
    "tls_accept": "3",
    "tls_psk_identity": "PSK 001",
    "tls_psk": "11111595725ac58dd977beef14b97461a7c1045b9a1c923453302c5473193478"
  },
  "id": 1
}
```

```
"id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Configuration

This class is designed to export and import Zabbix configuration data.

Available methods:

- **configuration.export** - export configuration data
- **configuration.import** - import configuration data
- **configuration.importcompare** - compare import file with current system elements

configuration.export

Description

string configuration.export(object parameters)

This method allows to export configuration data as a serialized string.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the objects to be exported and the format to use.

| Parameter | Type | Description |
|-------------|---------|---|
| format | string | Format in which the data must be exported. Possible values: yaml - YAML; xml - XML; json - JSON; raw - unprocessed PHP array. Parameter behavior: - <i>required</i> |
| prettyprint | boolean | Make the output more human readable by adding indentation. Possible values: true - add indentation; false - (<i>default</i>) do not add indentation. |

| Parameter | Type | Description |
|-----------|--------|---|
| options | object | <p>Objects to be exported.</p> <p>The options object has the following parameters:</p> <ul style="list-style-type: none"> host_groups - (array) IDs of host groups to export; hosts - (array) IDs of hosts to export; images - (array) IDs of images to export; maps - (array) IDs of maps to export; mediaTypes - (array) IDs of media types to export; template_groups - (array) IDs of template groups to export; templates - (array) IDs of templates to export. <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |

Return values

(string) Returns a serialized string containing the requested configuration data.

Examples

Exporting a template

Export the configuration of template "10571" as an XML string.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.export",
  "params": {
    "options": {
      "templates": [
        "10571"
      ]
    },
    "format": "xml"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "<?xml version='1.0' encoding='UTF-8'?>\n<zabbix_export><version>7.2</version><template_
  "id": 1
}
```

Source

CConfiguration::export() in ui/include/classes/api/services/CConfiguration.php.

configuration.import

Description

boolean configuration.import(object parameters)

This method allows to import configuration data from a serialized string.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the data to import and rules how the data should be handled.

| Parameter | Type | Description |
|-----------|--------|--|
| format | string | Format of the serialized string. Possible values: yaml - YAML; xml - XML; json - JSON. Parameter behavior: - <i>required</i> |
| source | string | Serialized string containing the configuration data. Parameter behavior: - <i>required</i> |
| rules | object | Rules on how new and existing objects should be imported. The rules parameter is described in detail in the table below. Parameter behavior: - <i>required</i> |

Note:

If no rules are given, the configuration will not be updated.

The rules object supports the following parameters.

| Parameter | Type | Description |
|----------------|--------|---|
| discoveryRules | object | Rules on how to import LLD rules. Supported parameters: createMissing - (boolean) if set to true, new LLD rules will be created; default: false; updateExisting - (boolean) if set to true, existing LLD rules will be updated; default: false; deleteMissing - (boolean) if set to true, LLD rules not present in the imported data will be deleted from the database; default: false. |
| graphs | object | Rules on how to import graphs. Supported parameters: createMissing - (boolean) if set to true, new graphs will be created; default: false; updateExisting - (boolean) if set to true, existing graphs will be updated; default: false; deleteMissing - (boolean) if set to true, graphs not present in the imported data will be deleted from the database; default: false. |
| host_groups | object | Rules on how to import host groups. Supported parameters: createMissing - (boolean) if set to true, new host groups will be created; default: false; updateExisting - (boolean) if set to true, existing host groups will be updated; default: false. |

| Parameter | Type | Description |
|-----------------|--------|--|
| template_groups | object | <p>Rules on how to import template groups.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new template groups will be created; default: false; updateExisting - (boolean) if set to true, existing template groups will be updated; default: false.</p> |
| hosts | object | <p>Rules on how to import hosts.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new hosts will be created; default: false; updateExisting - (boolean) if set to true, existing hosts will be updated; default: false.</p> |
| httptests | object | <p>Rules on how to import web scenarios.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new web scenarios will be created; default: false; updateExisting - (boolean) if set to true, existing web scenarios will be updated; default: false; deleteMissing - (boolean) if set to true, web scenarios not present in the imported data will be deleted from the database; default: false.</p> |
| images | object | <p>Rules on how to import images.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new images will be created; default: false; updateExisting - (boolean) if set to true, existing images will be updated; default: false.</p> |
| items | object | <p>Rules on how to import items.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new items will be created; default: false; updateExisting - (boolean) if set to true, existing items will be updated; default: false; deleteMissing - (boolean) if set to true, items not present in the imported data will be deleted from the database; default: false.</p> |
| maps | object | <p>Rules on how to import maps.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new maps will be created; default: false; updateExisting - (boolean) if set to true, existing maps will be updated; default: false.</p> |
| mediaTypes | object | <p>Rules on how to import media types.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new media types will be created; default: false; updateExisting - (boolean) if set to true, existing media types will be updated; default: false.</p> |

| Parameter | Type | Description |
|--------------------|--------|--|
| templateLinkage | object | Rules on how to import template links. |
| templates | object | <p>Supported parameters:</p> <p>createMissing - (boolean) if set to true, templates that are not linked to the host or template being imported, but are present in the imported data, will be linked; default: false;</p> <p>deleteMissing - (boolean) if set to true, templates that are linked to the host or template being imported, but are not present in the imported data, will be unlinked without removing entities (items, triggers, etc.) inherited from the unlinked templates; default: false.</p> <p>Rules on how to import templates.</p> <p>Supported parameters:</p> <p>createMissing - (boolean) if set to true, new templates will be created; default: false;</p> <p>updateExisting - (boolean) if set to true, existing templates will be updated; default: false.</p> |
| templateDashboards | object | <p>Rules on how to import template dashboards.</p> <p>Supported parameters:</p> <p>createMissing - (boolean) if set to true, new template dashboards will be created; default: false;</p> <p>updateExisting - (boolean) if set to true, existing template dashboards will be updated; default: false;</p> <p>deleteMissing - (boolean) if set to true, template dashboards not present in the imported data will be deleted from the database; default: false.</p> |
| triggers | object | <p>Rules on how to import triggers.</p> <p>Supported parameters:</p> <p>createMissing - (boolean) if set to true, new triggers will be created; default: false;</p> <p>updateExisting - (boolean) if set to true, existing triggers will be updated; default: false;</p> <p>deleteMissing - (boolean) if set to true, triggers not present in the imported data will be deleted from the database; default: false.</p> |
| valueMaps | object | <p>Rules on how to import host or template value maps.</p> <p>Supported parameters:</p> <p>createMissing - (boolean) if set to true, new value maps will be created; default: false;</p> <p>updateExisting - (boolean) if set to true, existing value maps will be updated; default: false;</p> <p>deleteMissing - (boolean) if set to true, value maps not present in the imported data will be deleted from the database; default: false.</p> |

Return values

(boolean) Returns true if importing has been successful.

Examples

Importing a template

Import the template configuration contained in the XML string. If any items or triggers in the XML string are missing, they will be deleted from the database, and everything else will be left unchanged.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.import",
  "params": {
    "format": "xml",
```

```

    "rules": {
      "templates": {
        "createMissing": true,
        "updateExisting": true
      },
      "items": {
        "createMissing": true,
        "updateExisting": true,
        "deleteMissing": true
      },
      "triggers": {
        "createMissing": true,
        "updateExisting": true,
        "deleteMissing": true
      },
      "valueMaps": {
        "createMissing": true,
        "updateExisting": false
      }
    },
    "source": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<zabbix_export><version>7.2</version><templ
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}

```

Source

CConfiguration::import() in *ui/include/classes/api/services/CConfiguration.php*.

configuration.importcompare

Description

array configuration.importcompare(object parameters)

This method allows to compare import file with current system elements and shows what will be changed if this import file will be imported.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the possible data to import and rules how the data should be handled.

| Parameter | Type | Description |
|-----------|--------|---|
| format | string | Format of the serialized string. Possible values: yaml - YAML; xml - XML; json - JSON. Parameter behavior: - <i>required</i> |

| Parameter | Type | Description |
|-----------|--------|--|
| source | string | Serialized string containing the configuration data. |
| rules | object | <p>Parameter behavior: - <i>required</i></p> <p>Rules on how new and existing objects should be compared.</p> <p>The rules parameter is described in detail in the table below.</p> <p>Parameter behavior: - <i>required</i></p> |

Note:

If no rules are given, there will be nothing to update and result will be empty.

Note:

Comparison will be done only for host groups and templates. Triggers and graphs will be compared only for imported templates, any other will be considered as "new".

The rules object supports the following parameters.

| Parameter | Type | Description |
|-----------------|--------|--|
| discoveryRules | object | Rules on how to import LLD rules. |
| graphs | object | <p>Supported parameters: createMissing - (boolean) if set to true, new LLD rules will be created; default: false; updateExisting - (boolean) if set to true, existing LLD rules will be updated; default: false; deleteMissing - (boolean) if set to true, LLD rules not present in the imported data will be deleted from the database; default: false.</p> <p>Rules on how to import graphs.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new graphs will be created; default: false; updateExisting - (boolean) if set to true, existing graphs will be updated; default: false; deleteMissing - (boolean) if set to true, graphs not present in the imported data will be deleted from the database; default: false.</p> |
| host_groups | object | Rules on how to import host groups. |
| template_groups | object | <p>Supported parameters: createMissing - (boolean) if set to true, new host groups will be created; default: false; updateExisting - (boolean) if set to true, existing host groups will be updated; default: false.</p> <p>Rules on how to import template groups.</p> <p>Supported parameters: createMissing - (boolean) if set to true, new template groups will be created; default: false; updateExisting - (boolean) if set to true, existing template groups will be updated; default: false.</p> |

| Parameter | Type | Description |
|------------|--------|---|
| hosts | object | <p>Rules on how to import hosts.</p> <p>Supported parameters: <code>createMissing</code> - (boolean) if set to true, new hosts will be created; default: false; <code>updateExisting</code> - (boolean) if set to true, existing hosts will be updated; default: false.</p> <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> |
| httptests | object | <p>Rules on how to import web scenarios.</p> <p>Supported parameters: <code>createMissing</code> - (boolean) if set to true, new web scenarios will be created; default: false; <code>updateExisting</code> - (boolean) if set to true, existing web scenarios will be updated; default: false; <code>deleteMissing</code> - (boolean) if set to true, web scenarios not present in the imported data will be deleted from the database; default: false.</p> |
| images | object | <p>Rules on how to import images.</p> <p>Supported parameters: <code>createMissing</code> - (boolean) if set to true, new images will be created; default: false; <code>updateExisting</code> - (boolean) if set to true, existing images will be updated; default: false.</p> <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> |
| items | object | <p>Rules on how to import items.</p> <p>Supported parameters: <code>createMissing</code> - (boolean) if set to true, new items will be created; default: false; <code>updateExisting</code> - (boolean) if set to true, existing items will be updated; default: false; <code>deleteMissing</code> - (boolean) if set to true, items not present in the imported data will be deleted from the database; default: false.</p> |
| maps | object | <p>Rules on how to import maps.</p> <p>Supported parameters: <code>createMissing</code> - (boolean) if set to true, new maps will be created; default: false; <code>updateExisting</code> - (boolean) if set to true, existing maps will be updated; default: false.</p> <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> |
| mediaTypes | object | <p>Rules on how to import media types.</p> <p>Supported parameters: <code>createMissing</code> - (boolean) if set to true, new media types will be created; default: false; <code>updateExisting</code> - (boolean) if set to true, existing media types will be updated; default: false.</p> <p>This parameter will make no difference to the output. It is allowed only for consistency with <code>configuration.import</code>.</p> |

| Parameter | Type | Description |
|--------------------|--------|---|
| templateLinkage | object | Rules on how to import template links. Supported parameters: createMissing - (boolean) if set to true, templates that are not linked to the host or template being imported, but are present in the imported data, will be linked; default: false; deleteMissing - (boolean) if set to true, templates that are linked to the host or template being imported, but are not present in the imported data, will be unlinked without removing entities (items, triggers, etc.) inherited from the unlinked templates; default: false. |
| templates | object | Rules on how to import templates. Supported parameters: createMissing - (boolean) if set to true, new templates will be created; default: false; updateExisting - (boolean) if set to true, existing templates will be updated; default: false. |
| templateDashboards | object | Rules on how to import template dashboards. Supported parameters: createMissing - (boolean) if set to true, new template dashboards will be created; default: false; updateExisting - (boolean) if set to true, existing template dashboards will be updated; default: false; deleteMissing - (boolean) if set to true, template dashboards not present in the imported data will be deleted from the database; default: false. |
| triggers | object | Rules on how to import triggers. Supported parameters: createMissing - (boolean) if set to true, new triggers will be created; default: false; updateExisting - (boolean) if set to true, existing triggers will be updated; default: false; deleteMissing - (boolean) if set to true, triggers not present in the imported data will be deleted from the database; default: false. |
| valueMaps | object | Rules on how to import host or template value maps. Supported parameters: createMissing - (boolean) if set to true, new value maps will be created; default: false; updateExisting - (boolean) if set to true, existing value maps will be updated; default: false; deleteMissing - (boolean) if set to true, value maps not present in the imported data will be deleted from the database; default: false. |

Return values

(array) Returns an array with changes in configuration, that will be made.

Examples

Comparing the import of a template

Compare the template contained in the XML string to the current system elements, and show what will be changed if this template will be imported.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "configuration.importcompare",
  "params": {
    "format": "xml",
```

```

Connector

This class is designed to work with connectors.

Object references:

- Connector
- Tag filter

Available methods:

- **connector.create** - create new connectors
- **connector.delete** - delete connectors
- **connector.get** - retrieve connectors
- **connector.update** - update connectors

Connector object

The following objects are directly related to the connector API.

Connector

The connector object has the following properties.

| Property | Type | Description |
|-------------|------|----------------------|
| connectorid | ID | ID of the connector. |

Property behavior:

- read-only

- *required* for update operations

| Property | Type | Description |
|------------------|---------|---|
| name | string | Name of the connector. |
| url | string | <p>Property behavior: - <i>required</i> for create operations Endpoint URL, that is, URL of the receiver. User macros are supported.</p> <p>Property behavior: - <i>required</i> for create operations Communication protocol.</p> <p>Possible values: 0 - (<i>default</i>) Zabbix Streaming Protocol v1.0. Data type.</p> |
| protocol | integer | <p>Possible values: 0 - (<i>default</i>) Item values; 1 - Events.</p> |
| data_type | integer | <p>Possible values: 0 - (<i>default</i>) Item values; 1 - Events.</p> |
| item_value_type | integer | <p>A sum of item value types to be sent.</p> <p>Possible values: 1 - Numeric (float); 2 - Character; 4 - Log; 8 - Numeric (unsigned); 10 - Text; 20 - Binary.</p> <p>Default: 31 - All item types (except binary).</p> <p>Property behavior: - <i>supported</i> if <code>data_type</code> is set to "Item values". Maximum number of events or items that can be sent within one message.</p> <p>Possible values: 0-2147483647 (max value of 32-bit signed integer).</p> |
| max_records | integer | <p>Default: 0 - Unlimited. Number of sender processes to run for this connector.</p> <p>Possible values: 1-100.</p> |
| max_senders | integer | <p>Default: 1. Number of attempts.</p> <p>Possible values: 1-5.</p> |
| max_attempts | integer | <p>Default: 1. The interval between retry attempts. Accepts seconds.</p> <p>Possible values: 0s-10s.</p> <p>Default: 5s.</p> <p>Property behavior: - <i>supported</i> if <code>max_attempts</code> is greater than 1.</p> |
| attempt_interval | string | |

| Property | Type | Description |
|------------------|---------|--|
| timeout | string | <p>Timeout.</p> <p>Time suffixes are supported (e.g., 30s, 1m).</p> <p>User macros are supported.</p> <p>Possible values: 1s-60s.</p> |
| http_proxy | string | <p>Default: 5s.</p> <p>HTTP(S) proxy connection string given as <i>[protocol]://[username[:password]@]proxy.example.com[:port]</i>.</p> |
| authtype | integer | <p>User macros are supported.</p> <p>HTTP authentication method.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (default) None; 1 - Basic; 2 - NTLM; 3 - Kerberos; 4 - Digest; 5 - Bearer. |
| username | string | <p>User name.</p> <p>User macros are supported.</p> |
| password | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if authtype is set to "Basic", "NTLM", "Kerberos", or "Digest" <p>Password.</p> <p>User macros are supported.</p> |
| token | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if authtype is set to "Basic", "NTLM", "Kerberos", or "Digest" <p>Bearer token.</p> <p>User macros are supported.</p> |
| verify_peer | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if authtype is set to "Bearer" <p>Whether to validate that the host's certificate is authentic.</p> |
| verify_host | integer | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Do not validate; 1 - (default) Validate. <p>Whether to validate that the host name for the connection matches the one in the host's certificate.</p> |
| ssl_cert_file | string | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Do not validate; 1 - (default) Validate. <p>Public SSL Key file path.</p> |
| ssl_key_file | string | <p>User macros are supported.</p> <p>Private SSL Key file path.</p> |
| ssl_key_password | string | <p>User macros are supported.</p> <p>Password for SSL Key file.</p> |
| description | text | <p>User macros are supported.</p> <p>Description of the connector.</p> |
| status | integer | <p>Whether the connector is enabled.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Disabled; 1 - (default) Enabled. |

| Property | Type | Description |
|---------------|---------|--|
| tags_evaltype | integer | Tag evaluation method. Possible values: 0 - (default) And/Or; 2 - Or. |

Tag filter

Tag filter allows to export only matching item values or events. If not set then everything will be exported. The tag filter object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| tag | string | Tag name. |
| operator | integer | Property behavior: - <i>required</i> Condition operator. Possible values: 0 - (default) Equals; 1 - Does not equal; 2 - Contains; 3 - Does not contain; 12 - Exists; 1 - Does not exist. |
| value | string | Tag value. |

connector.create

Description

`object connector.create(object/array connectors)`

This method allows to create new connector objects.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Connector objects to create.

Additionally to the [standard connector properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| tags | array | Connector tag filter . |

Return values

(object) Returns an object containing the IDs of the created connectors under the `connectorids` property. The order of the returned IDs matches the order of the passed connectors.

Examples

Creating a connector

Create a connector to export trigger events with a tag filter. HTTP authentication will be performed using Bearer token.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "connector.create",
  "params": [
    {
      "name": "Export of events",
      "data_type": 1,
      "url": "${DATA_EXPORT_URL}",
      "authtype": 5,
      "token": "${DATA_EXPORT_BEARER_TOKEN}",
      "tags": [
        {
          "tag": "service",
          "operator": 0,
          "value": "mysqld"
        }
      ]
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "connectorid": [
      "3"
    ]
  },
  "id": 1
}
```

Source

CConnector::create() in `ui/include/classes/api/services/CConnector.php`.

connector.delete

Description

object connector.delete(array connectorids)

This method allows to delete connector entries.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the connectors to delete.

Return values

(object) Returns an object containing the IDs of the deleted connectors under the `connectorids` property.

Examples

Deleting multiple connectors

Delete two connector entries.

Request:

```
{
  "jsonrpc": "2.0",
```

```

    "method": "connector.delete",
    "params": [
        3,
        5
    ],
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "connectorids": [
            "3",
            "5"
        ]
    },
    "id": 1
}

```

Source

CConnector::delete() in *ui/include/classes/api/services/CConnector.php*.

connector.get

Description

integer/array connector.get(object parameters)

The method allows to retrieve connector objects according to the given parameters.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| connectorids | ID/array | Return only connectors with the given IDs. |
| selectTags | query | Return a tags property with connector tag filter . |
| sortfield | string/array | Supports count. Sort the result by the given properties. |
| countOutput | boolean | Possible values: connectorid, name, data_type, status. |
| excludeSearch | boolean | These parameters are described in the reference commentary . |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving all connectors

Retrieve all data about all connectors and their properties.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "connector.get",
  "params": {
    "output": "extend",
    "selectTags": ["tag", "operator", "value"],
    "preservekeys": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "connectorid": "1",
      "name": "Export of item values",
      "protocol": "0",
      "data_type": "0",
      "url": "${DATA_EXPORT_VALUES_URL}",
      "item_value_type": "31",
      "authtype": "4",
      "username": "${DATA_EXPORT_VALUES_USERNAME}",
      "password": "${DATA_EXPORT_VALUES_PASSWORD}",
      "token": "",
      "max_records": "0",
      "max_senders": "4",
      "max_attempts": "2",
      "attempt_interval": "10s",
      "timeout": "10s",
      "http_proxy": "${DATA_EXPORT_VALUES_PROXY}",
      "verify_peer": "1",
      "verify_host": "1",
      "ssl_cert_file": "${DATA_EXPORT_VALUES_SSL_CERT_FILE}",
      "ssl_key_file": "${DATA_EXPORT_VALUES_SSL_KEY_FILE}",
      "ssl_key_password": "",
      "description": "",
      "status": "1",
      "tags_evaltype": "0",
      "tags": [
        {
          "tag": "component",
          "operator": "0",
          "value": "memory"
        }
      ]
    },
    {
      "connectorid": "2",
      "name": "Export of events",
      "protocol": "0",
      "data_type": "1",

```

```

        "url": "{$DATA_EXPORT_EVENTS_URL}",
        "item_value_type": "31",
        "authtype": "5",
        "username": "",
        "password": "",
        "token": "{$DATA_EXPORT_EVENTS_BEARER_TOKEN}",
        "max_records": "0",
        "max_senders": "2",
        "max_attempts": "1",
        "attempt_interval": "5s",
        "timeout": "5s",
        "http_proxy": "",
        "verify_peer": "1",
        "verify_host": "1",

            {
                "tag": "scope",
                "operator": "0",
                "value": "performance"
            }
        ]
    },
    "id": 1
}

```

Source

CConnector::get() in *ui/include/classes/api/services/CConnector.php*.

connector.update

Description

object connector.update(object/array connectors)

This method allows to update existing connectors.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Connector properties to be updated.

The `connectorid` property must be defined for each connector, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard connector properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| tags | array | Connector tag filter to replace the current tag filter. |

Return values

(object) Returns an object containing the IDs of the updated connectors under the `connectorids` property.

Examples

Changing HTTP authentication type

Change HTTP authentication type to Bearer for connector with ID "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "connector.update",
  "params": {
    "connectorid": 3,
    "authtype": 5,
    "token": "{$DATA_EXPORT_BEARER_TOKEN}"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "connectorids": [
      "3"
    ]
  },
  "id": 1
}
```

Updating tag filter

Change tag filter for connector with ID "5".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "connector.update",
  "params": [
    {
      "connectorid": 5,
      "tags_evaltype": 2,
      "tags": [
        {
          "tag": "service",
          "operator": 0,
          "value": "mysqld"
        },
        {
          "tag": "error",
          "operator": 12,
          "value": ""
        }
      ]
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "connectorids": [
      "5"
    ]
  },
  "id": 1
}
```

```
"id": 1  
}
```

Source

CConnector::update() in *ui/include/classes/api/services/CConnector.php*.

Correlation

This class is designed to work with correlations.

Object references:

- [Correlation](#)
- [Correlation operation](#)
- [Correlation filter](#)
 - [Correlation filter condition](#)

Available methods:

- [correlation.create](#) - create new correlations
- [correlation.delete](#) - delete correlations
- [correlation.get](#) - retrieve correlations
- [correlation.update](#) - update correlations

Correlation object

The following objects are directly related to the `correlation` API.

Correlation

The correlation object has the following properties.

| Property | Type | Description |
|---------------|---------|---|
| correlationid | ID | ID of the correlation. |
| name | string | Property behavior: - <i>read-only</i> - <i>required</i> for update operations Name of the correlation. |
| description | string | Property behavior: - <i>required</i> for create operations Description of the correlation. |
| status | integer | Whether the correlation is enabled or disabled. Possible values: 0 - (<i>default</i>) enabled; 1 - disabled. |

Correlation operation

The correlation operation object defines an operation that will be performed when a correlation is executed. It has the following properties.

| Property | Type | Description |
|----------|---------|---|
| type | integer | Type of operation. Possible values: 0 - close old events; 1 - close new event. Property behavior: - <i>required</i> |

Correlation filter

The correlation filter object defines a set of conditions that must be met to perform the configured correlation operations. It has the following properties.

| Property | Type | Description |
|--------------|---------|--|
| conditions | array | Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. Property behavior: - <i>required</i> |
| evaltype | integer | Filter condition evaluation method. Possible values: 0 - and/or; 1 - and; 2 - or; 3 - custom expression. Property behavior: - <i>required</i> |
| eval_formula | string | Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its <code>formulaid</code> . The value of <code>eval_formula</code> is equal to the value of <code>formula</code> for filters with a custom expression. Property behavior: - <i>read-only</i> |
| formula | string | User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its <code>formulaid</code> . The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - <i>required</i> if <code>evaltype</code> is set to "custom expression" |

Correlation filter condition

The correlation filter condition object defines a specific condition that must be checked before running the correlation operations.

| Property | Type | Description |
|-----------|---------|---|
| type | integer | Type of condition. Possible values: 0 - old event tag; 1 - new event tag; 2 - new event host group; 3 - event tag pair; 4 - old event tag value; 5 - new event tag value. |
| tag | string | Property behavior: - <i>required</i> Event tag (old or new). |
| groupid | ID | Property behavior: - <i>required</i> if type is set to "old event tag", "new event tag", "old event tag value", or "new event tag value" ID of the host group. |
| oldtag | string | Property behavior: - <i>required</i> if type is set to "new event host group" Old event tag. |
| newtag | string | Property behavior: - <i>required</i> if type is set to "event tag pair" Old event tag. |
| value | string | Property behavior: - <i>required</i> if type is set to "event tag pair" Event tag (old or new) value. |
| formulaid | string | Property behavior: - <i>required</i> if type is set to "old event tag value" or "new event tag value" Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| operator | integer | Condition operator. Property behavior: - <i>required</i> if type is set to "new event host group", "old event tag value", or "new event tag value" |

Note:

To better understand how to use filters with various types of expressions, see examples on the [correlation.get](#) and [correlation.create](#) method pages.

The following operators and values are supported for each condition type.

| Condition | Condition name | Supported operators | Expected value |
|-----------|---------------------|-----------------------|----------------|
| 2 | Host group | =, <> | Host group ID. |
| 4 | Old event tag value | =, <>, like, not like | string |
| 5 | New event tag value | =, <>, like, not like | string |

correlation.create

Description

`object correlation.create(object/array correlations)`

This method allows to create new correlations.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Correlations to create.

Additionally to the [standard correlation properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|--------|--|
| operations | array | Correlation operations to create for the correlation. Parameter behavior: - <i>required</i> |
| filter | object | Correlation filter object for the correlation. Parameter behavior: - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the created correlations under the `correlationids` property. The order of the returned IDs matches the order of the passed correlations.

Examples

Create a new event tag correlation

Create a correlation using evaluation method AND/OR with one condition and one operation. By default the correlation will be enabled.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.create",
  "params": {
    "name": "new event tag correlation",
    "filter": {
      "evaltype": 0,
      "conditions": [
        {
          "type": 1,
          "tag": "ok"
        }
      ]
    },
    "operations": [
      {
        "type": 0
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
```

```

        "1"
    ],
    },
    "id": 1
}

```

Using a custom expression filter

Create a correlation that will use a custom filter condition. The formula IDs "A" or "B" have been chosen arbitrarily. Condition type will be "Host group" with operator "<>".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "correlation.create",
  "params": {
    "name": "new host group correlation",
    "description": "a custom description",
    "status": 0,
    "filter": {
      "evaltype": 3,
      "formula": "A or B",
      "conditions": [
        {
          "type": 2,
          "operator": 1,
          "formulaid": "A"
        },
        {
          "type": 2,
          "operator": 1,
          "formulaid": "B"
        }
      ]
    },
    "operations": [
      {
        "type": 1
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "2"
    ]
  },
  "id": 1
}

```

Source

CCorrelation::create() in *ui/include/classes/api/services/CCorrelation.php*.

correlation.delete

Description

object correlation.delete(array correlationids)

This method allows to delete correlations.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the correlations to delete.

Return values

(object) Returns an object containing the IDs of the deleted correlations under the `correlationids` property.

Example

Delete multiple correlations

Delete two correlations.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.delete",
  "params": [
    "1",
    "2"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

CCorrelation::delete() in `ui/include/classes/api/services/CCorrelation.php`.

correlation.get

Description

integer/array correlation.get(object parameters)

The method allows to retrieve correlations according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| correlationids | ID/array | Return only correlations with the given IDs. |
| selectFilter | query | Return a filter property with the correlation conditions. |
| selectOperations | query | Return an operations property with the correlation operations. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: correlationid, name, status. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve correlations

Retrieve all configured correlations together with correlation conditions and operations. The filter uses the "and/or" evaluation type, so the formula property is empty and eval_formula is generated automatically.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.get",
  "params": {
    "output": "extend",
    "selectOperations": "extend",
    "selectFilter": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "correlationid": "1",
      "name": "Correlation 1",
      "description": "",
      "status": "0",
      "filter": {
        "evaltype": "0",
        "formula": "",
        "conditions": [
          {
            "type": "3",
            "oldtag": "error",

```

```

        "newtag": "ok",
        "formulaid": "A"
    },
    ],
    "eval_formula": "A"
},
"operations": [
    {
        "type": "O"
    }
]
}
],
"id": 1
}

```

correlation.update

Description

`object correlation.update(object/array correlations)`

This method allows to update existing correlations.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Correlation properties to be updated.

The `correlationid` property must be defined for each correlation, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard correlation properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|--------|--|
| filter | object | Correlation filter object to replace the current filter. |
| operations | array | Correlation operations to replace existing operations. |

Return values

(object) Returns an object containing the IDs of the updated correlations under the `correlationids` property.

Examples

Disable correlation

Request:

```

{
    "jsonrpc": "2.0",
    "method": "correlation.update",
    "params": {
        "correlationid": "1",
        "status": "1"
    },
}

```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1"
    ]
  },
  "id": 1
}
```

Replace conditions, but keep the evaluation method

Request:

```
{
  "jsonrpc": "2.0",
  "method": "correlation.update",
  "params": {
    "correlationid": "1",
    "filter": {
      "conditions": [
        {
          "type": 3,
          "oldtag": "error",
          "newtag": "ok"
        }
      ]
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "correlationids": [
      "1"
    ]
  },
  "id": 1
}
```

Dashboard

This class is designed to work with dashboards.

Object references:

- [Dashboard](#)
- [Dashboard page](#)
 - [Dashboard widget](#)
 - * [Dashboard widget field](#)

- **Dashboard user group**
- **Dashboard user**

Available methods:

- **dashboard.create** - create new dashboards
- **dashboard.delete** - delete dashboards
- **dashboard.get** - retrieve dashboards
- **dashboard.update** - update dashboards

Dashboard object

The following objects are directly related to the dashboard API.

Dashboard

The dashboard object has the following properties.

| Property | Type | Description |
|----------------|---------|---|
| dashboardid | ID | ID of the dashboard. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Name of the dashboard.</p> |
| userid | ID | ID of the user that is the owner of the dashboard. |
| private | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations <p>Type of dashboard sharing.</p> |
| display_period | integer | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - public dashboard; 1 - (<i>default</i>) private dashboard. <p>Default page display period (in seconds).</p> <p>Possible values: 10, 30, 60, 120, 600, 1800, 3600.</p> |
| auto_start | integer | <p>Default: 30.</p> <p>Auto start slideshow.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - do not auto start slideshow; 1 - (<i>default</i>) auto start slideshow. |

Dashboard page

The dashboard page object has the following properties.

| Property | Type | Description |
|------------------|---------|---|
| dashboard_pageid | ID | ID of the dashboard page. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> <p>Dashboard page name.</p> |
| display_period | integer | <p>Default: empty string.</p> <p>Dashboard page display period (in seconds).</p> <p>Possible values: 0, 10, 30, 60, 120, 600, 1800, 3600.</p> <p>Default: 0 (will use the default page display period).</p> |

| Property | Type | Description |
|----------|-------|---|
| widgets | array | Array of the dashboard widget objects. |

Dashboard widget

The dashboard widget object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| widgetid | ID | ID of the dashboard widget. |
| type | string | <p>Property behavior: - <i>read-only</i></p> <p>Type of the dashboard widget.</p> <p>Possible values: actionlog - Action log; clock - Clock; discovery - Discovery status; favgraphs - Favorite graphs; favmaps - Favorite maps; gauge - Gauge; geomap - Geomap; graph - Graph (classic); graphprototype - Graph prototype; honeycomb - Honeycomb; hostavail - Host availability; hostcard - Host card; hostnavigator - Host navigator; itemhistory - Item history; itemnavigator - Item navigator; item - Item value; map - Map; navtree - Map Navigation Tree; piechart - Pie chart; problemhosts - Problem hosts; problems - Problems; problemsbysv - Problems by severity; slareport - SLA report; svggraph - Graph; systeminfo - System information; tophosts - Top hosts; topitems - Top items; toptriggers - Top triggers; trigover - Trigger overview; url - URL; web - Web monitoring.</p> <p>Property behavior: - <i>required</i></p> |
| name | string | Custom widget name. |
| x | integer | A horizontal position from the left side of the dashboard. |
| y | integer | <p>Possible values range from 0 to 71. A vertical position from the top of the dashboard.</p> |
| width | integer | <p>Possible values range from 0 to 63. The widget width.</p> <p>Possible values range from 1 to 72.</p> |

| Property | Type | Description |
|---|---------|---|
| height | integer | The widget height. |
| view_mode | integer | Possible values range from 1 to 64. The widget view mode. |
| fields | array | Possible values: 0 - <i>(default)</i> default widget view; 1 - with hidden header; Array of the dashboard widget field objects. |
| Property behavior: - see individual widgets in Dashboard widget fields | | |

Dashboard widget field

The dashboard widget field object has the following properties.

| Property | Type | Description |
|----------|---------|---|
| type | integer | Type of the widget field. Possible values: 0 - Integer; 1 - String; 2 - Host group; 3 - Host; 4 - Item; 5 - Item prototype; 6 - Graph; 7 - Graph prototype; 8 - Map; 9 - Service; 10 - SLA; 11 - User; 12 - Action; 13 - Media type. |
| name | string | Property behavior: - <i>required</i> Widget field name. Possible values: see Dashboard widget fields . |
| value | mixed | Property behavior: - <i>required</i> Widget field value depending on the type. Possible values: see Dashboard widget fields . Property behavior: - <i>required</i> |

Dashboard user group

List of dashboard permissions based on user groups. It has the following properties.

| Property | Type | Description |
|------------|---------|---|
| usrgrpid | ID | ID of the user group. |
| permission | integer | <p>Property behavior: - <i>required</i></p> <p>Type of permission level.</p> <p>Possible values: 2 - read only; 3 - read-write.</p> <p>Property behavior: - <i>required</i></p> |

Dashboard user

List of dashboard permissions based on users. It has the following properties.

| Property | Type | Description |
|------------|---------|---|
| userid | ID | ID of the user. |
| permission | integer | <p>Property behavior: - <i>required</i></p> <p>Type of permission level.</p> <p>Possible values: 2 - read only; 3 - read-write.</p> <p>Property behavior: - <i>required</i></p> |

dashboard.create

Description

`object dashboard.create(object/array dashboards)`

This method allows to create new dashboards.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Dashboards to create.

Additionally to the [standard dashboard properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|-------|--|
| pages | array | <p>Dashboard pages to be created for the dashboard. Dashboard pages will be ordered in the same order as specified.</p> <p>Parameter behavior: - <i>required</i></p> |
| users | array | Dashboard user shares to be created on the dashboard. |
| userGroups | array | Dashboard user group shares to be created on the dashboard. |

Return values

(object) Returns an object containing the IDs of the created dashboards under the `dashboardids` property. The order of the returned IDs matches the order of the passed dashboards.

Examples

Creating a dashboard

Create a dashboard named "My dashboard" with one Problems widget with tags and using two types of sharing (user group and user) on a single dashboard page.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "problems",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 1,
                "name": "tags.0.tag",
                "value": "service"
              },
              {
                "type": 0,
                "name": "tags.0.operator",
                "value": 1
              },
              {
                "type": 1,
                "name": "tags.0.value",
                "value": "zabbix_server"
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrp_id": "7",
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": "4",
        "permission": 3
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 1
}
```

Source

CDashboard::create() in *ui/include/classes/api/services/CDashboard.php*.

dashboard.delete

Description

object dashboard.delete(array dashboardids)

This method allows to delete dashboards.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the dashboards to delete.

Return values

(object) Returns an object containing the IDs of the deleted dashboards under the `dashboardids` property.

Examples

Deleting multiple dashboards

Delete two dashboards.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.delete",
  "params": [
    "2",
    "3"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2",
      "3"
    ]
  }
}
```

```

    ],
    "id": 1
}

```

Source

CDashboard::delete() in *ui/include/classes/api/services/CDashboard.php*.

dashboard.get

Description

integer/array dashboard.get(object parameters)

The method allows to retrieve dashboards according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| dashboardids | ID/array | Return only dashboards with the given IDs. |
| selectPages | query | Return a pages property with dashboard pages, correctly ordered. |
| selectUsers | query | Return a users property with users that the dashboard is shared with. |
| selectUserGroups | query | Return a userGroups property with user groups that the dashboard is shared with. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: dashboardid. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving a dashboard by ID

Retrieve all data about dashboards "1" and "2".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.get",
  "params": {
    "output": "extend",
    "selectPages": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
    "dashboardids": [
      "1",
      "2"
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "dashboardid": "1",
      "name": "Dashboard",
      "userid": "1",
      "private": "0",
      "display_period": "30",
      "auto_start": "1",
      "users": [],
      "userGroups": [],
      "pages": [
        {
          "dashboard_pageid": "1",
          "name": "",
          "display_period": "0",
          "widgets": [
            {
              "widgetid": "9",
              "type": "systeminfo",
              "name": "",
              "x": "12",
              "y": "8",
              "width": "12",
              "height": "5",
              "view_mode": "0",
              "fields": []
            },
            {
              "widgetid": "8",
              "type": "problemsbysv",
              "name": "",
              "x": "12",
              "y": "4",
              "width": "12",

dashboard.update

Description

object dashboard.update(object/array dashboards)

This method allows to update existing dashboards.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Dashboard properties to be updated.

The dashboardid property must be defined for each dashboard, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard dashboard properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|-------|---|
| pages | array | Dashboard pages to replace the existing dashboard pages. Dashboard pages are updated by the dashboard_pageid property. New dashboard pages will be created for objects without dashboard_pageid property and the existing dashboard pages will be deleted if not reused. Dashboard pages will be ordered in the same order as specified. Only the specified properties of the dashboard pages will be updated. |
| users | array | Dashboard user shares to replace the existing elements. |
| userGroups | array | Dashboard user group shares to replace the existing elements. |

Return values

(object) Returns an object containing the IDs of the updated dashboards under the dashboardids property.

Examples

Renaming a dashboard

Rename a dashboard to "SQL server status".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.update",
  "params": {
    "dashboardid": "2",
    "name": "SQL server status"
  },
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 1
}
```

Updating dashboard pages

Rename the first dashboard page, replace widgets on the second dashboard page and add a new page as the third one. Delete all other dashboard pages.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.update",
  "params": {
    "dashboardid": "2",
    "pages": [
      {
        "dashboard_pageid": 1,
        "name": "Renamed Page"
      },
      {
        "dashboard_pageid": 2,
        "widgets": [
          {
            "type": "clock",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 3
          }
        ]
      }
    ],
    {
      "display_period": 60
    }
  ]
},
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 1
}
```

Change dashboard owner

Available only for admins and super admins.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.update",
  "params": {
    "dashboardid": "2",
    "userid": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "2"
    ]
  },
  "id": 1
}
```

Attention:

Deprecated widgets will be removed in the upcoming major release.

1 Action log

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Action log* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Action log* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Action log* widget.

| Parameter | type | name | value |
|-------------------------|------|----------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Recipients</i> | 11 | userids.0 | User ID. Note: To configure multiple users, create a dashboard widget field object for each user with an incremented number in the property name. |
| <i>Actions</i> | 12 | actionids.0 | Action ID. Note: To configure multiple actions, create a dashboard widget field object for each action with an incremented number in the property name. |
| <i>Media types</i> | 13 | mediatypeids.0 | Media type ID. Note: To configure multiple media types, create a dashboard widget field object for each media type with an incremented number in the property name. |
| <i>Status</i> | 0 | statuses.0 | 0 - In progress; 1 - Sent/Executed; 2 - Failed. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. |
| <i>Search string</i> | 1 | message | Any string value. |

| Parameter | type | name | value |
|------------------------|------|-----------------------|--|
| <i>Time period</i> | 1 | time_period.reference | DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its <i>Reference</i> parameter set to "ABCDE") as the data source. Default: DASHBOARD._timeperiod Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters. |
| <i>From</i> | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>To</i> | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>Sort entries by</i> | 0 | sort_triggers | 3 - Time (ascending); 4 - (<i>default</i>) Time (descending); 5 - Type (ascending); 6 - Type (descending); 7 - Status (ascending); 8 - Status (descending); 11 - Recipient (ascending); 12 - Recipient (descending). |
| <i>Show lines</i> | 0 | show_lines | Possible values range from 1-100. Default: 25. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Action log* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring an *Action log* widget

Configure an *Action log* widget that displays 10 entries of action operation details, sorted by time (in ascending order). In addition, display details only for those action operations that attempted to send an email to user "1", but were unsuccessful.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "actionlog",
            "name": "Action log",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
            "view_mode": 0,
            "fields": [

```

```

        "type": 0,
        "name": "show_lines",
        "value": 10
    },
    {
        "type": 0,
        "name": "sort_triggers",
        "value": 3
    },
    {
        "type": 11,
        "name": "userids.0",
        "value": 1
    },
    {
        "type": 13,
        "name": "mediatypeids.0",
        "value": 1
    },
    {
        "type": 0,
        "name": "statuses.0",
        "value": 2
    }
    ]
}
],
"userGroups": [
    {
        "usrgrpid": 7,
        "permission": 2
    }
],
"users": [
    {
        "userid": 1,
        "permission": 3
    }
]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}

```

2 Clock

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Clock* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Clock* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Clock* widget.

| Parameter | type | name | value |
|-------------------------|------|------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (default) 15 minutes. |
| <i>Time type</i> | 0 | time_type | 0 - (default) Local time; 1 - Server time; 2 - Host time. |
| <i>Clock type</i> | 0 | clock_type | 0 - (default) Analog; 1 - Digital. |

The following parameters are supported if *Time type* is set to "Host time".

| Parameter | type | name | value |
|-------------|------|----------|--|
| <i>Item</i> | 4 | itemid.0 | Item ID. Parameter behavior: - <i>required</i> |

The following parameters are supported if *Clock type* is set to "Digital".

| Parameter | type | name | value |
|--|------|--------|--|
| <i>Show</i> | 0 | show.0 | 1 - Date; 2 - (default) Time; 3 - Time zone. |
| Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. | | | |

Advanced configuration

The following advanced configuration parameters are supported if *Clock type* is set to "Digital".

| Parameter | type | name | value |
|-------------------------|------|----------|---|
| <i>Background color</i> | 1 | bg_color | Hexadecimal color code (e.g. FF0000). Default: "" (empty). |

Date

The following advanced configuration parameters are supported if *Clock type* is set to "Digital", and *Show* is set to "Date".

| Parameter | type | name | value |
|--------------|------|------------|---|
| <i>Bold</i> | 0 | date_bold | 0 - (default) Disabled; 1 - Enabled. |
| <i>Color</i> | 1 | date_color | Hexadecimal color code (e.g. FF0000). Default: "" (empty). |

Time

The following advanced configuration parameters are supported if *Clock type* is set to "Digital", and *Show* is set to "Time".

| Parameter | type | name | value |
|----------------|------|-------------|---|
| <i>Bold</i> | 0 | time_bold | 0 - (default) Disabled; 1 - Enabled. |
| <i>Color</i> | 1 | time_color | Hexadecimal color code (e.g. FF0000). Default: "" (empty). |
| <i>Seconds</i> | 0 | time_sec | 0 - Disabled; 1 - (default) Enabled. |
| <i>Format</i> | 0 | time_format | 0 - (default) 24-hour; 1 - 12-hour. |

Time zone

The following advanced configuration parameters are supported if *Clock type* is set to "Digital", and *Show* is set to "Time zone".

| Parameter | type | name | value |
|------------------|------|----------------|---|
| <i>Bold</i> | 0 | tzone_bold | 0 - (default) Disabled; 1 - Enabled. |
| <i>Color</i> | 1 | tzone_color | Hexadecimal color code (e.g. FF0000). Default: "" (empty). |
| <i>Time zone</i> | 1 | tzone_timezone | Valid timezone string (e.g. Europe/Riga, system, UTC, etc.). For the full list of supported time zones please refer to PHP documentation . Default: local. |
| <i>Format</i> | 0 | tzone_format | Parameter behavior: - supported if <i>Time type</i> is set to "Local time" or "Server time" 0 - (default) Short; 1 - Full. Parameter behavior: - supported if <i>Time type</i> is set to "Local time" or "Server time" |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Clock* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Clock* widget

Configure a *Clock* widget that displays local date, time and time zone in a customized digital clock.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
```

```

"name": "My dashboard",
"display_period": 30,
"auto_start": 1,
"pages": [
  {
    "widgets": [
      {
        "type": "clock",

3 Discovery status

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Discovery status* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Discovery status* widget.

| Parameter | type | name | value |
|-------------------------|------|---------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - <i>(default)</i> 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Discovery status* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring *Discovery status* widget

Configure a *Discovery status* widget with the refresh interval set to 15 minutes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "discovery",
            "name": "Discovery status",
            "x": 0,
            "y": 0,
            "width": 18,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "rf_rate",
                "value": 900
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrp_id": 7,
        "permission": 2
      }
    ],
    "users": [
      {
        "userid": 1,
        "permission": 3
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}
```

4 Favorite graphs

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Favorite graphs* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Favorite graphs* widget.

| Parameter | type | name | value |
|-------------------------|------|---------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (default) 15 minutes. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Favorite graphs* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Favorite graphs* widget

Configure a *Favorite graphs* widget with the refresh interval set to 10 minutes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "favgraphs",
            "name": "Favorite graphs",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "rf_rate",
                "value": 600
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrp_id": 7,
        "permission": 2
      }
    ]
  }
}
```

```

    }
  ],
  "users": [
    {
      "userid": 1,
      "permission": 3
    }
  ]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

5 Favorite maps

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Favorite maps* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Favorite maps* widget.

| Parameter | type | name | value |
|-------------------------|------|---------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (default) 15 minutes. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Favorite maps* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Favorite maps* widget

Configure a *Favorite maps* widget with the refresh interval set to 10 minutes.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {

```

```

    "name": "My dashboard",
    "display_period": 30,

6 Gauge

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Gauge* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Gauge* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Gauge* widget.

| Parameter | type | name | value |
|-------------------------|------|-------------------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Item</i> | 4 | itemid.0 | Item ID. |
| <i>Item (Widget)</i> | 1 | itemid._reference | <p>Parameter behavior: - <i>required</i> if <i>Item (Widget)</i> is not set</p> <p>Instead of Item ID: ABCDE._itemid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for items.</p> <p>Parameter behavior: - <i>required</i> if <i>Item</i> is not set</p> |
| <i>Min</i> | 1 | min | Any numeric value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. |
| <i>Max</i> | 1 | max | Default: "0". Any numeric value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. |
| <i>Value arc</i> | 1 | value_arc_color | Default: "100". Hexadecimal color code (e.g. FF0000). |
| <i>Arc background</i> | 1 | empty_color | Default: "" (empty). Hexadecimal color code (e.g. FF0000). |
| <i>Background</i> | 1 | bg_color | Default: "" (empty). Hexadecimal color code (e.g. FF0000). |
| | | | Default: "" (empty). |

| Parameter | type | name | value |
|----------------------|------|----------------------------|--|
| <i>Show</i> | 0 | show.0 | 1 - Description; 2 - Value; 3 - Needle; 4 - Scale; 5 - Value arc. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. Default: 1, 2, 4, 5. Values "Needle" and "Scale" are not supported if both: - no dashboard widget field object for <i>Show</i> with the value "Value arc" is set; - <i>Show arc</i> advanced configuration parameter is set to "Disabled". Advanced configuration parameters for <i>Show</i> options are not supported if no dashboard widget field objects with the respective values are set. |
| <i>Override host</i> | 1 | override_hostid._reference | ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard . |

Advanced configuration

The following advanced configuration parameters are supported for the *Gauge* widget.

Note:

The number in the *Thresholds* property name (e.g. thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g. "thresholds.0.threshold": "5" → "thresholds.0.threshold": "1"; "thresholds.1.threshold": "1" → "thresholds.1.threshold": "5").

| Parameter | type | name | value |
|--------------------------|------|----------------|---|
| <i>Angle</i> | 0 | angle | Possible values: 180 (<i>default</i>) or 270. |
| Description | | | |
| <i>Description</i> | 1 | description | Any string value, including macros. Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, user macros. Default: {ITEM.NAME}. |
| <i>Size</i> | 0 | desc_size | Possible values range from 1-100. |
| <i>Vertical position</i> | 0 | desc_v_pos | Default: 15. 0 - Top; 1 - (<i>default</i>) Bottom. |
| <i>Bold</i> | 0 | desc_bold | 0 - (<i>default</i>) Disabled; 1 - Enabled. |
| <i>Color</i> | 1 | desc_color | Hexadecimal color code (e.g. FF0000). Default: "" (empty). |
| Value | | | |
| <i>Decimal places</i> | 0 | decimal_places | Possible values range from 1-10. Default: 2. |

| Parameter | type | name | value |
|---|------|------------------|---|
| <i>Size</i> | 0 | value_size | Possible values range from 1-100. |
| <i>Bold</i> | 0 | value_bold | Default: 25. 0 - (default) Disabled; 1 - Enabled. |
| <i>Color</i> | 1 | value_color | Hexadecimal color code (e.g. FF0000). |
| Default: "" (empty). | | | |
| Units | | | |
| <i>Units</i> (checkbox) | 0 | units_show | 0 - Disabled; 1 - (default) Enabled. |
| <i>Units</i> (value) | 1 | units | Any string value. |
| Parameter behavior: - supported if <i>Units</i> (checkbox) is set to "Enabled" | | | |
| <i>Size</i> | 0 | units_size | Possible values range from 1-100. |
| Default: 25. | | | |
| Parameter behavior: - supported if <i>Units</i> (checkbox) is set to "Enabled" | | | |
| <i>Bold</i> | 0 | units_bold | 0 - (default) Disabled; 1 - Enabled. |
| Parameter behavior: - supported if <i>Units</i> (checkbox) is set to "Enabled" | | | |
| <i>Position</i> | 0 | units_pos | 0 - Before value; 1 - Above value; 2 - (default) After value; 3 - Below value. |
| Parameter behavior: - supported if <i>Units</i> (checkbox) is set to "Enabled" | | | |
| This parameter is ignored if set to one of the following time-related units : unixtime, uptime, s. | | | |
| <i>Color</i> | 1 | units_color | Hexadecimal color code (e.g. FF0000). |
| Default: "" (empty). | | | |
| Value arc | | | |
| <i>Arc size</i> | 0 | value_arc_size | Possible values range from 1-100. |
| Default: 20. | | | |
| Needle | | | |
| <i>Color</i> | 1 | needle_color | Hexadecimal color code (e.g. FF0000). |
| Default: "" (empty). | | | |
| Parameter behavior: - supported if a dashboard widget field object for <i>Show</i> with the value "Value arc" is set, or <i>Show arc</i> is set to "Enabled" | | | |
| Scale | | | |
| <i>Show units</i> | 0 | scale_show_units | 0 - Disabled; 1 - (default) Enabled. |
| Parameter behavior: - supported if <i>Units</i> (checkbox) is set to "Enabled" and either a dashboard widget field object for <i>Show</i> with the value "Value arc" is set, or <i>Show arc</i> is set to "Enabled" | | | |

| Parameter | type | name | value |
|-------------------|------|------------------------|--|
| Size | 0 | scale_size | Possible values range from 1-100. Default: 15. Parameter behavior: - <i>supported</i> if a dashboard widget field object for <i>Show</i> with the value "Value arc" is set, or <i>Show arc</i> is set to "Enabled" |
| Decimal places | 0 | scale_decimal_places | Possible values range from 1-10. Default: 0. Parameter behavior: - <i>supported</i> if a dashboard widget field object for <i>Show</i> with the value "Value arc" is set, or <i>Show arc</i> is set to "Enabled" |
| Thresholds | | | |
| Color | 1 | thresholds.0.color | Hexadecimal color code (e.g. FF0000). |
| Threshold | 1 | thresholds.0.threshold | Any numeric value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. |
| Show labels | 0 | th_show_labels | 0 - (default) Disabled; 1 - Enabled. Parameter behavior: - <i>supported</i> if <i>Thresholds</i> are set and either a dashboard widget field object for <i>Show</i> with the value "Value arc" is set or <i>Show arc</i> is set to "Enabled" |
| Show arc | 0 | th_show_arc | 0 - (default) Disabled; 1 - Enabled. Parameter behavior: - <i>supported</i> if <i>Thresholds</i> are set |
| Arc size | 0 | th_arc_size | Possible values range from 1-100. Default: 5. Parameter behavior: - <i>supported</i> if <i>Show arc</i> is set to "Enabled" |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Gauge* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Gauge* widget

Configure a *Gauge* widget that displays the item value for the item "44474" (Interface enp0s3: Bits sent). In addition, visually fine-tune the widget with multiple advanced options, including thresholds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {

7 Geomap

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Geomap* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Geomap* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Geomap* widget.

| Parameter | type | name | value |
|---------------------------------|------|---------------------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID: ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts</i> | 3 | hostids.0 | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | Instead of Host ID: DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype | 0 - (default) And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Tag name</i> | 1 | tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Tags</i> This parameter is not supported if configuring the widget on a template dashboard . |

| Parameter | type | name | value |
|---------------------|------|-----------------|--|
| <i>Operator</i> | 0 | tags.0.operator | 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Tags</i> This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Tag value</i> | 1 | tags.0.value | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Tags</i> This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Initial view</i> | 1 | default_view | Comma separated <i>latitude, longitude, zoom level (optional)</i> , possible values range from 0-30). Example: 40.6892494,-74.0466891,10. |
| <i>Reference</i> | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - <i>required</i> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Geomap* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *Geomap* widget

Configure a *Geomap* widget that displays hosts from host groups "2" and "22" based on the following tag configuration: tag with the name "component" contains value "node", and tag with the name "location" equals value "New York". In addition, set the map initial view to coordinates "40.6892494" (latitude), "-74.0466891" (longitude) with the zoom level "10".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "geomap",
            "name": "Geomap",
            "x": 0,
            "y": 0,
```

```

        "width": 36,
        "height": 5,
        "view_mode": 0,
        "fields": [
            {
                "type": 2,
                "name": "groupids.0",
                "value": 22
            },
            {
                "type": 2,
                "name": "groupids.1",
                "value": 2
            },
            {
                "type": 1,
                "name": "default_view",
                "value": "40.6892494,-74.0466891,10"
            },
            {
                "type": 0,

8 Graph

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Graph* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Graph* widget.

| Parameter | type | name | value |
|--|------|-----------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Reference</i> | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNI). This value must be unique within the dashboard to which the widget belongs. |
| Parameter behavior: - required | | | |

Data set

The following parameters are supported for configuring a *Data set*.

Note:

The first number in the property name (e.g. ds.0.hosts.0, ds.0.items.0) represents the particular data set, while the second number, if present, represents the configured host or item.

| Parameter | type | name | value |
|----------------------|------|-------------------|--|
| <i>Data set type</i> | 0 | ds.0.dataset_type | 0 - Item list; 1 - (default) Item patterns. |
| <i>Items</i> | 4 | ds.0.itemids.0 | Item ID. When configuring the widget on a template dashboard , only items configured on the template should be set. Note: To configure multiple items, create a dashboard widget field object for each item with an incremented number in the property name. Parameter behavior: - required if <i>Data set type</i> is set to "Item list" and <i>Items (Widget)</i> is not set Instead of Item ID: ABCDE._itemid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for items. Note: To configure multiple widgets, create a dashboard widget field object for each widget with an incremented number in the property name. Parameter behavior: - required if <i>Data set type</i> is set to "Item list" and <i>Items</i> is not set |
| <i>Color</i> | 1 | ds.0.color.0 | Hexadecimal color code (e.g. FF0000). Parameter behavior: - required if <i>Data set type</i> is set to "Item list" |
| <i>Host patterns</i> | 1 | ds.0.hosts.0 | Host name or pattern (e.g., "Zabbix*"). Parameter behavior: - required if <i>Data set type</i> is set to "Item patterns" |
| <i>Item patterns</i> | 1 | ds.0.items.0 | This parameter is not supported if configuring the widget on a template dashboard . Item name or pattern (e.g., "*: Number of processed *values per second"). When configuring the widget on a template dashboard , only the patterns for items configured on the template should be set. Parameter behavior: - required if <i>Data set type</i> is set to "Item patterns" |
| <i>Color</i> | 1 | ds.0.color | Hexadecimal color code (e.g. FF0000). Default: FF465C. Parameter behavior: - supported if <i>Data set type</i> is set to "Item patterns" |
| <i>Draw</i> | 0 | ds.0.type | 0 - (default) Line; 1 - Points; 2 - Staircase; 3 - Bar. |

| Parameter | type | name | value |
|----------------------|------|-------------------------|--|
| Stacked | 0 | ds.0.stacked | 0 - (default) Disabled; 1 - Enabled. |
| Width | 0 | ds.0.width | <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Draw</i> is set to "Line", "Staircase", or "Bar"</p> <p>Possible values range from 1-10.</p> <p>Default: 1.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Draw</i> is set to "Line" or "Staircase"</p> |
| Point size | 0 | ds.0.pointsize | <p>Possible values range from 1-10.</p> <p>Default: 3.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Draw</i> is set to "Points"</p> |
| Transparency | 0 | ds.0.transparency | <p>Possible values range from 1-10.</p> <p>Default: 5.</p> |
| Fill | 0 | ds.0.fill | <p>Possible values range from 1-10.</p> <p>Default: 3.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Draw</i> is set to "Line" or "Staircase"</p> |
| Missing data | 0 | ds.0.missingdatafunc | <p>0 - (default) None; 1 - Connected; 2 - Treat as 0; 3 - Last known.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Draw</i> is set to "Line" or "Staircase"</p> |
| Override host | 1 | ds.0.override_hostid | <p>ABCD - set a compatible widget (with its "Reference" parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| Y-axis | 0 | ds.0.axisy | <p>0 - (default) Left; 1 - Right.</p> |
| Time shift | 1 | ds.0.timeshift | <p>Valid time string (e.g. 3600, 1h, etc.). You may use time suffixes. Negative values are also allowed.</p> |
| Aggregation function | 0 | ds.0.aggregate_function | <p>Default: "" (empty). 0 - (default) not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last.</p> |
| Aggregation interval | 1 | ds.0.aggregate_interval | <p>Valid time string (e.g. 3600, 1h, etc.). You may use time suffixes.</p> <p>Default: 1h.</p> |

| Parameter | type | name | value |
|----------------|------|-------------------------|---|
| Aggregate | 0 | ds.0.aggregate_grouping | 0 - (default) Each item; 1 - Data set. |
| | | | Parameter behavior: - supported if Aggregation function is set to "min", "max", "avg", "count", "sum", "first", or "last" |
| Approximation | 0 | ds.0.approximation | 1 - min; 2 - (default) avg; 4 - max; 7 - all. |
| Data set label | 1 | ds.0.data_set_label | Any string value. Default: "" (empty). |

Display options

The following parameters are supported for configuring *Display options*.

| Parameter | type | name | value |
|-------------------------|------|------------------------|--|
| History data selection | 0 | source | 0 - (default) Auto; 1 - History; 2 - Trends. |
| Simple triggers | 0 | simple_triggers | 0 - (default) Disabled; 1 - Enabled. |
| Working time | 0 | working_time | 0 - (default) Disabled; 1 - Enabled. |
| Percentile line (left) | | | |
| Status | 0 | percentile_left | 0 - (default) Disabled; 1 - Enabled. |
| Value | 0 | percentile_left_value | Possible values range from 1-100. |
| | | | Parameter behavior: - supported if Y-axis (in <i>Data set</i> configuration) is set to "Left" |
| Percentile line (right) | | | |
| Status | 0 | percentile_right | 0 - (default) Disabled; 1 - Enabled. |
| Value | 0 | percentile_right_value | Possible values range from 1-100. |
| | | | Parameter behavior: - supported if Y-axis (in <i>Data set</i> configuration) is set to "Right" |

Time period

The following parameters are supported for configuring *Time period*.

| Parameter | type | name | value |
|--------------------|------|-----------------------|--|
| <i>Time period</i> | 1 | time_period.reference | DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its <i>Reference</i> parameter set to "ABCDE") as the data source. Default: DASHBOARD._timeperiod Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters. |
| <i>From</i> | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>To</i> | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |

Axes

The following parameters are supported for configuring Axes.

| Parameter | type | name | value |
|----------------------|------|------------------------------------|--|
| <i>Left Y</i> | 0 | lefty | 0 - Disabled; 1 - (default) Enabled. Parameter behavior: - <i>supported</i> if Y-axis (in <i>Data set</i> configuration) is set to "Left" |
| <i>Right Y</i> | 0 | righty | 0 - (default) Disabled; 1 - Enabled. Parameter behavior: - <i>supported</i> if Y-axis (in <i>Data set</i> configuration) is set to "Right" |
| <i>Scale</i> | 0 | lefty_scale | 0 - (default) Linear; 1 - Logarithmic. |
| <i>Min</i> | 1 | righty_scale lefty_min | Any numeric value. Default: "" (empty). |
| <i>Max</i> | 1 | righty_min lefty_max | Any numeric value. Default: "" (empty). |
| <i>Units (type)</i> | 0 | righty_max lefty_units | 0 - (default) Auto; 1 - Static. |
| <i>Units (value)</i> | 1 | righty_units lefty_static_units | Any string value. Default: "" (empty). |
| <i>X-Axis</i> | 0 | righty_static_units xaxis | 0 - Disabled; 1 - (default) Enabled. |

Legend

The following parameters are supported for configuring *Legend*.

| Parameter | type | name | value |
|---|------|--------------------|--|
| <i>Show legend</i> | 0 | legend | 0 - Disabled; 1 - (default) Enabled. |
| <i>Display min/avg/max</i> | 0 | legend_statistic | <p>Parameter behavior: - supported if <i>Show legend</i> is set to "Enabled"</p> 0 - (default) Disabled; 1 - Enabled. |
| <i>Show aggregation function</i> | 0 | legend_aggregation | <p>Parameter behavior: - supported if <i>Show legend</i> is set to "Enabled"</p> 0 - (default) Disabled; 1 - Enabled. |
| <i>Rows</i> | 0 | legend_lines_mode | <p>Parameter behavior: - supported if <i>Show legend</i> is set to "Enabled"</p> 0 - (default) Fixed; 1 - Variable. |
| <i>Number of rows/ Maximum number of rows</i> | 0 | legend_lines | <p>Parameter behavior: - supported if <i>Show legend</i> is set to "Enabled"</p> Possible values range from 1-10. Default: 1. |
| <i>Number of columns</i> | 0 | legend_columns | <p>Parameter behavior: - supported if <i>Show legend</i> is set to "Enabled"</p> Possible values range from 1-4. Default: 4. <p>Parameter behavior: - supported if <i>Show legend</i> is set to "Enabled", and <i>Display min/avg/max</i> is set to "Disabled"</p> |

Problems

The following parameters are supported for configuring *Problems*.

| Parameter | type | name | value |
|----------------------------|------|---------------------|--|
| <i>Show problems</i> | 0 | show_problems | 0 - (default) Disabled; 1 - Enabled. |
| <i>Selected items only</i> | 0 | graph_item_problems | 0 - Disabled; 1 - (default) Enabled. |
| <i>Problem hosts</i> | 1 | problemhosts.0 | <p>Host name.</p> <p>Note: The number in the property name references the configured host. To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |

| Parameter | type | name | value |
|-----------------|------|-----------------|--|
| Severity | 0 | severities.0 | 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. |
| Problem | 1 | problem_name | Problem event name (case insensitive, full name or part of it). |
| Problem tags | | | |
| Evaluation type | 0 | evaltype | 0 - (default) And/Or; 2 - Or. |
| Tag name | 1 | tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. |
| Operator | 0 | tags.0.operator | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. |
| Tag value | 1 | tags.0.value | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> |

Overrides

The following parameters are supported for configuring *Overrides*.

Note:

The first number in the property name (e.g. or.0.hosts.0, or.0.items.0) represents the particular data set, while the second number, if present, represents the configured host or item.

| Parameter | type | name | value |
|----------------------|------|----------------------|--|
| <i>Host patterns</i> | 1 | or.0.hosts.0 | <p>Host name or pattern (e.g. Zabbix*).</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Overrides</i></p> |
| <i>Item patterns</i> | 1 | or.0.items.0 | <p>Item name or pattern (e.g. *: Number of processed *values per second).</p> <p>When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Overrides</i></p> |
| <i>Base color</i> | 1 | or.0.color | Hexadecimal color code (e.g. FF0000). |
| <i>Width</i> | 0 | or.0.width | Possible values range from 1-10. |
| <i>Draw</i> | 0 | or.0.type | 0 - Line; 1 - Points; 2 - Staircase; 3 - Bar. |
| <i>Transparency</i> | 0 | or.0.transparency | Possible values range from 1-10. |
| <i>Fill</i> | 0 | or.0.fill | Possible values range from 1-10. |
| <i>Point size</i> | 0 | or.0.pointsize | Possible values range from 1-10. |
| <i>Missing data</i> | 0 | or.0.missingdatafunc | 0 - None; 1 - Connected; 2 - Treat as 0; 3 - Last known. |
| <i>Y-axis</i> | 0 | or.0.axisy | 0 - Left; 1 - Right. |
| <i>Time shift</i> | 1 | or.0.timeshift | Valid time string (e.g. 3600, 1h, etc.). You may use time suffixes . Negative values are allowed. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *Graph* widget

Configure a *Graph* widget in the following way:

- 2 data sets for a total of 9 items on 1 host.
- The first data set is of type "Item list" and consists of 3 items that are represented by lines with a different color, but the same width, transparency, and fill.
- The second data set is of type "Item patterns", consists of 6 items, has a configured aggregation, and is represented by a line with a custom color, width, transparency, and fill.
- The second data set also has a custom data set label.
- Data in the graph are displayed for a time period of the last 3 hours.
- Problems in the graph are displayed only for the configured items.
- Graph has two Y axes of which the right Y axis displays values only for the second data set.
- Graph legend displays configured items in 4 rows, as well as minimum, maximum and average values of the data sets.

9 Graph (classic)

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Graph (classic)* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph (classic)* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Graph (classic)* widget.

| Parameter | type | name | value |
|-------------------------|------|------------------------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Source</i> | 0 | source_type | 0 - (default) Graph; 1 - Simple graph. |
| <i>Graph</i> | 6 | graphid.0 | Graph ID. |
| | | | Parameter behavior: - <i>required</i> if <i>Source</i> is set to "Graph" |
| <i>Graph (Widget)</i> | 1 | graphid._reference | Instead of Graph ID: ABCDE._graphid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for graphs. |
| | | | Parameter behavior: - <i>required</i> if <i>Source</i> is set to "Simple graph" and <i>Graph</i> is not set |
| <i>Item</i> | 4 | itemid.0 | Item ID. |
| | | | Parameter behavior: - <i>required</i> if <i>Source</i> is set to "Simple graph" and <i>Item (Widget)</i> is not set |
| <i>Item (Widget)</i> | 1 | itemid._reference | Instead of Item ID: ABCDE._itemid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for items. |
| | | | Parameter behavior: - <i>required</i> if <i>Source</i> is set to "Simple graph" and <i>Item</i> is not set |
| <i>Time period</i> | 1 | time_period._reference | DASHBOARD._timeperiod - set the Time period selector as the data source; ABCDE._timeperiod - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source. |
| | | | Default: DASHBOARD._timeperiod |
| | | | Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters. |
| <i>From</i> | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.). |
| | | | Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>To</i> | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.). |
| | | | Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |

| Parameter | type | name | value |
|---------------|------|---------------------------|---|
| Show legend | 0 | show_legend | 0 - Disabled; 1 - (default) Enabled. |
| Override host | 1 | override_hostid_reference | ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard . |
| Reference | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - required |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph (classic)* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *Graph (classic)* widget

Configure a *Graph (classic)* widget that displays a simple graph for the item "42269".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "graph",
            "name": "Graph (classic)",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "source_type",
                "value": 1
              },
              {
                "type": 4,
                "name": "itemid.0",
                "value": 42269
              },
              {
                "type": 1,
                "name": "reference",
                "value": "RSTUV"
              }
            ]
          }
        ]
      }
    ]
  }
}
```

```

    }
  ],
  "userGroups": [
    {
      "usrgrpid": 7,
      "permission": 2
    }

10 Graph prototype

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Graph prototype* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph prototype* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Graph prototype* widget.

| Parameter | type | name | value |
|-------------------------|------|---------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - <i>(default)</i> 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |

| Parameter | type | name | value |
|------------------------------|------|---------------------------|---|
| Source | 0 | source_type | 2 - (default) Graph prototype; 3 - Simple graph prototype. |
| Graph pro- to- type | 7 | graphid.0 | Graph prototype ID. Parameter behavior: - required if Source is set to "Graph prototype" |
| Item pro- to- type | 5 | itemid.0 | Item prototype ID. Parameter behavior: - required if Source is set to "Simple graph prototype" |
| Time pe- riod | 1 | time_period.reference | DASHBOARD._timeperiod - set the Time period selector as the data source; ABCDE._timeperiod - set a compatible widget (with its Reference parameter set to "ABCDE") as the data source. Default: DASHBOARD._timeperiod Alternatively, you can set the time period only in the From and To parameters. |
| From | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - supported if Time period is not set |
| To | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - supported if Time period is not set |
| Show leg- end | 0 | show_legend | 0 - Disabled; 1 - (default) Enabled. |
| Override host | 1 | override_hostid.reference | ABCDE._hostid - set a compatible widget (with its Reference parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard. |
| Columns | 0 | columns | Possible values range from 1-24. |
| Rows | 0 | rows | Default: 2. Possible values range from 1-16. |
| Reference | 1 | reference | Default: 1. Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - required |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph prototype* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Graph prototype* widget

Configure a *Graph prototype* widget that displays a grid of 3 graphs (3 columns, 1 row) created from an item prototype (ID: "42316") by low-level discovery.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "graphprototype",
            "name": "Graph prototype",
            "x": 0,
            "y": 0,
            "width": 48,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {

11 Honeycomb

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Honeycomb* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Honeycomb* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Honeycomb* widget.

| Parameter | type | name | value |
|-----------------------------|------|---------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID: ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |

| Parameter | type | name | value |
|---------------------------------|------|----------------------|---|
| <i>Hosts</i> | 3 | hostids.0 | <p>Host ID.</p> <p>Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | <p>Instead of Host ID: DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Host tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype_host | <p>0 - (default) And/Or; 2 - Or.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Tag name</i> | 1 | host_tags.0.tag | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Operator</i> | 0 | host_tags.0.operator | <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> |
| <i>Tag value</i> | 1 | host_tags.0.value | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |

| Parameter | type | name | value |
|----------------------------------|------|----------------------|--|
| <i>Item patterns</i> | 1 | items.0 | <p>Item name or pattern.</p> <p>Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented number in the property name.</p> <p>Parameter behavior: - <i>required</i></p> |
| <i>Item tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype_item | <p>0 - (default) And/Or; 2 - Or.</p> |
| <i>Tag name</i> | 1 | item_tags.0.tag | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Item tags</i></p> |
| <i>Operator</i> | 0 | item_tags.0.operator | <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Item tags</i></p> |
| <i>Tag value</i> | 1 | item_tags.0.value | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Item tags</i></p> |
| <i>Show hosts in maintenance</i> | 0 | maintenance | <p>0 - (default) Disabled; 1 - Enabled.</p> |
| <i>Show</i> | 0 | show.0 | <p>1 - Primary label; 2 - Secondary label.</p> <p>Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.</p> |
| <i>Reference</i> | 1 | reference | <p>Default: 1, 2. Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs.</p> <p>Parameter behavior: - <i>required</i></p> |

The following advanced configuration parameters are supported for the *Honeycomb* widget.

Note:

The number in the *Thresholds* property name (e.g. thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g. "thresholds.0.threshold": "5" → "thresholds.0.threshold": "1"; "thresholds.1.threshold": "1" → "thresholds.1.threshold": "5").

| Parameter | type | name | value |
|------------------------|------|------------------------------|---|
| Primary label | | | |
| Type | 0 | primary_label_type | 0 - (default) Text; 1 - Value. |
| Text | 1 | primary_label | Any string value, including macros. Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, user macros. Default: {HOST.NAME} |
| Decimal places | 0 | primary_label_decimal_places | Parameter behavior: - supported if Type is set to "Text" Possible values range from 0-6. Default: 2. |
| Size (type) | 0 | primary_label_size_type | Parameter behavior: - supported if Type is set to "Value" 0 - (default) Auto; 1 - Custom. |
| Size | 0 | primary_label_size | Possible values range from 1-100. Default: 20. |
| Bold | 0 | primary_label_bold | Parameter behavior: - supported if Size (type) is set to "Custom" 0 - (default) Disabled; 1 - Enabled. |
| Color | 1 | primary_label_color | Hexadecimal color code (e.g. FF0000). Default: based on theme of Settings object and User object: 1F2C33 for "blue-theme" or "hc-light"; EEEEEE for "dark-theme" or "hc-dark". |
| Units (checkbox) | 0 | primary_label_units_show | 0 - Disabled; 1 - (default) Enabled. |
| Units (value) | 1 | primary_label_units | Parameter behavior: - supported if Type is set to "Value" Any string value. "" (empty) |
| Position | 0 | primary_label_units_pos | Parameter behavior: - supported if Type is set to "Value" and Units (checkbox) is set to "Enabled" 0 - Before value; 1 - (default) After value. |
| Secondary label | | | |

| Parameter | type | name | value |
|-------------------------|------|--------------------------------|--|
| Type | 0 | secondary_label_type | 0 - Text; 1 - (default) Value. |
| Text | 1 | secondary_label | Any string value, including macros. Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, user macros. Default: {{ITEM.LASTVALUE}.fmtnum(2)} |
| Decimal places | 0 | secondary_label_decimal_places | Parameter behavior: - supported if Type is set to "Text" Possible values range from 0-6. Default: 2. Parameter behavior: - supported if Type is set to "Value" |
| Size (type) | 0 | secondary_label_size_type | 0 - (default) Auto; 1 - Custom. |
| Size | 0 | secondary_label_size | Possible values range from 1-100. Default: 30. Parameter behavior: - supported if Size (type) is set to "Custom" |
| Bold | 0 | secondary_label_bold | 0 - Disabled; 1 - (default) Enabled. |
| Color | 1 | secondary_label_color | Hexadecimal color code (e.g. FF0000). Default: based on theme of Settings object and User object : 1F2C33 for "blue-theme" or "hc-light"; EEEEEE for "dark-theme" or "hc-dark". |
| Units (checkbox) | 0 | secondary_label_units_checkbox | 0 - Disabled; 1 - (default) Enabled. Parameter behavior: - supported if Type is set to "Value" |
| Units (value) | 1 | secondary_label_units | Any string value. "" (empty) Parameter behavior: - supported if Type is set to "Value" and Units (checkbox) is set to "Enabled" |
| Position | 0 | secondary_label_position | 0 - Before value; 1 - (default) After value. Parameter behavior: - supported if Type is set to "Value" and Units (checkbox) is set to "Enabled" |
| Background color | | | |
| Background color | 1 | bg_color | Hexadecimal color code (e.g. FF0000). Default: based on theme of Settings object and User object : D9E7ED for "blue-theme"; 3D5059 for "dark-theme"; AAD7E9 for "hc-light"; 335463 for "hc-dark". |
| Thresholds | | | |

| Parameter | type | name | value |
|----------------------------|------|------------------------|---|
| <i>Color interpolation</i> | 0 | interpolation | 0 - Disabled; 1 - (default) Enabled. |
| <i>Color</i> | 1 | thresholds.0.color | Hexadecimal color code (e.g. FF0000). |
| <i>Threshold</i> | 1 | thresholds.0.threshold | Any numeric value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Honeycomb* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Honeycomb* widget

Configure a *Honeycomb* widget that displays the utilization of Zabbix server processes. In addition, change the primary label of honeycomb cells and visually fine-tune the widget with thresholds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": "30",
    "auto_start": "1",
    "pages": [
      {

12 Host availability

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Host availability* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Host availability* widget.

| Parameter | type | name | value |
|----------------------------------|------|----------------------------------|---|
| <i>Refresh interval</i> | 0 | <code>rf_rate</code> | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (<i>default</i>) 15 minutes. |
| <i>Host groups</i> | 2 | <code>groupids.0</code> | <i>Host group</i> ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a <i>template dashboard</i> . |
| <i>Host groups (Widget)</i> | 1 | <code>groupids._reference</code> | Instead of <i>Host group</i> ID: <code>ABCDE._hostgroupids</code> - set a <i>compatible widget</i> (with its <i>Reference</i> parameter set to " <code>ABCDE</code> ") as the data source for host groups. |
| <i>Interface type</i> | 0 | <code>interface_type.0</code> | This parameter is not supported if configuring the widget on a <i>template dashboard</i> . 0 - None; 1 - Zabbix agent (passive checks); 2 - SNMP; 3 - IPMI; 4 - JMX; 5 - Zabbix agent (active checks). Default: 1, 2, 3, 4, 5 (all enabled). |
| <i>Layout</i> | 0 | <code>layout</code> | Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. 0 - (<i>default</i>) Horizontal; 1 - Vertical. |
| <i>Show hosts in maintenance</i> | 0 | <code>maintenance</code> | 0 - (<i>default</i>) Disabled; 1 - Enabled. |
| <i>Show only totals</i> | 0 | <code>only_totals</code> | 0 - (<i>default</i>) Disabled; 1 - Enabled. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host availability* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Host availability* widget

Configure a *Host availability* widget that displays availability information (in a vertical layout) for hosts in host group "4" with "Zabbix agent" and "SNMP" interfaces configured.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "hostavail",
            "name": "Host availability",
            "x": 0,
            "y": 0,
            "width": 18,
            "height": 3,
            "view_mode": 0,
            "fields": [
              {
                "type": 2,
                "name": "groupids.0",
                "value": 4
              },
              {
                "type": 0,
                "name": "interface_type",
                "value": 1
              },
              {
                "type": 0,
                "name": "interface_type",
                "value": 2
              },
              {
                "type": 0,
                "name": "layout",
                "value": 1
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [

13 Host card

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Host card* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Host card* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Host card* widget.

| Parameter | type | name | value |
|-------------------------|------|----------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host</i> | 3 | hostid.0 | Host ID. |

Parameter behavior:

- *required* if *Host (Widget/Dashboard)* is not set

This parameter is not supported if configuring the widget on a **template dashboard**.

| Parameter | type | name | value |
|---------------------------------|------|-------------------|---|
| <i>Host (Widget/Dashboard)</i> | 1 | hostid._reference | <p>Instead of Host ID: DASHBOARD.hostid - set the Host selector as the data source for host; ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host.</p> <p>Parameter behavior: - <i>required</i> if <i>Host</i> is not set</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Show suppressed problems</i> | 0 | show_suppressed | <p>0 - (default) Disabled; 1 - Enabled.</p> |
| <i>Show</i> | 0 | sections.0 | <p>0 - Host groups; 1 - Description; 2 - Monitoring; 3 - Availability; 4 - Monitored by; 5 - Templates; 6 - Inventory; 7 - Tags.</p> <p>Note: The number in the property name references section order in the section list. To configure multiple sections, create a dashboard widget field object for each section with an incremented number in the property name.</p> |

The following parameters are supported if *Show* is set to "Inventory".

| Parameter | type | name | value |
|-------------------------|------|-------------|---|
| <i>Inventory fields</i> | 0 | inventory.0 | <p>Inventory ID.</p> <p>Note: To configure multiple inventory fields, create a dashboard widget field object for each inventory field with an incremented number in the property name.</p> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host card* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *Host card* widget

Configure a *Host card* widget that displays these sections: "Monitoring", "Availability", "Monitored by", "Inventory", and "Tags".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "hostcard",
```

```

        "name": "Host card",
        "x": 0,
        "y": 0,
        "width": 14,
        "height": 7,
        "view_mode": 0,
        "fields": [
            {
                "type": 3,
                "name": "hostid.0",
                "value": 10084
            },
            {
                "type": 0,
                "name": "show_suppressed",
                "value": 1
            },
            {
                "type": 0,
                "name": "sections.0",
                "value": 2
            },
            {
                "type": 0,
                "name": "sections.1",

14 Host navigator

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Host navigator* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Host navigator* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Host navigator* widget.

| Parameter | type | name | value |
|-------------------------|------|------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. |

Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name.

This parameter is not supported if configuring the widget on a **template dashboard**.

| Parameter | type | name | value |
|-----------------------------|------|----------------------|--|
| <i>Host groups (Widget)</i> | 1 | groupids._reference | <p>Instead of Host group ID: ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Host patterns</i> | 1 | hosts.0 | <p>Host name or pattern.</p> <p>Note: To configure multiple host patterns, create a dashboard widget field object for each host pattern with an incremented number in the property name. For multiple host patterns, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the hosts matching the configured host patterns belong to.</p> |
| <i>Host status</i> | 0 | status | <p>This parameter is not supported if configuring the widget on a template dashboard.</p> <p>-1 - (default) Any; 0 - Enabled; 1 - Disabled.</p> |
| <i>Host tags</i> | | | <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Evaluation type</i> | 0 | host_tags_evaltype | <p>0 - (default) And/Or; 2 - Or.</p> |
| <i>Tag name</i> | 1 | host_tags.0.tag | <p>This parameter is not supported if configuring the widget on a template dashboard.</p> <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> |
| <i>Operator</i> | 0 | host_tags.0.operator | <p>This parameter is not supported if configuring the widget on a template dashboard.</p> <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |

| Parameter | type | name | value |
|----------------------------------|------|----------------------|--|
| <i>Tag value</i> | 1 | host_tags.0.value | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Host tags</i> |
| <i>Severity</i> | 0 | severities.0 | This parameter is not supported if configuring the widget on a template dashboard . 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). |
| <i>Show hosts in maintenance</i> | 0 | maintenance | Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. 0 - (default) Disabled; 1 - Enabled. |
| <i>Show problems</i> | 0 | show_problems | 0 - All; 1 - (default) Unsuppressed; 2 - None. |
| <i>Group by</i> | 0 | group_by.0.attribute | 0 - Host group; 1 - Tag value; 2 - Severity. |
| <i>Attribute</i> | 0 | group_by.0.attribute | Note: The number in the property name references attribute order in the grouping attribute list. Parameter behavior: - <i>required</i> if configuring <i>Group by</i> |
| <i>Value</i> | 1 | group_by.0.tag_name | Any string value. Note: The number in the property name references the grouping attribute set in the <i>Attribute</i> parameter. Parameter behavior: - <i>required</i> if configuring <i>Group by</i> and <i>Attribute</i> is set to "Tag value" |
| <i>Host limit</i> | 0 | show_lines | Possible values range from 1-9999. Default: 100. |
| <i>Reference</i> | 1 | reference | This parameter is not supported if configuring the widget on a template dashboard . Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - <i>required</i> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host navigator* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Host navigator* widget

Configure a *Host navigator* widget that displays hosts grouped by their host group and, then, by the "city" tag value.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": "30",
    "auto_start": "1",
    "pages": [
      {
        "widgets": [
          {
            "type": "hostnavigator",
            "name": "Host navigator",
            "x": "0",
            "y": "0",
            "width": "12",
            "height": "5",
            "view_mode": "0",
            "fields": [
              {
                "type": 2,
                "name": "groupids.0",
                "value": 2
              },
              {
                "type": 2,
                "name": "groupids.1",
                "value": 4
              },
              {
                "type": 0,
                "name": "group_by.0.attribute",
                "value": 0
              },
              {
                "type": 0,
                "name": "group_by.1.attribute",
                "value": 1
              },
              {
                "type": 1,
                "name": "group_by.1.tag_name",
                "value": "city"
              },
              {
                "type": 1,
                "name": "reference",
                "value": "SWKLB"
              }
            ]
          }
        ]
      }
    ]
  }
},
```

```

15 Item history

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Item history* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item history* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item history* widget.

| Parameter | type | name | value |
|---|------|---------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Layout</i> | 0 | layout | 0 - (default) Horizontal; 1 - Vertical. |
| <i>Columns</i> (see below) | | | |

| Parameter | type | name | value |
|---|------|----------------------------|---|
| <i>Show lines</i> | 0 | show_lines | Possible values range from 1-100. |
| <i>Override host</i> | 1 | override_hostid._reference | <p>Default: 25.</p> <p>ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts;</p> <p>DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Advanced configuration (see below)</i> | | | |
| <i>Reference</i> | 1 | reference | <p>Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs.</p> <p>Parameter behavior:</p> <p>- <i>required</i></p> |

Columns

Columns have common parameters and additional parameters depending on the configuration of the *Item* parameter.

Note:

For all parameters related to columns, the number in the property name (e.g. columns.0.name) references a column for which the parameter is configured.

The following parameters are supported for all columns.

| Parameter | type | name | value |
|-------------------|------|----------------------|--|
| <i>Name</i> | 1 | columns.0.name | Any string value. |
| <i>Item</i> | 4 | columns.0.itemid | <p>Parameter behavior:</p> <p>- <i>required</i></p> <p>Item ID.</p> <p>When configuring the widget on a template dashboard, only items configured on the template should be set.</p> <p>Parameter behavior:</p> <p>- <i>required</i></p> |
| <i>Base color</i> | 1 | columns.0.base_color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Default: "" (empty).</p> |

The following column parameters are supported if the configured *Item* is a numeric type item.

| Parameter | type | name | value |
|----------------|------|-------------------|---|
| <i>Display</i> | 0 | columns.0.display | <p>1 - (default) As is;</p> <p>2 - Bar;</p> <p>3 - Indicators.</p> |
| <i>Min</i> | 1 | columns.0.min | Any numeric value. |
| <i>Max</i> | 1 | columns.0.max | <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Display</i> is set to "Bar" or "Indicators"</p> <p>Any numeric value.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Display</i> is set to "Bar" or "Indicators"</p> |

| Parameter | type | name | value |
|-------------------|------|--------------------------------|---|
| Thresholds | | | |
| Color | 1 | columns.0.thresholds_hex_color | Hexadecimal color code (e.g. FF0000). |
| Threshold | 1 | columns.0.thresholds_threshold | Any integer value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. |
| History data | 0 | columns.0.history | 0 - (default) Auto; 1 - History; 2 - Trends. |

The following column parameters are supported if the configured *Item* is a character, text, or log type item.

| Parameter | type | name | value |
|--------------------|------|--------------------------------|--|
| Highlights | | | |
| Highlight | 1 | columns.0.highlights_hex_color | Hexadecimal color code (e.g. FF0000). |
| Threshold | 1 | columns.0.highlights_threshold | Any integer value. |
| Display | 0 | columns.0.display | 1 - (default) As is; 4 - HTML; 5 - Single line. |
| Single line | 0 | columns.0.max_length | Possible values range from 1-500. Default: 100. Parameter behavior: - supported if <i>Display</i> is set to "Single line" |
| Use monospace font | 0 | columns.0.monospace_font | 0 - (default) Use default font; 1 - Use monospace font. |
| Display local time | 0 | columns.0.local_time | 0 - (default) Display timestamp; 1 - Display local time. Parameter behavior: - supported if <i>Item</i> is set to log type item, and <i>Show timestamp</i> is set to "Enabled" |

The following column parameters are supported if the configured *Item* is a binary type item.

| Parameter | type | name | value |
|----------------|------|--------------------------|---|
| Show thumbnail | 1 | columns.0.show_thumbnail | 0 - (default) Disabled; 1 - Enabled. |

Advanced configuration

The following advanced configuration parameters are supported for the *Item history* widget.

| Parameter | type | name | value |
|--------------------|------|--------------------|--|
| New values | 0 | sortorder | 0 - (default) Top; 1 - Bottom. |
| Show timestamp | 0 | show_timestamp | 0 - (default) Disabled; 1 - Enabled. |
| Show column header | 0 | show_column_header | 0 - Off; 1 - Horizontal; 2 - (default) Vertical. |

| Parameter | type | name | value |
|--------------------|------|-----------------------|--|
| <i>Time period</i> | 1 | time_period.reference | DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its <i>Reference</i> parameter set to "ABCDE") as the data source. Default: DASHBOARD._timeperiod Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters. |
| <i>From</i> | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>To</i> | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item history* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring an *Item history* widget

Configure an *Item history* widget that displays latest data for two numeric items "42269" and "42270". In addition, configure the item columns to be displayed vertically, with column names displayed horizontally; limit the display to 15 lines of data and include a separate timestamp column.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "itemhistory",
            "name": "Item history",
            "x": "0",
            "y": "0",
            "width": "18",
            "height": "6",
            "view_mode": "0",
            "fields": [
              {
                "type": "0",
                "name": "layout",
                "value": "1"
              },
              {
                "type": "1",
                "name": "columns.0.name",
                "value": "CPU utilization"
              }
            ]
          }
        ]
      }
    ]
  }
}
```

```

        "type": "4",
        "name": "columns.0.itemid",
        "value": "42269"
    },
    {
        "type": "1",
        "name": "columns.1.name",
        "value": "Memory utilization"
    },
    {
        "type": "4",
        "name": "columns.1.itemid",
        "value": "42270"
    },
    {
        "type": "0",
        "name": "show_lines",
        "value": "15"
    },
    {
        "type": "0",
        "name": "show_timestamp",
        "value": "1"
    },
    {

16 Item navigator

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Item navigator* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item navigator* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item navigator* widget.

| Parameter | type | name | value |
|-----------------------------|------|---------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - <i>(default)</i> 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID : ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts</i> | 3 | hostids.0 | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . |

| Parameter | type | name | value |
|---------------------------------|------|----------------------|---|
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | <p>Instead of Host ID: DASHBOARD.hostid - set the Host selector as the data source for hosts; ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Host tags</i> | | | |
| <i>Evaluation type</i> | 0 | host_tags_evaltype | <p>0 - (default) And/Or; 2 - Or.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Tag name</i> | 1 | host_tags.0.tag | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Operator</i> | 0 | host_tags.0.operator | <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Tag value</i> | 1 | host_tags.0.value | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Item patterns</i> | 1 | items.0 | <p>Item name or pattern.</p> <p>Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented number in the property name.</p> |
| <i>Item tags</i> | | | |
| <i>Evaluation type</i> | 0 | item_tags_evaltype | <p>0 - (default) And/Or; 2 - Or.</p> |

| Parameter | type | name | value |
|------------------------|------|----------------------|---|
| Tag name | 1 | item_tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Item tags</i> |
| Operator | 0 | item_tags.0.operator | 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Item tags</i> |
| Tag value | 1 | item_tags.0.value | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Item tags</i> |
| State | 0 | state | -1 - (default) All; 0 - Normal; 1 - Not supported. |
| Show problems Group by | 0 | show_problems | 0 - All; 1 - (default) Unsuppressed; 2 - None. |
| Attribute | 0 | group_by.0.attribute | 0 - Host group; 1 - Host name; 2 - Host tag value; 3 - Item tag value. Note: The number in the property name references attribute order in the grouping attribute list. Parameter behavior: - <i>required</i> if configuring <i>Group by</i> |
| Value | 1 | group_by.0.tag_name | Any string value. Note: The number in the property name references the grouping attribute set in the <i>Attribute</i> parameter. Parameter behavior: - <i>required</i> if configuring <i>Group by</i> and <i>Attribute</i> is set to "Host tag value" or "Item tag value" |
| Item limit | 0 | show_lines | Possible values range from 1-9999. Default: 100. |
| Reference | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - <i>required</i> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item navigator* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring an *Item navigator* widget

Configure an *Item navigator* widget that displays up to 1000 items grouped by their host and, then, by the "component" item tag value.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": "30",
    "auto_start": "1",
    "pages": [
      {
        "widgets": [
          {
            "type": "itemnavigator",
            "name": "Item navigator",
            "x": "0",
            "y": "0",
            "width": "12",
            "height": "5",
            "view_mode": "0",
            "fields": [
              {
                "type": 0,
                "name": "group_by.0.attribute",
                "value": 0
              },
              {
                "type": 0,
                "name": "group_by.1.attribute",
                "value": 3
              },
              {
                "type": 1,
                "name": "group_by.1.tag_name",
                "value": "component"
              },
              {
                "type": 0,
                "name": "show_lines",
                "value": 1000
              },
              {
                "type": 1,
                "name": "reference",
                "value": "DFNLK"
              }
            ]
          }
        ]
      }
    ],
    "userGroups": [
      {
        "usrgrp_id": 7,
        "permission": 2
      }
    ]
  }
}
```

```

    }
    ],

17 Item value

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Item value* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item value* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item value* widget.

| Parameter | type | name | value |
|---------------------------|------|----------|--|
| <i>Refresh in-ter-val</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - <i>(default)</i> 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Item</i> | 4 | itemid.0 | Item ID. |

Parameter behavior:
- *required* if *Item (Widget)* is not set

| Parameter | type | name | value |
|----------------------|------|----------------------------|--|
| <i>Item (Widget)</i> | 1 | itemid._reference | Instead of Item ID: ABCDE._itemid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for items. |
| <i>Show</i> | 0 | show.0 | <p>Parameter behavior:</p> <p>- <i>required</i> if <i>Item</i> is not set</p> <p>1 - Description; 2 - Value; 3 - Time; 4 - Change indicator; 5 - Sparkline.</p> <p>Default: 1, 2, 3, 4.</p> <p>Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.</p> |
| <i>Override host</i> | 1 | override_hostid._reference | <p>ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |

Advanced configuration

The following advanced configuration parameters are supported for the *Item value* widget.

Note:

The number in the *Thresholds* property name (e.g. thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g. "thresholds.0.threshold": "5" → "thresholds.0.threshold": "1"; "thresholds.1.threshold": "1" → "thresholds.1.threshold": "5").

| Parameter | type | name | value |
|-----------------------------|------|------------------------|--|
| <i>Background color</i> | 1 | bg_color | Hexadecimal color code (e.g. FF0000). Default: "" (empty). |
| <i>Thresholds</i> | | | |
| <i>Color</i> | 1 | thresholds.0.color | Hexadecimal color code (e.g. FF0000). |
| <i>Threshold</i> | 1 | thresholds.0.threshold | Any string value. |
| <i>Aggregation function</i> | 0 | aggregate_function | 0 - (default) not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last. |

| Parameter | type | name | value |
|---------------------|------|-----------------------|--|
| <i>Time period</i> | 1 | time_period.reference | <p>DASHBOARD._timeperiod - set the Time period selector as the data source;</p> <p>ABCDE._timeperiod - set a compatible widget (with its reference parameter equal to ABCDE) as the data source.</p> <p>Default: DASHBOARD._timeperiod</p> <p>Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Aggregation function</i> is set to "min", "max", "avg", "count", "sum", "first", "last"</p> |
| <i>From</i> | 1 | time_period.from | <p>Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.).</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Time period</i> is not set and <i>Aggregation function</i> is set to "min", "max", "avg", "count", "sum", "first", "last"</p> |
| <i>To</i> | 1 | time_period.to | <p>Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.).</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Time period</i> is not set and <i>Aggregation function</i> is set to "min", "max", "avg", "count", "sum", "first", "last"</p> |
| <i>History data</i> | 0 | history | <p>0 - (default) Auto;</p> <p>1 - History;</p> <p>2 - Trends.</p> |

Description

The following advanced configuration parameters are supported if *Show* is set to "Description".

| Parameter | type | name | value |
|----------------------------|------|-------------|---|
| <i>Description</i> | 1 | description | <p>Any string value, including macros.</p> <p>Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, User macros.</p> |
| <i>Horizontal position</i> | 0 | desc_h_pos | <p>Default: {ITEM.NAME}.</p> <p>0 - Left;</p> <p>1 - (default) Center;</p> <p>2 - Right.</p> |
| <i>Vertical position</i> | 0 | desc_v_pos | <p>Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i>.</p> <p>0 - Top;</p> <p>1 - Middle;</p> <p>2 - (default) Bottom.</p> |
| <i>Size</i> | 0 | desc_size | <p>Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i>.</p> <p>Possible values range from 1-100.</p> |
| <i>Bold</i> | 0 | desc_bold | <p>Default: 15.</p> <p>0 - (default) Disabled;</p> <p>1 - Enabled.</p> |
| <i>Color</i> | 1 | desc_color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Default: "" (empty).</p> |

Value

The following advanced configuration parameters are supported if *Show* is set to "Value".

| Parameter | type | name | value |
|----------------------------|------|----------------|---|
| <i>Decimal places</i> | | | |
| <i>Decimal places</i> | 0 | decimal_places | Possible values range from 1-10. |
| <i>Size</i> | 0 | decimal_size | Default: 2. Possible values range from 1-100. |
| | | | Default: 35. |
| <i>Position</i> | | | |
| <i>Horizontal position</i> | 0 | value_h_pos | 0 - Left; 1 - (default) Center; 2 - Right. |
| <i>Vertical position</i> | 0 | value_v_pos | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> . 0 - Top; 1 - (default) Middle; 2 - Bottom. |
| <i>Size</i> | 0 | value_size | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> . Possible values range from 1-100. |
| <i>Bold</i> | 0 | value_bold | Default: 45. 0 - Disabled; |
| <i>Color</i> | 1 | value_color | 1 - (default) Enabled. Hexadecimal color code (e.g. FF0000). |
| <i>Units</i> | | | |
| <i>Units</i> (checkbox) | 0 | units_show | Default: "" (empty). 0 - Disabled; 1 - (default) Enabled. |
| <i>Units</i> (value) | 1 | units | Any string value. |
| <i>Position</i> | 0 | units_pos | 0 - Before value; 1 - Above value; 2 - (default) After value; 3 - Below value. |
| <i>Size</i> | 0 | units_size | Possible values range from 1-100. |
| <i>Bold</i> | 0 | units_bold | Default: 35. 0 - Disabled; |
| <i>Color</i> | 1 | units_color | 1 - (default) Enabled. Hexadecimal color code (e.g. FF0000). |
| | | | Default: "" (empty). |

Time

The following advanced configuration parameters are supported if *Show* is set to "Time".

| Parameter | type | name | value |
|----------------------------|------|------------|---|
| <i>Horizontal position</i> | 0 | time_h_pos | 0 - Left; 1 - (default) Center; 2 - Right. |
| | | | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> . |

| Parameter | type | name | value |
|--------------------------|------|------------|--|
| <i>Vertical position</i> | 0 | time_v_pos | 0 - (default) Top; 1 - Middle; 2 - Bottom. |
| <i>Size</i> | 0 | time_size | Two or more elements (Description, Value, Time) cannot share the same <i>Horizontal position</i> and <i>Vertical position</i> . Possible values range from 1-100. |
| <i>Bold</i> | 0 | time_bold | Default: 15. 0 - (default) Disabled; 1 - Enabled. |
| <i>Color</i> | 1 | time_color | Hexadecimal color code (e.g. FF0000). |
| | | | Default: "" (empty). |

Change indicator

The following advanced configuration parameters are supported if *Show* is set to "Change indicator".

| Parameter | type | name | value |
|---------------------------------|------|--------------|---|
| <i>Change indicator ↑ color</i> | 1 | up_color | Hexadecimal color code (e.g. FF0000). |
| <i>Change indicator ↓ color</i> | 1 | down_color | Default: "" (empty). Hexadecimal color code (e.g. FF0000). |
| <i>Change indicator ⇅ color</i> | 1 | updown_color | Default: "" (empty). Hexadecimal color code (e.g. FF0000). |
| | | | Default: "" (empty). |

Sparkline

The following advanced configuration parameters are supported if *Show* is set to "Sparkline".

| Parameter | type | name | value |
|--------------------|------|----------------------------|---|
| <i>Width</i> | 0 | sparkline.width | Possible values range from 0-10. |
| <i>Fill</i> | 0 | sparkline.fill | Default: 1. Possible values range from 0-10. |
| <i>Color</i> | 1 | sparkline.color | Default: 3. Hexadecimal color code (e.g. FF0000). |
| <i>Time period</i> | 1 | sparkline.time_period | Default: 42A5F5. DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its reference parameter equal to ABCDE) as the data source. |
| <i>From</i> | 1 | sparkline.time_period_from | Default: DASHBOARD._timeperiod Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). |
| <i>To</i> | 1 | sparkline.time_period_to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). |

| Parameter | type | name | value |
|---------------------|------|-------------------|--|
| <i>History data</i> | 0 | sparkline.history | 0 - (default) Auto; 1 - History; 2 - Trends. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item value* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring an *Item value* widget

Configure an *Item value* widget that displays the item value for the item "42266" (Zabbix agent availability). In addition, visually fine-tune the widget with multiple advanced options, including a dynamic background color that changes based on the availability status of Zabbix agent.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "item",
            "name": "Item value",

18 Map

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Map* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Map* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Map* widget.

| Parameter | type | name | value |
|-------------------------|------|---------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (default) 15 minutes. |
| <i>Map</i> | 8 | sysmapid.0 | Map ID. Parameter behavior: - required if <i>Map (Widget)</i> is not set |
| <i>Map (Widget)</i> | 1 | sysmapid._reference | ABCDE._mapid - set a Map navigation tree widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for maps. Parameter behavior: - required if <i>Map</i> is not set |
| <i>Reference</i> | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - required |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Map* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Map* widget

Configure a *Map* widget that displays the map "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "map",
            "name": "Map",
            "x": 0,
            "y": 0,
            "width": 54,
```

```

        "height": 5,
        "view_mode": 0,
        "fields": [
            {
                "type": 8,
                "name": "sysmapid.0",
                "value": 1
            }
        ]
    }
]
},
"userGroups": [
    {
        "usrgrpid": 7,
        "permission": 2
    }
],
"users": [
    {
        "userid": 1,
        "permission": 3
    }
]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}

```

Configuring a linked *Map* widget

Configure a *Map* widget that is linked to a *Map navigation tree* widget.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "map",
                        "name": "Map",
                        "x": 0,
                        "y": 5,
                        "width": 54,
                        "height": 5,
                        "view_mode": 0,

```

```

        "fields": [
            {
                "type": 1,
                "name": "sysmapid._reference",
                "value": "ABCDE._mapid"
            }
        ]
    },
    {
        "type": "navtree",
        "name": "Map navigation tree",
        "x": 0,
        "y": 0,
        "width": 18,
        "height": 5,
        "view_mode": 0,
        "fields": [
            {
                "type": 1,
                "name": "navtree.1.name",
                "value": "Element A"
            },
            {
                "type": 1,
                "name": "navtree.2.name",
                "value": "Element B"
            },
            {
                "type": 1,
                "name": "navtree.3.name",
                "value": "Element C"
            },
            {
                "type": 1,
                "name": "navtree.4.name",
                "value": "Element A1"
            },
            {
                "type": 1,
                "name": "navtree.5.name",
                "value": "Element A2"
            },
            {
                "type": 1,
                "name": "navtree.6.name",
                "value": "Element B1"
            },
            {
                "type": 1,
                "name": "navtree.7.name",
                "value": "Element B2"
            },
            {
                "type": 0,
                "name": "navtree.4.parent",
                "value": 1
            },
            {

19 Map navigation tree

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Map navigation tree* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Map navigation tree* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Map navigation tree* widget.

| Parameter | type | name | value |
|------------------------------|------|------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (default) 15 minutes. |
| <i>Show unavailable maps</i> | 1 | show_unavailable | 0 - (default) Disabled; 1 - Enabled. |

| Parameter | type | name | value |
|--|------|-----------|---|
| Reference | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. |
| Parameter behavior: - required | | | |

The following parameters are supported for configuring map navigation tree elements.

| Parameter | type | name | value |
|---|------|--------------------|---|
| Name | 1 | navtree.1.name | Any string value. |
| Linked map | 8 | navtree.1.sysmapid | Note: The number in the property name sets the element number. Map ID. |
| Parameters for creating element hierarchy | 0 | navtree.1.parent | Note: The number in the property name references the element to which the map is linked. Parent element number. |
| | 0 | navtree.1.order | Note: The number in the property name references the child element. The property value references the parent element. Element position in the map navigation tree. |
| | | | Note: The number in the property name references the element number. The property value references the element position in the map navigation tree. Parent element position is determined within the whole map navigation tree. Child element position is determined within the parent element. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Map navigation tree* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Map navigation tree* widget

Configure a *Map navigation tree* widget that displays the following map navigation tree:

- Element A
 - Element A1
 - Element A2
- Element B
 - Element B1 (contains linked map "1" that can be displayed in a *linked Map widget*)
 - Element B2
- Element C

Request:

```

20 Pie chart

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Pie chart* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Pie chart* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Pie chart* widget.

| Parameter | type | name | value |
|-------------------------|------|---------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |

Data set

The following parameters are supported for configuring a *Data set*.

Note:
The first number in the property name (e.g. `ds.0.hosts.0`, `ds.0.items.0`) represents the particular data set, while the second number, if present, represents the configured host or item.

| Parameter | type | name | value |
|----------------------|------|-------------------|--|
| <i>Data set type</i> | 0 | ds.0.dataset_type | 0 - Item list; 1 - (default) Item patterns. |

| Parameter | type | name | value |
|-----------------------------|------|--------------------------|---|
| <i>Items</i> | 4 | ds.0.itemids.0 | <p>Item ID.</p> <p>When configuring the widget on a template dashboard, only items configured on the template should be set.</p> <p>Note: To configure multiple items, create a dashboard widget field object for each item with an incremented number in the property name.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <i>Data set type</i> is set to "Item list" and <i>Items (Widget)</i> is not set |
| <i>Items (Widget)</i> | 1 | ds.0.itemids.0_reference | <p>Instead of Item ID:</p> <p>ABCDE. _itemid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for items.</p> <p>Note: To configure multiple widgets, create a dashboard widget field object for each widget with an incremented number in the property name.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <i>Data set type</i> is set to "Item list" and <i>Items</i> is not set |
| <i>Color</i> | 1 | ds.0.color.0 | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Data set type</i> is set to "Item list" |
| <i>Item type</i> | 0 | ds.0.type.0 | <p>0 - (default) Normal; 1 - Total.</p> <p>The value "Total" can be set only for one item in the whole chart.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Data set type</i> is set to "Item list" |
| <i>Host patterns</i> | 1 | ds.0.hosts.0 | <p>Host name or pattern (e.g., "Zabbix*").</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <i>Data set type</i> is set to "Item patterns" |
| <i>Item patterns</i> | 1 | ds.0.items.0 | <p>Item name or pattern (e.g., "*": Number of processed *values per second").</p> <p>When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <i>Data set type</i> is set to "Item patterns" |
| <i>Color</i> | 1 | ds.0.color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Data set type</i> is set to "Item patterns" |
| <i>Aggregation function</i> | 0 | ds.0.aggregate_function | <p>1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - (default) last.</p> |

| Parameter | type | name | value |
|----------------------|------|--------------------------|---|
| Data set aggregation | 0 | ds.0.dataset_aggregation | 0 - (default) none; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum. Parameter behavior: - <i>supported</i> if <i>Item type</i> is set to "Total" |
| Data set label | 1 | ds.0.data_set_label | Any string value. Default: "" (empty). |

Displaying options

The following parameters are supported for configuring *Displaying options*.

| Parameter | type | name | value |
|------------------------------|------|-----------------|---|
| History data selection | 0 | source | 0 - (default) Auto; 1 - History; 2 - Trends. |
| Draw | 0 | draw_type | 0 - (default) Pie; 1 - Doughnut. |
| Width | 0 | width | 20 - 20% of the radius; 30 - 30% of the radius; 40 - 40% of the radius; 50 - (default) 50% of the radius. Parameter behavior: - <i>supported</i> if <i>Draw</i> is set to "Doughnut" Possible values range from 0-10. Default: 0. Parameter behavior: - <i>supported</i> if <i>Draw</i> is set to "Doughnut" |
| Stroke width | 0 | stroke | Possible values range from 0-10. Default: 0. Parameter behavior: - <i>supported</i> if <i>Draw</i> is set to "Doughnut" |
| Show total value | 0 | total_show | 0 - (default) Disabled; 1 - Enabled. Parameter behavior: - <i>supported</i> if <i>Draw</i> is set to "Doughnut" |
| Size | 0 | value_size_type | 0 - (default) Auto; 1 - Custom. Parameter behavior: - <i>supported</i> if <i>Show total value</i> is set to "Enabled" |
| Size (value for custom size) | 0 | value_size | Possible values range from 1-100. Default: 20. Parameter behavior: - <i>supported</i> if <i>Show total value</i> is set to "Enabled" |

| Parameter | type | name | value |
|---|------|----------------|--|
| <i>Decimal places</i> | 0 | decimal_places | Possible values range from 0-6. Default: 2. Parameter behavior: - <i>supported</i> if <i>Show total value</i> is set to "Enabled" 0 - (default) Disabled; 1 - Enabled. |
| <i>Units (checkbox)</i> | 0 | units_show | Parameter behavior: - <i>supported</i> if <i>Show total value</i> is set to "Enabled" Any string value. |
| <i>Units (value)</i> | 1 | units | Parameter behavior: - <i>supported</i> if <i>Units (checkbox)</i> is set to "Enabled" 0 - (default) Disabled; 1 - Enabled. |
| <i>Bold</i> | 0 | value_bold | Parameter behavior: - <i>supported</i> if <i>Show total value</i> is set to "Enabled" Hexadecimal color code (e.g. FF0000). |
| <i>Color</i> | 1 | value_color | Parameter behavior: - <i>supported</i> if <i>Show total value</i> is set to "Enabled" Possible values range from 0-10. Default: 1. |
| <i>Space between sectors</i> | 0 | space | 0 - (default) Disabled; 1 - Enabled. |
| <i>Merge sectors smaller than N% (checkbox)</i> | 0 | merge | Possible values range from 1-10. Default: 1. |
| <i>Merge sectors smaller than N% (value)</i> | 0 | merge_percent | Parameter behavior: - <i>supported</i> if <i>Merge sectors smaller than N% (checkbox)</i> is set to "Enabled" |
| <i>Merge sectors smaller than N% (color)</i> | 1 | merge_color | Hexadecimal color code (e.g. FF0000). Parameter behavior: - <i>supported</i> if <i>Merge sectors smaller than N% (checkbox)</i> is set to "Enabled" |

Time period

The following parameters are supported for configuring *Time period*.

| Parameter | type | name | value |
|--------------------|------|-----------------------|--|
| <i>Time period</i> | 1 | time_period.reference | DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its <i>Reference</i> parameter set to "ABCDE") as the data source. Default: DASHBOARD._timeperiod Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters. |
| <i>From</i> | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>To</i> | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |

Legend

The following parameters are supported for configuring *Legend*.

| Parameter | type | name | value |
|---|------|--------------------|--|
| <i>Show legend</i> | 0 | legend | 0 - Disabled; 1 - (default) Enabled. |
| <i>Show value</i> | 0 | legend_value | 0 - (default) Disabled; 1 - Enabled. Parameter behavior: - <i>supported</i> if <i>Show legend</i> is set to "Enabled" |
| <i>Show aggregation function</i> | 0 | legend_aggregation | 0 - (default) Disabled; 1 - Enabled. Parameter behavior: - <i>supported</i> if <i>Show legend</i> is set to "Enabled" |
| <i>Rows</i> | 0 | legend_lines_mode | 0 - (default) Fixed; 1 - Variable. Parameter behavior: - <i>supported</i> if <i>Show legend</i> is set to "Enabled" |
| <i>Number of rows/ Maximum number of rows</i> | 0 | legend_lines | Possible values range from 1-10. Default: 1. Parameter behavior: - <i>supported</i> if <i>Show legend</i> is set to "Enabled" |
| <i>Number of columns</i> | 0 | legend_columns | Possible values range from 1-4. Default: 4. Parameter behavior: - <i>supported</i> if <i>Show legend</i> is set to "Enabled", and <i>Show value</i> is set to "Disabled" |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Pie chart* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Pie chart* widget

Configure a *Pie chart* widget in the following way:

- 2 data sets for a total of 9 items on 1 host.
- The first data set is of type "Item list" and consists of 3 items that are all with type "Normal" and represented by a different color.
- The second data set is of type "Item patterns", consists of 6 items, has a configured aggregation for each item, and is represented by a custom color.
- The second data set also has a custom data set label.
- Data in the pie chart are displayed as a doughnut chart with a custom width and total value with units in the center.
- Data in the pie chart are displayed and aggregated for a custom time period of the last 3 hours.
- Pie chart legend displays configured items in 4 rows.

21 Problem hosts

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Problem hosts* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problem hosts* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Problem hosts* widget.

| Parameter | type | name | value |
|---------------------------------|------|---------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID : ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Exclude host groups</i> | 2 | exclude_groupids.0 | Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts</i> | 3 | hostids.0 | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | Instead of Host ID : DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Problem</i> | 1 | problem | Problem event name (case insensitive, full name or part of it). |

| Parameter | type | name | value |
|-------------------------------------|------|-------------------|--|
| Severity | 0 | severities.0 | 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. |
| <i>Problem tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype | 0 - (default) And/Or; 2 - Or. |
| <i>Tag name</i> | 1 | tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Operator</i> | 0 | tags.0.operator | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Tag value</i> | 1 | tags.0.value | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> Any string value. Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Show suppressed problems</i> | 0 | show_suppressed | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> 0 - (default) Disabled; 1 - Enabled. |
| <i>Hide groups without problems</i> | 0 | hide_empty_groups | 0 - (default) Disabled; 1 - Enabled. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Problem display</i> | 0 | ext_ack | 0 - (default) All; 1 - Unacknowledged only; 2 - Separated. |

| Parameter | type | name | value |
|-----------|------|-----------|---|
| Reference | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. |
| | | | Parameter behavior: - required |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problem hosts* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Problem hosts* widget

Configure a *Problem hosts* widget that displays hosts from host groups "2" and "4" that have problems with a name that includes the string "CPU" and that have the following severities: "Warning", "Average", "High", "Disaster".

Request:

```
{

22 Problems

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Problems* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problems* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Problems* widget.

| Parameter | type | name | value |
|---------------------------------|------|---------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Show</i> | 0 | show | 1 - (default) Recent problems; 2 - History; 3 - Problems. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID : ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. |
| <i>Exclude host groups</i> | 2 | exclude_groupids.0 | Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. |
| <i>Hosts</i> | 3 | hostids.0 | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | This parameter is not supported if configuring the widget on a template dashboard . Instead of Host ID : DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. |
| <i>Problem</i> | 1 | problem | This parameter is not supported if configuring the widget on a template dashboard . Problem event name (case insensitive, full name or part of it). |

| Parameter | type | name | value |
|-----------------------------|------|-----------------|--|
| Severity | 0 | severities.0 | 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. |
| <i>Problem tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype | 0 - (default) And/Or; 2 - Or. |
| <i>Tag name</i> | 1 | tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Operator</i> | 0 | tags.0.operator | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Tag value</i> | 1 | tags.0.value | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> Any string value. Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Show tags</i> | 0 | show_tags | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> 0 - (default) None; 1 - 1; 2 - 2; 3 - 3. |
| <i>Tag name (format)</i> | 0 | tag_name_format | 0 - (default) Full; 1 - Shortened; 2 - None. Parameter behavior: - <i>supported</i> if <i>Show tags</i> is set to "1", "2", or "3" |
| <i>Tag display priority</i> | 1 | tag_priority | Comma-separated list of tags. Parameter behavior: - <i>supported</i> if <i>Show tags</i> is set to "1", "2", or "3" |

| Parameter | type | name | value |
|--------------------------|------|------------------------|--|
| Show operational data | 0 | show_opdata | 0 - (default) None; 1 - Separately; 2 - With problem name. |
| Show suppressed problems | 0 | show_suppressed | 0 - (default) Disabled; 1 - Enabled. |
| Acknowledgement status | 0 | acknowledgement_status | 0 - (default) all; 1 - Unacknowledged; 2 - Acknowledged. |
| By me | 0 | acknowledged_by_me | 0 - (default) Disabled; 1 - Enabled. |
| Sort entries by | 0 | sort_triggers | 1 - Severity (descending); 2 - Host (ascending); 3 - Time (ascending); 4 - (default) Time (descending); 13 - Severity (ascending); 14 - Host (descending); 15 - Problem (ascending); 16 - Problem (descending). |
| | | | For all values, except "Time (descending)" and "Time (ascending)", the <i>Show timeline</i> parameter must be set to "Disabled". |
| Show timeline | 0 | show_timeline | Values "Host (ascending)" and "Host (descending)" are not supported if configuring the widget on a template dashboard . 0 - Disabled; 1 - (default) Enabled. |
| | | | Parameter behavior: - supported if <i>Sort entries by</i> is set to "Time (descending)" or "Time (ascending)" |
| Show lines | 0 | show_lines | Possible values range from 1-100. |
| Reference | 1 | reference | Default: 25. Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. |
| | | | Parameter behavior: - required |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problems* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *Problems* widget

Configure a *Problems* widget that displays problems for host group "4" that satisfy the following conditions:

- Problems that have a tag with the name "scope" that contains values "performance" or "availability", or "capacity".
- Problems that have the following severities: "Warning", "Average", "High", "Disaster".

In addition, configure the widget to show tags and operational data.

23 Problems by severity

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Problems by severity* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problems by severity* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Problems by severity* widget.

| Parameter | type | name | value |
|-----------------------------|------|---------------------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID : ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Exclude host groups</i> | 2 | exclude_groupids.0 | Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |

| Parameter | type | name | value |
|---------------------------------|--------|-------------------------|---|
| <i>Hosts</i> | 3 | hostids.0 | <p>Host ID.</p> <p>Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | <p>Instead of Host ID: DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Problem Severity</i> | 1 0 | problem severities.0 | <p>Problem event name (case insensitive, full name or part of it). 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster.</p> <p>Default: empty (all enabled).</p> <p>Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.</p> |
| <i>Problem tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype | <p>0 - (default) And/Or; 2 - Or.</p> |
| <i>Tag name</i> | 1 | tags.0.tag | Any string value. |
| | | | <p>Note: The number in the property name references tag order in the tag evaluation list.</p> |
| <i>Operator</i> | 0 | tags.0.operator | <p>Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> |
| <i>Tag value</i> | 1 | tags.0.value | <p>Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i></p> |

| Parameter | type | name | value |
|------------------------------|------|-------------------|--|
| Show | 0 | show_type | 0 - (default) Host groups; 1 - Totals. |
| Layout | 0 | layout | This parameter is not supported if configuring the widget on a template dashboard , and by default is set to "Totals". 0 - (default) Horizontal; 1 - Vertical. |
| Show operational data | 0 | show_opdata | Parameter behavior: - <i>supported</i> if Show is set to "Totals" 0 - (default) None; 1 - Separately; 2 - With problem name. |
| Show suppressed problems | 0 | show_suppressed | 0 - (default) Disabled; 1 - Enabled. |
| Hide groups without problems | 0 | hide_empty_groups | 0 - (default) Disabled; 1 - Enabled. |
| Problem display | 0 | ext_ack | Parameter behavior: - <i>supported</i> if Show is set to "Host groups" This parameter is not supported if configuring the widget on a template dashboard . 0 - (default) All; 1 - Unacknowledged only; 2 - Separated. |
| Show timeline | 0 | show_timeline | 0 - Disabled; 1 - (default) Enabled. |
| Reference | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. |
| | | | Parameter behavior: - <i>required</i> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problems by severity* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Problems by severity* widget

Configure a *Problems by severity* widget that displays problem totals for all host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
```

```

    {
      "type": "problemsbysv",
      "name": "Problems by severity",
      "x": 0,
      "y": 0,
      "width": 36,
      "height": 5,
      "view_mode": 0,
      "fields": [
        {
          "type": 0,
          "name": "show_type",
          "value": 1
        }
      ]
    }
  ],
  "userGroups": [
    {
      "usrgrpid": 7,
      "permission": 2
    }
  ],
  "users": [
    {
      "userid": 1,
      "permission": 3
    }
  ]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

24 SLA report

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *SLA report* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *SLA report* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *SLA report* widget.

| Parameter | type | name | value |
|-------------------------|------|--------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - (default) No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>SLA</i> | 10 | slaid.0 | SLA ID. Parameter behavior: - <i>required</i> |
| <i>Service</i> | 9 | serviceid.0 | Service ID. |
| <i>Show periods</i> | 0 | show_periods | Possible values range from 1-100. |
| <i>From</i> | 1 | date_from | Default: 20. Valid date string in format YYYY-MM-DD. Relative dates with modifiers d, w, M, y (e.g. now, now/d, now/w-1w, etc.) are supported. |
| <i>To</i> | 1 | date_to | Valid date string in format YYYY-MM-DD. Relative dates with modifiers d, w, M, y (e.g. now, now/d, now/w-1w, etc.) are supported. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *SLA report* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring an *SLA report* widget

Configure an *SLA report* widget that displays the SLA report for SLA "4" service "2" for the period of last 30 days.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "slareport",
            "name": "SLA report",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
```

```

        "type": 10,
        "name": "slaid.0",
        "value": 4
      },
      {
        "type": 9,
        "name": "serviceid.0",
        "value": 2
      },
      {
        "type": 1,
        "name": "date_from",
        "value": "now-30d"
      },
      {
        "type": 1,
        "name": "date_to",
        "value": "now"
      }
    ]
  },
  "userGroups": [
    {
      "usrgrpid": 7,
      "permission": 2
    }
  ],
  "users": [
    {
      "userid": 1,
      "permission": 3
    }
  ]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

25 System information

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *System*

Information widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *System information* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *System Information* widget.

| Parameter | type | name | value |
|------------------------------------|------|------------------------------------|---|
| Refresh interval | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - (default) 15 minutes. |
| Show | 0 | info_type | 0 - (default) System stats; 1 - High availability nodes. |
| Show software update check details | 0 | show_software_update_check_details | 0 - (default) Disabled; 1 - Enabled. |

Parameter behavior:
- supported if `AllowSoftwareUpdateCheck` in Zabbix server configuration is enabled and `Show` is set to "System stats"

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *System information* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *System information* widget

Configure a *System information* widget that displays system stats with a refresh interval of 10 minutes and software update check enabled.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "systeminfo",
            "name": "System information",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 0,
                "name": "rf_rate",
                "value": 600
              }
            ]
          }
        ]
      }
    ]
  }
}
```

```

        },
        {
            "type": 0,
            "name": "show_software_update_check_details",
            "value": 1
        }
    ]
},
]
},
],
"userGroups": [
    {
        "usrgrpid": 7,
        "permission": 2
    }
],
"users": [
    {
        "userid": 1,
        "permission": 3
    }
]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}

```

26 Top hosts

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Top hosts* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top hosts* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Top hosts* widget.

| Parameter | type | name | value |
|--------------------------|------|---------------------|--|
| Refresh interval | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| Host groups | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| Host groups (Widget) | 1 | groupids._reference | Instead of Host group ID: ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |
| Hosts | 3 | hostids.0 | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . |
| Hosts (Widget/Dashboard) | 1 | hostids._reference | Instead of Host ID: DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard . |
| Host tags | | | |
| Evaluation type | 0 | evaltype | 0 - (default) And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard . |
| Tag name | 1 | tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Host tags</i> This parameter is not supported if configuring the widget on a template dashboard . |

| Parameter | type | name | value |
|--|------|-----------------|---|
| <i>Operator</i> | 0 | tags.0.operator | 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Host tags</i> This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Tag value</i> | 1 | tags.0.value | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Host tags</i> This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Show hosts in maintenance Columns (see below)</i> | 0 | maintenance | 0 - (default) Disabled; 1 - Enabled. |
| <i>Order by Order</i> | 0 | column | Column numeric value from the configured columns. |
| | 0 | order | 2 - (default) Top N; 3 - Bottom N. |
| <i>Host limit</i> | 0 | show_lines | Possible values range from 1-1000. Default: 10. This parameter is not supported if configuring the widget on a template dashboard . |

Columns

Columns have common parameters and additional parameters depending on the configuration of the parameter *Data*.

Note:

For all parameters related to columns the number in the property name (e.g. columns.0.name) references a column for which the parameter is configured.

The following parameters are supported for all columns.

| Parameter | type | name | value |
|------------|------|----------------------|---|
| Name | 1 | columns.0.name | Any string value. |
| Data | 0 | columns.0.data | <p>Parameter behavior:</p> <p>- <i>required</i></p> <p>1 - Item value; 2 - Host name; 3 - Text.</p> <p>Parameter behavior:</p> <p>- <i>required</i></p> |
| Base color | 1 | columns.0.base_color | Hexadecimal color code (e.g. FF0000). |
| | | | <p>Parameter behavior:</p> <p>- <i>required</i></p> |

Item value

The following parameters are supported if *Data* is set to "Item value".

Note:

The first number in the *Thresholds* property name (e.g. columnsthresholds.0.color.0) references the column for which thresholds are configured, while the second number references threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g. "threshold.0.threshold": "5" → "threshold.0.threshold": "1"; "threshold.1.threshold": "1" → "threshold.1.threshold": "5").

| Parameter | type | name | value |
|-----------------------|------|--------------------------|---|
| Item | 1 | columns.0.item | Valid item name. |
| Display item value as | 0 | columns.0.display_value | <p>When configuring the widget on a template dashboard, only items configured on the template should be set.</p> <p>1 - (default) Numeric; 2 - Text; 3 - Binary.</p> |
| Display as | 0 | columns.0.display | <p>1 - (default) As is; 2 - Bar; 3 - Indicators; 6 - Sparkline.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Display item value as</i> is set to "Numeric"</p> |
| Min | 1 | columns.0.min | Any numeric value. |
| Max | 1 | columns.0.max | Any numeric value. |
| Decimal places | 0 | columns.0.decimal_places | <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Display item value as</i> is set to "Numeric" and <i>Display</i> is set to "Bar" or "Indicators"</p> <p>Possible values range from 0-10.</p> <p>Default: 2.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Display item value as</i> is set to "Numeric"</p> |
| Sparkline | | | |

| Parameter | type | name | value |
|---------------------|------|---|---|
| Width | 0 | columns.0.sparkline.width | <p>Possible values range from 0-10.</p> <p>Default: 1.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - supported if <i>Display item value as</i> is set to "Numeric" and <i>Display</i> is set to "Sparkline" |
| Fill | 0 | columns.0.sparkline.fill | <p>Possible values range from 0-10.</p> <p>Default: 3.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - supported if <i>Display item value as</i> is set to "Numeric" and <i>Display</i> is set to "Sparkline" |
| Color | 1 | columns.0.sparkline.color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Default: 42A5F5.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - supported if <i>Display item value as</i> is set to "Numeric" and <i>Display</i> is set to "Sparkline" |

The following parameters are supported if *Data* is set to "Text".

| Parameter | type | name | value |
|-----------|------|----------------|---|
| Text | 1 | columns.0.text | Any string value, including macros. Supported macros: {HOST.*}, {INVENTORY.*}. Parameter behavior: - required if Data is set to "Text" |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top hosts* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Top hosts* widget

Configure a *Top hosts* widget that displays top hosts by CPU utilization in host group "4". In addition, configure the following custom columns: "Host name", "CPU utilization in %", "1m avg", "5m avg", "15m avg", "Processes".

27 Top items

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Top items* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top items* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Top items* widget.

| Parameter | type | name | value |
|---------------------------------|------|----------------------------------|--|
| <i>Refresh interval</i> | 0 | <code>rf_rate</code> | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | <code>groupids.0</code> | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . Instead of Host group ID : <code>ABCDE._hostgroupids</code> - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. |
| <i>Host groups (Widget)</i> | 1 | <code>groupids._reference</code> | This parameter is not supported if configuring the widget on a template dashboard . Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . Instead of Host ID : <code>DASHBOARD.hostids</code> - set the Host selector as the data source for hosts; <code>ABCDE._hostids</code> - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. |
| <i>Hosts</i> | 3 | <code>hostids.0</code> | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . Instead of Host ID : <code>DASHBOARD.hostids</code> - set the Host selector as the data source for hosts; <code>ABCDE._hostids</code> - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. |
| <i>Hosts (Widget/Dashboard)</i> | 1 | <code>hostids._reference</code> | This parameter is not supported if configuring the widget on a template dashboard . Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . Instead of Host ID : <code>DASHBOARD.hostids</code> - set the Host selector as the data source for hosts; <code>ABCDE._hostids</code> - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. |
| <i>Host tags</i> | | | |

| Parameter | type | name | value |
|---|------|----------------------|---|
| <i>Evaluation type</i> | 0 | host_tags_evaltype | 0 - (default) And/Or; 2 - Or. |
| <i>Tag name</i> | 1 | host_tags.0.tag | <p>This parameter is not supported if configuring the widget on a template dashboard.</p> <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Operator</i> | 0 | host_tags.0.operator | <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Tag value</i> | 1 | host_tags.0.value | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Host tags</i></p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Layout</i> | 0 | layout | 0 - (default) Horizontal; 1 - Vertical. |
| <i>Show problems Items</i> (see below) | 0 | show_problems | 0 - All; 1 - (default) Unsuppressed; 2 - None. |

Advanced configuration

The following advanced configuration parameters are supported for the *Top items* widget.

| Parameter | type | name | value |
|----------------------|------|------|-------|
| Host ordering | | | |

| Parameter | type | name | value |
|---|------|------------------------|--|
| <i>Order by</i> | 0 | host_ordering_order_by | By (default) Host name; 3 - Item value. |
| <i>Item patterns</i> | 1 | host_ordering_item.0 | Item name or pattern (e.g., "*": Number of processed *values per second"). |
| <p>Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented number in the property name.</p> <p>When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set.</p> <p>Parameter behavior: - required if <i>Order by</i> is set to "Item value"</p> | | | |
| <i>Order</i> | 0 | host_ordering_order | 2 - (default) Top N; 3 - Bottom N. |
| <i>Limit</i> | 0 | host_ordering_limit | Possible values range from 1-100. |
| Default: 10. | | | |
| Item or-ordering | | | |
| <i>Order by</i> | 0 | item_ordering_order_by | Host; 2 - Item name; 3 - (default) Item value. |
| <i>Host patterns</i> | 1 | item_ordering_host.0 | Host name or pattern. |
| <p>Note: To configure multiple host patterns, create a dashboard widget field object for each host pattern with an incremented number in the property name.</p> <p>Parameter behavior: - required if <i>Order by</i> is set to "Host"</p> | | | |
| <i>Order</i> | 0 | item_ordering_order | 2 - (default) Top N; 3 - Bottom N. |
| <i>Limit</i> | 0 | item_ordering_limit | Possible values range from 1-100. |
| Default: 10. | | | |

Columns

Note:

The first number in the property name (e.g. columns.0.items.0, columns.0.item_tags_evaltype) represents the particular column, while the second number, if present, represents the configured entity (e.g. item pattern, tag).

| Parameter | type | name | value |
|--|------|-------------------|--|
| <i>Item patterns</i> | 1 | columns.0.items.0 | Item name or pattern (e.g., "*": Number of processed *values per second"). |
| <p>Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented second number in the property name.</p> <p>When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set.</p> <p>Parameter behavior: - required</p> | | | |

| Parameter | type | name | value |
|-------------------------|------|-------------------------------------|--|
| <i>Item tags</i> | | | |
| <i>Evaluation type</i> | 0 | columns.0.item_tags_evaluation_type | 0 - (default) And/Or; 2 - Or. |
| <i>Tag name</i> | 1 | columns.0.item_tags_order | Any string value. Note: The second number in the property name references tag order in the tag evaluation list. |
| <i>Operator</i> | 0 | columns.0.item_tags_operator | Parameter behavior: - <i>required</i> if configuring <i>Item tags</i> 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The second number in the property name references tag order in the tag evaluation list. |
| <i>Tag value</i> | 1 | columns.0.item_tags_value | Parameter behavior: - <i>required</i> if configuring <i>Item tags</i> Any string value. Note: The second number in the property name references tag order in the tag evaluation list. |
| <i>Base color</i> | 1 | columns.0.base_color | Hexadecimal color code (e.g. FF0000). |
| <i>Display value as</i> | 0 | columns.0.display_value_as | 1 - (default) Numeric; 2 - Text. |
| <i>Display</i> | 0 | columns.0.display | 1 - (default) As is; 2 - Bar; 3 - Indicators; 6 - Sparkline. |
| <i>Min</i> | 1 | columns.0.min | Any numeric value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. Parameter behavior: - <i>supported</i> if <i>Display value as</i> is set to "Numeric" and <i>Display</i> is set to "Bar" or "Indicators" |
| <i>Max</i> | 1 | columns.0.max | Any numeric value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported. Parameter behavior: - <i>supported</i> if <i>Display value as</i> is set to "Numeric" and <i>Display</i> is set to "Bar" or "Indicators" |
| <i>Sparkline Width</i> | 0 | columns.0.sparkline_width | Possible values range from 0-10. Default: 1. Parameter behavior: - <i>supported</i> if <i>Display</i> is set to "Sparkline" |

| Parameter | type | name | value |
|---------------------------------------|------|--|--|
| <i>Fill</i> | 0 | columns.0.sparkline.fill | <p>Possible values range from 0-10.</p> <p>Default: 3.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display</i> is set to "Sparkline" |
| <i>Color</i> | 1 | columns.0.sparkline.color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Default: 42A5F5.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display</i> is set to "Sparkline" |
| <i>Time period</i> | 1 | columns.0.sparkline.DASHBOARD_ref.timeperiod | <p><i>DASHBOARD_ref.timeperiod</i> - set the Time period selector as the data source;</p> <p><i>ABCDE._timeperiod</i> - set a compatible widget (with its reference parameter equal to <i>ABCDE</i>) as the data source.</p> <p>Default: <i>DASHBOARD._timeperiod</i></p> <p>Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display</i> is set to "Sparkline" |
| <i>From</i> | 1 | columns.0.sparkline.valid_timestring | <p>Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (<i>now</i>, <i>now/d</i>, <i>now/w-1w</i>, etc.).</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display</i> is set to "Sparkline" |
| <i>To</i> | 1 | columns.0.sparkline.valid_timestring | <p>Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (<i>now</i>, <i>now/d</i>, <i>now/w-1w</i>, etc.).</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display</i> is set to "Sparkline" |
| <i>History data</i> | 0 | columns.0.sparkline.history | <p>History (default) Auto;</p> <p>1 - History;</p> <p>2 - Trends.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display</i> is set to "Sparkline" |
| <i>Thresholds</i> <i>Color</i> | 1 | columns.0.thresholds.color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display value as</i> is set to "Numeric" |
| <i>Threshold</i> | 1 | columns.0.thresholds.threshold | <p>Any threshold value. Suffixes (e.g. "1d", "2w", "4K", "8G") are supported.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display value as</i> is set to "Numeric" |
| <i>Highlights</i> <i>Highlight</i> | 1 | columns.0.highlights.color | <p>Hexadecimal color code (e.g. FF0000).</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <i>Display value as</i> is set to "Text" |

| <i>Decimal places</i> | 0 | columns.0.decimal_places | <p>Possible values range from 0-10.</p> <p>Default: 2.</p> |

| Parameter | type | name | value |
|-------------------------------|------|----------------------------|--|
| Advanced configuration | | | |
| Aggregation function | 0 | columns.0.aggregation | <p>If <i>Display value</i> as is set to "Numeric":</p> <p>0 - (default) not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last.</p> <p>If <i>Display value</i> as is set to "Text":</p> <p>0 - (default) not used; 4 - count; 6 - first; 7 - last.</p> |
| Time period | 1 | columns.0.time_period | <p>DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its reference parameter equal to ABCDE) as the data source.</p> <p>Default: DASHBOARD._timeperiod</p> <p>Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Aggregation function</i> is set to "min", "max", "avg", "count", "sum", "first", "last"</p> |
| From | 1 | columns.0.time_period_from | <p>Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.).</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Time period</i> is not set and <i>Aggregation function</i> is set to "min", "max", "avg", "count", "sum", "first", "last"</p> |
| To | 1 | columns.0.time_period_to | <p>Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.).</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Time period</i> is not set and <i>Aggregation function</i> is set to "min", "max", "avg", "count", "sum", "first", "last"</p> |
| History data | 0 | columns.0.history | <p>0 - (default) Auto; 1 - History; 2 - Trends.</p> <p>Parameter behavior:</p> <p>- <i>supported</i> if <i>Display value</i> as is set to "Numeric"</p> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top items* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Top items* widget

Configure a *Top items* widget that displays data for host "10084" and only for items for which the tag with the name "component" contains the value "cpu". In addition, display the data with hosts located at the top and use a colored gauge bar for cell

representation.

28 Top triggers

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Top triggers* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top triggers* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Top triggers* widget.

| Parameter | type | name | value |
|-------------------------|------|---------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - (default) No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |

| Parameter | type | name | value |
|-------------------------|--------|-------------------------|---|
| <i>Host groups</i> | 2 | groupids.0 | <p>Host group ID.</p> <p>Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Hosts</i> | 3 | hostids.0 | <p>Host ID.</p> <p>Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to.</p> <p>This parameter is not supported if configuring the widget on a template dashboard.</p> |
| <i>Problem Severity</i> | 1 0 | problem severities.0 | <p>Problem event name (case insensitive, full name or part of it). Trigger severities.</p> <p>0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster.</p> <p>Default: empty (all enabled).</p> <p>Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.</p> |
| <i>Problem tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype | <p>0 - (default) And/Or; 2 - Or.</p> |
| <i>Tag name</i> | 1 | tags.0.tag | <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> |
| <i>Operator</i> | 0 | tags.0.operator | <p>Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i></p> <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> <p>Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i></p> |

| Parameter | type | name | value |
|----------------------|------|-----------------------|--|
| <i>Tag value</i> | 1 | tags.0.value | Any string value. |
| | | | Note: The number in the property name references tag order in the tag evaluation list. |
| | | | Parameter behavior: - <i>required</i> if configuring <i>Problem tags</i> |
| <i>Time period</i> | 1 | time_period.reference | DASHBOARD._timeperiod - set the <i>Time period selector</i> as the data source; ABCDE._timeperiod - set a <i>compatible widget</i> (with its <i>Reference</i> parameter set to "ABCDE") as the data source. |
| | | | Default: DASHBOARD._timeperiod |
| | | | Alternatively, you can set the time period only in the <i>From</i> and <i>To</i> parameters. |
| <i>From</i> | 1 | time_period.from | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). |
| | | | Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>To</i> | 1 | time_period.to | Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or <i>relative</i> time syntax (now, now/d, now/w-1w, etc.). |
| | | | Parameter behavior: - <i>supported</i> if <i>Time period</i> is not set |
| <i>Trigger limit</i> | 0 | show_lines | Possible values range from 1-100. |
| | | | Default: 10. |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top triggers* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Top triggers* widget

Configure a *Top triggers* widget that displays the top 5 triggers for host group "4" with the count of all problems for each trigger. The widget displays only triggers that have severities "Warning", "Average", "High", or "Disaster", and problems that have a tag with the name "scope" that contains values "performance" or "availability", or "capacity".

Request:

```

29 Trigger overview

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Trigger overview* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Trigger overview* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Trigger Overview* widget.

| Parameter | type | name | value |
|---------------------------------|------|---------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Show</i> | 0 | show | 1 - (default) Recent problems; 2 - Any; 3 - Problems. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID : ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. |
| <i>Hosts</i> | 3 | hostids.0 | Host ID. This parameter is not supported if configuring the widget on a template dashboard . Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | This parameter is not supported if configuring the widget on a template dashboard . Instead of Host ID : DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. |
| <i>Problem tags</i> | | | This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Evaluation type</i> | 0 | evaltype | 0 - (default) And/Or; 2 - Or. |

| Parameter | type | name | value |
|---------------------------------|------|-----------------|---|
| <i>Tag name</i> | 1 | tags.0.tag | Any string value. |
| | | | Note: The number in the property name references tag order in the tag evaluation list. |
| <i>Operator</i> | 0 | tags.0.operator | <p>Parameter behavior:</p> <p>- <i>required</i> if configuring <i>Problem tags</i></p> <p>0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> |
| <i>Tag value</i> | 1 | tags.0.value | <p>Parameter behavior:</p> <p>- <i>required</i> if configuring <i>Problem tags</i></p> <p>Any string value.</p> <p>Note: The number in the property name references tag order in the tag evaluation list.</p> |
| <i>Show suppressed problems</i> | 0 | show_suppressed | <p>Parameter behavior:</p> <p>- <i>required</i> if configuring <i>Problem tags</i></p> <p>0 - (default) Disabled; 1 - Enabled.</p> |
| <i>Layout</i> | 0 | layout | <p>0 - (default) Horizontal; 1 - Vertical.</p> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Trigger overview* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Trigger overview* widget

Configure a *Trigger overview* widget that displays trigger states for all host groups that have triggers with a tag that has the name "scope" and contains value "availability".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "trigover",
            "name": "Trigger overview",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
```

```

        "view_mode": 0,
        "fields": [
            {
                "type": 1,
                "name": "tags.0.tag",
                "value": "scope"
            },
            {
                "type": 0,
                "name": "tags.0.operator",
                "value": 0
            },
            {
                "type": 1,
                "name": "tags.0.value",
                "value": "availability"
            }
        ]
    },
    "userGroups": [
        {
            "usrgrpid": 7,
            "permission": 2
        }
    ],

30 URL

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the [URL](#) widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *URL* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *URL* widget.

| Parameter | type | name | value |
|--|------|----------------------------|---|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - (default) No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>URL</i> | 1 | url | Valid URL string. |
| Parameter behavior: - <i>required</i> | | | |
| <i>Override host</i> | 1 | override_hostid._reference | ABCDE._hostid - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard Host selector as the data source for hosts. |
| This parameter is not supported if configuring the widget on a template dashboard . | | | |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *URL* widget. For more information on configuring a dashboard, see **dashboard.create**.

Configuring a *URL* widget

Configure a *URL* widget that displays the home page of Zabbix manual.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "url",
            "name": "URL",
            "x": 0,
            "y": 0,
            "width": 36,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 1,
                "name": "url",
                "value": "https://www.zabbix.com/documentation/7.2/en"
```

```

    }
  ],
  "userGroups": [

31 Web monitoring

Description

These parameters and the possible property values for the respective dashboard widget field objects allow to configure the *Web monitoring* widget in `dashboard.create` and `dashboard.update` methods.

Attention:

Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify **built-in widgets** and create **custom widgets**, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Web monitoring* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Web monitoring* widget.

| Parameter | type | name | value |
|---------------------------------|------|---------------------|--|
| <i>Refresh interval</i> | 0 | rf_rate | 0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - (default) 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes. |
| <i>Host groups</i> | 2 | groupids.0 | Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Host groups (Widget)</i> | 1 | groupids._reference | Instead of Host group ID : ABCDE._hostgroupids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Exclude host groups</i> | 2 | exclude_groupids.0 | Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts</i> | 3 | hostids.0 | Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter <i>Host groups</i> must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Hosts (Widget/Dashboard)</i> | 1 | hostids._reference | Instead of Host ID : DASHBOARD.hostids - set the Host selector as the data source for hosts; ABCDE._hostids - set a compatible widget (with its <i>Reference</i> parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard . |
| <i>Scenario tags</i> | | | |
| <i>Evaluation type</i> | 0 | evaltype | 0 - (default) And/Or; 2 - Or. |
| <i>Tag name</i> | 1 | tags.0.tag | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Scenario tags</i> |

| Parameter | type | name | value |
|--|------|-----------------|---|
| <i>Operator</i> | 0 | tags.0.operator | 0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Scenario tags</i> |
| <i>Tag value</i> | 1 | tags.0.value | Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - <i>required</i> if configuring <i>Scenario tags</i> |
| <i>Show hosts in maintenance Reference</i> | 0 | maintenance | 0 - Disabled; 1 - (default) Enabled. |
| | 1 | reference | Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - <i>required</i> |

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Web monitoring* widget. For more information on configuring a dashboard, see [dashboard.create](#).

Configuring a *Web monitoring* widget

Configure a *Web monitoring* widget that displays a status summary of the active web monitoring scenarios for host group "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dashboard.create",
  "params": {
    "name": "My dashboard",
    "display_period": 30,
    "auto_start": 1,
    "pages": [
      {
        "widgets": [
          {
            "type": "web",
            "name": "Web monitoring",
            "x": 0,
            "y": 0,
            "width": 18,
            "height": 3,
            "view_mode": 0,
            "fields": [

```

```

        "type": 2,
        "name": "groupids.0",
        "value": 4
      }
    ]
  },
  "userGroups": [
    {
      "usrgrpid": 7,
      "permission": 2
    }
  ],
  "users": [
    {
      "userid": 1,
      "permission": 3
    }
  ]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "3"
    ]
  },
  "id": 1
}

```

Discovered host

This class is designed to work with discovered hosts.

Object references:

- [Discovered host](#)

Available methods:

- [dhost.get](#) - retrieve discovered hosts

Discovered host object

The following objects are directly related to the dhost API.

Discovered host

Note:

Discovered host are created by the Zabbix server and cannot be modified via the API.

The discovered host object contains information about a host discovered by a network discovery rule. It has the following properties.

| Property | Type | Description |
|----------|-----------|---|
| dhostid | ID | ID of the discovered host. |
| druleid | ID | ID of the discovery rule that detected the host. |
| lastdown | timestamp | Time when the discovered host last went down. |
| lastup | timestamp | Time when the discovered host last went up. |
| status | integer | Whether the discovered host is up or down. A host is up if it has at least one active discovered service. |
| | | Possible values: 0 - host up; 1 - host down. |

dhost.get

Description

integer/array dhost.get(object parameters)

The method allows to retrieve discovered hosts according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|--|
| dhostids | ID/array | Return only discovered hosts with the given IDs. |
| druleids | ID/array | Return only discovered hosts that have been created by the given discovery rules. |
| dserviceids | ID/array | Return only discovered hosts that are running the given services. |
| selectDRules | query | Return a drules property with an array of the discovery rules that detected the host. |
| selectDServices | query | Return a dservices property with the discovered services running on the host. |
| limitSelects | integer | Supports count. Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: selectDServices - results will be sorted by dserviceid . Sort the result by the given properties. |
| countOutput | boolean | Possible values: dhostid, druleid. |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve discovered hosts by discovery rule

Retrieve all hosts and the discovered services they are running that have been detected by discovery rule "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dhost.get",
  "params": {
    "output": "extend",
    "selectDServices": "extend",
    "druleids": "4"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dservices": [
        {
          "dserviceid": "1",
          "dhostid": "1",
          "type": "4",
          "key_": "",
          "value": "",
          "port": "80",
          "status": "0",
          "lastup": "1337697227",
          "lastdown": "0",
          "dcheckid": "5",
          "ip": "192.168.1.1",
          "dns": "station.company.lan"
        }
      ],
      "dhostid": "1",
      "druleid": "4",
      "status": "0",

Discovered service object

The following objects are directly related to the `dservice` API.

Discovered service

Note:

Discovered services are created by the Zabbix server and cannot be modified via the API.

The discovered service object contains information about a service discovered by a network discovery rule on a host. It has the following properties.

| Property | Type | Description |
|-------------------------|-----------|---|
| <code>dserviceid</code> | ID | ID of the discovered service. |
| <code>dcheckid</code> | ID | ID of the discovery check used to detect the service. |
| <code>dhostid</code> | ID | ID of the discovered host running the service. |
| <code>dns</code> | string | DNS of the host running the service. |
| <code>ip</code> | string | IP address of the host running the service. |
| <code>lastdown</code> | timestamp | Time when the discovered service last went down. |
| <code>lastup</code> | timestamp | Time when the discovered service last went up. |
| <code>port</code> | integer | Service port number. |
| <code>status</code> | integer | Status of the service. |
| | | Possible values: 0 - service up; 1 - service down. |
| <code>value</code> | string | Value returned by the service when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check. |

`dservice.get`

Description

`integer/array dservice.get(object parameters)`

The method allows to retrieve discovered services according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------------------|----------|---|
| <code>dserviceids</code> | ID/array | Return only discovered services with the given IDs. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| dhostids | ID/array | Return only discovered services that belong to the given discovered hosts. |
| dcheckids | ID/array | Return only discovered services that have been detected by the given discovery checks. |
| druleids | ID/array | Return only discovered services that have been detected by the given discovery rules. |
| selectDRules | query | Return a drules property with an array of the discovery rules that detected the service. |
| selectDHosts | query | Return a dhosts property with an array the discovered hosts that the service belongs to. |
| selectHosts | query | Return a hosts property with the hosts with the same IP address and proxy as the service. |
| limitSelects | integer | Supports count. Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: selectHosts - result will be sorted by hostid. Sort the result by the given properties. |
| countOutput | boolean | Possible values: dserviceid, dhostid, ip. |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve services discovered on a host

Retrieve all discovered services detected on discovered host "11".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dservice.get",
  "params": {
    "output": "extend",
    "dhostids": "11"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
```

```
        "dserviceid": "12",
        "dhostid": "11",
        "value": "",
        "port": "80",
        "status": "1",
        "lastup": "0",
        "lastdown": "1348650607",
        "dcheckid": "5",
        "ip": "192.168.1.134",
        "dns": "john.local"
    },
    {
        "dserviceid": "13",
        "dhostid": "11",
        "value": "",
        "port": "21",
        "status": "1",
        "lastup": "0",
        "lastdown": "1348650610",
        "dcheckid": "6",
        "ip": "192.168.1.134",
        "dns": "john.local"
    }
],
    "id": 1
}
```

Discovery check object

The following objects are directly related to the `dcheck` API.

Discovery check

The discovery check object defines a specific check performed by a network discovery rule. It has the following properties.

| Property | Type | Description |
|----------|--------|--|
| dcheckid | ID | ID of the discovery check. |
| druleid | ID | ID of the discovery rule that the check belongs to. |
| key_ | string | Item key (if type is set to "Zabbix agent") or SNMP OID (if type is set to "SNMPv1 agent", "SNMPv2 agent", or "SNMPv3 agent"). |

Property behavior:

- *required* if type is set to "Zabbix agent", "SNMPv1 agent", "SNMPv2 agent", or "SNMPv3 agent"

| Property | Type | Description |
|-----------------------|---------|---|
| ports | string | One or several port ranges to check, separated by commas. Default: 0. Property behavior: - <i>supported</i> if type is set to "SSH" (0), "LDAP" (1), "SMTP" (2), "FTP" (3), "HTTP" (4), "POP" (5), "NNTP" (6), "IMAP" (7), "TCP" (8), "Zabbix agent" (9), "SNMPv1 agent" (10), "SNMPv2 agent" (11), "SNMPv3 agent" (13), "HTTPS" (14), or "Telnet" (15) |
| snmp_community | string | SNMP community. Property behavior: - <i>required</i> if type is set to "SNMPv1 agent" or "SNMPv2 agent" |
| snmpv3_authpassphrase | string | Authentication passphrase. Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent" and <code>snmpv3_securitylevel</code> is set to "authNoPriv" or "authPriv" |
| snmpv3_authprotocol | integer | Authentication protocol. Possible values: 0 - (default) MD5; 1 - SHA1; 2 - SHA224; 3 - SHA256; 4 - SHA384; 5 - SHA512. Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent" and <code>snmpv3_securitylevel</code> is set to "authNoPriv" or "authPriv" |
| snmpv3_contextname | string | SNMPv3 context name. Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent" |
| snmpv3_privpassphrase | string | Privacy passphrase. Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent" and <code>snmpv3_securitylevel</code> is set to "authPriv" |
| snmpv3_privprotocol | integer | Privacy protocol. Possible values: 0 - (default) DES; 1 - AES128; 2 - AES192; 3 - AES256; 4 - AES192C; 5 - AES256C. Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent" and <code>snmpv3_securitylevel</code> is set to "authPriv" |
| snmpv3_securitylevel | string | Security level. Possible values: 0 - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv. Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent" |

| Property | Type | Description |
|---------------------|---------|---|
| snmpv3_securityname | string | Security name. |
| type | integer | <p>Property behavior: - <i>supported</i> if type is set to "SNMPv3 agent"</p> <p>Type of check.</p> <p>Possible values: 0 - SSH; 1 - LDAP; 2 - SMTP; 3 - FTP; 4 - HTTP; 5 - POP; 6 - NNTP; 7 - IMAP; 8 - TCP; 9 - Zabbix agent; 10 - SNMPv1 agent; 11 - SNMPv2 agent; 12 - ICMP ping; 13 - SNMPv3 agent; 14 - HTTPS; 15 - Telnet.</p> <p>Property behavior: - <i>required</i></p> |
| uniq | integer | <p>Whether to use this check as a device uniqueness criteria. Only a single unique check can be configured for a discovery rule.</p> <p>Possible values: 0 - (<i>default</i>) do not use this check as a uniqueness criteria; 1 - use this check as a uniqueness criteria.</p> <p>Property behavior: - <i>supported</i> if type is set to "Zabbix agent", "SNMPv1 agent", "SNMPv2 agent", or "SNMPv3 agent"</p> |
| host_source | integer | <p>Source for host name.</p> <p>Possible values: 1 - (<i>default</i>) DNS; 2 - IP; 3 - discovery value of this check.</p> |
| name_source | integer | <p>Source for visible name.</p> <p>Possible values: 0 - (<i>default</i>) not specified; 1 - DNS; 2 - IP; 3 - discovery value of this check.</p> |
| allow_redirect | integer | <p>Allow situation where the target being ICMP pinged responds from a different IP address.</p> <p>Possible values: 0 - (<i>default</i>) treat redirected responses as if the target host is down (fail); 1 - treat redirected responses as if the target host is up (success).</p> <p>Property behavior: - <i>supported</i> if type is set to "ICMP ping"</p> |

dcheck.get

Description

integer/array dcheck.get(object parameters)

The method allows to retrieve discovery checks according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| dcheckids | ID/array | Return only discovery checks with the given IDs. |
| druleids | ID/array | Return only discovery checks that belong to the given discovery rules. |
| dserviceids | ID/array | Return only discovery checks that have detected the given discovered services. |
| selectDRules | query | Return discovery rules related to the discovery checks. |
| sortfield | string/array | Sort the result by the given properties. Possible values: dcheckid, druleid. These parameters are described in the reference commentary . |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve discovery checks for a discovery rule

Retrieve all discovery checks used by discovery rule "6".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "dcheck.get",
  "params": {
    "output": "extend",
    "dcheckids": "6"
  },
  "id": 1
}
```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "dcheckid": "6",
      "druleid": "4",
      "type": "3",
      "key_": "",
      "snmp_community": "",
      "ports": "21",
      "snmpv3_securityname": "",
      "snmpv3_securitylevel": "0",
      "snmpv3_authpassphrase": "",
      "snmpv3_privpassphrase": "",
      "uniq": "0",
      "snmpv3_authprotocol": "0",
      "snmpv3_privprotocol": "0",
      "snmpv3_contextname": "",
      "host_source": "1",
      "name_source": "0",
      "allow_redirect": "0"
    }
  ],
  "id": 1
}

```

Discovery rule

This class is designed to work with network discovery rules.

Note:

This API is meant to work with network discovery rules. For low-level discovery rules, see [LLD rule API](#).

Object references:

- [Discovery rule](#)

Available methods:

- [drule.create](#) - create new network discovery rules
- [drule.delete](#) - delete network discovery rules
- [drule.get](#) - retrieve network discovery rules
- [drule.update](#) - update network discovery rules

Discovery rule object

The following objects are directly related to the `drule` API.

Discovery rule

The discovery rule object defines a network discovery rule. It has the following properties.

| Property | Type | Description |
|----------------------|------|---------------------------|
| <code>druleid</code> | ID | ID of the discovery rule. |

Property behavior:

- *read-only*
- *required* for update operations

| Property | Type | Description |
|-----------------|---------|---|
| iprange | string | One or several IP ranges to check, separated by commas. Refer to the network discovery configuration section for more information on supported formats of IP ranges. Property behavior: - <i>required</i> for create operations |
| name | string | Name of the discovery rule. Property behavior: - <i>required</i> for create operations |
| delay | string | Execution interval of the discovery rule. Accepts seconds or time unit with suffix (e.g., 30s, 1m, 2h, 1d), or a user macro. |
| proxyid | ID | Default: 1h. ID of the proxy used for discovery. |
| status | integer | Whether the discovery rule is enabled. Possible values: 0 - (<i>default</i>) enabled; 1 - disabled. |
| concurrency_max | integer | Maximum number of concurrent checks per discovery rule. Possible values: 0 - (<i>default</i>) unlimited number of checks; 1 - one check; 2-999 - custom number of checks. |
| error | string | Error text if there have been any problems when executing the discovery rule. Property behavior: - <i>read-only</i> |

drule.create

Description

object drule.create(object/array discoveryRules)

This method allows to create new discovery rules.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Discovery rules to create.

Additionally to the [standard discovery rule properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| dchecks | array | Discovery checks to create for the discovery rule. Parameter behavior: - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the created discovery rules under the `druleids` property. The order of the returned IDs matches the order of the passed discovery rules.

Examples

Create a discovery rule

Create a discovery rule to find machines running the Zabbix agent in the local network. The rule must use a single Zabbix agent check on port 10050.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.create",
  "params": {
    "name": "Zabbix agent discovery",
    "iprange": "192.168.1.1-255",
    "concurrency_max": "10",
    "dchecks": [
      {
        "type": "9",
        "key_": "system.uptime",
        "ports": "10050",
        "uniq": "0"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "6"
    ]
  },
  "id": 1
}
```

See also

- [Discovery check](#)

Source

`CDRule::create()` in `ui/include/classes/api/services/CDRule.php`.

drule.delete

Description

`object drule.delete(array discoveryRuleIds)`

This method allows to delete discovery rules.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the discovery rules to delete.

Return values

(object) Returns an object containing the IDs of the deleted discovery rules under the `druleids` property.

Examples

Delete multiple discovery rules

Delete two discovery rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.delete",
  "params": [
    "4",
    "6"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "4",
      "6"
    ]
  },
  "id": 1
}
```

Source

CDRule::delete() in ui/include/classes/api/services/CDRule.php.

drule.get

Description

integer/array drule.get(object parameters)

The method allows to retrieve discovery rules according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---------------|----------|--|
| dhostids | ID/array | Return only discovery rules that created the given discovered hosts. |
| druleids | ID/array | Return only discovery rules with the given IDs. |
| dserviceids | ID/array | Return only discovery rules that created the given discovered services. |
| selectDChecks | query | Return a dchecks property with the discovery checks used by the discovery rule. |
| selectDHosts | query | Supports count. |
| | | Return a dhosts property with the discovered hosts created by the discovery rule. |
| | | Supports count. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| limitSelects | integer | Limits the number of records returned by subselects. |
| sortfield | string/array | <p>Applies to the following subselects:</p> <p>selectDChecks - results will be sorted by dcheckid;</p> <p>selectDHosts - results will be sorted by dhostsid.</p> <p>Sort the result by the given properties.</p> |
| countOutput | boolean | Possible values: druleid, name. These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve all discovery rules

Retrieve all configured discovery rules and the discovery checks they use.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "drule.get",
  "params": {
    "output": "extend",
    "selectDChecks": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "druleid": "2",
      "proxyid": "0",
      "name": "Local network",
      "iprange": "192.168.3.1-255",
      "delay": "5s",

drule.update

Description

object drule.update(object/array discoveryRules)

This method allows to update existing discovery rules.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Discovery rule properties to be updated.

The `druleid` property must be defined for each discovery rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard discovery rule properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| dchecks | array | Discovery checks to replace existing checks. |

Return values

(object) Returns an object containing the IDs of the updated discovery rules under the `druleids` property.

Examples

Change the IP range of a discovery rule

Change the IP range of a discovery rule to "192.168.2.1-255".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "drule.update",
  "params": {
    "druleid": "6",
    "iprange": "192.168.2.1-255"
  },
  "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "druleids": [
      "6"
    ]
  },
  "id": 1
}
```

Event

This class is designed to work with events.

Object references:

- [Event](#)
- [Event tag](#)
- [Media type URL](#)

Available methods:

- [event.get](#) - retrieve events
- [event.acknowledge](#) - acknowledge events

Event object

The following objects are directly related to the event API.

Event

Note:

Events are created by the Zabbix server and cannot be modified via the API.

The event object has the following properties.

| Property | Type | Description |
|---|---------|--------------------|
| eventid | ID | ID of the event. |
| source | integer | Type of the event. |
| Possible values: | | |
| 0 - event created by a trigger; | | |
| 1 - event created by a discovery rule; | | |
| 2 - event created by active agent autoregistration; | | |
| 3 - internal event; | | |
| 4 - event created on service status update. | | |

| Property | Type | Description |
|--------------|-----------|---|
| object | integer | <p>Type of object that is related to the event.</p> <p>Possible values if source is set to "event created by a trigger": 0 - trigger.</p> <p>Possible values if source is set to "event created by a discovery rule": 1 - discovered host; 2 - discovered service.</p> <p>Possible values if source is set to "event created by active agent autoregistration": 3 - auto-registered host.</p> <p>Possible values if source is set to "internal event": 0 - trigger; 4 - item; 5 - LLD rule.</p> <p>Possible values if source is set to "event created on service status update": 6 - service.</p> |
| objectid | ID | ID of the related object. |
| acknowledged | integer | Whether the event has been acknowledged. |
| clock | timestamp | Time when the event was created. |
| ns | integer | Nanoseconds when the event was created. |
| name | string | Resolved event name. |
| value | integer | State of the related object. |
| | | <p>Possible values if source is set to "event created by a trigger" or "event created on service status update": 0 - OK; 1 - problem.</p> <p>Possible values if source is set to "event created by a discovery rule": 0 - host or service up; 1 - host or service down; 2 - host or service discovered; 3 - host or service lost.</p> <p>Possible values if source is set to "internal event": 0 - "normal" state; 1 - "unknown" or "not supported" state.</p> |
| | | <p>Property behavior:</p> <p>- <i>supported</i> if source is set to "event created by a trigger", "event created by a discovery rule", "internal event", or "event created on service status update"</p> |
| severity | integer | <p>Event current severity.</p> <p>Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.</p> |
| r_eventid | ID | ID of the recovery event. |
| c_eventid | ID | <p>ID of the event that was used to override (close) current event under global correlation rule. See <code>correlationid</code> to identify exact correlation rule.</p> <p>This parameter is only defined when the event is closed by global correlation rule.</p> |

| Property | Type | Description |
|---------------|---------|--|
| cause_eventid | ID | ID of the cause event. |
| correlationid | ID | ID of the correlation rule that generated closing of the problem. This parameter is only defined when the event is closed by global correlation rule. |
| userid | ID | ID of the user that closed the event (if the event was closed manually). |
| suppressed | integer | Whether the event is suppressed. Possible values: 0 - event is in normal state; 1 - event is suppressed. |
| opdata | string | Operational data with expanded macros. |
| urls | array | Active media type URLs. |

Event tag

The event tag object has the following properties.

| Property | Type | Description |
|----------|--------|------------------|
| tag | string | Event tag name. |
| value | string | Event tag value. |

Media type URL

The media type URL object has the following properties.

| Property | Type | Description |
|----------|--------|-------------------------------|
| name | string | Media type defined URL name. |
| url | string | Media type defined URL value. |

Results will contain entries only for active media types with enabled event menu entry. Macro used in properties will be expanded, but if one of the properties contains an unexpanded macro, both properties will be excluded from results. For supported macros, see *Supported macros*.

event.acknowledge

Description

`object event.acknowledge(object/array parameters)`

This method allows to update events. The following update actions can be performed:

- Close event. If event is already resolved, this action will be skipped.
- Acknowledge event. If event is already acknowledged, this action will be skipped.
- Unacknowledge event. If event is not acknowledged, this action will be skipped.
- Add message.
- Change event severity. If event already has same severity, this action will be skipped.
- Suppress event. If event is already suppressed, this action will be skipped.
- Unsuppress event. If event is not suppressed, this action will be skipped.

Attention:

Only trigger events can be updated.

Only problem events can be updated.

Read/Write rights for trigger are required to close the event or to change event's severity.

To close an event, manual close should be allowed in the trigger.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Parameters containing the IDs of the events and update operations that should be performed.

| Parameter | Type | Description |
|----------------|----------|--|
| eventids | ID/array | IDs of the events to acknowledge. Parameter behavior: - <i>required</i> |
| action | integer | Event update action(s). Possible bitmap values: 1 - close problem; 2 - acknowledge event; 4 - add message; 8 - change severity; 16 - unacknowledge event; 32 - suppress event; 64 - unsuppress event; 128 - change event rank to cause; 256 - change event rank to symptom. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 34 for acknowledge and suppress event). Parameter behavior: - <i>required</i> |
| cause_eventid | ID | Cause event ID. Parameter behavior: - <i>required</i> if action contains the "change event rank to symptom" bit |
| message | string | Text of the message. Parameter behavior: - <i>required</i> if action contains the "add message" bit |
| severity | integer | New severity for events. Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. Parameter behavior: - <i>required</i> if action contains the "change severity" bit |
| suppress_until | integer | Unix timestamp until which event must be suppressed. If set to "0", the suppression will be indefinite. Parameter behavior: - <i>required</i> if action contains the "suppress event" bit |

Return values

(object) Returns an object containing the IDs of the updated events under the **eventids** property.

Examples

Acknowledging an event

Acknowledge a single event and leave a message.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.acknowledge",
  "params": {
    "eventids": "20427",
    "action": 6,
    "message": "Problem resolved."
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "eventids": [
      "20427"
    ]
  },
  "id": 1
}
```

Changing event's severity

Change severity for multiple events and leave a message.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.acknowledge",
  "params": {
    "eventids": ["20427", "20428"],
    "action": 12,
    "message": "Maintenance required to fix it.",
    "severity": 4
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "eventids": [
      "20427",
      "20428"
    ]
  },
  "id": 1
}
```

Source

CEvent::acknowledge() in *ui/include/classes/api/services/CEvent.php*.

event.get

Description

integer/array event.get(object parameters)

The method allows to retrieve events according to the given parameters.

Attention:

This method may return events of a deleted entity if these events have not been removed by the housekeeper yet.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------------|---------------|--|
| eventids | ID/array | Return only events with the given IDs. |
| groupids | ID/array | Return only events created by objects that belong to the given host groups. |
| hostids | ID/array | Return only events created by objects that belong to the given hosts. |
| objectids | ID/array | Return only events created by the given objects. |
| source | integer | Return only events with the given type. Refer to the event object page for a list of supported event types. |
| object | integer | Default: 0 - trigger events. Return only events created by objects of the given type. Refer to the event object page for a list of supported object types. |
| acknowledged | boolean | Default: 0 - trigger. |
| action | integer | If set to true return only acknowledged events. Return only events for which the given event update actions have been performed. For multiple actions, use a sum of any acceptable bitmap values as bitmask (for example, 34 for acknowledge and suppress event). |
| action_userids | ID/array | Return only events with the given IDs of users who performed the event update actions. |
| suppressed | boolean | true - return only suppressed events; false - return events in the normal state. |
| symptom | boolean | true - return only symptom events; false - return only cause events. |
| severities | integer/array | Return only events with the given event severities. Applies only if object is trigger. |
| trigger_severities | integer/array | Return only events with the given trigger severities. Applies only if object is trigger. |
| evaltype | integer | Rules for tag searching. Possible values: 0 - (default) And/Or; 2 - Or. |
| tags | array | Return only events with the given tags. Exact match by tag and case-insensitive search by value and operator. Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]. An empty array returns all events. Possible operator types: 0 - (default) Like; 1 - Equal; 2 - Not like; 3 - Not equal 4 - Exists; 5 - Not exists. |

| Parameter | Type | Description |
|-----------------------|---------------|--|
| eventid_from | string | Return only events with IDs greater or equal to the given ID. |
| eventid_till | string | Return only events with IDs less or equal to the given ID. |
| time_from | timestamp | Return only events that have been created after or at the given time. |
| time_till | timestamp | Return only events that have been created before or at the given time. |
| problem_time_from | timestamp | Returns only events that were in the problem state starting with <code>problem_time_from</code> . Applies only if the source is trigger event and object is trigger. Mandatory if <code>problem_time_till</code> is specified. |
| problem_time_till | timestamp | Returns only events that were in the problem state until <code>problem_time_till</code> . Applies only if the source is trigger event and object is trigger. Mandatory if <code>problem_time_from</code> is specified. |
| value | integer/array | Return only events with the given values. |
| selectAcknowledges | query | Return an <code>acknowledges</code> property with event updates. Event updates are sorted in reverse chronological order. The event update object has the following properties: <code>acknowledgeid</code> - (ID) acknowledgment's ID; <code>userid</code> - (ID) ID of the user that updated the event; <code>clock</code> - (timestamp) time when the event was updated; <code>message</code> - (string) text of the message; <code>action</code> - (integer) update action that was performed, see <code>event.acknowledge</code> ; <code>old_severity</code> - (integer) event severity before this update action; <code>new_severity</code> - (integer) event severity after this update action; <code>suppress_until</code> - (timestamp) time till event will be suppressed; <code>taskid</code> - (ID) ID of task if current event is undergoing a rank change; <code>username</code> - (string) username of the user that updated the event; <code>name</code> - (string) name of the user that updated the event; <code>surname</code> - (string) surname of the user that updated the event. |
| selectAlerts | query | Supports count. Return an <code>alerts</code> property with alerts generated by the event. Alerts are sorted in reverse chronological order. |
| selectHosts | query | Return a <code>hosts</code> property with hosts containing the object that created the event. Supported only for events generated by triggers, items or LLD rules. |
| selectRelatedObject | query | Return a <code>relatedObject</code> property with the object that created the event. The type of object returned depends on the event type. |
| selectSuppressionData | query | Return a <code>suppression_data</code> property with the list of active maintenances and manual suppressions: <code>maintenanceid</code> - (ID) ID of the maintenance; <code>userid</code> - (ID) ID of user who suppressed the event; <code>suppress_until</code> - (integer) time until the event is suppressed. |
| selectTags | query | Return a <code>tags</code> property with event tags. |
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. |
| sortfield | string/array | Does not support properties of text <code>data type</code> . Sort the result by the given properties. Possible values: <code>eventid</code> , <code>objectid</code> , <code>clock</code> . Possible values when used together with <code>groupBy</code> : <code>objectid</code> . Possible values when used together with <code>countOutput</code> and <code>groupBy</code> : <code>objectid</code> , <code>rowcount</code> . |
| groupBy | string/array | Group the results by the given properties. The specified properties will be returned in the results. Possible values: <code>objectid</code> . |

| Parameter | Type | Description |
|------------------------|--------------|--|
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used, but the groupBy parameter has not been used;
- an array of objects with aggregation results, if the groupBy parameter has been used.

Examples

Retrieving trigger events

Retrieve the latest events from trigger "22395".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "event.get",
  "params": {
    "output": "extend",
    "selectAcknowledges": "extend",
    "selectSuppressionData": "extend",
    "selectTags": "extend",
    "objectids": "22395",
    "sortfield": ["clock", "eventid"],
    "sortorder": "DESC"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",

Graph

This class is designed to work with graphs.

Object references:

- [Graph](#)

Available methods:

- [graph.create](#) - create new graphs
- [graph.delete](#) - delete graphs
- [graph.get](#) - retrieve graphs
- [graph.update](#) - update graphs

Graph object

The following objects are directly related to the graph API.

Graph

The graph object has the following properties.

| Property | Type | Description |
|------------------|---------|--|
| graphid | ID | ID of the graph. |
| height | integer | Property behavior: - <i>read-only</i> - <i>required</i> for update operations Height of the graph in pixels. |
| name | string | Property behavior: - <i>required</i> for create operations Name of the graph. |
| width | integer | Property behavior: - <i>required</i> for create operations Width of the graph in pixels. |
| flags | integer | Property behavior: - <i>required</i> for create operations Origin of the graph. Possible values: 0 - (<i>default</i>) a plain graph; 4 - a discovered graph. |
| graphtype | integer | Property behavior: - <i>read-only</i> Graph's layout type. Possible values: 0 - (<i>default</i>) normal; 1 - stacked; 2 - pie; 3 - exploded. |
| percent_left | float | Left percentile. |
| percent_right | float | Default: 0. Right percentile. |
| show_3d | integer | Default: 0. Whether to show pie and exploded graphs in 3D. |
| show_legend | integer | Possible values: 0 - (<i>default</i>) show in 2D; 1 - show in 3D. Whether to show the legend on the graph. |
| show_work_period | integer | Possible values: 0 - hide; 1 - (<i>default</i>) show. Whether to show the working time on the graph. Possible values: 0 - hide; 1 - (<i>default</i>) show. |

| Property | Type | Description |
|---------------|---------|---|
| show_triggers | integer | Whether to show the trigger line on the graph. Possible values: 0 - hide; 1 - <i>(default)</i> show. |
| templateid | ID | ID of the parent template graph. Property behavior: - <i>read-only</i> |
| yaxismax | float | The fixed maximum value for the Y axis. Default: 100. |
| yaxismin | float | The fixed minimum value for the Y axis. Default: 0. |
| ymax_itemid | ID | ID of the item that is used as the maximum value for the Y axis. If a user has no access to the specified item, the graph is rendered as if <code>ymax_type</code> is set to "calculated". |
| ymax_type | integer | Maximum value calculation method for the Y axis. Possible values: 0 - <i>(default)</i> calculated; 1 - fixed; 2 - item. |
| ymin_itemid | ID | ID of the item that is used as the minimum value for the Y axis. If a user has no access to the specified item, the graph is rendered as if <code>ymin_type</code> is set to "calculated". |
| ymin_type | integer | Minimum value calculation method for the Y axis. Possible values: 0 - <i>(default)</i> calculated; 1 - fixed; 2 - item. |
| uuid | string | Universal unique identifier, used for linking imported graphs to already existing ones. Auto-generated, if not given. Property behavior: - <i>supported</i> if the graph belongs to a template |

graph.create

Description

`object graph.create(object/array graphs)`

This method allows to create new graphs.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Graphs to create.

Additionally to the [standard graph properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---|-------|---|
| gitems | array | Graph items to be created for the graph. |
| Parameter behavior: - <i>required</i> | | |

Return values

(object) Returns an object containing the IDs of the created graphs under the graphids property. The order of the returned IDs matches the order of the passed graphs.

Examples

Creating a graph

Create a graph with two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.create",
  "params": {
    "name": "MySQL bandwidth",
    "width": 900,
    "height": 200,
    "gitems": [
      {
        "itemid": "22828",
        "color": "00AA00"
      },
      {
        "itemid": "22829",
        "color": "3333FF"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652"
    ]
  },
  "id": 1
}
```

See also

- [Graph item](#)

Source

CGraph::create() in `ui/include/classes/api/services/CGraph.php`.

graph.delete

Description

object graph.delete(array graphIds)

This method allows to delete graphs.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the graphs to delete.

Return values

(object) Returns an object containing the IDs of the deleted graphs under the `graphids` property.

Examples**Deleting multiple graphs**

Delete two graphs.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.delete",
  "params": [
    "652",
    "653"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652",
      "653"
    ]
  },
  "id": 1
}
```

Source

`CGraph::delete()` in `ui/include/classes/api/services/CGraph.php`.

graph.get**Description**

`integer/array graph.get(object parameters)`

The method allows to retrieve graphs according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------|----------|---|
| graphids | ID/array | Return only graphs with the given IDs. |
| groupids | ID/array | Return only graphs that belong to hosts or templates in the given host groups or template groups. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| templateids | ID/array | Return only graph that belong to the given templates. |
| hostids | ID/array | Return only graphs that belong to the given hosts. |
| itemids | ID/array | Return only graphs that contain the given items. |
| templated | boolean | If set to true return only graphs that belong to templates. |
| inherited | boolean | If set to true return only graphs inherited from a template. |
| expandName | flag | Expand macros in the graph name. |
| selectHostGroups | query | Return a hostgroups property with the host groups that the graph belongs to. |
| selectTemplateGroups | query | Return a templategroups property with the template groups that the graph belongs to. |
| selectTemplates | query | Return a templates property with the templates that the graph belongs to. |
| selectHosts | query | Return a hosts property with the hosts that the graph belongs to. |
| selectItems | query | Return an items property with the items used in the graph. |
| selectGraphDiscovery | query | Return a graphDiscovery property with the graph discovery object. The graph discovery objects links the graph to a graph prototype from which it was created. |
| | | <p>It has the following properties:</p> <p>graphid - (ID) ID of the graph;</p> <p>parent_graphid - (ID) ID of the graph prototype from which the graph has been created;</p> <p>lastcheck - (timestamp) time when the graph was last discovered;</p> <p>status - (int) graph discovery status:</p> <p>0 - (default) graph is discovered,</p> <p>1 - graph is not discovered anymore;</p> <p>ts_delete - (timestamp) time when a graph that is no longer discovered will be deleted.</p> |
| selectGraphItems | query | Return a gitems property with the items used in the graph. |
| selectDiscoveryRule | query | Return a discoveryRule property with the low-level discovery rule that created the graph. |
| filter | object | Return only those results that exactly match the given filter. |
| | | <p>Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against.</p> <p>Does not support properties of text data type.</p> <p>Supports additional properties:</p> <p>host - technical name of the host that the graph belongs to;</p> <p>hostid - ID of the host that the graph belongs to.</p> |
| sortfield | string/array | Sort the result by the given properties. |
| | | <p>Possible values: graphid, name, graphtype.</p> <p>These parameters are described in the reference commentary.</p> |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

Examples

Retrieving graphs from hosts

Retrieve all graphs from host "10107" and sort them by name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.get",
  "params": {
    "output": "extend",
    "hostids": 10107,
    "sortfield": "name"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "graphid": "612",
      "name": "CPU jumps",
      "width": "900",
      "height": "200",
      "yaxismin": "0",
      "yaxismax": "100",
      "templateid": "439",
      "show_work_period": "1",
      "show_triggers": "1",

graph.update

Description

`object graph.update(object/array graphs)`

This method allows to update existing graphs.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Graph properties to be updated.

The `graphid` property must be defined for each graph, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard graph properties](#) the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| gitems | array | Graph items to replace existing graph items. If a graph item has the <code>gitemid</code> property defined it will be updated, otherwise a new graph item will be created. |

Return values

(object) Returns an object containing the IDs of the updated graphs under the `graphids` property.

Examples

Setting the maximum for the Y scale

Set the maximum of the Y scale to a fixed value of 100.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graph.update",
  "params": {
    "graphid": "439",
    "ymax_type": 1,
    "yaxismax": 100
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "439"
    ]
  },
  "id": 1
}
```

Source

`CGraph::update()` in `ui/include/classes/api/services/CGraph.php`.

Graph item

This class is designed to work with graph items.

Object references:

- [Graph item](#)

Available methods:

- `graphitem.get` - retrieve graph items

Graph item object

The following objects are directly related to the `graphitem` API.

Graph item

Note:

Graph items can only be modified via the `graph` API.

The graph item object has the following properties.

| Property | Type | Description |
|-----------|---------|--|
| gitemid | ID | ID of the graph item. |
| color | string | Property behavior: - <i>read-only</i> Graph item's draw color as a hexadecimal color code. |
| itemid | ID | Property behavior: - <i>required</i> for create operations ID of the item. |
| calc_fnc | integer | Property behavior: - <i>required</i> for create operations Value of the item that will be displayed. Possible values: 1 - minimum value; 2 - (<i>default</i>) average value; 4 - maximum value; 7 - all values; 9 - last value, used only by pie and exploded graphs. |
| drawtype | integer | Draw style of the graph item. Possible values: 0 - (<i>default</i>) line; 1 - filled region; 2 - bold line; 3 - dot; 4 - dashed line; 5 - gradient line. |
| graphid | ID | ID of the graph that the graph item belongs to. |
| sortorder | integer | Position of the item in the graph. |
| type | integer | Default: starts with "0" and increases by one with each entry. Type of graph item. Possible values: 0 - (<i>default</i>) simple; 2 - graph sum, used only by pie and exploded graphs. |
| yaxisside | integer | Side of the graph where the graph item's Y scale will be drawn. Possible values: 0 - (<i>default</i>) left side; 1 - right side. |

graphitem.get

Description

`integer/array graphitem.get(object parameters)`

The method allows to retrieve graph items according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------|--------------|---|
| graphids | ID/array | Return only graph items that belong to the given graphs. |
| itemids | ID/array | Return only graph items with the given item IDs. |
| type | integer | Return only graph items with the given type. |
| | | Refer to the graph item object page for a list of supported graph item types. |
| selectGraphs | query | Return a graphs property with an array of graphs that the item belongs to. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: <code>gitemid</code> . |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| sortorder | string/array | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving graph items from a graph

Retrieve all graph items used in a graph with additional information about the item and the host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphitem.get",
  "params": {
    "output": "extend",
    "graphids": "387"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "gitemid": "1242",
      "graphid": "387",

```

```

        "itemid": "22665",
        "drawtype": "1",
        "sortorder": "1",
        "color": "FF5555",
        "yaxisside": "0",
        "calc_fnc": "2",
        "type": "0"
    },
    {
        "gitemid": "1243",
        "graphid": "387",
        "itemid": "22668",
        "drawtype": "1",
        "sortorder": "2",
        "color": "55FF55",
        "yaxisside": "0",
        "calc_fnc": "2",
        "type": "0"
    },
    {
        "gitemid": "1244",
        "graphid": "387",
        "itemid": "22671",
        "drawtype": "1",
        "sortorder": "3",
        "color": "009999",
        "yaxisside": "0",
        "calc_fnc": "2",
        "type": "0"
    }
],
"id": 1
}

```

Graph prototype

This class is designed to work with graph prototypes.

Object references:

- [Graph prototype](#)

Available methods:

- [graphprototype.create](#) - create new graph prototypes
- [graphprototype.delete](#) - delete graph prototypes
- [graphprototype.get](#) - retrieve graph prototypes
- [graphprototype.update](#) - update graph prototypes

Graph prototype object

The following objects are directly related to the graphprototype API.

Graph prototype

The graph prototype object has the following properties.

| Property | Type | Description |
|------------------|---------|---|
| graphid | ID | ID of the graph prototype. |
| | | Property behavior: - <i>read-only</i> - <i>required</i> for update operations |
| height | integer | Height of the graph prototype in pixels. |
| | | Property behavior: - <i>required</i> for create operations |
| name | string | Name of the graph prototype. |
| | | Property behavior: - <i>required</i> for create operations |
| width | integer | Width of the graph prototype in pixels. |
| | | Property behavior: - <i>required</i> for create operations |
| graphtype | integer | Graph prototypes's layout type. |
| | | Possible values: 0 - (<i>default</i>) normal; 1 - stacked; 2 - pie; 3 - exploded. |
| percent_left | float | Left percentile. |
| | | Default: 0. |
| percent_right | float | Right percentile. |
| | | Default: 0. |
| show_3d | integer | Whether to show discovered pie and exploded graphs in 3D. |
| | | Possible values: 0 - (<i>default</i>) show in 2D; 1 - show in 3D. |
| show_legend | integer | Whether to show the legend on the discovered graph. |
| | | Possible values: 0 - hide; 1 - (<i>default</i>) show. |
| show_work_period | integer | Whether to show the working time on the discovered graph. |
| | | Possible values: 0 - hide; 1 - (<i>default</i>) show. |
| templateid | ID | ID of the parent template graph prototype. |
| | | Property behavior: - <i>read-only</i> |
| yaxismax | float | The fixed maximum value for the Y axis. |
| yaxismin | float | The fixed minimum value for the Y axis. |
| ymax_itemid | ID | ID of the item that is used as the maximum value for the Y axis. |
| | | If a user has no access to the specified item, the graph is rendered as if <code>ymax_type</code> is set to "calculated". |
| ymax_type | integer | Maximum value calculation method for the Y axis. |
| | | Possible values: 0 - (<i>default</i>) calculated; 1 - fixed; 2 - item. |

| Property | Type | Description |
|-------------|---------|--|
| ymin_itemid | ID | ID of the item that is used as the minimum value for the Y axis. |
| ymin_type | integer | <p>If a user has no access to the specified item, the graph is rendered as if <code>ymin_type</code> is set to "calculated".</p> <p>Minimum value calculation method for the Y axis.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - <i>(default)</i> calculated; 1 - fixed; 2 - item. |
| discover | integer | <p>Graph prototype discovery status.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - <i>(default)</i> new graphs will be discovered; 1 - new graphs will not be discovered and existing graphs will be marked as lost. |
| uuid | string | <p>Universal unique identifier, used for linking imported graph prototypes to already existing ones. Auto-generated, if not given.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if the graph prototype belongs to a template |

graphprototype.create

Description

`object graphprototype.create(object/array graphPrototypes)`

This method allows to create new graph prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Graph prototypes to create.

Additionally to the [standard graph prototype properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| gitems | array | <p>Graph items to be created for the graph prototypes. Graph items can reference both items and item prototypes, but at least one item prototype must be present.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the created graph prototypes under the `graphids` property. The order of the returned IDs matches the order of the passed graph prototypes.

Examples

Creating a graph prototype

Create a graph prototype with two items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.create",
  "params": {
    "name": "Disk space usage {#FSNAME}",
    "width": 900,
    "height": 200,
    "gitems": [
      {
        "itemid": "22828",
        "color": "00AA00"
      },
      {
        "itemid": "22829",
        "color": "3333FF"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652"
    ]
  },
  "id": 1
}
```

See also

graphprototype.delete

Description

object graphprototype.delete(array graphPrototypeIds)

This method allows to delete graph prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the graph prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted graph prototypes under the `graphids` property.

Examples

Deleting multiple graph prototypes

Delete two graph prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.delete",
  "params": [
    "652",
    "653"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "652",
      "653"
    ]
  },
  "id": 1
}
```

Source

graphprototype.get

Description

integer/array graphprototype.get(object parameters)

The method allows to retrieve graph prototypes according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---------------------|----------|---|
| discoveryids | ID/array | Return only graph prototypes that belong to the given discovery rules. |
| graphids | ID/array | Return only graph prototypes with the given IDs. |
| groupids | ID/array | Return only graph prototypes that belong to hosts or templates in the given host groups or template groups. |
| hostids | ID/array | Return only graph prototypes that belong to the given hosts. |
| inherited | boolean | If set to true return only graph prototypes inherited from a template. |
| itemids | ID/array | Return only graph prototypes that contain the given item prototypes. |
| templated | boolean | If set to true return only graph prototypes that belong to templates. |
| templateids | ID/array | Return only graph prototypes that belong to the given templates. |
| selectDiscoveryRule | query | Return a discoveryRule property with the LLD rule that the graph prototype belongs to. |
| selectGraphItems | query | Return a gitems property with the graph items used in the graph prototype. |
| selectHostGroups | query | Return a hostgroups property with the host groups that the graph prototype belongs to. |
| selectHosts | query | Return a hosts property with the hosts that the graph prototype belongs to. |
| selectItems | query | Return an items property with the items and item prototypes used in the graph prototype. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| selectTemplateGroups | query | Return a templategroups property with the template groups that the graph prototype belongs to. |
| selectTemplates | query | Return a templates property with the templates that the graph prototype belongs to. |
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of text data type . Supports additional properties: host - technical name of the host that the graph prototype belongs to; hostid - ID of the host that the graph prototype belongs to. Sort the result by the given properties. Possible values: graphid, name, graphtype, discovered. These parameters are described in the reference commentary . |
| sortfield | string/array | |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving graph prototypes from an LLD rule

Retrieve all graph prototypes from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.get",
  "params": {
    "output": "extend",
    "discoveryids": "27426"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "graphid": "1017",
      "name": "Disk space usage {#FSNAME}",
      "width": "600",
      "height": "340",
      "yaxismin": "0.0000",
```

```

        "yaxismax": "0.0000",
        "templateid": "442",
        "show_work_period": "0",
        "show_triggers": "0",
        "graphtype": "2",
        "show_legend": "1",
        "show_3d": "1",
        "percent_left": "0.0000",
        "percent_right": "0.0000",
        "ymin_type": "0",
        "ymax_type": "0",
        "ymin_itemid": "0",
        "ymax_itemid": "0",
        "discover": "0"
    }
],
    "id": 1
}

```

CGraphPrototype::get() in `ui/include/classes/api/services/CGraphPrototype.php`.

graphprototype.update

Description

object graphprototype.update(object/array graphPrototypes)

This method allows to update existing graph prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Graph prototype properties to be updated.

The `graphid` property must be defined for each graph prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard graph prototype properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| gitems | array | Graph items to replace existing graph items. If a graph item has the <code>gitemid</code> property defined it will be updated, otherwise a new graph item will be created. |

Return values

(object) Returns an object containing the IDs of the updated graph prototypes under the `graphids` property.

Examples

Changing the size of a graph prototype

Change the size of a graph prototype to 1100 to 400 pixels.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "graphprototype.update",
  "params": {
    "graphid": "439",
    "width": 1100,
    "height": 400
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "graphids": [
      "439"
    ]
  },
  "id": 1
}
```

High availability node

This class is designed to work with server nodes that are part of a high availability cluster or a standalone server instance.

Object references:

- [High availability node](#)

Available methods:

- [hanode.get](#) - retrieve nodes

High availability node object

The following object is related to operating a High availability cluster of Zabbix servers.

High availability node

Note:

Nodes are created by the Zabbix server and cannot be modified via the API.

The High availability node object has the following properties.

| Property | Type | Description |
|------------|---------|---|
| ha_nodeid | ID | ID of the node. |
| name | string | Name assigned to the node, using the HANodeName configuration entry of zabbix_server.conf. Empty for a server running in standalone mode. |
| address | string | IP or DNS name where the node connects from. |
| port | integer | Port on which the node is running. |
| lastaccess | integer | Heartbeat time, that is, time of last update from the node. UTC timestamp. |

| Property | Type | Description |
|----------|---------|--|
| status | integer | State of the node. Possible values: 0 - standby; 1 - stopped manually; 2 - unavailable; 3 - active. |

hanode.get

Description

integer/array hanode.get(object parameters)

The method allows to retrieve a list of High availability cluster nodes according to the given parameters.

Note:

This method is only available to *Super admin* user types. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------|--------------|---|
| ha_nodeids | ID/array | Return only nodes with the given node IDs. |
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supports properties: <code>name</code> , <code>address</code> , <code>status</code> . Sort the result by the given properties. |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | flag | Possible values: <code>name</code> , <code>lastaccess</code> , <code>status</code> . These parameters are described in the reference commentary . |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| sortorder | string/array | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Get a list of nodes ordered by status

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hanode.get",
  "params": {
    "preservekeys": true,
    "sortfield": "status",
    "sortorder": "DESC"
  },
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "ckuo7i1nw000h0sajj3l3hh8u": {
      "ha_nodeid": "ckuo7i1nw000h0sajj3l3hh8u",
      "name": "node-active",
      "address": "192.168.1.13",
      "port": "10051",
      "lastaccess": "1635335704",
      "status": "3"
    },
    "ckuo7i1nw000e0sajwfttc1mp": {
      "ha_nodeid": "ckuo7i1nw000e0sajwfttc1mp",
      "name": "node6",
      "address": "192.168.1.10",
      "port": "10053",
      "lastaccess": "1635332902",
      "status": "2"
    },
    "ckuo7i1nv000c0sajz85xcrtt": {
      "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
      "name": "node4",
      "address": "192.168.1.8",
      "port": "10052",
      "lastaccess": "1635334214",
      "status": "1"
    },
    "ckuo7i1nv000a0saj1fcdkeu4": {
      "ha_nodeid": "ckuo7i1nv000a0saj1fcdkeu4",
      "name": "node2",
      "address": "192.168.1.6",
      "port": "10051",
      "lastaccess": "1635335705",
      "status": "0"
    }
  },
  "id": 1
}
```

Get a list of specific nodes by their IDs

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hanode.get",
  "params": {
    "ha_nodeids": ["ckuo7i1nw000e0sajwfttc1mp", "ckuo7i1nv000c0sajz85xcrtt"]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
      "name": "node4",
      "address": "192.168.1.8",

```

```

        "port": "10052",
        "lastaccess": "1635334214",
        "status": "1"
    },
    {
        "ha_nodeid": "ckuo7i1nw000e0sajwfttc1mp",
        "name": "node6",
        "address": "192.168.1.10",
        "port": "10053",
        "lastaccess": "1635332902",
        "status": "2"
    }
],
"id": 1
}

```

Get a list of stopped nodes

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "output": ["ha_nodeid", "address", "port"],
        "filter": {
            "status": 1
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "ha_nodeid": "ckuo7i1nw000g0sajjsjre7e3",
            "address": "192.168.1.12",
            "port": "10051"
        },
        {
            "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
            "address": "192.168.1.8",
            "port": "10052"
        },
        {
            "ha_nodeid": "ckuo7i1nv000d0sajd95y1b6x",
            "address": "192.168.1.9",
            "port": "10053"
        }
    ],
    "id": 1
}

```

Get a count of standby nodes

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "countOutput": true,
        "filter": {

```

```

        "status": 0
    }
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": "3",
    "id": 1
}

```

Check status of nodes at specific IP addresses

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "output": ["name", "status"],
        "filter": {
            "address": ["192.168.1.7", "192.168.1.13"]
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "name": "node3",
            "status": "0"
        },
        {
            "name": "node-active",
            "status": "3"
        }
    ],
    "id": 1
}

```

- [Float history](#)
- [Integer history](#)
- [String history](#)
- [Text history](#)
- [Log history](#)

Available methods:

- [history.clear](#) - clear history data
- [history.get](#) - retrieve history data
- [history.push](#) - send history data to Zabbix server

History object

The following objects are directly related to the `history` API.

Note:

History objects differ depending on the item's type of information. They are created by Zabbix server and cannot be modified via the API.

Float history

The float history object has the following properties.

| Property | Type | Description |
|----------|-----------|--|
| clock | timestamp | Time when that value was received. |
| itemid | ID | ID of the related item. |
| ns | integer | Nanoseconds when the value was received. |
| value | float | Received value. |

Integer history

The integer history object has the following properties.

| Property | Type | Description |
|----------|-----------|--|
| clock | timestamp | Time when that value was received. |
| itemid | ID | ID of the related item. |
| ns | integer | Nanoseconds when the value was received. |
| value | integer | Received value. |

String history

The string history object has the following properties.

| Property | Type | Description |
|----------|-----------|--|
| clock | timestamp | Time when that value was received. |
| itemid | ID | ID of the related item. |
| ns | integer | Nanoseconds when the value was received. |
| value | string | Received value. |

Text history

The text history object has the following properties.

| Property | Type | Description |
|----------|-----------|--|
| id | ID | ID of the history entry. |
| clock | timestamp | Time when that value was received. |
| itemid | ID | ID of the related item. |
| ns | integer | Nanoseconds when the value was received. |
| value | text | Received value. |

Log history

The log history object has the following properties.

| Property | Type | Description |
|------------|-----------|------------------------------------|
| id | ID | ID of the history entry. |
| clock | timestamp | Time when that value was received. |
| itemid | ID | ID of the related item. |
| logeventid | integer | Windows event log entry ID. |

| Property | Type | Description |
|-----------|-----------|--|
| ns | integer | Nanoseconds when the value was received. |
| severity | integer | Windows event log entry level. |
| source | string | Windows event log entry source. |
| timestamp | timestamp | Windows event log entry time. |
| value | text | Received value. |

history.clear

Description

object history.clear(array itemids)

This method allows to clear item history.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of items to clear.

Return values

(object) Returns an object containing the IDs of the cleared items under the `itemids` property.

Examples

Clear history

Request:

```
{
  "jsonrpc": "2.0",
  "method": "history.clear",
  "params": [
    "10325",
    "13205"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10325",
      "13205"
    ]
  },
  "id": 1
}
```

Source

CHistory::clear() in `ui/include/classes/api/services/CHistory.php`.

history.get

Description

integer/array history.get(object parameters)

The method allows to retrieve history data according to the given parameters.

Attention:

This method may return historical data of a deleted entity if this data has not been removed by the housekeeper yet.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| history | integer | History object types to return. Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - <i>(default)</i> numeric unsigned; 4 - text; 5 - binary. |
| hostids | ID/array | Return only history from the given hosts. |
| itemids | ID/array | Return only history from the given items. |
| time_from | timestamp | Return only values that have been received after or at the given time. |
| time_till | timestamp | Return only values that have been received before or at the given time. |
| sortfield | string/array | Sort the result by the given properties. Possible values: <code>itemid</code> , <code>clock</code> , <code>ns</code> . These parameters are described in the reference commentary . |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving item history data

Return 10 latest values received from a numeric(float) item.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "history.get",
  "params": {
    "output": "extend",
    "history": 0,
    "itemids": "23296",
    "sortfield": "clock",
```

```
    "sortorder": "DESC",
    "limit": 10
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "23296",
      "clock": "1351090996",
      "value": "0.085",
      "ns": "563157632"
    },
    {
      "itemid": "23296",
      "clock": "1351090936",
      "value": "0.16",
      "ns": "549216402"
    },
    {
      "itemid": "23296",
      "clock": "1351090876",
      "value": "0.18",
      "ns": "537418114"
    },
    {
      "itemid": "23296",
      "clock": "1351090816",
      "value": "0.21",
      "ns": "522659528"
    },
    {
      "itemid": "23296",
      "clock": "1351090756",
      "value": "0.215",
      "ns": "507809457"
    },
    {
      "itemid": "23296",
      "clock": "1351090696",
      "value": "0.255",
      "ns": "495509699"
    },
    {
      "itemid": "23296",
      "clock": "1351090636",
      "value": "0.36",
      "ns": "477708209"
    },
    {
      "itemid": "23296",
      "clock": "1351090576",
      "value": "0.375",
      "ns": "463251343"
    },
    {
      "itemid": "23296",
      "clock": "1351090516",
      "value": "0.315",

```

```

        "ns": "447947017"
    },
    {
        "itemid": "23296",
        "clock": "1351090456",
        "value": "0.275",
        "ns": "435307141"
    }
],
"id": 1
}

```

Source

CHistory::get() in `ui/include/classes/api/services/CHistory.php`.

history.push

Description

object history.push(object/array itemHistoryData)

This method allows sending item history data to Zabbix server.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Item history data to send.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------|-----------|--|
| itemid | ID | ID of the related item. |
| host | string | Parameter behavior: - <i>required</i> if host and key are not set Technical name of the host. |
| key | string | Parameter behavior: - <i>required</i> if itemid is not set Item key. |
| value | mixed | Parameter behavior: - <i>required</i> if itemid is not set Item value. |
| clock | timestamp | Parameter behavior: - <i>required</i> Time when the value was received. |
| ns | integer | Nanoseconds when the value was received. |

Return values

(object) Returns the result of the data sending operation.

Examples

Send item history data

Send item history data to Zabbix server for items "10600", "10601", and "999999".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "history.push",
  "params": [
    {
      "itemid": 10600,
      "value": 0.5,
      "clock": 1690891294,
      "ns": 45440940
    },
    {
      "itemid": 10600,
      "value": 0.6,
      "clock": 1690891295,
      "ns": 312431
    },
    {
      "itemid": 10601,
      "value": "[Tue Aug 01 15:01:35 2023] [error] [client 1.2.3.4] File does not exist: /var/www/ht
    },
    {
      "itemid": 999999,
      "value": 123
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "data": [
      {
        "itemid": "10600"
      },
      {
        "itemid": "10600"
      },
      {
        "itemid": "10601",
        "error": "Item is disabled."
      },
      {
        "error": "No permissions to referred object or it does not exist."
      }
    ]
  },
  "id": 1
}
```

Host

This class is designed to work with hosts.

Object references:

- [Host](#)
- [Host inventory](#)
- [Host tag](#)

Available methods:

- [host.create](#) - create new hosts
- [host.delete](#) - delete hosts
- [host.get](#) - retrieve hosts
- [host.massadd](#) - add related objects to hosts
- [host.massremove](#) - remove related objects from hosts
- [host.massupdate](#) - replace or remove related objects from hosts
- [host.update](#) - update hosts

Host object

The following objects are directly related to the host API.

Host

The host object has the following properties.

| Property | Type | Description |
|----------------|---------|---|
| hostid | ID | ID of the host. |
| host | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations <p>Technical name of the host.</p> |
| description | text | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Description of the host.</p> |
| flags | integer | <p>Origin of the host.</p> <p>Possible values:</p> <ul style="list-style-type: none">0 - a plain host;4 - a discovered host. |
| inventory_mode | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i> <p>Host inventory population mode.</p> <p>Possible values:</p> <ul style="list-style-type: none">-1 - (<i>default</i>) disabled;0 - manual;1 - automatic. |
| ipmi_authtype | integer | <p>IPMI authentication algorithm.</p> <p>Possible values:</p> <ul style="list-style-type: none">-1 - (<i>default</i>) default;0 - none;1 - MD2;2 - MD54 - straight;5 - OEM;6 - RMCP+. |
| ipmi_password | string | IPMI password. |

| Property | Type | Description |
|--------------------|-----------|---|
| ipmi_privilege | integer | IPMI privilege level. Possible values: 1 - callback; 2 - <i>(default)</i> user; 3 - operator; 4 - admin; 5 - OEM. |
| ipmi_username | string | IPMI username. |
| maintenance_from | timestamp | Starting time of the effective maintenance. |
| maintenance_status | integer | Property behavior: - <i>read-only</i> Effective maintenance status. Possible values: 0 - <i>(default)</i> no maintenance; 1 - maintenance in effect. Property behavior: - <i>read-only</i> |
| maintenance_type | integer | Effective maintenance type. Possible values: 0 - <i>(default)</i> maintenance with data collection; 1 - maintenance without data collection. Property behavior: - <i>read-only</i> |
| maintenanceid | ID | ID of the maintenance that is currently in effect on the host. Property behavior: - <i>read-only</i> |
| name | string | Visible name of the host. |
| monitored_by | integer | Default: host property value. Source that is used to monitor the host. Possible values: 0 - <i>(default)</i> Zabbix server; 1 - Proxy; 2 - Proxy group. |
| proxyid | ID | ID of the proxy that is used to monitor the host. Property behavior: - <i>required</i> if monitored_by is set to "Proxy" |
| proxy_groupid | ID | ID of the proxy group that is used to monitor the host. Property behavior: - <i>required</i> if monitored_by is set to "Proxy group" |
| status | integer | Status and function of the host. Possible values: 0 - <i>(default)</i> monitored host; 1 - unmonitored host. |
| tls_connect | integer | Connections to host. Possible values: 1 - <i>(default)</i> No encryption; 2 - PSK; 4 - certificate. |

| Property | Type | Description |
|------------------|---------|--|
| tls_accept | integer | Connections from host. Possible bitmap values: 1 - <i>(default)</i> No encryption; 2 - PSK; 4 - certificate. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for PSK and certificate). |
| tls_issuer | string | Certificate issuer. |
| tls_subject | string | Certificate subject. |
| tls_psk_identity | string | PSK identity; must be paired with only one PSK (across autoregistration , hosts , and proxies). Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. Property behavior: - <i>write-only</i> - <i>required</i> if <code>tls_connect</code> is set to "PSK", or <code>tls_accept</code> contains the "PSK" bit |
| tls_psk | string | Pre-shared key (PSK); must be at least 32 hex digits. Property behavior: - <i>write-only</i> - <i>required</i> if <code>tls_connect</code> is set to "PSK", or <code>tls_accept</code> contains the "PSK" bit |
| active_available | integer | Host active interface availability status. Possible values: 0 - interface status is unknown; 1 - interface is available; 2 - interface is not available. Property behavior: - <i>read-only</i> |
| assigned_proxyid | ID | ID of the proxy assigned by Zabbix server, if the host is monitored by a proxy group. Property behavior: - <i>read-only</i> |

Host inventory

The host inventory object has the following properties.

Note:

Each property has it's own unique ID number, which is used to associate host inventory fields with items.

| ID | Property | Type | Description | Maximum length |
|----|-------------------|--------|-----------------------------|------------------------------------|
| 4 | alias | string | Alias. | 128 characters |
| 11 | asset_tag | string | Asset tag. | 64 characters |
| 28 | chassis | string | Chassis. | 64 characters |
| 23 | contact | string | Contact person. | 65535 characters for SQL databases |
| 32 | contract_number | string | Contract number. | 64 characters |
| 47 | date_hw_decomm | string | HW decommissioning date. | 64 characters |
| 46 | date_hw_expiry | string | HW maintenance expiry date. | 64 characters |
| 45 | date_hw_install | string | HW installation date. | 64 characters |
| 44 | date_hw_purchase | string | HW purchase date. | 64 characters |
| 34 | deployment_status | string | Deployment status. | 64 characters |

| ID | Property | Type | Description | Maximum length |
|----|----------------|--------|------------------------------|------------------------------------|
| 14 | hardware | string | Hardware. | 255 characters |
| 15 | hardware_full | string | Detailed hardware. | 65535 characters for SQL databases |
| 39 | host_netmask | string | Host subnet mask. | 39 characters |
| 38 | host_networks | string | Host networks. | 65535 characters for SQL databases |
| 40 | host_router | string | Host router. | 39 characters |
| 30 | hw_arch | string | HW architecture. | 32 characters |
| 33 | installer_name | string | Installer name. | 64 characters |
| 24 | location | string | Location. | 65535 characters for SQL databases |
| 25 | location_lat | string | Location latitude. | 16 characters |
| 26 | location_lon | string | Location longitude. | 16 characters |
| 12 | macaddress_a | string | MAC address A. | 64 characters |
| 13 | macaddress_b | string | MAC address B. | 64 characters |
| 29 | model | string | Model. | 64 characters |
| 3 | name | string | Name. | 128 characters |
| 27 | notes | string | Notes. | 65535 characters for SQL databases |
| 41 | oob_ip | string | OOB IP address. | 39 characters |
| 42 | oob_netmask | string | OOB host subnet mask. | 39 characters |
| 43 | oob_router | string | OOB router. | 39 characters |
| 5 | os | string | OS name. | 128 characters |
| 6 | os_full | string | Detailed OS name. | 255 characters |
| 7 | os_short | string | Short OS name. | 128 characters |
| 61 | poc_1_cell | string | Primary POC mobile number. | 64 characters |
| 58 | poc_1_email | string | Primary email. | 128 characters |
| 57 | poc_1_name | string | Primary POC name. | 128 characters |
| 63 | poc_1_notes | string | Primary POC notes. | 65535 characters for SQL databases |
| 59 | poc_1_phone_a | string | Primary POC phone A. | 64 characters |
| 60 | poc_1_phone_b | string | Primary POC phone B. | 64 characters |
| 62 | poc_1_screen | string | Primary POC screen name. | 64 characters |
| 68 | poc_2_cell | string | Secondary POC mobile number. | 64 characters |
| 65 | poc_2_email | string | Secondary POC email. | 128 characters |
| 64 | poc_2_name | string | Secondary POC name. | 128 characters |
| 70 | poc_2_notes | string | Secondary POC notes. | 65535 characters for SQL databases |
| 66 | poc_2_phone_a | string | Secondary POC phone A. | 64 characters |
| 67 | poc_2_phone_b | string | Secondary POC phone B. | 64 characters |
| 69 | poc_2_screen | string | Secondary POC screen name. | 64 characters |
| 8 | serialno_a | string | Serial number A. | 64 characters |
| 9 | serialno_b | string | Serial number B. | 64 characters |
| 48 | site_address_a | string | Site address A. | 128 characters |
| 49 | site_address_b | string | Site address B. | 128 characters |
| 50 | site_address_c | string | Site address C. | 128 characters |
| 51 | site_city | string | Site city. | 128 characters |
| 53 | site_country | string | Site country. | 64 characters |
| 56 | site_notes | string | Site notes. | 65535 characters for SQL databases |
| 55 | site_rack | string | Site rack location. | 128 characters |
| 52 | site_state | string | Site state. | 64 characters |
| 54 | site_zip | string | Site ZIP/postal code. | 64 characters |
| 16 | software | string | Software. | 255 characters |
| 18 | software_app_a | string | Software application A. | 64 characters |
| 19 | software_app_b | string | Software application B. | 64 characters |
| 20 | software_app_c | string | Software application C. | 64 characters |
| 21 | software_app_d | string | Software application D. | 64 characters |
| 22 | software_app_e | string | Software application E. | 64 characters |
| 17 | software_full | string | Software details. | 65535 characters for SQL databases |
| 10 | tag | string | Tag. | 64 characters |
| 1 | type | string | Type. | 64 characters |
| 2 | type_full | string | Type details. | 64 characters |
| 35 | url_a | string | URL A. | 2048 characters |
| 36 | url_b | string | URL B. | 2048 characters |
| 37 | url_c | string | URL C. | 2048 characters |
| 31 | vendor | string | Vendor. | 64 characters |

Host tag

The host tag object has the following properties.

| Property | Type | Description |
|-----------|---------|---|
| tag | string | Host tag name. |
| value | string | Host tag value. |
| automatic | integer | Type of host tag. Possible values: 0 - <i>(default)</i> manual (tag created by user); 1 - automatic (tag created by low-level discovery) Property behavior: - <i>read-only</i> |

host.create

Description

`object host.create(object/array hosts)`

This method allows to create new hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Hosts to create.

Additionally to the [standard host properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|--------------|--|
| groups | object/array | Host groups to add the host to. The host groups must have only the <code>groupid</code> property defined. Parameter behavior: - <i>required</i> |
| interfaces | object/array | Interfaces to be created for the host. |
| tags | object/array | Host tags . |
| templates | object/array | Templates to be linked to the host. The templates must have only the <code>templateid</code> property defined. |
| macros | object/array | User macros to be created for the host. |
| inventory | object | Host inventory properties. |

Return values

(object) Returns an object containing the IDs of the created hosts under the `hostids` property. The order of the returned IDs matches the order of the passed hosts.

Examples

Creating a host

Create a host called "Linux server" with an IP interface and tags, add it to a group, link a template to it and set the MAC addresses in the host inventory.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "Linux server",
    "interfaces": [
      {
        "type": 1,
        "main": 1,
        "useip": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050"
      }
    ],
    "groups": [
      {
        "groupid": "50"
      }
    ],
    "tags": [
      {
        "tag": "host-name",
        "value": "linux-server"
      }
    ],
    "templates": [
      {
        "templateid": "20045"
      }
    ],
    "macros": [
      {
        "macro": "${USER_ID}",
        "value": "123321"
      },
      {
        "macro": "${USER_LOCATION}",
        "value": "0:0:0",
        "description": "latitude, longitude and altitude coordinates"
      }
    ],
    "inventory_mode": 0,
    "inventory": {
      "macaddress_a": "01234",
      "macaddress_b": "56768"
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "107819"
    ]
  },
  "id": 1
}

```

Creating a host with SNMP interface

Create a host called "SNMP host" with an SNMPv3 interface with details.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "SNMP host",
    "interfaces": [
      {
        "type": 2,
        "main": 1,
        "useip": 1,
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "details": {
          "version": 3,
          "bulk": 0,
          "securityname": "mysecurityname",
          "contextname": "",
          "securitylevel": 1
        }
      }
    ],
    "groups": [
      {
        "groupid": "4"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10658"
    ]
  },
  "id": 1
}
```

Creating a host with PSK encryption

Create a host called "PSK host" with PSK encryption configured. Note that the host has to be **pre-configured to use PSK**.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "PSK host",
    "interfaces": [
      {
        "type": 1,
        "ip": "192.168.3.1",
        "dns": "",
        "port": "10050",
        "useip": 1,
        "main": 1
      }
    ]
  }
}
```

```

    ],
    "groups": [
      {
        "groupid": "2"
      }
    ],
    "tls_accept": 2,
    "tls_connect": 2,
    "tls_psk_identity": "PSK 001",
    "tls_psk": "1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10590"
    ]
  },
  "id": 1
}

```

Creating a host monitored by a proxy

Create a host that will be monitored by proxy with ID "1".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.create",
  "params": {
    "host": "Host monitored by proxy",
    "groups": [
      {
        "groupid": "2"
      }
    ],
    "monitored_by": 1,
    "proxyid": 1
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10591"
    ]
  },
  "id": 1
}

```

Creating a host monitored by a proxy group

Create a host that will be monitored by proxy group with ID "1".

Request:

```

{
  "jsonrpc": "2.0",

```

```

"method": "host.create",
"params": {
  "host": "Host monitored by proxy group",
  "groups": [
    {
      "groupid": "2"
    }
  ],
  "monitored_by": 2,
  "proxy_groupid": 1
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10592"
    ]
  },
  "id": 1
}

```

`CHost::create()` in `ui/include/classes/api/services/CHost.php`.

host.delete

Description

object `host.delete(array hosts)`

This method allows to delete hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of hosts to delete.

Return values

(object) Returns an object containing the IDs of the deleted hosts under the `hostids` property.

Examples

Deleting multiple hosts

Delete two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.delete",
  "params": [
    "13",
    "32"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "13",
      "32"
    ]
  },
  "id": 1
}
```

Source

CHost::delete() in *ui/include/classes/api/services/CHost.php*.

host.get

Description

integer/array host.get(object parameters)

The method allows to retrieve hosts according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------|----------|--|
| groupids | ID/array | Return only hosts that belong to the given groups. |
| dserviceids | ID/array | Return only hosts that are related to the given discovered services. |
| graphids | ID/array | Return only hosts that have the given graphs. |
| hostids | ID/array | Return only hosts with the given host IDs. |
| httptestids | ID/array | Return only hosts that have the given web checks. |
| interfaceids | ID/array | Return only hosts that use the given interfaces. |
| itemids | ID/array | Return only hosts that have the given items. |
| maintenanceids | ID/array | Return only hosts that are affected by the given maintenances. |
| monitored_hosts | flag | Return only monitored hosts. |
| proxyids | ID/array | Return only hosts that are monitored by the given proxies. |
| proxy_groupids | ID/array | Return only hosts that are monitored by the given proxy groups. |
| templated_hosts | flag | Return both hosts and templates. |
| templateids | ID/array | Return only hosts that are linked to the given templates. |
| triggerids | ID/array | Return only hosts that have the given triggers. |
| with_items | flag | Return only hosts that have items. |

Overrides the `with_monitored_items` and `with_simple_graph_items` parameters.

| Parameter | Type | Description |
|-----------------------------------|---------------|---|
| with_item_prototypes | flag | Return only hosts that have item prototypes. |
| with_simple_graph_item_prototypes | flag | Overrides the with_simple_graph_item_prototypes parameter. Return only hosts that have item prototypes, which are enabled for creation and have numeric type of information. |
| with_graphs | flag | Return only hosts that have graphs. |
| with_graph_prototypes | flag | Return only hosts that have graph prototypes. |
| with_httptests | flag | Return only hosts that have web checks. |
| with_monitored_httptests | flag | Overrides the with_monitored_httptests parameter. Return only hosts that have enabled web checks. |
| with_monitored_items | flag | Return only hosts that have enabled items. |
| with_monitored_triggers | flag | Overrides the with_simple_graph_items parameter. Return only hosts that have enabled triggers. All of the items used in the trigger must also be enabled. |
| with_simple_graph_items | flag | Return only hosts that have items with numeric type of information. |
| with_triggers | flag | Return only hosts that have triggers. |
| withProblemsSuppressed | boolean | Overrides the with_monitored_triggers parameter. Return hosts that have suppressed problems. |
| evaltype | integer | <p>Possible values:</p> <ul style="list-style-type: none"> null - (default) all hosts; true - only hosts with suppressed problems; false - only hosts with unsuppressed problems. <p>Rules for tag searching.</p> |
| severities | integer/array | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (default) And/Or; 2 - Or. <p>Return hosts that have only problems with given severities. Applies only if problem object is trigger.</p> |
| tags | object/array | <p>Return only hosts with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.</p> <p>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].</p> <p>An empty array returns all hosts.</p> |
| inheritedTags | boolean | <p>Possible operator values:</p> <ul style="list-style-type: none"> 0 - (default) Contains; 1 - Equals; 2 - Not like; 3 - Not equal; 4 - Exists; 5 - Not exists. <p>Return hosts that have given tags also in all of their linked templates. Default:</p> |
| selectDiscoveries | query | <p>Possible values:</p> <ul style="list-style-type: none"> true - linked templates must also have given tags; false - (default) linked template tags are ignored. <p>Return a discoveries property with host low-level discovery rules.</p> |
| selectDiscoveryRule | query | <p>Supports count.</p> <p>Return a discoveryRule property with the low-level discovery rule that created the host (from host prototype in VMware monitoring).</p> |
| selectGraphs | query | <p>Return a graphs property with host graphs.</p> <p>Supports count.</p> |

| Parameter | Type | Description |
|-----------------------|-------|--|
| selectHostDiscovery | query | <p>Return a <code>hostDiscovery</code> property with host discovery object data.</p> <p>The host discovery object links a discovered host to a host prototype or a host prototypes to an LLD rule and has the following properties:</p> <p><code>host</code> - (<i>string</i>) host of the host prototype;</p> <p><code>hostid</code> - (<i>string</i>) ID of the discovered host or host prototype;</p> <p><code>parent_hostid</code> - (<i>string</i>) ID of the host prototype from which the host has been created;</p> <p><code>parent_itemid</code> - (<i>string</i>) ID of the LLD rule that created the discovered host;</p> <p><code>lastcheck</code> - (<i>timestamp</i>) time when the host was last discovered;</p> <p><code>status</code> - (<i>int</i>) host discovery status:</p> <p>0 - (<i>default</i>) host is discovered,</p> <p>1 - host is not discovered anymore;</p> <p><code>ts_delete</code> - (<i>timestamp</i>) time when a host that is no longer discovered will be deleted;</p> <p><code>ts_disable</code> - (<i>timestamp</i>) time when a host that is no longer discovered will be disabled;</p> <p><code>disable_source</code> - (<i>int</i>) indicator of whether host was disabled by an LLD rule or manually:</p> <p>0 - (<i>default</i>) disabled automatically,</p> <p>1 - disabled by an LLD rule.</p> |
| selectHostGroups | query | Return a <code>hostgroups</code> property with host groups data that the host belongs to. |
| selectHttpTests | query | Return an <code>httpTests</code> property with host web scenarios. |
| selectInterfaces | query | <p>Supports count.</p> <p>Return an <code>interfaces</code> property with host interfaces.</p> |
| selectInventory | query | Supports count. |
| selectItems | query | Return an <code>inventory</code> property with host inventory data. |
| | | Return an <code>items</code> property with host items. |
| selectMacros | query | Supports count. |
| selectParentTemplates | query | <p>Return a <code>macros</code> property with host macros.</p> <p>Return a <code>parentTemplates</code> property with <code>templates</code> that the host is linked to.</p> |
| | | <p>In addition to Template object fields, it contains <code>link_type</code> - (<i>integer</i>) the way that the template is linked to host.</p> <p>Possible values:</p> <p>0 - (<i>default</i>) manually linked;</p> <p>1 - automatically linked by LLD.</p> |
| selectDashboards | query | <p>Supports count.</p> <p>Return a <code>dashboards</code> property.</p> |
| selectTags | query | Supports count. |
| selectInheritedTags | query | Return a <code>tags</code> property with host tags. |
| | | Return an <code>inheritedTags</code> property with tags that are on all templates which are linked to host. |
| selectTriggers | query | Return a <code>triggers</code> property with host triggers. |
| selectValueMaps | query | <p>Supports count.</p> <p>Return a <code>valuemaps</code> property with host value maps.</p> |

| Parameter | Type | Description |
|------------------------|--------------|---|
| filter | object | <p>Return only those results that exactly match the given filter.</p> <p>Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against.</p> <p>Does not support properties of text data type.</p> |
| limitSelects | integer | <p>Supports additional properties: Host interface properties.</p> <p>Limits the number of records returned by subselects.</p> <p>Applies to the following subselects:</p> <ul style="list-style-type: none"> <code>selectParentTemplates</code> - results will be sorted by host; <code>selectInterfaces</code>; <code>selectItems</code> - sorted by name; <code>selectDiscoveries</code> - sorted by name; <code>selectTriggers</code> - sorted by description; <code>selectGraphs</code> - sorted by name; <code>selectDashboards</code> - sorted by name. |
| search | object | <p>Return results that match the given pattern (case-insensitive).</p> <p>Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.</p> <p>Supports only properties of string and text data type.</p> |
| searchInventory | object | <p>Supports additional properties: Host interface properties.</p> <p>Return hosts that have inventory data that match the given pattern (case-insensitive).</p> <p>Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%...%" search.</p> |
| sortfield | string/array | <p>Supports only properties of string and text data type.</p> <p>Sort the result by the given properties.</p> |
| countOutput | boolean | <p>Possible values: <code>hostid</code>, <code>host</code>, <code>name</code>, <code>status</code>.</p> <p>These parameters are described in the reference commentary.</p> |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two hosts named "Zabbix server" and "Linux server".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "filter": {
      "host": [
        "Zabbix server",
        "Linux server"
      ]
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10160",
      "proxyid": "0",
      "host": "Zabbix server",
      "status": "0",
      "ipmi_authtype": "-1",
      "ipmi_privilege": "2",
      "ipmi_username": "",
      "ipmi_password": "",
      "maintenanceid": "0",
      "maintenance_status": "0",
      "maintenance_type": "0",
      "maintenance_from": "0",
      "name": "Zabbix server",
      "flags": "0",
      "description": "The Zabbix monitoring server.",
      "tls_connect": "1",
      "tls_accept": "1",
      "tls_issuer": "",
      "tls_subject": "",
      "proxy_groupid": "0",
      "monitored_by": "0",
      "inventory_mode": "1",
      "active_available": "1",
      "assigned_proxyid": "0"
    },
    {
      "hostid": "10167",
      "proxyid": "0",
      "host": "Linux server",
      "status": "0",
      "ipmi_authtype": "-1",
      "ipmi_privilege": "2",
      "ipmi_username": "",
      "ipmi_password": "",
      "maintenanceid": "0",
      "maintenance_status": "0",
      "maintenance_type": "0",
      "maintenance_from": "0",
      "name": "Linux server",
      "flags": "0",
      "description": "",
      "tls_connect": "1",
      "tls_accept": "1",

```

```

        "tls_issuer": "",
        "tls_subject": "",
        "proxy_groupid": "0",
        "monitored_by": "0",
        "inventory_mode": "1",
        "active_available": "1",
        "assigned_proxyid": "0"
    }
],
    "id": 1
}

```

Retrieving host groups

Retrieve host groups that the host "Zabbix server" is a member of.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectHostGroups": "extend",
        "filter": {
            "host": [
                "Zabbix server"
            ]
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10085",
            "hostgroups": [
                {
                    "groupid": "2",
                    "name": "Linux servers",
                    "flags": "0",
                    "uuid": "dc579cd7a1a34222933f24f52a68bcd8"
                },
                {
                    "groupid": "4",
                    "name": "Zabbix servers",
                    "flags": "0",
                    "uuid": "6f6799aa69e844b4b3918f779f2abf08"
                }
            ]
        }
    ],
    "id": 1
}

```

Retrieving linked templates

Retrieve the IDs and names of templates linked to host "10084".

Request:

```

{
    "jsonrpc": "2.0",

```

```

    "method": "host.get",
    "params": {
      "output": ["hostid"],
      "selectParentTemplates": [
        "templateid",
        "name"
      ],
      "hostids": "10084"
    },
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "parentTemplates": [
        {
          "name": "Linux",
          "templateid": "10001"
        },
        {
          "name": "Zabbix Server",
          "templateid": "10047"
        }
      ]
    }
  ],
  "id": 1
}

```

Retrieving hosts by template

Retrieve hosts that have the "10001" (*Linux by Zabbix agent*) template linked to them.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "name"],
    "templateids": "10001"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "templateid": "10001",
      "hosts": [
        {
          "hostid": "10084",
          "name": "Zabbix server"
        },
        {
          "hostid": "10603",
          "name": "Host 1"
        }
      ]
    }
  ],

```

```

        {
            "hostid": "10604",
            "name": "Host 2"
        }
    ],
    "id": 1
}

```

Searching by host inventory data

Retrieve hosts that contain "Linux" in the host inventory "OS" field.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": [
            "host"
        ],
        "selectInventory": [
            "os"
        ],
        "searchInventory": {
            "os": "Linux"
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10084",
            "host": "Zabbix server",
            "inventory": {
                "os": "Linux Ubuntu"
            }
        },
        {
            "hostid": "10107",
            "host": "Linux server",
            "inventory": {
                "os": "Linux Mint"
            }
        }
    ],
    "id": 1
}

```

Searching by host tags

Retrieve hosts that have tag "host-name" equal to "linux-server".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],

```

```

    "selectTags": "extend",
    "evaltype": 0,
    "tags": [
      {
        "tag": "host-name",
        "value": "linux-server",
        "operator": 1
      }
    ],
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10085",
      "tags": [
        {
          "tag": "host-name",
          "value": "linux-server",
          "automatic": "0"
        },
        {
          "tag": "os",
          "value": "rhel-7",
          "automatic": "0"
        }
      ]
    }
  ],
  "id": 1
}

```

Retrieve hosts that have these tags not only on host level but also in their linked parent templates.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "tags": [
      {
        "tag": "os",
        "value": "rhel-7",
        "operator": 1
      }
    ],
    "inheritedTags": true
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10623",
      "name": "PC room 1"
    }
  ]
}

```

```

    },
    {
      "hostid": "10601",
      "name": "Office"
    }
  ],
  "id": 1
}

```

Searching host with tags and template tags

Retrieve a host with tags and all tags that are linked to parent templates.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "hostids": 10502,
    "selectTags": ["tag", "value"],
    "selectInheritedTags": ["tag", "value"]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10502",
      "name": "Desktop",
      "tags": [
        {
          "tag": "host-name",
          "value": "linux-server"
        },
        {
          "tag": "os",
          "value": "rhel-7"
        }
      ],
      "inheritedTags": [
        {
          "tag": "class",
          "value": "os"
        },
        {
          "tag": "target",
          "value": "linux"
        },
        {
          "tag": "os",
          "value": "rhel-7"
        }
      ]
    }
  ],
  "id": 1
}

```

Searching hosts by problem severity

Retrieve hosts that have "Disaster" problems.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "severities": 5
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10160",
      "name": "Zabbix server"
    }
  ],
  "id": 1
}
```

Retrieve hosts that have "Average" and "High" problems.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["name"],
    "severities": [3, 4]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "20170",
      "name": "Database"
    },
    {
      "hostid": "20183",
      "name": "workstation"
    }
  ],
  "id": 1
}
```

CHost::get() in ui/include/classes/api/services/CHost.php.

host.massadd

Description

object host.massadd(object parameters)

This method allows to simultaneously add multiple related objects to all the given hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to update and the objects to add to all the hosts.

The method accepts the following parameters.

| Parameter | Type | Description |
|------------|--------------|---|
| hosts | object/array | Hosts to be updated. The hosts must have only the <code>hostid</code> property defined. |
| groups | object/array | Parameter behavior: - <i>required</i> Host groups to add to the given hosts. The host groups must have only the <code>groupid</code> property defined. |
| interfaces | object/array | Host interfaces to be created for the given hosts. |
| macros | object/array | User macros to be created for the given hosts. |
| templates | object/array | Templates to link to the given hosts. The templates must have only the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Adding macros

Add two new macros to two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massadd",
  "params": {
    "hosts": [
      {
        "hostid": "10160"
      },
      {
        "hostid": "10167"
      }
    ],
    "macros": [
      {
        "macro": "{$TEST1}",
        "value": "MACROTEST1"
      },
      {

```

```

        "macro": "${TEST2}",
        "value": "MACROTEST2",
        "description": "Test description"
    }
]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10160",
      "10167"
    ]
  },
  "id": 1
}

```

`CHost::massAdd()` in `ui/include/classes/api/services/CHost.php`.

host.massremove

Description

`object host.massremove(object parameters)`

This method allows to remove related objects from multiple hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to update and the objects that should be removed.

| Parameter | Type | Description |
|-------------------|--------------|---|
| hostids | ID/array | IDs of the hosts to be updated. |
| groupids | ID/array | Parameter behavior: - <i>required</i> IDs of the host groups to remove the given hosts from. Host interfaces to remove from the given hosts. |
| interfaces | object/array | |
| macros | string/array | The host interface object must have only the <code>ip</code> , <code>dns</code> and <code>port</code> properties defined. User macros to delete from the given hosts. |
| templateids | ID/array | IDs of the templates to unlink from the given hosts. |
| templateids_clear | ID/array | IDs of the templates to unlink and clear from the given hosts. |

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Unlinking templates

Unlink a template from two hosts and delete all of the templated entities.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massremove",
  "params": {
    "hostids": ["69665", "69666"],
    "templateids_clear": "325"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "69665",
      "69666"
    ]
  },
  "id": 1
}
```

Source

`CHost::massRemove()` in `ui/include/classes/api/services/CHost.php`.

host.massupdate

Description

`object host.massupdate(object parameters)`

This method allows to simultaneously replace or remove related objects and update properties on multiple hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to update and the properties that should be updated.

Additionally to the [standard host properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|--------------|---|
| hosts | object/array | Hosts to be updated. The hosts must have only the <code>hostid</code> property defined. Parameter behavior: - <i>required</i> |

| Parameter | Type | Description |
|-----------------|--------------|---|
| groups | object/array | Host groups to replace the current host groups the hosts belong to. |
| interfaces | object/array | The host groups must have only the <code>groupid</code> property defined. Host interfaces to replace the current host interfaces on the given hosts. |
| inventory | object | Host inventory properties. |
| macros | object/array | Host inventory mode cannot be updated using the <code>inventory</code> parameter, use <code>inventory_mode</code> instead. User macros to replace the current user macros on the given hosts. |
| templates | object/array | Templates to replace the currently linked templates on the given hosts. |
| templates_clear | object/array | The templates must have only the <code>templateid</code> property defined. Templates to unlink and clear from the given hosts. |
| | | The templates must have only the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Enabling multiple hosts

Enable monitoring of two hosts, that is, set their status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.massupdate",
  "params": {
    "hosts": [
      {
        "hostid": "69665"
      },
      {
        "hostid": "69666"
      }
    ],
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "69665",
      "69666"
    ]
  },
  "id": 1
}
```

- [Host group](#)

- [Template](#)
- [User macro](#)
- [Host interface](#)

Source

`CHost::massUpdate()` in `ui/include/classes/api/services/CHost.php`.

host.update

Description

`object host.update(object/array hosts)`

This method allows to update existing hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host properties to be updated.

The `hostid` property must be defined for each host, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Note, however, that updating the host technical name will also update the host's visible name (if not given or empty) by the host's technical name value.

Additionally to the [standard host properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|---|
| groups | object/array | Host groups to replace the current host groups the host belongs to. All host groups that are not listed in the request will be unlinked. |
| interfaces | object/array | The host groups must have only the <code>groupid</code> property defined. Host interfaces to replace the current host interfaces. All interfaces that are not listed in the request will be removed. |
| tags | object/array | Host tags to replace the current host tags. All tags that are not listed in the request will be removed. |
| inventory | object | Host inventory properties. |
| macros | object/array | User macros to replace the current user macros. All macros that are not listed in the request will be removed. |
| templates | object/array | Templates to replace the currently linked templates. All templates that are not listed in the request will be only unlinked. |
| templates_clear | object/array | The templates must have only the <code>templateid</code> property defined. Templates to unlink and clear from the host. |
| | | The templates must have only the <code>templateid</code> property defined. |

Note:

As opposed to the Zabbix frontend, when `name` (visible host name) is the same as `host` (technical host name), updating `host` via API will not automatically update `name`. Both properties need to be updated explicitly.

Return values

(object) Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Enabling a host

Enable host monitoring, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}
```

Unlinking templates

Unlink and clear two templates from host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
    "templates_clear": [
      {
        "templateid": "10124"
      },
      {
        "templateid": "10125"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10126"
    ]
  },
  "id": 1
}
```

Updating host macros

Replace all host macros with two new ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10126",
```

```

        "macros": [
            {
                "macro": "${PASS}",
                "value": "password"
            },
            {
                "macro": "${DISC}",
                "value": "sda",
                "description": "Updated description"
            }
        ]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10126"
        ]
    },
    "id": 1
}

```

Updating host inventory

Change inventory mode and add location

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10387",
        "inventory_mode": 0,
        "inventory": {
            "location": "Latvia, Riga"
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10387"
        ]
    },
    "id": 1
}

```

Updating host tags

Replace all host tags with a new one.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {

```

```

    "hostid": "10387",
    "tags": {
      "tag": "os",
      "value": "rhel-7"
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10387"
    ]
  },
  "id": 1
}

```

Updating discovered host macros

Convert discovery rule created "automatic" macro to "manual" and change its value to "new-value".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10387",
    "macros": {
      "hostmacroid": "5541",
      "value": "new-value",
      "automatic": "0"
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10387"
    ]
  },
  "id": 1
}

```

Updating host encryption

Update the host "10590" to use PSK encryption only for connections from host to Zabbix server, and change the PSK identity and PSK key. Note that the host has to be **pre-configured to use PSK**.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.update",
  "params": {
    "hostid": "10590",
    "tls_connect": 1,
    "tls_accept": 2,
    "tls_psk_identity": "PSK 002",

```

```
    "tls_psk": "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10590"
    ]
  },
  "id": 1
}
```

`CHost::update()` in `ui/include/classes/api/services/CHost.php`.

Host group

This class is designed to work with host groups.

Object references:

- [Host group](#)

Available methods:

- [hostgroup.create](#) - create new host groups
- [hostgroup.delete](#) - delete host groups
- [hostgroup.get](#) - retrieve host groups
- [hostgroup.massadd](#) - add related objects to host groups
- [hostgroup.massremove](#) - remove related objects from host groups
- [hostgroup.massupdate](#) - replace or remove related objects from host groups
- [hostgroup.propagate](#) - propagate permissions and tag filters to host groups' subgroups
- [hostgroup.update](#) - update host groups

Host group object

The following objects are directly related to the `hostgroup` API.

Host group

The host group object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| groupid | ID | ID of the host group. |
| name | string | Property behavior: - <i>read-only</i> - <i>required</i> for update operations Name of the host group. |
| flags | integer | Property behavior: - <i>required</i> for create operations Origin of the host group. Possible values: 0 - a plain host group; 4 - a discovered host group. |
| uuid | string | Property behavior: - <i>read-only</i> Universal unique identifier, used for linking imported host groups to already existing ones. Auto-generated, if not given. |

hostgroup.create

Description

`object hostgroup.create(object/array hostGroups)`

This method allows to create new host groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host groups to create.

The method accepts host groups with the **standard host group properties**.

Return values

(object) Returns an object containing the IDs of the created host groups under the `groupids` property. The order of the returned IDs matches the order of the passed host groups.

Examples

Creating a host group

Create a host group called "Linux servers".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.create",
  "params": {
    "name": "Linux servers"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
```

```

        "107819"
    ],
    },
    "id": 1
}

```

Source

CHostGroup::create() in *ui/include/classes/api/services/CHostGroup.php*.

hostgroup.delete

Description

object hostgroup.delete(array hostGroupIds)

This method allows to delete host groups.

A host group cannot be deleted if:

- it contains hosts that belong to this group only;
- it is marked as internal;
- it is used by a host prototype;
- it is used in a global script;
- it is used in a correlation condition.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the host groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted host groups under the `groupids` property.

Examples

Deleting multiple host groups

Delete two host groups.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "hostgroup.delete",
  "params": [
    "107824",
    "107825"
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107824",
      "107825"
    ]
  },
  "id": 1
}

```

Source

`CHostGroup::delete()` in `ui/include/classes/api/services/CHostGroup.php`.

hostgroup.get

Description

`integer/array hostgroup.get(object parameters)`

The method allows to retrieve host groups according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------------------|----------|--|
| graphids | ID/array | Return only host groups that contain hosts with the given graphs. |
| groupids | ID/array | Return only host groups with the given host group IDs. |
| hostids | ID/array | Return only host groups that contain the given hosts. |
| maintenanceids | ID/array | Return only host groups that are affected by the given maintenances. |
| triggerids | ID/array | Return only host groups that contain hosts with the given triggers. |
| with_graphs | flag | Return only host groups that contain hosts with graphs. |
| with_graph_prototypes | flag | Return only host groups that contain hosts with graph prototypes. |
| with_hosts | flag | Return only host groups that contain hosts. |
| with_httptests | flag | Return only host groups that contain hosts with web checks. |
| with_items | flag | Overrides the <code>with_monitored_httptests</code> parameter. Return only host groups that contain hosts with items. |
| with_item_prototypes | flag | Overrides the <code>with_monitored_items</code> and <code>with_simple_graph_items</code> parameters. Return only host groups that contain hosts with item prototypes. |
| with_simple_graph_item_prototypes | flag | Overrides the <code>with_simple_graph_item_prototypes</code> parameter. Return only host groups that contain hosts with item prototypes, which are enabled for creation and have numeric type of information. |
| with_monitored_httptests | flag | Return only host groups that contain hosts with enabled web checks. |
| with_monitored_hosts | flag | Return only host groups that contain monitored hosts. |
| with_monitored_items | flag | Return only host groups that contain hosts with enabled items. |
| with_monitored_triggers | flag | Overrides the <code>with_simple_graph_items</code> parameter. Return only host groups that contain hosts with enabled triggers. All of the items used in the trigger must also be enabled. |
| with_simple_graph_items | flag | Return only host groups that contain hosts with numeric items. |
| with_triggers | flag | Return only host groups that contain hosts with triggers. |
| selectDiscoveryRules | query | Overrides the <code>with_monitored_triggers</code> parameter. Return a <code>discoveryRules</code> property with the LLD rules that discovered the host group. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| selectGroupDiscoveries | query | Return a <code>groupDiscoveries</code> property with the host group discovery objects. Each host group discovery object is a host group prototype linked to the discovered host group and has the following properties: <code>parent_group_prototypeid</code> - (ID) ID of the host group prototype from which the host group was discovered; <code>name</code> - (string) name of the host group prototype; <code>lastcheck</code> - (timestamp) time when the host group was last discovered; <code>ts_delete</code> - (timestamp) time when the host group that is no longer discovered will be deleted; <code>status</code> - (int) host group discovery status: 0 - (default) host group is discovered, 1 - host group is not discovered anymore. |
| selectHostPrototypes | query | Return a <code>hostPrototypes</code> property with host prototypes that discovered this host group. |
| selectHosts | query | Return a <code>hosts</code> property with the hosts that belong to the host group. |
| limitSelects | integer | Supports count. Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: <code>selectHosts</code> - results will be sorted by host. Sort the result by the given properties. Possible values: <code>groupid</code> , <code>name</code> . These parameters are described in the reference commentary . |
| countOutput | boolean | Possible values: <code>groupid</code> , <code>name</code> . These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two host groups named "Zabbix servers" and "Linux servers".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.get",
  "params": {
    "output": "extend",
    "filter": {
      "name": [
        "Zabbix servers",
        "Linux servers"
      ]
    }
  }
}
```

```

    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "groupid": "2",
      "name": "Linux servers",
      "internal": "0"
    },
    {
      "groupid": "4",
      "name": "Zabbix servers",
      "internal": "0"
    }
  ],
  "id": 1
}

```

hostgroup.massadd

Description

`object hostgroup.massadd(object parameters)`

This method allows to simultaneously add multiple related objects to all the given host groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects to add to all the host groups.

The method accepts the following parameters.

| Parameter | Type | Description |
|-----------|--------------|--|
| groups | object/array | <p>Host groups to be updated.</p> <p>The host groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior:</p> <p>- <i>required</i></p> |
| hosts | object/array | <p>Hosts to add to all host groups.</p> <p>The hosts must have only the <code>hostid</code> property defined.</p> |

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Adding hosts to host groups

Add two hosts to host groups with IDs 5 and 6.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massadd",
  "params": {
    "groups": [
      {
        "groupid": "5"
      },
      {
        "groupid": "6"
      }
    ],
    "hosts": [
      {
        "hostid": "30050"
      },
      {
        "hostid": "30001"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "5",
      "6"
    ]
  },
  "id": 1
}
```

hostgroup.massremove

Description

`object hostgroup.massremove(object parameters)`

This method allows to remove related objects from multiple host groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects that should be removed.

| Parameter | Type | Description |
|-----------|----------|---|
| groupids | ID/array | IDs of the host groups to be updated. |
| | | Parameter behavior: - <i>required</i> |
| hostids | ID/array | IDs of the hosts to remove from all host groups. |

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Removing hosts from host groups

Remove two hosts from the given host groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massremove",
  "params": {
    "groupids": [
      "5",
      "6"
    ],
    "hostids": [
      "30050",
      "30001"
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "5",
      "6"
    ]
  },
  "id": 1
}
```

Source

`CHostGroup::massRemove()` in `ui/include/classes/api/services/CHostGroup.php`.

hostgroup.massupdate

Description

object `hostgroup.massupdate(object parameters)`

This method allows to replace hosts and templates with the specified ones in multiple host groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object) Parameters containing the IDs of the host groups to update and the objects that should be updated.

| Parameter | Type | Description |
|-----------|--------------|--|
| groups | object/array | <p>Host groups to be updated.</p> <p>The host groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |
| hosts | object/array | <p>Hosts to replace the current hosts on the given host groups. All other hosts, except the ones mentioned, will be excluded from host groups. Discovered hosts will not be affected.</p> <p>The hosts must have only the <code>hostid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Replacing hosts in a host group

Replace all hosts in a host group to ones mentioned host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.massupdate",
  "params": {
    "groups": [
      {
        "groupid": "6"
      }
    ],
    "hosts": [
      {
        "hostid": "30050"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "6",
    ]
  },
  "id": 1
}
```

hostgroup.propagate

Description

object hostgroup.propagate(object parameters)

This method allows to apply permissions and tag filters to all subgroups of a host group.

Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-------------|--------------|--|
| groups | object/array | <p>Host groups to propagate.</p> <p>The host groups must have the <code>groupid</code> property defined.</p> <p>Parameter behavior:</p> <p>- <i>required</i></p> |
| permissions | boolean | <p>Set to "true" to propagate permissions.</p> <p>Parameter behavior:</p> <p>- <i>required</i> if <code>tag_filters</code> is not set</p> |
| tag_filters | boolean | <p>Set to "true" to propagate tag filters.</p> <p>Parameter behavior:</p> <p>- <i>required</i> if <code>permissions</code> is not set</p> |

Return values

(object) Returns an object containing the IDs of the propagated host groups under the `groupids` property.

Examples

Propagating host group permissions and tag filters to its subgroups.

Propagate host group permissions and tag filters to its subgroups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.propagate",
  "params": {
    "groups": [
      {
        "groupid": "6"
      }
    ],
    "permissions": true,
    "tag_filters": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "6",
    ]
  },
  "id": 1
}
```

- [Host](#)

Source

`CHostGroup::propagate()` in `ui/include/classes/api/services/CHostGroup.php`.

hostgroup.update

Description

`object hostgroup.update(object/array hostGroups)`

This method allows to update existing hosts groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) [Host group properties](#) to be updated.

The `groupid` property must be defined for each host group, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Renaming a host group

Rename a host group to "Linux hosts."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostgroup.update",
  "params": {
    "groupid": "7",
    "name": "Linux hosts"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "7"
    ]
  },
}
```

```
"id": 1  
}
```

Host interface

This class is designed to work with host interfaces.

Object references:

- [Host interface](#)
 - [Details](#)

Available methods:

- [hostinterface.create](#) - create new host interfaces
- [hostinterface.delete](#) - delete host interfaces
- [hostinterface.get](#) - retrieve host interfaces
- [hostinterface.massadd](#) - add host interfaces to hosts
- [hostinterface.massremove](#) - remove host interfaces from hosts
- [hostinterface.replacehostinterfaces](#) - replace host interfaces on a host
- [hostinterface.update](#) - update host interfaces

Host interface object

The following objects are directly related to the `hostinterface` API.

Host interface

The host interface object has the following properties.

Attention:

Note that both `ip` and `dns` properties are *required* for create operations. If you do not want to use DNS, set it to an empty string.

| Property | Type | Description |
|-------------|---------|--|
| interfaceid | ID | ID of the interface. |
| available | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations <p>Availability of host interface.</p> <p>Possible values:</p> <ul style="list-style-type: none">0 - (<i>default</i>) unknown;1 - available;2 - unavailable. |
| hostid | ID | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i> <p>ID of the host that the interface belongs to.</p> <p>Property behavior:</p> <ul style="list-style-type: none">- <i>constant</i>- <i>required</i> for create operations |

| Property | Type | Description |
|---------------|-----------|--|
| type | integer | Interface type. Possible values: 1 - Agent; 2 - SNMP; 3 - IPMI; 4 - JMX. |
| ip | string | Property behavior: - <i>required</i> for create operations IP address used by the interface. Can be empty if the connection is made via DNS. |
| dns | string | Property behavior: - <i>required</i> for create operations DNS name used by the interface. Can be empty if the connection is made via IP. |
| port | string | Property behavior: - <i>required</i> for create operations Port number used by the interface. Can contain user macros. |
| useip | integer | Property behavior: - <i>required</i> for create operations Whether the connection should be made via IP. Possible values: 0 - connect using host DNS name; 1 - connect using host IP address. |
| main | integer | Property behavior: - <i>required</i> for create operations Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host. Possible values: 0 - not default; 1 - default. |
| details | array | Property behavior: - <i>required</i> for create operations Additional details object for interface. |
| disable_until | timestamp | Property behavior: - <i>required</i> if type is set to "SNMP" The next polling time of an unavailable host interface. |
| error | string | Property behavior: - <i>read-only</i> Error text if host interface is unavailable. |
| errors_from | timestamp | Property behavior: - <i>read-only</i> Time when host interface became unavailable. |
| | | Property behavior: - <i>read-only</i> |

Details

The details object has the following properties.

| Property | Type | Description |
|-----------------|---------|--|
| version | integer | SNMP interface version. Possible values: 1 - SNMPv1; 2 - SNMPv2c; 3 - SNMPv3. Property behavior: - <i>required</i> |
| bulk | integer | Whether to use bulk SNMP requests. Possible values: 0 - don't use bulk requests; 1 - (default) - use bulk requests. |
| community | string | SNMP community. Used only by SNMPv1 and SNMPv2 interfaces. Property behavior: - <i>required</i> if version is set to "SNMPv1" or "SNMPv2c" |
| max_repetitions | integer | Max repetition value for native SNMP bulk requests (GetBulkRequest-PDUs). Used only for discovery [] and walk [] items in SNMPv2 and v3. |
| securityname | string | Default: 10. SNMPv3 security name. Used only by SNMPv3 interfaces. |
| securitylevel | integer | SNMPv3 security level. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv. |
| authpassphrase | string | SNMPv3 authentication passphrase. Used only by SNMPv3 interfaces. |
| privpassphrase | string | SNMPv3 privacy passphrase. Used only by SNMPv3 interfaces. |
| authprotocol | integer | SNMPv3 authentication protocol. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - MD5; 1 - SHA1; 2 - SHA224; 3 - SHA256; 4 - SHA384; 5 - SHA512. |
| privprotocol | integer | SNMPv3 privacy protocol. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - DES; 1 - AES128; 2 - AES192; 3 - AES256; 4 - AES192C; 5 - AES256C. |
| contextname | string | SNMPv3 context name. Used only by SNMPv3 interfaces. |

hostinterface.create

Description

object hostinterface.create(object/array hostInterfaces)

This method allows to create new host interfaces.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host interfaces to create.

The method accepts host interfaces with the [standard host interface properties](#).

Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property. The order of the returned IDs matches the order of the passed host interfaces.

Examples

Create a new interface

Create a secondary IP agent interface on host "30052."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.create",
  "params": {
    "hostid": "30052",
    "main": "0",
    "type": "1",
    "useip": "1",
    "ip": "127.0.0.1",
    "dns": "",
    "port": "10050"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30062"
    ]
  },
  "id": 1
}
```

Create an interface with SNMP details

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.create",
  "params": {
    "hostid": "10456",
    "main": "0",
    "type": "2",
    "useip": "1",
    "ip": "127.0.0.1",
    "dns": "",
    "port": "1601",
    "details": {
      "version": "2",

```

```

        "bulk": "1",
        "community": "{$SNMP_COMMUNITY}"
    }
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "interfaceids": [
            "30063"
        ]
    },
    "id": 1
}

```

See also

- [hostinterface.massadd](#)
- [host.massadd](#)

Source

`CHostInterface::create()` in `ui/include/classes/api/services/CHostInterface.php`.

hostinterface.delete

Description

`object hostinterface.delete(array hostInterfaceIds)`

This method allows to delete host interfaces.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the host interfaces to delete.

Return values

(object) Returns an object containing the IDs of the deleted host interfaces under the `interfaceids` property.

Examples

Delete a host interface

Delete the host interface with ID 30062.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "hostinterface.delete",
    "params": [
        "30062"
    ],
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {

```

```

        "interfaceids": [
            "30062"
        ],
        "id": 1
    }
}

```

See also

- [hostinterface.massremove](#)
- [host.massremove](#)

Source

`CHostInterface::delete()` in `ui/include/classes/api/services/CHostInterface.php`.

hostinterface.get

Description

`integer/array hostinterface.get(object parameters)`

The method allows to retrieve host interfaces according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|--|
| hostids | ID/array | Return only host interfaces used by the given hosts. |
| interfaceids | ID/array | Return only host interfaces with the given IDs. |
| itemids | ID/array | Return only host interfaces used by the given items. |
| triggerids | ID/array | Return only host interfaces used by items in the given triggers. |
| selectItems | query | Return an items property with the items that use the interface. |
| | | Supports count. |
| selectHosts | query | Return a hosts property with an array of hosts that use the interface. |
| limitSelects | integer | Limits the number of records returned by subselects. |
| | | Applies to the following subselects: |
| | | <code>selectItems</code> . |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: <code>interfaceid</code> , <code>dns</code> , <code>ip</code> . |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve host interfaces

Retrieve all data about the interfaces used by host "30057."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.get",
  "params": {
    "output": "extend",
    "hostids": "30057"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "interfaceid": "50039",
      "hostid": "30057",
      "main": "1",
      "type": "1",
      "useip": "0",
      "ip": "",
      "dns": "localhost",
      "port": "10050",
      "available": "0",
      "error": "",
      "errors_from": "0",
      "disable_until": "0",
      "details": []
    },
    {
      "interfaceid": "55082",
      "hostid": "30057",
      "main": "1",
      "type": "2",
      "useip": "1",
      "ip": "127.0.0.1",
      "dns": "",
      "port": "161",
      "available": "0",
      "error": "",
      "errors_from": "0",
      "disable_until": "0",
      "details": {
        "version": "2",
        "bulk": "0",
        "community": "{$SNMP_COMMUNITY}",
        "max_repetitions": "10"
      }
    }
  ],
  "id": 1
}
```

`CHostInterface::get()` in `ui/include/classes/api/services/CHostInterface.php`.

hostinterface.massadd

Description

`object hostinterface.massadd(object parameters)`

This method allows to simultaneously add host interfaces to multiple hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the host interfaces to be created on the given hosts.

The method accepts the following parameters.

| Parameter | Type | Description |
|------------|--------------|---|
| interfaces | object/array | Host interfaces to create on the given hosts. |
| hosts | object/array | Parameter behavior: - <i>required</i> Hosts to be updated. The hosts must have only the <code>hostid</code> property defined. Parameter behavior: - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property.

Examples

Creating interfaces

Create an interface on two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.massadd",
  "params": {
    "hosts": [
      {
        "hostid": "30050"
      },
      {
        "hostid": "30052"
      }
    ],
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "main": 0,

```

```

        "port": "10050",
        "type": 1,
        "useip": 1
    }
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30069",
      "30070"
    ]
  },
  "id": 1
}

```

hostinterface.massremove

Description

`object hostinterface.massremove(object parameters)`

This method allows to remove host interfaces from the given hosts.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the hosts to be updated and the interfaces to be removed.

| Parameter | Type | Description |
|------------|--------------|---|
| interfaces | object/array | <p>Host interfaces to remove from the given hosts.</p> <p>The host interface object must have only the <code>ip</code>, <code>dns</code> and <code>port</code> properties defined.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| hostids | ID/array | <p>IDs of the hosts to be updated.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the deleted host interfaces under the `interfaceids` property.

Examples

Removing interfaces

Remove the "127.0.0.1" SNMP interface from two hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.massremove",
  "params": {
    "hostids": [
      "30050",
      "30052"
    ],
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "port": "161"
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30069",
      "30070"
    ]
  },
  "id": 1
}
```

hostinterface.replacehostinterfaces

Description

object `hostinterface.replacehostinterfaces(object parameters)`

This method allows to replace all host interfaces on a given host.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the ID of the host to be updated and the new host interfaces.

| Parameter | Type | Description |
|---|--------------|--|
| interfaces | object/array | Host interfaces to replace the current host interfaces with. |
| Parameter behavior: - <i>required</i> | | |

| Parameter | Type | Description |
|---|------|-------------------------------|
| hostid | ID | ID of the host to be updated. |
| Parameter behavior: - <i>required</i> | | |

Return values

(object) Returns an object containing the IDs of the created host interfaces under the `interfaceids` property.

Examples

Replacing host interfaces

Replace all host interfaces with a single agent interface.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.replacehostinterfaces",
  "params": {
    "hostid": "30052",
    "interfaces": {
      "dns": "",
      "ip": "127.0.0.1",
      "main": 1,
      "port": "10050",
      "type": 1,
      "useip": 1
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30081"
    ]

CHostInterface::replaceHostInterfaces() in `ui/include/classes/api/services/CHostInterface.php`.

hostinterface.update

Description

object `hostinterface.update(object/array hostInterfaces)`

This method allows to update existing host interfaces.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Host interface properties** to be updated.

The `interfaceid` property must be defined for each host interface, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host interfaces under the `interfaceids` property.

Examples

Changing a host interface port

Change the port of a host interface.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostinterface.update",
  "params": {
    "interfaceid": "30048",
    "port": "30050"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "interfaceids": [
      "30048"
    ]
  },
  "id": 1
}
```

Host prototype

This class is designed to work with host prototypes.

Object references:

- [Host prototype](#)
- [Group link](#)
- [Group prototype](#)
- [Host prototype tag](#)
- [Custom interface](#)
 - [Custom interface details](#)

Available methods:

- [hostprototype.create](#) - create new host prototypes
- [hostprototype.delete](#) - delete host prototypes
- [hostprototype.get](#) - retrieve host prototypes
- [hostprototype.update](#) - update host prototypes

Host prototype object

The following objects are directly related to the `hostprototype` API.

Host prototype

The host prototype object has the following properties.

| Property | Type | Description |
|-------------------|---------|---|
| hostid | ID | ID of the host prototype. Property behavior: - <i>read-only</i> |
| host | string | - <i>required</i> for update operations Technical name of the host prototype. Property behavior: - <i>required</i> for create operations - <i>read-only</i> for inherited objects |
| name | string | Visible name of the host prototype. Default: <code>host</code> property value. Property behavior: - <i>read-only</i> for inherited objects |
| status | integer | Status of the host prototype. Possible values: 0 - (<i>default</i>) monitored host; 1 - unmonitored host. |
| inventory_mode | integer | Host inventory population mode. Possible values: -1 - (<i>default</i>) disabled; 0 - manual; 1 - automatic. |
| templateid | ID | ID of the parent template host prototype. Property behavior: - <i>read-only</i> |
| discover | integer | Host prototype discovery status. Possible values: 0 - (<i>default</i>) new hosts will be discovered; 1 - new hosts will not be discovered and existing hosts will be marked as lost. |
| custom_interfaces | integer | Source of custom interfaces for hosts created by the host prototype. Possible values: 0 - (<i>default</i>) inherit interfaces from parent host; 1 - use host prototypes custom interfaces. Property behavior: - <i>read-only</i> for inherited objects |
| uuid | string | Universal unique identifier, used for linking imported host prototypes to already existing ones. Auto-generated, if not given. Property behavior: - <i>supported</i> if the host prototype belongs to a template |

Group link

The group link object links a host prototype with a host group. It has the following properties.

| Property | Type | Description |
|----------|------|---|
| groupid | ID | ID of the host group. Property behavior: - <i>required</i> |

Group prototype

The group prototype object defines a group that will be created for a discovered host. It has the following properties.

| Property | Type | Description |
|-------------------|--------|---|
| group_prototypeid | ID | ID of the group prototype. |
| name | string | Property behavior: - <i>read-only</i> Name of the group prototype. Property behavior: - <i>required</i> for create operations |

Host prototype tag

The host prototype tag object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| tag | string | Host prototype tag name. Property behavior: - <i>required</i> |
| value | string | Host prototype tag value. |

Custom interface

Custom interfaces are supported if custom_interfaces of **Host prototype object** is set to "use host prototypes custom interfaces". The custom interface object has the following properties.

| Property | Type | Description |
|----------|---------|---|
| type | integer | Interface type. Possible values: 1 - Agent; 2 - SNMP; 3 - IPMI; 4 - JMX. |
| useip | integer | Property behavior: - <i>required</i> Whether the connection should be made via IP. Possible values: 0 - connect using host DNS name; 1 - connect using host IP address. |
| ip | string | Property behavior: - <i>required</i> IP address used by the interface. Can contain macros. Property behavior: - <i>required</i> if useip is set to "connect using host IP address" |

| Property | Type | Description |
|----------|---------|--|
| dns | string | DNS name used by the interface. Can contain macros. |
| port | string | <p>Property behavior: - <i>required</i> if useip is set to "connect using host DNS name"</p> <p>Port number used by the interface. Can contain user and LLD macros.</p> <p>Property behavior: - <i>required</i></p> |
| main | integer | <p>Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host.</p> <p>Possible values: 0 - not default; 1 - default.</p> <p>Property behavior: - <i>required</i></p> |
| details | array | <p>Additional object for custom interface details.</p> <p>Property behavior: - <i>required</i> if type is set to "SNMP"</p> |

Custom interface details

The details object has the following properties.

| Property | Type | Description |
|-----------------|---------|--|
| version | integer | <p>SNMP interface version.</p> <p>Possible values: 1 - SNMPv1; 2 - SNMPv2c; 3 - SNMPv3.</p> <p>Property behavior: - <i>required</i></p> |
| bulk | integer | <p>Whether to use bulk SNMP requests.</p> <p>Possible values: 0 - don't use bulk requests; 1 - (<i>default</i>) - use bulk requests.</p> |
| community | string | <p>SNMP community.</p> <p>Property behavior: - <i>required</i> if version is set to "SNMPv1" or "SNMPv2c"</p> |
| max_repetitions | integer | <p>Max repetition value for native SNMP bulk requests (GetBulkRequest-PDUs). Used only for <code>discovery []</code> and <code>walk []</code> items in SNMPv2 and v3.</p> <p>Default: 10.</p> |
| securityname | string | <p>SNMPv3 security name.</p> <p>Property behavior: - <i>supported</i> if version is set to "SNMPv3"</p> |

| Property | Type | Description |
|----------------|---------|---|
| securitylevel | integer | SNMPv3 security level. Possible values: 0 - (default) - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv. Property behavior: - <i>supported</i> if version is set to "SNMPv3" |
| authpassphrase | string | SNMPv3 authentication passphrase. Property behavior: - <i>supported</i> if version is set to "SNMPv3" and securitylevel is set to "authNoPriv" or "authPriv" |
| privpassphrase | string | SNMPv3 privacy passphrase. Property behavior: - <i>supported</i> if version is set to "SNMPv3" and securitylevel is set to "authPriv" |
| authprotocol | integer | SNMPv3 authentication protocol. Possible values: 0 - (default) - MD5; 1 - SHA1; 2 - SHA224; 3 - SHA256; 4 - SHA384; 5 - SHA512. Property behavior: - <i>supported</i> if version is set to "SNMPv3" and securitylevel is set to "authNoPriv" or "authPriv" |
| privprotocol | integer | SNMPv3 privacy protocol. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - DES; 1 - AES128; 2 - AES192; 3 - AES256; 4 - AES192C; 5 - AES256C. Property behavior: - <i>supported</i> if version is set to "SNMPv3" and securitylevel is set to "authPriv" |
| contextname | string | SNMPv3 context name. Property behavior: - <i>supported</i> if version is set to "SNMPv3" |

hostprototype.create

Description

object hostprototype.create(object/array hostPrototypes)

This method allows to create new host prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host prototypes to create.

Additionally to the [standard host prototype properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|---|
| groupLinks | array | Group links to be created for the host prototype. Parameter behavior: - <i>required</i> |
| ruleid | ID | ID of the LLD rule that the host prototype belongs to. Parameter behavior: - <i>required</i> |
| groupPrototypes | array | Group prototypes to be created for the host prototype. |
| macros | object/array | User macros to be created for the host prototype. |
| tags | object/array | Host prototype tags . |
| interfaces | object/array | Host prototype custom interfaces . |
| templates | object/array | Templates to be linked to the host prototype. The templates must have only the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the created host prototypes under the `hostids` property. The order of the returned IDs matches the order of the passed host prototypes.

Examples**Creating a host prototype**

Create a host prototype "`{#VM.NAME}`" on LLD rule "23542" with a group prototype "`{#HV.NAME}`", tag pair "datacenter": "`{#DATACENTER.NAME}`" and custom SNMPv2 interface 127.0.0.1:161 with community `{$SNMP_COMMUNITY}`. Link it to host group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.create",
  "params": {
    "host": "{#VM.NAME}",
    "ruleid": "23542",
    "custom_interfaces": "1",
    "groupLinks": [
      {
        "groupid": "2"
      }
    ],
    "groupPrototypes": [
      {
        "name": "{#HV.NAME}"
      }
    ],
    "tags": [
      {
        "tag": "datacenter",
        "value": "{#DATACENTER.NAME}"
      }
    ]
  }
}
```

```

    "interfaces": [
      {
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "details": {
          "version": "2",
          "bulk": "1",
          "community": "{$SNMP_COMMUNITY}"
        }
      }
    ],
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10103"
    ]
  },
  "id": 1
}

```

`CHostPrototype::create()` in `ui/include/classes/api/services/CHostPrototype.php`.

hostprototype.delete

Description

object `hostprototype.delete(array hostPrototypeIds)`

This method allows to delete host prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the host prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted host prototypes under the `hostids` property.

Examples

Deleting multiple host prototypes

Delete two host prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.delete",
  "params": [
    "10103",
    "10105"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10103",
      "10105"
    ]
  },
  "id": 1
}
```

Source

CHostPrototype::delete() in *ui/include/classes/api/services/CHostPrototype.php*.

hostprototype.get

Description

integer/array hostprototype.get(object parameters)

The method allows to retrieve host prototypes according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------|----------|--|
| hostids | ID/array | Return only host prototypes with the given IDs. |
| discoveryids | ID/array | Return only host prototypes that belong to the given LLD rules. |
| inherited | boolean | If set to true return only items inherited from a template. |
| selectDiscoveryRule | query | Return a discoveryRule property with the LLD rule that the host prototype belongs to. |
| selectInterfaces | query | Return an interfaces property with host prototype custom interfaces. |
| selectGroupLinks | query | Return a groupLinks property with the group links of the host prototype. |
| selectGroupPrototypes | query | Return a groupPrototypes property with the group prototypes of the host prototype. |
| selectMacros | query | Return a macros property with host prototype macros. |
| selectParentHost | query | Return a parentHost property with the host that the host prototype belongs to. |
| selectTags | query | Return a tags property with host prototype tags. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| selectTemplates | query | Return a templates property with the templates linked to the host prototype. |
| sortfield | string/array | Supports count. Sort the result by the given properties. |
| countOutput | boolean | Possible values: <code>hostid</code> , <code>host</code> , <code>name</code> , <code>status</code> , <code>discovered</code> . These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving host prototypes from an LLD rule

Retrieve all host prototypes, their group links, group prototypes and tags from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.get",
  "params": {
    "output": "extend",
    "selectInterfaces": "extend",
    "selectGroupLinks": "extend",
    "selectGroupPrototypes": "extend",
    "selectTags": "extend",
    "discoveryids": "23554"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10092",
      "host": "#{HV.UUID}",
      "name": "#{HV.UUID}",
      "status": "0",
      "templateid": "0",
      "discover": "0",
      "custom_interfaces": "1",
      "inventory_mode": "-1",
      "groupLinks": [
        {
```

```

        "group_prototypeid": "4",
        "hostid": "10092",
        "groupid": "7",
        "templateid": "0"
    },
],
"groupPrototypes": [
    {
        "group_prototypeid": "7",
        "hostid": "10092",
        "name": "{#CLUSTER.NAME}",
        "templateid": "0"
    }
],
"tags": [
    {
        "tag": "datacenter",
        "value": "{#DATACENTER.NAME}"
    },
    {
        "tag": "instance-type",
        "value": "{#INSTANCE_TYPE}"
    }
],
"interfaces": [
    {
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",
        "port": "161",
        "details": {
            "version": "2",
            "bulk": "1",
            "community": "{$SNMP_COMMUNITY}",
            "max_repetitions": "10"
        }
    }
]
},
"id": 1
}

```

`CHostPrototype::get()` in `ui/include/classes/api/services/CHostPrototype.php`.

hostprototype.update

Description

`object hostprototype.update(object/array hostPrototypes)`

This method allows to update existing host prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host prototype properties to be updated.

The `hostid` property must be defined for each host prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard host prototype properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|--|
| groupLinks | array | Group links to replace the current group links on the host prototype. Parameter behavior: - <i>read-only</i> for inherited objects |
| groupPrototypes | array | Group prototypes to replace the existing group prototypes on the host prototype. All group prototypes that are not listed in the request will be removed. Parameter behavior: - <i>read-only</i> for inherited objects |
| macros | object/array | User macros to replace the current user macros. All macros that are not listed in the request will be removed. |
| tags | object/array | Host prototype tags to replace the current tags. All tags that are not listed in the request will be removed. Parameter behavior: - <i>read-only</i> for inherited objects |
| interfaces | object/array | Host prototype custom interfaces to replace the current interfaces. Custom interface object should contain all its parameters. All interfaces that are not listed in the request will be removed. Parameter behavior: - <i>supported</i> if <code>custom_interfaces</code> of Host prototype object is set to "use host prototypes custom interfaces" - <i>read-only</i> for inherited objects |
| templates | object/array | Templates to replace the currently linked templates. The templates must have only the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated host prototypes under the `hostids` property.

Examples**Disabling a host prototype**

Disable a host prototype, that is, set its status to "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "status": 1
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10092"
    ]
  },
  "id": 1
}
```

Updating host prototype tags

Replace host prototype tags with new ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "tags": [
      {
        "tag": "datacenter",
        "value": "#{DATACENTER.NAME}"
      },
      {
        "tag": "instance-type",
        "value": "#{INSTANCE_TYPE}"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostids": [
      "10092"
    ]
  },
  "id": 1
}
```

Updating host prototype custom interfaces

Replace inherited interfaces with host prototype custom interfaces.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "hostprototype.update",
  "params": {
    "hostid": "10092",
    "custom_interfaces": "1",
    "interfaces": [
      {
        "main": "1",
        "type": "2",
        "useip": "1",
        "ip": "127.0.0.1",
        "dns": "",

```

```

        "port": "161",
        "details": {
            "version": "2",
            "bulk": "1",
            "community": "{$SNMP_COMMUNITY}"
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10092"
        ]
    },
    "id": 1
}

```

`CHostPrototype::update()` in `ui/include/classes/api/services/CHostPrototype.php`.

Housekeeping

This class is designed to work with housekeeping.

Object references:

- [Housekeeping](#)

Available methods:

- [housekeeping.get](#) - retrieve housekeeping
- [housekeeping.update](#) - update housekeeping

Housekeeping object

The following objects are directly related to the housekeeping API.

Housekeeping

The settings object has the following properties.

| Property | Type | Description |
|-------------------|---------|---|
| hk_events_mode | integer | Enable internal housekeeping for events and alerts. Possible values: 0 - Disable; 1 - <i>(default)</i> Enable. |
| hk_events_trigger | string | Trigger data storage period. Accepts seconds and time unit with suffix. Default: 365d. |

| Property | Type | Description |
|---------------------|---------|--|
| hk_events_service | string | Service data storage period. Accepts seconds and time unit with suffix. Default: 1d. |
| hk_events_internal | string | Internal data storage period. Accepts seconds and time unit with suffix. Default: 1d. |
| hk_events_discovery | string | Network discovery data storage period. Accepts seconds and time unit with suffix. Default: 1d. |
| hk_events_autoreg | string | Autoregistration data storage period. Accepts seconds and time unit with suffix. Default: 1d. |
| hk_services_mode | integer | Enable internal housekeeping for services. Possible values: 0 - Disable; 1 - (<i>default</i>) Enable. |
| hk_services | string | Services data storage period. Accepts seconds and time unit with suffix. Default: 365d. |
| hk_audit_mode | integer | Enable internal housekeeping for audit. Possible values: 0 - Disable; 1 - (<i>default</i>) Enable. |
| hk_audit | string | Audit data storage period. Accepts seconds and time unit with suffix. Default: 31d. |
| hk_sessions_mode | integer | Enable internal housekeeping for sessions. Possible values: 0 - Disable; 1 - (<i>default</i>) Enable. |
| hk_sessions | string | Sessions data storage period. Accepts seconds and time unit with suffix. Default: 365d. |
| hk_history_mode | integer | Enable internal housekeeping for history. Possible values: 0 - Disable; 1 - (<i>default</i>) Enable. |
| hk_history_global | integer | Override item history period. Possible values: 0 - Do not override; 1 - (<i>default</i>) Override. |
| hk_history | string | History data storage period. Accepts seconds and time unit with suffix. Default: 31d. |
| hk_trends_mode | integer | Enable internal housekeeping for trends. Possible values: 0 - Disable; 1 - (<i>default</i>) Enable. |

| Property | Type | Description |
|--------------------------|---------|---|
| hk_trends_global | integer | Override item trend period. Possible values: 0 - Do not override; 1 - <i>(default)</i> Override. |
| hk_trends | string | Trends data storage period. Accepts seconds and time unit with suffix. Default: 365d. |
| db_extension | string | Configuration flag DB extension. If this flag is set to "timescaledb" then the server changes its behavior for housekeeping and item deletion. Property behavior: - <i>read-only</i> |
| compression_availability | integer | Whether data compression is supported by the database (or its extension). Possible values: 0 - Unavailable; 1 - Available. Property behavior: - <i>read-only</i> |
| compression_status | integer | Enable TimescaleDB compression for history and trends. Possible values: 0 - <i>(default)</i> Off; 1 - On. |
| compress_older | string | Compress history and trends records older than specified period. Accepts seconds and time unit with suffix. Default: 7d. |

housekeeping.get

Description

`object housekeeping.get(object parameters)`

The method allows to retrieve housekeeping object according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type | Description |
|-----------|-------|---|
| output | query | This parameter is described in the reference commentary . |

Return values

(object) Returns housekeeping object.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "housekeeping.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hk_events_mode": "1",
    "hk_events_trigger": "365d",
    "hk_events_service": "1d",
    "hk_events_internal": "1d",
    "hk_events_discovery": "1d",
    "hk_events_autoreg": "1d",
    "hk_services_mode": "1",
    "hk_services": "365d",
    "hk_audit_mode": "1",
    "hk_audit": "31d",
    "hk_sessions_mode": "1",
    "hk_sessions": "365d",
    "hk_history_mode": "1",
    "hk_history_global": "0",
    "hk_history": "31d",
    "hk_trends_mode": "1",

housekeeping.update

Description

object housekeeping.update(object housekeeping)

This method allows to update existing housekeeping settings.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) **Housekeeping properties** to be updated.

Return values

(array) Returns an array with the names of updated parameters.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "housekeeping.update",
  "params": {
    "hk_events_mode": "1",
    "hk_events_trigger": "200d",
    "hk_events_internal": "2d",
    "hk_events_discovery": "2d"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    "hk_events_mode",
    "hk_events_trigger",
    "hk_events_internal",
    "hk_events_discovery"
  ],
  "id": 1
}
```

Icon map

This class is designed to work with icon maps.

Object references:

- [Icon map](#)
- [Icon mapping](#)

Available methods:

- [iconmap.create](#) - create new icon maps
- [iconmap.delete](#) - delete icon maps
- [iconmap.get](#) - retrieve icon maps
- [iconmap.update](#) - update icon maps

Icon map object

The following objects are directly related to the `iconmap` API.

Icon map

The icon map object has the following properties.

| Property | Type | Description |
|----------------|------|--|
| iconmapid | ID | ID of the icon map. Property behavior: - <i>read-only</i> |
| default_iconid | ID | - <i>required</i> for update operations ID of the default icon. Property behavior: - <i>required</i> for create operations |

| Property | Type | Description |
|--|--------|-----------------------|
| name | string | Name of the icon map. |
| Property behavior: - <i>required</i> for create operations | | |

Icon mapping

The icon mapping object defines a specific icon to be used for hosts with a certain inventory field value. It has the following properties.

| Property | Type | Description |
|---|---------|--|
| iconid | ID | ID of the icon used by the icon mapping. |
| Property behavior: - <i>required</i> | | |
| expression | string | Expression to match the inventory field against. |
| Property behavior: - <i>required</i> | | |
| inventory_link | integer | ID of the host inventory field. |
| Refer to the host inventory object for a list of supported inventory fields. | | |
| Property behavior: - <i>required</i> | | |
| sortorder | integer | Position of the icon mapping in the icon map. |
| Property behavior: - <i>read-only</i> | | |

iconmap.create

Description

`object iconmap.create(object/array iconMaps)`

This method allows to create new icon maps.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Icon maps to create.

Additionally to the **standard icon map properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|---|-------|--|
| mappings | array | Icon mappings to be created for the icon map. |
| Parameter behavior: - <i>required</i> | | |

Return values

(object) Returns an object containing the IDs of the created icon maps under the `iconmapids` property. The order of the returned IDs matches the order of the passed icon maps.

Examples

Create an icon map

Create an icon map to display hosts of different types.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.create",
  "params": {
    "name": "Type icons",
    "default_iconid": "2",
    "mappings": [
      {
        "inventory_link": 1,
        "expression": "server",
        "iconid": "3"
      },
      {
        "inventory_link": 1,
        "expression": "switch",
        "iconid": "4"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "2"
    ]
  },
  "id": 1
}
```

iconmap.delete

Description

object iconmap.delete(array iconMapIds)

This method allows to delete icon maps.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the icon maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted icon maps under the `iconmapids` property.

Examples

Delete multiple icon maps

Delete two icon maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.delete",
  "params": [
    "2",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "2",
      "5"
    ]
  },
  "id": 1
}
```

Source

ClconMap::delete() in *ui/include/classes/api/services/ClconMap.php*.

iconmap.get

Description

integer/array iconmap.get(object parameters)

The method allows to retrieve icon maps according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------|--------------|--|
| iconmapids | ID/array | Return only icon maps with the given IDs. |
| sysmapids | ID/array | Return only icon maps that are used in the given maps. |
| selectMappings | query | Return a mappings property with the icon mappings used. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: iconmapid, name. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| | | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve an icon map

Retrieve all data about icon map "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.get",
  "params": {
    "iconmapids": "3",
    "output": "extend",
    "selectMappings": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "mappings": [
        {
          "iconmappingid": "3",
          "iconmapid": "3",
          "iconid": "6",
          "inventory_link": "1",
          "expression": "server",
          "sortorder": "0"
        },
        {
          "iconmappingid": "4",
          "iconmapid": "3",
          "iconid": "10",
          "inventory_link": "1",
          "expression": "switch",
          "sortorder": "1"
        }
      ],
      "iconmapid": "3",
      "name": "Host type icons",
      "default_iconid": "2"
    }
  ],
  "id": 1
}
```

iconmap.update

Description

object iconmap.update(object/array iconMaps)

This method allows to update existing icon maps.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Icon map properties to be updated.

The `iconmapid` property must be defined for each icon map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard icon map properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| mappings | array | Icon mappings to replace the existing icon mappings. |

Return values

(object) Returns an object containing the IDs of the updated icon maps under the `iconmapids` property.

Examples

Rename icon map

Rename an icon map to "OS icons".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "iconmap.update",
  "params": {
    "iconmapid": "1",
    "name": "OS icons"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "iconmapids": [
      "1"
    ]
  },
  "id": 1
}
```

Image

This class is designed to work with images.

Object references:

- [Image](#)

Available methods:

- [image.create](#) - create new images
- [image.delete](#) - delete images
- [image.get](#) - retrieve images
- [image.update](#) - update images

Image object

The following objects are directly related to the `image` API.

Image

The image object has the following properties.

| Property | Type | Description |
|-----------|---------|--|
| imageid | ID | ID of the image. Property behavior: - <i>read-only</i> |
| name | string | - <i>required</i> for update operations Name of the image. Property behavior: - <i>required</i> for create operations |
| imagetype | integer | Type of image. Possible values: 1 - (<i>default</i>) icon; 2 - background image. Property behavior: - <i>constant</i> - <i>required</i> for create operations |
| image | string | Base64 encoded image. The maximum size of the encoded image is 1 MB. Maximum size can be adjusted by changing <code>ZBX_MAX_IMAGE_SIZE</code> constant value. Supported image formats: PNG, JPEG, GIF. Property behavior: - <i>required</i> for create operations |

image.create

Description

`object image.create(object/array images)`

This method allows to create new images.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Images to create.

The method accepts images with the **standard image properties**.

Return values

(object) Returns an object containing the IDs of the created images under the `imageids` property. The order of the returned IDs matches the order of the passed images.

Examples

Create an image

Create a cloud icon.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.create",
  "params": {
    "imagetype": 1,
    "name": "Cloud_(24)",
    "image": "iVBORw0KGgoAAAANSUhEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACmAAAAPgE
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "188"
    ]
  },
  "id": 1
}
```

Source

`CImage::create()` in `ui/include/classes/api/services/CImage.php`.

image.delete

Description

object `image.delete(array imageIds)`

This method allows to delete images.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(array) IDs of the images to delete.

Return values

(object) Returns an object containing the IDs of the deleted images under the `imageids` property.

Examples

Delete multiple images

Delete two images.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.delete",
  "params": [
    "188",
    "192"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "188",
      "192"
    ]
  },
  "id": 1
}
```

Source

CImage::delete() in *ui/include/classes/api/services/CImage.php*.

image.get

Description

integer/array image.get(object parameters)

The method allows to retrieve images according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|--|
| imageids | ID/array | Return only images with the given IDs. |
| sysmapids | ID/array | Return images that are used on the given maps. |
| select_image | flag | Return an image property with the Base64 encoded image. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: <code>imageid</code> , <code>name</code> . |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve an image

Retrieve all data for image with ID "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.get",
  "params": {
    "output": "extend",
    "select_image": true,
    "imageids": "2"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "imageid": "2",
      "imagetype": "1",
      "name": "Cloud_(24)",
      "image": "iVBORwOKGgoAAAANSUheEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACMAAA
    ],
  "id": 1
}
```

Source

`CImage::get()` in `ui/include/classes/api/services/CImage.php`.

image.update

Description

object `image.update(object/array images)`

This method allows to update existing images.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Image properties to be updated.

The `imageid` property must be defined for each image, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts images with the **standard image properties**.

Return values

(object) Returns an object containing the IDs of the updated images under the `imageids` property.

Examples

Rename image

Rename image to "Cloud icon".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "image.update",
  "params": {
    "imageid": "2",
    "name": "Cloud icon"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "imageids": [
      "2"
    ]
  },
  "id": 1
}
```

Source

Item

This class is designed to work with items.

Object references:

- **Item**
 - HTTP header
 - HTTP query field
- Item tag
- Item preprocessing

Available methods:

- **item.create** - create new items
- **item.delete** - delete items
- **item.get** - retrieve items
- **item.update** - update items

Item object

The following objects are directly related to the `item` API.

Item

Note:

Web items cannot be directly created, updated or deleted via the Zabbix API.

The item object has the following properties.

| Property | Type | Description |
|---------------|--------|--|
| itemid | ID | ID of the item. Property behavior: - <i>read-only</i> |
| delay | string | - <i>required</i> for update operations Update interval of the item. Accepts seconds or time unit with suffix (e.g., 30s, 1m, 2h, 1d) and, optionally, one or more custom intervals , all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {\$FLEX_INTERVAL}/{FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{\$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{\$Macro2} |
| hostid | ID | Property behavior: - <i>required</i> if type is set to "Zabbix agent" (0), "Simple check" (3), "Zabbix internal" (5), "External check" (10), "Database monitor" (11), "IPMI agent" (12), "SSH agent" (13), "TELNET agent" (14), "Calculated" (15), "JMX agent" (16), "HTTP agent" (19), "SNMP agent" (20), "Script" (21), "Browser" (22), or if type is set to "Zabbix agent (active)" (7) and key_ does not contain "mqtt.get" ID of the host or template that the item belongs to. |
| interfaceid | ID | Property behavior: - <i>constant</i> - <i>required</i> for create operations ID of the item's host interface. |
| key_ | string | Property behavior: - <i>required</i> if item belongs to host and type is set to "Zabbix agent", "IPMI agent", "JMX agent", "SNMP trap", or "SNMP agent" - <i>supported</i> if item belongs to host and type is set to "Simple check", "External check", "SSH agent", "TELNET agent", or "HTTP agent" - <i>read-only</i> for discovered objects Item key. |
| name | string | Property behavior: - <i>required</i> for create operations - <i>read-only</i> for inherited objects or discovered objects Name of the item. Supports user macros. |
| name_resolved | string | Property behavior: - <i>required</i> for create operations - <i>read-only</i> for inherited objects or discovered objects Name of the item with resolved user macros. Property behavior: - <i>read-only</i> |

| Property | Type | Description |
|-------------|---------|--|
| type | integer | <p>Type of the item.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 9 - Web item; 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 15 - Calculated; 16 - JMX agent; 17 - SNMP trap; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects or discovered objects |
| url | string | <p>URL string.</p> <p>Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| value_type | integer | <p>Type of information of the item.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text; 5 - binary. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects or discovered objects |
| allow_traps | integer | <p>Allow to populate value similarly to the trapper item.</p> <p>0 - (<i>default</i>) Do not allow to accept incoming data; 1 - Allow to accept incoming data.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for discovered objects |

| Property | Type | Description |
|------------------|---------|---|
| authtype | integer | <p>Authentication method.</p> <p>Possible values if type is set to "SSH agent": 0 - <i>(default)</i> password; 1 - public key.</p> <p>Possible values if type is set to "HTTP agent": 0 - <i>(default)</i> none; 1 - basic; 2 - NTLM; 3 - Kerberos.</p> <p>Property behavior: - <i>supported</i> if type is set to "SSH agent" or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent") or discovered objects</p> |
| description | string | <p>Description of the item.</p> <p>Property behavior: - <i>read-only</i> for discovered objects</p> |
| error | string | <p>Error text if there are problems updating the item value.</p> <p>Property behavior: - <i>read-only</i></p> |
| flags | integer | <p>Origin of the item.</p> <p>Possible values: 0 - a plain item; 4 - a discovered item.</p> <p>Property behavior: - <i>read-only</i></p> |
| follow_redirects | integer | <p>Follow response redirects while polling data.</p> <p>Possible values: 0 - Do not follow redirects; 1 - <i>(default)</i> Follow redirects.</p> <p>Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects</p> |
| headers | array | <p>Array of headers that will be sent when performing an HTTP request.</p> <p>Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects</p> |
| history | string | <p>A time unit of how long the history data should be stored. Also accepts user macro.</p> <p>Default: 31d.</p> <p>Property behavior: - <i>read-only</i> for discovered objects</p> |
| http_proxy | string | <p>HTTP(S) proxy connection string.</p> <p>Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects</p> |

| Property | Type | Description |
|----------------|-----------|---|
| inventory_link | integer | <p>ID of the host inventory field that is populated by the item.</p> <p>Refer to the host inventory page for a list of supported host inventory fields and their IDs.</p> <p>Default: 0.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if value_type is set to "numeric float", "character", "numeric unsigned", or "text" - <i>read-only</i> for discovered objects |
| ipmi_sensor | string | <p>IPMI sensor.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "IPMI agent" and key_ is not set to "ipmi.get" - <i>supported</i> if type is set to "IPMI agent" - <i>read-only</i> for inherited objects or discovered objects |
| jmx_endpoint | string | <p>JMX agent custom connection string.</p> <p>Default value: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "JMX agent" - <i>read-only</i> for discovered objects |
| lastclock | timestamp | <p>Time when the item value was last updated.</p> <p>By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of <i>Max history display period</i> parameter in the Administration → General menu section.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> |
| lastns | integer | <p>Nanoseconds when the item value was last updated.</p> <p>By default, only values that fall within the last 24 hours are displayed. | output_format | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Dependent item" - <i>read-only</i> for inherited objects or discovered objects <p>Should the response be converted to JSON.</p> <p>0 - (<i>default</i>) Store raw; 1 - Convert to JSON.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| params | string | <p>Additional parameters depending on the type of the item:</p> <ul style="list-style-type: none"> - executed script for SSH agent and TELNET agent items; - SQL query for database monitor items; - formula for calculated items; - the script for script and browser items. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Database monitor", "SSH agent", "TELNET agent", "Calculated", "Script", or "Browser" - <i>read-only</i> for inherited objects (if type is set to "Script" or "Browser") or discovered objects |
| parameters | object/array | <p>Additional parameters if type is set to "Script" or "Browser". Array of objects with name and value properties, where name must be unique.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "Script" or "Browser" - <i>read-only</i> for inherited objects or discovered objects |
| password | string | <p>Password for authentication.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "JMX agent" and username is set - <i>supported</i> if type is set to "Simple check", "SSH agent", "TELNET agent", "Database monitor", or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent") or discovered objects |
| post_type | integer | <p>Type of post data body stored in posts property.</p> <p>Possible values:</p> <p>0 - (<i>default</i>) Raw data; 2 - JSON data; 3 - XML data.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| posts | string | <p>HTTP(S) request body data.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "HTTP agent" and post_type is set to "JSON data" or "XML data" - <i>supported</i> if type is set to "HTTP agent" and post_type is set to "Raw data" - <i>read-only</i> for inherited objects or discovered objects |

| Property | Type | Description |
|----------------|---------|---|
| prevvalue | string | <p>Previous value of the item.</p> <p>By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of <i>Max history display period</i> parameter in the <i>Administration → General</i> menu section.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> |
| privatekey | string | <p>Name of the private key file.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SSH agent" and authtype is set to "public key" - <i>read-only</i> for discovered objects |
| publickey | string | <p>Name of the public key file.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SSH agent" and authtype is set to "public key" - <i>read-only</i> for discovered objects |
| query_fields | array | <p>Array of query fields that will be sent when performing an HTTP request.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| request_method | integer | <p>Type of request method.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) GET; 1 - POST; 2 - PUT; 3 - HEAD. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| retrieve_mode | integer | <p>What part of response should be stored.</p> <p>Possible values if request_method is set to "GET", "POST", or "PUT":</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) Body; 1 - Headers; 2 - Both body and headers will be stored. <p>Possible values if request_method is set to "HEAD":</p> <ul style="list-style-type: none"> 1 - Headers. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| snmp_oid | string | <p>SNMP OID.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SNMP agent" - <i>read-only</i> for inherited objects or discovered objects |
| ssl_cert_file | string | <p>Public SSL Key file path.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |

| Property | Type | Description |
|------------------|---------|--|
| ssl_key_file | string | Private SSL Key file path. |
| ssl_key_password | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects Password for SSL Key file. |
| state | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects State of the item. <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) normal; 1 - not supported. |
| status | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> Status of the item. <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) enabled item; 1 - disabled item. |
| status_codes | string | Ranges of required HTTP status codes, separated by commas. Also supports user macros as part of comma separated list. <p>Example: 200,200-{\$M},{M},200-400</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| templateid | ID | ID of the parent template item. <p><i>Hint:</i> Use the <code>hostid</code> property to specify the template that the item belongs to.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> |
| timeout | string | Item data polling request timeout. Accepts seconds or time unit with suffix (e.g., 30s, 1m). Also accepts user macros. <p>Possible values range: 1-600s.</p> <p>Default: "" - use proxy/global settings.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "Zabbix agent" (0), "Simple check" (3) and <code>key_</code> does not start with "vmware." and "icmpping", "Zabbix agent (active)" (7), "External check" (10), "Database monitor" (11), "SSH agent" (13), "TELNET agent" (14), "HTTP agent" (19), "SNMP agent" (20) and <code>snmp_oid</code> starts with "walk[" or "get[" , "Script" (21), "Browser" (22) - <i>read-only</i> for inherited and discovered objects |
| trapper_hosts | string | Allowed hosts. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>readonly</i> for discovered objects - <i>supported</i> if type is set to "Zabbix trapper", or if type is set to "HTTP agent" and <code>allow_traps</code> is set to "Allow to accept incoming data" |

| Property | Type | Description |
|-------------|---------|--|
| trends | string | <p>A time unit of how long the trends data should be stored. Also accepts user macro.</p> <p>Default: 365d.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>value_type</code> is set to "numeric float" or "numeric unsigned" - <i>read-only</i> for discovered objects |
| units | string | <p>Value units.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>value_type</code> is set to "numeric float" or "numeric unsigned" - <i>read-only</i> for inherited objects or discovered objects |
| username | string | <p>Username for authentication.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>type</code> is set to "SSH agent", "TELNET agent", or if <code>type</code> is set to "JMX agent" and <code>password</code> is set - <i>supported</i> if <code>type</code> is set to "Simple check", "Database monitor", or "HTTP agent" - <i>read-only</i> for inherited objects (if <code>type</code> is set to "HTTP agent") or discovered objects |
| uuid | string | <p>Universal unique identifier, used for linking imported item to already existing ones. Auto-generated, if not given.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if the item belongs to a template |
| valuemapid | ID | <p>ID of the associated value map.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>value_type</code> is set to "numeric float", "character", or "numeric unsigned" - <i>read-only</i> for inherited objects or discovered objects |
| verify_host | integer | <p>Whether to validate that the host name for the connection matches the one in the host's certificate.</p> <p>Possible values: 0 - (<i>default</i>) Do not validate; 1 - Validate.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>type</code> is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |
| verify_peer | integer | <p>Whether to validate that the host's certificate is authentic.</p> <p>Possible values: 0 - (<i>default</i>) Do not validate; 1 - Validate.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>type</code> is set to "HTTP agent" - <i>read-only</i> for inherited objects or discovered objects |

HTTP header

The header object has the following properties:

| Property | Type | Description |
|----------|--------|---|
| name | string | HTTP header name. Property behavior: - <i>required</i> |
| value | string | Header value. Property behavior: - <i>required</i> |

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

| Property | Type | Description |
|----------|--------|--|
| name | string | Name of the parameter. Property behavior: - <i>required</i> |
| value | string | Parameter value. Property behavior: - <i>required</i> |

Item tag

The item tag object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| tag | string | Item tag name. Property behavior: - <i>required</i> |
| value | string | Item tag value. |

Item preprocessing

The item preprocessing object has the following properties.

| Property | Type | Description |
|----------|---------|---|
| type | integer | <p>The preprocessing option type.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 1 - Custom multiplier; 2 - Right trim; 3 - Left trim; 4 - Trim; 5 - Regular expression; 6 - Boolean to decimal; 7 - Octal to decimal; 8 - Hexadecimal to decimal; 9 - Simple change; 10 - Change per second; 11 - XML XPath; 12 - JSONPath; 13 - In range; 14 - Matches regular expression; 15 - Does not match regular expression; 16 - Check for error in JSON; 17 - Check for error in XML; 18 - Check for error using regular expression; 19 - Discard unchanged; 20 - Discard unchanged with heartbeat; 21 - JavaScript; 22 - Prometheus pattern; 23 - Prometheus to JSON; 24 - CSV to JSON; 25 - Replace; 26 - Check unsupported; 27 - XML to JSON; 28 - SNMP walk value; 29 - SNMP walk to JSON; 30 - SNMP get value. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| params | string | <p>Additional parameters used by preprocessing option.</p> <p>Multiple parameters are separated by the newline (\n) character.</p> <p>If type is set to "Check unsupported", the parameters follow a <scope>[\n<pattern>] syntax, where <i>pattern</i> is a regular expression, and <i>scope</i> is one of:</p> <ul style="list-style-type: none"> -1 - match any error; 0 - check if error message matches <i>pattern</i>; 1 - check if error message does not match <i>pattern</i>. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Custom multiplier" (1), "Right trim" (2), "Left trim" (3), "Trim" (4), "Regular expression" (5), "XML XPath" (11), "JSONPath" (12), "In range" (13), "Matches regular expression" (14), "Does not match regular expression" (15), "Check for error in JSON" (16), "Check for error in XML" (17), "Check for error using regular expression" (18), "Discard unchanged with heartbeat" (20), "JavaScript" (21), "Prometheus pattern" (22), "Prometheus to JSON" (23), "CSV to JSON" (24), "Replace" (25), Check unsupported (26), "SNMP walk value" (28), "SNMP walk to JSON" (29), or "SNMP get value" (30) |

| Property | Type | Description |
|----------------------|---------|--|
| error_handler | integer | <p>Action type used in case of preprocessing step failure.</p> <p>Possible values:</p> <p>0 - Error message is set by Zabbix server;</p> <p>1 - Discard value;</p> <p>2 - Set custom value;</p> <p>3 - Set custom error message.</p> <p>Possible values if type is set to "Check unsupported":</p> <p>1 - Discard value;</p> <p>2 - Set custom value;</p> <p>3 - Set custom error message.</p> <p>Property behavior:</p> <p>- <i>required</i> if type is set to "Custom multiplier" (1), "Regular expression" (5), "Boolean to decimal" (6), "Octal to decimal" (7), "Hexadecimal to decimal" (8), "Simple change" (9), "Change per second" (10), "XML XPath" (11), "JSONPath" (12), "In range" (13), "Matches regular expression" (14), "Does not match regular expression" (15), "Check for error in JSON" (16), "Check for error in XML" (17), "Check for error using regular expression" (18), "Prometheus pattern" (22), "Prometheus to JSON" (23), "CSV to JSON" (24), "Check unsupported" (26), "XML to JSON" (27), "SNMP walk value" (28), "SNMP walk to JSON" (29), or "SNMP get value" (30)</p> |
| error_handler_params | string | <p>Error handler parameters.</p> <p>Property behavior:</p> <p>- <i>required</i> if error_handler is set to "Set custom value" or "Set custom error message"</p> |

The following parameters and error handlers are supported for each preprocessing type.

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|---------------------------------|---------------------------------|---------------------|-------------|--------------------------|
| 1 | Custom number ^{1, 6} | | | | 0, 1, 2, 3 |
| 2 | multiplier | list of characters ² | | | |
| 3 | Right trim | list of characters ² | | | |
| 4 | Left trim | list of characters ² | | | |
| 5 | Trim | list of characters ² | output ² | | 0, 1, 2, 3 |
| 6 | Regular expression ³ | | | | 0, 1, 2, 3 |
| 7 | Boolean to decimal | | | | 0, 1, 2, 3 |
| 8 | Octal to decimal | | | | 0, 1, 2, 3 |
| | Hexadecimal to decimal | | | | 0, 1, 2, 3 |

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|---|-------------------------|---------------------------|------------------------|--------------------------|
| 9 | Simple change | | | | 0, 1, 2, 3 |
| 10 | Change per sec- ond | | | | 0, 1, 2, 3 |
| 11 | XML XPath | path ⁴ | | | 0, 1, 2, 3 |
| 12 | JSONPath | path ⁴ | | | 0, 1, 2, 3 |
| 13 | In range | min ^{1, 6} | max ^{1, 6} | | 0, 1, 2, 3 |
| 14 | Matches regu- lar ex- pres- sion | pattern ³ | | | 0, 1, 2, 3 |
| 15 | Does not match regu- lar ex- pres- sion | pattern ³ | | | 0, 1, 2, 3 |
| 16 | Check for error in JSON | path ⁴ | | | 0, 1, 2, 3 |
| 17 | Check for error in XML | path ⁴ | | | 0, 1, 2, 3 |
| 18 | Check for error us- ing regu- lar ex- pres- sion | pattern ³ | output ² | | 0, 1, 2, 3 |
| 19 | Discard un- changed | | | | |
| 20 | Discard un- changed with heart- beat | seconds ^{5, 6} | | | |
| 21 | JavaScript | script ² | | | |
| 22 | Prometh- pat- tern | pattern ^{6, 7} | value, label, function | output ^{8, 9} | 0, 1, 2, 3 |
| 23 | Prometh- to JSON | pattern ^{6, 7} | | | 0, 1, 2, 3 |

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|---|---|--|--|--------------------------|
| 24 | CSV to JSON | character ² | character ² | 0,1 | 0, 1, 2, 3 |
| 25 | Replace search string ² | | replacement ² | | |
| 26 | Check scope ¹ un- sup- ported | | pattern ^{3, 6} | | 1, 2, 3 |
| 27 | XML to JSON | | | | 0, 1, 2, 3 |
| 28 | SNMP walk value | OID ² | Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | | 0, 1, 2, 3 |
| 29 | SNMP walk to JSON ¹⁰ | Field name ² | OID prefix ² | Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | 0, 1, 2, 3 |
| 30 | SNMP get value | Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | | | 0, 1, 2, 3 |

¹ integer or floating-point number

² string

³ regular expression

⁴ JSONPath or XML XPath

⁵ positive integer (with support of time suffixes, e.g. 30s, 1m, 2h, 1d)

⁶ user macro

⁷ Prometheus pattern following the syntax: <metric name>{<label name>=<label value>," ..."} == <value>. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.

⁸ Prometheus output following the syntax: <label name> (can be a user macro) if label is selected as the second parameter.

⁹ One of the aggregation functions: sum, min, max, avg, count if function is selected as the second parameter.

¹⁰ Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

item.create

Description

object item.create(object/array items)

This method allows to create new items.

Note:

Web items cannot be created via the Zabbix API.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Items to create.

Additionally to the [standard item properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---------------|-------|---|
| preprocessing | array | Item preprocessing options. |
| tags | array | Item tags . |

Return values

(object) Returns an object containing the IDs of the created items under the `itemids` property. The order of the returned IDs matches the order of the passed items.

Examples**Creating an item**

Create a numeric Zabbix agent item with 2 item tags to monitor free disk space on host with ID "30074".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Free disk space on /home/joe/",
    "key_": "vfs.fs.size[/home/joe/,free]",
    "hostid": "30074",
    "type": 0,
    "value_type": 3,
    "interfaceid": "30084",
    "tags": [
      {
        "tag": "component",
        "value": "storage"
      },
      {
        "tag": "equipment",
        "value": "workstation"
      }
    ],
    "delay": "30s"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "24758"
    ]
  },
  "id": 1
}
```

Creating a host inventory item

Create a Zabbix agent item to populate the host's "OS" inventory field.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "uname",
    "key_": "system.uname",
    "hostid": "30021",
    "type": 0,
    "interfaceid": "30007",
    "value_type": 1,
    "delay": "10s",
    "inventory_link": 5
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "24759"
    ]
  },
  "id": 1
}
```

Creating an item with preprocessing

Create an item using custom multiplier.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Device uptime",
    "key_": "sysUpTime",
    "hostid": "11312",
    "type": 4,
    "snmp_oid": "SNMPv2-MIB::sysUpTime.0",
    "value_type": 1,
    "delay": "60s",
    "units": "uptime",
    "interfaceid": "1156",
    "preprocessing": [
      {
        "type": 1,
        "params": "0.01",
        "error_handler": 1,
        "error_handler_params": ""
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
```

```

        "44210"
    ],
    },
    "id": 1
}

```

Creating dependent item

Create a dependent item for the master item with ID 24759. Only dependencies on the same host are allowed, therefore master and the dependent item should have the same hostid.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "hostid": "30074",
    "name": "Dependent test item",
    "key_": "dependent.item",
    "type": 18,
    "master_itemid": "24759",
    "value_type": 2
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}

```

Create HTTP agent item

Create POST request method item with JSON response preprocessing.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "url": "http://127.0.0.1/http.php",
    "query_fields": [
      {
        "name": "mode",
        "value": "json"
      },
      {
        "name": "min",
        "value": "10"
      },
      {
        "name": "max",
        "value": "100"
      }
    ],
    "interfaceid": "1",
    "type": 19,
    "hostid": "10254",
  }
}

```

```

    "delay": "5s",
    "key_": "json",
    "name": "HTTP agent example JSON",
    "value_type": 0,
    "output_format": 1,
    "preprocessing": [
      {
        "type": 12,
        "params": "$.random",
        "error_handler": 0,
        "error_handler_params": ""
      }
    ],
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}

```

Create script item

Create a simple data collection using a script item.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "item.create",
  "params": {
    "name": "Script example",
    "key_": "custom.script.item",
    "hostid": "12345",
    "type": 21,
    "value_type": 4,
    "params": "var request = new HttpRequest();\nreturn request.post(\"https://postman-echo.com/post\")",
    "parameters": [
      {
        "name": "host",
        "value": "{HOST.CONN}"
      }
    ],
    "timeout": "6s",
    "delay": "30s"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}

```

```
"id": 1
}
```

Source

CItem::create() in *ui/include/classes/api/services/CItem.php*.

item.delete

Description

object item.delete(array itemIds)

This method allows to delete items.

Note:

Web items cannot be deleted via the Zabbix API.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the items to delete.

Return values

(object) Returns an object containing the IDs of the deleted items under the *itemids* property.

Examples

Deleting multiple items

Delete two items.

Dependent items and item prototypes are removed automatically if master item is deleted.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.delete",
  "params": [
    "22982",
    "22986"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22982",
      "22986"
    ]
  },
  "id": 1
}
```

Source

CItem::delete() in *ui/include/classes/api/services/CItem.php*.

item.get

Description

integer/array item.get(object parameters)

The method allows to retrieve items according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------|----------|--|
| itemids | ID/array | Return only items with the given IDs. |
| groupids | ID/array | Return only items that belong to the hosts from the given groups. |
| templateids | ID/array | Return only items that belong to the given templates. |
| hostids | ID/array | Return only items that belong to the given hosts. |
| proxyids | ID/array | Return only items that are monitored by the given proxies. |
| interfaceids | ID/array | Return only items that use the given host interfaces. |
| graphids | ID/array | Return only items that are used in the given graphs. |
| triggerids | ID/array | Return only items that are used in the given triggers. |
| webitems | flag | Include web items in the result. |
| inherited | boolean | If set to true return only items inherited from a template. |
| templated | boolean | If set to true return only items that belong to templates. |
| monitored | boolean | If set to true return only enabled items that belong to monitored hosts. |
| group | string | Return only items that belong to a group with the given name. |
| host | string | Return only items that belong to a host with the given name. |
| evaltype | integer | Rules for tag searching. Possible values: 0 - (default) And/Or; 2 - Or. |
| tags | array | Return only items with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value. Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]. An empty array returns all items. Possible operator types: 0 - (default) Like; 1 - Equal; 2 - Not like; 3 - Not equal; 4 - Exists; 5 - Not exists. |
| with_triggers | boolean | If set to true return only items that are used in triggers. |
| selectHosts | query | Return a hosts property with an array of hosts that the item belongs to. |
| selectInterfaces | query | Return an interfaces property with an array of host interfaces used by the item. |
| selectTriggers | query | Return a triggers property with the triggers that the item is used in. |
| selectGraphs | query | Supports count. Return a graphs property with the graphs that contain the item. |
| | | Supports count. |

| Parameter | Type | Description |
|------------------------|--------------|---|
| selectDiscoveryRule | query | Return a discoveryRule property with the LLD rule that created the item. |
| selectItemDiscovery | query | Return an itemDiscovery property with the item discovery object. The item discovery object links the item to an item prototype from which it was created. It has the following properties: itemdiscoveryid - (string) ID of the item discovery; itemid - (string) ID of the discovered item; parent_itemid - (string) ID of the item prototype from which the item has been created; key_ - (string) key of the item prototype; lastcheck - (timestamp) time when the item was last discovered; status - (int) item discovery status: 0 - (default) item is discovered, 1 - item is not discovered anymore; ts_delete - (timestamp) time when an item that is no longer discovered will be deleted; ts_disable - (timestamp) time when an item that is no longer discovered will be disabled; disable_source - (int) indicator of whether item was disabled by an LLD rule or manually: 0 - (default) disabled automatically, 1 - disabled by an LLD rule. |
| selectPreprocessing | query | Return a preprocessing property with item preprocessing options. |
| selectTags | query | Return the item tags in tags property. |
| selectValueMap | query | Return a valuemap property with item value map. |
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of text data type . Supports additional properties: host - technical name of the host that the item belongs to. Limits the number of records returned by subselects. Applies to the following subselects: selectGraphs - results will be sorted by name; selectTriggers - results will be sorted by description. Sort the result by the given properties. Possible values: itemid , name , key_ , delay , history , trends , type , status . These parameters are described in the reference commentary . |
| limitSelects | integer | |
| sortfield | string/array | |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;

- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Finding items by key

Retrieve all items used in triggers for specific host ID that have word "system.cpu" in the item key and sort results by name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.get",
  "params": {
    "output": "extend",
    "hostids": "10084",
    "with_triggers": true,
    "search": {
      "key_": "system.cpu"
    },
    "sortfield": "name"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "42269",
      "type": "18",
      "snmp_oid": "",
      "hostid": "10084",
      "name": "CPU utilization",
      "key_": "system.cpu.util",

Retrieving items with preprocessing rules

Retrieve all items and their preprocessing rules for specific host ID.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.get",
  "params": {
    "output": ["itemid", "name", "key_"],
    "selectPreprocessing": "extend",
    "hostids": "10254"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemid": "23865",
    "name": "HTTP agent example JSON",
    "key_": "json",
    "preprocessing": [
      {
        "type": "12",
        "params": "$.random",
        "error_handler": "1",
        "error_handler_params": ""
      }
    ]
  },
  "id": 1
}
```

Source

CItem::get() in `ui/include/classes/api/services/CItem.php`.

item.update

Description

object item.update(object/array items)

This method allows to update existing items.

Note:

Web items cannot be updated via the Zabbix API.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Item properties to be updated.

The `itemid` property must be defined for each item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard item properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|---------------|-------|---|
| preprocessing | array | Item preprocessing options to replace the current preprocessing options. Parameter behavior: - <i>read-only</i> for inherited objects or discovered objects |
| tags | array | Item tags. Parameter behavior: - <i>read-only</i> for discovered objects |

Return values

(object) Returns an object containing the IDs of the updated items under the `itemids` property.

Examples

Enabling an item

Enable an item, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "10092",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "10092"
    ]
  },
  "id": 1
}
```

Update dependent item

Update Dependent item name and Master item ID. Only dependencies on same host are allowed, therefore Master and Dependent item should have same `hostid`.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "name": "Dependent item updated name",
    "master_itemid": "25562",
    "itemid": "189019"
  },
  "id": 1
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "189019"
    ]
  },
  "id": 1
}
```

Update HTTP agent item

Enable item value trapping.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "23856",
    "allow_traps": 1
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23856"
    ]
  },
  "id": 1
}
```

Updating an item with preprocessing

Update an item with item preprocessing rule "In range".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "23856",
    "preprocessing": [
      {
        "type": 13,
        "params": "\n100",
        "error_handler": 1,
        "error_handler_params": ""
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23856"
    ]
  },
  "id": 1
}
```

Updating a script item

Update a script item with a different script and remove unnecessary parameters that were used by previous script.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "item.update",
  "params": {
    "itemid": "23865",
    "parameters": [],
    "script": "Zabbix.log(3, 'Log test');\nreturn 1;"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}
```

CItem::update() in *ui/include/classes/api/services/CItem.php*.

Item prototype

This class is designed to work with item prototypes.

Object references:

- [Item prototype](#)
 - HTTP header
 - HTTP query field
- [Item prototype tag](#)
- [Item prototype preprocessing](#)

Available methods:

- [itemprototype.create](#) - create new item prototypes
- [itemprototype.delete](#) - delete item prototypes
- [itemprototype.get](#) - retrieve item prototypes
- [itemprototype.update](#) - update item prototypes

Item prototype object

The following objects are directly related to the `itemprototype` API.

Item prototype

The item prototype object has the following properties.

| Property | Type | Description |
|-------------|--------|--|
| itemid | ID | ID of the item prototype. |
| delay | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Update interval of the item prototype.</p> <p>Accepts seconds or time unit with suffix (e.g., 30s, 1m, 2h, 1d) and, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals.</p> <p>Accepts user macros and LLD macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {\$FLEX_INTERVAL}/{FLEX_PERIOD}).</p> <p>Example: 1h;wd1-5h9-18;{\$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{\$Macro2}</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Zabbix agent" (0), "Simple check" (3), "Zabbix internal" (5), "External check" (10), "Database monitor" (11), "IPMI agent" (12), "SSH agent" (13), "TELNET agent" (14), "Calculated" (15), "JMX agent" (16), "HTTP agent" (19), "SNMP agent" (20), "Script" (21), "Browser" (22), or if type is set to "Zabbix agent (active)" (7) and key_ does not contain "mqtt.get" |
| hostid | ID | ID of the host that the item prototype belongs to. |
| interfaceid | ID | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>constant</i> - <i>required</i> for create operations <p>ID of the item prototype's host interface.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if item prototype belongs to host and type is set to "Zabbix agent", "IPMI agent", "JMX agent", "SNMP trap", or "SNMP agent" - <i>supported</i> if item prototype belongs to host and type is set to "Simple check", "External check", "SSH agent", "TELNET agent", or "HTTP agent" |
| key_ | string | Item prototype key. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects <p>Name of the item prototype.</p> <p>Supports user macros.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects |

| Property | Type | Description |
|-------------|---------|---|
| type | integer | <p>Type of the item prototype.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 15 - Calculated; 16 - JMX agent; 17 - SNMP trap; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects |
| url | string | <p>URL string.</p> <p>Supports LLD macros, user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| value_type | integer | <p>Type of information of the item prototype.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text; 5 - binary. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects |
| allow_traps | integer | <p>Allow to populate value similarly to the trapper item.</p> <p>0 - (<i>default</i>) Do not allow to accept incoming data; 1 - Allow to accept incoming data.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" |

| Property | Type | Description |
|------------------|---------|---|
| authtype | integer | <p>Authentication method.</p> <p>Possible values if type is set to "SSH agent": 0 - (default) password; 1 - public key.</p> <p>Possible values if type is set to "HTTP agent": 0 - (default) none; 1 - basic; 2 - NTLM; 3 - Kerberos.</p> <p>Property behavior: - <i>supported</i> if type is set to "SSH agent" or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent")</p> |
| description | string | Description of the item prototype. |
| follow_redirects | integer | <p>Follow response redirects while polling data.</p> <p>Possible values: 0 - Do not follow redirects; 1 - (default) Follow redirects.</p> <p>Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects</p> |
| headers | array | <p>Array of headers that will be sent when performing an HTTP request.</p> <p>Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects</p> |
| history | string | <p>A time unit of how long the history data should be stored. Also accepts user macro and LLD macro.</p> |
| http_proxy | string | <p>Default: 31d. HTTP(S) proxy connection string.</p> <p>Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects</p> |
| ipmi_sensor | string | <p>IPMI sensor.</p> <p>Property behavior: - <i>required</i> if type is set to "IPMI agent" and key_ is not set to "ipmi.get" - <i>supported</i> if type is set to "IPMI agent" - <i>read-only</i> for inherited objects</p> |
| jmx_endpoint | string | <p>JMX agent custom connection string.</p> <p>Default: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi</p> <p>Property behavior: - <i>supported</i> if type is set to "JMX agent"</p> |
| logtimefmt | string | <p>Format of the time in log entries.</p> <p>Property behavior: - <i>supported</i> if value_type is set to "log" - <i>read-only</i> for inherited objects</p> |

| Property | Type | Description |
|---------------|--------------|--|
| master_itemid | ID | ID of the master item. |
| output_format | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Dependent item" - <i>read-only</i> for inherited objects <p>Should the response be converted to JSON.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) Store raw; 1 - Convert to JSON. |
| params | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects <p>Additional parameters depending on the type of the item prototype:</p> <ul style="list-style-type: none"> - executed script for SSH agent and TELNET agent item prototypes; - SQL query for database monitor item prototypes; - formula for calculated item prototypes; - the script for script and browser item prototypes. |
| parameters | object/array | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Database monitor", "SSH agent", "TELNET agent", "Calculated", "Script", or "Browser" - <i>read-only</i> for inherited objects (if type is set to "Script" or "Browser") <p>Additional parameters if type is set to "Script" or "Browser". | status | integer | <p>Status of the item prototype.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (default) enabled item prototype; 1 - disabled item prototype; 3 - unsupported item prototype. |

| Property | Type | Description |
|---------------|--------|--|
| status_codes | string | <p>Ranges of required HTTP status codes, separated by commas. Also supports user macros or LLD macros as part of comma separated list.</p> <p>Example: 200,200-{\$M},{\$M},200-400</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| templateid | ID | <p>ID of the parent template item prototype.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> |
| timeout | string | <p>Item data polling request timeout. Accepts seconds or time unit with suffix (e.g., 30s, 1m). Also accepts user macros and LLD macros.</p> <p>Possible values range: 1-600s.</p> <p>Default: "" - use proxy/global settings.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "Zabbix agent" (0), "Simple check" (3) and key_ does not start with "vmware." and "icmpping", "Zabbix agent (active)" (7), "External check" (10), "Database monitor" (11), "SSH agent" (13), "TELNET agent" (14), "HTTP agent" (19), "SNMP agent" (20) and snmp_oid starts with "walk[" or "get[" , "Script" (21), "Browser" (22) - <i>read-only</i> for inherited objects |
| trapper_hosts | string | <p>Allowed hosts.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "Zabbix trapper", or if type is set to "HTTP agent" and allow_traps is set to "Allow to accept incoming data" |
| trends | string | <p>A time unit of how long the trends data should be stored. Also accepts user macro and LLD macro.</p> <p>Default: 365d.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if value_type is set to "numeric float" or "numeric unsigned" |
| units | string | <p>Value units.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if value_type is set to "numeric float" or "numeric unsigned" - <i>read-only</i> for inherited objects |
| username | string | <p>Username for authentication.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SSH agent" or "TELNET agent", or if type is set to "JMX agent" and password is set - <i>supported</i> if type is set to "Simple check", "Database monitor", or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent") |
| uuid | string | <p>Universal unique identifier, used for linking imported item prototypes to already existing ones. Auto-generated, if not given.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if the item prototype belongs to a template |

| Property | Type | Description |
|-------------|---------|---|
| valuemapid | ID | ID of the associated value map. |
| verify_host | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if value_type is set to "numeric float", "character", or "numeric unsigned" - <i>read-only</i> for inherited objects <p>Whether to validate that the host name for the connection matches the one in the host's certificate.</p> <p>Possible values:</p> <p>0 - (<i>default</i>) Do not validate;</p> <p>1 - Validate.</p> |
| verify_peer | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects <p>Whether to validate that the host's certificate is authentic.</p> <p>Possible values:</p> <p>0 - (<i>default</i>) Do not validate;</p> <p>1 - Validate.</p> |
| discover | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects <p>Item prototype discovery status.</p> <p>Possible values:</p> <p>0 - (<i>default</i>) new items will be discovered;</p> <p>1 - new items will not be discovered and existing items will be marked as lost.</p> |

HTTP header

The header object has the following properties:

| Property | Type | Description |
|----------|--------|---|
| name | string | HTTP header name. Property behavior: - <i>required</i> |
| value | string | Header value. Property behavior: - <i>required</i> |

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

| Property | Type | Description |
|----------|--------|--|
| name | string | Name of the parameter. Property behavior: - <i>required</i> |
| value | string | Parameter value. Property behavior: - <i>required</i> |

Item prototype tag

The item prototype tag object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| tag | string | Item prototype tag name. |
| value | string | <p>Property behavior: - <i>required</i></p> Item prototype tag value. |

Item prototype preprocessing

The item prototype preprocessing object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| type | integer | <p>The preprocessing option type.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 1 - Custom multiplier; 2 - Right trim; 3 - Left trim; 4 - Trim; 5 - Regular expression; 6 - Boolean to decimal; 7 - Octal to decimal; 8 - Hexadecimal to decimal; 9 - Simple change; 10 - Change per second; 11 - XML XPath; 12 - JSONPath; 13 - In range; 14 - Matches regular expression; 15 - Does not match regular expression; 16 - Check for error in JSON; 17 - Check for error in XML; 18 - Check for error using regular expression; 19 - Discard unchanged; 20 - Discard unchanged with heartbeat; 21 - JavaScript; 22 - Prometheus pattern; 23 - Prometheus to JSON; 24 - CSV to JSON; 25 - Replace; 26 - Check unsupported; 27 - XML to JSON; 28 - SNMP walk value; 29 - SNMP walk to JSON; 30 - SNMP get value. <p>Property behavior: - <i>required</i></p> |

| Property | Type | Description |
|----------------------|---------|---|
| params | string | <p>Additional parameters used by preprocessing option. Multiple parameters are separated by the newline (\n) character.</p> <p>If type is set to "Check unsupported", the parameters follow a <code><scope>[\n<pattern>]</code> syntax, where <i>pattern</i> is a regular expression, and <i>scope</i> is one of:</p> <ul style="list-style-type: none"> -1 - match any error; 0 - check if error message matches <i>pattern</i>; 1 - check if error message does not match <i>pattern</i>. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Custom multiplier" (1), "Right trim" (2), "Left trim" (3), "Trim" (4), "Regular expression" (5), "XML XPath" (11), "JSONPath" (12), "In range" (13), "Matches regular expression" (14), "Does not match regular expression" (15), "Check for error in JSON" (16), "Check for error in XML" (17), "Check for error using regular expression" (18), "Discard unchanged with heartbeat" (20), "JavaScript" (21), "Prometheus pattern" (22), "Prometheus to JSON" (23), "CSV to JSON" (24), "Replace" (25), "Check unsupported" (26), "SNMP walk value" (28), "SNMP walk to JSON" (29), or "SNMP get value" (30) |

The following parameters and error handlers are supported for each preprocessing type.

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|-------------------------------|---------------------------------|-------------|-------------|--------------------------|
| 1 | Custom number ^{1, 6} | | | | 0, 1, 2, 3 |
| 2 | Right trim | list of characters ² | | | |

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|-----------------------------------|---------------------------------|---------------------|-------------|--------------------------|
| 3 | Left trim | list of characters ² | | | |
| 4 | Trim | list of characters ² | | | |
| 5 | Regular expression | pattern ³ | output ² | | 0, 1, 2, 3 |
| 6 | Boolean to decimal | | | | 0, 1, 2, 3 |
| 7 | Octal to decimal | | | | 0, 1, 2, 3 |
| 8 | Hexadecimal to decimal | | | | 0, 1, 2, 3 |
| 9 | Simple change | | | | 0, 1, 2, 3 |
| 10 | Change per second | | | | 0, 1, 2, 3 |
| 11 | XML XPath | path ⁴ | | | 0, 1, 2, 3 |
| 12 | JSONPath | path ⁴ | | | 0, 1, 2, 3 |
| 13 | In range | min ^{1, 6} | max ^{1, 6} | | 0, 1, 2, 3 |
| 14 | Matches regular expression | pattern ³ | | | 0, 1, 2, 3 |
| 15 | Does not match regular expression | pattern ³ | | | 0, 1, 2, 3 |
| 16 | Check for error in JSON | path ⁴ | | | 0, 1, 2, 3 |
| 17 | Check for error in XML | path ⁴ | | | 0, 1, 2, 3 |

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|---|--|---|---|--------------------------|
| 18 | Check for error using regular expression | pattern ³ | output ² | | 0, 1, 2, 3 |
| 19 | Discard unchanged | | | | |
| 20 | Discard seconds ^{5, 6} unchanged | | | | |
| 21 | JavaScript ² | | | | |
| 22 | Prometheus ^{6, 7} pattern | | value, label, function | output ^{8, 9} | 0, 1, 2, 3 |
| 23 | Prometheus ^{6, 7} to | | | | 0, 1, 2, 3 |
| 24 | JSON CSV to JSON | character ² | character ² | 0,1 | 0, 1, 2, 3 |
| 25 | Replace search string ² | | replacement ² | | |
| 26 | Check scope ¹ unsupported | | pattern ^{3, 6} | | 1, 2, 3 |
| 27 | XML to JSON | | | | 0, 1, 2, 3 |
| 28 | SNMP walk value | OID ² | Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | | 0, 1, 2, 3 |
| 29 | SNMP walk to JSON ¹⁰ | Field name ² | OID prefix ² | Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | 0, 1, 2, 3 |
| 30 | SNMP get value | Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | | | 0, 1, 2, 3 |

- ¹ integer or floating-point number
- ² string
- ³ regular expression
- ⁴ JSONPath or XML XPath
- ⁵ positive integer (with support of time suffixes, e.g. 30s, 1m, 2h, 1d)
- ⁶ user macro, LLD macro
- ⁷ Prometheus pattern following the syntax: <metric name>{<label name>=<label value>", ...} == <value>. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro or LLD macro.
- ⁸ Prometheus output following the syntax: <label name> (can be a user macro or an LLD macro) if label is selected as the second parameter.
- ⁹ One of the aggregation functions: sum, min, max, avg, count if function is selected as the second parameter.
- ¹⁰ Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

itemprototype.create

Description

object itemprototype.create(object/array itemPrototypes)

This method allows to create new item prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Item prototype to create.

Additionally to the [standard item prototype properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---------------|-------|--|
| ruleid | ID | ID of the LLD rule that the item belongs to. |
| preprocessing | array | Parameter behavior: - <i>required</i> Item prototype preprocessing options. |
| tags | array | Item prototype tags . |

Return values

(object) Returns an object containing the IDs of the created item prototypes under the `itemids` property. The order of the returned IDs matches the order of the passed item prototypes.

Examples

Creating an item prototype

Create an item prototype to monitor free disk space on a discovered file system. Discovered items should be numeric Zabbix agent items updated every 30 seconds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "name": "Free disk space on {#FSNAME}",
    "key_": "vfs.fs.size[{#FSNAME},free]",
    "hostid": "10197",
    "ruleid": "27665",
    "type": 0,
    "value_type": 3,
    "interfaceid": "112",
    "delay": "30s"
  },
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27666"
    ]
  },
  "id": 1
}
```

Creating an item prototype with preprocessing

Create an item using change per second and a custom multiplier as a second step.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "name": "Incoming network traffic on {#IFNAME}",
    "key_": "net.if.in[{#IFNAME}]",
    "hostid": "10001",
    "ruleid": "27665",
    "type": 0,
    "value_type": 3,
    "delay": "60s",
    "units": "bps",
    "interfaceid": "1155",
    "preprocessing": [
      {
        "type": 10,
        "params": "",
        "error_handler": 0,
        "error_handler_params": ""
      },
      {
        "type": 1,
        "params": "8",
        "error_handler": 2,
        "error_handler_params": "10"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}
```

Creating dependent item prototype

Create Dependent item prototype for Master item prototype with ID 44211. Only dependencies on same host (template/discovery

rule) are allowed, therefore Master and Dependent item should have same hostid and ruleid.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "hostid": "10001",
    "ruleid": "27665",
    "name": "Dependent test item prototype",
    "key_": "dependent.prototype",
    "type": 18,
    "master_itemid": "44211",
    "value_type": 3
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44212"
    ]
  },
  "id": 1
}
```

Create HTTP agent item prototype

Create item prototype with URL using user macro, query fields and custom headers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "type": "19",
    "hostid": "10254",
    "ruleid": "28256",
    "interfaceid": "2",
    "name": "api item prototype example",
    "key_": "api_http_item",
    "value_type": 3,
    "url": "${URL_PROTOTYPE}",
    "query_fields": [
      {
        "name": "min",
        "value": "10"
      },
      {
        "name": "max",
        "value": "100"
      }
    ],
    "headers": [
      {
        "name": "X-Source",
        "value": "api"
      }
    ],
    "delay": "35"
  },
  "id": 1
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28305"
    ]
  },
  "id": 1
}
```

Create script item prototype

Create a simple data collection using a script item prototype.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.create",
  "params": {
    "name": "Script example",
    "key_": "custom.script.itemprototype",
    "hostid": "12345",
    "type": 21,
    "value_type": 4,
    "params": "var request = new HttpRequest();\nreturn request.post(\"https://postman-echo.com/post\")",
    "parameters": [
      {
        "name": "host",
        "value": "{HOST.CONN}"
      }
    ],
    "timeout": "6s",
    "delay": "30s"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}
```

Source

`CIItemPrototype::create()` in `ui/include/classes/api/services/CIItemPrototype.php`.

itemprototype.delete

Description

object `itemprototype.delete(array itemPrototypeIds)`

This method allows to delete item prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the item prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted item prototypes under the `prototypeids` property.

Examples**Deleting multiple item prototypes**

Delete two item prototypes.

Dependent item prototypes are removed automatically if master item or item prototype is deleted.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.delete",
  "params": [
    "27352",
    "27356"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "prototypeids": [
      "27352",
      "27356"
    ]
  },
  "id": 1
}
```

Source

`CItemPrototype::delete()` in `ui/include/classes/api/services/CItemPrototype.php`.

itemprototype.get**Description**

`integer/array itemprototype.get(object parameters)`

The method allows to retrieve item prototypes according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------|----------|---|
| discoveryids | ID/array | Return only item prototypes that belong to the given LLD rules. |

| Parameter | Type | Description |
|------------------------|--------------|---|
| graphids | ID/array | Return only item prototypes that are used in the given graph prototypes. |
| hostids | ID/array | Return only item prototypes that belong to the given hosts. |
| inherited | boolean | If set to true return only item prototypes inherited from a template. |
| itemids | ID/array | Return only item prototypes with the given IDs. |
| monitored | boolean | If set to true return only enabled item prototypes that belong to monitored hosts. |
| templated | boolean | If set to true return only item prototypes that belong to templates. |
| templateids | ID/array | Return only item prototypes that belong to the given templates. |
| triggerids | ID/array | Return only item prototypes that are used in the given trigger prototypes. |
| selectDiscoveryRule | query | Return a discoveryRule property with the low-level discovery rule that the item prototype belongs to. |
| selectGraphs | query | Return a graphs property with graph prototypes that the item prototype is used in. |
| selectHosts | query | Supports count. Return a hosts property with an array of hosts that the item prototype belongs to. |
| selectTags | query | Return the item prototype tags in tags property. |
| selectTriggers | query | Return a triggers property with trigger prototypes that the item prototype is used in. |
| selectPreprocessing | query | Supports count. Return a preprocessing property with item prototype preprocessing options. |
| selectValueMap | query | Return a valuemap property with item prototype value map. |
| filter | object | Return only those results that exactly match the given filter. |
| | | Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. |
| | | Does not support properties of text data type . |
| limitSelects | integer | Supports additional properties: host - technical name of the host that the item prototype belongs to. Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: selectGraphs - results will be sorted by name ; selectTriggers - results will be sorted by description . Sort the result by the given properties. |
| countOutput | boolean | Possible values: itemid , name , key_ , delay , type , status , history , trends , discovered . |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;

- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving item prototypes from an LLD rule

Retrieve all item prototypes for specific LLD rule ID.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.get",
  "params": {
    "output": "extend",
    "discoveryids": "27426"
  },
  "id": 1
}
```

Response:

```

CltemPrototype::get() in *ui/include/classes/api/services/CltemPrototype.php*.

itemprototype.update

Description

object itemprototype.update(object/array itemPrototypes)

This method allows to update existing item prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Item prototype properties to be updated.

The *itemid* property must be defined for each item prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard item prototype properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---------------|-------|---|
| preprocessing | array | Item prototype preprocessing options to replace the current preprocessing options. |
| tags | array | Parameter behavior: - <i>read-only</i> for inherited objects Item prototype tags. |

Return values

(object) Returns an object containing the IDs of the updated item prototypes under the `itemids` property.

Examples

Changing the interface of an item prototype

Change the host interface that will be used by discovered items.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "27428",
    "interfaceid": "132"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27428"
    ]
  },
  "id": 1
}
```

Update dependent item prototype

Update Dependent item prototype with new Master item prototype ID. Only dependencies on same host (template/discovery rule) are allowed, therefore Master and Dependent item should have same `hostid` and `ruleid`.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "master_itemid": "25570",
    "itemid": "189030"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "189030"
    ]
  },
  "id": 1
}
```

```
    "id": 1
}
```

Update HTTP agent item prototype

Change query fields and remove all custom headers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "28305",
    "query_fields": [
      {
        "name": "random",
        "value": "qwertyuiopasdfghjklzxcvbnm"
      }
    ],
    "headers": []
  }
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28305"
    ]
  },
  "id": 1
}
```

Updating item preprocessing options

Update an item prototype with item preprocessing rule “Custom multiplier”.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "44211",
    "preprocessing": [
      {
        "type": 1,
        "params": "4",
        "error_handler": 2,
        "error_handler_params": "5"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  }
}
```

```

    },
    "id": 1
}

```

Updating a script item prototype

Update a script item prototype with a different script and remove unnecessary parameters that were used by previous script.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "itemprototype.update",
  "params": {
    "itemid": "23865",
    "parameters": [],
    "script": "Zabbix.log(3, 'Log test');\nreturn 1;"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}

```

CItemPrototype::update() in *ui/include/classes/api/services/CItemPrototype.php*.

LLD rule

This class is designed to work with low-level discovery rules.

Object references:

- LLD rule
 - HTTP header
 - HTTP query field
- LLD rule filter
 - LLD rule filter condition
- LLD macro path
- LLD rule preprocessing
- LLD rule overrides
 - LLD rule override filter
 - * LLD rule override filter condition
 - LLD rule override operation
 - * LLD rule override operation status
 - * LLD rule override operation discover
 - * LLD rule override operation period
 - * LLD rule override operation history
 - * LLD rule override operation trends
 - * LLD rule override operation severity
 - * LLD rule override operation tag
 - * LLD rule override operation template
 - * LLD rule override operation inventory

Available methods:

- **discoveryrule.create** - create new LLD rules

- `discoveryrule.delete` - delete LLD rules
- `discoveryrule.get` - retrieve LLD rules
- `discoveryrule.update` - update LLD rules

LLD rule object

The following objects are directly related to the `discoveryrule` API.

LLD rule

The low-level discovery rule object has the following properties.

| Property | Type | Description |
|-------------|--------|---|
| itemid | ID | ID of the LLD rule. |
| delay | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Update interval of the LLD rule.</p> <p>Accepts seconds or time unit with suffix (e.g., 30s, 1m, 2h, 1d) and, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals.</p> <p>Accepts user macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., <code>{FLEX_INTERVAL}/{FLEX_PERIOD}</code>).</p> <p>Example:</p> <pre>1h;wd1-5h9-18;{\$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{\$Macro2}</pre> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Zabbix agent" (0), "Simple check" (3), "Zabbix internal" (5), "External check" (10), "Database monitor" (11), "IPMI agent" (12), "SSH agent" (13), "TELNET agent" (14), "JMX agent" (16), "HTTP agent" (19), "SNMP agent" (20), "Script" (21), "Browser" (22), or if type is set to "Zabbix agent (active)" (7) and <code>key_</code> does not contain "mqtt.get" |
| hostid | ID | ID of the host that the LLD rule belongs to. |
| interfaceid | ID | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>constant</i> - <i>required</i> for create operations <p>ID of the LLD rule's host interface.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if LLD rule belongs to host and type is set to "Zabbix agent", "IPMI agent", "JMX agent", or "SNMP agent" - <i>supported</i> if LLD rule belongs to host and type is set to "Simple check", "External check", "SSH agent", "TELNET agent", or "HTTP agent" |
| key_ | string | <p>LLD rule key.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects |
| name | string | <p>Name of the LLD rule.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects |

| Property | Type | Description |
|-------------|---------|--|
| type | integer | <p>Type of the LLD rule.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 16 - JMX agent; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations - <i>read-only</i> for inherited objects |
| url | string | <p>URL string.</p> <p>Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| allow_traps | integer | <p>Allow to populate value similarly to the trapper item.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) Do not allow to accept incoming data; 1 - Allow to accept incoming data. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" |
| authtype | integer | <p>Authentication method.</p> <p>Possible values if type is set to "SSH agent":</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) password; 1 - public key. <p>Possible values if type is set to "HTTP agent":</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) none; 1 - basic; 2 - NTLM. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "SSH agent" or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent") |
| description | string | Description of the LLD rule. |
| error | string | <p>Error text if there are problems updating the LLD rule value.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> |

| Property | Type | Description |
|-----------------------|---------|---|
| follow_redirects | integer | Follow response redirects while polling data. Possible values: 0 - Do not follow redirects; 1 - <i>(default)</i> Follow redirects. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| headers | array | Array of headers that will be sent when performing an HTTP request. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| http_proxy | string | HTTP(S) proxy connection string. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| ipmi_sensor | string | IPMI sensor. Property behavior: - <i>required</i> if type is set to "IPMI agent" and key_ is not set to "ipmi.get" - <i>supported</i> if type is set to "IPMI agent" - <i>read-only</i> for inherited objects |
| jmx_endpoint | string | JMX agent custom connection string. Default: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi Property behavior: - <i>supported</i> if type is set to "JMX agent" |
| lifetime | string | Time period after which items that are no longer discovered will be deleted. Accepts seconds, time unit with suffix, or a user macro. |
| lifetime_type | integer | Default: 7d. Scenario to delete lost LLD resources. Possible values: 0 - <i>(default)</i> Delete after lifetime threshold is reached; 1 - Do not delete; 2 - Delete immediately. |
| enabled_lifetime | string | Time period after which items that are no longer discovered will be disabled. Accepts seconds, time unit with suffix, or a user macro. |
| enabled_lifetime_type | integer | Default: 0. Scenario to disable lost LLD resources. Possible values: 0 - Disable after lifetime threshold is reached; 1 - Do not disable; 2 - <i>(default)</i> Disable immediately. |
| master_itemid | ID | ID of the master item. Discovery rule cannot be master item for another discovery rule. Property behavior: - <i>required</i> if type is set to "Dependent item" - <i>read-only</i> for inherited objects |

| Property | Type | Description |
|---------------|--------------|--|
| output_format | integer | Should the response be converted to JSON. Possible values: 0 - (default) Store raw; 1 - Convert to JSON. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| params | string | Additional parameters depending on the type of the LLD rule: - executed script for SSH and Telnet LLD rules; - SQL query for database monitor LLD rules; - formula for calculated LLD rules; - the script for script and browser LLD rules. Property behavior: - <i>required</i> if type is set to "Database monitor", "SSH agent", "TELNET agent", "Script" or "Browser" - <i>read-only</i> for inherited objects (if type is set to "Script" or "Browser") |
| parameters | object/array | Additional parameters if type is set to "Script" or "Browser". Array of objects with name and value properties, where name must be unique. Property behavior: - <i>supported</i> if type is set to "Script" or "Browser" - <i>read-only</i> for inherited objects |
| password | string | Password for authentication. Property behavior: - <i>required</i> if type is set to "JMX agent" and username is set - <i>supported</i> if type is set to "Simple check", "Database monitor", "SSH agent", "TELNET agent", or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent") |
| post_type | integer | Type of post data body stored in posts property. Possible values: 0 - (default) Raw data; 2 - JSON data; 3 - XML data. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| posts | string | HTTP(S) request body data. Property behavior: - <i>required</i> if type is set to "HTTP agent" and post_type is set to "JSON data" or "XML data" - <i>supported</i> if type is set to "HTTP agent" and post_type is set to "Raw data" - <i>read-only</i> for inherited objects |
| privatekey | string | Name of the private key file. Property behavior: - <i>required</i> if type is set to "SSH agent" and auth_type is set to "public key" |
| publickey | string | Name of the public key file. Property behavior: - <i>required</i> if type is set to "SSH agent" and auth_type is set to "public key" |

| Property | Type | Description |
|------------------|---------|--|
| query_fields | array | Array of query fields that will be sent when performing an HTTP request. |
| request_method | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects <p>Type of request method.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (default) GET; 1 - POST; 2 - PUT; 3 - HEAD. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| retrieve_mode | integer | <p>What part of response should be stored.</p> <p>Possible values if request_method is set to "GET", "POST", or "PUT":</p> <ul style="list-style-type: none"> 0 - (default) Body; 1 - Headers; 2 - Both body and headers will be stored. <p>Possible values if request_method is set to "HEAD":</p> <ul style="list-style-type: none"> 1 - Headers. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| snmp_oid | string | <p>SNMP OID.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SNMP agent" - <i>read-only</i> for inherited objects |
| ssl_cert_file | string | <p>Public SSL Key file path.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| ssl_key_file | string | <p>Private SSL Key file path.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| ssl_key_password | string | <p>Password for SSL Key file.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| state | integer | <p>State of the LLD rule.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (default) normal; 1 - not supported. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> |

| Property | Type | Description |
|---------------|---------|--|
| status | integer | Status of the LLD rule. Possible values: 0 - <i>(default)</i> enabled LLD rule; 1 - disabled LLD rule. |
| status_codes | string | Ranges of required HTTP status codes, separated by commas. Also supports user macros as part of comma separated list. Example: 200,200-{\$M},{M},200-400 Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |
| templateid | ID | ID of the parent template LLD rule. Property behavior: - <i>read-only</i> |
| timeout | string | Item data polling request timeout. Accepts seconds or time unit with suffix (e.g., 30s, 1m). Also accepts user macros. Possible values range: 1-600s. Default: "" - use proxy/global settings. Property behavior: - <i>supported</i> if type is set to "Zabbix agent" (0), "Simple check" (3) and key_ does not start with "vmware." and "icmpping", "Zabbix agent (active)" (7), "External check" (10), "Database monitor" (11), "SSH agent" (13), "TELNET agent" (14), "HTTP agent" (19), "SNMP agent" (20) and snmp_oid starts with "walk[" or "get[" , "Script" (21), "Browser" (22) - <i>read-only</i> for inherited objects |
| trapper_hosts | string | Allowed hosts. Property behavior: - <i>supported</i> if type is set to "Zabbix trapper", or if type is set to "HTTP agent" and allow_traps is set to "Allow to accept incoming data" |
| username | string | Username for authentication. Property behavior: - <i>required</i> if type is set to "SSH agent", "TELNET agent", or if type is set to "JMX agent" and password is set - <i>supported</i> if type is set to "Simple check", "Database monitor", or "HTTP agent" - <i>read-only</i> for inherited objects (if type is set to "HTTP agent") |
| uuid | string | Universal unique identifier, used for linking imported LLD rules to already existing ones. Auto-generated, if not given. Property behavior: - <i>supported</i> if the LLD rule belongs to a template |
| verify_host | integer | Whether to validate that the host name for the connection matches the one in the host's certificate. Possible values: 0 - <i>(default)</i> Do not validate; 1 - Validate. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |

| Property | Type | Description |
|-------------|---------|--|
| verify_peer | integer | Whether to validate that the host's certificate is authentic. Possible values: 0 - (default) Do not validate; 1 - Validate. Property behavior: - <i>supported</i> if type is set to "HTTP agent" - <i>read-only</i> for inherited objects |

HTTP header

The header object has the following properties:

| Property | Type | Description |
|----------|--------|---|
| name | string | HTTP header name. Property behavior: - <i>required</i> |
| value | string | Header value. Property behavior: - <i>required</i> |

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

| Property | Type | Description |
|----------|--------|--|
| name | string | Name of the parameter. Property behavior: - <i>required</i> |
| value | string | Parameter value. Property behavior: - <i>required</i> |

LLD rule filter

The LLD rule filter object defines a set of conditions that can be used to filter discovered objects. It has the following properties:

| Property | Type | Description |
|------------|--------------|---|
| conditions | object/array | Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. Property behavior: - <i>required</i> |
| evaltype | integer | Filter condition evaluation method. Possible values: 0 - and/or; 1 - and; 2 - or; 3 - custom expression. Property behavior: - <i>required</i> |

| Property | Type | Description |
|--------------|--------|---|
| eval_formula | string | Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its formulaid. The value of eval_formula is equal to the value of formula for filters with a custom expression. |
| formula | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> <p>User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its formulaid. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if evaltype is set to "custom expression" |

LLD rule filter condition

The LLD rule filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

| Property | Type | Description |
|-----------|---------|--|
| macro | string | LLD macro to perform the check on. |
| value | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> <p>Value to compare with.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if operator is set to "matches regular expression" or "does not match regular expression" |
| formulaid | string | <p>Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if evaltype of LLD rule filter object is set to "custom expression" |
| operator | integer | <p>Condition operator.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 8 - (<i>default</i>) matches regular expression; 9 - does not match regular expression; 12 - exists; 13 - does not exist. |

Note:

To better understand how to use filters with various types of expressions, see examples on the [discoveryrule.get](#) and [discoveryrule.create](#) method pages.

LLD macro path

The LLD macro path has the following properties:

| Property | Type | Description |
|-----------|--------|--|
| lld_macro | string | LLD macro. |
| path | string | <p>Property behavior:</p> <p>- <i>required</i></p> <p>Selector for value which will be assigned to corresponding macro.</p> <p>Property behavior:</p> <p>- <i>required</i></p> |

LLD rule preprocessing

The LLD rule preprocessing object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| type | integer | <p>The preprocessing option type.</p> <p>Possible values:</p> <p>5 - Regular expression;</p> <p>11 - XML XPath;</p> <p>12 - JSONPath;</p> <p>14 - Matches regular expression;</p> <p>15 - Does not match regular expression;</p> <p>16 - Check for error in JSON;</p> <p>17 - Check for error in XML;</p> <p>20 - Discard unchanged with heartbeat;</p> <p>21 - JavaScript;</p> <p>23 - Prometheus to JSON;</p> <p>24 - CSV to JSON;</p> <p>25 - Replace;</p> <p>27 - XML to JSON;</p> <p>28 - SNMP walk value;</p> <p>29 - SNMP walk to JSON;</p> <p>30 - SNMP get value.</p> <p>Property behavior:</p> <p>- <i>required</i></p> |
| params | string | <p>Additional parameters used by preprocessing option. Multiple parameters are separated by the newline (\n) character.</p> <p>Property behavior:</p> <p>- <i>required</i> if type is set to "Regular expression" (5), "XML XPath" (11), "JSONPath" (12), "Matches regular expression" (14), "Does not match regular expression" (15), "Check for error in JSON" (16), "Check for error in XML" (17), "Discard unchanged with heartbeat" (20), "JavaScript" (21), "Prometheus to JSON" (23), "CSV to JSON" (24), "Replace" (25), "SNMP walk value" (28), "SNMP walk to JSON" (29), or "SNMP get value" (30)</p> |

| Property | Type | Description |
|----------------------|---------|---|
| error_handler | integer | <p>Action type used in case of preprocessing step failure.</p> <p>Possible values:</p> <p>0 - Error message is set by Zabbix server;</p> <p>1 - Discard value;</p> <p>2 - Set custom value;</p> <p>3 - Set custom error message.</p> <p>Property behavior:</p> <p>- <i>required</i> if type is set to "Regular expression" (5), "XML XPath" (11), "JSONPath" (12), "Matches regular expression" (14), "Does not match regular expression" (15), "Check for error in JSON" (16), "Check for error in XML" (17), "Prometheus to JSON" (23), "CSV to JSON" (24), "XML to JSON" (27), "SNMP walk value" (28), "SNMP walk to JSON" (29), or "SNMP get value" (30)</p> |
| error_handler_params | string | <p>Error handler parameters.</p> <p>Property behavior:</p> <p>- <i>required</i> if error_handler is set to "Set custom value" or "Set custom error message"</p> |

The following parameters and error handlers are supported for each preprocessing type.

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|-----------------------------------|----------------------|---------------------|-------------|--------------------------|
| 5 | Regular expression | pattern ¹ | output ² | | 0, 1, 2, 3 |
| 11 | XML XPath | path ³ | | | 0, 1, 2, 3 |
| 12 | JSONPath | path ³ | | | 0, 1, 2, 3 |
| 14 | Matches regular expression | pattern ¹ | | | 0, 1, 2, 3 |
| 15 | Does not match regular expression | pattern ¹ | | | 0, 1, 2, 3 |
| 16 | Check for error in JSON | path ³ | | | 0, 1, 2, 3 |
| 17 | Check for error in XML | path ³ | | | 0, 1, 2, 3 |

| Preprocessing type | Name | Parameter 1 | Parameter 2 | Parameter 3 | Supported error handlers |
|--------------------|---|---|--|--|--------------------------|
| 20 | Discard seconds ^{4, 5} un- changed with heart- beat | | | | |
| 21 | JavaScript ² | | | | |
| 23 | Prometheus pattern ^{5, 6} to JSON | | | | 0, 1, 2, 3 |
| 24 | CSV to JSON | character ² | character ² | 0,1 | 0, 1, 2, 3 |
| 25 | Replace search string ² | | replacement ² | | |
| 27 | XML to JSON | | | | 0, 1, 2, 3 |
| 28 | SNMP walk value | OID ² | Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | | 0, 1, 2, 3 |
| 29 | SNMP walk to JSON ⁷ | Field name ² | OID prefix ² | Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | 0, 1, 2, 3 |
| 30 | SNMP get value | Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS | | | 0, 1, 2, 3 |

¹ regular expression

² string

³ JSONPath or XML XPath

⁴ positive integer (with support of time suffixes, e.g. 30s, 1m, 2h, 1d)

⁵ user macro

⁶ Prometheus pattern following the syntax: <metric name>{<label name>=<label value>", ...} == <value>. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.

⁷ Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

LLD rule overrides

The LLD rule overrides object defines a set of rules (filters, conditions and operations) that are used to override properties of different prototype objects. It has the following properties:

| Property | Type | Description |
|----------|--------|-----------------------|
| name | string | Unique override name. |

Property behavior:
- required

| Property | Type | Description |
|------------|--------------|--|
| step | integer | Unique order number of the override. |
| stop | integer | <p>Property behavior: - <i>required</i> Stop processing next overrides if matches.</p> <p>Possible values: 0 - (<i>default</i>) don't stop processing overrides; 1 - stop processing overrides if filter matches.</p> |
| filter | object | Override filter. |
| operations | object/array | Override operations. |

LLD rule override filter

The LLD rule override filter object defines a set of conditions that if they match the discovered object the override is applied. It has the following properties:

| Property | Type | Description |
|--------------|--------------|---|
| conditions | object/array | Set of override filter conditions to use for matching the discovered objects. The conditions will be sorted in the order of their placement in the formula. |
| evaltype | integer | <p>Property behavior: - <i>required</i> Override filter condition evaluation method.</p> <p>Possible values: 0 - and/or; 1 - and; 2 - or; 3 - custom expression.</p> |
| eval_formula | string | <p>Property behavior: - <i>required</i> Generated expression that will be used for evaluating override filter conditions. The expression contains IDs that reference specific override filter conditions by its <code>formulaid</code>. The value of <code>eval_formula</code> is equal to the value of <code>formula</code> for filters with a custom expression.</p> |
| formula | string | <p>Property behavior: - <i>read-only</i> User-defined expression to be used for evaluating conditions of override filters with a custom expression. The expression must contain IDs that reference specific override filter conditions by its <code>formulaid</code>. The IDs used in the expression must exactly match the ones defined in the override filter conditions: no condition can remain unused or omitted.</p> <p>Property behavior: - <i>required</i> if <code>evaltype</code> is set to "custom expression"</p> |

LLD rule override filter condition

The LLD rule override filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

| Property | Type | Description |
|-----------|---------|--|
| macro | string | LLD macro to perform the check on. |
| value | string | <p>Property behavior: - <i>required</i> Value to compare with.</p> <p>Property behavior: - <i>required</i> if operator is set to "matches regular expression" or "does not match regular expression"</p> |
| formulaid | string | Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. |
| operator | integer | <p>Property behavior: - <i>required</i> if evaltype of LLD rule override filter object is set to "custom expression"</p> <p>Condition operator.</p> <p>Possible values: 8 - (<i>default</i>) matches regular expression; 9 - does not match regular expression; 12 - exists; 13 - does not exist.</p> |

LLD rule override operation

The LLD rule override operation is combination of conditions and actions to perform on the prototype object. It has the following properties:

| Property | Type | Description |
|-----------------|---------|---|
| operationobject | integer | <p>Type of discovered object to perform the action.</p> <p>Possible values: 0 - Item prototype; 1 - Trigger prototype; 2 - Graph prototype; 3 - Host prototype.</p> |
| operator | integer | <p>Property behavior: - <i>required</i> Override condition operator.</p> <p>Possible values: 0 - (<i>default</i>) equals; 1 - does not equal; 2 - contains; 3 - does not contain; 8 - matches; 9 - does not match.</p> |
| value | string | Pattern to match item, trigger, graph or host prototype name depending on selected object. |
| opstatus | object | Override operation status object for item, trigger and host prototype objects. |
| opdiscover | object | Override operation discover status object (all object types). |
| opperiod | object | Override operation period (update interval) object for item prototype object. |
| ophistory | object | Override operation history object for item prototype object. |
| optrends | object | Override operation trends object for item prototype object. |
| opseverity | object | Override operation severity object for trigger prototype object. |

| Property | Type | Description |
|-------------|--------------|---|
| optag | object/array | Override operation tag object for trigger and host prototype objects. |
| optemplate | object/array | Override operation template object for host prototype object. |
| opinventory | object | Override operation inventory object for host prototype object. |

LLD rule override operation status

LLD rule override operation status that is set to discovered object. It has the following properties:

| Property | Type | Description |
|----------|---------|---|
| status | integer | Override the status for selected object. Possible values: 0 - Create enabled; 1 - Create disabled. Property behavior: - <i>required</i> |

LLD rule override operation discover

LLD rule override operation discover status that is set to discovered object. It has the following properties:

| Property | Type | Description |
|----------|---------|---|
| discover | integer | Override the discover status for selected object. Possible values: 0 - Yes, continue discovering the objects; 1 - No, new objects will not be discovered and existing ones will be marked as lost. Property behavior: - <i>required</i> |

LLD rule override operation period

LLD rule override operation period is an update interval value that is set to discovered item. It has the following properties:

| Property | Type | Description |
|----------|--------|--|
| delay | string | Override the update interval of the item prototype. Accepts seconds or time unit with suffix (e.g., 30s, 1m, 2h, 1d) and, optionally, one or more custom intervals , all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros or LLD macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {\$FLEX_INTERVAL}/{FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{\$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{\$Macro2} Property behavior: - <i>required</i> |

LLD rule override operation history

LLD rule override operation history value that is set to discovered item. It has the following properties:

| Property | Type | Description |
|---|--------|---|
| history | string | Override the history of item prototype which is a time unit of how long the history data should be stored. Also accepts user macro and LLD macro. |
| Property behavior: - required | | |

LLD rule override operation trends

LLD rule override operation trends value that is set to discovered item. It has the following properties:

| Property | Type | Description |
|---|--------|---|
| trends | string | Override the trends of item prototype which is a time unit of how long the trends data should be stored. Also accepts user macro and LLD macro. |
| Property behavior: - required | | |

LLD rule override operation severity

LLD rule override operation severity value that is set to discovered trigger. It has the following properties:

| Property | Type | Description |
|--|---------|---|
| severity | integer | Override the severity of trigger prototype. |
| Possible values: 0 - <i>(default)</i> not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. | | |
| Property behavior: - required | | |

LLD rule override operation tag

LLD rule override operation tag object contains tag name and value that are set to discovered object. It has the following properties:

| Property | Type | Description |
|---|--------|----------------|
| tag | string | New tag name. |
| Property behavior: - required | | |
| value | string | New tag value. |

LLD rule override operation template

LLD rule override operation template object that is linked to discovered host. It has the following properties:

| Property | Type | Description |
|---|------|---|
| templateid | ID | Override the template of host prototype linked templates. |
| Property behavior: - required | | |

LLD rule override operation inventory

LLD rule override operation inventory mode value that is set to discovered host. It has the following properties:

| Property | Type | Description |
|----------------|---------|--|
| inventory_mode | integer | Override the host prototype inventory mode. Possible values: -1 - disabled; 0 - (default) manual; 1 - automatic. Property behavior: - required |

discoveryrule.create

Description

object discoveryrule.create(object/array lldRules)

This method allows to create new LLD rules.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) LLD rules to create.

Additionally to the **standard LLD rule properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|--|
| filter | object | LLD rule filter for the LLD rule. |
| preprocessing | object/array | LLD rule preprocessing options. |
| lld_macro_paths | object/array | LLD rule lld_macro_path options. |
| overrides | object/array | LLD rule overrides options. |

Return values

(object) Returns an object containing the IDs of the created LLD rules under the `itemids` property. The order of the returned IDs matches the order of the passed LLD rules.

Examples

Creating an LLD rule

Create a Zabbix agent LLD rule to discover mounted file systems. Discovered items will be updated every 30 seconds.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Mounted filesystem discovery",
    "key_": "vfs.fs.discovery",
    "hostid": "10197",
    "type": 0,
    "interfaceid": "112",
    "delay": "30s"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}
```

Using a filter

Create an LLD rule with a set of conditions to filter the results by. The conditions will be grouped together using the logical "and" operator.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Filtered LLD rule",
    "key_": "lld",
    "hostid": "10116",
    "type": 0,
    "interfaceid": "13",
    "delay": "30s",
    "filter": {
      "evaltype": 1,
      "conditions": [
        {
          "macro": "#{MACRO1}",
          "value": "@regex1"
        },
        {
          "macro": "#{MACRO2}",
          "value": "@regex2",
          "operator": "9"
        },
        {
          "macro": "#{MACRO3}",
          "value": "",
          "operator": "12"
        },
        {
          "macro": "#{MACRO4}",
          "value": "",
          "operator": "13"
        }
      ]
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}
```

```
    "id": 1
}
```

Creating an LLD rule with macro paths

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "LLD rule with LLD macro paths",
    "key_": "lld",
    "hostid": "10116",
    "type": 0,
    "interfaceid": "13",
    "delay": "30s",
    "lld_macro_paths": [
      {
        "lld_macro": "#{MACRO1}",
        "path": "$.path.1"
      },
      {
        "lld_macro": "#{MACRO2}",
        "path": "$.path.2"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}
```

Using a custom expression filter

Create an LLD rule with a filter that will use a custom expression to evaluate the conditions. The LLD rule must only discover objects the "#{MACRO1}" macro value of which matches both regular expression "regex1" and "regex2", and the value of "#{MACRO2}" matches either "regex3" or "regex4". The formula IDs "A", "B", "C" and "D" have been chosen arbitrarily.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Filtered LLD rule",
    "key_": "lld",
    "hostid": "10116",
    "type": 0,
    "interfaceid": "13",
    "delay": "30s",
    "filter": {
      "evaltype": 3,
      "formula": "(A and B) and (C or D)",
      "conditions": [
        {
          "macro": "#{MACRO1}",

```

```

        "value": "@regex1",
        "formulaid": "A"
    },
    {
        "macro": "#{MACRO1}",
        "value": "@regex2",
        "formulaid": "B"
    },
    {
        "macro": "#{MACRO2}",
        "value": "@regex3",
        "formulaid": "C"
    },
    {
        "macro": "#{MACRO2}",
        "value": "@regex4",
        "formulaid": "D"
    }
    ]
}
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "27665"
    ]
  },
  "id": 1
}

```

Using custom query fields and headers

Create LLD rule with custom query fields and headers.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "hostid": "10257",
    "interfaceid": "5",
    "type": 19,
    "name": "API HTTP agent",
    "key_": "api_discovery_rule",
    "delay": "5s",
    "url": "http://127.0.0.1?discoverer.php",
    "query_fields": [
      {
        "name": "mode",
        "value": "json"
      },
      {
        "name": "elements",
        "value": "2"
      }
    ],
    "headers": [
      {

```

```

        "name": "X-Type",
        "value": "api"
    },
    {
        "name": "Authorization",
        "value": "Bearer mF_A.B5f-2.1JcM"
    }
],
"allow_traps": 1,
"trapper_hosts": "127.0.0.1"
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28336"
    ]
  },
  "id": 1
}

```

Creating an LLD rule with preprocessing

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Discovery rule with preprocessing",
    "key_": "lld.with.preprocessing",
    "hostid": "10001",
    "ruleid": "27665",
    "type": 0,
    "delay": "60s",
    "interfaceid": "1155",
    "preprocessing": [
      {
        "type": 20,
        "params": "20",
        "error_handler": 0,
        "error_handler_params": ""
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}

```

Creating an LLD rule with overrides

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "Discover database host",
    "key_": "lld.with.overrides",
    "hostid": "10001",
    "type": 0,
    "delay": "60s",
    "interfaceid": "1155",
    "overrides": [
      {
        "name": "Discover MySQL host",
        "step": "1",
        "stop": "1",
        "filter": {
          "evaltype": "2",
          "conditions": [
            {
              "macro": "{#UNIT.NAME}",
              "operator": "8",
              "value": "^mysqld\\.\\.service$"
            },
            {
              "macro": "{#UNIT.NAME}",
              "operator": "8",
              "value": "^mariadb\\.\\.service$"
            }
          ]
        },
        "operations": [
          {
            "operationobject": "3",
            "operator": "2",
            "value": "Database host",
            "opstatus": {
              "status": "0"
            },
            "optemplate": [
              {
                "templateid": "10170"
              }
            ],
            "optag": [
              {
                "tag": "database",
                "value": "mysql"
              }
            ]
          }
        ]
      }
    ],
    "name": "Discover PostgreSQL host",
    "step": "2",
    "stop": "1",
    "filter": {
      "evaltype": "0",
      "conditions": [
        {
          "macro": "{#UNIT.NAME}",
```

```

        "operator": "8",
        "value": "~postgresql\\.service$"
    }
    ],
    "operations": [
        {
            "operationobject": "3",
            "operator": "2",
            "value": "Database host",
            "opstatus": {
                "status": "0"
            },
            "optemplate": [
                {
                    "templateid": "10263"
                }
            ],
            "optag": [
                {
                    "tag": "database",
                    "value": "postgresql"
                }
            ]
        }
    ]
}
    ],
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "30980"
        ]
    },
    "id": 1
}

```

Create script LLD rule

Create a simple data collection using a script LLD rule.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Script example",
        "key_": "custom.script.lldrule",
        "hostid": "12345",
        "type": 21,
        "params": "var request = new HttpRequest();\nreturn request.post(\"https://postman-echo.com/post\")",
        "parameters": [{
            "name": "host",
            "value": "{HOST.CONN}"
        }],
        "timeout": "6s",
        "delay": "30s"
    }
}

```

```

    },
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}

```

Create LLD rule with a specified time period for disabling and no deletion

Create an LLD rule with custom time period for disabling entity after it is no longer discovered, with the setting that it will never be deleted.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.create",
  "params": {
    "name": "lld disable after 1h",
    "key_": "lld.disable",
    "hostid": "10001",
    "type": 2,
    "lifetime_type": 1,
    "enabled_lifetime_type": 0,
    "enabled_lifetime": "1h"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "46864"
    ]
  },
  "id": 1
}

```

discoveryrule.delete

Description

`object discoveryrule.delete(array lldRuleIds)`

This method allows to delete LLD rules.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the LLD rules to delete.

Return values

(object) Returns an object containing the IDs of the deleted LLD rules under the `ruleids` property.

Examples**Deleting multiple LLD rules**

Delete two LLD rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.delete",
  "params": [
    "27665",
    "27668"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "ruleids": [
      "27665",
      "27668"
    ]
  },
  "id": 1
}
```

Source

`CDiscoveryRule::delete()` in `ui/include/classes/api/services/CDiscoveryRule.php`.

discoveryrule.get**Description**

`integer/array discoveryrule.get(object parameters)`

The method allows to retrieve LLD rules according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------|----------|---|
| itemids | ID/array | Return only LLD rules with the given IDs. |
| groupids | ID/array | Return only LLD rules that belong to the hosts from the given groups. |
| hostids | ID/array | Return only LLD rules that belong to the given hosts. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| inherited | boolean | If set to true return only LLD rules inherited from a template. |
| interfaceids | ID/array | Return only LLD rules use the given host interfaces. |
| monitored | boolean | If set to true return only enabled LLD rules that belong to monitored hosts. |
| templated | boolean | If set to true return only LLD rules that belong to templates. |
| templateids | ID/array | Return only LLD rules that belong to the given templates. |
| selectFilter | query | Return a filter property with data of the filter used by the LLD rule. |
| selectGraphs | query | Returns a graphs property with graph prototypes that belong to the LLD rule. |
| selectHostPrototypes | query | Supports count. Return a hostPrototypes property with host prototypes that belong to the LLD rule. |
| selectHosts | query | Supports count. Return a hosts property with an array of hosts that the LLD rule belongs to. |
| selectItems | query | Return an items property with item prototypes that belong to the LLD rule. |
| selectTriggers | query | Supports count. Return a triggers property with trigger prototypes that belong to the LLD rule. |
| selectLLDMacroPaths | query | Supports count. Return an lld_macro_paths property with a list of LLD macros and paths to values assigned to each corresponding macro. |
| selectPreprocessing | query | Return a preprocessing property with LLD rule preprocessing options. |
| selectOverrides | query | Return an lld_rule_overrides property with a list of override filters, conditions and operations that are performed on prototype objects. |
| filter | object | Return only those results that exactly match the given filter. |
| | | Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. |
| | | Does not support properties of text data type . |
| limitSelects | integer | Supports additional properties: host - technical name of the host that the LLD rule belongs to. Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: selectItems , selectGraphs , selectTriggers . Sort the result by the given properties. |
| countOutput | boolean | Possible values: itemid , name , key_ , delay , type , status . These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving discovery rules from a host

Retrieve all discovery rules for specific host ID.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.get",
  "params": {
    "output": "extend",
    "hostids": "10202"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "27425",
      "type": "0",

    "id": 1
}

```

Retrieving filter conditions

Retrieve the name of the LLD rule "24681" and its filter conditions. The filter uses the "and" evaluation type, so the formula property is empty and eval_formula is generated automatically.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.get",
  "params": {
    "output": ["name"],
    "selectFilter": "extend",
    "itemids": ["24681"]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "24681",
      "name": "Filtered LLD rule",
      "filter": {
        "evaltype": "1",
        "formula": "",
        "conditions": [
          {
            "macro": "{#MACRO1}",
            "value": "@regex1",
            "operator": "8",
            "formulaid": "A"
          },
          {
            "macro": "{#MACRO2}",
            "value": "@regex2",
            "operator": "9",
            "formulaid": "B"
          },
          {
            "macro": "{#MACRO3}",
            "value": "",
            "operator": "12",
            "formulaid": "C"
          },
          {
            "macro": "{#MACRO4}",
            "value": "",
            "operator": "13",
            "formulaid": "D"
          }
        ],
        "eval_formula": "A and B and C and D"
      }
    ]
  },
  "id": 1
}
```

Retrieve LLD rule by URL

Retrieve LLD rule for host by rule URL field value. Only exact match of URL string defined for LLD rule is supported.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "discoveryrule.get",
  "params": {
    "hostids": "10257",
    "filter": {
      "type": 19,
      "url": "http://127.0.0.1/discoverer.php"
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "28336",
      "type": "19",
      "snmp_oid": "",
      "hostid": "10257",
      "name": "API HTTP agent",
      "key_": "api_discovery_rule",
      "delay": "5s",
      "status": "0",
      "trapper_hosts": "",
      "templateid": "0",
      "valuemapid": "0",
      "params": "",
      "ipmi_sensor": "",
      "authtype": "0",
      "username": "",
      "password": "",
      "publickey": "",
      "privatekey": "",
      "interfaceid": "5",
      "description": "",
      "lifetime": "30d",
      "jmx_endpoint": "",
      "master_itemid": "0",
      "timeout": "",
      "url": "http://127.0.0.1/discoverer.php",
      "query_fields": [
        {
          "name": "mode",
          "value": "json"
        },
        {
          "name": "elements",
          "value": "2"
        }
      ],
      "posts": "",
      "status_codes": "200",
      "follow_redirects": "1",
      "post_type": "0",
      "http_proxy": "",
      "headers": [
        {
          "name": "X-Type",
          "value": "api"
        }
      ]
    }
  ]
}

```

```

        },
        {
            "name": "Authorization",
            "value": "Bearer mF_A.B5f-2.1JcM"
        }
    ],
    "retrieve_mode": "0",
    "request_method": "1",
    "ssl_cert_file": "",
    "ssl_key_file": "",
    "ssl_key_password": "",
    "verify_peer": "0",
    "verify_host": "0",
    "allow_traps": "0",
    "uuid": "",
    "lifetime_type": "0",

    "enabled_lifetime": "0",
    "state": "0",
    "error": "",
    "parameters": []
    }
],
"id": 1
}

```

Retrieve LLD rule with overrides

Retrieve one LLD rule that has various override settings.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "output": ["name"],
        "itemids": "30980",
        "selectOverrides": ["name", "step", "stop", "filter", "operations"]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "name": "Discover database host",
            "overrides": [
                {
                    "name": "Discover MySQL host",
                    "step": "1",
                    "stop": "1",
                    "filter": {
                        "evaltype": "2",
                        "formula": "",
                        "conditions": [
                            {
                                "macro": "{#UNIT.NAME}",
                                "operator": "8",
                                "value": "~mysqld\\.service$",
                                "formulaid": "A"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}

```

```

        {

Source

CDiscoveryRule::get() in *ui/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.update

Description

object discoveryrule.update(object/array lldRules)

This method allows to update existing LLD rules.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) LLD rule properties to be updated.

The `itemid` property must be defined for each LLD rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard LLD rule properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|--|
| filter | object | LLD rule filter to replace the existing filter. |
| preprocessing | object/array | LLD rule preprocessing options to replace the existing preprocessing options. Parameter behavior: - <i>read-only</i> for inherited objects |
| lld_macro_paths | object/array | LLD rule lld_macro_path options to replace the existing <code>lld_macro_path</code> options. Parameter behavior: - <i>read-only</i> for inherited objects |
| overrides | object/array | LLD rule overrides options to replace the existing overrides options. Parameter behavior: - <i>read-only</i> for inherited objects |

Return values

(object) Returns an object containing the IDs of the updated LLD rules under the `itemids` property.

Examples

Adding a filter to an LLD rule

Add a filter so that the contents of the `{#FSTYPE}` macro would match the `@File systems for discovery` regexp.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "22450",
    "filter": {
      "evaltype": 1,
      "conditions": [
        {
          "macro": "{#FSTYPE}",
          "value": "@File systems for discovery"
        }
      ]
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22450"
    ]
  },
  "id": 1
}
```

Adding LLD macro paths

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "22450",
    "lld_macro_paths": [
      {
        "lld_macro": "{#MACRO1}",
        "path": "$.json.path"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "22450"
    ]
  },
  "id": 1
}
```

```
    "id": 1
}
```

Disable trapping

Disable LLD trapping for discovery rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "28336",
    "allow_traps": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "28336"
    ]
  },
  "id": 1
}
```

Updating LLD rule preprocessing options

Update an LLD rule with preprocessing rule "JSONPath".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "44211",
    "preprocessing": [
      {
        "type": 12,
        "params": "$.path.to.json",
        "error_handler": 2,
        "error_handler_params": "5"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "44211"
    ]
  },
  "id": 1
}
```

Updating LLD rule script

Update an LLD rule script with a different script and remove unnecessary parameters that were used by previous script.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "23865",
    "parameters": [],
    "script": "Zabbix.log(3, 'Log test');\nreturn 1;"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "23865"
    ]
  },
  "id": 1
}
```

Updating LLD rule lifetime

Update LLD rule to disable no-longer discovered entity after 12 hours and to delete it after 7 days.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "discoveryrule.update",
  "params": {
    "itemid": "46864",
    "lifetime_type": 0,
    "lifetime": "7d",
    "enabled_lifetime_type": 0,
    "enabled_lifetime": "12h"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "itemids": [
      "46864"
    ]
  },
  "id": 1
}
```

CDiscoveryRule::update() in *ui/include/classes/api/services/CDiscoveryRule.php*.

Maintenance

This class is designed to work with maintenances.

Object references:

- [Maintenance](#)
- [Time period](#)

- **Problem tag**

Available methods:

- **maintenance.create** - create new maintenances
- **maintenance.delete** - delete maintenances
- **maintenance.get** - retrieve maintenances
- **maintenance.update** - update maintenances

Maintenance object

The following objects are directly related to the **maintenance** API.

Maintenance

The maintenance object has the following properties.

| Property | Type | Description |
|------------------|-----------|---|
| maintenanceid | ID | ID of the maintenance. |
| name | string | Property behavior: - <i>read-only</i> - <i>required</i> for update operations Name of the maintenance. |
| active_since | timestamp | Property behavior: - <i>required</i> for create operations Time when the maintenance becomes active. The given value will be rounded down to minutes. |
| active_till | timestamp | Property behavior: - <i>required</i> for create operations Time when the maintenance stops being active. The given value will be rounded down to minutes. |
| description | string | Property behavior: - <i>required</i> for create operations Description of the maintenance. |
| maintenance_type | integer | Type of maintenance. |
| tags_evaltype | integer | Possible values: 0 - (<i>default</i>) with data collection; 1 - without data collection. Problem tag evaluation method. Possible values: 0 - (<i>default</i>) And/Or; 2 - Or. |

Time period

The time period object is used to define periods when the maintenance must come into effect. It has the following properties.

| Property | Type | Description |
|----------|---------|--|
| period | integer | Duration of the maintenance period in seconds. The given value will be rounded down to minutes. Default: 3600. |

| Property | Type | Description |
|-----------------|-----------|--|
| timeperiod_type | integer | Type of time period. Possible values: 0 - (default) one time only; 2 - daily; 3 - weekly; 4 - monthly. |
| start_date | timestamp | Date when the maintenance period must come into effect. The given value will be rounded down to minutes. Default: current date. |
| start_time | integer | Property behavior: - <i>supported</i> if timeperiod_type is set to "one time only" Time of day when the maintenance starts in seconds. The given value will be rounded down to minutes. Default: 0. Property behavior: - <i>supported</i> if timeperiod_type is set to "daily", "weekly", or "monthly" |
| every | integer | For daily and weekly periods every defines the day or week intervals at which the maintenance must come into effect. Default value if timeperiod_type is set to "daily" or "weekly": 1. For monthly periods when day is set, the every property defines the day of the month when the maintenance must come into effect. Default value if timeperiod_type is set to "monthly" and day is set: 1. For monthly periods when dayofweek is set, the every property defines the week of the month when the maintenance must come into effect. Possible values if timeperiod_type is set to "monthly" and dayofweek is set: 1 - (default) first week; 2 - second week; 3 - third week; 4 - fourth week; 5 - last week. Property behavior: - <i>supported</i> if timeperiod_type is set to "daily", "weekly", or "monthly" |
| dayofweek | integer | Days of the week when the maintenance must come into effect. Possible bitmap values: 1 - Monday; 2 - Tuesday; 4 - Wednesday; 8 - Thursday; 16 - Friday; 32 - Saturday; 64 - Sunday. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 21 for Monday, Wednesday, and Friday). Property behavior: - <i>required</i> if timeperiod_type is set to "weekly" or if timeperiod_type is set to "monthly" and day is not set |

| Property | Type | Description |
|----------|---------|---|
| day | integer | Day of the month when the maintenance must come into effect. |
| month | integer | <p>Property behavior:</p> <p>- <i>required</i> if <code>timeperiod_type</code> is set to "monthly" and <code>dayofweek</code> is not set</p> <p>Months when the maintenance must come into effect.</p> <p>Possible bitmap values:</p> <p>1 - January; 2 - February; 4 - March; 8 - April; 16 - May; 32 - June; 64 - July; 128 - August; 256 - September; 512 - October; 1024 - November; 2048 - December.</p> <p>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 585 for January, April, July, and October).</p> <p>Property behavior:</p> <p>- <i>required</i> if <code>timeperiod_type</code> is set to "monthly"</p> |

Problem tag

The problem tag object is used to define which problems must be suppressed when the maintenance comes into effect. Tags can only be specified if `maintenance_type` of **Maintenance object** is set to "with data collection". It has the following properties.

| Property | Type | Description |
|----------|---------|---|
| tag | string | Problem tag name. |
| operator | integer | <p>Property behavior:</p> <p>- <i>required</i></p> <p>Condition operator.</p> <p>Possible values:</p> <p>0 - Equals; 2 - (<i>default</i>) Contains.</p> |
| value | string | Problem tag value. |

maintenance.create

Description

`object maintenance.create(object/array maintenances)`

This method allows to create new maintenances.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Maintenances to create.

Additionally to the **standard maintenance properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-------------|--------------|--|
| groups | object/array | <p>Host groups that will undergo maintenance.</p> <p>The host groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>hosts</code> is not set |
| hosts | object/array | <p>Hosts that will undergo maintenance.</p> <p>The hosts must have only the <code>hostid</code> property defined.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>groups</code> is not set |
| timeperiods | object/array | <p>Maintenance time periods.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| tags | object/array | <p>Problem tags.</p> <p>Define what problems must be suppressed. If no tags are given, all active maintenance host problems will be suppressed.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>maintenance_type</code> of Maintenance object is set to "with data collection" |

Return values

(object) Returns an object containing the IDs of the created maintenances under the `maintenanceids` property. The order of the returned IDs matches the order of the passed maintenances.

Examples

Creating a maintenance

Create a maintenance with data collection for host group with ID "2" and with problem tags **service:mysql** and **error**. It must be active from 22.01.2013 till 22.01.2014, come in effect each Sunday at 18:00 and last for one hour.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.create",
  "params": {
    "name": "Sunday maintenance",
    "active_since": 1358844540,
    "active_till": 1390466940,
    "tags_evaltype": 0,
    "groups": [
      {"groupid": "2"}
    ],
    "timeperiods": [
      {
        "period": 3600,
        "timeperiod_type": 3,
        "start_time": 64800,
        "every": 1,
        "dayofweek": 64
      }
    ],
    "tags": [
      {
        "tag": "service",
        "operator": "0",

```

```

        "value": "mysqlid"
    },
    {
        "tag": "error",
        "operator": "2",
        "value": ""
    }
]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "maintenanceids": [
            "3"
        ]
    },
    "id": 1
}

```

Source

CMaintenance::create() in *ui/include/classes/api/services/CMaintenance.php*.

maintenance.delete

Description

object maintenance.delete(array maintenanceIds)

This method allows to delete maintenance periods.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the maintenance periods to delete.

Return values

(object) Returns an object containing the IDs of the deleted maintenance periods under the `maintenanceids` property.

Examples

Deleting multiple maintenance periods

Delete two maintenance periods.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "maintenance.delete",
    "params": [
        "3",
        "1"
    ],
    "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "maintenanceids": [
      "3",
      "1"
    ]
  },
  "id": 1
}
```

Source

CMaintenance::delete() in *ui/include/classes/api/services/CMaintenance.php*.

maintenance.get

Description

integer/array maintenance.get(object parameters)

The method allows to retrieve maintenances according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---|--------------|---|
| groupids | ID/array | Return only maintenances that are assigned to the given host groups. |
| hostids | ID/array | Return only maintenances that are assigned to the given hosts. |
| maintenanceids | ID/array | Return only maintenances with the given IDs. |
| selectHostGroups | query | Return a hostgroups property with host groups assigned to the maintenance. |
| selectHosts | query | Return a hosts property with hosts assigned to the maintenance. |
| selectTags | query | Return a tags property with problem tags of the maintenance. |
| selectTimeperiods | query | Return a timeperiods property with time periods of the maintenance. |
| sortfield | string/array | Sort the result by the given properties. |
| Possible values: maintenanceid, name, maintenance_type. These parameters are described in the reference commentary . | | |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;

- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving maintenances

Retrieve all configured maintenances, and the data about the assigned host groups, defined time periods and problem tags.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.get",
  "params": {
    "output": "extend",
    "selectHostGroups": "extend",
    "selectTimeperiods": "extend",
    "selectTags": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "maintenanceid": "3",
      "name": "Sunday maintenance",
      "maintenance_type": "0",
      "description": "",
      "active_since": "1358844540",
      "active_till": "1390466940",
      "tags_evaltype": "0",
      "hostgroups": [
        {
          "groupid": "4",
          "name": "Zabbix servers",
          "flags": "0",
          "uuid": "6f6799aa69e844b4b3918f779f2abf08"
        }
      ],
      "timeperiods": [
        {
          "timeperiod_type": "3",
          "every": "1",
          "month": "0",
          "dayofweek": "1",
          "day": "0",
          "start_time": "64800",
          "period": "3600",
          "start_date": "2147483647"
        }
      ],
      "tags": [
        {
          "tag": "service",
          "operator": "0",
          "value": "mysqld",
        },
        {
          "tag": "error",
          "operator": "2",
          "value": ""
        }
      ]
    }
  ]
}
```

```

    ],
    "id": 1
}

```

Source

CMaintenance::get() in *ui/include/classes/api/services/CMaintenance.php*.

maintenance.update

Description

object maintenance.update(object/array maintenances)

This method allows to update existing maintenances.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Maintenance properties to be updated.

The `maintenanceid` property must be defined for each maintenance, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard maintenance properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-------------|--------------|---|
| groups | object/array | <p>Host groups to replace the current groups.</p> <p>The host groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>hosts</code> is not set |
| hosts | object/array | <p>Hosts to replace the current hosts.</p> <p>The hosts must have only the <code>hostid</code> property defined.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>groups</code> is not set |
| timeperiods | object/array | <p>Maintenance time periods to replace the current periods.</p> |
| tags | object/array | <p>Problem tags to replace the current tags.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>maintenance_type</code> of Maintenance object is set to "with data collection" |

Return values

(object) Returns an object containing the IDs of the updated maintenances under the `maintenanceids` property.

Examples

Assigning different hosts

Replace the hosts currently assigned to maintenance with two different ones.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "maintenance.update",
  "params": {
    "maintenanceid": "3",
    "hosts": [
      {"hostid": "10085"},
      {"hostid": "10084"}
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "maintenanceids": [
      "3"
    ]
  },
  "id": 1
}
```

- [Map lines](#)

Available methods:

- [map.create](#) - create new maps
- [map.delete](#) - delete maps
- [map.get](#) - retrieve maps
- [map.update](#) - update maps

Map object

The following objects are directly related to the map API.

Map

The map object has the following properties.

| Property | Type | Description |
|---------------|---------|---|
| sysmapid | ID | ID of the map. |
| height | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations Height of the map in pixels. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations Name of the map. |
| width | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations Width of the map in pixels. |
| backgroundid | ID | ID of the image used as the background for the map. |
| expand_macros | integer | Whether to expand macros in labels when configuring the map. |
| expandproblem | integer | <p>Possible values:</p> <ul style="list-style-type: none">0 - (<i>default</i>) do not expand macros;1 - expand macros. Whether the problem trigger will be displayed for elements with a single problem. |
| grid_align | integer | <p>Possible values:</p> <ul style="list-style-type: none">0 - always display the number of problems;1 - (<i>default</i>) display the problem trigger if there's only one problem. Whether to enable grid aligning. |
| grid_show | integer | <p>Possible values:</p> <ul style="list-style-type: none">0 - disable grid aligning;1 - (<i>default</i>) enable grid aligning. Whether to show the grid on the map. |
| grid_size | integer | <p>Possible values:</p> <ul style="list-style-type: none">0 - do not show the grid;1 - (<i>default</i>) show the grid. Size of the map grid in pixels. |
| highlight | integer | <p>Supported values: 20, 40, 50, 75 and 100.</p> <p>Default: 50.</p> Whether icon highlighting is enabled. |
| iconmapid | ID | ID of the icon map used on the map. |
| label_format | integer | Whether to enable advanced labels. |
| | | <p>Possible values:</p> <ul style="list-style-type: none">0 - (<i>default</i>) disable advanced labels;1 - enable advanced labels. |

| Property | Type | Description |
|------------------------|---------|---|
| label_location | integer | Location of the map element label. Possible values: 0 - <i>(default)</i> bottom; 1 - left; 2 - right; 3 - top. |
| label_string_host | string | Custom label for host elements. |
| label_string_hostgroup | string | Property behavior: - <i>required</i> if label_type_host is set to "custom" Custom label for host group elements. |
| label_string_image | string | Property behavior: - <i>required</i> if label_type_hostgroup is set to "custom" Custom label for image elements. |
| label_string_map | string | Property behavior: - <i>required</i> if label_type_image is set to "custom" Custom label for map elements. |
| label_string_trigger | string | Property behavior: - <i>required</i> if label_type_map is set to "custom" Custom label for trigger elements. |
| label_type | integer | Property behavior: - <i>required</i> if label_type_trigger is set to "custom" Map element label type. Possible values: 0 - label; 1 - IP address; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing. |
| label_type_host | integer | Label type for host elements. Possible values: 0 - label; 1 - IP address; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing; 5 - custom. |
| label_type_hostgroup | integer | Label type for host group elements. Possible values: 0 - label; 2 - <i>(default)</i> element name; 3 - status only; 4 - nothing; 5 - custom. |
| label_type_image | integer | Label type for host group elements. Possible values: 0 - label; 2 - <i>(default)</i> element name; 4 - nothing; 5 - custom. |

| Property | Type | Description |
|--------------------|---------|---|
| label_type_map | integer | Label type for map elements. Possible values: 0 - label; 2 - (<i>default</i>) element name; 3 - status only; 4 - nothing; 5 - custom. |
| label_type_trigger | integer | Label type for trigger elements. Possible values: 0 - label; 2 - (<i>default</i>) element name; 3 - status only; 4 - nothing; 5 - custom. |
| markelements | integer | Whether to highlight map elements that have recently changed their status. Possible values: 0 - (<i>default</i>) do not highlight elements; 1 - highlight elements. |
| severity_min | integer | Minimum severity of the triggers that will be displayed on the map. Refer to the trigger severity property for a list of supported trigger severities. |
| show_unack | integer | How problems should be displayed. Possible values: 0 - (<i>default</i>) display the count of all problems; 1 - display only the count of unacknowledged problems; 2 - display the count of acknowledged and unacknowledged problems separately. |
| userid | ID | ID of the user that is the owner of the map. |
| private | integer | Type of map sharing. Possible values: 0 - public map; 1 - (<i>default</i>) private map. |
| show_suppressed | integer | Whether suppressed problems are shown. Possible values: 0 - (<i>default</i>) hide suppressed problems; 1 - show suppressed problems. |

Map element

The map element object defines an object displayed on a map. It has the following properties.

| Property | Type | Description |
|------------|-------|---|
| selementid | ID | ID of the map element. Property behavior: - <i>read-only</i> |
| elements | array | Element data object. Property behavior: - <i>required</i> if elementtype is set to "host", "map", "trigger" or "host group" |

| Property | Type | Description |
|--------------------|---------|---|
| elementtype | integer | Type of map element. Possible values: 0 - host; 1 - map; 2 - trigger; 3 - host group; 4 - image. Property behavior: - <i>required</i> |
| iconid_off | ID | ID of the image used to display the element in default state. Property behavior: - <i>required</i> |
| areatype | integer | How separate host group hosts should be displayed. Possible values: 0 - (<i>default</i>) the host group element will take up the whole map; 1 - the host group element will have a fixed size. |
| elementsubtype | integer | How a host group element should be displayed on a map. Possible values: 0 - (<i>default</i>) display the host group as a single element; 1 - display each host in the group separately. |
| evaltype | integer | Map element tag filtering condition evaluation method. Possible values: 0 - (<i>default</i>) AND / OR; 2 - OR. |
| height | integer | Height of the fixed size host group element in pixels. Default: 200. |
| iconid_disabled | ID | ID of the image used to display disabled map elements. Property behavior: - <i>supported</i> if elementtype is set to "host", "map", "trigger", or "host group" |
| iconid_maintenance | ID | ID of the image used to display map elements in maintenance. Property behavior: - <i>supported</i> if elementtype is set to "host", "map", "trigger", or "host group" |
| iconid_on | ID | ID of the image used to display map elements with problems. Property behavior: - <i>supported</i> if elementtype is set to "host", "map", "trigger", or "host group" |
| label | string | Label of the element. |
| label_location | integer | Location of the map element label. Possible values: -1 - (<i>default</i>) default location; 0 - bottom; 1 - left; 2 - right; 3 - top. |

| Property | Type | Description |
|-------------|---------|--|
| permission | integer | Type of permission level. Possible values: -1 - none; 2 - read only; 3 - read-write. |
| sysmapid | ID | ID of the map that the element belongs to. |
| urls | array | Property behavior: - <i>read-only</i> Map element URLs. |
| use_iconmap | integer | The map element URL object is described in detail below . Whether icon mapping must be used for host elements. Possible values: 0 - do not use icon mapping; 1 - (<i>default</i>) use icon mapping. |
| viewtype | integer | Host group element placing algorithm. Possible values: 0 - (<i>default</i>) grid. |
| width | integer | Width of the fixed size host group element in pixels. |
| x | integer | Default: 200. X-coordinates of the element in pixels. |
| y | integer | Default: 0. Y-coordinates of the element in pixels. |
| | | Default: 0. |

Map element Host

The map element Host object defines one host element.

| Property | Type | Description |
|----------|------|-----------------|
| hostid | ID | ID of the host. |

Map element Host group

The map element Host group object defines one host group element.

| Property | Type | Description |
|----------|------|-----------------------|
| groupid | ID | ID of the host group. |

Map element Map

The map element Map object defines one map element.

| Property | Type | Description |
|----------|------|----------------|
| sysmapid | ID | ID of the map. |

Map element Trigger

The map element Trigger object defines one or more trigger elements.

| Property | Type | Description |
|-----------|------|--------------------|
| triggerid | ID | ID of the trigger. |

Map element Tag

The map element Tag object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| tag | string | Map element tag name. |
| operator | integer | <p>Property behavior: - <i>required</i></p> <p>Map element tag condition operator.</p> <p>Possible values: 0 - (<i>default</i>) Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.</p> |
| value | string | Map element tag value. |

Map element URL

The map element URL object defines a clickable link that will be available for a specific map element. It has the following properties:

| Property | Type | Description |
|--------------------|--------|--|
| sysmapelementurlid | ID | ID of the map element URL. |
| name | string | <p>Property behavior: - <i>read-only</i></p> <p>Link caption.</p> |
| url | string | <p>Property behavior: - <i>required</i></p> <p>Link URL.</p> |
| selementid | ID | <p>Property behavior: - <i>required</i></p> <p>ID of the map element that the URL belongs to.</p> |

Map link

The map link object defines a link between two map elements. It has the following properties.

| Property | Type | Description |
|-------------|------|---|
| linkid | ID | ID of the map link. |
| selementid1 | ID | <p>Property behavior: - <i>read-only</i></p> <p>ID of the first map element linked on one end.</p> |
| selementid2 | ID | <p>Property behavior: - <i>required</i></p> <p>ID of the first map element linked on the other end.</p> <p>Property behavior: - <i>required</i></p> |

| Property | Type | Description |
|--------------|---------|---|
| color | string | Line color as a hexadecimal color code. |
| drawtype | integer | Default: 000000. Link line draw style. Possible values: 0 - <i>(default)</i> line; 2 - bold line; 3 - dotted line; 4 - dashed line. |
| label | string | Link label. |
| linktriggers | array | Map link triggers to use as link status indicators. |
| permission | integer | The map link trigger object is described in detail below . Type of permission level. Possible values: -1 - none; 2 - read only; 3 - read-write. |
| sysmapid | ID | ID of the map the link belongs to. |

Map link trigger

The map link trigger object defines a map link status indicator based on the state of a trigger. It has the following properties:

| Property | Type | Description |
|---------------|---------|---|
| linktriggerid | ID | ID of the map link trigger. |
| triggerid | ID | Property behavior: - <i>read-only</i> ID of the trigger used as a link indicator. |
| color | string | Property behavior: - <i>required</i> Indicator color as a hexadecimal color code. |
| drawtype | integer | Default: DD0000. Indicator draw style. Possible values: 0 - <i>(default)</i> line; 2 - bold line; 3 - dotted line; 4 - dashed line. |
| linkid | ID | ID of the map link that the link trigger belongs to. |

Map URL

The map URL object defines a clickable link that will be available for all elements of a specific type on the map. It has the following properties:

| Property | Type | Description |
|-------------|------|---|
| sysmapurlid | ID | ID of the map URL. Property behavior: - <i>read-only</i> |

| Property | Type | Description |
|-------------|---------|--|
| name | string | Link caption. |
| url | string | <p>Property behavior: - <i>required</i></p> <p>Link URL.</p> |
| elementtype | integer | <p>Property behavior: - <i>required</i></p> <p>Type of map element for which the URL will be available.</p> <p>Refer to the map element type property for a list of supported types.</p> |
| sysmapid | ID | <p>Default: 0.</p> <p>ID of the map that the URL belongs to.</p> |

Map user

List of map permissions based on users. It has the following properties:

| Property | Type | Description |
|--------------|---------|---|
| sysmapuserid | ID | ID of the map user. |
| userid | ID | <p>Property behavior: - <i>read-only</i></p> <p>ID of the user.</p> |
| permission | integer | <p>Property behavior: - <i>required</i></p> <p>Type of permission level.</p> <p>Possible values: 2 - read only; 3 - read-write.</p> <p>Property behavior: - <i>required</i></p> |

Map user group

List of map permissions based on user groups. It has the following properties:

| Property | Type | Description |
|----------------|---------|---|
| sysmapusrgrpid | ID | ID of the map user group. |
| usrgrpid | ID | <p>Property behavior: - <i>read-only</i></p> <p>ID of the user group.</p> |
| permission | integer | <p>Property behavior: - <i>required</i></p> <p>Type of permission level.</p> <p>Possible values: 2 - read only; 3 - read-write.</p> <p>Property behavior: - <i>required</i></p> |

Map shapes

The map shape object defines a geometric shape (with or without text) displayed on a map. It has the following properties:

| Property | Type | Description |
|----------------|---------|---|
| sysmap_shapeid | ID | ID of the map shape element. |
| type | integer | <p>Property behavior: - <i>read-only</i></p> <p>Type of map shape element.</p> <p>Possible values: 0 - rectangle; 1 - ellipse.</p> <p>Property is required when new shapes are created.</p> <p>Property behavior: - <i>required</i></p> |
| x | integer | X-coordinates of the shape in pixels. |
| y | integer | <p>Default: 0.</p> <p>Y-coordinates of the shape in pixels.</p> |
| width | integer | <p>Default: 0.</p> <p>Width of the shape in pixels.</p> |
| height | integer | <p>Default: 200.</p> <p>Height of the shape in pixels.</p> |
| text | string | Default: 200. Text of the shape. |
| font | integer | <p>Font of the text within shape.</p> <p>Possible values: 0 - Georgia, serif 1 - "Palatino Linotype", "Book Antiqua", Palatino, serif 2 - "Times New Roman", Times, serif 3 - Arial, Helvetica, sans-serif 4 - "Arial Black", Gadget, sans-serif 5 - "Comic Sans MS", cursive, sans-serif 6 - Impact, Charcoal, sans-serif 7 - "Lucida Sans Unicode", "Lucida Grande", sans-serif 8 - Tahoma, Geneva, sans-serif 9 - "Trebuchet MS", Helvetica, sans-serif 10 - Verdana, Geneva, sans-serif 11 - "Courier New", Courier, monospace 12 - "Lucida Console", Monaco, monospace</p> |
| font_size | integer | <p>Default: 9.</p> <p>Font size in pixels.</p> |
| font_color | string | <p>Default: 11.</p> <p>Font color.</p> <p>Default: 000000.</p> |

| Property | Type | Description |
|------------------|---------|---|
| text_halign | integer | Horizontal alignment of text. Possible values: 0 - center; 1 - left; 2 - right. |
| text_valign | integer | Default: 0. Vertical alignment of text. Possible values: 0 - middle; 1 - top; 2 - bottom. |
| border_type | integer | Default: 0. Type of the border. Possible values: 0 - none; 1 - _____; 2 - ---; 3 - - - - -. |
| border_width | integer | Default: 0. Width of the border in pixels. |
| border_color | string | Default: 0. Border color. |
| background_color | string | Default: 000000. Background color (fill color). |
| zindex | integer | Default: (empty). Value used to order all shapes and lines (z-index). Default: 0. |

Map lines

The map line object defines a line displayed on a map. It has the following properties:

| Property | Type | Description |
|----------------|---------|---|
| sysmap_shapeid | ID | ID of the map shape element. |
| x1 | integer | Property behavior: - <i>read-only</i> X-coordinates of the line point 1 in pixels. |
| y1 | integer | Default: 0. Y-coordinates of the line point 1 in pixels. |
| x2 | integer | Default: 0. X-coordinates of the line point 2 in pixels. |
| y2 | integer | Default: 200. Y-coordinates of the line point 2 in pixels. Default: 200. |

| Property | Type | Description |
|------------|---------|---|
| line_type | integer | Type of the lines. Possible values: 0 - none; 1 - _____; 2 - ---; 3 - - - -. |
| line_width | integer | Default: 0. Width of the lines in pixels. |
| line_color | string | Default: 0. Line color. |
| zindex | integer | Default: 000000. Value used to order all shapes and lines (z-index). Default: 0. |

map.create

Description

object map.create(object/array maps)

This method allows to create new maps.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Maps to create.

Additionally to the [standard map properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|-------|---|
| links | array | Map links to be created on the map. |
| selements | array | Map elements to be created on the map. |
| urls | array | Map URLs to be created on the map. |
| users | array | Map user shares to be created on the map. |
| userGroups | array | Map user group shares to be created on the map. |
| shapes | array | Map shapes to be created on the map. |
| lines | array | Map lines to be created on the map. |

Note:

To create map links you'll need to set a map element `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. [See example](#).

Return values

(object) Returns an object containing the IDs of the created maps under the `sysmapids` property. The order of the returned IDs matches the order of the passed maps.

Examples

Create an empty map

Create a map with no elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map",
    "width": 600,
    "height": 600
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "8"
    ]
  },
  "id": 1
}
```

Create a host map

Create a map with two host elements and a link between them. Note the use of temporary "selementid1" and "selementid2" values in the map link object to refer to map elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Host map",
    "width": 600,
    "height": 600,
    "selements": [
      {
        "selementid": "1",
        "elements": [
          {"hostid": "1033"}
        ],
        "elementtype": 0,
        "iconid_off": "2"
      },
      {
        "selementid": "2",
        "elements": [
          {"hostid": "1037"}
        ],
        "elementtype": 0,
        "iconid_off": "2"
      }
    ],
    "links": [
      {
        "selementid1": "1",
        "selementid2": "2"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 1
}
```

Create a trigger map

Create a map with trigger element, which contains two triggers.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Trigger map",
    "width": 600,
    "height": 600,
    "selements": [
      {
        "elements": [
          {"triggerid": "12345"},
          {"triggerid": "67890"}
        ],
        "elementtype": 2,
        "iconid_off": "2"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "10"
    ]
  },
  "id": 1
}
```

Map sharing

Create a map with two types of sharing (user and user group).

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map sharing",
    "width": 600,
    "height": 600,
    "users": [
      {
        "userid": "4",
        "permission": "3"
      }
    ]
  }
}
```

```

    }
    ],
    "userGroups": [
      {
        "usrgrpid": "7",
        "permission": "2"
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 1
}

```

Map shapes

Create a map with map name title.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Host map",
    "width": 600,
    "height": 600,
    "shapes": [
      {
        "type": 0,
        "x": 0,
        "y": 0,
        "width": 600,
        "height": 11,
        "text": "{MAP.NAME}"
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "10"
    ]
  },
  "id": 1
}

```

Map lines

Create a map line.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.create",
  "params": {
    "name": "Map API lines",
    "width": 500,
    "height": 500,
    "lines": [
      {
        "x1": 30,
        "y1": 10,
        "x2": 100,
        "y2": 50,
        "line_type": 1,
        "line_width": 10,
        "line_color": "009900"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "11"
    ]
  },
  "id": 1
}
```

Source

CMap::create() in `ui/include/classes/api/services/CMap.php`.

map.delete

Description

object map.delete(array mapIds)

This method allows to delete maps.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted maps under the `sysmapids` property.

Examples

Delete multiple maps

Delete two maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.delete",
  "params": [
    "12",
    "34"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "12",
      "34"
    ]
  },
  "id": 1
}
```

Source

CMap::delete() in `ui/include/classes/api/services/CMap.php`.

map.get

Description

integer/array map.get(object parameters)

The method allows to retrieve maps according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------|----------|--|
| sysmapids | ID/array | Returns only maps with the given IDs. |
| userids | ID/array | Returns only maps that belong to the given user IDs. |
| expandUrls | flag | Adds global map URLs to the corresponding map elements and expands macros in all map element URLs. |
| selectIconMap | query | Returns an iconmap property with the icon map used on the map. |
| selectLinks | query | Returns a links property with the map links between elements. |
| selectSelements | query | Returns a selements property with the map elements. |
| selectUrls | query | Returns a urls property with the map URLs. |
| selectUsers | query | Returns a users property with users that the map is shared with. |
| selectUserGroups | query | Returns a userGroups property with user groups that the map is shared with. |
| selectShapes | query | Returns a shapes property with the map shapes. |

| Parameter | Type | Description |
|------------------------|--------------|---|
| selectLines | query | Returns a lines property with the map lines. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: name, width, height. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve a map

Retrieve all data about map "3".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.get",
  "params": {
    "output": "extend",
    "selectSelements": "extend",
    "selectLinks": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
    "selectShapes": "extend",
    "selectLines": "extend",
    "sysmapids": "3"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "selements": [
        {
          "selementid": "10",
          "sysmapid": "3",
          "elementtype": "4",
          "evaltype": "0",
          "iconid_off": "1",
          "iconid_on": "0",
          "label": "Zabbix server",
          "label_location": "3",
          "x": "11",

```

```

map.update

Description

object map.update(object/array maps)

This method allows to update existing maps.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Map properties to be updated.

The `mapid` property must be defined for each map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard map properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|------------|-------|---|
| links | array | Map links to replace the existing links. |
| selements | array | Map elements to replace the existing elements. |
| urls | array | Map URLs to replace the existing URLs. |
| users | array | Map user shares to replace the existing elements. |
| userGroups | array | Map user group shares to replace the existing elements. |
| shapes | array | Map shapes to replace the existing shapes. |
| lines | array | Map lines to replace the existing lines. |

Note:

To create map links between new map elements you'll need to set an element's `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. [See example for map.create](#).

Return values

(object) Returns an object containing the IDs of the updated maps under the `sysmapids` property.

Examples**Resize a map**

Change the size of the map to 1200x1200 pixels.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.update",
  "params": {
    "sysmapid": "8",
    "width": 1200,
    "height": 1200
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "8"
    ]
  },
  "id": 1
}
```

Change map owner

Available only for admins and super admins.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "map.update",
  "params": {
    "sysmapid": "9",
    "userid": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "sysmapids": [
      "9"
    ]
  },
  "id": 1
}
```

Media type

This class is designed to work with media types.

Object references:

- [Media type](#)
 - [Webhook parameters](#)
 - [Script parameters](#)
- [Message template](#)

Available methods:

- [mediatype.create](#) - create new media types
- [mediatype.delete](#) - delete media types
- [mediatype.get](#) - retrieve media types
- [mediatype.update](#) - update media types

Media type object

The following objects are directly related to the mediatype API.

Media type

The media type object has the following properties.

| Property | Type | Description |
|-------------|---------|---|
| mediatypeid | ID | ID of the media type. |
| | | Property behavior: - <i>read-only</i> |
| name | string | - <i>required</i> for update operations Name of the media type. |
| | | Property behavior: - <i>required</i> for create operations |
| type | integer | Transport used by the media type. Possible values: 0 - Email; 1 - Script; 2 - SMS; 4 - Webhook. |
| | | Property behavior: - <i>required</i> for create operations |
| exec_path | string | Name of the script file (e.g., notification.sh) that is located in the directory specified in the AlertScriptsPath server configuration parameter. |
| | | Property behavior: - <i>required</i> if type is set to "Script" |
| gsm_modem | string | Serial device name of the GSM modem. |
| | | Property behavior: - <i>required</i> if type is set to "SMS" |
| passwd | string | Authentication password. |
| | | Property behavior: - <i>supported</i> if smtp_authentication is set to "Normal password" |
| provider | integer | Email provider. Possible values: 0 - (default) Generic SMTP; 1 - Gmail; 2 - Gmail relay; 3 - Office365; 4 - Office365 relay. |
| smtp_email | string | Email address from which notifications will be sent. |
| | | Property behavior: - <i>required</i> if type is set to "Email" |
| smtp_helo | string | SMTP HELO. |
| | | Property behavior: - <i>supported</i> if type is set to "Email" |
| smtp_server | string | SMTP server. |
| | | Property behavior: - <i>required</i> if type is set to "Email" |
| smtp_port | integer | SMTP server port to connect to. Default: 25. |
| | | Property behavior: - <i>supported</i> if type is set to "Email" |

| Property | Type | Description |
|---------------------|---------|---|
| smtp_security | integer | SMTP connection security level to use. Possible values: 0 - (default) None; 1 - STARTTLS; 2 - SSL/TLS. Property behavior: - <i>supported</i> if type is set to "Email" |
| smtp_verify_host | integer | SSL verify host for SMTP. Possible values: 0 - (default) No; 1 - Yes. Property behavior: - <i>supported</i> if smtp_security is set to "STARTTLS" or "SSL/TLS" |
| smtp_verify_peer | integer | SSL verify peer for SMTP. Possible values: 0 - (default) No; 1 - Yes. Property behavior: - <i>supported</i> if smtp_security is set to "STARTTLS" or "SSL/TLS" |
| smtp_authentication | integer | SMTP authentication method to use. Possible values: 0 - (default) None; 1 - Normal password. Property behavior: - <i>supported</i> if type is set to "Email" |
| status | integer | Whether the media type is enabled. Possible values: 0 - (default) Enabled; 1 - Disabled. |
| username | string | User name. Property behavior: - <i>supported</i> if smtp_authentication is set to "Normal password" |
| maxsessions | integer | The maximum number of alerts that can be processed in parallel. Possible values if type is set to "SMS": 1. Possible values if type is set to "Email", "Script", or "Webhook": 0-100. |
| maxattempts | integer | Default: 1. The maximum number of attempts to send an alert. Possible values: 1-100. |
| attempt_interval | string | Default: 3. The interval between retry attempts. Accepts seconds and time unit with suffix. Possible values: 0-1h. Default: 10s. |

| Property | Type | Description |
|-----------------|---------|--|
| message_format | integer | <p>Message format.</p> <p>Possible values: 0 - Plain text; 1 - <i>(default)</i> HTML.</p> <p>Property behavior: - <i>supported</i> if type is set to "Email"</p> |
| script | text | <p>Webhook script body (JavaScript).</p> <p>Property behavior: - <i>required</i> if type is set to "Webhook"</p> |
| timeout | string | <p>Webhook script timeout. Accepts seconds and time unit with suffix.</p> <p>Possible values: 1-60s.</p> <p>Default: 30s.</p> <p>Property behavior: - <i>supported</i> if type is set to "Webhook"</p> |
| process_tags | integer | <p>Process JSON property values in Webhook script response as tags. These tags are added to any existing problem tags.</p> <p>Possible values: 0 - <i>(default)</i> Ignore webhook script response; 1 - Process webhook script response as tags.</p> <p>Property behavior: - <i>supported</i> if type is set to "Webhook"</p> |
| show_event_menu | integer | <p>Include an entry in the event menu that links to a custom URL. Also adds the <code>urls</code> property to the output of <code>problem.get</code> and <code>event.get</code>.</p> <p>Possible values: 0 - <i>(default)</i> Do not include event menu entry or <code>urls</code> property; 1 - Include event menu entry and <code>urls</code> property.</p> <p>Property behavior: - <i>supported</i> if type is set to "Webhook"</p> |
| event_menu_url | string | <p>URL used in the event menu entry and in the <code>urls</code> property returned by <code>problem.get</code> and <code>event.get</code>.</p> <p>Property behavior: - <i>supported</i> if <code>show_event_menu</code> is set to "Include event menu entry and <code>urls</code> property"</p> |
| event_menu_name | string | <p>Name used for the event menu entry and in the <code>urls</code> property returned by <code>problem.get</code> and <code>event.get</code>.</p> <p>Property behavior: - <i>supported</i> if <code>show_event_menu</code> is set to "Include event menu entry and <code>urls</code> property"</p> |
| parameters | array | <p>Webhook or script parameters.</p> <p>Property behavior: - <i>supported</i> if type is set to "Webhook" or "Script"</p> |
| description | text | <p>Media type description.</p> |

Webhook parameters

Webhook parameters have the following properties.

| Property | Type | Description |
|----------|--------|---|
| name | string | Parameter name. |
| value | string | Property behavior: - <i>required</i> Parameter value, supports macros. Supported macros are described on the Supported macros page. |

Script parameters

Script parameters have the following properties.

| Property | Type | Description |
|-----------|---------|---|
| sortorder | integer | The order in which parameter values will be passed to the script as command-line arguments, starting with 0 as the first one. |
| value | string | Property behavior: - <i>required</i> Parameter value, supports macros. Supported macros are described on the Supported macros page. |

Message template

The message template object defines a template that will be used as a default message for action operations to send a notification. It has the following properties.

| Property | Type | Description |
|--------------|---------|--|
| eventsources | integer | Event source. Possible values: 0 - Triggers; 1 - Discovery; 2 - Autoregistration; 3 - Internal; 4 - Services. |
| recovery | integer | Property behavior: - <i>required</i> Operation mode. Possible values: 0 - Operations; 1 - Recovery operations; 2 - Update operations. |
| subject | string | Property behavior: - <i>required</i> Message subject. |
| message | string | Message text. |

mediatype.create

Description

`object mediatype.create(object/array mediaTypes)`

This method allows to create new media types.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Media types to create.

Additionally to the **standard media type properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-------------------|-------|--|
| message_templates | array | Message templates to be created for the media type. |

Return values

(object) Returns an object containing the IDs of the created media types under the `mediatypeids` property. The order of the returned IDs matches the order of the passed media types.

Examples

Creating an email media type

Create a new email media type with a custom SMTP port and message templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "type": "0",
    "name": "Email",
    "smtp_server": "mail.example.com",
    "smtp_helo": "example.com",
    "smtp_email": "zabbix@example.com",
    "smtp_port": "587",
    "message_format": "1",
    "message_templates": [
      {
        "eventsourcing": "0",
        "recovery": "0",
        "subject": "Problem: {EVENT.NAME}",
        "message": "Problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\" started at {EVENT.TIME}."
      },
      {
        "eventsourcing": "0",
        "recovery": "1",
        "subject": "Resolved in {EVENT.DURATION}: {EVENT.NAME}",
        "message": "Problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\" has been resolved at {EVENT.TIME}."
      },
      {
        "eventsourcing": "0",
        "recovery": "2",
        "subject": "Updated problem in {EVENT.AGE}: {EVENT.NAME}",
        "message": "{USER.FULLNAME} {EVENT.UPDATE.ACTION} problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\""
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "7"
    ]
  },
}
```

```
    "id": 1
}
```

Creating a script media type

Create a new script media type with a custom value for the number of attempts and the interval between them.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "type": "1",
    "name": "Push notifications",
    "exec_path": "push-notification.sh",
    "maxattempts": "5",
    "attempt_interval": "11s",
    "parameters": [
      {
        "sortorder": "0",
        "value": "{ALERT.SENDTO}"
      },
      {
        "sortorder": "1",
        "value": "{ALERT.SUBJECT}"
      },
      {
        "sortorder": "2",
        "value": "{ALERT.MESSAGE}"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "8"
    ]
  },
  "id": 1
}
```

Creating a webhook media type

Create a new webhook media type.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.create",
  "params": {
    "type": "4",
    "name": "Webhook",
    "script": "var Webhook = {\r\n    token: null,\r\n    to: null,\r\n    subject: null,\r\n    messa",
    "parameters": [
      {
        "name": "Message",
        "value": "{ALERT.MESSAGE}"
      },
      {

```

```

        "name": "Subject",
        "value": "{ALERT.SUBJECT}"
    },
    {
        "name": "To",
        "value": "{ALERT.SENDTO}"
    },
    {
        "name": "Token",
        "value": "<Token>"
    }
]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "mediatypeids": [
            "9"
        ]
    },
    "id": 1
}

```

Source

CMediaType::create() in *ui/include/classes/api/services/CMediaType.php*.

mediatype.delete

Description

object mediatype.delete(array mediaTypeIds)

This method allows to delete media types.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the media types to delete.

Return values

(object) Returns an object containing the IDs of the deleted media types under the `mediatypeids` property.

Examples

Deleting multiple media types

Delete two media types.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "mediatype.delete",
    "params": [
        "3",
        "5"
    ],
}

```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "3",
      "5"
    ]
  },
  "id": 1
}
```

Source

CMediaType::delete() in *ui/include/classes/api/services/CMediaType.php*.

mediatype.get

Description

integer/array mediatype.get(object parameters)

The method allows to retrieve media types according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Note:

When requesting user-related information of media types, *Admin* and *User* type users may retrieve data only about their own user. For an example, see [Retrieving media types as Admin](#).

| Parameter | Type | Description |
|--|--------------|---|
| mediatypeids | ID/array | Return only media types with the given IDs. |
| mediaids | ID/array | Return only media types used by the given media . |
| userids | ID/array | Return only media types used by the given users. |
| selectActions | query | Return an actions property with the actions that use the media type. |
| selectMessageTemplates | query | Return a message_templates property with an array of media type messages. |
| Parameter behavior: | | |
| - <i>supported</i> for <i>Super admin</i> type users | | |
| selectUsers | query | Return a users property with the users that use the media type. |
| sortfield | string/array | See user.get for restrictions based on user type. Sort the result by the given properties. |
| Possible values: mediatypeid. | | |

| Parameter | Type | Description |
|------------------------|--------------|--|
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of text data type . Possible Media type object properties for <i>Admin</i> and <i>User</i> type users (since Zabbix 7.2.3): <code>mediatypeid</code> , <code>name</code> , <code>type</code> , <code>status</code> , <code>maxattempts</code> . Media type object properties to be returned. |
| output | query | Since Zabbix 7.2.3, <i>Admin</i> and <i>User</i> type users may retrieve only the following properties: <code>mediatypeid</code> , <code>name</code> , <code>type</code> , <code>status</code> , <code>maxattempts</code> , <code>description</code> . For an example, see Retrieving media types as Admin . |
| search | object | Default: <code>extend</code> . Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE <code>"%...%"</code> search. Supports only properties of string and text data type . Possible Media type object properties for <i>Admin</i> and <i>User</i> type users (since Zabbix 7.2.3): <code>name</code> , <code>description</code> . These parameters are described in the reference commentary . |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| preservekeys | boolean | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving media types

Retrieve all configured media types. The following example returns two media types:

- email media type;
- SMS media type.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.get",
  "params": {
    "output": "extend",
    "selectMessageTemplates": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "mediatypeid": "1",
      "type": "0",

Retrieving media types as *Admin*

As an *Admin* type user, retrieve all media types that are enabled, with users that use these media types. The following example returns two media types:

- email media type with one user (only *Admin* type user's own user);
- SMS media type with no users.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "mediatype.get",
  "params": {
    "output": "extend",
    "filter": {
      "status": 0
    },
    "selectUsers": "extend"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "mediatypeid": "1",
      "type": "0",
      "name": "Email",
      "status": "0",
      "description": "",
      "maxattempts": "3",
      "users": [
        {
          "userid": "3",
          "username": "database-admin",
          "name": "John",
          "surname": "Doe",
          "url": "",
          "autologin": "0",
          "autologout": "0",
          "lang": "default",
          "refresh": "30s",
          "theme": "default",
          "attempt_failed": "0",
          "attempt_ip": "",
          "attempt_clock": "0",
          "rows_per_page": "50",
          "timezone": "default",
          "roleid": "2",
          "provisioned": "0"
        }
      ]
    }
  ]
}

```

```

    },
    {
      "mediatypeid": "3",
      "type": "2",
      "name": "SMS",
      "status": "0",
      "description": "",
      "maxattempts": "3",
      "users": []
    }
  ],
  "id": 1
}

```

Retrieve script and webhook media types

The following example returns three media types:

- script media type with parameters;
- script media type without parameters;
- webhook media type with parameters.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "mediatype.get",
  "params": {
    "output": ["mediatypeid", "name", "parameters"],
    "filter": {
      "type": [1, 4]
    }
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "mediatypeid": "10",
      "name": "Script with parameters",
      "parameters": [
        {
          "sortorder": "0",
          "value": "{ALERT.SENDTO}"
        },
        {
          "sortorder": "1",
          "value": "{EVENT.NAME}"
        },
        {
          "sortorder": "2",
          "value": "{ALERT.MESSAGE}"
        },
        {
          "sortorder": "3",
          "value": "Zabbix alert"
        }
      ]
    },
    {
      "mediatypeid": "13",
      "name": "Script without parameters",

```

```

        "parameters": []
    },
    {
        "mediatypeid": "11",
        "name": "Webhook",
        "parameters": [
            {
                "name": "alert_message",
                "value": "{ALERT.MESSAGE}"
            },
            {
                "name": "event_update_message",
                "value": "{EVENT.UPDATE.MESSAGE}"
            },
            {
                "name": "host_name",
                "value": "{HOST.NAME}"
            },
            {
                "name": "trigger_description",
                "value": "{TRIGGER.DESCRPTION}"
            },
            {
                "name": "trigger_id",
                "value": "{TRIGGER.ID}"
            },
            {
                "name": "alert_source",
                "value": "Zabbix"
            }
        ]
    }
],
"id": 1
}

```

mediatype.update

Description

object mediatype.update(object/array mediaTypes)

This method allows to update existing media types.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Media type properties to be updated.

The mediatypeid property must be defined for each media type, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard media type properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-------------------|-------|--|
| message_templates | array | Message templates to replace the current message templates. |

Return values

(object) Returns an object containing the IDs of the updated media types under the `mediatypeids` property.

Examples

Enabling a media type

Enable a media type, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mediatype.update",
  "params": {
    "mediatypeid": "6",
    "status": "0"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mediatypeids": [
      "6"
    ]
  },
  "id": 1
}
```

MFA

This class is designed to work with MFA (Multi-Factor Authentication) methods.

Object references:

- **MFA**

Available methods:

- **mfa.create** - create new MFA methods
- **mfa.delete** - delete MFA methods
- **mfa.get** - retrieve MFA methods
- **mfa.update** - update MFA methods

MFA object

The following objects are directly related to the `mfa` API.

MFA

The MFA (Multi-Factor Authentication) object has the following properties.

| Property | Type | Description |
|---------------|---------|--|
| mfaid | ID | ID of the MFA method. |
| type | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Type of the MFA method.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 1 - TOTP (Time-based One-Time Passwords); 2 - Duo Universal Prompt. |
| name | string | <p>Unique name of the MFA method.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations |
| hash_function | integer | <p>Type of the hash function for generating TOTP codes.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 1 - SHA-1; 2 - SHA-256; 3 - SHA-512. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "TOTP" |
| code_length | integer | <p>Verification code length.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 6 - 6-digit long; 8 - 8-digit long. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "TOTP" |
| api_hostname | string | <p>API hostname provided by the Duo authentication service.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "TOTP" |
| clientid | string | <p>Client ID provided by the Duo authentication service.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Duo Universal Prompt" |
| client_secret | string | <p>Client secret provided by the Duo authentication service.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>write-only</i> - <i>required</i> if type is set to "Duo Universal Prompt" |

mfa.create

Description

object `mfa.create(object/array MFA methods)`

This method allows to create new MFA methods.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) MFA methods to create.

The method accepts MFA methods with the [standard MFA method properties](#).

Return values

(object) Returns an object containing the IDs of the created MFA methods under the `mfaids` property. The order of the returned IDs matches the order of the passed items.

Examples

Creating MFA methods

Create a "Zabbix TOTP" MFA method utilizing time-based one-time passwords (TOTP), with the hash function for generating TOTP codes set to SHA-1 and the verification code length set to 6 digits.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mfa.create",
  "params": {
    "type": 1,
    "name": "Zabbix TOTP",
    "hash_function": 1,
    "code_length": 6
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mfaids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

CMfa::create() in `ui/include/classes/api/services/CMfa.php`.

mfa.delete

Description

object mfa.delete(array mfaids)

This method allows to delete MFA methods.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the MFA methods to delete.

Return values

(object) Returns an object containing the IDs of the deleted MFA methods under the `mfaids` property.

Examples

Deleting MFA methods

Delete an MFA method.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mfa.delete",
  "params": [
    "2"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "mfaids": [
      "2"
    ]
  },
  "id": 1
}
```

Source

CMfa::delete() in *ui/include/classes/api/services/CMfa.php*.

mfa.get

Description

integer/array mfa.get(object parameters)

The method allows to retrieve MFA methods according to the given parameters.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---------------|--------------|--|
| mfaids | ID/array | Return only MFA methods with the given IDs. |
| selectUsrgrps | query | Return a <code>usrgrps</code> property with user groups associated with MFA methods. |
| filter | object | <p>Supports <code>count</code>.</p> <p>Return only those results that exactly match the given filter.</p> <p>Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against.</p> |
| sortfield | string/array | <p>Supports properties:</p> <ul style="list-style-type: none"> <code>mfaid</code> - ID of the MFA method; <code>type</code> - Type of the MFA method. <p>Sort the result by the given properties.</p> <p>Possible values: <code>name</code>.</p> |

| Parameter | Type | Description |
|------------------------|--------------|---|
| search | object | Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE "%..." search. Supported properties: name. These parameters are described in the reference commentary . |
| countOutput | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Finding MFA methods by name

Retrieve all MFA methods with "Zabbix" in their name.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "mfa.get",
  "params": {
    "output": "extend",
    "search": {
      "name": "Zabbix"
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "mfaid": "1",
      "type": "1",
      "name": "Zabbix TOTP 1",
      "hash_function": "1",
      "code_length": "6",
      "api_hostname": "",
      "clientid": ""
    },
    {
      "mfaid": "2",
      "type": "1",
      "name": "Zabbix TOTP 2",
      "hash_function": "3",
      "code_length": "8",
      "api_hostname": "",

```

```

        "clientid": ""
    }
],
    "id": 1
}

```

Source

mfa.update

Description

object mfa.update(object/array MFA methods)

This method allows to update existing MFA methods.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) MFA method properties to be updated.

The `mfaid` property must be defined for each item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts MFA methods with the [standard MFA method properties](#).

Return values

(object) Returns an object containing the IDs of the updated MFA methods under the `mfaids` property.

Examples

Updating method properties

Update the hash function for generating TOTP codes and the verification code length for the "Zabbix TOTP" MFA method utilizing time-based one-time passwords (TOTP).

Request:

```

{
    "jsonrpc": "2.0",
    "method": "mfa.update",
    "params": {
        "mfaid": "1",
        "hash_function": 3,
        "code_length": 8
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "mfaids": [
            "1"
        ]
    },
    "id": 1
}

```

Module

This class is designed to work with frontend modules.

Object references:

- [Module](#)

Available methods:

- [module.create](#) - install new modules
- [module.delete](#) - uninstall modules
- [module.get](#) - retrieve modules
- [module.update](#) - update modules

Module object

The following objects are directly related to the `module` API.

Module

The module object has the following properties.

| Property | Type | Description |
|---------------|---------|---|
| moduleid | ID | ID of the module as stored in the database. |
| id | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations <p>Unique module ID as defined by a developer in the <code>manifest.json</code> file of the module.</p> <p>Possible values for built-in modules: see property "type" description in Dashboard widget.</p> |
| relative_path | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Path to the directory of the module relative to the directory of the Zabbix frontend.</p> <p>Possible values: <code>widgets/*</code> - for built-in widget modules; <code>modules/*</code> - for third-party modules.</p> |
| status | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Whether the module is enabled or disabled.</p> <p>Possible values: 0 - (<i>default</i>) Disabled; 1 - Enabled.</p> |
| config | object | Module configuration. |

module.create

Description

`object module.create(object/array modules)`

This method allows to install new frontend modules.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Attention:

Module files must be unpacked manually in the correct subdirectories, matching the `relative_path` property of the modules.

Parameters

(object/array) Modules to create.

The method accepts modules with the **standard module properties**.

Return values

(object) Returns an object containing the IDs of the installed modules under the `moduleids` property. The order of the returned IDs matches the order of the passed modules.

Examples**Installing a module**

Install a module with the status "Enabled".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "module.create",
  "params": {
    "id": "example_module",
    "relative_path": "modules/example_module",
    "status": 1
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "moduleids": [
      "25"
    ]
  },
  "id": 1
}
```

See also

- [Module](#)
- [Frontend modules](#)

Source

CModule::create() in `ui/include/classes/api/services/CModule.php`.

module.delete**Description**

object `module.delete(array moduleids)`

This method allows to uninstall modules.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Attention:

Module files must be removed manually.

Parameters

(array) IDs of the modules to uninstall.

Return values

(object) Returns an object containing the IDs of the uninstalled modules under the `moduleids` property.

Examples

Uninstalling multiple modules

Uninstall modules "27" and "28".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "module.delete",
  "params": [
    "27",
    "28"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "moduleids": [
      "27",
      "28"
    ]
  },
  "id": 1
}
```

Source

CModule::delete() in `ui/include/classes/api/services/CModule.php`.

module.get

Description

integer/array `module.get(object parameters)`

The method allows to retrieve modules according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---------------|--------------|---|
| moduleids | ID/array | Return only modules with the given IDs. |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | boolean | Possible values: <code>moduleid</code> , <code>relative_path</code> . These parameters are described in the Reference commentary . |
| excludeSearch | boolean | |
| filter | object | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving a module by ID

Retrieve all data about modules "1", "2", and "25".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "module.get",
  "params": {
    "output": "extend",
    "moduleids": [
      "1",
      "2",
      "25"
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "moduleid": "1",
      "id": "actionlog",
      "relative_path": "widgets/actionlog",
      "status": "1",
      "config": []
    },
    {
      "moduleid": "2",
      "id": "clock",
      "relative_path": "widgets/clock",
      "status": "1",
      "config": []
    },
    {
      "moduleid": "25",
      "id": "example",
      "relative_path": "modules/example_module",
      "status": "1",
      "config": []
    }
  ],
}
```

```
    "id": 1
}
```

CModule::get() in `ui/include/classes/api/services/CModule.php`.

module.update

Description

object module.update(object/array modules)

This method allows to update existing modules.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Module properties to be updated.

The moduleid property must be defined for each module, all other properties are optional. Only the specified properties will be updated.

The method accepts modules with the [standard module properties](#).

Return values

(object) Returns an object containing the IDs of the updated modules under the moduleids property.

Examples

Disabling a module

Disable module "25".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "module.update",
  "params": {
    "moduleid": "25",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "moduleids": [
      "25"
    ]
  },
  "id": 1
}
```

Problem

This class is designed to work with problems.

Object references:

- [Problem](#)
 - [Media type URL](#)
- [Problem tag](#)

Available methods:

- [problem.get](#) - retrieve problems

Problem object

The following objects are directly related to the `problem` API.

Problem

Note:

Problems are created by the Zabbix server and cannot be modified via the API.

The problem object has the following properties.

| Property | Type | Description |
|---------------|-----------|---|
| eventid | ID | ID of the problem event. |
| source | integer | Type of the problem event. Possible values: 0 - event created by a trigger; 3 - internal event; 4 - event created on service status update. |
| object | integer | Type of object that is related to the problem event. Possible values if source is set to "event created by a trigger": 0 - trigger. Possible values if source is set to "internal event": 0 - trigger; 4 - item; 5 - LLD rule. Possible values if source is set to "event created on service status update": 6 - service. |
| objectid | ID | ID of the related object. |
| clock | timestamp | Time when the problem event was created. |
| ns | integer | Nanoseconds when the problem event was created. |
| r_eventid | ID | ID of the recovery event. |
| r_clock | timestamp | Time when the recovery event was created. |
| r_ns | integer | Nanoseconds when the recovery event was created. |
| cause_eventid | ID | ID of the cause event. |
| correlationid | ID | ID of the correlation rule if this event was recovered by a global correlation rule. |
| userid | ID | ID of the user that closed the problem (if the problem was closed manually). |
| name | string | Resolved problem name. |

| Property | Type | Description |
|--------------|---------|--|
| acknowledged | integer | Acknowledge state for problem. Possible values: 0 - not acknowledged; 1 - acknowledged. |
| severity | integer | Problem current severity. Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. |
| suppressed | integer | Whether the problem is suppressed. Possible values: 0 - problem is in normal state; 1 - problem is suppressed. |
| opdata | string | Operational data with expanded macros. |
| urls | array | Active media type URLs. |

Media type URL

The media type URL object has the following properties.

| Property | Type | Description |
|----------|--------|-------------------------------|
| name | string | Media type defined URL name. |
| url | string | Media type defined URL value. |

Results will contain entries only for active media types with enabled event menu entry. Macro used in properties will be expanded, but if one of the properties contains an unexpanded macro, both properties will be excluded from results. For supported macros, see *Supported macros*.

Problem tag

The problem tag object has the following properties.

| Property | Type | Description |
|----------|--------|--------------------|
| tag | string | Problem tag name. |
| value | string | Problem tag value. |

problem.get

Description

`integer/array problem.get(object parameters)`

The method allows to retrieve problems according to the given parameters.

This method is for retrieving unresolved problems. It is also possible, if specified, to additionally retrieve recently resolved problems. The period that determines how old is "recently" is defined in *Administration* → *General*. Problems that were resolved prior to that period are not kept in the problem table. To retrieve problems that were resolved further back in the past, use the `event.get` method.

Attention:

This method may return problems of a deleted entity if these problems have not been removed by the housekeeper yet.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------|---------------|---|
| eventids | ID/array | Return only problems with the given IDs. |
| groupids | ID/array | Return only problems created by objects that belong to the given host groups. |
| hostids | ID/array | Return only problems created by objects that belong to the given hosts. |
| objectids | ID/array | Return only problems created by the given objects. |
| source | integer | Return only problems with the given type. Refer to the problem event object page for a list of supported event types. |
| object | integer | Default: 0 - problem created by a trigger. Return only problems created by objects of the given type. Refer to the problem event object page for a list of supported object types. |
| acknowledged | boolean | Default: 0 - trigger. <code>true</code> - return acknowledged problems only; <code>false</code> - unacknowledged only. |
| action | integer | Return only problems for which the given event update actions have been performed. For multiple actions, use a sum of any acceptable bitmap values as bitmask (for example, 34 for acknowledge and suppress event). |
| action_userids | ID/array | Return only problems with the given IDs of users who performed the problem event update actions. |
| suppressed | boolean | <code>true</code> - return only suppressed problems; <code>false</code> - return problems in the normal state. |
| symptom | boolean | <code>true</code> - return only symptom problem events; <code>false</code> - return only cause problem events. |
| severities | integer/array | Return only problems with given event severities. Applies only if object is trigger. |
| evaltype | integer | Rules for tag searching. |
| tags | array | Possible values: 0 - (default) And/Or; 2 - Or. Return only problems with given tags. Exact match by tag and case-insensitive search by value and operator. Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]. An empty array returns all problems. |
| recent | boolean | Possible operator types: 0 - (default) Like; 1 - Equal; 2 - Not like; 3 - Not equal 4 - Exists; 5 - Not exists. <code>true</code> - return PROBLEM and recently RESOLVED problems (depends on Display OK triggers for N seconds) Default: <code>false</code> - UNRESOLVED problems only |

| Parameter | Type | Description |
|------------------------|--------------|--|
| eventid_from | string | Return only problems with IDs greater or equal to the given ID. |
| eventid_till | string | Return only problems with IDs less or equal to the given ID. |
| time_from | timestamp | Return only problems that have been created after or at the given time. |
| time_till | timestamp | Return only problems that have been created before or at the given time. |
| selectAcknowledges | query | Return an acknowledges property with the problem updates. Problem updates are sorted in reverse chronological order. The problem update object has the following properties: acknowledgeid - (ID) ID of the update; userid - (ID) ID of the user that updated the event; eventid - (ID) ID of the updated event; clock - (timestamp) time when the event was updated; message - (string) text of the message; action - (integer) type of update action (see event.acknowledge); old_severity - (integer) event severity before this update action; new_severity - (integer) event severity after this update action; suppress_until - (timestamp) time till event will be suppressed; taskid - (ID) ID of the task if the current event is undergoing a rank change. |
| selectTags | query | Supports count. Return a tags property with the problem tags. Output format: [{"tag": "<tag>", "value": "<value>"}, ...]. |
| selectSuppressionData | query | Return a suppression_data property with the list of active maintenances and manual suppressions: maintenanceid - (ID) ID of the maintenance; userid - (ID) ID of user who suppressed the problem; suppress_until - (integer) time until the problem is suppressed. |
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. |
| sortfield | string/array | Does not support properties of text data type . Sort the result by the given properties. Possible values: eventid. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving trigger problem events

Retrieve recent events from trigger "15112."

Request:

```
{
  "jsonrpc": "2.0",
  "method": "problem.get",
  "params": {
    "output": "extend",
    "selectAcknowledges": "extend",
    "selectTags": "extend",
    "selectSuppressionData": "extend",
    "objectids": "15112",
    "recent": true,
    "sortfield": ["eventid"],
    "sortorder": "DESC"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "eventid": "1245463",
      "source": "0",

Proxy

This class is designed to work with proxies.

Object references:

- [Proxy](#)

Available methods:

- [proxy.create](#) - create new proxies
- [proxy.delete](#) - delete proxies
- [proxy.get](#) - retrieve proxies
- [proxy.update](#) - update proxies

Proxy object

The following objects are directly related to the proxy API.

Proxy

The proxy object has the following properties.

| Property | Type | Description |
|----------------|---------|---|
| proxyid | ID | ID of the proxy. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Name of the proxy.</p> |
| proxy_groupid | ID | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations <p>ID of the proxy group.</p> |
| local_address | string | <p>0 - proxy is not assigned to any proxy group.</p> <p>Address for active agents. IP address or DNS name to connect to.</p> |
| local_port | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if proxy_groupid is not 0 <p>Local proxy port number to connect to.</p> |
| operating_mode | integer | <p>User macros are supported.</p> <p>Default: 10051.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if proxy_groupid is not 0 <p>Type of proxy.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - active proxy; 1 - passive proxy. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations |

| Property | Type | Description |
|-------------------|-----------|--|
| description | text | Description of the proxy. |
| lastaccess | timestamp | Time when the proxy last connected to the server. |
| address | string | <p>Property behavior:</p> <p>- <i>read-only</i></p> <p>IP address or DNS name to connect to.</p> <p>User macros are supported.</p> |
| | | <p>Property behavior:</p> <p>- <i>required</i> if the Zabbix proxy operating mode is passive</p> <p>Port number to connect to.</p> <p>User macros are supported.</p> <p>Default: 10051.</p> |
| allowed_addresses | string | <p>Property behavior:</p> <p>- <i>supported</i> if the Zabbix proxy operating mode is passive</p> <p>Comma-delimited IP addresses or DNS names of active Zabbix proxy.</p> <p>Connections to host.</p> <p>Possible values:</p> <p>1 - (<i>default</i>) No encryption;</p> <p>2 - PSK;</p> <p>4 - certificate.</p> |
| tls_connect | integer | |
| tls_accept | integer | <p>Connections from host.</p> <p>Possible bitmap values:</p> <p>1 - (<i>default</i>) No encryption;</p> <p>2 - PSK;</p> <p>4 - certificate.</p> <p>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for PSK and certificate).</p> |
| tls_issuer | string | Certificate issuer. |
| tls_subject | string | Certificate subject. |
| tls_psk_identity | string | <p>PSK identity; must be paired with only one PSK (across autoregistration, hosts, and proxies).</p> <p>Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use.</p> |
| tls_psk | string | <p>Property behavior:</p> <p>- <i>write-only</i></p> <p>- <i>required</i> if <code>tls_connect</code> is set to "PSK", or <code>tls_accept</code> contains the "PSK" bit</p> <p>Pre-shared key (PSK); must be at least 32 hex digits.</p> |
| | | <p>Property behavior:</p> <p>- <i>write-only</i></p> <p>- <i>required</i> if <code>tls_connect</code> is set to "PSK", or <code>tls_accept</code> contains the "PSK" bit</p> |
| custom_timeouts | integer | <p>Whether to override global item timeouts on the proxy level.</p> <p>Possible values:</p> <p>0 - (<i>default</i>) use global settings;</p> <p>1 - override timeouts.</p> |

| Property | Type | Description |
|--|---------|---|
| timeout_zabbix_agent | string | <p>Spend no more than <code>timeout_*</code> seconds on processing. Accepts seconds or time unit with suffix (e.g., 30s, 1m). Also accepts user macros.</p> <p>Possible values range: 1-600s.</p> <p>Default: "".</p> <p>Property behavior: - <i>required</i> if <code>custom_timeouts</code> is set to 1.</p> |
| timeout_simple_check timeout_snmp_agent timeout_external_check timeout_db_monitor timeout_http_agent timeout_ssh_agent timeout_telnet_agent timeout_script timeout_browser | integer | <p>Version of proxy.</p> <p>Three-part Zabbix version number, where two decimal digits are used for each part, e.g., 60401 for version 6.4.1, 70002 for version 7.0.2, etc.</p> <p>0 - Unknown proxy version.</p> <p>Property behavior: - <i>read-only</i></p> |
| compatibility | integer | <p>Version of proxy compared to Zabbix server version.</p> <p>Possible values: 0 - Undefined; 1 - Current version (proxy and server have the same major version); 2 - Outdated version (proxy version is older than server version, but is partially supported); 3 - Unsupported version (proxy version is older than server previous LTS release version or server major version is older than proxy major version).</p> <p>Property behavior: - <i>read-only</i></p> |
| state | integer | <p>State of the proxy.</p> <p>Possible values: 0 - Unknown; 1 - Offline; 2 - Online.</p> <p>Property behavior: - <i>read-only</i></p> |

proxy.create

Description

`object proxy.create(object/array proxies)`

This method allows to create new proxies.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Proxies to create.

Additionally to the [standard proxy properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| hosts | array | Hosts to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy. The hosts must have only the <code>hostid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the created proxies under the `proxyids` property. The order of the returned IDs matches the order of the passed proxies.

Examples

Create an active proxy

Create an action proxy "Active proxy" and assign a host to be monitored by it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "name": "Active proxy",
    "operating_mode": "0",
    "hosts": [
      {
        "hostid": "10279"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10280"
    ]
  },
  "id": 1
}
```

Create a passive proxy

Create a passive proxy "Passive proxy" and assign two hosts to be monitored by it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "name": "Passive proxy",
```

```

        "operating_mode": "1",
        "address": "127.0.0.1",
        "port": "10051",
        "hosts": [
            {
                "hostid": "10192"
            },
            {
                "hostid": "10139"
            }
        ]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10284"
        ]
    },
    "id": 1
}

```

Creating a proxy and adding it to a proxy group

Create an active proxy "Active proxy" and add it to proxy group with ID "1".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "name": "Active proxy",
        "proxy_groupid": "1",
        "operating_mode": "0"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "5"
        ]
    },
    "id": 1
}

```

See also

Source

CProxy::create() in `ui/include/classes/api/services/CProxy.php`.

proxy.delete

Description

`object proxy.delete(array proxies)`

This method allows to delete proxies.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of proxies to delete.

Return values

(object) Returns an object containing the IDs of the deleted proxies under the `proxyids` property.

Examples

Delete multiple proxies

Delete two proxies.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.delete",
  "params": [
    "10286",
    "10285"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10286",
      "10285"
    ]
  },
  "id": 1
}
```

Source

`CProxy::delete()` in `ui/include/classes/api/services/CProxy.php`.

proxy.get

Description

`integer/array proxy.get(object parameters)`

The method allows to retrieve proxies according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|--|
| proxyids | ID/array | Return only proxies with the given IDs. |
| proxy_groupids | ID/array | Return only proxies that belong to the given proxy groups. |
| selectAssignedHosts | query | Return an assignedHosts property with the hosts assigned to the proxy. |
| selectHosts | query | Supports count. Return a hosts property with the hosts monitored by the proxy. |
| selectProxyGroup | query | Supports count. Return a proxyGroup property with the proxy group object. |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | boolean | Possible values: proxyid, name, operating_mode. These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve all proxies

Retrieve all configured proxies and their interfaces.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "proxyid": "11",
      "name": "Active proxy",
      "proxy_groupid": "0",

proxy.update

Description

object proxy.update(object/array proxies)

This method allows to update existing proxies.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Proxy properties to be updated.

The proxyid property must be defined for each proxy, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard proxy properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| hosts | array | Hosts to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy. The hosts must have only the hostid property defined. |

Return values

(object) Returns an object containing the IDs of the updated proxies under the proxyids property.

Examples

Change hosts monitored by a proxy

Update the proxy to monitor the two given hosts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.update",
  "params": {
    "proxyid": "10293",
    "hosts": [
      {
        "hostid": "10294"
      },
      {
        "hostid": "10295"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10293"
    ]
  },
  "id": 1
}
```

Change proxy status

Change the proxy to an active proxy and rename it to "Active proxy".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.update",
  "params": {
    "proxyid": "10293",
    "name": "Active proxy",
    "operating_mode": "0"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "10293"
    ]
  },
  "id": 1
}
```

Add a proxy to a proxy group

Update proxy with ID "5" and add it to proxy group with ID "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxy.create",
  "params": {
    "proxyid": "5",
    "proxy_groupid": "1",
    "local_address": "127.0.0.1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxyids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

CProxy::update() in *ui/include/classes/api/services/CProxy.php*.

Proxy group

This class is designed to work with proxy groups.

Object references:

- [Proxy group](#)

Available methods:

- [proxygroup.create](#) - create new proxy groups
- [proxygroup.delete](#) - delete proxy groups
- [proxygroup.get](#) - retrieve proxy groups
- [proxygroup.update](#) - update proxy groups

Proxy group object

The following objects are directly related to the `proxygroup` API.

Proxy group

The proxy group object has the following properties.

| Property | Type | Description |
|----------------|---------|--|
| proxy_groupid | ID | ID of the proxy group. |
| name | string | Property behavior: - <i>read-only</i> - <i>required</i> for update operations Name of the proxy group. |
| description | text | Property behavior: - <i>required</i> for create operations Description of the proxy group. |
| failover_delay | string | Failover period for each proxy in the group to have online/offline state. Time suffixes are supported, e.g. 30s, 1m. User macros are supported. Possible values: 10s-15m. |
| min_online | string | Default: 1m. Minimum number of online proxies required for the group to be online. User macros are supported. Possible values range: 1-1000. |
| state | integer | Default: 1. State of the proxy group. Possible values: 0 - Unknown - on server startup; 1 - Offline - less that minimum number of proxies are online; 2 - Recovering - transition from offline to online state; 3 - Online - minimum number of online proxies are online; 4 - Degrading - transition from online to offline state. Property behavior: - <i>read-only</i> |

proxygroup.create

Description

`object proxygroup.create(object/array proxyGroups)`

This method allows to create new proxy groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Proxy groups to create.

The method accepts proxy groups with the [standard proxy group properties](#).

Return values

(object) Returns an object containing the IDs of the created proxy groups under the `proxy_groupids` property. The order of the returned IDs matches the order of the passed proxy groups.

Examples

Create a proxy group

Create a proxy group with custom settings.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxygroup.create",
  "params": {
    "name": "Proxy group",
    "failover_delay": "5m",
    "min_online": "10"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxy_groupids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

CProxyGroup::create() in `ui/include/classes/api/services/CProxyGroup.php`.

proxygroup.delete

Description

object proxygroup.delete(array proxyGroupIds)

This method allows to delete proxy groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of proxy groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted proxy groups under the `proxy_groupids` property.

Examples

Delete multiple proxy groups

Delete two proxy groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxygroup.delete",
  "params": [
    "5",
    "10"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxy_groupids": [
      "5",
      "10"
    ]
  },
  "id": 1
}
```

Source

CProxyGroup::delete() in ui/include/classes/api/services/CProxyGroup.php.

proxygroup.get

Description

integer/array proxygroup.get(object parameters)

The method allows to retrieve proxy groups according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------|--------------|---|
| proxy_groupids | ID/array | Return only proxy groups with the given IDs. |
| proxyids | ID/array | Return only proxy groups that contain the given proxies. |
| selectProxies | query | Return a proxies property with the proxies that belong to the proxy group. |
| sortfield | string/array | Supports count. Sort the result by the given properties. |
| countOutput | boolean | Possible values: proxy_groupid, name. |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve all proxy groups

Retrieve all configured proxy groups with proxies.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "proxygroup.get",
  "params": {
    "output": "extend",
    "selectProxies": ["proxyid", "name"]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "proxy_groupid": "1",
      "name": "Proxy group 1",
      "failover_delay": "1m",
      "min_online": "3",
      "description": "",
      "state": "1",
      "proxies": [
        {
          "proxyid": "1",
          "name": "proxy 1"
        },
        {
          "proxyid": "2",
          "name": "proxy 2"
        }
      ]
    },
    {
      "proxy_groupid": "2",
      "name": "Proxy group 2",
      "failover_delay": "10m",
      "min_online": "3",
      "description": "",
      "state": "3",
      "proxies": [
```

```

        {
            "proxyid": "3",
            "name": "proxy 3"
        },
        {
            "proxyid": "4",
            "name": "proxy 4"
        },
        {
            "proxyid": "5",
            "name": "proxy 5"
        }
    ],
    "id": 1
}

```

proxygroup.update

Description

`object proxygroup.update(object/array proxyGroups)`

This method allows to update existing proxy groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Proxy group properties to be updated.

The `proxy_groupid` property must be defined for each proxy group, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts proxy groups with the [standard proxy group properties](#).

Return values

(object) Returns an object containing the IDs of the updated proxy groups under the `proxy_groupids` property.

Examples

Change minimum number of online proxies

Change minimum number of online proxies required for the group to be online.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "proxygroup.update",
    "params": {
        "proxy_groupid": "5",
        "min_online": "3"
    },
    "id": 1
}

```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "proxy_groupids": [
      "5"
    ]
  },
  "id": 1
}
```

Regular expression

This class is designed to work with global regular expressions.

Object references:

- [Regular expression](#)
- [Expressions](#)

Available methods:

- [regexp.create](#) - create new regular expressions
- [regexp.delete](#) - delete regular expressions
- [regexp.get](#) - retrieve regular expressions
- [regexp.update](#) - update regular expressions

Regular expression object

The following objects are directly related to the `regexp` API.

Regular expression

The global regular expression object has the following properties.

| Property | Type | Description |
|-------------|--------|--|
| regexpid | ID | ID of the regular expression. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations Name of the regular expression. |
| test_string | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations Test string. |

Expressions

The expressions object has the following properties.

| Property | Type | Description |
|--|--------|---------------------|
| expression | string | Regular expression. |
| <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> | | |

| Property | Type | Description |
|-----------------|---------|--|
| expression_type | integer | Type of Regular expression. Possible values: 0 - Character string included; 1 - Any character string included; 2 - Character string not included; 3 - Result is TRUE; 4 - Result is FALSE. |
| exp_delimiter | string | Property behavior: - <i>required</i> Expression delimiter. Default value: ", ". Possible values: ", " or ". ", or "/". |
| case_sensitive | integer | Property behavior: - <i>supported</i> if expression_type is set to "Any character string included" Case sensitivity. Default value: 0. Possible values: 0 - Case insensitive; 1 - Case sensitive. |

regexp.create

Description

object regexp.create(object/array regularExpressions)

This method allows to create new global regular expressions.

Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Regular expressions to create.

Additionally to the [standard properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-------------|-------|--|
| expressions | array | Expressions options. Parameter behavior: - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the created regular expressions under the `regexpids` property.

Examples

Creating a new global regular expression.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regex.create",
  "params": {
    "name": "Storage devices for SNMP discovery",
    "test_string": "/boot",
    "expressions": [
      {
        "expression": "^(Physical memory|Virtual memory|Memory buffers|Cached memory|Swap space)$",
        "expression_type": "4",
        "case_sensitive": "1"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "regexpids": [
      "16"
    ]
  },
  "id": 1
}
```

Source

CRegexp::create() in *ui/include/classes/api/services/CRegexp.php*.

regex.delete

Description

object regex.delete(array regexpids)

This method allows to delete global regular expressions.

Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the regular expressions to delete.

Return values

(object) Returns an object containing the IDs of the deleted regular expressions under the `regexpids` property.

Examples

Deleting multiple global regular expressions.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regex.delete",
  "params": [
    "16",
    "17"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "regexpsids": [
      "16",
      "17"
    ]
  },
  "id": 1
}
```

Source

CRegexp::delete() in *ui/include/classes/api/services/CRegexp.php*.

regexp.get

Description

integer/array regexp.get(object parameters)

The method allows to retrieve global regular expressions according to the given parameters.

Note:

This method is available only to *Super Admin*. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------------------------|--------------|--|
| regexpsids | ID/array | Return only regular expressions with the given IDs. |
| selectExpressions | query | Return an expressions property. |
| sortfield | string/array | Sort the result by the given properties. |
| Possible values: regexpid, name. | | |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving global regular expressions.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regexp.get",
  "params": {
    "output": ["regexpid", "name"],
    "selectExpressions": ["expression", "expression_type"],
    "regexpids": [1, 2],
    "preservekeys": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "1": {
      "regexpid": "1",
      "name": "File systems for discovery",
      "expressions": [
        {
          "expression": "^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|ntfs|fat32)",
          "expression_type": "3"
        }
      ]
    },
    "2": {
      "regexpid": "2",
      "name": "Network interfaces for discovery",
      "expressions": [
        {
          "expression": "^Software Loopback Interface",
          "expression_type": "4"
        },
        {
          "expression": "^(In)?[Ll]oop[Bb]ack[0-9._]*$",
          "expression_type": "4"
        },
        {
          "expression": "^NULL[0-9.]*$",
          "expression_type": "4"
        },
        {
          "expression": "^[Ll]o[0-9.]*$",
          "expression_type": "4"
        },
        {
          "expression": "^[Ss]ystem$",
          "expression_type": "4"
        },
        {
          "expression": "^Nu[0-9.]*$",
          "expression_type": "4"
        }
      ]
    }
  },
  "id": 1
}
```

regexp.update

Description

object regexp.update(object/array regularExpressions)

This method allows to update existing global regular expressions.

Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Regular expression properties to be updated.

The regexpid property must be defined for each object, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-------------|-------|-----------------------------|
| expressions | array | Expressions options. |

Return values

(object) Returns an object containing the IDs of the updated regular expressions under the regexpids property.

Examples

Updating global regular expression for file systems discovery.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "regexp.update",
  "params": {
    "regexpid": "1",
    "name": "File systems for discovery",
    "test_string": "",
    "expressions": [
      {
        "expression": "^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|zfs)$",
        "expression_type": "3",
        "exp_delimiter": ",",
        "case_sensitive": "0"
      },
      {
        "expression": "^(ntfs|fat32|fat16)$",
        "expression_type": "3",
        "exp_delimiter": ",",
        "case_sensitive": "0"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "regexpids": [
      "1"
    ]
  }
}
```

```
},  
  "id": 1  
}
```

Report

This class is designed to work with scheduled reports.

Object references:

- [Report](#)
- [Users](#)
- [User groups](#)

Available methods:

- [report.create](#) - create new scheduled reports
- [report.delete](#) - delete scheduled reports
- [report.get](#) - retrieve scheduled reports
- [report.update](#) - update scheduled reports

Report object

The following objects are directly related to the report API.

Report

The report object has the following properties:

| Property | Type | Description |
|-------------|---------|--|
| reportid | ID | ID of the report. Property behavior: - <i>read-only</i> |
| userid | ID | ID of the user who created the report. Property behavior: - <i>required</i> for update operations |
| name | string | Unique name of the report. Property behavior: - <i>required</i> for create operations |
| dashboardid | ID | ID of the dashboard that the report is based on. Property behavior: - <i>required</i> for create operations |
| period | integer | Period for which the report will be prepared. Possible values: 0 - (<i>default</i>) previous day; 1 - previous week; 2 - previous month; 3 - previous year. |
| cycle | integer | Period repeating schedule. Possible values: 0 - (<i>default</i>) daily; 1 - weekly; 2 - monthly; 3 - yearly. |

| Property | Type | Description |
|--------------|-----------|---|
| start_time | integer | Time of the day, in seconds, when the report will be prepared for sending. |
| weekdays | integer | <p>Default: 0. Days of the week for sending the report.</p> <p>Possible bitmap values: 1 - Monday; 2 - Tuesday; 4 - Wednesday; 8 - Thursday; 16 - Friday; 32 - Saturday; 64 - Sunday.</p> <p>This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 21 for Monday, Wednesday, and Friday).</p> <p>Default: 0.</p> <p>Property behavior: - <i>required</i> if cycle is set to "weekly". On which date to start.</p> |
| active_since | string | <p>Possible values: empty string - (<i>default</i>) not specified (stored as 0); specific date in YYYY-MM-DD format (stored as a timestamp of the beginning of a day (00:00:00)).</p> |
| active_till | string | <p>On which date to end.</p> <p>Possible values: empty string - (<i>default</i>) not specified (stored as 0); specific date in YYYY-MM-DD format (stored as a timestamp of the end of a day (23:59:59)).</p> |
| subject | string | Report message subject. |
| message | string | Report message text. |
| status | integer | Whether the report is enabled or disabled. |
| description | text | Possible values: 0 - Disabled; 1 - (<i>default</i>) Enabled. Description of the report. |
| state | integer | State of the report. |
| lastsent | timestamp | <p>Possible values: 0 - (<i>default</i>) report was not yet processed; 1 - report was generated and successfully sent to all recipients; 2 - report generating failed; "info" contains error information; 3 - report was generated, but sending to some (or all) recipients failed; "info" contains error information.</p> <p>Property behavior: - <i>read-only</i> Unix timestamp of the last successfully sent report.</p> |
| info | string | <p>Property behavior: - <i>read-only</i> Error description or additional information.</p> <p>Property behavior: - <i>read-only</i></p> |

Users

The users object has the following properties:

| Property | Type | Description |
|---------------|---------|---|
| userid | ID | ID of user to send the report to. |
| access_userid | ID | Property behavior: - <i>required</i> ID of user on whose behalf the report will be generated. |
| exclude | integer | 0 - (<i>default</i>) Generate report by recipient. Whether to exclude the user from mailing list. Possible values: 0 - (<i>default</i>) Include; 1 - Exclude. |

User groups

The user groups object has the following properties:

| Property | Type | Description |
|---------------|------|--|
| usrgrpid | ID | ID of user group to send the report to. |
| access_userid | ID | Property behavior: - <i>required</i> ID of user on whose behalf the report will be generated. 0 - (<i>default</i>) Generate report by recipient. |

report.create

Description

`object report.create(object/array reports)`

This method allows to create new scheduled reports.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Scheduled reports to create.

Additionally to the [standard scheduled report properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-------------|--------------|--|
| users | object/array | Users to send the report to. Parameter behavior: - <i>required</i> if <code>user_groups</code> is not set |
| user_groups | object/array | User groups to send the report to. Parameter behavior: - <i>required</i> if <code>users</code> is not set |

Return values

(object) Returns an object containing the IDs of the created scheduled reports under the `reportids` property. The order of the returned IDs matches the order of the passed scheduled reports.

Examples

Creating a scheduled report

Create a weekly report that will be prepared for the previous week every Monday-Friday at 12:00 from 2021-04-01 to 2021-08-31.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.create",
  "params": {
    "userid": "1",
    "name": "Weekly report",
    "dashboardid": "1",
    "period": "1",
    "cycle": "1",
    "start_time": "43200",
    "weekdays": "31",
    "active_since": "2021-04-01",
    "active_till": "2021-08-31",
    "subject": "Weekly report",
    "message": "Report accompanying text",
    "status": "1",
    "description": "Report description",
    "users": [
      {
        "userid": "1",
        "access_userid": "1",
        "exclude": "0"
      },
      {
        "userid": "2",
        "access_userid": "0",
        "exclude": "1"
      }
    ],
    "user_groups": [
      {
        "usrgrpid": "7",
        "access_userid": "0"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "reportids": [
      "1"
    ]
  },
  "id": 1
}
```

report.delete

Description

object report.delete(array reportids)

This method allows to delete scheduled reports.

Note:

This method is only available to *Admin* and *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the scheduled reports to delete.

Return values

(object) Returns an object containing the IDs of the deleted scheduled reports under the `reportids` property.

Examples

Deleting multiple scheduled reports

Delete two scheduled reports.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.delete",
  "params": [
    "1",
    "2"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "reportids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

CReport::delete() in *ui/include/classes/api/services/CReport.php*.

report.get

Description

integer/array report.get(object parameters)

The method allows to retrieve scheduled reports according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| reportids | ID/array | Return only scheduled reports with the given report IDs. |
| expired | boolean | If set to true returns only expired scheduled reports, if false - only active scheduled reports. |
| selectUsers | query | Return a users property with users the report is configured to be sent to. |
| selectUserGroups | query | Return a user_groups property with user groups the report is configured to be sent to. |
| sortfield | string/array | Sort the result by the given properties. Possible values: reportid, name, status. These parameters are described in the reference commentary . |
| countOutput | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving report data

Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.get",
  "params": [
    "output": "extend",
    "selectUsers": "extend",
    "selectUserGroups": "extend",
    "reportids": ["1", "2"]
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "reportid": "1",
      "userid": "1",
      "name": "Weekly report",
      "dashboardid": "1",
      "period": "1",
      "cycle": "1",

```

```

        "start_time": "43200",
        "weekdays": "31",
        "active_since": "2021-04-01",
        "active_till": "2021-08-31",
        "subject": "Weekly report",
        "message": "Report accompanying text",
        "status": "1",
        "description": "Report description",
        "state": "1",
        "lastsent": "1613563219",
        "info": "",
        "users": [
            {
                "userid": "1",

report.update

Description

object report.update(object/array reports)

This method allows to update existing scheduled reports.

Note:

This method is only available to *Admin* and *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Scheduled report properties to be updated.

The `reportid` property must be defined for each scheduled report, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard scheduled report properties](#) the method accepts the following parameters.

| Parameter | Type | Description |
|-------------|--------------|---|
| users | object/array | Users to replace the current users assigned to the scheduled report. |
| user_groups | object/array | <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>user_groups</code> is not set <p>User groups to replace the current user groups assigned to the scheduled report.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>users</code> is not set |

Return values

(object) Returns an object containing the IDs of the updated scheduled reports under the `reportids` property.

Examples

Disabling scheduled report

Request:

```
{
  "jsonrpc": "2.0",
  "method": "report.update",
  "params": {
    "reportid": "1",
    "status": "0"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "reportids": [
      "1"
    ]
  }
}
```

```
},  
  "id": 1  
}
```

Role

This class is designed to work with user roles.

Object references:

- [Role](#)
- [Role rules](#)
 - [UI element](#)
 - [Service](#)
 - [Service tag](#)
 - [Module](#)
 - [Action](#)

Available methods:

- [role.create](#) - create new user roles
- [role.delete](#) - delete user roles
- [role.get](#) - retrieve user roles
- [role.update](#) - update user roles

Role object

The following objects are directly related to the role API.

Role

The role object has the following properties:

| Property | Type | Description |
|----------|---------|---|
| roleid | ID | ID of the role. Property behavior: <ul style="list-style-type: none">- <i>read-only</i> |
| name | string | - <i>required</i> for update operations Name of the role. Property behavior: <ul style="list-style-type: none">- <i>required</i> for create operations |
| type | integer | User type. Possible values: 1 - (<i>default</i>) User; 2 - Admin; 3 - Super admin. Property behavior: <ul style="list-style-type: none">- <i>required</i> for create operations |

| Property | Type | Description |
|----------|---------|--|
| readonly | integer | Whether the role is readonly. Possible values: 0 - (default) No; 1 - Yes. Property behavior: - read-only |

Role rules

The role rules object has the following properties:

| Property | Type | Description |
|---------------------|---------|---|
| ui | array | Array of the UI element objects. |
| ui.default_access | integer | Whether access to new UI elements is enabled. Possible values: 0 - Disabled; 1 - (default) Enabled. |
| services.read.mode | integer | Read-only access to services. Possible values: 0 - Read-only access to the services, specified by the <code>services.read.list</code> or matched by the <code>services.read.tag</code> properties; 1 - (default) Read-only access to all services. |
| services.read.list | array | Array of Service objects. The specified services, including child services, will be granted a read-only access to the user role. Read-only access will not override read-write access to the services. Property behavior: - supported if <code>services.read.mode</code> is set to "0" |
| services.read.tag | object | Array of Service tag objects. The tag matched services, including child services, will be granted a read-only access to the user role. Read-only access will not override read-write access to the services. Property behavior: - supported if <code>services.read.mode</code> is set to "0" |
| services.write.mode | integer | Read-write access to services. Possible values: 0 - (default) Read-write access to the services, specified by the <code>services.write.list</code> or matched by the <code>services.write.tag</code> properties; 1 - Read-write access to all services. |
| services.write.list | array | Array of Service objects. The specified services, including child services, will be granted a read-write access to the user role. Read-write access will override read-only access to the services. Property behavior: - supported if <code>services.write.mode</code> is set to "0" |

| Property | Type | Description |
|------------------------|---------|---|
| services.write.tag | object | <p>Array of Service tag objects.</p> <p>The tag matched services, including child services, will be granted a read-write access to the user role. Read-write access will override read-only access to the services.</p> <p>Property behavior: - <i>supported</i> if <code>services.write.mode</code> is set to "0"</p> |
| modules | array | Array of the module objects. |
| modules.default_access | integer | Whether access to new modules is enabled. |
| | | Possible values: 0 - Disabled; 1 - (<i>default</i>) Enabled. |
| api.access | integer | Whether access to API is enabled. |
| | | Possible values: 0 - Disabled; 1 - (<i>default</i>) Enabled. |
| api.mode | integer | Mode for treating API methods listed in the <code>api</code> property. |
| | | Possible values: 0 - (<i>default</i>) Deny list; 1 - Allow list. |
| api | array | Array of API methods. |
| actions | array | Array of the action objects. |
| actions.default_access | integer | Whether access to new actions is enabled. |
| | | Possible values: 0 - Disabled; 1 - (<i>default</i>) Enabled. |

UI element

The UI element object has the following properties:

| Property | Type | Description |
|----------|--------|---|
| name | string | <p>Name of the UI element.</p> <p>Possible values if type of the Role object is set to "User", "Admin", or "Super admin":</p> <p>monitoring.dashboard - <i>Dashboards</i>; monitoring.problems - <i>Monitoring → Problems</i>; monitoring.hosts - <i>Monitoring → Hosts</i>; monitoring.latest_data - <i>Monitoring → Latest data</i>; monitoring.maps - <i>Monitoring → Maps</i>; services.services - <i>Services → Services</i>; services.sla_report - <i>Services → SLA report</i>; inventory.overview - <i>Inventory → Overview</i>; inventory.hosts - <i>Inventory → Hosts</i>; reports.availability_report - <i>Reports → Availability report</i>; reports.top_triggers - <i>Reports → Triggers top 100</i>.</p> <p>Possible values if type of the Role object is set to "Admin" or "Super admin":</p> <p>monitoring.discovery - <i>Monitoring → Discovery</i>; services.sla - <i>Services → SLA</i>; reports.scheduled_reports - <i>Reports → Scheduled reports</i>; reports.notifications - <i>Reports → Notifications</i>; configuration.template_groups - <i>Data collection → Template groups</i>; configuration.host_groups - <i>Data collection → Host groups</i>; configuration.templates - <i>Data collection → Templates</i>; configuration.hosts - <i>Data collection → Hosts</i>; configuration.maintenance - <i>Data collection → Maintenance</i>; configuration.discovery - <i>Data collection → Discovery</i>; configuration.trigger_actions - <i>Alerts → Actions → Trigger actions</i>; configuration.service_actions - <i>Alerts → Actions → Service actions</i>; configuration.discovery_actions - <i>Alerts → Actions → Discovery actions</i>; configuration.autoregistration_actions - <i>Alerts → Actions → Autoregistration actions</i>; configuration.internal_actions - <i>Alerts → Actions → Internal actions</i>.</p> <p>Possible values if type of the Role object is set to "Super admin":</p> <p>reports.system_info - <i>Reports → System information</i>; reports.audit - <i>Reports → Audit log</i>; reports.action_log - <i>Reports → Action log</i>; configuration.event_correlation - <i>Data collection → Event correlation</i>; administration.media_types - <i>Alerts → Media types</i>; administration.scripts - <i>Alerts → Scripts</i>; administration.user_groups - <i>Users → User groups</i>; administration.user_roles - <i>Users → User roles</i>; administration.users - <i>Users → Users</i>; administration.api_tokens - <i>Users → API tokens</i>; administration.authentication - <i>Users → Authentication</i>; administration.general - <i>Administration → General</i>; administration.audit_log - <i>Administration → Audit log</i>; administration.housekeeping - <i>Administration → Housekeeping</i>; administration.proxies - <i>Administration → Proxies</i>; administration.macros - <i>Administration → Macros</i>; administration.queue - <i>Administration → Queue</i>.</p> |

Property behavior:

- required

| Property | Type | Description |
|----------|---------|--|
| status | integer | Whether access to the UI element is enabled. Possible values: 0 - Disabled; 1 - <i>(default)</i> Enabled. |

Service

| Property | Type | Description |
|-----------|------|--|
| serviceid | ID | ID of the Service. Property behavior: - <i>required</i> |

Service tag

| Property | Type | Description |
|----------|--------|--|
| tag | string | Tag name. If empty string is specified, the service tag will not be used for service matching. |
| value | string | Property behavior: - <i>required</i> Tag value. If no value or empty string is specified, only the tag name will be used for service matching. |

Module

The module object has the following properties:

| Property | Type | Description |
|----------|---------|--|
| moduleid | ID | ID of the module. Property behavior: - <i>required</i> |
| status | integer | Whether access to the module is enabled. Possible values: 0 - Disabled; 1 - <i>(default)</i> Enabled. |

Action

The action object has the following properties:

| Property | Type | Description |
|----------|---------|--|
| name | string | <p>Name of the action.</p> <p>Possible values if type of the Role object is set to "User", "Admin", or "Super admin":</p> <p>edit_dashboards - Create and edit dashboards;</p> <p>edit_maps - Create and edit maps;</p> <p>add_problem_comments - Add problem comments;</p> <p>change_severity - Change problem severity;</p> <p>acknowledge_problems - Acknowledge problems;</p> <p>suppress_problems - Suppress problems;</p> <p>close_problems - Close problems;</p> <p>execute_scripts - Execute scripts;</p> <p>manage_api_tokens - Manage API tokens.</p> <p>Possible values if type of the Role object is set to "Admin" or "Super admin":</p> <p>edit_maintenance - Create and edit maintenances;</p> <p>manage_scheduled_reports - Manage scheduled reports,</p> <p>manage_sla - Manage SLA.</p> <p>Possible values if type of the Role object is set to "User" or "Admin":</p> <p>invoke_execute_now - allows to execute item checks for users that have only read permissions on host.</p> <p>Property behavior:</p> <p>- <i>required</i></p> |
| status | integer | <p>Whether access to perform the action is enabled.</p> <p>Possible values:</p> <p>0 - Disabled;</p> <p>1 - <i>(default)</i> Enabled.</p> |

role.create

Description

object role.create(object/array roles)

This method allows to create new roles.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Roles to create.

Additionally to the **standard role properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| rules | array | Role rules to be created for the role. |

Return values

(object) Returns an object containing the IDs of the created roles under the **roleids** property. The order of the returned IDs matches the order of the passed roles.

Examples

Creating a role

Create a role with type "User" and denied access to two UI elements.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.create",
  "params": {
    "name": "Operator",
    "type": "1",
    "rules": {
      "ui": [
        {
          "name": "monitoring.hosts",
          "status": "0"
        },
        {
          "name": "monitoring.maps",
          "status": "0"
        }
      ]
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "roleids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

CRole::create() in `ui/include/classes/api/services/CRole.php`.

role.delete

Description

object role.delete(array roleids)

This method allows to delete roles.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the roles to delete.

Return values

(object) Returns an object containing the IDs of the deleted roles under the `roleids` property.

Examples

Deleting multiple user roles

Delete two user roles.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.delete",
  "params": [
    "4",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "roleids": [
      "4",
      "5"
    ]
  },
  "id": 1
}
```

Source

CRole::delete() in ui/include/classes/api/services/CRole.php.

role.get

Description

integer/array role.get(object parameters)

The method allows to retrieve roles according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---------------|--------------|---|
| roleids | ID/array | Return only roles with the given IDs. |
| selectRules | query | Return a rules property with the role rules. |
| selectUsers | query | Return a users property with the users that the role is assigned to. |
| sortfield | string/array | See user.get for restrictions based on user type. Sort the result by the given properties. |
| countOutput | boolean | Possible values: roleid, name. |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving role data

Retrieve "Super admin role" role data and its access rules.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.get",
  "params": {
    "output": "extend",
    "selectRules": "extend",
    "roleids": "3"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "roleid": "3",
      "name": "Super admin role",
      "type": "3",
      "readonly": "1",
      "rules": {
        "ui": [
          {
            "name": "monitoring.dashboard",
            "status": "1"
          },
          {
            "name": "monitoring.problems",
            "status": "1"
          },
          {
            "name": "monitoring.hosts",
            "status": "1"
          },
          {
            "name": "monitoring.latest_data",
            "status": "1"
          },
          {
            "name": "monitoring.maps",
            "status": "1"
          }
        ]
      }
    }
  ]
}
```

```

        "name": "services.services",
        "status": "1"
    },
    {
        "name": "services.sla_report",
        "status": "1"
    },
    {
        "name": "inventory.overview",
        "status": "1"
    },
    {
        "name": "inventory.hosts",
        "status": "1"
    },
    {
        "name": "reports.availability_report",
        "status": "1"
    },

role.update

Description

object role.update(object/array roles)

This method allows to update existing roles.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Role properties to be updated.

The `roleid` property must be defined for each role, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard role properties](#) the method accepts the following parameters.

| Parameter | Type | Description |
|--------------------|-------|--|
| <code>rules</code> | array | Access rules to update for the role. |

Return values

(object) Returns an object containing the IDs of the updated roles under the `roleids` property.

Examples**Disabling ability to execute scripts**

Update role with ID "5", disable ability to execute scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.update",
  "params": [
    {
      "roleid": "5",
      "rules": {
        "actions": [
          {
            "name": "execute_scripts",
            "status": "0"
          }
        ]
      }
    ]
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "roleids": [
      "5"
    ]
  },
  "id": 1
}
```

Limiting access to API

Update role with ID "5", deny to call any "create", "update" or "delete" methods.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "role.update",
```

```

    "params": [
      {
        "roleid": "5",
        "rules": {
          "api.access": "1",
          "api.mode": "0",
          "api": ["*.create", "*.update", "*.delete"]
        }
      }
    ],
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "roleids": [
      "5"
    ]
  },
  "id": 1
}

```

Script

This class is designed to work with scripts.

Object references:

- [Script](#)
 - [Webhook parameters](#)
- [Debug](#)
 - [Log entry](#)

Available methods:

- [script.create](#) - create new scripts
- [script.delete](#) - delete scripts
- [script.execute](#) - run scripts
- [script.get](#) - retrieve scripts
- [script.getscriptsbyevents](#) - retrieve scripts for events
- [script.getscriptsbyhosts](#) - retrieve scripts for hosts
- [script.update](#) - update scripts

Script object

The following objects are directly related to the script API.

Script

The script object has the following properties.

| Property | Type | Description |
|----------|------|-------------------|
| scriptid | ID | ID of the script. |

Property behavior:

- *read-only*
- *required* for update operations

| Property | Type | Description |
|------------|---------|--|
| name | string | Name of the script. |
| type | integer | <p>Property behavior: - <i>required</i> for create operations</p> <p>Script type.</p> <p>Possible values if scope is set to "action operation": 0 - Script; 1 - IPMI; 2 - SSH; 3 - TELNET; 5 - Webhook.</p> <p>Possible values if scope is set to "manual host action" or "manual event action": 6 - URL.</p> |
| command | string | <p>Property behavior: - <i>required</i> for create operations</p> <p>Command to run.</p> |
| scope | integer | <p>Property behavior: - <i>required</i> if type is set to "Script", "IPMI", "SSH", "TELNET", or "Webhook"</p> <p>Script scope.</p> <p>Possible values: 1 - action operation; 2 - manual host action; 4 - manual event action.</p> |
| execute_on | integer | <p>Property behavior: - <i>required</i> for create operations</p> <p>Where to run the script.</p> <p>Possible values: 0 - run on Zabbix agent; 1 - run on Zabbix server. It is <i>supported</i> only if execution of global scripts is enabled on Zabbix server; 2 - (<i>default</i>) run on Zabbix server or proxy.</p> |
| menu_path | string | <p>Property behavior: - <i>supported</i> if type is set to "Script"</p> <p>Folders separated by slash that form a menu like navigation in frontend when clicked on host or event.</p> |
| authtype | integer | <p>Property behavior: - <i>supported</i> if scope is set to "manual host action" or "manual event action"</p> <p>Authentication method used for SSH script type.</p> <p>Possible values: 0 - password; 1 - public key.</p> |
| username | string | <p>Property behavior: - <i>supported</i> if type is set to "SSH"</p> <p>User name used for authentication.</p> <p>Property behavior: - <i>required</i> if type is set to "SSH" or "TELNET"</p> |

| Property | Type | Description |
|--------------|---------|--|
| password | string | Password used for SSH scripts with password authentication and TELNET scripts. |
| publickey | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "SSH" and authtype is set to "password", or type is set to "TELNET" <p>Name of the public key file used for SSH scripts with public key authentication.</p> |
| privatekey | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SSH" and authtype is set to "public key" <p>Name of the private key file used for SSH scripts with public key authentication.</p> |
| port | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "SSH" and authtype is set to "public key" <p>Port number used for SSH and TELNET scripts.</p> |
| groupid | ID | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if type is set to "SSH" or "TELNET" <p>ID of the host group that the script can be run on.</p> <p>If set to "0", the script will be available on all host groups.</p> |
| usrgrpuid | ID | <p>Default: 0.</p> <p>ID of the user group that will be allowed to run the script.</p> <p>If set to "0", the script will be available for all user groups.</p> <p>Default: 0.</p> |
| host_access | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if scope is set to "manual host action" or "manual event action" <p>Host permissions needed to run the script.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 2 - (<i>default</i>) read; 3 - write. |
| confirmation | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if scope is set to "manual host action" or "manual event action" <p>Confirmation pop up text.</p> <p>The pop up will appear when trying to run the script from the Zabbix frontend.</p> |
| timeout | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if scope is set to "manual host action" or "manual event action" <p>Webhook script execution timeout in seconds. Time suffixes are supported (e.g., 30s, 1m).</p> <p>Possible values: 1-60s.</p> <p>Default: 30s.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "Webhook" |

| Property | Type | Description |
|----------------------------|---------|---|
| parameters | array | Array of webhook input parameters . |
| description | string | Property behavior: - <i>supported</i> if type is set to "Webhook" Description of the script. |
| url | string | User defined URL. |
| new_window | integer | Property behavior: - <i>required</i> if type is set to "URL" Open URL in a new window. Possible values: 0 - No; 1 - <i>(default)</i> Yes. |
| manualinput | integer | Property behavior: - <i>supported</i> if type is set to "URL" Indicates whether the script accepts user-provided input. Possible values: 0 - <i>(default)</i> Disabled; 1 - Enabled; |
| manualinput_prompt | string | Property behavior: - <i>supported</i> if scope is set to "manual host action" or "manual event action" Manual input prompt text. |
| manualinput_validator | string | Property behavior: - <i>required</i> if <code>manualinput</code> is set to "Enabled" A character string field used to validate the user provided input. The string consists of either a regular expression or a set of values separated by commas. |
| manualinput_validator_type | integer | Property behavior: - <i>required</i> if <code>manualinput</code> is set to "Enabled" Determines the type of user input expected. Possible values: 0 - <i>(default)</i> String. Indicates that <code>manualinput_validator</code> is to be treated as a regular expression; 1 - List. Indicates that <code>manualinput_validator</code> is to be treated as a comma-separated list of possible input values. |
| manualinput_default_value | string | Property behavior: - <i>supported</i> if <code>manualinput</code> is set to "Enabled" Default value for auto-filling user input. Property behavior: - <i>supported</i> if <code>manualinput_validator_type</code> is set to "String" |

Webhook parameters

Parameters passed to webhook script when it is called have the following properties.

| Property | Type | Description |
|----------|--------|---|
| name | string | Parameter name. Property behavior: - <i>required</i> |
| value | string | Parameter value. Supports macros . |

Debug

Debug information of executed webhook script. The debug object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| logs | array | Array of log entries . |
| ms | string | Script execution duration in milliseconds. |

Log entry

The log entry object has the following properties.

| Property | Type | Description |
|----------|---------|---|
| level | integer | Log level. |
| ms | string | The time elapsed in milliseconds since the script was run before log entry was added. |
| message | string | Log message. |

script.create

Description

`object script.create(object/array scripts)`

This method allows to create new scripts.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Scripts to create.

The method accepts scripts with the **standard script properties**.

Return values

(object) Returns an object containing the IDs of the created scripts under the `scriptids` property. The order of the returned IDs matches the order of the passed scripts.

Examples

Create a webhook script

Create a webhook script that sends HTTP request to external service.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "Webhook script",
    "command": "try {\n var request = new HttpRequest(),\n response,\n data;\n\n request.addHeader('Co",
    "type": 5,
    "timeout": "40s",
    "parameters": [
      {
        "name": "token",
        "value": "${WEBHOOK.TOKEN}"
      },
      {
        "name": "host",
        "value": "${HOST.HOST}"
      }
    ]
  }
}
```

```

        {
            "name": "v",
            "value": "2.2"
        }
    ],
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "3"
        ]
    },
    "id": 1
}

```

Create an SSH script

Create an SSH script with public key authentication that can be executed on a host and has a context menu.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "script.create",
    "params": {
        "name": "SSH script",
        "command": "my script command",
        "type": 2,
        "authtype": 1,
        "username": "John",
        "publickey": "pub.key",
        "privatekey": "priv.key",
        "password": "secret",
        "port": "12345",
        "scope": 2,
        "menu_path": "All scripts/SSH",
        "usrgrpuid": "7",
        "groupid": "4"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "5"
        ]
    },
    "id": 1
}

```

Create a custom script

Create a custom script that will reboot a server. The script will require write access to the host and will prompt the user for manual input. Upon successful input submission, script will display confirmation message in the frontend.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "Reboot server",
    "command": "reboot server {MANUALINPUT}",
    "type": 0,
    "scope": 2,
    "confirmation": "Are you sure you would like to reboot the server {MANUALINPUT}?",
    "manualinput": 1,
    "manualinput_prompt": "Which server you want to reboot?",
    "manualinput_validator": "[1-9]",
    "manualinput_validator_type": 0,
    "manualinput_default_value": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "4"
    ]
  },
  "id": 1
}
```

Create a URL type script

Create a URL type script for host scope that remains in the same window and has confirmation text.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "URL script",
    "type": 6,
    "scope": 2,
    "url": "http://zabbix/ui/zabbix.php?action=host.edit&hostid={HOST.ID}",
    "confirmation": "Edit host {HOST.NAME}?",
    "new_window": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "56"
    ]
  },
  "id": 1
}
```

Create a URL type script with manual input

Create a URL type script for event scope that opens in a new window and has manual input.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.create",
  "params": {
    "name": "URL script with manual input",
    "type": 6,
    "scope": 4,
    "url": "http://zabbix/ui/zabbix.php?action={MANUALINPUT}",
    "new_window": 1,
    "manualinput": 1,
    "manualinput_prompt": "Select a page to open:",
    "manualinput_validator": "dashboard.view,script.list,actionlog.list",
    "manualinput_validator_type": 1
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "57"
    ]
  },
  "id": 1
}
```

Source

CScript::create() in `ui/include/classes/api/services/CScript.php`.

script.delete

Description

object script.delete(array scriptIds)

This method allows to delete scripts.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the scripts to delete.

Return values

(object) Returns an object containing the IDs of the deleted scripts under the `scriptids` property.

Examples

Delete multiple scripts

Delete two scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.delete",
  "params": [
    "3",
    "4"
  ],
  "id": 1
}
```

```
}
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "3",
      "4"
    ]
  },
  "id": 1
}
```

Source

CScript::delete() in `ui/include/classes/api/services/CScript.php`.

script.execute

Description

object script.execute(object parameters)

This method allows to run a script on a host or event. Except for URL type scripts. Those are not executable.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the ID of the script to run, either the ID of the host or the ID of the event and manualinput value.

| Parameter | Type | Description |
|-------------|--------|--|
| scriptid | ID | ID of the script to run. |
| hostid | ID | Parameter behavior: - <i>required</i> ID of the host to run the script on. |
| eventid | ID | Parameter behavior: - <i>required</i> if eventid is not set ID of the event to run the script on. |
| manualinput | string | Parameter behavior: - <i>required</i> if hostid is not set User-provided value to run the script with, substituting the {MANUALINPUT} macro. |

Return values

(object) Returns the result of script execution.

| Property | Type | Description |
|----------|--------|---|
| response | string | Whether the script was run successfully. |
| value | string | Possible value - success . |
| debug | object | Script output. Contains a debug object if a webhook script is executed. For other script types, it contains empty object. |

Examples

Run a webhook script

Run a webhook script that sends HTTP request to external service.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.execute",
  "params": {
    "scriptid": "4",
    "hostid": "30079"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "value": "{\"status\":\"sent\", \"timestamp\":\"1611235391\"}",
    "debug": {
      "logs": [
        {
          "level": 3,
          "ms": 480,

```

Run a custom script

Run a "ping" script on a host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.execute",
  "params": {
    "scriptid": "1",
    "hostid": "30079"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "value": "PING 127.0.0.1 (127.0.0.1) 56(84) bytes of data.\n64 bytes from 127.0.0.1: icmp_req=1 tt",
    "debug": []
  },
  "id": 1
}
```

Run a custom script with manual input

Run a "ping" script with command "ping -c {MANUALINPUT} {HOST.CONN}"; case \$? in [01]) true;; *) false;; esac" on a host.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.execute",
  "params": {
    "scriptid": "7",
    "hostid": "30079",
    "manualinput": "2"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "response": "success",
    "value": "PING 127.0.0.1 (127.0.0.1) 56(84) bytes of data.\n64 bytes from 127.0.0.1: icmp_seq=1 tt",
    "debug": []
  },
  "id": 1
}
```

Source

CScript::execute() in ui/include/classes/api/services/CScript.php.

script.get

Description

integer/array script.get(object parameters)

The method allows to retrieve scripts according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------|--------------|--|
| groupids | ID/array | Return only scripts that can be run on the given host groups. |
| hostids | ID/array | Return only scripts that can be run on the given hosts. |
| scriptids | ID/array | Return only scripts with the given IDs. |
| usrgrpids | ID/array | Return only scripts that can be run by users in the given user groups. |
| selectHostGroups | query | Return a hostgroups property with host groups that the script can be run on. |
| selectHosts | query | Return a hosts property with hosts that the script can be run on. |
| selectActions | query | Return an actions property with actions that the script is associated with. |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | boolean | Possible values: scriptid, name. These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve all scripts

Retrieve all configured scripts.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "scriptid": "1",
      "name": "Ping",
      "command": "/bin/ping -c 3 {HOST.CONN} 2>&1",

Source

CScript::get() in `ui/include/classes/api/services/CScript.php`.

script.getscriptsbyevents

Description

object script.getscriptsbyevents(object parameters)

This method allows to retrieve all available scripts on the given event or specific script if script ID is provided. When manualinput is provided, it substitutes the {MANUALINPUT} macro with the specified value.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) The method accepts object or array of objects with the following parameters.

| Parameter | Type | Description |
|-------------|--------|---|
| eventid | ID | ID of event to return scripts for. Must be unique. |
| scriptid | ID | ID of script to return. |
| manualinput | string | Value of the user-provided {MANUALINPUT} macro value. |

Return values

(object) Returns an object with event IDs as properties and arrays of available scripts as values. If script ID is provided, the associated value is an array containing the specific script.

Note:

The method will automatically expand macros in the confirmation text, manualinput prompt text and url. If the manualinput parameter is provided, the {MANUALINPUT} macro will be resolved to the specified value.

Examples

Retrieve scripts by event IDs

Retrieve all scripts available to events "632" and "614".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.getscriptsbyevents",
  "params": [
    {
      "eventid": "632"
    },
    {
      "eventid": "614"
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "632": [
      {
        "scriptid": "3",
        "name": "Detect operating system",

}

```

Retrieve specific script with manualinput value.

Retrieve script with ID "4" on event "632" with manualinput value "dashboard.view".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "script.getscriptsbyevents",
  "params": [
    {
      "eventid": "632",
      "scriptid": "4",
      "manualinput": "dashboard.view"
    }
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "632": [
      {
        "scriptid": "4",
        "name": "Open Zabbix page",
        "command": "",
        "host_access": "2",
        "usrgrpuid": "0",

```

```

CScript::getScriptsByEvents() in `ui/include/classes/api/services/CScript.php`.

script.getscriptsbyhosts

Description

`object script.getscriptsbyhosts(object parameters)`

This method allows to retrieve all available scripts on the given host or specific script if script ID is provided. When manualinput is provided, it substitutes the {MANUALINPUT} macro with the specified value.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) The method accepts object or array of objects with the following parameters.

| Parameter | Type | Description |
|-------------|--------|---|
| hostid | ID | ID of host to return scripts for. Must be unique. |
| scriptid | ID | ID of script to return. |
| manualinput | string | Value of the user-provided {MANUALINPUT} macro value. |

Parameter behavior:
- *required*

Return values

(object) Returns an object with host IDs as properties and arrays of available scripts as values. If script ID is provided, the associated value is an array containing the specific script.

Note:

The method will automatically expand macros in the confirmation text, manualinput prompt text and url. If the manualinput parameter is provided, the {MANUALINPUT} macro will be resolved to the specified value.

Examples

Retrieve scripts by host IDs

Retrieve all scripts available on hosts "30079" and "30073".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.getscriptsbyhosts",
  "params": [
    {
      "hostid": "30079"
    },
    {
      "hostid": "30073"
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",

    }
    ],
    "id": 1
}

```

Retrieve specific script with manualinput value.

Retrieve script with ID "4" on host "30079" with manualinput value "dashboard.view".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "script.getscriptsbyhosts",
  "params": [
    {
      "hostid": "30079",
      "scriptid": "4",
      "manualinput": "dashboard.view"
    }
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "30079": [
      {
        "scriptid": "4",
        "name": "Open Zabbix page",
        "command": "",
        "host_access": "2",
        "usrgrpid": "0",
        "groupid": "0",
        "description": "",
        "confirmation": "Are you sure you want to open page dashboard.view?",
        "type": "6",
        "execute_on": "2",
        "timeout": "30s",
        "scope": "2",
        "port": "",
        "authtype": "0",
        "username": "",
        "password": "",
        "publickey": "",
        "privatekey": "",

        "manualinput_validator": "dashboard.view,discovery.view",
        "manualinput_default_value": "",
        "parameters": []
    }
}
},
"id": 1
}

```

Source

CScript::getScriptsByHosts() in `ui/include/classes/api/services/CScript.php`.

script.update

Description

object script.update(object/array scripts)

This method allows to update existing scripts.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Script properties** to be updated.

The `scriptid` property must be defined for each script, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged. An exception is type property change from 5 (Webhook) to other: the `parameters` property will be cleaned.

Return values

(object) Returns an object containing the IDs of the updated scripts under the `scriptids` property.

Examples

Change script command

Change the command of the script to `"/bin/ping -c 10 {HOST.CONN} 2>&1"`.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "script.update",
    "params": {
        "scriptid": "1",
        "command": "/bin/ping -c 10 {HOST.CONN} 2>&1"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "1"
        ]
    },
}

```

```
    "id": 1
}
```

Change script command and add manual input

Change the command of the script to `"/bin/ping -c {MANUALINPUT} {HOST.CONN} 2>&1"`.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "script.update",
  "params": {
    "scriptid": "1",
    "command": "/bin/ping -c {MANUALINPUT} {HOST.CONN} 2>&1",
    "manualinput": "1",
    "manualinput_prompt": "Specify the number of ICMP packets to send with the ping command",
    "manualinput_validator": "^(?:[1-9]|10)$",
    "manualinput_validator_type": "0",
    "manualinput_default_value": "10"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "scriptids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

CScript::update() in `ui/include/classes/api/services/CScript.php`.

Service

This class is designed to work with IT infrastructure/business services.

Object references:

- [Service](#)
- [Status rule](#)
- [Service tag](#)
- [Service alarm](#)
- [Problem tag](#)

Available methods:

- [service.create](#) - create new services
- [service.delete](#) - delete services
- [service.get](#) - retrieve services
- [service.update](#) - update services

Service object

The following objects are directly related to the service API.

Service

The service object has the following properties.

| Property | Type | Description |
|------------------|---------|---|
| serviceid | ID | ID of the service. |
| algorithm | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Status calculation rule. Only applicable if child services exist.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - set status to OK; 1 - most critical if all children have problems; 2 - most critical of child services. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations |
| name | string | <p>Name of the service.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations |
| sortorder | integer | <p>Position of the service used for sorting.</p> <p>Possible values: 0-999.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations |
| weight | integer | <p>Service weight.</p> <p>Possible values: 0-1000000.</p> |
| propagation_rule | integer | <p>Default: 0.</p> <p>Status propagation rule.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) propagate service status as is - without any changes; 1 - increase the propagated status by a given <code>propagation_value</code> (by 1 to 5 severities); 2 - decrease the propagated status by a given <code>propagation_value</code> (by 1 to 5 severities); 3 - ignore this service - the status is not propagated to the parent service at all; 4 - set fixed service status using a given <code>propagation_value</code>. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if <code>propagation_value</code> is set |

| Property | Type | Description |
|-------------------|---------|---|
| propagation_value | integer | <p>Status propagation value.</p> <p>Possible values if <code>propagation_rule</code> is set to "0" or "3": 0 - Not classified.</p> <p>Possible values if <code>propagation_rule</code> is set to "1" or "2": 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster.</p> <p>Possible values if <code>propagation_rule</code> is set to "4": -1 - OK; 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster.</p> <p>Property behavior: - <i>required</i> if <code>propagation_rule</code> is set</p> |
| status | integer | <p>Whether the service is in OK or problem state.</p> <p>If the service is in problem state, <code>status</code> is equal either to: - the severity of the most critical problem; - the highest status of a child service in problem state.</p> <p>If the service is in OK state, <code>status</code> is equal to: -1.</p> <p>Property behavior: - <i>read-only</i></p> |
| description | string | Description of the service. |
| uuid | string | Universal unique identifier, used for linking imported services to already existing ones. Auto-generated, if not given. |
| created_at | integer | Unix timestamp when service was created. |
| readonly | boolean | <p>Access to the service.</p> <p>Possible values: 0 - Read-write; 1 - Read-only.</p> <p>Property behavior: - <i>read-only</i></p> |

Status rule

The status rule object has the following properties.

| Property | Type | Description |
|--------------|---------|--|
| type | integer | <p>Condition for setting (New status) status.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - if at least (N) child services have (Status) status or above; 1 - if at least (N%) of child services have (Status) status or above; 2 - if less than (N) child services have (Status) status or below; 3 - if less than (N%) of child services have (Status) status or below; 4 - if weight of child services with (Status) status or above is at least (W); 5 - if weight of child services with (Status) status or above is at least (N%); 6 - if weight of child services with (Status) status or below is less than (W); 7 - if weight of child services with (Status) status or below is less than (N%). <p>Where:</p> <ul style="list-style-type: none"> - N (W) is <code>limit_value</code>; - (Status) is <code>limit_status</code>; - (New status) is <code>new_status</code>. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| limit_value | integer | <p>Limit value.</p> <p>Possible values:</p> <ul style="list-style-type: none"> - for N and W: 1-100000; - for N%: 1-100. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| limit_status | integer | <p>Limit status.</p> <p>Possible values:</p> <ul style="list-style-type: none"> -1 - OK; 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |
| new_status | integer | <p>New status value.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |

Service tag

The service tag object has the following properties.

| Property | Type | Description |
|----------|--------|---|
| tag | string | Service tag name. Property behavior: - <i>required</i> |
| value | string | Service tag value. |

Service alarm

Note:

Service alarms cannot be directly created, updated or deleted via the Zabbix API.

The service alarm objects represent a service's state change. It has the following properties.

| Property | Type | Description |
|----------|-----------|--|
| clock | timestamp | Time when the service state change has happened. |
| value | integer | Status of the service. Refer to the service status property for a list of possible values. |

Problem tag

Problem tags allow linking services with problem events. The problem tag object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| tag | string | Problem tag name. Property behavior: - <i>required</i> |
| operator | integer | Mapping condition operator. Possible values: 0 - (<i>default</i>) equals; 2 - like. |
| value | string | Problem tag value. |

service.create

Description

`object service.create(object/array services)`

This method allows to create new services.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) services to create.

Additionally to the **standard service properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| children | array | Child services to be linked to the service. The child services must have only the serviceid property defined. |
| parents | array | Parent services to be linked to the service. The parent services must have only the serviceid property defined. |

| Parameter | Type | Description |
|--------------|-------|--|
| tags | array | Service tags to be created for the service. |
| problem_tags | array | Problem tags to be created for the service. |
| status_rules | array | Status rules to be created for the service. |

Return values

(object) Returns an object containing the IDs of the created services under the `serviceids` property. The order of the returned IDs matches the order of the passed services.

Examples

Creating a service

Create a service that will be switched to problem state, if at least one child has a problem.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.create",
  "params": {
    "name": "Server 1",
    "algorithm": 1,
    "sortorder": 1
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "5"
    ]
  },
  "id": 1
}
```

Source

CService::create() in `ui/include/classes/api/services/CService.php`.

service.delete

Description

object service.delete(array serviceIds)

This method allows to delete services.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the services to delete.

Return values

(object) Returns an object containing the IDs of the deleted services under the `serviceids` property.

Examples

Deleting multiple services

Delete two services.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.delete",
  "params": [
    "4",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "4",
      "5"
    ]
  },
  "id": 1
}
```

service.get

Description

integer/array service.get(object parameters)

The method allows to retrieve services according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------|----------|--|
| serviceids | ID/array | Return only services with the given IDs. |
| parentids | ID/array | Return only services that are linked to the given parent services. |
| deep_parentids | flag | Return all direct and indirect child services. Used together with <code>parentids</code> . |
| childids | ID/array | Return only services that are linked to the given child services. |
| evaltype | integer | Rules for tag searching. Possible values: 0 - (default) And/Or; 2 - Or. |

| Parameter | Type | Description |
|----------------------|--------------|---|
| tags | object/array | <p>Return only services with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.</p> <p>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].</p> <p>An empty array returns all services.</p> <p>Possible operator values:</p> <ul style="list-style-type: none"> 0 - (default) Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. |
| problem_tags | object/array | <p>Return only services with given problem tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.</p> <p>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].</p> <p>An empty array returns all services.</p> <p>Possible operator values:</p> <ul style="list-style-type: none"> 0 - (default) Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. |
| without_problem_tags | flag | Return only services without problem tags. |
| slais | ID/array | Return only services that are linked to the specific SLA(s). |
| selectChildren | query | Return a children property with the child services. |
| selectParents | query | <p>Supports count.</p> <p>Return a parents property with the parent services.</p> |
| selectTags | query | <p>Supports count.</p> <p>Return a tags property with service tags.</p> |
| selectProblemEvents | query | <p>Supports count.</p> <p>Return a problem_events property with an array of problem event objects.</p> <p>The problem event object has the following properties:</p> <ul style="list-style-type: none"> eventid - (ID) Event ID; severity - (string) Current event severity; name - (string) Resolved event name. |
| selectProblemTags | query | <p>Supports count.</p> <p>Return a problem_tags property with problem tags.</p> |
| selectStatusRules | query | <p>Supports count.</p> <p>Return a status_rules property with status rules.</p> <p>Supports count.</p> |

| Parameter | Type | Description |
|------------------------|--------------|---|
| selectStatusTimeline | object/array | Return a status_timeline property containing service state changes for given periods. Format [{"period_from": "<period_from>", "period_to": "<period_to>"}, ...] - period_from being a starting date (inclusive; integer timestamp) and period_to being an ending date (exclusive; integer timestamp) for the period you're interested in. Returns an array of entries containing a start_value property and an alarms array for the state changes within specified periods. |
| sortfield | string/array | Sort the result by the given properties. Possible values: serviceid, name, status, sortorder, created_at. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving all services

Retrieve all data about all services and their dependencies.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.get",
  "params": {
    "output": "extend",
    "selectChildren": "extend",
    "selectParents": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "serviceid": "1",
      "name": "My Service - 0001",
      "status": "-1",
      "algorithm": "2",
      "sortorder": "0",
      "weight": "0",
```

```

        "propagation_rule": "0",
        "propagation_value": "0",
        "description": "My Service Description 0001.",
        "uuid": "dfa4daeaea754e3a95c04d6029182681",
        "created_at": "946684800",
        "readonly": false,
        "parents": [],
        "children": []
    },
    {
        "serviceid": "2",
        "name": "My Service - 0002",
        "status": "-1",
        "algorithm": "2",
        "sortorder": "0",
        "weight": "0",
        "propagation_rule": "0",
        "propagation_value": "0",
        "description": "My Service Description 0002.",
        "uuid": "20ea0d85212841219130abeaca28c065",
        "created_at": "946684800",
        "readonly": false,
        "parents": [],
        "children": []
    }
],
    "id": 1
}

```

CService::get() in *ui/include/classes/api/services/CService.php*.

service.update

Description

object service.update(object/array services)

This method allows to update existing services.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) service properties to be updated.

The serviceid property must be defined for each service, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard service properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|--------------|-------|--|
| children | array | Child services to replace the current child services. |
| parents | array | The child services must have only the serviceid property defined. Parent services to replace the current parent services. |
| tags | array | The parent services must have only the serviceid property defined. Service tags to replace the current service tags. |
| problem_tags | array | Problem tags to replace the current problem tags. |
| status_rules | array | Status rules to replace the current status rules. |

Return values

(object) Returns an object containing the IDs of the updated services under the `serviceids` property.

Examples

Setting the parent for a service

Make service with ID "3" to be the parent for service with ID "5".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "serviceid": "5",
    "parents": [
      {
        "serviceid": "3"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "5"
    ]
  },
  "id": 1
}
```

Adding a scheduled downtime

Add a downtime for service with ID "4" scheduled weekly from Monday 22:00 till Tuesday 10:00.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "service.update",
  "params": {
    "serviceid": "4",
    "times": [
      {
        "type": "1",
        "ts_from": "165600",
        "ts_to": "201600"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "serviceids": [
      "4"
    ]
  },
  "id": 1
}
```

```
"id": 1  
}
```

Settings

This class is designed to work with common administration settings.

Object references:

- [Settings](#)

Available methods:

- [settings.get](#) - retrieve settings
- [settings.update](#) - update settings

Settings object

The following objects are directly related to the `settings` API.

Settings

The settings object has the following properties.

| Property | Type | Description |
|-------------------------|---------|---|
| default_lang | string | System language by default. Default: <code>en_US</code> . |
| default_timezone | string | System time zone by default. Default: <code>system</code> - system default. For the full list of supported time zones please refer to PHP documentation . |
| default_theme | string | Default theme. Possible values: <code>blue-theme</code> - <i>(default)</i> Blue; <code>dark-theme</code> - Dark; <code>hc-light</code> - High-contrast light; <code>hc-dark</code> - High-contrast dark. |
| search_limit | integer | Limit for search and filter results. Default: 1000. |
| max_overview_table_size | integer | Max number of columns and rows in Data overview and Trigger overview dashboard widgets. Default: 50. |
| max_in_table | integer | Max count of elements to show inside table cell. Default: 50. |
| server_check_interval | integer | Show warning if Zabbix server is down. Possible values: 0 - Do not show warning; 10 - <i>(default)</i> Show warning. |
| work_period | string | Working time. Default: 1-5,09:00-18:00. |

| Property | Type | Description |
|-----------------------|---------|--|
| show_technical_errors | integer | Show technical errors (PHP/SQL) to non-Super admin users and to users that are not part of user groups with debug mode enabled. Possible values: 0 - <i>(default)</i> Do not technical errors; 1 - Show technical errors. |
| history_period | string | Max period to display history data in Latest data, Web, and Data overview dashboard widgets. Accepts seconds and time unit with suffix. |
| period_default | string | Default: 24h. Time filter default period. Accepts seconds and time unit with suffix with month and year support (30s, 1m, 2h, 1d, 1M, 1y). |
| max_period | string | Default: 1h. Max period for time filter. Accepts seconds and time unit with suffix with month and year support (30s, 1m, 2h, 1d, 1M, 1y). |
| severity_color_0 | string | Default: 2y. Color for "Not classified" severity as a hexadecimal color code. |
| severity_color_1 | string | Default: 97AAB3. Color for "Information" severity as a hexadecimal color code. |
| severity_color_2 | string | Default: 7499FF. Color for "Warning" severity as a hexadecimal color code. |
| severity_color_3 | string | Default: FFC859. Color for "Average" severity as a hexadecimal color code. |
| severity_color_4 | string | Default: FFA059. Color for "High" severity as a hexadecimal color code. |
| severity_color_5 | string | Default: E97659. Color for "Disaster" severity as a hexadecimal color code. |
| severity_name_0 | string | Default: E45959. Name for "Not classified" severity. |
| severity_name_1 | string | Default: Not classified. Name for "Information" severity. |
| severity_name_2 | string | Default: Information. Name for "Warning" severity. |
| severity_name_3 | string | Default: Warning. Name for "Average" severity. |
| severity_name_4 | string | Default: Average. Name for "High" severity. |
| severity_name_5 | string | Default: High. Name for "Disaster" severity. |
| custom_color | integer | Default: Disaster. Use custom event status colors. Possible values: 0 - <i>(default)</i> Do not use custom event status colors; 1 - Use custom event status colors. |

| Property | Type | Description |
|------------------------|---------|--|
| ok_period | string | Display OK triggers period. Accepts seconds and time unit with suffix. |
| blink_period | string | Default: 5m. On status change triggers blink period. Accepts seconds and time unit with suffix. |
| problem_unack_color | string | Default: 2m. Color for unacknowledged PROBLEM events as a hexadecimal color code. |
| problem_ack_color | string | Default: CC0000. Color for acknowledged PROBLEM events as a hexadecimal color code. |
| ok_unack_color | string | Default: CC0000. Color for unacknowledged RESOLVED events as a hexadecimal color code. |
| ok_ack_color | string | Default: 009900. Color for acknowledged RESOLVED events as a hexadecimal color code. |
| problem_unack_style | integer | Default: 009900. Blinking for unacknowledged PROBLEM events. |
| problem_ack_style | integer | Possible values: 0 - Do not show blinking; 1 - <i>(default)</i> Show blinking. Blinking for acknowledged PROBLEM events. |
| ok_unack_style | integer | Possible values: 0 - Do not show blinking; 1 - <i>(default)</i> Show blinking. Blinking for unacknowledged RESOLVED events. |
| ok_ack_style | integer | Possible values: 0 - Do not show blinking; 1 - <i>(default)</i> Show blinking. Blinking for acknowledged RESOLVED events. |
| url | string | Possible values: 0 - Do not show blinking; 1 - <i>(default)</i> Show blinking. Frontend URL. |
| discovery_groupid | ID | ID of the host group to which will be automatically placed discovered hosts. |
| default_inventory_mode | integer | Default host inventory mode. |
| alert_usrgrpid | ID | Possible values: -1 - <i>(default)</i> Disabled; 0 - Manual; 1 - Automatic. ID of the user group to which will be sending database down alarm message. |
| snmptrap_logging | integer | If set to "0", the alarm message will not be sent. Log unmatched SNMP traps. |
| | | Possible values: 0 - Do not log unmatched SNMP traps; 1 - <i>(default)</i> Log unmatched SNMP traps. |

| Property | Type | Description |
|------------------------------|---------|--|
| login_attempts | integer | Number of failed login attempts after which login form will be blocked. |
| login_block | string | Default: 5. Time interval during which login form will be blocked if number of failed login attempts exceeds defined in login_attempts field. Accepts seconds and time unit with suffix. |
| validate_uri_schemes | integer | Default: 30s. Validate URI schemes. |
| uri_valid_schemes | string | Possible values: 0 - Do not validate; 1 - <i>(default)</i> Validate. Valid URI schemes. |
| x_frame_options | string | Default: http,https,ftp,file,mailto,tel,ssh. X-Frame-Options HTTP header. |
| iframe_sandboxing_enabled | integer | Default: SAMEORIGIN. Use iframe sandboxing. |
| iframe_sandboxing_exceptions | string | Possible values: 0 - Do not use; 1 - <i>(default)</i> Use. Iframe sandboxing exceptions. |
| connect_timeout | string | Connection timeout with Zabbix server. Possible values range: 1-30s. Default: 3s. |
| socket_timeout | string | Property behavior: - <i>required</i> Network default timeout. Possible values range: 1-300s. Default: 3s. |
| media_type_test_timeout | string | Property behavior: - <i>required</i> Network timeout for media type test. Possible values range: 1-300s. Default: 65s. |
| item_test_timeout | string | Property behavior: - <i>required</i> Network timeout for item tests. Possible value range: 1-600s. Default: 60s. |
| | | Property behavior: - <i>required</i> |

| Property | Type | Description |
|-----------------------|---------|---|
| script_timeout | string | <p>Network timeout for script execution.</p> <p>Possible values range: 1-300s.</p> <p>Default: 60s.</p> <p>Property behavior: - <i>required</i></p> |
| report_test_timeout | string | <p>Network timeout for scheduled report test.</p> <p>Possible values range: 1-300s.</p> <p>Default: 60s.</p> <p>Property behavior: - <i>required</i></p> |
| auditlog_enabled | integer | <p>Whether to enable audit logging.</p> <p>Possible values: 0 - Disable; 1 - (<i>default</i>) Enable.</p> |
| auditlog_mode | integer | <p>Whether to enable audit logging of low-level discovery, network discovery and autoregistration activities performed by the server (System user).</p> <p>Possible values: 0 - Disable; 1 - (<i>default</i>) Enable.</p> |
| ha_failover_delay | string | <p>Failover delay in seconds.</p> <p>Default: 1m.</p> <p>Property behavior: - <i>read-only</i></p> |
| geomaps_tile_provider | string | <p>Geomap tile provider.</p> <p>Possible values: OpenStreetMap.Mapnik - (<i>default</i>) OpenStreetMap Mapnik; OpenTopoMap - OpenTopoMap; Stamen.TonerLite - Stamen Toner Lite; Stamen.Terrain - Stamen Terrain; USGS.USTopo - USGS US Topo; USGS.USImagery - USGS US Imagery.</p> <p>Supports empty string to specify custom values of geomaps_tile_url, geomaps_max_zoom and geomaps_attribution.</p> |
| geomaps_tile_url | string | <p>Geomap tile URL.</p> <p>Property behavior: - <i>supported</i> if geomaps_tile_provider is set to empty string</p> |
| geomaps_max_zoom | integer | <p>Geomap max zoom level.</p> <p>Possible values: 0-30.</p> <p>Property behavior: - <i>supported</i> if geomaps_tile_provider is set to empty string</p> |
| geomaps_attribution | string | <p>Geomap attribution text.</p> <p>Property behavior: - <i>supported</i> if geomaps_tile_provider is set to empty string</p> |

| Property | Type | Description |
|------------------------|---------|---|
| vault_provider | integer | Vault provider. Possible values: 0 - <i>(default)</i> HashiCorp Vault; 1 - CyberArk Vault. |
| timeout_zabbix_agent | string | Spend no more than timeout_* seconds on processing. Accepts seconds or time unit with suffix (e.g., 30s, 1m). Also accepts user macros. Possible values range: 1-600s. Default: 3s. Default for timeout_browser: 60s. Property behavior: - <i>required</i> |
| timeout_simple_check | | |
| timeout_snmp_agent | | |
| timeout_external_check | | |
| timeout_db_monitor | | |
| timeout_http_agent | | |
| timeout_ssh_agent | | |
| timeout_telnet_agent | | |
| timeout_script | | |
| timeout_browser | | |

settings.get

Description

object settings.get(object parameters)

The method allows to retrieve settings object according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

| Parameter | Type | Description |
|-----------|-------|---|
| output | query | This parameter is described in the reference commentary . |

Return values

(object) Returns settings object.

Examples

Request:

```
{
  "jsonrpc": "2.0",
  "method": "settings.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "default_theme": "blue-theme",
    "search_limit": "1000",
    "max_in_table": "50",

settings.update

Description

object settings.update(object settings)

This method allows to update existing common settings.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) **Settings properties** to be updated.

Return values

(array) Returns an array with the names of updated parameters.

Examples

Request:

```

{
    "jsonrpc": "2.0",
    "method": "settings.update",
    "params": {
        "login_attempts": "1",
        "login_block": "1m"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        "login_attempts",
        "login_block"
    ],
    "id": 1
}

SLA

This class is designed to work with SLA (Service Level Agreement) objects used to estimate the performance of IT infrastructure and business services.

Object references:

- [SLA](#)
- [SLA schedule](#)
- [SLA excluded downtime](#)
- [SLA service tag](#)

Available methods:

- [sla.create](#) - create new SLAs
- [sla.delete](#) - delete SLAs
- [sla.get](#) - retrieve SLAs
- [sla.getsli](#) - retrieve Service Level Indicator (SLI) data for SLAs
- [sla.update](#) - update SLAs

SLA object

The following objects are directly related to the `sla` (Service Level Agreement) API.

SLA

The SLA object has the following properties.

| Property | Type | Description |
|----------------|---------|---|
| slaid | ID | ID of the SLA. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations <p>Name of the SLA.</p> |
| period | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Reporting period of the SLA.</p> <p>Possible values:</p> <ul style="list-style-type: none">0 - daily;1 - weekly;2 - monthly;3 - quarterly;4 - annually. |
| slo | float | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Minimum acceptable Service Level Objective expressed as a percent. If the Service Level Indicator (SLI) drops lower, the SLA is considered to be in problem/unfulfilled state.</p> <p>Possible values: 0-100 (up to 4 fractional digits).</p> |
| effective_date | integer | <p>Property behavior:</p> <ul style="list-style-type: none">- <i>required</i> for create operations <p>Effective date of the SLA.</p> <p>Possible values: date timestamp in UTC.</p> |

| Property | Type | Description |
|-------------|---------|--|
| timezone | string | Reporting time zone, for example: Europe/London, UTC. For the full list of supported time zones please refer to PHP documentation . |
| status | integer | Property behavior: - <i>required</i> for create operations Status of the SLA. Possible values: 0 - (<i>default</i>) disabled SLA; 1 - enabled SLA. |
| description | string | Description of the SLA. |

SLA schedule

The SLA schedule object defines periods where the connected service(s) are scheduled to be in working order. It has the following properties.

| Property | Type | Description |
|-------------|---------|---|
| period_from | integer | Starting time of the recurrent weekly period of time (inclusive). Possible values: number of seconds (counting from Sunday). |
| period_to | integer | Property behavior: - <i>required</i> Ending time of the recurrent weekly period of time (exclusive). Possible values: number of seconds (counting from Sunday). Property behavior: - <i>required</i> |

SLA excluded downtime

The excluded downtime object defines periods where the connected service(s) are scheduled to be out of working order, without affecting SLI, e.g., undergoing planned maintenance. It has the following properties.

| Property | Type | Description |
|-------------|---------|--|
| name | string | Name of the excluded downtime. Property behavior: - <i>required</i> |
| period_from | integer | Starting time of the excluded downtime (inclusive). Possible values: timestamp. Property behavior: - <i>required</i> |
| period_to | integer | Ending time of the excluded downtime (exclusive). Possible values: timestamp. Property behavior: - <i>required</i> |

SLA service tag

The SLA service tag object links services to include in the calculations for the SLA. It has the following properties.

| Property | Type | Description |
|----------|---------|--|
| tag | string | SLA service tag name. |
| operator | integer | Property behavior: - <i>required</i> SLA service tag operator. Possible values: 0 - (<i>default</i>) equals; 2 - contains. |
| value | string | SLA service tag value. |

sla.create

Description

object `sla.create(object/array SLAs)`

This method allows to create new SLA objects.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) SLA objects to create.

Additionally to the **standard SLA properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|--------------------|-------|---|
| service_tags | array | SLA service tags to be created for the SLA. |
| schedule | array | Parameter behavior: - <i>required</i> SLA schedule to be created for the SLA. Specifying an empty parameter will be interpreted as a 24x7 schedule. Default: 24x7 schedule. |
| excluded_downtimes | array | SLA excluded downtimes to be created for the SLA. |

Return values

(object) Returns an object containing the IDs of the created SLAs under the `slaids` property. The order of the returned IDs matches the order of the passed SLAs.

Examples

Creating an SLA

Instruct to create an SLA entry for: * tracking uptime for SQL-engine related services; * custom schedule of all weekdays excluding last hour on Saturday; * an effective date of the last day of the year 2022; * with 1 hour and 15 minutes long planned downtime starting at midnight on the 4th of July; * SLA weekly report calculation will be on; * the minimum acceptable SLO will be 99.9995%.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.create",
  "params": [
    {
      "name": "Database Uptime",
      "slo": "99.9995",
      "period": "1",
      "timezone": "America/Toronto",
    }
  ]
}
```

```

        "description": "Provide excellent uptime for main database engines.",
        "effective_date": 1672444800,
        "status": 1,
        "schedule": [
            {
                "period_from": 0,
                "period_to": 601200
            }
        ],
        "service_tags": [
            {
                "tag": "database",
                "operator": "0",
                "value": "mysql"
            },
            {
                "tag": "database",
                "operator": "0",
                "value": "postgresql"
            }
        ],
        "excluded_downtimes": [
            {
                "name": "Software version upgrade rollout",
                "period_from": "1648760400",
                "period_to": "1648764900"
            }
        ]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "slaid": [
            "5"
        ]
    },
    "id": 1
}

```

Source

CSla::create() in `ui/include/classes/api/services/CSla.php`.

sla.delete

Description

object `sla.delete(array slaid)`

This method allows to delete SLA entries.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the SLAs to delete.

Return values

(object) Returns an object containing the IDs of the deleted SLAs under the `slaims` property.

Examples

Deleting multiple SLAs

Delete two SLA entries.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.delete",
  "params": [
    "4",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "slaims": [
      "4",
      "5"
    ]
  },
  "id": 1
}
```

Source

`CSla::delete()` in `ui/include/classes/api/services/CSla.php`.

sla.get

Description

integer/array `sla.get(object parameters)`

The method allows to retrieve SLA objects according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---|----------|--|
| <code>slaims</code> | ID/array | Return only SLAs with the given IDs. |
| <code>serviceids</code> | ID/array | Return only SLAs matching the specific services. |
| <code>selectSchedule</code> | query | Return a <code>schedule</code> property with SLA schedules. |
| <code>selectExcludedDowntimesquery</code> | | Supports count. Return an <code>excluded_downtimes</code> property with SLA excluded downtimes. |
| | | Supports count. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| selectServiceTags | query | Return a service_tags property with SLA service tags. |
| sortfield | string/array | Supports count. Sort the result by the given properties. Possible values: slaid, name, period, slo, effective_date, timezone, status, description. These parameters are described in the reference commentary . |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving all SLAs

Retrieve all data about all SLAs and their properties.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.get",
  "params": {
    "output": "extend",
    "selectSchedule": ["period_from", "period_to"],
    "selectExcludedDowntimes": ["name", "period_from", "period_to"],
    "selectServiceTags": ["tag", "operator", "value"],
    "preservekeys": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "1": {
      "slaid": "1",
      "name": "Database Uptime",
      "period": "1",
      "slo": "99.9995",
      "effective_date": "1672444800",
      "timezone": "America/Toronto",
      "status": "1",
      "description": "Provide excellent uptime for main SQL database engines.",
      "service_tags": [
        {
          "tag": "database",
```

```

        "operator": "0",
        "value": "mysql"
    },
    {
        "tag": "database",
        "operator": "0",
        "value": "postgresql"
    }
],
"schedule": [
    {
        "period_from": "0",
        "period_to": "601200"
    }
],
"excluded_downtimes": [
    {
        "name": "Software version upgrade rollout",
        "period_from": "1648760400",
        "period_to": "1648764900"
    }
]
},
"id": 1
}

```

CSla:get() in `ui/include/classes/api/services/CSla.php`.

sla.getsli

Description

object sla.getsli(object parameters)

This method allows to calculate the Service Level Indicator (SLI) data for a Service Level Agreement (SLA).

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the SLA ID, reporting periods and, optionally, the IDs of the services - to calculate the SLI for.

| Parameter | Type | Description |
|-------------|-----------|---|
| slaid | ID | ID of the SLA to return availability information for. |
| period_from | timestamp | Parameter behavior: - <i>required</i> Starting date (inclusive) to report the SLI for. |
| period_to | timestamp | Possible values: timestamp. Ending date (exclusive) to report the SLI for. |
| periods | array | Possible values: timestamp. Preferred number of periods to report. |
| serviceids | ID/array | Possible values: 1-100 IDs of services to return the SLI for. |

Partitioning of periods

The following table demonstrates the arrangement of returned period slices based on combinations of parameters.

Note:

The returned periods will not precede the first available period based on the effective date of the SLA and will not exceed the current period.

| Parameters | | | Description |
|--------------------|------------------|----------------|---|
| period_from | period_to | periods | |
| - | - | - | Return the last 20 periods. |
| - | - | specified | Return the last periods specified by the periods parameter. |
| - | specified | - | Return the last 20 periods before the specified period_to date. |
| - | specified | specified | Return the last periods specified by the periods parameter before the specified period_to date. |
| specified | - | - | Return the first 20 periods starting with the specified period_from date. |
| specified | - | specified | Return the first periods specified by the periods parameter starting with the specified period_from date. |
| specified | specified | - | Return up to 100 periods within the specified date range. |
| specified | specified | specified | Return periods specified by the periods parameter within the specified date range. |

Return values

(object) Returns the results of the calculation.

| Property | Type | Description |
|------------|-------|--|
| periods | array | List of the reported periods. Each reported period is represented as an object consisting of: - period_from - Starting date of the reported period (timestamp). - period_to - Ending date of the reported period (timestamp). |
| serviceids | array | Periods are sorted by period_from field ascending. List of service IDs in the reported periods. |
| sli | array | The sorting order of the list is not defined. Even if serviceids parameter was passed to the sla.getsli method. SLI data (as a two-dimensional array) for each reported period and service. The index of the periods property is used as the first dimension of the sli property. The index of the serviceids property is used as the second dimension of the sli property. |

SLI data

The SLI data returned for each reported period and service consists of:

| Property | Type | Description |
|----------|---------|---|
| uptime | integer | Amount of time service spent in an OK state during scheduled uptime, less the excluded downtimes. |

| Property | Type | Description |
|--------------------|---------|---|
| downtime | integer | Amount of time service spent in a <i>not OK</i> state during scheduled uptime, less the excluded downtimes. |
| sli | float | SLI (per cent of total uptime), based on uptime and downtime. |
| error_budget | integer | Error budget (in seconds), based on the SLI and the SLO. |
| excluded_downtimes | array | Array of excluded downtimes in this reporting period. Each object will contain the following parameters: - name - Name of the excluded downtime. - period_from - Starting date and time (inclusive) of the excluded downtime. - period_to - Ending date and time (exclusive) of the excluded downtime. Excluded downtimes are sorted by period_from field ascending. |

Examples

Calculating SLI

Retrieve SLI data on services with IDs "50", "60" and "70" that are linked to the SLA with ID "5". Retrieve data for 3 periods starting from Nov 01, 2021.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.getsli",
  "params": {
    "slaid": "5",
    "serviceids": [
      50,
      60,
      70
    ],
    "periods": 3,
    "period_from": "1635724800"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "periods": [
      {
        "period_from": 1635724800,
        "period_to": 1638316800
      },
      {
        "period_from": 1638316800,
        "period_to": 1640995200
      },
      {
        "period_from": 1640995200,
        "period_to": 1643673600
      }
    ],
    "serviceids": [
      50,
      60,
      70
    ]
  }
}
```

```

CSla::getSli() in *ui/include/classes/api/services/CSla.php*

sla.update

Description

object sla.update(object/array slaids)

This method allows to update existing SLA entries.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) SLA properties to be updated.

The `slaid` property must be defined for each SLA, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard SLA properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|--------------------|-------|---|
| service_tags | array | SLA service tags to replace the current SLA service tags. |
| schedule | array | SLA schedule to replace the current one. Specifying parameter as empty will be interpreted as a 24x7 schedule. |
| excluded_downtimes | array | SLA excluded downtimes to replace the current ones. |

Return values

(object) Returns an object containing the IDs of the updated SLAs under the `slaid`s property.

Examples**Updating service tags**

Make SLA with ID "5" to be calculated at monthly intervals for NoSQL related services, without changing its schedule or excluded downtimes; set SLO to 95%.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.update",
  "params": [
    {
      "slaid": "5",
      "name": "NoSQL Database engines",
      "slo": "95",
      "period": 2,
      "service_tags": [
        {
          "tag": "database",
          "operator": "0",
          "value": "redis"
        },
        {
          "tag": "database",
          "operator": "0",
          "value": "mongodb"
        }
      ]
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "slaid": [
      "5"
    ]
  }
}
```

```
  },
  "id": 1
}
```

Changing the schedule of an SLA

Switch the SLA with ID "5" to a 24x7 schedule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.update",
  "params": {
    "slaid": "5",
    "schedule": []
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "slaids": [
      "5"
    ]
  },
  "id": 1
}
```

Changing the excluded downtimes for an SLA

Add a planned 4 hour long RAM upgrade downtime on the 6th of April, 2022, while keeping (needs to be defined anew) a previously existing software upgrade planned on the 4th of July for the SLA with ID "5".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "sla.update",
  "params": {
    "slaid": "5",
    "excluded_downtimes": [
      {
        "name": "Software version upgrade rollout",
        "period_from": "1648760400",
        "period_to": "1648764900"
      },
      {
        "name": "RAM upgrade",
        "period_from": "1649192400",
        "period_to": "1649206800"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "slaids": [
      "5"
    ]
  }
}
```

```

    },
    "id": 1
}

```

CSla::update() in *ui/include/classes/api/services/CSla.php*.

Task

This class is designed to work with tasks (such as checking items or low-level discovery rules without config reload).

Object references:

- **Task**
 - 'Execute now' request object
 - 'Refresh proxy configuration' request object
 - 'Diagnostic information' request object
 - * Statistic request object
 - * Statistic result object

Available methods:

- **task.create** - create new tasks
- **task.get** - retrieve tasks

Task object

The following objects are directly related to the task API.

Task

The task object has the following properties:

| Property | Type | Description |
|----------|-----------|---|
| taskid | ID | ID of the task. |
| type | integer | Property behavior: - <i>read-only</i> Type of the task. Possible values: 1 - Diagnostic information; 2 - Refresh proxy configuration; 6 - Execute now. |
| status | integer | Property behavior: - <i>required</i> Status of the task. Possible values: 1 - new task; 2 - task in progress; 3 - task is completed; 4 - task is expired. |
| clock | timestamp | Property behavior: - <i>read-only</i> Time when the task was created. Property behavior: - <i>read-only</i> |

| Property | Type | Description |
|----------|---------|--|
| ttd | integer | The time in seconds after which task expires. |
| proxyid | ID | <p>Property behavior: - <i>read-only</i></p> <p>ID of the proxy about which diagnostic information statistic is collected.</p> <p>Property behavior: - <i>supported</i> if type is set to "Diagnostic information" or "Refresh proxy configuration"</p> |
| request | object | <p>Task request object according to the task type: Object of 'Execute now' task is described in detail below; Object of 'Refresh proxy configuration' task is described in detail below; Object of 'Diagnostic information' task is described in detail below.</p> <p>Property behavior: - <i>required</i></p> |
| result | object | <p>Result object of the diagnostic information task. May contain NULL if result is not yet ready. Result object is described in detail below.</p> <p>Property behavior: - <i>read-only</i></p> |

'Execute now' request object

The 'Execute now' task request object has the following properties.

| Property | Type | Description |
|----------|------|---|
| itemid | ID | ID of item and low-level discovery rules. |

'Refresh proxy configuration' request object

The 'Refresh proxy configuration' task request object has the following properties.

| Property | Type | Description |
|----------|-------|-------------|
| proxyids | array | Proxy IDs. |

'Diagnostic information' request object

The diagnostic information task request object has the following properties. Statistic request object for all types of properties is [described in detail below](#).

| Property | Type | Description |
|---------------|--------|---|
| historycache | object | History cache statistic request. Available on server and proxy. |
| valuecache | object | Items cache statistic request. Available on server. |
| preprocessing | object | Preprocessing manager statistic request. Available on server and proxy. |
| alerting | object | Alert manager statistic request. Available on server. |
| lld | object | LLD manager statistic request. Available on server. |

Statistic request object

Statistic request object is used to define what type of information should be collected about server/proxy internal processes. It has the following properties.

| Property | Type | Description |
|----------|--------|---|
| stats | query | Statistic object properties to be returned. The list of available fields for each type of diagnostic information statistic are described in detail below . |
| top | object | Default: <code>extend</code> will return all available statistic fields. Object to sort and limit returned statistic values. The list of available fields for each type of diagnostic information statistic are described in detail below . Example: { "source.alerts": 10 } |

List of statistic fields available for each type of diagnostic information request

Following statistic fields can be requested for each type of diagnostic information request property.

| Diagnostic type | Available fields | Description |
|-----------------|------------------|--|
| historycache | items | Number of cached items. |
| | values | Number of cached values. |
| | memory | Shared memory statistics (free space, number of used chunks, number of free chunks, max size of free chunk). |
| | memory.data | History data cache shared memory statistics. |
| valuecache | memory.index | History index cache shared memory statistics. |
| | items | Number of cached items. |
| | values | Number of cached values. |
| | memory | Shared memory statistics (free space, number of used chunks, number of free chunks, max size of free chunk). |
| preprocessing | mode | Value cache mode. |
| | values | Number of queued values. |
| | preproc.values | Number of queued values with preprocessing steps. |
| alerting | alerts | Number of queued alerts. |
| lld | rules | Number of queued rules. |
| | values | Number of queued values. |

List of sorting fields available for each type of diagnostic information request

Following statistic fields can be used to sort and limit requested information.

| Diagnostic type | Available fields | Type |
|-----------------|------------------|---------|
| historycache | values | integer |
| valuecache | values | integer |
| | request.values | integer |
| preprocessing | values | integer |
| alerting | media.alerts | integer |
| | source.alerts | integer |
| lld | values | integer |

Statistic result object

Statistic result object is retrieved in `result` field of task object.

| Property | Type | Description |
|----------|---------------|---|
| status | integer | Status of the task result. Possible values: -1 - error occurred during performing task; 0 - task result is created. Property behavior: - <i>read-only</i> |
| data | string/object | Results according the statistic request object of particular diagnostic information task. Contains error message string if error occurred during performing task. |

task.create

Description

`object task.create(object/array tasks)`

This method allows to create a new task (such as collect diagnostic data or check items or low-level discovery rules without config reload).

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) A task to create.

The method accepts tasks with the [standard task properties](#).

Note that 'Execute now' tasks can be created only for the following types of items/discovery rules:

- Zabbix agent
- SNMPv1/v2/v3 agent
- Simple check
- Internal check
- External check
- Database monitor
- HTTP agent
- IPMI agent
- SSH agent
- TELNET agent
- Calculated check
- JMX agent
- Dependent item

If item or discovery rule is of type "Dependent item", then top level master item must be of type:

- Zabbix agent
- SNMPv1/v2/v3 agent
- Simple check
- Internal check
- External check
- Database monitor
- HTTP agent
- IPMI agent
- SSH agent
- TELNET agent
- Calculated check
- JMX agent

Return values

(object) Returns an object containing the IDs of the created tasks under the `taskids` property. One task is created for each item and low-level discovery rule. The order of the returned IDs matches the order of the passed `itemids`.

Examples

Creating a task

Create a task `Execute now` for two items. One is an item, the other is a low-level discovery rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "task.create",
  "params": [
    {
      "type": 6,
      "request": {
        "itemid": "10092"
      }
    },
    {
      "type": 6,
      "request": {
        "itemid": "10093"
      }
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "taskids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Create a task `Refresh proxy configuration` for two proxies.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "task.create",
  "params": [
    {
      "type": 2,
      "request": {
        "proxyids": ["10459", "10460"]
      }
    }
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "taskids": [
```

```

        "1"
    ],
    "id": 1
}

```

Create a task diagnostic information.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "task.create",
  "params": [
    {
      "type": 1,
      "request": {
        "alerting": {
          "stats": [
            "alerts"
          ],
          "top": {
            "media.alerts": 10
          }
        },
        "l1d": {
          "stats": "extend",
          "top": {
            "values": 5
          }
        }
      },
      "proxyid": 0
    }
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "taskids": [
      "3"
    ]
  },
  "id": 1
}

```

task.get

Description

integer/array task.get(object parameters)

The method allows to retrieve tasks according to the given parameters. Method returns details only about 'diagnostic information' tasks.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|--------------|----------|--|
| taskids | ID/array | Return only tasks with the given IDs. |
| output | query | These parameters are described in the reference commentary . |
| preservekeys | boolean | |

Return values

(integer/array) Returns an array of objects.

Examples

Retrieve task by ID

Retrieve all the data about the task with the ID "1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "task.get",
  "params": {
    "output": "extend",
    "taskids": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "taskid": "1",
      "type": "7",
      "status": "3",
      "clock": "1601039076",
      "ttl": "3600",
      "proxyid": null,
      "request": {
        "alerting": {
          "stats": [
            "alerts"
          ],
          "top": {
            "media.alerts": 10
          }
        },
        "l1d": {
          "stats": "extend",
          "top": {
            "values": 5
          }
        }
      }
    }
  ]
}
```

```

    }
  },
  "result": {
    "data": {
      "alerting": {
        "alerts": 0,
        "top": {
          "media.alerts": []
        },
      },
      "time": 0.000663
    },
    "lld": {
      "rules": 0,
      "values": 0,
      "top": {
        "values": []
      },
    },
    "time": 0.000442
  },
  "status": "0"
}
],
"id": 1
}

```

Template

This class is designed to work with templates.

Object references:

- [Template](#)
- [Template tag](#)

Available methods:

- [template.create](#) - create new templates
- [template.delete](#) - delete templates
- [template.get](#) - retrieve templates
- [template.massadd](#) - add related objects to templates
- [template.massremove](#) - remove related objects from templates
- [template.massupdate](#) - replace or remove related objects from templates
- [template.update](#) - update templates

Template object

The following objects are directly related to the `template` API.

Template

The template object has the following properties.

| Property | Type | Description |
|----------------|--------|---|
| templateid | ID | ID of the template. |
| host | string | Property behavior: - <i>read-only</i> - <i>required</i> for update operations Technical name of the template. |
| description | text | Property behavior: - <i>required</i> for create operations Description of the template. |
| name | string | Visible name of the template. |
| uuid | string | Default: <code>host</code> property value. Universal unique identifier, used for linking imported templates to already existing ones. Auto-generated, if not given. |
| vendor_name | string | Template vendor name. |
| vendor_version | string | For create operations, both <code>vendor_name</code> and <code>vendor_version</code> should be either set or left empty. For update operations, <code>vendor_version</code> can be left empty if it has a value in the database. Template vendor version. For create operations, both <code>vendor_name</code> and <code>vendor_version</code> should be either set or left empty. For update operations, <code>vendor_name</code> can be left empty if it has a value in the database. |

Template tag

The template tag object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| tag | string | Template tag name. Property behavior: - <i>required</i> |
| value | string | Template tag value. |

template.create

Description

`object template.create(object/array templates)`

This method allows to create new templates.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Templates to create.

Additionally to the [standard template properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|--------------|---|
| groups | object/array | <p>Template groups to add the template to.</p> <p>The template groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |
| tags | object/array | Template tags. |
| templates | object/array | Templates to be linked to the template. |
| macros | object/array | <p>The templates must have only the <code>templateid</code> property defined.</p> <p>User macros to be created for the template.</p> |

Return values

(object) Returns an object containing the IDs of the created templates under the `templateids` property. The order of the returned IDs matches the order of the passed templates.

Examples

Creating a template

Create a template with tags and link two templates to this template.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.create",
  "params": {
    "host": "Linux template",
    "groups": {
      "groupid": 1
    },
    "templates": [
      {
        "templateid": "11115"
      },
      {
        "templateid": "11116"
      }
    ],
    "tags": [
      {
        "tag": "host-name",
        "value": "{HOST.NAME}"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "11117"
    ]
  },
  "id": 1
}
```

Source

CTemplate::create() in *ui/include/classes/api/services/CTemplate.php*.

template.delete

Description

object `template.delete(array $templateIds)`

This method allows to delete templates.

Deleting a template will cause deletion of all template entities (items, triggers, graphs, etc.). To leave template entities with the hosts, but delete the template itself, first unlink the template from required hosts using one of these methods: `template.update`, `template.massupdate`, `host.update`, `host.massupdate`.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the templates to delete.

Return values

(object) Returns an object containing the IDs of the deleted templates under the `templateids` property.

Examples

Deleting multiple templates

Delete two templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.delete",
  "params": [
    "13",
    "32"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "13",
      "32"
    ]
  },
  "id": 1
}
```

Source

CTemplate::delete() in *ui/include/classes/api/services/CTemplate.php*.

template.get

Description

integer/array `template.get(object $parameters)`

The method allows to retrieve templates according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------|--------------|--|
| templateids | ID/array | Return only templates with the given template IDs. |
| groupids | ID/array | Return only templates that belong to the given template groups. |
| parentTemplateids | ID/array | Return only templates that the given template is linked to. |
| hostids | ID/array | Return only templates that are linked to the given hosts/templates. |
| graphids | ID/array | Return only templates that contain the given graphs. |
| itemids | ID/array | Return only templates that contain the given items. |
| triggerids | ID/array | Return only templates that contain the given triggers. |
| with_items | flag | Return only templates that have items. |
| with_triggers | flag | Return only templates that have triggers. |
| with_graphs | flag | Return only templates that have graphs. |
| with_httptests | flag | Return only templates that have web scenarios. |
| evaltype | integer | Rules for tag searching. Possible values: 0 - (default) And/Or; 2 - Or. |
| tags | object/array | Return only templates with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value. Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]. An empty array returns all templates. Possible operator values: 0 - (default) Contains; 1 - Equals; 2 - Not like; 3 - Not equal; 4 - Exists; 5 - Not exists. |
| selectTags | query | Return template tags in the tags property. |
| selectHosts | query | Return the hosts that are linked to the template in the hosts property. |
| selectTemplateGroups | query | Supports count. Return the template groups that the template belongs to in the templategroups property. |
| selectTemplates | query | Return templates to which the given template is linked in the templates property. |
| selectParentTemplates | query | Supports count. Return templates that are linked to the given template in the parentTemplates property. |
| selectHttpTests | query | Supports count. Return the web scenarios from the template in the httpTests property. |
| selectItems | query | Supports count. Return items from the template in the items property. |
| | | Supports count. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| selectDiscoveries | query | Return low-level discoveries from the template in the <code>discoveries</code> property. |
| selectTriggers | query | Supports count. Return triggers from the template in the <code>triggers</code> property. |
| selectGraphs | query | Supports count. Return graphs from the template in the <code>graphs</code> property. |
| selectMacros | query | Supports count. Return the macros from the template in the <code>macros</code> property. |
| selectDashboards | query | Return dashboards from the template in the <code>dashboards</code> property. |
| selectValueMaps | query | Supports count. Return a <code>valuemaps</code> property with template value maps. |
| limitSelects | integer | Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: <code>selectTemplates</code> - results will be sorted by name; <code>selectHosts</code> - sorted by host; <code>selectParentTemplates</code> - sorted by host; <code>selectItems</code> - sorted by name; <code>selectDiscoveries</code> - sorted by name; <code>selectTriggers</code> - sorted by description; <code>selectGraphs</code> - sorted by name; <code>selectDashboards</code> - sorted by name. Sort the result by the given properties. |
| countOutput | boolean | Possible values: <code>hostid</code> , <code>host</code> , <code>name</code> , <code>status</code> . |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving templates by name

Retrieve all data about two templates named "Linux" and "Windows".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.get",
  "params": {
    "output": "extend",
    "filter": {
      "host": [
```

```

        "Linux",
        "Windows"
    ]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "proxyid": "0",
      "host": "Linux",
      "status": "3",
      "disable_until": "0",
      "error": "",
      "available": "0",
      "errors_from": "0",
      "lastaccess": "0",
      "ipmi_authtype": "0",
      "ipmi_privilege": "2",
      "ipmi_username": "",
      "ipmi_password": "",
      "ipmi_disable_until": "0",

    },
    {
      "proxyid": "0",
      "host": "Windows",
      "status": "3",
      "disable_until": "0",
      "error": "",
      "available": "0",
      "errors_from": "0",
      "lastaccess": "0",

```

```

        "ipmi_authtype": "0",
        "ipmi_privilege": "2",
        "ipmi_username": "",
        "ipmi_password": "",
        "ipmi_disable_until": "0",
        "ipmi_available": "0",
        "snmp_disable_until": "0",
        "snmp_available": "0",
        "maintenanceid": "0",
        "maintenance_status": "0",
        "maintenance_type": "0",
        "maintenance_from": "0",
        "ipmi_errors_from": "0",
        "snmp_errors_from": "0",
        "ipmi_error": "",
        "snmp_error": "",
        "jmx_disable_until": "0",
        "jmx_available": "0",
        "jmx_errors_from": "0",
        "jmx_error": "",
        "name": "Windows",
        "flags": "0",
        "templateid": "10081",
        "description": "",
        "tls_connect": "1",
        "tls_accept": "1",
        "tls_issuer": "",
        "tls_subject": "",
        "tls_psk_identity": "",
        "tls_psk": "",
        "uuid": "522d17e1834049be879287b7c0518e5d"
    },
    "id": 1
}

```

Retrieving template groups

Retrieve template groups that the template "Linux by Zabbix agent" is a member of.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": ["hostid"],
        "selectTemplateGroups": "extend",
        "filter": {
            "host": [
                "Linux by Zabbix agent"
            ]
        }
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "templateid": "10001",
            "templategroups": [

```

```

        {
            "groupid": "10",
            "name": "Templates/Operating systems",
            "uuid": "846977d1dfed4968bc5f8bdb363285bc"
        }
    ],
    "id": 1
}

```

Retrieving hosts by template

Retrieve hosts that have the "10001" (*Linux by Zabbix agent*) template linked to them.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": "templateid",
        "templateids": "10001",
        "selectHosts": ["hostid", "name"]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "templateid": "10001",
            "hosts": [
                {
                    "hostid": "10084",
                    "name": "Zabbix server"
                },
                {
                    "hostid": "10603",
                    "name": "Host 1"
                },
                {
                    "hostid": "10604",
                    "name": "Host 2"
                }
            ]
        }
    ],
    "id": 1
}

```

Searching by template tags

Retrieve templates that have tag "host-name" equal to "{HOST.NAME}".

Request:

```

{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": ["hostid"],
        "selectTags": "extend",
        "evaltype": 0,

```

```

        "tags": [
            {
                "tag": "host-name",
                "value": "{HOST.NAME}",
                "operator": 1
            }
        ],
        "id": 1
    }
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10402",
            "tags": [
                {
                    "tag": "host-name",
                    "value": "{HOST.NAME}"
                }
            ]
        }
    ],
    "id": 1
}

```

CTemplate::get() in `ui/include/classes/api/services/CTemplate.php`.

template.massadd

Description

object `template.massadd(object parameters)`

This method allows to simultaneously add multiple related objects to the given templates.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects to add to the templates.

The method accepts the following parameters.

| Parameter | Type | Description |
|-----------|--------------|--|
| templates | object/array | Templates to be updated. |

The templates must have only the `templateid` property defined.

Parameter behavior:

- *required*

| Parameter | Type | Description |
|----------------|--------------|--|
| groups | object/array | Template groups to add the given templates to. |
| macros | object/array | The template groups must have only the <code>groupid</code> property defined. User macros to be created for the given templates. |
| templates_link | object/array | Templates to link to the given templates. |
| | | The templates must have only the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Link a group to templates

Add template group "2" to two templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massadd",
  "params": {
    "templates": [
      {
        "templateid": "10085"
      },
      {
        "templateid": "10086"
      }
    ],
    "groups": [
      {
        "groupid": "2"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}
```

Link two templates to a template

Link templates "10106" and "10104" to template "10073".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massadd",
  "params": {
    "templates": [
      {
```

```

        "templateid": "10073"
    }
],
"templates_link": [
    {
        "templateid": "10106"
    },
    {
        "templateid": "10104"
    }
]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10073"
        ]
    },
    "id": 1
}

```

CTemplate::massAdd() in `ui/include/classes/api/services/CTemplate.php`.

template.massremove

Description

object `template.massremove(object parameters)`

This method allows to remove related objects from multiple templates.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects that should be removed.

| Parameter | Type | Description |
|-------------------|--------------|--|
| templateids | ID/array | IDs of the templates to be updated. |
| groupids | ID/array | IDs of the template groups from which to remove the given templates. |
| macros | string/array | IDs of the user macros to delete from the given templates. |
| templateids_clear | ID/array | IDs of the templates to unlink and clear from the given templates (upstream). |
| templateids_link | ID/array | IDs of the templates to unlink from the given templates (upstream). |

Parameter behavior:
- *required*

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Removing templates from a group

Remove two templates from group "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massremove",
  "params": {
    "templateids": [
      "10085",
      "10086"
    ],
    "groupids": "2"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}
```

Unlinking templates from a host

Unlink templates "10106" and "10104" from template "10085".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massremove",
  "params": {
    "templateids": "10085",
    "templateids_link": [
      "10106",
      "10104"
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085"
    ]
  },
  "id": 1
}
```

Source

CTemplate::massRemove() in *ui/include/classes/api/services/CTemplate.php*.

template.massupdate

Description

object `template.massupdate(object parameters)`

This method allows to simultaneously replace or remove related objects and update properties on multiple templates.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the templates to update and the objects to replace for the templates.

The method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|--|
| templates | object/array | <p>Templates to be updated.</p> <p>The templates must have only the <code>templateid</code> property defined.</p> <p>Parameter behavior:</p> <p>- <i>required</i></p> |
| groups | object/array | <p>Template groups to replace the current template groups the templates belong to.</p> <p>The template groups must have only the <code>groupid</code> property defined.</p> |
| macros | object/array | <p>User macros to replace all of the current user macros on the given templates.</p> |
| templates_clear | object/array | <p>Templates to unlink and clear from the given templates.</p> |
| templates_link | object/array | <p>The templates must have only the <code>templateid</code> property defined.</p> <p>Templates to replace the currently linked templates.</p> <p>The templates must have only the <code>templateid</code> property defined.</p> |

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Unlinking a template

Unlink and clear template "10091" from the given templates.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.massupdate",
  "params": {
    "templates": [
      {
        "templateid": "10085"
      },
      {
        "templateid": "10086"
      }
    ]
  }
}
```

```

    }
  ],
  "templates_clear": [
    {
      "templateid": "10091"
    }
  ]
},
"id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10085",
      "10086"
    ]
  },
  "id": 1
}

```

Replacing user macros

Replace all user macros with the given user macro on multiple templates.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "template.massupdate",
  "params": {
    "templates": [
      {
        "templateid": "10074"
      },
      {
        "templateid": "10075"
      },
      {
        "templateid": "10076"
      },
      {
        "templateid": "10077"
      }
    ],
    "macros": [
      {
        "macro": "${AGENT.TIMEOUT}",
        "value": "5m",
        "description": "Timeout after which agent is considered unavailable. Works only for agents"
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10074",

```

```

        "10075",
        "10076",
        "10077"
    ],
    },
    "id": 1
}

```

Source

CTemplate::massUpdate() in *ui/include/classes/api/services/CTemplate.php*.

template.update

Description

object template.update(object/array templates)

This method allows to update existing templates.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Template properties to be updated.

The `templateid` property must be defined for each template, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Additionally to the [standard template properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------------|--------------|---|
| groups | object/array | Template groups to replace the current template groups the templates belong to. |
| tags | object/array | The template groups must have only the <code>groupid</code> property defined. Template tags to replace the current template tags. |
| macros | object/array | User macros to replace the current user macros on the given templates. |
| templates | object/array | Templates to replace the currently linked templates. Templates that are not passed are only unlinked. |
| templates_clear | object/array | The templates must have only the <code>templateid</code> property defined. Templates to unlink and clear from the given templates. |
| | | The templates must have only the <code>templateid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Changing the standard template properties

Change the technical name of the template to "Linux by Zabbix agent Custom", the visible name to "My template", and update the template description.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "host": "Linux by Zabbix agent Custom",
    "name": "My template",
    "description": "This is a custom Linux template."
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

Updating template groups

Replace all template groups for the given template with a different one.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "groups": [
      {
        "groupid": "24"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}
```

Updating template tags

Replace all template tags with a different one.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
```

```

    "tags": [
      {
        "tag": "host-name",
        "value": "{HOST.NAME}"
      }
    ],
    "id": 1
  }
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}

```

Updating template macros

Replace all template macros with a different one.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "macros": [
      {
        "macro": "{$MY_MACRO}",
        "value": "new_value"
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "templateids": [
      "10086"
    ]
  },
  "id": 1
}

```

Updating template linked templates

Unlink (without clearing) all templates from the given template and link a different one to it.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "template.update",
  "params": {
    "templateid": "10086",
    "templates": [
      {

```

```

        "templateid": "10087"
    }
    ],
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}

```

Clearing template linked templates

Unlink and clear the given template from a specific linked template.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": {
        "templateid": "10086",
        "templates_clear": [
            {
                "templateid": "10087"
            }
        ]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}

```

Source

CTemplate::update() in *ui/include/classes/api/services/CTemplate.php*.

Template dashboard

This class is designed to work with template dashboards.

Object references:

- [Template dashboard](#)
- [Template dashboard page](#)
 - [Template dashboard widget](#)
 - * [Template dashboard widget field](#)

Available methods:

- `templatedashboard.create` - create new template dashboards
- `templatedashboard.delete` - delete template dashboards
- `templatedashboard.get` - retrieve template dashboards
- `templatedashboard.update` - update template dashboards

Template dashboard object

The following objects are directly related to the `templatedashboard` API.

Template dashboard

The template dashboard object has the following properties.

| Property | Type | Description |
|-----------------------------|---------|---|
| <code>dashboardid</code> | ID | ID of the template dashboard. |
| <code>name</code> | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations Name of the template dashboard. |
| <code>templateid</code> | ID | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations ID of the template the dashboard belongs to. |
| <code>display_period</code> | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>constant</i> - <i>required</i> for create operations Default page display period (in seconds). Possible values: 10, 30, 60, 120, 600, 1800, 3600. |
| <code>auto_start</code> | integer | Default: 30. Auto start slideshow. Possible values: 0 - do not auto start slideshow; 1 - (<i>default</i>) auto start slideshow. |
| <code>uuid</code> | string | Universal unique identifier, used for linking imported template dashboards to already existing ones. Auto-generated, if not given. |

Template dashboard page

The template dashboard page object has the following properties.

| Property | Type | Description |
|-------------------------------|---------|--|
| <code>dashboard_pageid</code> | ID | ID of the dashboard page. |
| <code>name</code> | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> Dashboard page name. |
| <code>display_period</code> | integer | Default: empty string. Dashboard page display period (in seconds). Possible values: 0, 10, 30, 60, 120, 600, 1800, 3600. |
| <code>widgets</code> | array | Default: 0 (will use the default page display period). Array of the template dashboard widget objects. |

Template dashboard widget

The template dashboard widget object has the following properties.

| Property | Type | Description |
|-----------|---------|--|
| widgetid | ID | ID of the dashboard widget. |
| type | string | <p>Property behavior: - <i>read-only</i></p> <p>Type of the dashboard widget.</p> <p>Possible values: actionlog - Action log; clock - Clock; discovery - Discovery status; favgraphs - Favorite graphs; favmaps - Favorite maps; gauge - Gauge; graph - Graph (classic); graphprototype - Graph prototype; honeycomb - Honeycomb; hostavail - Host availability; hostcard - Host card; hostnavigator - Host navigator; itemnavigator - Item navigator; item - Item value; map - Map; navtree - Map Navigation Tree; piechart - Pie chart; plaintext - Plain text; problemhosts - Problem hosts; problems - Problems; problemsbysv - Problems by severity; slareport - SLA report; svggraph - Graph; systeminfo - System information; tophosts - Top hosts; topitems - Top items; toptriggers - Top triggers; trigover - Trigger overview; url - URL; web - Web monitoring.</p> <p>Property behavior: - <i>required</i></p> |
| name | string | Custom widget name. |
| x | integer | A horizontal position from the left side of the dashboard. |
| y | integer | <p>Possible values range from 0 to 71.</p> <p>A vertical position from the top of the dashboard.</p> |
| width | integer | <p>Possible values range from 0 to 63.</p> <p>The widget width.</p> |
| height | integer | <p>Possible values range from 1 to 72.</p> <p>The widget height.</p> |
| view_mode | integer | <p>Possible values range from 1 to 64.</p> <p>The widget view mode.</p> |
| fields | array | <p>Possible values: 0 - (<i>default</i>) default widget view; 1 - with hidden header;</p> <p>Array of the template dashboard widget field objects.</p> |

Template dashboard widget field

The template dashboard widget field object has the following properties.

| Property | Type | Description |
|----------|---------|--|
| type | integer | Type of the widget field. Possible values: 0 - Integer; 1 - String; 4 - Item; 5 - Item prototype; 6 - Graph; 7 - Graph prototype; 8 - Map; 9 - Service; 10 - SLA; 11 - User; 12 - Action; 13 - Media type. |
| name | string | Property behavior: - <i>required</i> Widget field name. Possible values: see Dashboard widget fields . Note that some host-related parameters (e.g., <i>Host groups</i> , <i>Exclude host groups</i> and <i>Hosts</i> in the Problems widget, <i>Host groups</i> in the Host availability widget, etc.) are not available when configuring the widget on a template dashboard. This is because template dashboards display data only from the host that the template is linked to. |
| value | mixed | Property behavior: - <i>required</i> Widget field value depending on the type. Possible values: see Dashboard widget fields . Note that some host-related parameters (e.g., <i>Host groups</i> , <i>Exclude host groups</i> and <i>Hosts</i> in the Problems widget, <i>Host groups</i> in the Host availability widget, etc.) are not available when configuring the widget on a template dashboard. This is because template dashboards display data only from the host that the template is linked to. Property behavior: - <i>required</i> |

templatedashboard.create

Description

object templatedashboard.create(object/array templateDashboards)

This method allows to create new template dashboards.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Template dashboards to create.

Additionally to the **standard template dashboard properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| pages | array | <p>Template dashboard pages to be created for the dashboard. Dashboard pages will be ordered in the same order as specified.</p> <p>Parameter behavior: - <i>required</i></p> |

Return values

(object) Returns an object containing the IDs of the created template dashboards under the dashboardids property. The order of the returned IDs matches the order of the passed template dashboards.

Examples

Creating a template dashboard

Create a template dashboard named “Graphs” with one Graph widget on a single dashboard page.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.create",
  "params": {
    "templateid": "10318",
    "name": "Graphs",
    "pages": [
      {
        "widgets": [
          {
            "type": "graph",
            "x": 0,
            "y": 0,
            "width": 12,
            "height": 5,
            "view_mode": 0,
            "fields": [
              {
                "type": 6,
                "name": "graphid",
                "value": "1123"
              }
            ]
          }
        ]
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "32"
    ]
  },
  "id": 1
}
```

Source

CTemplateDashboard::create() in *ui/include/classes/api/services/CTemplateDashboard.php*.

templatedashboard.delete

Description

object templatedashboard.delete(array templateDashboardIds)

This method allows to delete template dashboards.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the template dashboards to delete.

Return values

(object) Returns an object containing the IDs of the deleted template dashboards under the dashboardids property.

Examples

Deleting multiple template dashboards

Delete two template dashboards.

Request:

```
{

templatedashboard.get

Description

integer/array templatedashboard.get(object parameters)

The method allows to retrieve template dashboards according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|---|
| dashboardids | ID/array | Return only template dashboards with the given IDs. |
| templateids | ID/array | Return only template dashboards that belong to the given templates. |
| selectPages | query | Return a pages property with template dashboard pages, correctly ordered. |
| sortfield | string/array | Sort the result by the given properties. Possible values: <code>dashboardid</code> , <code>name</code> . These parameters are described in the reference commentary . |
| countOutput | boolean | |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples**Retrieving template dashboards**

Retrieve all template dashboards with widgets for a specified template.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.get",
  "params": {
    "output": "extend",
    "selectPages": "extend",
    "templateids": "10001"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "dashboardid": "23",
      "name": "Docker overview",
      "templateid": "10001",

```

```

templatedashboard.update

Description

object templatedashboard.update(object/array templateDashboards)

This method allows to update existing template dashboards.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Template dashboard properties to be updated.

The dashboardid property must be specified for each dashboard, all other properties are optional. Only the specified properties will be updated.

Additionally to the [standard template dashboard properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| pages | array | <p>Template dashboard pages to replace the existing dashboard pages.</p> <p>Dashboard pages are updated by the dashboard_pageid property. New dashboard pages will be created for objects without dashboard_pageid property and the existing dashboard pages will be deleted if not reused. Dashboard pages will be ordered in the same order as specified. Only the specified properties of the dashboard pages will be updated. At least one dashboard page object is required for pages property.</p> |

Return values

(object) Returns an object containing the IDs of the updated template dashboards under the dashboardids property.

Examples

Renaming a template dashboard

Rename a template dashboard to "Performance graphs".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.update",
  "params": {
    "dashboardid": "23",
    "name": "Performance graphs"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "dashboardids": [
      "23"
    ]
  },
  "id": 1
}
```

Updating template dashboard pages

Rename the first dashboard page, replace widgets on the second dashboard page and add a new page as the third one. Delete all other dashboard pages.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templatedashboard.update",
  "params": {
    "dashboardid": "2",
    "pages": [
      {
        "dashboard_pageid": 1,
        "name": "Renamed Page"
      },
      {

```

```

        "dashboard_pageid": 2,
        "widgets": [
            {
                "type": "clock",
                "x": 0,
                "y": 0,
                "width": 12,
                "height": 3
            }
        ],
        {
            "display_period": 60
        }
    ],
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "2"
        ]
    },
    "id": 1
}

```

Template group

This class is designed to work with template groups.

Object references:

- [Template group](#)

Available methods:

- [templategroup.create](#) - create new template groups
- [templategroup.delete](#) - delete template groups
- [templategroup.get](#) - retrieve template groups
- [templategroup.massadd](#) - add related objects to template groups
- [templategroup.massremove](#) - remove related objects from template groups
- [templategroup.massupdate](#) - replace or remove related objects from template groups
- [templategroup.propagate](#) - propagate permissions to template groups' subgroups
- [templategroup.update](#) - update template groups

Template group object

The following objects are directly related to the `templategroup` API.

Template group

The template group object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| groupid | ID | ID of the template group. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Name of the template group.</p> |
| uuid | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations <p>Universal unique identifier, used for linking imported template groups to already existing ones. Auto-generated, if not given.</p> |

templategroup.create

Description

object templategroup.create(object/array templateGroups)

This method allows to create new template groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Template groups to create. The method accepts template groups with the **standard template group properties**.

Return values

(object) Returns an object containing the IDs of the created template groups under the `groupids` property. The order of the returned IDs matches the order of the passed template groups.

Examples

Creating a template group

Create a template group called "Templates/Databases".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templategroup.create",
  "params": {
    "name": "Templates/Databases"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107820"
    ]
  },
  "id": 1
}
```

Source

CTemplateGroup::create() in `ui/include/classes/api/services/CTemplateGroup.php`.

templategroup.delete

Description

object templategroup.delete(array templateGroupIds)

This method allows to delete template groups.

A template group can not be deleted if it contains templates that belong to this group only.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the template groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted template groups under the `groupids` property.

Examples

Deleting multiple template groups

Delete two template groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templategroup.delete",
  "params": [
    "107814",
    "107815"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "107814",
      "107815"
    ]
  },
  "id": 1
}
```

Source

CTemplateGroup::delete() in `ui/include/classes/api/services/CTemplateGroup.php`.

templategroup.get

Description

integer/array templategroup.get(object parameters)

The method allows to retrieve template groups according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------------------|--------------|--|
| graphids | ID/array | Return only template groups that contain templates with the given graphs. |
| groupids | ID/array | Return only template groups with the given template group IDs. |
| templateids | ID/array | Return only template groups that contain the given templates. |
| triggerids | ID/array | Return only template groups that contain templates with the given triggers. |
| with_graphs | flag | Return only template groups that contain templates with graphs. |
| with_graph_prototypes | flag | Return only template groups that contain templates with graph prototypes. |
| with_httptests | flag | Return only template groups that contain templates with web checks. |
| with_items | flag | Return only template groups that contain templates with items. |
| with_item_prototypes | flag | Overrides the <code>with_simple_graph_items</code> parameters. Return only template groups that contain templates with item prototypes. |
| with_simple_graph_item_prototypes | flag | Overrides the <code>with_simple_graph_item_prototypes</code> parameter. Return only template groups that contain templates with item prototypes, which are enabled for creation and have numeric type of information. |
| with_simple_graph_items | flag | Return only template groups that contain templates with numeric items. |
| with_templates | flag | Return only template groups that contain templates. |
| with_triggers | flag | Return only template groups that contain templates with triggers. |
| selectTemplates | query | Return a <code>templates</code> property with the templates that belong to the template group. |
| limitSelects | integer | Supports count. Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: <code>selectTemplates</code> - results will be sorted by <code>template</code> . Sort the result by the given properties. |
| countOutput | boolean | Possible values: <code>groupid</code> , <code>name</code> . These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two template groups named "Templates/Databases" and "Templates/Modules".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templategroup.get",
  "params": {
    "output": "extend",
    "filter": {
      "name": [
        "Templates/Databases",
        "Templates/Modules"
      ]
    }
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "groupid": "13",
      "name": "Templates/Databases",
      "uuid": "748ad4d098d447d492bb935c907f652f"
    },
    {
      "groupid": "8",
      "name": "Templates/Modules",
      "uuid": "57b7ae836ca64446ba2c296389c009b7"
    }
  ],
  "id": 1
}
```

templategroup.massadd

Description

object templategroup.massadd(object parameters)

This method allows to simultaneously add multiple related objects to all the given template groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the template groups to update and the objects to add to all the template groups.

The method accepts the following parameters.

| Parameter | Type | Description |
|-----------|--------------|--|
| groups | object/array | <p>Template groups to be updated.</p> <p>The template groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |
| templates | object/array | <p>Templates to add to all template groups.</p> <p>The templates must have only the <code>templateid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |

Return values

(object) Returns an object containing the IDs of the updated template groups under the `groupids` property.

Examples

Adding templates to template groups

Add two templates to template groups with IDs 12 and 13.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templategroup.massadd",
  "params": {
    "groups": [
      {
        "groupid": "12"
      },
      {
        "groupid": "13"
      }
    ],
    "templates": [
      {
        "templateid": "10486"
      },
      {
        "templateid": "10487"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "12",
      "13"
    ]
  },
  "id": 1
}
```

templategroup.massremove

Description

object templategroup.massremove(object parameters)

This method allows to remove related objects from multiple template groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the template groups to update and the objects that should be removed.

| Parameter | Type | Description |
|-------------|----------|--|
| groupids | ID/array | IDs of the template groups to be updated. Parameter behavior: - <i>required</i> |
| templateids | ID/array | IDs of the templates to remove from all template groups. Parameter behavior: - <i>required</i> |

Return values

(object) Returns an object containing the IDs of the updated template groups under the groupids property.

Examples

Removing templates from template groups

Remove two templates from the given template groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templategroup.massremove",
  "params": {
    "groupids": [
      "5",
      "6"
    ],
    "templateids": [
      "30050",
      "30001"
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "5",
      "6"
    ]
  }
}
```

```

    ],
    },
    "id": 1
}

```

Source

CTemplateGroup::massRemove() in *ui/include/classes/api/services/CTemplateGroup.php*.

templategroup.massupdate

Description

object templategroup.massupdate(object parameters)

This method allows to replace templates with the specified ones in multiple template groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters containing the IDs of the template groups to update and the objects that should be updated.

| Parameter | Type | Description |
|-----------|--------------|--|
| groups | object/array | <p>Template groups to be updated.</p> <p>The template groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |
| templates | object/array | <p>Templates to replace the current template on the given template groups.</p> <p>All other template, except the ones mentioned, will be excluded from template groups.</p> <p>The templates must have only the <code>templateid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |

Return values

(object) Returns an object containing the IDs of the updated template groups under the `groupids` property.

Examples

Replacing templates in a template group

Replace all templates in a template group to ones mentioned templates.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "templategroup.massupdate",
  "params": {
    "groups": [
      {
        "groupid": "8"
      }
    ],
    "templates": [
      {

```

```

        "templateid": "40050"
    }
    ],
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "8",
        ]
    },
    "id": 1
}

```

templegroup.propagate

Description

object templegroup.propagate(object parameters)

This method allows to apply permissions to all template groups' subgroups.

Note:

This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-------------|--------------|--|
| groups | object/array | <p>Template groups to propagate.</p> <p>The template groups must have only the <code>groupid</code> property defined.</p> <p>Parameter behavior: - <i>required</i></p> |
| permissions | boolean | <p>Set true if need to propagate permissions.</p> <p>Parameter behavior: - <i>required</i></p> |

Return values

(object) Returns an object containing the IDs of the propagated template groups under the `groupids` property.

Examples

Propagating template group permissions to its subgroups.

Propagate template group permissions to its subgroups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "templategroup.propagate",
  "params": {
    "groups": [
      {
        "groupid": "15"
      }
    ],
    "permissions": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "groupids": [
      "15",
    ]
  },
  "id": 1
}
```

- [Template](#)

Source

CTemplateGroup::propagate() in `ui/include/classes/api/services/CTemplateGroup.php`.

templategroup.update

Description

object templategroup.update(object/array templateGroups)

This method allows to update existing template groups.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Template group properties** to be updated.

The `groupid` property must be defined for each template group, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated template groups under the `groupids` property.

Examples

Renaming a template group

Rename a template group to "Templates/Databases"

Request:

```
{
  "jsonrpc": "2.0",

CTemplateGroup::update() in *ui/include/classes/api/services/CTemplateGroup.php*.

Token

This class is designed to work with tokens.

Object references:

- [Token](#)

Available methods:

- [token.create](#) - create new tokens
- [token.delete](#) - delete tokens
- [token.get](#) - retrieve tokens
- [token.update](#) - update tokens
- [token.generate](#) - generate tokens

Token object

The following objects are directly related to the `token` API.

Token

The token object has the following properties.

| Property | Type | Description |
|-------------|--------|--|
| tokenid | ID | ID of the token. |
| | | Property behavior: - <i>read-only</i> - <i>required</i> for update operations |
| name | string | Name of the token. |
| | | Property behavior: - <i>required</i> for create operations |
| description | text | Description of the token. |

| Property | Type | Description |
|----------------|-----------|--|
| userid | ID | ID of the user that the token has been assigned to. Default: <i>current user</i> . |
| lastaccess | timestamp | Property behavior: - <i>constant</i> Most recent date and time the token was authenticated. "0" if the token has never been authenticated. |
| status | integer | Property behavior: - <i>read-only</i> Token status. Possible values: 0 - (<i>default</i>) enabled token; 1 - disabled token. |
| expires_at | timestamp | Token expiration date and time. "0" for never-expiring tokens. |
| created_at | timestamp | Token creation date and time. |
| creator_userid | ID | Property behavior: - <i>read-only</i> ID of the user that created the token. Property behavior: - <i>read-only</i> |

token.create

Description

object token.create(object/array tokens)

This method allows to create new tokens.

Note:

The *Manage API tokens* **permission** is required for the user role to manage tokens for other users.

Attention:

A token created by this method also has to be **generated** before it is usable.

Parameters

(object/array) Tokens to create.

The method accepts tokens with the **standard token properties**.

Return values

(object) Returns an object containing the IDs of the created tokens under the **tokenids** property. The order of the returned IDs matches the order of the passed tokens.

Examples

Create a token

Create an enabled token that never expires and authenticates user of ID 2.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.create",
```

```

    "params": {
        "name": "Your token",
        "userid": "2"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "tokenids": [
            "188"
        ]
    },
    "id": 1
}

```

Create a disabled token that expires at January 21st, 2021. This token will authenticate current user.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "token.create",
    "params": {
        "name": "Your token",
        "status": "1",
        "expires_at": "1611238072"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "tokenids": [
            "189"
        ]
    },
    "id": 1
}

```

Source

CToken::create() in *ui/include/classes/api/services/CToken.php*.

token.delete

Description

object token.delete(array tokenids)

This method allows to delete tokens.

Note:

The *Manage API tokens* **permission** is required for the user role to manage tokens for other users.

Parameters

(array) IDs of the tokens to delete.

Return values

(object) Returns an object containing the IDs of the deleted tokens under the `tokenids` property.

Examples

Delete multiple tokens

Delete two tokens.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.delete",
  "params": [
    "188",
    "192"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tokenids": [
      "188",
      "192"
    ]
  },
  "id": 1
}
```

Source

CToken::delete() in *ui/include/classes/api/services/CToken.php*.

token.generate

Description

object token.generate(array tokenids)

This method allows to generate tokens.

Note:

The *Manage API tokens* **permission** is required for the user role to manage tokens for other users.

Attention:

A token can be generated by this method only if it has been **created**.

Parameters

(array) IDs of the tokens to generate.

Return values

(array) Returns an array of objects containing the ID of the generated token under the `tokenid` property and generated authorization string under `token` property.

| Property | Type | Description |
|----------|--------|--|
| tokenid | ID | ID of the token. |
| token | string | The generated authorization string for this token. |

Examples

Generate multiple tokens

Generate two tokens.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.generate",
  "params": [
    "1",
    "2"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "tokenId": "1",
      "token": "bbcfce79a2d95037502f7e9a534906d3466c9a1484beb6ea0f4e7be28e8b8ce2"
    },
    {
      "tokenId": "2",
      "token": "fa1258a83d518eabd87698a96bd7f07e5a6ae8aeb8463cae33d50b91dd21bd6d"
    }
  ],
  "id": 1
}
```

Source

CToken::generate() in *ui/include/classes/api/services/CToken.php*.

token.get

Description

integer/array token.get(object parameters)

The method allows to retrieve tokens according to the given parameters.

Note:

Only *Super admin* user type is allowed to view tokens for other users.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|---------------|--------------|---|
| tokenids | ID/array | Return only tokens with the given IDs. |
| userids | ID/array | Return only tokens created for the given users. |
| token | string | Return only tokens created for the given <i>Auth token</i> . |
| valid_at | timestamp | Return only tokens, which are valid (not expired) at the given date and time. |
| expired_at | timestamp | Return only tokens, which are expired (not valid) at the given date and time. |
| sortfield | string/array | Sort the result by the given properties. Possible values: tokenId, name, lastaccess, status, expires_at, created_at. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve a token

Retrieve all data for the token with ID "2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.get",
  "params": {
    "output": "extend",
    "tokenids": "2"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "tokenid": "1",
      "name": "The Token",
      "description": "",
      "userid": "1",
      "lastaccess": "0",
      "status": "0",
      "expires_at": "1609406220",
      "created_at": "1611239454",
      "creator_userid": "1"
    }
  ],
  "id": 1
}
```

Source

`CToken::get()` in `ui/include/classes/api/services/CToken.php`.

token.update

Description

object `token.update(object/array tokens)`

This method allows to update existing tokens.

Note:

The *Manage API tokens* **permission** is required for the user role to manage tokens for other users.

Parameters

(object/array) Token properties to be updated.

The `tokenid` property must be defined for each token, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts tokens with the **standard token properties**.

Return values

(object) Returns an object containing the IDs of the updated tokens under the `tokenids` property.

Examples**Remove token expiry**

Remove expiry date from token.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "token.update",
  "params": {
    "tokenid": "2",
    "expires_at": "0"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "tokenids": [
      "2"
    ]
  },
  "id": 1
}
```

Trend

This class is designed to work with trend data.

Object references:

- **Float trend**
- **Integer trend**

Available methods:

- **trend.get** - retrieve trends

Trend object

The following objects are directly related to the `trend` API.

Note:

Trend objects differ depending on the item's type of information. They are created by the Zabbix server and cannot be modified via the API.

Float trend

The float trend object has the following properties.

| Property | Type | Description |
|-----------|-----------|---|
| clock | timestamp | Timestamp of an hour for which the value was calculated. For example, timestamp of "04:00:00" means values calculated for period "04:00:00-04:59:59". |
| itemid | ID | ID of the related item. |
| num | integer | Number of values that were available for the hour. |
| value_min | float | Hourly minimum value. |
| value_avg | float | Hourly average value. |
| value_max | float | Hourly maximum value. |

Integer trend

The integer trend object has the following properties.

| Property | Type | Description |
|-----------|-----------|---|
| clock | timestamp | Timestamp of an hour for which the value was calculated. For example, timestamp of "04:00:00" means values calculated for period "04:00:00-04:59:59". |
| itemid | ID | ID of the related item. |
| num | integer | Number of values that were available for the hour. |
| value_min | integer | Hourly minimum value. |
| value_avg | integer | Hourly average value. |
| value_max | integer | Hourly maximum value. |

trend.get

Description

`integer/array trend.get(object parameters)`

The method allows to retrieve trend data according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-------------|-----------|--|
| itemids | ID/array | Return only trends with the given item IDs. |
| time_from | timestamp | Return only values that have been collected after or at the given time. |
| time_till | timestamp | Return only values that have been collected before or at the given time. |
| countOutput | boolean | Count the number of retrieved objects. |
| limit | integer | Limit the amount of retrieved objects. |
| output | query | Set Trend object properties to be returned. |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving item trend data

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trend.get",
  "params": {
    "output": [
      "itemid",
      "clock",
      "num",
      "value_min",
      "value_avg",
      "value_max",
    ],
    "itemids": [
      "23715"
    ],
    "limit": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "itemid": "23715",
      "clock": "1446199200",
      "num": "60",
      "value_min": "0.165",
      "value_avg": "0.2168",
      "value_max": "0.35",
    }
  ],
  "id": 1
}
```

CTrend::get() in `ui/include/classes/api/services/CTrend.php`.

Trigger

This class is designed to work with triggers.

Object references:

- [Trigger](#)
- [Trigger tag](#)

Available methods:

- [trigger.create](#) - create new triggers
- [trigger.delete](#) - delete triggers
- [trigger.get](#) - retrieve triggers
- [trigger.update](#) - update triggers

Trigger object

The following objects are directly related to the `trigger` API.

Trigger

The trigger object has the following properties.

| Property | Type | Description |
|-------------|-----------|--|
| triggerid | ID | ID of the trigger. Property behavior: - <i>read-only</i> |
| description | string | - <i>required</i> for update operations Name of the trigger. Property behavior: - <i>required</i> for create operations |
| expression | string | Reduced trigger expression. Property behavior: - <i>required</i> for create operations |
| event_name | string | Event name generated by the trigger. |
| opdata | string | Operational data. |
| comments | string | Additional description of the trigger. |
| error | string | Error text if there have been any problems when updating the state of the trigger. Property behavior: - <i>read-only</i> |
| flags | integer | Origin of the trigger. Possible values: 0 - (<i>default</i>) a plain trigger; 4 - a discovered trigger. Property behavior: - <i>read-only</i> |
| lastchange | timestamp | Time when the trigger last changed its state. Property behavior: - <i>read-only</i> |
| priority | integer | Severity of the trigger. Possible values: 0 - (<i>default</i>) not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. |
| state | integer | State of the trigger. Possible values: 0 - (<i>default</i>) trigger state is up to date; 1 - current trigger state is unknown. Property behavior: - <i>read-only</i> |
| status | integer | Whether the trigger is enabled or disabled. Possible values: 0 - (<i>default</i>) enabled; 1 - disabled. |

| Property | Type | Description |
|---------------------|---------|---|
| templateid | ID | ID of the parent template trigger. |
| type | integer | <p>Property behavior: - <i>read-only</i></p> <p>Whether the trigger can generate multiple problem events.</p> <p>Possible values: 0 - (<i>default</i>) do not generate multiple events; 1 - generate multiple events.</p> |
| url | string | URL associated with the trigger. |
| url_name | string | Label for the URL associated with the trigger. |
| value | integer | <p>Whether the trigger is in OK or problem state.</p> <p>Possible values: 0 - (<i>default</i>) OK; 1 - problem.</p> <p>Property behavior: - <i>read-only</i></p> |
| recovery_mode | integer | <p>OK event generation mode.</p> <p>Possible values: 0 - (<i>default</i>) Expression; 1 - Recovery expression; 2 - None.</p> |
| recovery_expression | string | Reduced trigger recovery expression. |
| correlation_mode | integer | <p>OK event closes.</p> <p>Possible values: 0 - (<i>default</i>) All problems; 1 - All problems if tag values match.</p> |
| correlation_tag | string | Tag for matching. |
| manual_close | integer | Allow manual close. |
| uuid | string | <p>Possible values: 0 - (<i>default</i>) No; 1 - Yes.</p> <p>Universal unique identifier, used for linking imported triggers to already existing ones. Auto-generated, if not given.</p> <p>Property behavior: - <i>supported</i> if the trigger belongs to a template</p> |

Trigger tag

The trigger tag object has the following properties.

| Property | Type | Description |
|----------|--------|---|
| tag | string | <p>Trigger tag name.</p> <p>Property behavior: - <i>required</i></p> |
| value | string | Trigger tag value. |

trigger.create

Description

```
object trigger.create(object/array triggers)
```

This method allows to create new triggers.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Triggers to create.

Additionally to the [standard trigger properties](#) the method accepts the following parameters.

| Parameter | Type | Description |
|--------------|-------|--|
| dependencies | array | Triggers that the trigger is dependent on. |
| tags | array | The triggers must have only the <code>triggerid</code> property defined. Trigger tags . |

Attention:

The trigger expression has to be given in its expanded form.

Return values

(object) Returns an object containing the IDs of the created triggers under the `triggerids` property. The order of the returned IDs matches the order of the passed triggers.

Examples**Creating a trigger**

Create a trigger with a single trigger dependency.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.create",
  "params": [
    {
      "description": "Processor load is too high on {HOST.NAME}",
      "expression": "last(/Linux server/system.cpu.load[percpu,avg1])>5",
      "dependencies": [
        {
          "triggerid": "17367"
        }
      ]
    },
    {
      "description": "Service status",
      "expression": "length(last(/Linux server/log[/var/log/system,Service .* has stopped]))<>0",
      "dependencies": [
        {
          "triggerid": "17368"
        }
      ],
      "tags": [
        {
          "tag": "service",
          "value": "{{ITEM.VALUE}.regsub(\"Service (.*?) has stopped\", \"\\1\")}"
        },
        {
          "tag": "error",
          "value": ""
        }
      ]
    }
  ]
}
```

```
    ],  
    "id": 1  
}
```

Response:

```
{  
  "jsonrpc": "2.0",  
  "result": {  
    "triggerids": [  
      "17369",  
      "17370"  
    ]  
  },  
  "id": 1  
}
```

Source

CTrigger::create() in *ui/include/classes/api/services/CTrigger.php*.

trigger.delete

Description

object trigger.delete(array triggerIds)

This method allows to delete triggers.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the triggers to delete.

Return values

(object) Returns an object containing the IDs of the deleted triggers under the `triggerids` property.

Examples

Delete multiple triggers

Delete two triggers.

Request:

```
{  
  "jsonrpc": "2.0",  
  "method": "trigger.delete",  
  "params": [  
    "12002",  
    "12003"  
  ],  
  "id": 1  
}
```

Response:

```
{  
  "jsonrpc": "2.0",  
  "result": {  
    "triggerids": [  
      "12002",  
      "12003"  
    ]  
  },  
}
```

```
"id": 1
}
```

Source

CTrigger::delete() in *ui/include/classes/api/services/CTrigger.php*.

trigger.get

Description

integer/array trigger.get(object parameters)

The method allows to retrieve triggers according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------------|--------------|---|
| triggerids | ID/array | Return only triggers with the given IDs. |
| groupids | ID/array | Return only triggers that belong to hosts or templates from the given host groups or template groups. |
| templateids | ID/array | Return only triggers that belong to the given templates. |
| hostids | ID/array | Return only triggers that belong to the given hosts. |
| itemids | ID/array | Return only triggers that contain the given items. |
| functions | string/array | Return only triggers that use the given functions. |
| group | string | Refer to the supported function page for a list of supported functions. Return only triggers that belong to hosts or templates from the host group or template group with the given name. |
| host | string | Return only triggers that belong to host with the given technical name. |
| inherited | boolean | If set to <code>true</code> return only triggers inherited from a template. |
| templated | boolean | If set to <code>true</code> return only triggers that belong to templates. |
| dependent | boolean | If set to <code>true</code> return only triggers that have dependencies. If set to <code>false</code> return only triggers that do not have dependencies. |
| monitored | flag | Return only enabled triggers that belong to monitored hosts and contain only enabled items. |
| active | flag | Return only enabled triggers that belong to monitored hosts. |
| maintenance | boolean | If set to <code>true</code> return only enabled triggers that belong to hosts in maintenance. |
| withUnacknowledgedEvents | flag | Return only triggers that have unacknowledged events. |
| withAcknowledgedEvents | flag | Return only triggers with all events acknowledged. |
| withLastEventUnacknowledged | flag | Return only triggers with the last event unacknowledged. |
| skipDependent | flag | Skip triggers in a problem state that are dependent on other triggers. Note that the other triggers are ignored if disabled, have disabled items or disabled item hosts. |
| lastChangeSince | timestamp | Return only triggers that have changed their state after the given time. |
| lastChangeTill | timestamp | Return only triggers that have changed their state before the given time. |
| only_true | flag | Return only triggers that have recently been in a problem state. |
| min_severity | integer | Return only triggers with severity greater or equal than the given severity. |
| evaltype | integer | Rules for tag searching. |

Possible values:

0 - (default) And/Or;
2 - Or.

| Parameter | Type | Description |
|------------------------|-------|--|
| tags | array | <p>Return only triggers with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value.</p> <p>Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...].</p> <p>An empty array returns all triggers.</p> <p>Possible operator types:</p> <ul style="list-style-type: none"> 0 - (default) Like; 1 - Equal; 2 - Not like; 3 - Not equal; 4 - Exists; 5 - Not exists. |
| expandComment | flag | Expand macros in the trigger description. |
| expandDescription | flag | Expand macros in the name of the trigger. |
| expandExpression | flag | Expand functions and macros in the trigger expression. |
| selectHostGroups | query | Return the host groups that the trigger belongs to in the hostgroups property. |
| selectHosts | query | Return the hosts that the trigger belongs to in the hosts property. |
| selectItems | query | Return items contained by the trigger in the items property. |
| selectFunctions | query | Return functions used in the trigger in the functions property. |
| | | <p>The function objects represent the functions used in the trigger expression and has the following properties:</p> <ul style="list-style-type: none"> functionid - (ID) ID of the function; itemid - (ID) ID of the item used in the function; function - (string) name of the function; parameter - (string) parameter passed to the function. Query parameter is replaced by \$ symbol in returned string. |
| selectDependencies | query | Return triggers that the trigger depends on in the dependencies property. |
| selectDiscoveryRule | query | Return the low-level discovery rule that created the trigger in the discoveryRule property. |
| selectLastEvent | query | Return the last significant trigger event in the lastEvent property. |
| selectTags | query | Return the trigger tags in tags property. |
| selectTemplateGroups | query | Return the template groups that the trigger belongs to in the templategroups property. |
| selectTriggerDiscovery | query | Return the trigger discovery object in the triggerDiscovery property. The trigger discovery objects link the trigger to a trigger prototype from which it was created. |
| | | <p>It has the following properties:</p> <ul style="list-style-type: none"> parent_triggerid - (ID) ID of the trigger prototype from which the trigger has been created; status - (int) trigger discovery status: <ul style="list-style-type: none"> 0 - (default) trigger is discovered, 1 - trigger is not discovered anymore; ts_delete - (timestamp) time when a trigger that is no longer discovered will be deleted; ts_disable - (timestamp) time when a trigger that is no longer discovered will be disabled; disable_source - (int) indicator of whether trigger was disabled by an LLD rule or manually: <ul style="list-style-type: none"> 0 - (default) disabled automatically, 1 - disabled by an LLD rule. |

| Parameter | Type | Description |
|------------------------|--------------|---|
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of text data type . Supports additional properties: host - technical name of the host that the trigger belongs to; hostid - ID of the host that the trigger belongs to. |
| limitSelects | integer | Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: selectHosts - results will be sorted by host. Sort the result by the given properties. Possible values: triggerid, description, status, priority, lastchange, hostname. |
| countOutput | boolean | These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving data by trigger ID

Retrieve all data and the functions used in trigger "14062".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.get",

Retrieving triggers in problem state

Retrieve the ID, name and severity of all triggers in problem state and sort them by severity in descending order.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "trigger.get",
    "params": {
        "output": [
            "triggerid",
            "description",
            "priority"
        ],
        "filter": {
            "value": 1
        },
        "sortfield": "priority",
        "sortorder": "DESC"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "13907",

```

```

        "description": "Zabbix self-monitoring processes < 100% busy",
        "priority": "4"
    },
    {
        "triggerid": "13824",
        "description": "Zabbix discoverer processes more than 75% busy",
        "priority": "3"
    }
],
"id": 1
}

```

Retrieving a specific trigger with tags

Retrieve a specific trigger with tags.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "trigger.get",
    "params": {
        "output": [
            "triggerid",
            "description"
        ],
        "selectTags": "extend",
        "triggerids": [
            "17578"
        ]
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "17370",
            "description": "Service status",
            "tags": [
                {
                    "tag": "service",
                    "value": "{{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")}"
                },
                {
                    "tag": "error",
                    "value": ""
                }
            ]
        }
    ],
    "id": 1
}

```

CTrigger::get() in *ui/include/classes/api/services/CTrigger.php*.

trigger.update

Description

object trigger.update(object/array triggers)

This method allows to update existing triggers.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Trigger properties to be updated.

The triggerid property must be defined for each trigger, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard trigger properties](#) the method accepts the following parameters.

| Parameter | Type | Description |
|--------------|-------|---|
| dependencies | array | Triggers that the trigger is dependent on. |
| tags | array | The triggers must have only the triggerid property defined. Trigger tags . |

Attention:

The trigger expression has to be given in its expanded form.

Return values

(object) Returns an object containing the IDs of the updated triggers under the triggerids property.

Examples

Enabling a trigger

Enable a trigger, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": {
    "triggerid": "13938",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

Replacing triggers tags

Replace tags for trigger.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": {
    "triggerid": "13938",
    "tags": [
      {
        "tag": "service",
        "value": "{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")"
      },
      {
        "tag": "error",
        "value": ""
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

Replacing dependencies

Replace dependencies for trigger.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "trigger.update",
  "params": {
    "triggerid": "22713",
    "dependencies": [
      {
        "triggerid": "22712"
      },
      {
        "triggerid": "22772"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "22713"
    ]
  }
}
```

```

    },
    "id": 1
}

```

CTrigger::update() in *ui/include/classes/api/services/CTrigger.php*.

Trigger prototype

This class is designed to work with trigger prototypes.

Object references:

- [Trigger prototype](#)
- [Trigger prototype tag](#)

Available methods:

- [triggerprototype.create](#) - create new trigger prototypes
- [triggerprototype.delete](#) - delete trigger prototypes
- [triggerprototype.get](#) - retrieve trigger prototypes
- [triggerprototype.update](#) - update trigger prototypes

Trigger prototype object

The following objects are directly related to the triggerprototype API.

Trigger prototype

The trigger prototype object has the following properties.

| Property | Type | Description |
|-------------|---------|--|
| triggerid | ID | ID of the trigger prototype. |
| | | Property behavior: - <i>read-only</i> |
| description | string | - <i>required</i> for update operations Name of the trigger prototype. |
| | | Property behavior: - <i>required</i> for create operations |
| expression | string | Reduced trigger expression. |
| | | Property behavior: - <i>required</i> for create operations |
| event_name | string | Event name generated by the trigger. |
| opdata | string | Operational data. |
| comments | string | Additional comments to the trigger prototype. |
| priority | integer | Severity of the trigger prototype. |
| | | Possible values: 0 - (<i>default</i>) not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. |
| status | integer | Whether the trigger prototype is enabled or disabled. |
| | | Possible values: 0 - (<i>default</i>) enabled; 1 - disabled. |

| Property | Type | Description |
|--|---------|--|
| templateid | ID | ID of the parent template trigger prototype. |
| type | integer | Property behavior: - <i>read-only</i> Whether the trigger prototype can generate multiple problem events. Possible values: 0 - (<i>default</i>) do not generate multiple events; 1 - generate multiple events. |
| url | string | URL associated with the trigger prototype. |
| url_name | string | Label for the URL associated with the trigger prototype. |
| recovery_mode | integer | OK event generation mode. Possible values: 0 - (<i>default</i>) Expression; 1 - Recovery expression; 2 - None. |
| recovery_expression | string | Reduced trigger recovery expression. |
| correlation_mode | integer | OK event closes. Possible values: 0 - (<i>default</i>) All problems; 1 - All problems if tag values match. |
| correlation_tag | string | Tag for matching. |
| manual_close | integer | Allow manual close. Possible values: 0 - (<i>default</i>) No; 1 - Yes. |
| discover | integer | Trigger prototype discovery status. Possible values: 0 - (<i>default</i>) new triggers will be discovered; 1 - new triggers will not be discovered and existing triggers will be marked as lost. |
| uuid | string | Universal unique identifier, used for linking imported trigger prototypes to already existing ones. Auto-generated, if not given. |
| Property behavior: - <i>supported</i> if the trigger prototype belongs to a template | | |

Trigger prototype tag

The trigger prototype tag object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| tag | string | Trigger prototype tag name. |
| value | string | Property behavior: - <i>required</i> Trigger prototype tag value. |

triggerprototype.create

Description

```
object triggerprototype.create(object/array triggerPrototypes)
```

This method allows to create new trigger prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Trigger prototypes to create.

Additionally to the [standard trigger prototype properties](#) the method accepts the following parameters.

| Parameter | Type | Description |
|--------------|-------|--|
| dependencies | array | Triggers and trigger prototypes that the trigger prototype is dependent on. |
| tags | array | The triggers must have only the <code>triggerid</code> property defined. Trigger prototype tags . |

Attention:

The trigger expression has to be given in its expanded form and must contain at least one item prototype.

Return values

(object) Returns an object containing the IDs of the created trigger prototypes under the `triggerids` property. The order of the returned IDs matches the order of the passed trigger prototypes.

Examples**Creating a trigger prototype**

Create a trigger prototype to detect when a file system has less than 20% free disk space.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.create",
  "params": {
    "description": "Free disk space is less than 20% on volume {#FSNAME}",
    "expression": "last(/Zabbix server/vfs.fs.size[{#FSNAME},pfree])<20",
    "tags": [
      {
        "tag": "volume",
        "value": "{#FSNAME}"
      },
      {
        "tag": "type",
        "value": "{#FSTYPE}"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "17372"
    ]
  },
  "id": 1
}
```

Source

CTriggerPrototype::create() in *ui/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.delete

Description

object triggerprototype.delete(array triggerPrototypeIds)

This method allows to delete trigger prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the trigger prototypes to delete.

Return values

(object) Returns an object containing the IDs of the deleted trigger prototypes under the `triggerids` property.

Examples

Deleting multiple trigger prototypes

Delete two trigger prototypes.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.delete",
  "params": [
    "12002",
    "12003"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "12002",
      "12003"
    ]
  },
  "id": 1
}
```

Source

CTriggerPrototype::delete() in *ui/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.get

Description

integer/array triggerprototype.get(object parameters)

The method allows to retrieve trigger prototypes according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------------|--------------|--|
| active | flag | Return only enabled trigger prototypes that belong to monitored hosts. |
| discoveryids | ID/array | Return only trigger prototypes that belong to the given LLD rules. |
| functions | string/array | Return only triggers that use the given functions. |
| group | string | Refer to the Supported functions page for a list of supported functions. Return only trigger prototypes that belong to hosts or templates from the host groups or template groups with the given name. |
| groupids | ID/array | Return only trigger prototypes that belong to hosts or templates from the given host groups or template groups. |
| host | string | Return only trigger prototypes that belong to hosts with the given name. |
| hostids | ID/array | Return only trigger prototypes that belong to the given hosts. |
| inherited | boolean | If set to true return only trigger prototypes inherited from a template. |
| maintenance | boolean | If set to true return only enabled trigger prototypes that belong to hosts in maintenance. |
| min_severity | integer | Return only trigger prototypes with severity greater or equal than the given severity. |
| monitored | flag | Return only enabled trigger prototypes that belong to monitored hosts and contain only enabled items. |
| templated | boolean | If set to true return only trigger prototypes that belong to templates. |
| templateids | ID/array | Return only trigger prototypes that belong to the given templates. |
| triggerids | ID/array | Return only trigger prototypes with the given IDs. |
| expandExpression | flag | Expand functions and macros in the trigger expression. |
| selectDependencies | query | Return trigger prototypes and triggers that the trigger prototype depends on in the dependencies property. |
| selectDiscoveryRule | query | Return the LLD rule that the trigger prototype belongs to in the discoveryRule property. |
| selectFunctions | query | Return functions used in the trigger prototype in the functions property. |
| selectHostGroups | query | The function objects represent the functions used in the trigger expression and has the following properties: functionid - (ID) ID of the function; itemid - (ID) ID of the item used in the function; function - (string) name of the function; parameter - (string) parameter passed to the function. Query parameter is replaced by \$ symbol in returned string. Return the host groups that the trigger prototype belongs to in the hostgroups property. |
| selectHosts | query | Return the hosts that the trigger prototype belongs to in the hosts property. |
| selectItems | query | Return items and item prototypes used the trigger prototype in the items property. |
| selectTags | query | Return the trigger prototype tags in tags property. |
| selectTemplateGroups | query | Return the template groups that the trigger prototype belongs to in the templategroups property. |

| Parameter | Type | Description |
|------------------------|--------------|---|
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of text data type . Supports additional properties: host - technical name of the host that the trigger prototype belongs to; hostid - ID of the host that the trigger prototype belongs to. |
| limitSelects | integer | Limits the number of records returned by subselects. |
| sortfield | string/array | Applies to the following subselects: selectHosts - results will be sorted by host. Sort the result by the given properties. |
| countOutput | boolean | Possible values: triggerid, description, status, priority, discovered. These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieve trigger prototypes from an LLD rule

Retrieve all trigger prototypes and their functions from an LLD rule.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.get",
  "params": {
    "output": "extend",
    "selectFunctions": "extend",
    "discoveryids": "22450"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "triggerid": "13272",
      "expression": "{12598}<20",
      "description": "Free inodes is less than 20% on volume {#FSNAME}",
    }
  ]
}

CTriggerPrototype::get() in `ui/include/classes/api/services/CTriggerPrototype.php`.

triggerprototype.update

Description

`object triggerprototype.update(object/array triggerPrototypes)`

This method allows to update existing trigger prototypes.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Trigger prototype properties to be updated.

The `triggerid` property must be defined for each trigger prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the **standard trigger prototype properties** the method accepts the following parameters.

| Parameter | Type | Description |
|--------------|-------|--|
| dependencies | array | Triggers and trigger prototypes that the trigger prototype is dependent on. |
| tags | array | The triggers must have only the <code>triggerid</code> property defined. Trigger prototype tags. |

Attention:

The trigger expression has to be given in its expanded form and must contain at least one item prototype.

Return values

(object) Returns an object containing the IDs of the updated trigger prototypes under the `triggerids` property.

Examples

Enabling a trigger prototype

Enable a trigger prototype, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.update",
  "params": {
    "triggerid": "13938",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "13938"
    ]
  },
  "id": 1
}
```

Replacing trigger prototype tags

Replace tags for one trigger prototype.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "triggerprototype.update",
  "params": {
    "triggerid": "17373",
    "tags": [
      {
        "tag": "volume",
        "value": "{#FSNAME}"
      },
      {
        "tag": "type",
        "value": "{#FSTYPE}"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "triggerids": [
      "17373"
    ]
  },
  "id": 1
}
```

User

This class is designed to work with users.

Object references:

- [User](#)
- [Media](#)

Available methods:

- [user.checkauthentication](#) - check and prolong user sessions
- [user.create](#) - create new users
- [user.delete](#) - delete users
- [user.get](#) - retrieve users
- [user.login](#) - log in to the API
- [user.logout](#) - log out of the API
- [user.provision](#) - provision LDAP users
- [user.resettotp](#) - reset user TOTP secrets
- [user.unblock](#) - unblock users
- [user.update](#) - update users

User object

The following objects are directly related to the user API.

User

The user object has the following properties.

| Property | Type | Description |
|----------------|-----------|---|
| userid | ID | ID of the user. Property behavior: - <i>read-only</i> |
| username | string | - <i>required</i> for update operations User's name. Property behavior: - <i>required</i> for create operations - <i>read-only</i> for provisioned users if the user is linked to a user directory (userdirectoryid is set to a valid value that is not "0"), and user directory provisioning status is enabled (provision_status of User directory object is set to "1"), and authentication status of all LDAP or SAML provisioning is enabled (ldap_jit_status of Authentication object is set to "Enabled for configured LDAP IdPs" or saml_jit_status of Authentication object is set to "Enabled for configured SAML IdPs") |
| passwd | string | User's password. The value of this parameter can be an empty string if the user is linked to a user directory . Property behavior: - <i>write-only</i> |
| roleid | ID | ID of the role of the user. Note that users without a role can log into Zabbix only using LDAP or SAML authentication, provided their LDAP/SAML information matches the user group mappings configured in Zabbix. |
| attempt_clock | timestamp | Time of the last unsuccessful login attempt. Property behavior: - <i>read-only</i> |
| attempt_failed | integer | Recent failed login attempt count. Property behavior: - <i>read-only</i> |
| attempt_ip | string | IP address from where the last unsuccessful login attempt came from. Property behavior: - <i>read-only</i> |
| autologin | integer | Whether to enable auto-login. Possible values: 0 - (<i>default</i>) auto-login disabled; 1 - auto-login enabled. |
| autologout | string | User session life time. Accepts seconds and time unit with suffix. If set to 0s, the session will never expire. |
| lang | string | Default: 15m. Language code of the user's language, for example, en_US. |
| name | string | Default: default - system default. Name of the user. |

| Property | Type | Description |
|-----------------|-----------|---|
| provisioned | integer | <p>Whether the user has been provisioned.</p> <p>Possible values: 0 - not provisioned; 1 - provisioned.</p> <p>This property is supported since Zabbix 7.2.3.</p> <p>Property behavior: - <i>read-only</i></p> |
| refresh | string | <p>Automatic refresh period. Accepts seconds or time unit with suffix (e.g., 30s, 90s, 1m, 1h).</p> <p>Default: 30s.</p> |
| rows_per_page | integer | <p>Amount of object rows to show per page.</p> <p>Default: 50.</p> |
| surname | string | Surname of the user. |
| theme | string | User's theme. |
| ts_provisioned | timestamp | <p>Possible values: default - (<i>default</i>) system default; blue-theme - Blue; dark-theme - Dark.</p> <p>Time when the latest provisioning operation was made.</p> <p>Property behavior: - <i>read-only</i> - <i>supported</i> for <i>Super admin</i> type users (since Zabbix 7.2.3)</p> |
| url | string | URL of the page to redirect the user to after logging in. |
| userdirectoryid | ID | <p>ID of the user directory that the user is linked to.</p> <p>Used for provisioning (creating or updating), as well as to login a user that is linked to a user directory.</p> <p>For login operations the value of this property will have priority over the userdirectoryid property of user groups that the user belongs to.</p> <p>Default: 0.</p> <p>Property behavior: - <i>read-only</i> - <i>supported</i> for <i>Super admin</i> type users (since Zabbix 7.2.3)</p> |
| timezone | string | <p>User's time zone, for example, Europe/London, UTC.</p> <p>Default: default - system default.</p> <p>For the full list of supported time zones please refer to PHP documentation.</p> |

Media

The media object has the following properties.

| Property | Type | Description |
|-------------|------|--|
| mediatypeid | ID | ID of the media type used by the media. |
| | | <p>Property behavior: - <i>required</i></p> |

| Property | Type | Description |
|-----------------------|--------------|--|
| sendto | string/array | Address, user name or other identifier of the recipient. If type of Media type is set to "Email", values are represented as array. For other types of Media types , value is represented as a string. |
| active | integer | Property behavior: - <i>required</i> Whether the media is enabled. Possible values: 0 - (<i>default</i>) enabled; 1 - disabled. |
| severity | integer | Trigger severities to send notifications about. Possible bitmap values: 1 - Not classified; 2 - Information; 4 - Warning; 8 - Average; 16 - High; 32 - Disaster. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 48 for Average, High, and Disaster). |
| period | string | Default: 63. Time when the notifications can be sent as a time period or user macros separated by a semicolon. |
| provisioned | integer | Default: 1-7,00:00-24:00. Whether the user has been provisioned . Possible values: 0 - not provisioned; 1 - provisioned. |
| userdirectory_mediaid | ID | This property is supported since Zabbix 7.2.3. User directory media mapping ID for provisioned media. Property behavior: - <i>read-only</i> - <i>supported for Super admin</i> type users (since Zabbix 7.2.3) |

user.checkAuthentication

Description

object `user.checkAuthentication`

This method checks and prolongs the user session.

Attention:

Calling the `user.checkAuthentication` method using the parameter `sessionid` prolongs the user session by default.

Parameters

The method accepts the following parameters.

| Parameter | Type | Description |
|-----------|---------|--|
| extend | boolean | Whether to prolong the user session. Default value: "true". Setting the value to "false" allows to check the user session without prolonging it. |
| sessionid | string | Parameter behavior: - <i>supported</i> if sessionid is set User authentication token . |
| secret | string | Parameter behavior: - <i>required</i> if token is not set Random 32 characters string. Is generated on user login. |
| token | string | User API token . Parameter behavior: - <i>required</i> if sessionid is not set |

Return values

(object) Returns an object containing information about the user.

Additionally to the **standard user properties**, the following information is returned.

| Property | Type | Description |
|---------------|---------|---|
| auth_type | integer | Default authentication for the user. |
| debug_mode | integer | Refer to the authentication_type property of the Authentication object for a list of possible values. Whether debug mode is enabled or disabled for the user. |
| deprovisioned | boolean | Refer to the debug_mode property of the User group object for a list of possible values. Whether the user belongs to a deprovisioned users group . |
| gui_access | string | User's authentication method to the frontend. |
| secret | string | Refer to the gui_access property of the User group object for a list of possible values. Random 32 characters string. Is generated on user login. |
| sessionid | string | Property secret is not returned if the user session is checked using an API token. Authentication token, which must be used in the following API requests. |
| type | integer | Property sessionid is not returned if the user session is checked using an API token. User type. |
| userip | string | Refer to the type property of the Role object for a list of possible values. IP address of the user. |

Examples

Check authentication using authentication token

Check and prolong a user session using the user authentication token, and return additional information about the user.

Request:

```
{
  "jsonrpc": "2.0",
```

```

    "method": "user.checkAuthentication",
    "params": {
        "sessionId": "673b8ba11562a35da902c66cf5c23fa2"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "userid": "1",
        "username": "Admin",
        "name": "Zabbix",
        "surname": "Administrator",
        "url": "",
        "autologin": "1",
        "autologout": "0",
        "lang": "ru_RU",
        "refresh": "0",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "127.0.0.1",
        "attempt_clock": "1355919038",
        "rows_per_page": "50",
        "timezone": "Europe/Riga",
        "roleid": "3",
        "userdirectoryid": "0",
        "ts_provisioned": "0",
        "type": 3,
        "userip": "127.0.0.1",
        "debug_mode": 0,
        "gui_access": "0",
        "deprovisioned": false,
        "auth_type": 0,
        "sessionId": "673b8ba11562a35da902c66cf5c23fa2",
        "secret": "0e329b933e46984e49a5c1051ecd0751"
    },
    "id": 1
}

```

Check authentication using API token

Check a user session using the user API token, and return additional information about the user.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "user.checkAuthentication",
    "params": {
        "token": "00aff470e07c12d707e50d98cfe39edef9e6ec349c14728dbdfbc8ddc5ea3eae"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "userid": "1",
        "username": "Admin",
        "name": "Zabbix",
        "surname": "Administrator",

```

```

        "url": "",
        "autologin": "1",
        "autologout": "0",
        "lang": "ru_RU",
        "refresh": "0",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "127.0.0.1",
        "attempt_clock": "1355919338",
        "rows_per_page": "50",
        "timezone": "Europe/Riga",
        "roleid": "3",
        "userdirectoryid": "0",
        "ts_provisioned": "0",
        "type": 3,
        "userip": "127.0.0.1",
        "debug_mode": 0,
        "gui_access": "1",
        "deprovisioned": false,
        "auth_type": 0
    },
    "id": 1
}

```

Source

CUser::checkAuthentication() in *ui/include/classes/api/services/CUser.php*.

user.create

Description

object user.create(object/array users)

This method allows to create new users.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Note:

The strength of user password is validated according the password policy rules defined by Authentication API. See [Authentication API](#) for more information.

Parameters

(object/array) Users to create.

Additionally to the [standard user properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| usrgrps | array | User groups to add the user to. The user groups must have only the <code>usrgrp_id</code> property defined. |
| medias | array | User media to be created. |

Return values

(object) Returns an object containing the IDs of the created users under the `user_ids` property. The order of the returned IDs matches the order of the passed users.

Examples

Creating a user

Create a new user, add him to a user group and create a new media for him.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.create",
  "params": {
    "username": "John",
    "passwd": "Doe123",
    "roleid": "5",
    "usrgrps": [
      {
        "usrgrp": "7"
      }
    ],
    "medias": [
      {
        "mediatypeid": "1",
        "sendto": [
          "support@company.com"
        ],
        "active": 0,
        "severity": 63,
        "period": "1-7,00:00-24:00"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "12"
    ]
  },
  "id": 1
}
```

Source

CUser::create() in `ui/include/classes/api/services/CUser.php`.

user.delete

Description

object user.delete(array users)

This method allows to delete users.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of users to delete.

Return values

(object) Returns an object containing the IDs of the deleted users under the `userids` property.

Examples

Deleting multiple users

Delete two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.delete",
  "params": [
    "1",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "5"
    ]
  },
  "id": 1
}
```

`CUser::delete()` in `ui/include/classes/api/services/CUser.php`.

user.get

Description

`integer/array user.get(object parameters)`

The method allows to retrieve users according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Note:

Since Zabbix 7.2.3, when requesting user media, permissions, or role information, *Admin* and *User* type users may retrieve data only about their own user. For an example, see [Retrieving users as Admin](#).

| Parameter | Type | Description |
|--------------|----------|---|
| mediaids | ID/array | Return only users that use the given media. |
| mediatypeids | ID/array | Return only users that use the given media types. |
| userids | ID/array | Return only users with the given IDs. |
| usrgrpids | ID/array | Return only users that belong to the given user groups. |

| Parameter | Type | Description |
|------------------------|--------------|--|
| getAccess | flag | <p>Adds additional information about user permissions.</p> <p>Adds the following properties for each user:</p> <p><code>gui_access</code> - (integer) user's frontend authentication method. Refer to the <code>gui_access</code> property of the user group object for a list of possible values.</p> <p><code>debug_mode</code> - (integer) indicates whether debug is enabled for the user. Possible values: 0 - debug disabled, 1 - debug enabled.</p> <p><code>users_status</code> - (integer) indicates whether the user is disabled. Possible values: 0 - user enabled, 1 - user disabled.</p> |
| selectMedias | query | Return media used by the user in the medias property. |
| selectMediatypes | query | Return media types used by the user in the mediatypes property. |
| selectUsrgrps | query | <p>See mediatype.get for restrictions based on user type.</p> <p>Return user groups that the user belongs to in the usrgrps property.</p> |
| selectRole | query | See usergroup.get for restrictions based on user type. |
| filter | object | Return user role in the role property. |
| | | Return only those results that exactly match the given filter. |
| | | Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. |
| | | Does not support properties of text data type . |
| output | query | <p>Possible User object properties for <i>Admin</i> and <i>User</i> type users when requesting data on users in their user group (since Zabbix 7.2.3): <code>userid</code>, <code>name</code>, <code>surname</code>, <code>username</code>.</p> <p>User object properties to be returned.</p> <p>Since Zabbix 7.2.3, <i>Admin</i> and <i>User</i> type users may retrieve only the following properties:</p> <ul style="list-style-type: none"> - For their own user: <code>userid</code>, <code>attempt_clock</code>, <code>attempt_failed</code>, <code>attempt_ip</code>, <code>autologin</code>, <code>autologout</code>, <code>lang</code>, <code>name</code>, <code>provisioned</code>, <code>refresh</code>, <code>roleid</code>, <code>rows_per_page</code>, <code>surname</code>, <code>theme</code>, <code>timezone</code>, <code>url</code>, <code>username</code>. - For users in their user group: <code>userid</code>, <code>name</code>, <code>surname</code>, <code>username</code>. |
| search | object | <p>Default: <code>extend</code>.</p> <p>Return results that match the given pattern (case-insensitive).</p> <p>Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE <code>"%...%"</code> search.</p> <p>Supports only properties of <code>string</code> and text data type.</p> <p>Possible User object properties for <i>Admin</i> and <i>User</i> type users when requesting data on users in their user group (since Zabbix 7.2.3): <code>name</code>, <code>surname</code>, <code>username</code>.</p> |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | boolean | Possible values: <code>userid</code> , <code>username</code> . |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| limit | integer | |
| preservekeys | boolean | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |

| Parameter | Type | Description |
|-------------|---------|-------------|
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving users

Retrieve all of the configured users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "1",
      "username": "Admin",
      "name": "Zabbix",

        "userdirectoryid": "0",
        "ts_provisioned": "0"
    }
],
    "id": 1
}

```

Retrieving users as *Admin*

As an *Admin* type user, retrieve detailed data about your own user and limited data for users in your user group.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "user.get",
    "params": {
        "output": "extend",
        "getAccess": true,
        "selectMedias": "extend",
        "selectMediatypes": "extend",
        "selectUsrgrps": "extend",
        "selectRole": "extend"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": [
        {
            "userid": "1",
            "username": "Admin",
            "name": "Zabbix",
            "surname": "Administrator",
            "usrgrps": [
                {
                    "usrgrpid": "7",
                    "name": "Zabbix administrators",
                    "gui_access": "0",

```

```

        "users_status": "0",
        "debug_mode": "0",
        "mfa_status": "0"
    }
]
},
{
    "userid": "3",

}
],
"id": 1
}

```

Retrieving user data

Retrieve data of a user with ID "12".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "user.get",
  "params": {
    "output": ["userid", "username"],
    "selectRole": "extend",
    "userids": "12"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "12",
      "username": "John",
      "role": {
        "roleid": "5",
        "name": "Operator",
        "type": "1",
        "readonly": "0"
      }
    }
  ],

user.login

Description

string/object user.login(object parameters)

This method allows to log in to the API and generate an authentication token.

Warning:

When using this method, you also need to do **user.logout** to prevent the generation of a large number of open session records.

Attention:

This method is only available to unauthenticated users who do not belong to any **user group** with enabled multi-factor authentication.

Parameters

(object) Parameters containing the user name and password.

The method accepts the following parameters.

| Parameter | Type | Description |
|-----------|--------|---|
| password | string | User password. Parameter behavior: - <i>required</i> |
| username | string | User name. Parameter behavior: - <i>required</i> |
| userData | flag | Return information about the authenticated user. |

Return values

(string/object) If the **userData** parameter is used, returns an object containing information about the authenticated user.

Additionally to the **standard user properties**, the following information is returned:

| Property | Type | Description |
|---------------|---------|---|
| auth_type | integer | Default authentication for the user. |
| debug_mode | integer | Refer to the authentication_type property of the Authentication object for a list of possible values. Whether debug mode is enabled or disabled for the user. |
| deprovisioned | boolean | Refer to the debug_mode property of the User group object for a list of possible values. Whether the user belongs to a deprovisioned users group . |
| gui_access | string | User's authentication method to the frontend. Refer to the gui_access property of the User group object for a list of possible values. |
| mfaid | integer | ID of the MFA method to use for the user during login. |
| secret | string | Returns "0" if MFA is disabled globally or for all user groups that the user belongs to. |
| sessionid | string | Random 32 characters string. Is generated on user login. |
| type | integer | Authentication token, which must be used in the following API requests. User type. Refer to the type property of the Role object for a list of possible values. |
| userip | string | IP address of the user. |

Note:

If a user has been successfully authenticated after one or more failed attempts, the method will return the current values for the **attempt_clock**, **attempt_failed** and **attempt_ip** properties and then reset them.

If the **userData** parameter is not used, the method returns an authentication token that is required for **authentication**.

Examples

Authenticating a user

Authenticate a user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "username": "Admin",
    "password": "zabbix"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": "0424bd59b807674191e7d77572075f33",
  "id": 1
}
```

Requesting authenticated user's information

Authenticate and return additional information about the user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.login",
  "params": {
    "username": "Admin",
    "password": "zabbix",
    "userData": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userid": "1",
    "username": "Admin",
    "name": "Zabbix",
    "surname": "Administrator",
    "url": "",
    "autologin": "1",
    "autologout": "0",
    "lang": "ru_RU",
    "refresh": "0",
    "theme": "default",
    "attempt_failed": "0",
    "attempt_ip": "127.0.0.1",
    "attempt_clock": "1355919038",
    "rows_per_page": "50",
    "timezone": "Europe/Riga",
    "roleid": "3",
    "userdirectoryid": "0",
    "type": 3,
    "userip": "127.0.0.1",
    "debug_mode": 0,
    "gui_access": "0",
    "mfaid": "1",
    "deprovisioned": false,
    "auth_type": 0,
    "sessionid": "5b56eee8be445e98f0bd42b435736e42",
  }
}
```

```
    "secret": "cd0ba923319741c6586f3d866423a8f4"
  },
  "id": 1
}
```

- [user.logout](#)

Source

CUser::login() in *ui/include/classes/api/services/CUser.php*.

user.logout

Description

string/object `user.logout(array)`

This method allows to log out of the API and invalidates the current authentication token.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) The method accepts an empty array.

Return values

(boolean) Returns true if the user has been logged out successfully.

Examples

Logging out

Log out from the API.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.logout",
  "params": [],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

user.provision

Description

object `user.provision(object/array users)`

This method allows to provision LDAP users.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of users to provision.

Return values

(object) Returns an object containing the IDs of the provisioned users under the `userids` property.

Examples**Provisioning multiple users**

Provision two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.provision",
  "params": [
    "1",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "5"
    ]
  },
  "id": 1
}
```

Source

`CUser::provision()` in `ui/include/classes/api/services/CUser.php`.

user.resetotp**Description**

`object user.resetotp(object/array users)`

This method allows to reset user TOTP secrets.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of users for which to reset TOTP secrets.

Note:

User sessions for the specified users will also be deleted (except for the user sending the request).

Return values

(object) Returns an object containing the IDs of the users for which TOTP secrets have been reset, under the `userids` property.

Examples

Resetting TOTP secrets for multiple users

Reset TOTP secrets for two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.resettotp",
  "params": [
    "1",
    "5"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1",
      "5"
    ]
  },
  "id": 1
}
```

- [MFA object](#)

Source

CUser::resettotp() in `ui/include/classes/api/services/CUser.php`.

user.unblock

Description

object user.unblock(array userids)

This method allows to unblock users.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of users to unblock.

Return values

(object) Returns an object containing the IDs of the unblocked users under the `userids` property.

Examples

Unblocking multiple users

Unblock two users.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.unblock",
  "params": [
    "1",
```

```

        "5"
    ],
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "1",
            "5"
        ]
    },
    "id": 1
}

```

Source

CUser::unlock() in *ui/include/classes/api/services/CUser.php*.

user.update

Description

object user.update(object/array users)

This method allows to update existing users.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Note:

The strength of user password is validated according the password policy rules defined by Authentication API. See [Authentication API](#) for more information.

Parameters

(object/array) User properties to be updated.

The `userid` property must be defined for each user, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|----------------|--------|---|
| current_passwd | string | <p>User's current password.</p> <p>The value of this parameter can be an empty string if the user is linked to a user directory.</p> <p>Parameter behavior:</p> <ul style="list-style-type: none"> - <i>write-only</i> - <i>required</i> if <code>passwd</code> of User object is set and user changes own user password <p>User groups to replace existing user groups.</p> |
| usrgrps | array | <p>User groups to replace existing user groups.</p> |
| medias | array | <p>The user groups must have only the <code>usrgrp_id</code> property defined.</p> <p>User media to replace existing, non-provisioned media. Provisioned media can be omitted when updating media.</p> |

Return values

(object) Returns an object containing the IDs of the updated users under the `userids` property.

Examples

Renaming a user

Rename a user to John Doe.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.update",
  "params": {
    "userid": "1",
    "name": "John",
    "surname": "Doe"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "1"
    ]
  },
  "id": 1
}
```

Changing user role

Change a role of a user.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "user.update",
  "params": {
    "userid": "12",
    "roleid": "6"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userids": [
      "12"
    ]
  },
  "id": 1
}
```

`CUser::update()` in `ui/include/classes/api/services/CUser.php`.

User directory

This class is designed to work with user directories.

Object references:

- **User directory**
 - Media type mappings
 - Provisioning groups mappings

Available methods:

- **userdirectory.create** - create new user directory
- **userdirectory.delete** - delete user directory
- **userdirectory.get** - retrieve user directory
- **userdirectory.update** - update user directory
- **userdirectory.test** - test user directory connection

User directory object

The following objects are directly related to the userdirectory API.

User directory

The user directory object has the following properties.

| Property | Type | Description |
|-----------------|---------|---|
| userdirectoryid | ID | ID of the user directory. If a user directory is deleted, the value of the User object property userdirectoryid is set to "0" for all users that are linked to the deleted user directory. Property behavior: - <i>read-only</i> |
| idp_type | integer | - <i>required</i> for update operations Type of the authentication protocol used by the identity provider for the user directory. Note that only one user directory of type SAML can exist. Possible values: 1 - User directory of type LDAP; 2 - User directory of type SAML. Property behavior: - <i>required</i> for create operations |
| group_name | string | LDAP/SAML user directory attribute that contains the group name used to map groups between the LDAP/SAML user directory and Zabbix. Example: <i>cn</i> Property behavior: - <i>required</i> if provision_status is set to "Enabled" and saml_jit_status of Authentication object is set to "Enabled for configured SAML IdPs" |
| user_username | string | LDAP/SAML user directory attribute (also SCIM attribute if scim_status is set to "SCIM provisioning is enabled") that contains the user's name which is used as the value for the User object property name when the user is provisioned. |
| user_lastname | string | Examples: <i>cn, commonName, displayName, name</i> LDAP/SAML user directory attribute (also SCIM attribute if scim_status is set to "SCIM provisioning is enabled") that contains the user's last name which is used as the value for the User object property surname when the user is provisioned. Examples: <i>sn, surname, lastName</i> |

| Property | Type | Description |
|----------------------------------|---------|---|
| provision_status | integer | Provisioning status of the user directory. Possible values: 0 - <i>(default)</i> Disabled (provisioning of users created by this user directory is disabled); 1 - Enabled (provisioning of users created by this user directory is enabled; additionally, the status of LDAP or SAML provisioning (ldap_jit_status or saml_jit_status of Authentication object) must be enabled). |
| provision_groups | array | Array of provisioning groups mappings objects for mapping LDAP/SAML user group pattern to Zabbix user group and user role. Property behavior: - <i>required</i> if provision_status is set to "Enabled" |
| provision_media | array | Array of media type mappings objects for mapping user's LDAP/SAML media attributes (e.g., email) to Zabbix user media for sending notifications. |
| LDAP-specific properties: | | |
| name | string | Unique name of the user directory. Property behavior: - <i>required</i> if idp_type is set to "User directory of type LDAP" |
| host | string | Host name, IP or URI of the LDAP server. URI must contain schema (ldap:// or ldaps://), host, and port (optional). Examples: <i>host.example.com</i> <i>127.0.0.1</i> <i>ldap://ldap.example.com:389</i> |
| port | integer | Property behavior: - <i>required</i> if idp_type is set to "User directory of type LDAP" Port of the LDAP server. |
| base_dn | string | Property behavior: - <i>required</i> if idp_type is set to "User directory of type LDAP" LDAP user directory base path to user accounts. Examples: <i>ou=Users,dc=example,dc=org</i> <i>ou=Users,ou=system</i> (for OpenLDAP) <i>DC=company,DC=com</i> (for Microsoft Active Directory) <i>uid=%{user},dc=example,dc=com</i> (for direct user binding; placeholder "%{user}" is mandatory) |
| search_attribute | string | Property behavior: - <i>required</i> if idp_type is set to "User directory of type LDAP" LDAP user directory attribute by which to identify the user account from the information provided in the login request. Examples: <i>uid</i> (for OpenLDAP) <i>sAMAccountName</i> (for Microsoft Active Directory) Property behavior: - <i>required</i> if idp_type is set to "User directory of type LDAP" |

| Property | Type | Description |
|---------------|--------|--|
| bind_dn | string | <p>LDAP server account for binding and searching over the LDAP server.</p> <p>For direct user binding and anonymous binding, <code>bind_dn</code> must be empty.</p> <p>Examples: <i>uid=ldap_search,ou=system</i> (for OpenLDAP) <i>CN=ldap_search,OU=user_group,DC=company,DC=com</i> (for Microsoft Active Directory) <i>CN=Admin,OU=Users,OU=Zabbix,DC=zbx,DC=local</i></p> <p>Property behavior: - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP"</p> |
| bind_password | string | <p>LDAP password of the account for binding and searching over the LDAP server.</p> <p>For direct user binding and anonymous binding, <code>bind_password</code> must be empty.</p> <p>Property behavior: - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP"</p> |
| description | string | <p>Description of the user directory.</p> <p>Property behavior: - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP"</p> |
| group_basedn | string | <p>LDAP user directory base path to groups; used to configure a user membership check in the LDAP user directory.</p> <p>Ignored when provisioning a user if <code>group_membership</code> is set.</p> <p>Example: <i>ou=Groups,dc=example,dc=com</i></p> <p>Property behavior: - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP"</p> |

| Property | Type | Description |
|------------------|--------|---|
| group_filter | string | <p>Filter string for retrieving LDAP user directory groups that the user is a member of; used to configure a user membership check in the LDAP user directory.</p> <p>Ignored when provisioning a user if <code>group_membership</code> is set.</p> <p>Supported <code>group_filter</code> placeholders:</p> <ul style="list-style-type: none"> <code>%{attr}</code> - search attribute (replaced by the <code>search_attribute</code> property value); <code>%{groupattr}</code> - group attribute (replaced by the <code>group_member</code> property value); <code>%{host}</code> - host name, IP or URI of the LDAP server (replaced by the <code>host</code> property value); <code>%{user}</code> - Zabbix user username. <p>Default: <code>(%{groupattr}=%{user})</code></p> <p>Examples:</p> <ul style="list-style-type: none"> - <code>(member=uid=%{ref},ou=Users,dc=example,dc=com)</code> will match "User1" if an LDAP group object contains the "member" attribute with the value "uid=User1,ou=Users,dc=example,dc=com", and will return the group that "User1" is a member of; - <code>(%{groupattr}=cn=%{ref},ou=Users,ou=Zabbix,DC=example,DC=com)</code> will match "User1" if an LDAP group object contains the attribute specified in the <code>group_member</code> property with the value "cn=User1,ou=Users,ou=Zabbix,DC=example,DC=com", and will return the group that "User1" is a member of. <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP" |
| group_member | string | <p>LDAP user directory attribute that contains information about the group members; used to configure a user membership check in the LDAP user directory.</p> <p>Ignored when provisioning a user if <code>group_membership</code> is set.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP" |
| group_membership | string | <p>LDAP user directory attribute that contains information about the groups that a user belongs to.</p> <p>Example: <code>memberOf</code></p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP" |
| search_filter | string | <p>Custom filter string used to locate and authenticate a user in an LDAP user directory based on the information provided in the login request.</p> <p>Supported <code>search_filter</code> placeholders:</p> <ul style="list-style-type: none"> <code>%{attr}</code> - search attribute name (e.g., <code>uid</code>, <code>sAMAccountName</code>); <code>%{user}</code> - Zabbix user username. <p>Default: <code>(%{attr}=%{user})</code></p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if <code>idp_type</code> is set to "User directory of type LDAP" |

| Property | Type | Description |
|----------------------------------|---------|--|
| start_tls | integer | <p>LDAP server configuration option that allows the communication with the LDAP server to be secured using Transport Layer Security (TLS).</p> <p>Note that start_tls must be set to "Disabled" for hosts using the ldaps:// protocol.</p> <p>Possible values: 0 - (default) Disabled; 1 - Enabled.</p> <p>Property behavior: - supported if idp_type is set to "User directory of type LDAP"</p> |
| user_ref_attr | string | <p>LDAP user directory attribute used to reference a user object. The value of user_ref_attr is used to get values from the specified attribute in the user directory and place them instead of the %{ref} placeholder in the group_filter string.</p> <p>Examples: <i>cn, uid, member, uniqueMember</i></p> <p>Property behavior: - supported if idp_type is set to "User directory of type LDAP"</p> |
| SAML-specific properties: | | |
| idp_entityid | string | <p>URI that identifies the identity provider and is used to communicate with the identity provider in SAML messages.</p> <p>Example: <i>https://idp.example.com/idp</i></p> <p>Property behavior: - required if idp_type is set to "User directory of type SAML"</p> |
| sp_entityid | string | <p>URL or any string that identifies the identity provider's service provider.</p> <p>Examples: <i>https://idp.example.com/sp</i> <i>zabbix</i></p> <p>Property behavior: - required if idp_type is set to "User directory of type SAML"</p> |
| username_attribute | string | <p>SAML user directory attribute (also SCIM attribute if scim_status is set to "SCIM provisioning is enabled") that contains the user's username which is compared with the value of the User object property username when authenticating.</p> <p>Examples: <i>uid, userprincipalname, samaccountname, username, userusername, urn:oid:0.9.2342.19200300.100.1.1, urn:oid:1.3.6.1.4.1.5923.1.1.1.13, urn:oid:0.9.2342.19200300.100.1.44</i></p> <p>Property behavior: - required if idp_type is set to "User directory of type SAML"</p> |
| sso_url | string | <p>URL of the identity provider's SAML single sign-on service, to which Zabbix will send the SAML authentication requests.</p> <p>Example: <i>http://idp.example.com/idp/sso/saml</i></p> <p>Property behavior: - required if idp_type is set to "User directory of type SAML"</p> |

| Property | Type | Description |
|---------------------|---------|---|
| slo_url | string | <p>URL of the identity provider's SAML single log-out service, to which Zabbix will send the SAML logout requests.</p> <p>Example: <i>https://idp.example.com/idp/slo/saml</i></p> <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Whether the SAML name ID should be encrypted.</p> <p>Possible values: 0 - (<i>default</i>) Do not encrypt name ID; 1 - Encrypt name ID.</p> |
| encrypt_nameid | integer | <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Whether the SAML name ID should be encrypted.</p> <p>Possible values: 0 - (<i>default</i>) Do not encrypt name ID; 1 - Encrypt name ID.</p> |
| encrypt_assertions | integer | <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Whether the SAML assertions should be encrypted.</p> <p>Possible values: 0 - (<i>default</i>) Do not encrypt assertions; 1 - Encrypt assertions.</p> |
| nameid_format | string | <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Name ID format of the SAML identity provider's service provider.</p> <p>Examples: <i>urn:oasis:names:tc:SAML:2.0:nameid-format:persistent</i> <i>urn:oasis:names:tc:SAML:2.0:nameid-format:transient</i> <i>urn:oasis:names:tc:SAML:2.0:nameid-format:kerberos</i> <i>urn:oasis:names:tc:SAML:2.0:nameid-format:entity</i></p> |
| scim_status | integer | <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Whether SCIM provisioning for SAML is enabled or disabled.</p> <p>Possible values: 0 - (<i>default</i>) SCIM provisioning is disabled; 1 - SCIM provisioning is enabled.</p> |
| sign_assertions | integer | <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Whether the SAML assertions should be signed with a SAML signature.</p> <p>Possible values: 0 - (<i>default</i>) Do not sign assertions; 1 - Sign assertions.</p> |
| sign_authn_requests | integer | <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML" Whether the SAML AuthN requests should be signed with a SAML signature.</p> <p>Possible values: 0 - (<i>default</i>) Do not sign AuthN requests; 1 - Sign AuthN requests.</p> <p>Property behavior: - <i>supported</i> if <i>idp_type</i> is set to "User directory of type SAML"</p> |

| Property | Type | Description |
|-----------------------|---------|--|
| sign_messages | integer | Whether the SAML messages should be signed with a SAML signature. Possible values: 0 - <i>(default)</i> Do not sign messages; 1 - Sign messages. Property behavior: - <i>supported</i> if idp_type is set to "User directory of type SAML" |
| sign_logout_requests | integer | Whether the SAML logout requests should be signed with a SAML signature. Possible values: 0 - <i>(default)</i> Do not sign logout requests; 1 - Sign logout requests. Property behavior: - <i>supported</i> if idp_type is set to "User directory of type SAML" |
| sign_logout_responses | integer | Whether the SAML logout responses should be signed with a SAML signature. Possible values: 0 - <i>(default)</i> Do not sign logout responses; 1 - Sign logout responses. Property behavior: - <i>supported</i> if idp_type is set to "User directory of type SAML" |

Media type mappings

The media type mappings object has the following properties.

| Property | Type | Description |
|------------------|---------|--|
| userdirectory_id | mediaid | Media type mapping ID. Property behavior: - <i>read-only</i> |
| name | string | Visible name in the list of media type mappings. Property behavior: - <i>required</i> |
| mediatypeid | ID | ID of the media type to be created; used as the value for the Media object property mediatypeid. Property behavior: - <i>required</i> |
| attribute | string | LDAP/SAML user directory attribute (also SCIM attribute if scim_status is set to "SCIM provisioning is enabled") that contains the user's media (e.g., user@example.com) which is used as the value for the Media object property sendto. If present in data received from the LDAP/SAML identity provider, and the value is not empty, this will trigger media creation for the provisioned user. Property behavior: - <i>required</i> |
| active | integer | User media active property value when media is created for the provisioned user. Possible values: 0 - <i>(default)</i> enabled; 1 - disabled. |

| Property | Type | Description |
|----------|---------|---|
| severity | integer | User media severity property value when media is created for the provisioned user. |
| period | string | Default: 63. User media period property value when media is created for the provisioned user. Default: 1-7,00:00-24:00. |

Provisioning groups mappings

The provisioning groups mappings has the following properties.

| Property | Type | Description |
|-------------|--------|--|
| name | string | Full name of a group (e.g., <i>Zabbix administrators</i>) in LDAP/SAML user directory (also SCIM if <code>scim_status</code> is set to "SCIM provisioning is enabled"). Supports the wildcard character <code>"*"</code> . Unique across all provisioning groups mappings. |
| roleid | ID | <p>Property behavior: - <i>required</i></p> <p>ID of the user role to assign to the user.</p> <p>If multiple provisioning groups mappings are matched, the role of the highest user type (<i>User</i>, <i>Admin</i>, or <i>Super admin</i>) is assigned to the user. If there are multiple roles with the same user type, the first role (sorted in alphabetical order) is assigned to the user.</p> <p>Property behavior: - <i>required</i></p> |
| user_groups | array | <p>Array of Zabbix user group ID objects. Each object has the following properties: <code>usrgrp_id</code> - (ID) ID of Zabbix user group to assign to the user.</p> <p>If multiple provisioning groups mappings are matched, Zabbix user groups of all matched mappings is assigned to the user.</p> <p>Property behavior: - <i>required</i></p> |

userdirectory.create

Description

```
object userdirectory.create(object/array userDirectory)
```

This method allows to create new user directories.

Note:

This method is only available to *Super admin* user type.

Parameters

(object/array) User directories to create.

The method accepts user directories with the **standard user directory properties**.

Return values

(object) Returns an object containing the IDs of the created user directories under the `userdirectoryids` property. The order of the returned IDs matches the order of the passed user directories.

Examples

Creating a user directory

Create a user directory to authenticate users with StartTLS over LDAP. Note that to authenticate users over LDAP, **LDAP authentication** must be enabled.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.create",
  "params": {
    "idp_type": "1",
    "name": "LDAP API server #1",
    "host": "ldap://local.ldap",
    "port": "389",
    "base_dn": "ou=Users,dc=example,dc=org",
    "bind_dn": "cn=ldap_search,dc=example,dc=org",
    "bind_password": "ldapsecretpassword",
    "search_attribute": "uid",
    "start_tls": "1"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userdirectoryids": [
      "3"
    ]
  },
  "id": 1
}
```

Creating a user directory (JIT provisioning enabled)

Create a user directory to authenticate users over LDAP (with JIT provisioning enabled). Note that to authenticate users over LDAP, **LDAP authentication** must be enabled.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.create",
  "params": {
    "idp_type": "1",
    "name": "AD server",
    "provision_status": "1",
    "description": "",
    "host": "host.example.com",
    "port": "389",
    "base_dn": "DC=zbx,DC=local",
    "search_attribute": "sAMAccountName",
    "bind_dn": "CN=Admin,OU=Users,OU=Zabbix,DC=zbx,DC=local",
    "start_tls": "0",
    "search_filter": "",
    "group_basedn": "OU=Zabbix,DC=zbx,DC=local",
    "group_name": "CN",
    "group_member": "member",
    "group_filter": "(%{groupattr}=CN=%{ref},OU=Users,OU=Zabbix,DC=zbx,DC=local)",
    "group_membership": "",
    "user_username": "givenName",
    "user_lastname": "sn",
    "user_ref_attr": "CN",
    "provision_media": [
      {
        "name": "example.com",
        "mediatypeid": "1",
        "attribute": "user@example.com"
      }
    ]
  }
}
```

```

    },
    "provision_groups": [
        {
            "name": "*",
            "roleid": "4",
            "user_groups": [
                {
                    "usrgrpid": "8"
                }
            ]
        },
        {
            "name": "Zabbix administrators",
            "roleid": "2",
            "user_groups": [
                {
                    "usrgrpid": "7"
                },
                {
                    "usrgrpid": "8"
                }
            ]
        }
    ]
},
"id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "2"
        ]
    },
    "id": 1
}

```

Source

CUserDirectory::create() in `ui/include/classes/api/services/CUserDirectory.php`.

userdirectory.delete

Description

object userdirectory.delete(array userDirectoryIds)

This method allows to delete user directories. User directory cannot be deleted when it is directly used for at least one user group. Default LDAP user directory cannot be deleted when `authentication.ldap_configured` is set to 1 or when there are more user directories left.

Note:

This method is only available to *Super admin* user type.

Parameters

(array) IDs of the user directories to delete.

Return values

(object) Returns an object containing the IDs of the deleted user directories under the `userdirectoryids` property.

Examples

Deleting multiple user directories

Delete two user directories.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.delete",
  "params": [
    "2",
    "12"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "userdirectoryids": [
      "2",
      "12"
    ]
  },
  "id": 1
}
```

CUserDirectory::delete() in *ui/include/classes/api/services/CUserDirectory.php*.

userdirectory.get

Description

integer/array userdirectory.get(object parameters)

The method allows to retrieve user directories according to the given parameters.

Note:

This method is only available to *Super admin* user types.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------|--------------|--|
| userdirectoryids | ID/array | Return only user directories with the given IDs. |
| selectUsrgrps | query | Return a usrgrps property with user groups associated with a user directory. |
| selectProvisionMedia | query | Supports count. Return a provision_media property with media type mappings associated with a user directory. |
| selectProvisionGroups | query | Return a provision_groups property with provisioning groups mappings associated with a user directory. |
| sortfield | string/array | Sort the result by the given properties. |
| | | Possible values: name . |

| Parameter | Type | Description |
|------------------------|--------------|---|
| filter | object | Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values. Supports properties: <code>userdirectoryid</code> , <code>idp_type</code> , <code>provision_status</code> . |
| search | object | Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a LIKE <code>"%...%"</code> search. Supported properties: <code>name</code> , <code>description</code> . User directory of type SAML will have an empty value for both <code>name</code> and <code>description</code> properties. Both properties can be changed with the <code>userdirectory.update</code> operation. These parameters are described in the reference commentary . |
| countOutput | boolean | |
| excludeSearch | boolean | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving user directories

Retrieve all user directories with additional properties that display media type mappings and provisioning groups mappings associated with each user directory.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.get",
  "params": {
    "output": "extend",
    "selectProvisionMedia": "extend",
    "selectProvisionGroups": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "userdirectoryid": "1",
      "idp_type": "2",
      "name": "",
      "provision_status": "1",

```

userdirectory.test

Description

object userdirectory.test(array userDirectory)

This method allows to test user directory connection settings.

Note:
This method also allows to test what configured data matches the user directory settings for user provisioning (e.g., what user role, user groups, user medias will be assigned to the user). For this type of test the API request should be made for a [user directory](#) that has provision_status set to enabled.

Note:
This method is only available to *Super admin* user type.

Parameters

(object) User directory properties.

Since userdirectory.get API does not return bind_password field, userdirectoryid and/or bind_password should be supplied.

Additionally to the [standard user directory properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---------------|--------|---|
| test_username | string | Username to test in user directory. |
| test_password | string | Username associated password to test in user directory. |

Return values

(bool) Returns true on success.

Examples

Test user directory for existing user

Test user directory "3" for "user1".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.test",
  "params": {
    "userdirectoryid": "3",
    "host": "127.0.0.1",
    "port": "389",
    "base_dn": "ou=Users,dc=example,dc=org",
    "search_attribute": "uid",
    "bind_dn": "cn=ldap_search,dc=example,dc=org",
    "bind_password": "password",
    "test_username": "user1",
    "test_password": "password"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": true,
  "id": 1
}
```

Test user directory for non-existing user

Test user directory "3" for non-existing "user2".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.test",
  "params": {
    "userdirectoryid": "3",
    "host": "127.0.0.1",
    "port": "389",
    "base_dn": "ou=Users,dc=example,dc=org",
    "search_attribute": "uid",
    "bind_dn": "cn=ldap_search,dc=example,dc=org",
    "test_username": "user2",
    "test_password": "password"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "error": {
    "code": -32500,
    "message": "Application error.",
    "data": "Incorrect user name or password or account is temporarily blocked."
  },
  "id": 1
}
```

Test user directory for user provisioning

Test userdirectory "3" for what configured data matches the user directory settings for "user3" provisioning (e.g., what user role, user groups, user medias will be assigned to the user).

Request:

```
{
  "jsonrpc": "2.0",
  "method": "userdirectory.test",
  "params": {
    "userdirectoryid": "2",
    "host": "host.example.com",
    "port": "389",
    "base_dn": "DC=zbx,DC=local",
    "search_attribute": "sAMAccountName",
    "bind_dn": "CN=Admin,OU=Users,OU=Zabbix,DC=zbx,DC=local",
    "test_username": "user3",
    "test_password": "password"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
```

```

        "username": "user3",
        "name": "John",
        "surname": "Doe",
        "medias": [],
        "usrgrps": [
            {
                "usrgrpid": "8"
            },
            {
                "usrgrpid": "7"
            }
        ],
        "roleid": "2",
        "userdirectoryid": "2"
    },
    "id": 1
}

```

CUserDirectory::test() in *ui/include/classes/api/services/CUserDirectory.php*.

userdirectory.update

Description

object userdirectory.update(object/array userDirectory)

This method allows to update existing user directories.

Note:

This method is only available to *Super admin* user type.

Parameters

(object/array) **User directory properties** to be updated.

The userdirectoryid property must be defined for each user directory, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated user directories under the userdirectoryids property.

Examples

Update bind password for user directory

Set new bind password for a user directory.

Request:

```

{
    "jsonrpc": "2.0",
    "method": "userdirectory.update",
    "params": {
        "userdirectoryid": "3",
        "bind_password": "newldappassword"
    },
    "id": 1
}

```

Response:

```

{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "3"
        ]
    }
}

```

```

    ],
    "id": 1
}

```

Update mappings for user directory

Update provisioning groups mappings and media type mappings for user directory "2".

Request:

```

{
  "jsonrpc": "2.0",
  "method": "userdirectory.update",
  "params": {
    "userdirectoryid": "2",
    "provision_media": [
      {
        "userdirectory_mediaid": "2"
      }
    ],
    "provision_groups": [
      {
        "name": "Zabbix administrators",
        "roleid": "2",
        "user_groups": [
          {
            "usrgrpid": "7"
          },
          {
            "usrgrpid": "8"
          },
          {
            "usrgrpid": "11"
          }
        ]
      }
    ]
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "userdirectoryids": [
      "2"
    ]
  },
  "id": 1
}

```

Source

CUserDirectory::update() in *ui/include/classes/api/services/CUserDirectory.php*.

User group

This class is designed to work with user groups.

Object references:

- [User group](#)
- [Permission](#)

- **Tag-based permission**

Available methods:

- **usergroup.create** - create new user groups
- **usergroup.delete** - delete user groups
- **usergroup.get** - retrieve user groups
- **usergroup.update** - update user groups

User group object

The following objects are directly related to the usergroup API.

User group

The user group object has the following properties.

| Property | Type | Description |
|-----------------|---------|--|
| usrgrpid | ID | ID of the user group. |
| name | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Name of the user group.</p> |
| debug_mode | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations <p>Whether debug mode is enabled or disabled.</p> |
| gui_access | integer | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) disabled; 1 - enabled. <p>Frontend authentication method of the users in the group.</p> |
| mfa_status | integer | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) use the system default authentication method; 1 - use internal authentication; 2 - use LDAP authentication; 3 - disable access to the frontend. <p>Whether MFA is enabled or disabled for the users in the group.</p> |
| mfaid | ID | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - disabled (for all configured MFA methods); 1 - enabled (for all configured MFA methods). <p>MFA method used for the users in the group.</p> |
| users_status | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> for <i>Super admin</i> type users (since Zabbix 7.2.3) - <i>supported</i> if <code>mfa_status</code> of Authentication object is set to "Enabled" <p>Whether the user group is enabled or disabled.</p> <p>For deprovisioned users, the user group cannot be enabled.</p> |
| userdirectoryid | ID | <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) enabled; 1 - disabled. <p>ID of the user directory used for authentication.</p> |
| | | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> for <i>Super admin</i> type users (since Zabbix 7.2.3) - <i>supported</i> if <code>gui_access</code> is set to "use the system default authentication method" or "use LDAP authentication" |

Permission

The permission object has the following properties.

| Property | Type | Description |
|------------|---------|---|
| id | ID | ID of the host group or template group to add permission to. |
| permission | integer | <p>Property behavior:</p> <p>- <i>required</i></p> <p>Access level to the host group or template group.</p> <p>Possible values:</p> <p>0 - access denied;</p> <p>2 - read-only access;</p> <p>3 - read-write access.</p> <p>Property behavior:</p> <p>- <i>required</i> for create operations</p> |

Tag-based permission

The tag-based permission object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| groupid | ID | ID of the host group to add permission to. |
| tag | string | <p>Property behavior:</p> <p>- <i>required</i></p> <p>Tag name.</p> |
| value | string | Tag value. |

usergroup.create

Description

`object usergroup.create(object/array userGroups)`

This method allows to create new user groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) User groups to create.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|----------------------|--------------|---|
| hostgroup_rights | object/array | Host group permissions to assign to the user group. |
| templategroup_rights | object/array | Template group permissions to assign to the user group. |
| tag_filters | array | Tag-based permissions to assign to the user group. |
| users | object/array | Users to add to the user group. |
| | | The user must have only the <code>userid</code> property defined. |

Return values

(object) Returns an object containing the IDs of the created user groups under the `usrgrpids` property. The order of the returned IDs matches the order of the passed user groups.

Examples

Creating a user group

Create a user group *Operation managers* with denied access to host group "2", and add a user to it.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.create",
  "params": {
    "name": "Operation managers",
    "hostgroup_rights": {
      "id": "2",
      "permission": 0
    },
    "users": [
      {
        "userid": "12"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "20"
    ]
  },
  "id": 1
}
```

usergroup.delete

Description

object usergroup.delete(array userGroupIds)

This method allows to delete user groups.

Attention:

Deprovisioned users group (the user group specified for disabled_usrgrp_id in **Authentication**) cannot be deleted.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(array) IDs of the user groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted user groups under the *usrgrpids* property.

Examples

Deleting multiple user groups

Delete two user groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.delete",
  "params": [
    "20",
    "21"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "20",
      "21"
    ]
  },
  "id": 1
}
```

CUserGroup::delete() in ui/include/classes/api/services/CUserGroup.php.

usergroup.get

Description

integer/array usergroup.get(object parameters)

The method allows to retrieve user groups according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------|----------|---|
| mfaids | ID/array | Return only user groups with the given MFA methods. |
| mfa_status | integer | Parameter behavior: - <i>supported</i> for <i>Super admin</i> type users (since Zabbix 7.2.3) Return only user groups with the given MFA status. |
| status | integer | Refer to the user group page for a list of supported statuses. Return only user groups with the given status. |
| usersids | ID/array | Refer to the user group page for a list of supported statuses. Return only user groups that contain the given users. |
| usrgrpids | ID/array | Return only user groups with the given IDs. |
| selectTagFilters | query | Return user group tag-based permissions in the tag_filters property. |

| Parameter | Type | Description |
|---------------------------|--------------|---|
| selectUsers | query | Return the users from the user group in the users property. |
| selectHostGroupRights | query | See user.get for restrictions based on user type. Return user group host group permissions in the hostgroup_rights property. |
| selectTemplateGroupRights | query | Refer to the user group page for a list of access levels to host groups. Return user group template group permissions in the templategroup_rights property. |
| limitSelects | integer | Refer to the user group page for a list of access levels to template groups. |
| output | query | Limits the number of records returned by subselects. User group object properties to be returned. |
| sortfield | string/array | Since Zabbix 7.2.3, <i>Admin</i> and <i>User</i> type users may retrieve only the following properties: usrgrpid , name , gui_access , users_status , debug_mode , mfa_status . Default: extend . Sort the result by the given properties. |
| countOutput | boolean | Possible values: usrgrpid , name . These parameters are described in the reference commentary . |
| editable | boolean | |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the **countOutput** parameter has been used.

Examples

Retrieving enabled user groups

Retrieve all enabled user groups.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.get",
  "params": {
    "output": "extend",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
```

```

{
  "usrgrpid": "7",
  "name": "Zabbix administrators",
  "gui_access": "0",
  "users_status": "0",
  "debug_mode": "1",
  "userdirectoryid": "0",
  "mfa_status": "0",
  "mfaid": "0"
},
{
  "usrgrpid": "8",
  "name": "Guests",
  "gui_access": "0",
  "users_status": "0",
  "debug_mode": "0",
  "userdirectoryid": "0",
  "mfa_status": "0",
  "mfaid": "0"
},
{
  "usrgrpid": "11",
  "name": "Enabled debug mode",
  "gui_access": "0",
  "users_status": "0",
  "debug_mode": "1",
  "userdirectoryid": "0",
  "mfa_status": "0",
  "mfaid": "0"
},
{
  "usrgrpid": "12",
  "name": "No access to the frontend",
  "gui_access": "2",
  "users_status": "0",
  "debug_mode": "0",
  "userdirectoryid": "0",
  "mfa_status": "0",
  "mfaid": "0"
},
{
  "usrgrpid": "14",
  "name": "Read only",
  "gui_access": "0",
  "users_status": "0",
  "debug_mode": "0",
  "userdirectoryid": "0",
  "mfa_status": "0",
  "mfaid": "0"
},
{
  "usrgrpid": "18",
  "name": "Deny",
  "gui_access": "0",
  "users_status": "0",
  "debug_mode": "0",
  "userdirectoryid": "0",
  "mfa_status": "0",
  "mfaid": "0"
}
],
"id": 1

```

```
}
```

usergroup.update

Description

object usergroup.update(object/array userGroups)

This method allows to update existing user groups.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) User group properties to be updated.

The `usrgrp_id` property must be defined for each user group, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard user group properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|---|--------------|---|
| hostgroup_rights | object/array | Host group permissions to replace the current permissions assigned to the user group. |
| templategroup_rights | object/array | Template group permissions to replace the current permissions assigned to the user group. |
| tag_filters | array | Tag-based permissions to replace the current permissions assigned to the user group. |
| users | object/array | Users to replace the current users assigned to the user group. |
| The user must have only the <code>userid</code> property defined. | | |

Return values

(object) Returns an object containing the IDs of the updated user groups under the `usrgrp_ids` property.

Examples

Enabling a user group and updating permissions

Enable a user group and provide read-write access for it to host groups "2" and "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usergroup.update",
  "params": {
    "usrgrp_id": "17",
    "users_status": "0",
    "hostgroup_rights": [
      {
        "id": "2",
        "permission": 3
      },
      {
        "id": "4",
        "permission": 3
      }
    ]
  }
}
```

```

    }
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "usrgrpids": [
      "17"
    ]
  },
  "id": 1
}

```

User macro

This class is designed to work with host-level and global user macros.

Object references:

- [Global macro](#)
- [Host macro](#)

Available methods:

- [usermacro.create](#) - create new host macros
- [usermacro.createglobal](#) - create new global macros
- [usermacro.delete](#) - delete host macros
- [usermacro.deleteglobal](#) - delete global macros
- [usermacro.get](#) - retrieve host and global macros
- [usermacro.update](#) - update host macros
- [usermacro.updateglobal](#) - update global macros

User macro object

The following objects are directly related to the `usermacro` API.

Global macro

The global macro object has the following properties.

| Property | Type | Description |
|---------------|--------|--|
| globalmacroid | ID | ID of the global macro. |
| macro | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>Macro string.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations |

| Property | Type | Description |
|-------------|---------|---|
| value | string | Value of the macro. |
| type | integer | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>write-only</i> if type is set to "Secret macro" - <i>required</i> for create operations <p>Type of macro.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) Text macro; 1 - Secret macro; 2 - Vault secret. |
| description | string | Description of the macro. |

Host macro

The host macro object defines a macro available on a host, host prototype or template. It has the following properties.

| Property | Type | Description |
|-------------|---------|---|
| hostmacroid | ID | ID of the host macro. |
| hostid | ID | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>read-only</i> - <i>required</i> for update operations <p>ID of the host that the macro belongs to.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>constant</i> - <i>required</i> for create operations |
| macro | string | Macro string. |
| value | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations <p>Value of the macro.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>write-only</i> if type is set to "Secret macro" - <i>required</i> for create operations |
| type | integer | <p>Type of macro.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) Text macro; 1 - Secret macro; 2 - Vault secret. |
| description | string | Description of the macro. |
| automatic | integer | <p>Defines whether the macro is controlled by discovery rule.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) Macro is managed by user; 1 - Macro is managed by discovery rule. <p>User is not allowed to create automatic macro. To update automatic macro, it must be converted to manual.</p> |

usermacro.create

Description

`object usermacro.create(object/array hostMacros)`

This method allows to create new host macros.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Host macros to create.

The method accepts host macros with the [standard host macro properties](#).

Return values

(object) Returns an object containing the IDs of the created host macros under the `hostmacroids` property. The order of the returned IDs matches the order of the passed host macros.

Examples**Creating a host macro**

Create a host macro "{`$SNMP_COMMUNITY`}" with the value "public" on host "10198".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.create",
  "params": {
    "hostid": "10198",
    "macro": "{$SNMP_COMMUNITY}",
    "value": "public"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "11"
    ]
  },
  "id": 1
}
```

Source

`CUserMacro::create()` in `ui/include/classes/api/services/CUserMacro.php`.

usermacro.createglobal**Description**

object `usermacro.createglobal(object/array globalMacros)`

This method allows to create new global macros.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Global macros to create.

The method accepts global macros with the [standard global macro properties](#).

Return values

(object) Returns an object containing the IDs of the created global macros under the `globalmacroids` property. The order of the returned IDs matches the order of the passed global macros.

Examples

Creating a global macro

Create a global macro `"{$SNMP_COMMUNITY}"` with value `"public"`.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.createglobal",
  "params": {
    "macro": "{$SNMP_COMMUNITY}",
    "value": "public"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "globalmacroids": [
      "6"
    ]
  },
  "id": 1
}
```

Source

`CUserMacro::createGlobal()` in `ui/include/classes/api/services/CUserMacro.php`.

usermacro.delete

Description

`object usermacro.delete(array hostMacroIds)`

This method allows to delete host macros.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the host macros to delete.

Return values

(object) Returns an object containing the IDs of the deleted host macros under the `hostmacroids` property.

Examples

Deleting multiple host macros

Delete two host macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.delete",
  "params": [
    "32",
    "11"
  ]
}
```

```
    ],  
    "id": 1  
}
```

Response:

```
{  
  "jsonrpc": "2.0",  
  "result": {  
    "hostmacroids": [  
      "32",  
      "11"  
    ]  
  },  
  "id": 1  
}
```

usermacro.deleteglobal

Description

object usermacro.deleteglobal(array globalMacroIds)

This method allows to delete global macros.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the global macros to delete.

Return values

(object) Returns an object containing the IDs of the deleted global macros under the `globalmacroids` property.

Examples

Deleting multiple global macros

Delete two global macros.

Request:

```
{  
  "jsonrpc": "2.0",  
  "method": "usermacro.deleteglobal",  
  "params": [  
    "32",  
    "11"  
  ],  
  "id": 1  
}
```

Response:

```
{  
  "jsonrpc": "2.0",  
  "result": {  
    "globalmacroids": [  
      "32",  
      "11"  
    ]  
  },  
}
```

```
"id": 1
}
```

CUserMacro::deleteGlobal() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.get

Description

integer/array usermacro.get(object parameters)

The method allows to retrieve host and global macros according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|------------------------|--------------|--|
| globalmacro | flag | Return global macros instead of host macros. |
| globalmacroids | ID/array | Return only global macros with the given IDs. |
| groupids | ID/array | Return only host macros that belong to hosts or templates from the given host groups or template groups. |
| hostids | ID/array | Return only macros that belong to the given hosts or templates. |
| hostmacroids | ID/array | Return only host macros with the given IDs. |
| inherited | boolean | If set to <code>true</code> return only host prototype user macros inherited from a template. |
| selectHostGroups | query | Return host groups that the host macro belongs to in the <code>hostgroups</code> property. |
| selectHosts | query | Used only when retrieving host macros. Return hosts that the host macro belongs to in the <code>hosts</code> property. |
| selectTemplateGroups | query | Used only when retrieving host macros. Return template groups that the template macro belongs to in the <code>templategroups</code> property. |
| selectTemplates | query | Used only when retrieving template macros. Return templates that the host macro belongs to in the <code>templates</code> property. |
| sortfield | string/array | Used only when retrieving host macros. Sort the result by the given properties. |
| countOutput | boolean | Possible values: <code>macro</code> . |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving host macros for a host

Retrieve all host macros defined for host "10198".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.get",
  "params": {
    "output": "extend",
    "hostids": "10198"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostmacroid": "9",
      "hostid": "10198",
      "macro": "{$INTERFACE}",
      "value": "eth0",
      "description": "",
      "type": "0",
      "automatic": "0"
    },
    {
      "hostmacroid": "11",
      "hostid": "10198",
      "macro": "{$SNMP_COMMUNITY}",
      "value": "public",
      "description": "",
      "type": "0",
      "automatic": "0"
    }
  ],
  "id": 1
}
```

Retrieving global macros

Retrieve all global macros.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.get",
  "params": {
    "output": "extend",
    "globalmacro": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "globalmacroid": "6",
      "macro": "{$SNMP_COMMUNITY}",
      "value": "public",
      "description": "",
      "type": "0"
    }
  ],
  "id": 1
}
```

Source

CUserMacro::get() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.update

Description

object usermacro.update(object/array hostMacros)

This method allows to update existing host macros.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Host macro properties** to be updated.

The **hostmacroid** property must be defined for each host macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated host macros under the **hostmacroids** property.

Examples

Changing the value of a host macro

Change the value of a host macro to "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.update",
  "params": {
    "hostmacroid": "1",
    "value": "public"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "1"
    ]
  },
}
```

```
    "id": 1
}
```

Change macro value that was created by discovery rule

Convert discovery rule created "automatic" macro to "manual" and change its value to "new-value".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.update",
  "params": {
    "hostmacroid": "1",
    "value": "new-value",
    "automatic": "0"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "hostmacroids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

CUserMacro::update() in `ui/include/classes/api/services/CUserMacro.php`.

usermacro.updateglobal

Description

object usermacro.updateglobal(object/array globalMacros)

This method allows to update existing global macros.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Global macro properties** to be updated.

The globalmacroid property must be defined for each global macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated global macros under the globalmacroids property.

Examples

Changing the value of a global macro

Change the value of a global macro to "public".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "usermacro.updateglobal",
  "params": {
```

```

    "globalmacroid": "1",
    "value": "public"
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "globalmacroids": [
      "1"
    ]
  },
  "id": 1
}

```

CUserMacro::updateGlobal() in *ui/include/classes/api/services/CUserMacro.php*.

Value map

This class is designed to work with value maps.

Object references:

- [Value map](#)
 - [Value mappings](#)

Available methods:

- [valuemap.create](#) - create new value maps
- [valuemap.delete](#) - delete value maps
- [valuemap.get](#) - retrieve value maps
- [valuemap.update](#) - update value maps

Value map object

The following objects are directly related to the `valuemap` API.

Value map

The value map object has the following properties.

| Property | Type | Description |
|------------|--------|--|
| valuemapid | ID | ID of the value map. Property behavior: - <i>read-only</i> |
| hostid | ID | - <i>required</i> for update operations ID of the host or template that the value map belongs to. Property behavior: - <i>constant</i> |
| name | string | - <i>required</i> for create operations Name of the value map. Property behavior: - <i>required</i> for create operations |

| Property | Type | Description |
|----------|--------|--|
| mappings | array | Value mappings for current value map. The mapping object is described in detail below . |
| uuid | string | <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> for create operations <p>Universal unique identifier, used for linking imported value maps to already existing ones. Auto-generated, if not given.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>supported</i> if the value map belongs to a template |

Value mappings

The value mappings object defines value mappings of the value map. It has the following properties.

| Property | Type | Description |
|----------|---------|---|
| type | integer | <p>Mapping match type.</p> <p>Possible values:</p> <ul style="list-style-type: none"> 0 - (<i>default</i>) mapping will be applied if value is equal; 1 - mapping will be applied if value is greater or equal¹; 2 - mapping will be applied if value is less or equal¹; 3 - mapping will be applied if value is in range (ranges are inclusive; multiple ranges, separated by comma character, can be defined)¹; 4 - mapping will be applied if value matches a regular expression²; 5 - if no matches are found, mapping will not be applied, and the default value will be used. <p>If type is set to "0", "1", "2", "3", "4", then value cannot be empty.</p> |
| value | string | <p>If type is set to "5", then value must be empty.</p> <p>Original value.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> if type is set to "1", "2", "3", "4" - <i>supported</i> if type is set to "5" |
| newvalue | string | <p>Value to which the original value is mapped to.</p> <p>Property behavior:</p> <ul style="list-style-type: none"> - <i>required</i> |

¹ supported only for items having value type "numeric unsigned", "numeric float".

² supported only for items having value type "character".

valuemap.create

Description

`object valuemap.create(object/array valuemaps)`

This method allows to create new value maps.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Value maps to create.

The method accepts value maps with the **standard value map properties**.

Return values

(object) Returns an object containing the IDs of the created value maps the `valuemapids` property. The order of the returned IDs matches the order of the passed value maps.

Examples

Creating a value map

Create one value map with two mappings.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.create",
  "params": {
    "hostid": "50009",
    "name": "Service state",
    "mappings": [
      {
        "type": "1",
        "value": "1",
        "newvalue": "Up"
      },
      {
        "type": "5",
        "newvalue": "Down"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "1"
    ]
  },
  "id": 1
}
```

Source

`CValueMap::create()` in `ui/include/classes/api/services/CValueMap.php`.

valuemap.delete

Description

object `valuemap.delete(array valuemapids)`

This method allows to delete value maps.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(array) IDs of the value maps to delete.

Return values

(object) Returns an object containing the IDs of the deleted value maps under the `valuemapids` property.

Examples

Deleting multiple value maps

Delete two value maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.delete",
  "params": [
    "1",
    "2"
  ],
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "1",
      "2"
    ]
  },
  "id": 1
}
```

Source

`CValueMap::delete()` in `ui/include/classes/api/services/CValueMap.php`.

valuemap.get

Description

`integer/array valuemap.get(object parameters)`

The method allows to retrieve value maps according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|-----------------------------|--------------|--|
| <code>valuemapids</code> | ID/array | Return only value maps with the given IDs. |
| <code>selectMappings</code> | query | Return the value mappings for current value map in the <code>mappings</code> property. |
| <code>sortfield</code> | string/array | Supports count. Sort the result by the given properties. |
| <code>countOutput</code> | boolean | Possible values: <code>valuemapid</code> , <code>name</code> . |
| <code>editable</code> | boolean | These parameters are described in the reference commentary . |
| <code>excludeSearch</code> | boolean | |
| <code>filter</code> | object | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| limit | integer | |
| output | query | |
| preservekeys | boolean | |
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving value maps

Retrieve all configured value maps.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.get",
  "params": {
    "output": "extend"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "valuemapid": "4",
      "name": "APC Battery Replacement Status"
    },
    {
      "valuemapid": "5",
      "name": "APC Battery Status"
    },
    {
      "valuemapid": "7",
      "name": "Dell Open Manage System Status"
    }
  ],
  "id": 1
}
```

Retrieve one value map with its mappings.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.get",
  "params": {
    "output": "extend",
    "selectMappings": "extend",
    "valuemapids": ["4"]
  },
  "id": 1
}
```

```
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "valuemapid": "4",
      "name": "APC Battery Replacement Status",
      "mappings": [
        {
          "type": "0",
          "value": "1",
          "newvalue": "unknown"
        },
        {
          "type": "0",
          "value": "2",
          "newvalue": "notInstalled"
        },
        {
          "type": "0",
          "value": "3",
          "newvalue": "ok"
        },
        {
          "type": "0",
          "value": "4",
          "newvalue": "failed"
        },
        {
          "type": "0",
          "value": "5",
          "newvalue": "highTemperature"
        },
        {
          "type": "0",
          "value": "6",
          "newvalue": "replaceImmediately"
        },
        {
          "type": "0",
          "value": "7",
          "newvalue": "lowCapacity"
        }
      ]
    }
  ],
  "id": 1
}
```

Source

CValueMap::get() in *ui/include/classes/api/services/CValueMap.php*.

valuemap.update

Description

object valuemap.update(object/array valuemaps)

This method allows to update existing value maps.

Note:

This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) **Value map properties** to be updated.

The `valuemapid` property must be defined for each value map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated value maps under the `valuemapids` property.

Examples**Changing value map name**

Change value map name to "Device status".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.update",
  "params": {
    "valuemapid": "2",
    "name": "Device status"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "2"
    ]
  },
  "id": 1
}
```

Changing mappings for one value map.**Request:**

```
{
  "jsonrpc": "2.0",
  "method": "valuemap.update",
  "params": {
    "valuemapid": "2",
    "mappings": [
      {
        "type": "0",
        "value": "0",
        "newvalue": "Online"
      },
      {
        "type": "0",
        "value": "1",
        "newvalue": "Offline"
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "valuemapids": [
      "2"
    ]
  },
  "id": 1
}
```

Web scenario

This class is designed to work with web scenarios.

Object references:

- [Web scenario](#)
- [Scenario step](#)
 - [HTTP field](#)
- [Web scenario tag](#)

Available methods:

- [httptest.create](#) - create new web scenarios
- [httptest.delete](#) - delete web scenarios
- [httptest.get](#) - retrieve web scenarios
- [httptest.update](#) - update web scenarios

Web scenario object

The following objects are directly related to the webcheck API.

Web scenario

The web scenario object has the following properties.

| Property | Type | Description |
|----------------|---------|--|
| httptestid | ID | ID of the web scenario. Property behavior: <ul style="list-style-type: none">- <i>read-only</i>- <i>required</i> for update operations |
| hostid | ID | ID of the host that the web scenario belongs to. Property behavior: <ul style="list-style-type: none">- <i>constant</i>- <i>required</i> for create operations |
| name | string | Name of the web scenario. Property behavior: <ul style="list-style-type: none">- <i>required</i> for create operations |
| agent | string | User agent string that will be used by the web scenario. |
| authentication | integer | Default: Zabbix Authentication method that will be used by the web scenario. Possible values: <ul style="list-style-type: none">0 - (<i>default</i>) none;1 - basic HTTP authentication;2 - NTLM authentication. |

| Property | Type | Description |
|------------------|---------|--|
| delay | string | Execution interval of the web scenario. Accepts seconds or time unit with suffix (e.g., 30s, 1m, 2h, 1d), or a user macro. Default: 1m. |
| headers | array | HTTP headers that will be sent when performing a request. |
| http_password | string | Password used for basic HTTP or NTLM authentication. |
| http_proxy | string | Proxy that will be used by the web scenario given as <i>http://[username[:password]]@[proxy.example.com][:port]</i> . |
| http_user | string | User name used for basic HTTP or NTLM authentication. |
| retries | integer | Number of times a web scenario will try to execute each step before failing. Default: 1. |
| ssl_cert_file | string | Name of the SSL certificate file used for client authentication (must be in PEM format). |
| ssl_key_file | string | Name of the SSL private key file used for client authentication (must be in PEM format). |
| ssl_key_password | string | SSL private key password. |
| status | integer | Whether the web scenario is enabled. Possible values: 0 - (<i>default</i>) enabled; 1 - disabled. |
| templateid | ID | ID of the parent template web scenario. |
| variables | array | Property behavior: - <i>read-only</i> Web scenario variables . |
| verify_host | integer | Whether to validate that the host name for the connection matches the one in the host's certificate. Possible values: 0 - (<i>default</i>) skip host verification; 1 - verify host. |
| verify_peer | integer | Whether to validate that the host's certificate is authentic. Possible values: 0 - (<i>default</i>) skip peer verification; 1 - verify peer. |
| uuid | string | Global unique identifier, used for linking imported web scenarios to already existing ones. Auto-generated, if not given. Property behavior: - <i>supported</i> if the web scenario belongs to a template |

Scenario step

The scenario step object defines a specific web scenario check. It has the following properties.

| Property | Type | Description |
|----------|---------|--|
| name | string | Name of the scenario step. Property behavior: - <i>required</i> |
| no | integer | Sequence number of the step in a web scenario. Property behavior: - <i>required</i> |

| Property | Type | Description |
|------------------|--------------|--|
| url | string | URL to be checked. |
| follow_redirects | integer | Property behavior: - <i>required</i> Whether to follow HTTP redirects. Possible values: 0 - don't follow redirects; 1 - (<i>default</i>) follow redirects. |
| headers | array | HTTP headers that will be sent when performing a request. Scenario step headers will overwrite headers specified for the web scenario. |
| posts | string/array | HTTP POST variables as a string (raw post data) or as an array of HTTP fields (form field data). |
| required | string | Text that must be present in the response. |
| retrieve_mode | integer | Part of the HTTP response that the scenario step must retrieve. Possible values: 0 - (<i>default</i>) only body; 1 - only headers; 2 - headers and body. |
| status_codes | string | Ranges of required HTTP status codes, separated by commas. |
| timeout | string | Request timeout in seconds. Accepts seconds, time unit with suffix, or a user macro. Default: 15s. Maximum: 1h. Minimum: 1s. |
| variables | array | Scenario step variables . |
| query_fields | array | Query fields - array of HTTP fields that will be added to URL when performing a request. |

HTTP field

The HTTP field object defines the name and value that is used to specify the web scenario variables, HTTP headers, and POST fields or query fields. It has the following properties.

| Property | Type | Description |
|----------|--------|---|
| name | string | Name of header/variable/POST or GET field. |
| value | string | Property behavior: - <i>required</i> Value of header/variable/POST or GET field. Property behavior: - <i>required</i> |

Web scenario tag

The web scenario tag object has the following properties.

| Property | Type | Description |
|----------|--------|--|
| tag | string | Web scenario tag name. Property behavior: - <i>required</i> |
| value | string | Web scenario tag value. |

httptest.create

Description

object httptest.create(object/array webScenarios)

This method allows to create new web scenarios.

Note:

Creating a web scenario will automatically create a set of **web monitoring items**.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See **User roles** for more information.

Parameters

(object/array) Web scenarios to create.

Additionally to the **standard web scenario properties**, the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|---|
| steps | array | Scenario steps. Parameter behavior: - <i>required</i> |
| tags | array | Web scenario tags. |

Return values

(object) Returns an object containing the IDs of the created web scenarios under the `httptestids` property. The order of the returned IDs matches the order of the passed web scenarios.

Examples

Creating a web scenario

Create a web scenario to monitor the company home page. The scenario will have two steps, to check the home page and the "About" page and make sure they return the HTTP status code 200.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.create",
  "params": {
    "name": "Homepage check",
    "hostid": "10085",
    "steps": [
      {
        "name": "Homepage",
        "url": "http://example.com",
        "status_codes": "200",
        "no": 1
      },
      {
        "name": "Homepage / About",
        "url": "http://example.com/about",
        "status_codes": "200",
        "no": 2
      }
    ]
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "5"
    ]
  }
}
```

```

    ],
    },
    "id": 1
}

```

- [Scenario step](#)

Source

CHttpTest::create() in *ui/include/classes/api/services/CHttpTest.php*.

httptest.delete

Description

object httptest.delete(array webScenarioIds)

This method allows to delete web scenarios.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(array) IDs of the web scenarios to delete.

Return values

(object) Returns an object containing the IDs of the deleted web scenarios under the `httptestids` property.

Examples

Deleting multiple web scenarios

Delete two web scenarios.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "httptest.delete",
  "params": [
    "2",
    "3"
  ],
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "2",
      "3"
    ]
  },
  "id": 1
}

```

Source

CHttpTest::delete() in *ui/include/classes/api/services/CHttpTest.php*.

httptest.get

Description

integer/array httptest.get(object parameters)

The method allows to retrieve web scenarios according to the given parameters.

Note:

This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

| Parameter | Type | Description |
|----------------|--------------|---|
| groupids | ID/array | Return only web scenarios that belong to the given host groups. |
| hostids | ID/array | Return only web scenarios that belong to the given hosts. |
| httptestids | ID/array | Return only web scenarios with the given IDs. |
| inherited | boolean | If set to true return only web scenarios inherited from a template. |
| monitored | boolean | If set to true return only enabled web scenarios that belong to monitored hosts. |
| templated | boolean | If set to true return only web scenarios that belong to templates. |
| templateids | ID/array | Return only web scenarios that belong to the given templates. |
| expandName | flag | Expand macros in the name of the web scenario. |
| expandStepName | flag | Expand macros in the names of scenario steps. |
| evaltype | integer | Rules for tag searching. Possible values: 0 - (default) And/Or; 2 - Or. |
| tags | array | Return only web scenarios with given tags. Exact match by tag and case-sensitive or case-insensitive search by tag value depending on operator value. Format: [{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]. An empty array returns all web scenarios. Possible operator types: 0 - (default) Like; 1 - Equal; 2 - Not like; 3 - Not equal 4 - Exists; 5 - Not exists. |
| selectHosts | query | Return the hosts that the web scenario belongs to as an array in the hosts property. |
| selectSteps | query | Return web scenario steps in the steps property. |
| selectTags | query | Supports count. Return web scenario tags in the tags property. |
| sortfield | string/array | Sort the result by the given properties. |
| countOutput | boolean | Possible values: httptestid, name. |
| editable | boolean | These parameters are described in the reference commentary . |
| excludeSearch | boolean | |
| filter | object | |
| limit | integer | |
| output | query | |
| preservekeys | boolean | |

| Parameter | Type | Description |
|------------------------|--------------|-------------|
| search | object | |
| searchByAny | boolean | |
| searchWildcardsEnabled | boolean | |
| sortorder | string/array | |
| startSearch | boolean | |

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving a web scenario

Retrieve all data about web scenario "4".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.get",
  "params": {
    "output": "extend",
    "selectSteps": "extend",
    "httptestids": "9"
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "httptestid": "9",
      "name": "Homepage check",
      "delay": "1m",

httptest.update

Description

object httptest.update(object/array webScenarios)

This method allows to update existing web scenarios.

Note:

This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See [User roles](#) for more information.

Parameters

(object/array) Web scenario properties to be updated.

The `httptestid` property must be defined for each web scenario, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the [standard web scenario properties](#), the method accepts the following parameters.

| Parameter | Type | Description |
|-----------|-------|--|
| steps | array | Scenario steps to replace existing steps. |
| tags | array | Web scenario tags . |

Return values

(object) Returns an object containing the IDs of the updated web scenarios under the `httptestid` property.

Examples

Enabling a web scenario

Enable a web scenario, that is, set its status to "0".

Request:

```
{
  "jsonrpc": "2.0",
  "method": "httptest.update",
  "params": {
    "httptestid": "5",
    "status": 0
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "httptestids": [
      "5"
    ]
  },
  "id": 1
}
```

Appendix 1. Reference commentary

Notation Data types

The Zabbix API supports the following data types as input:

| Type | Description |
|-----------|---|
| ID | A unique identifier used to reference an entity. |
| boolean | A boolean value (either <code>true</code> or <code>false</code>). |
| flag | A value that is considered to be <code>true</code> if passed and not equal to <code>null</code> ; otherwise, the value is considered to be <code>false</code> . |
| integer | A whole number. |
| float | A floating point number. |
| string | A text string. |
| text | A longer text string. |
| timestamp | A Unix timestamp. |
| array | An ordered sequence of values (a plain array). |
| object | An associative array. |

| Type | Description |
|-------|---|
| query | A value that defines the data to be returned. The value can be defined as an array of property names (to return only specific properties), or as one of the predefined values: <i>extend</i> - returns all object properties; <i>count</i> - returns the number of retrieved records, supported only by certain subselects. |

Attention:

Zabbix API always returns values as strings or arrays only.

Property behavior

Some of the object properties are marked with short labels to describe their behavior. The following labels are used:

- **read-only** - the value of the property is set automatically and cannot be defined or changed by the user, even in some specific conditions (e.g., *read-only* for inherited objects or discovered objects);
- **write-only** - the value of the property can be set, but cannot be accessed after;
- **constant** - the value of the property can be set when creating an object, but cannot be changed after;
- **supported** - the value of the property is not required to be set, but is allowed to be set in some specific conditions (e.g., *supported* if *type* is set to "Simple check", "External check", "SSH agent", "TELNET agent", or "HTTP agent"); note, however, that *supported* properties may still be set to their default values regardless of conditions;
- **required** - the value of the property is required to be set for all operations (except get operations) or in some specific conditions (e.g., *required* for create operations; *required* if *operationtype* is set to "global script" and *opcommand_hst* is not set).

Note:

For update operations, a property is considered as "set" when setting it during the update operation.

Properties that are not marked with labels are optional.

Parameter behavior

Some of the operation parameters are marked with short labels to describe their behavior for the operation. The following labels are used:

- **read-only** - the value of the parameter is set automatically and cannot be defined or changed by the user, even in some specific conditions (e.g., *read-only* for inherited objects or discovered objects);
- **write-only** - the value of the parameter can be set, but cannot be accessed after;
- **supported** - the value of the parameter is not required to be set, but is allowed to be set in some specific conditions (e.g., *supported* if *operating_mode* of Proxy object is set to "passive proxy"); note, however, that *supported* parameters may still be set to their default values regardless of conditions;
- **required** - the value of the parameter is required to be set.

Parameters that are not marked with labels are optional.

Reserved ID value "0" Reserved ID value "0" can be used to filter elements and to remove referenced objects. For example, to remove a referenced proxy from a host, *proxyid* should be set to 0 ("*proxyid*": "0") or to filter hosts monitored by server option *proxyids* should be set to 0 ("*proxyids*": "0").

Common "get" method parameters The following parameters are supported by all get methods:

| Parameter | Type | Description |
|---------------|---------|---|
| countOutput | boolean | Return the number of records in the result instead of the actual data. |
| editable | boolean | If set to <code>true</code> , return only objects that the user has write permissions to. |
| | | Default: <code>false</code> . |
| excludeSearch | boolean | Return results that do not match the criteria given in the <code>search</code> parameter. |

| Parameter | Type | Description |
|------------------------|--------------|---|
| filter | object | <p>Return only those results that exactly match the given filter.</p> <p>Accepts an object, where the keys are property names (e.g., Host object properties in <code>host.get</code>, Item object properties in <code>item.get</code>, etc.), and the values are either a single value or an array of values to match against.</p> <p>Does not support properties of text data type.</p> <p>Note that some methods have specific functionality for this parameter, which is described on the method page (e.g., the <code>filter</code> parameter in <code>host.get</code> also supports Host interface properties).</p> |
| limit | integer | Limit the number of records returned. |
| output | query | Object properties to be returned. |
| preservekeys | boolean | Default: <code>extend</code> . Use IDs as keys in the resulting array. |
| search | object | <p>Return results that match the given pattern (case-insensitive).</p> <p>Accepts an object, where the keys are property names (e.g., Host object properties in <code>host.get</code>, Item object properties in <code>item.get</code>, etc.), and the values are strings to search for. If no additional options are given, this will perform a LIKE <code>"%...%"</code> search.</p> <p>Supports only properties of string and text data type.</p> <p>Note that some methods have specific functionality for this parameter, which is described on the method page (e.g., the <code>search</code> parameter in <code>host.get</code> also supports Host interface properties).</p> |
| searchByAny | boolean | If set to <code>true</code> , return results that match any of the criteria given in the <code>filter</code> or <code>search</code> parameter instead of all of them. |
| searchWildcardsEnabled | boolean | <p>Default: <code>false</code>.</p> <p>If set to <code>true</code>, enables the use of <code>"*"</code> as a wildcard character in the <code>search</code> parameter.</p> |
| sortfield | string/array | <p>Default: <code>false</code>.</p> <p>Sort the result by the given properties. Refer to a specific API get method description for a list of properties that can be used for sorting. Macros are not expanded before sorting.</p> |
| sortorder | string/array | <p>If no value is specified, data will be returned unsorted.</p> <p>Order of sorting. If an array is passed, each value will be matched to the corresponding property given in the <code>sortfield</code> parameter.</p> <p>Possible values: ASC - (default) ascending; DESC - descending.</p> |
| startSearch | boolean | <p>The <code>search</code> parameter will compare the beginning of fields, that is, perform a LIKE <code>"...%"</code> search instead.</p> <p>Ignored if <code>searchWildcardsEnabled</code> is set to <code>true</code>.</p> |

Examples User permission check

Does the user have permission to write to hosts whose names begin with "MySQL" or "Linux" ?

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "countOutput": true,
    "search": {
      "host": ["MySQL", "Linux"]
    }
  }
}
```

```

    },
    "editable": true,
    "startSearch": true,
    "searchByAny": true
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": "0",
  "id": 1
}

```

Note:

Zero result means no hosts with read/write permissions.

Mismatch counting

Count the number of hosts whose names do not contain the substring "ubuntu"

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "countOutput": true,
    "search": {
      "host": "ubuntu"
    },
    "excludeSearch": true
  },
  "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": "44",
  "id": 1
}

```

Searching for hosts using wildcards

Find hosts whose name contains word "server" and have interface ports "10050" or "10071". Sort the result by host name in descending order and limit it to 5 hosts.

Request:

```

{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "host"],
    "selectInterfaces": ["port"],
    "filter": {
      "port": ["10050", "10071"]
    },
    "search": {
      "host": "*server*"
    },
    "searchWildcardsEnabled": true,
    "searchByAny": true,
  }
}

```

```

        "sortfield": "host",
        "sortorder": "DESC",
        "limit": 5
    },
    "id": 1
}

```

Response:

```

{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "50003",
      "host": "WebServer-Tomcat02",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "50005",
      "host": "WebServer-Tomcat01",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "50004",
      "host": "WebServer-Nginx",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    {
      "hostid": "99032",
      "host": "MySQL server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    },
    {
      "hostid": "99061",
      "host": "Linux server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    }
  ],
  "id": 1
}

```

Searching for hosts using wildcards with "preservekeys"

If you add the parameter "preservekeys" to the previous request, the result is returned as an associative array, where the keys

are the id of the objects.

Request:

```
{
  "jsonrpc": "2.0",
  "method": "host.get",
  "params": {
    "output": ["hostid", "host"],
    "selectInterfaces": ["port"],
    "filter": {
      "port": ["10050", "10071"]
    },
    "search": {
      "host": "*server*"
    },
    "searchWildcardsEnabled": true,
    "searchByAny": true,
    "sortfield": "host",
    "sortorder": "DESC",
    "limit": 5,
    "preservekeys": true
  },
  "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "50003": {
      "hostid": "50003",
      "host": "WebServer-Tomcat02",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "50005": {
      "hostid": "50005",
      "host": "WebServer-Tomcat01",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "50004": {
      "hostid": "50004",
      "host": "WebServer-Nginx",
      "interfaces": [
        {
          "port": "10071"
        }
      ]
    },
    "99032": {
      "hostid": "99032",
      "host": "MySQL server 01",
      "interfaces": [
        {
          "port": "10050"
        }
      ]
    }
  }
}
```

```

    ],
    "99061": {
        "hostid": "99061",
        "host": "Linux server 01",
        "interfaces": [
            {
                "port": "10050"
            }
        ]
    },
    "id": 1
}

```

Appendix 2. Changes from 7.0 to 7.2

Backward incompatible changes API

[ZBXNEXT-9452](#) Removed support for deprecated property `auth`.

dashboard

[ZBXNEXT-7689](#) Removed support for deprecated `dashboard widget` type `dataover`.

[ZBXNEXT-7689](#) Renamed `dashboard widget` field `style` to `layout` in `tophosts` widget.

[ZBXNEXT-9297](#) Removed dashboard widget fields `date_size`, `time_size`, `tzone_size` in `clock` widget.

discoveryrule

[ZBXNEXT-9452](#) `discoveryrule.copy`: Removed support for deprecated method `discoveryrule.copy`.

event

[ZBXNEXT-9452](#) `event.get`: Removed support for deprecated parameters `select_acknowledges`, `select_alerts`.

graph

[ZBXNEXT-9452](#) `graph.get`: Removed support for deprecated parameter `selectGroups`.

graphprototype

[ZBXNEXT-9452](#) `graphprototype.get`: Removed support for deprecated parameter `selectGroups`.

host

[ZBXNEXT-9452](#) `host.get`: Removed support for deprecated parameter `selectGroups`.

hostgroup

[ZBXNEXT-9452](#) `hostgroup.get`: Removed support for deprecated parameters `monitored_hosts`, `real_hosts`.

maintenance

[ZBXNEXT-9452](#) `maintenance.create`, `maintenance.update`: Removed support for deprecated parameters `groupids`, `hostids`.

[ZBXNEXT-9452](#) `maintenance.get`: Removed support for deprecated parameter `selectGroups`.

mediatype

[ZBXNEXT-9452](#) Removed support for deprecated properties `content_type`, `exec_params`.
[ZBX-25385](#) `mediatype.get`: Added strict validation of output, filter, search parameters.

script

[ZBXNEXT-9452](#) `script.get`: Removed support for deprecated parameter `selectGroups`.

template

[ZBXNEXT-9452](#) `template.get`: Removed support for deprecated parameter `selectGroups`.

trigger

[ZBXNEXT-9452](#) `trigger.get`: Removed support for deprecated parameter `selectGroups`.

triggerprototype

[ZBXNEXT-9452](#) `triggerprototype.get`: Removed support for deprecated parameter `selectGroups`.

usergroup

[ZBXNEXT-9452](#) `usergroup.create`, `usergroup.update`: Removed support for deprecated parameters `rights`, `userids`.

[ZBXNEXT-9452](#) `usergroup.get`: Removed support for deprecated parameter `selectRights`.

usermacro

[ZBXNEXT-9452](#) `usermacro.get`: Removed support for deprecated parameter `selectGroups`.

Other changes and bug fixes dashboard

[ZBXNEXT-7689](#) Added new **dashboard widget** type **topitems**.

[ZBXNEXT-9199](#) Added new dashboard widget column configuration fields `columns.0.display_value_as`, `columns.0.highlights.0.columns.0.highlights.0.pattern`, `columns.0.show_thumbnail` in **top_hosts** widget for more variety when configuring item value columns and to support binary item value display in the widget.

[ZBXNEXT-9232](#) Added new dashboard widget fields for value visualization as sparklines in **item_value** widget and **top_hosts** widget.

[ZBXNEXT-9086](#) Added new **dashboard widget** type **hostcard**.

[ZBXNEXT-9555](#) Added dashboard widget field `ds.0.override_hostid._reference` in **graph** widget.

[ZBXNEXT-599](#) Added dashboard widget fields `lefty_scale`, `righty_scale` in **graph** widget.

templatedashboard

[ZBXNEXT-7689](#) Added new **template dashboard widget** type **topitems**.

[ZBXNEXT-9086](#) Added new **template dashboard widget** type **hostcard**.

Appendix 3. Changes in 7.2

7.2.5 API

[ZBX-22952](#) Added support for accepting headers in a case-insensitive way (e.g., `authorization`, `Authorization`, and `AUTHORIZATION` are treated the same).

7.2.4 alert

[ZBX-26023](#) `alert.get`: *Admin* and *User* type users may now retrieve "message" (0) type alert data about users in their user group.

drule

ZBX-23760 `drule.update`: It is no longer possible to delete a discovery rule check that is used in action condition. In such case, an error message is returned instead of automatically disabling the action.

host

ZBX-23760 `host.delete`: It is no longer possible to delete a host that is used in action condition or operation. In such cases, an error message is returned instead of automatically disabling the action.

hostgroup

ZBX-23760 `hostgroup.delete`: It is no longer possible to delete a host group that is used in action condition or operation. In such cases, an error message is returned instead of automatically disabling the action.

template

ZBX-23760 `template.delete`: It is no longer possible to delete a template that is used in action condition or operation. In such cases, an error message is returned instead of automatically disabling the action.

trigger

ZBX-23760 `trigger.delete`: It is no longer possible to delete a trigger that is used in action condition. In such case, an error message is returned instead of automatically disabling the action.

7.2.3 alert

ZBX-26258 `alert.get`: Parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

ZBX-26258 `alert.get`: *Admin* and *User* type users may now retrieve "message" (0) type alert data only about their own user.

mediatype

ZBX-26258 `mediatype.get`: Parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

role

ZBX-26258 `role.get`: Parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

user

ZBX-26258 Added new property `provisioned` to *User* object and *user Media* object.

ZBX-26258 Properties `ts_provisioned`, `userdirectoryid`, and `userdirectory_mediaid` are now supported only for *Super admin* type users.

ZBX-26258 `user.get`: When requesting user media, permissions, or role information, *Admin* and *User* type users may retrieve data only about their own user.

ZBX-26258 `user.get`: *Admin* and *User* type users may now retrieve only the following **User object** properties for their own user: `userid`, `attempt_clock`, `attempt_failed`, `attempt_ip`, `autologin`, `autologout`, `lang`, `name`, `provisioned`, `refresh`, `roleid`, `rows_per_page`, `surname`, `theme`, `timezone`, `url`, `username`. For users in their user group: `userid`, `name`, `surname`, `username`.

usergroup

ZBX-26258 Properties `mfaid` and `userdirectoryid` are now supported only for *Super admin* type users.

ZBX-26258 `usergroup.get`: Parameter `mfaid` is now supported only for *Super admin* type users.

ZBX-26258 `usergroup.get`: Parameter `selectUsers` now returns data based on the restrictions added to `user.get` method.

7.2.1 API

ZBX-25732 Added support for Authorization HTTP request header and OPTIONS HTTP request method in cross-origin requests (CORS).

21 Extensions

Overview Although Zabbix offers a multiplicity of features, there is always room for additional functionality. Extensions are a convenient way of modifying and enhancing the monitoring capabilities of Zabbix without changing its source code.

You can extend Zabbix functionality either by using built-in extension options (trapper items, user parameters, etc.) or by using or creating custom extensions (loadable modules, plugins, etc.).

This section provides an overview with references to all the options for extending Zabbix.

Data collection with custom commands Trapper items

Trapper items are items that accept incoming data instead of querying for it. Trapper items are useful for sending specific data to Zabbix server or proxy, for example, periodic availability and performance data in the case of long-running user scripts. Sending data to Zabbix server or proxy is possible using the **Zabbix sender** utility or Zabbix sender **protocol**. Sending data to Zabbix server is also possible using the **history.push** API method.

External checks

An **external check** is an item for executing checks by running an executable, for example, a **shell script** or a binary.

External checks are executed by Zabbix server or proxy (when host is monitored by proxy), and do not require an agent running on the host being monitored.

User parameters

A **user parameter** is a user-defined command (associated with a user-defined key) that, when executed, can retrieve the data you need from the host where Zabbix agent is running. User parameters are useful for configuring agent or agent 2 items that are not predefined in Zabbix.

system.run[] Zabbix agent items

`system.run[]` Zabbix **agent item** is an item for a user-defined command (associated with a predefined key `system.run[]`, for example, `system.run[myscript.sh]`) that can be executed on the host where Zabbix agent is running.

Note: `system.run[]` items are disabled by default and, if used, must be enabled (**allowed**) and defined in the Zabbix agent or agent 2 configuration file (`AllowKey` configuration parameter).

Attention:

User-defined commands in items such as external checks, user parameters and `system.run[]` Zabbix agent items are executed from the OS user that is used to run Zabbix components. To execute these commands, this user must have the necessary permissions.

HTTP agent items

HTTP agent item is an item for executing data requests over HTTP/HTTPS. HTTP agent items are useful for sending requests to HTTP endpoints to retrieve data from services such as *Elasticsearch* and *OpenWeatherMap*, for checking the status of Zabbix API or the status of Apache or Nginx web server, etc. HTTP agent items (with trapping enabled) can also function as **trapper items**.

Script items

A **script item** is an item for executing user-defined JavaScript code that retrieves data over HTTP/HTTPS. Script items are useful when the functionality provided by HTTP agent items is not enough. For example, in demanding data collection scenarios that require multiple steps or complex logic, a script item can be configured to make an HTTP call, then process the data received, and then pass the transformed value to a second HTTP call.

Note:

HTTP agent items and script items are supported by Zabbix server and proxy, and do not require an agent running on the host being monitored.

Advanced extensions Loadable modules

Loadable modules, written in C, are a versatile and performance-minded option for extending the functionality of Zabbix components (server, proxy, agent) on UNIX platforms. A loadable module is basically a shared library used by Zabbix daemon and loaded on startup. The library should contain certain functions, so that a Zabbix process may detect that the file is indeed a module it can load and work with.

Loadable modules have a number of benefits, including the ability to add new metrics or implement any other logic (for example, Zabbix [history data export](#)), great performance, and the option to develop, use and share the functionality they provide. It contributes to trouble-free maintenance and helps to deliver new functionality easier and independently of the Zabbix core code base.

Loadable modules are especially useful in a complex monitoring setup. When monitoring embedded systems, having a large number of monitored parameters or heavy scripts with complex logic or long startup time, extensions such as user parameters, `system.run[]` Zabbix agent items, and external checks will have an impact on performance. Loadable modules offer a way of extending Zabbix functionality without sacrificing performance.

Plugins

Plugins provide an alternative to loadable modules (written in C). However, plugins are a way to extend Zabbix agent 2 only.

A plugin is a Go package that defines the structure and implements one or several plugin interfaces (*Exporter, Collector, Configurator, Runner, Watcher*). Two types of Zabbix agent 2 plugins are supported:

- [Built-in plugins](#) (supported since Zabbix 4.4.0)
- [Loadable plugins](#) (supported since Zabbix 6.0.0)

See the list of [built-in plugins](#).

For instructions and tutorials on writing your own plugins, see [Developer center](#).

Alert customization Webhooks

A **webhook** is a Zabbix [media type](#) that provides an option to extend Zabbix alerting capabilities to external software such as helpdesk systems, chats, or messengers. Similarly to script items, webhooks are useful for making HTTP calls using custom JavaScript code, for example, to push notifications to different platforms such as Microsoft Teams, Discord, and Jira. It is also possible to return some data (for example, about created helpdesk tickets) that is then displayed in Zabbix.

Existing webhooks are available in the Zabbix [Git repository](#). For custom webhook development, see [Webhook development guidelines](#).

Alert scripts

An **alert script** is a Zabbix [media type](#) that provides an option to create an alternative way (script) to handle Zabbix alerts. Alert scripts are useful if you are not satisfied with the existing media types for sending alerts in Zabbix.

Frontend customization Custom themes

It is possible to change Zabbix frontend visual appearance by using custom themes. See the [instructions](#) on creating and applying your own themes.

Frontend modules

Frontend modules provide an option to extend Zabbix frontend functionality by adding third-party modules or by developing your own. With frontend modules you can add new menu items, their respective views, actions, etc.

Global scripts A **global script** is a user-defined set of commands that can be executed on a monitoring target (by shell (/bin/sh) interpreter), depending on the configured scope and user permissions. Global scripts can be configured for the following actions:

- Action [operation](#)
- [Manual host action](#)
- [Manual event action](#)

Global scripts are useful in many cases. For example, if configured for action operations or manual host actions, you can use global scripts to automatically or manually execute [remote commands](#) such as restarting an application (web server, middleware, CRM, etc.) or freeing disk space (removing older files, cleaning /tmp, etc). Or, another example, if configured for manual event actions, you can use global scripts to manage problem tickets in external systems.

Global scripts can be executed by Zabbix server, proxy or agent.

Attention:

User-defined commands are executed from the OS user that is used to run Zabbix components. To execute these commands, this user must have the necessary permissions.

Zabbix API **Zabbix API** is an HTTP-based API that is part of Zabbix frontend. With Zabbix API, you can do any of the following operations:

- Programmatically retrieve and modify the configuration of Zabbix.
- Import and export Zabbix configuration.
- Access Zabbix historical and trend data.
- Configure applications to work with Zabbix.
- Integrate Zabbix with third-party software.
- Automate routine tasks.

Zabbix API consists of a multiplicity of methods that are nominally grouped into separate APIs. Each method performs a specific task. For the available methods, as well as an overview of the functions provided by Zabbix API, see [Zabbix API Method reference](#).

1 Loadable modules

Overview

Loadable modules offer a performance-minded option for extending Zabbix functionality.

You can **extend** Zabbix functionality in many ways, for example, with **user parameters**, **external checks**, and `system.run[]` **Zabbix agent items**. These work very well, but have one major drawback, namely `fork()`. Zabbix has to fork a new process every time it handles a user metric, which is not good for performance. It is not a big deal normally, however it could be a serious issue when monitoring embedded systems, having a large number of monitored parameters or heavy scripts with complex logic or long startup time.

Support of loadable modules offers ways for extending Zabbix agent, server and proxy without sacrificing performance.

A loadable module is basically a shared library used by Zabbix daemon and loaded on startup. The library should contain certain functions, so that a Zabbix process may detect that the file is indeed a module it can load and work with.

Loadable modules have a number of benefits. Great performance and ability to implement any logic are very important, but perhaps the most important advantage is the ability to develop, use and share Zabbix modules. It contributes to trouble-free maintenance and helps to deliver new functionality easier and independently of the Zabbix core code base.

Module licensing and distribution in binary form is governed by the AGPL-3.0 license (modules are linking with Zabbix in runtime and are using Zabbix headers; the whole Zabbix code is licensed under AGPL-3.0 license since Zabbix 7.0). Binary compatibility is not guaranteed by Zabbix.

Module API stability is guaranteed during one Zabbix LTS (Long Term Support) **release** cycle. Stability of Zabbix API is not guaranteed (technically it is possible to call Zabbix internal functions from a module, but there is no guarantee that such modules will work).

Module API

In order for a shared library to be treated as a Zabbix module, it should implement and export several functions. There are currently six functions in the Zabbix module API, only one of which is mandatory and the other five are optional.

Mandatory interface

The only mandatory function is **zbx_module_api_version()**:

```
int zbx_module_api_version(void);
```

This function should return the API version implemented by this module and in order for the module to be loaded this version must match module API version supported by Zabbix. Version of module API supported by Zabbix is `ZBX_MODULE_API_VERSION`. So this function should return this constant. Old constant `ZBX_MODULE_API_VERSION_ONE` used for this purpose is now defined to equal `ZBX_MODULE_API_VERSION` to preserve source compatibility, but it's usage is not recommended.

Optional interface

The optional functions are **zbx_module_init()**, **zbx_module_item_list()**, **zbx_module_item_timeout()**, **zbx_module_history_write_cbs()** and **zbx_module_uninit()**:

```
int zbx_module_init(void);
```

This function should perform the necessary initialization for the module (if any). If successful, it should return `ZBX_MODULE_OK`. Otherwise, it should return `ZBX_MODULE_FAIL`. In the latter case Zabbix will not start.

```
ZBX_METRIC *zbx_module_item_list(void);
```

This function should return a list of items supported by the module. Each item is defined in a `ZBX_METRIC` structure, see the section below for details. The list is terminated by a `ZBX_METRIC` structure with "key" field of `NULL`.

```
void zbx_module_item_timeout(int timeout);
```

If module exports **zbx_module_item_list()** then this function is used by Zabbix to specify the timeout settings in Zabbix configuration file that the item checks implemented by the module should obey. Here, the "timeout" parameter is in seconds.

```
ZBX_HISTORY_WRITE_CBS zbx_module_history_write_cbs(void);
```

This function should return callback functions Zabbix server will use to export history of different data types. Callback functions are provided as fields of ZBX_HISTORY_WRITE_CBS structure, fields can be NULL if module is not interested in the history of certain type.

```
int zbx_module_uninit(void);
```

This function should perform the necessary uninitialization (if any) like freeing allocated resources, closing file descriptors, etc.

All functions are called once on Zabbix startup when the module is loaded, with the exception of `zbx_module_uninit()`, which is called once on Zabbix shutdown when the module is unloaded.

Defining items

Each item is defined in a ZBX_METRIC structure:

```
typedef struct
{
    char      *key;
    unsigned   flags;
    int       (*function)();
    char      *test_param;
}
ZBX_METRIC;
```

Here, **key** is the item key (e.g., "dummy.random"), **flags** is either CF_HAVEPARAMS or 0 (depending on whether the item accepts parameters or not), **function** is a C function that implements the item (e.g., "zbx_module_dummy_random"), and **test_param** is the parameter list to be used when Zabbix agent is started with the "-p" flag (e.g., "1,1000", can be NULL). An example definition may look like this:

```
static ZBX_METRIC keys[] =
{
    { "dummy.random", CF_HAVEPARAMS, zbx_module_dummy_random, "1,1000" },
    { NULL }
}
```

Each function that implements an item should accept two pointer parameters, the first one of type AGENT_REQUEST and the second one of type AGENT_RESULT:

```
int zbx_module_dummy_random(AGENT_REQUEST *request, AGENT_RESULT *result)
{
    ...

    SET_UI64_RESULT(result, from + rand() % (to - from + 1));

    return SYSINFO_RET_OK;
}
```

These functions should return SYSINFO_RET_OK, if the item value was successfully obtained. Otherwise, they should return SYSINFO_RET_FAIL. See example "dummy" module below for details on how to obtain information from AGENT_REQUEST and how to set information in AGENT_RESULT.

Providing history export callbacks

Attention:

History export via module is no longer supported by Zabbix proxy.

Module can specify functions to export history data by type: Numeric (float), Numeric (unsigned), Character, Text and Log:

```
typedef struct
{
    void (*history_float_cb)(const ZBX_HISTORY_FLOAT *history, int history_num);
    void (*history_integer_cb)(const ZBX_HISTORY_INTEGER *history, int history_num);
}
```

```

void      (*history_string_cb)(const ZBX_HISTORY_STRING *history, int history_num);
void      (*history_text_cb)(const ZBX_HISTORY_TEXT *history, int history_num);
void      (*history_log_cb)(const ZBX_HISTORY_LOG *history, int history_num);
}
ZBX_HISTORY_WRITE_CBS;

```

Each of them should take "history" array of "history_num" elements as arguments. Depending on history data type to be exported, "history" is an array of the following structures, respectively:

```

typedef struct
{
    zbx_uint64_t    itemid;
    int             clock;
    int             ns;
    double          value;
}
ZBX_HISTORY_FLOAT;

```

```

typedef struct
{
    zbx_uint64_t    itemid;
    int             clock;
    int             ns;
    zbx_uint64_t    value;
}
ZBX_HISTORY_INTEGER;

```

```

typedef struct
{
    zbx_uint64_t    itemid;
    int             clock;
    int             ns;
    const char      *value;
}
ZBX_HISTORY_STRING;

```

```

typedef struct
{
    zbx_uint64_t    itemid;
    int             clock;
    int             ns;
    const char      *value;
}
ZBX_HISTORY_TEXT;

```

```

typedef struct
{
    zbx_uint64_t    itemid;
    int             clock;
    int             ns;
    const char      *value;
    const char      *source;
    int             timestamp;
    int             logeventid;
    int             severity;
}
ZBX_HISTORY_LOG;

```

Callbacks will be used by Zabbix server history syncer processes in the end of history sync procedure after data is written into Zabbix database and saved in value cache.

Attention:

In case of internal error in history export module, it is recommended that module is written in such a way that it does not block whole monitoring until it recovers but discards data instead and allows Zabbix server to continue running.

Building modules

Modules are currently meant to be built inside Zabbix source tree, because the module API depends on some data structures that are defined in Zabbix headers.

The most important header for loadable modules is **include/module.h**, which defines these data structures. Other necessary system headers that help **include/module.h** to work properly are **stdlib.h** and **stdint.h**.

With this information in mind, everything is ready for the module to be built. The module should include **stdlib.h**, **stdint.h** and **module.h**, and the build script should make sure that these files are in the include path. See example "dummy" module below for details.

Another useful header is **include/zbxcommon.h**, which defines **zabbix_log()** function, which can be used for logging and debugging purposes.

Configuration parameters

Zabbix agent, server and proxy support two **parameters** to deal with modules:

- LoadModulePath – full path to the location of loadable modules
- LoadModule – module(s) to load at startup. The modules must be located in a directory specified by LoadModulePath or the path must precede the module name. If the preceding path is absolute (starts with '/') then LoadModulePath is ignored. It is allowed to include multiple LoadModule parameters.

For example, to extend Zabbix agent we could add the following parameters:

```
LoadModulePath=/usr/local/lib/zabbix/agent/
LoadModule=mariadb.so
LoadModule=apache.so
LoadModule=kernel.so
LoadModule=/usr/local/lib/zabbix/dummy.so
```

Upon agent startup it will load the mariadb.so, apache.so and kernel.so modules from the /usr/local/lib/zabbix/agent directory while dummy.so will be loaded from /usr/local/lib/zabbix. The agent will fail to start if a module is missing, in case of bad permissions or if a shared library is not a Zabbix module.

Frontend configuration

Loadable modules are supported by Zabbix agent, server and proxy. Therefore, item type in Zabbix frontend depends on where the module is loaded. If the module is loaded into the agent, then the item type should be "Zabbix agent" or "Zabbix agent (active)". If the module is loaded into server or proxy, then the item type should be "Simple check".

History export through Zabbix modules does not need any frontend configuration. If the module is successfully loaded by server and provides **zbx_module_history_write_cbs()** function which returns at least one non-NULL callback function then history export will be enabled automatically.

Dummy module

Zabbix includes a sample module written in C language. The module is located under src/modules/dummy:

```
alex@alex:~trunk/src/modules/dummy$ ls -l
-rw-rw-r-- 1 alex alex 9019 Apr 24 17:54 dummy.c
-rw-rw-r-- 1 alex alex 67 Apr 24 17:54 Makefile
-rw-rw-r-- 1 alex alex 245 Apr 24 17:54 README
```

The module is well documented, it can be used as a template for your own modules.

After ./configure has been run in the root of Zabbix source tree as described above, just run **make** in order to build **dummy.so**.

        /* do something with history[i].itemid, history[i].clock, history[i].ns, history[i].value, ... */
    }
}

/*****
 *
 * Function: zbx_module_history_write_cbs
 *
 * Purpose: returns a set of module functions Zabbix will call to export
 *          different types of historical data
 *
 * Return value: structure with callback function pointers (can be NULL if
 *               module is not interested in data of certain types)
 *
 *****/
ZBX_HISTORY_WRITE_CBS    zbx_module_history_write_cbs(void)
{
    static ZBX_HISTORY_WRITE_CBS    dummy_callbacks =
    {
        dummy_history_float_cb,
        dummy_history_integer_cb,
        dummy_history_string_cb,
        dummy_history_text_cb,
        dummy_history_log_cb,
    };

    return dummy_callbacks;
}

```

The module exports three new items:

- `dummy.ping` - always returns '1'
- `dummy.echo[param1]` - returns the first parameter as it is, for example, `dummy.echo[ABC]` will return ABC
- `dummy.random[param1, param2]` - returns a random number within the range of param1-param2, for example, `dummy.random[1,1000000]`

Limitations

Support of loadable modules is implemented for the Unix platform only. It means that it does not work for Windows agents.

In some cases a module may need to read module-related configuration parameters from `zabbix_agentd.conf`. It is not supported currently. If you need your module to use some configuration parameters you should probably implement parsing of a module-specific configuration file.

2 Plugins

Overview

Plugins provide an option to extend the monitoring capabilities of Zabbix. Plugins are written in Go programming language and are supported by Zabbix agent 2 only. Plugins provide an alternative to **loadable modules** (written in C), and **other methods** for extending Zabbix functionality.

The following features are specific to agent 2 and its plugins:

- support of scheduled and flexible intervals for both passive and active checks;
- task queue management with respect to schedule and task concurrency;
- plugin-level timeouts;
- compatibility check of Zabbix agent 2 and its plugins on start up.

Since Zabbix 6.0, plugins don't have to be integrated into the agent 2 directly and can be added as loadable plugins, thus making the creation process of additional plugins for gathering new monitoring metrics easier.

This page lists Zabbix native and loadable plugins, and describes plugin configuration principles from the user perspective.

Note:

For instructions on writing your own plugins, see [Developer center](#) and [Example plugin for Zabbix agent 2](#).

For details on the communication process between Zabbix agent 2 and a loadable plugin as well as the metric collection process, see [Connection diagram](#).

Configuring plugins

This section provides common plugin configuration principles and best practices.

All plugins are configured using *Plugins.** parameter, which can either be part of the Zabbix agent 2 [configuration file](#) or a plugin's own [configuration file](#). If a plugin uses a separate configuration file, path to this file should be specified in the Include parameter of Zabbix agent 2 configuration file.

A typical plugin parameter has the following structure:

Plugins.<PluginName>.<Parameter>=<Value>

Additionally, there are two specific groups of parameters:

- *Plugins.<PluginName>.Default.<Parameter>=<Value>* used for defining [default parameter values](#).
- *Plugins.<PluginName>.<SessionName>.<Parameter>=<Value>* used for defining separate sets of parameters for different monitoring targets via [named sessions](#).

All parameter names should adhere to the following requirements:

- it is recommended to capitalize the names of your plugins;
- the parameter should be capitalized;
- special characters are not allowed;
- nesting isn't limited by a maximum level;
- the number of parameters is not limited.

For example, to perform [active checks](#) that do not have *Scheduling update interval* immediately after the agent restart only for the Uptime plugin, set *Plugins.Uptime.System.ForceActiveChecksOnStart=1* in the [configuration file](#). Similarly, to set custom limit for [concurrent checks](#) for the CPU plugin, set the *Plugins.CPU.System.Capacity=N* in the [configuration file](#).

Default values

You can set default values for the connection-related parameters (URI, username, password, etc.) in the configuration file in the format:

Plugins.<PluginName>.Default.<Parameter>=<Value>

For example, *Plugins.Mysql.Default.Username=zabbix*, *Plugins.MongoDB.Default.Uri=tcp://127.0.0.1:27017*, etc.

If a value for such parameter is not provided in an item key or in the [named session](#) parameters, the plugin will use the default value. If a default parameter is also undefined, hardcoded defaults will be used.

Note:

If an item key does not have any parameters, Zabbix agent 2 will attempt to collect the metric using values defined in the default parameters section.

Named sessions

Named sessions represent an additional level of plugin parameters and can be used to specify separate sets of authentication parameters for each of the instances being monitored. Each named session parameter should have the following structure:

Plugins.<PluginName>.Sessions.<SessionName>.<Parameter>=<Value>

A session name can be used as a connString item key parameter instead of specifying a URI, username, and/or password separately.

In item keys, the first parameter can be either a connString or a URI. If the first key parameter doesn't match any session name, it will be treated as a URI. Note that passing embedded URI credentials in the item key is not supported, use named session parameters instead.

The list of available **named session parameters** depends on the plugin.

It is possible to override session parameters by specifying new values in the item key parameters (see **example**).

If a parameter is not defined for the named session, Zabbix agent 2 will use the value defined in the **default plugin parameter**.

Parameter priority

Zabbix agent 2 plugins search for connection-related parameter values in the following order:

1. The first item key parameter is compared to session names. If no match is found, it is treated as an actual value; in this case, step 3 will be skipped. If a match is found, the parameter value (usually, a URI) must be defined in the named session.
2. Other parameters will be taken from the item key if defined.
3. If an item key parameter (for example, password) is empty, plugin will look for the corresponding named session parameter.
4. If the session parameter is also not specified, the value defined in the corresponding **default parameter** will be used.
5. If all else fails, the plugin will use the hardcoded default value.

Example 1

Monitoring of two instances "MySQL1" and "MySQL2".

Configuration parameters:

```
Plugins.Mysql.Sessions.MySQL1.Uri=tcp://127.0.0.1:3306
Plugins.Mysql.Sessions.MySQL1.User=mysql1_user
Plugins.Mysql.Sessions.MySQL1.Password=unique_password
Plugins.Mysql.Sessions.MySQL2.Uri=tcp://192.0.2.0:3306
Plugins.Mysql.Sessions.MySQL2.User=mysql2_user
Plugins.Mysql.Sessions.MySQL2.Password=different_password
```

As a result of this configuration, each session name may be used as a connString in an **item key**, e.g., `mysql.ping[MySQL1]` or `mysql.ping[MySQL2]`.

Example 2

Providing some of the parameters in the item key.

Configuration parameters:

```
Plugins.PostgreSQL.Sessions.Session1.Uri=tcp://192.0.2.234:5432
Plugins.PostgreSQL.Sessions.Session1.User=old_username
Plugins.PostgreSQL.Sessions.Session1.Password=session_password
```

Item key: `pgsql.ping[session1,new_username,,postgres]`

As a result of this configuration, the agent will connect to PostgreSQL using the following parameters:

- URI from session parameter: *192.0.2.234:5432*
- Username from the item key: *new_username*
- Password from session parameter (since it is omitted in the item key): *session_password*
- Database name from the item key: *postgres*

Example 3

Collecting a metric using default configuration parameters.

Configuration parameters:

```
Plugins.PostgreSQL.Default.Uri=tcp://192.0.2.234:5432
Plugins.PostgreSQL.Default.User=zabbix
Plugins.PostgreSQL.Default.Password=password
```

Item key: `pgsql.ping[,,,postgres]`

As a result of this configuration, the agent will connect to PostgreSQL using the parameters:

- Default URI: *192.0.2.234:5432*
- Default username: *zabbix*
- Default password: *password*
- Database name from the item key: *postgres*

Connections

Some plugins support gathering metrics from multiple instances simultaneously. Both local and remote instances can be monitored. TCP and Unix-socket connections are supported.

It is recommended to configure plugins to keep connections to instances in an open state. The benefits are reduced network congestion, latency, and CPU and memory usage due to the lower number of connections. The client library takes care of this.

Note:

Time period for which unused connections should remain open can be determined by *Plugins.<PluginName>.KeepAlive* parameter. Example: *Plugins.Memcached.KeepAlive*

Plugins

All metrics supported by Zabbix agent 2 are collected by plugins.

Built-in

The following plugins for Zabbix agent 2 are available out-of-the-box. Click on the plugin name to go to the plugin repository with additional information.

| Plugin name | Description | Supported item keys | Comments |
|-----------------------|--|---|---|
| Agent | Metrics of the Zabbix agent being used. | agent.hostname, agent.ping, agent.version | Supported keys have the same parameters as Zabbix agent keys . |
| Ceph | Ceph monitoring. | ceph.df.details, ceph.osd.stats, ceph.osd.discovery, ceph.osd.dump, ceph.ping, ceph.pool.discovery, ceph.status | |
| CPU | System CPU monitoring (number of CPUs/CPU cores, discovered CPUs, utilization percentage). | system.cpu.discovery, system.cpu.num, system.cpu.util | Supported keys have the same parameters as Zabbix agent keys . |

| Plugin name | Description | Supported item keys | Comments |
|---------------------------|---|--|---|
| Docker | Monitoring of Docker containers. | docker.container_info, docker.container_stats, docker.containers, docker.containers.discovery, docker.data_usage, docker.images, docker.images.discovery, docker.info, docker.ping | See also: Configuration parameters |
| File | File metrics collection. | vfs.file.cksum, vfs.file.contents, vfs.file.exists, vfs.file.md5sum, vfs.file.regexp, vfs.file.regmatch, vfs.file.size, vfs.file.time | Supported keys have the same parameters as Zabbix agent keys . |
| Kernel | Kernel monitoring. | kernel.maxfiles, kernel.maxproc | Supported keys have the same parameters as Zabbix agent keys . |
| Log | Log file monitoring. | log, log.count, logrt, logrt.count | Supported keys have the same parameters as Zabbix agent keys . See also: Plugin configuration parameters (Unix/Windows) |
| Memcached | Memcached server monitoring. | memcached.ping, memcached.stats | |
| Modbus | Reads Modbus data. | modbus.get | Supported keys have the same parameters as Zabbix agent keys . |
| MQTT | Receives published values of MQTT topics. | mqtt.get | To configure encrypted connection to the MQTT broker, specify the TLS parameters in the agent configuration file as named session or default parameters. Currently, TLS parameters cannot be passed as item key parameters. |
| MySQL | Monitoring of MySQL and its forks. | mysql.custom.query, mysql.db.discovery, mysql.db.size, mysql.get_status_variables, mysql.ping, mysql.replication.discovery, mysql.replication.get_slave_status, mysql.version | To configure encrypted connection to the database, specify the TLS parameters in the agent configuration file as named session or default parameters. Currently, TLS parameters cannot be passed as item key parameters. |
| Netif | Monitoring of network interfaces. | net.if.collisions, net.if.discovery, net.if.in, net.if.out, net.if.total | Supported keys have the same parameters as Zabbix agent keys . |

| Plugin name | Description | Supported item keys | Comments |
|-------------|--------------------------------------|--|--|
| Oracle | Oracle Database monitoring. | oracle.diskgroups.stats, ora- cle.diskgroups.discovery, oracle.archive.info, or- acle.archive.discovery, oracle.cdb.info, oracle.custom.query, oracle.datafiles.stats, oracle.db.discovery, oracle.fra.stats, oracle.instance.info, oracle.pdb.info, oracle.pdb.discovery, oracle.pga.stats, oracle.ping, oracle.proc.stats, oracle.redolog.info, oracle.sga.stats, oracle.sessions.stats, oracle.sys.metrics, oracle.sys.params, oracle.ts.stats, oracle.ts.discovery, oracle.user.info, oracle.version | Install the Oracle Instant Client before using the plugin. |
| Proc | Process CPU utilization percentage. | proc.cpu.util | Supported key has the same parameters as Zabbix agent key . |
| Redis | Redis server monitoring. | redis.config, redis.info, redis.ping, redis.slowlog.count | |
| Smart | S.M.A.R.T. monitoring. | smart.attribute.discovery, smart.disk.discovery, smart.disk.get | The minimum required smartctl version is 7.1. Sudo/root access rights to smartctl are required for the user executing Zabbix agent 2. The plugin uses only the following commands: <pre>/usr/sbin/smartctl -a * /usr/sbin/smartctl --scan * /usr/sbin/smartctl -j -V</pre> Supported keys can be used with Zabbix agent 2 only on Linux/Windows, both as a passive and active check. See also: Configuration parameters |
| SW | Listing of installed packages. | system.sw.packages, sys- tem.sw.packages.get | The supported keys have the same parameters as Zabbix agent key . |
| Swap | Swap space size in bytes/percentage. | system.swap.size | Supported key has the same parameters as Zabbix agent key . |
| SystemRun | Runs specified command. | system.run | Supported key has the same parameters as Zabbix agent key . See also: Plugin configuration parameters (Unix/Windows) |
| Systemd | Monitoring of systemd services. | systemd.unit.discovery, systemd.unit.get, systemd.unit.info | |
| TCP | TCP connection availability check. | net.tcp.port | Supported key has the same parameters as Zabbix agent key . |

| Plugin name | Description | Supported item keys | Comments |
|--------------------------------|---|---|--|
| UDP | Monitoring of the UDP services availability and performance. | net.udp.service, net.udp.service.perf | Supported keys have the same parameters as Zabbix agent keys . |
| Uname | Retrieval of information about the system. | system.hostname, system.sw.arch, system.uname | Supported keys have the same parameters as Zabbix agent keys . |
| Uptime | System uptime metrics collection. | system.uptime | Supported key has the same parameters as Zabbix agent key . |
| VFSDev | VFS metrics collection. | vfs.dev.discovery, vfs.dev.read, vfs.dev.write | Supported keys have the same parameters as Zabbix agent keys . |
| WebCertificate | Monitoring of TLS/SSL website certificates. | web.certificate.get | |
| WebPage | Web page monitoring. | web.page.get, web.page.perf, web.page.regex | Supported keys have the same parameters as Zabbix agent keys . |
| ZabbixAsync | Asynchronous metrics collection. | net.tcp.listen, net.udp.listen, sensor, system.boottime, system.cpu.intr, system.cpu.load, system.cpu.switches, system.hw.cpu, system.hw.macaddr, system.localtime, system.sw.os, system.swap.in, system.swap.out, vfs.fs.discovery | Supported keys have the same parameters as Zabbix agent keys . |
| ZabbixStats | Zabbix server/proxy internal metrics or number of delayed items in a queue. | zabbix.stats | Supported keys have the same parameters as Zabbix agent keys . |
| ZabbixSync | Synchronous metrics collection. | net.dns, net.dns.record, net.tcp.service, net.tcp.service.perf, proc.mem, proc.num, system.hw.chassis, system.hw.devices, system.sw.packages, system.users.num, vfs.dir.count, vfs.dir.size, vfs.fs.get, vfs.fs.inode, vfs.fs.size, vm.memory.size. | Supported keys have the same parameters as Zabbix agent keys . |

Loadable

Loadable plugins for Zabbix agent 2 are not available out-of-the-box and need to be installed separately:

- For Linux, see [Building loadable plugins](#).
- For Windows, see [Windows agent installation from MSI](#).

Click on the plugin name to go to the plugin repository with additional information.

| Plugin name | Description | Supported item keys | Comments |
|-------------|--|---|--|
| Ember+ | Monitoring of Ember+. | ember.get | Currently only available to be built from the source (for both Unix and Windows). See also Ember+ plugin configuration parameters . |
| MongoDB | Monitoring of MongoDB servers and clusters (document-based, distributed database). | mongodb.collection.stats, mon-godb.collections.discovery, mon-godb.collections.usage, mon-godb.connpool.stats, mongodb.db.stats, mon-godb.db.discovery, mon-godb.jumbo_chunks.count, mongodb.oplog.stats, mongodb.ping, mongodb.rs.config, mongodb.rs.status, mon-godb.server.status, mongodb.sh.discovery, mongodb.version | To configure encrypted connections to the database, specify the TLS parameters in the agent configuration file as named session parameters. Currently, TLS parameters cannot be passed as item key parameters. See also MongoDB plugin configuration parameters . |
| MSSQL | Monitoring of MSSQL database. | mssql.availability.group.get, mssql.custom.query, mssql.db.get, mssql.job.status.get, mssql.last.backup.get, mssql.local.db.get, mssql.mirroring.get, mssql.nonlocal.db.get, mssql.perfcounter.get, mssql.ping, mssql.quorum.get, mssql.quorum.member.get, mssql.replica.get, mssql.version | To configure encrypted connection to the database, specify the TLS parameters in the agent configuration file as named session or default parameters. Currently, TLS parameters cannot be passed as item key parameters. See also MSSQL plugin configuration parameters . |

| Plugin name | Description | Supported item keys | Comments |
|----------------------------|---|--|---|
| NVIDIA GPU | Monitoring of NVIDIA GPU. | nvml.device.count, nvml.device.decoder.utilization, nvml.device.ecc.mode, nvml.device.encoder.stats.get, nvml.device.encoder.utilization, nvml.device.energy.consumption, nvml.device.errors.memory, nvml.device.errors, nvml.device.errors.register, nvml.device.fan.speed.avg, nvml.device.get, nvml.device.graphics.frequency, nvml.device.memory.bar1.get, nvml.device.memory.fb.get, nvml.device.memory.frequency, nvml.device.pci.utilization, nvml.device.performance.state, nvml.device.power.limit, nvml.device.power.usage, nvml.device.serial, nvml.device.sm.frequency, nvml.device.temperature, nvml.device.utilization, nvml.device.video.frequency, nvml.system.driver.version, nvml.version | See also NVIDIA GPU plugin configuration parameters . |
| PostgreSQL | Monitoring of PostgreSQL and its forks. | pgsql.autovacuum.count, pgsql.archive, pgsql.bgwriter, pgsql.cache.hit, pgsql.connections, pgsql.custom.query, pgsql.dbstat, pgsql.dbstat.sum, pgsql.db.age, pgsql.db.bloating_tables, pgsql.db.discovery, pgsql.db.size, pgsql.locks, pgsql.oldest.xid, pgsql.ping, pgsql.queries, pgsql.replication.count, pgsql.replication.process, pgsql.replication.process.discovery, pgsql.replication.recovery_role, pgsql.replication.status, pgsql.replication_lag.b, pgsql.replication_lag.sec, pgsql.uptime, pgsql.version, pgsql.wal.stat | To configure encrypted connections to the database, specify the TLS parameters in the agent configuration file as named session or default parameters. Currently, TLS parameters cannot be passed as item key parameters. See also PostgreSQL plugin configuration parameters . |

Note:

Loadable plugins, when launched with:
 -V --version - print plugin version and license information;
 -h --help - print help information.

1 Building loadable plugins

Overview

This page provides the steps required to build a loadable plugin binary from the sources.

If the source tarball is downloaded, it is possible to build the plugin offline, i.e. without the internet connection.

The PostgreSQL plugin is used as an example. Other loadable plugins can be built in a similar way.

Steps

1. Download the plugin sources from [Zabbix Cloud Images and Appliances](#). The official download page will be available soon.
2. Transfer the archive to the machine where you are going to build the plugin.
3. Unarchive the tarball, e.g.:

```
tar xvf zabbix-agent2-plugin-postgresql-1.0.0.tar.gz
```

Make sure to replace "zabbix-agent2-plugin-postgresql-1.0.0.tar.gz" with the name of the downloaded archive.

4. Enter the extracted directory:

```
cd <path to directory>
```

5. Run:

```
make
```

6. The plugin executable may be placed anywhere as long as it is loadable by Zabbix agent 2. Specify the path to the plugin binary in the plugin configuration file, e.g. in postgresql.conf for the PostgreSQL plugin:

```
Plugins.PostgreSQL.System.Path=/path/to/executable/zabbix-agent2-plugin-postgresql
```

7. Path to the plugin configuration file must be specified in the Include parameter of the Zabbix agent 2 configuration file:

```
Include=/path/to/plugin/configuration/file/postgresql.conf
```

Makefile targets

Loadable plugins provided by Zabbix have simple makefiles with the following targets:

| Target | Description |
|-------------|--|
| make | Build plugin. |
| make clean | Delete all files that are normally created by building the plugin. |
| make check | Perform self-tests. A real PostgreSQL database is required. |
| make style | Check Go code style with 'golangci-lint'. |
| make format | Format Go code with 'go fmt'. |
| make dist | Create an archive containing the plugin sources and sources of all packages needed to build the plugin and its self-tests. |

3 Frontend modules

Overview

It is possible to enhance Zabbix frontend functionality by adding third-party modules or by developing your own modules without the need to change the source code of Zabbix.

Note that the module code will run with the same privileges as Zabbix source code. This means:

- third-party modules can be harmful. You must trust the modules you are installing;
- Errors in a third-party module code may crash the frontend. If this happens, just remove the module code from the frontend. As soon as you reload Zabbix frontend, you'll see a note saying that some modules are absent. Go to **Module administration** (in *Administration* → *General* → *Modules*) and click *Scan directory* again to remove non-existent modules from the database.

Installation

Please always read the installation manual for a particular module. It is recommended to install new modules one by one to catch failures easily.

Just before you install a module:

- Make sure you have downloaded the module from a trusted source. Installation of harmful code may lead to consequences, such as data loss

- Different versions of the same module (same ID) can be installed in parallel, but only a single version can be enabled at once

Steps to install a module:

- Unpack your module within its own folder in the `modules` folder of the Zabbix frontend
- Ensure that your module folder contains at least the `manifest.json` file
- Navigate to **Module administration** and click the *Scan directory* button
- New module will appear in the list along with its version, author, description and status
- Enable module by clicking on its status

Troubleshooting:

| Problem | Solution |
|---|--|
| <i>Module did not appear in the list</i> | If your module didn't appear in the list, make sure <code>manifest.json</code> exists in <code>modules/your-module/</code> . If it doesn't, you might have unpacked the module to the wrong directory. If it does, the module might not be compatible with your Zabbix version. Also, check that the web server user has at least read-write access (+rx) to the module folder and all subdirectories, and read access (+r) to all files inside. |
| <i>Frontend crashed</i> | The module code is not compatible with the current Zabbix version or server configuration. Please delete module files and reload the frontend. You'll see a notice that some modules are absent. Go to Module administration and click <i>Scan directory</i> again to remove non-existent modules from the database. |
| <i>Error message about identical namespace, ID or actions appears</i> | New module tried to register a namespace, ID or actions which are already registered by other enabled modules. Disable the conflicting module (mentioned in error message) prior to enabling the new one. |
| <i>Technical error messages appear</i> | Report errors to the developer of the module. |

Developing modules

For information about developing custom modules, see **Developer center**.

22 Appendixes

Please use the sidebar to access content in the Appendixes section.

1 Installation and setup

Please use the sidebar to access content in this section.

1 Database creation

Overview

A Zabbix database must be created during the installation of Zabbix server or proxy.

This section provides instructions for creating a Zabbix database. A separate set of instructions is available for each supported database.

Note:

To improve database security by creating database roles/users with minimal privileges, see database creation best practices for each supported database:

- **MySQL/MariaDB**
- **PostgreSQL/TimescaleDB**

For configuring secure TLS connections, see **Secure connection to the database**.

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings. For switching to UTF-8, see [Repairing Zabbix database character set and collation](#). See also [Limits of filtering with utf8mb4 collations](#).

Note:

If installing from [Zabbix Git repository](#), you need to run the following command prior to proceeding to the next steps:

 make dbschema

MySQL/MariaDB

Character sets utf8 (aka utf8mb3) and utf8mb4 are supported (with utf8_bin and utf8mb4_bin collation respectively) for Zabbix server/proxy to work properly with MySQL database. It is recommended to use utf8mb4 for new installations.

Deterministic triggers need to be created during the import of schema. On MySQL and MariaDB, this requires GLOBAL log_bin_trust_function_creators = 1 to be set if binary logging is enabled and there is no superuser privileges and log_bin_trust_function_creators = 1 is not set in MySQL configuration file.

If you are installing from Zabbix **packages**, proceed to the [instructions](#) for your platform.

If you are installing Zabbix from sources:

- Create and configure a database and a user.

```
mysql -uroot -p<password>
```

```
mysql> create database zabbix character set utf8mb4 collate utf8mb4_bin;
mysql> create user 'zabbix'@'localhost' identified by '<password>';
mysql> grant all privileges on zabbix.* to 'zabbix'@'localhost';
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
mysql> quit;
```

- Import the data into the database and set utf8mb4 character set as default. For a Zabbix proxy database, only schema.sql should be imported (no images.sql nor data.sql).

```
cd database/mysql
mysql -uzabbix -p<password> zabbix < schema.sql
#### stop here if you are creating database for Zabbix proxy
mysql -uzabbix -p<password> zabbix < images.sql
mysql -uzabbix -p<password> --default-character-set=utf8mb4 zabbix < data.sql
```

log_bin_trust_function_creators can be disabled after the schema has been successfully imported:

```
mysql -uroot -p<password>

mysql> SET GLOBAL log_bin_trust_function_creators = 0;
mysql> quit;
```

PostgreSQL

You need to have database user with permissions to create database objects.

If you are installing from Zabbix **packages**, proceed to the [instructions](#) for your platform.

If you are installing Zabbix from sources:

- Create a database user.

The following shell command will create user zabbix. Specify a password when prompted and repeat the password (note, you may first be asked for sudo password):

```
sudo -u postgres createuser --pwprompt zabbix
```

- Create a database.

The following shell command will create the database zabbix (last parameter) with the previously created user as the owner (-O zabbix).

```
sudo -u postgres createdb -O zabbix -E Unicode -T template0 zabbix
```

- Import the initial schema and data (assuming you are in the root directory of Zabbix sources). For a Zabbix proxy database, only schema.sql should be imported (no images.sql nor data.sql).

```
cd database/postgresql
cat schema.sql | sudo -u zabbix psql zabbix
#### stop here if you are creating database for Zabbix proxy
cat images.sql | sudo -u zabbix psql zabbix
cat data.sql | sudo -u zabbix psql zabbix
```

Attention:

The above commands are provided as an example that will work in most of GNU/Linux installations. You can use different commands depending on how your system/database is configured, for example: `psql -U <username>`
If you have any trouble setting up the database, please consult your Database administrator.

TimescaleDB

Instructions for creating and configuring TimescaleDB are provided in a separate [section](#).

SQLite

Using SQLite is supported for **Zabbix proxy** only!

The database will be automatically created if it does not exist.

Return to the [installation section](#).

2 Repairing Zabbix database character set and collation

MySQL/MariaDB

Historically, MySQL and derivatives used 'utf8' as an alias for utf8mb3 - MySQL's own 3-byte implementation of the standard UTF8, which is 4-byte. Starting from MySQL 8.0.28 and MariaDB 10.6.1, 'utf8mb3' character set is deprecated and at some point its support will be dropped while 'utf8' will become a reference to 'utf8mb4'. Since Zabbix 6.0, 'utf8mb4' is supported. To avoid future problems, it is highly recommended to use 'utf8mb4'. Another advantage of switching to 'utf8mb4' is support of supplementary Unicode characters.

Warning:

As versions before Zabbix 6.0 are not aware of utf8mb4, make sure to first upgrade Zabbix server and DB schema to 6.0.x or later before executing utf8mb4 conversion.

1. Check the database character set and collation.

For example:

```
mysql> SELECT @@character_set_database, @@collation_database;
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| latin2                   | latin2_general_ci    |
+-----+-----+
```

Or:

```
mysql> SELECT @@character_set_database, @@collation_database;
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| utf8                     | utf8_bin              |
+-----+-----+
```

As we see, the character set here is not 'utf8mb4' and collation is not 'utf8mb4_bin', so we need to fix them.

2. Stop Zabbix.

3. Create a backup copy of the database!

4. Fix the character set and collation on database level:

```
alter database <your DB name> character set utf8mb4 collate utf8mb4_bin;
```

Fixed values:

```
mysql> SELECT @@character_set_database, @@collation_database;
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| utf8mb4                  | utf8mb4_bin          |
+-----+-----+
```

5. Load the **script** to fix character set and collation on table and column level:

```
mysql <your DB name> < utf8mb4_convert.sql
```

6. Execute the script:

```
SET @ZABBIX_DATABASE = '<your DB name>';
If MariaDB → set innodb_strict_mode = OFF;
              CALL zbx_convert_utf8();
If MariaDB → set innodb_strict_mode = ON;
              drop procedure zbx_convert_utf8;
```

Please note that 'utf8mb4' is expected to consume slightly more disk space.

7. If no errors - you may want to create a database backup copy with the fixed database.

8. Start Zabbix.

3 Database upgrade to primary keys

Overview

This section provides instructions for manually upgrading tables in existing installations to primary keys.

Upgrading to primary keys optimizes how data is indexed and accessed, which may speed up queries and save space. It also improves data management and synchronization in clustered setups, helping with scaling and ensuring the system remains reliable even if some servers fail.

Attention:

The instructions provided on this page are designed for advanced users and may need to be adjusted for your specific configuration. Upgrading to primary keys can be time-consuming and resource-intensive. Ensure that enough free disk space is available; depending on your database size and stored data, the process may require up to 2.5 times the space currently used by history tables.

Primary keys are used for all tables in new installations since Zabbix 6.0.

There is no automatic database upgrade to primary keys; however, existing installations may be upgraded manually **after** upgrading Zabbix server to 6.0 or newer.

Attention:

Since Zabbix 7.0, upgrading tables to primary keys also upgrades tables to use double precision data types.

 If you have Zabbix 7.0 (or later), tables already use double precision. However, the instructions on this page can still be followed to upgrade tables to primary keys without affecting tables that already use double precision.

 If you have Zabbix 6.4 (or earlier), consider upgrading tables to double precision first. For more information, see [Upgrading to numeric values of extended range](#) in Zabbix 7.0 documentation.

Instructions are available for:

- [MySQL](#)
- [PostgreSQL](#)
- [TimescaleDB](#)

Important notes

To perform the database upgrade:

1. Stop Zabbix server.

Stopping Zabbix server for the time of the upgrade is strongly recommended. However, if absolutely necessary, you can perform the upgrade while the server is running (only for MySQL, MariaDB, and PostgreSQL without TimescaleDB).

2. Back up your database.

3. Install the latest zabbix-sql-scripts package compatible with your Zabbix version (e.g., for RHEL: `dnf install zabbix-sql-scripts`).
4. Run the scripts for your database.
5. Start Zabbix server.

Warning:

Run the scripts for the server database only. The proxy will not benefit from this upgrade.

If the database uses partitions, contact the DB administrator or Zabbix Support for help.

CSV files can be removed after a successful upgrade to primary keys.

Optionally, Zabbix frontend may be switched to **maintenance mode**.

MySQL

Export and import must be performed in tmux/screen to ensure that the session isn't dropped.

See also: [Important notes](#)

MySQL 8.0+ with mysqlsh

This method can be used with a running Zabbix server, but it is recommended to stop the server for the time of the upgrade. The MySQL Shell (*mysqlsh*) must be [installed](#) and able to connect to the DB.

- Log in to MySQL console as root (recommended) or as any user with FILE privileges.
- Start MySQL with [local_infile](#) variable enabled.
- Rename old tables and create new tables by running `history_upgrade_prepare.sql`.

```
mysql -uzabbix -p<password> zabbix < /usr/share/zabbix/sql-scripts/mysql/option-patches/history_upgrade_prepare.sql
```

- Export and import data.

Connect via mysqlsh. If using a socket connection, specifying the path might be required.

```
sudo mysqlsh -uroot -S /run/mysqld/mysqld.sock --no-password -Dzabbix
```

Switch into JavaScript mode using:

```
\js
```

Then run the code below (CSVPATH can be changed as needed):

```
CSVPATH="/var/lib/mysql-files";

util.exportTable("history_old", CSVPATH + "/history.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history.csv", {"dialect": "csv", "table": "history" });

util.exportTable("history_uint_old", CSVPATH + "/history_uint.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_uint.csv", {"dialect": "csv", "table": "history_uint" });

util.exportTable("history_str_old", CSVPATH + "/history_str.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_str.csv", {"dialect": "csv", "table": "history_str" });

util.exportTable("history_log_old", CSVPATH + "/history_log.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_log.csv", {"dialect": "csv", "table": "history_log" });

util.exportTable("history_text_old", CSVPATH + "/history_text.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_text.csv", {"dialect": "csv", "table": "history_text" });
```

If you receive the message "JavaScript is not supported", your MySQL Shell installation lacks JS support. In that case, install the official [MySQL Shell package](#) from Oracle (or build it from source) so that JavaScript mode is enabled.

- Follow [post-migration instructions](#) to drop the old tables.

MariaDB/MySQL 8.0+ without mysqlsh

This upgrade method takes more time and should be used only if an upgrade with *mysqlsh* is not possible.

Table upgrade

- Log in to MySQL console as root (recommended) or any user with FILE privileges.

- Start MySQL with [local_infile](#) variable enabled.
- Rename old tables and create new tables by running `history_upgrade_prepare.sql`:

```
mysql -uzabbix -p<password> zabbix < /usr/share/zabbix/sql-scripts/mysql/option-patches/history_upgrade_prepare.sql
```

Migration with stopped server

`max_execution_time` must be disabled before migrating data to avoid timeout during migration.

```
SET @@max_execution_time=0;

INSERT IGNORE INTO history SELECT * FROM history_old;
INSERT IGNORE INTO history_uint SELECT * FROM history_uint_old;
INSERT IGNORE INTO history_str SELECT * FROM history_str_old;
INSERT IGNORE INTO history_log SELECT * FROM history_log_old;
INSERT IGNORE INTO history_text SELECT * FROM history_text_old;
```

Follow [post-migration instructions](#) to drop the old tables.

Migration with running server

Check for which paths import/export is enabled:

```
mysql> SELECT @@secure_file_priv;
+-----+
| @@secure_file_priv |
+-----+
| /var/lib/mysql-files/ |
+-----+
```

If `secure_file_priv` value is a path to a directory, export/import will be performed for files in that directory. In this case, edit paths to files in queries accordingly or set the `secure_file_priv` value to an empty string for the upgrade time.

If `secure_file_priv` value is empty, export/import can be performed from any location.

If `secure_file_priv` value is NULL, set it to the path that contains exported table data ('/var/lib/mysql-files/' in the example above).

For more information, see [MySQL documentation](#).

`max_execution_time` must be disabled before exporting data to avoid timeout during export.

```
SET @@max_execution_time=0;

SELECT * INTO OUTFILE '/var/lib/mysql-files/history.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n'
LOAD DATA INFILE '/var/lib/mysql-files/history.csv' IGNORE INTO TABLE history FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n';

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_uint.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n'
LOAD DATA INFILE '/var/lib/mysql-files/history_uint.csv' IGNORE INTO TABLE history_uint FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n';

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_str.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n'
LOAD DATA INFILE '/var/lib/mysql-files/history_str.csv' IGNORE INTO TABLE history_str FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n';

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_log.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n'
LOAD DATA INFILE '/var/lib/mysql-files/history_log.csv' IGNORE INTO TABLE history_log FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n';

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_text.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n'
LOAD DATA INFILE '/var/lib/mysql-files/history_text.csv' IGNORE INTO TABLE history_text FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TERMINATED BY '\n';
```

Follow [post-migration instructions](#) to drop the old tables.

PostgreSQL

Export and import must be performed in `tmux/screen` to ensure that the session isn't dropped. For installations with TimescaleDB, skip this section and proceed to [PostgreSQL + TimescaleDB](#).

See also: [Important notes](#)

Table upgrade

- Rename tables using `history_upgrade_prepare.sql`:

```
sudo -u zabbix psql zabbix < /usr/share/zabbix/sql-scripts/postgresql/option-patches/history_upgrade_prepa
```

Migration with stopped server

- Export current history, import it to the temp table, then insert the data into new tables while ignoring duplicates:

```
INSERT INTO history SELECT * FROM history_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_uint SELECT * FROM history_uint_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_str SELECT * FROM history_str_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_log SELECT * FROM history_log_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_text SELECT * FROM history_text_old ON CONFLICT (itemid,clock,ns) DO NOTHING;
```

See tips for improving INSERT performance: [PostgreSQL: Bulk Loading Huge Amounts of Data, Checkpoint Distance and Amount of WAL](#).

- Follow [post-migration instructions](#) to drop the old tables.

Migration with running server

- Export current history, import it to the temp table, then insert the data into new tables while ignoring duplicates:

```
\copy history_old TO '/tmp/history.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history (
    itemid          bigint          NOT NULL,
    clock           integer         DEFAULT '0'      NOT NULL,
    value           DOUBLE PRECISION DEFAULT '0.0000' NOT NULL,
    ns              integer         DEFAULT '0'      NOT NULL
);
\copy temp_history FROM '/tmp/history.csv' DELIMITER ',' CSV
INSERT INTO history SELECT * FROM temp_history ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_uint_old TO '/tmp/history_uint.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_uint (
    itemid          bigint          NOT NULL,
    clock           integer         DEFAULT '0'      NOT NULL,
    value           numeric(20)     DEFAULT '0'      NOT NULL,
    ns              integer         DEFAULT '0'      NOT NULL
);
\copy temp_history_uint FROM '/tmp/history_uint.csv' DELIMITER ',' CSV
INSERT INTO history_uint SELECT * FROM temp_history_uint ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_str_old TO '/tmp/history_str.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_str (
    itemid          bigint          NOT NULL,
    clock           integer         DEFAULT '0'      NOT NULL,
    value           varchar(255)    DEFAULT ''       NOT NULL,
    ns              integer         DEFAULT '0'      NOT NULL
);
\copy temp_history_str FROM '/tmp/history_str.csv' DELIMITER ',' CSV
INSERT INTO history_str (itemid,clock,value,ns) SELECT * FROM temp_history_str ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_log_old TO '/tmp/history_log.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_log (
    itemid          bigint          NOT NULL,
    clock           integer         DEFAULT '0'      NOT NULL,
    timestamp       integer         DEFAULT '0'      NOT NULL,
    source          varchar(64)     DEFAULT ''       NOT NULL,
    severity        integer         DEFAULT '0'      NOT NULL,
    value           text            DEFAULT ''       NOT NULL,
    logeventid      integer         DEFAULT '0'      NOT NULL,
    ns              integer         DEFAULT '0'      NOT NULL
);
```

```
\copy temp_history_log FROM '/tmp/history_log.csv' DELIMITER ',' CSV
INSERT INTO history_log SELECT * FROM temp_history_log ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_text_old TO '/tmp/history_text.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_text (
    itemid          bigint          NOT NULL,
    clock           integer         DEFAULT '0' NOT NULL,
    value           text           DEFAULT '' NOT NULL,
    ns              integer         DEFAULT '0' NOT NULL
);
\copy temp_history_text FROM '/tmp/history_text.csv' DELIMITER ',' CSV
INSERT INTO history_text SELECT * FROM temp_history_text ON CONFLICT (itemid,clock,ns) DO NOTHING;
```

- Follow [post-migration instructions](#) to drop the old tables.

PostgreSQL + TimescaleDB

Export and import must be performed in tmux/screen to ensure that the session isn't dropped. Zabbix server should be down during the upgrade.

See also: [Important notes](#)

- Rename tables using `history_upgrade_prepare.sql`.
 - If compression is enabled (on default installation), run the script from `/usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql`

```
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
```
 - If compression is disabled, run the script from `/usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql`

```
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
```
- Run TimescaleDB hypertable migration scripts based on compression settings:
 - If compression is enabled (on default installation), run scripts from `/usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql`

```
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/trends_upgrade_prepare.sql
```
 - If compression is disabled, run scripts from `/usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql`

```
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/history_upgrade_prepare.sql
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/trends_upgrade_prepare.sql
```

See also: [Tips](#) for improving INSERT performance.

- Follow [post-migration instructions](#) to drop the old tables.

Post-migration

For all databases, once the migration is completed, do the following:

- Verify that everything works as expected.
- Drop old tables:

```
DROP TABLE history_old;
DROP TABLE history_uint_old;
DROP TABLE history_str_old;
DROP TABLE history_log_old;
DROP TABLE history_text_old;
```

- For TimescaleDB, also drop the following old table:

```
DROP TABLE trends_old;
```

See also

- [Preparing auditlog table for partitioning](#)

4 Preparing auditlog table for partitioning

Overview

Some databases (for example, MySQL) require the partitioning column to be part of the table's unique constraint. Therefore, to partition the auditlog table by time, the primary key must be changed from auditid to a composite key auditid + clock.

This section provides instructions for altering the primary key of the auditlog table.

Attention:

The instructions provided on this page are designed for advanced users. Note that these instructions might need to be adjusted for your specific configuration. Altering the primary key can also be incompatible with future upgrade patches, so manually handling future upgrades may be necessary.

 Altering the primary key can be a resource-intensive operation that takes a lot of time depending on the auditlog table size. Stopping Zabbix server and switching Zabbix frontend to **maintenance mode** for the time of the alteration is recommended. However, if absolutely necessary, there is a way to alter the primary key without downtime (see below).

Partitioning the auditlog table can improve, for example, housekeeping in large setups. Although Zabbix **housekeeping** currently cannot take advantage of partitioned tables (except for TimescaleDB), you can disable Zabbix housekeeping and delete partitions using scripts.

Since Zabbix 7.0, the auditlog table for TimescaleDB has been converted to a hypertable, which allows the housekeeper to drop data by chunks. To upgrade the existing auditlog table to a hypertable, see [Upgrading TimescaleDB schema](#).

MySQL

Important notes on rebuilding indexes

MySQL automatically rebuilds indexes for the primary key during the ALTER TABLE operation. However, it is highly recommended to also manually rebuild indexes with the OPTIMIZE TABLE statement to ensure optimal database performance.

Rebuilding indexes may temporarily require as much additional disk space as the table itself uses. To obtain the current size of data and indexes, you can execute the following statements:

```
ANALYZE TABLE auditlog;
SHOW TABLE STATUS LIKE 'auditlog';
```

If the available disk space is a concern, follow the [Altering primary key without downtime](#) instructions. Other options are also available:

- Increasing the `sort_buffer_size` MySQL parameter may help to reduce disk space usage when manually rebuilding indexes. However, modifying this variable may impact overall memory usage of the database.
- Consider freeing up space by deleting potentially unnecessary data.
- Consider decreasing the *Data storage period* **housekeeper** parameter before executing the housekeeper.

Altering primary key with downtime

1. Drop the current auditlog table primary key and add the new primary key.

```
ALTER TABLE auditlog DROP PRIMARY KEY, ADD PRIMARY KEY (auditid, clock);
```

2. Rebuild indexes (optional but highly recommended, see [Important notes on rebuilding indexes](#)).

```
OPTIMIZE TABLE auditlog;
```

Altering primary key without downtime

Manual method of altering the primary key is described here. Alternatively, you can use the [pt-online-schema-change](#) toolkit from Percona. This toolkit performs the following actions automatically, while also minimizing the space used for altering the auditlog table.

1. Create a new table with the new primary key and create indexes.

```
CREATE TABLE `auditlog_new` (
  `auditid`          varchar(25)                NOT NULL,
  `userid`           bigint unsigned             NULL,
  `username`         varchar(100) DEFAULT ''      NOT NULL,
  `clock`            integer                     DEFAULT '0' NOT NULL,
  `ip`               varchar(39)  DEFAULT ''      NOT NULL,
```

```

`action`            integer            DEFAULT '0'            NOT NULL,
`resourcetype`      integer            DEFAULT '0'            NOT NULL,
`resourceid`        bigint unsigned    NULL,
`resource_cuid`     varchar(25)        NULL,
`resourcename`      varchar(255)      DEFAULT ''            NOT NULL,
`recordsetid`       varchar(25)        NOT NULL,
`details`           longtext           NOT NULL,
PRIMARY KEY (auditid,clock)
) ENGINE=InnoDB;
CREATE INDEX `auditlog_1` ON `auditlog_new` (`userid`,`clock`);
CREATE INDEX `auditlog_2` ON `auditlog_new` (`clock`);
CREATE INDEX `auditlog_3` ON `auditlog_new` (`resourcetype`,`resourceid`);

```

2. Swap tables.

```
RENAME TABLE auditlog TO auditlog_old, auditlog_new TO auditlog;
```

3. Copy data from the old table to the new table.

```
INSERT INTO auditlog SELECT * FROM auditlog_old;
```

This can be done in chunks (multiple INSERT INTO statements with WHERE clock clauses as needed) to avoid excessive resource usage.

4. Drop the old table.

```
DROP TABLE auditlog_old;
```

PostgreSQL

Important notes on rebuilding indexes

PostgreSQL automatically rebuilds indexes for the primary key during the ALTER TABLE operation. However, it is highly recommended to also manually rebuild indexes with the REINDEX TABLE CONCURRENTLY statement to ensure optimal database performance.

Rebuilding indexes may temporarily require up to three times of disk space currently used by indexes. To obtain the current size of indexes, you can execute the following query:

```
SELECT pg_size_pretty(pg_indexes_size('auditlog'));
```

If the available disk space is a concern, follow the [Altering primary key without downtime](#) instructions. Other options are also available:

- Increasing the [maintenance_work_mem](#) PostgreSQL parameter may help to reduce disk space usage when manually rebuilding indexes. However, modifying this variable may impact overall memory usage of the database.
- If you have another disk or tablespace with more available space, you might consider changing the temporary storage location for the index rebuild. You can set the [temp_tablespaces](#) PostgreSQL parameter to specify a different tablespace for temporary objects.
- Consider freeing up space by deleting potentially unnecessary data.
- Consider decreasing the *Data storage period* [housekeeper](#) parameter before executing the housekeeper.

Altering primary key with downtime

1. Drop the current auditlog table primary key and add the new primary key.

```
ALTER TABLE auditlog DROP CONSTRAINT auditlog_pkey;
ALTER TABLE auditlog ADD PRIMARY KEY (auditid,clock);
```

2. Rebuild indexes (optional but highly recommended, see [Important notes on rebuilding indexes](#)).

```
REINDEX TABLE CONCURRENTLY auditlog;
```

Altering primary key without downtime

Manual method of altering the primary key is described [here](#). Alternatively, the `pg_repack` extension can be considered for creating a new table, copying data, and swapping tables.

1. Create a new table with the new primary key and create indexes.

```
CREATE TABLE auditlog_new (
  auditid          varchar(25)          NOT NULL,
```

```

userid          bigint          NULL,
username        varchar(100)    DEFAULT ''      NOT NULL,
clock           integer         DEFAULT '0'         NOT NULL,
ip              varchar(39)      DEFAULT ''      NOT NULL,
action          integer         DEFAULT '0'         NOT NULL,
resourcetype    integer         DEFAULT '0'         NOT NULL,
resourceid      bigint          NULL,
resource_cuid   varchar(25)      NULL,
resourcename    varchar(255)    DEFAULT ''      NOT NULL,
recordsetid     varchar(25)      NOT NULL,
details         text            DEFAULT ''         NOT NULL,
PRIMARY KEY (auditid,clock)
);
CREATE INDEX auditlog_new_1 ON auditlog_new (userid,clock);
CREATE INDEX auditlog_new_2 ON auditlog_new (clock);
CREATE INDEX auditlog_new_3 ON auditlog_new (resourcetype,resourceid);

```

2. Swap tables.

```

ALTER TABLE auditlog RENAME TO auditlog_old;
ALTER TABLE auditlog_new RENAME TO auditlog;

```

3. Copy data from the old table to the new table.

```

INSERT INTO auditlog SELECT * FROM auditlog_old;

```

This can be done in chunks (multiple INSERT INTO statements with WHERE clock clauses as needed) to avoid excessive resource usage.

4. Drop the old table.

```

DROP TABLE auditlog_old;

```

- [Database upgrade to primary keys](#)

5 Secure connection to the database

Overview

This section provides Zabbix setup steps and configuration examples for secure TLS connections between:

| Database | Zabbix components |
|------------|--|
| MySQL | Zabbix frontend, Zabbix server, Zabbix proxy |
| PostgreSQL | Zabbix frontend, Zabbix server, Zabbix proxy |

To set up connection encryption within the DBMS, see official vendor documentation for details:

- [MySQL](#): source and replica replication database servers.
- [MySQL](#): group replication, etc. database servers.
- [PostgreSQL](#) encryption options.

All examples are based on the GA releases of MySQL CE (8.0) and PgSQL (13) available through official repositories using CentOS 8.

Requirements

The following is required to set up encryption:

- Developer-supported operating system with OpenSSL >=1.1.X or alternative.

Note:

It is recommended to avoid OS in the end-of-life status, especially in the case of new installations

- Database engine (RDBMS) installed and maintained from the official repository provided by developer. Operating systems often shipped with outdated database software versions for which encryption support is not implemented, for example RHEL 7 based systems and PostgreSQL 9.2, MariaDB 5.5 without encryption support.

Terminology

Setting this option enforces to use TLS connection to database from Zabbix server/proxy and frontend to database:

- `required` - connect using TLS as transport mode without identity checks
- `verify_ca` - connect using TLS and verify certificate
- `verify_full` - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate

Zabbix configuration

Frontend to the database

A secure connection to the database can be configured during frontend installation:

- Mark the *Database TLS encryption* checkbox in the **Configure DB connection** step to enable transport encryption.
- Mark the *Verify database certificate* checkbox that appears when *TLS encryption* field is checked to enable encryption with certificates.

Note:

For MySQL, the *Database TLS encryption* checkbox is disabled, if *Database host* is set to localhost, because connection that uses a socket file (on Unix) or shared memory (on Windows) cannot be encrypted.

For PostgreSQL, the *TLS encryption* checkbox is disabled, if the value of the *Database host* field begins with a slash or the field is empty.

The following parameters become available in the TLS encryption in certificates mode (if both checkboxes are marked):

| Parameter | Description |
|--------------------------------------|---|
| <i>Database TLS CA file</i> | Specify the full path to a valid TLS certificate authority (CA) file. |
| <i>Database TLS key file</i> | Specify the full path to a valid TLS key file. |
| <i>Database TLS certificate file</i> | Specify the full path to a valid TLS certificate file. |
| <i>Database host verification</i> | Mark this checkbox to activate host verification. Disabled for MYSQL, because PHP MySQL library does not allow to skip the peer certificate validation step. |
| <i>Database TLS cipher list</i> | Specify a custom list of valid ciphers. The format of the cipher list must conform to the OpenSSL standard. Available for MySQL only. |

Attention:

TLS parameters must point to valid files. If they point to non-existent or invalid files, it will lead to the authorization error. If certificate files are writable, the frontend generates a warning in the **System information** report that "TLS certificate files must be read-only." (displayed only if the PHP user is the owner of the certificate).

Certificates protected by passwords are not supported.

Use cases

Zabbix frontend uses GUI interface to define possible options: `required`, `verify_ca`, `verify_full`. Specify required options in the installation wizard step *Configure DB connections*. These options are mapped to the configuration file (`zabbix.conf.php`) in the following manner:

| GUI settings | Configuration file | Description | Result |
|--------------|--------------------|-------------|--------|
|--------------|--------------------|-------------|--------|

```
...
// Used for TLS connection.
$DB['ENCRIPTION'] = true;
$DB['KEY_FILE'] = "";
$DB['CERT_FILE'] = "";
$DB['CA_FILE'] = "";
$DB['VERIFY_HOST'] =
false;
$DB['CIPHER_LIST'] = "";
...
```

Check *Database TLS encryption*
Leave *Verify database certificate* unchecked

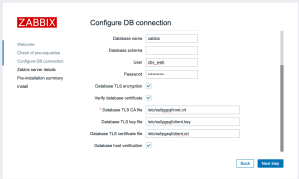

Enable required mode.

```
...
$DB['ENCRIPTION'] = true;
$DB['KEY_FILE'] = "";
$DB['CERT_FILE'] = "";
$DB['CA_FILE'] =
'/etc/ssl/mysql/ca.pem';
$DB['VERIFY_HOST'] =
false;
$DB['CIPHER_LIST'] = "";
...
```

1. Check *Database TLS encryption* and *Verify database certificate*
2. Specify path to *Database TLS CA file*

Enable `verify_ca` mode.

| GUI settings | Configuration file | Description | Result |
|---|---|---|--|
|  | <pre> ... // Used for TLS connection with strictly defined Cipher list. \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = '<key_file_path>'; \$DB['CERT_FILE'] = '<key_file_path>'; \$DB['CA_FILE'] = '<key_file_path>'; \$DB['VERIFY_HOST'] = true; \$DB['CIPHER_LIST'] = '<cipher_list>'; ... Or: ... // Used for TLS connection without Cipher list defined - selected by MySQL server \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = '<key_file_path>'; \$DB['CERT_FILE'] = '<key_file_path>'; \$DB['CA_FILE'] = '<key_file_path>'; \$DB['VERIFY_HOST'] = true; \$DB['CIPHER_LIST'] = ''; ... </pre> | <ol style="list-style-type: none"> 1. Check <i>Database TLS encryption</i> and <i>Verify database certificate</i> 2. Specify path to <i>Database TLS key file</i> 3. Specify path to <i>Database TLS CA file</i> 4. Specify path to <i>Database TLS certificate file</i> 5. Specify <i>Database TLS cipher list</i> (optional) | Enable <code>verify_full</code> mode for MySQL. |
|  | <pre> ... \$DB['ENCRYPTION'] = true; \$DB['KEY_FILE'] = '<key_file_path>'; \$DB['CERT_FILE'] = '<key_file_path>'; \$DB['CA_FILE'] = '<key_file_path>'; \$DB['VERIFY_HOST'] = true; \$DB['CIPHER_LIST'] = ''; ... </pre> | <ol style="list-style-type: none"> 1. Check <i>Database TLS encryption</i> and <i>Verify database certificate</i> 2. Specify path to <i>Database TLS key file</i> 3. Specify path to <i>Database TLS CA file</i> 4. Specify path to <i>Database TLS certificate file</i> 5. Check <i>Database host verification</i> | Enable <code>verify_full</code> mode for PostgreSQL. |

See also: [Encryption configuration examples for MySQL](#), [Encryption configuration examples for PostgreSQL](#).

Zabbix server/proxy configuration

Secure connections to the database can be configured with the respective parameters in the Zabbix [server](#) and/or [proxy](#) configuration file.

| Configuration | Result |
|---|---|
| None | Connection to the database without encryption. |
| 1. Set DBTLSConnect=required | Server/proxy make a TLS connection to the database. An unencrypted connection is not allowed. |
| 1. Set DBTLSConnect=verify_ca | Server/proxy make a TLS connection to the database after verifying the database certificate. |
| 2. Set DBTLSCAFile - specify the TLS certificate authority file | |
| 1. Set DBTLSConnect=verify_full | Server/proxy make a TLS connection to the database after verifying the database certificate and the database host identity. |
| 2. Set DBTLSCAFile - specify TLS certificate authority file | |
| 1. Set DBTLSCAFile - specify TLS certificate authority file | Server/proxy provide a client certificate while connecting to the database. |
| 2. Set DBTLSCertFile - specify the client public key certificate file | |
| 3. Set DBTLSKeyFile - specify the client private key file | |
| 1. Set DBTLSCipher - the list of encryption ciphers that the client permits for connections using TLS protocols up to TLS 1.2 | (MySQL) TLS connection is made using a cipher from the provided list. (PostgreSQL) Setting this option will be considered as an error. |
| or DBTLSCipher13 - the list of encryption ciphers that the client permits for connections using TLS 1.3 protocol | |

1 MySQL encryption configuration

Overview

This section provides several encryption configuration examples for CentOS 8.2 and MySQL 8.0.21 and can be used as a quickstart guide for encrypting the connection to the database.

Attention:

If MySQL host is set to localhost, encryption options will not be available. In this case a connection between Zabbix frontend and the database uses a socket file (on Unix) or shared memory (on Windows) and cannot be encrypted.

Note:

List of encryption combinations is not limited to the ones listed on this page. There are a lot more combinations available.

Pre-requisites

Install MySQL database from the [official repository](#).

See [MySQL documentation](#) for details on how to use MySQL repo.

MySQL server is ready to accept secure connections using a self-signed certificate.

To see which users are using an encrypted connection, run the following query (Performance Schema should be turned ON):

```
mysql> SELECT sbt.variable_value AS tls_version, t2.variable_value AS cipher, processlist_user AS user, pr
FROM performance_schema.status_by_thread AS sbt
JOIN performance_schema.threads AS t ON t.thread_id = sbt.thread_id
JOIN performance_schema.status_by_thread AS t2 ON t2.thread_id = t.thread_id
WHERE sbt.variable_name = 'Ssl_version' and t2.variable_name = 'Ssl_cipher'
ORDER BY tls_version;
```

Transport-only encryption

MySQL configuration

Modern versions of the database are ready out-of-the-box for required **encryption mode**. A server-side certificate will be created after initial setup and launch.

Create users and roles for the main components:

```
mysql> CREATE USER
'zbx_srv'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>',
'zbx_web'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>'
REQUIRE SSL
PASSWORD HISTORY 5;
```

```
mysql> CREATE ROLE 'zbx_srv_role', 'zbx_web_role';
```

```
mysql> GRANT 'zbx_srv_role' TO 'zbx_srv'@'%';
mysql> GRANT 'zbx_web_role' TO 'zbx_web'@'%';
```

Note that the X.509 protocol is not used to check identity, but the user is configured to use only encrypted connections. See [MySQL documentation](#) for more details about configuring users.

```
mysql -u zbx srv -p -h 10.211.55.9 --ssl-mode=REQUIRED
```

```
mysql> status
```

```
Connection id: 62

Verify database certificate
☐

Back
Next step

Server

To enable transport-only encryption for connections between server and the database, configure `/etc/zabbix/zabbix_server.conf`:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=required
...
```

Encryption with certificate authority verification

Copy required MySQL CA to the Zabbix frontend server, assign proper permissions to allow the webserver to read this file.

Note:

This mode doesn't work on RHEL 7 due to older MySQL libraries.

Frontend

To enable encryption with certificate verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to Database TLS CA file

Configure DB connection

Please create database manually, and set the configuration parameters for connection to this database. Press "Next step" button when done.

- Welcome
- Check of pre-requisites

* Database TLS CA file

/etc/ssl/mysql/ca.pem

Back

Next step

Alternatively, this can be set in `/etc/zabbix/web/zabbix.conf.php`:

```
...
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '';
$DB['CERT_FILE'] = '';
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';
$DB['VERIFY_HOST'] = false;
$DB['CIPHER_LIST'] = '';
...
```

Troubleshoot user using command-line tool to check if connection is possible for required user:

```
mysql -u zbx_web -p -h 10.211.55.9 --ssl-mode=REQUIRED --ssl-ca=/var/lib/mysql/ca.pem
```

Server

To enable encryption with certificate verification for connections between Zabbix server and the database, configure `/etc/zabbix/zabbix_server.conf`:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_ca
DBTLSCAFile=/etc/ssl/mysql/ca.pem
...
```

Encryption with full verification

MySQL configuration

Set MySQL CE server configuration option (`/etc/my.cnf.d/server-tls.cnf`) to:

```
[mysqld]
...
# in this examples keys are located in the MySQL CE datadir directory
ssl_ca=ca.pem
ssl_cert=server-cert.pem
ssl_key=server-key.pem

require_secure_transport=ON
```

```
tls_version=TLSv1.3
```

...

Keys for the MySQL CE server and client (Zabbix frontend) should be created manually according to the MySQL CE documentation: [Creating SSL and RSA certificates and keys using MySQL](#) or [Creating SSL certificates and keys using openssl](#)

Attention:

MySQL server certificate should contain the Common Name field set to the FQDN name as Zabbix frontend will use the DNS name to communicate with the database or IP address of the database host.

Create MySQL user:

```
mysql> CREATE USER
'zbx_srv'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>',
'zbx_web'@'%' IDENTIFIED WITH mysql_native_password BY '<strong_password>'
REQUIRE X509
PASSWORD HISTORY 5;
```

Check if it is possible to log in with that user:

```
mysql -u zbx_web -p -h 10.211.55.9 --ssl-mode=VERIFY_IDENTITY --ssl-ca=/var/lib/mysql/ca.pem --ssl-cert=/v
```

Frontend

To enable encryption with full verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS key file*
- Specify path to *Database TLS CA file*
- Specify path to *Database TLS certificate file*

Note that *Database host verification* is checked and grayed out - this step cannot be skipped for MySQL.

Warning:

If *Database TLS cipher list* field is left empty, the common ciphers permitted by both frontend (client) and server will be enabled. Alternatively, the ciphers can be set explicitly, in conformance with the [cipher configuration requirements](#).

Alternatively, this can be set in `/etc/zabbix/web/zabbix.conf.php`:

```
...
// Used for TLS connection with strictly defined Cipher list.
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '/etc/ssl/mysql/client-key.pem';
$DB['CERT_FILE'] = '/etc/ssl/mysql/client-cert.pem';
```

```
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';  
$DB['VERIFY_HOST'] = true;  
$DB['CIPHER_LIST'] = 'TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256:TLS_AES_1  
...  
// or  
...  
// Used for TLS connection without Cipher list defined - selected by MySQL server  
$DB['ENCRYPTION'] = true;  
$DB['KEY_FILE'] = '/etc/ssl/mysql/client-key.pem';  
$DB['CERT_FILE'] = '/etc/ssl/mysql/client-cert.pem';  
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';  
$DB['VERIFY_HOST'] = true;  
$DB['CIPHER_LIST'] = '';  
...
```

To enable encryption with full verification for connections between Zabbix server and the database, configure `/etc/zabbix/zabbix_server.conf`:

2 PostgreSQL encryption configuration

This section provides several encryption configuration examples for CentOS 8.2 and PostgreSQL 13.

Connection between Zabbix frontend and PostgreSQL cannot be encrypted (parameters in GUI are disabled), if the value of *Database host* field begins with a slash or the field is empty.

Install the PostgreSQL database using the [official repository](#).

By default, the PostgreSQL socket is bound to the localhost, for the network remote connections to allow listening on the real network interface.

```
/var/lib/pgsql/13/data/postgresql.conf:
```

For access control adjust `/var/lib/postgresql/13/data/pg_hba.conf`:

```

hostssl all all 0.0.0.0/0 md5

### verify CA
hostssl all all 0.0.0.0/0 md5 clientcert=verify-ca

### verify full
hostssl all all 0.0.0.0/0 md5 clientcert=verify-full
...

```

Transport-only encryption

Frontend

To enable transport-only encryption for connections between Zabbix frontend and the database:

- Check *Database TLS encryption*
- Leave *Verify database certificate* unchecked

Server

To enable transport-only encryption for connections between server and the database, configure `/etc/zabbix/zabbix_server.conf`:

```

...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=required
...

```

Encryption with certificate authority verification

Frontend

To enable encryption with certificate authority verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS CA file*

...
```

Encryption with full verification

Frontend

To enable encryption with certificate and database host identity verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS key file*
- Specify path to *Database TLS CA file*
- Specify path to *Database TLS certificate file*
- Check *Database host verification*

Alternatively, this can be set in `/etc/zabbix/web/zabbix.conf.php`:

```
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '';
$DB['CERT_FILE'] = '';
$DB['CA_FILE'] = '/etc/ssl/pgsql/root.crt';
$DB['VERIFY_HOST'] = true;
$DB['CIPHER_LIST'] = '';
...
```

Server

To enable encryption with certificate and database host identity verification for connections between Zabbix server and the database, configure `/etc/zabbix/zabbix_server.conf`:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_full
DBTLSCAFile=/etc/ssl/pgsql/root.crt
DBTLSCertFile=/etc/ssl/pgsql/client.crt
DBTLSKeyFile=/etc/ssl/pgsql/client.key
...
```

6 TimescaleDB setup

Overview

Zabbix supports TimescaleDB, a PostgreSQL-based database solution of automatically partitioning data into time-based chunks to support faster performance at scale.

Warning:

Currently, TimescaleDB is not supported by Zabbix proxy.

Instructions on this page can be used for the following scenarios:

- Creating a TimescaleDB database or migrating from existing PostgreSQL tables to TimescaleDB (see [Configuration](#)).
- Upgrading an existing TimescaleDB database schema when upgrading Zabbix (see [Upgrading TimescaleDB schema](#)).

Configuration

Pre-requisites: TimescaleDB extension of a [supported version](#) installed on the database server. For installation instructions, see [Timescale documentation](#)).

Enable TimescaleDB extension for the specific database by executing:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb CASCADE;" | sudo -u postgres psql zabbix
```

Running this command requires database administrator privileges.

Note:

If you use a database schema other than 'public' you need to add a SCHEMA clause to the command above. E.g.:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb SCHEMA yourschema CASCADE;" | sudo -u postgres psql zabbix
```

Then run the `postgresql/timescaledb/schema.sql` script. For new installations, the script must be run after the regular PostgreSQL database has been created with initial schema/data (see [database creation](#)).

```
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/schema.sql | sudo -u zabbix psql zabbix
```

Attention:

Please ignore warning messages informing that the best practices are not followed while running `schema.sql` script on TimescaleDB version 2.9.0 and higher. Regardless of this warning, the configuration will be completed successfully.

The migration of existing history, trends and audit log data may take a lot of time. Zabbix server and frontend must be down for the period of migration.

The `schema.sql` script sets the following housekeeping parameters:

- Override item history period
- Override item trend period

In order to use partitioned housekeeping for history and trends, both these options must be enabled. It is also possible to enable override individually either for history only or trends only.

For PostgreSQL and TimescaleDB, the `postgresql/timescaledb/schema.sql` script sets two additional parameters:

- Enable compression
- Compress records older than 7 days

To successfully remove compressed data by housekeeper, both *Override item history period* and *Override item trend period* options must be enabled. If override is disabled and tables have compressed chunks, the housekeeper will not remove data from these tables, and warnings about incorrect configuration will be displayed in the [Housekeeping](#) and [System information](#) sections.

All of these parameters can be changed in *Administration* → [Housekeeping](#) after the installation.

Note:

You may want to run the `timescaledb-tune` tool provided by TimescaleDB to optimize PostgreSQL configuration parameters in your `postgresql.conf`.

Upgrading TimescaleDB schema

When upgrading Zabbix to a version that contains new TimescaleDB hypertables, Zabbix server does not automatically configure those hypertables (for example, when upgrading from Zabbix 6.4 to 7.2, as versions 7.0.0 and 7.0.2 have introduced new hypertables).

To configure new TimescaleDB hypertables, follow these steps:

1. Start Zabbix server; this upgrades the existing database.
2. Check the server log file that the database upgrade is completed; when completed, stop Zabbix server. Note that the server logs a warning if it attempts to enable compression for a table that is not a hypertable.
3. Run the `postgresql/timescaledb/schema.sql` script; this configures the new TimescaleDB hypertables. Note that, since Zabbix 7.0.0, the script's location and name have changed from `postgresql/timescaledb.sql` to `postgresql/timescaledb/schema.sql`.

Attention:

Please ignore warning messages informing that the best practices are not followed while running `schema.sql` script on TimescaleDB version 2.9.0 and higher. Regardless of this warning, the configuration will be completed successfully.

TimescaleDB compression

Native TimescaleDB compression is supported for all Zabbix tables that are TimescaleDB hypertables. During the upgrade or migration to TimescaleDB, initial compression of the large tables may take a lot of time.

Note that compression is supported under the "timescale" Timescale Community license and it is not supported under "apache" Apache 2.0 license. If Zabbix detects that compression is not supported a warning message is written into the Zabbix server log and users cannot enable compression in the frontend.

Note:

Users are encouraged to get familiar with compression in [Timescale documentation](#) before using compression.

Note that there are certain limitations imposed by compression, specifically:

- Compressed chunk modifications (inserts, deletes, updates) are not allowed
- Schema changes for compressed tables are not allowed.

Compression settings can be changed in the *History, trends and audit log compression* block in *Administration* → *Housekeeping* section of Zabbix frontend.

| Parameter | Default | Comments |
|------------------------------------|---------|--|
| <i>Enable compression</i> | Enabled | Checking or unchecking the checkbox does not activate/deactivate compression immediately. Because compression is handled by the Housekeeper, the changes will take effect in up to 2 times HousekeepingFrequency hours (set in <code>zabbix_server.conf</code>) After disabling compression, new chunks that fall into the compression period will not be compressed. However, all previously compressed data will stay compressed. To uncompress previously compressed chunks, follow the instructions in Timescale documentation . When upgrading from older versions of Zabbix with TimescaleDB support, compression will not be enabled by default. This parameter cannot be less than 7 days. |
| <i>Compress records older than</i> | 7d | Due to immutability of compressed chunks all late data (e.g. data delayed by a proxy) that is older than this value will be discarded. |

For better trend update performance, you may want to lower the "chunk_time_interval" for trends and trends_uint tables from 30 days to 7 days or less depending on how many items use trends. The purpose of this setting is to adhere to TimescaleDB's best practices and to ensure that the chunk size remains within the system's available resources.

7 Elasticsearch setup

Attention:

Elasticsearch support is experimental!

Zabbix supports the storage of historical data by means of Elasticsearch instead of a database. Users can choose the storage place for historical data between a compatible database and Elasticsearch. The setup procedure described in this section is applicable to Elasticsearch version 7.X. In case an earlier or later version of Elasticsearch is used, some functionality may not work as intended.

Warning:

1.If all history data is stored in Elasticsearch, trends are **not** calculated nor stored in the database. With no trends calculated and stored, the history storage period may need to be extended.
 2. When Elasticsearch is used, range queries retrieving values from the database are limited by the timestamp of the data storage period.

Configuration

To ensure proper communication between all elements involved make sure server configuration file and frontend configuration file parameters are properly configured.

Zabbix server and frontend

Zabbix server configuration file draft with parameters to be updated:

```
### Option: HistoryStorageURL
# History storage HTTP[S] URL.
#
# Mandatory: no
# Default:
# HistoryStorageURL=
### Option: HistoryStorageTypes
# Comma separated list of value types to be sent to the history storage.
#
# Mandatory: no
# Default:
# HistoryStorageTypes=uint,dbl,str,log,text
```

Example parameter values to fill the Zabbix server configuration file with:

```
HistoryStorageURL=http://test.elasticsearch.lan:9200
HistoryStorageTypes=str,log,text
```

This configuration forces Zabbix Server to store history values of numeric types in the corresponding database and textual history data in Elasticsearch.

Elasticsearch supports the following item types:

uint,dbl,str,log,text

Supported item type explanation:

| Item value type | Database table | Elasticsearch type |
|--------------------|----------------|--------------------|
| Numeric (unsigned) | history_uint | uint |
| Numeric (float) | history | dbl |
| Character | history_str | str |
| Log | history_log | log |
| Text | history_text | text |

Zabbix frontend configuration file (conf/zabbix.conf.php) draft with parameters to be updated:

```
// Elasticsearch url (can be string if same url is used for all types).
$HISTORY['url'] = [
    'uint' => 'http://localhost:9200',
    'text' => 'http://localhost:9200'
];
// Value types stored in Elasticsearch.
$HISTORY['types'] = ['uint', 'text'];
```

Example parameter values to fill the Zabbix frontend configuration file with:

```
$HISTORY['url'] = 'http://test.elasticsearch.lan:9200';
$HISTORY['types'] = ['str', 'text', 'log'];
```

This configuration forces to store Text, Character and Log history values in Elasticsearch.

It is also required to make \$HISTORY global in conf/zabbix.conf.php to ensure everything is working properly (see conf/zabbix.conf.php.example for how to do it):

```
// Zabbix GUI configuration file.
global $DB, $HISTORY;
```

Installing Elasticsearch and creating mapping

Final two steps of making things work are installing Elasticsearch itself and creating mapping process.

To install Elasticsearch, please refer to [Elasticsearch installation guide](#).

Note:

Mapping is a data structure in Elasticsearch (similar to a table in a database). Mapping for all history data types is available here: database/elasticsearch/elasticsearch.map.

Warning:

Creation of mapping is mandatory. Some functionality will be broken if mapping is not created according to the instruction.

To create mapping for text type, send the following request to Elasticsearch:

```
curl -X PUT \
  http://your-elasticsearch.here:9200/text \
  -H 'content-type:application/json' \
  -d '{
    "settings": {
      "index": {
        "number_of_replicas": 1,
        "number_of_shards": 5
      }
    },
    "mappings": {
      "properties": {
        "itemid": {
          "type": "long"
        },
        "clock": {
          "format": "epoch_second",
          "type": "date"
        },
        "value": {
          "fields": {
            "analyzed": {
              "index": true,
              "type": "text",
              "analyzer": "standard"
            }
          },
          "index": false,
          "type": "text"
        }
      }
    }
  }'
```

Similar request is required to be executed for Character and Log history values mapping creation with corresponding type correction.

Note:

To work with Elasticsearch please refer to the [Requirements](#) for additional information.

Note:

Housekeeper is not deleting any data from Elasticsearch.

Storing history data in multiple date-based indices

This section describes additional steps required to work with pipelines and ingest nodes.

To begin with, you must create templates for indices.

The following example shows a request for creating uint template:

```
curl -X PUT \
  http://your-elasticsearch.here:9200/_template/uint_template \
  -H 'content-type:application/json' \
  -d '{
    "index_patterns": [
      "uint*"
    ],
    "settings": {
```

```

    "index": {
      "number_of_replicas": 1,
      "number_of_shards": 5
    }
  },
  "mappings": {
    "properties": {
      "itemid": {
        "type": "long"
      },
      "clock": {
        "format": "epoch_second",
        "type": "date"
      },
      "value": {
        "type": "long"
      }
    }
  }
}
}'

```

To create other templates, user should change the URL (last part is the name of template), change "index_patterns" field to match index name and to set valid mapping, which can be taken from database/elasticsearch/elasticsearch.map.

For example, the following command can be used to create a template for text index:

```

curl -X PUT \
  http://your-elasticsearch.here:9200/_template/text_template \
  -H 'content-type:application/json' \
  -d '{
    "index_patterns": [
      "text*"
    ],
    "settings": {
      "index": {
        "number_of_replicas": 1,
        "number_of_shards": 5
      }
    },
    "mappings": {
      "properties": {
        "itemid": {
          "type": "long"
        },
        "clock": {
          "format": "epoch_second",
          "type": "date"
        },
        "value": {
          "fields": {
            "analyzed": {
              "index": true,
              "type": "text",
              "analyzer": "standard"
            }
          },
          "index": false,
          "type": "text"
        }
      }
    }
  }
}'

```

This is required to allow Elasticsearch to set valid mapping for indices created automatically. Then it is required to create the

pipeline definition. Pipeline is some sort of preprocessing of data before putting data in indices. The following command can be used to create pipeline for uint index:

```
curl -X PUT \
  http://your-elasticsearch.here:9200/_ingest/pipeline/uint-pipeline \
  -H 'content-type:application/json' \
  -d '{
    "description": "daily uint index naming",
    "processors": [
      {
        "date_index_name": {
          "field": "clock",
          "date_formats": [
            "UNIX"
          ],
          "index_name_prefix": "uint-",
          "date_rounding": "d"
        }
      }
    ]
  }'
```

User can change the rounding parameter ("date_rounding") to set a specific index rotation period. To create other pipelines, user should change the URL (last part is the name of pipeline) and change "index_name_prefix" field to match index name.

See also [Elasticsearch documentation](#).

Additionally, storing history data in multiple date-based indices should also be enabled in the new parameter in Zabbix server configuration:

```
### Option: HistoryStorageDateIndex
# Enable preprocessing of history values in history storage to store values in different indices based on
# 0 - disable
# 1 - enable
#
# Mandatory: no
# Default:
# HistoryStorageDateIndex=0
```

Troubleshooting

The following steps may help you troubleshoot problems with Elasticsearch setup:

1. Check if the mapping is correct (GET request to required index URL like `http://localhost:9200/uint`).
2. Check if shards are not in failed state (restart of Elasticsearch should help).
3. Check the configuration of Elasticsearch. Configuration should allow access from the Zabbix frontend host and the Zabbix server host.
4. Check Elasticsearch logs.
5. [LogSlowQueries](#) can be used to check for slow queries in the Elasticsearch database.

If you are still experiencing problems with your installation then please create a bug report with all the information from this list (mapping, error logs, configuration, version, etc.)

8 Distribution-specific notes on setting up Nginx for Zabbix

RHEL

Nginx is available only in EPEL:

```
dnf -y install epel-release
```

SLES 15

In SUSE Linux Enterprise Server 15 you need to configure php-fpm (the path to configuration file may vary slightly depending on the service pack):

```
cp /etc/php8/fpm/php-fpm.conf{.default,}
cp /etc/php8/fpm/php-fpm.d/www.conf{.default,}
sed -i 's/user = nobody/user = wwwrun; s/group = nobody/group = www/' /etc/php8/fpm/php-fpm.d/www.conf
```

9 Running agent as root

Since Zabbix **5.0.0**, the systemd service file for Zabbix agent in [official packages](#) explicitly includes directives for User and Group. Both are set to zabbix.

It is no longer possible to configure which user Zabbix agent runs as via `zabbix_agentd.conf` file, because the agent will bypass this configuration and run as the user specified in the systemd service file. To run Zabbix agent as root you need to make the modifications described below.

Zabbix agent

To override the default user and group for Zabbix agent, run:

```
systemctl edit zabbix-agent
```

Then, add the following content:

```
[Service]
User=root
Group=root
```

Reload daemons and restart the zabbix-agent service:

```
systemctl daemon-reload
systemctl restart zabbix-agent
```

For **Zabbix agent** this re-enables the functionality of configuring user in the `zabbix_agentd.conf` file. Now you need to set `User=root` and `AllowRoot=1` configuration parameters in the agent [configuration file](#).

Zabbix agent 2

To override the default user and group for Zabbix agent 2, run:

```
systemctl edit zabbix-agent2
```

Then, add the following content:

```
[Service]
User=root
Group=root
```

Reload daemons and restart the zabbix-agent2 service:

```
systemctl daemon-reload
systemctl restart zabbix-agent2
```

For **Zabbix agent2** this completely determines the user that it runs as. No additional modifications are required.

10 Zabbix agent on Microsoft Windows

Configuring agent

Both generations of Zabbix agents run as a Windows service. For Zabbix agent 2, replace *agentd* with *agent2* in the instructions below.

You can run a single instance of Zabbix agent or multiple instances of the agent on a Microsoft Windows host. A single instance may use either:

- the default configuration file, located in the same directory as the agent binary;
- a configuration file specified in the command line.

In case of multiple instances each agent instance must have its own configuration file (one of the instances can use the default configuration file).

An example configuration file is available in the Zabbix source archive as:

- `conf/zabbix_agentd.conf` for Zabbix agent;
- `conf/zabbix_agent2.conf` for Zabbix agent2.

If you want to install Zabbix agent/agent 2 for Windows as a service from an [archive](#) without specifying the configuration file explicitly, then, before installing the agent:

- `conf/zabbix_agentd.conf` should be copied manually to the directory where `zabbix_agentd.exe` will be installed;

- `conf/zabbix_agent2.conf` and the `conf/zabbix_agent2.d` directory should be copied manually to the directory where `zabbix_agent2.exe` will be installed.

See the [configuration file](#) options for details on configuring Zabbix Windows agent.

Hostname parameter

To perform [active checks](#) on a host Zabbix agent needs to have the hostname defined. Moreover, the hostname value set on the agent side should exactly match the "Host name" configured for the host in the frontend.

The hostname value on the agent side can be defined by either the **Hostname** or **Hostnameltem** parameter in the agent [configuration file](#) - or the default values are used if any of these parameters are not specified.

The default value for **Hostnameltem** parameter is the value returned by the "system.hostname" agent key. For Windows, it returns result of the `gethostname()` function, which queries namespace providers to determine the local host name. If no namespace provider responds, the NetBIOS name is returned.

The default value for **Hostname** is the value returned by the **Hostnameltem** parameter. So, in effect, if both these parameters are unspecified, the actual hostname will be the host NetBIOS name; Zabbix agent will use NetBIOS host name to retrieve the list of active checks from Zabbix server and send results to it.

The "system.hostname" key supports two optional parameters - *type* and *transform*.

Type determines the type of the name the item should return:

- *netbios* (default) - returns the NetBIOS host name which is limited to 15 symbols and is in the UPPERCASE only;
- *host* - case-sensitive, returns the full, real Windows host name (without a domain);
- *shorthost* - returns part of the hostname before the first dot. It will return a full string if the name does not contain a dot.
- *fqdn* - returns Fully Qualified Domain Name (without the trailing dot).

Transform allows to specify additional transformation rule for the hostname:

- *none* (default) - use the original letter case;
- *lower* - convert the text into lowercase.

So, to simplify the configuration of `zabbix_agentd.conf` file and make it unified, three different approaches can be used:

1. Leave **Hostname** or **Hostnameltem** parameters undefined and Zabbix agent will use NetBIOS host name as the hostname.
2. Leave **Hostname** parameter undefined and define **Hostnameltem** like this:
Hostnameltem=system.hostname[host] - for Zabbix agent to use the full, real (case-sensitive) Windows host name as the hostname
Hostnameltem=system.hostname[shorthost,lower] - for Zabbix agent to use only part of the hostname before the first dot, converted into lowercase.
Hostnameltem=system.hostname[fqdn] - for Zabbix agent to use the Fully Qualified Domain Name as the hostname.

Host name is also used as part of Windows service name which is used for installing, starting, stopping and uninstalling the Windows service. For example, if Zabbix agent configuration file specifies `Hostname=Windows_db_server`, then the agent will be installed as a Windows service "Zabbix Agent [Windows_db_server]". Therefore, to have a different Windows service name for each Zabbix agent instance, each instance must use a different host name.

Installing agent as Windows service

Before installing the agent, copy `conf/zabbix_agentd.conf` manually to the directory where `zabbix_agentd.exe` will be installed.

To install a single instance of Zabbix agent with the default configuration file:

```
zabbix_agentd.exe --install
```

Attention:

On a 64-bit system, a 64-bit Zabbix agent version is required for all checks related to running 64-bit processes to work correctly.

If you wish to use a configuration file other than the default one, you should use the following command for service installation:

```
zabbix_agentd.exe --config <your_configuration_file> --install
```

A full path to the configuration file should be specified.

Multiple instances of Zabbix agent can be installed as services like this:

```
zabbix_agentd.exe --config <configuration_file_for_instance_1> --install --multiple-agents
zabbix_agentd.exe --config <configuration_file_for_instance_2> --install --multiple-agents
...
```

```
zabbix_agentd.exe --config <configuration_file_for_instance_N> --install --multiple-agents
```

The installed service should now be visible in Control Panel.

Starting agent

To start the agent service, you can use Control Panel or do it from command line.

To start a single instance of Zabbix agent with the default configuration file:

```
zabbix_agentd.exe --start
```

To start a single instance of Zabbix agent with another configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --start
```

To start one of multiple instances of Zabbix agent:

```
zabbix_agentd.exe --config <configuration_file_for_this_instance> --start --multiple-agents
```

Stopping agent

To stop the agent service, you can use Control Panel or do it from command line.

To stop a single instance of Zabbix agent started with the default configuration file:

```
zabbix_agentd.exe --stop
```

To stop a single instance of Zabbix agent started with another configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --stop
```

To stop one of multiple instances of Zabbix agent:

```
zabbix_agentd.exe --config <configuration_file_for_this_instance> --stop --multiple-agents
```

Uninstalling agent Windows service

To uninstall a single instance of Zabbix agent using the default configuration file:

```
zabbix_agentd.exe --uninstall
```

To uninstall a single instance of Zabbix agent using a non-default configuration file:

```
zabbix_agentd.exe --config <your_configuration_file> --uninstall
```

To uninstall multiple instances of Zabbix agent from Windows services:

```
zabbix_agentd.exe --config <configuration_file_for_instance_1> --uninstall --multiple-agents
zabbix_agentd.exe --config <configuration_file_for_instance_2> --uninstall --multiple-agents
...
zabbix_agentd.exe --config <configuration_file_for_instance_N> --uninstall --multiple-agents
```

Limitations

Zabbix agent for Windows does not support non-standard Windows configurations where CPUs are distributed non-uniformly across NUMA nodes. If logical CPUs are distributed non-uniformly, then CPU performance metrics may not be available for some CPUs. For example, if there are 72 logical CPUs with 2 NUMA nodes, both nodes must have 36 CPUs each.

11 SAML setup with Microsoft Entra ID

Overview

This section provides guidelines for configuring single sign-on and user provisioning into Zabbix from Microsoft Entra ID (formerly Microsoft Azure Active Directory) using SAML 2.0 authentication.

Microsoft Entra ID configuration

Creating application

1. Log into Microsoft Entra admin center at [Microsoft Entra ID](#). For testing purposes, you may create a free trial account in Microsoft Entra ID.
2. In Microsoft Entra admin center select *Applications -> Enterprise applications -> New application -> Create your own application*.
3. Add the name of your app and select the *Integrate any other application...* option. After that, click on *Create*.

What's the name of your app?

Zabbix SAML/SCIM

What are you looking to do with your application?

- ☐ Configure Application Proxy for secure remote access to an on-premises application
- ☐ Register an application to integrate with Microsoft Entra ID (App you're developing)
- ☒ Integrate any other application you don't find in the gallery (Non-gallery)

Setting up single sign-on

1. In your application page, go to *Set up single sign on* and click on *Get started*. Then select *SAML*.

2. Edit *Basic SAML Configuration*:

- In *Identifier (Entity ID)* set a unique name to identify your app to Microsoft Entra ID, for example, `zabbix`;
- In *Reply URL (Assertion Consumer Service URL)* set the Zabbix single sign-on endpoint: `https://<path-to-zabbix-ui>/index_sso.php?acs`

Identifier (Entity ID) * ⓘ

The unique ID that identifies your application to Microsoft Entra ID. This value must be unique across all applications in your Microsoft Entra tenant. The default identifier will be the audience of the SAML response for IDP-initiated SSO.

Default

zabbix

[Add identifier](#)

Reply URL (Assertion Consumer Service URL) * ⓘ

The reply URL is where the application expects to receive the authentication token. This is also referred to as the "Assertion Consumer Service" (ACS) in SAML.

Ind...

Default

https://path-to-zabbix-ui/index_sso.php?acs

Note that "https" is required. To make that work with Zabbix, it is necessary to add to `conf/zabbix.conf.php` the following line:

```
$SSO['SETTINGS'] = ['use_proxy_headers' => true];
```

3. Edit *Attributes & Claims*. You must add all attributes that you want to pass to Zabbix (`user_name`, `user_lastname`, `user_email`, `user_mobile`, `groups`).

The attribute names are arbitrary. Different attribute names may be used, however, it is required that they match the respective field value in Zabbix SAML settings.

- Click on *Add new claim* to add an attribute:

Name *

user_email

Namespace

Enter a namespace URI

∨ Choose name format

Source *

Attribute

Transformation

Source attribute *

user.mail

- Click on *Add a group claim* to add an attribute for passing groups to Zabbix:

Group Claims

Manage the group claims used by Microsoft Entra ID to populate SAML tokens issued to your app

Which groups associated with the user should be returned in the claim?

- ☐ None
- ☐ All groups
- ☐ Security groups
- ☐ Directory roles
- ☒ Groups assigned to the application

Source attribute *

Cloud-only group display names

☐ Emit group name for cloud-only groups ⓘ

^ Advanced options

☐ Filter groups

Attribute to match

Match with

String

☒ Customize the name of the group claim

Name (required)

groups

Save

It is important in this claim that the group names (rather than group IDs) are passed to Zabbix by the selected *Source attribute*. Otherwise JIT user provisioning will not work properly.

4. In *SAML Certificates* download the Base64 certificate provided by Entra ID and place it into `conf/certs` of the Zabbix frontend installation.

Set 644 permissions to it by running:

```
chmod 644 entra.cer
```

Make sure that `conf/zabbix.conf.php` contains the line:

```
$SSO['IDP_CERT'] = 'conf/certs/entra.cer';
```

5. Use the values from *Set up <your app name>* in Entra ID to configure Zabbix SAML authentication (see next section):

4

Set up Zabbix SAML/SCIM

You'll need to configure the application to link with Microsoft Entra ID.

Login URL

https://login.microsoftonline.com/38c221ff-4 ...

Microsoft Entra Identifier

https://sts.windows.net/38c221ff-42f4-4ec0-8...

Logout URL

https://login.microsoftonline.com/38c221ff-4 ...

Zabbix configuration

- 1. In Zabbix, go to the **SAML settings** and fill the configuration options based on the Entra ID configuration:

Enable SAML authentication ☒

Enable JIT provisioning ☒

* IdP entity ID

* SSO service URL

SLO service URL

* Username attribute

* SP entity ID

SP name ID format

- Sign ☐ Messages
☐ Assertions
☐ AuthN requests
☐ Logout requests
☐ Logout responses

- Encrypt ☐ Name ID
☐ Assertions

Case-sensitive login ☒

Configure JIT provisioning ☒

* Group name attribute

User name attribute

User last name attribute

| * User group mapping | SAML group pattern | User groups | User role | Action |
|----------------------|------------------------------|-----------------------|------------------|------------------------|
| | Zabbix admin | Zabbix administrators | Super admin role | Remove |
| | Add | | | |

| Media type mapping ? | Name | Media type | Attribute | Action |
|----------------------|------------------------|------------|-------------|------------------------|
| | Email | Email | user_email | Remove |
| | Mobile | SMS | user_mobile | Remove |
| | Add | | | |

Enable SCIM provisioning ☒

| Zabbix field | Setup field in Entra ID | Sample value |
|-----------------------------|----------------------------|--------------|
| <i>IdP entity ID</i> | Microsoft Entra identifier | |
| <i>SSO service URL</i> | Login URL | |
| <i>SLO service URL</i> | Logout URL | |
| <i>SP entity ID</i> | Identifier (Entity ID) | |
| <i>Username attribute</i> | Custom attribute (claim) | user_email |
| <i>Group name attribute</i> | Custom attribute (claim) | groups |
| <i>User name attribute</i> | Custom attribute (claim) | user_name |

| Zabbix field | Setup field in Entra ID | Sample value |
|---------------------------------|--------------------------|---------------|
| <i>User last name attribute</i> | Custom attribute (claim) | user_lastname |

It is also required to configure user group mapping. Media mapping is optional.

Click on *Update* to save these settings.

SCIM user provisioning

1. In your Entra ID application page, from the main menu open the Provisioning page. Click on *Get started* and then select Automatic provisioning mode:

- In *Tenant URL*, set the following value: `https://<path-to-zabbix-ui>/api_scim.php`
- In *Secret token*, enter a Zabbix API token with Super admin permissions.
- Click on *Test connection* to see if the connection is established.

Provisioning Mode

Automatic

Use Microsoft Entra to manage the creation and synchronization of user accounts in Zabbix SAML/SCIM based on user and group assignment.

Admin Credentials

Admin Credentials

Microsoft Entra needs the following information to connect to Zabbix SAML/SCIM's API and synchronize user data.

Tenant URL * ⓘ

`https://path-to-zabbix-ui/api_scim.php`

Secret Token

.....

Test Connection

2. Now you can add all the attributes that will be passed with SCIM to Zabbix. To do that, click on *Mappings* and then on *Provision Microsoft Entra ID Users*.

Mappings

Mappings

Mappings allow you to define how data should flow between Microsoft Entra ID and customappsso.

| Name | Enabled |
|---|---------|
| Provision Microsoft Entra ID Groups | Yes |
| Provision Microsoft Entra ID Users | Yes |

☐ Restore default mappings

At the bottom of the Attribute Mapping list, enable *Show advanced options*, and then click on *Edit attribute list for customappsso*.

At the bottom of the attribute list, add your own attributes with type 'String':

| | | | |
|--------------------------------|-----------|--------------------------|--------------------------|
| urn:ietf:params:scim:schema... | Reference | <input type="checkbox"/> | <input type="checkbox"/> |
| user_name | String | <input type="checkbox"/> | <input type="checkbox"/> |
| user_lastname | String | <input type="checkbox"/> | <input type="checkbox"/> |
| user_email ✓ | String ▼ | <input type="checkbox"/> | <input type="checkbox"/> |
| | String ▼ | <input type="checkbox"/> | <input type="checkbox"/> |

Save the list.

3. Now you can add mappings for the added attributes. At the bottom of the Attribute Mapping list, click on *Add New Mapping* and create mappings as shown below:

Mapping type ⓘ

Source attribute * ⓘ

Default value if null (optional) ⓘ

Target attribute * ⓘ

When all mappings are added, save the list of mappings.

 Save  Discard

| | |
|------------|---------------------------------------|
| department | urn:ietf:params:scim:schemas:exten... |
| manager | urn:ietf:params:scim:schemas:exten... |
| givenName | user_name |
| mobile | user_mobile |
| surname | user_lastname |
| mail | user_email |

4. As a prerequisite of user provisioning into Zabbix, you must have users and groups configured in Entra ID.

To do that, go to *Microsoft Entra admin center* and then add users/groups in the respective Users and Groups pages.

5. When users and groups have been created in Entra ID, you can go to the *Users and groups* menu of your application and add them to the app.

6. Go to the *Provisioning* menu of your app, and click on *Start provisioning* to have users provisioned to Zabbix.

Note that the Users PATCH request in Entra ID does not support changes in media.

12 SAML setup with Okta

This section provides guidelines for configuring [Okta](#) to enable SAML 2.0 authentication and user provisioning for Zabbix.

Okta configuration

1. Go to <https://developer.okta.com/signup/> and register/sign into your account.
2. In the Okta web interface navigate to *Applications* → *Applications*.
3. Click on *Create App Integration*.

Create a new app integration

×

Sign-in method

[Learn More](#)

- ☐ **OIDC - OpenID Connect**
Token-based OAuth 2.0 authentication for Single Sign-On (SSO) through API endpoints. Recommended if you intend to build a custom app integration with the Okta Sign-In Widget.
- ☒ **SAML 2.0**
XML-based open standard for SSO. Use if the Identity Provider for your application only supports SAML.
- ☐ **SWA - Secure Web Authentication**
Okta-specific SSO method. Use if your application doesn't support OIDC or SAML.
- ☐ **API Services**
Interact with Okta APIs using the scoped OAuth 2.0 access tokens for machine-to-machine authentication.

Cancel

Next

Select "SAML 2.0" as the sign-in method and click on *Next*.

4. In general settings, fill in the app name and click on *Next*.

5. In SAML configuration, enter the values provided below, then click on *Next*.

A SAML Settings

General

Single sign-on URL ?

http://zabbix-uri/zabbix/index_sso.php?acs

☒ Use this for Recipient URL and Destination URL

Audience URI (SP Entity ID) ?

zabbix

Default RelayState ?

If no value is set, a blank RelayState is sent

- In **General** add:

- *Single sign-on URL*: http://<your-zabbix-url>/zabbix/index_sso.php?acs
Note the use of "http", and not "https", so that the acs parameter is not cut out in the request. The *Use this for Recipient URL and Destination URL* checkbox should also be marked.
- *Audience URI (SP Entity ID)*: zabbix
Note that this value will be used within the SAML assertion as a unique service provider identifier (if not matching, the operation will be rejected). It is possible to specify a URL or any string of data in this field.
- *Default RelayState*:
Leave this field blank; if a custom redirect is required, it can be added in Zabbix in the *Users* → *Users* settings.
- Fill in other fields according to your preferences.

- In **Attribute Statements/Group Attribute Statements** add:

Attribute Statements (optional)

[LEARN MORE](#)

| Name | Name format (optional) | Value | |
|---------------|---------------------------|--------------------|---|
| usrEmail | Unspecified ▼ | user.email ▼ | |
| user_name | Unspecified ▼ | user.firstName ▼ | × |
| user_lastname | Unspecified ▼ | user.lastName ▼ | × |
| user_mobile | Unspecified ▼ | user.mobilePhone ▼ | × |

[Add Another](#)

Group Attribute Statements (optional)

| Name | Name format (optional) | Filter |
|--------|---------------------------|----------------------------|
| groups | Unspecified ▼ | Matches regex ▼ .*zabbix.* |

These attribute statements are inserted into the SAML assertions shared with Zabbix.

The attribute names used here are arbitrary examples. You may use different attribute names, however, it is required that they match the respective field value in Zabbix SAML settings.

If you want to configure SAML sign-in into Zabbix *without* JIT user provisioning, then only the email attribute is required.

Note:

If planning to use an encrypted connection, generate the private and public encryption certificates, then upload the public certificate to Okta. The certificate upload form appears when *Assertion Encryption* is set to "Encrypted" (click *Show Advanced Settings* to find this parameter).

6. In the next tab, select "I'm a software vendor. I'd like to integrate my app with Okta" and press "Finish".

7. Navigate to the "Assignments" tab of the newly-created application and click on the *Assign* button, then select "Assign to People" from the drop-down.

General **Sign On** **Provisioning** **Import** **Assignments** **Push Groups**

Assign ▼

Assign to People

Assign to Groups

Convert assignments ▼

Search...

| Type |
|----------|
| ins Vvvv |

8. In a popup that appears, assign the app to people that will use SAML 2.0 to authenticate with Zabbix, then click on *Save and go back*.
9. Navigate to the "Sign On" tab and click on the *View Setup Instructions* button.

Setup **instructions** will be opened in a new tab; keep this tab open while configuring Zabbix.

Zabbix configuration

1. In Zabbix, go to the **SAML settings** and fill the configuration options based on setup instructions from Okta:

Enable SAML authentication ☒

Enable JIT provisioning ☒

* IdP entity ID

* SSO service URL

SLO service URL

* Username attribute

* SP entity ID

SP name ID format

- Sign ☐ Messages
☐ Assertions
☐ AuthN requests
☐ Logout requests
☐ Logout responses

- Encrypt ☐ Name ID
☐ Assertions

Case-sensitive login ☒

Configure JIT provisioning ☒

* Group name attribute

User name attribute

User last name attribute

* User group mapping

| SAML group pattern | User groups | User role | Action |
|------------------------------|-----------------------|------------------|------------------------|
| zabbix-admin | Zabbix administrators | Super admin role | Remove |
| zabbix* | Zabbix users | User role | Remove |
| Add | | | |

Media type mapping ?

| Name | Media type | Attribute | |
|------------------------|------------|-------------|------------------------|
| Mobile | SMS | user_mobile | Remove |
| Email | Email | usrEmail | Remove |
| Add | | | |

Enable SCIM provisioning ☒

[Update](#)

| Zabbix field | Setup field in Okta | Sample value |
|-----------------------------|--------------------------------------|--------------|
| <i>IdP entity ID</i> | Identity Provider Issuer | |
| <i>SSO service URL</i> | Identity Provider Single Sign-On URL | |
| <i>Username attribute</i> | Attribute name | usrEmail |
| <i>SP entity ID</i> | Audience URI | zabbix |
| <i>Group name attribute</i> | Attribute name | groups |

| Zabbix field | Setup field in Okta | Sample value |
|---------------------------------|---------------------|---------------|
| <i>User name attribute</i> | Attribute name | user_name |
| <i>User last name attribute</i> | Attribute name | user_lastname |

It is also required to configure user group and media mapping.

2. Download the certificate provided in the Okta SAML setup instructions into `ui/conf/certs` folder as `idp.crt`.

Set 644 permissions to it by running:

```
chmod 644 idp.crt
```

3. If *Assertion Encryption* has been set to "Encrypted" in Okta, the "Assertions" checkbox of the *Encrypt* parameter should be marked in Zabbix as well.

4. Press the "Update" button to save these settings.

SCIM provisioning

1. To turn on SCIM provisioning, go to "General" -> "App Settings" of the application in Okta.

Mark the *Enable SCIM provisioning* checkbox. As a result, a new *Provisioning* tab appears.

2. Go to the "Provisioning" tab to set up a SCIM connection:

- In *SCIM connector base URL* specify the path to the Zabbix frontend and append `api_scim.php` to it, i.e.:
`https://<your-zabbix-url>/zabbix/api_scim.php`
- *Unique identifier field for users*: email
- *Authentication mode*: HTTP header
- In *Authorization* enter a valid API token with Super admin rights

Test Connector Configuration

Save
Cancel

Attention:

If you are experiencing authentication issues, see [Authorization header forwarding](#).

3. Click on *Test Connector Configuration* to test the connection. If all is correct a success message will be displayed.

4. In "Provisioning" -> "To App", make sure to mark the following checkboxes:

- Create Users

- Update User Attributes
- Deactivate Users

This will make sure that these request types will be sent to Zabbix.

5. Make sure that all attributes defined in SAML are defined in SCIM. You can access the profile editor for your app in "Provisioning" -> "To App", by clicking on *Go to Profile Editor*.

Click on *Add Attribute*. Fill the values for *Display name*, *Variable name*, *External name* with the SAML attribute name, for example, `user_name`.

Add Attribute

★ Local app attributes are only stored on Okta and not created in Zabbix-SAML. Use local attributes if you plan to add the attribute to Zabbix-SAML or only want to store the mapped value in Okta.

| | |
|----------------------|---|
| Data type | <input type="text" value="string"/> |
| Display name ? | <input type="text" value="user_name"/> |
| Variable name ? | <input type="text" value="user_name"/> |
| External name ? | <input type="text" value="user_name"/> |
| External namespace ? | <input type="text" value="urn:ietf:params:scim:schemas:core:2.0:User"/> |
| Description | <input type="text"/> |

External namespace should be the same as user schema: `urn:ietf:params:scim:schemas:core:2.0:User`

6. Go to "Provisioning" -> "To App" -> "Attribute Mappings" of your application. Click on *Show Unmapped Attributes* at the bottom. Newly added attributes appear.

7. Map each added attribute.

Zabbix-SAML - user_name

Attribute value

Map from Okta Pr...

"Martins"

Apply on

☐ Create

☒ Create and update

 Preview

Martins Vvvv

Save

Cancel

8. Add users in the "Assignments" tab. The users previously need to be added in *Directory* -> *People*. All these assignments will be sent as requests to Zabbix.

9. Add groups in the "Push Groups" tab. The user group mapping pattern in Zabbix SAML settings must match a group specified here. If there is no match, the user cannot be created in Zabbix.

Information about group members is sent every time when some change is made.

13 SAML setup with OneLogin

Overview

This section provides guidelines for configuring single sign-on and user provisioning into Zabbix from [OneLogin](#) using SAML 2.0 authentication.

OneLogin configuration

Creating application

1. Log into your account at OneLogin. For testing purposes, you may create a free developer account in OneLogin.
2. In the OneLogin web interface navigate to *Applications* → *Applications*.
3. Click on "Add App" and search for the appropriate app. The guidelines in this page are based on the *SCIM Provisioner with SAML (SCIM v2 Enterprise, full SAML)* app example.
4. To begin with, you may want to customize the display name of your app. You may also want to add the icon and app details. After that, click on *Save*.

Setting up SSO/SCIM provisioning

1. In *Configuration* -> *Application details*, set the Zabbix single sign-on endpoint `http://<zabbix-instance-url>/zabbix/index_sso.php` as the value of these fields:

- ACS (Consumer) URL Validator
- ACS (Consumer) URL

Note the use of "http", and not "https", so that the acs parameter is not cut out in the request.

| | |
|----------------------|--|
| Info | Application details |
| Configuration | SAML Audience URL |
| Parameters | <input type="text"/> |
| Rules | RelayState |
| SSO | <input type="text"/> |
| Access | Recipient |
| Provisioning | <input type="text"/> |
| Users | ACS (Consumer) URL Validator* |
| Privileges | <input type="text" value="http://<zabbix-instance-url>/zabbix/index_sso.php?acs"/> |
| | <i>*Required.</i> |
| | ACS (Consumer) URL* |
| | <input type="text" value="http://<zabbix-instance-url>/zabbix/index_sso.php?acs"/> |

It is also possible to use "https". To make that work with Zabbix, it is necessary to add to `conf/zabbix.conf.php` the following line:

```
$SSO['SETTINGS'] = ['use_proxy_headers' => true];
```

Leave other options with their default values.

2. In *Configuration -> API connection*, set the following values:

- *SCIM Base URL*: `https://<zabbix-instance-url>/zabbix/api_scim.php`
- *SCIM JSON Template*: should contain all custom attributes that you would like to pass to Zabbix via SCIM such as `user_name`, `user_lastname`, `user_email`, and `user_mobile`:

```
{
  "schemas": [
    "urn:ietf:params:scim:schemas:core:2.0:User"
  ],
  "userName": "{$parameters.scimusername}",
  "name": {
    "familyName": "{$user.lastname}",
    "givenName": "{$user.firstname}"
  },
  "user_name": "{$user.firstname}",
  "user_lastname": "{$user.lastname}",
  "user_mobile": "{$user.phone}",
  "user_email": "{$user.email}"
}
```

The attribute names are arbitrary. Different attribute names may be used, however, it is required that they match the respective field value in Zabbix SAML settings.

Note that for user provisioning to work, OneLogin needs to receive in response a 'name' attribute with 'givenName' and 'family-Name', even if it was not required by the service provider. Thus it is necessary to specify this in the schema in the application configuration part.

- *SCIM Bearer Token*: enter a Zabbix API token with Super admin permissions.

Click on *Enable* to activate the connection.

3. In the *Provisioning* page, enable the Provisioning option:

Info

Configuration

Parameters

Rules

SSO

Access

Provisioning

Users

Privileges

Workflow

☒ Enable provisioning

Require admin approval before this action is performed

☐ Create user
 ☐ Delete user
 ☐ Update user

When users are deleted in OneLogin, or the user's app access is removed, perform the below action

Delete

When user accounts are suspended in OneLogin, perform the following action:

Suspend

4. The *Parameters* page contains a list of default parameters:

- Make sure that the 'scimusername' matches the user login value in OneLogin (e.g. email);
- Mark the *Include in User Provisioning* option for the 'Groups' parameter;
- Click on "+" to create the custom parameters that are required for SAML assertions and user provisioning such as user_name, user_lastname, user_email, and user_mobile:

Edit Field user_email

Name

user_email

Value

Email

Flags

Include in SAML assertion

Include in User Provisioning

Cancel

Delete

Save

When adding a parameter, make sure to mark both the *Include in SAML assertion* and *Include in User Provisioning* options.

- Add a 'group' parameter that matches user roles in OneLogin. User roles will be passed as a string, separated by a semicolon ;. The OneLogin user roles will be the used for creating user groups in Zabbix:

Edit Field group

Name

group

Value

User Roles

Flags

Include in SAML assertion

Include in User Provisioning

Cancel

Delete

Save

Verify the list of parameters:

Enable SCIM provisioning

☒

Update

| Zabbix field | Setup field in OneLogin | Sample value |
|-----------------|---|--------------|
| IdP entity ID | Issuer URL (see SSO tab of your application in OneLogin) | |
| SSO service URL | SAML 2.0 Endpoint (HTTP) (see SSO tab of your application in OneLogin) | |

| Zabbix field | Setup field in OneLogin | Sample value |
|---------------------------------|--|---------------|
| <i>SLO service URL</i> | SLO Endpoint (HTTP) (see SSO tab of your application in OneLogin) | |
| <i>Username attribute</i> | Custom parameter | user_email |
| <i>Group name attribute</i> | Custom parameter | group |
| <i>User name attribute</i> | Custom parameter | user_name |
| <i>User last name attribute</i> | Custom parameter | user_lastname |

It is also required to configure user group mapping. Media mapping is optional. Click on *Update* to save these settings.

2. Download the certificate provided by OneLogin and place it into `conf/certs` of the Zabbix frontend installation, as `idp.crt`.

Set 644 permissions to it by running:

```
chmod 644 idp.crt
```

You can access the certificate download in OneLogin in *Applications* -> *SSO* -> click on *View details* under the current certificate.

It is possible to use a different certificate name and location. In that case, make sure to add to `conf/zabbix.conf.php` the following line:

```
$SSO['IDP_CERT'] = 'path/to/certname.crt';
```

SCIM user provisioning

With user provisioning enabled, it is now possible to add/update users and their roles in OneLogin and have them immediately provisioned to Zabbix.

For example, you may create a new user:

Active ☒

First name * Last name * Email

Username Phone number Manager

Company Department Title

Add it to a user role and the application that will provision the user:

Roles

- Developer ☒
- User ☐
- Zabbix admin ☐

Applications

- Zabbix with SAML (SCIM v2 Enterprise, full SAML) example.user@example.com

When saving the user, it will be provisioned to Zabbix. In Application -> Users you can check the provisioning status of current application users:

| | | | | |
|---------------|--------|--------------------|------------|------------|
| Info | Search | All roles | All groups | Any status |
| Configuration | | | | |
| Parameters | | | | |
| Rules | | | | |
| User | | Provisioning State | | |
| Example User | | Provisioned | | |

If successfully provisioned, the user can be seen in the Zabbix user list.

| <input type="checkbox"/> | Username ▲ | Name | Last name | User role | Groups | Is online? | Login | Frontend access |
|--------------------------|--|---------|---------------|------------------|---------------------------------------|---------------------------|-------|-----------------|
| <input type="checkbox"/> | Admin | Zabbix | Administrator | Super admin role | Zabbix administrators | Yes (2023-04-18 21:11:43) | Ok | System default |
| <input type="checkbox"/> | example.user@example.com | Example | User | Admin role | Zabbix administrators | No | Ok | SAML |

14 Setting up scheduled reports

Overview

This section provides instructions on installing Zabbix web service and configuring Zabbix to enable generation of **scheduled reports**.

Installation

A new **Zabbix web service** process and **Google Chrome browser** should be installed to enable generation of scheduled reports. The web service may be installed on the same machine where the Zabbix server is installed or on a different machine. Google Chrome browser should be installed on the same machine, where the web service is installed.

The official zabbix-web-service package is available in the [Zabbix repository](#). Google Chrome browser is not included into these packages and has to be installed separately.

To compile Zabbix web service from sources, see [Installing Zabbix web service](#).

After the installation, run `zabbix_web_service` on the machine, where the web service is installed:

```
zabbix_web_service
```

Configuration

To ensure proper communication between all elements involved make sure server configuration file and frontend configuration parameters are properly configured.

Zabbix server

The following parameters in Zabbix server configuration file need to be updated: *WebServiceURL* and *StartReportWriters*.

WebServiceURL

This parameter is required to enable communication with the web service. The URL should be in the format `<host:port>/report`.

- By default, the web service listens on port 10053. A different port can be specified in the web service **configuration file**.
- Specifying the `/report` path is mandatory (the path is hardcoded and cannot be changed).

Example:

```
WebServiceURL=http://localhost:10053/report
```

Attention:

It is strongly recommended to set up encryption between Zabbix server and Zabbix web service **using certificates**. By default, data transmitted between Zabbix server and Zabbix web service is not encrypted, which can lead to unauthorized access.

StartReportWriters

This parameter determines how many report writer processes should be started. If it is not set or equals 0, report generation is disabled. Based on the number and frequency of reports required, it is possible to enable from 1 to 100 report writer processes.

Example:

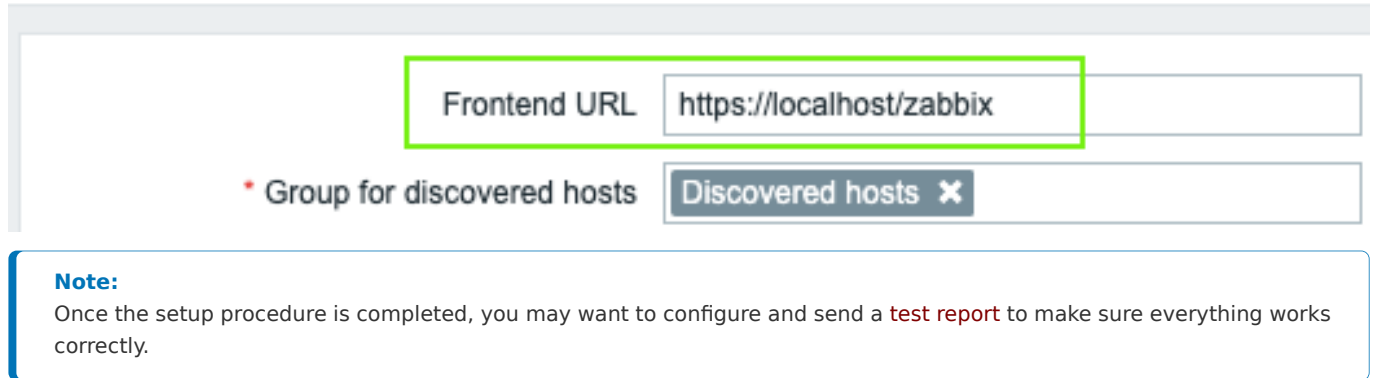

```
StartReportWriters=3
```

Zabbix frontend

A *Frontend URL* parameter should be set to enable communication between Zabbix frontend and Zabbix web service:

- Proceed to the *Administration* → *General* → *Other parameters* frontend menu section
- Specify the full URL of the Zabbix web interface in the *Frontend URL* parameter

Other configuration parameters ▾

The screenshot shows a configuration form with two main sections. The first section has a label 'Frontend URL' and a text input field containing 'https://localhost/zabbix'. The second section has a label 'Group for discovered hosts' and a dropdown menu currently showing 'Discovered hosts' with a close icon. Below the form is a 'Note' box with the text: 'Once the setup procedure is completed, you may want to configure and send a test report to make sure everything works correctly.'

15 Additional frontend languages

Overview

In order to use any other language than English in Zabbix web interface, its locale should be installed on the web server. Additionally, the PHP gettext extension is required for the translations to work.

Installing locales

To list all installed languages, run:

```
locale -a
```

If some languages that are needed are not listed, open the `/etc/locale.gen` file and uncomment the required locales. Since Zabbix uses UTF-8 encoding, you need to select locales with UTF-8 charset.

Now run:

```
locale-gen
```

Restart the web server.

The locales should now be installed. It may be required to reload Zabbix frontend page in browser using Ctrl + F5 for new languages to appear.

Installing Zabbix

If installing Zabbix directly from [Zabbix git repository](#), translation files should be generated manually. To generate translation files, run:

```
make gettext
locale/make_mo.sh
```

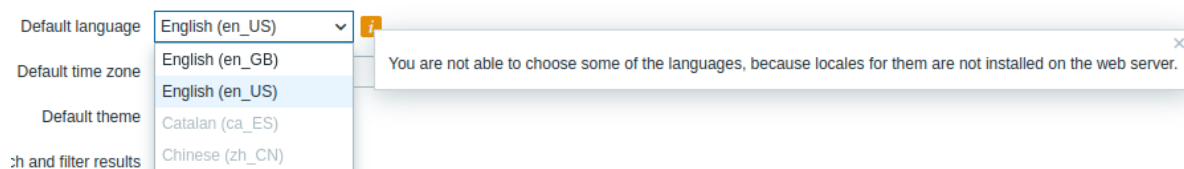

This step is not needed when installing Zabbix from packages or source tar.gz files.

Selecting a language

There are several ways to select a language in Zabbix web interface:

- When installing web interface - in the frontend **installation wizard**. Selected language will be set as system default.
- After the installation, system default language can be changed in the *Administration*→*General*→*GUI menu section*.
- Language for a particular user can be changed in the **user profile**.

If a locale for a language is not installed on the machine, this language will be greyed out in Zabbix language selector. An orange icon is displayed next to the language selector if at least one locale is missing. Upon pressing on this icon the following message will be displayed: "You are not able to choose some of the languages, because locales for them are not installed on the web server."

2 Process configuration

Please use the sidebar to access content in this section.

1 Zabbix server

Overview

The parameters supported by the Zabbix server configuration file (zabbix_server.conf) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|--|---|
| AlertScriptsPath | The location of custom alert scripts. |
| AllowRoot | Allow the server to run as 'root'. |
| AllowSoftwareUpdateCheck | Allow Zabbix UI to receive information about software updates from zabbix.com. |
| AllowUnsupportedDBVersions | Allow the server to work with unsupported database versions. |
| CacheSize | The size of the configuration cache. |
| CacheUpdateFrequency | This parameter determines how often Zabbix will perform the configuration cache update in seconds. |
| DBHost | The database host name. |
| DBName | The database name. |
| DBPassword | The database password. |
| DBPort | The database port when not using local socket. |
| DBSchema | The database schema name. Used for PostgreSQL. |
| DBSocket | The path to the MySQL socket file. |
| DBUser | The database user. |
| DBTLSConnect | Setting this option to the specified value enforces to use a TLS connection to the database. |
| DBTLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for database certificate verification. |
| DBTLSCertFile | The full pathname of a file containing the Zabbix server certificate for authenticating to database. |
| DBTLSKeyFile | The full pathname of a file containing the private key for authenticating to database. |
| DBTLSCipher | The list of encryption ciphers that Zabbix server permits for TLS protocols up through TLS v1.2. Supported only for MySQL. |
| DBTLSCipher13 | The list of encryption ciphersuites that Zabbix server permits for the TLS v1.3 protocol. Supported only for MySQL, starting from version 8.0.16. |
| DebugLevel | Specify the debug level. |
| EnableGlobalScripts | Enable global scripts on Zabbix server. |
| ExportDir | The directory for real-time export of events, history and trends in newline-delimited JSON format. If set, enables the real-time export. |
| ExportFileSize | The maximum size per export file in bytes. |
| ExportType | The list of comma-delimited entity types (events, history, trends) for real-time export (all types by default). |
| ExternalScripts | The location of external scripts. |
| Fping6Location | The location of fping6. |
| FpingLocation | The location of fping. |
| HANodeName | The high availability cluster node name. |
| HistoryCacheSize | The size of the history cache. |
| HistoryIndexCacheSize | The size of the history index cache. |
| HistoryStorageDateIndex | Enable preprocessing of history values in history storage to store values in different indices based on date. |
| HistoryStorageURL | The history storage HTTP[S] URL. |
| HistoryStorageTypes | A comma-separated list of value types to be sent to the history storage. |
| HousekeepingFrequency | This parameter determines how often Zabbix will perform the housekeeping procedure in hours. |

| Parameter | Description |
|------------------------------|--|
| Include | You may include individual files or all files in a directory in the configuration file. |
| JavaGateway | The IP address (or hostname) of Zabbix Java gateway. |
| JavaGatewayPort | The port that Zabbix Java gateway listens on. |
| ListenBacklog | The maximum number of pending connections in the TCP queue. |
| ListenIP | A list of comma-delimited IP addresses that the trapper should listen on. |
| ListenPort | The listen port for trapper. |
| LoadModule | The module to load at server startup. |
| LoadModulePath | The full path to the location of server modules. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogSlowQueries | Determines how long a database query may take before being logged in milliseconds. |
| LogType | The type of the log output. |
| MaxConcurrentChecksPerPoller | The maximum number of asynchronous checks that can be executed at once by each HTTP agent poller, agent poller or SNMP poller. |
| MaxHousekeeperDelete | No more than 'MaxHousekeeperDelete' rows (corresponding to [tablename], [field], value) will be deleted per one task in one housekeeping cycle. |
| NodeAddress | The IP or hostname with optional port to override how the frontend should connect to the server. |
| PidFile | The name of the PID file. |
| ProblemHousekeepingFrequency | Determines how often Zabbix will delete problems for deleted triggers. |
| ProxyConfigFrequency | Determines how often Zabbix server sends configuration data to a Zabbix proxy. |
| ProxyDataFrequency | Determines how often Zabbix server requests history data from a Zabbix proxy. |
| ServiceManagerSyncFrequency | Determines how often Zabbix will synchronize the configuration of a service manager. |
| SMSDevices | A list of comma-delimited modem files allowed to use Zabbix server. |
| SNMPTrapperFile | The temporary file used for passing data from the SNMP trap daemon to the server. |
| SocketDir | The directory to store the IPC sockets used by internal Zabbix services. |
| SourceIP | The source IP address. |
| SSHKeyLocation | The location of public and private keys for SSH checks and actions. |
| SSLCertLocation | The location of SSL client certificate files for client authentication. |
| SSLKeyLocation | The location of SSL private key files for client authentication. |
| SSLCALocation | Override the location of certificate authority (CA) files for SSL server certificate verification. |
| StartAgentPollers | The number of pre-forked instances of asynchronous Zabbix agent pollers. |
| StartAlerters | The number of pre-forked instances of alerters. |
| StartBrowserPollers | The number of pre-forked instances of browser item pollers. |
| StartConnectors | The number of pre-forked instances of connector workers. |
| StartDBSyncers | The number of pre-forked instances of history syncers. |
| StartDiscoverers | The number of pre-forked instances of discovery workers. |
| StartEscalators | The number of pre-forked instances of escalators. |
| StartHistoryPollers | The number of pre-forked instances of history pollers. |
| StartHTTPAgentPollers | The number of pre-forked instances of asynchronous HTTP agent pollers. |
| StartHTTTPollers | The number of pre-forked instances of HTTP pollers. |
| StartIPMIPollers | The number of pre-forked instances of IPMI pollers. |
| StartJavaPollers | The number of pre-forked instances of Java pollers. |
| StartLLDProcessors | The number of pre-forked instances of low-level discovery (LLD) workers. |
| StartODBCPollers | The number of pre-forked instances of ODBC pollers. |
| StartPingers | The number of pre-forked instances of ICMP pingers. |
| StartPollersUnreachable | The number of pre-forked instances of pollers for unreachable hosts (including IPMI and Java). |
| StartPollers | The number of pre-forked instances of pollers. |
| StartPreprocessors | The number of pre-started instances of preprocessing workers. |
| StartProxyPollers | The number of pre-forked instances of pollers for passive proxies. |
| StartReportWriters | The number of pre-forked instances of report writers. |
| StartSNMPPollers | The number of pre-forked instances of asynchronous SNMP pollers. |
| StartSNMPTrapper | If set to 1, an SNMP trapper process will be started. |
| StartTimers | The number of pre-forked instances of timers. |
| StartTrappers | The number of pre-forked instances of trappers. |
| StartVMwareCollectors | The number of pre-forked VMware collector instances. |
| StatsAllowedIP | A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of external Zabbix instances. The stats request will be accepted only from the addresses listed here. |
| Timeout | Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy, agent, web service, and for SNMP checks (except SNMP walk[OID] and get[OID] items) and icmping[*] item. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |

| Parameter | Description |
|------------------------|---|
| TLSCertFile | The full pathname of a file containing the server certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLSCipherAll | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLSCipherAll13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLSCipherCert | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLSCipherCert13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLSCipherPSK | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSCipherPSK13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSCRLFile | The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. |
| TLSKeyFile | The full pathname of a file containing the server private key, used for encrypted communications between Zabbix components. |
| TmpDir | The temporary directory. |
| TrapperTimeout | Specifies timeout in seconds for: <ul style="list-style-type: none"> - retrieval of historical data from Zabbix proxy; - sending configuration data to Zabbix proxy; - global script execution or remote command execution on Zabbix server. |
| TrendCacheSize | The size of the trend cache. |
| TrendFunctionCacheSize | The size of the trend function cache. |
| UnavailableDelay | Determines how often host is checked for availability during the unavailability period. |
| UnreachableDelay | Determines how often host is checked for availability during the unreachability period. |
| UnreachablePeriod | Determines after how many seconds of unreachability treats a host as unavailable. |
| User | Drop privileges to a specific, existing user on the system. |
| ValueCacheSize | The size of the history value cache. |
| Vault | Specifies the vault provider. |
| VaultDBPath | Specifies a location, from where database credentials should be retrieved by keys. |
| VaultPrefix | Custom prefix for the vault path or query. |
| VaultTLSCertFile | The name of the SSL certificate file used for client authentication. |
| VaultTLSKeyFile | The name of the SSL private key file used for client authentication. |
| VaultToken | The HashiCorp vault authentication token. |
| VaultURL | The vault server HTTP[S] URL. |
| VMwareCacheSize | The shared memory size for storing VMware data. |
| VMwareFrequency | The delay in seconds between data gathering from a single VMware service. |
| VMwarePerfFrequency | The delay in seconds between performance counter statistics retrieval from a single VMware service. |
| VMwareTimeout | The maximum number of seconds a vmware collector will wait for a response from VMware service. |
| WebDriverURL | WebDriver interface HTTP[S] URL. |
| WebServiceURL | HTTP[S] URL to Zabbix web service in the format <host:port>/report. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported in the beginning of the line.

Parameter details

AlertScriptsPath

The location of custom alert scripts (depends on the *datadir* compile-time installation variable).

Default: `/usr/local/share/zabbix/alertscripts`

AllowRoot

Allow the server to run as 'root'. If disabled and the server is started by 'root', the server will try to switch to the 'zabbix' user instead. Has no effect if started under a regular user.

Default: 0
 Values: 0 - do not allow; 1 - allow

AllowSoftwareUpdateCheck

Allow Zabbix UI to receive information about software updates from zabbix.com.

Default: 1
 Values: 0 - do not allow; 1 - allow

AllowUnsupportedDBVersions

Allow the server to work with unsupported database versions.

Default: 0
 Values: 0 - do not allow; 1 - allow

CacheSize

The size of the configuration cache, in bytes. The shared memory size for storing host, item and trigger data.

Default: 32M
 Range: 128K-64G

CacheUpdateFrequency

This parameter determines how often Zabbix will perform the configuration cache update in seconds. See also [runtime control options](#).

Default: 10
 Range: 1-3600

DBHost

The database host name.
With MySQL localhost or empty string results in using a socket. With PostgreSQL only empty string results in attempt to use socket.

Default: localhost

DBName

The database name.

Mandatory: Yes

DBPassword

The database password. Comment this line if no password is used.

DBPort

The database port when not using local socket.³

Default for MySQL: 3306

Default for PostgreSQL: 5432

Range: 1024-65535

DBSchema

The database schema name. Used for PostgreSQL.

DBSocket

The path to the MySQL socket file.³

DBUser

The database user.

DBTLSConnect

Setting this option to the following values enforces to use a TLS connection to the database:
required - connect using TLS
verify_ca - connect using TLS and verify certificate
verify_full - connect using TLS, verify certificate and verify that database identity specified by DBHost matches its certificate

With MySQL, starting from 5.7.11, and PostgreSQL the following values are supported: *required*, *verify_ca*, *verify_full*.
With MariaDB, starting from version 10.2.6, the *required* and *verify_full* values are supported.
By default not set to any option and the behavior depends on database configuration.

DBTLSCAFile

The full pathname of a file containing the top-level CA(s) certificates for database certificate verification.

Mandatory: no (yes, if DBTLSCertFile set to *verify_ca* or *verify_full*)

DBTLSCertFile

The full pathname of a file containing the Zabbix server certificate for authenticating to database.

DBTLSKeyFile

The full pathname of a file containing the private key for authenticating to database.

DBTLSCipher

The list of encryption ciphers that Zabbix server permits for TLS protocols up through TLS v1.2. Supported only for MySQL.

DBTLSCipher13

The list of encryption ciphersuites that Zabbix server permits for the TLS v1.3 protocol. Supported only for MySQL, starting from version 8.0.16.

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).
See also [runtime control](#) options.

Default: 3
 Range: 0-5

EnableGlobalScripts

Enable global scripts on Zabbix server.
 Note: Global script execution is enabled by default. However, for new installations starting with Zabbix 7.0, EnableGlobalScripts is explicitly set to 0 (disabled).

Default: 1
 Values: 0 - disable; 1 - enable

ExportDir

The directory for [real-time export](#) of events, history and trends in newline-delimited JSON format. If set, enables the real-time export.

ExportFileSize

The maximum size per export file in bytes. Used for rotation if ExportDir is set.

Default: 1G
 Range: 1M-1G

ExportType

The list of comma-delimited entity types (events, history, trends) for [real-time export](#) (all types by default). Valid only if ExportDir is set.
Note that if ExportType is specified, but ExportDir is not, then this is a configuration error and the server will not start.

Example for history and trends export:

ExportType=history,trends

Example for event export only:

ExportType=events

ExternalScripts

The location of external scripts (depends on the datadir compile-time installation variable).

Default: /usr/local/share/zabbix/externalscripts

Fping6Location

The location of fping6. Make sure that the fping6 binary has root ownership and the SUID flag set. Make empty ("Fping6Location=") if your fping utility is capable to process IPv6 addresses.

Default: /usr/sbin/fping6

FpingLocation

The location of fping. Make sure that the fping binary has root ownership and the SUID flag set.

Default: /usr/sbin/fping

HANodeName

The high availability cluster node name. When empty the server is working in standalone mode and a node with empty name is created.

HistoryCacheSize

The size of the history cache, in bytes. The shared memory size for storing history data.

Default: 16M
 Range: 128K-2G

HistoryIndexCacheSize

The size of the history index cache, in bytes. The shared memory size for indexing the history data stored in history cache. The index cache size needs roughly 100 bytes to cache one item.

Default: 4M
 Range: 128K-2G

HistoryStorageDateIndex

Enable preprocessing of history values in history storage to store values in different indices based on date.

Default: 0
 Values: 0 - disable; 1 - enable

HistoryStorageURL

The history storage HTTP[S] URL. This parameter is used for [Elasticsearch](#) setup.

HistoryStorageTypes

A comma-separated list of value types to be sent to the history storage. This parameter is used for [Elasticsearch](#) setup.

Default: uint,dbl,str,log,text

HousekeepingFrequency

This parameter determines how often Zabbix will perform the housekeeping procedure in hours. Housekeeping is removing outdated information from the database.
Note: To prevent housekeeper from being overloaded (for example, when history and trend periods are greatly reduced), no more than 4 times HousekeepingFrequency hours of outdated information are deleted in one housekeeping cycle, for each item. Thus, if HousekeepingFrequency is 1, no more than 4 hours of outdated information (starting from the oldest entry) will be deleted per cycle.
Note: To lower load on server startup housekeeping is postponed for 30 minutes after server start. Thus, if HousekeepingFrequency is 1, the very first housekeeping procedure after server start will run after 30 minutes, and will repeat with one hour delay thereafter.
It is possible to disable automatic housekeeping by setting HousekeepingFrequency to 0. In this case the housekeeping procedure can only be started by *housekeeper_execute* runtime control option and the period of outdated information deleted in one housekeeping cycle is 4 times the period since the last housekeeping cycle, but not less than 4 hours and not greater than 4 days.
See also [runtime control](#) options.

Default: 1
 Range: 0-24

Include

You may include individual files or all files in a directory in the configuration file. To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching. See [special notes](#) about limitations.

Example:

```
Include=/absolute/path/to/config/files/*.conf
```

JavaGateway

The IP address (or hostname) of Zabbix Java gateway. Only required if Java pollers are started.

JavaGatewayPort

The port that Zabbix Java gateway listens on.

Default: 10052
 Range: 1024-32767

ListenBacklog

The maximum number of pending connections in the TCP queue.
The default value is a hard-coded constant, which depends on the system.
The maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.

Default: SOMAXCONN
 Range: 0 - INT_MAX

ListenIP

A list of comma-delimited IP addresses that the trapper should listen on.
Trapper will listen on all network interfaces if this parameter is missing.

Default: 0.0.0.0

ListenPort

The listen port for trapper.

Default: 10051
 Range: 1024-32767

LoadModule

The module to load at server startup. Modules are used to extend the functionality of the server. The module must be located in the directory specified by LoadModulePath or the path must precede the module name. If the preceding path is absolute (starts with '/') then LoadModulePath is ignored.
Formats:
LoadModule=<module.so>
LoadModule=<path/module.so>
LoadModule=</ab is allowed to include multiple LoadModule parameters.

LoadModulePath

The full path to the location of server modules. The default depends on compilation options.

LogFile

The name of the log file.

Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of the log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: 1
 Range: 0-1024
 Mandatory: Yes, if LogType is set to *file*; otherwise no

LogSlowQueries

Determines how long a database query may take before being logged in milliseconds.
0 - don't log slow queries.
This option becomes enabled starting with DebugLevel=3.

Default: 0
 Range: 0-3600000

LogType

The type of the log output:
file - write log to file specified by LogFile parameter;
system - write log to syslog;
console - write log to standard output.

Default: *file*

MaxConcurrentChecksPerPoller

The maximum number of asynchronous checks that can be executed at once by each HTTP agent poller, agent poller or SNMP poller. See [StartHTTPAgentPollers](#), [StartAgentPollers](#), and [StartSNMPPollers](#).

Default: 1000
 Range: 1-1000

MaxHousekeeperDelete

No more than 'MaxHousekeeperDelete' rows (corresponding to [tablename], [field], [value]) will be deleted per one task in one housekeeping cycle.
If set to 0 then no limit is used at all. In this case you must know what you are doing, so as not to **overload the database!** ²
This parameter applies only to deleting history and trends of already deleted items.

Default: 5000
 Range: 0-1000000

NodeAddress

IP or hostname with optional port to override how the frontend should connect to the server.
Format: <address>[:<port>]

If IP or hostname is not set, the value of ListenIP will be used. If ListenIP is not set, the value localhost will be used.
If port is not set, the value of ListenPort will be used. If ListenPort is not set, the value 10051 will be used.

This option can be overridden by the address specified in the frontend configuration.

See also: [HANodeName](#) parameter; [Enabling high availability](#).

Default: localhost:10051

PidFile

Name of the PID file.

Default: /tmp/zabbix_server.pid

ProblemHousekeepingFrequency

Determines how often Zabbix will delete problems for deleted triggers in seconds.

Default: 60
 Range: 1-3600

ProxyConfigFrequency

Determines how often Zabbix server sends configuration data to a Zabbix proxy in seconds. Used only for proxies in a passive mode.

Default: 10
 Range: 1-604800

ProxyDataFrequency

Determines how often Zabbix server requests history data from a Zabbix proxy in seconds. Used only for proxies in the passive mode.

Default: 1
 Range: 1-3600

ServiceManagerSyncFrequency

Determines how often Zabbix will synchronize the configuration of a service manager in seconds.

Default: 60
 Range: 1-3600

SMSDevices

A list of comma-delimited modem files allowed to use Zabbix server.
SMS sending is not possible if this parameter is not set.

Example:

```
SMSDevices=/dev/ttyUSB0,/dev/ttyUSB1
```

SNMPTrapperFile

Temporary file used for passing data from the SNMP trap daemon to the server.
Must be the same as in zabbix_trap_receiver.pl or SNMPTT configuration file.

Default: /tmp/zabbix_traps.tmp

SocketDir

Directory to store IPC sockets used by internal Zabbix services.

Default: /tmp

SourceIP

Source IP address for:

- outgoing connections to Zabbix proxy and Zabbix agent;
- agentless connections (VMware, SSH, JMX, SNMP, Telnet and simple checks);
- HTTP agent connections;
- script item JavaScript HTTP requests;
- preprocessing JavaScript HTTP requests;
- sending notification emails (connections to SMTP server);
- webhook notifications (JavaScript HTTP connections);
- connections to the Vault

SSHKeyLocation

Location of public and private keys for SSH checks and actions.

SSLCertLocation

Location of SSL client certificate files for client authentication.
This parameter is used in web monitoring only.

SSLKeyLocation

Location of SSL private key files for client authentication.
This parameter is used in web monitoring only.

SSLCALocation

Override the location of certificate authority (CA) files for SSL server certificate verification. If not set, system-wide directory will be used.
Note that the value of this parameter will be set as libcurl option CURLOPT_CAPATH. For libcurl versions before 7.42.0, this only has effect if libcurl was compiled to use OpenSSL. For more information see [cURL web page](#).
This parameter is used in web monitoring and in SMTP authentication.

StartAgentPollers

The number of pre-forked instances of Zabbix agent **pollers**. See **MaxConcurrentChecksPerPoller**.

Default: 1
 Range: 0-1000

StartAlerters

The number of pre-forked instances of **alerters**.

Default: 3
 Range: 1-100

StartBrowserPollers

The number of pre-forked instances of browser item **pollers**.

Default: 1
 Range: 0-1000

StartConnectors

The number of pre-forked instances of **connector workers**. The connector manager process is started automatically when a connector worker is started.

Default: 0
 Range: 0-1000

StartDBSyncers

The number of pre-forked instances of **history syncers**.
Note: Be careful when changing this value, increasing it may do more harm than good. Roughly, the default value should be enough to handle up to 4000 NVPS.

Default: 4
 Range: 1-100

StartDiscoverers

The number of pre-forked instances of **discovery workers**¹.

Default: 5
 Range: 0-1000

StartEscalators

The number of pre-forked instances of **escalators**.

Default: 1
 Range: 1-100

StartHistoryPollers

The number of pre-forked instances of **history pollers**.
Only required for calculated checks.

Default: 5
 Range: 0-1000

StartHTTPAgentPollers

The number of pre-forked instances of HTTP agent **pollers**. See **MaxConcurrentChecksPerPoller**.

Default: 1
 Range: 0-1000

StartHTTTPollers

The number of pre-forked instances of **HTTP pollers**¹.

Default: 1
 Range: 0-1000

StartIPMIPollers

The number of pre-forked instances of **IPMI pollers**.

Default: 0
 Range: 0-1000

StartJavaPollers

The number of pre-forked instances of **java pollers**¹.

Default: 0
 Range: 0-1000

StartLLDProcessors

The number of pre-forked instances of low-level discovery (LLD) **workers**¹.
The LLD manager process is automatically started when an LLD worker is started.

Default: 2
 Range: 0-100

StartODBCPollers

The number of pre-forked instances of **ODBC pollers**¹.

Default: 1
 Range: 0-1000

StartPingers

The number of pre-forked instances of **ICMP pingers**¹.

Default: 1
 Range: 0-1000

StartPollersUnreachable

The number of pre-forked instances of **pollers for unreachable hosts** (including IPMI and Java)¹.
At least one poller for unreachable hosts must be running if regular, IPMI or Java pollers are started.

Default: 1
 Range: 0-1000

StartPollers

The number of pre-forked instances of **pollers**¹.

Default: 5
 Range: 0-1000

StartPreprocessors

The number of pre-started instances of preprocessing **worker**¹ threads should be set to no less than the available CPU core count. More workers should be set if preprocessing is not CPU-bound and has lots of network requests.

Default: 16
 Range: 1-1000

StartProxyPollers

The number of pre-forked instances of **pollers for passive proxies**¹.

Default: 1
 Range: 0-250

StartReportWriters

The number of pre-forked instances of **report writers**.
If set to 0, scheduled report generation is disabled.
The report manager process is automatically started when a report writer is started.

Default: 0
 Range: 0-100

StartSNMPPollers

The number of pre-forked instances of SNMP **pollers**. See **MaxConcurrentChecksPerPoller**.

Default: 1
 Range: 0-1000

StartSNMPTrapper

If set to 1, an **SNMP trapper** process will be started.

Default: 0
 Range: 0-1

StartTimers

The number of pre-forked instances of **timers**.
Timers process maintenance periods.

Default: 1
 Range: 1-1000

StartTrappers

The number of pre-forked instances of **trappers**¹.
Trappers accept incoming connections from Zabbix sender, active agents and active proxies.

Default: 5
 Range: 1-1000

StartVMwareCollectors

The number of pre-forked **VMware collector** instances.

Default: 0
 Range: 0-250

StatsAllowedIP

A list of comma delimited IP addresses, optionally in CIDR notation, or DNS names of external Zabbix instances. Stats request will be accepted only from the addresses listed here. If this parameter is not set no stats requests will be accepted.
If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address.

Example:

StatsAllowedIP=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

Timeout

Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy, agent, web service, and for SNMP checks (except `SNMP walk[OID]` and `get[OID]` items) and `icmping[*]` item. This parameter defines the duration for various communication operations:

- remote command execution on the Zabbix agent;
- SSH / Telnet command execution;
- requests to the Zabbix Web Service;
- communication timeout for `mediatype test request` and `history.push` method;
- rescheduling of items when IPMI interface becomes unavailable;
- sending response to Zabbix proxy when failing to exchange data due to rights or encryption issues;
- ICMP pinger;
- deadline for IPC asynchronous sockets and runtime control options;
- JMX connections;
- fetching statistics from a remote Zabbix proxy or server;
- sending responses to the Zabbix frontend;
- asynchronous poller DNS requests;
- response for active check heartbeat;
- retrieval of Zabbix agent data (values) from active agents;
- retrieval of data from Zabbix sender;
- response when trapper fails to process a request;
- sending active check list to Zabbix agent.

Default: 3 Range: 1-30

TLSCAFile

The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of a file containing the server certificate or certificate chain, used for encrypted communications between Zabbix components.

TLSCipherAll

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example:

```
TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256
```

TLSCipherAll13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL
```

Example for OpenSSL:

```
EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128
```

TLSCipherCert

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIG
```

Example for OpenSSL:

```
EECDH+aRSA+AES128:RSA+aRSA+AES128
```

TLSCipherCert13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption.

TLSCipherPSK

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption.

Example for GnuTLS:

NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP=NULL:+SIG

Example for OpenSSL:

kECDHEPSK+AES128:kPSK+AES128

TLSCipherPSK13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption.

Example:

TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256

TLSCRLFile

The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.

TLSKeyFile

The full pathname of a file containing the server private key, used for encrypted communications between Zabbix components.

TmpDir

The temporary directory.

Default: /tmp

TrapperTimeout

Specifies timeout in seconds for:

- retrieval of historical data from Zabbix proxy;
- sending configuration data to Zabbix proxy;
- global script execution or remote command execution on Zabbix server.

Default: 300
 Range: 1-300

TrendCacheSize

The size of the trend cache, in bytes.
The shared memory size for storing trends data.

Default: 4M
 Range: 128K-2G

TrendFunctionCacheSize

The size of the trend function cache, in bytes.
The shared memory size for caching calculated trend function data.

Default: 4M
 Range: 128K-2G

UnavailableDelay

Determines how often host is checked for availability during the **unavailability** period in seconds.

Default: 60
 Range: 1-3600

UnreachableDelay

Determines how often host is checked for availability during the **unreachability** period in seconds.

Default: 15
 Range: 1-3600

UnreachablePeriod

Determines after how many seconds of **unreachability** treats a host as unavailable.

Default: 45
 Range: 1-3600

User

Drop privileges to a specific, existing user on the system.
Only has effect if run as 'root' and AllowRoot is disabled.

Default: zabbix

ValueCacheSize

The size of the history value cache, in bytes.
The shared memory size for caching item history data requests.
Setting to 0 disables the value cache (not recommended).
When the value cache runs out of the shared memory a warning message is written to the server log every 5 minutes.

Default: 8M
 Range: 0,128K-64G

Vault

Specifies the vault provider:
HashiCorp - HashiCorp KV Secrets Engine version 2
CyberArk - CyberArk Central Credential Provider
Must match the vault provider set in the frontend.

Default: HashiCorp

VaultDBPath

Vault path or query, depending on the Vault, from where credentials for database will be retrieved by keys.

The keys used for *HashiCorp* are 'password' and 'username'.

Example path with VaultPrefix=/v1/secret/data/zabbix/:

database

Example path without VaultPrefix:

secret/zabbix/database

The keys used for *CyberArk* are 'Content' and 'UserName'.

Example:

AppID=zabbix_server&Query=Safe=passwordSafe;Object=zabbix_server_database

This option can only be used if DBUser and DBPassword are not specified.

VaultPrefix

A custom prefix for Vault path or query, depending on the Vault. The most suitable defaults will be used if not specified.
Note that 'data' is automatically appended after mountpoint for HashiCorp if VaultPrefix is not specified.

Example prefix for Hashicorp:

v1/secret/data/zabbix/

Example prefix for Cyberark:

/AIMWebService/api/Accounts?

VaultTLSCertFile

The name of the SSL certificate file used for client authentication
 The certificate file must be in PEM1 format.
 If the certificate file contains also the private key, leave the SSL key file field empty.
 The directory containing this file is specified by the configuration parameter SSLCertLocation.
This option can be omitted but is recommended for CyberArkCCP vault.

VaultTLSKeyFile

The name of the SSL private key file used for client authentication.
 The private key file must be in PEM1 format.
 The directory containing this file is specified by the configuration parameter SSLKeyLocation.
This option can be omitted but is recommended for CyberArkCCP vault.

VaultToken

The HashiCorp Vault authentication token that should have been generated exclusively for Zabbix server with read-only permission to the paths specified in *Vault macros* and read-only permission to the path specified in the optional VaultDBPath configuration parameter.
It is an error if VaultToken and VAULT_TOKEN environment variable are defined at the same time.

Mandatory: Yes, if Vault is set to *HashiCorp*; otherwise no

VaultURL

The vault server HTTP[S] URL. The system-wide CA certificates directory will be used if SSLCALocation is not specified.

Default: https://127.0.0.1:8200

VMwareCacheSize

The shared memory size for storing VMware data.
A VMware internal check `zabbix[vmware,buffer,...]` can be used to monitor the VMware cache usage (see [Internal checks](#)).
Note that shared memory is not allocated if there are no vmware collector instances configured to start.

Default: 8M
 Range: 256K-2G

VMwareFrequency

The delay in seconds between data gathering from a single VMware service.
This delay should be set to the least update interval of any VMware monitoring item.

Default: 60
 Range: 10-86400

VMwarePerfFrequency

The delay in seconds between performance counter statistics retrieval from a single VMware service. This delay should be set to the least update interval of any VMware monitoring [item](#) that uses VMware performance counters.

Default: 60
 Range: 10-86400

VMwareTimeout

The maximum number of seconds a vmware collector will wait for a response from VMware service (vCenter or ESX hypervisor).

Default: 10
 Range: 1-300

WebServiceURL

The HTTP[S] URL to Zabbix web service in the format `<host:port>/report`.

Example:

`WebServiceURL=http://localhost:10053/report`

WebDriverURL

WebDriver interface HTTP[S] URL.

Example (used with Selenium WebDriver standalone server):

`WebDriverURL=http://localhost:4444`

Footnotes

¹ Note that too many data gathering processes (pollers, unreachable pollers, ODBC pollers, HTTP pollers, Java pollers, pingers, trappers, proxypollers) together with IPMI manager, SNMP trapper, preprocessing workers, and discovery workers can exhaust the per-process file descriptor limit for the preprocessing manager.

Warning:

Exhausting the file descriptor limit will cause Zabbix server to stop, typically shortly after startup but sometimes taking longer. To avoid such issues, review the [Zabbix server configuration file](#) to optimize the number of concurrent checks and processes. Additionally, if necessary, ensure that the file descriptor limit is set sufficiently high by checking and adjusting system limits.

² When a lot of items are deleted it increases the load to the database, because the housekeeper will need to remove all the history data that these items had. For example, if we only have to remove 1 item prototype from the template, but this template is linked to 50 hosts and for every host the prototype is expanded to 100 real items, 5000 items in total have to be removed (1*50*100). If 500 is set for `MaxHousekeeperDelete` (`MaxHousekeeperDelete=500`), the housekeeper process will have to remove up to 2500000 values (5000*500) for the deleted items from history and trends tables in one cycle.

³ `DBSocket` and `DBPort` are mutually exclusive in server configuration. Specify only one, or leave both undefined.

2 Zabbix proxy

Overview

The parameters supported by the Zabbix proxy configuration file (`zabbix_proxy.conf`) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|--|---|
| AllowRoot | Allow the proxy to run as 'root'. |
| AllowUnsupportedDBVersions | Allow the proxy to work with unsupported database versions. |

| Parameter | Description |
|------------------------------|--|
| CacheSize | The size of the configuration cache. |
| ConfigFrequency | This parameter is deprecated (use ProxyConfigFrequency instead). How often the proxy retrieves configuration data from Zabbix server in seconds. |
| DataSenderFrequency | The proxy will send collected data to the server every N seconds. |
| DBHost | The database host name. |
| DBName | The database name or path to the database file for SQLite3. |
| DBPassword | The database password. |
| DBPort | The database port when not using local socket. |
| DBSchema | The database schema name. Used for PostgreSQL. |
| DBSocket | The path to the MySQL socket file. |
| DBUser | The database user. |
| DBTLSConnect | Setting this option to the specified value enforces to use a TLS connection to the database. |
| DBTLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for database certificate verification. |
| DBTLSCertFile | The full pathname of a file containing the Zabbix proxy certificate for authenticating to database. |
| DBTLSKeyFile | The full pathname of a file containing the private key for authenticating to database. |
| DBTLSCipher | The list of encryption ciphers that Zabbix proxy permits for TLS protocols up through TLS v1.2. Supported only for MySQL. |
| DBTLSCipher13 | The list of encryption ciphersuites that Zabbix proxy permits for the TLS v1.3 protocol. Supported only for MySQL, starting from version 8.0.16. |
| DebugLevel | The debug level. |
| EnableRemoteCommands | Whether remote commands from Zabbix server are allowed. |
| ExternalScripts | The location of external scripts. |
| Fping6Location | The location of fping6. |
| FpingLocation | The location of fping. |
| HistoryCacheSize | The size of the history cache. |
| HistoryIndexCacheSize | The size of the history index cache. |
| Hostname | A unique, case sensitive proxy name. |
| Hostnameltem | The item used for setting Hostname if it is undefined. |
| HousekeepingFrequency | How often Zabbix will perform the housekeeping procedure in hours. |
| Include | You may include individual files or all files in a directory in the configuration file. |
| JavaGateway | The IP address (or hostname) of Zabbix Java gateway. |
| JavaGatewayPort | The port that Zabbix Java gateway listens on. |
| ListenBacklog | The maximum number of pending connections in the TCP queue. |
| ListenIP | A list of comma-delimited IP addresses that the trapper should listen on. |
| ListenPort | The listen port for trapper. |
| LoadModule | The module to load at proxy startup. |
| LoadModulePath | The full path to the location of proxy modules. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogRemoteCommands | Enable logging of executed shell commands as warnings. |
| LogSlowQueries | How long a database query may take before being logged. |
| LogType | The type of the log output. |
| MaxConcurrentChecksPerPoller | The maximum number of asynchronous checks that can be executed at once by each HTTP agent poller, agent poller or SNMP poller. |
| PidFile | The name of the PID file. |
| ProxyBufferMode | Specifies history, discovery and autoregistration data storage mechanism (disk/memory/hybrid). |
| ProxyConfigFrequency | How often the proxy retrieves configuration data from Zabbix server in seconds. |
| ProxyLocalBuffer | The proxy will keep data locally for N hours, even if the data have already been synced with the server. |
| ProxyMemoryBufferAge | The maximum age of data in proxy memory buffer in seconds. |
| ProxyMemoryBufferSize | The size of shared memory cache for collected history, discovery and auto registration data. |
| ProxyMode | The proxy operating mode (active/passive). |
| ProxyOfflineBuffer | The proxy will keep data for N hours in case of no connectivity with Zabbix server. |
| Server | If ProxyMode is set to active mode: Zabbix server IP address or DNS name (address:port) or cluster (address:port;address2:port) to get configuration data from and send data to. If ProxyMode is set to passive mode: List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix server. |
| SNMPTrapperFile | The temporary file used for passing data from the SNMP trap daemon to the proxy. |
| SocketDir | The directory to store the IPC sockets used by internal Zabbix services. |
| SourceIP | The source IP address. |

| Parameter | Description |
|-------------------------|--|
| SSHKeyLocation | The location of public and private keys for SSH checks and actions. |
| SSLCertLocation | The location of SSL client certificate files for client authentication. |
| SSLKeyLocation | The location of SSL private key files for client authentication. |
| SSLCALocation | Override the location of certificate authority (CA) files for SSL server certificate verification. |
| StartAgentPollers | The number of pre-forked instances of asynchronous Zabbix agent pollers. |
| StartBrowserPollers | The number of pre-forked instances of browser item pollers. |
| StartDBSyncers | The number of pre-forked instances of history syncers. |
| StartDiscoverers | The number of pre-forked instances of discovery workers. |
| StartHTTPAgentPollers | The number of pre-forked instances of asynchronous HTTP agent pollers. |
| StartHTTTPollers | The number of pre-forked instances of HTTP pollers. |
| StartIPMIPollers | The number of pre-forked instances of IPMI pollers. |
| StartJavaPollers | The number of pre-forked instances of Java pollers. |
| StartODBCPollers | The number of pre-forked instances of ODBC pollers. |
| StartPingers | The number of pre-forked instances of ICMP pingers. |
| StartPollersUnreachable | The number of pre-forked instances of pollers for unreachable hosts (including IPMI and Java). |
| StartPollers | The number of pre-forked instances of pollers. |
| StartPreprocessors | The number of pre-started instances of preprocessing workers. |
| StartSNMPPollers | The number of pre-forked instances of asynchronous SNMP pollers. |
| StartSNMPTrapper | If set to 1, an SNMP trapper process will be started. |
| StartTrappers | The number of pre-forked instances of trappers. |
| StartVMwareCollectors | The number of pre-forked VMware collector instances. |
| StatsAllowedIP | A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of external Zabbix instances. The stats request will be accepted only from the addresses listed here. |
| Timeout | Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy, agent, web service, and for SNMP checks (except SNMP walk[OID] and get[OID] items) and icmping[*] item. |
| TLSAccept | What incoming connections to accept from Zabbix server. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |
| TLS_CERT_FILE | The full pathname of a file containing the server certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLS_CIPHER_ALL | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLS_CIPHER_ALL13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLS_CIPHER_CERT | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLS_CIPHER_CERT13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLS_CIPHER_PSK | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLS_CIPHER_PSK13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLS_CONNECT | How the proxy should connect to Zabbix server. |
| TLS_CRL_FILE | The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. |
| TLS_KEY_FILE | The full pathname of a file containing the proxy private key, used for encrypted communications between Zabbix components. |
| TLS_PSK_FILE | The full pathname of a file containing the proxy pre-shared key, used for encrypted communications with Zabbix server. |
| TLS_PSK_IDENTITY | The pre-shared key identity string, used for encrypted communications with Zabbix server. |
| TLS_SERVER_CERT_ISSUER | The allowed server certificate issuer. |
| TLS_SERVER_CERT_SUBJECT | The allowed server certificate subject. |
| TmpDir | The temporary directory. |
| TrapperTimeout | Specifies timeout in seconds for: <ul style="list-style-type: none"> - retrieval of configuration data from the Zabbix server; - global script execution or remote command execution. |
| UnavailableDelay | How often a host is checked for availability during the unavailability period. |
| UnreachableDelay | How often a host is checked for availability during the unreachability period. |
| UnreachablePeriod | After how many seconds of unreachability treat the host as unavailable. |
| User | Drop privileges to a specific, existing user on the system. |

| Parameter | Description |
|----------------------------|---|
| Vault | The vault provider. |
| VaultDBPath | The location, from where database credentials should be retrieved by keys. |
| VaultPrefix | Custom prefix for the vault path or query. |
| VaultTLSCertFile | The name of the SSL certificate file used for client authentication. |
| VaultTLSKeyFile | The name of the SSL private key file used for client authentication. |
| VaultToken | The HashiCorp vault authentication token. |
| VaultURL | The vault server HTTP[S] URL. |
| VMwareCacheSize | The shared memory size for storing VMware data. |
| VMwareFrequency | The delay in seconds between data gathering from a single VMware service. |
| VMwarePerfFrequency | The delay in seconds between performance counter statistics retrieval from a single VMware service. |
| VMwareTimeout | The maximum number of seconds a vmware collector will wait for a response from VMware service. |
| WebDriverURL | WebDriver interface HTTP[S] URL. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files.
- Values support **environment variables**.
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**.
- Comments starting with **"#"** are only supported in the beginning of the line.

Parameter details

AllowRoot

Allow the proxy to run as 'root'. If disabled and the proxy is started by 'root', the proxy will try to switch to the 'zabbix' user instead. Has no effect if started under a regular user.

Default: 0
 Values: 0 - do not allow; 1 - allow

AllowUnsupportedDBVersions

Allow the proxy to work with unsupported database versions.

Default: 0
 Values: 0 - do not allow; 1 - allow

CacheSize

The size of the configuration cache, in bytes. The shared memory size for storing host and item data.

Default: 32M
 Range: 128K-64G

ConfigFrequency

This parameter is **deprecated** (use ProxyConfigFrequency instead).
How often the proxy retrieves configuration data from Zabbix server in seconds.
Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).

Default: 3600
 Range: 1-604800

DataSenderFrequency

The proxy will send collected data to the server every N seconds. Note that an active proxy will still poll Zabbix server every second for remote command tasks.
Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).

Default: 1
 Range: 1-3600

DBHost

The database host name.
With MySQL localhost or empty string results in using a socket. With PostgreSQL only empty string results in attempt to use socket.

Default: localhost

DBName

The database name or path to the database file for SQLite3 (the multi-process architecture of Zabbix does not allow to use **in-memory database**, e.g. :memory:, file::memory:?cache=shared or file::memdb1?mode=memory&cache=shared).
Warning: Do not attempt to use the same database the Zabbix server is using.

Mandatory: Yes

DBPassword

The database password. Comment this line if no password is used. Ignored for SQLite.

DBPort

The database port when not using local socket.¹ Ignored for SQLite.

Default for MySQL: 3306

Default for PostgreSQL: 5432

Range: 1024-65535

DBSchema

The database schema name. Used for PostgreSQL.

DBSocket

The path to the MySQL socket file.¹
The database port when not using local socket. Ignored for SQLite.

Default: 3306

DBUser

The database user. Ignored for SQLite.

DBTLSConnect

Setting this option enforces to use TLS connection to the database:
required - connect using TLS
verify_ca - connect using TLS and verify certificate
verify_full - connect using TLS, verify certificate and verify that database identity specified by DBHost matches its certificate
On MySQL starting from 5.7.11 and PostgreSQL the following values are supported: "required", "verify", "verify_full".
On MariaDB starting from version 10.2.6 "required" and "verify_full" values are supported.
By default not set to any option and the behavior depends on database configuration.

DBTLSCAFile

The full pathname of a file containing the top-level CA(s) certificates for database certificate verification.

Mandatory: no (yes, if DBTLSConnect set to *verify_ca* or *verify_full*)

DBTLSCertFile

The full pathname of a file containing the Zabbix proxy certificate for authenticating to database.

DBTLSKeyFile

The full pathname of a file containing the private key for authenticating to the database.

DBTLSCipher

The list of encryption ciphers that Zabbix proxy permits for TLS protocols up through TLS v1.2. Supported only for MySQL.

DBTLSCipher13

The list of encryption ciphersuites that Zabbix proxy permits for the TLS v1.3 protocol. Supported only for MySQL, starting from version 8.0.16.

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).

Default: 3
Range: 0-5

EnableRemoteCommands

Whether remote commands from Zabbix server are allowed.

Default: 0
Values: 0 - not allowed; 1 - allowed

ExternalScripts

The location of external scripts (depends on the `datadir` compile-time installation variable).

Default: `/usr/local/share/zabbix/externalscripts`

Fping6Location

The location of `fping6`. Make sure that the `fping6` binary has root ownership and the SUID flag set. Make empty ("`Fping6Location=`") if your `fping` utility is capable to process IPv6 addresses.

Default: `/usr/sbin/fping6`

FpingLocation

The location of `fping`. Make sure that the `fping` binary has root ownership and the SUID flag set.

Default: `/usr/sbin/fping`

HistoryCacheSize

The size of the history cache, in bytes. The shared memory size for storing history data.

Default: 16M
 Range: 128K-2G

HistoryIndexCacheSize

The size of the history index cache, in bytes. The shared memory size for indexing the history data stored in history cache. The index cache size needs roughly 100 bytes to cache one item.

Default: 4M
 Range: 128K-2G

Hostname

A unique, case sensitive proxy name. Make sure the proxy name is known to the server.
Allowed characters: alphanumeric, `'`, `'`, `'`, `'`, `'` and `'`. Maximum length: 128

Default: Set by `Hostnameltem`

Hostnameltem

The item used for setting `Hostname` if it is undefined (this will be run on the proxy similarly as on an agent). Ignored if `Hostname` is set.
Does not support `UserParameters`, performance counters or aliases, but does support `system.run[]`.

Default: `system.hostname`

HousekeepingFrequency

How often Zabbix will perform housekeeping procedure (in hours). Housekeeping is removing outdated information from the database.
Note: To lower load on proxy startup housekeeping is postponed for 30 minutes after proxy start. Thus, if `HousekeepingFrequency` is 1, the very first housekeeping procedure after proxy start will run after 30 minutes, and will repeat every hour thereafter.
It is possible to disable automatic housekeeping by setting `HousekeepingFrequency` to 0. In this case the housekeeping procedure can only be started by `housekeeper_execute` runtime control option.

Default: 1
 Range: 0-24

Include

You may include individual files or all files in a directory in the configuration file.
To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.
See [special notes](#) about limitations.

Example:

`Include=/absolute/path/to/config/files/*.conf`

JavaGateway

The IP address (or hostname) of Zabbix Java gateway. Only required if Java pollers are started.

JavaGatewayPort

The port that Zabbix Java gateway listens on.

Default: 10052
 Range: 1024-32767

ListenBacklog

The maximum number of pending connections in the TCP queue.
The default value is a hard-coded constant, which depends on the system.
The maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.

Default: `SOMAXCONN`
 Range: 0 - `INT_MAX`

ListenIP

A list of comma-delimited IP addresses that the trapper should listen on.
Trapper will listen on all network interfaces if this parameter is missing.

Default: 0.0.0.0

ListenPort

The listen port for trapper.

Default: 10051
 Range: 1024-32767

LoadModule

The module to load at proxy startup. Modules are used to extend the functionality of the proxy. The module must be located in the directory specified by LoadModulePath or the path must precede the module name. If the preceding path is absolute (starts with '/') then LoadModulePath is ignored.
Formats:
LoadModule=<module.so>
LoadModule=<path/module.so>
LoadModule=</ab> is allowed to include multiple LoadModule parameters.

LoadModulePath

The full path to the location of proxy modules. The default depends on compilation options.

LogFile

The name of the log file.

Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of a log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: 1
 Range: 0-1024

LogRemoteCommands

Enable the logging of executed shell commands as warnings.

Default: 0
 Values: 0 - disabled, 1 - enabled

LogType

The type of the log output:
file - write log to the file specified by LogFile parameter;
system - write log to syslog;
console - write log to standard output.

Default: file

LogSlowQueries

How long a database query may take before being logged (in milliseconds).
0 - don't log slow queries.
This option becomes enabled starting with DebugLevel=3.

Default: 0
 Range: 0-3600000

MaxConcurrentChecksPerPoller

The maximum number of asynchronous checks that can be executed at once by each HTTP agent poller, agent poller or SNMP poller. See [StartHTTPAgentPollers](#), [StartAgentPollers](#), and [StartSNMPPollers](#).

Default: 1000
 Range: 1-1000

PidFile

The name of the PID file.

Default: /tmp/zabbix_proxy.pid

ProxyBufferMode

Specifies history, network discovery and autoregistration data storage mechanism: *disk* - data are stored in database and uploaded from database; *memory* - data are stored in memory and uploaded from memory. If buffer runs out of memory the old data will be discarded. On shutdown the buffer is discarded. *hybrid* - the proxy buffer normally works like in the memory mode until it runs out of memory or the oldest record exceeds the configured age. If that happens the buffer is flushed to database and it works like in disk mode until all data have been uploaded and it starts working with memory again. On shutdown the memory buffer is flushed to database.

See also: [Proxy memory buffer](#).

Default: disk
 Values: disk; memory; hybrid

ProxyConfigFrequency

How often the proxy retrieves configuration data from Zabbix server in seconds.
Active proxy parameter. Ignored for passive proxies (see ProxyMode parameter).

Default: 10
 Range: 1-604800

ProxyLocalBuffer

The proxy will keep data locally for N hours, even if the data have already been synced with the server.
This parameter may be used if local data will be used by third-party applications.

Default: 0
 Range: 0-720

ProxyMemoryBufferAge

The maximum age of data in proxy memory buffer, in seconds. When enabled (not zero) and records in proxy memory buffer are older, then it forces proxy buffer to switch to database mode until all records are uploaded to server. This parameter must be less or equal to ProxyOfflineBuffer parameter.

Default: 0
 Range: 0;600-864000

ProxyMemoryBufferSize

The size of shared memory cache for collected history, discovery and autoregistration data, in bytes. If enabled (not zero) proxy will keep history discovery and autoregistration data in memory unless cache is full or stored records are older than defined ProxyMemoryBufferAge. This parameter cannot be used together with ProxyLocalBuffer parameter.

Default: 0
 Range: 0;128K-2G

ProxyMode

The proxy operating mode.
0 - proxy in the active mode
1 - proxy in the passive mode
Note that (sensitive) proxy configuration data may become available to parties having access to the Zabbix server trapper port when using an active proxy. This is possible because anyone may pretend to be an active proxy and request configuration data; authentication does not take place.

Default: 0
 Range: 0-1

ProxyOfflineBuffer

The proxy will keep data for N hours in case of no connectivity with Zabbix server.
Older data will be lost.

Default: 1
 Range: 1-720

Server

If ProxyMode is set to *active mode*:
Zabbix server IP address or DNS name (address:port) or **cluster** (address:port;address2:port) to get configuration data from and send data to.
If port is not specified, the default port is used.
Cluster nodes must be separated by a semicolon.
If ProxyMode is set to *passive mode*:
List of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix server. Incoming connections will be accepted only from the addresses listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally.
'::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address.

Example:

Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

Mandatory: yes

SNMPTrapperFile

A temporary file used for passing data from the SNMP trap daemon to the proxy.
Must be the same as in zabbix_trap_receiver.pl or SNMPPTT configuration file.

Default: /tmp/zabbix_traps.tmp

SocketDir

The directory to store IPC sockets used by internal Zabbix services.

Default: /tmp

SourceIP

The source IP address for:
- outgoing connections to Zabbix server;
- agentless connections (VMware, SSH, JMX, SNMP, Telnet and simple checks);
- HTTP agent connections;
- script item JavaScript HTTP requests;
- preprocessing JavaScript HTTP requests;
- connections to the Vault

SSHKeyLocation

The location of public and private keys for SSH checks and actions.

SSLCertLocation

The location of SSL client certificate files for client authentication.
This parameter is used in web monitoring only.

SSLKeyLocation

The location of SSL private key files for client authentication.
This parameter is used in web monitoring only.

SSLCALocation

The location of certificate authority (CA) files for SSL server certificate verification.
Note that the value of this parameter will be set as the CURLOPT_CAPATH libcurl option. For libcurl versions before 7.42.0, this only has effect if libcurl was compiled to use OpenSSL. For more information see the [CURL web page](#).
This parameter is used in web monitoring and in SMTP authentication.

StartAgentPollers

The number of pre-forked instances of Zabbix agent **pollers**. See **MaxConcurrentChecksPerPoller**.

Default: 1
 Range: 0-1000

StartBrowserPollers

The number of pre-forked instances of browser item **pollers**.

Default: 1
 Range: 0-1000

StartDBSyncers

The number of pre-forked instances of **history syncers**.
Note: Be careful when changing this value, increasing it may do more harm than good.

Default: 4
 Range: 1-100

StartDiscoverers

The number of pre-forked instances of **discovery workers**.

Default: 5
 Range: 0-1000

StartHTTPAgentPollers

The number of pre-forked instances of HTTP agent **pollers**. See **MaxConcurrentChecksPerPoller**.

Default: 1
 Range: 0-1000

StartHTTPPollers

The number of pre-forked instances of **HTTP pollers**.

Default: 1
 Range: 0-1000

StartIPMIPollers

The number of pre-forked instances of **IPMI pollers**.

Default: 0
 Range: 0-1000

StartJavaPollers

The number of pre-forked instances of **Java pollers**.

Default: 0
 Range: 0-1000

StartODBCPollers

The number of pre-forked instances of **ODBC pollers**.

Default: 1
 Range: 0-1000

StartPingers

The number of pre-forked instances of **ICMP pingers**.

Default: 1
 Range: 0-1000

StartPollersUnreachable

The number of pre-forked instances of **pollers for unreachable hosts** (including IPMI and Java). At least one poller for unreachable hosts must be running if regular, IPMI or Java pollers are started.

Default: 1
 Range: 0-1000

StartPollers

The number of pre-forked instances of **pollers**.

Default: 5
 Range: 0-1000

StartPreprocessors

The number of pre-started instances of preprocessing **worker** threads should be set to no less than the available CPU core count. More workers should be set if preprocessing is not CPU-bound and has lots of network requests.

Default: 16
 Range: 1-1000

StartSNMPPollers

The number of pre-forked instances of SNMP **pollers**. See **MaxConcurrentChecksPerPoller**.

Default: 1
 Range: 0-1000

StartSNMPTrapper

If set to 1, an **SNMP trapper** process will be started.

Default: 0
 Range: 0-1

StartTrappers

The number of pre-forked instances of **trappers**.
Trappers accept incoming connections from Zabbix sender and active agents.

Default: 5
 Range: 0-1000

StartVMwareCollectors

The number of pre-forked **VMware collector** instances.

Default: 0
 Range: 0-250

StatsAllowedIP

A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of external Zabbix instances. The stats request will be accepted only from the addresses listed here. If this parameter is not set no stats requests will be accepted.
If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address.

Example:

StatsAllowedIP=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

Timeout

Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix server, agent, web service, and for SNMP checks (except SNMP walk[OID] and get[OID] items) and icmping[*] item. This parameter defines the duration for various communication operations:

- Remote command execution on Zabbix agent.
- SSH / Telnet command execution.
- Rescheduling of items when IPMI interface becomes unavailable.
- ICMP pinger.
- Sending response to Zabbix server when failing to exchange data due to rights or encryption issues.
- Deadline for IPC asynchronous sockets and runtime control options.
- Asynchronous poller DNS requests.
- Response for active check heartbeat.
- Retrieval of Zabbix agent data (values) from active agents.
- Retrieval of data from Zabbix sender.
- Sending active check list to Zabbix agent.

Default: 3
 Range: 1-30

TLSAccept

What incoming connections to accept from Zabbix server. Used for a passive proxy, ignored on an active proxy. Multiple values can be specified, separated by comma:
unencrypted - accept connections without encryption (default)
psk - accept connections with TLS and a pre-shared key (PSK)
cert - accept connections with TLS and a certificate

Mandatory: yes for passive proxy, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCAFile

The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of a file containing the proxy certificate or certificate chain, used for encrypted communications between Zabbix components.

TLSCipherAll

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example:

```
TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256
```

TLSCipherAll13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL
```

Example for OpenSSL:

```
EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128
```

TLSCipherCert

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP=NULL:+SIG
```

Example for OpenSSL:

```
EECDH+aRSA+AES128:RSA+aRSA+AES128
```

TLSCipherCert13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption.

TLSCipherPSK

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP=NULL:+SIG
```

Example for OpenSSL:

```
kECDHEPSK+AES128:kPSK+AES128
```

TLSCipherPSK13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption.

Example:

```
TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256
```

TLSCConnect

How the proxy should connect to Zabbix server. Used for an active proxy, ignored on a passive proxy. Only one value can be specified: `
unencrypted` - connect without encryption (default) `
psk` - connect using TLS and a pre-shared key (PSK) `
cert` - connect using TLS and a certificate

Mandatory: yes for active proxy, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCRLFile

The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.

TLSKeyFile

The full pathname of a file containing the proxy private key, used for encrypted communications between Zabbix components.

TLSPSKFile

The full pathname of a file containing the proxy pre-shared key, used for encrypted communications with Zabbix server.

TLSPSKIdentity

The pre-shared key identity string, used for encrypted communications with Zabbix server.

TLSServerCertIssuer

The allowed server certificate issuer.

TLSServerCertSubject

The allowed server certificate subject.

TmpDir

The temporary directory.

Default: /tmp

TrapperTimeout

Specifies timeout in seconds for:
 - retrieval of configuration data from the Zabbix server;
 - global script execution or remote command execution.

Default: 300
 Range: 1-300

UnavailableDelay

How often a host is checked for availability during the **unavailability** period in seconds.

Default: 60
 Range: 1-3600

UnreachableDelay

How often a host is checked for availability during the **unreachability** period in seconds.

Default: 15
 Range: 1-3600

UnreachablePeriod

After how many seconds of **unreachability** treat a host as unavailable.

Default: 45
 Range: 1-3600

User

Drop privileges to a specific, existing user on the system.
Only has effect if run as 'root' and AllowRoot is disabled.

Default: zabbix

Vault

The vault provider:
HashiCorp - HashiCorp KV Secrets Engine version 2
CyberArk - CyberArk Central Credential Provider
Must match the vault provider set in the frontend.

Default: HashiCorp

VaultDBPath

Vault path or query, depending on the Vault, from where credentials for database will be retrieved by keys.

The keys used for **HashiCorp** are 'password' and 'username'.

Example path with VaultPrefix=/v1/secret/data/zabbix/:

database

Example path without VaultPrefix:

secret/zabbix/database

The keys used for **CyberArk** are 'Content' and 'UserName'.

Example:

AppID=zabbix_server&Query=Safe=passwordSafe;Object=zabbix_proxy_database

This option can only be used if DBUser and DBPassword are not specified.

VaultPrefix

A custom prefix for Vault path or query, depending on the Vault. The most suitable defaults will be used if not specified.
Note that 'data' is automatically appended after mountpoint for HashiCorp if VaultPrefix is not specified.

Example prefix for Hashicorp:

v1/secret/data/zabbix/

Example prefix for Cyberark:

/AIMWebService/api/Accounts?

VaultTLSCertFile

The name of the SSL certificate file used for client authentication. The certificate file must be in PEM1 format.
If the certificate file contains also the private key, leave the SSL key file field empty.
The directory containing this file is specified by the SSLCertLocation configuration parameter.
This option can be omitted, but is recommended for CyberArkCCP vault.

VaultTLSKeyFile

The name of the SSL private key file used for client authentication. The private key file must be in PEM1 format.
The directory containing this file is specified by the SSLKeyLocation configuration parameter.
This option can be omitted, but is recommended for CyberArkCCP vault.

VaultToken

The HashiCorp vault authentication token that should have been generated exclusively for Zabbix proxy with read-only permission to the path specified in the optional VaultDBPath configuration parameter.
It is an error if VaultToken and the VAULT_TOKEN environment variable are defined at the same time.

Mandatory: Yes, if Vault is set to *HashiCorp*; otherwise no

VaultURL

The vault server HTTP[S] URL. The system-wide CA certificates directory will be used if SSLCALocation is not specified.

Default: https://127.0.0.1:8200

VMwareCacheSize

The shared memory size for storing VMware data.
A VMware internal check zabbix[vmware,buffer,...] can be used to monitor the VMware cache usage (see **Internal checks**).
Note that shared memory is not allocated if there are no vmware collector instances configured to start.

Default: 8M
 Range: 256K-2G

VMwareFrequency

The delay in seconds between data gathering from a single VMware service.
This delay should be set to the least update interval of any VMware monitoring item.

Default: 60
 Range: 10-86400

VMwarePerfFrequency

The delay in seconds between performance counter statistics retrieval from a single VMware service.
This delay should be set to the least update interval of any VMware monitoring **item** that uses VMware performance counters.

Default: 60
 Range: 10-86400

VMwareTimeout

The maximum number of seconds a vmware collector will wait for a response from VMware service (vCenter or ESX hypervisor).

Default: 10
 Range: 1-300

WebDriverURL

WebDriver interface HTTP[S] URL.

Example (used with Selenium WebDriver standalone server):

WebDriverURL=http://localhost:4444

Footnotes

¹ DBSocket and DBPort are mutually exclusive in proxy configuration. Specify only one, or leave both undefined.

3 Zabbix agent (UNIX)

Overview

The parameters supported by the Zabbix agent configuration file (zabbix_agentd.conf) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|--------------------------------------|---|
| Alias | Sets an alias for an item key. |
| AllowKey | Allow the execution of those item keys that match a pattern. |
| AllowRoot | Allow the agent to run as 'root'. |
| BufferSend | Do not keep data longer than N seconds in buffer. |
| BufferSize | The maximum number of values in the memory buffer. |
| DebugLevel | The debug level. |
| DenyKey | Deny the execution of those item keys that match a pattern. |
| EnableRemoteCommands | Whether remote commands from Zabbix server are allowed. |
| HeartbeatFrequency | The frequency of heartbeat messages in seconds. |
| HostInterface | An optional parameter that defines the host interface. |
| HostInterfaceItem | An optional parameter that defines an item used for getting the host interface. |
| HostMetadata | An optional parameter that defines the host metadata. |
| HostMetadataItem | An optional parameter that defines a Zabbix agent item used for getting the host metadata. |
| Hostname | An optional parameter that defines the hostname. |
| HostnameItem | An optional parameter that defines a Zabbix agent item used for getting the hostname. |
| Include | You may include individual files or all files in a directory in the configuration file. |
| ListenBacklog | The maximum number of pending connections in the TCP queue. |
| ListenIP | A list of comma-delimited IP addresses that the agent should listen on. |
| ListenPort | The agent will listen on this port for connections from the server. |
| LoadModule | The module to load at agent startup. |
| LoadModulePath | The full path to the location of agent modules. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogRemoteCommands | Enable logging of executed shell commands as warnings. |
| LogType | The type of the log output. |
| MaxLinesPerSecond | The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' active checks. |
| PidFile | The name of the PID file. |
| RefreshActiveChecks | How often the list of active checks is refreshed. |
| Server | A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. |
| ServerActive | The Zabbix server/proxy address or cluster configuration to get active checks from. |
| SourceIP | The source IP address. |
| StartAgents | The number of pre-forked instances of zabbix_agentd that process passive checks. |
| Timeout | Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server. |
| TLSAccept | What incoming connections to accept. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |
| TLSCertFile | The full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLSCipherAll | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLSCipherAll13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLSCipherCert | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption. |

| Parameter | Description |
|-----------------------------|--|
| TLSCipherCert13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLSCipherPSK | The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSCipherPSK13 | The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSConnect | How the agent should connect to Zabbix server or proxy. |
| TLSCRLFile | The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. |
| TLSKeyFile | The full pathname of a file containing the agent private key, used for encrypted communications between Zabbix components. |
| TLSPSKFile | The full pathname of a file containing the agent pre-shared key, used for encrypted communications with Zabbix server. |
| TLSPSKIdentity | The pre-shared key identity string, used for encrypted communications with Zabbix server. |
| TLSServerCertIssuer | The allowed server (proxy) certificate issuer. |
| TLSServerCertSubject | The allowed server (proxy) certificate subject. |
| UnsafeUserParameters | Allow all characters to be passed in arguments to user-defined parameters. |
| User | Drop privileges to a specific, existing user on the system. |
| UserParameter | A user-defined parameter to monitor. |
| UserParameterDir | The default search path for UserParameter commands. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported in the beginning of the line.

Parameter details

Alias

Sets an alias for an item key. It can be used to substitute a long and complex item key with a shorter and simpler one.
Multiple *Alias* parameters may be present. Multiple parameters with the same *Alias* key are not allowed.
Different *Alias* keys may reference the same item key.
Aliases can be used in *HostMetadataItem* but not in *HostnameItem* parameter.

Example 1: Retrieving the ID of user 'zabbix'.

```
Alias=zabbix.userid:vfs.file.regexp[/etc/passwd,"^zabbix: :([0-9]+)",,,\1]
```

Now the **zabbix.userid** shorthand key may be used to retrieve data.

Example 2: Getting CPU utilization with default and custom parameters.

```
Alias=cpu.util:system.cpu.util
Alias=cpu.util[*]:system.cpu.util[*]
```

This allows use the **cpu.util** key to get CPU utilization percentage with default parameters as well as use **cpu.util[all, idle, avg15]** to get specific data about CPU utilization.

Example 3: Running multiple **low-level discovery** rules processing the same discovery items.

```
Alias=vfs.fs.discovery[*]:vfs.fs.discovery
```

Now it is possible to set up several discovery rules using **vfs.fs.discovery** with different parameters for each rule, e.g., **vfs.fs.discovery[foo]**, **vfs.fs.discovery[bar]**, etc.

AllowKey

Allow the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the **"*"** character to match any number of any characters.
Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order. See also: **Restricting agent checks**.

AllowRoot

Allow the agent to run as 'root'. If disabled and the agent is started by 'root', the agent will try to switch to user 'zabbix' instead. Has no effect if started under a regular user.

Default: 0
 Values: 0 - do not allow; 1 - allow

BufferSend

Do not keep data longer than N seconds in buffer.

Default: 5
 Range: 1-3600

BufferSize

The maximum number of values in the memory buffer. The agent will send all collected data to the Zabbix server or proxy if the buffer is full.

Default: 100
 Range: 2-65535

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).

Default: 3
 Range: 0-5

DenyKey

Deny the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the "*" character to match any number of any characters.
Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order. See also: [Restricting agent checks](#).

EnableRemoteCommands

Whether remote commands from Zabbix server are allowed. This parameter is **deprecated**, use AllowKey=system.run[*] or DenyKey=system.run[*] instead.
It is an internal alias for AllowKey/DenyKey parameters depending on value:
0 - DenyKey=system.run[*]
1 - AllowKey=system.run[*]

Default: 0
 Values: 0 - do not allow, 1 - allow

HeartbeatFrequency

The frequency of heartbeat messages in seconds. Used for monitoring the availability of active checks.
0 - heartbeat messages disabled.

Default: 60
 Range: 0-3600

HostInterface

An optional parameter that defines the host interface. The host interface is used at host [autoregistration](#) process. If not defined, the value will be acquired from HostInterfaceItem.
The agent will issue an error and not start if the value is over the limit of 255 characters.

Range: 0-255 characters

HostInterfaceItem

An optional parameter that defines an item used for getting the host interface.
Host interface is used at host [autoregistration](#) process.
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.
The [system.run\[\]](#) item is supported regardless of AllowKey/DenyKey values.
This option is only used when HostInterface is not defined.

HostMetadata

An optional parameter that defines host metadata. Host metadata is used only at host autoregistration process (active agent). If not defined, the value will be acquired from HostMetadataItem.
The agent will issue an error and not start if the specified value is over the limit of 2034 bytes or a non-UTF-8 string.

Range: 0-2034 bytes

HostMetadataItem

An optional parameter that defines a Zabbix agent item used for getting host metadata. This option is only used when HostMetadata is not defined. User parameters and aliases are supported. The [system.run\[\]](#) item is supported regardless of AllowKey/DenyKey values.
The HostMetadataItem value is retrieved on each autoregistration attempt and is used only at host autoregistration process (active agent).
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 65535 UTF-8 code points. The value returned by the item must be a UTF-8 string otherwise it will be ignored.

Hostname

A list of comma-delimited, unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. The value is acquired from HostnameItem if undefined.
Allowed characters: alphanumeric, '.', '-', '_' and '-'. Maximum length: 128 characters per hostname, 2048 characters for the entire line.

Default: Set by HostnameItem

HostnameItem

An optional parameter that defines a Zabbix agent item used for getting the host name. This option is only used when Hostname is not defined. User parameters or aliases are not supported, but the `system.run[]` item is supported regardless of AllowKey/DenyKey values.

Default: `system.hostname`

Include

You may include individual files or all files in a directory in the configuration file. To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.
See [special notes](#) about limitations.

Example:

```
Include=/absolute/path/to/config/files/*.conf
```

ListenBacklog

The maximum number of pending connections in the TCP queue.
The default value is a hard-coded constant, which depends on the system.
The maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.

Default: `SOMAXCONN`
 Range: 0 - `INT_MAX`

ListenIP

A list of comma-delimited IP addresses that the agent should listen on.

Default: `0.0.0.0`

ListenPort

The agent will listen on this port for connections from the server.

Default: `10050`
 Range: `1024-32767`

LoadModule

The module to load at agent startup. Modules are used to extend the functionality of the agent. The module must be located in the directory specified by LoadModulePath or the path must precede the module name. If the preceding path is absolute (starts with '/') then LoadModulePath is ignored.
Formats:
LoadModule=<module.so>
LoadModule=<path/module.so>
LoadModule=</ab is allowed to include multiple LoadModule parameters.

LoadModulePath

The full path to the location of agent modules. The default depends on compilation options.

LogFile

The name of the log file.

Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of a log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: `1`
 Range: `0-1024`

LogRemoteCommands

Enable logging of the executed shell commands as warnings. Commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by HostMetadataItem, HostInterfaceItem or HostnameItem parameters.

Default: `0`
 Values: 0 - disabled, 1 - enabled

LogType

The type of the log output:
file - write log to the file specified by LogFile parameter;
system - write log to syslog;
console - write log to standard output.

Default: file

MaxLinesPerSecond

The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' active checks. The provided value will be overridden by the 'maxlines' parameter, provided in the 'log' or 'logrt' item key.
Note: Zabbix will process 10 times more new lines than set in *MaxLinesPerSecond* to seek the required string in log items.

Default: 20
 Range: 1-1000

PidFile

The name of the PID file.

Default: /tmp/zabbix_agentd.pid

RefreshActiveChecks

How often the list of active checks is refreshed, in seconds. Note that after failing to refresh active checks the next refresh will be attempted in 60 seconds.

Default: 5
 Range: 1-86400

Server

A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. Incoming connections will be accepted only from the hosts listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address. Note that "IPv4-compatible IPv6 addresses" (0000::/96 prefix) are supported but deprecated by [RFC4291](#). Spaces are allowed.

Example:

Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

Mandatory: yes, if StartAgents is not explicitly set to 0

ServerActive

The Zabbix server/proxy address or cluster configuration to get active checks from. The server/proxy address is an IP address or DNS name and optional port separated by colon.
Cluster configuration is one or more server addresses separated by semicolon. Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma. More than one Zabbix proxy should not be specified from each Zabbix server/cluster. If Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.
Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.
If the port is not specified, default port is used.
IPv6 addresses must be enclosed in square brackets if port for that host is specified. If port is not specified, square brackets for IPv6 addresses are optional.
If this parameter is not specified, active checks are disabled.

Example for Zabbix proxy:

ServerActive=127.0.0.1:10051

Example for multiple servers:

ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]

Example for high availability:

ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.cluster.node3

Example for high availability with two clusters and one server:

ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.cluster2.node1;zabbix.cluster2.node2,z

SourceIP

The source IP address for:
- outgoing connections to Zabbix server or Zabbix proxy;
- making connections while executing some items (web.page.get, net.tcp.port, etc.).

StartAgents

The number of pre-forked instances of zabbix_agentd that process passive checks. If set to 0, passive checks are disabled and the agent will not listen on any TCP port.

Default: 10
 Range: 0-100

Timeout

Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server. This parameter defines the duration of various operations, including:

- awaiting a response from the Zabbix server;
- sending requests to Zabbix server, including **active checks** configuration requests and item data;
- retrieving log data through logfile or Windows event log monitoring;
- sending heartbeat messages;
- maximum duration for `vfs.*` checks;
- being used by Zabbix agent modules;
- serving as a fallback in scenarios where a server or proxy older than version 7.0 sends checks without timeouts.

Default: 3 Range: 1-30

TLSAccept

What incoming connections to accept. Used for a passive checks. Multiple values can be specified, separated by comma:
unencrypted - accept connections without encryption (default)
psk - accept connections with TLS and a pre-shared key (PSK)
cert - accept connections with TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCAFile

The full pathname of the file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of the file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.

TLSCipherAll

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example:

```
TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256
```

TLSCipherAll13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL
```

Example for OpenSSL:

```
EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128
```

TLSCipherCert

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for certificate-based encryption.

Example for GnuTLS:

```
NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIG
```

Example for OpenSSL:

```
EECDH+aRSA+AES128:RSA+aRSA+AES128
```

TLSCipherCert13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for certificate-based encryption.

TLSCipherPSK

The GnuTLS priority string or OpenSSL (TLS 1.2) cipher string. Override the default ciphersuite selection criteria for PSK-based encryption.

Example for GnuTLS:

NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP=NULL:+SIG

Example for OpenSSL:

kECDHEPSK+AES128:kPSK+AES128

TLSCipherPSK13

The cipher string for OpenSSL 1.1.1 or newer in TLS 1.3. Override the default ciphersuite selection criteria for PSK-based encryption.

Example:

TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256

TLSCConnect

How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:
unencrypted - connect without encryption (default)
psk - connect using TLS and a pre-shared key (PSK)
cert - connect using TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCRLFile

The full pathname of the file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.

TLSKeyFile

The full pathname of the file containing the agent private key, used for encrypted communications between Zabbix components.

TLSPSKFile

The full pathname of the file containing the agent pre-shared key, used for encrypted communications with Zabbix server.

TLSPSKIdentity

The pre-shared key identity string, used for encrypted communications with Zabbix server.

TLSServerCertIssuer

The allowed server (proxy) certificate issuer.

TLSServerCertSubject

The allowed server (proxy) certificate subject.

UnsafeUserParameters

Allow all characters to be passed in arguments to user-defined parameters. The following characters are not allowed: \ ' " ' * ? [] { } ~ \$! & ; () < > | # @
Additionally, newline characters are not allowed.

Default: 0
Values: 0 - do not allow, 1 - allow

User

Drop privileges to a specific, existing user on the system.
Only has effect if run as 'root' and AllowRoot is disabled.

Default: zabbix

UserParameter

A user-defined parameter to monitor. There can be several user-defined parameters.
Format: UserParameter=<key>,<shell command>
Note that the shell command must not return empty string or EOL only. Shell commands may have relative paths, if the UserParameterDir parameter is specified.

Example:

UserParameter=system.test,who|wc -l

UserParameter=check_cpu,./custom_script.sh

UserParameterDir

The default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path.
Only one entry is allowed.

Example:

UserParameterDir=/opt/myscripts

1. [Differences in the Zabbix agent configuration for active and passive checks starting from version 2.0.0](#)

4 Zabbix agent 2 (UNIX)

Overview

Zabbix agent 2 is a new generation of Zabbix agent and may be used in place of Zabbix agent.

The parameters supported by the Zabbix agent 2 configuration file (zabbix_agent2.conf) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|---|---|
| Alias | Sets an alias for an item key. |
| AllowKey | Allow the execution of those item keys that match a pattern. |
| BufferSend | Do not keep data longer than N seconds in buffer. |
| BufferSize | The maximum number of values in the memory buffer. |
| ControlSocket | The control socket, used to send runtime commands with the '-R' option. |
| DebugLevel | The debug level. |
| DenyKey | Deny the execution of those item keys that match a pattern. |
| EnablePersistentBuffer | Enable the usage of local persistent storage for active items. |
| ForceActiveChecksOnStart | Perform active checks immediately after the restart for the first received configuration. |
| HeartbeatFrequency | The frequency of heartbeat messages in seconds. |
| HostInterface | An optional parameter that defines the host interface. |
| HostInterfaceItem | An optional parameter that defines an item used for getting the host interface. |
| HostMetadata | An optional parameter that defines the host metadata. |
| HostMetadataItem | An optional parameter that defines a Zabbix agent item used for getting the host metadata. |
| Hostname | An optional parameter that defines the hostname. |
| HostnameItem | An optional parameter that defines a Zabbix agent item used for getting the hostname. |
| Include | You may include individual files or all files in a directory in the configuration file. |
| ListenIP | A list of comma-delimited IP addresses that the agent should listen on. |
| ListenPort | The agent will listen on this port for connections from the server. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogType | The type of the log output. |
| PersistentBufferFile | The file where Zabbix agent 2 should keep the SQLite database. |
| PersistentBufferPeriod | The time period for which data should be stored when there is no connection to the server or proxy. |
| PidFile | The name of the PID file. |
| Plugins.<PluginName>.SystemRun.CapsPerSec | The number of checks per plugin that can be executed at the same time. |
| Plugins.Log.MaxLinesPerSecond | The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' active checks. |
| Plugins.SystemRun.LogRemoteOnTimeLog | Enable the logging of the executed shell commands as warnings. |
| PluginSocket | The path to the UNIX socket for loadable plugin communications. |
| PluginTimeout | The timeout for connections with loadable plugins, in seconds. |
| RefreshActiveChecks | How often the list of active checks is refreshed. |
| Server | A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. |
| ServerActive | The Zabbix server/proxy address or cluster configuration to get active checks from. |
| SourceIP | The source IP address. |
| StatusPort | If set, the agent will listen on this port for HTTP status requests (http://localhost:<port>/status). |
| Timeout | Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server. |
| TLSAccept | What incoming connections to accept. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |
| TLSCertFile | The full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLSCipherAll | The OpenSSL cipher string (TLS 1.2). Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLSCipherAll13 | The OpenSSL cipher string (TLS 1.3) for OpenSSL 1.1.1 or newer. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |

| Parameter | Description |
|-----------------------------|---|
| TLSCipherCert | The OpenSSL cipher string (TLS 1.2). Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLSCipherCert13 | The OpenSSL cipher string (TLS 1.3) for OpenSSL 1.1.1 or newer. Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLSCipherPSK | The OpenSSL cipher string (TLS 1.2). Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSCipherPSK13 | The OpenSSL cipher string (TLS 1.3) for OpenSSL 1.1.1 or newer. Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSConnect | How the agent should connect to Zabbix server or proxy. |
| TLSCRLFile | The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. |
| TLSKeyFile | The full pathname of a file containing the agent private key, used for encrypted communications between Zabbix components. |
| TLSPSKFile | The full pathname of a file containing the agent pre-shared key, used for encrypted communications with Zabbix server. |
| TLSPSKIdentity | The pre-shared key identity string, used for encrypted communications with Zabbix server. |
| TLSServerCertIssuer | The allowed server (proxy) certificate issuer. |
| TLSServerCertSubject | The allowed server (proxy) certificate subject. |
| UnsafeUserParameters | Allow all characters to be passed in arguments to user-defined parameters. |
| UserParameter | A user-defined parameter to monitor. |
| UserParameterDir | The default search path for UserParameter commands. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported in the beginning of the line.

Parameter details

Alias

Sets an alias for an item key. It can be used to substitute a long and complex item key with a shorter and simpler one.
Multiple *Alias* parameters may be present. Multiple parameters with the same *Alias* key are not allowed.
Different *Alias* keys may reference the same item key.
Aliases can be used in *HostMetadataItem* but not in *HostnameItem* parameter.

Example 1: Retrieving the ID of user 'zabbix'.

```
Alias=zabbix.userid:vfs.file.regexp[/etc/passwd,"^zabbix:.:([0-9]+)",,,\1]
```

Now the **zabbix.userid** shorthand key may be used to retrieve data.

Example 2: Getting CPU utilization with default and custom parameters.

```
Alias=cpu.util:system.cpu.util
Alias=cpu.util[*]:system.cpu.util[*]
```

This allows use the **cpu.util** key to get CPU utilization percentage with default parameters as well as use **cpu.util[all, idle, avg15]** to get specific data about CPU utilization.

Example 3: Running multiple **low-level discovery** rules processing the same discovery items.

```
Alias=vfs.fs.discovery[*]:vfs.fs.discovery
```

Now it is possible to set up several discovery rules using **vfs.fs.discovery** with different parameters for each rule, e.g., **vfs.fs.discovery[foo]**, **vfs.fs.discovery[bar]**, etc.

AllowKey

Allow the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the **"*"** character to match any number of any characters.
Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order. See also: **Restricting agent checks**.

BufferSend

The time interval in seconds which determines how often values are sent from the buffer to Zabbix server. Note that if the buffer is full, the data will be sent sooner.

Default: 5
 Range: 1-3600

BufferSize

The maximum number of values in the memory buffer. The agent will send all collected data to the Zabbix server or proxy if the buffer is full. This parameter should only be used if persistent buffer is disabled (*EnablePersistentBuffer=0*).

Default: 1000
 Range: 2-65535

ControlSocket

The control socket, used to send runtime commands with the '-R' option.

Default: /tmp/agent.sock

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).

Default: 3
 Range: 0-5

DenyKey

Deny the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the "*" character to match any number of any characters.
Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order. See also: [Restricting agent checks](#).

EnablePersistentBuffer

Enable the usage of local persistent storage for active items. If persistent storage is disabled, the memory buffer will be used.

Default: 0
 Values: 0 - disabled, 1 - enabled

ForceActiveChecksOnStart

Perform active checks immediately after the restart for the first received configuration. Also available as a per-plugin configuration parameter, for example: `Plugins.Uptime.System.ForceActiveChecksOnStart=1`

Default: 0
 Values: 0 - disabled, 1 - enabled

HeartbeatFrequency

The frequency of heartbeat messages in seconds. Used for monitoring the availability of active checks.
0 - heartbeat messages disabled.

Default: 60
 Range: 0-3600

HostInterface

An optional parameter that defines the host interface. The host interface is used at host [autoregistration](#) process. If not defined, the value will be acquired from HostInterfaceItem.
The agent will issue an error and not start if the value is over the limit of 255 characters.

Range: 0-255 characters

HostInterfaceItem

An optional parameter that defines an item used for getting the host interface.
Host interface is used at host [autoregistration](#) process. This option is only used when HostInterface is not defined.
The [system.run\[\]](#) item is supported regardless of AllowKey/DenyKey values.
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.

HostMetadata

An optional parameter that defines host metadata. Host metadata is used only at host autoregistration process. If not defined, the value will be acquired from HostMetadataItem.
The agent will issue an error and not start if the specified value is over the limit of 2034 bytes or a non-UTF-8 string.

Range: 0-2034 bytes

HostMetadataItem

An optional parameter that defines an item used for getting host metadata. This option is only used when HostMetadata is not defined. User parameters and aliases are supported. The [system.run\[\]](#) item is supported regardless of AllowKey/DenyKey values.
The HostMetadataItem value is retrieved on each autoregistration attempt and is used only at host autoregistration

process.
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 65535 UTF-8 code points. The value returned by the item must be a UTF-8 string otherwise it will be ignored.

Hostname

A list of comma-delimited, unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. The value is acquired from HostnameItem if undefined.
Allowed characters: alphanumeric, '.', '-', '_' and '-'. Maximum length: 128 characters per hostname, 2048 characters for the entire line.

Default: Set by HostnameItem

HostnameItem

An optional parameter that defines an item used for getting the host name. This option is only used when Hostname is not defined. User parameters or aliases are not supported, but the `system.run[]` item is supported regardless of AllowKey/DenyKey values.

Default: `system.hostname`

Include

You may include individual files or all files in a directory in the configuration file. During the installation Zabbix will create the include directory in `/usr/local/etc`, unless modified during the compile time. The path can be relative to the `zabbix_agent2.conf` file location.
To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.
See [special notes](#) about limitations.

Example:

```
Include=/absolute/path/to/config/files/*.conf
```

ListenIP

A list of comma-delimited IP addresses that the agent should listen on. The first IP address is sent to the Zabbix server, if connecting to it, to retrieve the list of active checks.

Default: `0.0.0.0`

ListenPort

The agent will listen on this port for connections from the server.

Default: `10050`
 Range: `1024-32767`

LogFile

The name of the log file.

Default: `/tmp/zabbix_agent2.log`
 Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of a log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: `1`
 Range: `0-1024`

LogType

The type of the log output:
file - write log to the file specified by LogFile parameter;
system - write log to syslog;
console - write log to standard output

Default: `file`

PersistentBufferFile

The file where Zabbix agent 2 should keep the SQLite database. Must be a full filename. This parameter is only used if persistent buffer is enabled (`EnablePersistentBuffer=1`).

PersistentBufferPeriod

The time period for which data should be stored when there is no connection to the server or proxy. Older data will be lost. Log data will be preserved. This parameter is only used if persistent buffer is enabled (`EnablePersistentBuffer=1`).

Default: `1h`
 Range: `1m-365d`

PidFile

The name of the PID file.

Default: `/tmp/zabbix_agent2.pid`

Plugins.<PluginName>.System.Capacity

The limit of checks per <PluginName> plugin that can be executed at the same time.

Default: 1000 Range: 1-1000

Plugins.Log.MaxLinesPerSecond

The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' active checks. The provided value will be overridden by the 'maxlines' parameter, provided in the 'log' and 'logrt' item key.
Note: Zabbix will process 10 times more new lines than set in *MaxLinesPerSecond* to seek the required string in log items.

Default: 20
 Range: 1-1000

Plugins.SystemRun.LogRemoteCommands

Enable the logging of the executed shell commands as warnings. The commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by the HostMetadataItem, HostInterfaceItem or HostnameItem parameters.

Default: 0
 Values: 0 - disabled, 1 - enabled

PluginSocket

The path to the UNIX socket for loadable plugin communications.

Default: /tmp/agent.plugin.sock

PluginTimeout

The timeout for connections with loadable plugins, in seconds.

Default: Timeout
 Range: 1-30

RefreshActiveChecks

How often the list of active checks is refreshed, in seconds. Note that after failing to refresh active checks the next refresh will be attempted in 60 seconds.

Default: 5
 Range: 1-86400

Server

A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers or Zabbix proxies. Incoming connections will be accepted only from the hosts listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address. Spaces are allowed. If this parameter is not specified, disables passive checks and the agent will not listen on any TCP port.

Example:

Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

ServerActive

The Zabbix server/proxy address or cluster configuration to get active checks from. The server/proxy address is an IP address or DNS name and optional port separated by colon.
The cluster configuration is one or more server addresses separated by semicolon. Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma. More than one Zabbix proxy should not be specified from each Zabbix server/cluster. If a Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.
Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.
If the port is not specified, default port is used.
IPv6 addresses must be enclosed in square brackets if port for that host is specified. If port is not specified, square brackets for IPv6 addresses are optional.
If this parameter is not specified, active checks are disabled.

Example for Zabbix proxy:

ServerActive=127.0.0.1:10051

Example for multiple servers:

ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]

Example for high availability:

ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.cluster.node3

Example for high availability with two clusters and one server:

ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.cluster2.node1;zabbix.cluster2.node2,z

SourceIP

The source IP address for:
- outgoing connections to Zabbix server or Zabbix proxy;
- making connections while executing some items (web.page.get, net.tcp.port, etc.).

StatusPort

If set, the agent will listen on this port for HTTP status requests (http://localhost:<port>/status).

Range: 1024-32767

Timeout

Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server.
 This parameter defines the duration of various operations, including:
 - awaiting a response from the Zabbix server;
 - sending requests to Zabbix server, including **active checks** configuration requests and item data;
 - retrieving log data through logfile or Windows event log monitoring;
 - sending heartbeat messages;
 - maximum duration for vfs.* checks;
 - serving as a fallback in scenarios where a server or proxy older than version 7.0 sends checks without timeouts.

Default: 3
 Range: 1-30

TLSAccept

The incoming connections to accept. Used for passive checks. Multiple values can be specified, separated by comma:
unencrypted - accept connections without encryption (default)
psk - accept connections with TLS and a pre-shared key (PSK)
cert - accept connections with TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCAFile

The full pathname of the file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of the file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.

TLSCipherAll

The OpenSSL cipher string (TLS 1.2). Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example:

EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128

TLSCipherAll13

The OpenSSL cipher string (TLS 1.3) for OpenSSL 1.1.1 or newer. Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example:

TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256

TLSCipherCert

The OpenSSL cipher string (TLS 1.2). Override the default ciphersuite selection criteria for certificate-based encryption.

Example:

EECDH+aRSA+AES128:RSA+aRSA+AES128

Note that this parameter cannot be used together with `TLSAccept=cert,psk`; for certificate connection (`TLSCConnect=cert`) use `TLSCipherAll` instead.

TLSCipherCert13

The OpenSSL cipher string (TLS 1.3) for OpenSSL 1.1.1 or newer. Override the default ciphersuite selection criteria for certificate-based encryption.

Note that this parameter cannot be used together with `TLSAccept=cert,psk`; for certificate connection (`TLSCConnect=cert`) use `TLSCipherAll13` instead.

TLSCipherPSK

The OpenSSL cipher string (TLS 1.2). Override the default ciphersuite selection criteria for PSK-based encryption.

Example:

kECDHEPSK+AES128:kPSK+AES128

TLSCipherPSK13

The OpenSSL cipher string (TLS 1.3) for OpenSSL 1.1.1 or newer. Override the default ciphersuite selection criteria for PSK-based encryption.

Example:

TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256

TLSConnect

How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified: *unencrypted* - connect without encryption (default) *psk* - connect using TLS and a pre-shared key (PSK) *cert* - connect using TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCRLFile

The full pathname of the file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.

TLSKeyFile

The full pathname of the file containing the agent private key, used for encrypted communications between Zabbix components.

TLSPSKFile

The full pathname of the file containing the agent pre-shared key, used for encrypted communications with Zabbix server.

TLSPSKIdentity

The pre-shared key identity string, used for encrypted communications with Zabbix server.

TLSServerCertIssuer

The allowed server (proxy) certificate issuer.

TLSServerCertSubject

The allowed server (proxy) certificate subject.

UnsafeUserParameters

Allow all characters to be passed in arguments to user-defined parameters. The following characters are not allowed: \ ' " ' * ? [] { } ~ \$! & ; () < > | # @
Additionally, newline characters are not allowed.

Default: 0
Values: 0 - do not allow, 1 - allow

UserParameter

A user-defined parameter to monitor. There can be several user-defined parameters.
Format: UserParameter=<key>,<shell command>
Note that the shell command must not return empty string or EOL only. Shell commands may have relative paths, if the UserParameterDir parameter is specified.

Example:

UserParameter=system.test,who|wc -l

UserParameter=check_cpu,./custom_script.sh

UserParameterDir

The default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path.
Only one entry is allowed.

Example:

UserParameterDir=/opt/myscripts

5 Zabbix agent (Windows)

Overview

The parameters supported by the Windows Zabbix agent configuration file (zabbix_agentd.conf) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|--------------------------------------|--|
| Alias | Sets an alias for an item key. |
| AllowKey | Allow the execution of those item keys that match a pattern. |
| BufferSend | Do not keep data longer than N seconds in buffer. |
| BufferSize | The maximum number of values in the memory buffer. |
| DebugLevel | The debug level. |
| DenyKey | Deny the execution of those item keys that match a pattern. |
| EnableRemoteCommands | Whether remote commands from Zabbix server are allowed. |
| HeartbeatFrequency | The frequency of heartbeat messages in seconds. |
| HostInterface | An optional parameter that defines the host interface. |
| HostInterfaceItem | An optional parameter that defines an item used for getting the host interface. |
| HostMetadata | An optional parameter that defines the host metadata. |
| HostMetadataItem | An optional parameter that defines a Zabbix agent item used for getting the host metadata. |
| Hostname | An optional parameter that defines the hostname. |
| Hostnameltem | An optional parameter that defines a Zabbix agent item used for getting the hostname. |
| Include | You may include individual files or all files in a directory in the configuration file. |
| ListenBacklog | The maximum number of pending connections in the TCP queue. |
| ListenIP | A list of comma-delimited IP addresses that the agent should listen on. |
| ListenPort | The agent will listen on this port for connections from the server. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogRemoteCommands | Enable logging of executed shell commands as warnings. |
| LogType | The type of the log output. |
| MaxLinesPerSecond | The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' active checks. |
| PerfCounter | Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds). |
| PerfCounterEn | Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds). Compared to PerfCounter, the perfcounter paths must be in English. |
| RefreshActiveChecks | How often the list of active checks is refreshed. |
| Server | A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. |
| ServerActive | The Zabbix server/proxy address or cluster configuration to get active checks from. |
| SourceIP | The source IP address. |
| StartAgents | The number of pre-forked instances of zabbix_agentd that process passive checks. |
| Timeout | Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server. |
| TLSAccept | What incoming connections to accept. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |
| TLSCertFile | The full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLSConnect | How the agent should connect to Zabbix server or proxy. |
| TLSCRLFile | The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. |
| TLSKeyFile | The full pathname of a file containing the agent private key, used for encrypted communications between Zabbix components. |
| TLSPSKFile | The full pathname of a file containing the agent pre-shared key, used for encrypted communications with Zabbix server. |
| TLSPSKIdentity | The pre-shared key identity string, used for encrypted communications with Zabbix server. |
| TLSServerCertIssuer | The allowed server (proxy) certificate issuer. |
| TLSServerCertSubject | The allowed server (proxy) certificate subject. |
| UnsafeUserParameters | Allow all characters to be passed in arguments to user-defined parameters. |
| UserParameter | A user-defined parameter to monitor. |

| Parameter | Description |
|-------------------------|---|
| UserParameterDir | The default search path for UserParameter commands. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect daemon defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported in the beginning of the line.

Parameter details

Alias

Sets an alias for an item key. It can be used to substitute a long and complex item key with a shorter and simpler one.
Multiple *Alias* parameters may be present. Multiple parameters with the same *Alias* key are not allowed.
Different *Alias* keys may reference the same item key.
Aliases can be used in *HostMetadataItem* but not in *HostnameItem* or *PerfCounter* parameter.

Example 1: Retrieving the paging file usage in percentage from the server.

```
Alias=pg_usage:perf_counter[\Paging File(_Total)\% Usage]
```

Now the shorthand key **pg_usage** may be used to retrieve data.

Example 2: Getting the CPU load with default and custom parameters.

```
Alias=cpu.load:system.cpu.load
Alias=cpu.load[*]:system.cpu.load[*]
```

This allows use **cpu.load** key to get the CPU load with default parameters as well as use **cpu.load[percpu,avg15]** to get specific data about the CPU load.

Example 3: Running multiple **low-level discovery** rules processing the same discovery items.

```
Alias=vfs.fs.discovery[*]:vfs.fs.discovery
```

Now it is possible to set up several discovery rules using **vfs.fs.discovery** with different parameters for each rule, e.g., **vfs.fs.discovery[foo]**, **vfs.fs.discovery[bar]**, etc.

AllowKey

Allow the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the **"*"** character to match any number of any characters.
Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order. See also: **Restricting agent checks**.

BufferSend

Do not keep data longer than N seconds in buffer.

Default: 5
 Range: 1-3600

BufferSize

The maximum number of values in the memory buffer. The agent will send all collected data to the Zabbix server or proxy if the buffer is full.

Default: 100
 Range: 2-65535

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).

Default: 3
 Range: 0-5

DenyKey

Deny the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the **"*"** character to match any number of any characters.
Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order. See also: **Restricting agent checks**.

EnableRemoteCommands

Whether remote commands from Zabbix server are allowed. This parameter is **deprecated**, use `AllowKey=system.run[*]` or `DenyKey=system.run[*]` instead.
It is an internal alias for `AllowKey/DenyKey` parameters depending on value:
0 - `DenyKey=system.run[*]`
1 - `AllowKey=system.run[*]`

Default: 0
 Values: 0 - do not allow, 1 - allow

HeartbeatFrequency

The frequency of heartbeat messages in seconds. Used for monitoring the availability of active checks.
0 - heartbeat messages disabled.

Default: 60
 Range: 0-3600

HostInterface

An optional parameter that defines the host interface. The host interface is used at host **autoregistration** process. If not defined, the value will be acquired from `HostInterfaceItem`.
The agent will issue an error and not start if the value is over the limit of 255 characters.

Range: 0-255 characters

HostInterfaceItem

An optional parameter that defines an item used for getting the host interface.
Host interface is used at host **autoregistration** process.
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.
The **system.run[]** item is supported regardless of `AllowKey/DenyKey` values.
This option is only used when `HostInterface` is not defined.

HostMetadata

An optional parameter that defines host metadata. Host metadata is used only at host autoregistration process (active agent). If not defined, the value will be acquired from `HostMetadataItem`.
The agent will issue an error and not start if the specified value is over the limit of 2034 bytes or a non-UTF-8 string.

Range: 0-2034 bytes

HostMetadataItem

An optional parameter that defines a Zabbix agent item used for getting host metadata. This option is only used when `HostMetadata` is not defined. User parameters, performance counters and aliases are supported. The **system.run[]** item is supported regardless of `AllowKey/DenyKey` values.
The `HostMetadataItem` value is retrieved on each autoregistration attempt and is used only at host autoregistration process (active agent).
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 65535 UTF-8 code points. The value returned by the item must be a UTF-8 string otherwise it will be ignored.

Hostname

A list of comma-delimited, unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. The value is acquired from `HostnameItem` if undefined.
Allowed characters: alphanumeric, '.', ',', '_' and '-'. Maximum length: 128 characters per hostname, 2048 characters for the entire line.

Default: Set by `HostnameItem`

HostnameItem

An optional parameter that defines a Zabbix agent item used for getting the host name. This option is only used when `Hostname` is not defined. User parameters, performance counters or aliases are not supported, but the **system.run[]** item is supported regardless of `AllowKey/DenyKey` values.
See also a **more detailed description**.

Default: `system.hostname`

Include

You may include individual files or all files in a directory in the configuration file (located in `C:\Program Files\Zabbix Agent` by default if Zabbix agent is installed using Windows MSI installer packages; located in the folder specified during installation if Zabbix agent is installed as a zip archive). All included files must have correct syntax, otherwise agent will not start.
To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.
See **special notes** about limitations.

Example:

```
Include=C:\Program Files\Zabbix Agent\zabbix_agentd.d\*.conf
```

ListenBacklog

The maximum number of pending connections in the TCP queue.
The default value is a hard-coded constant, which depends on the system.
The maximum supported value depends on the system, too high values may be silently truncated to the 'implementation-specified maximum'.

Default: SOMAXCONN
 Range: 0 - INT_MAX

ListenIP

A list of comma-delimited IP addresses that the agent should listen on.

Default: 0.0.0.0

ListenPort

The agent will listen on this port for connections from the server.

Default: 10050
 Range: 1024-32767

LogFile

The name of the agent log file.

Default: C:\\zabbix_agentd.log
 Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of a log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: 1
 Range: 0-1024

LogRemoteCommands

Enable the logging of the executed shell commands as warnings. Commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by HostMetadataltem, HostInterfaceltem or Hostnameltem parameters.

Default: 0
 Values: 0 - disabled, 1 - enabled

LogType

The type of the log output:
file - write log to the file specified by LogFile parameter;
system - write log to Windows Event Log;
console - write log to standard output.

Default: file

MaxLinesPerSecond

The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log', 'logrt', and 'eventlog' active checks. The provided value will be overridden by the 'maxlines' parameter, provided in the 'log', 'logrt', or 'eventlog' item key.
Note: Zabbix will process 10 times more new lines than set in *MaxLinesPerSecond* to seek the required string in log items.

Default: 20
 Range: 1-1000

PerfCounter

Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds).
Syntax: <parameter_name>,"<perf_counter_path>",<period>

For example, if you wish to receive the average number of processor interrupts per second for the last minute, you can define a new parameter "interrupts" as the following:

```
PerfCounter = interrupts,"\\Processor(0)\\Interrupts/sec",60
```

Please note the double quotes around the performance counter path. The parameter name (interrupts) is to be used as the item key when creating an item. Samples for calculating the average value will be taken every second.
You may run "typeperf -qx" to get the list of all performance counters available in Windows.

PerfCounterEn

Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds). Compared to PerfCounter, the perfcounter paths must be in English. Supported only on **Windows Server 2008/Vista** and later.
Syntax: <parameter_name>,"<perf_counter_path>",<period>

For example, if you wish to receive the average number of processor interrupts per second for the last minute, you can define a new parameter "interrupts" as the following:

```
PerfCounterEn = interrupts,"\\Processor(0)\\Interrupts/sec",60
```

Please note the double quotes around the performance counter path. The parameter name (interrupts) is to be used as the item key when creating an item. Samples for calculating the average value will be taken every second.
You can find the list of English strings by viewing the following registry key: `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib\009`.

RefreshActiveChecks

How often the list of active checks is refreshed, in seconds. Note that after failing to refresh active checks the next refresh will be attempted in 60 seconds.

Default: 5
 Range: 1-86400

Server

A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers or Zabbix proxies. Incoming connections will be accepted only from the hosts listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and ':::0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address. Note that "IPv4-compatible IPv6 addresses" (0000::/96 prefix) are supported but deprecated by [RFC4291](#). Spaces are allowed.

Example:

`Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com`

Mandatory: yes, if StartAgents is not explicitly set to 0

ServerActive

The Zabbix server/proxy address or cluster configuration to get active checks from. The server/proxy address is an IP address or DNS name and optional port separated by colon.
The cluster configuration is one or more server addresses separated by semicolon. Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma. More than one Zabbix proxy should not be specified from each Zabbix server/cluster. If Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.
Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.
If the port is not specified, default port is used.
IPv6 addresses must be enclosed in square brackets if port for that host is specified. If port is not specified, square brackets for IPv6 addresses are optional.
If this parameter is not specified, active checks are disabled.

Example for Zabbix proxy:

`ServerActive=127.0.0.1:10051`

Example for multiple servers:

`ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]`

Example for high availability:

`ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.cluster.node3`

Example for high availability with two clusters and one server:

`ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.cluster2.node1;zabbix.cluster2.node2,z`

Range: (*)

SourceIP

The source IP address for:
- outgoing connections to Zabbix server or Zabbix proxy;
- making connections while executing some items (web.page.get, net.tcp.port, etc.).

StartAgents

The number of pre-forked instances of zabbix_agentd that process passive checks. If set to 0, passive checks are disabled and the agent will not listen on any TCP port.

Default: 10
 Range: 0-100 (*)

Timeout

Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server.
 This parameter is used for defining the duration of various operations:
 - awaiting a response from Zabbix server;
 - sending requests to Zabbix server, including **active checks** configuration requests and item data;
 - retrieving log data through logfile or Windows event log monitoring;
 - sending heartbeat messages;
 - maximum duration of **vfs.** checks;
 - used by Zabbix agent modules;
 - also used as a fallback in scenarios where server/proxy older than version 7.0 is sending checks without timeouts.

Default: 3
 Range: 1-30

TLSAccept

The incoming connections to accept. Used for passive checks. Multiple values can be specified, separated by comma:
unencrypted - accept connections without encryption (default)
psk - accept connections with TLS and a pre-shared key (PSK)
cert - accept connections with TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCAFile

The full pathname of the file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of the file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.

TLSConnect

How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:
unencrypted - connect without encryption (default)
psk - connect using TLS and a pre-shared key (PSK)
cert - connect using TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCRLFile

The full pathname of the file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.

TLSKeyFile

The full pathname of the file containing the agent private key, used for encrypted communications between Zabbix components.

TLSPSKFile

The full pathname of the file containing the agent pre-shared key, used for encrypted communications with Zabbix server.

TLSPSKIdentity

The pre-shared key identity string, used for encrypted communications with Zabbix server.

TLSServerCertIssuer

The allowed server (proxy) certificate issuer.

TLSServerCertSubject

The allowed server (proxy) certificate subject.

UnsafeUserParameters

Allow all characters to be passed in arguments to user-defined parameters. The following characters are not allowed: \ ' " ' * ? [] { } ~ \$! & ; () < > | # @
Additionally, newline characters are not allowed.

Default: 0
Values: 0 - do not allow, 1 - allow

UserParameter

A user-defined parameter to monitor. There can be several user-defined parameters.
Format: UserParameter=<key>,<shell command>
Note that the shell command must not return empty string or EOL only. Shell commands may have relative paths, if the UserParameterDir parameter is specified.

Example:

```
UserParameter=system.test,dir /b | find /c /v ""
UserParameter=check_cpu,.\custom\_script.bat
```

UserParameterDir

The default search path for UserParameter commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, UserParameter commands can have a relative ./ prefix instead of a full path. Only one entry is allowed.

Example:

```
UserParameterDir=C:\opt\myscripts
```

Note:

(*) The number of active servers listed in `ServerActive` plus the number of pre-forked instances for passive checks specified in `StartAgents` must be less than 64.

6 Zabbix agent 2 (Windows)

Overview

Zabbix agent 2 is a new generation of Zabbix agent and may be used in place of Zabbix agent.

The parameters supported by the Windows Zabbix agent 2 configuration file (`zabbix_agent2.conf`) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|---|--|
| Alias | Sets an alias for an item key. |
| AllowKey | Allow the execution of those item keys that match a pattern. |
| BufferSend | Do not keep data longer than N seconds in buffer. |
| BufferSize | The maximum number of values in the memory buffer. |
| ControlSocket | The control socket, used to send runtime commands with the '-R' option. |
| DebugLevel | The debug level. |
| DenyKey | Deny the execution of those item keys that match a pattern. |
| EnablePersistentBuffer | Enable the usage of local persistent storage for active items. |
| ForceActiveChecksOnStart | Perform active checks immediately after the restart for the first received configuration. |
| HeartbeatFrequency | The frequency of heartbeat messages in seconds. |
| HostInterface | An optional parameter that defines the host interface. |
| HostInterfaceItem | An optional parameter that defines an item used for getting the host interface. |
| HostMetadata | An optional parameter that defines the host metadata. |
| HostMetadataItem | An optional parameter that defines a Zabbix agent item used for getting the host metadata. |
| Hostname | An optional parameter that defines the hostname. |
| HostnameItem | An optional parameter that defines a Zabbix agent item used for getting the hostname. |
| Include | You may include individual files or all files in a directory in the configuration file. |
| ListenIP | A list of comma-delimited IP addresses that the agent should listen on. |
| ListenPort | The agent will listen on this port for connections from the server. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogType | The type of the log output. |
| PersistentBufferFile | The file where Zabbix agent 2 should keep the SQLite database. |
| PersistentBufferPeriod | The time period for which data should be stored when there is no connection to the server or proxy. |
| Plugins.<PluginName>.SystemRun.CpuProfile | The number of checks per plugin that can be executed at the same time. |
| Plugins.Log.MaxLinesPerSecond | The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log' and 'logrt' active checks. |
| Plugins.SystemRun.LogRemote | Enable the logging of the executed shell commands as warnings. |
| PluginSocket | The path to the UNIX socket for loadable plugin communications. |
| PluginTimeout | The timeout for connections with loadable plugins, in seconds. |
| PerfCounter | Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds). |
| PerfCounterEn | Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds). Compared to PerfCounter, the perfcounter paths must be in English. |
| RefreshActiveChecks | How often the list of active checks is refreshed. |
| Server | A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. |
| ServerActive | The Zabbix server/proxy address or cluster configuration to get active checks from. |
| SourceIP | The source IP address. |
| StatusPort | If set, the agent will listen on this port for HTTP status requests (<code>http://localhost:<port>/status</code>). |
| Timeout | Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server. |
| TLSAccept | What incoming connections to accept. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |

| Parameter | Description |
|-----------------------------|---|
| TLSCertFile | The full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLSCipherAll13 | The OpenSSL cipher string (TLS 1.3). Override the default ciphersuite selection criteria for certificate- and PSK-based encryption. |
| TLSCipherCert13 | The OpenSSL cipher string (TLS 1.3). Override the default ciphersuite selection criteria for certificate-based encryption. |
| TLSCipherPSK13 | The OpenSSL cipher string (TLS 1.3). Override the default ciphersuite selection criteria for PSK-based encryption. |
| TLSConnect | How the agent should connect to Zabbix server or proxy. |
| TLSCRLFile | The full pathname of a file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components. |
| TLSKeyFile | The full pathname of a file containing the agent private key, used for encrypted communications between Zabbix components. |
| TLSPSKFile | The full pathname of a file containing the agent pre-shared key, used for encrypted communications with Zabbix server. |
| TLSPSKIdentity | The pre-shared key identity string, used for encrypted communications with Zabbix server. |
| TLSServerCertIssuer | The allowed server (proxy) certificate issuer. |
| TLSServerCertSubject | The allowed server (proxy) certificate subject. |
| UnsafeUserParameters | Allow all characters to be passed in arguments to user-defined parameters. |
| UserParameter | A user-defined parameter to monitor. |
| UserParameterDir | The default search path for UserParameter commands. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported in the beginning of the line.

Parameter details

Alias

Sets an alias for an item key. It can be used to substitute a long and complex item key with a shorter and simpler one.
Multiple *Alias* parameters may be present. Multiple parameters with the same *Alias* key are not allowed.
Different *Alias* keys may reference the same item key.
Aliases can be used in *HostMetadataItem* but not in the *HostnameItem* parameter.

Example 1: Retrieving the paging file usage in percentage from the server.

```
Alias=pg_usage:perf_counter[\Paging File(_Total)\% Usage]
```

Now the shorthand key **pg_usage** may be used to retrieve data.

Example 2: Getting the CPU load with default and custom parameters.

```
Alias=cpu.load:system.cpu.load
Alias=cpu.load[*]:system.cpu.load[*]
```

This allows use **cpu.load** key to get the CPU load with default parameters as well as use **cpu.load[percpu,avg15]** to get specific data about the CPU load.

Example 3: Running multiple **low-level discovery** rules processing the same discovery items.

```
Alias=vfs.fs.discovery[*]:vfs.fs.discovery
```

Now it is possible to set up several discovery rules using **vfs.fs.discovery** with different parameters for each rule, e.g., **vfs.fs.discovery[foo]**, **vfs.fs.discovery[bar]**, etc.

AllowKey

Allow the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the **"*"** character to match any number of any characters.
Multiple key matching rules may be defined in combination with DenyKey. The parameters are processed one by one according to their appearance order. See also: **Restricting agent checks**.

BufferSend

The time interval in seconds which determines how often values are sent from the buffer to Zabbix server.
Note that if the buffer is full, the data will be sent sooner.

Default: 5
 Range: 1-3600

BufferSize

The maximum number of values in the memory buffer. The agent will send all collected data to the Zabbix server or proxy if the buffer is full.
This parameter should only be used if persistent buffer is disabled (*EnablePersistentBuffer=0*).

Default: 1000
 Range: 2-65535

ControlSocket

The control socket, used to send runtime commands with the '-R' option.

Default: \\.\pipe\agent.sock

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).

Default: 3
 Range: 0-5

DenyKey

Deny the execution of those item keys that match a pattern. The key pattern is a wildcard expression that supports the "*" character to match any number of any characters.
Multiple key matching rules may be defined in combination with AllowKey. The parameters are processed one by one according to their appearance order. See also: [Restricting agent checks](#).

EnablePersistentBuffer

Enable the usage of local persistent storage for active items. If persistent storage is disabled, the memory buffer will be used.

Default: 0
 Values: 0 - disabled, 1 - enabled

ForceActiveChecksOnStart

Perform active checks immediately after the restart for the first received configuration. Also available as a per-plugin configuration parameter, for example: `Plugins.Uptime.System.ForceActiveChecksOnStart=1`

Default: 0
 Values: 0 - disabled, 1 - enabled

HeartbeatFrequency

The frequency of heartbeat messages in seconds. Used for monitoring the availability of active checks.
0 - heartbeat messages disabled.

Default: 60
 Range: 0-3600

HostInterface

An optional parameter that defines the host interface. The host interface is used at host [autoregistration](#) process. If not defined, the value will be acquired from HostInterfaceItem.
The agent will issue an error and not start if the value is over the limit of 255 characters.

Range: 0-255 characters

HostInterfaceItem

An optional parameter that defines an item used for getting the host interface.
Host interface is used at host [autoregistration](#) process. This option is only used when HostInterface is not defined.
The [system.run\[\]](#) item is supported regardless of AllowKey/DenyKey values.
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 255 characters.

HostMetadata

An optional parameter that defines host metadata. Host metadata is used only at host autoregistration process (active agent). If not defined, the value will be acquired from HostMetadataItem.
The agent will issue an error and not start if the specified value is over the limit of 2034 bytes or a non-UTF-8 string.

Range: 0-2034 bytes

HostMetadataItem

An optional parameter that defines an item used for getting host metadata. This option is only used when HostMetadata is not defined. User parameters and aliases are supported. The [system.run\[\]](#) item is supported regardless of AllowKey/DenyKey values.
The HostMetadataItem value is retrieved on each autoregistration attempt and is used only at host autoregistration

process.
During an autoregistration request the agent will log a warning message if the value returned by the specified item is over the limit of 65535 UTF-8 code points. The value returned by the item must be a UTF-8 string otherwise it will be ignored.

Hostname

A list of comma-delimited, unique, case-sensitive hostnames. Required for active checks and must match hostnames as configured on the server. The value is acquired from HostnameItem if undefined.
Allowed characters: alphanumeric, '.', ' ', '_' and '-'. Maximum length: 128 characters per hostname, 2048 characters for the entire line.

Default: Set by HostnameItem

HostnameItem

An optional parameter that defines an item used for getting the host name. This option is only used when Hostname is not defined. User parameters or aliases are not supported, but the `system.run[]` item is supported regardless of AllowKey/DenyKey values.

Default: `system.hostname`

Include

You may include individual files or all files in a directory in the configuration file (located in C:\Program Files\Zabbix Agent 2 by default if Zabbix agent is installed using Windows MSI installer packages; located in the folder specified during installation if Zabbix agent is installed as a zip archive). All included files must have correct syntax, otherwise agent will not start. The path can be relative to the `zabbix_agent2.conf` file location (e.g., `Include=. \zabbix_agent2.d\plugins.d*.conf`).
To only include relevant files in the specified directory, the asterisk wildcard character is supported for pattern matching.
See [special notes](#) about limitations.

Example:

```
Include=C:\Program Files\Zabbix Agent2\zabbix_agent2.d\*.conf
```

ListenIP

A list of comma-delimited IP addresses that the agent should listen on. The first IP address is sent to the Zabbix server, if connecting to it, to retrieve the list of active checks.

Default: 0.0.0.0

ListenPort

The agent will listen on this port for connections from the server.

Default: 10050
 Range: 1024-32767

LogFile

The name of the agent log file.

Default: `c:\zabbix_agent2.log`
 Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of a log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: 1
 Range: 0-1024

LogType

The type of the log output:
file - write log to the file specified by LogFile parameter;
console - write log to standard output.

Default: *file*

PersistentBufferFile

The file where Zabbix agent 2 should keep the SQLite database. Must be a full filename. This parameter is only used if persistent buffer is enabled (*EnablePersistentBuffer=1*).

PersistentBufferPeriod

The time period for which data should be stored when there is no connection to the server or proxy. Older data will be lost. Log data will be preserved. This parameter is only used if persistent buffer is enabled (*EnablePersistentBuffer=1*).

Default: 1h
 Range: 1m-365d

Plugins.<PluginName>.System.Capacity

The limit of checks per <PluginName> plugin that can be executed at the same time.

Default: 1000 Range: 1-1000

Plugins.Log.MaxLinesPerSecond

The maximum number of new lines the agent will send per second to Zabbix server or proxy when processing 'log', 'logrt' and 'eventlog' active checks. The provided value will be overridden by the 'maxlines' parameter, provided in the 'log', 'logrt' or 'eventlog' item key.
Note: Zabbix will process 10 times more new lines than set in *MaxLinesPerSecond* to seek the required string in log items.

Default: 20
 Range: 1-1000

Plugins.SystemRun.LogRemoteCommands

Enable the logging of the executed shell commands as warnings. The commands will be logged only if executed remotely. Log entries will not be created if system.run[] is launched locally by the HostMetadataItem, HostInterfaceItem or HostnameItem parameters.

Default: 0
 Values: 0 - disabled, 1 - enabled

PluginSocket

The path to the UNIX socket for loadable plugin communications.

Default: \\.\pipe\agent.plugin.sock

PluginTimeout

The timeout for connections with loadable plugins, in seconds.

Default: Timeout
 Range: 1-30

PerfCounter

Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds).
Syntax: <parameter_name>,"<perf_counter_path>",<period>

For example, if you wish to receive the average number of processor interrupts per second for the last minute, you can define a new parameter "interrupts" as the following:

```
PerfCounter = interrupts,"\Processor(0)\Interrupts/sec",60
```

Please note the double quotes around the performance counter path. The parameter name (interrupts) is to be used as the item key when creating an item. Samples for calculating the average value will be taken every second.
You may run "typeperf -qx" to get the list of all performance counters available in Windows.

PerfCounterEn

Defines a new parameter <parameter_name> which is the average value for system performance counter <perf_counter_path> for the specified time period <period> (in seconds). Compared to PerfCounter, the perfcounter paths must be in English. Supported only on **Windows Server 2008/Vista** and later.
Syntax: <parameter_name>,"<perf_counter_path>",<period>

For example, if you wish to receive the average number of processor interrupts per second for the last minute, you can define a new parameter "interrupts" as the following:

```
PerfCounterEn = interrupts,"\Processor(0)\Interrupts/sec",60
```

Please note the double quotes around the performance counter path. The parameter name (interrupts) is to be used as the item key when creating an item. Samples for calculating the average value will be taken every second.
You can find the list of English strings by viewing the following registry key: HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Perflib\009.

RefreshActiveChecks

How often the list of active checks is refreshed, in seconds. Note that after failing to refresh active checks the next refresh will be attempted in 60 seconds.

Default: 5
 Range: 1-86400

Server

A list of comma-delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers or Zabbix proxies. Incoming connections will be accepted only from the hosts listed here. If IPv6 support is enabled then '127.0.0.1', '::127.0.0.1', '::ffff:127.0.0.1' are treated equally and '::/0' will allow any IPv4 or IPv6 address. '0.0.0.0/0' can be used to allow any IPv4 address. Spaces are allowed. If this parameter is not specified, disables passive checks and the agent will not listen on any TCP port.

Example:

Server=127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

ServerActive

The Zabbix server/proxy address or cluster configuration to get active checks from. The server/proxy address is an IP address or DNS name and optional port separated by colon.
The cluster configuration is one or more server addresses separated by semicolon. Multiple Zabbix servers/clusters and Zabbix proxies can be specified, separated by comma. More than one Zabbix proxy should not be specified from each Zabbix server/cluster. If a Zabbix proxy is specified then Zabbix server/cluster for that proxy should not be specified.
Multiple comma-delimited addresses can be provided to use several independent Zabbix servers in parallel. Spaces are allowed.
If the port is not specified, default port is used.
IPv6 addresses must be enclosed in square brackets if port for that host is specified. If port is not specified, square brackets for IPv6 addresses are optional.
If this parameter is not specified, active checks are disabled.

Example for Zabbix proxy:

ServerActive=127.0.0.1:10051

Example for multiple servers:

ServerActive=127.0.0.1:20051,zabbix.domain,[::1]:30051,::1,[12fc::1]

Example for high availability:

ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051;zabbix.cluster.node3

Example for high availability with two clusters and one server:

ServerActive=zabbix.cluster.node1;zabbix.cluster.node2:20051,zabbix.cluster2.node1;zabbix.cluster2.node2,

SourceIP

The source IP address for:
- outgoing connections to Zabbix server or Zabbix proxy;
- making connections while executing some items (web.page.get, net.tcp.port, etc.).

StatusPort

If set, the agent will listen on this port for HTTP status requests (http://localhost:<port>/status).

Range: 1024-32767

Timeout

Specifies how long to wait (in seconds) for establishing connection and exchanging data with Zabbix proxy or server.
 This parameter defines the duration of various operations, including:
 - awaiting a response from the Zabbix server;
 - sending requests to Zabbix server, including **active checks** configuration requests and item data;
 - retrieving log data through logfile or Windows event log monitoring;
 - sending heartbeat messages;
 - maximum duration for vifs.* checks;
 - serving as a fallback in scenarios where a server or proxy older than version 7.0 sends checks without timeouts.

Default: 3
 Range: 1-30

TLSAccept

The incoming connections to accept. Used for passive checks. Multiple values can be specified, separated by comma:
unencrypted - accept connections without encryption (default)
psk - accept connections with TLS and a pre-shared key (PSK)
cert - accept connections with TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for *unencrypted* connection); otherwise no

TLSCAFile

The full pathname of the file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of the file containing the agent certificate or certificate chain, used for encrypted communications with Zabbix components.

TLSCipherAll13

The OpenSSL cipher string (TLS 1.3). Override the default ciphersuite selection criteria for certificate- and PSK-based encryption.

Example:

TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256

TLSCipherCert13

The OpenSSL cipher string (TLS 1.3). Override the default ciphersuite selection criteria for certificate-based encryption.

Note that this parameter cannot be used together with `TLSAccept=cert,psk`; for certificate connection (`TLSConnect=cert`) use `TLSCipherAll13` instead.

TLSCipherPSK13

The OpenSSL cipher string (TLS 1.3). Override the default ciphersuite selection criteria for PSK-based encryption.

Example:

```
TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256
```

TLSConnect

How the agent should connect to Zabbix server or proxy. Used for active checks. Only one value can be specified:
`unencrypted` - connect without encryption (default)
`psk` - connect using TLS and a pre-shared key (PSK)
`cert` - connect using TLS and a certificate

Mandatory: yes, if TLS certificate or PSK parameters are defined (even for `unencrypted` connection); otherwise no

TLSCRLFile

The full pathname of the file containing revoked certificates. This parameter is used for encrypted communications between Zabbix components.

TLSEKeyFile

The full pathname of the file containing the agent private key, used for encrypted communications between Zabbix components.

TLSPSKFile

The full pathname of the file containing the agent pre-shared key, used for encrypted communications with Zabbix server.

TLSPSKIdentity

The pre-shared key identity string, used for encrypted communications with Zabbix server.

TLSServerCertIssuer

The allowed server (proxy) certificate issuer.

TLSServerCertSubject

The allowed server (proxy) certificate subject.

UnsafeUserParameters

Allow all characters to be passed in arguments to user-defined parameters. The following characters are not allowed: `\ ' " ' * ? [] { } ~ $! & ; () < > | # @`
Additionally, newline characters are not allowed.

Default: 0
Values: 0 - do not allow, 1 - allow

UserParameter

A user-defined parameter to monitor. There can be several user-defined parameters.
Format: `UserParameter=<key>,<shell command>`
Note that the shell command must not return empty string or EOL only. Shell commands may have relative paths, if the `UserParameterDir` parameter is specified.

Example:

```
UserParameter=system.test,dir /b | find /c /v ""  
UserParameter=check_cpu,.\custom\_script.bat
```

UserParameterDir

The default search path for `UserParameter` commands. If used, the agent will change its working directory to the one specified here before executing a command. Thereby, `UserParameter` commands can have a relative `.\` prefix instead of a full path.
Only one entry is allowed.

Example:

```
UserParameterDir=C:\opt\myscripts
```

7 Zabbix agent 2 plugins

Overview

This section contains descriptions of configuration file parameters for Zabbix agent 2 plugins. Please use the sidebar to access information about the specific plugin.

1 Ceph plugin

Overview

This section lists parameters supported in the Ceph Zabbix agent 2 plugin configuration file (ceph.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|--|-----------|--------------|------------------------|---|
| Plugins.Ceph.Default.ApiKey | no | | | Default API key for connecting to Ceph; used if no value is specified in an item key or named session. |
| Plugins.Ceph.Default.User | no | | | Default username for connecting to Ceph; used if no value is specified in an item key or named session. |
| Plugins.Ceph.Default.Uri | no | | https://localhost:8003 | Default URI for connecting to Ceph; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Only https scheme is supported; a scheme can be omitted. A port can be omitted (default=8003). Examples: https://127.0.0.1:8003 localhost |
| Plugins.Ceph.InsecureSkipVerify | no | false / true | false | Determines whether an http client should verify the server's certificate chain and host name. If true, TLS accepts any certificate presented by the server and any host name in that certificate. In this mode, TLS is susceptible to man-in-the-middle attacks (should be used only for testing). |
| Plugins.Ceph.KeepAlive | no | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.Ceph.Sessions.<SessionName>.ApiKey | no | | | Named session API key. <SessionName> - define name of a session for using in item keys. |
| Plugins.Ceph.Sessions.<SessionName>.User | no | | | Named session username. <SessionName> - define name of a session for using in item keys. |
| Plugins.Ceph.Sessions.<SessionName>.Uri | no | | | Connection string of a named session. <SessionName> - define name of a session for using in item keys. Should not include embedded credentials (they will be ignored). Must match the URI format. Only https scheme is supported; a scheme can be omitted. A port can be omitted (default=8003). Examples: https://127.0.0.1:8003 localhost |

| Parameter | Mandatory | Range | Default | Description |
|----------------------|-----------|-------|----------------|--|
| Plugins.Ceph.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\) / Zabbix agent 2 \(Windows\)](#)
- Instructions for configuring [plugins](#)

2 Docker plugin

Overview

This section lists parameters supported in the Docker Zabbix agent 2 plugin configuration file (docker.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|-------------------------|-----------|-------|-----------------------------|--|
| Plugins.Docker.Endpoint | | | unix:///var/run/docker.sock | Docker daemon unix-socket location. Must contain a scheme (only <code>unix://</code> is supported). |
| Plugins.Docker.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

3 Ember+ plugin

Overview

This section lists parameters supported in the Ember+ Zabbix agent 2 plugin configuration file (ember.conf).

The Ember+ plugin is a loadable plugin and is available and fully described in the [Ember+ plugin repository](#).

This plugin is currently only available to be built from the source (for both Unix and Windows).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|-------------------------------|-----------|--------|----------------------|---|
| Plugins.EmberPlus.Default.Uri | | | tcp://localhost:9999 | Default URI to connect. The only supported schema is <code>tcp://</code> . A schema can be omitted. Embedded credentials will be ignored. |
| Plugins.EmberPlus.KeepAlive | | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |

| Parameter | Mandatory | Range | Default | Description |
|--|-----------|-------|----------------------|---|
| Plugins.EmberPlus.Sessions.<SessionName>.Uri | | | tcp://localhost:9999 | URI to connect, for the named session. The only supported schema is tcp://. A schema can be omitted. Embedded credentials will be ignored. <SessionName> - define name of a session for using in item keys. |
| Plugins.EmberPlus.System.Path | | | | Path to the Ember+ plugin executable. Example usage: Plugins.EmberPlus.System.Path=/usr/libexec/zabbix/zabbix |
| Plugins.EmberPlus.Timeout | | 1-30 | global timeout | The duration, in seconds, to wait for a server to respond when first connecting and on follow-up operations in the session. |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\) / Zabbix agent 2 \(Windows\)](#)
- Instructions for configuring [plugins](#)

4 Memcached plugin

Overview

This section lists parameters supported in the Memcached Zabbix agent 2 plugin configuration file (memcached.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|--------|-----------------------|--|
| Plugins.Memcached.Default.Password | | | | Default password for connecting to Memcached; used if no value is specified in an item key or named session. |
| Plugins.Memcached.Default.Uri | | | tcp://localhost:11211 | Default URI for connecting to Memcached; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: tcp, unix; a scheme can be omitted. A port can be omitted (default=11211). Examples: tcp://localhost:11211 localhost unix:/var/run/memcached.sock |
| Plugins.Memcached.Default.User | | | | Default username for connecting to Memcached; used if no value is specified in an item key or named session. |
| Plugins.Memcached.KeepAlive | | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.Memcached.Sessions.<SessionName>.Password | | | | Named session password. <SessionName> - define name of a session for using in item keys. |

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|-------|----------------|--|
| Plugins.Memcached.Sessions.<SessionName>.Uri | | | | Connection string of a named session. <SessionName> - define name of a session for using in item keys. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: <code>tcp</code> , <code>unix</code> ; a scheme can be omitted. A port can be omitted (default=11211). Examples: <code>tcp://localhost:11211</code> <code>localhost</code> <code>unix:/var/run/memcached.sock</code> |
| Plugins.Memcached.Sessions.<SessionName>.User | | | | Named session username. <SessionName> - define name of a session for using in item keys. |
| Plugins.Memcached.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\) / Zabbix agent 2 \(Windows\)](#)
- Instructions for configuring [plugins](#)

5 Modbus plugin

Overview

This section lists parameters supported in the Modbus Zabbix agent 2 plugin configuration file (`modbus.conf`).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|--|-----------|-------|---------|---|
| Plugins.Modbus.Sessions.<SessionName>.Endpoint | | | | Endpoint is a connection string consisting of a protocol scheme, a host address and a port or serial port name and attributes. <SessionName> - define name of a session for using in item keys. |
| Plugins.Modbus.Sessions.<SessionName>.SlaveID | | | | Slave ID of a named session. <SessionName> - define name of a session for using in item keys. Example: <code>Plugins.Modbus.Sessions.MB1.SlaveID=20</code> <i>Note that this named session parameter is checked only if the value provided in the item key slave ID parameter is empty.</i> |
| Plugins.Modbus.Sessions.<SessionName>.Timeout | | | | Timeout of a named session in seconds. <SessionName> - define name of a session for using in item keys. Example: <code>Plugins.Modbus.Sessions.MB1.Timeout=2</code> |

If you need to set the request execution timeout (how long to wait for a request to complete before shutting it down), use the [item configuration](#) form.

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\) / Zabbix agent 2 \(Windows\)](#)
- Instructions for configuring [plugins](#)

6 MongoDB plugin

Overview

This section lists parameters supported in the MongoDB Zabbix agent 2 plugin configuration file (mongo.conf).

The MongoDB plugin is a loadable plugin and is available and fully described in the [MongoDB plugin repository](#).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support **environment variables**;
- Zabbix supports configuration files only in UTF-8 encoding without **BOM**;
- Comments starting with **"#"** are only supported at the beginning of the line.

Options

| Parameter | Description |
|--------------|---|
| -V --version | Print the plugin version and license information. |
| -h --help | Print help information (shorthand). |

Parameters

| Parameter | Mandatory | Range | Default | Description |
|--|-----------|--------|---------|---|
| Plugins.MongoDB.Default.Password | | | | Default password for connecting to MongoDB; used if no value is specified in an item key or named session. |
| Plugins.MongoDB.Default.Uri | | | | Default URI for connecting to MongoDB; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Only tcp scheme is supported; a scheme can be omitted. A port can be omitted (default=27017). Examples: tcp://127.0.0.1:27017, tcp:localhost, localhost |
| Plugins.MongoDB.Default.User | | | | Default username for connecting to MongoDB; used if no value is specified in an item key or named session. |
| Plugins.MongoDB.KeepAlive | | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.MongoDB.Sessions.<SessionName>.Password | | | | Named session password. <SessionName> - define name of a session for using in item keys. |
| Plugins.MongoDB.Sessions.<SessionName>.TLSCAFile | | | | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. |
| Plugins.MongoDB.Sessions.<SessionName>.TLSConnot | | | | |
| Plugins.MongoDB.Sessions.<SessionName>.TLSCertFile | | | | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. |

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|-------|----------------|--|
| Plugins.MongoDB.Sessions.<SessionName>.TLSConnect | | | | Encryption type for communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. Supported values: <i>required</i> - require TLS connection; <i>verify_ca</i> - verify certificates; <i>verify_full</i> - verify certificates and IP address. |
| Plugins.MongoDB.Sessions.<SessionName>.TLSKeyFile | | | | Supported since plugin version 1.2.1 Full pathname of a file containing the database private key |
| Plugins.MongoDB.Sessions.<SessionName>.TLSCertificateFile | | | | Full pathname of a file containing the database private key used for encrypted communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. |
| Plugins.MongoDB.Sessions.<SessionName>.Uri | | | | Connection string of a named session. <SessionName> - define name of a session for using in item keys. Should not include embedded credentials (they will be ignored). Must match the URI format. Only tcp scheme is supported; a scheme can be omitted. A port can be omitted (default=27017). Examples: tcp://127.0.0.1:27017, tcp:localhost, localhost |
| Plugins.MongoDB.Sessions.<SessionName>.User | | | | Named session username. <SessionName> - define name of a session for using in item keys. |
| Plugins.MongoDB.System.Path | | | | Path to the MongoDB plugin executable. Example usage: Plugins.MongoDB.System.Path=/usr/libexec/zabbix/zabbix-agent |
| Plugins.MongoDB.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

7 MQTT plugin

Overview

This section lists parameters supported in the MQTT Zabbix agent 2 plugin configuration file (mqtt.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|-------------------------------|-----------|-------|---------|---|
| Plugins.MQTT.Default.Password | | | | Default password for connecting to MQTT; used if no value is specified in an item key or named session. |

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|-------|----------------------|---|
| Plugins.MQTT.Default.TLSCAFile | | | | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification for encrypted communications between Zabbix agent 2 and MQTT broker; used if no value is specified in a named session. |
| Plugins.MQTT.Default.TLSCertFile | | | | Full pathname of a file containing the agent certificate or certificate chain for encrypted communications between Zabbix agent 2 and MQTT broker; used if no value is specified in a named session. |
| Plugins.MQTT.Default.TLSKeyFile | | | | Full pathname of a file containing the MQTT private key for encrypted communications between Zabbix agent 2 and MQTT broker; used if no value is specified in a named session. |
| Plugins.MQTT.Default.Topic | | | | Default topic for MQTT subscription; used if no value is specified in an item key or named session. The topic may contain wildcards ("+", "#") Examples: path/to/file path/to/# path/+ /topic |
| Plugins.MQTT.Default.Url | | | tcp://localhost:1883 | Default MQTT broker connection string; used if no value is specified in an item key or named session. Should not include query parameters. Must match the URL format. Supported schemes: tcp (default), ws, tls; a scheme can be omitted. A port can be omitted (default=1883). Examples: tcp://host:1883 localhost ws://host:8080 |
| Plugins.MQTT.Default.User | | | | Default username for connecting to MQTT; used if no value is specified in an item key or named session. |
| Plugins.MQTT.Sessions.<SessionName>.Password | | | | Named session password. <SessionName> - define name of a session for using in item keys. |
| Plugins.MQTT.Sessions.<SessionName>.TLSCAFile | | | | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix agent 2 and MQTT broker. <SessionName> - define name of a session for using in item keys. |
| Plugins.MQTT.Sessions.<SessionName>.TLSCertFile | | | | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix agent 2 and MQTT broker. <SessionName> - define name of a session for using in item keys. |
| Plugins.MQTT.Sessions.<SessionName>.TLSKeyFile | | | | Full pathname of a file containing the MQTT private key used for encrypted communications between Zabbix agent 2 and MQTT broker. <SessionName> - define name of a session for using in item keys. |
| Plugins.MQTT.Sessions.<SessionName>.Topic | | | | Named session topic for MQTT subscription. <SessionName> - define name of a session for using in item keys. The topic may contain wildcards ("+", "#") Examples: path/to/file path/to/# path/+ /topic |

| Parameter | Mandatory | Range | Default | Description |
|--|-----------|-------|---------|--|
| Plugins.MQTT.Sessions.<SessionName>.Url | | | | Connection string of a named session. <SessionName> - define name of a session for using in item keys. Should not include query parameters. Must match the URL format. Supported schemes: <code>tcp</code> (default), <code>ws</code> , <code>tls</code> ; a scheme can be omitted. A port can be omitted (default=1883). Examples: <code>tcp://host:1883</code> <code>localhost</code> <code>ws://host:8080</code> |
| Plugins.MQTT.Sessions.<SessionName>.User | | | | Named session username. <SessionName> - define name of a session for using in item keys. |

If you need to set the request execution timeout (how long to wait for a request to complete before shutting it down), use the [item configuration](#) form.

8 MSSQL plugin

Overview

This section lists parameters supported in the MSSQL Zabbix agent 2 plugin configuration file (`mssql.conf`).

The MSSQL plugin is a loadable plugin and is available and fully described in the [MSSQL plugin repository](#).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|-------|---------|--|
| Plugins.MSSQL.CustomQueriesDir | | | empty | Specifies the file path to a directory containing user-defined .sql files with custom queries that the plugin can execute. The plugin loads all available .sql files in the configured directory at startup. This means that any changes to the custom query files will not be reflected until the plugin is restarted. The plugin is started and stopped together with Zabbix agent 2. |
| Plugins.MSSQL.Default.CACertPath | | | | The default file path to the public key certificate of the certificate authority (CA) that issued the certificate of the MSSQL server. The certificate must be in PEM format. |
| Plugins.MSSQL.Default.Database | | | | The default database name to connect to. |
| Plugins.MSSQL.Default.Encrypt | | | | Specifies the default connection encryption type. Possible values are: <i>true</i> - data sending between plugin and server is encrypted; <i>false</i> - data sending between plugin and server is not encrypted beyond the login packet; <i>strict</i> - data sending between plugin and server is encrypted E2E using TDS8 ; <i>disable</i> - data sending between plugin and server is not encrypted. |
| Plugins.MSSQL.Default.HostNameInCertificate | | | | The common name (CN) of the certificate of the MSSQL server by default. |

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|--------|-----------------------|--|
| Plugins.MSSQL.Default.Password | Default | | | The password to be sent to a protected MSSQL server by default. |
| Plugins.MSSQL.Default.TLSMinVersion | Default | | | The minimum TLS version to use by default. Possible values are: 1.0, 1.1, 1.2, 1.3. |
| Plugins.MSSQL.Default.TrustServerCertificate | Default | | | Whether the plugin should trust the server certificate without validating it by default. Possible values: true, false. |
| Plugins.MSSQL.Default.Uri | Default | | sqlserver://localhost | The default URI to connect. The only supported schema is sqlserver://. A schema can be omitted. Embedded credentials will be ignored. |
| Plugins.MSSQL.Default.User | Default | | | The default username to be sent to a protected MSSQL server. |
| Plugins.MSSQL.KeepAlive | Keep | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.MSSQL.Sessions.<SessionName>.CACertPath | Sessions | | | The file path to the public key certificate of the certificate authority (CA) that issued the certificate of the MSSQL server for the named session. The certificate must be in PEM format. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.Database | Sessions | | | The database name to connect to for the named session. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.Encrypt | Sessions | | | Specifies the connection encryption type for the named session. Possible values are: true - data sending between plugin and server is encrypted; false - data sending between plugin and server is not encrypted beyond the login packet; strict - data sending between plugin and server is encrypted E2E using TDS8; disable - data sending between plugin and server is not encrypted. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.HostNameInCertificate | Sessions | | | The common name (CN) of the certificate of the MSSQL server for the named session. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.Password | Sessions | | | The password to be sent to a protected MSSQL server for the named session. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.TLSMinVersion | Sessions | | | The minimum TLS version to use for the named session. Possible values are: 1.0, 1.1, 1.2, 1.3. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.TrustServerCertificate | Sessions | | | Whether the plugin should trust the server certificate without validating it for the named session. Possible values: true, false. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.Uri | Sessions | | sqlserver://localhost | The URI to connect, for the named session. The only supported schema is sqlserver://. A schema can be omitted. Embedded credentials will be ignored. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.Sessions.<SessionName>.User | Sessions | | | The username to be sent to a protected MSSQL server for the named session. <SessionName> - define name of a session for using in item keys. |
| Plugins.MSSQL.System.Path | System | | | Path to the MSSQL plugin executable. Global setting for the MSSQL plugin. Applied to all connections. Example usage: Plugins.MSSQL.System.Path=/usr/libexec/zabbix/zabbix-agent |

| Parameter | Mandatory | Range | Default | Description |
|-----------------------|-----------|-------|----------------|---|
| Plugins.MSSQL.Timeout | no | 1-30 | global timeout | The duration, in seconds, to wait for a server to respond when first connecting and on follow-up operations in the session. |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\) / Zabbix agent 2 \(Windows\)](#)

9 MySQL plugin

Overview

This section lists parameters supported in the MySQL Zabbix agent 2 plugin configuration file (mysql.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with `"#"` are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|-------|----------------|---|
| Plugins.MySQL.CallbackTimeout | no | 1-30 | global timeout | The maximum amount of time in seconds to wait for a request to be done. |
| Plugins.MySQL.CustomQueriesPath | no | | empty | Full path to the directory used for storing custom queries. |
| Plugins.MySQL.Default.Password | no | | | Default password for connecting to MySQL; used if no value is specified in an item key or named session. |
| Plugins.MySQL.Default.TLSCAFile (yes, if Plugins.MySQL.Default.TLSConnect is set to <code>verify_ca</code> or <code>verify_full</code>) | no | | | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. |
| Plugins.MySQL.Default.TLSCertFile (yes, if Plugins.MySQL.Default.TLSConnect is set to <code>verify_ca</code> or <code>verify_full</code>) | no | | | Full pathname of a file containing the agent certificate or certificate chain for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. |
| Plugins.MySQL.Default.TLSConnect | no | | | Encryption type for communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. Supported values: <i>required</i> - require TLS connection; <i>verify_ca</i> - verify certificates; <i>verify_full</i> - verify certificates and IP address. |
| Plugins.MySQL.Default.TLSKeyFile (yes, if Plugins.MySQL.Default.TLSConnect is set to <code>verify_ca</code> or <code>verify_full</code>) | no | | | Full pathname of a file containing the database private key for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. |

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|--------|----------------------|--|
| Plugins.Mysql.Default.Uri | yes | | tcp://localhost:3306 | Default URI for connecting to MySQL; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: <code>tcp</code> , <code>unix</code> ; a scheme can be omitted. A port can be omitted (default=3306). Examples: <code>tcp://localhost:3306</code> <code>localhost</code> <code>unix:/var/run/mysql.sock</code> |
| Plugins.Mysql.Default.User | yes | | | Default username for connecting to MySQL; used if no value is specified in an item key or named session. |
| Plugins.MysqlKeepAlive | yes | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.MysqlSessions.<SessionName>.Password | yes | | | Named session password. <SessionName> - define name of a session for using in item keys. |
| Plugins.MysqlSessions.<SessionName>.TLSCAFile (yes, if Plugins.MysqlSessions.<SessionName>.TLSConnect is set to <code>verify_ca</code> or <code>verify_full</code>) | yes | | | Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. |
| Plugins.MysqlSessions.<SessionName>.TLSCertFile (yes, if Plugins.MysqlSessions.<SessionName>.TLSKeyFile is specified) | yes | | | Full pathname of a file containing the agent certificate or certificate chain, used for encrypted communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. |
| Plugins.MysqlSessions.<SessionName>.TLSConnect | yes | | | Encryption type for communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. Supported values: <code>required</code> - require TLS connection; <code>verify_ca</code> - verify certificates; <code>verify_full</code> - verify certificates and IP address. |
| Plugins.MysqlSessions.<SessionName>.TLSKeyFile (yes, if Plugins.MysqlSessions.<SessionName>.TLSCertFile is specified) | yes | | | Full pathname of a file containing the database private key used for encrypted communications between Zabbix agent 2 and monitored databases. <SessionName> - define name of a session for using in item keys. |
| Plugins.MysqlSessions.<SessionName>.Uri | yes | | | Connection string of a named session. <SessionName> - define name of a session for using in item keys. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: <code>tcp</code> , <code>unix</code> ; a scheme can be omitted. A port can be omitted (default=3306). Examples: <code>tcp://localhost:3306</code> <code>localhost</code> <code>unix:/var/run/mysql.sock</code> |
| Plugins.MysqlSessions.<SessionName>.User | yes | | | Named session username. <SessionName> - define name of a session for using in item keys. |
| Plugins.MysqlTimeout | yes | 1-30 | global timeout | The maximum time in seconds for waiting when a connection has to be established. |

10 NVIDIA GPU plugin

Overview

This section lists parameters supported in the NVIDIA GPU Zabbix agent 2 plugin configuration file (nvidia.conf).

The NVIDIA GPU plugin is a loadable plugin and is available and fully described in the [NVIDIA GPU plugin repository](#).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|----------------------------|-----------|-------|-------------------|---|
| Plugins.NVIDIA.System.Path | | | | Path to the NVIDIA GPU plugin executable. Example usage: Plugins.NVIDIA.System.Path=/path/to/executable/nvidia |
| Plugins.NVIDIA.Timeout | | 1-30 | global timeout | Specifies the maximum time (in seconds) to wait for a server response during connection attempts and subsequent operations in the session. The global item-type timeout or individual item timeout will override this value if greater. |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\)](#) / [Zabbix agent 2 \(Windows\)](#)
- Instructions for configuring [plugins](#)

11 Oracle plugin

Overview

This section lists parameters supported in the Oracle Zabbix agent 2 plugin configuration file (oracle.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|----------------------------------|-----------|-------|-------------------|--|
| Plugins.Oracle.CallTimeout | | 1-30 | global timeout | The maximum wait time in seconds for a request to be completed. |
| Plugins.Oracle.ConnectTimeout | | 1-30 | global timeout | The maximum wait time in seconds for a connection to be established. |
| Plugins.Oracle.CustomQueriesPath | | | | Full pathname of a directory containing .sql files with custom queries. Disabled by default. Example: /etc/zabbix/oracle/sql |
| Plugins.Oracle.Default.Password | | | | Default password for connecting to Oracle; used if no value is specified in an item key or named session. |
| Plugins.Oracle.Default.Service | | | | Default service name for connecting to Oracle (SID is not supported); used if no value is specified in an item key or named session. |

| Parameter | Mandatory | Range | Default | Description |
|--|-----------|--------|----------------------|---|
| Plugins.Oracle.Default.Uri | Yes | | tcp://localhost:1521 | Default URI for connecting to Oracle; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Only tcp scheme is supported; a scheme can be omitted. A port can be omitted (default=1521). Examples: tcp://127.0.0.1:1521 localhost |
| Plugins.Oracle.Default.User | Yes | | | Default username for connecting to Oracle; used if no value is specified in an item key or named session. |
| Plugins.Oracle.KeepAlive | Yes | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.Oracle.Sessions.<SessionName>.Password | Yes | | | Named session password. <SessionName> - define name of a session for using in item keys. |
| Plugins.Oracle.Sessions.<SessionName>.Service | Yes | | | Named session service name to be used for connection (SID is not supported). <SessionName> - define name of a session for using in item keys. |
| Plugins.Oracle.Sessions.<SessionName>.Uri | Yes | | | Named session connection string for Oracle. <SessionName> - define name of a session for using in item keys. Should not include embedded credentials (they will be ignored). Must match the URI format. Only tcp scheme is supported; a scheme can be omitted. A port can be omitted (default=1521). Examples: tcp://127.0.0.1:1521 localhost |
| Plugins.Oracle.Sessions.<SessionName>.User | Yes | | | Named session username. <SessionName> - define name of a session for using in item keys. |

12 PostgreSQL plugin

Overview

This section lists parameters supported in the PostgreSQL Zabbix agent 2 plugin configuration file (postgresql.conf).

The PostgreSQL plugin is a loadable plugin and is available and fully described in the [PostgreSQL plugin repository](#).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported at the beginning of the line.

Options

| Parameter | Description |
|--------------|---|
| -V --version | Print the plugin version and license information. |
| -h --help | Print help information (shorthand). |

Parameters

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|-------|----------------|--|
| Plugins.PostgreSQL.Default.CacheMode | | | prepare | Cache mode for the PostgreSQL connection. Supported values: <i>prepare</i> (default) - will create prepared statements on the PostgreSQL server; <i>describe</i> - will use the anonymous prepared statement to describe a statement without creating a statement on the server. Note that "describe" is primarily useful when the environment does not allow prepared statements such as when running a connection pooler like PgBouncer. |
| Plugins.PostgreSQL.CallTimeout | | 1-30 | global timeout | Maximum wait time (in seconds) for a request to be completed. |
| Plugins.PostgreSQL.CustomQueriesPath | | | disabled | Full pathname of the directory containing <i>.sql</i> files with custom queries. |
| Plugins.PostgreSQL.Default.Database | | | | Default database for connecting to PostgreSQL; used if no value is specified in an item key or named session. |
| Plugins.PostgreSQL.Default.Password | | | | Default password for connecting to PostgreSQL; used if no value is specified in an item key or named session. |
| Plugins.PostgreSQL.Default.TLSCAFile (yes, if Plugins.PostgreSQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i>) | | | | Full pathname of a file containing the top-level CA(s) certificate for peer certificate verification for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. |
| Plugins.PostgreSQL.Default.TLSCertFile (yes, if Plugins.PostgreSQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i>) | | | | Full pathname of a file containing the PostgreSQL certificate or certificate chain for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. |
| Plugins.PostgreSQL.Default.TLSConnect | | | | Encryption type for communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. Supported values: <i>required</i> - connect using TLS as transport mode without identity checks; <i>verify_ca</i> - connect using TLS and verify certificate; <i>verify_full</i> - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate. Undefined encryption type means unencrypted connection. |
| Plugins.PostgreSQL.Default.TLSKeyFile (yes, if Plugins.PostgreSQL.Default.TLSConnect is set to <i>verify_ca</i> or <i>verify_full</i>) | | | | Full pathname of a file containing the PostgreSQL private key for encrypted communications between Zabbix agent 2 and monitored databases; used if no value is specified in a named session. |
| Plugins.PostgreSQL.Default.Uri | | | | Default URI for connecting to PostgreSQL; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: <i>tcp</i> , <i>unix</i> . Examples: <i>tcp://127.0.0.1:5432</i> <i>tcp://localhost</i> <i>unix:/var/run/postgresql/.s.PGSQL.5432</i> |
| Plugins.PostgreSQL.Default.User | | | | Default username for connecting to PostgreSQL; used if no value is specified in an item key or named session. |

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|---|---------|---|
| Plugins.PostgreSQL.KeepAlive | SQL | 60-900 | 300 | Maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.PostgreSQL.Sessions.<SessionName>.CacheMode | SQL | | prepare | Cache mode for the PostgreSQL connection. <SessionName> - define name of a session for using in item keys. Supported values: <i>prepare</i> (default) - will create prepared statements on the PostgreSQL server; <i>describe</i> - will use the anonymous prepared statement to describe a statement without creating a statement on the server. Note that "describe" is primarily useful when the environment does not allow prepared statements such as when running a connection pooler like PgBouncer. |
| Plugins.PostgreSQL.Sessions.<SessionName>.Database | SQL | | | Database for session connection. <SessionName> - define name of a session for using in item keys. |
| Plugins.PostgreSQL.Sessions.<SessionName>.Password | SQL | the password format. | | Password for session connection. <SessionName> - define name of a session for using in item keys. |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSCAFile | SQL | (yes, if Plugins.PostgreSQL.Sessions.<SessionName>.TLSConnectionMode is set to <i>verify_ca</i> or <i>verify_full</i>) | | Full pathname of a file containing the top-level CA(s) certificate peer certificate verification. <SessionName> - define name of a session for using in item keys. |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSCertFile | SQL | (yes, if Plugins.PostgreSQL.Sessions.<SessionName>.TLSKeyFile is specified) | | Full pathname of a file containing the PostgreSQL certificate certificate chain. <SessionName> - define name of a session for using in item keys. |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSConnect | SQL | | | Encryption type for PostgreSQL connection. <SessionName> - define name of a session for using in item keys. Supported values: <i>required</i> - connect using TLS as transport mode without identity checks; <i>verify_ca</i> - connect using TLS and verify certificate; <i>verify_full</i> - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate. Undefined encryption type means unencrypted connection. |
| Plugins.PostgreSQL.Sessions.<SessionName>.TLSKeyFile | SQL | (yes, if Plugins.PostgreSQL.Sessions.<SessionName>.TLSCertFile is specified) | | Full pathname of a file containing the PostgreSQL private key. <SessionName> - define name of a session for using in item keys. |
| Plugins.PostgreSQL.Sessions.<SessionName>.Uri | SQL | | | Connection string of a named session. <SessionName> - define name of a session for using in item keys. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: <i>tcp</i> , <i>unix</i> . Examples: <i>tcp://127.0.0.1:5432</i> <i>tcp://localhost</i> <i>unix:/var/run/postgresql/.s.PGSQL.5432</i> |
| Plugins.PostgreSQL.Sessions.<SessionName>.User | SQL | | | Named session username. <SessionName> - define name of a session for using in item keys. |

| Parameter | Mandatory | Range | Default | Description |
|--------------------------------|-----------|-------|----------------|---|
| Plugins.PostgreSQL.System.Path | | | | Path to the PostgreSQL plugin executable. Example usage: Plugins.PostgreSQL.System.Path=/usr/libexec/zabbix/zabbix_ |
| Plugins.PostgreSQL.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

13 Redis plugin

Overview

This section lists parameters supported in the Redis Zabbix agent 2 plugin configuration file (redis.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|---|-----------|--------|----------------------|--|
| Plugins.Redis.Default.Password | | | | Default password for connecting to Redis; used if no value is specified in an item key or named session. |
| Plugins.Redis.Default.Uri | | | tcp://localhost:6379 | Default URI for connecting to Redis; used if no value is specified in an item key or named session. Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: tcp, unix; a scheme can be omitted. A port can be omitted (default=6379). Examples: tcp://localhost:6379 localhost unix:/var/run/redis.sock |
| Plugins.Redis.Default.User | | | | Default user to send to the protected Redis server; used if no value is specified in an item key or named session. |
| Plugins.Redis.KeepAlive | | 60-900 | 300 | The maximum time of waiting (in seconds) before unused plugin connections are closed. |
| Plugins.Redis.Sessions.<SessionName>.Password | | | | Named session password. <SessionName> - define the session name to be used in item keys. |
| Plugins.Redis.Sessions.<SessionName>.Uri | | | | Connection string of a named session. <SessionName> - define the session name to be used in item keys. |
| | | | | Should not include embedded credentials (they will be ignored). Must match the URI format. Supported schemes: tcp, unix; a scheme can be omitted. A port can be omitted (default=6379). Examples: tcp://localhost:6379 localhost unix:/var/run/redis.sock |
| Plugins.Redis.Sessions.<SessionName>.User | | | | User to send to the protected Redis server. <SessionName> - define the session name to be used in item keys. |

| Parameter | Mandatory | Range | Default | Description |
|-----------------------|-----------|-------|----------------|--|
| Plugins.Redis.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

14 SMART plugin

Overview

This section lists parameters supported in the SMART Zabbix agent 2 plugin configuration file (smart.conf).

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- The path to the smartctl executable must be set either by adding its directory to the system’s PATH environment variable or by configuring Plugins.Smart.Path; this applies to both Linux and Windows;
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with “#” are only supported at the beginning of the line.

Parameters

| Parameter | Mandatory | Range | Default | Description |
|-----------------------|-----------|-------|----------------|--|
| Plugins.Smart.Path | | | smartctl | Path to the smartctl executable. |
| Plugins.Smart.Timeout | | 1-30 | global timeout | Request execution timeout (the duration, in seconds, to wait for a request to complete before shutting it down). |

See also:

- Description of general Zabbix agent 2 configuration parameters: [Zabbix agent 2 \(UNIX\)](#) / [Zabbix agent 2 \(Windows\)](#)

8 Zabbix Java gateway

If you use startup.sh and shutdown.sh scripts for starting [Zabbix Java gateway](#), then you can specify the necessary configuration parameters in the settings.sh file. The startup and shutdown scripts source the settings file and take care of converting shell variables (listed in the first column) to Java properties (listed in the second column).

If you start Zabbix Java gateway manually by running java directly, then you specify the corresponding Java properties on the command line.

| Variable | Property | Mandatory | Range | Default | Description |
|-------------|-------------------|-----------|------------|----------------------|--|
| LISTEN_IP | zabbix.listenIP | no | | 0.0.0.0 | IP address to listen on. |
| LISTEN_PORT | zabbix.listenPort | no | 1024-32767 | 10052 | Port to listen on. |
| PID_FILE | zabbix.pidFile | no | | /tmp/zabbix_java.pid | Name of PID file. If omitted, Zabbix Java Gateway is started as a console application. |

| Variable | Property | Mandatory | Range | Default | Description |
|-----------------|-----------------------|-----------|--------|---------|---|
| PROPERTIES_FILE | zabbix.propertiesFile | no | | | Name of properties file. Can be used to set additional properties using a key-value format in such a way that they are not visible on a command line or to overwrite existing ones. For example: "javax.net.ssl.trustStorePassword=<p> |
| START_POLLERS | zabbix.startPollers | no | 1-1000 | 5 | Number of worker threads to start. |
| TIMEOUT | zabbix.timeout | no | 1-30 | 3 | How long to wait for network operations. |

Warning:

Port 10052 is not [IANA registered](#).

9 Zabbix web service

Overview

The Zabbix web service is a process that is used for communication with external web services.

The parameters supported by the Zabbix web service configuration file (zabbix_web_service.conf) are listed in this section.

The parameters are listed without additional information. Click on the parameter to see the full details.

| Parameter | Description |
|-------------------------------------|---|
| AllowedIP | A list of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. |
| DebugLevel | The debug level. |
| IgnoreURLCertErrors | Specifies TLS certificate validation error handling when accessing the frontend URL. |
| ListenPort | The service will listen on this port for connections from the server. |
| LogFile | The name of the log file. |
| LogFileSize | The maximum size of the log file. |
| LogType | The type of the log output. |
| Timeout | The maximum time (in seconds) spent formatting the PDF report of a dashboard. |
| TLSAccept | What incoming connections to accept. |
| TLSCAFile | The full pathname of a file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components. |
| TLSCertFile | The full pathname of a file containing the service certificate or certificate chain, used for encrypted communications between Zabbix components. |
| TLSKeyFile | The full pathname of a file containing the service private key, used for encrypted communications between Zabbix components. |

All parameters are non-mandatory unless explicitly stated that the parameter is mandatory.

Note that:

- The default values reflect process defaults, not the values in the shipped configuration files;
- Values support [environment variables](#);
- Zabbix supports configuration files only in UTF-8 encoding without [BOM](#);
- Comments starting with "#" are only supported at the beginning of the line.

Parameter details

AllowedIP

A list of comma delimited IP addresses, optionally in CIDR notation, or DNS names of Zabbix servers and Zabbix proxies. Incoming connections will be accepted only from the hosts listed here.
If IPv6 support is enabled then 127.0.0.1, ::127.0.0.1,

::ffff:127.0.0.1 are treated equally and ::/0 will allow any IPv4 or IPv6 address. 0.0.0.0/0 can be used to allow any IPv4 address.

Example:

127.0.0.1,192.168.1.0/24,::1,2001:db8::/32,zabbix.example.com

Mandatory: yes

DebugLevel

Specify the debug level:
0 - basic information about starting and stopping of Zabbix processes
1 - critical information;
2 - error information;
3 - warnings;
4 - for debugging (produces lots of information);
5 - extended debugging (produces even more information).

Default: 3
 Range: 0-5

IgnoreURLCertErrors

Specifies TLS certificate validation error handling when accessing the frontend URL:
0 - do not ignore certificate errors;
1 - ignore certificate errors.

Default: 0
 Range: 0-1

ListenPort

The service will listen on this port for connections from the server.

Default: 10053
 Range: 1024-32767

LogFile

The name of the log file.

Example:

/tmp/zabbix_web_service.log

Mandatory: Yes, if LogType is set to *file*; otherwise no

LogFileSize

The maximum size of a log file in MB.
0 - disable automatic log rotation.
Note: If the log file size limit is reached and file rotation fails, for whatever reason, the existing log file is truncated and started anew.

Default: 1
 Range: 0-1024

LogType

The type of the log output:
file - write log to the file specified by LogFile parameter;
system - write log to syslog;
console - write log to standard output.

Default: *file*

Timeout

The maximum time (in seconds) spent formatting the PDF **report** of a dashboard.

Default: 10
 Range: 1-30

TLSAccept

What incoming connections to accept:
unencrypted - accept connections without encryption (default)
cert - accept connections with TLS and a certificate

Default: *unencrypted*

TLSCAFile

The full pathname of the file containing the top-level CA(s) certificates for peer certificate verification, used for encrypted communications between Zabbix components.

TLSCertFile

The full pathname of the file containing the service certificate or certificate chain, used for encrypted communications with Zabbix components.

TLSKeyFile

The full pathname of the file containing the service private key, used for encrypted communications between Zabbix components.

10 Environment variables

Overview

Environment variables allow configuring Zabbix components without hardcoding values in configuration files. This makes it easy to manage configurations in dynamic environments, such as Docker, where variables can be passed at runtime to adapt to different setups.

In the simplest case, by setting the Zabbix server **DebugLevel** configuration parameter value to an environment variable, you can then use it to configure the server on startup:

```
#### Zabbix server configuration file:
DebugLevel=${NEW_DEBUG_LEVEL}

#### Starting Zabbix server:
NEW_DEBUG_LEVEL=5 /usr/sbin/zabbix_server
```

Environment variables are supported by the following Zabbix components:

- **Server**
- **Proxy**
- **Agent (UNIX or Windows)**
- **Agent 2 (UNIX or Windows)**, including **plugins**
- **Web service**
- Zabbix sender (when using the **-C, --config** option)

Important notes

- When a configuration parameter is set to an environment variable, which is not specified when running the component, the default value of the parameter is used.
- When using **runtime commands** (e.g., to increase the agent log level), any previously used environment variables must be specified. This is because Zabbix components use their configuration file to execute runtime commands; if environment variables are omitted, configuration parameter default values will be used. See **Examples**.
- The `userparameter_reload` **runtime command** does not support reloading environment variables. During reload, variables are ignored, and only parameters with regular values are reloaded.
- Process current environment variables, which were used in configuration files, are cleared after the Zabbix component is started. This ensures that child processes (e.g., remote scripts executed by Zabbix) cannot access these variables. However, note that process initial variables can still be retrieved (e.g., via the `/proc/<PID>/environ` file).

Syntax

Environment variables must use the following syntax: `${alphanumerics/underscores}`.

The variable name may only include letters (a-z, A-Z), underscores (`_`), and digits (0-9), and must not begin with a digit.

Variables that do not match the required syntax or are combined with a regular value will be treated as regular values, which may produce errors.

Correct variable syntax:

```
DebugLevel=${NEW_DEBUG_LEVEL}
Hostname=${ZBX_HOSTNAME}
LogFile=${LogFile_001}
```

Incorrect variable syntax:

```
DebugLevel=${5_DebugLevel}
Hostname=${ZBX.HOSTNAME 1}
LogFile=/${HOME}/zabbix/zabbix_server.log
```

Note:

In Windows, environment variable names are case-insensitive.

Examples

The following examples show how to configure and use environment variables with Zabbix components.

Example 1: Configuring and testing Zabbix agent

1. Set environment variables in the agent configuration file:

```
Hostname=${ZBX_HOSTNAME}
ServerActive=${ServerActive}
```

2. Test the configuration file:

```
ZBX_HOSTNAME="New Zabbix agent" ServerActive=127.0.0.1 /usr/sbin/zabbix_agentd -c /etc/zabbix/zabbix_agentd.conf
```

3. Start agent with environment variables:

```
ZBX_HOSTNAME="New Zabbix agent" ServerActive=127.0.0.1 /usr/sbin/zabbix_agentd -c /etc/zabbix/zabbix_agentd.conf
```

When using **runtime commands** (e.g., to increase the agent log level), any previously used environment variables must be specified:

```
ZBX_HOSTNAME="New Zabbix agent" ServerActive=127.0.0.1 /usr/sbin/zabbix_agentd -c /etc/zabbix/zabbix_agentd.conf
```

This is because agent uses its configuration file to execute runtime commands; if environment variables are omitted, configuration parameter default values will be used.

Alternatively, after setting environment variables in the agent configuration file, you may make them available to processes (e.g., by using the `export` command). This reduces the risk of unexpected behavior due to missing or incorrectly set variables.

```
export ZBX_HOSTNAME="New Zabbix agent"
export ServerActive=127.0.0.1
/usr/sbin/zabbix_agentd -c /etc/zabbix/zabbix_agentd.conf --test-config
/usr/sbin/zabbix_agentd -c /etc/zabbix/zabbix_agentd.conf
/usr/sbin/zabbix_agentd -c /etc/zabbix/zabbix_agentd.conf -R log_level_increase
```

Example 2: Configuring Zabbix agent for a container

If you're creating and configuring your own custom image for Zabbix components (e.g., Zabbix agent), you can define configuration parameters using environment variables and then start the container with those variables.

1. When preparing the image, set environment variables in the agent configuration file:

```
Hostname=${ZBX_HOSTNAME}
BufferSize=${BUFSZ}
ListenPort=${LISTENPORT}
UserParameter=${_UsrPar01}
UserParameter=${_UsrPar02}
```

2. After building the container image, start the agent container (e.g., Docker) with environment variables:

```
docker run --name my-zabbix-agent -e ZBX_HOSTNAME="new-hostname" -e BUFSZ=1000 -e LISTENPORT=20050 -e _UsrPar01="..."
```

3. When using **runtime commands** (e.g., to increase the agent log level), access the container shell and execute the runtime command:

```
docker exec -it <containerid> sh
/usr/sbin/zabbix_agentd -R log_level_increase
```

Attention:

The `userparameter_reload` runtime command does not support reloading environment variables. During reload, variables are ignored, and only parameters with regular values are reloaded.

11 Inclusion

Overview

Additional files or directories can be included into server/proxy/agent configuration using the `Include` parameter.

Notes on inclusion

If the `Include` parameter is used for including a file, the file must be readable.

If the `Include` parameter is used for including a directory:

- All files in the directory must be readable.
- No particular order of inclusion should be assumed (e.g. files are not included in alphabetical order). Therefore do not define one parameter in several "Include" files (e.g. to override a general setting with a specific one).
- All files in the directory are included into configuration.

- Beware of file backup copies automatically created by some text editors. For example, if editing the "include/my_specific.conf" file produces a backup copy "include/my_specific_conf.BAK" then both files will be included. Move "include/my_specific.conf.BAK" out of the "Include" directory. On Linux, contents of the "Include" directory can be checked with a "ls -al" command for unnecessary files.

If the Include parameter is used for including files using a pattern:

- All files matching the pattern must be readable.
- No particular order of inclusion should be assumed (e.g. files are not included in alphabetical order). Therefore do not define one parameter in several "Include" files (e.g. to override a general setting with a specific one).

3 Protocols

Please use the sidebar to access content in this section.

1 Server-proxy data exchange protocol

Overview

Server - proxy data exchange is based on JSON format.

Request and response messages must begin with **header and data length**.

Passive proxy

Configuration request

The server will first send an empty proxy config request. This request is sent every ProxyConfigFrequency (server configuration parameter) seconds.

The proxy responds with the current proxy version, session token and configuration revision. The server responds with the configuration data that need to be updated.

| name | value type | description |
|-----------------------------------|----------------------|--|
| server→proxy: request | <i>string</i> | 'proxy config' |
| proxy→server: version | <i>string</i> | Proxy version (<major>.<minor>.<build>). |
| session | <i>string</i> | Proxy configuration session token. |
| config_revision | <i>number</i> | Proxy configuration revision. |
| server→proxy: full_sync | <i>number</i> | 1 - if full configuration data is sent; absent - otherwise (optional). |
| data | <i>array</i> | Object of table data. Absent if configuration has not been changed (optional). |
| <table> | <i>object</i> | One or more objects with <table> data (optional, depending on changes). |
| fields | <i>array</i> | Array of field names. |
| - | <i>string</i> | Field name. |
| data | <i>array</i> | Array of rows. |
| - | <i>array</i> | Array of columns. |
| - | <i>string,number</i> | Column value with type depending on column type in database schema. |
| macro.secrets | <i>object</i> | Secret macro information, absent if there are no changes in vault macros (optional). |
| config_revision | <i>number</i> | Configuration cache revision - sent with configuration data (optional). |
| del_hostids | <i>array</i> | Array of removed hostids (optional). |
| - | <i>number</i> | Host identifier. |
| del_macro_hostids | <i>array</i> | Array of hostids with all macros removed (optional). |
| - | <i>number</i> | Host identifier. |

| name | value type | description |
|-----------------|---------------|--|
| proxy→server: | | |
| response | <i>string</i> | Request success information ('success' or 'failed'). |
| version | <i>string</i> | Proxy version (<major>.<minor>.<build>). |

Example:

server→proxy:

server→proxy:

```
{
  "request": "proxy config"
}
```

proxy→server:

```
{
  "version": "7.2.0",
  "session": "0033124949800811e5686dbfd9bcea98",
  "config_revision": 0
}
```

```

| name | value type | description |
|--------------------------|---------------|---|
| interfaceid | <i>number</i> | Interface identifier. |
| available | <i>number</i> | Interface availability: 0 , <i>INTERFACE_AVAILABLE_UNKNOWN</i> - unknown 1 , <i>INTERFACE_AVAILABLE_TRUE</i> - available 2 , <i>INTERFACE_AVAILABLE_FALSE</i> - unavailable |
| error | <i>string</i> | Interface error message or empty string. |
| history data | <i>array</i> | (<i>optional</i>) Array of history data objects. |
| itemid | <i>number</i> | Item identifier. |
| clock | <i>number</i> | Item value timestamp (seconds). |
| ns | <i>number</i> | Item value timestamp (nanoseconds). |
| value | <i>string</i> | (<i>optional</i>) Item value. |
| id | <i>number</i> | Value identifier (ascending counter, unique within one data session). |
| timestamp | <i>number</i> | (<i>optional</i>) Timestamp of log type items. |
| source | <i>string</i> | (<i>optional</i>) Eventlog item source value. |
| severity | <i>number</i> | (<i>optional</i>) Eventlog item severity value. |
| eventid | <i>number</i> | (<i>optional</i>) Eventlog item eventid value. |
| state | <i>string</i> | (<i>optional</i>) Item state: 0 , <i>ITEM_STATE_NORMAL</i> 1 , <i>ITEM_STATE_NOTSUPPORTED</i> |
| lastlogsize | <i>number</i> | (<i>optional</i>) Last log size of log type items. |
| mtime | <i>number</i> | (<i>optional</i>) Modification time of log type items. |
| discovery data | <i>array</i> | (<i>optional</i>) Array of discovery data objects. |
| clock | <i>number</i> | Discovery data timestamp. |
| druleid | <i>number</i> | Discovery rule identifier. |
| dcheckid | <i>number</i> | Discovery check identifier or null for discovery rule data. |
| type | <i>number</i> | Discovery check type: -1 discovery rule data 0 , <i>SVC_SSH</i> - SSH service check 1 , <i>SVC_LDAP</i> - LDAP service check 2 , <i>SVC_SMTP</i> - SMTP service check 3 , <i>SVC_FTP</i> - FTP service check 4 , <i>SVC_HTTP</i> - HTTP service check 5 , <i>SVC_POP</i> - POP service check 6 , <i>SVC_NNTP</i> - NNTP service check 7 , <i>SVC_IMAP</i> - IMAP service check 8 , <i>SVC_TCP</i> - TCP port availability check 9 , <i>SVC_AGENT</i> - Zabbix agent 10 , <i>SVC_SNMPv1</i> - SNMPv1 agent 11 , <i>SVC_SNMPv2</i> - SNMPv2 agent 12 , <i>SVC_ICMPPING</i> - ICMP ping 13 , <i>SVC_SNMPv3</i> - SNMPv3 agent 14 , <i>SVC_HTTPS</i> - HTTPS service check 15 , <i>SVC_TELNET</i> - Telnet availability check |
| ip | <i>string</i> | Host IP address. |
| dns | <i>string</i> | Host DNS name. |
| port | <i>number</i> | (<i>optional</i>) Service port number. |
| key_value | <i>string</i> | (<i>optional</i>) Item key for discovery check of type 9 <i>SVC_AGENT</i> (<i>optional</i>) Value received from the service, can be empty for most of services. |
| status | <i>number</i> | (<i>optional</i>) Service status: 0 , <i>DOBJECT_STATUS_UP</i> - Service UP 1 , <i>DOBJECT_STATUS_DOWN</i> - Service DOWN |
| auto registration | <i>array</i> | (<i>optional</i>) Array of autoregistration data objects. |

| name | value type | description |
|----------------------|---------------|---|
| clock | <i>number</i> | Autoregistration data timestamp. |
| host | <i>string</i> | Host name. |
| ip | <i>string</i> | (<i>optional</i>) Host IP address. |
| dns | <i>string</i> | (<i>optional</i>) Resolved DNS name from IP address. |
| port | <i>string</i> | (<i>optional</i>) Host port. |
| host_metadata | <i>string</i> | (<i>optional</i>) Host metadata sent by agent (based on HostMetadata or HostMetadataItem agent configuration parameter). |
| tasks | <i>array</i> | (<i>optional</i>) Array of tasks. |
| type | <i>number</i> | Task type: 0 , ZBX_TM_TASK_PROCESS_REMOTE_COMMAND_RESULT - remote command result |
| status | <i>number</i> | Remote-command execution status: 0 , ZBX_TM_REMOTE_COMMAND_COMPLETED - remote command completed successfully 1 , ZBX_TM_REMOTE_COMMAND_FAILED - remote command failed |
| error | <i>string</i> | (<i>optional</i>) Error message. |
| parent_taskid | <i>number</i> | Parent task ID. |
| more | <i>number</i> | (<i>optional</i>) 1 - there are more history data to send. |
| clock | <i>number</i> | (<i>optional</i>) Data transfer timestamp (seconds). |
| ns | <i>number</i> | (<i>optional</i>) Data transfer timestamp (nanoseconds). |
| version | <i>string</i> | Proxy version (<major>.<minor>.<build>). |
| server→proxy: | | |
| response | <i>string</i> | Request success information ('success' or 'failed'). |
| tasks | <i>array</i> | (<i>optional</i>) Array of tasks. |
| type | <i>number</i> | Task type: 1 , ZBX_TM_TASK_PROCESS_REMOTE_COMMAND - remote command |
| clock | <i>number</i> | Task creation time. |
| ttl | <i>number</i> | Time in seconds after which the task expires. |
| commandtype | <i>number</i> | Remote-command type: 0 , ZBX_SCRIPT_TYPE_CUSTOM_SCRIPT - use custom script 1 , ZBX_SCRIPT_TYPE_IPMI - use IPMI 2 , ZBX_SCRIPT_TYPE_SSH - use SSH 3 , ZBX_SCRIPT_TYPE_TELNET - use Telnet 4 , ZBX_SCRIPT_TYPE_GLOBAL_SCRIPT - use global script (currently functionally equivalent to custom script) |
| command | <i>string</i> | Remote command to execute. |
| execute_on | <i>number</i> | Execution target for custom scripts: 0 , ZBX_SCRIPT_EXECUTE_ON_AGENT - execute script on agent 1 , ZBX_SCRIPT_EXECUTE_ON_SERVER - execute script on server 2 , ZBX_SCRIPT_EXECUTE_ON_PROXY - execute script on proxy |
| port | <i>number</i> | (<i>optional</i>) Port for Telnet and SSH commands. |
| authtype | <i>number</i> | (<i>optional</i>) Authentication type for SSH commands. |
| username | <i>string</i> | (<i>optional</i>) User name for Telnet and SSH commands. |
| password | <i>string</i> | (<i>optional</i>) Password for Telnet and SSH commands. |
| publickey | <i>string</i> | (<i>optional</i>) Public key for SSH commands. |
| privatekey | <i>string</i> | (<i>optional</i>) Private key for SSH commands. |
| parent_taskid | <i>number</i> | Parent task ID. |
| hostid | <i>number</i> | Target host ID. |

Active proxy

Configuration request

The proxy config request is sent by active proxy to obtain proxy configuration data. This request is sent every ProxyConfigFrequency (proxy configuration parameter) seconds.

| name | value type | description |
|--------------------------|-------------------------|--|
| proxy→server: | | |
| request | <i>string</i> | 'proxy config' |
| host | <i>string </i> | Proxy name. |
| version | <i>string</i> | Proxy version (<major>.<minor>.<build>). |
| session | <i>string</i> | Proxy configuration session token. |
| config_revision | <i>number</i> | Proxy configuration revision. |
| server→proxy: | | |
| fullsync | <i>number</i> | 1 - if full configuration data is sent, absent otherwise (optional). |
| data | <i>array</i> | Object of table data. Absent if configuration has not been changed (optional). |
| <table> | <i>object</i> | One or more objects with <table> data (optional, depending on changes). |
| fields | <i>array</i> | Array of field names. |
| - | <i>string</i> | Field name. |
| data | <i>array</i> | Array of rows. |
| - | <i>array</i> | Array of columns. |
| - | <i>string,number</i> | Column value with type depending on column type in database schema. |
| macro.secrets | <i>object</i> | Secret macro information, absent if there are no changes in vault macros (optional). |
| config_revision | <i>number</i> | Configuration cache revision - sent with configuration data (optional). |
| del_hostids | <i>array</i> | Array of removed hostids (optional). |
| - | <i>number</i> | Host identifier. |
| del_macro_hostids | <i>array</i> | Array of hostids with all macros removed (optional). |
| - | <i>number</i> | Host identifier. |

Example:

proxy→server:

```

{
  "request": "proxy config",
  "host": "Zabbix proxy",
  "version": "7.2.0",
  "session": "fd59a09ff4e9d1fb447de1f04599bcf6",

Data request

The proxy data request is sent by proxy to provide host interface availability, history, discovery and autoregistration data. This request is sent every DataSenderFrequency (proxy configuration parameter) seconds. Note that active proxy will still poll Zabbix server every second for remote command tasks (with an empty proxy data request).

| name | value type | description |
|---------------------------------|---------------|---|
| proxy→server: | | |
| request | <i>string</i> | 'proxy data' |
| host | <i>string</i> | Proxy name. |
| session | <i>string</i> | Data session token. |
| interface | <i>array</i> | (optional) Array of interface availability data objects. |
| avail- abil- ity | | |
| interfaceid | <i>number</i> | Interface identifier. |
| available | <i>number</i> | Interface availability: 0 , <i>INTERFACE_AVAILABLE_UNKNOWN</i> - unknown 1 , <i>INTERFACE_AVAILABLE_TRUE</i> - available 2 , <i>INTERFACE_AVAILABLE_FALSE</i> - unavailable |
| error | <i>string</i> | Interface error message or empty string. |
| history | <i>array</i> | (optional) Array of history data objects. |
| data | | |
| itemid | <i>number</i> | Item identifier. |
| clock | <i>number</i> | Item value timestamp (seconds). |
| ns | <i>number</i> | Item value timestamp (nanoseconds). |
| value | <i>string</i> | (optional) Item value. |
| id | <i>number</i> | Value identifier (ascending counter, unique within one data session). |
| timestamp | <i>number</i> | (optional) Timestamp of log type items. |
| source | <i>string</i> | (optional) Eventlog item source value. |
| severity | <i>number</i> | (optional) Eventlog item severity value. |
| eventid | <i>number</i> | (optional) Eventlog item eventid value. |
| state | <i>string</i> | (optional) Item state: 0 , <i>ITEM_STATE_NORMAL</i> 1 , <i>ITEM_STATE_NOTSUPPORTED</i> |
| lastlogsize | <i>number</i> | (optional) Last log size of log type items. |
| mtime | <i>number</i> | (optional) Modification time of log type items. |
| discovery | <i>array</i> | (optional) Array of discovery data objects. |
| data | | |
| clock | <i>number</i> | Discovery data timestamp. |
| druleid | <i>number</i> | Discovery rule identifier. |
| dcheckid | <i>number</i> | Discovery check identifier or null for discovery rule data. |

| name | value type | description |
|-------------------------|---------------|---|
| type | <i>number</i> | Discovery check type: -1 discovery rule data 0 , <i>SVC_SSH</i> - SSH service check 1 , <i>SVC_LDAP</i> - LDAP service check 2 , <i>SVC_SMTP</i> - SMTP service check 3 , <i>SVC_FTP</i> - FTP service check 4 , <i>SVC_HTTP</i> - HTTP service check 5 , <i>SVC_POP</i> - POP service check 6 , <i>SVC_NNTP</i> - NNTP service check 7 , <i>SVC_IMAP</i> - IMAP service check 8 , <i>SVC_TCP</i> - TCP port availability check 9 , <i>SVC_AGENT</i> - Zabbix agent 10 , <i>SVC_SNMPv1</i> - SNMPv1 agent 11 , <i>SVC_SNMPv2</i> - SNMPv2 agent 12 , <i>SVC_ICMPPING</i> - ICMP ping 13 , <i>SVC_SNMPv3</i> - SNMPv3 agent 14 , <i>SVC_HTTPS</i> - HTTPS service check 15 , <i>SVC_TELNET</i> - Telnet availability check |
| ip | <i>string</i> | Host IP address. |
| dns | <i>string</i> | Host DNS name. |
| port | <i>number</i> | (<i>optional</i>) Service port number. |
| key_ | <i>string</i> | (<i>optional</i>) Item key for discovery check of type 9 <i>SVC_AGENT</i> |
| value | <i>string</i> | (<i>optional</i>) Value received from the service, can be empty for most services. |
| status | <i>number</i> | (<i>optional</i>) Service status: 0 , <i>DOBJECT_STATUS_UP</i> - Service UP 1 , <i>DOBJECT_STATUS_DOWN</i> - Service DOWN (<i>optional</i>) Array of autoregistration data objects. |
| autoregistration | <i>array</i> | |
| clock | <i>number</i> | Autoregistration data timestamp. |
| host | <i>string</i> | Host name. |
| ip | <i>string</i> | (<i>optional</i>) Host IP address. |
| dns | <i>string</i> | (<i>optional</i>) Resolved DNS name from IP address. |
| port | <i>string</i> | (<i>optional</i>) Host port. |
| host_metadata | <i>string</i> | (<i>optional</i>) Host metadata sent by agent (based on HostMetadata or HostMetadataItem agent configuration parameter). |
| tasks | <i>array</i> | (<i>optional</i>) Array of tasks. |
| type | <i>number</i> | Task type: 0 , <i>ZBX_TM_TASK_PROCESS_REMOTE_COMMAND_RESULT</i> - remote command result |
| status | <i>number</i> | Remote-command execution status: 0 , <i>ZBX_TM_REMOTE_COMMAND_COMPLETED</i> - remote command completed successfully 1 , <i>ZBX_TM_REMOTE_COMMAND_FAILED</i> - remote command failed (<i>optional</i>) Error message. |
| error | <i>string</i> | |
| parent_taskid | <i>number</i> | Parent task ID. |
| more | <i>number</i> | (<i>optional</i>) 1 - there are more history data to send |
| clock | <i>number</i> | (<i>optional</i>) Data transfer timestamp (seconds). |
| ns | <i>number</i> | (<i>optional</i>) Data transfer timestamp (nanoseconds). |
| version | <i>string</i> | Proxy version (<major>.<minor>.<build>). |
| server→proxy: | | |
| response | <i>string</i> | Request success information ('success' or 'failed'). |
| upload | <i>string</i> | Upload control for historical data (history, autoregistration, host availability, network discovery). Possible values: enabled - normal operation disabled - server is not accepting data (possibly due to internal cache over limit) |

| name | value type | description |
|----------------------|---------------|---|
| tasks | <i>array</i> | (optional) Array of tasks. |
| type | <i>number</i> | Task type: 1 , ZBX_TM_TASK_PROCESS_REMOTE_COMMAND - remote command Task creation time. Time in seconds after which the task expires. Remote-command type: 0 , ZBX_SCRIPT_TYPE_CUSTOM_SCRIPT - use custom script 1 , ZBX_SCRIPT_TYPE_IPMI - use IPMI 2 , ZBX_SCRIPT_TYPE_SSH - use SSH 3 , ZBX_SCRIPT_TYPE_TELNET - use Telnet 4 , ZBX_SCRIPT_TYPE_GLOBAL_SCRIPT - use global script (currently functionally equivalent to custom script) |
| clock | <i>number</i> | |
| ttr | <i>number</i> | |
| commandtype | <i>number</i> | |
| command | <i>string</i> | Remote command to execute. |
| execute_on | <i>number</i> | Execution target for custom scripts: 0 , ZBX_SCRIPT_EXECUTE_ON_AGENT - execute script on agent 1 , ZBX_SCRIPT_EXECUTE_ON_SERVER - execute script on server 2 , ZBX_SCRIPT_EXECUTE_ON_PROXY - execute script on proxy (optional) Port for Telnet and SSH commands. |
| port | <i>number</i> | |
| authtype | <i>number</i> | (optional) Authentication type for SSH commands. |
| username | <i>string</i> | (optional) User name for Telnet and SSH commands. |
| password | <i>string</i> | (optional) Password for Telnet and SSH commands. |
| publickey | <i>string</i> | (optional) Public key for SSH commands. |
| privatekey | <i>string</i> | (optional) Private key for SSH commands. |
| parent_taskid | <i>number</i> | Parent task ID. |
| hostid | <i>number</i> | Target host ID. |

Example:

2 Zabbix agent/agent2 protocol

Please refer to [Passive and active agent checks](#) page for more information on Zabbix agent and Zabbix agent 2 protocols.

4 Zabbix agent 2 plugin protocol

Zabbix agent 2 protocol is based on code, size and data model.

Code

| Type | Size | Comments |
|------|------|---|
| Byte | 4 | Payload type, currently only JSON is supported. |

Size

| Type | Size | Comments |
|------|------|---------------------------------------|
| Byte | 4 | Size of the current payload in bytes. |

Payload data

| Type | Size | Comments |
|------|----------------------------------|----------------------|
| Byte | Defined by the <i>Size</i> field | JSON formatted data. |

Payload data definition

Common data

These parameters are present in all requests/responses:

| Name | Type | Comments |
|------|--------|---|
| id | uint32 | For requests - the incrementing identifier used to link requests with responses. Unique within a request direction (i.e. from agent to plugin or from plugin to agent). |
| type | uint32 | For responses - ID of the corresponding request. The request type. |

Log request

A request sent by a plugin to write a log message into the agent log file.

| | |
|-----------|----------------|
| direction | plugin → agent |
| response | no |

Parameters specific to log requests:

| Name | Type | Comments |
|----------|--------|-----------------------------------|
| severity | uint32 | The message severity (log level). |
| message | string | The message to log. |

Example:

```
{"id":0,"type":1,"severity":3,"message":"message"}
```

Register request

A request sent by the agent during the agent startup phase to obtain provided metrics to register a plugin.

| | |
|-----------|----------------|
| direction | agent → plugin |
| response | yes |

Parameters specific to register requests:

| Name | Type | Comments |
|---------|--------|--------------------------------------|
| version | string | The protocol version <major>.<minor> |

Example:

```
{"id":1,"type":2,"version":"1.0"}
```

Register response

Plugin's response to the register request.

| | |
|-----------|----------------|
| direction | plugin → agent |
| response | n/a |

Parameters specific to register responses:

| Name | Type | Comments |
|------------|-----------------------------|--|
| name | string | The plugin name. |
| metrics | array of strings (optional) | The metrics with descriptions as used in the plugin. Returns RegisterMetrics(). Absent if error is returned. |
| interfaces | uint32 (optional) | The bit mask of plugin's supported interfaces. Absent if error is returned. |
| error | string (optional) | An error message returned if a plugin cannot be started. Absent, if metrics are returned. |

Examples:

```
{"id":2,"type":3,"metrics":["external.test", "External exporter Test."], "interfaces": 4}
```

or

```
{"id":2,"type":3,"error":"error message"}
```

Start request

A request to execute the Start function of the Runner interface.

| | |
|-----------|----------------|
| direction | agent → plugin |
| response | no |

The request doesn't have specific parameters, it only contains **common data** parameters.

Example:

```
{"id":3,"type":4}
```

Terminate request

A request sent by the agent to shutdown a plugin.

| | |
|-----------|----------------|
| direction | agent → plugin |
| response | no |

The request doesn't have specific parameters, it only contains **common data** parameters.

Example:

```
{"id":3,"type":5}
```

Export request

A request to execute the Export function of the Exporter interface.

| | |
|-----------|----------------|
| direction | agent → plugin |
| response | no |

Parameters specific to export requests:

| Name | Type | Comments |
|------------|-----------------------------|-------------------------------------|
| key | string | The plugin key. |
| parameters | array of strings (optional) | The parameters for Export function. |

Example:

```
{"id":4,"type":6,"key":"test.key","parameters":["foo","bar"]}
```

Export response

Response from the Export function of the Exporter interface.

| | |
|-----------|----------------|
| direction | plugin → agent |
| response | n/a |

Parameters specific to export responses:

| Name | Type | Comments |
|-------|-------------------|--|
| value | string (optional) | Response value from the Export function. Absent, if error is returned. |
| error | string (optional) | Error message if the Export function has not been executed successfully. Absent, if value is returned. |

Examples:

```
{"id":5,"type":7,"value":"response"}
```

or

```
{"id":5,"type":7,"error":"error message"}
```

Configure request

A request to execute the *Configure* function of the *Configurator* interface.

| | |
|-----------|----------------|
| direction | agent → plugin |
| response | n/a |

Parameters specific to *Configure* requests:

| Name | Type | Comments |
|-----------------|------------------------|--|
| global_options | JSON object | JSON object containing global agent configuration options. |
| private_options | JSON object (optional) | JSON object containing private plugin configuration options, if provided. |

Example:

```
{"id":6,"type":8,"global_options":{"..."},"private_options":{"..."}}
```

Validate request

A request to execute *Validate* function of the *Configurator* interface.

| | |
|-----------|----------------|
| direction | agent → plugin |
| response | yes |

Parameters specific to *Validate* requests:

| Name | Type | Comments |
|-----------------|------------------------|---|
| private_options | JSON object (optional) | JSON object containing private plugin configuration options, if provided. |

Example:

```
{"id":7,"type":9,"private_options":{"..."}}
```

Validate response

Response from *Validate* function of *Configurator* interface.

| | |
|-----------|----------------|
| direction | plugin → agent |
| response | n/a |

Parameters specific to *Validate* responses:

| Name | Type | Comments |
|-------|-------------------|---|
| error | string (optional) | An error message returned if the <i>Validate</i> function is not executed successfully. Absent if executed successfully. |

Example:

```
{"id":8,"type":10}
```

or

```
{"id":8,"type":10,"error":"error message"}
```

5 Zabbix sender protocol

Overview

Zabbix server and Zabbix proxy use a JSON-based communication protocol for receiving data from Zabbix sender. Data can be received with the help of a **trapper item**, or an **HTTP agent item** with trapping enabled.

Request and response messages must begin with **header and data length**.

Zabbix sender request

```
{
  "request": "sender data",
  "data": [
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value"
    }
  ]
}
```

Zabbix server response

```
{
  "response": "success",
  "info": "processed: 1; failed: 0; total: 1; seconds spent: 0.060753"
}
```

Zabbix sender request with a timestamp

Alternatively, Zabbix sender can send a request with a timestamp and nanoseconds.

```
{
  "request": "sender data",
  "data": [
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value",
      "clock": 1516710794,
      "ns": 592397170
    },
    {
      "host": "<hostname>",
      "key": "trap",
      "value": "test value",
      "clock": 1516710795,
      "ns": 192399456
    }
  ],
  "clock": 1516712029,
  "ns": 873386094
}
```

Zabbix server response

```
{
  "response": "success",
  "info": "processed: 2; failed: 0; total: 2; seconds spent: 0.060904"
}
```

6 Header

Overview

The header is present in all request and response messages between Zabbix components. It is required to determine the message length, if it is compressed or not, if it is a large packet or not.

Zabbix communications protocol has 1GB packet size limit per connection. The limit of 1GB is applied to both the received packet data length and the uncompressed data length.

When sending configuration to Zabbix proxy, the packet size limit is increased to 4GB to allow syncing large configurations. When data length before compression exceeds 4GB, Zabbix server automatically starts using the large packet format (0x04 flag) which increases the packet size limit to 16GB.

Note that while a large packet format can be used for sending any data, currently only the Zabbix proxy configuration syncer can handle packets that are larger than 1GB.

Structure

The header consists of four fields. All numbers in the header are formatted as little-endian.

| Field | Size | Size (large packet) | Description |
|------------|------|---------------------------|---|
| <PROTOCOL> | 4 | 4 | "ZBXD" or 5A 42 58 44 |
| <FLAGS> | 1 | 1 | Protocol flags: 0x01 - Zabbix communications protocol 0x02 - compression 0x04 - large packet |

| Field | Size | Size (large packet) | Description |
|------------|------|---------------------------|--|
| <DATALEN> | 4 | 8 | Data length. |
| <RESERVED> | 4 | 8 | When compression is used (0x02 flag) - the length of uncompressed data When compression is not used - 00 00 00 00 |

Examples

Here are some code snippets showing how to add Zabbix protocol header to the data you want to send in order to obtain the packet you should send to Zabbix so that it is interpreted correctly. These code snippets assume that the data is not larger than 1GB, thus the large packet format is not used.

Python

```
packet = b"ZBXD\1" + struct.pack("<II", len(data), 0) + data
```

or

```
def zbx_create_header(plain_data_size, compressed_data_size=None):
    protocol = b"ZBXD"
    flags = 0x01
    if compressed_data_size is None:
        datalen = plain_data_size
        reserved = 0
    else:
        flags |= 0x02
        datalen = compressed_data_size
        reserved = plain_data_size
    return protocol + struct.pack("<BII", flags, datalen, reserved)
```

```
packet = zbx_create_header(len(data)) + data
```

Perl

```
my $packet = "ZBXD\1" . pack("(II)<", length($data), 0) . $data;
```

or

```
sub zbx_create_header($;$)
{
    my $plain_data_size = shift;
    my $compressed_data_size = shift;

    my $protocol = "ZBXD";
    my $flags = 0x01;
    my $datalen;
    my $reserved;

    if (!defined($compressed_data_size))
    {
        $datalen = $plain_data_size;
        $reserved = 0;
    }
    else
    {
        $flags |= 0x02;
        $datalen = $compressed_data_size;
        $reserved = $plain_data_size;
    }

    return $protocol . chr($flags) . pack("(II)<", $datalen, $reserved);
}

my $packet = zbx_create_header(length($data)) . $data;
```

PHP

```
$packet = "ZBXD\1" . pack("VV", strlen($data), 0) . $data;
```

or

```
function zbx_create_header($plain_data_size, $compressed_data_size = null)
{
    $protocol = "ZBXD";
    $flags = 0x01;
    if (is_null($compressed_data_size))
    {
        $datalen = $plain_data_size;
        $reserved = 0;
    }
    else
    {
        $flags |= 0x02;
        $datalen = $compressed_data_size;
        $reserved = $plain_data_size;
    }
    return $protocol . chr($flags) . pack("VV", $datalen, $reserved);
}

$packet = zbx_create_header(strlen($data)) . $data;
```

Bash

```
datalen=$(printf "%08x" ${#data})
datalen="\x${datalen:6:2}\\x${datalen:4:2}\\x${datalen:2:2}\\x${datalen:0:2}"
printf "ZBXD\1${datalen}\0\0\0\0%s" "$data"
```

7 Newline-delimited JSON export protocol

This section presents details of the export protocol in a newline-delimited JSON format, used in:

- **data export to files**
- **streaming to external systems**

The following can be exported:

- **trigger events**
- **item values**
- **trends** (export to files only)

All files have a .ndjson extension. Each line of the export file is a JSON object.

Trigger events

The following information is exported for a problem event:

| Field | Type | Description |
|-----------------|--------|---|
| <i>clock</i> | number | Number of seconds since Epoch to the moment when problem was detected (integer part). |
| <i>ns</i> | number | Number of nanoseconds to be added to <i>clock</i> to get a precise problem detection time. |
| <i>value</i> | number | 1 (always). |
| <i>eventid</i> | number | Problem event ID. |
| <i>name</i> | string | Problem event name. |
| <i>severity</i> | number | Problem event severity (0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster). |
| <i>hosts</i> | array | List of hosts involved in the trigger expression; there should be at least one element in array. |
| - | object | |
| <i>host</i> | string | Host name. |

| Field | Type | Description |
|---------------|--------|---|
| <i>name</i> | string | Visible host name. |
| <i>groups</i> | array | List of host groups of all hosts involved in the trigger expression; there should be at least one element in array. |
| - | string | Host group name. |
| <i>tags</i> | array | List of problem tags (can be empty). |
| - | object | |
| <i>tag</i> | string | Tag name. |
| <i>value</i> | string | Tag value (can be empty). |

The following information is exported for a recovery event:

| Field | Type | Description |
|------------------|--------|---|
| <i>clock</i> | number | Number of seconds since Epoch to the moment when problem was resolved (integer part). |
| <i>ns</i> | number | Number of nanoseconds to be added to <i>clock</i> to get a precise problem resolution time. |
| <i>value</i> | number | 0 (always). |
| <i>eventid</i> | number | Recovery event ID. |
| <i>p_eventid</i> | number | Problem event ID. |

Examples

Problem:

```
{"clock":1519304285,"ns":123456789,"value":1,"name":"Either Zabbix agent is unreachable on Host B or polle
```

Recovery:

```
{"clock":1519304345,"ns":987654321,"value":0,"eventid":43,"p_eventid":42}
```

Problem (multiple problem event generation):

```
{"clock":1519304286,"ns":123456789,"value":1,"eventid":43,"name":"Either Zabbix agent is unreachable on Ho
```

```
{"clock":1519304286,"ns":123456789,"value":1,"eventid":43,"name":"Either Zabbix agent is unreachable on Ho
```

Recovery:

```
{"clock":1519304346,"ns":987654321,"value":0,"eventid":44,"p_eventid":43}
```

```
{"clock":1519304346,"ns":987654321,"value":0,"eventid":44,"p_eventid":42}
```

Item values

The following information is exported for a collected item value:

| Field | Type | Description |
|------------------|--------|---|
| <i>host</i> | object | Host name of the item host. |
| <i>host</i> | string | Host name. |
| <i>name</i> | string | Visible host name. |
| <i>groups</i> | array | List of host groups of the item host; there should be at least one element in array. |
| - | string | Host group name. |
| <i>item_tags</i> | array | List of item tags (can be empty). |
| - | object | |
| <i>tag</i> | string | Tag name. |
| <i>value</i> | string | Tag value (can be empty). |
| <i>itemid</i> | number | Item ID. |
| <i>name</i> | string | Visible item name. |
| <i>clock</i> | number | Number of seconds since Epoch to the moment when value was collected (integer part). |
| <i>ns</i> | number | Number of nanoseconds to be added to <i>clock</i> to get a precise value collection time. |

| Field | Type | Description |
|--------------------------------|---|--|
| <i>timestamp</i> (Log only) | number | 0 if not available. |
| <i>source</i> (Log only) | string | Empty string if not available. |
| <i>severity</i> (Log only) | number | 0 if not available. |
| <i>eventid</i> (Log only) | number | 0 if not available. |
| <i>value</i> | number (for numeric items) or string (for text items) | Collected item value. |
| <i>type</i> | number | Collected value type: 0 - numeric float, 1 - character, 2 - log, 3 - numeric unsigned, 4 - text, 5 - binary |

Examples

Numeric (unsigned) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[]}]}
```

Numeric (float) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[]}]}
```

Character, text value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[]}]}
```

Log value:

```
{"host":{"host":"Host A","name":"Host A visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"host":{"host":"Host A","name":"Host A visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[]}]}
```

Trends

The following information is exported for a calculated trend value:

| Field | Type | Description |
|------------------|--------|--|
| <i>host</i> | object | Host name of the item host. |
| <i>host</i> | string | Host name. |
| <i>name</i> | string | Visible host name. |
| <i>groups</i> | array | List of host groups of the item host; there should be at least one element in array. |
| - | string | Host group name. |
| <i>item_tags</i> | array | List of item tags (can be empty). |
| - | object | |
| <i>tag</i> | string | Tag name. |
| <i>value</i> | string | Tag value (can be empty). |
| <i>itemid</i> | number | Item ID. |
| <i>name</i> | string | Visible item name. |
| <i>clock</i> | number | Number of seconds since Epoch to the moment when value was collected (integer part). |
| <i>count</i> | number | Number of values collected for a given hour. |
| <i>min</i> | number | Minimum item value for a given hour. |
| <i>avg</i> | number | Average item value for a given hour. |
| <i>max</i> | number | Maximum item value for a given hour. |
| <i>type</i> | number | Value type: 0 - numeric float, 3 - numeric unsigned |

Examples

Numeric (unsigned) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[]}}
```

Numeric (float) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[]}}
```

4 Items

Please use the sidebar to access content in this section.

1 vm.memory.size parameters

Overview

This section provides some parameter details for the `vm.memory.size[<mode>]` agent item.

Parameters

The following parameters are available for this item:

- **active** - memory currently in use or very recently used, and so it is in RAM
- **anon** - memory not associated with a file (cannot be re-read from it)
- **available** - available memory, calculated differently depending on the platform (see the table below)
- **buffers** - cache for things like file system metadata
- **cached** - cache for various things
- **exec** - executable code, typically from a (program) file
- **file** - cache for contents of recently accessed files
- **free** - memory that is readily available to any entity requesting memory
- **inactive** - memory that is marked as not used
- **pavailable** - 'available' memory as percentage of 'total' (calculated as `available/total*100`)
- **pinned** - same as 'wired'
- **pused** - 'used' memory as percentage of 'total' (calculated as `used/total*100`)
- **shared** - memory that may be simultaneously accessed by multiple processes
- **slab** - total amount of memory used by the kernel to cache data structures for its own use
- **total** - total physical memory available
- **used** - used memory, calculated differently depending on the platform (see the table below)
- **wired** - memory that is marked to always stay in RAM. It is never moved to disk.

Warning:
Some of these parameters are platform-specific and might not be available on your platform. See [Zabbix agent items](#) for details.

Platform-specific calculation of **available** and **used**:

| Platform | "available" | "used" |
|-------------------------------------|---|-------------------------|
| AIX | free + cached | real memory in use |
| FreeBSD | inactive + cached + free | active + wired + cached |
| HP UX | free | total - free |
| Linux<3.14 | free + buffers + cached | total - free |
| Linux 3.14+ | /proc/meminfo, see "MemAvailable" in Linux kernel | total - free |
| (also backported to 3.10 on RHEL 7) | documentation for details. Note that free + buffers + cached is no longer equal to 'available' due to not all the page cache can be freed and low watermark being used in calculation. | |
| NetBSD | inactive + execpages + file + free | total - free |
| OpenBSD | inactive + free + cached | active + wired |
| OSX | inactive + free | active + wired |
| Solaris | free | total - free |
| Win32 | free | total - free |

Attention:

The sum of `vm.memory.size[used]` and `vm.memory.size[available]` does not necessarily equal total. For instance, on FreeBSD:

- * Active, inactive, wired, cached memories are considered used, because they store some useful information.
- * At the same time inactive, cached, free memories are considered available, because these kinds of memories can be given instantly to processes that request more memory.

So inactive memory is both used and available simultaneously. Because of this, the `vm.memory.size[used]` item is designed for informational purposes only, while `vm.memory.size[available]` is designed to be used in triggers.

1. [Additional details about memory calculation in different OS](#)

2 Passive and active agent checks

Overview

This section provides details on passive and active checks performed by **Zabbix agent** and **Zabbix agent 2**.

Zabbix uses a JSON-based communication protocol for communicating with the agents.

Zabbix agent and Zabbix agent 2 protocols have been unified since Zabbix 7.0. The difference between Zabbix agent and Zabbix agent 2 requests/responses is expressed by the "variant" tag value.

Passive checks

A passive check is a simple data request. Zabbix server or proxy asks for some data (for example, CPU load) and Zabbix agent sends back the result to the server.

Passive checks are executed asynchronously - it is not required to receive the response to one request before other checks are started. DNS resolving is asynchronous as well.

The agent poller will attempt to connect to all addresses returned by the DNS lookup. This ensures that if one IP address is unreachable, the poller will try the next available address, increasing the likelihood of a successful connection. This enhancement applies to both Zabbix server and proxy.

The maximum concurrency of asynchronous checks is 1000 (defined by **MaxConcurrentChecksPerPoller**).

The number of asynchronous agent pollers is defined by the **StartAgentPollers** parameter.

Server request

For definition of header and data length please refer to [protocol details](#).

```
{
  "request": "passive checks",
  "data": [
    {
      "key": "agent.version",
      "timeout": 3
    }
  ]
}
```

| Field | Type | Mandatory | Value |
|---------|-----------------|-----------|--------------------------------|
| request | string | yes | "passive checks" |
| data | array of object | yes | Passive check item. |
| | key | yes | Item key with expanded macros. |
| | timeout | yes | Item timeout. |

Agent response

```
{
  "version": "7.2.0",
  "variant": 2,
  "data": [
```

```

{
  "value": "7.2.0"
}
]
}

```

| Field | Type | Mandatory | Value |
|---------|-----------------|-----------|---|
| version | string | yes | The agent version number. |
| variant | number | yes | The agent variant (1 - Zabbix agent, 2 - Zabbix agent 2). |
| data | array of object | yes | Contains the result of the check. |
| value | string | no | The item value if the check was successful. |
| error | string | no | The error message if the check was not successful. |

For example, for supported items:

1. Server opens a TCP connection
2. Server sends **<HEADER><DATALEN>{"request":"passive checks","data":[{"key":"agent.ping","timeout":3}]}**
3. Agent reads the request and responds with **<HEADER><DATALEN>{"version":"7.2.0","variant":2,"data":[{"value":1}]}**
4. Server processes data to get the value, '1' in our case
5. TCP connection is closed

For not supported items:

1. Server opens a TCP connection
2. Server sends **<HEADER><DATALEN>{"request":"passive checks","data":[{"key":"vfs.fs.size[/nono],"timeout":3}]}**
3. Agent reads the request and responds with **<HEADER><DATALEN>{"version":"7.2.0","variant":2,"data":[{"error":"Unsupported item key."}]}**
4. Server processes data, changes item state to not supported with the specified error message
5. TCP connection is closed

Failover to old protocol

To make sure that Zabbix server or proxy can work with agents from pre-7.2 versions, which have plaintext protocol, a failover to the old protocol is implemented.

Passive checks are performed using the JSON protocol (7.0 and later) after restart or when the interface configuration is changed. If no valid JSON is received in response (agent sent "ZBX_NOTSUPPORTED"), Zabbix will cache the interface as old protocol and **retry** the check by sending only the item key.

Note that every hour Zabbix server/proxy will again try working with the new protocol with all interfaces, falling back to the old protocol if required.

Active checks

Active checks require more complex processing. The agent must first retrieve from the server/proxy a list of items and/or **remote commands** for independent processing.

The servers/proxies to get the active checks from are listed in the 'ServerActive' parameter of the agent **configuration file**. The frequency of asking for these checks is set by the 'RefreshActiveChecks' parameter in the same configuration file. However, if refreshing active checks fails, it is retried after hardcoded 60 seconds.

Note:

Since Zabbix 6.4 the agent (in active mode) no longer receives from the server/proxy a full copy of the configuration once every two minutes (default). Instead, in order to decrease network traffic and resources usage, an incremental configuration sync is performed every 5 seconds (default) upon which the server/proxy provides a full copy of the configuration **only** if the agent has not yet received it, or something has changed in host configuration, global macros or global regular expressions.

The agent then periodically sends the new values to the server(s). If the agent received any **remote commands** to execute, the execution result will also be sent. Note that remote command execution on an active agent is supported since Zabbix agent 7.0.

Note:

If an agent is behind the firewall you might consider using only Active checks because in this case you wouldn't need to modify the firewall to allow initial incoming connections.

Getting the list of items

Agent request

The active checks request is used to obtain the active checks to be processed by agent. This request is sent by the agent upon start and then with **RefreshActiveChecks** intervals.

```
{
  "request": "active checks",
  "host": "Zabbix server",
  "host_metadata": "mysql,nginx",
  "interface": "zabbix.server.lan",
  "ip": "159.168.1.1",
  "port": 12050,
  "version": "7.2.0",
  "variant": 2,
  "config_revision": 1,
  "session": "e3dcbd9ace2c9694e1d7bbd030eeef6e"
}
```

| Field | Type | Mandatory | Value |
|-----------------|--------|-----------|---|
| request | string | yes | active checks |
| host | string | yes | Host name. |
| host_metadata | string | no | The configuration parameter HostMetadata or HostMetadataItem metric value. |
| interface | string | no | The configuration parameter HostInterface or HostInterfaceItem metric value. |
| ip | string | no | The configuration parameter ListenIP first IP if set. |
| port | number | no | The configuration parameter ListenPort value if set and not default agent listening port. |
| version | string | yes | The agent version number. |
| variant | number | yes | The agent variant (1 - Zabbix agent, 2 - Zabbix agent 2). |
| config_revision | number | no | Configuration identifier for incremental configuration sync . |
| session | string | no | Session identifier for incremental configuration sync . |

Server response

The active checks response is sent by the server back to agent after processing the active checks request.

```
{
  "response": "success",
  "config_revision": 2,
  "data": [
    {
      "key": "system.uptime",
      "itemid": 1234,
      "delay": "10s",
      "lastlogsize": 0,
      "mtime": 0
    },
    {
      "key": "agent.version",
      "itemid": 5678,
      "delay": "10m",
      "lastlogsize": 0,
      "mtime": 0,
      "timeout": "30s"
    }
  ],
  "commands": [
    {
```

```

    "command": "df -h --output=source,size / | awk 'NR>1 {print $2}''",
    "id": 1324,
    "wait": 1
  }
]
}

```

| Field | Type | Mandatory | Value |
|---------------------|-------------------------|-----------|--|
| response | <i>string</i> | yes | success failed |
| info | <i>string</i> | no | Error information in case of failure. |
| data | <i>array of objects</i> | no | Active check items. Omitted if host configuration is unchanged. |
| key | <i>string</i> | no | Item key with expanded macros. |
| itemid | <i>number</i> | no | Item identifier. |
| delay | <i>string</i> | no | Item update interval. Flexible/scheduling intervals are supported by both Zabbix agent and Zabbix agent 2 since Zabbix 7.0. |
| lastlogsize | <i>number</i> | no | Item lastlogsize. |
| mtime | <i>number</i> | no | Item mtime. |
| timeout | <i>string</i> | no | Item timeout. |
| refresh_unsupported | <i>number</i> | no | Unsupported item refresh interval. |
| regexp | <i>array of objects</i> | no | Global regular expressions. |
| name | <i>string</i> | no | Global regular expression name. |
| expression | <i>string</i> | no | Global regular expression. |
| expression_type | <i>number</i> | no | Global regular expression type. |
| exp_delimiter | <i>string</i> | no | Global regular expression delimiter. |
| case_sensitive | <i>number</i> | no | Global regular expression case sensitivity setting. |
| commands | <i>array of objects</i> | no | Remote commands to execute. Included if remote command execution has been triggered by an action operation or manual script execution. Note that remote command execution on an active agent is supported since Zabbix agent 7.0. Older active agents will ignore any remote commands included in the active checks server response. |
| command | <i>string</i> | no | Remote command. |
| id | <i>number</i> | no | Remote command identifier. |
| wait | <i>number</i> | no | Remote command mode of execution ("0" (nowait) for commands from action operations ; "1" (wait) for commands from manual script execution). |
| config_revision | <i>number</i> | no | Configuration identifier for incremental configuration sync . Omitted if host configuration is unchanged. Incremented if host configuration is changed. |

The server must respond with success.

For example:

1. Agent opens a TCP connection
2. Agent asks for the list of checks
3. Server responds with a list of items and remote commands to execute
4. Agent parses the response
5. TCP connection is closed
6. Agent starts periodical collection of data and executes remote commands (supported since Zabbix agent 7.0)

Attention:

Note that (sensitive) configuration data may become available to parties having access to the Zabbix server trapper port when using an active check. This is possible because anyone may pretend to be an active agent and request item configuration data; authentication does not take place unless you use **encryption** options.

Sending in collected data

Agent sends

The agent data request contains the gathered item values and the values for executed remote commands (if any).

```

{
  "request": "agent data",
  "data": [
    {
      "id": 1,
      "itemid": 5678,
      "value": "7.0.0",
      "clock": 1712830783,
      "ns": 76808644
    },
    {
      "id": 2,
      "itemid": 1234,
      "value": "69672",
      "clock": 1712830783,
      "ns": 77053975
    }
  ],
  "commands": [
    {
      "id": 1324,
      "value": "16G"
    }
  ],
  "session": "1234456akdsjhfoui",
  "host": "Zabbix server",
  "version": "7.2.0",
  "variant": 2
}

```

| Field | Type | Mandatory | Description |
|-------------|------------------|-----------|---|
| request | string | yes | agent data |
| data | array of objects | yes | Item values. |
| id | number | yes | The value identifier (incremental counter used for checking duplicated values in the case of network problems). |
| itemid | string | yes | The item identifier. |
| value | string | no | The item value. |
| lastlogsize | number | no | The item lastlogsize. |
| mtime | number | no | The item mtime. |
| state | number | no | The item state. |
| source | string | no | The value event log source. |
| eventid | number | no | The value event log eventid. |
| severity | number | no | The value event log severity. |
| timestamp | number | no | The value event log timestamp. |
| clock | number | yes | The value timestamp (seconds since Epoch). |
| ns | number | yes | The value timestamp nanoseconds. |
| commands | array of objects | no | Remote commands execution result. Note that remote command execution on an active agent is supported since Zabbix agent 7.0. Older active agents will ignore any remote commands included in the active checks server response. |
| id | number | no | Remote command identifier. |
| value | string | no | Remote command execution result if the execution was successful. |
| error | string | no | Remote command execution error message if the execution failed. |
| session | string | yes | Unique session identifier generated each time when agent is started. |
| host | string | yes | Host name. |
| version | string | yes | The agent version number. |
| variant | number | yes | The agent variant (1 - Zabbix agent, 2 - Zabbix agent 2). |

A virtual ID is assigned to each value. Value ID is a simple ascending counter, unique within one data session (identified by the session token). This ID is used to discard duplicate values that might be sent in poor connectivity environments.

Server response

The agent data response is sent by the server back to the agent after processing the agent data request.

```
{
  "response": "success",
  "info": "processed: 2; failed: 0; total: 2; seconds spent: 0.003534"
}
```

| Field | Type | Mandatory | Value |
|----------|--------|-----------|--------------------------|
| response | string | yes | success failed |
| info | string | yes | Item processing results. |

Attention:

If sending of some values fails on the server (for example, because host or item has been disabled or deleted), agent will not retry sending of those values.

For example:

1. Agent opens a TCP connection
2. Agent sends a list of values
3. Server processes the data and sends the status back
4. TCP connection is closed

Note how in the example above the not supported status for `vfs.fs.size[/nono]` is indicated by the "state" value of 1 and the error message in "value" property.

Attention:

Error message will be trimmed to 2048 symbols on server side.

Heartbeat message

Agent sends

The heartbeat message is sent by an active agent to Zabbix server/proxy every `HeartbeatFrequency` seconds (configured in the [Zabbix agent/ agent 2](#) configuration file).

It is used to monitor the availability of active checks.

```
{
  "request": "active check heartbeat",
  "host": "Zabbix server",
  "heartbeat_freq": 60,
  "version": "7.2.0",
  "variant": 2
}
```

| Field | Type | Mandatory | Value |
|----------------|--------|-----------|---|
| request | string | yes | active check heartbeat |
| host | string | yes | The host name. |
| heartbeat_freq | number | yes | The agent heartbeat frequency (<code>HeartbeatFrequency</code> configuration parameter). |
| version | string | yes | The agent version number. |
| variant | number | yes | The agent variant (1 - Zabbix agent, 2 - Zabbix agent 2). |

Redirect response

When a host has been reassigned, the server may instruct the agent to redirect its heartbeat (and subsequent active checks) to another proxy or server instance.

```
{
  "response": "failed",
  "redirect": {
    "revision": 2,
    "address": "192.0.2.0:10055"
  }
}
```

```
}
}
```

| Field | Type | Mandatory | Value |
|----------|---------------|-----------|------------------------------------|
| response | <i>string</i> | yes | success failed |
| redirect | <i>object</i> | yes | Redirect instructions. |
| revision | <i>number</i> | yes | Configuration revision identifier. |
| address | <i>string</i> | yes | Target server/proxy address. |

Older XML protocol

Note:

Zabbix will take up to 16 MB of XML Base64-encoded data, but a single decoded value should be no longer than 64 KB otherwise it will be truncated to 64 KB while decoding.

3 Minimum permission level for Windows agent items

Overview

When monitoring systems using an agent, a good practice is to obtain metrics from the host on which the agent is installed. To use the principle of least privilege, it is necessary to determine what metrics are obtained from the agent.

The table in this document allows you to select the minimum rights for guaranteed correct operation of Zabbix agent.

If a different user is selected for the agent to work, rather than 'LocalSystem', then for the operation of agent as a Windows service, the new user must have the rights "Log on as a service" from "Local Policy→User Rights Assignment" and the right to create, write and delete the Zabbix agent log file. An Active Directory user must be added to the *Performance Monitor Users* group.

Note:

When working with the rights of an agent based on the "minimum technically acceptable" group, prior provision of rights to objects for monitoring is required.

Common agent items supported on Windows

| Item key | User group | |
|----------------------|---------------------------|---|
| | Recommended | Minimum technically acceptable (functionality is limited) |
| agent.hostname | Guests | Guests |
| agent.ping | Guests | Guests |
| agent.variant | Guests | Guests |
| agent.version | Guests | Guests |
| log | Administrators | Guests |
| log.count | Administrators | Guests |
| logrt | Administrators | Guests |
| logrt.count | Administrators | Guests |
| net.dns | Guests | Guests |
| net.dns.perf | Guests | Guests |
| net.dns.record | Guests | Guests |
| net.if.discovery | Guests | Guests |
| net.if.in | Guests | Guests |
| net.if.out | Guests | Guests |
| net.if.total | Guests | Guests |
| net.tcp.listen | Guests | Guests |
| net.tcp.port | Guests | Guests |
| net.tcp.service | Guests | Guests |
| net.tcp.service.perf | Guests | Guests |
| net.udp.service | Guests | Guests |
| net.udp.service.perf | Guests | Guests |
| proc.num | Administrators | Guests |
| system.cpu.discovery | Performance Monitor Users | Performance Monitor Users |
| system.cpu.load | Performance Monitor Users | Performance Monitor Users |

| Item key | User group | |
|-------------------|---------------------------|---------------------------|
| system.cpu.num | Guests | Guests |
| system.cpu.util | Performance Monitor Users | Performance Monitor Users |
| system.hostname | Guests | Guests |
| system.localtime | Guests | Guests |
| system.run | Administrators | Guests |
| system.sw.arch | Guests | Guests |
| system.swap.size | Guests | Guests |
| system.uname | Guests | Guests |
| system.uptime | Performance Monitor Users | Performance Monitor Users |
| vfs.dir.count | Administrators | Guests |
| vfs.dir.get | Administrators | Guests |
| vfs.dir.size | Administrators | Guests |
| vfs.file.cksum | Administrators | Guests |
| vfs.file.contents | Administrators | Guests |
| vfs.file.exists | Administrators | Guests |
| vfs.file.md5sum | Administrators | Guests |
| vfs.file.regexp | Administrators | Guests |
| vfs.file.regmatch | Administrators | Guests |
| vfs.file.size | Administrators | Guests |
| vfs.file.time | Administrators | Guests |
| vfs.fs.discovery | Administrators | Guests |
| vfs.fs.size | Administrators | Guests |
| vfs.fs.get | Administrators | Guests |
| vm.memory.size | Guests | Guests |
| web.page.get | Guests | Guests |
| web.page.perf | Guests | Guests |
| web.page.regexp | Guests | Guests |
| zabbix.stats | Guests | Guests |

Windows-specific item keys

| Item key | User group | |
|-------------------|---------------------------|---|
| | Recommended | Minimum technically acceptable (functionality is limited) |
| eventlog | Event Log Readers | Guests |
| net.if.list | Guests | Guests |
| perf_counter | Performance Monitor Users | Performance Monitor Users |
| proc_info | Administrators | Guests |
| service.discovery | Guests | Guests |
| service.info | Guests | Guests |
| services | Guests | Guests |
| wmi.get | Administrators | Guests |
| vm.vmemory.size | Guests | Guests |

4 Encoding of returned values

Zabbix server expects every returned text value in the UTF8 encoding. This is related to any type of checks: Zabbix agent, SSH, Telnet, etc.

Different monitored systems/devices and checks can return non-ASCII characters in the value. For such cases, almost all possible **zabbix** keys contain an additional item key parameter - **<encoding>**. This key parameter is optional but it should be specified if the returned value is not in the UTF8 encoding and it contains non-ASCII characters. Otherwise the result can be unexpected and unpredictable.

A description of behavior with different database backends in such cases follows.

MySQL

If a value contains a non-ASCII character in non UTF8 encoding - this character and the following will be discarded when the database stores this value. No warning messages will be written to the *zabbix_server.log*.

Relevant for at least MySQL version 5.1.61

PostgreSQL

If a value contains a non-ASCII character in non UTF8 encoding - this will lead to a failed SQL query (PGRES_FATAL_ERROR:ERROR invalid byte sequence for encoding) and data will not be stored. An appropriate warning message will be written to the *zabbix_server.log*.

Relevant for at least PostgreSQL version 9.1.3

5 Large file support

Large file support, often abbreviated to LFS, is the term applied to the ability to work with files larger than 2 GB on 32-bit operating systems. Support for large files affects at least **log file monitoring** and all **vfs.file.* items**. Large file support depends on the capabilities of a system at Zabbix compilation time, but is completely disabled on a 32-bit Solaris due to its incompatibility with procfs and swapctl.

6 Sensor

Each sensor chip gets its own directory in the sysfs */sys/devices* tree. To find all sensor chips, it is easier to follow the device symlinks from */sys/class/hwmon/hwmon**, where *** is a real number (0,1,2,...).

The sensor readings are located either in */sys/class/hwmon/hwmon*/* directory for virtual devices, or in */sys/class/hwmon/hwmon*/device* directory for non-virtual devices. A file, called *name*, located inside *hwmon** or *hwmon*/device* directories contains the name of the chip, which corresponds to the name of the kernel driver used by the sensor chip.

There is only one sensor reading value per file. The common scheme for naming the files that contain sensor readings inside any of the directories mentioned above is: *<type><number>_<item>*, where

- **type** - for sensor chips is "in" (voltage), "temp" (temperature), "fan" (fan), etc.,
- **item** - "input" (measured value), "max" (high threshold), "min" (low threshold), etc.,
- **number** - always used for elements that can be present more than once (usually starts from 1, except for voltages which start from 0). If files do not refer to a specific element they have a simple name with no number.

The information regarding sensors available on the host can be acquired using **sensor-detect** and **sensors** tools (lm-sensors package: <http://lm-sensors.org/>). **Sensors-detect** helps to determine which modules are necessary for available sensors. When modules are loaded the **sensors** program can be used to show the readings of all sensor chips. The labeling of sensor readings, used by this program, can be different from the common naming scheme (*<type><number>_<item>*):

- if there is a file called *<type><number>_label*, then the label inside this file will be used instead of *<type><number><item>* name;
- if there is no *<type><number>_label* file, then the program searches inside the */etc/sensors.conf* (could be also */etc/sensors3.conf*, or different) for the name substitution.

This labeling allows user to determine what kind of hardware is used. If there is neither *<type><number>_label* file nor label inside the configuration file the type of hardware can be determined by the name attribute (*hwmon*/device/name*). The actual names of sensors, which zabbix_agent accepts, can be obtained by running **sensors** program with **-u** parameter (**sensors -u**).

In **sensor** program the available sensors are separated by the bus type (ISA adapter, PCI adapter, SPI adapter, Virtual device, ACPI interface, HID adapter).

On Linux 2.4:

(Sensor readings are obtained from */proc/sys/dev/sensors* directory)

- **device** - device name (if *<mode>* is used, it is a regular expression);
- **sensor** - sensor name (if *<mode>* is used, it is a regular expression);
- **mode** - possible values: avg, max, min (if this parameter is omitted, device and sensor are treated verbatim).

Example key: *sensor[w83781d-i2c-0-2d,temp1]*

On Linux 2.6+:

(Sensor readings are obtained from */sys/class/hwmon* directory)

- **device** - device name (non regular expression). The device name could be the actual name of the device (e.g 0000:00:18.3) or the name acquired using sensors program (e.g. k8temp-pci-00c3). It is up to the user to choose which name to use;
- **sensor** - sensor name (non regular expression);
- **mode** - possible values: avg, max, min (if this parameter is omitted, device and sensor are treated verbatim).

Example key:

sensor[k8temp-pci-00c3,temp,max] or *sensor[0000:00:18.3,temp1]*

sensor[sm5c47b397-isa-0880,in,avg] or sensor[sm5c47b397.2176,in1]

Obtaining sensor names

Sensor labels, as printed by the *sensors* command, cannot always be used directly because the naming of labels may be different for each sensor chip vendor. For example, *sensors* output might contain the following lines:

```
$ sensors
in0:          +2.24 V  (min =  +0.00 V, max =  +3.32 V)
Vcore:        +1.15 V  (min =  +0.00 V, max =  +2.99 V)
+3.3V:        +3.30 V  (min =  +2.97 V, max =  +3.63 V)
+12V:         +13.00 V (min =  +0.00 V, max = +15.94 V)
M/B Temp:     +30.0°C  (low  = -127.0°C, high = +127.0°C)
```

Out of these, only one label may be used directly:

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in0]
2.240000
```

Attempting to use other labels (like *Vcore* or *+12V*) will not work.

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,Vcore]
ZBX_NOTSUPPORTED
```

To find out the actual sensor name, which can be used by Zabbix to retrieve the sensor readings, run *sensors -u*. In the output, the following may be observed:

```
$ sensors -u
...
Vcore:
  in1_input: 1.15
  in1_min: 0.00
  in1_max: 2.99
  in1_alarm: 0.00
...
+12V:
  in4_input: 13.00
  in4_min: 0.00
  in4_max: 15.94
  in4_alarm: 0.00
...
```

So *Vcore* should be queried as *in1*, and *+12V* should be queried as *in4*. According to [specification](#), these are voltages on chip pins and generally speaking may need scaling.

```
$ zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in1]
1.301000
```

Not only voltage (in), but also current (curr), temperature (temp) and fan speed (fan) readings can be retrieved by Zabbix.

7 Notes on memtype parameter in proc.mem items

Overview

The **memtype** parameter is supported on Linux, AIX, FreeBSD, and Solaris platforms.

Three common values of 'memtype' are supported on all of these platforms: *pmem*, *rss* and *vsize*. Additionally, platform-specific 'memtype' values are supported on some platforms.

AIX

See values supported for 'memtype' parameter on AIX in the table.

| Supported value | Description | Source in proctentry64 structure | Tries to be compatible with |
|--------------------|---------------------------|----------------------------------|-----------------------------|
| vsize ¹ | Virtual memory size | pi_size | |
| pmem | Percentage of real memory | pi_prm | ps -o pmem |
| rss | Resident set size | pi_trss + pi_drss | ps -o rssize |

| Supported value | Description | Source in proctentry64 structure | Tries to be compatible with |
|-----------------|-------------------------------|----------------------------------|-----------------------------|
| size | Size of process (code + data) | pi_dvm | "ps gvw" SIZE column |
| dsize | Data size | pi_dsize | "ps gvw" TSIZ column |
| tsize | Text (code) size | pi_tsize | |
| sdsiz | Data size from shared library | pi_sdsiz | "ps gvw" TSIZ column |
| drss | Data resident set size | pi_drss | |
| trss | Text resident set size | pi_trss | |

Notes for AIX:

1. When choosing parameters for proc.mem[] item key on AIX, try to specify narrow process selection criteria. Otherwise there is a risk of getting unwanted processes counted into proc.mem[] result.

Example:

```
$ zabbix_agentd -t proc.mem[,,,NonExistingProcess,rss]
proc.mem[,,,NonExistingProcess,rss] [u|2879488]
```

This example shows how specifying only command line (regular expression to match) parameter results in Zabbix agent self-accounting - probably not what you want.

2. Do not use "ps -ef" to browse processes - it shows only non-kernel processes. Use "ps -Af" to see all processes which will be seen by Zabbix agent.
3. Let's go through example of 'topasrec' how Zabbix agent proc.mem[] selects processes.

```
$ ps -Af | grep topasrec
root 10747984      1   0   Mar 16      -   0:00 /usr/bin/topasrec -L -s 300 -R 1 -r 6 -o /var/perf daily
```

proc.mem[] has arguments:

```
proc.mem[<name>,<user>,<mode>,<cmdline>,<memtype>]
```

The 1st criterion is a process name (argument <name>). In our example Zabbix agent will see it as 'topasrec'. In order to match, you need to either specify 'topasrec' or to leave it empty. The 2nd criterion is a user name (argument <user>). To match, you need to either specify 'root' or to leave it empty. The 3rd criterion used in process selection is an argument <cmdline>. Zabbix agent will see its value as '/usr/bin/topasrec -L -s 300 -R 1 -r 6 -o /var/perf/daily/ -ypersistent=1 -O type=bin -ystart_time=04:08:54,Mar16,2023'. To match, you need to either specify a regular expression which matches this string or to leave it empty.

Arguments <mode> and <memtype> are applied after using the three criteria mentioned above.

FreeBSD

See values supported for 'memtype' parameter on FreeBSD in the table.

| Supported value | Description | Source in kinfo_proc structure | Tries to be compatible with |
|-------------------|---------------------------------------|--------------------------------------|-----------------------------|
| vsize | Virtual memory size | kp_eproc.e_vm.vm_mapsize or ki_size | ps -o vsize |
| pmem | Percentage of real memory | calculated from rss | ps -o pmem |
| rss | Resident set size | kp_eproc.e_vm.vm_rssize or ki_rssize | ps -o rss |
| size ¹ | Size of process (code + data + stack) | tsize + dsize + ssize | ps -o size |
| tsize | Text (code) size | kp_eproc.e_vm.vm_tsize or ki_tsize | ps -o tsize |
| dsize | Data size | kp_eproc.e_vm.vm_dsize or ki_dsize | ps -o dsize |
| ssize | Stack size | kp_eproc.e_vm.vm_ssize or ki_ssize | ps -o ssize |

Linux

See values supported for 'memtype' parameter on Linux in the table.

| Supported value | Description | Source in /proc/<pid>/status file |
|--------------------|--|-----------------------------------|
| vsize ¹ | Virtual memory size | VmSize |
| pmem | Percentage of real memory | (VmRSS/total_memory) * 100 |
| rss | Resident set size | VmRSS |
| data | Size of data segment | VmData |
| exe | Size of code segment | VmExe |
| hwm | Peak resident set size | VmHWM |
| lck | Size of locked memory | VmLck |
| lib | Size of shared libraries | VmLib |
| peak | Peak virtual memory size | VmPeak |
| pin | Size of pinned pages | VmPin |
| pte | Size of page table entries | VmPTE |
| size | Size of process code + data + stack segments | VmExe + VmData + VmStk |
| stk | Size of stack segment | VmStk |
| swap | Size of swap space used | VmSwap |

Notes for Linux:

1. Not all 'memtype' values are supported by older Linux kernels. For example, Linux 2.4 kernels do not support hwm, pin, peak, pte and swap values.
2. We have noticed that self-monitoring of the Zabbix agent active check process with `proc.mem[...,...,...,data]` shows a value that is 4 kB larger than reported by VmData line in the agent's /proc/<pid>/status file. At the time of self-measurement the agent's data segment increases by 4 kB and then returns to the previous size.

Solaris

See values supported for 'memtype' parameter on Solaris in the table.

| Supported value | Description | Source in psinfo structure | Tries to be compatible with |
|--------------------|--|----------------------------|-----------------------------|
| vsize ¹ | Size of process image | pr_size | ps -o vsz |
| pmem | Percentage of real memory | pr_pctmem | ps -o pmem |
| rss | Resident set size It may be underestimated - see rss description in "man ps". | pr_rssize | ps -o rss |

Footnotes

¹ Default value.

8 Notes on selecting processes in proc.mem and proc.num items

Processes modifying their commandline

Some programs use modifying their commandline as a method for displaying their current activity. A user can see the activity by running `ps` and `top` commands. Examples of such programs include *PostgreSQL*, *Sendmail*, *Zabbix*.

Let's see an example from Linux. Let's assume we want to monitor a number of Zabbix agent processes.

`ps` command shows processes of interest as

```
$ ps -fu zabbix
UID          PID  PPID  C  STIME TTY          TIME CMD
...
zabbix      6318     1   0  12:01 ?        00:00:00 sbin/zabbix_agentd -c /home/zabbix/ZBXNEXT-1078/zabbix_age
zabbix      6319   6318   0  12:01 ?        00:00:01 sbin/zabbix_agentd: collector [idle 1 sec]
zabbix      6320   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: listener #1 [waiting for connection]
zabbix      6321   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: listener #2 [waiting for connection]
zabbix      6322   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: listener #3 [waiting for connection]
zabbix      6323   6318   0  12:01 ?        00:00:00 sbin/zabbix_agentd: active checks #1 [idle 1 sec]
...
```

When checking the next process, the agent takes `zabbix_agentd_30: collector [idle 1 sec]` from the `cmdline` file and it does not meet our name parameter `zabbix_agentd_30`. So, only the main process which does not modify its commandline, gets counted. Other agent processes modify their command line and are ignored.

This example shows that the name parameter cannot be used in `proc.mem[]` and `proc.num[]` for selecting processes in this case.

Note:

For `proc.get[]` item, when Zabbix agent checks "cmdline" for the process name, it will only use part of the name starting from the last slash and until the first space or colon sign. Process name received from `cmdline` file will only be used if its beginning completely matches the shortened process name in the status file. The algorithm is the same for both process name in the filter and in the JSON output.

Using `cmdline` parameter with a proper regular expression produces a correct result:

```
$ zabbix_get -s localhost -k 'proc.num[,zabbix,,zabbix_agentd_30[ :]]'
6
```

Be careful when using `proc.get[]`, `proc.mem[]` and `proc.num[]` items for monitoring programs which modify their command lines.

Before putting name and `cmdline` parameters into `proc.get[]`, `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

Linux kernel threads

Threads cannot be selected with `cmdline` parameter in `proc.get[]`, `proc.mem[]` and `proc.num[]` items

Let's take as an example one of kernel threads:

```
$ ps -ef | grep kthreadd
root          2      0  0 09:33 ?          00:00:00 [kthreadd]
```

It can be selected with process name parameter:

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd,root]'
1
```

But selection by process `cmdline` parameter does not work:

```
$ zabbix_get -s localhost -k 'proc.num[,root,,kthreadd]'
0
```

The reason is that Zabbix agent takes the regular expression specified in `cmdline` parameter and applies it to contents of process `/proc/<pid>/cmdline`. For kernel threads their `/proc/<pid>/cmdline` files are empty. So, `cmdline` parameter never matches.

Counting of threads in `proc.mem[]` and `proc.num[]` items

Linux kernel threads are counted by `proc.num[]` item but do not report memory in `proc.mem[]` item. For example:

```
$ ps -ef | grep kthreadd
root          2      0  0 09:51 ?          00:00:00 [kthreadd]
```

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd]'
1
```

```
$ zabbix_get -s localhost -k 'proc.mem[kthreadd]'
ZBX_NOTSUPPORTED: Cannot get amount of "VmSize" memory.
```

But what happens if there is a user process with the same name as a kernel thread ? Then it could look like this:

```
$ ps -ef | grep kthreadd
root          2      0  0 09:51 ?          00:00:00 [kthreadd]
zabbix       9611  6133  0 17:58 pts/1    00:00:00 ./kthreadd
```

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd]'
2
```

```
$ zabbix_get -s localhost -k 'proc.mem[kthreadd]'
4157440
```

`proc.num[]` counted both the kernel thread and the user process. `proc.mem[]` reports memory for the user process only and counts the kernel thread memory as if it was 0. This is different from the case above when `ZBX_NOTSUPPORTED` was reported.

Be careful when using `proc.mem[]` and `proc.num[]` items if the program name happens to match one of the thread.

Before putting parameters into `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

9 Implementation details of net.tcp.service and net.udp.service checks

Implementation of `net.tcp.service` and `net.udp.service` checks is detailed on this page for various services specified in the service parameter.

Item `net.tcp.service` parameters

ftp

Creates a TCP connection and expects the first 4 characters of the response to be "220 ", then sends "QUIT\r\n". Default port 21 is used if not specified.

http

Creates a TCP connection without expecting and sending anything. Default port 80 is used if not specified.

https

Uses (and only works with) `libcurl`, does not verify the authenticity of the certificate, does not verify the host name in the SSL certificate, only fetches the response header (HEAD request). Default port 443 is used if not specified.

imap

Creates a TCP connection and expects the first 4 characters of the response to be "* OK", then sends "a1 LOGOUT\r\n". Default port 143 is used if not specified.

ldap

Opens a connection to an LDAP server and performs an LDAP search operation with filter set to `(objectClass=*)`. Expects successful retrieval of the first attribute of the first entry. Default port 389 is used if not specified.

nntp

Creates a TCP connection and expects the first 3 characters of the response to be "200" or "201", then sends "QUIT\r\n". Default port 119 is used if not specified.

pop

Creates a TCP connection and expects the first 3 characters of the response to be "+OK", then sends "QUIT\r\n". Default port 110 is used if not specified.

smtp

Creates a TCP connection and expects the first 3 characters of the response to be "220", followed by a space, the line ending or a dash. The lines containing a dash belong to a multiline response and the response will be re-read until a line without the dash is received. Then sends "QUIT\r\n". Default port 25 is used if not specified.

ssh

Creates a TCP connection. If the connection has been established, both sides exchange an identification string (`SSH-major.minor-XXXX`), where major and minor are protocol versions and XXXX is a string. Zabbix checks if the string matching the specification is found and then sends back the string `"SSH-major.minor-zabbix_agent\r\n"` or `"0\r\n"` on mismatch. Default port 22 is used if not specified.

tcp

Creates a TCP connection without expecting and sending anything. Unlike the other checks requires the port parameter to be specified.

telnet

Creates a TCP connection and expects a login prompt (':' at the end). Default port 23 is used if not specified.

Item `net.udp.service` parameters

ntp

Sends an SNTP packet over UDP and validates the response according to [RFC 4330, section 5](#). Default port 123 is used if not specified.

10 proc.get parameters

Overview

The item **proc.get**[<name>,<user>,<cmdline>,<mode>] is supported on Linux, Windows, FreeBSD, OpenBSD, and NetBSD.

List of process parameters returned by the item varies depending on the operating system and 'mode' argument value.

Linux

The following process parameters are returned on Linux for each mode:

| mode=process | mode=thread | mode=summary |
|---|---|--|
| pid: PID | pid: PID | name: process name |
| ppid: parent PID | ppid: parent PID | processes: number of processes |
| name: process name | name: process name | vsize: virtual memory size |
| cmdline: command with arguments | user: user (real) the process runs under | pmem: percentage of real memory |
| user: user (real) the process runs under | group: group (real) the process runs under | rss: resident set size |
| group: group (real) the process runs under | uid: user ID | data: size of data segment |
| uid: user ID | gid: ID of the group the process runs under | exe: size of code segment |
| gid: ID of the group the process runs under | tid: thread ID | lib: size of shared libraries |
| vsize: virtual memory size | tname: thread name | lck: size of locked memory |
| pmem: percentage of real memory | cputime_user: total CPU seconds (user) | pin: size of pinned pages |
| rss: resident set size | cputime_system: total CPU seconds (system) | pte: size of page table entries |
| data: size of data segment | state: thread state | size: size of process code + data + stack segments |
| exe: size of code segment | ctx_switches: number of context switches | stk: size of stack segment |
| hwm: peak resident set size | page_faults: number of page faults | swap: size of swap space used |
| lck: size of locked memory | | cputime_user: total CPU seconds (user) |
| lib: size of shared libraries | | cputime_system: total CPU seconds (system) |
| peak: peak virtual memory size | | ctx_switches: number of context switches |
| | | threads: number of threads |
| pin: size of pinned pages | | page_faults: number of page faults |
| pte: size of page table entries | | pss: proportional set size memory |
| size: size of process code + data + stack segments | | |
| stk: size of stack segment | | |
| swap: size of swap space used | | |
| cputime_user: total CPU seconds (user) | | |
| cputime_system: total CPU seconds (system) | | |
| state: process state (transparently retrieved from procfs, long form) | | |
| ctx_switches: number of context switches | | |
| threads: number of threads | | |
| page_faults: number of page faults | | |
| pss: proportional set size memory | | |

The following process parameters are returned on FreeBSD, OpenBSD, and NetBSD for each mode:

| mode=process | mode=thread | mode=summary |
|--|---|---|
| pid: PID | pid: PID | name: process name |
| ppid: parent PID | ppid: parent PID | processes: number of processes |
| jid: ID of jail (FreeBSD only) | jid: ID of jail (FreeBSD only) | vsize: virtual memory size |
| jname: name of jail (FreeBSD only) | jname: name of jail (FreeBSD only) | pmem: percentage of real memory (FreeBSD only) |
| name: process name | name: process name | rss: resident set size |
| cmdline: command with arguments | user: user (real) the process runs under | size: size of process (code + data + stack) |
| user: user (real) the process runs under | group: group (real) the process runs under | tsize: text (code) size |
| group: group (real) the process runs under | uid: user ID | dsize: data size |
| uid: user ID | gid: ID of the group the process runs under | ssize: stack size |
| gid: ID of the group the process runs under | tid: thread ID | cputime_user: total CPU seconds (user) |
| vsize: virtual memory size | tname: thread name | cputime_system: total CPU seconds (system) |
| pmem: percentage of real memory (FreeBSD only) | cputime_user: total CPU seconds (user) | ctx_switches: number of context switches |
| rss: resident set size | cputime_system: total CPU seconds (system) | threads: number of threads (not supported for NetBSD) |
| size: size of process (code + data + stack) | state: thread state | stk: size of stack segment |
| tsize: text (code) size | ctx_switches: number of context switches | page_faults: number of page faults |
| dsize: data size | io_read_op: number of times the system had to perform input | fds: number of file descriptors (OpenBSD only) |
| ssize: stack size | io_write_op: number of times the system had to perform output | swap: size of swap space used |
| cputime_user: total CPU seconds (user) | | io_read_op: number of times the system had to perform input |
| cputime_system: total CPU seconds (system) | | io_write_op: number of times the system had to perform output |
| state: process state (disk sleep/running/sleeping/tracing stop/zombie/other) | | |
| ctx_switches: number of context switches | | |
| threads: number of threads (not supported for NetBSD) | | |
| page_faults: number of page faults | | |
| fds: number of file descriptors (OpenBSD only) | | |
| swap: size of swap space used | | |
| io_read_op: number of times the system had to perform input | | |
| io_write_op: number of times the system had to perform output | | |

Windows

The following process parameters are returned on Windows for each mode:

| mode=process | mode=thread | mode=summary |
|--------------------|--------------------|--------------------------------|
| pid: PID | pid: PID | name: process name |
| ppid: parent PID | ppid: parent PID | processes: number of processes |
| name: process name | name: process name | vmsize: virtual memory size |

| mode=process | mode=thread | mode=summary |
|--|--|--|
| user: user the process runs under sid: user SID | user: user the process runs under sid: user SID | wkset: size of process working set cputime_user: total CPU seconds (user) cputime_system: total CPU seconds (system) threads: number of threads page_faults: number of page faults handles: number of handles |
| vmsize: virtual memory size | tid: thread ID | io_read_b: IO bytes read io_write_b: IO bytes written io_read_op: IO read operations io_write_op: IO write operations io_other_b: IO bytes transferred, other than read and write operations io_other_op: IO operations, other than read and write operations |
| wkset: size of process working set cputime_user: total CPU seconds (user) cputime_system: total CPU seconds (system) threads: number of threads page_faults: number of page faults handles: number of handles io_read_b: IO bytes read io_write_b: IO bytes written io_read_op: IO read operations io_write_op: IO write operations io_other_b: IO bytes transferred, other than read and write operations io_other_op: IO operations, other than read and write operations | | |

11 Unreachable/unavailable host interface settings

Overview

Several configuration **parameters** define how Zabbix server should behave when an agent check (Zabbix, SNMP, IPMI, JMX) fails and a host interface becomes unreachable.

Unreachable interface

A host interface is treated as unreachable after a failed check (network error, timeout) by Zabbix, SNMP, IPMI or JMX agents. Since Zabbix 6.2.0, active Zabbix agent checks also affect interface availability. When active checks become unavailable, they contribute to the overall availability status of the agent interface.

From the moment an interface becomes unreachable, **UnreachableDelay** defines how often it is rechecked using one of the items (including LLD rules). These rechecks are performed by unreachable pollers (or IPMI pollers for IPMI checks). By default, the next check is in 15 seconds.

Attention:

Checks performed by asynchronous pollers are not moved to unreachable pollers.

In the Zabbix server log unreachability is indicated by messages like:

```
Zabbix agent item "system.cpu.load[percpu,avg1]" on host "New host" failed: first network error, wait for
Zabbix agent item "system.cpu.load[percpu,avg15]" on host "New host" failed: another network error, wait f
```

The log messages specify the exact item that failed and its type (Zabbix agent).

Note:

The *Timeout* parameter will also affect how early an interface is rechecked during unreachability. If Timeout is set to 20 seconds and UnreachableDelay to 30 seconds, the next check will be in 50 seconds after the first attempt.

The **UnreachablePeriod** parameter defines the total duration of the unreachability period. By default UnreachablePeriod is 45 seconds. This value should be several times larger than UnreachableDelay to ensure that an interface is rechecked multiple times before being marked as unavailable.

An internal item, **zabbix[host,active_agent,available]**, allows monitoring the availability of active checks in unreachable scenarios.

Switching interface back to available

When the unreachability period is over, the interface is polled again, decreasing priority for item that turned the interface into unreachable state. If the unreachable interface reappears, the monitoring returns to normal automatically:

resuming Zabbix agent checks on host "New host": connection restored

Note:

Once interface becomes available, the host does not poll all its items immediately for two reasons:

- It might overload the host.
- The interface restore time is not always matching planned item polling schedule time.

So, after the interface becomes available, items are not polled immediately, but they are getting rescheduled to their next polling round.

Unavailable interface

After the UnreachablePeriod ends and the interface has not reappeared, the interface is treated as unavailable.

In the server log it is indicated by messages like these:

temporarily disabling Zabbix agent checks on host "New host": interface unavailable

and in the **frontend** the host availability icon goes from green/gray to yellow/red (the unavailable interface details can be seen in the hint box that is displayed when a mouse is positioned on the host availability icon):

| ZBX Items 7 Triggers 3 Graphs Discovery rules Web scenarios 2 | | | | |
|---|-----------------|---------------|---|--|
| | Interface | Status | Error | |
| | 127.0.0.1:10050 | Available | | |
| me: S | 192.0.0.1:10050 | Not available | Get value from agent failed: cannot connect to [[192.0.0.1]:10050]: [4] system call | |

The **UnavailableDelay** parameter defines how often an interface is checked during interface unavailability.

By default it is 60 seconds (so in this case "temporarily disabling", from the log message above, will mean disabling checks for one minute).

When the connection to the interface is restored, the monitoring returns to normal automatically, too:

enabling Zabbix agent checks on host "New host": interface became available

12 Remote monitoring of Zabbix stats

Overview

It is possible to make some internal metrics of Zabbix server and proxy accessible remotely by another Zabbix instance or a third-party tool. This can be useful so that supporters/service providers can monitor their client Zabbix servers/proxies remotely or, in organizations where Zabbix is not the main monitoring tool, that Zabbix internal metrics can be monitored by a third-party system in an umbrella-monitoring setup.

Zabbix internal stats are exposed to a configurable set of addresses listed in the new 'StatsAllowedIP' **server/proxy** parameter. Requests will be accepted only from these addresses.

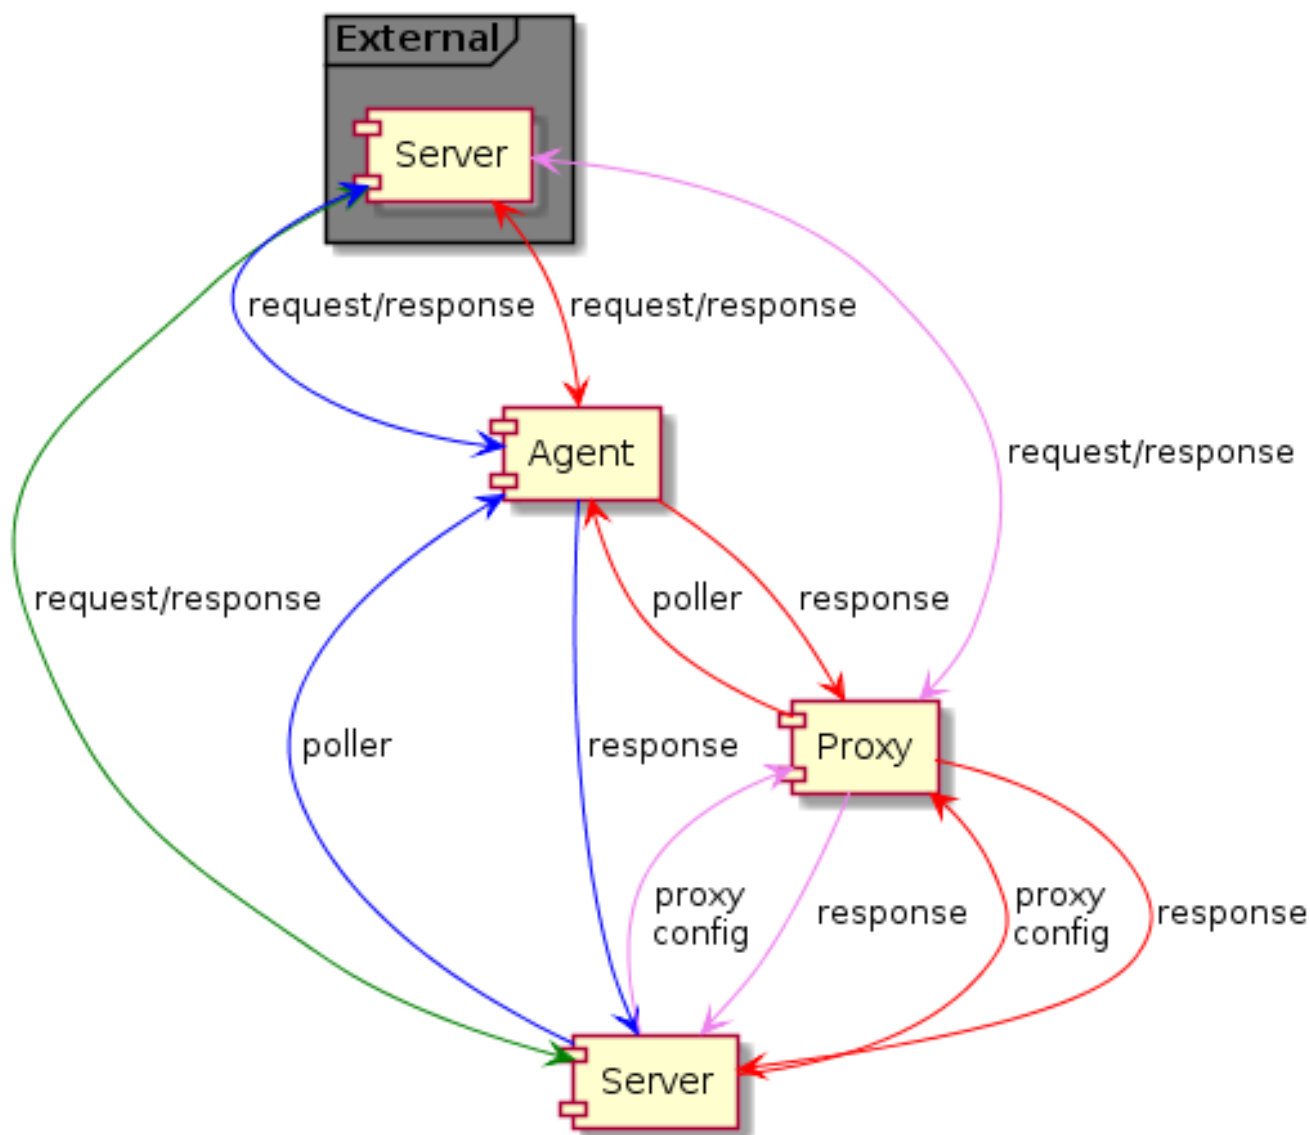

Items

To configure querying of internal stats on another Zabbix instance, you may use two items:

- `zabbix[stats,<ip>,<port>]` internal item - for direct remote queries of Zabbix server/proxy. `<ip>` and `<port>` are used to identify the target instance.
- `zabbix.stats[<ip>,<port>]` agent item - for agent-based remote queries of Zabbix server/proxy. `<ip>` and `<port>` are used to identify the target instance.

See also: [Internal items](#), [Zabbix agent items](#)

The following diagram illustrates the use of either item depending on the context.

- █ - Server → external Zabbix instance (zabbix[stats,<ip>,<port>])
- █ - Server → proxy → external Zabbix instance (zabbix[stats,<ip>,<port>])
- █ - Server → agent → external Zabbix instance (zabbix.stats[<ip>,<port>])
- █ - Server → proxy → agent → external Zabbix instance (zabbix.stats[<ip>,<port>])

To make sure that the target instance allows querying it by the external instance, list the address of the external instance in the 'StatsAllowedIP' parameter on the target instance.

Exposed metrics

The stats items gather the statistics in bulk and return a JSON, which is the basis for dependent items to get their data from. The following **internal metrics** are returned by either of the two items:

- zabbix[boottime]
- zabbix[hosts]
- zabbix[items]
- zabbix[items_unsupported]
- zabbix[preprocessing] (server only)
- zabbix[preprocessing_queue] (server only)
- zabbix[process,<type>,<mode>,<state>] (only process type based statistics)
- zabbix[rcache,<cache>,<mode>]
- zabbix[requiredperformance]
- zabbix[triggers] (server only)
- zabbix[uptime]
- zabbix[vcache,buffer,<mode>] (server only)

- zabbix[vcache,cache,<parameter>]
- zabbix[version]
- zabbix[vmware,buffer,<mode>]
- zabbix[wcache,<cache>,<mode>] ('trends' cache type server only)

Templates

Templates are available for remote monitoring of Zabbix server or proxy internal metrics from an external instance:

- Remote Zabbix server health
- Remote Zabbix proxy health

Note that in order to use a template for remote monitoring of multiple external instances, a separate host is required for each external instance monitoring.

Trapper process

Receiving internal metric requests from an external Zabbix instance is handled by the trapper process that validates the request, gathers the metrics, creates the JSON data buffer and sends the prepared JSON back, for example, from server:

```
{
  "response": "success",
  "data": {
    "boottime": N,
    "uptime": N,
    "hosts": N,
    "items": N,
    "items_unsupported": N,
    "preprocessing": {
      "queued": {
        "count": N,
        "size": N
      },
      "direct": {
        "count": N,
        "size": N
      },
      "queue": N
    },
    "preprocessing_queue": N,
    "process": {
      "alert manager": {
        "busy": {
          "avg": N,
          "max": N,
          "min": N
        },
        "idle": {
          "avg": N,
          "max": N,
          "min": N
        },
        "count": N
      },
      ...
    },
    "queue": N,
    "rcache": {
      "total": N,
      "free": N,
      "pfree": N,
      "used": N,
      "pused": N
    },
    "requiredperformance": N,
    "triggers": N,
```

```

"uptime": N,
"vcache": {
  "buffer": {
    "total": N,
    "free": N,
    "pfree": N,
    "used": N,
    "pused": N
  },
  "cache": {
    "requests": N,
    "hits": N,

    "not supported": N
  },
  "history": {
    "pfree": N,
    "free": N,
    "total": N,
    "used": N,
    "pused": N
  },
  "index": {
    "pfree": N,
    "free": N,
    "total": N,
    "used": N,
    "pused": N
  },
  "trend": {
    "pfree": N,
    "free": N,
    "total": N,
    "used": N,
    "pused": N
  }
}
}
}
}

```

Internal queue items

There are also another two items specifically allowing to remote query internal queue stats on another Zabbix instance:

- `zabbix[stats,<ip>,<port>,queue,<from>,<to>]` internal item - for direct internal queue queries to remote Zabbix

- server/proxy
- `zabbix.stats[<ip>,<port>,queue,<from>,<to>]` agent item - for agent-based internal queue queries to remote Zabbix server/proxy

See also: [Internal items](#), [Zabbix agent items](#)

13 Configuring Kerberos with Zabbix

Overview

Kerberos authentication can be used in web monitoring and HTTP items in Zabbix.

This section describes an example of configuring Kerberos with Zabbix server to perform web monitoring of `www.example.com` with user 'zabbix'.

Steps

Step 1

Install Kerberos package.

For Debian/Ubuntu:

```
apt install krb5-user
```

For RHEL:

```
dnf install krb5-workstation
```

Step 2

Configure Kerberos configuration file (see MIT documentation for details)

```
cat /etc/krb5.conf
[libdefaults]
    default_realm = EXAMPLE.COM

#### The following krb5.conf variables are only for MIT Kerberos.
    kdc_timesync = 1
    ccache_type = 4
    forwardable = true
    proxiable = true

[realms]
    EXAMPLE.COM = {
    }

[domain_realm]
    .example.com=EXAMPLE.COM
    example.com=EXAMPLE.COM
```

Step 3

Create a Kerberos ticket for user *zabbix*. Run the following command as user *zabbix*:

```
kinit zabbix
```

Attention:

It is important to run the above command as user *zabbix*. If you run it as *root* the authentication will not work.

Step 4

Create a web scenario or HTTP agent item with Kerberos authentication type.

Optionally can be tested with the following curl command:

```
curl -v --negotiate -u : http://example.com
```

Note that for lengthy web monitoring it is necessary to take care of renewing the Kerberos ticket. Default time of ticket expiration is 10h.

14 modbus.get parameters

Overview

The table below presents details of the `modbus.get` [item](#) parameters.

Parameters

| Parameter | Description | Defaults | Example |
|-----------------|---|--|---|
| <i>endpoint</i> | <p>Protocol and address of the endpoint, defined as <code>protocol://connection_string</code></p> <p>Possible protocol values: <i>rtu</i>, <i>ascii</i> (Agent 2 only), <i>tcp</i></p> <p>Connection string format:</p> <p>with <i>tcp</i> - <code>address:port</code> with serial line: <i>rtu</i>, <i>ascii</i> - <code>port_name:speed:params</code> where 'speed' - 1200, 9600 etc 'params' - data bits (5,6,7 or 8), parity (n,e or o for none/even/odd), stop bits (1 or 2)</p> | <p>protocol: none</p> <p><i>rtu/ascii</i> protocol: port_name: none speed: 115200 params: 8n1</p> <p><i>tcp</i> protocol: address: none port: 502</p> | <p><code>tcp://192.168.6.1:511</code> <code>tcp://192.168.6.2</code> <code>tcp://[::1]:511</code> <code>tcp://::1</code> <code>tcp://localhost:511</code> <code>tcp://localhost</code> <code>rtu://COM1:9600:8n</code> <code>ascii://COM2:1200:7o2</code> <code>rtu://ttyS0:9600</code> <code>ascii://ttyS1</code></p> |
| <i>slave id</i> | Modbus address of the device it is intended for (1 to 247), see MODBUS Messaging Implementation Guide (page 23) | <p>serial: 1</p> <p><i>tcp</i>: 255 (0xFF)</p> | 2 |
| <i>function</i> | <p><i>tcp</i> device (not GW) will ignore the field</p> <p>Empty or value of a supported function:</p> <p>1 - Read Coil, 2 - Read Discrete Input, 3 - Read Holding Registers, 4 - Read Input Registers</p> | empty | 3 |
| <i>address</i> | <p>Address of the first registry, coil or input.</p> <p>If 'function' is empty, then 'address' should be in range for: Coil - 00001 - 09999 Discrete input - 10001 - 19999 Input register - 30001 - 39999 Holding register - 40001 - 49999</p> <p>If 'function' is not empty, the 'address' field will be from 0 till 65535 and used without modification (PDU)</p> | <p>empty function: 00001</p> <p>non-empty function: 0</p> | 9999 |
| <i>count</i> | <p>Count of sequenced 'type' which will be read from device, where:</p> <p>for Coil or Discrete input the 'type' = 1 bit for other cases: $(count * sizeof(type)) / 2 = \text{real count of registers for reading}$ If 'offset' is not 0, the value will be added to 'real count' Acceptable range for 'real count' is 1:65535</p> | 1 | 2 |

| Parameter | Description | Defaults | Example |
|-------------------|---|---------------|---------|
| <i>type</i> | Data type: for Read Coil and Read Discrete Input - <i>bit</i> for Read Holding Registers and Read Input Registers: <i>int8</i> - 8bit <i>uint8</i> - 8bit (unsigned) <i>int16</i> - 16bit <i>uint16</i> - 16bit (unsigned) <i>int32</i> - 32bit <i>uint32</i> - 32bit (unsigned) <i>float</i> - 32bit <i>uint64</i> - 64bit (unsigned) <i>double</i> - 64bit | bit uint16 | uint64 |
| <i>endianness</i> | Endianness type: <i>be</i> - Big Endian <i>le</i> - Little Endian <i>mbe</i> - Mid-Big Endian <i>mle</i> - Mid-Little Endian Limitations: for 1 bit - be for 8 bits - be,le for 16 bits - be,le | be | le |
| <i>offset</i> | Number of registers, starting from 'address', the result of which will be discarded. The size of each register is 16bit (needed to support equipment that does not support random read access). | 0 | 4 |

15 Creating custom performance counter names for VMware

Overview

The VMware performance counter path has the `group/counter[rollup]` format where:

- *group* - the performance counter group, for example *cpu*
- *counter* - the performance counter name, for example *usagemhz*
- *rollup* - the performance counter rollup type, for example *average*

So the above example would give the following counter path: `cpu/usagemhz[average]`

The performance counter group descriptions, counter names and rollup types can be found in [VMware documentation](#).

It is possible to obtain internal names and create custom performance counter names by using script item in Zabbix.

Configuration

1. Create disabled Script item on the main VMware host (where the **eventlog[]** item is present) with the following parameters:

Item Tags Preprocessing

* Name

Type

* Key

Type of information

Parameters

| Name | Value | Action |
|----------------------|----------------------|------------------------|
| <input type="text"/> | <input type="text"/> | Remove |

[Add](#)

* Script

* Update interval

Custom intervals

| Type | Interval | Period | Action |
|--|----------------------------------|--|------------------------|
| <input checked="" type="radio"/> Flexible <input type="radio"/> Scheduling | <input type="text" value="50s"/> | <input type="text" value="1-7,00:00-24:00"/> | Remove |

[Add](#)

* Timeout ☐ Global ☒ Override [Timeouts](#)

* History ☒ Do not store ☐ Store up to

Populates host inventory field

Description

Enabled ☐

- Name: VMware metrics
- Type: Script
- Key: vmware.metrics
- Type of information: Text
- Script: copy and paste the **script** provided below
- Timeout: 10
- History: Do not store
- Enabled: unmarked

Script

```
try {
  Zabbix.log(4, 'vmware metrics script');

  var result, resp,
  req = new HttpRequest();
  req.addHeader('Content-Type: application/xml');
  req.addHeader('SOAPAction: "urn:vim25/6.0"');

  login = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:vim25/6.0">
<soapenv:Header/>
<soapenv:Body>
  <urn:Login>
    <urn:_this type="SessionManager">SessionManager</urn:_this>
    <urn:userName>{$VMWARE.USERNAME}</urn:userName>
    <urn:password>{$VMWARE.PASSWORD}</urn:password>
  </urn:Login>
</soapenv:Body>
</soapenv:Envelope>'

  resp = req.post("{ $VMWARE.URL }", login);
  if (req.getStatus() != 200) {
```

```

        throw 'Response code: '+req.getStatus();
    }

    query = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:vi
<soapenv:Header/>\
<soapenv:Body>\
    <urn:RetrieveProperties>\
        <urn:_this type="PropertyCollector">propertyCollector</urn:_this>\
        <urn:specSet>\
            <urn:propSet>\
                <urn:type>PerformanceManager</urn:type>\
                <urn:pathSet>perfCounter</urn:pathSet>\
            </urn:propSet>\
            <urn:objectSet>\
                <urn:obj type="PerformanceManager">PerfMgr</urn:obj>\
            </urn:objectSet>\
        </urn:specSet>\
    </urn:RetrieveProperties>\
</soapenv:Body>\
</soapenv:Envelope>'
    resp = req.post("${VMWARE.URL}", query);
    if (req.getStatus() != 200) {
        throw 'Response code: '+req.getStatus();
    }
    Zabbix.log(4, 'vmware metrics=' + resp);
    result = resp;

    logout = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:v
<soapenv:Header/>\
<soapenv:Body>\
    <urn:Logout>\
        <urn:_this type="SessionManager">SessionManager</urn:_this>\
    </urn:Logout>\
</soapenv:Body>\
</soapenv:Envelope>'

    resp = req.post("${VMWARE.URL}",logout);
    if (req.getStatus() != 200) {
        throw 'Response code: '+req.getStatus();
    }
}
} catch (error) {
    Zabbix.log(4, 'vmware call failed : '+error);
    result = {};
}

```

return result;

Once the item is configured, press *Test* button, then press *Get value*.

Test item

Proxy

Get value

Copy received XML to any XML formatter and find the desired metric.

An example of XML for one metric:

```

<PerfCounterInfo xsi:type="PerfCounterInfo">
    <key>6</key>

```

```

<nameInfo>
  <label>Usage in MHz</label>
  <summary>CPU usage in megahertz during the interval</summary>
  <key>usagemhz</key>
</nameInfo>
<groupInfo>
  <label>CPU</label>
  <summary>CPU</summary>
  <key>cpu</key>
</groupInfo>
<unitInfo>
  <label>MHz</label>
  <summary>Megahertz</summary>
  <key>megaHertz</key>
</unitInfo>
<rollupType>average</rollupType>
<statsType>rate</statsType>
<level>1</level>
<perDeviceLevel>3</perDeviceLevel>
</PerfCounterInfo>

```

Use XPath to extract the counter path from received XML. For the example above, the XPath will be:

| field | xPath | value |
|---------|---------------------------|----------|
| group | //groupInfo[../key=6]/key | cpu |
| counter | //nameInfo[../key=6]/key | usagemhz |
| rollup | //rollupType[../key=6] | average |

Resulting performance counter path in this case is: `cpu/usagemhz[average]`

16 Return values for `system.sw.packages.get`

Overview

This section provides return value details for the `system.sw.packages.get` Zabbix agent item.

Details

The output of this item is an array of objects each containing the following keys:

- **name** - package name
- **manager** - package manager that reported this data (rpm, dpkg, pacman, pkgtool, or portage)
- **version** - package version
- **size** - uncompressed package size in bytes (if not available, set to 0)
- **arch** - package architecture
- **buildtime** - an object with 2 entries:
 - **timestamp** - UNIX timestamp when the package was built (if not available, set to 0)
 - **value** - human readable date and time when the package was built (if not available, set to empty string)
- **installtime** - an object with 2 entries:
 - **timestamp** - UNIX timestamp when the package was installed (if not available, set to 0)
 - **value** - human readable date and time when the package was installed (if not available, set to empty string)

Example:

```

[
  {
    "name": "util-linux-core",
    "manager": "rpm",
    "version": "2.37.4-3.e19",
    "size": 1296335,
    "arch": "x86_64",
    "buildtime": {
      "timestamp" : 1653552239,
      "value" : "Sep 20 01:39:40 2021 UTC"
    }
  }
]

```

```

    },
    "installtime": {
      "timestamp" : 1660780885,
      "value" : "Aug 18 00:01:25 2022 UTC"
    }
  },
  {
    "name": "xfonts-base",
    "manager": "dpkg",
    "version": "1:1.0.5",
    "size": 7337984,
    "arch": "all",
    "buildtime": {
      "timestamp": 0,
      "value": ""
    },
    "installtime": {
      "timestamp": 0,
      "value": ""
    }
  }
]

```

17 Return values for net.dns.get

Overview

This section provides return value details for the `net.dns.get` Zabbix agent 2 item.

Details

The output of this item is an object containing DNS record information based on the parameters provided in the item key.

For example, the `net.dns.get[,example.com]` item may return the following JSON of a refused query:

```

{
  "flags": [
    "RA"
  ],
  "query_time": "0.019030",
  "question_section": [
    {
      "qclass": "IN",
      "qname": "example.com.",
      "qtype": "SOA"
    }
  ],
  "response_code": "REFUSED",
  "zbx_error_code": 0
}

```

By specifying the IP address of the DNS server, the `net.dns.get[192.0.2.0,example.com]` item may return the following JSON:

```

{
  "answer_section": [
    {
      "class": "IN",
      "name": "example.com.",
      "rdata": {
        "expire": 1209600,
        "mbox": "noc.dns.example.org.",
        "minttl": 3600,
        "ns": "ns.example.org.",
        "refresh": 7200,

```

```

        "retry": 3600,
        "serial": 2022091378
    },
    "rdlength": 44,
    "ttl": 1205,
    "type": "SOA"
},
],
"flags": [
    "RA"
],
"query_time": "0.029556",
"question_section": [
    {
        "qclass": "IN",
        "qname": "example.com.",
        "qtype": "SOA"
    }
],
"response_code": "NOERROR",
"zbx_error_code": 0
}

```

If there is a connection problem, the `net.dns.get[192.0.2.0,example.com]` item may an error:

```

{
    "zbx_error_code": -1,
    "zbx_error_msg": "Communication error: read udp 192.0.2.0:12345->192.0.2.0:53: i/o timeout"
}

```

The following types of error codes are possible:

| Scenario | "zbx_error_code" | "zbx_error_msg" |
|---|------------------|--------------------------------|
| No errors and the DNS response was received and parsed. | 0 | |
| DNS is down. | -1 | "Communication error" |
| Error occurs during JSON parsing | -2 | "Received unexpected response" |

With additional parameters, the `net.dns.get[192.0.2.0,example.com,ANY,5,5,tcp,"cdflag,rdflag,dnssec,nsid,edns0,aaf]` item may return the following JSON:

```

{
    "additional_section": [
        {
            "extended_rcode": 32768,
            "name": ".",
            "rdata": {
                "options": [
                    {
                        "code": 0,
                        "nsid": "67 70 64 6e 73 2d 6c 70 70"
                    }
                ]
            },
            "rdlength": 13,
            "type": "OPT",
            "udp_payload": 512
        }
    ],
    "answer_section": [
        {
            "class": "IN",
            "name": "example.com.",
            "rdata": {

```

```

        "a": "192.0.2.0"
    },
    "rdlength": 4,
    "ttl": 19308,
    "type": "A"
},
{
    "class": "IN",
    "name": "example.com.",
    "rdata": {
        "algorithm": 13,
        "expiration": 1704715951,
        "inception": 1702910624,
        "key_tag": 21021,
        "labels": 2,
        "orig_ttl": 86400,
        "signature": "HVB0BcJJQyOS08J3f8kviPj8UkEUj7wmyiMyQqPSWgQIY9SCEJ5plq6KuxJmtAek1txZWXDo+6tp",
        "signer_name": "example.com.",
        "type_covered": "A"
    },
    "rdlength": 95,
    "ttl": 19308,
    "type": "RRSIG"
}
],
"flags": [
    "RD",
    "RA",
    "AD",
    "CD"
],
"query_time": "0.058221",
"question_section": [
    {
        "qclass": "IN",
        "qname": "example.com.",
        "qtype": "ANY"
    }
],
"response_code": "NOERROR",
"zbx_error_code": 0
}

```

- [Domain Name System \(DNS\) Parameters](#)

18 Notes on system.cpu.util items on Windows

`system.cpu.util` item provides the CPU utilization percentage.

When a collector process is started on Zabbix agent for Windows, a buffer for N items for N logical processors (threads) is initialized. Values are periodically updated in the buffer using Windows performance counters. These values are reported when `system.cpu.util[n]` is requested, where $0 \leq n < N$.

One more item in the buffer is used for `system.cpu.util[total]`.

Zabbix automatically selects different performance counters to support both NUMA systems and older Windows versions with no processor group support.

If logical processor (thread) count is less or equal than 64 and number of processor groups is equal to 1, then:

N is logical processor (thread) count.

```
\Processor(_Total)\% Processor Time
\Processor(0)\% Processor Time
\Processor(1)\% Processor Time
\Processor(2)\% Processor Time
...
\Processor(N-1)\% Processor Time
```

Else:

G is processor group count and N is logical processor (thread) count in group.

```
\Processor Information(_Total)\% Processor Time
\Processor Information(0,0)\% Processor Time
\Processor Information(0,1)\% Processor Time
\Processor Information(0,2)\% Processor Time
...
\Processor Information(0,N-1)\% Processor Time
...
\Processor Information(G-1,0)\% Processor Time
\Processor Information(G-1,1)\% Processor Time
\Processor Information(G-1,2)\% Processor Time
...
\Processor Information(G-1,N-1)\% Processor Time
```

5 Supported functions

Click on the respective function group to see more details.

| Function group | Functions |
|---------------------------------|---|
| Aggregate func-tions | avg, bucket_percentile, count, histogram_quantile, item_count, kurtosis, mad, max, min, skewness, stddevpop, stddevsamp, sum, sumofsquares, varpop, varsamp |
| Foreach functions | avg_foreach, bucket_rate_foreach, count_foreach, exists_foreach, last_foreach, max_foreach, min_foreach, sum_foreach |
| Bitwise func-tions | bitand, bitlshift, bitnot, bitor, bitrshift, bitxor |
| Date and time func-tions | date, dayofmonth, dayofweek, now, time |
| History func-tions | change, changecount, count, countunique, find, first, fuzzytime, last, logeventid, logseverity, logsource, monodec, monoinc, nodata, percentile, rate |
| Trend func-tions | baselinedev, baselinewma, trendavg, trendcount, trendmax, trendmin, trendstl, trendsum |
| Mathematical func-tions | abs, acos, asin, atan, atan2, avg, cbrt, ceil, cos, cosh, cot, degrees, e, exp, expm1, floor, log, log10, max, min, mod, pi, power, radians, rand, round, signum, sin, sinh, sqrt, sum, tan, truncate |
| Operator func-tions | between, in |
| Predictive func-tions | forecast, timeleft |

| Function group | Functions |
|------------------|---|
| String functions | ascii, bitlength, bytelength, char, concat, insert, jsonpath, left, length, ltrim, mid, repeat, replace, right, rtrim, trim, xmlxpath |

These functions are supported in [trigger expressions](#) and [calculated items](#).

Foreach functions are supported only for [aggregate calculations](#).

1 Aggregate functions

Except where stated otherwise, all functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Aggregate functions can work with either:

- history of items, for example, `min(/host/key,1h)`
- [foreach functions](#) as the only parameter, for example, `min(last_foreach(/*/key))` (only in calculated items; cannot be used in triggers)

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|------------------------------------|--|
| avg | The average value of an item within the defined evaluation period. |
| bucket_percentile | Calculates the percentile from the buckets of a histogram. |
| count | The count of values in an array returned by a foreach function. |
| histogram_quantile | Calculates the ϕ -quantile from the buckets of a histogram. |
| item_count | The count of existing items in configuration that match the filter criteria. |
| kurtosis | The "tailedness" of the probability distribution in collected values within the defined evaluation period. |
| mad | The median absolute deviation in collected values within the defined evaluation period. |
| max | The highest value of an item within the defined evaluation period. |
| min | The lowest value of an item within the defined evaluation period. |
| skewness | The asymmetry of the probability distribution in collected values within the defined evaluation period. |
| stddevpop | The population standard deviation in collected values within the defined evaluation period. |
| stddevsamp | The sample standard deviation in collected values within the defined evaluation period. |
| sum | The sum of collected values within the defined evaluation period. |
| sumofsquares | The sum of squares in collected values within the defined evaluation period. |
| varpop | The population variance of collected values within the defined evaluation period. |
| varsamp | The sample variance of collected values within the defined evaluation period. |

Common parameters

- `/host/key` is a common mandatory first parameter for the functions referencing the host item history
- `(sec|#num)<:time shift>` is a common second parameter for the functions referencing the host item history, where:
 - **sec** - maximum [evaluation period](#) in seconds (time [suffixes](#) can be used), or
 - **#num** - maximum [evaluation range](#) in latest collected values (if preceded by a hash mark)
 - **time shift** (optional) allows to move the evaluation point back in time. See [more details](#) on specifying time shift.

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by `< >`
- Function-specific parameters are described with each function
- `/host/key` and `(sec|#num)<:time shift>` parameters must never be quoted

`avg(/host/key,(sec|#num)<:time shift>)`

The average value of an item within the defined evaluation period.
 Supported value types: *Float*, *Integer*.
 Supported [foreach functions](#): *avg_foreach*, *count_foreach*, *exists_foreach*, *last_foreach*, *max_foreach*, *min_foreach*, *sum_foreach*.

Parameters: see [common parameters](#).

Time shift is useful when there is a need to compare the current average value with the average value some time ago.

Examples:

```
avg(/host/key,1h) #the average value for the last hour until now
avg(/host/key,1h:now-1d) #the average value for an hour from 25 hours ago to 24 hours ago from now
avg(/host/key,#5) #the average value of the five latest values
avg(/host/key,#5:now-1d) #the average value of the five latest values excluding the values received in the
```

bucket_percentile(item filter,time period,percentage)

Calculates the percentile from the buckets of a histogram.

Parameters:

- **item filter** - see [item filter](#);

- **time period** - see [time period](#);

- **percentage** - percentage (0-100).

Comments:

- Supported only in calculated items;
- This function is an alias for histogram_quantile(percentage/100, bucket_rate_foreach(item filter, time period, 1)).

count(func_foreach(item filter,<time period>),<operator>,<pattern>)

The count of values in an array returned by a foreach function.
 Supported **foreach functions**: *avg_foreach*, *count_foreach*, *exists_foreach*, *last_foreach*, *max_foreach*, *min_foreach*, *sum_foreach*.

Parameters:

- **func_foreach** - foreach function for which the number of returned values should be counted. See [foreach functions](#) for details. Note that count_foreach and bucket_rate_foreach support [additional parameters](#).
- **item filter** - see [item filter](#);

- **time period** - see [time period](#);

- **operator** (must be double-quoted). Supported operators:
eq - equal
ne - not equal
gt - greater
ge - greater or equal
lt - less
le - less or equal
like - matches if contains pattern (case-sensitive)
bitand - bitwise AND
regexp - case-sensitive match of the regular expression given in pattern
iregexp - case-insensitive match of the regular expression given in pattern

- **pattern** - the required pattern (string arguments must be double-quoted); supported if *operator* is specified in the third parameter.

Comments:

- Using **count()** with a history-related foreach function (*max_foreach*, *avg_foreach*, etc.) may lead to performance implications, whereas using **exists_foreach()**, which works only with configuration data, will not have such effect.
- Optional parameters *operator* or *pattern* can't be left empty after a comma, only fully omitted.
- With *bitand* as the third parameter, the fourth *pattern* parameter can be specified as two numbers, separated by '/': **number_to_compare_with/mask**. count() calculates "bitwise AND" from the value and the *mask* and compares the result to *number_to_compare_with*. If the result of "bitwise AND" is equal to *number_to_compare_with*, the value is counted.
If *number_to_compare_with* and *mask* are equal, only the *mask* need be specified (without '/').
- With *regexp* or *iregexp* as the third parameter, the fourth *pattern* parameter can be an ordinary or **global** (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings. For the purpose of regexp matching, float values will always be represented with 4 decimal digits after '.'. Also note that for large numbers difference in decimal (stored in database) and binary (used by Zabbix server) representation may affect the 4th decimal digit.

Examples:

```
count(max_foreach(/*/net.if.in[*],1h)) #the number of net.if.in items that received data in the last hour
count(last_foreach(/*/vfs.fs.dependent.size[*,pused]),"gt",95) #the number of file systems with over 95% o
histogram_quantile(quantile,bucket1,value1,bucket2,value2,...)
```

Calculates the ϕ -quantile from the buckets of a histogram.
 Supported **foreach function**: *bucket_rate_foreach*.

Parameters:

- **quantile** - $0 \leq \phi \leq 1$;

- **bucketN, valueN** - manually entered pairs (≥ 2) of parameters or the response of [bucket_rate_foreach](#).

Comments:

- Supported only in calculated items;
- Functionally corresponds to 'histogram_quantile' of PromQL;
- Returns -1 if values of the last 'Infinity' bucket ("+inf") are equal to 0.

Examples:

```
histogram_quantile(0.75,1.0,last(/host/rate_bucket[1.0]),"+Inf",last(/host/rate_bucket[Inf]))
histogram_quantile(0.5,bucket_rate_foreach(/item_key,30s))
item_count(item filter)
```

The count of existing items in configuration that match the filter criteria.
 Supported value type: *Integer*.

Parameter:

- **item filter** - criteria for item selection, allows referencing by host group, host, item key, and tags. Wildcards are supported. See [item filter](#) for more details.

Comments:

- Supported only in calculated items;
- Works as an alias for the *count(exists_foreach(item_filter))* function.

Examples:

```
item_count(/*/agent.ping?[group="Host group 1"]) #the number of hosts with the *agent.ping* item in the "Host group 1"
kurtosis(/host/key,(sec|#num)<:time shift>)
```

The "tailedness" of the probability distribution in collected values within the defined evaluation period. See also: [Kurtosis](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

Example:

```
kurtosis(/host/key,1h) #kurtosis for the last hour until now
mad(/host/key,(sec|#num)<:time shift>)
```

The median absolute deviation in collected values within the defined evaluation period. See also: [Median absolute deviation](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

Example:

```
mad(/host/key,1h) #median absolute deviation for the last hour until now
max(/host/key,(sec|#num)<:time shift>)
```

The highest value of an item within the defined evaluation period.
 Supported value types: *Float*, *Integer*.
 Supported **foreach functions**: *avg_foreach*, *count_foreach*, *exists_foreach*, *last_foreach*, *max_foreach*, *min_foreach*, *sum_foreach*.

Parameters: see [common parameters](#).

Example:

```
max(/host/key,1h) - min(/host/key,1h) #calculate the difference between the maximum and minimum values within the last hour until now
min(/host/key,(sec|#num)<:time shift>)
```

The lowest value of an item within the defined evaluation period.
 Supported value types: *Float*, *Integer*.
 Supported **foreach functions**: *avg_foreach*, *count_foreach*, *exists_foreach*, *last_foreach*, *max_foreach*, *min_foreach*, *sum_foreach*.

Parameters: see [common parameters](#).

Example:

```
max(/host/key,1h) - min(/host/key,1h) #calculate the difference between the maximum and minimum values within the last hour until now
skewness(/host/key,(sec|#num)<:time shift>)
```

The asymmetry of the probability distribution in collected values within the defined evaluation period. See also: [Skewness](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

Example:

```
skewness(/host/key,1h) #the skewness for the last hour until now  
stddevpop(/host/key,(sec|#num)<:time shift>)
```

The population standard deviation in collected values within the defined evaluation period. See also: [Standard deviation](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

Example:

```
stddevpop(/host/key,1h) #the population standard deviation for the last hour until now  
stddevsamp(/host/key,(sec|#num)<:time shift>)
```

The sample standard deviation in collected values within the defined evaluation period. See also: [Standard deviation](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

At least two data values are required for this function to work.

Example:

```
stddevsamp(/host/key,1h) #the sample standard deviation for the last hour until now  
sum(/host/key,(sec|#num)<:time shift>)
```

The sum of collected values within the defined evaluation period.
 Supported value types: *Float*, *Integer*.
 Supported **foreach functions**: *avg_foreach*, *count_foreach*, *exists_foreach*, *last_foreach*, *max_foreach*, *min_foreach*, *sum_foreach*.

Parameters: see [common parameters](#).

Example:

```
sum(/host/key,1h) #the sum of values for the last hour until now  
sumofsquares(/host/key,(sec|#num)<:time shift>)
```

The sum of squares in collected values within the defined evaluation period.
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

Example:

```
sumofsquares(/host/key,1h) #the sum of squares for the last hour until now  
varpop(/host/key,(sec|#num)<:time shift>)
```

The population variance of collected values within the defined evaluation period. See also: [Variance](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

Example:

```
varpop(/host/key,1h) #the population variance for the last hour until now  
varsamp(/host/key,(sec|#num)<:time shift>)
```

The sample variance of collected values within the defined evaluation period. See also: [Variance](#).
 Supported value types: *Float*, *Integer*.
 Supported **foreach function**: *last_foreach*.

Parameters: see [common parameters](#).

At least two data values are required for this function to work.

Example:

```
varsamp(/host/key,1h) #the sample variance for the last hour until now
```

See [all supported functions](#).

1 Foreach functions

Overview

Foreach functions are used in **aggregate calculations** to return one aggregate value for each item that is selected by the used **item filter**. An array of values is returned.

For example, the *avg_foreach* function will return an array of values, where each value is the *average* history value of the selected item, during the time interval that is specified.

The **item filter** is part of the syntax used by foreach functions. The use of wildcards is supported in the item filter, thus the required items can be selected quite flexibly.

Supported functions

| Function | Description |
|----------------------------|---|
| <i>avg_foreach</i> | Returns the average value for each item. |
| <i>bucket_rate_foreach</i> | Returns pairs (bucket upper bound, rate value) suitable for use in the <i>histogram_quantile()</i> function, where "bucket upper bound" is the value of item key parameter defined by the <parameter number> parameter . |
| <i>count_foreach</i> | Returns the number of values for each item. |
| <i>exists_foreach</i> | Returns '1' for each enabled item. |
| <i>last_foreach</i> | Returns the last value for each item. |
| <i>max_foreach</i> | Returns the maximum value for each item. |
| <i>min_foreach</i> | Returns the minimum value for each item. |
| <i>sum_foreach</i> | Returns the sum of values for each item. |

Function syntax

Foreach functions support two common parameters: **item filter** (see details below) and **time period**:

`foreach_function(item filter,time period)`

For example:

`avg_foreach(/*/mysql.qps?[group="MySQL Servers"],5m)`

will return the five-minute average of each 'mysql.qps' item in the MySQL server group.

Note that some functions support additional **parameters**.

Item filter syntax

The item filter:

`/host/key[parameters]?[conditions]`

consists of four parts, where:

- host - host name
- key - item key (without parameters)
- parameters - item key parameters
- conditions - host group and/or item tag based conditions (as expression)

Spaces are allowed only inside the conditions expression.

Wildcard usage

- Wildcard can be used to replace the host name, item key or an individual item key parameter.
- Either the host or item key must be specified without wildcard. So `/host/*` and `/*/key` are valid filters, but `/*/*` is invalid.
- Wildcard cannot be used for a *part* of host name, item key, item key parameter.
- Wildcard does not match more than a single item key parameter. So a wildcard must be specified for each parameter in separation (i.e. `key[abc,*,*]`).

Conditions expression

The conditions expression supports:

- operands:
 - group - host group
 - tag - item tag
 - "<text>" - string constant, with the \ escape character to escape " and \

- case-sensitive string comparison operators: =, <>
- logical operators: and, or, not
- grouping with parentheses: ()

Quotation of string constants is mandatory. Only case-sensitive full string comparison is supported.

Warning:

When specifying tags in the filter (i.e. tag="tagname:value"), the colon ":" is used as a delimiter. Everything after it is considered the tag value. Thus it is currently not supported to specify a tag name containing ":" in it.

Examples

A complex filter may be used, referencing the item key, host group and tags, as illustrated by the examples:

| Syntax example | Description |
|---|---|
| /host/key[abc,*] | Matches similar items on this host. |
| /*/key | Matches the same item of any host. |
| */key?[group="ABC" and tag="tagname:value"] | Matches the same item of any host from the ABC group having 'tagname:value' tags. |
| */key[a,*,c]?[(group="ABC" and tag="Tag1") or (group="DEF" and (tag="Tag2" or tag="Tag3:value"))] | Matches similar items of any host from the ABC or DEF group with the respective tags. |

All referenced items must exist and collect data. Only enabled items on enabled hosts are included in the calculations. Items in the unsupported state are not included.

Attention:

If the item key of a referenced item is changed, the filter must be updated manually.

Specifying a parent host group includes the parent group and all nested host groups with their items.

Time period

The **second** parameter allows to specify the time period for aggregation. The time period can only be expressed as time, the amount of values (prefixed with #) is not supported.

Supported unit symbols can be used in this parameter for convenience, for example, '5m' (five minutes) instead of '300s' (300 seconds) or '1d' (one day) instead of '86400' (86400 seconds).

For the *last_foreach* function time period is an optional parameter (supported since Zabbix 7.0), which can be omitted:

```
last_foreach(/*/key?[group="host group"])
```

Time period is not supported with the *exists_foreach* function.

Additional parameters

bucket_rate_foreach

A third optional parameter is supported by the *bucket_rate_foreach* function:

```
bucket_rate_foreach(item filter,time period,<parameter number>)
```

where <parameter number> is the position of the "bucket" value in the item key. For example, if the "bucket" value in myItem[aaa,0.2] is '0.2', then its position is 2.

The default value of <parameter number> is '1'.

count_foreach

Third and fourth optional parameters are supported by the *count_foreach* function:

```
count_foreach(item filter,time period,<operator>,<pattern>)
```

Where:

- **operator** is the conditional operator for item values (must be double-quoted). Supported operators:
eq - equal
ne - not equal
gt - greater
ge - greater or equal
lt - less
le - less or equal
like - matches if contains pattern (case-sensitive)
bitand - bitwise AND
regex - case-sensitive match of the regular expression given in pattern
iregex - case-insensitive match of the regular expression given in pattern

- **pattern** is the required pattern (string arguments must be double-quoted); supported if *operator* is specified in the third parameter.

Comments:

- Optional parameters *operator* or *pattern* can't be left empty after a comma, only fully omitted.
- With *bitand* as the third parameter, the fourth *pattern* parameter can be specified as two numbers, separated by '/': **number_to_compare_with/mask**. `count_foreach()` calculates "bitwise AND" from the value and the *mask* and compares the result to *number_to_compare_with*. If the result of "bitwise AND" is equal to *number_to_compare_with*, the value is counted.
If *number_to_compare_with* and *mask* are equal, only the *mask* need be specified (without '/').
- With *regex* or *iregex* as the third parameter, the fourth *pattern* parameter can be an ordinary or **global** (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings. For the purpose of regex matching, float values will always be represented with 4 decimal digits after '.'. Also note that for large numbers difference in decimal (stored in database) and binary (used by Zabbix server) representation may affect the 4th decimal digit.

See [aggregate calculations](#) for more details and examples on using foreach functions.

Behavior depending on availability

The following table illustrates how each function behaves in cases of limited availability of host/item and history data.

| Function | Disabled host | Unavailable host with data | Unavailable host without data | Disabled item | Unsupported item | Data retrieval error (SQL) |
|----------------------------|---------------|----------------------------|-------------------------------|---------------|------------------|----------------------------|
| <i>avg_foreach</i> | ignore | return avg | ignore | ignore | ignore | ignore |
| <i>bucket_rate_foreach</i> | ignore | return bucket rate | ignore | ignore | ignore | ignore |
| <i>count_foreach</i> | ignore | return count | 0 | ignore | ignore | ignore |
| <i>exists_foreach</i> | ignore | 1 | 1 | ignore | 1 | n/a |
| <i>last_foreach</i> | ignore | return last | ignore | ignore | ignore | ignore |
| <i>max_foreach</i> | ignore | return max | ignore | ignore | ignore | ignore |
| <i>min_foreach</i> | ignore | return min | ignore | ignore | ignore | ignore |
| <i>sum_foreach</i> | ignore | return sum | ignore | ignore | ignore | ignore |

If the item is *ignored*, nothing is added to the aggregation.

2 Bitwise functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|---------------------------|--|
| bitand | The value of "bitwise AND" of an item value and mask. |
| bitlshift | The bitwise shift left of an item value. |
| bitnot | The value of "bitwise NOT" of an item value. |
| bitor | The value of "bitwise OR" of an item value and mask. |
| bitrshift | The bitwise shift right of an item value. |
| bitxor | The value of "bitwise exclusive OR" of an item value and mask. |

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters
- Optional function parameters (or parameter parts) are indicated by < >

`bitand(value,mask)`

The value of "bitwise AND" of an item value and mask.
Supported value types: *Integer*.

Parameters:

- **value** - the value to check;
- **mask** (mandatory) - a 64-bit unsigned integer (0 - 18446744073709551615).

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

Examples:

`bitand(last(/host/key),12)=8` or `bitand(last(/host/key),12)=4` #3rd or 4th bit set, but not both at the same time
`bitand(last(/host/key),20)=16` #3rd bit not set and 5th bit set

`bitlshift(value,bits to shift)`

The bitwise shift left of an item value.
 Supported value types: *Integer*.

Parameters:

- **value** - the value to check;
- **bits to shift** (mandatory) - the number of bits to shift.

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

`bitnot(value)`

The value of "bitwise NOT" of an item value.
 Supported value types: *Integer*.

Parameter:

- **value** - the value to check.

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

`bitor(value,mask)`

The value of "bitwise OR" of an item value and mask.
 Supported value types: *Integer*.

Parameters:

- **value** - the value to check;
- **mask** (mandatory) - a 64-bit unsigned integer (0 - 18446744073709551615).

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

`bitrshift(value,bits to shift)`

The bitwise shift right of an item value.
 Supported value types: *Integer*.

Parameters:

- **value** - the value to check;
- **bits to shift** (mandatory) - the number of bits to shift.

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

`bitxor(value,mask)`

The value of "bitwise exclusive OR" of an item value and mask.
 Supported value types: *Integer*.

Parameters:

- **value** - the value to check;
- **mask** (mandatory) - a 64-bit unsigned integer (0 - 18446744073709551615).

Although the comparison is done in a bitwise manner, all the values must be supplied and are returned in decimal. For example, checking for the 3rd bit is done by comparing to 4, not 100.

See [all supported functions](#).

3 Date and time functions

All functions listed here are supported in:

- [Trigger expressions](#)

- [Calculated items](#)

Attention:

Date and time functions cannot be used in the expression by themselves; at least one function from [another group](#), referencing the host item, must be included in the expression (except the [nodata\(\)](#) function). For detailed information on how date and time functions work within expressions, see [Calculation time](#).

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|----------------------------|--|
| date | The current date in YYYYMMDD format. |
| dayofmonth | The day of month in range of 1 to 31. |
| dayofweek | The day of week in range of 1 to 7. |
| now | The number of seconds since the Epoch (00:00:00 UTC, January 1, 1970). |
| time | The current time in HHMMSS format. |

Function details

[date](#)

The current date in YYYYMMDD format.

Example:

`date()<20220101`

[dayofmonth](#)

The day of month in range of 1 to 31.

Example:

`dayofmonth()=1`

[dayofweek](#)

The day of week in range of 1 to 7 (Mon - 1, Sun - 7).

Example (only weekdays):

`dayofweek()<6`

Example (only weekend):

`dayofweek()>5`

[now](#)

The number of seconds since the Epoch (00:00:00 UTC, January 1, 1970).

Example:

`now()<1640998800`

[time](#)

The current time in HHMMSS format.

Example (only nighttime, 00:00-06:00):

`time()<060000`

See [all supported functions](#).

4 History functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|--------------------------|---|
| <code>change</code> | The amount of difference between the previous and latest value. |
| <code>changecount</code> | The number of changes between adjacent values within the defined evaluation period. |
| <code>count</code> | The number of values within the defined evaluation period. |
| <code>countunique</code> | The number of unique values within the defined evaluation period. |
| <code>find</code> | Find a value match within the defined evaluation period. |
| <code>first</code> | The first (the oldest) value within the defined evaluation period. |
| <code>fuzzytime</code> | Check how much the passive agent time differs from the Zabbix server/proxy time. |
| <code>last</code> | The most recent value. |
| <code>logeventid</code> | Check if the event ID of the last log entry matches a regular expression. |
| <code>logseverity</code> | The log severity of the last log entry. |
| <code>logsource</code> | Check if log source of the last log entry matches a regular expression. |
| <code>monodec</code> | Check if there has been a monotonous decrease in values. |
| <code>monoinc</code> | Check if there has been a monotonous increase in values. |
| <code>nodata</code> | Check for no data received. |
| <code>percentile</code> | The P-th percentile of a period, where P (percentage) is specified by the third parameter. |
| <code>rate</code> | The per-second average rate of the increase in a monotonically increasing counter within the defined time period. |

Common parameters

- `/host/key` is a common mandatory first parameter for the functions referencing the host item history
- `(sec|#num)<:time shift>` is a common second parameter for the functions referencing the host item history, where:
 - **sec** - maximum **evaluation period** in seconds (time **suffixes** can be used), or
 - **#num** - maximum **evaluation range** in latest collected values (if preceded by a hash mark)
 - **time shift** (optional) allows to move the evaluation point back in time. See **more details** on specifying time shift.

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by `< >`
- Function-specific parameters are described with each function
- `/host/key` and `(sec|#num)<:time shift>` parameters must never be quoted

`change(/host/key)`

The amount of difference between the previous and latest value.
 Supported value types: *Float, Integer, String, Text, Log*.
 For strings returns: 0 - values are equal; 1 - values differ.

Parameters: see **common parameters**.

Comments:

- Numeric difference will be calculated, as seen with these incoming example values ('previous' and 'latest' value = difference):
'1' and '5' = +4
'3' and '1' = -2
'0' and '-2.5' = -2.5

- See also: **abs** for comparison.

Examples:

```
change(/host/key)>10
```

```
changecount(/host/key,(sec|#num)<:time shift>,<mode>)
```

The number of changes between adjacent values within the defined evaluation period.
 Supported value types: *Float, Integer, String, Text, Log*.

Parameters:

- See **common parameters**;

- **mode** (must be double-quoted) - possible values: *all* - count all changes (default); *dec* - count decreases; *inc* - count increases

For non-numeric value types, the *mode* parameter is ignored.

Examples:

```
changecount(/host/key,1w) #the number of value changes for the last week until now
```

```
changecount(/host/key,#10,"inc") #the number of value increases (relative to the adjacent value) among the
```

```
changecount(/host/key,24h,"dec") #the number of value decreases (relative to the adjacent value) for the 1
```

count(/host/key,(sec|#num)<:time shift>,<operator>,<pattern>)

The number of values within the defined evaluation period.
 Supported value types: *Float, Integer, String, Text, Log*.

Parameters:

- See [common parameters](#);

- **operator** (must be double-quoted). Supported operators:
eq - equal (default for integer, float)
ne - not equal
gt - greater
ge - greater or equal
lt - less
le - less or equal
like (default for string, text, log)
- matches if contains pattern (case-sensitive)
bitand - bitwise AND
regexp - case-sensitive match of the regular expression given in *pattern*
iregexp - case-insensitive match of the regular expression given in *pattern*

- **pattern** - the required pattern (string arguments must be double-quoted).

Comments:

- Float items match with the precision of 2.22e-16;
- *like* is not supported as operator for integer values;
- *like* and *bitand* are not supported as operators for float values;
- For string, text, and log values only *eq*, *ne*, *like*, *regexp* and *iregexp* operators are supported;
- With *bitand* as operator, the fourth *pattern* parameter can be specified as two numbers, separated by '/': **number_to_compare_with/mask**. *count()* calculates "bitwise AND" from the value and the *mask* and compares the result to *number_to_compare_with*. If the result of "bitwise AND" is equal to *number_to_compare_with*, the value is counted.
If *number_to_compare_with* and *mask* are equal, only the *mask* need be specified (without '/').
- With *regexp* or *iregexp* as operator, the fourth *pattern* parameter can be an ordinary or **global** (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings. For the purpose of regexp matching, float values will always be represented with 4 decimal digits after '.'. Also note that for large numbers difference in decimal (stored in database) and binary (used by Zabbix server) representation may affect the 4th decimal digit.

Examples:

```
count(/host/key,10m) #the values for the last 10 minutes until now
count(/host/key,10m,"like","error") #the number of values for the last 10 minutes until now that contain 'error'
count(/host/key,10m,,12) #the number of values for the last 10 minutes until now that equal '12'
count(/host/key,10m,"gt",12) #the number of values for the last 10 minutes until now that are over '12'
count(/host/key,#10,"gt",12) #the number of values within the last 10 values until now that are over '12'
count(/host/key,10m:now-1d,"gt",12) #the number of values between 24 hours and 10 minutes and 24 hours ago
count(/host/key,10m,"bitand","6/7") #the number of values for the last 10 minutes until now having '110' (6 & 7 = 110)
count(/host/key,10m:now-1d) #the number of values between 24 hours and 10 minutes and 24 hours ago from now
```

countunique(/host/key,(sec|#num)<:time shift>,<operator>,<pattern>)

The number of unique values within the defined evaluation period.
 Supported value types: *Float, Integer, String, Text, Log*.

Parameters:

- See [common parameters](#);

- **operator** (must be double-quoted). Supported operators:
eq - equal (default for integer, float)
ne - not equal
gt - greater
ge - greater or equal
lt - less
le - less or equal
like (default for string, text, log)
- matches if contains pattern (case-sensitive)
bitand - bitwise AND
regexp - case-sensitive match of the regular expression given in *pattern*
iregexp - case-insensitive match of the regular expression given in *pattern*

- **pattern** - the required pattern (string arguments must be double-quoted).

Comments:

- Float items match with the precision of 2.22e-16;
- *like* is not supported as operator for integer values;
- *like* and *bitand* are not supported as operators for float values;
- For string, text, and log values only *eq*, *ne*, *like*, *regexp* and *iregexp* operators are supported;
- With *bitand* as operator, the fourth *pattern* parameter can be specified as two numbers, separated by '/': **number_to_compare_with/mask**. *countunique()* calculates "bitwise AND" from the value and the *mask* and compares the result to *number_to_compare_with*. If the result of "bitwise AND" is equal to *number_to_compare_with*, the value is counted.
If *number_to_compare_with* and *mask* are equal, only the *mask* need be specified (without '/').
- With *regexp* or *iregexp* as operator, the fourth *pattern* parameter can be an ordinary or **global** (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from global regular expression settings. For the purpose of regexp matching, float values will always be represented with 4 decimal digits after '.'. Also note that for large numbers difference in decimal (stored in database) and binary (used by Zabbix server) representation may affect the 4th decimal digit.

Examples:

```
countunique(/host/key,10m) #the number of unique values for the last 10 minutes until now
countunique(/host/key,10m,"like","error") #the number of unique values for the last 10 minutes until now t
countunique(/host/key,10m,,12) #the number of unique values for the last 10 minutes until now that equal '
countunique(/host/key,10m,"gt",12) #the number of unique values for the last 10 minutes until now that are
countunique(/host/key,#10,"gt",12) #the number of unique values within the last 10 values until now that a
countunique(/host/key,10m:now-1d,"gt",12) #the number of unique values between 24 hours and 10 minutes and
countunique(/host/key,10m,"bitand","6/7") #the number of unique values for the last 10 minutes until now h
countunique(/host/key,10m:now-1d) #the number of unique values between 24 hours and 10 minutes and 24 hour
```

```
find(/host/key,(sec|#num)<:time shift>,<operator>,<pattern>)
```

Find a value match within the defined evaluation period.
 Supported value types: *Float, Integer, String, Text, Log*.
 Returns: 1 - found; 0 - otherwise.

Parameters:

- See [common parameters](#);

- **sec** or **#num** (optional) - defaults to the latest value if not specified
- **operator** (must be double-quoted). Supported operators:
eq - equal (default for integer, float)
ne - not equal
gt - greater
ge - greater or equal
lt - less
le - less or equal
like (default for string, text, log) - matches if contains the string given in *pattern* (case-sensitive)
bitand - bitwise AND
regex - case-sensitive match of the regular expression given in *pattern*
iregexp - case-insensitive match of the regular expression given in *pattern*

- **pattern** - the required pattern (string arguments must be double-quoted); [Perl Compatible Regular Expression](#) (PCRE) regular expression if operator is *regex*, *iregexp*.

Comments:

- If more than one value is processed, '1' is returned if there is at least one matching value;
- *like* is not supported as operator for integer values;
- *like* and *bitand* are not supported as operators for float values;
- For string, text, and log values only *eq*, *ne*, *like*, *regex* and *iregexp* operators are supported;
- With *regex* or *iregexp* as operator, the fourth *pattern* parameter can be an ordinary or [global](#) (starting with '@') regular expression. In case of global regular expressions case sensitivity is inherited from the global regular expression settings.

Example:

```
find(/host/key,10m,"like","error") #find a value that contains 'error' within the last 10 minutes until now
first(/host/key,sec<:time shift>)
```

The first (the oldest) value within the defined evaluation period.
 Supported value types: *Float, Integer, String, Text, Log*.

Parameters:

- See [common parameters](#).

See also [last\(\)](#).

Example:

```
first(/host/key,1h) #retrieve the oldest value within the last hour until now
fuzzytime(/host/key,sec)
```

Check how much the passive agent time differs from the Zabbix server/proxy time.
 Supported value types: *Float, Integer*.
 Returns: 1 - difference between the passive item value (as timestamp) and Zabbix server/proxy timestamp (the clock of value collection) is less than or equal to *sec* seconds; 0 - otherwise.

Parameters:

- See [common parameters](#).

Comments:

- Usually used with the 'system.localtime' item to check that local time is in sync with the local time of Zabbix server. *Note* that 'system.localtime' must be configured as a [passive check](#).
- Can be used also with the *vfs.file.time[/path/file,modify]* key to check that the file did not get updates for long time;
- This function is not recommended for use in complex trigger expressions (with multiple items involved), because it may cause unexpected results (time difference will be measured with the most recent metric), e.g. in *fuzzytime(/Host/system.localtime,60)* or *last(/Host/trap)<>0*.

Example:

fuzzytime(/host/key,60s)=0 #detect a problem if the time difference is over 60 seconds

last(/host/key,<#num<:time shift>)

The most recent value.
 Supported value types: *Float, Integer, String, Text, Log*.

Parameters:

- See [common parameters](#);

- **#num** (optional) - the Nth most recent value.

Comments:

- Take note that a hash-tagged time period (#N) works differently here than with many other functions. For example: last(/host/key) is always equal to last(/host/key,#1); last(/host/key,#3) - the third most recent value (*not* three latest values);
- Zabbix does not guarantee the exact order of values if more than two values exist within one second in history;
- See also [first\(\)](#).

Example:

```
last(/host/key) #retrieve the last value
last(/host/key,#2) #retrieve the previous value
last(/host/key,#1) <> last(/host/key,#2) #the last and previous values differ
```

logeventid(/host/key,<#num<:time shift>,<pattern>)

Check if the event ID of the last log entry matches a regular expression.
 Supported value types: *Log*.
 Returns: 0 - does not match; 1 - matches.

Parameters:

- See [common parameters](#);

- **#num** (optional) - the Nth most recent value;

- **pattern** (optional) - the regular expression describing the required pattern, [Perl Compatible Regular Expression](#) (PCRE) style (string arguments must be double-quoted).

logseverity(/host/key,<#num<:time shift>)

Log severity of the last log entry.
 Supported value types: *Log*.
 Returns: 0 - default severity; N - severity (integer, useful for Windows event logs: 1 - Information, 2 - Warning, 4 - Error, 7 - Failure Audit, 8 - Success Audit, 9 - Critical, 10 - Verbose).

Parameters:

- See [common parameters](#);

- **#num** (optional) - the Nth most recent value.

Zabbix takes log severity from the **Information** field of Windows event log.

logsource(/host/key,<#num<:time shift>,<pattern>)

Check if log source of the last log entry matches a regular expression.
 Supported value types: *Log*.
 Returns: 0 - does not match; 1 - matches.

Parameters:

- See [common parameters](#);

- **#num** (optional) - the Nth most recent value;

- **pattern** (optional) - the regular expression describing the required pattern, [Perl Compatible Regular Expression](#) (PCRE) style (string arguments must be double-quoted).

Normally used for Windows event logs.

Example:

```
logsource(/host/key,, "VMware Server")
monodec(/host/key,(sec|#num)<:time shift>,<mode>)
```

Check if there has been a monotonous decrease in values.
 Supported value types: *Integer*.
 Returns: 1 - if all elements in the time period continuously decrease; 0 - otherwise.

Parameters:

- See [common parameters](#);

- **mode** (must be double-quoted) - *weak* (every value is smaller or the same as the previous one; default) or *strict* (every value has decreased).

Example:

```
monodec(/Host1/system.swap.size[all,free],60s) + monodec(/Host2/system.swap.size[all,free],60s) + monodec(/Host3/system.swap.size[all,free],60s)
monoinc(/host/key,(sec|#num)<:time shift>,<mode>)
```

Check if there has been a monotonous increase in values.
 Supported value types: *Integer*.
 Returns: 1 - if all elements in the time period continuously increase; 0 - otherwise.

Parameters:

- See [common parameters](#);

- **mode** (must be double-quoted) - *weak* (every value is bigger or the same as the previous one; default) or *strict* (every value has increased).

Example:

```
monoinc(/Host1/system.localtime,#3,"strict")=0 #check if the system local time has been increasing consistently
nodata(/host/key,sec,<mode>)
```

Check for no data received.
 Supported value types: *Integer, Float, Character, Text, Log*.
 Returns: 1 - if no data received during the defined period of time; 0 - otherwise.

Parameters:

- See [common parameters](#);

- **sec** - the period should not be less than 30 seconds because the history syncer process calculates this function only every 30 seconds; `nodata(/host/key,0)` is disallowed.
- **mode** - if set to *strict* (double-quoted), this function will be insensitive to proxy availability (see comments for details).

Comments:

- the 'nodata' triggers monitored by proxy are, by default, sensitive to proxy availability - if proxy becomes unavailable, the 'nodata' triggers will not fire immediately after a restored connection, but will skip the data for the delayed period. Note that for passive proxies suppression is activated if connection is restored more than 15 seconds and no less than 2 seconds later. For active proxies suppression is activated if connection is restored more than 15 seconds later. To turn off sensitiveness to proxy availability, use the third parameter, e.g.: `nodata(/host/key,5m,"strict")`; in this case the function will fire as soon as the evaluation period (five minutes) without data has past.

- This function will display an error if, within the period of the 1st parameter:
- there's no data and Zabbix server was restarted
- there's no data and maintenance was completed
- there's no data and the item was added or re-enabled

- Errors are displayed in the *Info* column in trigger [configuration](#);

- This function may not work properly if there are time differences between Zabbix server, proxy and agent. See also: [Time synchronization requirement](#);

- `nodata()` function cannot be used in the expression by itself; at least one function from [another group](#), referencing the host item, must be included in the expression (except [date and time functions](#)). For detailed information on how the `nodata()` function works within expressions, see [Calculation time](#).

```
percentile(/host/key,(sec|#num)<:time shift>,percentage)
```

The P-th percentile of a period, where P (percentage) is specified by the third parameter.
 Supported value types: *Float, Integer*.

Parameters:

- See [common parameters](#);

- **percentage** - a floating-point number between 0 and 100 (inclusive) with up to 4 digits after the decimal point.

```
rate(/host/key,sec<:time shift>)
```

The per-second average rate of the increase in a monotonically increasing counter within the defined time period.
 Supported value types: *Float, Integer*.

Parameters:

- See [common parameters](#).

Functionally corresponds to '[rate](#)' of PromQL.

Example:

```
rate(/host/key,30s) #if the monotonic increase over 30 seconds is 20, this function will return 0.67.
```

See [all supported functions](#).

5 Trend functions

Trend functions, in contrast to **history functions**, use **trend** data for calculations.

Trends store hourly aggregate values. Trend functions use these hourly averages, and thus are useful for long-term analysis.

Trend function results are cached so multiple calls to the same function with the same parameters fetch info from the database only once. The trend function cache is controlled by the **TrendFunctionCacheSize** server parameter.

Triggers that reference trend functions **only** are evaluated once per the smallest time period in the expression. For instance, a trigger like

```
trendavg(/host/key,1d:now/d) > 1 or trendavg(/host/key2,1w:now/w) > 2
```

will be evaluated once per day. If the trigger contains both trend and history (or **date and time** and/or **nodata()**) functions, it is calculated in accordance with the **usual principles**.

All functions listed here are supported in:

- **Trigger expressions**
- **Calculated items**

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|--------------------|--|
| baselinedev | Returns the number of deviations (by stddevpop algorithm) between the last data period and the same data periods in preceding seasons. |
| baselinewma | Calculates the baseline by averaging data from the same timeframe in multiple equal time periods ('seasons') using the weighted moving average algorithm. |
| trendavg | The average of trend values within the defined time period. |
| trendcount | The number of successfully retrieved history values used to calculate the trend value within the defined time period. |
| trendmax | The maximum in trend values within the defined time period. |
| trendmin | The minimum in trend values within the defined time period. |
| trendstl | Returns the rate of anomalies during the detection period - a decimal value between 0 and 1 that is ((the number of anomaly values)/(total number of values)). |
| trendsum | The sum of trend values within the defined time period. |

Common parameters

- **/host/key** is a common mandatory first parameter
- **time period:time shift** is a common second parameter, where:
 - **time period** - the time period (minimum '1h'), defined as **<N><time unit>** where **N** - the number of time units, **time unit** - h (hour), d (day), w (week), M (month) or y (year).
 - **time shift** - the **time period offset** (see function examples)

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by **< >**
- Function-specific parameters are described with each function
- **/host/key** and **time period:time shift** parameters must never be quoted

baselinedev(/host/key,data period:time shift,season unit,num seasons)

Returns the number of deviations (by stddevpop algorithm) between the last data period and the same data periods in preceding seasons.

Parameters:

- See **common parameters**;

- **data period** - the data gathering period within a season, defined as **<N><time unit>** where:
N - the number of time units
time unit - h (hour), d (day), w (week), M (month) or y (year), must be equal to or less than season

- **season unit** - the duration of one season (h, d, w, M, y), cannot be smaller than data period;
- **num seasons** - the number of seasons to evaluate.

Examples:

```
baselinedev(/host/key,1d:now/d,"M",6) #calculating the number of standard deviations (population) between
baselinedev(/host/key,1h:now/h,"d",10) #calculating the number of standard deviations (population) between
baselinewma(/host/key,data period:time shift,season unit,num seasons)
```

Calculates the baseline by averaging data from the same timeframe in multiple equal time periods ('seasons') using the weighted moving average algorithm.

Parameters:

- See [common parameters](#);

- **data period** - the data gathering period within a season, defined as <N><time unit> where:
N - the number of time units
time unit - h (hour), d (day), w (week), M (month) or y (year), must be equal to or less than season
Time shift - the time period offset, defines the end of data gathering time frame in seasons (see examples);

- **season unit** - the duration of one season (h, d, w, M, y), cannot be smaller than data period;

- **num seasons** - the number of seasons to evaluate.

Examples:

```
baselinewma(/host/key,1h:now/h,"d",3) #calculating the baseline based on the last full hour within a 3-day
baselinewma(/host/key,2h:now/h,"d",3) #calculating the baseline based on the last two hours within a 3-day
baselinewma(/host/key,1d:now/d,"M",4) #calculating the baseline based on the same day of month as 'yesterday'
trendavg(/host/key,time period:time shift)
```

The average of trend values within the defined time period.

Parameters:

- See [common parameters](#).

Examples:

```
trendavg(/host/key,1h:now/h) #the average for the previous hour (e.g. 12:00-13:00)
trendavg(/host/key,1h:now/h-1h) #the average for two hours ago (11:00-12:00)
trendavg(/host/key,1h:now/h-2h) #the average for three hours ago (10:00-11:00)
trendavg(/host/key,1M:now/M-1y) #the average for the previous month a year ago
trendcount(/host/key,time period:time shift)
```

The number of successfully retrieved history values used to calculate the trend value within the defined time period.

Parameters:

- See [common parameters](#).

Examples:

```
trendcount(/host/key,1h:now/h) #the value count for the previous hour (e.g. 12:00-13:00)
trendcount(/host/key,1h:now/h-1h) #the value count for two hours ago (11:00-12:00)
trendcount(/host/key,1h:now/h-2h) #the value count for three hours ago (10:00-11:00)
trendcount(/host/key,1M:now/M-1y) #the value count for the previous month a year ago
trendmax(/host/key,time period:time shift)
```

The maximum in trend values within the defined time period.

Parameters:

- See [common parameters](#).

Examples:

```
trendmax(/host/key,1h:now/h) #the maximum for the previous hour (e.g. 12:00-13:00)
trendmax(/host/key,1h:now/h) - trendmin(/host/key,1h:now/h) → calculate the difference between the maximum and minimum
trendmax(/host/key,1h:now/h-1h) #the maximum for two hours ago (11:00-12:00)
trendmax(/host/key,1h:now/h-2h) #the maximum for three hours ago (10:00-11:00)
trendmax(/host/key,1M:now/M-1y) #the maximum for the previous month a year ago
trendmin(/host/key,time period:time shift)
```

The minimum in trend values within the defined time period.

Parameters:

- See [common parameters](#).

Examples:

```
trendmin(/host/key,1h:now/h) #the minimum for the previous hour (e.g. 12:00-13:00)
trendmax(/host/key,1h:now/h) - trendmin(/host/key,1h:now/h) → calculate the difference between the maximum and minimum
trendmin(/host/key,1h:now/h-1h) #the minimum for two hours ago (11:00-12:00)
trendmin(/host/key,1h:now/h-2h) #the minimum for three hours ago (10:00-11:00)
trendmin(/host/key,1M:now/M-1y) #the minimum for the previous month a year ago

trendstl(/host/key,eval period:time shift,detection period,season,<deviations>,<devalg>,<s window>)
```

Returns the rate of anomalies during the detection period - a decimal value between 0 and 1 that is ((the number of anomaly values)/(total number of values)).

Parameters:

- See [common parameters](#);
- **eval period** - the time period that must be decomposed (minimum '1h'), defined as <N><time unit> where
N - the number of time units
time unit - h (hour), d (day), w (week), M (month) or y (year)

- **detection period** - the time period before the end of eval period for which anomalies are calculated (minimum '1h', cannot be longer than eval period), defined as <N><time unit> where
N - the number of time units
time unit - h (hour), d (day), w (week)

- **season** - the shortest time period where a repeating pattern ("season") is expected (minimum '2h', cannot be longer than eval period, the number of entries in the eval period must be greater than the two times of the resulting frequency (season/h)), defined as <N><time unit> where
N - the number of time units
time unit - h (hour), d (day), w (week)
- **deviations** - the number of deviations (calculated by devalg) to count as anomaly (can be decimal), (must be greater than or equal to 1, default is 3);
- **devalg** (must be double-quoted) - the deviation algorithm, can be *stddevpop*, *stddevsamp* or *mad* (default);
- **s window** - the span (in lags) of the loess window for seasonal extraction (default is 10 * number of entries in eval period + 1)

Examples:

```
trendstl(/host/key,100h:now/h,10h,2h) #analyse the last 100 hours of trend data, find the anomaly rate for the last 10 hours
trendstl(/host/key,100h:now/h-10h,100h,2h,2.1,"mad") #analyse the period of 100 hours of trend data, up to 10 hours ago, find the anomaly rate
trendstl(/host/key,100d:now/d-1d,10d,1d,4,,10) #analyse 100 days of trend data up to a day ago, find the anomaly rate
trendstl(/host/key,1M:now/M-1y,1d,2h,,,"stddevsamp") #analyse the previous month a year ago, find the anomaly rate

trendsum(/host/key,time period:time shift)
```

The sum of trend values within the defined time period.

Parameters:

- See [common parameters](#).

Examples:

```
trendsum(/host/key,1h:now/h) #the sum for the previous hour (e.g. 12:00-13:00)
trendsum(/host/key,1h:now/h-1h) #the sum for two hours ago (11:00-12:00)
trendsum(/host/key,1h:now/h-2h) #the sum for three hours ago (10:00-11:00)
trendsum(/host/key,1M:now/M-1y) #the sum for the previous month a year ago
```

See [all supported functions](#).

6 Mathematical functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

Mathematical functions are supported with float and integer value types, unless stated otherwise.

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|----------------------|--|
| abs | The absolute value of a value. |
| acos | The arccosine of a value as an angle, expressed in radians. |
| asin | The arcsine of a value as an angle, expressed in radians. |
| atan | The arctangent of a value as an angle, expressed in radians. |

| Function | Description |
|-----------------------|--|
| <code>atan2</code> | The arctangent of the ordinate (value) and abscissa coordinates specified as an angle, expressed in radians. |
| <code>avg</code> | The average value of the referenced item values. |
| <code>cbrt</code> | The cube root of a value. |
| <code>ceil</code> | Round the value up to the nearest greater or equal integer. |
| <code>cos</code> | The cosine of a value, where the value is an angle expressed in radians. |
| <code>cosh</code> | The hyperbolic cosine of a value. |
| <code>cot</code> | The cotangent of a value, where the value is an angle expressed in radians. |
| <code>degrees</code> | Converts a value from radians to degrees. |
| <code>e</code> | The Euler's number (2.718281828459045). |
| <code>exp</code> | The Euler's number at a power of a value. |
| <code>expm1</code> | The Euler's number at a power of a value minus 1. |
| <code>floor</code> | Round the value down to the nearest smaller or equal integer. |
| <code>log</code> | The natural logarithm. |
| <code>log10</code> | The decimal logarithm. |
| <code>max</code> | The highest value of the referenced item values. |
| <code>min</code> | The lowest value of the referenced item values. |
| <code>mod</code> | The division remainder. |
| <code>pi</code> | The Pi constant (3.14159265358979). |
| <code>power</code> | The power of a value. |
| <code>radians</code> | Converts a value from degrees to radians. |
| <code>rand</code> | Return a random integer value. |
| <code>round</code> | Round the value to decimal places. |
| <code>signum</code> | Returns '-1' if a value is negative, '0' if a value is zero, '1' if a value is positive. |
| <code>sin</code> | The sine of a value, where the value is an angle expressed in radians. |
| <code>sinh</code> | The hyperbolical sine of a value, where the value is an angle expressed in radians. |
| <code>sqrt</code> | The square root of a value. |
| <code>sum</code> | The sum of the referenced item values. |
| <code>tan</code> | The tangent of a value. |
| <code>truncate</code> | Truncate the value to decimal places. |

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters
- Optional function parameters (or parameter parts) are indicated by < >

`abs(value)`

The absolute value (from 0) of a value.

Parameter:

- **value** - the value to check

For example, the absolute value of either '3' or '-3' will be '3'.

Example:

```
abs(last(/host/key))>10
```

`acos(value)`

The arccosine of a value as an angle, expressed in radians.

Parameter:

- **value** - the value to check

The value must be between -1 and 1. For example, the arccosine of a value '0.5' will be '2.0943951'.

Example:

```
acos(last(/host/key))
```

`asin(value)`

The arcsine of a value as an angle, expressed in radians.

Parameter:

- **value** - the value to check

The value must be between -1 and 1. For example, the arcsine of a value '0.5' will be '-0.523598776'.

Example:

```
asin(last(/host/key))
```

```
atan(value)
```

The arctangent of a value as an angle, expressed in radians.

Parameter:

- **value** - the value to check

The value must be between -1 and 1. For example, the arctangent of a value '1' will be '0.785398163'.

Example:

```
atan(last(/host/key))
```

```
atan2(value,abscissa)
```

The arctangent of the ordinate (value) and abscissa coordinates specified as an angle, expressed in radians.

Parameters:

- **value** - the value to check;
- **abscissa** - the abscissa value.

For example, the arctangent of the ordinate and abscissa coordinates of a value '1' will be '2.21429744'.

Example:

```
atan2(last(/host/key),2)
```

```
avg(<value1>,<value2>,...)
```

The average value of the referenced item values.

Parameter:

- **valueX** - the value returned by another function that is working with item history.

Example:

```
avg(avg(/host/key),avg(/host2/key2))
```

```
cbirt(value)
```

The cube root of a value.

Parameter:

- **value** - the value to check

For example, the cube root of '64' will be '4', of '63' will be '3.97905721'.

Example:

```
cbirt(last(/host/key))
```

```
ceil(value)
```

Round the value up to the nearest greater or equal integer.

Parameter:

- **value** - the value to check

For example, '2.4' will be rounded up to '3'. See also **floor()**.

Example:

```
ceil(last(/host/key))
```

`cos(value)`

The cosine of a value, where the value is an angle expressed in radians.

Parameter:

- **value** - the value to check

For example, the cosine of a value '1' will be '0.54030230586'.

Example:

`cos(last(/host/key))`

`cosh(value)`

The hyperbolic cosine of a value. Returns the value as a real number, not as scientific notation.

Parameter:

- **value** - the value to check

For example, the hyperbolic cosine of a value '1' will be '1.54308063482'.

Example:

`cosh(last(/host/key))`

`cot(value)`

The cotangent of a value, where the value is an angle expressed in radians.

Parameter:

- **value** - the value to check

For example, the cotangent of a value '1' will be '0.54030230586'.

Example:

`cot(last(/host/key))`

`degrees(value)`

Converts a value from radians to degrees.

Parameter:

- **value** - the value to check

For example, a value '1' converted to degrees will be '57.2957795'.

Example:

`degrees(last(/host/key))`

`e`

The Euler's number (2.718281828459045).

Example:

`e()`

`exp(value)`

The Euler's number at a power of a value.

Parameter:

- **value** - the value to check

For example, Euler's number at a power of a value '2' will be '7.38905609893065'.

Example:

`exp(last(/host/key))`

`expm1(value)`

The Euler's number at a power of a value minus 1.

Parameter:

- **value** - the value to check

For example, Euler's number at a power of a value '2' minus 1 will be '6.38905609893065'.

Example:

```
expm1(last(/host/key))
```

```
floor(value)
```

Round the value down to the nearest smaller or equal integer.

Parameter:

- **value** - the value to check

For example, '2.6' will be rounded down to '2'. See also [ceil\(\)](#).

Example:

```
floor(last(/host/key))
```

```
log(value)
```

The natural logarithm.

Parameter:

- **value** - the value to check

For example, the natural logarithm of a value '2' will be '0.69314718055994529'.

Example:

```
log(last(/host/key))
```

```
log10(value)
```

The decimal logarithm.

Parameter:

- **value** - the value to check

For example, the decimal logarithm of a value '5' will be '0.69897000433'.

Example:

```
log10(last(/host/key))
```

```
max(<value1>,<value2>,...)
```

The highest value of the referenced item values.

Parameter:

- **valueX** - the value returned by another function that is working with item history.

Example:

```
max(avg(/host/key),avg(/host2/key2))
```

```
min(<value1>,<value2>,...)
```

The lowest value of the referenced item values.

Parameter:

- **valueX** - the value returned by another function that is working with item history.

Example:

```
min(avg(/host/key),avg(/host2/key2))
```

```
mod(value,denominator)
```

The division remainder.

Parameters:

- **value** - the value to check;
- **denominator** - the division denominator.

For example, division remainder of a value '5' with division denominator '2' will be '1'.

Example:

```
mod(last(/host/key),2)
```

pi

The Pi constant (3.14159265358979).

Example:

```
pi()
```

```
power(value,power value)
```

The power of a value.

Parameters:

- **value** - the value to check;
- **power value** - the Nth power to use.

For example, the 3rd power of a value '2' will be '8'.

Example:

```
power(last(/host/key),3)
```

```
radians(value)
```

Converts a value from degrees to radians.

Parameter:

- **value** - the value to check

For example, a value '1' converted to radians will be '0.0174532925'.

Example:

```
radians(last(/host/key))
```

rand

Return a random integer value. A pseudo-random generated number using time as seed (enough for mathematical purposes, but not cryptography).

Example:

```
rand()
```

```
round(value,decimal places)
```

Round the value to decimal places.

Parameters:

- **value** - the value to check;
- **decimal places** - specify decimal places for rounding (0 is also possible).

For example, a value '2.5482' rounded to 2 decimal places will be '2.55'.

Example:

```
round(last(/host/key),2)
```

```
signum(value)
```

Returns '-1' if a value is negative, '0' if a value is zero, '1' if a value is positive.

Parameter:

- **value** - the value to check.

Example:

```
signum(last(/host/key))
```

`sin(value)`

The sine of a value, where the value is an angle expressed in radians.

Parameter:

- **value** - the value to check

For example, the sine of a value '1' will be '0.8414709848'.

Example:

```
sin(last(/host/key))
```

`sinh(value)`

The hyperbolic sine of a value, where the value is an angle expressed in radians.

Parameter:

- **value** - the value to check

For example, the hyperbolic sine of a value '1' will be '1.17520119364'.

Example:

```
sinh(last(/host/key))
```

`sqrt(value)`

The square root of a value.
 This function will fail with a negative value.

Parameter:

- **value** - the value to check

For example, the square root of a value '3.5' will be '1.87082869339'.

Example:

```
sqrt(last(/host/key))
```

```
sum(<value1>,<value2>,...)
```

The sum of the referenced item values.

Parameter:

- **valueX** - the value returned by another function that is working with item history.

Example:

```
sum(avg(/host/key),avg(/host2/key2))
```

`tan(value)`

The tangent of a value.

Parameter:

- **value** - the value to check

For example, the tangent of a value '1' will be '1.55740772465'.

Example:

```
tan(last(/host/key))
```

`truncate(value,decimal places)`

Truncate the value to decimal places.

Parameters:

- **value** - the value to check;
- **decimal places** - specify decimal places for truncating (0 is also possible).

For example, a value '2.5482' truncated to 2 decimal places will be '2.54'.

Example:

```
truncate(last(/host/key),2)
```

See [all supported functions](#).

7 Operator functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|-------------------------|---|
| between | Check if the value belongs to the given range. |
| in | Check if the value is equal to at least one of the listed values. |

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters

`between(value,min,max)`

Check if the value belongs to the given range.
 Supported value types: *Integer, Float*.
 Returns: 1 - in range; 0 - otherwise.

Parameters:

- **value** - the value to check;

- **min** - the minimum value;

- **max** - the maximum value.

Example:

`between(last(/host/key),1,10)=1` #trigger if the value is between 1 and 10

`in(value,value1,value2,...valueN)`

Check if the value is equal to at least one of the listed values.
 Supported value types: *Integer, Float, Character, Text, Log*.
 Returns: 1 - if equal; 0 - otherwise.

Parameters:

- **value** - the value to check;

- **valueX** - listed values (string values must be double-quoted).

The value is compared to the listed values as numbers, if all of these values can be converted to numeric; otherwise compared as strings.

Example:

`in(last(/host/key),5,10)=1` #trigger if the last value is equal to 5 or 10

`in("text",last(/host/key),last(/host/key,#2))=1` #trigger if "text" is equal to either of the last 2 values

See [all supported functions](#).

8 Predictive functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|--------------------------|--|
| forecast | The future value, max, min, delta or avg of the item. |
| timeleft | The time in seconds needed for an item to reach the specified threshold. |

Common parameters

- `/host/key` is a common mandatory first parameter for the functions referencing the host item history
- `(sec|#num)<:time shift>` is a common second parameter for the functions referencing the host item history, where:
 - **sec** - maximum **evaluation period** in seconds (time **suffixes** can be used), or
 - **#num** - maximum **evaluation range** in latest collected values (if preceded by a hash mark)
 - **time shift** (optional) allows to move the evaluation point back in time. See **more details** on specifying time shift.

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Optional function parameters (or parameter parts) are indicated by `< >`
- Function-specific parameters are described with each function
- `/host/key` and `(sec|#num)<:time shift>` parameters must never be quoted

`forecast(/host/key,(sec|#num)<:time shift>,time,<fit>,<mode>)`

The future value, max, min, delta or avg of the item. `
` Supported value types: *Float, Integer*.

Parameters:

- See **common parameters**; `
`
- **time** - the forecasting horizon in seconds (time suffixes can be used); negative values are supported; `
`
- **fit** (optional; must be double-quoted) - the function used to fit historical data. Supported fits: `
`*linear* - linear function (default) `
`*polynomialN* - polynomial of degree N (1 <= N <= 6) `
`*exponential* - exponential function `
`*logarithmic* - logarithmic function `
`*power* - power function `
`Note that *polynomial1* is equivalent to *linear*;
- **mode** (optional; must be double-quoted) - the demanded output. Supported modes: `
`*value* - value (default) `
`*max* - maximum `
`*min* - minimum `
`*delta* - *max-min* `
`*avg* - average `
`Note that *value* estimates the item value at the moment now + time; *max*, *min*, *delta* and *avg* investigate the item value estimate on the interval between now and now + time.

Comments:

- If the value to return is larger than 1.7976931348623158E+308 or less than -1.7976931348623158E+308, the return value is cropped to 1.7976931348623158E+308 or -1.7976931348623158E+308 correspondingly;
- Becomes unsupported only if misused in the expression (wrong item type, invalid parameters), otherwise returns -1 in case of errors;
- See also additional information on **predictive trigger functions**.

Examples:

```
forecast(/host/key,#10,1h) #forecast the item value in one hour based on the last 10 values
forecast(/host/key,1h,30m) #forecast the item value in 30 minutes based on the last hour data
forecast(/host/key,1h:now-1d,12h) #forecast the item value in 12 hours based on one hour one day ago
forecast(/host/key,1h,10m,"exponential") #forecast the item value in 10 minutes based on the last hour data
forecast(/host/key,1h,2h,"polynomial3","max") #forecast the maximum value the item can reach in the next 2 hours
forecast(/host/key,#2,-20m) #estimate the item value 20 minutes ago based on the last two values (this can be used for predictive trigger functions)
```

`timeleft(/host/key,(sec|#num)<:time shift>,threshold,<fit>)`

The time in seconds needed for an item to reach the specified threshold. `
` Supported value types: *Float, Integer*.

Parameters:

- See **common parameters**; `
`
- **threshold** - the value to reach (unit suffixes can be used);
- **fit** (optional; must be double-quoted) - see **forecast()**.

Comments:

- If the value to return is larger than 1.7976931348623158E+308, the return value is cropped to 1.7976931348623158E+308;
- Returns 1.7976931348623158E+308 if the threshold cannot be reached;
- Becomes unsupported only if misused in the expression (wrong item type, invalid parameters), otherwise returns -1 in case of errors;
- See also additional information on **predictive trigger functions**.

Examples:

```
timeleft(/host/key,#10,0) #the time until the item value reaches zero based on the last 10 values
timeleft(/host/key,1h,100) #the time until the item value reaches 100 based on the last hour data
timeleft(/host/key,1h:now-1d,100) #the time until the item value reaches 100 based on one hour one day ago
timeleft(/host/key,1h,200,"polynomial2") #the time until the item value reaches 200 based on the last hour data
```

See [all supported functions](#).

9 String functions

All functions listed here are supported in:

- [Trigger expressions](#)
- [Calculated items](#)

The functions are listed without additional information. Click on the function to see the full details.

| Function | Description |
|---------------------------|--|
| ascii | The ASCII code of the leftmost character of the value. |
| bitlength | The length of value in bits. |
| bytlength | The length of value in bytes. |
| char | Return the character by interpreting the value as ASCII code. |
| concat | The string resulting from concatenating the referenced item values or constant values. |
| insert | Insert specified characters or spaces into the character string beginning at the specified position in the string. |
| jsonpath | Return the JSONPath result. |
| left | Return the leftmost characters of the value. |
| length | The length of value in characters. |
| ltrim | Remove specified characters from the beginning of string. |
| mid | Return a substring of N characters beginning at the character position specified by 'start'. |
| repeat | Repeat a string. |
| replace | Find the pattern in the value and replace with replacement. |
| right | Return the rightmost characters of the value. |
| rtrim | Remove specified characters from the end of string. |
| trim | Remove specified characters from the beginning and end of string. |
| xmlxpath | Return the XML XPath result. |

Function details

Some general notes on function parameters:

- Function parameters are separated by a comma
- Expressions are accepted as parameters
- String parameters must be double-quoted; otherwise they might get misinterpreted
- Optional function parameters (or parameter parts) are indicated by < >

[ascii\(value\)](#)

The ASCII code of the leftmost character of the value.
 Supported value types: *String, Text, Log*.

Parameter:

- **value** - the value to check

For example, a value like 'Abc' will return '65' (ASCII code for 'A').

Example:

```
ascii(last(/host/key))
```

[bitlength\(value\)](#)

The length of value in bits.
 Supported value types: *String, Text, Log, Integer*.

Parameter:

- **value** - the value to check

Example:

```
bitlength(last(/host/key))
```

[bytlength\(value\)](#)

The length of value in bytes.
 Supported value types: *String, Text, Log, Integer*.

Parameter:

- **value** - the value to check

Example:

```
bytelength(last(/host/key))
```

```
char(value)
```

Return the character by interpreting the value as ASCII code.
 Supported value types: *Integer*.

Parameter:

- **value** - the value to check

The value must be in the 0-255 range. For example, a value like '65' (interpreted as ASCII code) will return 'A'.

Example:

```
char(last(/host/key))
```

```
concat(<value1>,<value2>,...)
```

The string resulting from concatenating the referenced item values or constant values.
 Supported value types: *String, Text, Log, Float, Integer*.

Parameter:

- **valueX** - the value returned by one of the history functions or a constant value (string, integer, or float number). Must contain at least two parameters.

For example, a value like 'Zab' concatenated to 'bix' (the constant string) will return 'Zabbix'.

Examples:

```
concat(last(/host/key),"bix")
```

```
concat("1 min: ",last(/host/system.cpu.load[all,avg1]),", 15 min: ",last(/host/system.cpu.load[all,avg15]))
```

```
insert(value,start,length,replacement)
```

Insert specified characters or spaces into the character string beginning at the specified position in the string.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **start** - start position;

- **length** - positions to replace;

- **replacement** - replacement string.

For example, a value like 'Zabbbix' will be replaced by 'Zabbix' if 'bb' (starting position 3, positions to replace 2) is replaced by 'b'.

Example:

```
insert(last(/host/key),3,2,"b")
```

```
jsonpath(value,path,<default>)
```

Return the JSONPath result.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **path** - the path (must be quoted);

- **default** - the optional fallback value if the JSONPath query returns no data. Note that on other errors failure is returned (e.g. "unsupported construct").

Example:

```
jsonpath(last(/host/proc.get[zabbix_agentd,,,summary]),"$..size")
```

```
left(value,count)
```

Return the leftmost characters of the value.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **count** - the number of characters to return.

For example, you may return 'Zab' from 'Zabbix' by specifying 3 leftmost characters to return. See also [right\(\)](#).

Example:

```
left(last(/host/key),3) #return three leftmost characters
```

length(value)

The length of value in characters.
 Supported value types: *String, Text, Log*.

Parameter:

- **value** - the value to check.

Examples:

```
length(last(/host/key)) #the length of the latest value
```

```
length(last(/host/key,#3)) #the length of the third most recent value
```

```
length(last(/host/key,#1:now-1d)) #the length of the most recent value one day ago
```

ltrim(value,<chars>)

Remove specified characters from the beginning of string.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **chars** (optional) - specify the characters to remove.

Whitespace is left-trimmed by default (if no optional characters are specified). See also: [rtrim\(\)](#), [trim\(\)](#).

Examples:

```
ltrim(last(/host/key)) #remove whitespace from the beginning of string
```

```
ltrim(last(/host/key),"Z") #remove any 'Z' from the beginning of string
```

```
ltrim(last(/host/key)," Z") #remove any space and 'Z' from the beginning of string
```

mid(value,start,length)

Return a substring of N characters beginning at the character position specified by 'start'.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **start** - start position of the substring;

- **length** - positions to return in substring.

For example, it is possible return 'abbi' from a value like 'Zabbix' if starting position is 2, and positions to return is 4.

Example:

```
mid(last(/host/key),2,4)="abbi"
```

repeat(value,count)

Repeat a string.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **count** - the number of times to repeat.

Example:

```
repeat(last(/host/key),2) #repeat the value two times
```

replace(value,pattern,replacement)

Find the pattern in the value and replace with replacement. All occurrences of the pattern will be replaced.
 Supported value types: *String, Text, Log*.

Parameters:

- **value** - the value to check;

- **pattern** - the pattern to find;

- **replacement** - the string to replace the pattern with.

Example:

```
replace(last(/host/key),"ibb","abb") #replace all 'ibb' with 'abb'
```

```
right(value,count)
```

Return the rightmost characters of the value.
 Supported value types: *String*, *Text*, *Log*.

Parameters:

- **value** - the value to check;

- **count** - the number of characters to return.

For example, you may return 'bix' from 'Zabbix' by specifying 3 rightmost characters to return. See also [left\(\)](#).

Example:

```
right(last(/host/key),3) #return three rightmost characters
```

```
rtrim(value,<chars>)
```

Remove specified characters from the end of string.
 Supported value types: *String*, *Text*, *Log*.

Parameters:

- **value** - the value to check;

- **chars** (optional) - specify the characters to remove.

Whitespace is right-trimmed by default (if no optional characters are specified). See also: [ltrim\(\)](#), [trim\(\)](#).

Examples:

```
rtrim(last(/host/key)) #remove whitespace from the end of string
```

```
rtrim(last(/host/key),"x") #remove any 'x' from the end of string
```

```
rtrim(last(/host/key),"x ") #remove any 'x' and space from the end of string
```

```
trim(value,<chars>)
```

Remove specified characters from the beginning and end of string.
 Supported value types: *String*, *Text*, *Log*.

Parameters:

- **value** - the value to check;

- **chars** (optional) - specify the characters to remove.

Whitespace is trimmed from both sides by default (if no optional characters are specified). See also: [ltrim\(\)](#), [rtrim\(\)](#).

Examples:

```
trim(last(/host/key)) #remove whitespace from the beginning and end of string
```

```
trim(last(/host/key),"_") #remove '_' from the beginning and end of string
```

```
xmlxpath(value,path,<default>)
```

Return the XML XPath result.
 Supported value types: *String*, *Text*, *Log*.

Parameters:

- **value** - the value to check;

- **path** - the path (must be quoted);

- **default** - the optional fallback value if the XML XPath query returns an empty nodeset. It will not be returned if the empty result is not a nodeset (i.e., empty string). On other errors failure is returned (e.g. "invalid expression").

Example:

```
xmlxpath(last(/host/xml_result),"/response/error/status")
```

See [all supported functions](#).

6 Macros

It is possible to use out-of-the-box [Supported macros](#) and [User macros supported by location](#).

1 Supported macros

Overview

This page contains a complete list of built-in macros supported by Zabbix, grouped by application area.

Note:

To view all macros supported in a specific location, paste the location name (for example, "map URL") into your browser's search box (accessible by pressing CTRL+F) and search for *next*.

Note:

To customize macro values (for example, shorten or extract specific substrings), you can use **macro functions**.

Actions

| Macro | Supported in | Description |
|-----------------|---|--|
| {ACTION.ID} | → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications | <i>Numeric ID of the triggered action.</i> |
| {ACTION.NAME} | → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications | <i>Name of the triggered action.</i> |
| {ALERT.MESSAGE} | → Alert script parameters → Webhook parameters | <i>'Default message' value from action configuration.</i> |
| {ALERT.SENDTO} | → Alert script parameters → Webhook parameters | <i>'Send to' value from user media configuration.</i> |
| {ALERT.SUBJECT} | → Alert script parameters → Webhook parameters | <i>'Default subject' value from action configuration.</i> |
| {ESC.HISTORY} | → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Internal notifications | <i>Escalation history. Log of previously sent messages. Shows previously sent notifications, on which escalation step they were sent and their status (sent, in progress or failed).</i> |

Date and time

| Macro | Supported in | Description |
|--------|---|--|
| {DATE} | → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Manual event action script commands | <i>Current date in yyyy.mm.dd. format.</i> |

| Macro | Supported in | Description |
|-------------|--|---|
| {TIME} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Trigger event names → Manual event action script commands → Scheduled reports subject/message fields | <i>Current time in hh:mm:ss.</i> |
| {TIMESTAMP} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Trigger event names → Manual event action script commands → Scheduled reports subject/message fields | <i>Current time in Unix timestamp format.</i> |

Discovery

| Macro | Supported in | Description |
|---------------------------|--------------------------------------|--|
| {DISCOVERY.DEVICEADDRESS} | Discovery notifications and commands | <i>IP address of the discovered device.</i> Available always, does not depend on host being added. |
| {DISCOVERY.DEVICEDNS} | Discovery notifications and commands | <i>DNS name of the discovered device.</i> Available always, does not depend on host being added. |
| {DISCOVERY.DEVICESTATUS} | Discovery notifications and commands | <i>Status of the discovered device:</i> can be either UP or DOWN. |
| {DISCOVERY.DEVICETIME} | Discovery notifications and commands | <i>Time since the last change of discovery status for a particular device,</i> with precision down to a second. For example: 1h 29m 01s. For devices with status DOWN, this is the period of their downtime. |
| {DISCOVERY.RULENAME} | Discovery notifications and commands | <i>Name of the discovery rule that discovered the presence or absence of the device or service.</i> |
| {DISCOVERY.SERVICENAME} | Discovery notifications and commands | <i>Name of the service that was discovered.</i> For example: HTTP. |
| {DISCOVERY.SERVICEPORT} | Discovery notifications and commands | <i>Port of the service that was discovered.</i> For example: 80. |
| {DISCOVERY.SERVICESTATUS} | Discovery notifications and commands | <i>Status of the discovered service:</i> can be either UP or DOWN. |
| {DISCOVERY.SERVICETIME} | Discovery notifications and commands | <i>Time since the last change of discovery status for a particular service,</i> with precision down to a second. For example: 1h 29m 01s. For services with status DOWN, this is the period of their downtime. |

Events

| Macro | Supported in | Description |
|--------------------|---|---|
| {EVENT.ACK.STATUS} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Acknowledgment status of the event (Yes/No).</i> |

| Macro | Supported in | Description |
|-------------------|---|---|
| {EVENT.AGE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Manual event action script commands | <p><i>Age of the event that triggered an action, with precision down to a second.</i></p> <p>Useful in escalated messages.</p> |
| {EVENT.DATE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Manual event action script commands | <p><i>Date of the event that triggered an action.</i></p> <p>For example: 2025.04.14.</p> |
| {EVENT.DURATION} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Internal notifications → Manual event action script commands | <p><i>Duration of the event (time difference between problem and recovery events), with precision down to a second.</i></p> <p>Useful in problem recovery messages.</p> |
| {EVENT.ID} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Trigger URLs → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <p><i>Numeric ID of the event that triggered an action.</i></p> |
| {EVENT.NAME} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Internal notifications → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <p><i>Name of the problem event that triggered an action.</i></p> |
| {EVENT.NSEVERITY} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <p><i>Numeric value of the event severity. | {EVENT.UPDATE.SEVERITY} | → Problem update notifications and commands | <i>Numeric value of the new event severity set during problem update operation.</i> |
| {EVENT.UPDATE.SEVERITY} | → Problem update notifications and commands | <i>Name of the new event severity set during problem update operation.</i> |
| {EVENT.UPDATE.STATUS} | <ul style="list-style-type: none"> → Service-based notifications and commands → Problem update notifications and commands → Service update notifications and commands → Manual event action script commands | <i>Numeric value of the problem update status.</i> Possible values: 0 - Webhook was called because of problem/recovery event, 1 - Update operation. |
| {EVENT.UPDATE.TIME} | → Problem update notifications and commands | <i>Time of event update (acknowledgment, etc).</i> |
| {EVENT.UPDATE.TIMESTAMP} | <ul style="list-style-type: none"> → Problem update notifications and commands → Service update notifications and commands | <i>Unix timestamp of event update (acknowledgment, etc).</i> Deprecated name: {ACK.TIME} |

| Macro | Supported in | Description |
|---------------|--|---|
| {EVENT.VALUE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Service-based notifications and commands → Service update notifications and commands → Service recovery notifications and commands → Internal notifications → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <i>Numeric value of the event that triggered an action (1 for problem, 0 for recovering).</i> |

Cause and symptom events

{EVENT.CAUSE.*} macros are used in the context of a symptom event, for example, in notifications; they return information about the cause event.

The {EVENT.SYMPTOMS} macro is used in the context of the cause event and returns information about symptom events.

| Macro | Supported in | Description |
|-------------------------|---|--|
| {EVENT.CAUSE.ACKSTATUS} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Acknowledgment status of the cause event (Yes/No).</i> |
| {EVENT.CAUSE.AGE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Age of the cause event, with precision down to a second.</i> <i>Useful in escalated messages.</i> |
| {EVENT.CAUSE.DATE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Date of the cause event.</i> |
| {EVENT.CAUSE.DURATION} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Duration of the cause event (time difference between problem and recovery events), with precision down to a second.</i> <i>Useful in problem recovery messages.</i> |
| {EVENT.CAUSE.ID} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Numeric ID of the cause event .</i> |
| {EVENT.CAUSE.NAME} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Name of the cause problem event.</i> |
| {EVENT.CAUSE.SEVERITY} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Numeric value of the cause event severity.</i> <i>Possible values: 0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster.</i> |
| {EVENT.CAUSE.OBJECT} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Numeric value of the cause event object.</i> <i>Possible values: 0 - Trigger, 1 - Discovered host, 2 - Discovered service, 3 - Autoregistration, 4 - Item, 5 - Low-level discovery rule.</i> |
| {EVENT.CAUSE.OPDATA} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Operational data of the underlying trigger of the cause problem.</i> |
| {EVENT.CAUSE.SEVERITY} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Name of the cause event severity.</i> |
| {EVENT.CAUSE.SOURCE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Numeric value of the cause event source.</i> <i>Possible values: 0 - Trigger, 1 - Discovery, 2 - Autoregistration, 3 - Internal.</i> |
| {EVENT.CAUSE.STATUS} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>Verbal value of the cause event.</i> |
| {EVENT.CAUSE.TAGS} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>A comma separated list of cause event tags.</i> <i>Expanded to an empty string if no tags exist.</i> |

| Macro | Supported in | Description |
|------------------------------|---|--|
| {EVENT.CAUSE.TAGS} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | A JSON array containing cause event tag objects . Expanded to an empty array if no tags exist. |
| {EVENT.CAUSE.TAGS<tag name>} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | Cause event tag value referenced by the tag name. A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) should be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash. |
| {EVENT.CAUSE.TIME} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | Time of the cause event. |
| {EVENT.CAUSE.TIMEStamp} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | Unix timestamp of the cause event. |
| {EVENT.CAUSE.UPDATEHistory} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | Log of cause problem updates (acknowledgments, etc). |
| {EVENT.CAUSE.VALUE} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | Numeric value of the cause event (1 for problem, 0 for recovering). |
| {EVENT.SYMPOMS} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | The list of symptom events. Includes the following details: host name, event name, severity, age, service tags and values. |

Functions

| Macro | Supported in | Description |
|---------------------------|--|--|
| {FUNCTION.VALUE} | Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands → Event names | Results of the <i>Nth</i> item-based function in the trigger expression at the time of the event. Only functions with <i>/host/key</i> as the first parameter are counted. This macro may be used with a numeric index e.g. {FUNCTION.VALUE<1-9>} to point to the first, second, third, etc. function in a trigger expression. See indexed macros . |
| {FUNCTION.RECOVERY.VALUE} | Problem recovery notifications and commands → Problem update notifications and commands → Manual event action script commands → Event names | Results of the <i>Nth</i> item-based function in the recovery expression at the time of the event. Only functions with <i>/host/key</i> as the first parameter are counted. This macro may be used with a numeric index e.g. {FUNCTION.RECOVERY.VALUE<1-9>} to point to the first, second, third, etc. function in a trigger expression. See indexed macros . |

Hosts

| Macro | Supported in | Description |
|-------------------|--|---|
| {HOST.CONN} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Map element labels, map URL names and values → Item key parameters¹ → Host interface IP/DNS → Trapper item "Allowed hosts" field → Database monitoring additional parameters → SSH and Telnet scripts → JMX item endpoint field → Web monitoring⁴ → Low-level discovery rule filter regular expressions → URL field of dynamic URL dashboard widget → Trigger names, event names, operational data and descriptions → Trigger URLs → Tag names and values → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in Item value and Gauge widget → Primary/Secondary label <i>Text</i> parameter in Honeycomb widget → Column of data type <i>Text</i> in Top hosts widget | <p><i>Host IP address or DNS name, depending on host settings².</i></p> <p>This macro may be used with a numeric index as {HOST.CONN<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> |
| {HOST.DESCRPTION} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Map element labels → Manual event action script commands → <i>Description</i> parameter in Item value and Gauge widget → Primary/Secondary label <i>Text</i> parameter in Honeycomb widget → Column of data type <i>Text</i> in Top hosts widget | <p><i>Host description.</i></p> <p>This macro may be used with a numeric index e.g. {HOST.DESCRPTION<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|------------|--|--|
| {HOST.DNS} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Map element labels, map URL names and values → Item key parameters¹ → Host interface IP/DNS → Trapper item "Allowed hosts" field → Database monitoring additional parameters → SSH and Telnet scripts → JMX item endpoint field → Web monitoring⁴ → Low-level discovery rule filter regular expressions → URL field of dynamic URL dashboard widget → Trigger names, event names, operational data and descriptions → Trigger URLs → Tag names and values → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget → Column of data type <i>Text</i> in <i>Top hosts</i> widget | <p><i>Host DNS name</i>².</p> <p>This macro may be used with a numeric index e.g. {HOST.DNS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|-------------|---|--|
| {HOST.HOST} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Autoregistration notifications and commands → Internal notifications → Item key parameters → Map element labels, map URL names and values → Host interface IP/DNS → Trapper item "Allowed hosts" field → Database monitoring additional parameters → SSH and Telnet scripts → JMX item endpoint field → Web monitoring⁴ → Low-level discovery rule filter regular expressions → URL field of dynamic URL dashboard widget → Trigger names, event names, operational data and descriptions → Trigger URLs → Tag names and values → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in Item value and Gauge widget → Primary/Secondary label <i>Text</i> parameter in Honeycomb widget → Column of data type <i>Text</i> in Top hosts widget | <p><i>Host name.</i></p> <p>This macro may be used with a numeric index e.g. {HOST.HOST<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> <p>{HOSTNAME<1-9>} is deprecated.</p> <p>Macro functions are not supported for this macro if it is used as a placeholder in the first parameter of a history function, for example, <code>last (/ {HOST.HOST} / {ITEM.KEY})</code>.</p> |
| {HOST.ID} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Map element labels, map URL names and values → URL field of dynamic URL dashboard widget → Trigger URLs → Tag names and values → Manual host action script confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in Item value and Gauge widget → Primary/Secondary label <i>Text</i> parameter in Honeycomb widget → Column of data type <i>Text</i> in Top hosts widget | <p><i>Host ID.</i></p> <p>May be used with a numeric index as {HOST.ID<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|-----------------|--|---|
| {HOST.IP} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Autoregistration notifications and commands → Internal notifications → Map element labels, map URL names and values → Item key parameters¹ → Host interface IP/DNS → Trapper item "Allowed hosts" field → Database monitoring additional parameters → SSH and Telnet scripts → JMX item endpoint field → Web monitoring⁴ → Low-level discovery rule filter regular expressions → URL field of dynamic URL dashboard widget → Trigger names, event names, operational data and descriptions → Trigger URLs → Tag names and values → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget → Column of data type <i>Text</i> in <i>Top hosts</i> widget | <p><i>Host IP address</i>².</p> <p>This macro may be used with a numeric index e.g. {HOST.IP<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> <p>{IPADDRESS<1-9>} is deprecated.</p> |
| {HOST.METADATA} | <ul style="list-style-type: none"> → Autoregistration notifications and commands | <p><i>Host metadata.</i></p> <p>Used only for active agent autoregistration.</p> |

| Macro | Supported in | Description |
|-------------|---|---|
| {HOST.NAME} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Map element labels, map URL names and values → Item key parameters → Host interface IP/DNS → Trapper item "Allowed hosts" field → Database monitoring additional parameters → SSH and Telnet scripts → Web monitoring⁴ → Low-level discovery rule filter regular expressions → URL field of dynamic URL dashboard widget → Trigger names, event names, operational data and descriptions → Trigger URLs → Tag names and values → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, SSL certificate file, SSL key file, Allowed hosts → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget → Column of data type <i>Text</i> in <i>Top hosts</i> widget | <p><i>Visible host name.</i></p> <p>This macro may be used with a numeric index e.g. {HOST.NAME<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|--------------------|--|--|
| {HOST.PORT} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Autoregistration notifications and commands → Internal notifications → Map element labels, map URL names and values → Item key parameters¹ → Database monitoring additional parameters → SSH and Telnet scripts → JMX item endpoint field → Web monitoring⁴ → Low-level discovery rule filter regular expressions → URL field of dynamic URL dashboard widget → Trigger names, event names, operational data and descriptions → Trigger URLs → Tag names and values → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, SSL certificate file, SSL key file → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget → Column of data type <i>Text</i> in <i>Top hosts</i> widget | <p><i>Host (agent) port</i>².</p> <p>This macro may be used with a numeric index e.g. {HOST.PORT<1-9>} to point to the first, second, third, etc. host in a trigger expression. | {ITEM.KEY} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, Proxy, SSL certificate file, SSL key file → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Key of the Nth item in the trigger expression that caused a notification.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.KEY<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> <p>{TRIGGER.KEY} is deprecated.</p> <p>Macro functions are not supported for this macro if it is used as a placeholder in the first parameter of a history function, for example, last (/ {HOST.HOST} / {ITEM.KEY}).</p> |
| {ITEM.KEY.ORIG} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Script-type item and Browser-type item, item prototype and discovery rule parameter names and values → HTTP agent type item, item prototype and discovery rule fields: URL, Query fields, Request body, Headers, Proxy, SSL certificate file, SSL key file → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Original key (with macros not expanded) of the Nth item in the trigger expression that caused a notification ⁴.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.KEY.ORIG<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|------------------|--|---|
| {ITEM.LASTVALUE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, event names, operational data and descriptions → Tag names and values → Trigger URLs → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>The latest value of the Nth item in the trigger expression that caused a notification.</i></p> <p>It will resolve to *UNKNOWN* in the frontend if the latest history value has been collected more than the <i>Max history display period</i> time ago (set in the Administration→General menu section).</p> <p>When used in the problem name, the macro will not resolve to the latest item value when viewing problem events; instead, it will keep the item value from the time when the problem happened.</p> <p>When used in notifications, in some cases the macro might not resolve to the latest item value at the moment the trigger fired. For example, if an item quickly receives two values, "A" and "B", and the trigger fires for "A", notifications might show "B" as the latest value due to a slight processing delay - the latest item value changed between the time the trigger fired and when the notification was created. To avoid this, you can use the {ITEM.VALUE} macro, which resolves to the value at the moment the trigger fires, ensuring the correct value is used in the notification.</p> <p>It is alias to <code>last (/ {HOST.HOST} / {ITEM.KEY})</code>.</p> <p>The resolved value for text/log items is truncated to 20 characters by the frontend in the following locations:</p> <ul style="list-style-type: none"> - Operational data; - Trigger description; - Trigger URLs; - Trigger URL labels; - Description of the item value widget. <p>To resolve to a full value, you may use macro functions, as no values are truncated by the server. For example: <code>{{ITEM.LASTVALUE}}.regsub("(.*)", \1)</code></p> <p>This macro may be used with a numeric index e.g. {ITEM.LASTVALUE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |
| {ITEM.LOG.AGE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Age of the log event, with precision down to a second.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.AGE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|----------------------|--|---|
| {ITEM.LOG.DATE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Date when the log entry was written to the log.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.DATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |
| {ITEM.LOG.EVENTID} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>ID of the event in the event log.</i></p> <p>For Windows event log monitoring only.</p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.EVENTID<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |
| {ITEM.LOG.NSEVERITY} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Numeric severity of the event in the event log.</i></p> <p>For Windows event log monitoring only.</p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.NSEVERITY<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |
| {ITEM.LOG.SEVERITY} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Verbal severity of the event in the event log.</i></p> <p>For Windows event log monitoring only.</p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.SEVERITY<1-9>} to point to the first, second, third, etc. item in a trigger expression. | {ITEM.LOG.SOURCE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Source of the event in the event log.</i></p> <p>For Windows event log monitoring only.</p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.SOURCE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |
| {ITEM.LOG.TIME} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Time when the log entry was written to the log.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.TIME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |

| Macro | Supported in | Description |
|----------------------|--|---|
| {ITEM.LOG.TIMESTAMP} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, operational data and descriptions → Trigger URLs → Event tags and values → Manual event action <i>script</i> commands → <i>Description</i> parameter in <i>Item value</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Unix timestamp when the log entry was written to the log.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.LOG.TIMESTAMP<1-9>} to point to the first, second, third, etc. item in a trigger expression. See <i>indexed macros</i>.</p> |
| {ITEM.NAME} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Manual event action <i>script</i> commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Name of the item with all macros resolved.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.NAME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See <i>indexed macros</i>.</p> |
| {ITEM.NAME.ORIG} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Manual event action <i>script</i> commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p>This macro is used to resolve to the <i>original name</i> (i.e. <i>without macros resolved</i>) of the item.</p> <p>This macro may be used with a numeric index e.g. {ITEM.NAME.ORIG<1-9>} to point to the first, second, third, etc. item in a trigger expression. See <i>indexed macros</i>.</p> |
| {ITEM.STATE} | <ul style="list-style-type: none"> → Item-based internal notifications → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>The latest state of the Nth item in the trigger expression that caused a notification. Possible values: Not supported and Normal.</i></p> <p>This macro may be used with a numeric index e.g. {ITEM.STATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See <i>indexed macros</i>.</p> |
| {ITEM.STATE.ERROR} | <ul style="list-style-type: none"> → Item-based internal notifications | <p><i>Error message with details why an item became unsupported.</i></p> <p>If an item goes into the unsupported state and then immediately gets supported again the error field can be empty.</p> |

| Macro | Supported in | Description |
|------------------|--|--|
| {ITEM.VALUE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Trigger names, event names, operational data and descriptions → Tag names and values → Trigger URLs → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p>Resolved to either:</p> <ol style="list-style-type: none"> 1) the historical (at-the-time-of-event) value of the Nth item in the trigger expression, if used in the context of trigger status change, for example, when displaying events or sending notifications. 2) the latest value of the Nth item in the trigger expression, if used without the context of trigger status change, for example, when displaying a list of triggers in a pop-up selection window. In this case works the same as {ITEM.LASTVALUE} <p>In the first case it will resolve to *UNKNOWN* if the history value has already been deleted or has never been stored.</p> <p>In the second case, and in the frontend only, it will resolve to *UNKNOWN* if the latest history value has been collected more than the <i>Max history display period</i> time ago (set in the Administration→General menu section).</p> <p>The resolved value for text/log items is truncated to 20 characters by the frontend in the following locations:</p> <ul style="list-style-type: none"> - Operational data; - Trigger description; - Trigger URLs; - Trigger URL labels; - Description of the item value widget. <p>To resolve to a full value, you may use macro functions, as no values are truncated by the server. For example: <code>{{ITEM.VALUE}.regsub("(.*)", \1)}</code></p> <p>This macro may be used with a numeric index e.g. <code>{ITEM.VALUE<1-9>}</code> to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |
| {ITEM.VALUETYPE} | <ul style="list-style-type: none"> → Trigger-based notifications and commands → Problem update notifications and commands → Internal notifications → Manual event action script commands → <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> widget → Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> widget | <p><i>Value type of the Nth item in the trigger expression that caused a notification.</i> Possible values: 0 - numeric float, 1 - character, 2 - log, 3 - numeric unsigned, 4 - text.</p> <p>This macro may be used with a numeric index e.g. <code>{ITEM.VALUETYPE<1-9>}</code> to point to the first, second, third, etc. item in a trigger expression. See indexed macros.</p> |

Low-level discovery rules

| Macro | Supported in | Description |
|-------------------------|---|---|
| {LLDRULE.DESCRPTION} | → LLD-rule based internal notifications | <i>Description of the low-level discovery rule which caused a notification.</i> |
| {LLDRULE.DESCRPTIONURL} | → LLD-rule based internal notifications | <i>Description (with macros unresolved) of the low-level discovery rule which caused a notification.</i> |
| {LLDRULE.ID} | → LLD-rule based internal notifications | <i>Numeric ID of the low-level discovery rule which caused a notification.</i> |
| {LLDRULE.KEY} | → LLD-rule based internal notifications | <i>Key of the low-level discovery rule which caused a notification.</i> |
| {LLDRULE.KEY.ORIG} | → LLD-rule based internal notifications | <i>Original key (with macros not expanded) of the low-level discovery rule which caused a notification.</i> |

| Macro | Supported in | Description |
|-------------------------|---------------------------------------|---|
| {LLDRULE.NAME} | LLD-rule based internal notifications | <i>Name of the low-level discovery rule (with macros resolved) that caused a notification.</i> |
| {LLDRULE.NAME-ORIGINAL} | rule based internal notifications | <i>Original name (i.e. without macros resolved) of the low-level discovery rule that caused a notification.</i> |
| {LLDRULE.STATE} | LLD-rule based internal notifications | <i>The latest state of the low-level discovery rule.</i> Possible values: Not supported and Normal . |
| {LLDRULE.STATE-ERROR} | rule based internal notifications | <i>Error message with details why an LLD rule became unsupported.</i> If an LLD rule goes into the unsupported state and then immediately gets supported again the error field can be empty. |

Maps

| Macro | Supported in | Description |
|------------|--|--------------------------|
| {MAP.ID} | → Map element labels, map URL names and values | <i>Network map ID.</i> |
| {MAP.NAME} | → Map element labels, map URL names and values → Text field in map shapes | <i>Network map name.</i> |

Proxies

| Macro | Supported in | Description |
|--------------------|--|--|
| {PROXY.DESCRPTION} | → Trigger-based notifications and commands → Problem update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Manual event action script commands | <i>Description of the proxy.</i> Resolves to either: 1) proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use indexed macros here. 2) proxy, which executed discovery (in discovery notifications). Use {PROXY.DESCRPTION} here, without indexing. 3) proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.DESCRPTION} here, without indexing. This macro may be used with a numeric index e.g. {PROXY.DESCRPTION<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros . |
| {PROXY.NAME} | → Trigger-based notifications and commands → Problem update notifications and commands → Discovery notifications and commands → Autoregistration notifications and commands → Internal notifications → Manual event action script commands | <i>Name of the proxy.</i> Resolves to either: 1) proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use indexed macros here. 2) proxy, which executed discovery (in discovery notifications). Use {PROXY.NAME} here, without indexing. 3) proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.NAME} here, without indexing. This macro may be used with a numeric index e.g. {PROXY.NAME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros . |

Scripts

| Macro | Supported in | Description |
|---------------|---|---|
| {MANUALINPUT} | → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <i>Manual input value</i> specified by user at script execution time. |

Services

| Macro | Supported in | Description |
|---------------------------|---|---|
| {SERVICE.DESCRPTION} | → Service-based notifications and commands → Service update notifications and commands | <i>Description of the service</i> (with macros resolved). |
| {SERVICE.ID} | → Service-based notifications and commands → Service update notifications and commands | <i>Numeric ID of the service that triggered an action.</i> |
| {SERVICE.NAME} | → Service-based notifications and commands → Service update notifications and commands | <i>Name of the service</i> (with macros resolved). |
| {SERVICE.ROOTCAUSE} | → Service-based notifications and commands → Service update notifications and commands | <i>List of trigger problem events that caused a service to fail</i> , sorted by severity and host name. Includes the following details: host name, event name, severity, age, service tags and values. |
| {SERVICE.TAGS} | → Service-based notifications and commands → Service update notifications and commands | <i>A comma separated list of service event tags.</i> Service event tags can be defined in the service configuration section Tags. Expanded to an empty string if no tags exist. |
| {SERVICE.TAGSJSON} | → Service-based notifications and commands → Service update notifications and commands | <i>A JSON array containing service event tag objects.</i> Service event tags can be defined in the service configuration section Tags. Expanded to an empty array if no tags exist. |
| {SERVICE.TAGS.<tag name>} | → Service-based notifications and commands → Service update notifications and commands | <i>Service event tag value referenced by the tag name.</i> Service event tags can be defined in the service configuration section Tags. A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) should be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash. |

Triggers

| Macro | Supported in | Description |
|-------------------------------|---|---|
| {TRIGGER.DESCRPTION} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | <i>Trigger description.</i> All macros supported in a trigger description will be expanded if {TRIGGER.DESCRPTION} is used in notification text. {TRIGGER.COMMENT} is deprecated. |
| {TRIGGER.EXPRESSION} | → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands → Event names | <i>Partially evaluated trigger expression.</i> Item-based functions are evaluated and replaced by the results at the time of event generation whereas all other functions are displayed as written in the expression. Can be used for debugging trigger expressions. |
| {TRIGGER.EXPRESSION.RECOVERY} | → Problem update notifications and commands → Manual event action script commands | <i>Partially evaluated trigger recovery expression.</i> Item-based functions are evaluated and replaced by the results at the time of event generation whereas all other functions are displayed as written in the expression. Can be used for debugging trigger recovery expressions. |

| Macro | Supported in | Description |
|--|--|---|
| {TRIGGER.EVENTS.TACK} | → Trigger-based notifications and commands → Problem update notifications and commands → Map element labels → Manual event action script commands | Number of acknowledged events for a map element in maps, or for the trigger which generated current event in notifications. |
| {TRIGGER.EVENTS.PROBLEM.ACK} | → Trigger-based notifications and commands → Problem update notifications and commands → Map element labels → Manual event action script commands | Number of acknowledged PROBLEM events for all triggers disregarding their state. |
| {TRIGGER.EVENTS.PROBLEM.UNACK} | → Trigger-based notifications and commands → Problem update notifications and commands → Map element labels → Manual event action script commands | Number of unacknowledged PROBLEM events for all triggers disregarding their state. |
| {TRIGGER.EVENTS.TUNACK} | → Trigger-based notifications and commands → Problem update notifications and commands → Map element labels → Manual event action script commands | Number of unacknowledged events for a map element in maps, or for the trigger which generated current event in notifications. |
| {TRIGGER.HOSTGROUPS} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | A sorted (by SQL query), comma-space separated list of host groups in which the trigger is defined. |
| {TRIGGER.PROBLEM.EVENTS.PROBLEM.ACK} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Number of acknowledged PROBLEM events for triggers in PROBLEM state. |
| {TRIGGER.PROBLEM.EVENTS.PROBLEM.UNACK} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Number of unacknowledged PROBLEM events for triggers in PROBLEM state. |
| {TRIGGER.EXPRESSION} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Trigger expression. |
| {TRIGGER.EXPRESSION.RECOVERY} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Trigger recovery expression if OK event generation in trigger configuration is set to 'Recovery expression'; otherwise an empty string is returned. |
| {TRIGGER.ID} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Map element labels, map URL names and values → Trigger URLs → Trigger tag value → Manual event action script commands | Numeric trigger ID which triggered this action. Supported in trigger tag values. |
| {TRIGGER.NAME} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Name of the trigger (with macros resolved). Note that since 4.0.0 {EVENT.NAME} can be used in actions to display the triggered event/problem name with macros resolved. |
| {TRIGGER.NAME.ORIGINAL} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Original name of the trigger (i.e. without macros resolved). |
| {TRIGGER.NSEVERITY} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Numerical trigger severity. Possible values: 0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster. |
| {TRIGGER.SEVERITY} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | Trigger severity name. Can be defined in Administration → General → Trigger displaying options. |
| {TRIGGER.STATE} | → Trigger-based internal notifications | The latest state of the trigger. Possible values: Unknown and Normal . |

| Macro | Supported in | Description |
|-------------------------|---|--|
| {TRIGGER.STATE-ERROR} | → Trigger-based internal notifications | <i>Error message with details why a trigger became unsupported.</i> |
| {TRIGGER.STATUS} | → Trigger-based notifications and commands → Problem update notifications and commands → Manual event action script commands | <i>If a trigger goes into the unsupported state and then immediately gets supported again the error field can be empty.</i> <i>Trigger value at the time of operation step execution. Can be either PROBLEM or OK.</i> {STATUS} is deprecated. |
| {TRIGGER.TEMPLATE} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | <i>A sorted (by SQL query), comma-space separated list of templates in which the trigger is defined, or *UNKNOWN* if the trigger is defined in a host.</i> |
| {TRIGGER.URL} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | <i>Trigger URL.</i> |
| {TRIGGER.URL-LABEL} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger-based internal notifications → Manual event action script commands | <i>The label for the trigger URL.</i> |
| {TRIGGER.VALUE} | → Trigger-based notifications and commands → Problem update notifications and commands → Trigger expressions → Manual event action script commands | <i>Current trigger numeric value: 0 - trigger is in OK state, 1 - trigger is in PROBLEM state.</i> |
| {TRIGGERS.UNACK} | → Map element labels | <i>Number of unacknowledged triggers for a map element, disregarding trigger state.</i> A trigger is considered to be unacknowledged if at least one of its PROBLEM events is unacknowledged. |
| {TRIGGERS.PROBLEMUNACK} | → Map element labels | <i>Number of unacknowledged PROBLEM triggers for a map element.</i> A trigger is considered to be unacknowledged if at least one of its PROBLEM events is unacknowledged. |
| {TRIGGERS.ACK} | → Map element labels | <i>Number of acknowledged triggers for a map element, disregarding trigger state.</i> A trigger is considered to be acknowledged if all of its PROBLEM events are acknowledged. |
| {TRIGGERS.PROBLEMACK} | → Map element labels | <i>Number of acknowledged PROBLEM triggers for a map element.</i> A trigger is considered to be acknowledged if all of its PROBLEM events are acknowledged. |

Users

| Macro | Supported in | Description |
|-----------------|--|---|
| {USER.FULLNAME} | → Problem update notifications and commands → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <i>Name, surname and username of the user who added event acknowledgment or started the script.</i> |
| {USER.NAME} | → Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <i>Name of the user who started the script.</i> |

| Macro | Supported in | Description |
|-----------------|---|---|
| {USER.SURNAME} | Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <i>Surname of the user</i> who started the script. |
| {USER.USERNAME} | Manual host action script commands, confirmation text → Manual event action script commands, confirmation text → Manual event/host action URLs, confirmation text | <i>Username of the user</i> who started the script. {USER.ALIAS}, supported before Zabbix 5.4.0, is now deprecated. |

Other macro types

| Macro | Supported in | Description |
|---------------|--|--------------------------------------|
| {\$MACRO} | → See: User macros supported by location | <i>User-definable macros.</i> |
| {#MACRO} | → See: Low-level discovery macros | <i>Low-level discovery macros.</i> |
| {?EXPRESSION} | → Trigger event names → Trigger-based notifications and commands → Problem update notifications and commands → Script commands and their webhook parameters → Map element labels ³ → Map shape labels ³ → Link labels in maps ³ → Graph names ⁵ | See expression macros . |
| \$1...\$9 | → Trigger names → User parameter commands | <i>Positional macros/references.</i> |

Footnotes

¹ The {HOST.*} macros supported in item key parameters will resolve to the interface that is selected for the item. When used in items without interfaces they will resolve to either the Zabbix agent, SNMP, JMX or IPMI interface of the host in this order of priority or to 'UNKNOWN' if the host does not have any interface.

² In global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface. If an agent interface is not defined, the main SNMP interface will be used. If an SNMP interface is also not defined, the main JMX interface will be used. If a JMX interface is not defined either, the main IPMI interface will be used. If the host does not have any interface, the macro resolves to 'UNKNOWN'.

³ Only the **avg**, **last**, **max** and **min** functions, with seconds as parameter are supported in this macro in map labels.

⁴ {HOST.*} macros are supported in web scenario *Variables*, *Headers*, *SSL certificate file* and *SSL key file* fields and in scenario step *URL*, *Post*, *Headers* and *Required string* fields. Since Zabbix 5.2.2, {HOST.*} macros are no longer supported in web scenario *Name* and web scenario step *Name* fields.

⁵ Only the **avg**, **last**, **max** and **min** functions, with seconds as parameter are supported within this macro in graph names. The {HOST.HOST<1-9>} macro can be used as host within the macro. For example:

```
last(/Cisco switch/ifAlias[{#SNMPINDEX}])
last(/{HOST.HOST}/ifAlias[{#SNMPINDEX}])
```

⁶ Supported in Script-type items and Browser-type items and manual host action scripts for Zabbix server and Zabbix proxy.

Indexed macros

The indexed macro syntax **{MACRO<1-9>}** can only reference the N-th item, function, or host in a trigger's *Expression* field:

- **{HOST.IP1}**, **{HOST.IP2}**, **{HOST.IP3}** resolve to the IP addresses of the first, second, and third hosts in the trigger expression (if present).
- **{ITEM.VALUE1}**, **{ITEM.VALUE2}**, **{ITEM.VALUE3}** resolve to the values of the first, second, and third items in the trigger expression at the time of the event (if present).
- **{FUNCTION.VALUE1}**, **{FUNCTION.VALUE2}**, **{FUNCTION.VALUE3}** resolve to the values of the first, second, and third item-based functions at the time of the event (if present).

In the context of triggers, indexed macros always refer to the *Expression* field of the trigger configuration, not the *Recovery expression*. For example, in a recovery event, **{ITEM.VALUE2}** will resolve to the value of the second item from the problem expression at the time of recovery.

The **{HOST.HOST<1-9>}** macro is also supported within the `{?func(/host/key,param)}` expression macro in **graph names**. For example, `{?func(/{HOST.HOST2}/key,param)}` in a graph name will resolve to the host of the second item in the graph.

Warning:

Indexed macros will not resolve in any other context beyond the cases mentioned here. For other contexts, use macros without an index (**{HOST.HOST}**, **{HOST.IP}**, etc.).

2 User macros supported by location

Overview

This section contains a list of locations, where **user-definable** macros are supported.

Note:

Only global-level user macros are supported for *Actions*, *Network discovery*, *Proxies* and all locations listed under *Other locations* section of this page. In the mentioned locations, host-level and template-level macros will not be resolved.

Note:

To customize macro values (for example, shorten or extract specific substrings), you can use **macro functions**.

Actions

In **actions**, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|--|--|
| Trigger-based notifications and commands | yes |
| Trigger-based internal notifications | yes |
| Problem update notifications | yes |

| Step duration | no |

Hosts/host prototypes

In a **host** and **host prototype** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---------------------------|--|
| Interface IP/DNS | DNS only |
| Interface port | no |
| <i>SNMP v1, v2</i> | |
| SNMP community | yes |
| <i>SNMP v3</i> | |
| Context name | yes |
| Security name | yes |
| Authentication passphrase | yes |
| Privacy passphrase | yes |
| <i>IPMI</i> | |
| Username | yes |
| Password | yes |
| <i>Tags²</i> | |
| Tag names | yes |
| Tag values | yes |

Items / item prototypes

In an **item** or an **item prototype** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---|--|
| Item name | yes |
| Item key parameters | yes |
| Update interval | no |
| Custom intervals | no |
| Timeout (available for supported item types) | no |
| Store up to (for history and trends) | no |
| Description | yes |
| <i>Calculated/aggregate item</i> | |
| Formula (expression constants and function parameters; item key parameters; (aggregate item only) filter conditions (host group name and tag name)) | yes |
| <i>Database monitor</i> | |
| Username | yes |
| Password | yes |
| SQL query | yes |
| <i>HTTP agent</i> | |
| URL ³ | yes |
| Query fields | yes |
| Request body | yes |
| Headers (names and values) | yes |
| Required status codes | yes |
| HTTP proxy | yes |
| HTTP authentication username | yes |
| HTTP authentication password | yes |
| SSI certificate file | yes |
| SSI key file | yes |
| SSI key password | yes |

| Location | Multiple macros/mix with text ¹ |
|--|--|
| Allowed hosts | yes |
| <i>JMX agent</i> | |
| JMX endpoint | yes |
| <i>Script item</i> | |
| Parameter names and values | yes |
| <i>Browser item</i> | |
| Parameter names and values | yes |
| <i>SNMP agent</i> | |
| SNMP OID | yes |
| <i>SSH agent</i> | |
| Username | yes |
| Public key file | yes |
| Private key file | yes |
| Password | yes |
| Script | yes |
| <i>TELNET agent</i> | |
| Username | yes |
| Password | yes |
| Script | yes |
| <i>Zabbix trap-per</i> | |
| Allowed hosts | yes |
| <i>Tags²</i> | |
| Tag names | yes |
| Tag values | yes |
| <i>Preprocessing steps</i> | |
| Parameters (including custom scripts) | yes |
| Custom error-handling parameters (<i>Set value to</i> and <i>Set error to</i> fields) | yes |

Low-level discovery

In a **low-level discovery rule**, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---|--|
| Key parameters | yes |
| Update interval | no |
| Custom interval | no |
| Timeout (available for supported item types) | no |
| Delete lost resources | no |
| Disable lost resources | no |
| Description | yes |
| <i>SNMP agent</i> | |
| SNMP OID | yes |
| <i>SSH agent</i> | |
| Username | yes |
| Public key file | yes |
| Private key file | yes |
| Password | yes |
| Script | yes |
| <i>TELNET agent</i> | |
| Username | yes |
| Password | yes |

| Location | | Multiple macros/mix with text ¹ |
|-------------------------|--|--|
| <i>Zabbix trapper</i> | Script | yes |
| | Allowed hosts | yes |
| <i>Database monitor</i> | Username | yes |
| | Password | yes |
| | SQL query | yes |
| <i>JMX agent</i> | JMX endpoint | yes |
| <i>HTTP agent</i> | URL ³ | yes |
| | Query fields | yes |
| | Request body | yes |
| | Headers (names and values) | yes |
| | Required status codes | yes |
| | HTTP authentication username | yes |
| | HTTP authentication password | yes |
| <i>Filters</i> | Regular expression | yes |
| <i>Overrides</i> | Filters: regular expression | yes |
| | Operations: update interval (for item prototypes) | no |
| | Operations: history storage period (for item prototypes) | no |
| | Operations: trend storage period (for item prototypes) | no |

Network discovery

In a **network discovery rule**, user macros can be used in the following fields:

| Location | | Multiple macros/mix with text ¹ |
|--------------------|---------------------------|--|
| Update interval | | no |
| <i>SNMP v1, v2</i> | SNMP community | yes |
| | SNMP OID | yes |
| <i>SNMP v3</i> | Context name | yes |
| | Security name | yes |
| | Authentication passphrase | yes |
| | Privacy passphrase | yes |
| | SNMP OID | yes |

Proxies

In a **proxy** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---|--|
| Interface port (for active agents, if proxy belongs to group) | no |
| Interface port (for passive proxy) | no |
| Timeouts for item types | no |

Proxy groups

In a **proxy group** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---------------------------|--|
| Failover period | no |
| Minimum number of proxies | no |

Templates

In a **template** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|--------------------------|--|
| <i>Tags</i> ² | |
| Tag names | yes |
| Tag values | yes |

Triggers

In a **trigger** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---|--|
| Name | yes |
| Operational data | yes |
| Expression (only in constants and function parameters; secret macros are not supported) | yes |
| Tag for matching | yes |
| Menu entry name | yes |
| Menu entry URL ³ | yes |
| Description | yes |
| <i>Tags</i> ² | |
| Tag names | yes |
| Tag values | yes |

Web scenario

In a **web scenario** configuration, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|-----------------|--|
| Name | yes |
| Update interval | no |

| Location | Multiple macros/mix with text ¹ |
|----------------------------|--|
| Agent | yes |
| HTTP proxy | yes |
| Variables (values only) | yes |
| Headers (names and values) | yes |
| <i>Steps</i> | |
| Name | yes |
| URL ³ | yes |
| Variables (values only) | yes |
| Headers (names and values) | yes |
| Timeout | no |
| Required string | yes |
| Required status codes | no |
| <i>Authentication</i> | |
| User | yes |
| Password | yes |
| SSL certificate | yes |
| SSL key file | yes |
| SSL key password | yes |
| <i>Tags²</i> | |
| Tag names | yes |
| Tag values | yes |

Other locations

In addition to the locations listed here, user macros can be used in the following fields:

| Location | Multiple macros/mix with text ¹ |
|---|--|
| Global scripts (URL, script, SSH, Telnet, IPMI), including configuration text | yes |
| Webhooks | |
| JavaScript script | no |
| JavaScript script parameter name | no |
| JavaScript script parameter value | yes |
| <i>Dashboards</i> | |
| Column of data type <i>Text</i> in <i>Top hosts</i> dashboard widget | yes |
| <i>Description</i> parameter in <i>Item value</i> and <i>Gauge</i> dashboard widget | yes |
| Primary/Secondary label <i>Text</i> parameter in <i>Honeycomb</i> dashboard widget | yes |
| URL ³ parameter in <i>URL</i> dashboard widget | yes |
| <i>Users</i> | |
| → <i>Users</i> | |
| → <i>Media</i> | |
| When active | no |

| Location | Multiple macros/mix with text ¹ |
|-------------------------|--|
| <i>Administration</i> | |
| → | |
| <i>Gen-eral</i> | |
| → | |
| <i>GUI</i> | |
| Working time | no |
| <i>Administration</i> | |
| → | |
| <i>Gen-eral</i> | |
| → | |
| <i>Time-outs</i> | |
| Timeouts for item types | no |
| <i>Administration</i> | |
| → | |
| <i>Gen-eral</i> | |
| → | |
| <i>Con-nec-tors</i> | |
| URL | yes |
| Username | yes |
| Password | yes |
| Bearer token | yes |
| Timeout | no |
| HTTP proxy | yes |
| SSL certificate file | yes |
| SSL key file | yes |
| SSL key password | yes |
| <i>Alerts</i> | |
| → | |
| <i>Me-dia</i> | |
| <i>types</i> | |
| → | |
| <i>Mes-sage</i> | |
| <i>tem-plates</i> | |
| Subject | yes |
| Message | yes |
| <i>Alerts</i> | |
| → | |
| <i>Me-dia</i> | |
| <i>types</i> | |
| → | |
| <i>Script</i> | |
| Script parameters | yes |
| <i>Alerts</i> | |
| → | |
| <i>Me-dia</i> | |
| <i>types</i> | |
| → | |
| <i>Me-dia</i> | |
| <i>type</i> | |

| Location | Multiple macros/mix with text ¹ |
|--|--|
| <i>Username and Password</i> fields for the <i>Email</i> media type (when <i>Authentication</i> is set to "Username and password"; secret macros recommended) | yes |

For a complete list of all macros supported in Zabbix, see [supported macros](#).

Footnotes

- ¹ If multiple macros in a field or macros mixed with text are not supported for the location, a single macro has to fill the whole field.
- ² Macros used in tag names and values are resolved only during event generation process.
- ³ URLs that contain a **secret macro** will not work, as the macro in them will be resolved as "*****".

7 Unit symbols

Overview

Working with large values such as 86400, 104857600, or 1000000 can be challenging and can lead to errors. To simplify configuration and improve readability, Zabbix supports unit symbols (suffixes) that function as value multipliers.

Trigger expressions without suffixes:

```
last(/host/system.uptime)<86400
avg(/host/system.cpu.load,600s)<10
last(/host/vm.memory.size[available])<20971520
```

Trigger expressions with suffixes:

```
last(/host/system.uptime)<1d
avg(/host/system.cpu.load,10m)<10
last(/host/vm.memory.size[available])<20M
```

Suffixes can also simplify the configuration of other entities, such as items, widgets, etc., and help display item values in a human-readable format.

Note:

To see if an entity configuration field supports suffixes, always see the relevant page for the entity being configured.

Time suffixes

Zabbix frontend supports the following time suffixes in entity configuration:

- **s** - seconds (*when used, works the same as the raw value*)
- **m** - minutes
- **h** - hours
- **d** - days
- **w** - weeks
- **M** - months (*trend functions only*)
- **y** - years (*trend functions only*)

Time suffixes are supported only with integer numbers. For example, 1h is supported, but 1,5h or 1.5h is not supported; use 90m instead.

Memory size suffixes

Zabbix supports the following memory size suffixes:

- **K** - kilobytes
- **M** - megabytes
- **G** - gigabytes
- **T** - terabytes

Item value suffixes

Suffixes can also be used to display numeric item values in a human-readable format.

To enable this, use one of the following suffixes in the *Units* field when [configuring an item](#):

- **B** - bytes
- **Bps** - bytes per second
- **s** - seconds, displayed using up to three largest non-zero time units
- **uptime** - elapsed time in hh:mm:ss or N days, hh:mm:ss
- **unixtime** - Unix timestamp, formatted as yyyy.mm.dd hh:mm:ss

The following additional rules apply to how these suffixes are interpreted and displayed:

- For B and Bps, Zabbix uses base-2 conversion (1K = 1024B), following the [JEDEC](#) standard.
- For other units (such as Hz, W, etc.), Zabbix uses base-10 conversion (1K = 1000).
- For s (seconds):
 - The format includes yyy mmm ddd hhh mmm sss ms; only up to three largest non-zero time units are displayed (e.g., 1M 10d 4h).
 - If a unit is zero and between two non-zero units, it is omitted (e.g., 10d 56m instead of 10d 0h 56m).

When *Units* are used, the following multiplier suffixes are automatically applied to item values:

- **K, M, G, T** - kilo, mega, giga, tera
- **P, E, Z, Y** - peta, exa, zetta, yotta (*these are applied in frontend only*)

To prevent unit conversion, use the **!** prefix (e.g., !B or !s).

The following examples show how received item values are converted based on the specified units:

```
1 B → 1 B
1024 B → 1 KB
1536 B → 1.5 KB
881764 B → 881.76 KB
881764 !B → 881764 B

0.0000155 s → 0.016ms
3470400 s → 1M 10d 4h
2606400 s → 1M 4h
2592000 s → 1M
2592001 s → 1M
2592001 !s → 2592001 s

17764 uptime → 04:56:04
86400 uptime → 1 day, 00:00:00
881764 uptime → 10 days, 04:56:04
32417764 uptime → 375 days, 04:56:04
32417764 !uptime → 32417764 uptime

881764 unixtime → 1970-01-11 04:56:04 AM

17764 Hz → 17.76 KHz
86400 Hz → 86.4 KHz
881764 Hz → 881.76 KHz
32417764 Hz → 32.42 MHz

0 ! → 0
0 !! → 0 !
```

Note:

Before Zabbix 4.0, there was a hardcoded unit stoplist consisting of ms, rpm, RPM, %. This stoplist has been deprecated, thus the correct way to prevent converting such units is !ms, !rpm, !RPM, !%.

8 Time period syntax

Overview

To set a time period, the following format has to be used:

d-d, hh:mm-hh:mm

where the symbols stand for the following:

| Symbol | Description |
|-----------|--|
| <i>d</i> | Day of the week: 1 - Monday, 2 - Tuesday ,... , 7 - Sunday |
| <i>hh</i> | Hours: 00-24 |
| <i>mm</i> | Minutes: 00-59 |

You can specify more than one time period using a semicolon (;) separator:

`d-d, hh:mm-hh:mm; d-d, hh:mm-hh:mm . . .`

Leaving the time period empty equals 1-7,00:00-24:00, which is the default value.

Attention:

The upper limit of a time period is not included. Thus, if you specify 09:00-18:00 the last second included in the time period is 17:59:59.

Examples

Working hours. Monday - Friday from 9:00 till 18:00:

`1-5,09:00-18:00`

Working hours plus weekend. Monday - Friday from 9:00 till 18:00 and Saturday, Sunday from 10:00 till 16:00:

`1-5,09:00-18:00;6-7,10:00-16:00`

9 Command execution

Zabbix uses common functionality for external checks, user parameters, system.run items, custom alert scripts, remote commands and global scripts.

Execution steps

Note:

By default, all scripts in Zabbix are executed using the `sh` shell, and it is not possible to modify the default shell. To utilize a different shell, you can employ a workaround: create a script file and invoke that script during command execution.

The command/script is executed similarly on both Unix and Windows platforms:

1. Zabbix (the parent process) creates a pipe for communication
2. Zabbix sets the pipe as the output for the to-be-created child process
3. Zabbix creates the child process (runs the command/script)
4. A new process group (in Unix) or a job (in Windows) is created for the child process
5. Zabbix reads from the pipe until timeout occurs or no one is writing to the other end (ALL handles/file descriptors have been closed). Note that the child process can create more processes and exit before they exit or close the handle/file descriptor.
6. If the timeout has not been reached, Zabbix waits until the initial child process exits or timeout occurs
7. If the initial child process exited and the timeout has not been reached, Zabbix checks exit code of the initial child process and compares it to 0 (non-zero value is considered as execution failure, only for custom alert scripts, remote commands and user scripts executed on Zabbix server and Zabbix proxy)
8. At this point it is assumed that everything is done and the whole process tree (i.e. the process group or the job) is terminated

Attention:

Zabbix assumes that a command/script has done processing when the initial child process has exited AND no other process is still keeping the output handle/file descriptor open. When processing is done, ALL created processes are terminated.

All double quotes and backslashes in the command are escaped with backslashes and the command is enclosed in double quotes.

Exit code checking

Exit code are checked with the following conditions:

- Only for custom alert scripts, remote commands and user scripts executed on Zabbix server and Zabbix proxy.
- Any exit code that is different from 0 is considered as execution failure.

- Contents of standard error and standard output for failed executions are collected and available in frontend (where execution result is displayed).
- Additional log entry may be created for remote commands executed on Zabbix agent/proxy by enabling the LogRemoteCommands parameter on [agent/proxy](#).

Possible frontend messages and log entries for failed commands/scripts:

- Contents of standard error and standard output for failed executions (if any).
- "Process exited with code: N." (for empty output, and exit code not equal to 0).
- "Process killed by signal: N." (for process terminated by a signal, on Linux only).
- "Process terminated unexpectedly." (for process terminated for unknown reasons).

10 Version compatibility

Supported agents

To be compatible with Zabbix 7.2, Zabbix agent must not be older than version 1.4 and must not be newer than 7.2.

You may need to review the configuration of older agents as some parameters have changed, for example, parameters related to [logging](#) for versions before 3.0.

To take full advantage of the latest functionality, metrics, improved performance and reduced memory usage, use the latest supported agent.

Notes for Windows XP

- On 32-bit Windows XP, do not use Zabbix agents newer than 6.0.x;
- On Windows XP/Server 2003, do not use agent templates that are newer than Zabbix 4.0.x. The newer templates use English performance counters, which are only supported since Windows Vista/Server 2008.

Supported agents 2

Older Zabbix agents 2 from version 4.4 onwards are compatible with Zabbix 7.2; Zabbix agent 2 must not be newer than 7.2.

Note that when using Zabbix agent 2 versions 4.4 and 5.0, the default interval of 10 minutes is used for refreshing unsupported items.

To take full advantage of the latest functionality, metrics, improved performance and reduced memory usage, use the latest supported agent 2.

Supported Zabbix proxies

For full compatibility with Zabbix 7.2, proxies must match the server's major version. Only Zabbix 7.2.x proxies are fully compatible with a Zabbix 7.2.x server.

Outdated proxies are partially supported: they can still collect data and execute scripts but cannot receive configuration updates, such as new items.

In relation to Zabbix server, proxies can be:

- *Current* (proxy and server have the same major version);
- *Outdated* (proxy version is older than server version, but is partially supported);
- *Unsupported* (proxy version is older than server previous LTS release version *or* proxy version is newer than server major version).

Examples:

| Server version | <i>Current</i> proxy version | <i>Outdated</i> proxy version | <i>Unsupported</i> proxy version |
|----------------|------------------------------|-------------------------------|----------------------------------|
| 6.4 | 6.4 | 6.0, 6.2 | Older than 6.0; newer than 6.4 |
| 7.0 | 7.0 | 6.0, 6.2, 6.4 | Older than 6.0; newer than 7.0 |

| Server version | Current proxy version | Outdated proxy version | Unsupported proxy version |
|----------------|-----------------------|------------------------|--------------------------------|
| 7.2 | 7.2 | 7.0 | Older than 7.0; newer than 7.2 |

Functionality supported by proxies:

| Proxy version | Data update | Configuration update | Tasks |
|---------------|-------------|----------------------|--|
| Current | Yes | Yes | Yes |
| Outdated | Yes | No | Remote commands (e.g., shell scripts); Immediate item value checks (i.e., <i>Execute now</i>); Note: Preprocessing tests with a real value are not supported. |
| Unsupported | No | No | No |

Warnings about using incompatible Zabbix daemon versions are logged.

Supported XML files

XML files not older than version 1.8 are supported for import in Zabbix 7.2.

Attention:

In the XML export format, trigger dependencies are stored by name only. If there are several triggers with the same name (for example, having different severities and expressions) that have a dependency defined between them, it is not possible to import them. Such dependencies must be manually removed from the XML file and re-added after import.

12 Zabbix sender dynamic link library for Windows

Overview

In a Windows environment applications can send data to Zabbix server/proxy by using the Zabbix sender dynamic link library (zabbix_sender.dll) instead of having to launch an external process (zabbix_sender.exe).

zabbix_sender.h and zabbix_sender.lib are required for compiling user applications with zabbix_sender.dll.

Getting it

There are two ways of getting zabbix_sender.dll.

1. [Download](#) zabbix_sender.h, zabbix_sender.lib and zabbix_sender.dll files as a ZIP archive.

When choosing download options make sure to select "No encryption" under *Encryption* and "Archive" under *Packaging*. Then download Zabbix agent (not Zabbix agent 2).

The zabbix_sender.h, zabbix_sender.lib and zabbix_sender.dll files will be inside the downloaded ZIP archive in the bin\dev directory. Unzip the files where you need it.

2. Build zabbix_sender.dll from source (see [instructions](#)).

The dynamic link library with the development files will be located in the bin\winXX\dev directory. To use it, include the zabbix_sender.h header file and link with the zabbix_sender.lib library.

See also

- [example](#) of a simple Zabbix sender utility implemented with Zabbix sender dynamic link library to illustrate the library usage;
- [zabbix_sender.h](#) file for the interface functions of the Zabbix sender dynamic link library. This file contains documentation explaining the purpose of each interface function, its arguments, and return value.

13 Python library for Zabbix API

Overview

[zabbix_utils](#) is a Python library for:

- working with Zabbix API;
- acting like Zabbix sender;
- acting like Zabbix get.

It is supported for Zabbix 5.0, 6.0, 6.4 and later.

14 Service monitoring upgrade

Overview In Zabbix 6.0, **service monitoring** functionality has been reworked significantly (see [What's new in Zabbix 6.0.0](#) for the list of changes).

This page describes how services and SLAs, defined in earlier Zabbix versions, are changed during an upgrade to Zabbix 6.0 or newer.

Services In older Zabbix versions, services had two types of dependencies: soft and hard. After an upgrade, all dependencies will become equal.

If a service "Child service" has been previously linked to "Parent service 1" via hard dependency and additionally "Parent service 2" via soft dependency, after an upgrade the "Child service" will have two parent services "Parent service 1" and "Parent service 2".

Trigger-based mapping between problems and services has been replaced by tag-based mapping. In Zabbix 6.0 and newer, service configuration form has a new parameter *Problem tags*, which allows specifying one or multiple tag name and value pairs for problem matching. Triggers that have been linked to a service will get a new tag `ServiceLink: <trigger ID>:<trigger name>` (tag value will be truncated to 32 characters). Linked services will get `ServiceLink problem tag` with the same value.

Status calculation rules

The 'Status calculation algorithm' will be upgraded using the following rules:

- Do not calculate → Set status to OK
- Problem, if at least one child has a problem → Most critical of child services
- Problem, if all children have problems → Most critical if all children have problems

SLAs Previously, SLA targets had to be defined for each service separately. Since Zabbix 6.0, SLA has become a separate entity, which contains information about service schedule, expected service level objective (SLO) and downtime periods to exclude from the calculation. Once configured, an SLA can be assigned to multiple services through **service tags**.

During an upgrade:

- Identical SLAs defined for each service will be grouped and one SLA per each group will be created.
- Each affected service will get a special tag `SLA:<ID>` and the same tag will be specified in the *Service tags* parameter of the corresponding SLA.
- Service creation time, a new metric in SLA reports, will be set to 01/01/2000 00:00 for existing services.

15 Other issues

Login and systemd

We recommend **creating** a *zabbix* user as system user, that is, without ability to log in. Some users ignore this recommendation and use the same account to log in (e. g. using SSH) to host running Zabbix. This might crash Zabbix daemon on log out. In this case you will get something like the following in Zabbix server log:

```
zabbix_server [27730]: [file:'selfmon.c',line:375] lock failed: [22] Invalid argument
zabbix_server [27716]: [file:'dbconfig.c',line:5266] lock failed: [22] Invalid argument
zabbix_server [27706]: [file:'log.c',line:238] lock failed: [22] Invalid argument
```

and in Zabbix agent log:

```
zabbix_agentd [27796]: [file:'log.c',line:238] lock failed: [22] Invalid argument
```

This happens because of default systemd setting `RemoveIPC=yes` configured in `/etc/systemd/logind.conf`. When you log out of the system the semaphores created by Zabbix previously are removed which causes the crash.

A quote from systemd documentation:

RemoveIPC=

Controls whether System V and POSIX IPC objects belonging to the user shall be removed when the user fully logs out. Takes a boolean argument. If enabled, the user may not consume IPC resources after the last of the user's sessions terminated. This covers System V semaphores, shared memory and message queues, as well as POSIX shared memory and message queues. Note that IPC objects of the root user and other system users are excluded from the effect of this setting. Defaults to "yes".

There are 2 solutions to this problem:

1. (recommended) Stop using *zabbix* account for anything else than Zabbix processes, create a dedicated account for other things.
2. (not recommended) Set RemoveIPC=no in `/etc/systemd/logind.conf` and reboot the system. Note that RemoveIPC is a system-wide parameter, changing it will affect the whole system.

Using Zabbix frontend behind proxy

If Zabbix frontend runs behind proxy server, the cookie path in the proxy configuration file needs to be rewritten in order to match the reverse-proxied path. See examples below. If the cookie path is not rewritten, users may experience authorization issues, when trying to login to Zabbix frontend.

Example configuration for nginx

```
# ..
location / {
# ..
proxy_cookie_path /zabbix /;
proxy_pass http://192.168.0.94/zabbix/;
# ..
```

Example configuration for Apache

```
# ..
ProxyPass "/" http://host/zabbix/
ProxyPassReverse "/" http://host/zabbix/
ProxyPassReverseCookiePath /zabbix /
ProxyPassReverseCookieDomain host zabbix.example.com
# ..
```

16 Agent vs agent 2 comparison

This section describes the differences between the Zabbix agent and the Zabbix agent 2.

| Parameter | Zabbix agent | Zabbix agent 2 |
|-----------------------------|---|---|
| Programming language | C | Go with some parts in C |
| Daemonization | yes | by systemd only (yes on Windows) |
| Supported extensions | Custom loadable modules in C. | Custom plugins in Go. |
| <i>Requirements</i> | | |
| Supported platforms | Linux, IBM AIX, FreeBSD, NetBSD, OpenBSD, HP-UX, Mac OS X, Solaris: 9, 10, 11, Windows: all desktop and server versions since XP | Linux, Windows: all desktop and server versions, on which a supported Go version can be installed. |
| Supported crypto libraries | GnuTLS 3.1.18 and newer OpenSSL 1.0.1, 1.0.2, 1.1.0, 1.1.1, 3.0.x LibreSSL - tested with versions 2.7.4, 2.8.2 (certain limitations apply, see the Encryption page for details). | Linux: OpenSSL 1.0.1 and later. MS Windows: OpenSSL 1.1.1 or later. The OpenSSL library must have PSK support enabled. LibreSSL is not supported. |
| <i>Monitoring processes</i> | | |
| Processes | A separate active check process for each server/proxy record. | Single process with automatically created threads. The maximum number of threads is determined by the GOMAXPROCS environment variable. |

| Parameter | Zabbix agent | Zabbix agent 2 |
|-------------------------------------|---|---|
| Metrics | UNIX: see a list of supported items . Windows: see a list of additional Windows-specific items . | UNIX: All metrics supported by Zabbix agent. Additionally, the agent 2 provides Zabbix-native monitoring solution for: Docker, Memcached, MySQL, PostgreSQL, Redis, systemd, and other monitoring targets - see a full list of agent 2 specific items . Windows: All metrics supported by Zabbix agent, and also net.tcp.service* checks of HTTPS, LDAP. Additionally, the agent 2 provides Zabbix-native monitoring solution for: PostgreSQL, Redis. Checks from different plugins or multiple checks within one plugin can be executed concurrently. |
| Concurrency | Active checks for single server are executed sequentially. | yes |
| Third-party traps | no | yes |
| <i>Additional features</i> | | |
| Persistent storage | no | yes |
| Persistent files for log*[] metrics | yes (only on Unix) | no |
| Log data upload | Can be performed during log gathering to free the buffer. | Log gathering is stopped when the buffer is full, therefore the BufferSize parameter must be at least MaxLinesPerSecond x 2. |
| Changes user at runtime | yes (Unix-like systems only) | no (controlled by systemd) |
| User-configurable ciphersuites | yes | no |

17 Escaping examples

Overview

This page provides examples of using correct escaping when using regular expressions in various contexts.

Note:

When using the trigger expression constructor, correct escaping in regular expressions is added automatically.

Examples

User macro with context

Regular expression: `\. +\"[a-z]+
` User macro with context: `{${MACRO:regex: \"\\. +\"[a-z]+\"}`

Notice:

- backslashes are **not escaped**;
- quotation marks are escaped.

Macro function inside item key parameter

Regular expression: `.+:(\d+)$
` Item key: `net.tcp.service[tcp, ,\"{{${ENDPOINT}}.regsub(\".+:(\d+)$\", \1)}\"`

Notice:

- regular expression inside the `regsub` macro function is double-quoted (because of contains closing parenthesis);
- quotation marks around the regular expression are escaped (because the whole third item parameter is double-quoted);

- third item key parameter is double-quoted because it contains a comma.

LLD macro function

Regular expression: `\.+\"([a-z]+)`
LLD macro: `{{#MACRO}}.iregsub(\".+\"([a-z]+)\", \1)}`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

LLD macro function inside user macro context

Regular expression: `\.+\"([a-z]+)`
LLD macro: `{{#MACRO}}.iregsub(\".+\"([a-z]+)\", \1)}`
User macro with context: `{{#MACRO: \"{{#MACRO}}.iregsub(\".+\"([a-z]+)\", \1)}}}`

Notice:

- backslash escaping for LLD does not change;
 - upon inserting the LLD macro into user macro context, we need to put it into string;
1. Quotation marks are added around the macro expression;
 2. Quotation marks get escaped; in total, 3 new backslashes are introduced.

String parameter of function (any)

concat is used as example.

String content: `\.+\"[a-z]+`
Expression: `concat("abc", "\\.\"[a-z]+")`

Notice:

- String parameters require escaping both for backslashes and quotation marks.

LLD macro function inside string parameter of function

Regular expression: `\.+\"([a-z]+)`
LLD macro: `{{#MACRO}}.iregsub(\".+\"([a-z]+)\", \1)}`
Expression: `concat("abc", "{{#MACRO}}.iregsub(\"\\.\"([a-z]+)\", \1)")`

Notice:

- String parameters require escaping both for backslashes and quotation marks;
- Another layer of escaping is added, because the macro will be resolved only after string is unquoted;

User macro with context inside string parameter of function

Regular expression: `\.+\"[a-z]+`
User macro with context: `{{#MACRO: regex: \"\\.\"[a-z]+}}`
Expression: `concat("abc", "{{#MACRO: regex: \"\\.\"[a-z]+}}")`

Notice:

- Same as in the previous example an additional layer of escaping is needed;
- Backslashes and quotation marks are escaped only for the top-level escaping (by virtue of it being a string parameter).

LLD macro function inside user macro context inside function

Regular expression: `\.+\"([a-z]+)`
LLD macro: `{{#MACRO}}.iregsub(\".+\"([a-z]+)\", \1)}`
User macro with context: `{{#MACRO: \"{{#MACRO}}.iregsub(\"\\.\"([a-z]+)\", \1)}}}`
Expression: `concat("abc", "{{#MACRO: \"{{#MACRO}}.iregsub(\"\\.\"([a-z]+)\", \1)}}")`

Notice the three layers of escaping:

1. For LLD macro function, without escaping of backslashes;
2. For User macro with context, without escaping of backslashes;
3. For the string parameter of a function, with escaping of backslashes.

User macro with context just inside string

Regular expression: `\.+\"[a-z]+`
User macro with context: `{{#MACRO: regex: \"\\.\"[a-z]+}}`
Inside string of some expression, for example: `func(arg1, arg2, arg3)="{{#MACRO: regex: \"\\.\"[a-z]+}}"`

Notice:

- Strings also require backslash escaping;
- Strings also require quotation mark escaping;
- Again a case with 2 levels of escaping:

1. Escaping for user macro context without backslash escaping;

2. Escaping for it being a string with backslash escaping.

23 Quick reference guides

Overview

This documentation section contains quick recipes for setting up Zabbix for some commonly required monitoring goals.

It is designed with the new Zabbix user in mind and can be used as a navigator through other documentation sections that contain information required for resolving the task.

The following quick reference guides are available:

- [Monitor Linux with Zabbix agent](#)
- [Monitor Windows with Zabbix agent](#)
- [Monitor Apache via HTTP](#)
- [Monitor MySQL with Zabbix agent 2](#)
- [Monitor VMware with Zabbix](#)
- [Monitor network traffic with Zabbix](#)
- [Monitor network traffic with Zabbix using active checks](#)
- [Monitor websites with Browser items](#)
- [Monitor website certificates with Zabbix agent 2 \(passive\)](#)
- [Monitor a network switch or router with Zabbix](#)
- [Monitor Windows event log using active checks](#)

1 Monitor Linux with Zabbix agent

Introduction This page walks you through the steps required to start basic monitoring of Linux machines with Zabbix. The steps described in this tutorial can be applied to any Linux-based operating system.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of your Linux machine. If you are looking for deep customization options or require more advanced configuration, see [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server and Zabbix frontend according to the instructions for your OS.

Install Zabbix agent Zabbix agent is the process responsible for gathering data.

Check your Zabbix server version:

```
zabbix_server -V
```

Install Zabbix agent of the same version (recommended) on the Linux machine that you want to monitor. Based on your monitoring needs, it may be the same machine, where Zabbix server is installed, or a completely different machine.

Choose the most suitable installation method:

- Run as a Docker container - see the list of available images in [Zabbix Docker repository](#).
- Install from Zabbix [packages](#) (available for Alma Linux, CentOS, Debian, Oracle Linux, Raspberry Pi OS, RHEL, Rocky Linux, SUSE Linux Enterprise Server, Ubuntu).
- Compile [from sources](#).

Configure Zabbix for monitoring Zabbix agent can collect metrics in active or passive mode (simultaneously).

Note:

A passive check is a simple data request. Zabbix server or proxy asks for some data (for example, CPU load) and Zabbix agent sends back the result to the server. Active checks require more complex processing. The agent must first retrieve from the server(s) a list of items for independent processing and then bulk send the data back. See [Passive and active agent checks](#) for more info.

Monitoring templates provided by Zabbix usually offer two alternatives - a template for Zabbix agent and a template for Zabbix agent (active). With the first option, the agent will collect metrics in passive mode. Such templates will deliver identical monitoring results, but using different communication protocols.

Further Zabbix configuration depends on whether you select a template for [active](#) or [passive](#) Zabbix agent checks.

Passive checks Zabbix agent

1. Open the agent configuration file on the machine where the agent is installed.

```
sudo vi /etc/zabbix/zabbix_agentd.conf
```

2. Add the IP address or DNS name (and optional port) of your Zabbix server to the server parameter. For example:

```
Server=192.0.2.0:10051
```

Zabbix agent will use this address to accept incoming connections only from the specified Zabbix servers or proxies to retrieve data.

3. Restart Zabbix agent.

```
systemctl restart zabbix-agent
```

Zabbix frontend

1. Log in to Zabbix frontend.

2. [Create a host](#) in Zabbix web interface.

- In the *Host name* field, enter a host name (e.g., "Linux server").
- In the *Templates* field, type or select the template "Linux by Zabbix agent" that will be [linked](#) to the host.
- In the *Host groups* field, type or select a host group (e.g., "Linux servers").
- In the *Interfaces* parameter, add *Agent* interface and specify the IP address or DNS name of the Linux machine where the agent is installed.

The screenshot shows the 'New host' configuration form in the Zabbix web interface. The form is divided into several sections: 'Host' (selected), 'IPMI', 'Tags', 'Macros', 'Inventory', 'Encryption', and 'Value mapping'. The 'Host' section contains fields for 'Host name' (filled with 'Linux server'), 'Visible name' (filled with 'Linux server'), 'Templates' (filled with 'Linux by Zabbix agent'), and 'Host groups' (filled with 'Linux servers'). Below these is the 'Interfaces' section, which is a table with columns: Type, IP address, DNS name, Connect to, Port, and Default. The first row shows 'Agent' as the type, '198.51.100.0' as the IP address, and '10050' as the port. The 'Connect to' column has radio buttons for 'IP' (selected) and 'DNS'. A 'Remove' button is next to the row. Below the table is an 'Add' button. The 'Description' field is a large text area. At the bottom, there is a 'Monitored by' section with radio buttons for 'Server' (selected), 'Proxy', and 'Proxy group'. There is also an 'Enabled' checkbox which is checked. At the very bottom right are 'Add' and 'Cancel' buttons.

3. Click on *Add* to add the host. This host will represent the monitored Linux machine.

Active checks Zabbix agent

1. Open the agent configuration file on the machine where the agent is installed.

```
sudo vi /etc/zabbix/zabbix_agentd.conf
```

2. Add the IP address or DNS name (and optional port) of your Zabbix server to the `ServerActive` parameter. For example:

```
ServerActive=192.0.2.0:10051
```

Zabbix agent will use this address to connect to Zabbix server's trapper port (default: 10051) and request the configuration data for active checks.

3. Define the `Hostname` parameter, which must match the host name that will be defined in **Zabbix frontend**. In our example, it is:

```
Hostname=Linux server
```

The `Hostname` value must match because, for active checks, Zabbix agent uses it to retrieve the correct host configuration from the server. Specifically, the agent initiates a connection to the server and identifies itself using the `Hostname` value. The server then provides the monitoring configuration for that host. If these values differ, the agent will not receive the appropriate configuration, resulting in missing metrics or monitoring issues.

4. Restart Zabbix agent.

```
systemctl restart zabbix-agent
```

Zabbix frontend

1. Log in to Zabbix frontend.

2. **Create a host** in Zabbix web interface.

- In the *Host name* field, enter a host name (e.g., "Linux server") that matches the *Hostname* parameter value defined earlier in the agent configuration file.
- In the *Templates* field, type or select the template "Linux by Zabbix agent active" that will be **linked** to the host.
- In the *Host groups* field, type or select a host group (e.g., "Linux servers").
- Leave *Interfaces* undefined; an interface is not necessary for active checks because the agent initiates the connection to the server instead of listening for a connection from the server.

Set up problem alerts Zabbix can notify you about a problem with your infrastructure using a variety of methods. This guide provides configuration steps for sending email alerts.

1. Go to the *User settings -> Profile*, switch to the tab *Media* and **add your email**.

Media

Type Email

* Send to user@domain.tld Remove

Add

* When active 1-7,00:00-24:00

Use if severity

☒ Not classified
 ☒ Information
 ☒ Warning
 ☒ Average
 ☒ High
 ☒ Disaster

Enabled ☒

Add

Cancel

2. Follow the guide for **Receiving problem notification**.

Next time, when Zabbix detects a problem you should receive an alert via email.

Test your configuration On Linux, you can simulate high CPU load and as a result receive a problem alert by running:

```
cat /dev/urandom | md5sum
```

You may need to run several **md5sum** processes for CPU load to exceed the threshold.

When Zabbix detects the problem, it will appear in the Monitoring->Problems section.

| Time ▼ | <input type="checkbox"/> Severity | Recovery time | Status | Info | Host | Problem | Duration | Ack | Actions | Tags |
|---------------------|-----------------------------------|---------------|---------|------|--------------|--|-------------|-----|---------|-------------------------------------|
| 2022-10-18 18:08:17 | <input type="checkbox"/> Average | | PROBLEM | | Linux server | ↑ /: Disk space is critically low (used > 90%) ? | 15h 15m 26s | No | | class: os compone filesystem: / ... |

If the alerts are **configured**, you will also receive the problem notification.

See also:

- **Creating an item** - how to start monitoring additional metrics (custom monitoring without templates).
- **Zabbix agent items, Zabbix agent items for Windows** - full list of metrics you can monitor using Zabbix agent on Windows.
- **Problem escalations** - how to create multi-step alert scenarios (e.g., first send message to the system administrator, then, if a problem is not resolved in 45 minutes, send message to the data center manager).
- **Installation from packages** - how to install Zabbix components using official RPM and DEB packages for various Linux distributions, ensuring access to the latest features and bug fixes.

2 Monitor Windows with Zabbix agent

Introduction This page walks you through the steps required to start basic monitoring of Windows machines with Zabbix.

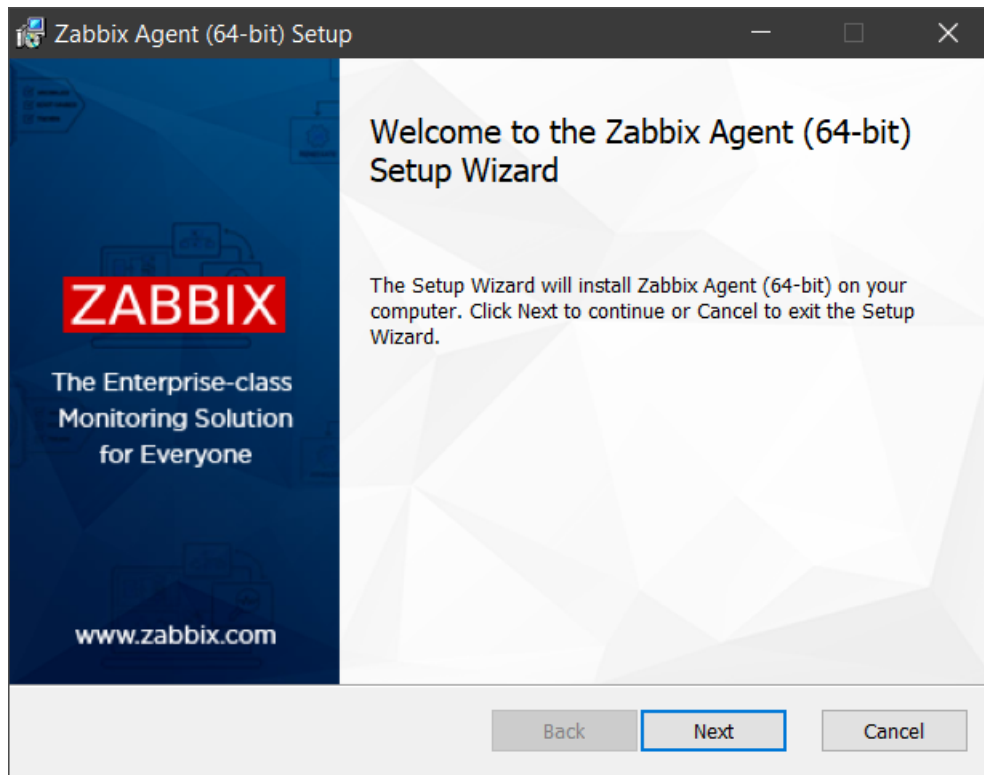

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of your Windows machine. If you are looking for deep customization options or require more advanced configuration, see [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this installation guide, you must [download and install](#) Zabbix server and Zabbix frontend according to instructions for your OS.

Install Zabbix agent Zabbix agent is the process responsible for gathering data. You need to install it on the Windows machine that you want to monitor. Follow Zabbix agent installation instructions for [Windows](#).

Configure Zabbix for monitoring Zabbix agent can collect metrics in active or passive mode (simultaneously).

Note:

A passive check is a simple data request. Zabbix server or proxy asks for some data (for example, CPU load) and Zabbix agent sends back the result to the server. Active checks require more complex processing. The agent must first retrieve from the server(s) a list of items for independent processing and then bulk send the data back. See [Passive and active agent checks](#) for more info.

Monitoring templates provided by Zabbix usually offer two alternatives - a template for Zabbix agent and a template for Zabbix agent (active). With the first option, the agent will collect metrics in passive mode. Such templates will deliver identical monitoring results, but using different communication protocols.

Further Zabbix configuration depends on whether you select a template for [active](#) or [passive](#) Zabbix agent checks.

Passive checks Zabbix frontend

1. Log into Zabbix frontend.
2. [Create a host](#) in Zabbix web interface.

This host will represent your Windows machine.

3. In the *Interfaces* parameter, add *Agent* interface and specify the IP address or DNS name of the Windows machine where the agent is installed.

4. In the *Templates* parameter, type or select *Windows by Zabbix agent*.

Description

Zabbix agent

For passive checks Zabbix agent needs to know the IP address or DNS name of Zabbix server. If you have provided correct information during the agent installation, the configuration file is already updated. Otherwise, you need to manually specify it. Go to the `C:\Program files\Zabbix Agent` folder, open the file `zabbix_agentd.conf` and add the IP/DNS of your Zabbix server to the *Server* parameter.

Example:

```
Server=192.0.2.22
```

Active checks Zabbix frontend

1. Log in to Zabbix frontend.

2. **Create a host** in Zabbix web interface.

This host will represent your Windows machine.

3. In the *Templates* parameter, type or select *Windows by Zabbix agent active*.

2. Follow the guide for [Receiving problem notification](#).

Next time, when Zabbix detects a problem you should receive an alert via email.

Note:

On Windows, you can use [CpuStres](#) utility to simulate high CPU load and as a result receive a problem alert.

See also:

- [Creating an item](#) - how to start monitoring additional metrics (custom monitoring without templates).
- [Zabbix agent items](#), [Zabbix agent items for Windows](#) - full list of metrics you can monitor using Zabbix agent on Windows.
- [Problem escalations](#) - how to create multi-step alert scenarios (e.g., first send message to the system administrator, then, if a problem is not resolved in 45 minutes, send message to the data center manager).

3 Monitor Apache via HTTP

Introduction This page shows a quick and simple way to start monitoring an Apache web server without installing any additional software.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of your Apache installation. If you are looking for deep customization options or require more advanced configuration, see [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this installation guide, you must [download and install](#) Zabbix server and Zabbix frontend according to instructions for your OS.

Prepare Apache 1. Check, which Apache version you are using:

On RHEL-based system, run:

```
httpd -v
```

On Debian/Ubuntu, run:

```
apache2 -v
```

2. Make sure that the [Status module](#) is enabled in your Apache instance.

On RHEL-based system, run:

```
httpd -M | grep status
status_module (shared)
```

On Debian/Ubuntu, run:

```
apache2ctl -M | grep status
status_module (shared)
```

If you don't see `status_module` in the list, enable the module by running:

On RHEL-based system, run:

```
LoadModule status_module /usr/lib/apache2/modules/mod_status.so
```

On Debian/Ubuntu, run:

```
sudo /usr/sbin/a2enmod status
```

3. Edit Apache configuration file to allow access to status reports from Zabbix server IP.

On an RHEL-based system: `/etc/httpd/conf.modules.d/status.conf`:

```
sudo vi /etc/httpd/conf.modules.d/status.conf
```

On Debian/Ubuntu: `/etc/apache2/mods-enabled/status.conf`:

```
sudo vi /etc/apache2/mods-enabled/status.conf
```

Add the following lines to the file (**replace 198.51.100.255** with your Zabbix server IP address):

- For Apache 2.2:
`<Location /server-status> SetHandler server-status`
`Order Deny,Allow Deny from all Allow from 198.51.100.255 </Location>`
- For Apache 2.4:
`<Location "/server-status"> SetHandler server-status Require ip 198.51.100.255 </Location>`

4. Restart Apache

On an RHEL-based system, run:

```
sudo systemctl restart httpd
```

On Debian/Ubuntu, run:

```
sudo systemctl restart apache2
```

5. To check, if everything is configured correctly, run (**replace 198.51.100.255** with your Zabbix server IP address):

```
curl 198.51.100.255/server-status
```

The response should contain Apache web server statistics.

Configure Zabbix for monitoring 1. Log into Zabbix frontend.

2. **Create a host** in Zabbix web interface.

This host will represent your Apache server.

3. In the *Interfaces* parameter, add *Agent* interface and specify your Apache instance IP address. **You don't need to install Zabbix agent on the machine**, the interface will only be used for resolving `{HOST.CONN}` macro. This macro is used in template items to locate Apache instance.

4. In the *Templates* parameter, type or select *Apache by HTTP*.

2. Follow the guide for **Receiving problem notification**.

Next time, when Zabbix detects a problem you should receive an alert via email.

Test your configuration To simulate real problem and receive a test problem alert:

1. Open the *Apache server* host configuration in Zabbix.
2. Switch to the *Macros* tab and select *Inherited and host macros*.
3. Press *Change* next to `{$APACHE.STATUS.PORT}` macro and set a different port.
4. Press *Update* to save host configuration.
5. In a few minutes, Zabbix will detect the problem *Apache service is down*, because now it cannot connect to the instance. It will appear in the *Monitoring->Problems* section.

| Time | Severity | Recovery time | Status | Info | Host | Problem | Duration | Ack | Actions |
|----------|----------|---------------|---------|------|---------------|-------------------------|----------|-----|---------|
| 09:34:16 | Average | | PROBLEM | | Apache server | Apache: Service is down | 45s | No | |

If the alerts are **configured**, you will also receive the problem notification.

6. Change the macro value back to resolve the problem and continue monitoring Apache.

4 Monitor MySQL with Zabbix agent 2

Introduction

This page walks you through the steps required to start basic monitoring of a MySQL server.

To monitor a MySQL server, there are several approaches: Zabbix agent, Zabbix agent 2, or the Open Database Connectivity (ODBC) standard. The primary focus of this guide is on monitoring a MySQL server with Zabbix agent 2, which is the **recommended** approach due to its seamless configuration across various setups. However, this page also offers instructions for the **other approaches**, so feel free to choose the one that best suits your requirements.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of a MySQL server. If you are looking for deep customization options or require more advanced configuration, see the **Configuration** section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server, Zabbix frontend and Zabbix agent 2 according to the instructions for your OS.

Based on your setup, some of the steps in this guide may slightly differ. This guide is based on the following setup:

- Zabbix version: Zabbix 7.2 (installed from packages)
- OS distribution: Ubuntu
- OS version: 22.04 (Jammy)
- Zabbix components: Server, Frontend, Agent 2
- Database: MySQL
- Web server: Apache

Create MySQL user

To monitor a MySQL server, Zabbix requires access to it and its processes. Your MySQL installation already has a user with the required level of access (the user "zabbix" that was created when installing Zabbix), however, this user has more privileges than necessary for simple monitoring (privileges to DROP databases, DELETE entries from tables, etc.). Therefore, a MySQL user for the purpose of *only* monitoring the MySQL server needs to be created.

1. Connect to the MySQL client, create a "zbx_monitor" user (replace *<password>* for the "zbx_monitor" user with a password of your choice), and **GRANT** the necessary privileges to the user:

```
mysql -u root -p
# Enter password:
```

```
mysql> CREATE USER 'zbx_monitor'@'%' IDENTIFIED BY '<password>';
mysql> GRANT REPLICATION CLIENT,PROCESS,SHOW DATABASES,SHOW VIEW ON *.* TO 'zbx_monitor'@'%';
mysql> quit;
```

Once the user is created, you can move on to the next step.

Configure Zabbix frontend

1. Log into Zabbix frontend.

2. **Create a host** in Zabbix web interface:

- In the *Host name* field, enter a host name (e.g., "MySQL server").
- In the *Templates* field, type or select the template "MySQL by Zabbix agent 2" that will be **linked** to the host.
- In the *Host groups* field, type or select a host group (e.g., "Databases").
- In the *Interfaces* field, add an interface of type "Agent" and specify your MySQL server IP address. This guide uses "127.0.0.1" (localhost) for monitoring a MySQL server that is installed on the same machine as Zabbix server and Zabbix agent 2.

Monitored by proxy

Enabled ☒

- In the **Macros** tab, switch to *Inherited and host macros*, look for the following macros and click on *Change* next to the macro value to update it:
 - {`$MYSQL.DSN`} - set the data source of the MySQL server (the **connection string of a named session** from the MySQL Zabbix agent 2 plugin configuration file). This guide uses the default data source "`tcp://localhost:3306`" for monitoring a MySQL server that is installed on the same machine as Zabbix server and Zabbix agent 2.
 - {`$MYSQL.PASSWORD`} - set the password of the previously **created MySQL user** "`zbx_monitor`".
 - {`$MYSQL.USER`} - set the name of the previously **created MySQL user** "`zbx_monitor`".

[Add](#)

3. Click on *Add* to add the host. This host will represent your MySQL server.

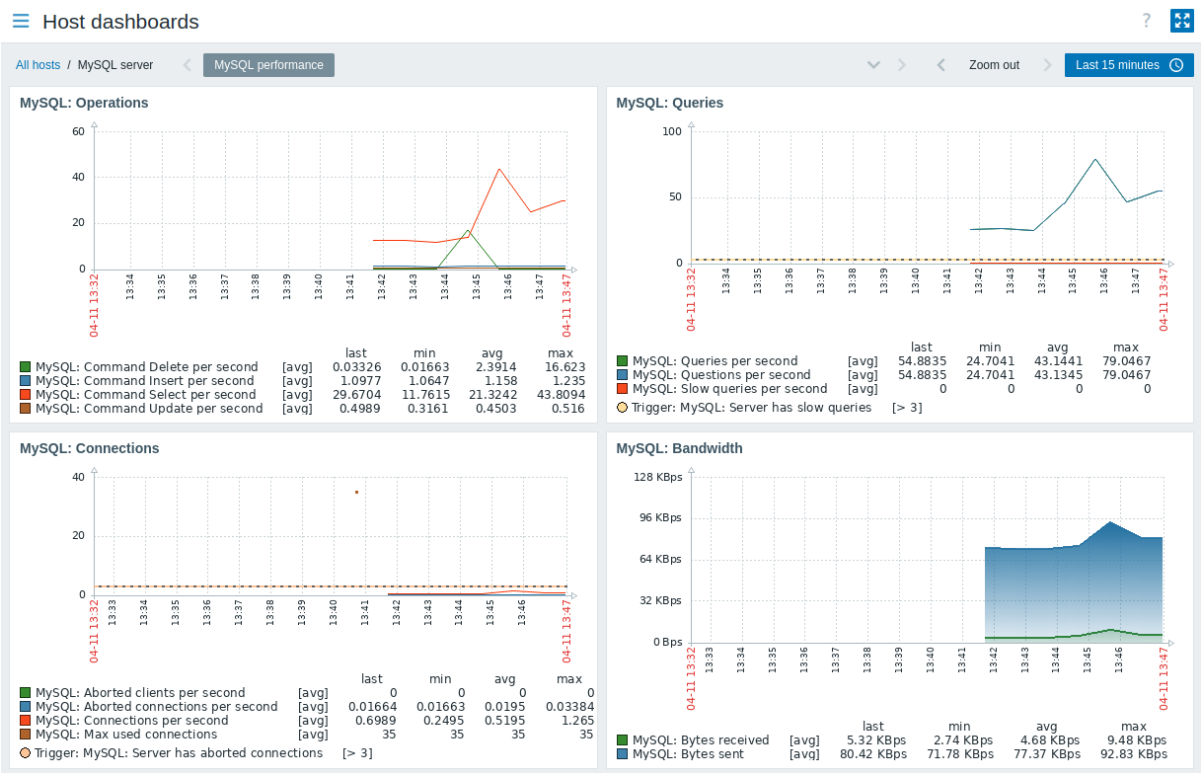

View collected metrics

Congratulations! At this point, Zabbix is already monitoring your MySQL server.

To view collected metrics, navigate to the *Monitoring* → *Hosts* menu section and click on *Dashboards* next to the host.

This action will take you to the host dashboard (configured on the template level) with the most important metrics collected from the MySQL server.

Alternatively, from the *Monitoring* → *Hosts* menu section, you can click on *Latest data* to view all the latest collected metrics in a list. Note that the item *MySQL: Calculated value of innodb_log_file_size* is expected to have no data, as the value will be calculated from data in the last hour.

Subfilter affects only filtered data

2. Follow the guide for *Receiving a problem notification*.

Next time, when Zabbix detects a problem, you should receive an alert via email.

Test your configuration

To test your configuration, we can simulate a real problem by updating the host configuration in Zabbix frontend.

1. Open your MySQL server host configuration in Zabbix.
2. Switch to the *Macros* tab and select *Inherited and host macros*.

3. Click on *Change* next to, for example, the **previously configured** `{MYSQL.USER}` macro value and set a different MySQL user name.
4. Click on *Update* to update the host configuration.
5. In a few moments, Zabbix will detect the problem "MySQL: Service is down", because it will not be able to connect to the MySQL server. The problem will appear in **Monitoring → Problems**.

If alerts are **configured**, you will also receive the problem notification.

6. Change the macro value back to its previous value to resolve the problem and continue monitoring the MySQL server.

Other approaches to monitor MySQL

Instead of monitoring a MySQL server with Zabbix agent 2, you could also use Zabbix agent or the Open Database Connectivity (ODBC) standard. While using Zabbix agent 2 is recommended, there might be some setups that do not support Zabbix agent 2 or require a custom approach.

The key difference between Zabbix agent and ODBC lies in the data collection method - Zabbix agent is installed directly on the MySQL server and collects data using its built-in functionality, while ODBC relies on an ODBC driver to establish a connection to the MySQL server and retrieve data using SQL queries.

Although many of the configuration steps are similar to monitoring a MySQL server with Zabbix agent 2, there are some significant differences - you need to configure Zabbix agent or ODBC to be able to monitor a MySQL server. The following instructions walk you through these **differences**.

Monitor MySQL with Zabbix agent

To monitor a MySQL server with Zabbix agent, you need to [download and install](#) Zabbix server, Zabbix frontend and Zabbix agent according to the instructions for your OS.

Once you have successfully installed the required Zabbix components, you need to create a MySQL user as described in the **Create MySQL user** section.

After you have created the MySQL user, you need to configure Zabbix agent to be able to establish a connection with the MySQL server and monitor it. This includes configuring multiple **user parameters** for executing custom agent checks, as well as providing Zabbix agent with the necessary credentials for connecting to the MySQL server as the **previously created** "zbx_monitor" user.

Configure Zabbix agent

1. Navigate to the Zabbix agent additional configurations directory.

```
cd /usr/local/etc/zabbix/zabbix_agentd.d
```

Attention:

The Zabbix agent additional configurations directory should be located in the same directory as your Zabbix agent configuration file (`zabbix_agentd.conf`). Depending on your OS and Zabbix installation, this directory can have a different location than specified in this guide. For default locations, check the **Include** parameter in the Zabbix agent configuration file.

Instead of defining all of the necessary user parameters for monitoring the MySQL server in the Zabbix agent configuration file, these parameters will be defined in a separate file in the additional configurations directory.

2. Create a `template_db_mysql.conf` file in the Zabbix agent additional configurations directory.

```
vi template_db_mysql.conf
```

3. Copy the contents from the `template_db_mysql.conf` file (located in the Zabbix repository) to the `template_db_mysql.conf` file you created, and save.

4. Restart Zabbix agent to update its configuration.

```
systemctl restart zabbix-agent
```

Once you have configured Zabbix agent user parameters, you can move on to configure the credentials that will allow Zabbix agent to access the MySQL server.

5. Navigate to the Zabbix agent home directory (if it does not exist on your system, you need to create it; default: `/var/lib/zabbix`).

```
cd /var/lib/zabbix
```

6. Create a `.my.cnf` file in the Zabbix agent home directory.

```
vi .my.cnf
```

7. Copy the following contents to the `.my.cnf` file (replace `<password>` with the password of the "zbx_monitor" user).

```
[client]
user='zbx_monitor'
password='<password>'
```

Configure Zabbix frontend and test your configuration

To configure Zabbix frontend, follow the instructions in the [Configure Zabbix frontend](#) section with the following adjustments:

- In the *Templates* field, type or select the template "MySQL by Zabbix agent" that will be [linked](#) to the host.
- Configuring *Macros* is not required.

Once you have configured Zabbix frontend, you can [view collected metrics](#) and [set up problem alerts](#).

To test your configuration, follow the instructions in the [Test your configuration](#) section with the following adjustments:

- In the *Inherited and host macros* section of the MySQL server host configuration, click on *Change* next to the `{$MYSQL.PORT}` macro value and set a different port (e.g., "6033").

The screenshot shows the Zabbix web interface for configuring a host. The 'Host' tab is selected, and the 'Macros' sub-tab is active. The 'Inherited and host macros' section is displayed, showing a list of macros and their values. The macro `{MYSQL.PORT}` is highlighted with a green box, and its 'Change' link is also highlighted. The 'Change' link for `{MYSQL.PORT}` is highlighted with a green box.

| Macro | Effective value | Template value | Global value (configure) |
|--|-----------------|------------------------------------|--------------------------|
| <code>{MYSQLABORTED_CONN.MAX.WARN}</code> | 3 | MySQL by Zabbix agent: "3" | |
| The number of failed attempts to connect to the MySQL server for trigger expressions. | | | |
| <code>{MYSQLBUFF_UTIL.MIN.WARN}</code> | 50 | MySQL by Zabbix agent: "50" | |
| The minimum buffer pool utilization in percentage for trigger expression. | | | |
| <code>{MYSQL.CREATED_TMP_DISK_TABLES.MAX.WARN}</code> | 10 | MySQL by Zabbix agent: "10" | |
| The maximum number of created tmp tables on a disk per second for trigger expressions. | | | |
| <code>{MYSQL.CREATED_TMP_FILES.MAX.WARN}</code> | 10 | MySQL by Zabbix agent: "10" | |
| The maximum number of created tmp files on a disk per second for trigger expressions. | | | |
| <code>{MYSQL.CREATED_TMP_TABLES.MAX.WARN}</code> | 30 | MySQL by Zabbix agent: "30" | |
| The maximum number of created tmp tables in memory per second for trigger expressions. | | | |
| <code>{MYSQL.HOST}</code> | 127.0.0.1 | MySQL by Zabbix agent: "127.0.0.1" | |
| Hostname or IP of MySQL host or container. | | | |
| <code>{MYSQL.INNODB_LOG_FILES}</code> | 2 | MySQL by Zabbix agent: "2" | |
| Number of physical files in the InnoDB redo log for calculating innodb_log_file_size. | | | |
| <code>{MYSQL.PORT}</code> | 3306 | MySQL by Zabbix agent: "3306" | |
| MySQL service port. | | | |
| <code>{MYSQL.REPL_LAG.MAX.WARN}</code> | 30m | MySQL by Zabbix agent: "30m" | |
| The lag of slave from master for trigger expression. | | | |
| <code>{MYSQL.SLOW_QUERIES.MAX.WARN}</code> | 3 | MySQL by Zabbix agent: "3" | |
| The number of slow queries for trigger expression. | | | |
| <code>{SNMP_COMMUNITY}</code> | public | | ← "public" |

Buttons: Update, Clone, Full clone, Delete, Cancel

To monitor a MySQL server with ODBC, you need to [download and install](#) Zabbix server and Zabbix frontend.

Once you have successfully installed the required Zabbix components, you need to create a MySQL user as described in the [Create MySQL user](#) section.

After you have created the MySQL user, you need to setup ODBC. This includes installing one of the most commonly used open source ODBC API implementations - [unixODBC](#) - and a unixODBC driver, as well as editing the ODBC driver configuration file.

Configure ODBC

1. Install unixODBC. The suggested way of installing unixODBC is to use the Linux operating system default package repositories.

```
apt install unixodbc
```

2. Install the MariaDB unixODBC database driver. Although you have a MySQL database, the MariaDB unixODBC driver is used for compatibility issues.

```
apt install odbc-mariadb
```

3. Check the location of the ODBC configuration files *odbcinst.ini* and *odbc.ini*.

```
odbcinst -j
```

The result of executing this command should be similar to the following.

```
unixODBC 2.3.9
DRIVERS.....: /etc/odbcinst.ini
SYSTEM DATA SOURCES: /etc/odbc.ini
FILE DATA SOURCES..: /etc/ODBCDataSources
...
```

4. To configure the ODBC driver for monitoring a MySQL database, you need the driver name, which is located in the *odbcinst.ini* file. In the following *odbcinst.ini* file example, the driver name is "MariaDB Unicode".

```
[MariaDB Unicode]
Driver=libmaodbc.so
Description=MariaDB Connector/ODBC(Unicode)
Threading=0
UsageCount=1
```

5. Copy the following contents to the *odbc.ini* file (replace *<password>* with the password of the "zbx_monitor" user). This guide uses "127.0.0.1" (localhost) as the MySQL server address for monitoring a MySQL server that is installed on the same machine as the ODBC driver. Note the data source name (DSN) "test", which will be required when [configure Zabbix frontend](#).

```
[test]
Driver=MariaDB Unicode
Server=127.0.0.1
User=zbx_monitor
Password=<password>
Port=3306
Database=zabbix
```

Configure Zabbix frontend and test your configuration

To configure Zabbix frontend, follow the instructions in the [Configure Zabbix frontend](#) section with the following adjustments:

- In the *Templates* field, type or select the template "MySQL by ODBC" that will be [linked](#) to the host.
- Configuring *Interfaces* is not required.
- The {\$MYSQL.DSN} macro value In the *Inherited and host macros* section of the MySQL server host configuration should be set to the DSN name from the *odbc.ini* file.

Once you have configured Zabbix frontend, you can [view collected metrics](#), [set up problem alerts](#) and [test your configuration](#).

5 Monitor VMware with Zabbix

Introduction

This page walks you through the steps required to start basic monitoring of VMware.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of VMware. If you are looking for deep customization options or require more advanced configuration, see the [Virtual machine monitoring](#) section or the [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server and Zabbix frontend according to the instructions for your OS.

This guide is based on the following setup:

- Zabbix version: 7.2 (installed from packages)
- OS distribution: Ubuntu
- OS version: 22.04 (Jammy)
- Zabbix components: Server, Frontend, Agent
- Database: MySQL
- Web server: Apache

It is assumed that VMware is already configured. This guide does not cover the configuration of VMware.

Configure Zabbix server

To monitor VMware, the *vmware collector* Zabbix processes need to be enabled. For more information on how VMware monitoring is performed, see [Virtual machine monitoring](#).

1. Open the Zabbix server configuration file.

```
vi /etc/zabbix/zabbix_server.conf
```

2. Locate and set the `StartVMwareCollectors` parameter in Zabbix server configuration file to 2 or more (the default value is 0).

```
##### Option: StartVMwareCollectors
###      Number of pre-forked vmware collector instances.
###
### Mandatory: no
### Range: 0-250
### Default:
### StartVMwareCollectors=0

StartVMwareCollectors=2
```

3. Restart Zabbix server.

```
systemctl restart zabbix-server
```

Once the *vmware collector* processes have been started, move on to the next step.

Configure Zabbix frontend

1. Log into Zabbix frontend.

2. **Create a host** in Zabbix web interface:

- In the *Host name* field, enter a host name (for example, "VMware environment").
- In the *Templates* field, type or select the "VMware FQDN" (or "VMware") template. For more information on these templates, see [Virtual machine monitoring](#).
- In the *Host groups* field, type or select a host group (for example, a new host group "VMware").

0 selected Display stacked graph Display graph Execute now

Note that some items have no data and the *Not supported* state. This is because Zabbix cannot find valid **performance counters** on the specific datastore, as it is not enabled in the VMware environment being monitored.

Set up problem alerts

Zabbix can notify you about a problem with your infrastructure using a variety of methods. This guide provides basic configuration steps for sending email alerts.

1. Navigate to **User settings → Profile**, switch to the **Media** tab and **add your email**.

Media

Type

Email

* Send to

user@domain.tld

6 Monitor network traffic with Zabbix

Introduction This page walks you through the steps required to start basic monitoring of your network traffic with Zabbix.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of your network traffic. If you are looking for deep customization options or require more advanced configuration, see the [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server, Zabbix frontend and Zabbix agent according to the instructions for your OS. Note that you should install Zabbix agent on the machine that requires traffic monitoring. This can be either the same host where Zabbix server is installed or a different host.

This guide will provide the instructions on configuring the network traffic monitoring of *eth0* interface on a separate machine named *Remote host*.

Configure Zabbix for monitoring Zabbix agent can collect metrics in active or passive mode (simultaneously). See [Passive and active agent checks](#) for more info. In this guide, monitoring by means of passive checks will be described.

Configuring Zabbix agent

1. Open the agent configuration file on the machine where the agent is installed (by default, the path is `/usr/local/etc/zabbix_agentd.conf`):

```
sudo vi /usr/local/etc/zabbix_agentd.conf
```

2. Add the IP address or DNS name of your Zabbix server to the *Server* parameter. For example:

```
Server=192.0.2.22
```

3. Restart Zabbix agent:

```
systemctl restart zabbix-agent
```

Zabbix frontend

1. Log into Zabbix frontend.

2. **Create a host** in Zabbix web interface, specifying the IP address or DNS name of the machine on which the agent is installed.

The screenshot shows the 'New host' form in the Zabbix web interface. The form has tabs for Host, IPMI, Tags, Macros, Inventory, Encryption, and Value mapping. The 'Host' tab is active. The form contains the following fields and options:

- * Host name:** Text input field with 'Remote host' entered.
- Visible name:** Text input field with 'Remote host' entered.
- Templates:** Text input field with 'type here to search' and a 'Select' button.
- * Host groups:** Text input field with 'Zabbix servers' selected and a 'Select' button.
- Interfaces:** Text area with 'No interfaces are defined.' and an 'Add' link.
- Description:** Text area.
- Monitored by:** Radio buttons for 'Server' (selected), 'Proxy', and 'Proxy group'.
- Enabled:** Checkmark.
- Buttons:** 'Add' and 'Cancel' buttons at the bottom right.

Create items Follow the instructions on **creating an item** to add the items for traffic monitoring, namely:

- **Incoming traffic**
- **Outgoing traffic**
- **Total traffic**

A simple setup for the incoming traffic monitoring item would look as follows:

The screenshot shows the 'Item' form in the Zabbix web interface. The form has tabs for Item, Tags, and Preprocessing. The 'Item' tab is active. The form contains the following fields and options:

- * Name:** Text input field with 'Incoming traffic' entered.
- Type:** Dropdown menu with 'Zabbix agent' selected.
- * Key:** Text input field with 'net.if.in[eth0]' entered and a 'Select' button.
- Type of information:** Dropdown menu with 'Numeric (unsigned)' selected.
- * Host interface:** Text input field with '192.0.2.255:10050' entered.
- Units:** Text input field with 'bps' entered.
- * Update interval:** Text input field with '10s' entered.

To make the collected data suitable for practical use, you can set some **preprocessing** steps when creating the items. In the given case, those can be multiplication by 8 (to convert bytes to bits) and presentation as change per second.

Item
Tags
Preprocessing 2

Preprocessing steps

Name

Parameters

1: Custom multiplier
2: Change per second

Add

Type of information

Numeric (unsigned)

Add

Test

Cancel

View collected data Congratulations! At this point, Zabbix is already monitoring your network traffic.

To view collected metrics, open the **Monitoring → Hosts** menu section and click on the *Latest data* in the row of the host.

| Name ▲ | Interface | Availability | Tags | Status | Latest data |
|-------------|-------------------|--------------|------|---------|---------------|
| Remote host | 192.0.2.255:10050 | ZBX | | Enabled | Latest data 3 |

You will see the traffic data.

| <input type="checkbox"/> Host | Name ▲ | Last check | Last value | Change | Tags | Info |
|--------------------------------------|------------------|------------|------------|-------------|--------------------|-------|
| <input type="checkbox"/> Remote host | Incoming traffic | 10s | 2.02 Mbps | +1.63 Mbps | component: network | Graph |
| <input type="checkbox"/> Remote host | Outgoing traffic | 9s | 36.69 Kbps | +26.03 Kbps | component: network | Graph |
| <input type="checkbox"/> Remote host | Total traffic | 8s | 1.28 Mbps | -23.43 Kbps | component: network | Graph |

Displaying 3 of 3 found

View graphs The data collected can be displayed as **graphs**. To view those, in the *Latest data* section click on *Graph* in the row of the item or select required items and click on *Display graph* below.

Configure triggers You can set **triggers** to detect abnormal network traffic. See the instructions on **configuring a trigger** and add the trigger signalling that the total traffic is too high, for example:

Trigger
Tags
Dependencies

* Name

High total traffic

Event name

High total traffic

Operational data

Severity

Not classified

Information

Warning

Average

High

Disaster

* Expression

last(/Remote host/net.if.total[eth0])>100K

Add

[Expression constructor](#)

Now make the traffic exceed the threshold you have set in the trigger expression and navigate to the **Monitoring → Problems** to check that the problem is listed there.

| <input type="checkbox"/> | Time ▾ | Severity | Recovery time | Status | Info | Host | Problem |
|--------------------------|----------|----------|---------------|---------|------|-------------|--------------------|
| <input type="checkbox"/> | 17:36:27 | Warning | | PROBLEM | | Remote host | High total traffic |

Set up problem alerts There are several ways of getting notifications about the problem. Email being the most popular one, follow the instructions on setting up a [problem notification](#) via email. You can also choose other [media types](#) to be used for the notification delivery.

See also:

- [Problem escalations](#) - how to create multi-step alert scenarios (e.g., first send message to the system administrator, then, if a problem is not resolved in 45 minutes, send message to the data center manager).
- [Problem acknowledgment](#) - how to indicate that the problem is known, make comments on resolving it, suppress or close the problem.
- [Monitor Linux with Zabbix agent](#) - how to start basic monitoring of the most important items by linking a pre-configured template.

7 Monitor network traffic using active checks

Introduction This page walks you through the steps required to start basic monitoring of your network traffic with Zabbix using active checks.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of your network traffic using active checks. If you are looking for deep customization options or require more advanced configuration, see the [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server, Zabbix frontend and Zabbix agent according to the instructions for your OS. Note that you should install Zabbix agent on the machine that requires traffic monitoring. This can be either the same host where Zabbix server is installed or a different host.

This guide will provide the instructions on configuring the network traffic monitoring of *eth0* interface on a separate machine named *Remote host*.

Configure Zabbix for monitoring Zabbix agent can collect metrics in active or passive mode (simultaneously). See [Passive and active agent checks](#) for more info. In this guide, monitoring by means of **active checks** will be described.

Configuring Zabbix agent

1. Open the agent configuration file on the machine where the agent is installed.

If you're using Zabbix agent:

```
sudo vi /etc/zabbix/zabbix_agentd.conf
```

If you're using Zabbix agent 2:

```
sudo vi /etc/zabbix/zabbix_agent2.conf
```

2. Add the IP address or DNS name (and optional port) of your Zabbix server to the `ServerActive` parameter. For example:

```
ServerActive=192.0.2.0:10051
```

Zabbix agent will use this address to connect to Zabbix server's trapper port (default: 10051) and request the configuration data for active checks.

3. Define the `Hostname` parameter, which must match the host name that will be defined in [Zabbix frontend](#). In our example, it is:

```
Hostname=Remote host
```

The `Hostname` value must match because, for active checks, Zabbix agent uses it to retrieve the correct host configuration from the server. Specifically, the agent initiates a connection to the server and identifies itself using the `Hostname` value. The server then provides the monitoring configuration for that host. If these values differ, the agent will not receive the appropriate configuration, resulting in missing metrics or monitoring issues.

4. Restart Zabbix agent.

If you're using Zabbix agent:

```
systemctl restart zabbix-agent
```

If you're using Zabbix agent 2:

```
systemctl restart zabbix-agent2
```

Zabbix frontend

1. Log into Zabbix frontend.

2. **Create a host** in Zabbix web interface.

- In the *Host name* field, enter a host name (e.g., "Remote host") that matches the *Hostname* parameter value defined earlier in the agent configuration file.
- In the *Host groups* field, type or select a host group (e.g., "Zabbix servers").
- Leave *Interfaces* undefined; an interface is not necessary for active checks because the agent initiates the connection to the server instead of listening for a connection from the server.

8 Monitor websites with Browser items

Introduction

This page walks you through the steps required to start basic monitoring of websites with Browser items.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of websites with Browser items. If you are looking for deep customization options or require more advanced configuration, see the [Browser items](#) page or the [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server and Zabbix frontend according to the instructions for your OS.

This guide is based on the following setup:

- Zabbix version: 7.2 (installed from packages)
- OS distribution: Ubuntu
- OS version: 22.04 (Jammy)
- Zabbix components: Server, Frontend, Agent
- Database: MySQL
- Web server: Apache

Configure WebDriver

Browser items require an automation framework (either Selenium Server or a plain WebDriver, for example, ChromeDriver) as a web testing endpoint that controls and interacts with a browser, executing test commands such as clicking buttons or entering text. As an example, this guide will use Selenium Server with Chrome in a Docker container.

It is assumed that Docker is already configured. This guide does not cover the configuration of Docker. For installation instructions, see [Install Docker Engine on Ubuntu](#).

1. Launch Selenium Server with Chrome in a Docker container with the following options:

- **docker run --name browser** - runs a new Docker container named "browser";
- **-p 4444:4444** - maps port 4444 on your host machine to port 4444 on the container (this is the port used by Selenium Server to accept commands);
- **-p 7900:7900** - maps port 7900 on your host machine to port 7900 on the container (this is the port used by the Virtual Network Computing (VNC) server, allowing you to view the browser GUI remotely; requires a VNC client);
- **--shm-size="2g"** - allocates 2GB of shared memory to the container (this is important for Chrome to run properly, as it can require a significant amount of shared memory to avoid crashes);
- **-d** - runs the container in detached mode, meaning it will run in the background;
- **selenium/standalone-chrome:latest** - specifies the Docker image to use; in this case, the latest version of [Selenium Server with Chrome](#).

```
docker run --name browser \
-p 4444:4444 \
-p 7900:7900 \
--shm-size="2g" \
-d selenium/standalone-chrome:latest
```

2. Ensure that the browser Docker container is running and accessible.

- Retrieve the IP address of the container (in this example, 192.0.2.1):

```
ip addr
```

```
### 1: lo: <LOOPBACK,UP,LOWER_UP>
### ...
```

```
### 3: docker0: <NO-CARRIER,BROADCAST,MULTICAST,UP> ...
###    inet 192.0.2.1/16 brd 192.0.255.255 scope global docker0
###    ...
```

- Test the connection to the container with [Ncat](#):

```
nc -zv 192.0.2.1 4444
```

```
### Connection to 192.0.2.1 4444 port [tcp/*] succeeded!
```

- Retrieve the webpage content from Selenium Server with [curl](#):

```
curl -L 192.0.2.1:4444
```

```
### <!DOCTYPE html>
### <html lang="en">
###
### <head>
###   <meta charset="utf-8"/>
###   <link href="favicon.svg" rel="icon" type="image/svg">
###   <meta content="width=device-width, initial-scale=1" name="viewport"/>
###   <link href="logo192.png" rel="apple-touch-icon"/>
###   <link href="manifest.json" rel="manifest"/>
###   <title>Selenium Grid</title>
### </head>
###
### <body>
### ...
```

Note:

For troubleshooting, refer to [Docker documentation](#).

Configure Zabbix server

Browser items are executed and processed by *browser poller* Zabbix processes that need to be enabled by adjusting the **StartBrowserPollers** server configuration parameter. Additionally, the **WebDriverURL** parameter should specify the previously configured web testing endpoint.

By default, the **StartBrowserPollers** parameter is set to 1, therefore you only need to specify the web testing endpoint.

1. Open the Zabbix server configuration file.

```
vi /etc/zabbix/zabbix_server.conf
```

2. Locate and set the **WebDriverURL** parameter in Zabbix server configuration file:

```
##### Option: WebDriverURL
###WebDriver interface HTTP[S] URL. For example http://localhost:4444 used with Selenium WebDriver standard
###
### Mandatory: no
### Default:
### WebDriverURL=

WebDriverURL=192.0.2.1:4444
```

3. Restart Zabbix server.

```
systemctl restart zabbix-server
```

Configure Zabbix frontend

1. Log into Zabbix frontend.

2. **Create a host** in Zabbix web interface:

- In the *Host name* field, enter a host name (for example, "git.zabbix.com").
- In the *Templates* field, type or select the "Website by Browser" template. For more information on this template, see [Website by Browser](#).
- In the *Host groups* field, type or select a host group (for example, a new host group "Websites").

| The path to resource. | | | |
| { <code>\$WEBSITE.RESOURCE.LOAD.MAX.WARN</code> } | 5 | T | = Website by Browser: "5" |

3. Click the **Add** button to create the host. This host will represent the website you want to monitor.

View collected metrics

Congratulations! At this point, Zabbix is already monitoring the website you specified.

To view collected metrics, navigate to the **Monitoring → Hosts** menu section and click on **Dashboards** next to the host.

This action will take you to the host dashboard (configured on the template level) with the most important metrics collected from the website.

Set up problem alerts

Zabbix can notify you about a problem with your infrastructure using a variety of methods. This guide provides basic configuration steps for sending email alerts.

1. Navigate to *User settings* → *Profile*, switch to the *Media* tab and add your email.

2. Follow the guide for [Receiving a problem notification](#).

Next time, when Zabbix detects a problem, you should receive an alert via email.

Test your configuration

To test your configuration, we can simulate a real problem by updating the host configuration in Zabbix frontend.

1. Open your website host configuration in Zabbix.
2. Switch to the *Macros* tab and select *Inherited and host macros*.
3. Click on *Change* next to, for example, the [previously configured](#) `{ $WEBSITE.DOMAIN }` macro value and set an incorrect domain name (for example, `/git.zabbix.com/projects/ZBX/repos/zabbix/browse`).
4. Click on *Update* to update the host configuration.
5. In a few moments, Zabbix will detect the problem "Failed to get JSON of the requested website", because it will not be able to connect to the specified website. The problem will appear in [Monitoring](#) → [Problems](#).

If alerts are [configured](#), you will also receive the problem notification.

6. Change the macro value back to its previous value to resolve the problem and continue monitoring the website.

See also

- [Creating an item](#) - how to start monitoring additional metrics.
- [Problem escalations](#) - how to create multi-step alert scenarios (e.g., first send message to the system administrator, then, if a problem is not resolved in 45 minutes, send message to the data center manager).

9 Monitor website certificates with Zabbix agent 2 (passive)

Introduction

This guide provides a comprehensive overview of how to set up and monitor SSL/TLS certificates using the `web.certificate.get` key in Zabbix agent 2. It is designed to simplify certificate monitoring for single or multiple websites, ensuring administrators can quickly identify potential issues such as expired or invalid certificates.

Who this guide is for

This guide is designed for new Zabbix users and contains the minimum set of steps required to enable basic monitoring of website certificates. If you are looking for deep customization options or require more advanced configuration, see [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server, Zabbix frontend, and Zabbix agent 2 according to the instructions for your OS. This tutorial assumes that both the Zabbix server and agent are installed on the same machine; therefore, `127.0.0.1` is used in the configuration.

Configure Zabbix agent 2

1. Open the Zabbix agent configuration file (default path: `/etc/zabbix/zabbix_agent2.conf`):

```
sudo vi /etc/zabbix/zabbix_agent2.conf
```

2. Set the `Server` parameter to `127.0.0.1`, since the agent and server are running on the same machine:

```
Server=127.0.0.1
```

3. Save the file and restart the Zabbix agent 2 service:

```
sudo systemctl restart zabbix-agent2
```

4. After setup and configuring Zabbix agent 2, test its availability with:

```
zabbix_get -s 127.0.0.1 -k web.certificate.get[<website_DNS_name>]
```

Zabbix agent 2 includes the `WebCertificate` plugin by default, so no separate installation or configuration is required.

Configure Zabbix frontend

1. Log into Zabbix frontend.
2. Navigate to *Monitoring > Hosts*.
3. Click on an existing host where you want to monitor website certificates, or [create a host](#) if necessary:
- In the *Host name* field, enter a host name (e.g., "Certificate Monitoring").
 - In the *Templates* field, type or select the template "Website certificate by Zabbix agent 2" that will be [linked](#) to the host.
 - In the *Host groups* field, type or select a host group (e.g., "SSL/TLS Monitoring").
 - In the *Interfaces* field, add an interface of type "Agent" and specify an IP address. For this example, "127.0.0.1" is used.

[Add](#)

Add

Cancel

4. Click on *Add* to add the host.

To monitor multiple websites, repeat the steps above to create separate hosts for each website. Each host should use the "Website certificate by Zabbix agent 2" template and be configured with the corresponding macros. To simplify the process, consider cloning existing hosts. When cloning, make sure to update both the *Host name* and the `{$CERT.WEBSITE.HOSTNAME}` macro with the desired values.

View collected metrics

Congratulations! At this point, Zabbix is already monitoring desired web certificate.

To view collected metrics, navigate to the *Monitoring > Hosts* menu section and click on *Latest data* next to the host to view all the latest collected metrics in a list, like expiration date, issuer, and subject.

Set up problem alerts

Zabbix can notify you about infrastructure issues. This guide provides basic configuration steps for sending email alerts.

1. Navigate to *User settings > Profile*, switch to the *Media* tab and **add your email**.

Media ✕

Type

* Send to [Remove](#)

[Add](#)

* When active

Use if severity ☒ Not classified
☒ Information
☒ Warning
☒ Average
☒ High
☒ Disaster

Enabled ☒

2. Follow the guide for **Receiving a problem notification**.

Next time, when Zabbix detects a problem, you should receive an alert via email.

Test your configuration

To test your configuration, we can simulate a real problem by updating the host configuration in Zabbix frontend.

1. Open your "Certificate Monitoring" host configuration in Zabbix.
2. Switch to the *Macros* tab and select *Inherited and host macros*.
3. Click on *Change* next to the previously configured `{$.CERT.EXPIRY.WARN}` macro value and set a very high number of days (greater than 365 days should be sufficient) to receive a warning before the certificate expires.
4. Click on *Update* to update the host configuration.
5. In a few moments, Zabbix will detect the problem "SSL certificate expires soon", with the number of days until expiration. The problem will appear in *Monitoring > Problems*.

If alerts are **configured**, you will also receive the problem notification.

6. Change the macro value back to its previous value to resolve the problem and continue monitoring the certificate values.

10 Monitor a network switch or router with Zabbix

Introduction This guide walks you through the steps required to start basic monitoring of your network switch or router using Zabbix. A Cisco router is used as an example, but the procedure applies to any SNMP-enabled network device.

Who this guide is for

This guide is designed for new Zabbix users and network administrators who want to quickly enable basic monitoring for network devices. If you require deep customization or advanced configuration options, please refer to the [SNMP agent](#) page or the [Configuration](#) section of Zabbix manual.

Prerequisites

Before proceeding with this guide, ensure that you have:

- Zabbix server and Zabbix frontend installed: install according to the instructions for your operating system (see [Installation from packages](#) and [Web interface installation](#)).
- SNMP-enabled device: a network switch or router (for example, a Cisco router) with SNMP enabled.
- [MIB files](#) installed: Installing MIB files enables Zabbix to translate numeric OIDs into human-readable names and descriptions. Without proper MIB support, you may see only numeric values, making it harder to configure items and troubleshoot issues.

To install MIB files on Ubuntu:

1. Install the MIB downloader package:

```
sudo apt-get update
sudo apt-get install snmp-mibs-downloader
```

If you need to add vendor-specific MIBs (e.g., from Cisco, Juniper), place them in the appropriate MIB directory:

- For Linux-based systems common locations include `/usr/share/snmp/mibs/` or `/usr/local/share/snmp/mibs/`.
- For Zabbix installations MIB files can be stored in `/var/lib/zabbix/mibs/`.

Ensure the MIBDIRS environment variable or the `snmp.conf` file includes the correct path.

To verify that your system recognizes the new MIBs, use:

```
snmptranslate -IR -On <MIB-NAME>::<object>
```

For detailed instructions, refer to your SNMP library documentation:

- [Cisco MIBs](#)
- [Juniper MIBs](#)

2. Edit `/etc/snmp/snmp.conf` and comment out the line that starts with `mibs :` to allow the system to load all available MIBs. 3. Verify by running an `snmpwalk` (for example, `snmpwalk -v 2c -c <your_community_string> <device_IP>`) and check that OIDs are displayed with descriptive names.

This guide is based on the following setup:

- Zabbix version: 7.2 (installed from packages)
- OS distribution: Ubuntu
- OS version: 24.04.2+
- Zabbix components: server, frontend, and optionally agent (if monitoring local network metrics)
- Database: MySQL
- Web server: Apache
- Network device: Cisco Catalyst 3750V2-24FS

It is assumed that your network device is already physically installed and connected.

Configure the network device (Cisco router example) For monitoring via SNMP, you must configure your network device to allow SNMP queries. The example below is for SNMPv2 and does not take into account existing settings. Caution: applying these commands may override current SNMP configurations.

For a Cisco router, the configuration typically involves steps written below.

SNMPv2 Example 1. Enable SNMP and set community string.

Log in to your Cisco router's console and enter configuration mode:

```
configure terminal
```

Then, **enable SNMP** by specifying a read-only community string. For example:

```
snmp-server community <your_community_string> RO
```

Replace <your_community_string> with your secure community string. Note: the RO (Read-Only) option allows SNMP to retrieve data from the device but prevents any configuration changes.

It is recommended to restrict SNMP access to only the necessary devices for security reasons. For further guidance on configuring access control lists (ACLs), refer to [Cisco's official documentation](#).

2. Save the configuration.

Save your changes to ensure SNMP settings persist after a reboot:

```
write memory
```

SNMPv3 Example SNMPv3 provides enhanced security with authentication and encryption. Its configuration is more secure than SNMPv2 and should be verified against your device-specific documentation.

1. Create an SNMP group.

Configure an SNMPv3 group with privacy (encryption) enabled:

```
configure terminal
snmp-server group <your_group> v3 priv
```

2. Create an SNMP user: Add an SNMPv3 user with authentication and privacy. Replace the placeholders with your desired values:

```
snmp-server user <your_user> <your_group> v3 auth md5 <auth_password> priv aes 128 <priv_password>
```

3. Save the configuration:

```
write memory
```

For further details or model-specific instructions, you may refer to external [Cisco SNMP configuration tutorials](#). This guide, however, provides the basic steps for enabling SNMP monitoring.

Configure Zabbix frontend

Create a host in Zabbix frontend 1. Log into Zabbix frontend.

2. Add a new host.

Navigate to *Data collection > Hosts* and click on *Create host*.

- *Host name*: enter a name for your device (e.g., "Cisco Router").
- *Host groups*: select an existing group or create a new group such as "Network Devices".
- *Interfaces*:
 - Click *Add* under Interfaces.
 - Choose *SNMP* as the interface type.
 - Enter the IP address or DNS name of your Cisco router.
 - Set the default SNMP port (usually 161).
 - Use the drop-down menu to select the appropriate SNMP version (e.g. SNMPv2).
 - For SNMPv1/v2, enter the community string in the *SNMP community* field. For SNMPv3, additional credentials (*Context name*, *Security name*, and *Security level*, etc.) will be prompted.

3. Link Templates

In the *Templates* field, select the SNMP template that best matches your device. Zabbix provides a range of pre-built **SNMP templates** for many device families. For example, if you are monitoring a Cisco device, choose the template that corresponds to your device's OS or model (such as Cisco IOS SNMP or Cisco Catalyst 3750<device model> SNMP).

4. Click on *Add* to save the host.

Type of information

To retrieve multiple values in one SNMP transaction, you can specify several OIDs using the syntax `walk[OID1,OID2,...]`.

Translating OIDs between Numeric and MIB Names When working with SNMP, you might need to convert between numeric OIDs and their corresponding MIB names. This translation helps in identifying and troubleshooting metrics more easily.

- Translating a MIB name to a numeric OID: use the `snmptranslate` command with the `-On` option. For example, to translate the MIB name `IF-MIB::ifHCInOctets.3` to its numeric OID, run:

```
snmptranslate -On IF-MIB::ifHCInOctets.3
```

This command might output:

```
.1.3.6.1.2.1.31.1.1.1.6.3
```

- Translating a numeric OID to its MIB name: use the `snmptranslate` command with the `-IR` (or `-m ALL`) option to reverse the translation. For example, to translate the numeric OID `.1.3.6.1.2.1.31.1.1.1.6.3` back to its MIB name, run:

```
snmptranslate -IR -On .1.3.6.1.2.1.31.1.1.1.6.3
```

This command might output:

IF-MIB::ifHCInOctets.3

Set up problem alerts This guide provides basic configuration steps for sending email alerts.

1. Navigate to *User settings > Profile*, switch to the *Media* tab and **add your email**.

☒ Average

☒ High

☒ Disaster

Enabled

☒

Add

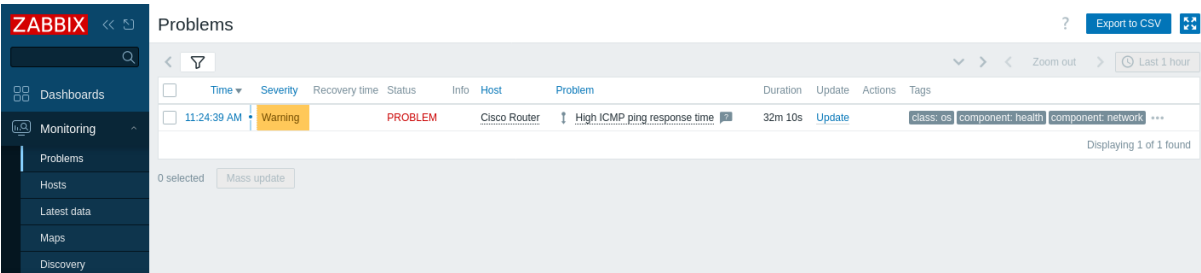

Cancel

2. Follow the guide for **Receiving a problem notification**.

Next time, when Zabbix detects a problem, you should receive an alert via email.

Test your configuration To ensure that Zabbix correctly detects network performance issues, simulate a real problem by increasing the ICMP ping response time threshold.

1. Open your "Cisco Router" host configuration in Zabbix.
2. Navigate to the *Macros* tab and select *Inherited and host macros*.
3. Locate the `{$ICMP_RESPONSE_TIME_WARN}` macro (or a similar response time threshold macro).
4. Set a very low value (e.g., 0.001) to trigger an alert when the ping response exceeds this value.
5. Click *Update* to apply the changes.
6. Wait a few moments for Zabbix to detect the simulated issue.
7. Navigate to *Monitoring > Problems* to verify that an alert appears (e.g., "High ICMP ping response time").

If alerts are **configured**, you should also receive a problem alert.

8. Revert the macro value to its original setting and click *Update* to save the changes.
9. Confirm that the problem is resolved and disappears from the *Problems* section.

Troubleshooting SNMP Monitoring If you notice that the SNMP icon in the Zabbix frontend appears RED or no data is collected, try the following steps:

1. Check SNMP connectivity.

For SNMPv2 run the following command from your Zabbix server:

```
snmpwalk -v 2c -c <community_string> <device_IP> .
```

This command verifies that the device responds to SNMP queries.

For SNMPv3, include the appropriate SNMPv3 credentials:

```
snmpwalk -v3 -u <your_user> -l authPriv -a MD5 -A <auth_password> -x AES -X <priv_password> <device_IP> .
```

This verifies that SNMPv3 credentials are correct and the device is responding securely.

2. Ensure that MIB files are installed and enabled as described in the [prerequisites](#). To ensure that, following command must not give error when you query a network device:

```
snmpwalk -v 2c -c <your_community_string> <device_IP> ifInOctets
```

This should return translated OIDs without errors.

3. Confirm that the SNMP version and credentials configured in Zabbix match those set on your device. For instance, review the SNMP settings in the Zabbix host configuration and verify them against your device's configuration. On a Cisco device, you might check the SNMP settings by running:

```
show running-config | include snmp
```

This ensures that the community string (for SNMPv2) or SNMPv3 user details are correct.

4. Verify that SNMP is correctly enabled on your network device. On a Cisco router, log in to the console and run:

```
show running-config | include snmp
```

This command displays the active SNMP configuration and helps confirm that SNMP is properly configured.

5. Ensure that no firewalls or network issues are blocking SNMP traffic (typically on port 161) between the Zabbix server and the device. You can test connectivity using:

```
nc -zv <device_IP> 161
```

nc -zv checks if port 161 is open and listening on the device.

Additionally, if you are using UFW on Ubuntu, check the firewall status:

```
sudo ufw status
```

Or, for iptables:

```
sudo iptables -L -n
```

6. Review the Zabbix server log files for any SNMP-related errors to help pinpoint the issue:

```
tail -f /tmp/zabbix_server.log
```

tail -f allows you to monitor log updates in real time.

11 Monitor Windows event log using active checks

Introduction

This guide explains how to monitor Windows event logs with Zabbix using active checks. With Zabbix Windows-specific item keys, you can collect and analyze critical events (such as failed logon attempts, system errors, etc.) in real time.

Who this guide is for

This guide is designed for new Zabbix users and network administrators who want to monitor Windows event logs. For advanced configuration options, refer to the [Windows-specific item keys](#) documentation.

Prerequisites

Before proceeding with this guide, you need to [download and install](#) Zabbix server and Zabbix frontend according to the instructions for your OS. You also need Zabbix agent [downloaded and installed](#) on the Windows machine you want to monitor.

Configure Zabbix agent for Windows event log monitoring

1. Open `zabbix_agentd.conf` (default path `C:\Program Files\Zabbix Agent\zabbix_agentd.conf`) on your Windows host and ensure that the `ServerActive` parameter is set to the IP address of your Zabbix server, and the `Hostname` parameter matches the host name that will be defined in [Zabbix frontend](#). This enables the agent to request active checks for its host and from the specified Zabbix server. For example:

```
ServerActive=192.0.2.0
Hostname=MyWindowsHost
```

2. Restart Zabbix agent service to apply the changes:

```
net stop "Zabbix Agent" && net start "Zabbix Agent"
```

3. Check that the Windows host is running:

- Ensure Zabbix agent service is running on the Windows host.
- Check that the Windows host can connect to Zabbix server on port 10051. To test connectivity from the Windows host, open PowerShell and run the following command:

```
Test-NetConnection -ComputerName <Zabbix-server-IP> -Port 10051
```

Configure Zabbix frontend

1. Navigate to *Data collection > Hosts* and **create a host**:

- In the *Host name* field, enter a host name (e.g., "MyWindowsHost").
- In the *Host groups* field, type or select a host group (e.g., "Event log Monitoring").
- Press **Add** to save the configured host.

Note:

In the *Templates* field you may add the "Windows by Zabbix agent active" template to help you troubleshoot by observing whether other active items on the same host are updating.

The screenshot shows the 'New host' configuration window in the Zabbix web interface. The 'Host' tab is selected. The 'Host name' field contains 'MyWindowsHost'. The 'Visible name' field also contains 'MyWindowsHost'. The 'Templates' field has a search box and a 'Select' button. The 'Host groups' field shows 'Event log Monitoring (new)' with a close button and a search box. The 'Interfaces' section states 'No interfaces are defined' with an 'Add' link. There is a large 'Description' text area. The 'Monitored by' section has radio buttons for 'Server', 'Proxy', and 'Proxy group', with 'Server' selected. The 'Enabled' checkbox is checked. At the bottom right, there are 'Add' and 'Cancel' buttons.

2. Create a new item with the following parameters:

- In the *Name* field, enter a descriptive item name (e.g., "Security log: failed logon events").
- In the *Type* drop-down, select "Zabbix agent (active)" (required for Event log monitoring).
- In the *Key* field, use the `eventlog` item key. For example, to monitor failed logon attempts (Event ID: 4625) in the Security log and to ignore entries older than the item's last check (using the `skip` parameter), enter the following item key: `eventlog[Security,,,4625,,skip]`

- In the *Type of information* drop-down, select "Log".

Test and view collected metrics

Congratulations! Zabbix is now set up to collect your Windows event logs. To verify that event logs are being collected, you can test the "Security log: failed logon events" item by logging out of your Windows account and attempting to log in using incorrect credentials.

Then, view the collected logs in Zabbix frontend:

1. Navigate to *Monitoring > Latest data* in Zabbix frontend.

Latest data

<
Filter

Subfilter affects only filtered data

|--|-----------------------------------|-------------|-------------------------------|--------|
| <input type="checkbox"/> MyWindowsHost | Security log: failed logon events | 20h 10m 38s | An account failed to log o... | |

2. Filter by your "MyWindowsHost" host in the *Name* field.

3. Click *History* to view recorded log values.

MyWindowsHost: Security log: failed logon events

| Timestamp | Local time | Source | Severity | Event ID | Value |
|------------------------|------------------------|-------------------------------------|---------------|----------|--|
| 2025-04-07 11:13:11 PM | 2025-04-07 11:12:19 PM | Microsoft-Windows-Security-Auditing | Failure Audit | 4625 | <div>An account failed to log on.</div> <div>Subject:<div>Security ID:NT AUTHORITY\SYSTEM</div><div>Account Name:DESKTOP-NNEM26U\$</div><div>Account Domain:WORKGROUP</div><div>Logon ID:0x3E7</div></div> <div>Logon Type:2</div> <div>Account For Which Logon Failed:<div>Security ID:NULL SID</div><div>Account Name:Admin</div><div>Account Domain:DESKTOP-NNEM26U</div></div> <div>Failure Information:<div>Failure Reason:Unknown user name or bad password.</div><div>Status:0xC000006D</div><div>Sub Status:0xC000006A</div></div> |

4. If log values are absent, proceed to the **Troubleshooting** section of the guide.

Set up problem alerts

This guide provides basic configuration steps for sending email alerts.

1. Navigate to Data collection > Hosts to **define a trigger** that fires when your event log item records the pattern you care about. For example, to catch failed logon attempts in the Security log, use the **find()** function:

```
find(/MyWindowsHost/eventlog[Security,,,4625,,skip],10m,"like","Logon failed")
```

2. Navigate to **User settings > Profile**, switch to the **Media** tab and **add your email**.

3. Follow the guide for [Receiving a problem notification](#).

Next time, when Zabbix detects a problem, you should receive an alert via email.

Troubleshooting

If you encounter issues with collecting or viewing Windows event logs, use the tips below to identify and resolve common problems:

1. On Zabbix server (Linux) list your iptables rules with the following command:

```
sudo iptables -L -n
```

and verify there's an ACCEPT rule for TCP port 10051.

2. Make sure your `eventlog[. . .]` key uses the exact log name (case-sensitive), event ID, mode (e.g. skip) and other parameters exactly as shown in the [Windows-specific item keys](#).

Modules

What is a PHP frontend module?

- A module is an entity with a unique ID, name, description, author, and other fields defined in its manifest file, along with PHP, Javascript and other files located in a single directory inside the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
- A module should conform to simple rules to guarantee correct operation.
- A module must be installed (unpacked) and enabled in the frontend by the administrator.

What a module can be used for

- Adding new functionality via custom frontend sections;
- Creating custom dashboard widget types (see [widget modules](#));
- Overriding or extending the existing functionality.

What a module cannot be used for

- Registering a new API method or modifying an existing one.

How modules work

- An enabled module is launched on each HTTP request, before executing the action code.
- The module will register new actions or redefine the existing ones.
- The module will add new frontend sections and remove or redefine the existing ones.
- The module will hook to frontend events like `onBeforeAction` and `onTerminate`, if needed.
- The requested action is finally executed by running the action code - either the default one, or module-defined.

Where to go next Whether you prefer to learn by doing or read the guidelines first, these pages contain the information and steps required to build your own modules:

- [Step-by-step tutorials for writing your first module](#)
- [Module file structure](#)
- [Widget module specifics](#)
- [Module examples to reuse](#)

Module file structure

All code related to a module is stored in a single directory inside the **modules** directory of your Zabbix frontend installation (for example, `zabbix/ui/modules`).

| | | |
|--|------------|---|
| <code>example_module_directory/</code> | (required) | |
| <code>manifest.json</code> | (required) | Metadata and action definition. |
| <code>Module.php</code> | | Module initialization and event handling. |
| <code>actions/</code> | | Action controller files. |
| <code> SomethingView.php</code> | | |
| <code> SomethingCreate.php</code> | | |
| <code> SomethingDelete.php</code> | | |
| <code>data_export/</code> | | |
| <code> ExportAsXml.php</code> | | |
| <code> ExportAsExcel.php</code> | | |
| <code>views/</code> | | View files. |
| <code> example.something.view.php</code> | | |
| <code> example.something.delete.php</code> | | |
| <code>assets/</code> | | Any additional files to be used in views. Must be specified |
| <code> js/</code> | | JavaScript files used in views. |
| <code> example.something.view.js.php</code> | | |
| <code> css/</code> | | CSS files used in views. |
| <code> example.something.css</code> | | |
| <code> image.png</code> | | Images used in views. |
| <code> example.something.file</code> | | Any file for using in views. |

Module file tree

Writing a module A sample module writing process consists of the following steps (where available, click on the file or folder name to view additional details about the step):

1. Create a new directory for the module inside **zabbix/ui/modules/**.
2. Add **manifest.json** file with module metadata.
3. Create **views** folder and define a module view(s).
4. Create **actions** folder and define a module action(s).
5. Create **Module.php** (or **Widget.php** for dashboard widgets) file and define initialization and event handling rules.
6. Create **assets** folder for JavaScript files (place into **assets/js**), CSS styles (place into **assets/css**), or any other additional files.
7. Make sure to specify required views, actions and asset files in the **manifest.json**.
8. **Register** the module in Zabbix frontend and start using it.

Note:

You can register and enable a module as soon as you create manifest.json file. Once the module is enabled, you can preview all changes made to module files immediately by refreshing Zabbix frontend.

manifest.json

Any module needs the manifest.json file. The file must be located in the module's primary directory (for example, *zabbix/ui/modules/module_name/manifest.json*).

As a bare minimum, manifest.json should specify these fields:

```
{
    "manifest_version": 2.0,
    "id": "my_ip_address",
    "name": "My IP Address",
    "namespace": "MyIPAddress",
    "version": "1.0"
}
```

Parameters supported in **manifest.json** (press on the parameter name for a detailed description):

| Parameter | Description | Required |
|----------------------------------|---|-------------------------------|
| manifest_version | Manifest version of the module. | Yes |
| id | Unique module ID. | |
| name | Module name that will be displayed in the Administration section. | |
| namespace | PHP namespace for module classes. | |
| version | Module version. | |
| type | Type of the module. For widget must be set to <i>widget</i> | Yes for widgets, otherwise no |
| widget | Widget configuration. Used for widgets only. | |
| actions | Actions to register with the module. | |
| assets | CSS styles and JavaScript files to include. | No |
| author | Module author. | |
| config | Default values for custom module options. | |
| description | Module description. | |
| url | A link to the module description. | |

manifest_version

Manifest version of the module. Currently, supported version is **2.0**.

Type: Double

Example:

```
"manifest_version": 2.0
```

id

Module ID. Must be unique. To avoid future naming conflicts, it is recommended to use prefix for modules (author or company name, or any other). For example, if a module is an example for lessons and the module name is "My module", then the ID will be "example_my_module".

Type: String

Example:

```
"id": "example_my_module"
```

name

Module name that will be displayed in the Administration section.

Type: String

Example:

```
"name": "My module"
```

namespace

PHP namespace for module classes.

Type: String

Example:

```
"namespace": "ClockWidget"
```

version

Module version. The version will be displayed in the Administration section.

Type: String

Example:

```
"version": "1.0"
```

type

Type of the module. Required for widgets and must equal "widget".

Type: String

Default: "module"

Example:

```
"type": "widget"
```

actions

Actions to register with the module. Defining *class* object key for each action is required, other action keys are optional.

Type: Object

Supported object keys if *type* is *module*:

- **write.your.action.name** (object) - action name, should be written in lowercase [a-z], separating words with dots. Supports the keys:
 - **class** (string; required) - action class name.
 - **layout** (string) - action layout. Supported values: *layout.json*, *layout.htmlpage* (default), *null*.
 - **view** (string) - action view.

Example:

```
"actions": {
  "module.example.list": {
    "class": "ExampleList",
    "view": "example.list",
    "layout": "layout.htmlpage"
  }
}
```

Supported object keys if *type* is *widget*:

- **widget.{id}.view** (object) - file and class name for widget view. Replace **{id}** with the widget's *id* value (for example, *widget.example_clock.view*). Supports the keys:
 - **class** (string; required) - action class name for widget view mode to extend the default *CControllerDashboardWidgetView* class. The class source file must be located in the *actions* directory.
 - **view** (string) - widget view. Must be located in the *views* directory. If the view file is *widget.view.php*, which is expected by default, this parameter maybe omitted. If using a different name, specify it here.
- **widget.{id}.edit** (object) - file name for widget configuration view. Replace **{id}** with the widget's *id* value (for example, *widget.example_clock.edit*). Supports the keys:
 - **class** (string; required) - action class name for widget configuration view mode. The class source file must be located in the *actions* directory.
 - **view** (string) - widget configuration view. Must be located in the *views* directory. If the view file is *widget.edit.php*, which is expected by default, this parameter maybe omitted. If using a different name, specify it here.

Example:

```
"actions": {
  "widget.tophosts.view": {
    "class": "WidgetView"
  },
  "widget.tophosts.column.edit": {
    "class": "ColumnEdit",
    "view": "column.edit",
    "layout": "layout.json"
  }
}
```

assets

CSS styles and JavaScript files to include.

Type: Object

Supported object keys:

- **css** (array) - CSS files to include. The files must be located in the *assets/css*.
- **js** (array) - JavaScript files to include. The files must be located in the *assets/js*.

Example:

```
"assets": {
  "css": ["widget.css"],
  "js": ["class.widget.js"]
}
```

author

Module author. The author will be displayed in the Administration section.

Type: String

Example:

```
"author": "John Smith"
```

config

Default values for the module options. The object may contain any custom keys. If specified, these values will be written into the database during module registration. New variables added later will be written upon the first call. Afterwards, the variable values can only be changed directly in the database.

Type: Object

Example:

```
"config": {
  "username": "Admin",
  "password": "",
  "auth_url": "https://example.com/auth"
}
```

description

Module description.

Type: String

Example:

```
"description": "This is a clock widget."
```

widget

Widget configuration. Used, if *type* is set to *widget*.

Type: Object

Supported object keys:

- **name** (string) - used in the widget list and as default header. If empty, "name" parameter from the module will be used.
- **size** (object) - default widget dimensions. Supports keys:

- *width* (integer) - default widget width.
- *height* (integer) - default widget height.
- **form_class** (string) - class with widget fields form. Must be located in the *includes* directory. If the class is *WidgetForm.php*, which is expected by default, this parameter maybe omitted. If using a different name, specify it here.
- **js_class** (string) - name of a JavaScript class for widget view mode to extend the default *CWidget* class. The class will be loaded with the dashboard. The class source file must be located in the *assets/js* directory. See also: [assets](#).
- **use_time_selector** (boolean) - determines whether the widget requires dashboard time selector. Supported values: *true*, *false* (default).
- **refresh_rate** (integer) - widget refresh rate in seconds (default: 60).

Example:

```
"widget": {
  "name": "",
  "size": {
    "width": 12,
    "height": 5
  },
  "form_class": "WidgetForm",
  "js_class": "CWidget",
  "use_time_selector": false,
  "refresh_rate": 60
}
```

url

A link to the module description. For widgets, this link will be opened when clicking on the help icon  in the *Add widget* or *Edit widget* window. If **url** is not specified, clicking on the help icon will open the general *Dashboard widgets* page.

Type: String

Example:

```
"url": "http://example.com"
```

Actions

Actions are responsible for 'business logic' of the module. An action usually consists of a **controller** and an **action view**.

A module can:

- Call actions that are already defined in Zabbix frontend.
- Override default actions with custom actions.
- Define completely new actions.

To override a default action behavior with some custom behavior, define an action with the same name in the module configuration. When the action is called, the module action will be executed instead of the default Zabbix action.

Action files should be stored in the *actions* folder. The actions need to be specified in the **manifest.json**.

Controller

Action controller workflow:

- 1) Check that all parameters passed in an HTTP request are valid:
 - Call the controller's *checkInput()* method
 - Use validation rules defined in *CNewValidator.php*
 - Call *validateInput()* method
- 2) Check user permissions.
- 3) Prepare the data according to passed parameters: if *checkInput()* returns true, Zabbix calls the controller's *doAction()* method.
- 4) Prepare the **\$data** array for the view. Use *CControllerResponseData* and *setResponse()* method to store response in the **\$data** array.

Example:

```
/**
 * Validate input parameters.
 *
 * @return bool
 */
protected function checkInput(): bool {
    $ret = $this->validateInput([
        'status' => 'in '.implode(',', [HOST_STATUS_MONITORED, HOST_STATUS_NOT_MONITORED])
    ]);

    if (!$ret) {
        $this->setResponse(new CControllerResponseFatal());
    }

    return $ret;
}

/**
 * Check user permissions.
 *
 * @return bool
 */
protected function checkPermissions() {
    return $this->getUserType() >= USER_TYPE_ZABBIX_ADMIN;
}

/**
 * Execute action and generate response object.
 */
protected function do Action(): void {
    $data = [
        'hosts_count' => API::Host()->get([
            'countOutput' => true,
            'filter' => [
                'status' => $this->getInput('status')
            ]
        ])
    ];

    $this->setResponse(new CControllerResponseData($data));
}
```

Note:

You can view the full list of available controller classes in Zabbix [source code](#).

Views

View file receives the data from a controller and then prepares the HTML look of it.

Note:

Defining view(s) for a frontend module is optional, unless the module is a widget.

Dashboard widgets need at least two views: one for the edit mode and one for the view mode (should be stored in the views directory).

It is possible to use pre-defined Zabbix HTML classes (from the `/zabbix/ui/include/classes/html`) in the view as well as add new HTML and CSS classes. New classes should be stored in the module's `assets` folder.

Example:

```
...
(new CColHeader(_('Name')))
```

This will add a new column name *Name* and style the top table row as on other Zabbix pages.

Action view

This is a reference file for defining an action view.

```
<?php declare(strict_types = 1);

/**
 * @var CView $this
 */

$this->includeJsFile('example.something.view.js.php');

(new CWidget())
    ->setTitle(_('Something view'))
    ->addItem(new CDiv($data['name']))
    ->addItem(new CPartial('module.example.something.reusable', [
        'contacts' => $data['contacts']
    ]))
    ->show();
```

Assets

The folder *assets* may contain any files and subfolders that do not belong to other directories. You can use it for:

- JavaScript styles (must be inside *assets/js*);
- CSS styles (must be inside *assets/css*);
- Images;
- Fonts;
- Anything else you need to include.

assets/js

assets/js directory is reserved and should only contain JavaScript files. To be used by the widget, specify these files in the *manifest.json*.

For example:

```
"assets": {
    "js": ["class.widget.js"]
}
```

assets/css

assets/css is reserved and should only contain CSS style files. To be used by the widget, specify these files in the *manifest.json*.

For example:

```
"assets": {
    "css": ["mywidget.css"]
}
```

CSS styles

CSS files may contain a custom attribute *theme* to define different style for a specific frontend themes.

Available themes and their attribute values:

- **Blue** - [theme='blue-theme']
- **Dark** - [theme='dark-theme']
- **High-contrast light** - [theme='hc-light']
- **High-contrast dark** - [theme='hc-dark']

Example:

```
.widget {
    background-color: red;
}

[theme='dark-theme'] .widget {
```

```
background-color: green;
}
```

Register a new module

This section explains how to add a new module to Zabbix frontend.

Pre-requisites Before proceeding make sure, that:

- The module is located inside the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
- The module has at least a basic version of *manifest.json* file.
- You have access to the Administration menu section in Zabbix (requires Super admin user role type).

Note:

The frontend will not install or even recognize incompatible modules.

Adding a module Open *Administration→General→Modules* page and press *Scan directory*.

Scan directory

Locate your module in the list and activate it.

To activate a module, press on the *Disabled* hyperlink - the module's state will change to *Enabled*.

Press on the module name to view additional information about the module, such as author, version, or short description (if defined in the manifest).

Widget preview Widget modules, once added, become immediately visible in the dashboard widget list.

You can open a dashboard, switch to the edit mode and add the widget to the dashboard as usual.

When you make some changes to the widget, refresh the dashboard to view how the widget looks with the most recent updates.

Widgets

Widgets are Zabbix frontend modules used for the dashboards. Unless otherwise noted, all module guidelines are also applicable to widgets.

However, a widget is notably different from a module. To build a widget:

- specify the type "widget" in the *manifest.json* file ("type": "widget");
- include at least two views: one for the *widget presentation mode* and one for the *widget configuration mode* (example.widget.view.php and example.widget.edit.php);
- and a *controller* for widget presentation (WidgetView.php);
- use and extend default *widget classes*.

Configuration

This page describes classes that can be used to create a widget configuration view with custom configuration fields. The widget configuration view is the part of the widget that allows the user to configure widget parameters for *presentation*.

Widget

Primary widget class, extends the base class of all dashboard widgets - *CWidget*. Required for overriding the default widget behavior.

The *Widget* class should be located in the root directory of the widget (for example, *zabbix/ui/modules/my_custom_widget*).

Widget.php example

```
<?php
namespace Modules\MyCustomWidget;
```

```

use Zabbix\Core\CWidget;

class Widget extends CWidget {

    public const MY_CONSTANT = 0;

    public function getTranslationStrings(): array {
        return [
            'class.widget.js' => [
                'No data' => _('No data')
            ]
        ];
    }
}

```

WidgetForm

The *WidgetForm* class extends the default class *CWidgetForm* and contains a set of *CWidgetField* fields that are required for defining widget configuration storage structure in the database and handling input validation.

The *WidgetForm* class should be located in the *includes* directory. If the class has a different name, the name should be specified in the *widget/form_class* parameter in the *manifest.json* file.

includes/WidgetForm.php example

```

<?php

namespace Modules\MyCustomWidget\Includes;

use Modules\MyCustomWidget\Widget;

use Zabbix\Widgets\{
    CWidgetField,
    CWidgetForm
};

use Zabbix\Widgets\Fields\{
    CWidgetFieldMultiSelectItem,
    CWidgetFieldTextBox,
    CWidgetFieldColor
};

class WidgetForm extends CWidgetForm {

    public const DEFAULT_COLOR_PALETTE = [
        'FF465C', 'BOAF07', '0EC9AC', '524BBC', 'ED1248', 'D1E754', '2AB5FF', '385CC7', 'EC1594', 'BAE37D',
        '6AC8FF', 'EE2B29', '3CA20D', '6F4BBC', '00A1FF', 'F3601B', '1CAE59', '45CFDB', '894BBC', '6D6D6D'
    ];

    public function addFields(): self {
        return $this
            ->addField(
                (new CWidgetFieldMultiSelectItem('itemid', _('Item')))
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
                    ->setMultiple(false)
            )
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            )
            ->addField(
                (new CWidgetFieldColor('chart_color', _('Color')))->setDefault('FF0000')
            );
    }
}

```

CWidgetFormView

The *CWidgetFormView* class is required for specifying the presentation logic of the fields defined in the *WidgetForm* class, determining their appearance and behavior when rendered in the configuration view.

The *CWidgetFormView* class supports the following methods:

- *addField()* - receives an instance of the *CWidgetFieldView* class as a parameter; each *CWidgetField* class, has a respective *CWidgetFieldView* class for using in the widget configuration view.
- *addFieldset()* - receives an instance of the *CWidgetFieldsGroupView* class that combines fields into a collapsible container.
- *addFieldsGroup()* - receives an instance of *CWidgetFormFieldsetCollapsibleView* that visually (with a border) combines fields into a group.
- *includeJsFile()* - allows to add a JavaScript file to the widget configuration view.
- *addJavaScript()* - allows to add inline JavaScript that will be executed as soon as the widget configuration view is loaded.

The *CWidgetFormView* class should be located in the *views* directory.

views/widget.edit.php example

```
<?php

/**
 * My custom widget form view.
 *
 * @var CView $this
 * @var array $data
 */

use Modules\MyCustomWidget\Includes\WidgetForm;

(new CWidgetFormView($data))
    ->addField(
        (new CWidgetFieldMultiSelectItemView($data['fields']['itemid']))->setPopupParameter('numeric', true)
    )
    ->addFieldset(
        (new CWidgetFormFieldsetCollapsibleView(_('Advanced configuration')))
            ->addField(
                new CWidgetFieldTextBoxView($data['fields']['description'])
            )
            ->addField(
                new CWidgetFieldColorView($data['fields']['chart_color'])
            )
    )
    ->includeJsFile('widget.edit.js.php')
    ->addJavaScript('my_custom_widget_form.init('.json_encode([
        'color_palette' => WidgetForm::DEFAULT_COLOR_PALETTE
    ])).');')
    ->show();
```

JavaScript

A JavaScript class can be used to add dynamic behavior and interactivity to the widget configuration view. For example, you can initialize a color picker, defined in the *CWidgetFormView* class.

The JavaScript class should be loaded with the form, therefore it should be referenced in the *CWidgetFormView* class by using the methods *includeJsFile()* and *addJavaScript()*.

In the example below, a singleton class instance is immediately created and stored under the *window.my_custom_widget_form* name. Thus, opening the form for the second time will re-create the instance.

The JavaScript class should be located in the *views* directory.

views/widget.edit.js.php example

```
<?php

use Modules\MyCustomWidget\Widget;

?>
```

```

window.my_custom_widget_form = new class {

  init({color_palette}) {
    colorPalette.setThemeColors(color_palette);

    for (const colorpicker of jQuery('<? ZBX_STYLE_COLOR_PICKER ?> input')) {
      jQuery(colorpicker).colorpicker();
    }

    const overlay = overlays_stack.getById('widget_properties');

    for (const event of ['overlay.reload', 'overlay.close']) {
      overlay.$dialogue[0].addEventListener(event, () => { jQuery.colorpicker('hide'); });
    }
  }
};

```

CWidgetField

The *CWidgetField* class is a base class from which all form field classes (*CWidgetFieldCheckBox*, *CWidgetFieldTextArea*, *CWidgetFieldRadioButtonList*, etc.) are inherited. Classes extending *CWidgetField* are responsible for receiving, saving, and validating widget configuration values.

The following *CWidgetField* classes are available.

| CWidgetField class | Database field type | Description |
|---|----------------------------------|--|
| <i>CWidgetFieldCheckBox</i> | int32 | Single checkbox. |
| <i>CWidgetFieldCheckBoxList</i> | array of int32 | Multiple checkboxes under a single configuration field. |
| <i>CWidgetFieldColor</i> | string | Color selection field. |
| <i>CWidgetFieldDatePicker</i> | string | Date selection field. |
| <i>CWidgetFieldHostPatternSelect</i> | string | Multiselect field that allows to select one or multiple hosts. Supports defining host name patterns (all matching hosts will be selected). |
| <i>CWidgetFieldIntegerBox</i> | int32 | Field to enter an integer. Can be used to configure minimum and maximum values. |
| <i>CWidgetFieldLatLng</i> | string | Text box that allows to enter comma-separated latitude, longitude, and map zoom level. |
| <i>CWidgetFieldMultiSelectActions</i> | ID | Multiselect field for selecting actions (from the list of actions defined in the <i>Alerts</i> → <i>Actions</i>). |
| <i>CWidgetFieldMultiSelectGraphs</i> | ID | Multiselect field for selecting custom graphs. |
| <i>CWidgetFieldMultiSelectGraphPrototypes</i> | ID | Multiselect field for selecting custom graph prototypes. |
| <i>CWidgetFieldMultiSelectGroups</i> | ID | Multiselect field for selecting host groups. |
| <i>CWidgetFieldMultiSelectHostID</i> | ID | Multiselect field for selecting hosts. |
| <i>CWidgetFieldMultiSelectItemID</i> | ID | Multiselect field for selecting items. |
| <i>CWidgetFieldMultiSelectItemPattern</i> | Pattern | Multiselect field for selecting item patterns. |
| <i>CWidgetFieldMultiSelectItemPrototype</i> | Prototype | Multiselect field for selecting item prototypes. |
| <i>CWidgetFieldMultiSelectMapID</i> | ID | Multiselect field for selecting maps. |
| <i>CWidgetFieldMultiSelectMediaType</i> | MediaType | Multiselect field for selecting media types. |
| <i>CWidgetFieldMultiSelectOverTimeHost</i> | Host | Multiselect field for selecting a data source (dashboard or other widget) containing a host for which the widget can display data. |
| <i>CWidgetFieldMultiSelectServiceID</i> | ID | Multiselect field for selecting services. |
| <i>CWidgetFieldMultiSelectSLAID</i> | ID | Multiselect field for selecting SLAs. |
| <i>CWidgetFieldMultiSelectUserID</i> | ID | Multiselect field for selecting users. |
| <i>CWidgetFieldNumericBox</i> | string | Field to enter a float number. |
| <i>CWidgetFieldRadioButtonList</i> | int32 | Radio box group that consists of one or more radio boxes. |
| <i>CWidgetFieldRangeControl</i> | int32 | Slider to select an integer type value. |
| <i>CWidgetFieldReference</i> | string | Creates a unique identifier for this widget on dashboard. It is used to reference this widget from other widgets. |
| <i>CWidgetFieldSelect</i> | int32 | Dropdown select box. |
| <i>CWidgetFieldSeverities</i> | array of int32 | <i>CWidgetFieldCheckBoxList</i> preset with trigger severities. |
| <i>CWidgetFieldTags</i> | array of (string, int32, string) | Allows to configure one or more tag filter rows. |
| <i>CWidgetFieldTextArea</i> | string | Text area for entering multi-line text. |

| CWidgetField class | Database field type | Description |
|-------------------------------|---------------------------|--|
| <i>CWidgetFieldTextBox</i> | string | Text box for entering single-line text. |
| <i>CWidgetFieldTimePeriod</i> | array of string | Time period selecting field. |
| <i>CWidgetFieldTimeZone</i> | string | Dropdown with timezones. |
| <i>CWidgetFieldThresholds</i> | array of (string, string) | Allows configuring color and number pairs. |
| <i>CWidgetFieldUrl</i> | string | Text box that allows to enter URLs. |

The following *CWidgetField* classes have been created for particular widgets. These classes have very specific use cases, but they can also be reused if needed.

| CWidgetField class | Database field type | Description |
|--------------------------------|---------------------------|---|
| <i>CWidgetFieldColumnsList</i> | array of (multiple mixed) | For <i>Top hosts</i> widget. Create a table with custom columns of allowed types. |
| <i>CWidgetFieldNavTree</i> | string | For <i>Map navigation tree</i> widget. Replaces widget view in edit mode with the map selection tree. |

Presentation

This page describes the components that can be used to create a widget presentation view. The widget presentation view is the part of the widget that receives the data according to its **configuration** and displays it on the dashboard in a container.

The presentation view consists of three parts:

- **Widget action**
- **Widget view**
- **JavaScript**

Widget action

The widget action class (*WidgetView*) contains methods for operations with widgets in the presentation view mode. The majority of widget actions use and/or extend the default controller class *CControllerDashboardWidgetView*.

The widget action class should be located in the *actions* directory and specified in the **actions** parameter (*actions/widget.{id}.view/class*) in the *manifest.json* file.

actions/WidgetView.php example (implemented in the Zabbix-native **System information** widget)

```
class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $this->setResponse(new CControllerResponseData([
            'name' => $this->getInput('name', $this->widget->getDefaultName()),
            'system_info' => CSystemInfoHelper::getData(),
            'info_type' => $this->fields_values['info_type'],
            'user_type' => CWebUser::getType(),
            'user' => [
                'debug_mode' => $this->getDebugMode()
            ]
        ]));
    }
}
```

Widget view

The widget view class (*CWidgetView*) is responsible for building the widget presentation view.

The widget view class should be located in the *views* directory. If the file containing the widget view class has a different name than the default (*widget.view.php*), then it must be specified in the *manifest.json* file **actions** parameter (*actions/widget.{id}.view/view*).

views/widget.view.php example

```
<?php

/**
 * My custom widget view.
 */
```

```

* @var CView $this
* @var array $data
*/

(new CWidgetView($data))
    ->addItem(
        new CTag('h1', true, $data['name'])
    )
    ->show();

```

JavaScript

The JavaScript class is responsible for determining widget behavior, such as updating widget data, resizing the widget, displaying widget elements, etc.

All JavaScript operations use and/or extend the base JavaScript class of all dashboard widgets - *CWidget*. The *CWidget* class contains a set of methods with the default implementation for widget behavior. Depending on widget complexity, these methods can be utilized as is or extended.

The *CWidget* class contains the following methods:

- Methods that define widget lifecycle: *onInitialize()*, *onStart()*, *onActivate()*, *onDeactivate()*, *onDestroy()*, *onEdit()*.
- Methods that handle updating and displaying widget data: *promiseUpdate()*, *getUpdateRequestData()*, *processUpdateResponse(response)*, *processUpdateErrorResponse(error)*, *setContents(response)*.
- Methods that modify widget appearance: *onResize()*, *hasPadding()*.

The JavaScript class should be located in the *assets/js* directory and specified in the *assets* (*assets/js*) parameter in the *manifest.json* file.

Lifecycle methods

The widget lifecycle methods are invoked by the dashboard, and at different stages of the widget's lifecycle during its existence within the dashboard.

The ***onInitialize()*** method defines the initial state and/or values of the widget, without performing any HTML or data manipulation. This method is invoked when a widget is created (a widget object is instantiated), typically by adding the widget to a dashboard page or loading the dashboard page.

Example:

```

onInitialize() {
    this._time_offset = 0;
    this._interval_id = null;
    this._clock_type = CWidgetClock.TYPE_ANALOG;
    this._time_zone = null;
    this._show_seconds = true;
    this._time_format = 0;
    this._tzone_format = 0;
    this._show = [];
    this._has_contents = false;
    this._is_enabled = true;
}

```

The ***onStart()*** method defines the HTML structure of the widget, without performing any data manipulation. This method is invoked before the first activation of the dashboard page, that is, before the dashboard and its widgets are fully displayed to the user.

Example:

```

onStart() {
    this._events.resize = () => {
        const padding = 25;
        const header_height = this._view_mode === ZBX_WIDGET_VIEW_MODE_HIDDEN_HEADER
            ? 0
            : this._header.offsetHeight;

        this._target.style.setProperty(
            '--content-height',
            `${this._cell_height * this._pos.height - padding * 2 - header_height}px`
        );
    };
}

```

```

    }
}

```

The ***onActivate()*** method makes the widget active and interactive by enabling custom event listeners (for responding to user actions) and initiating the widget update cycle (for keeping its content up-to-date). This method is invoked when the dashboard page is activated, that is, when it becomes fully displayed in the user interface.

Note that before the *onActivate()* method is invoked, the widget is in the inactive state (WIDGET_STATE_INACTIVE). After successful invocation, the widget transitions to the active state (WIDGET_STATE_ACTIVE). In the active state, the widget is responsive, listens to events, updates its content periodically, and can interact with other widgets.

Example:

```

onActivate() {
    this._startClock();

    this._resize_observer = new ResizeObserver(this._events.resize);
    this._resize_observer.observe(this._target);
}

```

The ***onDeactivate()*** method stops any activity and interactivity of the widget by deactivating custom event listeners and stopping the widget update cycle. This method is invoked when the dashboard page is deactivated, that is, switched away or deleted, or when the widget is deleted from the dashboard page.

Note that before the *onDeactivate()* method is invoked, the widget is in the active state (WIDGET_STATE_ACTIVE). After successful invocation, the widget transitions to the inactive state (WIDGET_STATE_INACTIVE).

Example:

```

onDeactivate() {
    this._stopClock();
    this._resize_observer.disconnect();
}

```

The ***onDestroy()*** method performs cleanup tasks before the widget is deleted from the dashboard, which can include closing a database connection that was established during widget initialization, cleaning up temporary data to free up system memory and avoid resource leaks, unregistering event listeners related to resize events or button clicks to prevent unnecessary event handling and memory leaks, etc. This method is invoked when the widget or the dashboard page that contains it is deleted.

Note that before the *onDestroy()* method is invoked, a widget in an active state (WIDGET_STATE_ACTIVE) is always deactivated with the invocation of the *onDeactivate()* method.

Example:

```

onDestroy() {
    if (this._filter_widget) {
        this._filter_widget.off(CWidgetMap.WIDGET_NAVTREE_EVENT_MARK, this._events.mark);
        this._filter_widget.off(CWidgetMap.WIDGET_NAVTREE_EVENT_SELECT, this._events.select);
    }
}

```

The ***onEdit()*** method defines the appearance and behavior of the widget when the dashboard transitions into editing mode. This method is invoked when the dashboard transitions into editing mode, typically when a user interacts with the widget's *Edit* button or the dashboard's *Edit dashboard* button.

Example:

```

onEdit() {
    this._deactivateGraph();
}

```

Update process methods

The widget update process methods are responsible for retrieving updated data from Zabbix server or any other data source and displaying it in the widget.

The ***promiseUpdate()*** method initiates the data update process by retrieving data, typically using web requests or API calls. This method is invoked when a dashboard page is displayed and periodically after, until the dashboard page is switched to another dashboard page.

The following is an example of the default implementation of the *promiseUpdate()* method used by most Zabbix-native widgets. In the default implementation, the *promiseUpdate()* method follows a general pattern for retrieving data from the server. It creates a new *Curl* object with the appropriate URL and request parameters, sends a POST request using the *fetch()* method with the data object constructed by the *getUpdateRequestData()* method, and processes the response (or an error response) with the *processUpdateResponse(response)* or *processUpdateErrorResponse(error)* accordingly. This implementation is suitable for most widgets as they typically retrieve data in a JSON format and handle it in a consistent manner.

```
promiseUpdate() {
  const curl = new Curl('zabbix.php');

  curl.setArgument('action', `widget.${this._type}.view`);

  return fetch(curl.getUrl(), {
    method: 'POST',
    headers: {'Content-Type': 'application/json'},
    body: JSON.stringify(this.getUpdateRequestData()),
    signal: this._update_abort_controller.signal
  })
  .then((response) => response.json())
  .then((response) => {
    if ('error' in response) {
      this.processUpdateErrorResponse(response.error);

      return;
    }

    this.processUpdateResponse(response);
  });
}
```

The *getUpdateRequestData()* method prepares the server request data for updating the widget by gathering various properties and their corresponding values (widget identifiers, filter settings, time ranges, etc.) from the widget's state and configuration, and constructing a data object that represents the necessary information to be sent to the server in the update request. This method is invoked only as part of the default *promiseUpdate()* method, that is, during the widget update process.

Default implementation:

```
getUpdateRequestData() {
  return {
    templateid: this._dashboard.templateid ?? undefined,
    dashboardid: this._dashboard.dashboardid ?? undefined,
    widgetid: this._widgetid ?? undefined,
    name: this._name !== '' ? this._name : undefined,
    fields: Object.keys(this._fields).length > 0 ? this._fields : undefined,
    view_mode: this._view_mode,
    edit_mode: this._is_edit_mode ? 1 : 0,
    dynamic_hostid: this._dashboard.templateid !== null || this.supportsDynamicHosts()
      ? (this._dynamic_hostid ?? undefined)
      : undefined,
    ...this._contents_size
  };
}
```

The *processUpdateResponse(response)* method handles the response received from the server after the update request, and, if the update process has been successful and without errors, clears widget data and displays new contents with the *setContents()* method. This method is invoked only as part of the default *promiseUpdate()* method, that is, during the widget update process.

Default implementation:

```
processUpdateResponse(response) {
  this._setHeaderName(response.name);

  this._updateMessages(response.messages);
  this._updateInfo(response.info);
  this._updateDebug(response.debug);
}
```

```

    this.setContents(response);
}

```

The ***processUpdateErrorResponse(error)*** method handles the response received from the server after the update request if the response is an error, and displays the error message/-s. This method is invoked only as part of the default *promiseUpdate()* method, that is, during the widget update process.

Default implementation:

```

processUpdateErrorResponse(error) {
    this._updateMessages(error.messages, error.title);
}

```

The ***setContents(response)*** method displays widget contents if the widget update process has been successful and without errors, which can include manipulating DOM elements, updating UI components, applying styles or formatting, etc. This method is invoked only as part of the default *processUpdateResponse(response)* method, that is, during the process of handling the response received from the server after the update request.

Default implementation:

```

setContents(response) {
    this._body.innerHTML = response.body ?? '';
}

```

Presentation modification methods

The widget presentation modification methods are responsible for modifying widget appearance.

The ***onResize()*** method is responsible for adjusting widget's visual elements to accommodate the new widget size, which can include rearranging elements, adjusting element dimensions, text truncation, implementing lazy loading to improve responsiveness during resizing, etc. This method is invoked when the widget is resized, for example, when the user manually resizes the widget or when the browser window is resized.

Example:

```

onResize() {
    if (this.getState() === WIDGET_STATE_ACTIVE) {
        this._startUpdating();
    }
}

```

The ***hasPadding()*** method is responsible for applying an 8px vertical padding at the bottom of the widget when it is configured to **show its header**. This method is invoked when the dashboard page is activated, that is, when it becomes the displayed page in the user interface.

Default implementation:

```

hasPadding() {
    return this.getViewMode() !== ZBX_WIDGET_VIEW_MODE_HIDDEN_HEADER;
}

```

For some widgets it is necessary to use all of the available widget space to configure, for example, a custom background color. The following is an example of the implementation of the *hasPadding()* method used in the Zabbix-native *Item value* widget.

```

hasPadding() {
    return false;
}

```

Tutorials

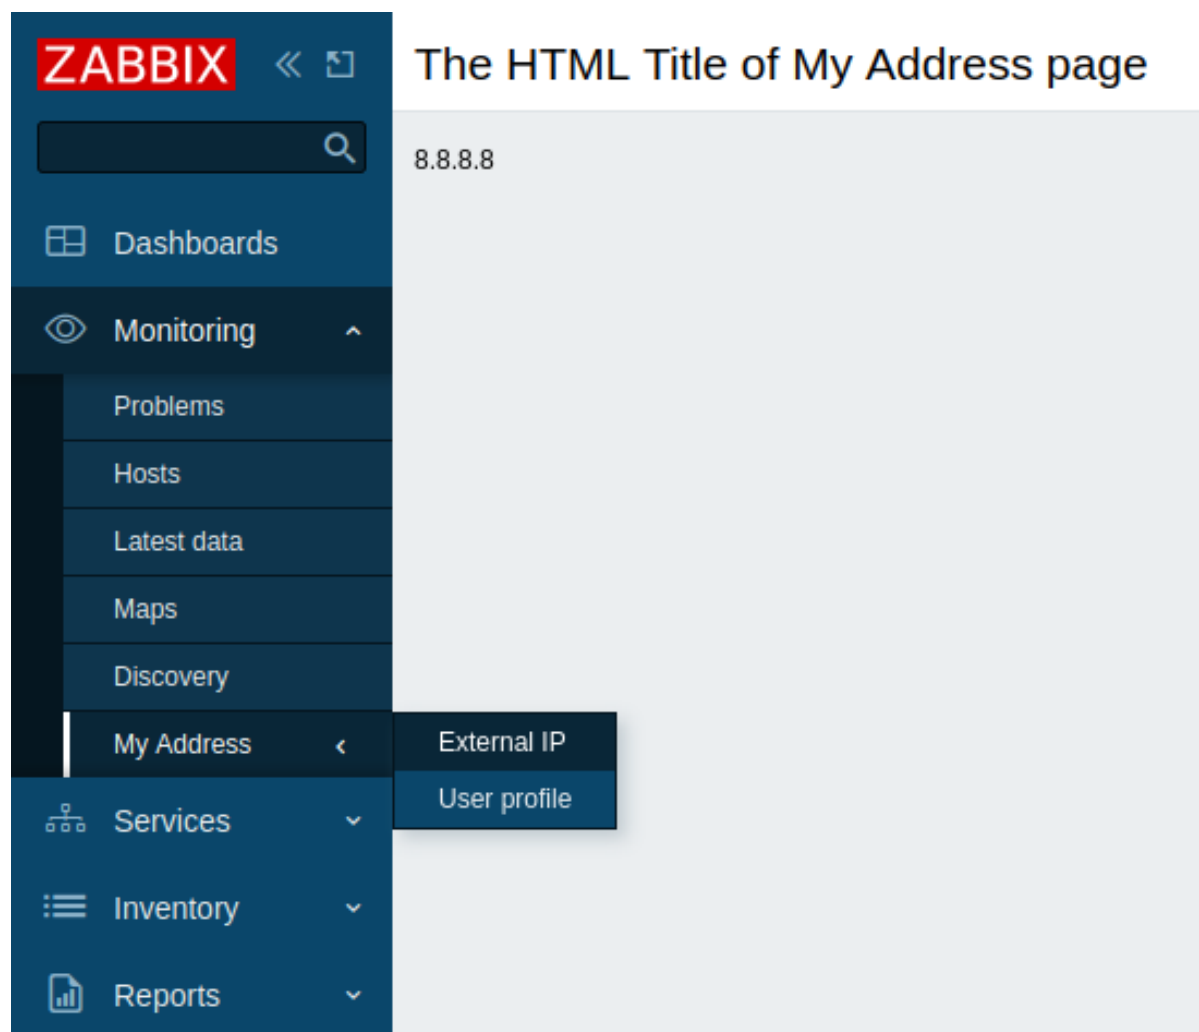

This section contains practical step-by-step tutorials to illustrate how to build a custom **module** and a **widget** in Zabbix.

Create a module (tutorial)

This is a step-by-step tutorial that shows how to create a simple Zabbix frontend module. You can download all files of this module as a ZIP archive: [MyAddress.zip](#).

What you'll build

During this tutorial, you will first build a frontend module that adds a new *My Address* menu section and then convert it into a **more advanced** frontend module that makes an HTTP request to <https://api.seeip.org> and displays the response - the IP address of your computer - on a new page in the newly created *My Address* menu section. Here's how the finished module will look like:

Part I - New menu section

Add a blank module to Zabbix frontend

1. Create a directory *MyAddress* in the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
2. Create a *manifest.json* file with basic module metadata (see the description of supported **parameters**).

ui/modules/MyAddress/manifest.json

```
{
  "manifest_version": 2.0,
  "id": "my-address",
  "name": "My IP Address",
  "version": "1.0",
  "namespace": "MyAddress",
  "description": "My External IP Address."
}
```

3. In Zabbix frontend, go to *Administration* → *General* → *Modules* section and click on the *Scan directory* button.

Scan directory

4. Locate the new module *My IP Address* in the list and click on the "Disabled" hyperlink to change the module's status from "Disabled" to "Enabled" (if the module is not listed, see **troubleshooting** section).

| | | | | | |
|--------------------------|---------------------|-----|--------|---|----------|
| <input type="checkbox"/> | Map | 1.0 | Zabbix | Displays either a single configured network map or one of the configured network maps in the map navigation tree. | Enabled |
| <input type="checkbox"/> | Map navigation tree | 1.0 | Zabbix | Allows to build a hierarchy of existing maps and display problem statistics for each included map and map group. | Enabled |
| <input type="checkbox"/> | My IP Address | 1.0 | | My External IP Address. | Disabled |
| <input type="checkbox"/> | Plain text | 1.0 | Zabbix | Displays the latest data for the selected items in plain text. | Enabled |
| <input type="checkbox"/> | Problem hosts | 1.0 | Zabbix | Displays the problem count by host group and the highest problem severity within a group. | Enabled |

The module is now registered in the frontend. However, it is not visible yet, because you still need to define the module functionality. Once you add content to the module directory, you will immediately see the changes in Zabbix frontend upon refreshing the page.

Create a menu section

1. Create a *Module.php* file in the *MyAddress* directory.

This file implements a new *Module* class that extends the default *CModule* class. The *Module* class will insert a new *My Address* menu section into the main menu.

The *setAction()* method specifies an action to be executed upon clicking on the menu section. To start with, you can use the predefined action *userprofile.edit*, which will open the *User profile* page. In **part III** of this tutorial, you will learn how to create a custom action.

ui/modules/MyAddress/Module.php

```
<?php

namespace Modules\MyAddress;

use Zabbix\Core\CModule,
    APP,
    CMenuItem;

class Module extends CModule {

    public function init(): void {
        APP::Component()->get('menu.main')
            ->add((new CMenuItem(_('My Address'))))
            ->setAction('userprofile.edit'));
    }
}
```

Note:

You can replace 'userprofile.edit' with other actions, for example, 'charts.view' (opens custom graphs), 'problems.view' (opens *Monitoring → Problems*), or 'report.status' (opens *System information* report).

3. Refresh Zabbix frontend. There is now a new *My Address* section at the bottom of the Zabbix main menu. Click on *My Address* to open the *User profile* page.

Part II - Menu section location change

In this part, you will move the *My Address* menu section to the *Monitoring* section and then add a nested menu to it. As a result, users will be able to access two sub-menu pages from the *Monitoring* → *My Address* menu section.

1. Open and edit the *Module.php* file.

ui/modules/MyAddress/Module.php

```
<?php

namespace Modules\MyAddress;

use Zabbix\Core\CModule,
    APP,
    CMenuItem;

class Module extends CModule {

    public function init(): void {
        APP::Component()->get('menu.main')
            ->findOrAdd_('Monitoring')
            ->getSubmenu()
            ->insertAfter_('Discovery',
                (new CMenuItem_('My Address'))->setAction('userprofile.edit')
            );
    }
}
```

2. Refresh Zabbix frontend. Expand the *Monitoring* menu section and observe that the *My address* section is now located below the *Discovery* section.

3. To add nested pages to the *My Address* menu section, open and edit the *Module.php* file again.

This step creates two subsections:

- *External IP* that executes a new 'my.address' action that will be defined in the next steps;
- *User profile* that executes the predefined 'userprofile.edit' action to open the *User profile* page.

Note that for the nested menu, you need to use the *CMenu* class in addition to the classes used in the previous steps.

ui/modules/MyAddress/Module.php

```
<?php

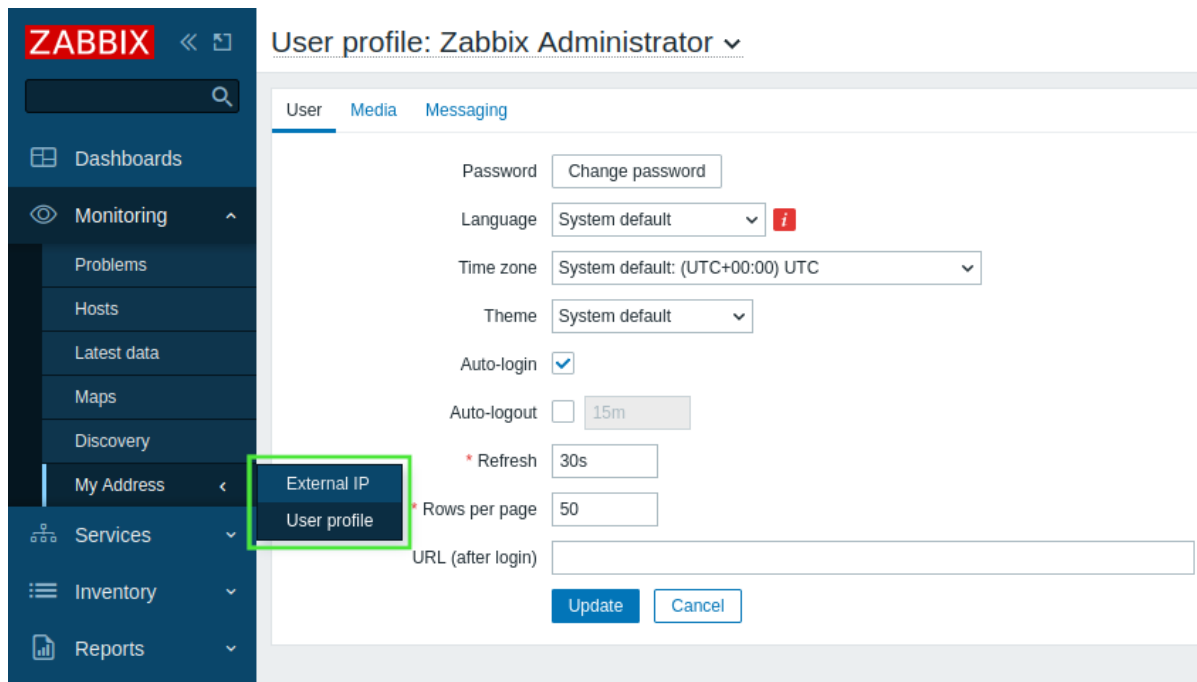

namespace Modules\MyAddress;

use Zabbix\Core\CModule,
    APP,
    CMenu,
    CMenuItem;

class Module extends CModule {

    public function init(): void {
        APP::Component()->get('menu.main')
            ->findOrAdd(_('Monitoring'))
            ->getSubmenu()
            ->insertAfter(_('Discovery'),
                (new CMenuItem(_('My Address'))->setSubMenu(
                    new CMenu([
                        (new CMenuItem(_('External IP'))->setAction('my.address'),
                        (new CMenuItem(_('User profile'))->setAction('userprofile.edit')
                    ])
                ))
            );
    }
}
```

4. Refresh Zabbix frontend. Observe that the *My address* menu section now contains a third-level menu with two pages - *External IP* and *User profile*.

Part III - Module action

An action is implemented in two files - *actions/MyAddress.php* and *views/my.address.php*. The ***actions/MyAddress.php*** file takes care of the business logic implementation, while the ***views/my.address.php*** file is responsible for the view.

1. Create a directory *actions* in the *MyAddress* directory.
2. Create a *MyAddress.php* file in the *actions* directory.

The action logic will be defined in the *MyAddress* class. This action class will implement four functions: *init()*, *checkInput()*, *checkPermissions()*, and *doAction()*. Zabbix frontend calls the *doAction()* function when the action is requested. This function is responsible for the business logic of the module.

Attention:

The data must be organized as an associative array. The array can be multidimensional and may contain any data expected by the view.

ui/modules/MyAddress/actions/MyAddress.php

```
<?php

namespace Modules\MyAddress\Actions;

use CController,
    CControllerResponseData;

class MyAddress extends CController {

    public function init(): void {
        $this->disableCsrfValidation();
    }

    protected function checkInput(): bool {
        return true;
    }

    protected function checkPermissions(): bool {
        return true;
    }

    protected function doAction(): void {
        $data = ['my-ip' => file_get_contents("https://api.seeip.org")];
        $response = new CControllerResponseData($data);
    }
}
```

```

        $this->setResponse($response);
    }
}

```

3. Create a new directory *views* in the *MyAddress* directory.
4. Create a *my.address.php* file in the *views* directory and define the module view.

Note that the variable *\$data* is available in the view without specifically defining it. The framework automatically passes the associative array to the view.

ui/modules/MyAddress/views/my.address.php

```

<?php

(new CHtmlPage())
->setTitle(_('The HTML Title of My Address Page'))
->addItem(new CDiv($data['my-ip']))
->show();

```

5. The module action has to be registered in the *manifest.json* file. Open *manifest.json* and add a new object actions that contains:
 - the action key with the action name written in lowercase (a-z) and with words separated by dots (for example, *my.address*);
 - the action class name (*MyAddress*) as a value for the *class* key of the *my.address* object;
 - the action view name (*my.address*) as a value for the *view* key of the *my.address* object.

ui/modules/MyAddress/manifest.json

```

{
    "manifest_version": 2.0,
    "id": "my-address",
    "name": "My IP Address",
    "version": "1.0",
    "namespace": "MyAddress",
    "description": "My External IP Address.",
    "actions": {
        "my.address": {
            "class": "MyAddress",
            "view": "my.address"
        }
    }
}

```

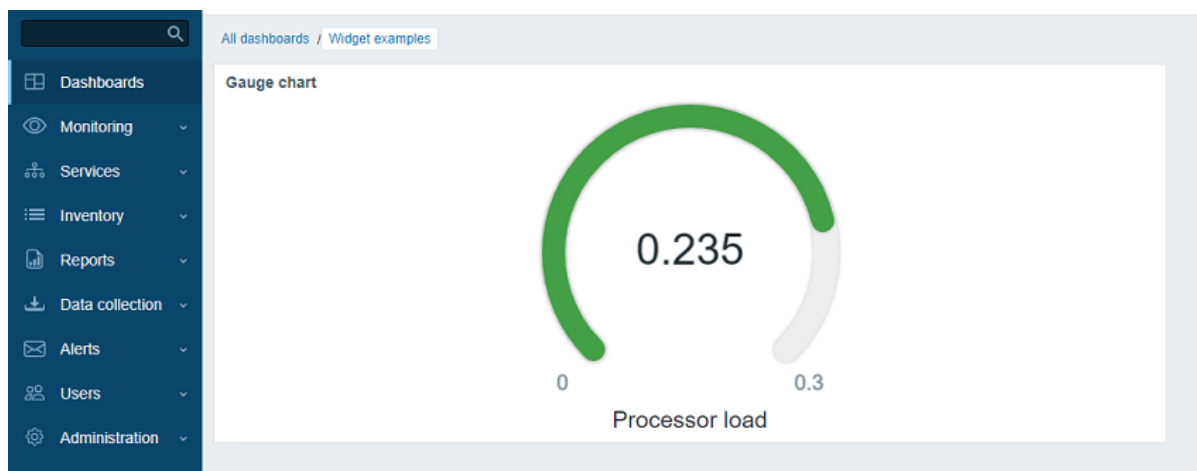

6. Refresh Zabbix frontend. Click on *My address* → *External IP* to see the IP address of your computer.

Create a widget (tutorial)

This is a step-by-step tutorial that shows how to create a simple dashboard widget. You can download all files of this widget as a ZIP archive: [lesson_gauge_chart.zip](#).

What you'll build During this tutorial, you will first build a **basic** "Hello, world!" widget and then convert it into a **more advanced** widget that displays an item value as a gauge chart. Here's how the finished widget will look like:

Part I - "Hello, world!" In this section you will learn how to create the minimum required widget elements and add a new widget to Zabbix frontend.

Add a blank widget to Zabbix frontend

1. Create a directory `lesson_gauge_chart` in the `modules` directory of your Zabbix frontend installation (for example, `zabbix/ui/modules`).

Note:

All custom widgets are treated as external modules and must be added to the `modules` directory of your Zabbix frontend installation (for example, `zabbix/ui/modules`). The directory `zabbix/ui/widgets` is reserved for Zabbix built-in widgets and gets updated along with Zabbix UI.

2. Create a `manifest.json` file with basic widget metadata (see the description of supported [parameters](#)).

`ui/modules/lesson_gauge_chart/manifest.json`

```
{
  "manifest_version": 2.0,
  "id": "lesson_gauge_chart",
  "type": "widget",
  "name": "Gauge chart",
  "namespace": "LessonGaugeChart",
  "version": "1.1",
  "author": "Zabbix"
}
```

3. In Zabbix frontend, go to *Administration* → *General* → *Modules* section and click on the *Scan directory* button.

Scan directory

4. Locate the new module *Gauge chart* in the list and click on the "Disabled" hyperlink to change the module's status from "Disabled" to "Enabled" (if the module is not listed, see [troubleshooting](#) section).

| | | | | | | |
|----------------|--------------------------|-----------------|-----|--------|--|----------|
| Administration | <input type="checkbox"/> | Favorite graphs | 1.0 | Zabbix | Displays shortcuts to the most needed graphs (marked as favorite). | Enabled |
| Users | <input type="checkbox"/> | Favorite maps | 1.0 | Zabbix | Displays shortcuts to the most needed network maps (marked as favorite). | Enabled |
| Administration | <input type="checkbox"/> | Gauge chart | 1.0 | Zabbix | | Disabled |
| General | <input type="checkbox"/> | Geomap | 1.0 | Zabbix | Displays hosts as markers on a geographical map. | Enabled |
| Audit log | <input type="checkbox"/> | Graph | 1.0 | Zabbix | Displays data of up to 50 items as line, points, staircase, or bar charts. | Enabled |

5. Open a dashboard, switch it to the edit mode and add a new widget. In the *Type* field, select "Gauge chart".

The screenshot shows the 'Add widget' dialog box. The 'Type' dropdown menu is open, displaying a list of available widget types: Action log, Clock, Discovery status, Favorite graphs, Favorite maps, Gauge chart (which is highlighted), Geomap, Graph, and Graph (classic). The 'Name' field is empty, and the 'Refresh interval' field is also empty. The 'Show header' checkbox is checked. At the bottom right, there are 'Add' and 'Cancel' buttons.

6. At this point, the *Gauge chart* widget configuration contains only common widget fields *Name* and *Refresh interval*. Click on *Add* to add the widget to the dashboard.

?

×

Add widget

Type

Gauge chart

Show header

☒

Name

default

Refresh interval

Default (1 minute)

Add

Cancel

7. A blank widget should appear on the dashboard. Click on *Save changes* in the top right corner to save the dashboard.

Add a widget view

Note:

The widget's **view** file should be located in the *views* directory (for this tutorial, *ui/modules/lesson_gauge_chart/views/*). If the file has the default name *widget.view.php*, you do not need to register it in the *manifest.json* file. If the file has a different name, specify it in the *actions/widget.lesson_gauge_chart.view* section of the *manifest.json* file.

1. Create a directory *views* in the *lesson_gauge_chart* directory.
2. Create a *widget.view.php* file in the *views* directory.

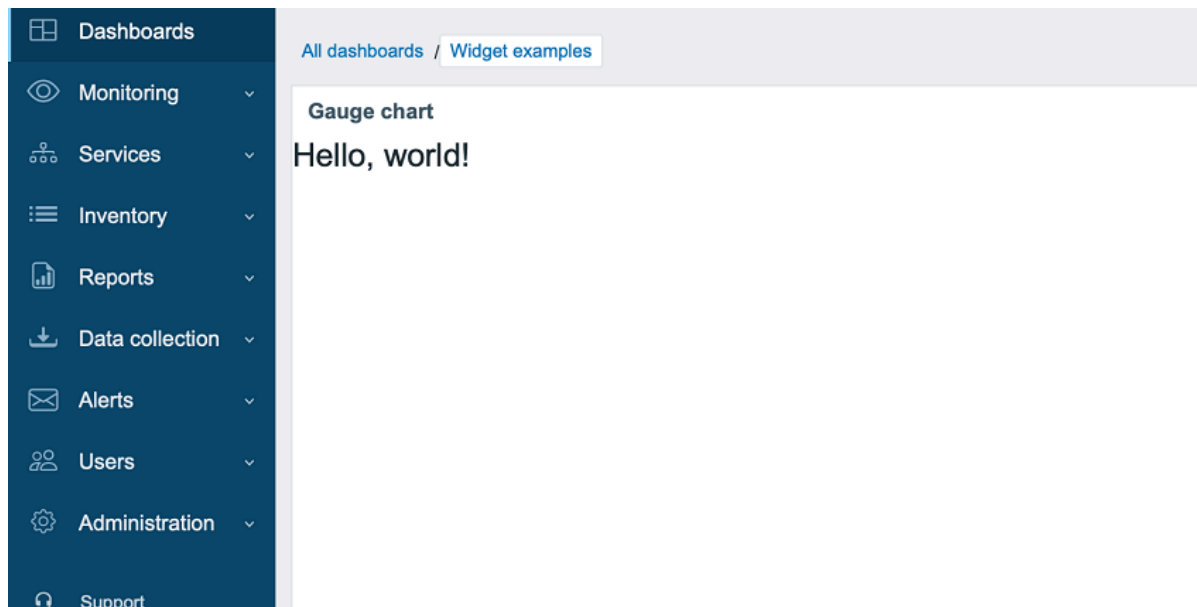

ui/modules/lesson_gauge_chart/views/widget.view.php

```
<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem(
        new CTag('h1', true, 'Hello, world!')
    )
    ->show();
```

3. Refresh the dashboard. The *Gauge chart* widget now displays "Hello, world!".

Part II - Gauge chart

Add settings to a configuration view and use them in a widget view

In this section, you will learn how to add a widget configuration field and show the entered value in the widget view as text.

The widget configuration consists of a form (`Zabbix\Widgets\CWidgetForm`) and a widget form view (`widget.edit.php`). To add fields (`Zabbix\Widgets\CWidgetField`), you need to create a `WidgetForm` class, which will extend `Zabbix\Widgets\CWidgetForm`.

The form contains the set of fields (`Zabbix\Widgets\CWidgetField`) of various types, which are used to validate user-entered values. The form field (`Zabbix\Widgets\CWidgetField`) for each input element type converts the value into a single format to store it in the database.

Note:

The widget's **form** file should be located in the `includes` directory (for this tutorial, `ui/modules/lesson_gauge_chart/includes/`). If the file has the default name `WidgetForm.php`, you do not need to register it in the `manifest.json` file. If the file has a different name, specify it in the `widget/form_class` section of the `manifest.json` file.

1. Create a new directory `includes` in the `lesson_gauge_chart` directory.
2. Create a `WidgetForm.php` file in the `includes` directory.

ui/modules/lesson_gauge_chart/includes/WidgetForm.php

```
<?php

namespace Modules\LessonGaugeChart\Includes;

use Zabbix\Widgets\CWidgetForm;

class WidgetForm extends CWidgetForm {
}
```

3. Add a `Description` field to widget configuration form. This is a regular text field, where a user can enter any character set. You can use the `CWidgetFieldTextBox` class for it.

ui/modules/lesson_gauge_chart/includes/WidgetForm.php

```
<?php

namespace Modules\LessonGaugeChart\Includes;

use Zabbix\Widgets\CWidgetForm;
use Zabbix\Widgets\Fields\CWidgetFieldTextBox;

class WidgetForm extends CWidgetForm {
```

```

    public function addFields(): self {
        return $this
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            );
    }
}

```

4. In the `views` directory, create a widget configuration view file `widget.edit.php` and add a view for the new `Description` field. For the `CWidgetFieldTextBox` field class, the view is `CWidgetFieldTextBoxView`.

ui/modules/lesson_gauge_chart/views/widget.edit.php

```

<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetFormView($data))
    ->addField(
        new CWidgetFieldTextBoxView($data['fields']['description'])
    )
    ->show();

```

5. Go to the dashboard and click on the gear icon in the widget to open the widget configuration form.
6. The widget configuration form now contains a new `Description` text field. Enter any value, for example, *Gauge chart description*.

7. Click on *Apply* in the widget configuration form. Then click on *Save changes* in the top right corner to save the dashboard. Note that the new description is not visible anywhere, and the widget still displays "Hello, world!".

For the new description to appear in the widget, the `Description` field value needs to be retrieved from the database and passed to the widget view. For that, you need to create an action class.

8. Create a new directory `actions` in the `lesson_gauge_chart` directory.
9. Create a `WidgetView.php` file in the `actions` directory. The `WidgetView` action class will extend the `CControllerDashboard-WidgetView` class.

Values of the widget configuration fields are stored in the `$fields_values` property of the action class.

ui/modules/lesson_gauge_chart/actions/WidgetView.php

```

<?php

namespace Modules\LessonGaugeChart\Actions;

use CControllerDashboardWidgetView,
    CControllerResponseData;

class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $this->setResponse(new CControllerResponseData([
            'name' => $this->getInput('name', $this->widget->getName()),
            'description' => $this->fields_values['description'],
            'user' => [
                'debug_mode' => $this->getDebugMode()
            ]
        ]));
    }
}

```

10. Open *manifest.json* and register *WidgetView* as an action class in the *actions/widget.lesson_gauge_chart.view* section.

ui/modules/lesson_gauge_chart/manifest.json

```

{
    "manifest_version": 2.0,
    "id": "lesson_gauge_chart",
    "type": "widget",
    "name": "Gauge chart",
    "namespace": "LessonGaugeChart",
    "version": "1.0",
    "author": "Zabbix",
    "actions": {
        "widget.lesson_gauge_chart.view": {
            "class": "WidgetView"
        }
    }
}

```

11. Now you can use the value of the description field, contained in *\$data['description']*, in the widget view. Open *views/widget.view.php* and replace the static text "Hello, world!" with *\$data['description']*.

ui/modules/lesson_gauge_chart/views/widget.view.php

```

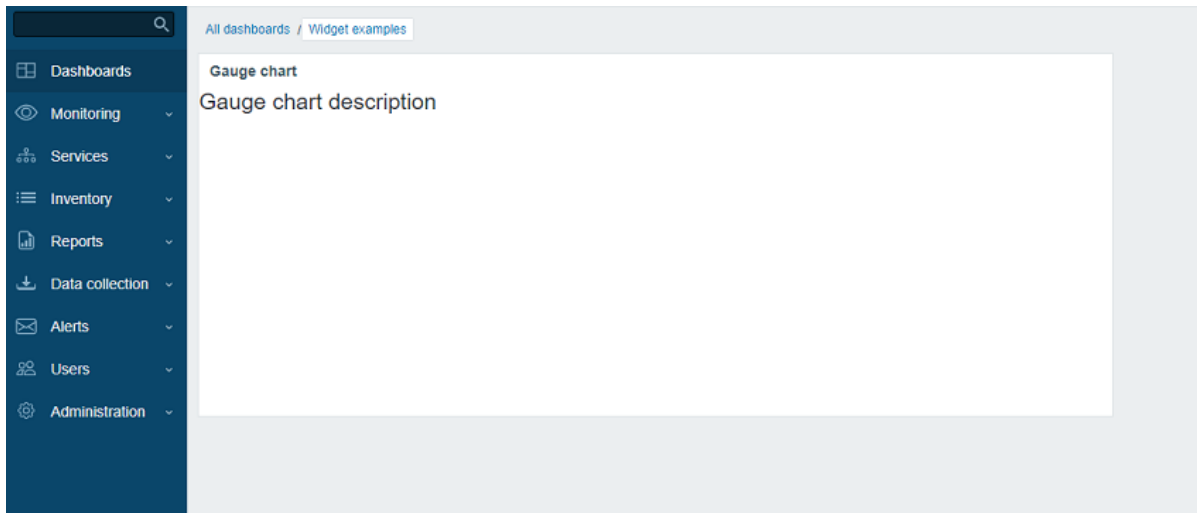

<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem(
        new CTag('h1', true, $data['description'])
    )
    ->show();

```

12. Refresh the dashboard page. You should now see the widget description text instead of "Hello, world!".

Retrieve an item value via API

The widget should show the last value of an item of user's choice. For that, you need to add the ability to select items in the widget configuration.

In this section, you will learn how to add an item selection field to the widget form and how to add the visual part of this field to the configuration view. Then, the widget controller will be able to retrieve item data and its value via an API request. Once received, the value can be displayed in the widget view.

1. Open `includes/WidgetForm.php` and add the `CWidgetFieldMultiSelectItem` field. This will allow selecting an item in the configuration form.

ui/modules/lesson_gauge_chart/includes/WidgetForm.php

```
<?php

namespace Modules\LessonGaugeChart\Includes;

use Zabbix\Widgets\{
    CWidgetField,
    CWidgetForm
};

use Zabbix\Widgets\Fields\{
    CWidgetFieldMultiSelectItem,
    CWidgetFieldTextBox
};

/**
 * Gauge chart widget form.
 */
class WidgetForm extends CWidgetForm {

    public function addFields(): self {
        return $this
            ->addField(
                (new CWidgetFieldMultiSelectItem('itemid', _('Item')))
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
                    ->setMultiple(false)
            )
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            );
    }
}
```

2. Open `views/widget.edit.php` and add the field visual component to the configuration view.

ui/modules/lesson_gauge_chart/views/widget.edit.php

```

<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetFormView($data))
    ->addField(
        new CWidgetFieldMultiSelectItemView($data['fields']['itemid'])
    )
    ->addField(
        new CWidgetFieldTextBoxView($data['fields']['description'])
    )
    ->show();

```

3. Return to the dashboard and click on the gear icon in the widget to open the widget configuration form.
4. The widget configuration form now contains a new input field *Item*. Select the host "Zabbix server" and the item "Load average (1m avg)".

Edit widget ? x

Type: Gauge chart ☐ Show header

Name: default

Refresh interval: Default (1 minute)

* Item: Zabbix server: Load average (1m avg)

Description: Gauge chart description

5. Click on *Apply* in the widget configuration form. Then click on *Save changes* in the top right corner to save the dashboard.
6. Open and modify *actions/WidgetView.php*.

From now on, the item ID will be available in the widget controller in `$this->fields_values['itemid']`. The `doAction()` controller method collects the item data (name, value type, units) using the API method `item.get` and the item last value using the API method `history.get`.

ui/modules/lesson_gauge_chart/actions/WidgetView.php

```

<?php

namespace Modules\LessonGaugeChart\Actions;

use API,
    CControllerDashboardWidgetView,
    CControllerResponseData;

class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $db_items = API::Item()->get([
            'output' => ['itemid', 'value_type', 'name', 'units'],
            'itemids' => $this->fields_values['itemid'],
            'webitems' => true,
            'filter' => [
                'value_type' => [ITEM_VALUE_TYPE_UINT64, ITEM_VALUE_TYPE_FLOAT]
            ]
        ])
    }
}

```

```

]);

$value = null;

if ($db_items) {
    $item = $db_items[0];

    $history = API::History()->get([
        'output' => API_OUTPUT_EXTEND,
        'itemids' => $item['itemid'],
        'history' => $item['value_type'],
        'sortfield' => 'clock',
        'sortorder' => ZBX_SORT_DOWN,
        'limit' => 1
    ]);

    if ($history) {
        $value = convertUnitsRaw([
            'value' => $history[0]['value'],
            'units' => $item['units']
        ]);
    }
}

$this->setResponse(new CControllerResponseData([
    'name' => $this->getInput('name', $this->widget->getName()),
    'value' => $value,
    'description' => $this->fields_values['description'],
    'user' => [
        'debug_mode' => $this->getDebugMode()
    ]
]));
}
}
}

```

7. Open `views/widget.view.php` and add the item value to the widget view.

ui/modules/lesson_gauge_chart/views/widget.view.php

```

<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem([
        new CTag('h1', true, $data['description']),
        new CDiv($data['value'] !== null ? $data['value']['value'] : _('No data'))
    ])
    ->show();

```

8. Refresh the dashboard page. The widget will display the latest item value.

Add advanced configuration settings to a configuration view

In this section, you will learn how to add an expandable/collapsible *Advanced configuration* section with optional parameters, such as color, minimum and maximum values, units and the *Description* field created earlier.

1. Create a *Widget.php* file in the main widget directory *lesson_gauge_chart* to create a new class *Widget*.

The *Widget* class will extend the *CWidget* base class to add/override the default widget settings (in this case - translations). JavaScript, provided below, displays the string "No data" in case of missing data. The "No data" string is present in the Zabbix UI translation files.

If there are any widget constants, it is recommended to also specify them in the *Widget* class.

ui/modules/lesson_gauge_chart/Widget.php

```
<?php

namespace Modules\LessonGaugeChart;

use Zabbix\Core\CWidget;

class Widget extends CWidget {

    public const UNIT_AUTO = 0;
    public const UNIT_STATIC = 1;

    public function getTranslationStrings(): array {
        return [
            'class.widget.js' => [
                'No data' => _('No data')
            ]
        ];
    }
}
```

2. Open *includes/WidgetForm.php* and add the new fields *Color* (color picker), *Min* (numeric field), *Max* (numeric field), and *Units* (select), and define the default color palette for the color picker, so that it can be used in the next steps.

ui/modules/lesson_gauge_chart/includes/WidgetForm.php

```
<?php

namespace Modules\LessonGaugeChart\Includes;

use Modules\LessonGaugeChart\Widget;

use Zabbix\Widgets\{
    CWidgetField,
    CWidgetForm
};
```

```

use Zabbix\Widgets\Fields\{
    CWidgetFieldColor,
    CWidgetFieldMultiSelectItem,
    CWidgetFieldNumericBox,
    CWidgetFieldSelect,
    CWidgetFieldTextBox
};

/**
 * Gauge chart widget form.
 */
class WidgetForm extends CWidgetForm {

    public const DEFAULT_COLOR_PALETTE = [
        'FF465C', 'BOAF07', 'OEC9AC', '524BBC', 'ED1248', 'D1E754', '2AB5FF', '385CC7', 'EC1594', 'BAE37D',
        '6AC8FF', 'EE2B29', '3CA20D', '6F4BBC', '00A1FF', 'F3601B', '1CAE59', '45CFDB', '894BBC', '6D6D6D'
    ];

    public function addFields(): self {
        return $this
            ->addField(
                (new CWidgetFieldMultiSelectItem('itemid', _('Item')))
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
                    ->setMultiple(false)
            )
            ->addField(
                (new CWidgetFieldColor('chart_color', _('Color')))->setDefault('FF0000')
            )
            ->addField(
                (new CWidgetFieldNumericBox('value_min', _('Min')))
                    ->setDefault(0)
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
            )
            ->addField(
                (new CWidgetFieldNumericBox('value_max', _('Max')))
                    ->setDefault(100)
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
            )
            ->addField(
                (new CWidgetFieldSelect('value_units', _('Units'), [
                    Widget::UNIT_AUTO => _x('Auto', 'history source selection method'),
                    Widget::UNIT_STATIC => _x('Static', 'history source selection method')
                ]))->setDefault(Widget::UNIT_AUTO)
            )
            ->addField(
                (new CWidgetFieldTextBox('value_static_units'))
            )
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            );
    }
}

```

3. Open `views/widget.edit.php` and add the field visual components to the configuration view.

ui/modules/lesson_gauge_chart/views/widget.edit.php

```

<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data

```

```

*/

$lefty_units = new CWidgetFieldSelectView($data['fields']['value_units']);
$lefty_static_units = (new CWidgetFieldTextBoxView($data['fields']['value_static_units']))
    ->setPlaceholder(_('value'))
    ->setWidth(ZBX_TEXTAREA_TINY_WIDTH);

(new CWidgetFormView($data))
    ->addField(
        (new CWidgetFieldMultiSelectItemView($data['fields']['itemid']))
            ->setPopupParameter('numeric', true)
    )
    ->addFieldset(
        (new CWidgetFormFieldsetCollapsibleView(_('Advanced configuration')))
            ->addField(
                new CWidgetFieldColorView($data['fields']['chart_color'])
            )
            ->addField(
                new CWidgetFieldNumericBoxView($data['fields']['value_min'])
            )
            ->addField(
                new CWidgetFieldNumericBoxView($data['fields']['value_max'])
            )
            ->addItem([
                $lefty_units->getLabel(),
                (new CFormField([
                    $lefty_units->getView()->addClass(ZBX_STYLE_FORM_INPUT_MARGIN),
                    $lefty_static_units->getView()
                ]))
            ])
            ->addField(
                new CWidgetFieldTextBoxView($data['fields']['description'])
            )
    )
    ->show();

```

Note:

The `addField()` method of the `CWidgetFormView` class takes a CSS class string as the second parameter.

- Return to the dashboard, switch to the edit mode and click on the gear icon in the widget to open the widget configuration form. The widget configuration form now contains a new expandable/collapsible section *Advanced configuration*.

- Expand the *Advanced configuration* section to see additional widget configuration fields. Note that the field *Color* has no color picker yet. This is because the color picker must be initialized with JavaScript, which will be added in the next section - *Add JavaScript to the widget*.

Add JavaScript to the widget

In this section, you will learn how to add a gauge chart - made using JavaScript - that shows if the latest value is normal or too high/too low.

1. Create a *widget.edit.js.php* file in the *views* directory.

JavaScript will be responsible for initializing the color picker in the configuration view.

ui/modules/lesson_gauge_chart/views/widget.edit.js.php

```
<?php
```

```
use Modules\LessonGaugeChart\Widget;
```

```
?>
```

```
window.widget_lesson_gauge_chart_form = new class {
    init({color_palette}) {
        this._unit_select = document.getElementById('value_units');
        this._unit_value = document.getElementById('value_static_units');

        this._unit_select.addEventListener('change', () => this.updateForm());

        colorPalette.setThemeColors(color_palette);

        for (const colorpicker of jQuery('.<?= ZBX_STYLE_COLOR_PICKER ?> input')) {
            jQuery(colorpicker).colorpicker();
        }

        const overlay = overlays_stack.getById('widget_properties');

        for (const event of ['overlay.reload', 'overlay.close']) {
            overlay.$dialogue[0].addEventListener(event, () => { jQuery.colorpicker('hide'); });
        }

        this.updateForm();
    }
}
```

```

updateForm() {
    this._unit_value.disabled = this._unit_select.value == <?= Widget::UNIT_AUTO ?>;
}
};

```

2. Open `views/widget.edit.php` and add the `widget.edit.js.php` file with the JavaScript to the configuration view. To do this, use the `includeJsFile()` method. To add inline JavaScript, use the `addJavaScript()` method.

ui/modules/lesson_gauge_chart/views/widget.edit.php

```

<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
 */

use Modules\LessonGaugeChart\Includes\WidgetForm;

$lefty_units = new CWidgetFieldSelectView($data['fields']['value_units']);
$lefty_static_units = (new CWidgetFieldTextBoxView($data['fields']['value_static_units']))
    ->setPlaceholder(_('value'))
    ->setWidth(ZBX_TEXTAREA_TINY_WIDTH);

(new CWidgetFormView($data))
    ->addField(
        (new CWidgetFieldMultiSelectItemView($data['fields']['itemid']))
        ->setPopupParameter('numeric', true)
    )
    ->addFieldset(
        (new CWidgetFormFieldsetCollapsibleView(_('Advanced configuration')))
        ->addField(
            new CWidgetFieldColorView($data['fields']['chart_color'])
        )
        ->addField(
            new CWidgetFieldNumericBoxView($data['fields']['value_min'])
        )
        ->addField(
            new CWidgetFieldNumericBoxView($data['fields']['value_max'])
        )
        ->addItem([
            $lefty_units->getLabel(),
            (new CFormField([
                $lefty_units->getView()->addClass(ZBX_STYLE_FORM_INPUT_MARGIN),
                $lefty_static_units->getView()
            ]))
        ])
        ->addField(
            new CWidgetFieldTextBoxView($data['fields']['description'])
        )
    )
    ->includeJsFile('widget.edit.js.php')
    ->addJavaScript('widget_lesson_gauge_chart_form.init(' . json_encode([
        'color_palette' => WidgetForm::DEFAULT_COLOR_PALETTE
    ], JSON_THROW_ON_ERROR).');')
    ->show();

```

3. Return to the dashboard, click on the gear icon in the widget to open the widget configuration form. Now, expand the *Advanced configuration* section to see the initialized color picker. Fill in the fields with values and select a color for the gauge chart.

Edit widget

Apply Cancel

4. Click on *Apply* in the widget configuration form. Then click on *Save changes* in the top right corner to save the dashboard.

5. Open *actions/WidgetView.php* and update the controller.

The `$this->fields_values` property now contains the values of all the *Advanced configuration* fields. Finalize the controller to enable passing the configuration and selected item value to the widget view.

ui/modules/lesson_gauge_chart/actions/WidgetView.php

```
<?php

namespace Modules\LessonGaugeChart\Actions;

use API,
    CControllerDashboardWidgetView,
    CControllerResponseData;

class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $db_items = API::Item()->get([
            'output' => ['itemid', 'value_type', 'name', 'units'],
            'itemids' => $this->fields_values['itemid'],
            'webitems' => true,
            'filter' => [
                'value_type' => [ITEM_VALUE_TYPE_UINT64, ITEM_VALUE_TYPE_FLOAT]
            ]
        ]);

        $history_value = null;

        if ($db_items) {
            $item = $db_items[0];

            $history = API::History()->get([
                'output' => API_OUTPUT_EXTEND,
                'itemids' => $item['itemid'],
                'history' => $item['value_type'],
                'sortfield' => 'clock',
                'sortorder' => ZBX_SORT_DOWN,
            ]);
        }
    }
}
```

```

        'limit' => 1
    ]]);

    if ($history) {
        $history_value = convertUnitsRaw([
            'value' => $history[0]['value'],
            'units' => $item['units']
        ]);
    }
}

$this->setResponse(new CControllerResponseData([
    'name' => $this->getInput('name', $this->widget->getName()),
    'history' => $history_value,
    'fields_values' => $this->fields_values,
    'user' => [
        'debug_mode' => $this->getDebugMode()
    ]
]));
}
}

```

6. Open and modify *views/widget.view.php*.

You need to create a container for the gauge chart, which you will draw in the next steps, and a container for the description.

To pass values to JavaScript as a JSON object, use the *setVar()* method.

ui/modules/lesson_gauge_chart/views/widget.view.php

```

<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem([
        (new CDiv())->addClass('chart'),
        $data['fields_values']['description']
        ? (new CDiv($data['fields_values']['description']))->addClass('description')
        : null
    ])
    ->setVar('history', $data['history'])
    ->setVar('fields_values', $data['fields_values'])
    ->show();

```

7. Create a new directory *assets* in the *lesson_gauge_chart* directory. This directory will be used for storing JavaScript, CSS, and potentially any other assets, such as fonts or images.

8. For widget view JavaScript, create a directory *js* in the *assets* directory.

9. Create a *class.widget.js* file in the *assets/js* directory.

This JavaScript widget class will extend the base JavaScript class of all dashboard widgets - *CWidget*.

The dashboard relies on a correct implementation of a widget and communicates any relevant information to the widget through calling the respective JavaScript methods. The dashboard also expects the widget to generate events when some interaction occurs. Thus, the *CWidget* class contains a set of methods with the default implementation of widget behavior, which can be customized by extending the class.

In this case, some customization is necessary, therefore custom logic will be implemented for the following widget behavior:

- widget initialization that is responsible for defining the initial state of the widget (see the *onInitialize()* method);

- displaying widget contents (that is, drawing the gauge chart) if the widget update process has been successful and without errors (see the *processUpdateResponse(response)* method and the related *_resizeChart()* and *_updatedChart()* methods)
- resizing the widget (see the *onResize()* method and the related *_resizeChart()* method)

For other aspects of the gauge chart widget, the default implementation for widget behavior will be used. To learn more about the JavaScript methods of the *CWidget* class, see: [JavaScript](#).

Since this JavaScript is required for the widget view, it should be loaded with the dashboard page. To enable JavaScript loading, you will need to update the *assets/js* and *js_class* parameters in the **manifest.json** file as shown in step 10.

ui/modules/lesson_gauge_chart/assets/js/class.widget.js

```
class WidgetLessonGaugeChart extends CWidget {

    static UNIT_AUTO = 0;
    static UNIT_STATIC = 1;

    onInitialize() {
        super.onInitialize();

        this._refresh_frame = null;
        this._chart_container = null;
        this._canvas = null;
        this._chart_color = null;
        this._min = null;
        this._max = null;
        this._value = null;
        this._last_value = null;
        this._units = '';
    }

    processUpdateResponse(response) {
        if (response.history === null) {
            this._value = null;
            this._units = '';
        }
        else {
            this._value = Number(response.history.value);
            this._units = response.fields_values.value_units == WidgetLessonGaugeChart.UNIT_AUTO
                ? response.history.units
                : response.fields_values.value_static_units;
        }

        this._chart_color = response.fields_values.chart_color;
        this._min = Number(response.fields_values.value_min);
        this._max = Number(response.fields_values.value_max);

        super.processUpdateResponse(response);
    }

    setContents(response) {
        if (this._canvas === null) {
            super.setContents(response);

            this._chart_container = this._body.querySelector('.chart');
            this._chart_container.style.height =
                `${this._getContentsSize().height - this._body.querySelector('.description').clientHeight}`;
            this._canvas = document.createElement('canvas');

            this._chart_container.appendChild(this._canvas);

            this._resizeChart();
        }

        this._updatedChart();
    }
}
```

```

}

onResize() {
  super.onResize();

  if (this._state === WIDGET_STATE_ACTIVE) {
    this._resizeChart();
  }
}

_resizeChart() {
  const ctx = this._canvas.getContext('2d');
  const dpr = window.devicePixelRatio;

  this._canvas.style.display = 'none';
  const size = Math.min(this._chart_container.offsetWidth, this._chart_container.offsetHeight);
  this._canvas.style.display = '';

  this._canvas.width = size * dpr;
  this._canvas.height = size * dpr;

  ctx.scale(dpr, dpr);

  this._canvas.style.width = `${size}px`;
  this._canvas.style.height = `${size}px`;

  this._refresh_frame = null;

  this._updatedChart();
}

_updatedChart() {
  if (this._last_value === null) {
    this._last_value = this._min;
  }

  const start_time = Date.now();
  const end_time = start_time + 400;

  const animate = () => {
    const time = Date.now();

    if (time <= end_time) {
      const progress = (time - start_time) / (end_time - start_time);
      const smooth_progress = 0.5 + Math.sin(Math.PI * (progress - 0.5)) / 2;
      let value = this._value !== null ? this._value : this._min;
      value = (this._last_value + (value - this._last_value) * smooth_progress - this._min) / (this._max - this._min);

      const ctx = this._canvas.getContext('2d');
      const size = this._canvas.width;
      const char_weight = size / 12;
      const char_shadow = 3;
      const char_x = size / 2;
      const char_y = size / 2;
      const char_radius = (size - char_weight) / 2 - char_shadow;

      const font_ratio = 32 / 100;

      ctx.clearRect(0, 0, size, size);

      ctx.beginPath();
      ctx.shadowBlur = char_shadow;
    }
  };
}

```

```

        ctx.shadowColor = '#bbb';
        ctx.strokeStyle = '#eee';
        ctx.lineWidth = char_weight;
        ctx.lineCap = 'round';
        ctx.arc(char_x, char_y, char_radius, Math.PI * 0.749, Math.PI * 2.251, false);
        ctx.stroke();

        ctx.beginPath();
        ctx.strokeStyle = `#${this._chart_color}`;
        ctx.lineWidth = char_weight - 2;
        ctx.lineCap = 'round';
        ctx.arc(char_x, char_y, char_radius, Math.PI * 0.75,
            Math.PI * (0.75 + (1.5 * Math.min(1, Math.max(0, value)))), false
        );
        ctx.stroke();

        ctx.shadowBlur = 2;
        ctx.fillStyle = '#1f2c33';
        ctx.font = `${(char_radius * font_ratio)|0}px Arial`;
        ctx.textAlign = 'center';
        ctx.textBaseline = 'middle';
        ctx.fillText(`${this._value !== null ? this._value : t('No data')}${this._units}`,
            char_x, char_y, size - char_shadow * 4 - char_weight * 2
        );

        ctx.fillStyle = '#768d99';
        ctx.font = `${(char_radius * font_ratio * .5)|0}px Arial`;
        ctx.textBaseline = 'top';

        ctx.textAlign = 'left';
        ctx.fillText(`${this._min}${this._min !== '' ? this._units : ''}`,
            char_weight * .75, size - char_weight * 1.25, size / 2 - char_weight
        );

        ctx.textAlign = 'right';
        ctx.fillText(`${this._max}${this._max !== '' ? this._units : ''}`,
            size - char_weight * .75, size - char_weight * 1.25, size / 2 - char_weight
        );

        requestAnimationFrame(animate);
    }
    else {
        this._last_value = this._value;
    }
};

requestAnimationFrame(animate);
}
}

```

10. Open *manifest.json* and add:

- file name (*class.widget.js*) to the array in the *assets/js* section;
- class name (*WidgetLessonGaugeChart*) to the *js_class* parameter in the *widget* section.

The *WidgetLessonGaugeChart* class will now be automatically loaded with the dashboard.

ui/modules/lesson_gauge_chart/manifest.json

```

{
  "manifest_version": 2.0,
  "id": "lesson_gauge_chart",
  "type": "widget",
  "name": "Gauge chart",
  "namespace": "LessonGaugeChart",

```

```

    "version": "1.0",
    "author": "Zabbix",
    "actions": {
        "widget.lesson_gauge_chart.view": {
            "class": "WidgetView"
        }
    },
    "widget": {
        "js_class": "WidgetLessonGaugeChart"
    },
    "assets": {
        "js": ["class.widget.js"]
    }
}

```

Add CSS styles to the widget

In this section you will learn how to add custom CSS styles to make the widget look more appealing.

1. For widget styles, create a new directory `css` in the `assets` directory.
2. Create a `widget.css` file in the `assets/css` directory. To style widget elements, use the selector `div.dashboard-widget-{widget id}`. To configure CSS for the whole widget, use the selector `form.dashboard-widget-{widget id}`

ui/modules/lesson_gauge_chart/assets/css/widget.css

```

div.dashboard-widget-lesson_gauge_chart {
    display: grid;
    grid-template-rows: 1fr;
    padding: 0;
}

div.dashboard-widget-lesson_gauge_chart .chart {
    display: grid;
    align-items: center;
    justify-items: center;
}

div.dashboard-widget-lesson_gauge_chart .chart canvas {
    background: white;
}

div.dashboard-widget-lesson_gauge_chart .description {
    padding-bottom: 8px;
    font-size: 1.750em;
    line-height: 1.2;
    text-align: center;
}

.dashboard-grid-widget-hidden-header div.dashboard-widget-lesson_gauge_chart .chart {
    margin-top: 8px;
}

```

3. Open `manifest.json` and add the CSS file name (`widget.css`) to the array in the `assets/css` section. This will allow the CSS styles defined in `widget.css` to load with the dashboard page.

ui/modules/lesson_gauge_chart/manifest.json

```

{
    "manifest_version": 2.0,
    "id": "lesson_gauge_chart",
    "type": "widget",
    "name": "Gauge chart",
    "namespace": "LessonGaugeChart",
    "version": "1.0",
    "author": "Zabbix",
    "actions": {

```

```

    "widget.lesson_gauge_chart.view": {
      "class": "WidgetView"
    },
    "widget": {
      "js_class": "WidgetLessonGaugeChart"
    },
    "assets": {
      "css": ["widget.css"],
      "js": ["class.widget.js"]
    }
  }
}

```

4. Refresh the dashboard page to see the finished version of the widget.

Examples

This section provides files of sample modules and widgets, which you can use as a base for your custom modules.

To use a module:

1. Download the ZIP archive.
2. Unpack the content into a separate directory inside the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
3. Register the module in Zabbix frontend.

Module example

- When creating a host group, grant read permissions to configured user groups - [hg_auto_perm.zip](#)

Widget examples

- Minimal widget - [widget_min.zip](#)
- "Hello, world" widget using CSS only - [hello_world_css.zip](#)
- "Hello, world" widget using JavaScript only - [hello_world_js.zip](#)
- "Hello, world" widget using PHP - [hello_world_php.zip](#)

Note:

You can also use [Zabbix native widgets](#) as examples.

Plugins

Overview Custom loadable plugins extend Zabbix agent 2 functionality. They are compiled separately, but use a package shared with Zabbix agent 2.

Each plugin is a *Go* package that defines the structure and implements one or several plugin interfaces (*Exporter*, *Configurator*, *Runner*).

Jump to:

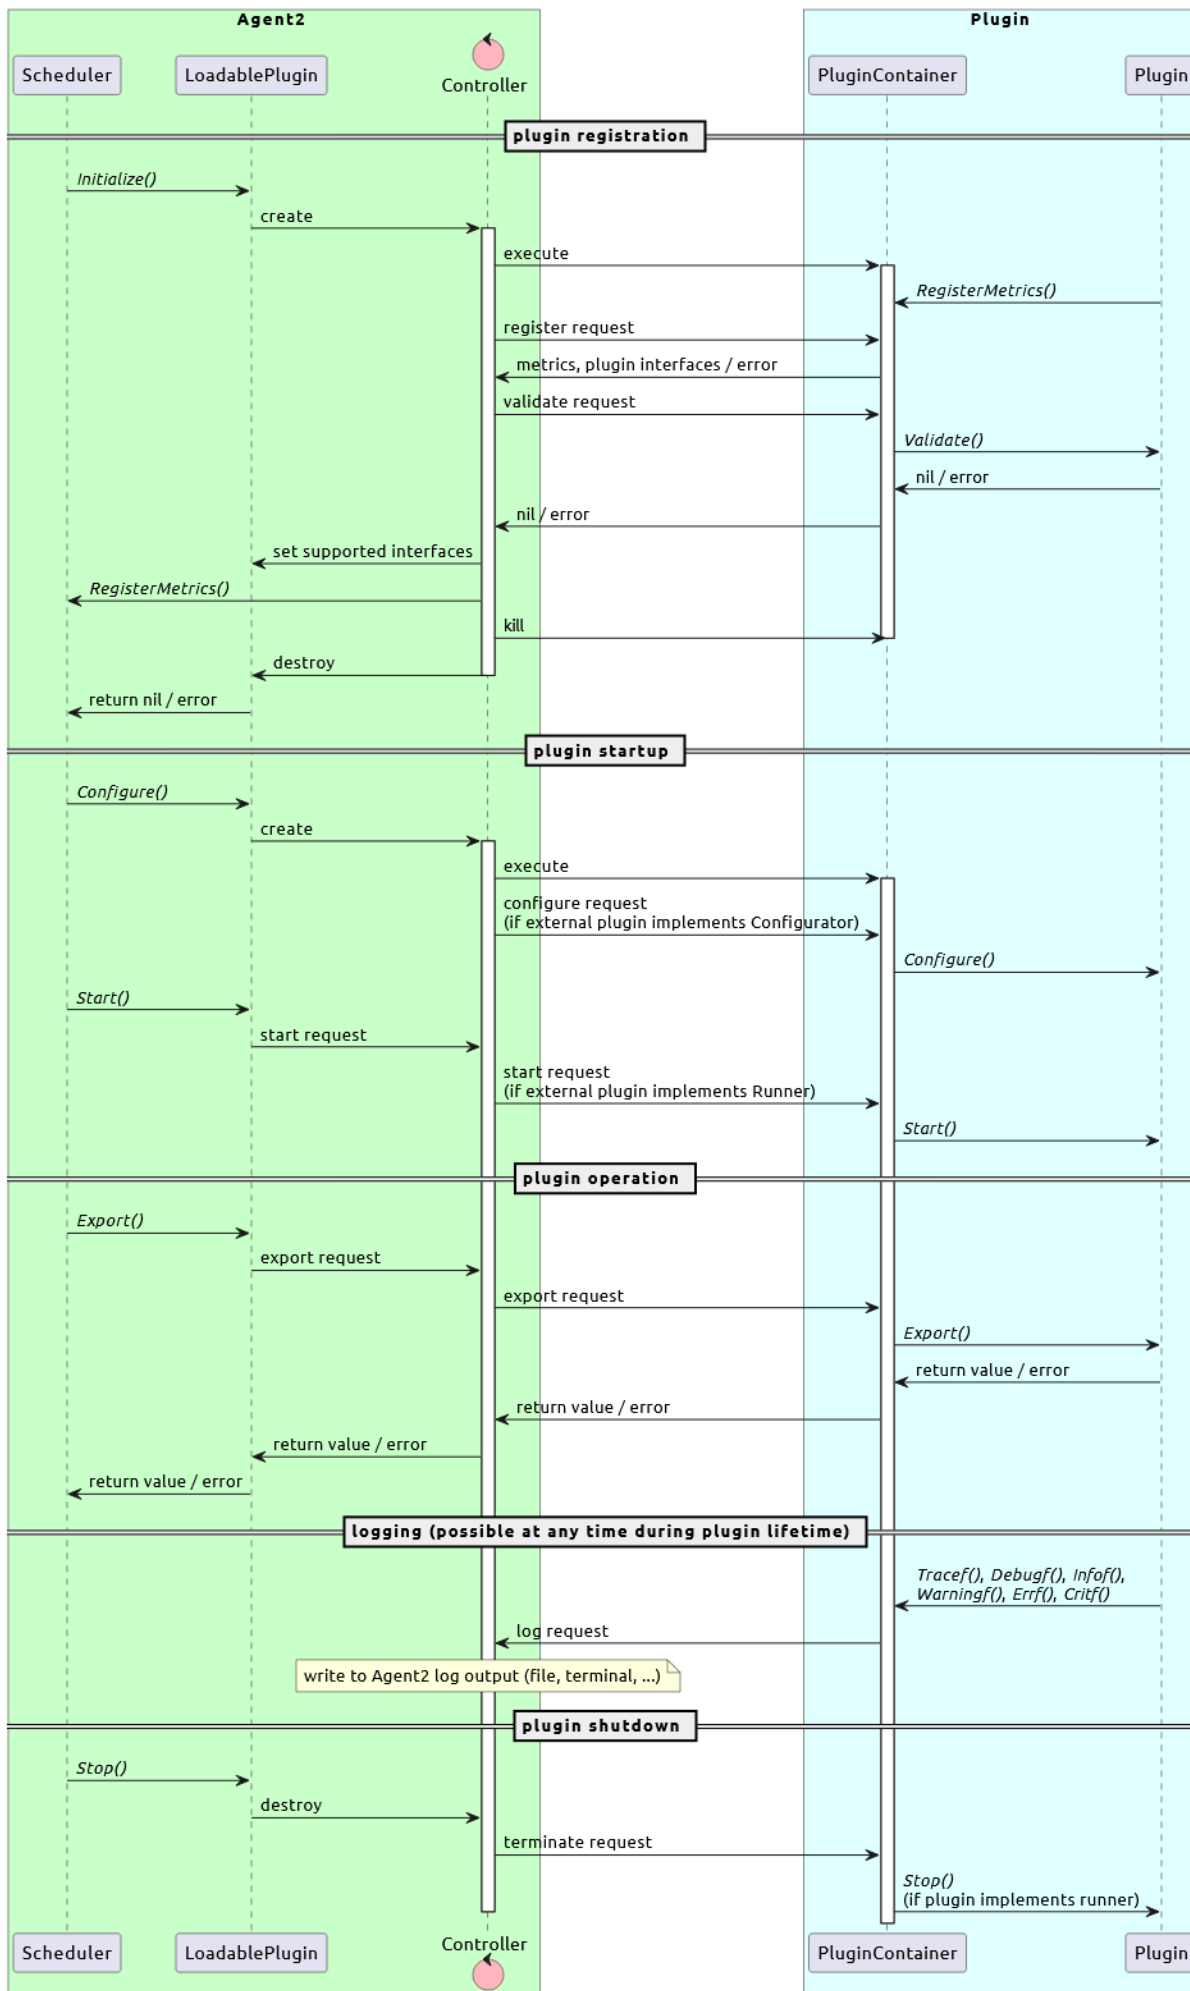

- [Write your first plugin](#)
- [Plugin interfaces](#)

See also:

- [Example plugin for Zabbix agent 2](#)

Connection diagram Zabbix agent 2 connects bidirectionally to the plugins using UNIX sockets on Linux and Named Pipes on Windows.

The connection diagram below illustrates the communication process between Zabbix agent 2 and a loadable plugin and the metrics collection process.

Examples

You can use several empty examples as well as existing loadable plugins supplied by Zabbix as a reference:

- [Example plugin for Zabbix agent 2](#)
- [MSSQL plugin](#)
- [MongoDB plugin](#)
- [PostgreSQL plugin](#)

Create a plugin (tutorial)

This is a step-by-step tutorial on how to create a simple loadable plugin for Zabbix agent 2.

You can also use the [example repository](#) as a template or guide for creating your own plugins.

What you'll create This tutorial demonstrates how to create a new loadable plugin **MyIP**. The plugin will implement a single item key, **myip**, which returns the external IP address of the host where Zabbix agent 2 is running.

Step 1: Setup

1. A plugin is a standard Go module. Start by initializing the `go.mod` file in the plugin directory to track plugin dependencies:

```
cd path/to/plugins/myip # Switch to your plugin directory
go mod init myip
```

2. Install the mandatory dependency Zabbix Go SDK (`golang.zabbix.com/sdk`):

```
go get golang.zabbix.com/sdk@$LATEST_COMMIT_HASH
```

Replace `$LATEST_COMMIT_HASH` with the latest HEAD commit hash from the `golang.zabbix.com/sdk` [repository](#) in the appropriate release branch. For example:

```
go get golang.zabbix.com/sdk@af85407
```

Note that `golang.zabbix.com/sdk` versioning is currently not supported, but this may change in the future.

Additional dependencies can be installed as needed using `go get`.

3. Create an empty `main.go` file for the plugin source code:

```
touch main.go
```

Now the initial setup is complete, and the plugin is ready for development.

Step 2: Plugin structure The `golang.zabbix.com/sdk` module, installed in the previous step, provides the necessary framework for plugin development and ensures all plugins have a consistent structure.

1. Set up basic execution flow.

Start by defining the main execution flow of the plugin. Add the following code to `main.go`:

```
package main

func main() {
    err := run()
    if err != nil {
        panic(err)
    }
}

func run() error {
    return nil
}
```

This establishes the basic execution flow for the plugin. The `run` function will later contain the core logic of the plugin.

2. Explore the plugin interfaces.

A Zabbix agent 2 plugin shall be represented by a struct that implements interfaces from the `golang.zabbix.com/sdk/plugin` package:

- *Accessor* - defines essential methods all plugins must implement, such as setting the plugin name and handling item key timeouts.
- One or more of the following functional plugin interfaces:
- *Exporter* - performs a poll and returns a value (or values), nothing, or an error; often used alongside the *Collector* interface.
- *Collector* - manages the periodic collection of data.
- *Runner* - defines plugin startup and shutdown procedures.
- *Watcher* - allows to implement independent metric polling, bypassing the agent's internal scheduler; useful for trap-based or event-driven monitoring.
- *Configurator* - defines how the plugin reads and applies its configuration settings.

You can either implement these interfaces yourself or use the default ones provided by the Zabbix Go SDK, modifying them as needed. This tutorial uses the default implementations.

3. Create the plugin struct.

Now, import the *plugin* package and create a `myIP` struct that embeds the `plugin.Base` struct:

```
import "golang.zabbix.com/sdk/plugin"

type myIP struct {
    plugin.Base
}
```

The `myIP` struct currently satisfies the *Accessor* interface. A method for implementing one of the functional plugin interfaces, the *Exporter*, will be added later in the tutorial.

Step 3: Define item keys Your plugin needs the item keys to collect data and provide it to Zabbix server or proxy.

1. Import *errs* package for error handling:

```
import "golang.zabbix.com/sdk/errs"
```

2. Register item keys using the `plugin.RegisterMetrics()` function within the `run()` function:

```
func run() error {
    p := &myIP{}

    // Register the `myip` item key.
    err := plugin.RegisterMetrics(
        p,
        "MyIP",                // Plugin name
        "myip",                // Item key name
        "Returns the host's IP address.", // Item key description
    )
    if err != nil {
        return errs.Wrap(err, "failed to register metrics")
    }

    return nil
}
```

To register several item keys, repeat the parameters *metric name* and *description* for each metric. For example:

```
plugin.RegisterMetrics(&impl, "Myip", "metric.one", "Metric one description.", "metric.two", "Metric two d
```

Step 4: Set up the handler The handler facilitates communication between the agent and the plugin.

1. Import the *container* package:

```
import "golang.zabbix.com/sdk/plugin/container"
```

2. Inside the `run()` function add code to create and set up a handler:

```
func run() error {
    p := &myIP{}
```

```

// Register the `myip` item key.
err := plugin.RegisterMetrics(
p,
"MyIP",           // Plugin name
"myip",          // Item key name
>Returns the host's IP address.", // Item key description
)
if err != nil {
return errs.Wrap(err, "failed to register metrics")
}

// Create a new handler.
h, err := container.NewHandler("MyIP") // Plugin name
if err != nil {
return errs.Wrap(err, "failed to create new handler")
}

// Setup logging to forward logs from the plugin to the agent.
// Available via p.Logger.Infof, p.Logger.Debugf, etc.
p.Logger = h

// Start plugin execution.
// Blocks until a termination request is received from the agent.
err = h.Execute()
if err != nil {
return errs.Wrap(err, "failed to execute plugin handler")
}

return nil
}

```

Step 5: Implement data collection Data collection is done via the Exporter interface, which describes the Export method:

```

func Export(
    key string,           // The item key to collect.
    params []string,      // Arguments passed to the item key (`myip[arg1, arg2]`).
    context ContextProvider // Metadata about the item key data collection.
) (any, error)

```

1. Import the required packages for HTTP requests and response reading:

```

import (
    "io"
    "net/http"
)

```

2. Implement the Export method for the myIP struct:

```

func (p *myIP) Export(
key string, params []string, context plugin.ContextProvider,
) (any, error) {
// The plugin can use different data collection logic based on the `key` parameter.
// This implementation only verifies that the provided `key` is supported.
if key != "myip" {
return nil, errs.Errorf("unknown item key %q", key)
}

// The log will get forwarded to the agent 2 log.
p.Infof(
    "received request to handle %q key with %d parameters",
    key,
    len(params),
)

```

```
// Collect the data and return it.

resp, err := http.Get("https://api.ipify.org")
if err != nil {
return nil, errs.Wrap(err, "failed to get IP address")
}

defer resp.Body.Close()

body, err := io.ReadAll(resp.Body)
if err != nil {
return nil, errs.Wrap(err, "failed to read response body")
}

return string(body), nil
}
```

Step 6: Build and configure the plugin

1. To build the plugin, run:

```
go mod tidy
go build
```

This should create an executable `myip` in the current directory.

2. Configure Zabbix agent 2 to use the plugin:

```
echo "Plugins.MyIP.System.Path=$PATH_TO_THE_MYIP_PLUGIN_EXECUTABLE" > /etc/zabbix_agent2.d/plugins.d/myip.
```

Replace `$PATH_TO_THE_MYIP_PLUGIN_EXECUTABLE` with the path to the `myip` created in step 5.

The plugin name in the configuration parameter name (*MyIP* in this tutorial) must match the plugin name defined in the `plugin.RegisterMetrics()` function.

3. To test the plugin and its `myip` item, run:

```
zabbix_agent2 -c /etc/zabbix_agent2.conf -t myip
```

The output should contain an external IP address of your host and look similar to this:

```
myip                               [s|192.0.2.0]
```

With that, you have created a simple loadable plugin for Zabbix agent 2. Congrats!

```
package main

import (
    "io"
    "net/http"

    "golang.zabbix.com/sdk/errs"
    "golang.zabbix.com/sdk/plugin"
    "golang.zabbix.com/sdk/plugin/container"
)

var _ plugin.Exporter = (*myIP)(nil)

type myIP struct {
    plugin.Base
}

func main() {
    err := run()
    if err != nil {
        panic(err)
    }
}
```

```

}
}

func run() error {
p := &myIP{ }

// Register the `myip` item key.
err := plugin.RegisterMetrics(
p,
"MyIP",           // Plugin name
"myip",           // Item key name
>Returns the host's IP address.", // Item key description
)
if err != nil {
return errs.Wrap(err, "failed to register metrics")
}

// Create a new handler.
h, err := container.NewHandler("MyIP") // Plugin name
if err != nil {
return errs.Wrap(err, "failed to create new handler")
}

// Setup logging to forward logs from the plugin to the agent.
// Available via p.Logger.Infof, p.Logger.Debugf, etc.
p.Logger = h

// Start plugin execution.
// Blocks until a termination request from the agent is received.
err = h.Execute()
if err != nil {
return errs.Wrap(err, "failed to execute plugin handler")
}

return nil
}

func (p *myIP) Export(
key string, params []string, context plugin.ContextProvider,
) (any, error) {
// The plugin can use different data collection logic based on the `key` parameter.
// This implementation only verifies that the provided `key` is supported.
if key != "myip" {
return nil, errs.Errorf("unknown item key %q", key)
}

// The log will get forwarded to the agent 2 log.
p.Infof(
"received request to handle %q key with %d parameters",
key,
len(params),
)

// Collect the data and return it.

resp, err := http.Get("https://api.ipify.org")
if err != nil {
return nil, errs.Wrap(err, "failed to get IP address")
}

defer resp.Body.Close()

```

```
body, err := io.ReadAll(resp.Body)
if err != nil {
return nil, errs.Wrap(err, "failed to read response body")
}

return string(body), nil
}
```

Complete source code

Plugin interfaces

This section describes available plugin interfaces.

plugin.Exporter *Exporter* is the simplest interface that performs a poll and returns a value (values), nothing, or error. It accepts a prepared item key, parameters, and context. Access to all other plugin interfaces is exclusive and no method can be called if a plugin is already performing a task. Also, there is a limit of 100 maximum concurrent *Export()* calls per plugin, which can be reduced according to the requirements for each plugin.

plugin.Configurator *Configurator* interface provides plugin configuration parameters from Zabbix agent 2 configuration files.

plugin.Runner *Runner* interface provides the means for performing initialization when a plugin is started (activated) and deinitialization when a plugin is stopped (deactivated). For example, a plugin can start/stop some background *goroutine* by implementing the Runner interface.

NAME

zabbix_agent2 - Zabbix agent 2

SYNOPSIS

```
zabbix_agent2 [-c config-file]  
zabbix_agent2 [-c config-file] [-v] -p  
zabbix_agent2 [-c config-file] [-v] -t item-key  
zabbix_agent2 [-c config-file] -R runtime-option  
zabbix_agent2 [-c config-file] -T  
zabbix_agent2 -h  
zabbix_agent2 -V
```

DESCRIPTION

zabbix_agent2 is an application for monitoring parameters of various services.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options: **userparameter_reload**

Reload user parameters from the configuration file

log_level_increase

Increase log level

log_level_decrease

Decrease log level

help

List available runtime control options

metrics

List available metrics

version

Display version

-p, --print

Print known items and exit. For each item either generic defaults are used, or specific defaults for testing are supplied. These defaults are listed in square brackets as item key parameters. Returned values are enclosed in square brackets and prefixed with the type of the returned value, separated by a pipe character. For user parameters type is always **t**, as the agent can not determine all possible return values. Items, displayed as working, are not guaranteed to work from the Zabbix server or `zabbix_get` when querying a running agent daemon as permissions or environment may be different. Returned value types are:

d

Number with a decimal part.

m

Not supported. This could be caused by querying an item that only works in the active mode like a log monitoring item or an item that requires multiple collected values. Permission issues or incorrect user parameters could also result in the not supported state.

s

Text. Maximum length not limited.

t

Text. Same as **s**.

u

Unsigned integer.

-t, --test *item-key*

Test single item and exit. See **--print** for output description.

-v, --verbose

Enable verbose output when test item or print known items.

-T, --test-config

Validate configuration file and exit.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_agent2.conf

Default location of Zabbix agent 2 configuration file (if not modified during compile time).

NAME

zabbix_agentd - Zabbix agent daemon

SYNOPSIS

```
zabbix_agentd [-c config-file]  
zabbix_agentd [-c config-file] -p  
zabbix_agentd [-c config-file] -t item-key  
zabbix_agentd [-c config-file] -R runtime-option  
zabbix_agentd [-c config-file] -T  
zabbix_agentd -h  
zabbix_agentd -V
```

DESCRIPTION

zabbix_agentd is a daemon for monitoring various server parameters.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one.

-f, --foreground

Run Zabbix agent in foreground.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options **userparameter_reload**

Reload user parameters from the configuration file

log_level_increase[=*target*]

Increase log level, affects all processes if target is not specified

log_level_decrease[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

process-type

All processes of specified type (active checks, collector, listener)

process-type,N

Process type and number (e.g., listener,3)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

-p, --print

Print known items and exit. For each item either generic defaults are used, or specific defaults for testing are supplied. These defaults are listed in square brackets as item key parameters. Returned values are enclosed in square brackets and prefixed with the type of the returned value, separated by a pipe character. For user parameters type is always **t**, as the agent can not determine all possible return values. Items, displayed as working, are not guaranteed to work from the Zabbix server or `zabbix_get` when querying a running agent daemon as permissions or environment may be different. Returned value types are:

d

Number with a decimal part.

m

Not supported. This could be caused by querying an item that only works in the active mode like a log monitoring item or an item that requires multiple collected values. Permission issues or incorrect user parameters could also result in the not supported state.

s

Text. Maximum length not limited.

t

Text. Same as **s**.

u

Unsigned integer.

-t, --test *item-key*

Test single item and exit. See **--print** for output description.

-T, --test-config

Validate configuration file and exit.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_agentd.conf

Default location of Zabbix agent configuration file (if not modified during compile time).

NAME

zabbix_get - Zabbix get utility

SYNOPSIS

zabbix_get -s *host-name-or-IP* [-p *port-number*] [-I *IP-address*] [-t *timeout*] -k *item-key*

zabbix_get -s *host-name-or-IP* [-p *port-number*] [-I *IP-address*] [-t *timeout*] --tls-connect *cert* --tls-ca-file *CA-file* [--tls-crl-file *CRL-file*] [--tls-agent-cert-issuer *cert-issuer*] [--tls-agent-cert-subject *cert-subject*] --tls-cert-file *cert-file* --tls-key-file *key-file* [--tls-cipher13 *cipher-string*] [--tls-cipher *cipher-string*] -k *item-key*

zabbix_get -s *host-name-or-IP* [-p *port-number*] [-I *IP-address*] [-t *timeout*] --tls-connect *psk* --tls-psk-identity *PSK-identity*

--tls-psk-file *PSK-file* [**--tls-cipher13** *cipher-string*] [**--tls-cipher** *cipher-string*] **-k** *item-key*
zabbix_get -h
zabbix_get -V

DESCRIPTION

zabbix_get is a command line utility for getting data from Zabbix agent.

OPTIONS

-s, --host *host-name-or-IP*

Specify host name or IP address of a host.

-p, --port *port-number*

Specify port number of agent running on the host. Default is 10050.

-I, --source-address *IP-address*

Specify source IP address.

-t, --timeout *seconds*

Specify timeout. Valid range: 1-30 seconds (default: 30)

-k, --key *item-key*

Specify key of item to retrieve value for.

-P, --protocol *value*

Protocol used to communicate with agent. Values:

auto connect using JSON protocol, fallback and retry with plaintext protocol (default)

json connect using JSON protocol

plaintext connect using plaintext protocol where just item key is sent (6.4.x and older releases)

--tls-connect *value*

How to connect to agent. Values:

unencrypted

connect without encryption (default)

psk

connect using TLS and a pre-shared key

cert

connect using TLS and a certificate

--tls-ca-file *CA-file*

Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

--tls-crl-file *CRL-file*

Full pathname of a file containing revoked certificates.

--tls-agent-cert-issuer *cert-issuer*

Allowed agent certificate issuer.

--tls-agent-cert-subject *cert-subject*

Allowed agent certificate subject.

--tls-cert-file *cert-file*

Full pathname of a file containing the certificate or certificate chain.

--tls-key-file *key-file*

Full pathname of a file containing the private key.

--tls-psk-identity *PSK-identity*

PSK-identity string.

--tls-psk-file *PSK-file*

Full pathname of a file containing the pre-shared key.

--tls-cipher13 *cipher-string*

Cipher string for OpenSSL 1.1.1 or newer for TLS 1.3. Override the default ciphersuite selection criteria. This option is not available if OpenSSL version is less than 1.1.1.

--tls-cipher *cipher-string*

GnuTLS priority string (for TLS 1.2 and up) or OpenSSL cipher string (only for TLS 1.2). Override the default ciphersuite selection criteria.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

EXAMPLES

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]"
```

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]" --tls-connect cert --tls-ca-file /home/zabbix/zabbix_ca_file  
--tls-agent-cert-issuer "CN=Signing CA,OU=IT operations,O=Example Corp,DC=example,DC=com" --tls-agent-cert-  
subject "CN=server1,OU=IT operations,O=Example Corp,DC=example,DC=com" --tls-cert-file /home/zabbix/zabbix_get.crt  
--tls-key-file /home/zabbix/zabbix_get.key
```

```
zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]" --tls-connect psk --tls-psk-identity "PSK ID Zabbix  
agentd" --tls-psk-file /home/zabbix/zabbix_agentd.psk
```

NAME

zabbix_js - Zabbix JS utility

SYNOPSIS

```
zabbix_js -s script-file -p input-param [-l log-level] [-t timeout]  
zabbix_js -s script-file -i input-file [-l log-level] [-t timeout]  
zabbix_js -h  
zabbix_js -V
```

DESCRIPTION

zabbix_js is a command line utility that can be used for embedded script testing.

OPTIONS

-s, --script *script-file*

Specify the file name of the script to execute. If '-' is specified as file name, the script will be read from stdin.

-p, --param *input-param*

Specify the input parameter.

-i, --input *input-file*

Specify the file name of the input parameter. If '-' is specified as file name, the input will be read from stdin.

-w, --webdriver *url*

Specify the webdriver URL.

-l, --loglevel *log-level*

Specify the log level.

-t, --timeout *timeout*

Specify the timeout in seconds. Valid range: 1-60 seconds (default: 10)

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

EXAMPLES

```
zabbix_js -s script-file.js -p example
```

NAME

zabbix_proxy - Zabbix proxy daemon

SYNOPSIS

zabbix_proxy [-c *config-file*]
zabbix_proxy [-c *config-file*] -R *runtime-option*
zabbix_proxy [-c *config-file*] -T
zabbix_proxy -h
zabbix_proxy -V

DESCRIPTION

zabbix_proxy is a daemon that collects monitoring data from devices and sends it to Zabbix server.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one.

-f, --foreground

Run Zabbix proxy in foreground.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

Runtime control options

config_cache_reload

Reload configuration cache. Ignored if cache is being currently loaded. Active Zabbix proxy will connect to the Zabbix server and request configuration data. Default configuration file (unless **-c** option is specified) will be used to find PID file and signal will be sent to process, listed in PID file.

snmp_cache_reload

Reload SNMP cache.

housekeeper_execute

Execute the housekeeper. Ignored if housekeeper is being currently executed.

diaginfo[=*section*]

Log internal diagnostic information of the specified section. Section can be *historycache*, *preprocessing*, *locks*. By default diagnostic information of all sections is logged.

log_level_increase[=*target*]

Increase log level, affects all processes if target is not specified.

log_level_decrease[=*target*]

Decrease log level, affects all processes if target is not specified.

Log level control targets

process-type

All processes of specified type (availability manager, browser poller, configuration syncer, data sender, discovery manager, history syncer, housekeeper, http poller, icmp pinger, ipmi manager, ipmi poller, java poller, odbc poller, poller, agent poller, http agent poller, snmp poller, preprocessing manager, self-monitoring, snmp trapper, task manager, trapper, unreachable poller, vmware collector)

process-type,N

Process type and number (e.g., poller,3)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

Profiling control targets

process-type

All processes of specified type (configuration syncer, data sender, discovery manager, history syncer, housekeeper, http poller, preprocessing manager, icmp pinger, ipmi manager, ipmi poller, java poller, poller, agent poller, http agent poller, snmp poller, self-monitoring, snmp trapper, task manager, trapper, unreachable poller, vmware collector, history poller, availability manager, odbc poller)

process-type,N

Process type and number (e.g., history syncer,1)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

scope

Profiling scope (rwlock, mutex, processing) can be used with process type (e.g., history syncer,1,processing)

-T, --test-config

Validate configuration file and exit.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_proxy.conf

Default location of Zabbix proxy configuration file (if not modified during compile time).

zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-t timeout] [-s host] --tls-connect psk --tls-psk-identity PSK-identity --tls-psk-file PSK-file [--tls-cipher13 cipher-string] [--tls-cipher cipher-string] -k key -o value
zabbix_sender [-v] -c config-file [-z server] [-p port] [-I IP-address] [-t timeout] [-s host] --tls-connect psk --tls-psk-identity PSK-identity --tls-psk-file PSK-file [--tls-cipher13 cipher-string] [--tls-cipher cipher-string] [-T] [-N] [-r] [-g] -i input-file
zabbix_sender -h
zabbix_sender -V
```

DESCRIPTION

zabbix_sender is a command line utility for sending monitoring data to Zabbix server or proxy. On the Zabbix server an item of type **Zabbix trapper** should be created with corresponding key. Note that incoming values will only be accepted from hosts specified in **Allowed hosts** field for this item.

OPTIONS

-c, --config *config-file*

Use *config-file*. **Zabbix sender** reads server details from the agentd configuration file. By default **Zabbix sender** does not read any configuration file. Only parameters **Hostname**, **ListenBacklog**, **ServerActive**, **SourceIP**, **TLSCConnect**, **TLSCAFile**, **TLSCRLFile**, **TLSServerCertIssuer**, **TLSServerCertSubject**, **TLSCertFile**, **TLSKeyFile**, **TLSPSKIdentity** and **TLSPSKFile** are supported. Hostname defined through **Hostnameltem** parameter will not be picked up, in this case the hostname should be specified via command line (see **-s** option). All addresses defined in the agent **ServerActive** configuration parameter are used for sending data. If sending of batch data fails to one address, the following batches are not sent to this address.

-z, --zabbix-server *server*

Hostname or IP address of Zabbix server. If a host is monitored by a proxy, proxy hostname or IP address should be used instead. When used together with **--config**, overrides the entries of **ServerActive** parameter specified in agentd configuration file.

-p, --port *port*

Specify port number of Zabbix server trapper running on the server. Default is 10051. When used together with **--config**, overrides the port entries of **ServerActive** parameter specified in agentd configuration file.

-I, --source-address *IP-address*

Specify source IP address. When used together with **--config**, overrides **SourceIP** parameter specified in agentd configuration file.

-t, --timeout *seconds*

Specify timeout. Valid range: 1-300 seconds (default: 60)

-s, --host *host*

Specify host name the item belongs to (as registered in Zabbix frontend). Host IP address and DNS name will not work. When used together with **--config**, overrides **Hostname** parameter specified in agentd configuration file.

-k, --key *key*

Specify item key to send value to.

-o, --value *value*

Specify item value.

-i, --input-file *input-file*

Load values from input file. Specify - as **<input-file>** to read values from standard input. Each line of file contains whitespace delimited: **<hostname> <key> <value>**. Each value must be specified on its own line. Each line must contain 3 whitespace delimited entries: **<hostname> <key> <value>**, where "hostname" is the name of monitored host as registered in Zabbix frontend, "key" is target item key and "value" - the value to send. Specify - as **<hostname>** to use hostname from agent configuration file or from **--host** argument.

An example of a line of an input file:

"Linux DB3" db.connections 43

The value type must be correctly set in item configuration of Zabbix frontend. Zabbix sender will send up to 250 values in one connection. **Size limit** for sending values from an input file depends on the size described in Zabbix communication protocol. Contents of the input file must be in the UTF-8 encoding. All values from the input file are sent in a sequential order top-down. Entries must be formatted using the following rules:

- Quoted and non-quoted entries are supported.
- Double-quote is the quoting character.
- Entries with whitespace must be quoted.
- Double-quote and backslash characters inside quoted entry must be escaped with a backslash.
- Escaping is not supported in non-quoted entries.
- Linefeed escape sequences (\n) are supported in quoted strings.
- Linefeed escape sequences are trimmed from the end of an entry.

-T, --with-timestamps

This option can be only used with **--input-file** option.

Each line of the input file must contain 4 whitespace delimited entries: **<hostname> <key> <timestamp> <value>**. Timestamp should be specified in Unix timestamp format. If target item has triggers referencing it, all timestamps must be in an increasing order, otherwise event calculation will not be correct.

An example of a line of the input file:

"Linux DB3" db.connections 1429533600 43

For more details please see option **--input-file**.

If a timestamped value is sent for a host that is in a "no data" maintenance type then this value will be dropped; however, it is possible to send a timestamped value in for an expired maintenance period and it will be accepted.

-N, --with-ns

This option can be only used with **--with-timestamps** option.

Each line of the input file must contain 5 whitespace delimited entries: **<hostname> <key> <timestamp> <ns> <value>**.

An example of a line of the input file:

"Linux DB3" db.connections 1429533600 7402561 43

For more details please see option **--input-file**.

-r, --real-time

Send values one by one as soon as they are received. This can be used when reading from standard input.

-g, --group

Group values by hosts and send to each host in a separate batch.

--tls-connect *value*

How to connect to server or proxy. Values:

unencrypted

connect without encryption (default)

psk

connect using TLS and a pre-shared key

cert

connect using TLS and a certificate

--tls-ca-file *CA-file*

Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

--tls-crl-file *CRL-file*

Full pathname of a file containing revoked certificates.

--tls-server-cert-issuer *cert-issuer*

Allowed server certificate issuer.

--tls-server-cert-subject *cert-subject*

Allowed server certificate subject.

--tls-cert-file *cert-file*

Full pathname of a file containing the certificate or certificate chain.

--tls-key-file *key-file*

Full pathname of a file containing the private key.

--tls-psk-identity *PSK-identity*

PSK-identity string.

--tls-psk-file *PSK-file*

Full pathname of a file containing the pre-shared key.

--tls-cipher13 *cipher-string*

Cipher string for OpenSSL 1.1.1 or newer for TLS 1.3. Override the default ciphersuite selection criteria. This option is not available if OpenSSL version is less than 1.1.1.

--tls-cipher *cipher-string*

GnuTLS priority string (for TLS 1.2 and up) or OpenSSL cipher string (only for TLS 1.2). Override the default ciphersuite selection criteria.

-v, --verbose

Verbose mode, **-vv** for more details.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

EXIT STATUS

The exit status is 0 if the values were sent and all of them were successfully processed by server. If data was sent, but processing of at least one of the values failed, the exit status is 2. If data sending failed, the exit status is 1.

EXAMPLES

zabbix_sender -c /etc/zabbix/zabbix_agentd.conf -k mysql.queries -o 342.45

Send **342.45** as the value for **mysql.queries** item of monitored host. Use monitored host and Zabbix server defined in agent configuration file.

```
zabbix_sender -c /etc/zabbix/zabbix_agentd.conf -s "Monitored Host" -k mysql.queries -o 342.45
```

Send **342.45** as the value for **mysql.queries** item of **Monitored Host** host using Zabbix server defined in agent configuration file.

```
zabbix_sender -z 192.168.1.113 -i data_values.txt
```

Send values from file **data_values.txt** to Zabbix server with IP **192.168.1.113**. Host names and keys are defined in the file.

```
echo "- hw.serial.number 1287872261 SQ4321ASDF" | zabbix_sender -c /usr/local/etc/zabbix_agentd.conf -T -i -
```

Send a timestamped value from the commandline to Zabbix server, specified in the agent configuration file. Dash in the input data indicates that hostname also should be used from the same configuration file.

```
echo ""Zabbix server" trapper.item "" | zabbix_sender -z 192.168.1.113 -p 10000 -i -
```

Send empty value of an item to the Zabbix server with IP address **192.168.1.113** on port **10000** from the commandline. Empty values must be indicated by empty double quotes.

```
zabbix_sender -z 192.168.1.113 -s "Monitored Host" -k mysql.queries -o 342.45 --tls-connect cert --tls-ca-file /home/zabbix/zabbix_ca_file --tls-cert-file /home/zabbix/zabbix_agentd.crt --tls-key-file /home/zabbix/zabbix_agentd.key
```

Send **342.45** as the value for **mysql.queries** item in **Monitored Host** host to server with IP **192.168.1.113** using TLS with certificate.

```
zabbix_sender -z 192.168.1.113 -s "Monitored Host" -k mysql.queries -o 342.45 --tls-connect psk --tls-psk-identity "PSK ID Zabbix agentd" --tls-psk-file /home/zabbix/zabbix_agentd.psk
```

Send **342.45** as the value for **mysql.queries** item in **Monitored Host** host to server with IP **192.168.1.113** using TLS with pre-shared key (PSK).

NAME

zabbix_server - Zabbix server daemon

SYNOPSIS

```
zabbix_server [-c config-file]  
zabbix_server [-c config-file] -R runtime-option  
zabbix_server [-c config-file] -T  
zabbix_server -h  
zabbix_server -V
```

DESCRIPTION

zabbix_server is the core daemon of Zabbix software.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one.

-f, --foreground

Run Zabbix server in foreground.

-R, --runtime-control *runtime-option*

Perform administrative functions according to *runtime-option*.

-T, --test-config

Validate configuration file and exit.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

Examples of running Zabbix server with command line parameters:

```
zabbix_server -c /usr/local/etc/zabbix_server.conf  
zabbix_server --help  
zabbix_server -V
```

RUNTIME CONTROL

Runtime control options:

config_cache_reload

Reload configuration cache. Ignored if cache is being currently loaded. Default configuration file (unless **-c** option is specified) will be used to find PID file and signal will be sent to process, listed in PID file.

snmp_cache_reload

Reload SNMP cache, clear the SNMP properties (engine time, engine boots, engine id, credentials) for all hosts.

housekeeper_execute

Execute the housekeeper. Ignored if housekeeper is being currently executed.

trigger_housekeeper_execute

Execute the trigger housekeeper (remove problems for deleted triggers). Ignored if trigger housekeeper for services is being currently executed.

diaginfo[=*section*]

Log internal diagnostic information of the specified section. Section can be *historycache*, *preprocessing*, *alerting*, *lld*, *valuecache*, *locks*. By default diagnostic information of all sections is logged.

ha_status

Log high availability (HA) cluster status.

ha_remove_node[=*target*]

Remove the high availability (HA) node specified by its name or ID. Note that active/standby nodes cannot be removed.

ha_set_failover_delay[=*delay*]

Set high availability (HA) failover delay. Time suffixes are supported, e.g. 10s, 1m.

proxy_config_cache_reload[=*target*] Reload proxy configuration cache.**secrets_reload**

Reload secrets from Vault.

service_cache_reload

Reload the service manager cache.

prof_enable[=*target*]

Enable profiling. Affects all processes if target is not specified. Enabled profiling provides details of all rwlocks/mutexes by function name.

prof_disable[=*target*]

Disable profiling. Affects all processes if target is not specified.

log_level_increase[=*target*]

Increase log level, affects all processes if target is not specified

log_level_decrease[=*target*]

Decrease log level, affects all processes if target is not specified

Log level control targets

process-type

All processes of specified type (alerter, alert manager, availability manager, browser poller, configuration syncer, configuration syncer worker, connector manager, connector worker, discovery manager, escalator, ha manager, history poller, history syncer, housekeeper, http poller, icmp pinger, internal poller, ipmi manager, ipmi poller, java poller, odbc poller, poller, agent poller, http agent poller, snmp poller, preprocessing manager, proxy group manager, proxy poller, self-monitoring, service manager, snmp trapper, task manager, timer, trapper, unreachable poller, vmware collector)

process-type,N

Process type and number (e.g., poller,3)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

Profiling control targets

process-type

All processes of specified type (alerter, alert manager, availability manager, browser poller, configuration syncer, configuration syncer worker, connector manager, connector worker, discovery manager, escalator, ha manager, history poller, history syncer, housekeeper, http poller, icmp pinger, internal poller, ipmi manager, ipmi poller, java poller, odbc poller, poller, agent poller, http agent poller, snmp poller, preprocessing manager, proxy group manager, proxy poller, self-monitoring, service manager, snmp trapper, task manager, timer, trapper, unreachable poller, vmware collector)

process-type,N

Process type and number (e.g., history syncer,1)

pid

Process identifier, up to 65535. For larger values specify target as "process-type,N"

scope

Profiling scope (rwlock, mutex, processing) can be used with process type (e.g., history syncer,1,processing)

FILES

`/usr/local/etc/zabbix_server.conf`

Default location of Zabbix server configuration file (if not modified during compile time).

NAME

`zabbix_web_service` - Zabbix web service

SYNOPSIS

zabbix_web_service `[-c config-file]`

zabbix_web_service `[-c config-file] -T`

zabbix_web_service `-h`

zabbix_web_service `-V`

DESCRIPTION

zabbix_web_service is an application for providing web services to Zabbix components.

OPTIONS

-c, --config *config-file*

Use the alternate *config-file* instead of the default one.

-T, --test-config

Validate configuration file and exit.

-h, --help

Display this help and exit.

-V, --version

Output version information and exit.

FILES

/usr/local/etc/zabbix_web_service.conf

Default location of Zabbix web service configuration file (if not modified during compile time).
