selectDiscoveryRulePrototype	query	Return a `discoveryRulePrototype` property with the parent LLD rule prototype that the item prototype belongs to.
selectGraphs	query	Return a `graphs` property with graph prototypes that the item prototype is used in. Supports `count`.
selectHosts	query	Return a `hosts` property with an array of hosts that the item prototype belongs to.
selectInheritedTags	query	Return an `inheritedTags` property with tags that are on template/host/linked templates.
selectTags	query	Return the item prototype tags in `tags` property.
selectTriggers	query	Return a `triggers` property with trigger prototypes that the item prototype is used in. Supports `count`.
selectPreprocessing	query	Return a `preprocessing` property with item prototype preprocessing options.
selectValueMap	query	Return a `valuemap` property with item prototype value map.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the item prototype belongs to.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectGraphs` - results will be sorted by `name`; `selectTriggers` - results will be sorted by `description`.
sortfield	string/array	Sort the result by the given properties. Possible values: `itemid`, `name`, `key_`, `delay`, `type`, `status`, `history`, `trends`, `discovered`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	

Parameter	Type	Description
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving item prototypes from an LLD rule

Retrieve all item prototypes for specific LLD rule ID.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.get",
    "params": {
        "output": "extend",
        "discoveryids": "27426"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {

CItemPrototype::get() in *ui/include/classes/api/services/CItemPrototype.php*.

itemprototype.update

Description

`object itemprototype.update(object/array itemPrototypes)`

This method allows you to update existing item prototypes.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Item prototype properties to be updated.

The `itemid` property must be defined for each item prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard item prototype properties, the method accepts the following parameters.

Parameter	Type	Description
preprocessing	array	Item prototype preprocessing options to replace the current preprocessing options. Parameter behavior: - *read-only* for inherited objects
tags	array	Item prototype tags.

Return values

`(object)` Returns an object containing the IDs of the updated item prototypes under the `itemids` property.

Examples

Changing the interface of an item prototype

Change the host interface that will be used by discovered items.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.update",
    "params": {
```

```
        "itemid": "27428",
        "interfaceid": "132"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27428"
        ]
    },
    "id": 1
}
```

Update dependent item prototype

Update Dependent item prototype with new Master item prototype ID. Only dependencies on same host (template/discovery rule) are allowed, therefore Master and Dependent item should have same hostid and ruleid.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.update",
    "params": {
        "master_itemid": "25570",
        "itemid": "189030"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "189030"
        ]
    },
    "id": 1
}
```

Update HTTP agent item prototype

Change query fields and remove all custom headers.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.update",
    "params": {
        "itemid":"28305",
        "query_fields": [
            {
                "name": "random",
                "value": "qwertyuiopasdfghjklzxcvbnm"
            }
        ],
        "headers": []
    }
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "28305"
        ]
    },
    "id": 1
}
```

Updating item preprocessing options

Update an item prototype with item preprocessing rule “Custom multiplier”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.update",
    "params": {
        "itemid": "44211",
        "preprocessing": [
            {
                "type": 1,
                "params": "4",
                "error_handler": 2,
                "error_handler_params": "5"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44211"
        ]
    },
    "id": 1
}
```

Updating a script item prototype

Update a script item prototype with a different script and remove unnecessary parameters that were used by previous script.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.update",
    "params": {
        "itemid": "23865",
        "parameters": [],
        "script": "Zabbix.log(3, 'Log test');\nreturn 1;"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
```

```
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}
```

CItemPrototype::update() in *ui/include/classes/api/services/CItemPrototype.php*.

LLD rule

This class is designed to work with low-level discovery rules.

Object references:

- LLD rule
  - HTTP header
  - HTTP query field
- LLD rule filter
  - LLD rule filter condition
- LLD macro path
- LLD rule preprocessing
- LLD rule overrides
  - LLD rule override filter
    - LLD rule override filter condition
  - LLD rule override operation
    - LLD rule override operation status
    - LLD rule override operation discover
    - LLD rule override operation period
    - LLD rule override operation history
    - LLD rule override operation trends
    - LLD rule override operation severity
    - LLD rule override operation tag
    - LLD rule override operation template
    - LLD rule override operation inventory

Available methods:

- discoveryrule.create - create new LLD rules
- discoveryrule.delete - delete LLD rules
- discoveryrule.get - retrieve LLD rules
- discoveryrule.update - update LLD rules

LLD rule object

The following objects are directly related to the `discoveryrule` API.

LLD rule

The low-level discovery rule object has the following properties.

Property	Type	Description
itemid	ID	ID of the LLD rule. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
delay	string	Update interval of the LLD rule. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {$FLEX_INTERVAL}/{$FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{$Macr Property behavior: - *required* if type is set to ”Zabbix agent” (0), ”Simple check” (3), ”Zabbix internal” (5), ”External check” (10), ”Database monitor” (11), ”IPMI agent” (12), ”SSH agent” (13), ”TELNET agent” (14), ”JMX agent” (16), ”HTTP agent” (19), ”SNMP agent” (20), ”Script” (21), ”Browser” (22), or if type is set to ”Zabbix agent (active)” (7) and key_ does not contain ”mqtt.get”
hostid	ID	ID of the host that the LLD rule belongs to. Property behavior: - *constant* - *required* for create operations
flags	integer	Origin of the discovery rule. Possible values: 1 - a low-level discovery rule; 5 - a low-level discovery rule converted from prototype. Property behavior: - *read-only*
interfaceid	ID	ID of the LLD rule’s host interface. Property behavior: - *required* if LLD rule belongs to host and type is set to ”Zabbix agent”, ”IPMI agent”, ”JMX agent”, or ”SNMP agent” - *supported* if LLD rule belongs to host and type is set to ”Simple check”, ”External check”, ”SSH agent”, ”TELNET agent”, or ”HTTP agent”
key_	string	LLD rule key. Property behavior: - *required* for create operations - *read-only* for inherited objects
name	string	Name of the LLD rule. Property behavior: - *required* for create operations - *read-only* for inherited objects

Property	Type	Description
type	integer	Type of the LLD rule. Possible values: 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 16 - JMX agent; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser; 23 - Nested. This type is allowed only if the rule's parent is a template (assumed to be linked to a host prototype on discovery) or discovered host (which has an LLD rule at its root). Property behavior: - *required* for create operations - *read-only* for inherited objects
url	string	URL string. Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}. Property behavior: - *required* if `type` is set to "HTTP agent" - *read-only* for inherited objects
allow_traps	integer	Allow the value to be populated similarly to the trapper item. Possible values: 0 - *(default)* Do not accept incoming data; 1 - Accept incoming data. Property behavior: - *supported* if `type` is set to "HTTP agent"
authtype	integer	Authentication method. Possible values if `type` is set to "SSH agent": 0 - *(default)* password; 1 - public key. Possible values if `type` is set to "HTTP agent": 0 - *(default)* none; 1 - basic; 2 - NTLM; 3 - Kerberos; 4 - Digest. Property behavior: - *supported* if `type` is set to "SSH agent" or "HTTP agent" - *read-only* for inherited objects (if `type` is set to "HTTP agent")
description	string	Description of the LLD rule.
error	string	Error text if there are problems updating the LLD rule value. Property behavior: - *read-only*

Property	Type	Description
follow_redirects	integer	Follow response redirects while polling data. Possible values: 0 - Do not follow redirects; 1 - *(default)* Follow redirects. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
headers	array	Array of headers that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
http_proxy	string	HTTP(S) proxy connection string. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ipmi_sensor	string	IPMI sensor. Property behavior: - *required* if `type` is set to ”IPMI agent” and `key_` is not set to ”ipmi.get” - *supported* if `type` is set to ”IPMI agent” - *read-only* for inherited objects
jmx_endpoint	string	JMX agent custom connection string. Default: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi Property behavior: - *supported* if `type` is set to ”JMX agent”
lifetime	string	Time period after which items that are no longer discovered will be deleted. Accepts a number of seconds (e.g., 3600), or a value with a time suffix (e.g., `3600s`, `180m`, `24h`, `1d`), or a user macro. Default: `7d`.
lifetime_type	integer	Scenario to delete lost LLD resources. Possible values: 0 - *(default)* Delete after lifetime threshold is reached; 1 - Do not delete; 2 - Delete immediately.
enabled_lifetime	string	Time period after which items that are no longer discovered will be disabled. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`), or a user macro. Default: 0.
enabled_lifetime_type	integer	Scenario to disable lost LLD resources. Possible values: 0 - Disable after lifetime threshold is reached; 1 - Do not disable; 2 - *(default)* Disable immediately.
master_itemid	ID	ID of the master item. Discovery rule cannot be master item for another discovery rule. Property behavior: - *required* if `type` is set to ”Dependent item” - *read-only* for inherited objects

Property	Type	Description
output_format	integer	Should the response be converted to JSON. Possible values: 0 - *(default)* Store raw; 1 - Convert to JSON. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
params	string	Additional parameters depending on the type of the LLD rule: - executed script for SSH and Telnet LLD rules; - SQL query for database monitor LLD rules; - formula for calculated LLD rules; - the script for script and browser LLD rules. Property behavior: - *required* if `type` is set to ”Database monitor”, ”SSH agent”, ”TELNET agent”, ”Script” or ”Browser” - *read-only* for inherited objects (if `type` is set to ”Script” or ”Browser”)
parameters	object/array	Additional parameters if `type` is set to ”Script” or ”Browser”. Array of objects with `name` and `value` properties, where `name` must be unique. Property behavior: - *supported* if `type` is set to ”Script” or ”Browser” - *read-only* for inherited objects
password	string	Password for authentication. Property behavior: - *required* if `type` is set to ”JMX agent” and `username` is set - *supported* if `type` is set to ”Simple check”, ”Database monitor”, ”SSH agent”, ”TELNET agent”, or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”)
post_type	integer	Type of post data body stored in `posts` property. Possible values: 0 - *(default)* Raw data; 2 - JSON data; 3 - XML data. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
posts	string	HTTP(S) request body data. Property behavior: - *required* if `type` is set to ”HTTP agent” and `post_type` is set to ”JSON data” or ”XML data” - *supported* if `type` is set to ”HTTP agent” and `post_type` is set to ”Raw data” - *read-only* for inherited objects
privatekey	string	Name of the private key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key”
publickey	string	Name of the public key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key”

Property	Type	Description
query_fields	array	Array of query fields that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
request_method	integer	Type of request method. Possible values: 0 - *(default)* GET; 1 - POST; 2 - PUT; 3 - HEAD. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
retrieve_mode	integer	What part of response should be stored. Possible values if `request_method` is set to ”GET”, ”POST”, or ”PUT”: 0 - *(default)* Body; 1 - Headers; 2 - Both body and headers will be stored. Possible values if `request_method` is set to ”HEAD”: 1 - Headers. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
snmp_oid	string	SNMP OID. Property behavior: - *required* if `type` is set to ”SNMP agent” - *read-only* for inherited objects
ssl_cert_file	string	Public SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ssl_key_file	string	Private SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ssl_key_password	string	Password for SSL Key file. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
state	integer	State of the LLD rule. Possible values: 0 - *(default)* normal; 1 - not supported. Property behavior: - *read-only*

Property	Type	Description
status	integer	Status of the LLD rule. Possible values: 0 - *(default)* enabled LLD rule; 1 - disabled LLD rule.
status_codes	string	Ranges of required HTTP status codes, separated by commas. Also supports user macros as part of comma separated list. Example: 200,200-{$M},{$M},200-400 Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects
templateid	ID	ID of the parent template LLD rule. Property behavior: - *read-only*
timeout	string	Item data polling request timeout. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m). Also accepts user macros. Possible values range: 1-600s. Default: "" - use proxy/global settings. Property behavior: - *supported* if `type` is set to "Zabbix agent" (0), "Simple check" (3) and `key_` does not start with "`vmware.`" and "`icmpping`", "Zabbix agent (active)" (7), "External check" (10), "Database monitor" (11), "SSH agent" (13), "TELNET agent" (14), "HTTP agent" (19), "SNMP agent" (20) and `snmp_oid` starts with "`walk[`" or "`get[`", "Script" (21), "Browser" (22) - *read-only* for inherited objects, - if the default value is applied and the item belongs to a host monitored by an inaccessible proxy or proxy group, the global timeout is used.
trapper_hosts	string	Allowed hosts. Property behavior: - *supported* if `type` is set to "Zabbix trapper", or if `type` is set to "HTTP agent" and `allow_traps` is set to "Allow incoming data". If the property is omitted, it is automatically set to the `{$TRAPPER.ALLOWED_HOSTS}` user macro (default value). By default, `{$TRAPPER.ALLOWED_HOSTS}` is `127.0.0.1,::1`. If the property is set to an empty string, incoming connections will be denied from all hosts.
username	string	Username for authentication. Property behavior: - *required* if `type` is set to "SSH agent", "TELNET agent", or if `type` is set to "JMX agent" and `password` is set - *supported* if `type` is set to "Simple check", "Database monitor", or "HTTP agent" - *read-only* for inherited objects (if `type` is set to "HTTP agent")
uuid	string	Universal unique identifier, used for linking imported LLD rules to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the LLD rule belongs to a template

Property	Type	Description
verify_host	integer	Whether to validate that the host name for the connection matches the one in the host's certificate. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects
verify_peer	integer	Whether to validate that the host's certificate is authentic. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects

HTTP header

The header object has the following properties:

Property	Type	Description
name	string	HTTP header name. Property behavior: - *required*
value	string	Header value. Property behavior: - *required*

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

Property	Type	Description
name	string	Name of the parameter. Property behavior: - *required*
value	string	Parameter value. Property behavior: - *required*

LLD rule filter

The LLD rule filter object defines a set of conditions that can be used to filter discovered objects. It has the following properties:

Property	Type	Description
conditions	object/array	Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. Property behavior: - *required*

Property	Type	Description
evaltype	integer	Filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to ”custom expression”

LLD rule filter condition

The LLD rule filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

Property	Type	Description
macro	string	LLD macro to perform the check on. Property behavior: - *required*
value	string	Value to compare with. Property behavior: - *required* if `operator` is set to ”matches regular expression” or ”does not match regular expression”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. Property behavior: - *required* if `evaltype` of LLD rule filter object is set to ”custom expression”
operator	integer	Condition operator. Possible values: 8 - *(default)* matches regular expression; 9 - does not match regular expression; 12 - exists; 13 - does not exist.

Note:
To better understand how to use filters with various types of expressions, see examples on the discoveryrule.get and discoveryrule.create method pages.

LLD macro path

The LLD macro path has the following properties:

Property	Type	Description
lld_macro	string	LLD macro. Property behavior: - *required*
path	string	Selector for value which will be assigned to corresponding macro. Property behavior: - *required*

LLD rule preprocessing

The LLD rule preprocessing object has the following properties.

Property	Type	Description
type	integer	The preprocessing option type. Possible values: 5 - Regular expression; 11 - XML XPath; 12 - JSONPath; 14 - Matches regular expression; 15 - Does not match regular expression; 16 - Check for error in JSON; 17 - Check for error in XML; 20 - Discard unchanged with heartbeat; 21 - JavaScript; 23 - Prometheus to JSON; 24 - CSV to JSON; 25 - Replace; 27 - XML to JSON; 28 - SNMP walk value; 29 - SNMP walk to JSON; 30 - SNMP get value. Property behavior: - *required*
params	string	Additional parameters used by preprocessing option. Multiple parameters are separated by the newline (\n) character. Property behavior: - *required* if `type` is set to ”Regular expression” (5), ”XML XPath” (11), ”JSONPath” (12), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Discard unchanged with heartbeat” (20), ”JavaScript” (21), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”Replace” (25), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)

Property	Type	Description
error_handler	integer	Action type used in case of preprocessing step failure. Possible values: 0 - Error message is set by Zabbix server; 1 - Discard value; 2 - Set custom value; 3 - Set custom error message. Property behavior: - *required* if `type` is set to ”Regular expression” (5), ”XML XPath” (11), ”JSONPath” (12), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”XML to JSON” (27), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)
error_handler_params	string	Error handler parameters. Property behavior: - *required* if `error_handler` is set to ”Set custom value” or ”Set custom error message”

The following parameters and error handlers are supported for each preprocessing type.

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
5	Regular expression	pattern[1]	output[2]		0, 1, 2, 3
11	XML XPath	path[3]			0, 1, 2, 3
12	JSONPath	path[3]			0, 1, 2, 3
14	Matches regular expression	pattern[1]			0, 1, 2, 3
15	Does not match regular expression	pattern[1]			0, 1, 2, 3
16	Check for error in JSON	path[3]			0, 1, 2, 3
17	Check for error in XML	path[3]			0, 1, 2, 3

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
20	Discard unchanged with heartbeat	seconds^4, 5^			
21	JavaScript	script[2]			
23	Prometheus to JSON	pattern^5, 6^			0, 1, 2, 3
24	CSV to JSON	character[2]	character[2]	0,1	0, 1, 2, 3
25	Replace	search string[2]	replacement[2]		
27	XML to JSON				0, 1, 2, 3
28	SNMP walk value	OID[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS		0, 1, 2, 3
29	SNMP walk to JSON[7]	Field name[2]	OID prefix[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS	0, 1, 2, 3
30	SNMP get value	Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS			0, 1, 2, 3

[1] regular expression
 [2] string
 [3] JSONPath or XML XPath
 [4] positive integer (with support of time suffixes, e.g., 30s, 1m, 2h, 1d)
 [5] user macro
 [6] Prometheus pattern following the syntax: `<metric name>{<label name>="<label value>", ...} == <value>`. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.
 [7] Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

LLD rule overrides

The LLD rule overrides object defines a set of rules (filters, conditions and operations) that are used to override properties of different prototype objects. It has the following properties:

Property	Type	Description
name	string	Unique override name. Property behavior: - *required*
step	integer	Unique order number of the override. Property behavior: - *required*

Property	Type	Description
stop	integer	Stop processing next overrides if matches. Possible values: 0 - *(default)* don't stop processing overrides; 1 - stop processing overrides if filter matches.
filter	object	Override filter.
operations	object/array	Override operations.

LLD rule override filter

The LLD rule override filter object defines a set of conditions that if they match the discovered object the override is applied. It has the following properties:

Property	Type	Description
conditions	object/array	Set of override filter conditions to use for matching the discovered objects. The conditions will be sorted in the order of their placement in the formula. Property behavior: - *required*
evaltype	integer	Override filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating override filter conditions. The expression contains IDs that reference specific override filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of override filters with a custom expression. The expression must contain IDs that reference specific override filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the override filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to "custom expression"

LLD rule override filter condition

The LLD rule override filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

Property	Type	Description
macro	string	LLD macro to perform the check on. Property behavior: - *required*

Property	Type	Description
value	string	Value to compare with. Property behavior: - *required* if `operator` is set to ”matches regular expression” or ”does not match regular expression”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. Property behavior: - *required* if `evaltype` of LLD rule override filter object is set to ”custom expression”
operator	integer	Condition operator. Possible values: 8 - *(default)* matches regular expression; 9 - does not match regular expression; 12 - exists; 13 - does not exist.

LLD rule override operation

The LLD rule override operation is combination of conditions and actions to perform on the prototype object. It has the following properties:

Property	Type	Description
operationobject	integer	Type of discovered object to perform the action. Possible values: 0 - Item prototype; 1 - Trigger prototype; 2 - Graph prototype; 3 - Host prototype; 4 - Discovery prototype. Property behavior: - *required*
operator	integer	Override condition operator. Possible values: 0 - *(default)* equals; 1 - does not equal; 2 - contains; 3 - does not contain; 8 - matches; 9 - does not match.
value	string	Pattern to match item, trigger, graph or host prototype name depending on selected object.
opstatus	object	Override operation status object for item, trigger and host prototype objects.
opdiscover	object	Override operation discover status object (all object types).
opperiod	object	Override operation period (update interval) object for item prototype object.
ophistory	object	Override operation history object for item prototype object.
optrends	object	Override operation trends object for item prototype object.
opseverity	object	Override operation severity object for trigger prototype object.
optag	object/array	Override operation tag object for trigger and host prototype objects.
optemplate	object/array	Override operation template object for host prototype object.
opinventory	object	Override operation inventory object for host prototype object.

LLD rule override operation status

LLD rule override operation status that is set to discovered object. It has the following properties:

Property	Type	Description
status	integer	Override the status for selected object. Possible values: 0 - Create enabled; 1 - Create disabled. Property behavior: - *required*

LLD rule override operation discover

LLD rule override operation discover status that is set to discovered object. It has the following properties:

Property	Type	Description
discover	integer	Override the discover status for selected object. Possible values: 0 - Yes, continue discovering the objects; 1 - No, new objects will not be discovered and existing ones will be marked as lost. Property behavior: - *required*

LLD rule override operation period

LLD rule override operation period is an update interval value that is set to discovered item. It has the following properties:

Property	Type	Description
delay	string	Override the update interval of the item prototype. Accepts a number of seconds (e.g., `1`, `60`, `300`), a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`), or, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros or LLD macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., `{$FLEX_INTERVAL}/{$FLEX_PERIOD}`). Example: `1h;wd1-5h9-18;{$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{$Macr` Property behavior: - *required*

LLD rule override operation history

LLD rule override operation history value that is set to discovered item. It has the following properties:

Property	Type	Description
history	string	Override the history of item prototype which is a time unit of how long the history data should be stored. Also accepts user macro and LLD macro. Property behavior: - *required*

LLD rule override operation trends

LLD rule override operation trends value that is set to discovered item. It has the following properties:

Property	Type	Description
trends	string	Override the trends of item prototype which is a time unit of how long the trends data should be stored. Also accepts user macro and LLD macro. Property behavior: - *required*

LLD rule override operation severity

LLD rule override operation severity value that is set to discovered trigger. It has the following properties:

Property	Type	Description
severity	integer	Override the severity of trigger prototype. Possible values: 0 - *(default)* not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. Property behavior: - *required*

LLD rule override operation tag

LLD rule override operation tag object contains tag name and value that are set to discovered object. It has the following properties:

Property	Type	Description
tag	string	New tag name. Also accepts user macro and LLD macro. Property behavior: - *required*
value	string	New tag value. Also accepts user macro and LLD macro.

LLD rule override operation template

LLD rule override operation template object that is linked to discovered host. It has the following properties:

Property	Type	Description
templateid	ID	Override the template of host prototype linked templates. Property behavior: - *required*

LLD rule override operation inventory

LLD rule override operation inventory mode value that is set to discovered host. It has the following properties:

Property	Type	Description
inventory_mode	integer	Override the host prototype inventory mode. Possible values: -1 - disabled; 0 - *(default)* manual; 1 - automatic. Property behavior: - *required*

discoveryrule.create

Description

`object discoveryrule.create(object/array lldRules)`

This method allows you to create new LLD rules.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` LLD rules to create.

Additionally to the standard LLD rule properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	LLD rule filter for the LLD rule.
preprocessing	object/array	LLD rule preprocessing options.
lld_macro_paths	object/array	LLD rule lld_macro_path options.
overrides	object/array	LLD rule overrides options.

Return values

`(object)` Returns an object containing the IDs of the created LLD rules under the `itemids` property. The order of the returned IDs matches the order of the passed LLD rules.

Examples

Creating an LLD rule

Create a Zabbix agent LLD rule to discover mounted file systems. Discovered items will be updated every 30 seconds.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Mounted filesystem discovery",
        "key_": "vfs.fs.discovery",
        "hostid": "10197",
        "type": 0,
        "interfaceid": "112",
        "delay": "30s"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27665"
        ]
    },
    "id": 1
}
```

Using a filter

Create an LLD rule with a set of conditions to filter the results by. The conditions will be grouped together using the logical "and" operator.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Filtered LLD rule",
        "key_": "lld",
        "hostid": "10116",
        "type": 0,
        "interfaceid": "13",
        "delay": "30s",
        "filter": {
            "evaltype": 1,
            "conditions": [
                {
                    "macro": "{#MACRO1}",
                    "value": "@regex1"
                },
                {
                    "macro": "{#MACRO2}",
                    "value": "@regex2",
                    "operator": "9"
                },
                {
                    "macro": "{#MACRO3}",
                    "value": "",
                    "operator": "12"
                },
                {
                    "macro": "{#MACRO4}",
                    "value": "",
                    "operator": "13"
                }
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27665"
        ]
    },
```

```
    "id": 1
}
```

Creating an LLD rule with macro paths

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "LLD rule with LLD macro paths",
        "key_": "lld",
        "hostid": "10116",
        "type": 0,
        "interfaceid": "13",
        "delay": "30s",
        "lld_macro_paths": [
            {
                "lld_macro": "{#MACRO1}",
                "path": "$.path.1"
            },
            {
                "lld_macro": "{#MACRO2}",
                "path": "$.path.2"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27665"
        ]
    },
    "id": 1
}
```

Using a custom expression filter

Create an LLD rule with a filter that will use a custom expression to evaluate the conditions. The LLD rule must only discover objects the "{#MACRO1}" macro value of which matches both regular expression "regex1" and "regex2", and the value of "{#MACRO2}" matches either "regex3" or "regex4". The formula IDs "A", "B", "C" and "D" have been chosen arbitrarily.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Filtered LLD rule",
        "key_": "lld",
        "hostid": "10116",
        "type": 0,
        "interfaceid": "13",
        "delay": "30s",
        "filter": {
            "evaltype": 3,
            "formula": "(A and B) and (C or D)",
            "conditions": [
                {
                    "macro": "{#MACRO1}",
```

```
                    "value": "@regex1",
                    "formulaid": "A"
                },
                {
                    "macro": "{#MACRO1}",
                    "value": "@regex2",
                    "formulaid": "B"
                },
                {
                    "macro": "{#MACRO2}",
                    "value": "@regex3",
                    "formulaid": "C"
                },
                {
                    "macro": "{#MACRO2}",
                    "value": "@regex4",
                    "formulaid": "D"
                }
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27665"
        ]
    },
    "id": 1
}
```

Using custom query fields and headers

Create LLD rule with custom query fields and headers.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "hostid": "10257",
        "interfaceid": "5",
        "type": 19,
        "name": "API HTTP agent",
        "key_": "api_discovery_rule",
        "delay": "5s",
        "url": "http://127.0.0.1?discoverer.php",
        "query_fields": [
            {
                "name": "mode",
                "value": "json"
            },
            {
                "name": "elements",
                "value": "2"
            }
        ],
        "headers": [
            {
```

```
                "name": "X-Type",
                "value": "api"
            },
            {
                "name": "Authorization",
                "value": "Bearer mF_A.B5f-2.1JcM"
            }
        ],
        "allow_traps": 1,
        "trapper_hosts": "127.0.0.1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "28336"
        ]
    },
    "id": 1
}
```

Creating an LLD rule with preprocessing

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Discovery rule with preprocessing",
        "key_": "lld.with.preprocessing",
        "hostid": "10001",
        "ruleid": "27665",
        "type": 0,
        "delay": "60s",
        "interfaceid": "1155",
        "preprocessing": [
            {
                "type": 20,
                "params": "20",
                "error_handler": 0,
                "error_handler_params": ""
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44211"
        ]
    },
    "id": 1
}
```

Creating an LLD rule with overrides

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Discover database host",
        "key_": "lld.with.overrides",
        "hostid": "10001",
        "type": 0,
        "delay": "60s",
        "interfaceid": "1155",
        "overrides": [
            {
                "name": "Discover MySQL host",
                "step": "1",
                "stop": "1",
                "filter": {
                    "evaltype": "2",
                    "conditions": [
                        {
                            "macro": "{#UNIT.NAME}",
                            "operator": "8",
                            "value": "^mysqld\\.service$"
                        },
                        {
                            "macro": "{#UNIT.NAME}",
                            "operator": "8",
                            "value": "^mariadb\\.service$"
                        }
                    ]
                },
                "operations": [
                    {
                        "operationobject": "3",
                        "operator": "2",
                        "value": "Database host",
                        "opstatus": {
                            "status": "0"
                        },
                        "optemplate": [
                            {
                                "templateid": "10170"
                            }
                        ],
                        "optag": [
                            {
                                "tag": "database",
                                "value": "mysql"
                            }
                        ]
                    }
                ]
            },
            {
                "name": "Discover PostgreSQL host",
                "step": "2",
                "stop": "1",
                "filter": {
                    "evaltype": "0",
                    "conditions": [
                        {
                            "macro": "{#UNIT.NAME}",
```

```
                            "operator": "8",
                            "value": "^postgresql\\.service$"
                        }
                    ]
                },
                "operations": [
                    {
                        "operationobject": "3",
                        "operator": "2",
                        "value": "Database host",
                        "opstatus": {
                            "status": "0"
                        },
                        "optemplate": [
                            {
                                "templateid": "10263"
                            }
                        ],
                        "optag": [
                            {
                                "tag": "database",
                                "value": "postgresql"
                            }
                        ]
                    }
                ]
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "30980"
        ]
    },
    "id": 1
}
```

Create script LLD rule

Create a simple data collection using a script LLD rule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "Script example",
        "key_": "custom.script.lldrule",
        "hostid": "12345",
        "type": 21,
        "params": "var request = new HttpRequest();\nreturn request.post(\"https://postman-echo.com/post\"
        "parameters": [{
            "name": "host",
            "value": "{HOST.CONN}"
        }],
        "timeout": "6s",
        "delay": "30s"
```

```
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}
```

Create LLD rule with a specified time period for disabling and no deletion

Create an LLD rule with custom time period for disabling entity after it is no longer discovered, with the setting that it will never be deleted.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.create",
    "params": {
        "name": "lld disable after 1h",
        "key_": "lld.disable",
        "hostid": "10001",
        "type": 2,
        "lifetime_type": 1,
        "enabled_lifetime_type": 0,
        "enabled_lifetime": "1h"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "46864"
        ]
    },
    "id": 1
}
```

discoveryrule.delete

Description

`object discoveryrule.delete(array lldRuleIds)`

This method allows you to delete LLD rules.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 The user will not be able to delete a LLD rule that discover entities using inaccessible proxy. See user group configuration (*Proxy access list*) for more information.

Parameters

`(array)` IDs of the LLD rules to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted LLD rules under the `ruleids` property.

Examples

Deleting multiple LLD rules

Delete two LLD rules.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.delete",
    "params": [
        "27665",
        "27668"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "ruleids": [
            "27665",
            "27668"
        ]
    },
    "id": 1
}
```

CDiscoveryRule::delete() in *ui/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.get

Description

`integer/array discoveryrule.get(object parameters)`

The method allows you to retrieve LLD rules according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
itemids	ID/array	Return only LLD rules with the given IDs.
groupids	ID/array	Return only LLD rules that belong to the hosts from the given groups.

Parameter	Type	Description
hostids	ID/array	Return only LLD rules that belong to the given hosts.
inherited	boolean	If set to `true` return only LLD rules inherited from a template.
interfaceids	ID/array	Return only LLD rules use the given host interfaces.
monitored	boolean	If set to `true` return only enabled LLD rules that belong to monitored hosts.
templated	boolean	If set to `true` return only LLD rules that belong to templates.
templateids	ID/array	Return only LLD rules that belong to the given templates.
selectDiscoveryData	query	Return a `discoveryData` property with the LLD rule discovery object data. The LLD rule discovery object links a discovered LLD rule to an LLD rule prototype from which it was discovered.
selectDiscoveryRulePrototypes	query	Return a `discoveryRulePrototypes` property with LLD rule prototypes that belong to the LLD rule. Supports `count`.
selectFilter	query	Return a `filter` property with data of the filter used by the LLD rule.
selectGraphs	query	Returns a `graphs` property with graph prototypes that belong to the LLD rule. Supports `count`.
selectHostPrototypes	query	Return a `hostPrototypes` property with host prototypes that belong to the LLD rule. Supports `count`.
selectHosts	query	Return a `hosts` property with an array of hosts that the LLD rule belongs to.
selectItems	query	Return an `items` property with item prototypes that belong to the LLD rule. Supports `count`.
selectTriggers	query	Return a `triggers` property with trigger prototypes that belong to the LLD rule. Supports `count`.
selectLLDMacroPaths	query	Return an `lld_macro_paths` property with a list of LLD macros and paths to values assigned to each corresponding macro.
selectPreprocessing	query	Return a `preprocessing` property with LLD rule preprocessing options.
selectOverrides	query	Return an `lld_rule_overrides` property with a list of override filters, conditions and operations that are performed on prototype objects.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the LLD rule belongs to.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectItems`, `selectGraphs`, `selectTriggers`.
sortfield	string/array	Sort the result by the given properties. Possible values: `itemid`, `name`, `key_`, `delay`, `type`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	

Parameter	Type	Description
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving discovery rules from a host

Retrieve all discovery rules for specific host ID.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "output": "extend",
        "hostids": "10202"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "27425",
            "type": "0",
            "snmp_oid": "",
            "hostid": "10202",
            "name": "Network interface discovery",
            "key_": "net.if.discovery",
            "delay": "1h",
            "status": "0",
            "trapper_hosts": "",
            "templateid": "22444",
            "valuemapid": "0",
            "params": "",
            "ipmi_sensor": "",
            "authtype": "0",
            "username": "",
            "password": "",
            "publickey": "",
            "privatekey": "",

```

Retrieving filter conditions

Retrieve the name of the LLD rule "24681" and its filter conditions. The filter uses the "and" evaluation type, so the `formula` property is empty and `eval_formula` is generated automatically.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "output": ["name"],
        "selectFilter": "extend",
        "itemids": ["24681"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "24681",
            "name": "Filtered LLD rule",
            "filter": {
                "evaltype": "1",
                "formula": "",
                "conditions": [
                    {
                        "macro": "{#MACRO1}",
                        "value": "@regex1",
                        "operator": "8",
                        "formulaid": "A"
                    },
                    {
                        "macro": "{#MACRO2}",
                        "value": "@regex2",
                        "operator": "9",
                        "formulaid": "B"
                    },
                    {
                        "macro": "{#MACRO3}",
                        "value": "",
                        "operator": "12",
                        "formulaid": "C"
                    },
                    {
```

```
                        "macro": "{#MACRO4}",
                        "value": "",
                        "operator": "13",
                        "formulaid": "D"
                    }
                ],
                "eval_formula": "A and B and C and D"
            }
        }
    ],
    "id": 1
}
```

Retrieve LLD rule by URL

Retrieve LLD rule for host by rule URL field value. Only exact match of URL string defined for LLD rule is supported.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "hostids": "10257",
        "filter": {
            "type": 19,
            "url": "http://127.0.0.1/discoverer.php"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "28336",

    "id": 1
}
```

Retrieve LLD rule with overrides

Retrieve one LLD rule that has various override settings.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.get",
    "params": {
        "output": ["name"],
        "itemids": "30980",
        "selectOverrides": ["name", "step", "stop", "filter", "operations"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "name": "Discover database host",
            "overrides": [
                {
                    "name": "Discover MySQL host",
                    "step": "1",
                    "stop": "1",
                    "filter": {
                        "evaltype": "2",

Source

CDiscoveryRule::get() in *ui/include/classes/api/services/CDiscoveryRule.php*.

discoveryrule.update

Description

`object discoveryrule.update(object/array lldRules)`

This method allows you to update existing LLD rules.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` LLD rule properties to be updated.

The `itemid` property must be defined for each LLD rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard LLD rule properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	LLD rule filter to replace the existing filter.
preprocessing	object/array	LLD rule preprocessing options to replace the existing preprocessing options. Parameter behavior: - *read-only* for inherited objects
lld_macro_paths	object/array	LLD rule lld_macro_path options to replace the existing lld_macro_path options. Parameter behavior: - *read-only* for inherited objects
overrides	object/array	LLD rule overrides options to replace the existing overrides options. Parameter behavior: - *read-only* for inherited objects

Return values

`(object)` Returns an object containing the IDs of the updated LLD rules under the `itemids` property.

Examples

Adding a filter to an LLD rule

Add a filter so that the contents of the *{#FSTYPE}* macro would match the *@File systems for discovery* regexp.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.update",
    "params": {
        "itemid": "22450",
        "filter": {
            "evaltype": 1,
            "conditions": [
                {
                    "macro": "{#FSTYPE}",
                    "value": "@File systems for discovery"
                }
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "22450"
        ]
    },
    "id": 1
}
```

Adding LLD macro paths

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.update",
    "params": {
```

```
        "itemid": "22450",
        "lld_macro_paths": [
            {
                "lld_macro": "{#MACRO1}",
                "path": "$.json.path"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "22450"
        ]
    },
    "id": 1
}
```

Disable trapping

Disable LLD trapping for discovery rule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.update",
    "params": {
        "itemid": "28336",
        "allow_traps": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "28336"
        ]
    },
    "id": 1
}
```

Updating LLD rule preprocessing options

Update an LLD rule with preprocessing rule ”JSONPath”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.update",
    "params": {
        "itemid": "44211",
        "preprocessing": [
            {
                "type": 12,
                "params": "$.path.to.json",
                "error_handler": 2,
                "error_handler_params": "5"
```

```
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44211"
        ]
    },
    "id": 1
}
```

Updating LLD rule script

Update an LLD rule script with a different script and remove unnecessary parameters that were used by previous script.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.update",
    "params": {
        "itemid": "23865",
        "parameters": [],
        "script": "Zabbix.log(3, 'Log test');\nreturn 1;"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}
```

Updating LLD rule lifetime

Update LLD rule to disable no-longer discovered entity after 12 hours and to delete it after 7 days.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryrule.update",
    "params": {
        "itemid": "46864",
        "lifetime_type": 0,
        "lifetime": "7d",
        "enabled_lifetime_type": 0,
        "enabled_lifetime": "12h"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "46864"
        ]
    },
    "id": 1
}
```

Source

CDiscoveryRule::update() in *ui/include/classes/api/services/CDiscoveryRule.php*.

LLD rule prototype

This class is designed to work with low-level discovery rule prototypes.

Object references:

- LLD rule prototype
  - HTTP header
  - HTTP query field
- LLD rule prototype filter
  - LLD rule prototype filter condition
- LLD prototype macro path
- LLD rule prototype preprocessing
- LLD rule prototype overrides
  - LLD rule prototype override filter
    - LLD rule prototype override filter condition
  - LLD rule prototype override operation
    - LLD rule prototype override operation status
    - LLD rule prototype override operation discover
    - LLD rule prototype override operation period
    - LLD rule prototype override operation history
    - LLD rule prototype override operation trends
    - LLD rule prototype override operation severity
    - LLD rule prototype override operation tag
    - LLD rule prototype override operation template
    - LLD rule prototype override operation inventory

Available methods:

- discoveryruleprototype.create - create new LLD rule prototypes
- discoveryruleprototype.delete - delete LLD rule prototypes
- discoveryruleprototype.get - retrieve LLD rule prototypes
- discoveryruleprototype.update - update LLD rule prototypes

LLD rule prototype object

The following objects are directly related to the `discoveryruleprototype` API.

LLD rule prototype

The low-level discovery rule prototype object has the following properties.

Property	Type	Description
itemid	ID	ID of the LLD rule prototype. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
ruleid	ID	ID of the parent LLD rule/LLD rule prototype. Property behavior: - *read-only* - *required* for create operations
delay	string	Update interval of the LLD rule prototype. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {$FLEX_INTERVAL}/{$FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{$Macr Property behavior: - *required* if type is set to ”Zabbix agent” (0), ”Simple check” (3), ”Zabbix internal” (5), ”External check” (10), ”Database monitor” (11), ”IPMI agent” (12), ”SSH agent” (13), ”TELNET agent” (14), ”JMX agent” (16), ”HTTP agent” (19), ”SNMP agent” (20), ”Script” (21), ”Browser” (22), or if type is set to ”Zabbix agent (active)” (7) and key_ does not contain ”mqtt.get”
hostid	ID	ID of the host that the LLD rule prototype belongs to. Property behavior: - *constant* - *required* for create operations
flags	integer	Origin of the LLD rule prototype. Possible values: 3 - a low-level discovery rule prototype; 7 - a discovered low-level discovery rule prototype. Property behavior: - *read-only*
interfaceid	ID	ID of the LLD rule prototype’s host interface. Property behavior: - *required* if LLD rule prototype belongs to host and type is set to ”Zabbix agent”, ”IPMI agent”, ”JMX agent”, or ”SNMP agent” - *supported* if LLD rule prototype belongs to host and type is set to ”Simple check”, ”External check”, ”SSH agent”, ”TELNET agent”, or ”HTTP agent”
key_	string	LLD rule prototype key. At least one LLD macro is required. Property behavior: - *required* for create operations - *read-only* for inherited objects
name	string	Name of the LLD rule prototype. Property behavior: - *required* for create operations - *read-only* for inherited objects

Property	Type	Description
type	integer	Type of the LLD rule prototype. Possible values: 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 16 - JMX agent; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser; 23 - Nested. Property behavior: - *required* for create operations - *read-only* for inherited objects
url	string	URL string. Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}. Property behavior: - *required* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
allow_traps	integer	Allow the value to be populated similarly to the trapper item. Possible values: 0 - *(default)* Do not accept incoming data; 1 - Accept incoming data. Property behavior: - *supported* if `type` is set to ”HTTP agent”
authtype	integer	Authentication method. Possible values if `type` is set to ”SSH agent”: 0 - *(default)* password; 1 - public key. Possible values if `type` is set to ”HTTP agent”: 0 - *(default)* none; 1 - basic; 2 - NTLM. Property behavior: - *supported* if `type` is set to ”SSH agent” or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”)
description	string	Description of the LLD rule prototype.
error	string	Error text if there are problems updating the LLD rule prototype value. Property behavior: - *read-only*

Property	Type	Description
follow_redirects	integer	Follow response redirects while polling data. Possible values: 0 - Do not follow redirects; 1 - *(default)* Follow redirects. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
headers	array	Array of headers that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
http_proxy	string	HTTP(S) proxy connection string. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ipmi_sensor	string	IPMI sensor. Property behavior: - *required* if `type` is set to ”IPMI agent” and `key_` is not set to ”ipmi.get” - *supported* if `type` is set to ”IPMI agent” - *read-only* for inherited objects
jmx_endpoint	string	JMX agent custom connection string. Default: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi Property behavior: - *supported* if `type` is set to ”JMX agent”
lifetime	string	Time period after which items that are no longer discovered will be deleted. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`), or a user macro. Default: `7d`.
lifetime_type	integer	Scenario to delete lost LLD resources. Possible values: 0 - *(default)* Delete after lifetime threshold is reached; 1 - Do not delete; 2 - Delete immediately.
enabled_lifetime	string	Time period after which items that are no longer discovered will be disabled. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`), or a user macro. Default: 0.
enabled_lifetime_type	integer	Scenario to disable lost LLD resources. Possible values: 0 - Disable after lifetime threshold is reached; 1 - Do not disable; 2 - *(default)* Disable immediately.
master_itemid	ID	ID of the master item. Discovery rule cannot be master item for another discovery rule. Property behavior: - *required* if `type` is set to ”Dependent item” - *read-only* for inherited objects

Property	Type	Description
output_format	integer	Should the response be converted to JSON. Possible values: 0 - *(default)* Store raw; 1 - Convert to JSON. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
params	string	Additional parameters depending on the type of the LLD rule prototype: - executed script for SSH and Telnet LLD rules; - SQL query for database monitor LLD rules; - formula for calculated LLD rules; - the script for script and browser LLD rules. Property behavior: - *required* if `type` is set to ”Database monitor”, ”SSH agent”, ”TELNET agent”, ”Script” or ”Browser” - *read-only* for inherited objects (if `type` is set to ”Script” or ”Browser”)
parameters	object/array	Additional parameters if `type` is set to ”Script” or ”Browser”. Array of objects with `name` and `value` properties, where `name` must be unique. Property behavior: - *supported* if `type` is set to ”Script” or ”Browser” - *read-only* for inherited objects
password	string	Password for authentication. Property behavior: - *required* if `type` is set to ”JMX agent” and `username` is set - *supported* if `type` is set to ”Simple check”, ”Database monitor”, ”SSH agent”, ”TELNET agent”, or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”)
post_type	integer	Type of post data body stored in `posts` property. Possible values: 0 - *(default)* Raw data; 2 - JSON data; 3 - XML data. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
posts	string	HTTP(S) request body data. Property behavior: - *required* if `type` is set to ”HTTP agent” and `post_type` is set to ”JSON data” or ”XML data” - *supported* if `type` is set to ”HTTP agent” and `post_type` is set to ”Raw data” - *read-only* for inherited objects
privatekey	string	Name of the private key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key”
publickey	string	Name of the public key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key”

Property	Type	Description
query_fields	array	Array of query fields that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
request_method	integer	Type of request method. Possible values: 0 - *(default)* GET; 1 - POST; 2 - PUT; 3 - HEAD. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
retrieve_mode	integer	What part of response should be stored. Possible values if `request_method` is set to ”GET”, ”POST”, or ”PUT”: 0 - *(default)* Body; 1 - Headers; 2 - Both body and headers will be stored. Possible values if `request_method` is set to ”HEAD”: 1 - Headers. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
snmp_oid	string	SNMP OID. Property behavior: - *required* if `type` is set to ”SNMP agent” - *read-only* for inherited objects
ssl_cert_file	string	Public SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ssl_key_file	string	Private SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ssl_key_password	string	Password for SSL Key file. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
state	integer	State of the LLD rule prototype. Possible values: 0 - *(default)* normal; 1 - not supported. Property behavior: - *read-only*

Property	Type	Description
status	integer	Status of the LLD rule prototype. Possible values: 0 - *(default)* enabled LLD rule prototype; 1 - disabled LLD rule prototype.
status_codes	string	Ranges of required HTTP status codes, separated by commas. Also supports user macros as part of comma separated list. Example: 200,200-{$M},{$M},200-400 Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects
templateid	ID	ID of the parent template LLD rule prototype. Property behavior: - *read-only*
timeout	string	Item data polling request timeout. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m). Also accepts user macros. Possible values range: 1-600s. Default: "" - use proxy/global settings. Property behavior: - *supported* if `type` is set to "Zabbix agent" (0), "Simple check" (3) and `key_` does not start with "`vmware.`" and "`icmpping`", "Zabbix agent (active)" (7), "External check" (10), "Database monitor" (11), "SSH agent" (13), "TELNET agent" (14), "HTTP agent" (19), "SNMP agent" (20) and `snmp_oid` starts with "`walk[`" or "`get[`", "Script" (21), "Browser" (22) - *read-only* for inherited objects
trapper_hosts	string	Allowed hosts. Property behavior: - *supported* if `type` is set to "Zabbix trapper", or if `type` is set to "HTTP agent" and `allow_traps` is set to "Allow incoming data". If the property is omitted, it is automatically set to the `{$TRAPPER.ALLOWED_HOSTS}` user macro (default value). By default, `{$TRAPPER.ALLOWED_HOSTS}` is `127.0.0.1,::1`. If the property is set to an empty string, incoming connections will be denied from all hosts.
username	string	Username for authentication. Property behavior: - *required* if `type` is set to "SSH agent", "TELNET agent", or if `type` is set to "JMX agent" and `password` is set - *supported* if `type` is set to "Simple check", "Database monitor", or "HTTP agent" - *read-only* for inherited objects (if `type` is set to "HTTP agent")
uuid	string	Universal unique identifier, used for linking imported LLD rule prototypes to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the LLD rule prototype belongs to a template

Property	Type	Description
verify_host	integer	Whether to validate that the host name for the connection matches the one in the host's certificate. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects
verify_peer	integer	Whether to validate that the host's certificate is authentic. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects

HTTP header

The header object has the following properties:

Property	Type	Description
name	string	HTTP header name. Property behavior: - *required*
value	string	Header value. Property behavior: - *required*

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

Property	Type	Description
name	string	Name of the parameter. Property behavior: - *required*
value	string	Parameter value. Property behavior: - *required*

LLD rule prototype filter

The LLD rule prototype filter object defines a set of conditions that can be used to filter discovered objects. It has the following properties:

Property	Type	Description
conditions	object/array	Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. Property behavior: - *required*

Property	Type	Description
evaltype	integer	Filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to ”custom expression”

LLD rule prototype filter condition

The LLD rule prototype filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

Property	Type	Description
macro	string	LLD macro to perform the check on. Property behavior: - *required*
value	string	Value to compare with. Property behavior: - *required* if `operator` is set to ”matches regular expression” or ”does not match regular expression”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. Property behavior: - *required* if `evaltype` of LLD rule prototype filter object is set to ”custom expression”
operator	integer	Condition operator. Possible values: 8 - *(default)* matches regular expression; 9 - does not match regular expression; 12 - exists; 13 - does not exist.

Note:
To better understand how to use filters with various types of expressions, see examples on the discoveryruleprototype.get and discoveryruleprototype.create method pages.

LLD macro path

The LLD macro path has the following properties:

Property	Type	Description
lld_macro	string	LLD macro. Property behavior: - *required*
path	string	Selector for value which will be assigned to corresponding macro. Property behavior: - *required*

LLD rule prototype preprocessing

The LLD rule prototype preprocessing object has the following properties.

Property	Type	Description
type	integer	The preprocessing option type. Possible values: 5 - Regular expression; 11 - XML XPath; 12 - JSONPath; 14 - Matches regular expression; 15 - Does not match regular expression; 16 - Check for error in JSON; 17 - Check for error in XML; 20 - Discard unchanged with heartbeat; 21 - JavaScript; 23 - Prometheus to JSON; 24 - CSV to JSON; 25 - Replace; 27 - XML to JSON; 28 - SNMP walk value; 29 - SNMP walk to JSON; 30 - SNMP get value. Property behavior: - *required*
params	string	Additional parameters used by preprocessing option. Multiple parameters are separated by the newline (\n) character. Property behavior: - *required* if `type` is set to ”Regular expression” (5), ”XML XPath” (11), ”JSONPath” (12), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Discard unchanged with heartbeat” (20), ”JavaScript” (21), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”Replace” (25), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)

Property	Type	Description
error_handler	integer	Action type used in case of preprocessing step failure. Possible values: 0 - Error message is set by Zabbix server; 1 - Discard value; 2 - Set custom value; 3 - Set custom error message. Property behavior: - *required* if `type` is set to ”Regular expression” (5), ”XML XPath” (11), ”JSONPath” (12), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”XML to JSON” (27), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)
error_handler_params	string	Error handler parameters. Property behavior: - *required* if `error_handler` is set to ”Set custom value” or ”Set custom error message”

The following parameters and error handlers are supported for each preprocessing type.

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
5	Regular expression	pattern[1]	output[2]		0, 1, 2, 3
11	XML XPath	path[3]			0, 1, 2, 3
12	JSONPath	path[3]			0, 1, 2, 3
14	Matches regular expression	pattern[1]			0, 1, 2, 3
15	Does not match regular expression	pattern[1]			0, 1, 2, 3
16	Check for error in JSON	path[3]			0, 1, 2, 3
17	Check for error in XML	path[3]			0, 1, 2, 3

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
20	Discard unchanged with heartbeat	seconds^4, 5^			
21	JavaScript	script[2]			
23	Prometheus to JSON	pattern^5, 6^			0, 1, 2, 3
24	CSV to JSON	character[2]	character[2]	0,1	0, 1, 2, 3
25	Replace	search string[2]	replacement[2]		
27	XML to JSON				0, 1, 2, 3
28	SNMP walk value	OID[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS		0, 1, 2, 3
29	SNMP walk to JSON[7]	Field name[2]	OID prefix[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS	0, 1, 2, 3
30	SNMP get value	Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS			0, 1, 2, 3

[1] regular expression
 [2] string
 [3] JSONPath or XML XPath
 [4] positive integer (with support of time suffixes, e.g., 30s, 1m, 2h, 1d)
 [5] user macro
 [6] Prometheus pattern following the syntax: `<metric name>{<label name>="<label value>", ...} == <value>`. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.
 [7] Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

LLD rule prototype overrides

The LLD rule prototype overrides object defines a set of rules (filters, conditions and operations) that are used to override properties of different prototype objects. It has the following properties:

Property	Type	Description
name	string	Unique override name. Property behavior: - *required*
step	integer	Unique order number of the override. Property behavior: - *required*

Property	Type	Description
stop	integer	Stop processing next overrides if matches. Possible values: 0 - *(default)* don't stop processing overrides; 1 - stop processing overrides if filter matches.
filter	object	Override filter.
operations	object/array	Override operations.

LLD rule prototype override filter

The LLD rule prototype override filter object defines a set of conditions that if they match the discovered object the override is applied. It has the following properties:

Property	Type	Description
conditions	object/array	Set of override filter conditions to use for matching the discovered objects. The conditions will be sorted in the order of their placement in the formula. Property behavior: - *required*
evaltype	integer	Override filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating override filter conditions. The expression contains IDs that reference specific override filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of override filters with a custom expression. The expression must contain IDs that reference specific override filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the override filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to "custom expression"

LLD rule prototype override filter condition

The LLD rule prototype override filter condition object defines a separate check to perform on the value of an LLD macro. It has the following properties:

Property	Type	Description
macro	string	LLD macro to perform the check on. Property behavior: - *required*

Property	Type	Description
value	string	Value to compare with. Property behavior: - *required* if `operator` is set to ”matches regular expression” or ”does not match regular expression”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. Property behavior: - *required* if `evaltype` of LLD rule prototype override filter object is set to ”custom expression”
operator	integer	Condition operator. Possible values: 8 - *(default)* matches regular expression; 9 - does not match regular expression; 12 - exists; 13 - does not exist.

LLD rule prototype override operation

The LLD rule prototype override operation is combination of conditions and actions to perform on the prototype object. It has the following properties:

Property	Type	Description
operationobject	integer	Type of discovered object to perform the action. Possible values: 0 - Item prototype; 1 - Trigger prototype; 2 - Graph prototype; 3 - Host prototype. Property behavior: - *required*
operator	integer	Override condition operator. Possible values: 0 - *(default)* equals; 1 - does not equal; 2 - contains; 3 - does not contain; 8 - matches; 9 - does not match.
value	string	Pattern to match item, trigger, graph or host prototype name depending on selected object.
opstatus	object	Override operation status object for item, trigger and host prototype objects.
opdiscover	object	Override operation discover status object (all object types).
opperiod	object	Override operation period (update interval) object for item prototype object.
ophistory	object	Override operation history object for item prototype object.
optrends	object	Override operation trends object for item prototype object.
opseverity	object	Override operation severity object for trigger prototype object.
optag	object/array	Override operation tag object for trigger and host prototype objects.
optemplate	object/array	Override operation template object for host prototype object.
opinventory	object	Override operation inventory object for host prototype object.

LLD rule prototype override operation status

LLD rule prototype override operation status that is set to discovered object. It has the following properties:

Property	Type	Description
status	integer	Override the status for selected object. Possible values: 0 - Create enabled; 1 - Create disabled. Property behavior: - *required*

LLD rule prototype override operation discover

LLD rule prototype override operation discover status that is set to discovered object. It has the following properties:

Property	Type	Description
discover	integer	Override the discover status for selected object. Possible values: 0 - Yes, continue discovering the objects; 1 - No, new objects will not be discovered and existing ones will be marked as lost. Property behavior: - *required*

LLD rule prototype override operation period

LLD rule prototype override operation period is an update interval value that is set to discovered item. It has the following properties:

Property	Type	Description
delay	string	Override the update interval of the item prototype. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros or LLD macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {$FLEX_INTERVAL}/{$FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{$Macr Property behavior: - *required*

LLD rule prototype override operation history

LLD rule prototype override operation history value that is set to discovered item. It has the following properties:

Property	Type	Description
history	string	Override the history of item prototype which is a time unit of how long the history data should be stored. Also accepts user macro and LLD macro. Property behavior: - *required*

LLD rule prototype override operation trends

LLD rule prototype override operation trends value that is set to discovered item. It has the following properties:

Property	Type	Description
trends	string	Override the trends of item prototype which is a time unit of how long the trends data should be stored. Also accepts user macro and LLD macro. Property behavior: - *required*

LLD rule prototype override operation severity

LLD rule prototype override operation severity value that is set to discovered trigger. It has the following properties:

Property	Type	Description
severity	integer	Override the severity of trigger prototype. Possible values: 0 - *(default)* not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. Property behavior: - *required*

LLD rule prototype override operation tag

LLD rule prototype override operation tag object contains tag name and value that are set to discovered object. It has the following properties:

Property	Type	Description
tag	string	New tag name. Property behavior: - *required*
value	string	New tag value.

LLD rule prototype override operation template

LLD rule prototype override operation template object that is linked to discovered host. It has the following properties:

Property	Type	Description
templateid	ID	Override the template of host prototype linked templates. Property behavior: - *required*

LLD rule prototype override operation inventory

LLD rule prototype override operation inventory mode value that is set to discovered host. It has the following properties:

Property	Type	Description
inventory_mode	integer	Override the host prototype inventory mode. Possible values: -1 - disabled; 0 - *(default)* manual; 1 - automatic. Property behavior: - *required*

discoveryruleprototype.create

Description

`object discoveryruleprototype.create(object/array lldRules)`

This method allows you to create new LLD rule prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` LLD rule prototypes to create.

Additionally to the standard LLD rule prototype properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	LLD rule prototype filter for the LLD rule.
preprocessing	object/array	LLD rule prototype preprocessing options.
lld_macro_paths	object/array	LLD rule prototype lld_macro_path options.
overrides	object/array	LLD rule prototype overrides options.

Return values

`(object)` Returns an object containing the IDs of the created LLD rule prototypes under the `itemids` property. The order of the returned IDs matches the order of the passed LLD rule prototypes.

Examples

Creating an LLD rule prototype

Create an LLD rule prototype (Type: Nested) to discover tablespaces in database instance.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryruleprototype.create",
    "params": {
        "name": "Discover tablespaces for {#DB}",
        "key_": "db.tablespace.discovery[{#DB}]",
        "hostid": "10084",
        "ruleid": "47251",
        "type": 23
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "47252"
        ]
    },
    "id": 1
}
```

Source

CDiscoveryRulePrototype::create() in *ui/include/classes/api/services/CDiscoveryRulePrototype.php*.

discoveryruleprototype.delete

Description

`object discoveryruleprototype.delete(array lldRuleIds)`

This method allows you to delete LLD rule prototypes.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the LLD rule prototypes to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted LLD rule prototypes under the `ruleids` property.

Examples

Deleting multiple LLD rule prototypes

Delete two LLD rule prototypes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryruleprototype.delete",
    "params": [
        "47252",
        "47253"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "ruleids": [
            "47252",
            "47253"
        ]
    },
```

```
    "id": 1
}
```

Source

CDiscoveryRulePrototype::delete() in *ui/include/classes/api/services/CDiscoveryRulePrototype.php*.

discoveryruleprototype.get

Description

`integer/array discoveryruleprototype.get(object parameters)`

The method allows you to retrieve LLD rule prototypes according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
discoveryids	ID/array	Return only LLD rule prototypes that belong to the given LLD rules or LLD rule prototypes.
itemids	ID/array	Return only LLD rule prototypes with the given IDs.
groupids	ID/array	Return only LLD rule prototypes that belong to the hosts from the given groups.
hostids	ID/array	Return only LLD rule prototypes that belong to the given hosts.
inherited	boolean	If set to `true` return only LLD rule prototypes inherited from a template.
interfaceids	ID/array	Return only LLD rule prototypes use the given host interfaces.
monitored	boolean	If set to `true` return only enabled LLD rule prototypes that belong to monitored hosts.
templated	boolean	If set to `true` return only LLD rule prototypes that belong to templates.
templateids	ID/array	Return only LLD rule prototypes that belong to the given templates.
selectDiscoveryRule	query	Return a `discoveryRule` property with the parent LLD rule of the LLD rule prototype. It will return an empty response if the parent is a discovery rule prototype.
selectDiscoveryRulePrototype	query	Return a `discoveryRulePrototype` property with the parent LLD rule prototype of the LLD rule prototype. It will return an empty response if the parent is a discovery rule (not prototype).
selectDiscoveryRulePrototypes	query	Return a `discoveryRulePrototypes` property with child LLD rule prototypes that belong to the LLD rule prototype. Supports `count`.
selectFilter	query	Return a `filter` property with data of the filter used by the LLD rule prototype.
selectGraphs	query	Returns a `graphs` property with graph prototypes that belong to the LLD rule prototype. Supports `count`.
selectHostPrototypes	query	Return a `hostPrototypes` property with host prototypes that belong to the LLD rule prototype. Supports `count`.
selectHosts	query	Return a `hosts` property with an array of hosts that the LLD rule prototype belongs to.

Parameter	Type	Description
selectItems	query	Return an `items` property with item prototypes that belong to the LLD rule prototype. Supports `count`.
selectTriggers	query	Return a `triggers` property with trigger prototypes that belong to the LLD rule prototype. Supports `count`.
selectLLDMacroPaths	query	Return an `lld_macro_paths` property with a list of LLD macros and paths to values assigned to each corresponding macro.
selectPreprocessing	query	Return a `preprocessing` property with LLD rule prototype preprocessing options.
selectOverrides	query	Return an `lld_rule_overrides` property with a list of override filters, conditions and operations that are performed on prototype objects.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the LLD rule prototype belongs to.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectItems`, `selectGraphs`, `selectTriggers`.
sortfield	string/array	Sort the result by the given properties. Possible values: `itemid`, `name`, `key_`, `delay`, `type`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving discovery rule prototypes from a host

Retrieve all discovery rule prototypes for specific host ID.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryruleprototype.get",
    "params": {
        "hostids": "10084"
```

```
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "47253",
            "type": "23",

CDiscoveryRulePrototype::get() in *ui/include/classes/api/services/CDiscoveryRulePrototype.php*.

discoveryruleprototype.update

Description

`object discoveryruleprototype.update(object/array lldRules)`

This method allows you to update existing LLD rule prototypes.

Note that the updating of already discovered prototypes is limited.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` LLD rule prototype properties to be updated.

The `itemid` property must be defined for each LLD rule prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard LLD rule prototype properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	LLD rule prototype filter to replace the existing filter.
preprocessing	object/array	LLD rule prototype preprocessing options to replace the existing preprocessing options. Parameter behavior: - *read-only* for inherited objects
lld_macro_paths	object/array	LLD rule prototype lld_macro_path options to replace the existing lld_macro_path options. Parameter behavior: - *read-only* for inherited objects
overrides	object/array	LLD rule prototype overrides options to replace the existing overrides options. Parameter behavior: - *read-only* for inherited objects

Return values

`(object)` Returns an object containing the IDs of the updated LLD rule prototypes under the `itemids` property.

Examples

Updating LLD rule prototype preprocessing options

Update an LLD rule prototype with a JSONPath preprocessing rule. Request:

```
{
    "jsonrpc": "2.0",
    "method": "discoveryruleprototype.update",
    "params": {
        "itemid": "47253",
        "preprocessing": [
            {
                "type": 12,
                "params": "$.tablespaces",
                "error_handler": 1
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "47253"
        ]
    },
    "id": 1
}
```

Source

CDiscoveryRulePrototype::update() in *ui/include/classes/api/services/CDiscoveryRulePrototype.php*.

Maintenance

This class is designed to work with maintenances.

Object references:

- Maintenance
- Time period
- Problem tag

Available methods:

- maintenance.create - create new maintenances
- maintenance.delete - delete maintenances
- maintenance.get - retrieve maintenances
- maintenance.update - update maintenances

Maintenance object

The following objects are directly related to the `maintenance` API.

Maintenance

The maintenance object has the following properties.

Property	Type	Description
maintenanceid	ID	ID of the maintenance. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
name	string	Name of the maintenance. Property behavior: - *required* for create operations
active_since	timestamp	Time when the maintenance becomes active (inclusive). The given value will be rounded down to minutes. Property behavior: - *required* for create operations
active_till	timestamp	Time when the maintenance stops being active (exclusive). The given value will be rounded down to minutes. Property behavior: - *required* for create operations
description	string	Description of the maintenance.
maintenance_type	integer	Type of maintenance. Possible values: 0 - *(default)* with data collection; 1 - without data collection.
tags_evaltype	integer	Problem tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.

Time period

The time period object is used to define periods when the maintenance must come into effect. It has the following properties.

Property	Type	Description
period	integer	Duration of the maintenance period in seconds. The given value will be rounded down to minutes. Possible values range: 300 - 86399940. Default: 3600.
timeperiod_type	integer	Type of time period. Possible values: 0 - *(default)* one time only; 2 - daily; 3 - weekly; 4 - monthly.
start_date	timestamp	Date when the maintenance period must come into effect. The given value will be rounded down to minutes. Default: current date. Property behavior: - *supported* if `timeperiod_type` is set to ”one time only”

Property	Type	Description
start_time	integer	Time of day when the maintenance starts in seconds. The given value will be rounded down to minutes. Default: 0. Property behavior: - *supported* if `timeperiod_type` is set to ”daily”, ”weekly”, or ”monthly”
every	integer	For daily and weekly periods `every` defines the day or week intervals at which the maintenance must come into effect. Default value if `timeperiod_type` is set to ”daily” or ”weekly”: 1. For monthly periods when `day` is set, the `every` property defines the day of the month when the maintenance must come into effect. Default value if `timeperiod_type` is set to ”monthly” and `day` is set: 1. For monthly periods when `dayofweek` is set, the `every` property defines the week of the month when the maintenance must come into effect. Possible values if `timeperiod_type` is set to ”monthly” and `dayofweek` is set: 1 - *(default)* first week; 2 - second week; 3 - third week; 4 - fourth week; 5 - last week. Property behavior: - *supported* if `timeperiod_type` is set to ”daily”, ”weekly”, or ”monthly”
dayofweek	integer	Days of the week when the maintenance must come into effect. Possible bitmap values: 1 - Monday; 2 - Tuesday; 4 - Wednesday; 8 - Thursday; 16 - Friday; 32 - Saturday; 64 - Sunday. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 21 for Monday, Wednesday, and Friday). Property behavior: - *required* if `timeperiod_type` is set to ”weekly” or if `timeperiod_type` is set to ”monthly” and `day` is not set
day	integer	Day of the month when the maintenance must come into effect. Property behavior: - *required* if `timeperiod_type` is set to ”monthly” and `dayofweek` is not set

Property	Type	Description
month	integer	Months when the maintenance must come into effect. Possible bitmap values: 1 - January; 2 - February; 4 - March; 8 - April; 16 - May; 32 - June; 64 - July; 128 - August; 256 - September; 512 - October; 1024 - November; 2048 - December. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 585 for January, April, July, and October). Property behavior: - *required* if `timeperiod_type` is set to ”monthly”

Event name

The event name object is used to define which problems must be suppressed when the maintenance comes into effect. Event names can only be specified if `maintenance_type` of Maintenance object is set to ”with data collection”. It has the following properties.

Property	Type	Description
operator	integer	Condition operator. Possible values: 2 - *(default)* Contains; 3 - Does not contain.
value	string	Event name value. Property behavior: - *required*

Problem tag

The problem tag object is used to define which problems must be suppressed when the maintenance comes into effect. Tags can only be specified if `maintenance_type` of Maintenance object is set to ”with data collection”. It has the following properties.

Property	Type	Description
tag	string	Problem tag name. Property behavior: - *required*
operator	integer	Condition operator. Possible values: 0 - Equals; 1 - Does not equal; 2 - *(default)* Contains; 3 - Does not contain.
value	string	Problem tag value.

maintenance.create

Description

`object maintenance.create(object/array maintenances)`

This method allows you to create new maintenances.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Maintenances to create.

Additionally to the standard maintenance properties, the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to be put into maintenance. The host groups must have only the `groupid` property defined. Parameter behavior: - *required* if `hosts` is not set
hosts	object/array	Hosts to be put into maintenance. The hosts must have only the `hostid` property defined. Parameter behavior: - *required* if `groups` is not set
triggers	object/array	Triggers to be put into maintenance. The triggers must have only the `triggerid` property defined. Parameter behavior: - *required* if `groups` and `hosts` are not set - *supported* if maintenance_type=0 (with data collection)
event_names	object/array	Event names to define problems to be put into by maintenance. Parameter behavior: - *supported* if maintenance_type=0 (with data collection)
tags	object/array	Problem tags to define problems to be put into maintenance. Parameter behavior: - *supported* if `maintenance_type` of Maintenance object is set to "with data collection"
timeperiods	object/array	Maintenance time periods. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the created maintenances under the `maintenanceids` property. The order of the returned IDs matches the order of the passed maintenances.

Examples

Creating a maintenance

Create a maintenance with data collection for host group with ID "20", and with problem tags **service:mysqld** and **error**. It must be active from 17.03.2026 till 17.03.2027, come in effect each Sunday at 18:00 and last for one hour.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "maintenance.create",
    "params": {
        "name": "Sunday maintenance",
        "active_since": 1773720240,
        "active_till": 1805256240,
        "tags_evaltype": 0,
        "groups": [
            {"groupid": "20"}
        ],
        "timeperiods": [
            {
                "period": 3600,
                "timeperiod_type": 3,
                "start_time": 64800,
                "every": 1,
                "dayofweek": 64
            }
        ],
        "tags": [
            {
                "tag": "service",
                "operator": "0",
                "value": "mysqld"
            },
            {
                "tag": "error",
                "operator": "2",
                "value": ""
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "maintenanceids": [
            "3"
        ]
    },
    "id": 1
}
```

Creating ad-hoc maintenance

Create a one hour ad-hoc maintenance with data collection for host group with ID ”4”, trigger with ID ”12345”, and event name **Printer: ink low**.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "maintenance.create",

maintenance.delete

Description

`object maintenance.delete(array maintenanceIds)`

This method allows you to delete maintenance periods.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the maintenance periods to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted maintenance periods under the `maintenanceids` property.

Examples

Deleting multiple maintenance periods

Delete two maintenance periods.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "maintenance.delete",
    "params": [
        "3",
        "1"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "maintenanceids": [
            "3",
            "1"
        ]
    },
    "id": 1
}
```

maintenance.get

Description

`integer/array maintenance.get(object parameters)`

The method allows you to retrieve maintenances according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	ID/array	Return only maintenances that are assigned to the given host groups.
hostids	ID/array	Return only maintenances that are assigned to the given hosts.
triggerids	ID/array	Return only maintenances that are assigned to the given triggers.
maintenanceids	ID/array	Return only maintenances with the given IDs.
selectHostGroups	query	Return a `hostgroups` property with host groups assigned to the maintenance.
selectHosts	query	Return a `hosts` property with hosts assigned to the maintenance.
selectTriggers	query	Return a `triggers` property with triggers assigned to the maintenance.
selectEventNames	query	Return an `event_names` proper,ty with event names assigned to the maintenance.
selectTags	query	Return a `tags` property with problem tags of the maintenance.
selectTimeperiods	query	Return a `timeperiods` property with time periods of the maintenance.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties. Possible values: `maintenanceid`, `name`, `maintenance_type`, `active_since`, `active_till`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving maintenances

Retrieve all configured maintenances, the data about the assigned maintenance scope (host group, host, trigger, event name, tags), and defined time periods.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "maintenance.get",
    "params": {
        "output": "extend",
        "selectHostGroups": "extend",
        "selectHosts": "extend",
        "selectTriggers": "extend",
        "selectEventNames": "extend",
        "selectTags": "extend",
        "selectTimeperiods": "extend"
    },
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "maintenanceid": "1",
      "name": "Regular DB maintenance",
      "maintenance_type": "0",

Source

CMaintenance::get() in *ui/include/classes/api/services/CMaintenance.php*.

maintenance.update

Description

`object maintenance.update(object/array maintenances)`

This method allows you to update existing maintenances.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Maintenance properties to be updated.

The `maintenanceid` property must be defined for each maintenance, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard maintenance properties, the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to replace the current groups. The host groups must have only the `groupid` property defined. Parameter behavior: - *required* if `hosts` is not set
hosts	object/array	Hosts to replace the current hosts. The hosts must have only the `hostid` property defined. Parameter behavior: - *required* if `groups` is not set
triggers	object/array	Triggers to replace the current triggers. The triggers must have only the `triggerid` property defined. Parameter behavior: - *required* if `groups` and `hosts` are not set - *supported* if maintenance_type=0 (with data collection)
event_names	object/array	Event names to replace the current event names. Parameter behavior: - *supported* if maintenance_type=0 (with data collection)
tags	object/array	Problem tags to replace the current tags. Parameter behavior: - *supported* if `maintenance_type` of Maintenance object is set to "with data collection"
timeperiods	object/array	Maintenance time periods to replace the current periods.

Return values

(object) Returns an object containing the IDs of the updated maintenances under the maintenanceids property.

Examples

Assigning different hosts

Replace the hosts currently assigned to maintenance with two different ones.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "maintenance.update",
    "params": {
        "maintenanceid": "3",
        "hosts": [
            {"hostid": "10085"},
            {"hostid": "10084"}
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "maintenanceids": [
            "3"
        ]
    },
    "id": 1
}
```

Map

This class is designed to work with maps.

Object references:

- Map
- Map element
  - Map element Host
  - Map element Host group
  - Map element Map
  - Map element Trigger
  - Map element Tag
  - Map element URL
- Map link
  - Map link trigger
  - Map link indicators
- Map URL
- Map user
- Map user group
- Map shapes
- Map lines

Available methods:

- map.create - create new maps
- map.delete - delete maps
- map.get - retrieve maps
- map.update - update maps

Map object

The following objects are directly related to the `map` API.

Map

The map object has the following properties.

Property	Type	Description
sysmapid	ID	ID of the map. Property behavior: - *read-only* - *required* for update operations
height	integer	Height of the map in pixels. Property behavior: - *required* for create operations
name	string	Name of the map. Property behavior: - *required* for create operations
width	integer	Width of the map in pixels. Property behavior: - *required* for create operations
backgroundid	ID	ID of the image used as the background for the map.
background_scale	integer	Whether to enable background image proportional scaling. Possible values: 0 - disable scaling; 1 - *(default)* enable image scaling.
expand_macros	integer	Whether to expand macros in labels when configuring the map. Possible values: 0 - *(default)* do not expand macros; 1 - expand macros.
expandproblem	integer	Whether the problem trigger will be displayed for elements with a single problem. Possible values: 0 - always display the number of problems; 1 - *(default)* display the problem trigger if there's only one problem.
grid_align	integer	Whether to enable grid aligning. Possible values: 0 - disable grid aligning; 1 - *(default)* enable grid aligning.
grid_show	integer	Whether to show the grid on the map. Possible values: 0 - do not show the grid; 1 - *(default)* show the grid.
grid_size	integer	Size of the map grid in pixels. Supported values: 20, 40, 50, 75 and 100. Default: 50.

Property	Type	Description
highlight	integer	Whether icon highlighting is enabled. Possible values: 0 - highlighting disabled; 1 - *(default)* highlighting enabled.
iconmapid	ID	ID of the icon map used on the map.
label_format	integer	Whether to enable advanced labels. Possible values: 0 - *(default)* disable advanced labels; 1 - enable advanced labels.
label_location	integer	Location of the map element label. Possible values: 0 - *(default)* bottom; 1 - left; 2 - right; 3 - top.
label_string_host	string	Custom label for host elements. Property behavior: - *required* if `label_type_host` is set to ”custom”
label_string_hostgroup	string	Custom label for host group elements. Property behavior: - *required* if `label_type_hostgroup` is set to ”custom”
label_string_image	string	Custom label for image elements. Property behavior: - *required* if `label_type_image` is set to ”custom”
label_string_map	string	Custom label for map elements. Property behavior: - *required* if `label_type_map` is set to ”custom”
label_string_trigger	string	Custom label for trigger elements. Property behavior: - *required* if `label_type_trigger` is set to ”custom”
label_type	integer	Map element label type. Possible values: 0 - label; 1 - IP address; 2 - *(default)* element name; 3 - status only; 4 - nothing.
label_type_host	integer	Label type for host elements. Possible values: 0 - label; 1 - IP address; 2 - *(default)* element name; 3 - status only; 4 - nothing; 5 - custom.

Property	Type	Description
label_type_hostgroup	integer	Label type for host group elements. Possible values: 0 - label; 2 - *(default)* element name; 3 - status only; 4 - nothing; 5 - custom.
label_type_image	integer	Label type for host group elements. Possible values: 0 - label; 2 - *(default)* element name; 4 - nothing; 5 - custom.
label_type_map	integer	Label type for map elements. Possible values: 0 - label; 2 - *(default)* element name; 3 - status only; 4 - nothing; 5 - custom.
label_type_trigger	integer	Label type for trigger elements. Possible values: 0 - label; 2 - *(default)* element name; 3 - status only; 4 - nothing; 5 - custom.
markelements	integer	Whether to highlight map elements that have recently changed their status. Possible values: 0 - *(default)* do not highlight elements; 1 - highlight elements.
severity_min	integer	Minimum severity of the triggers that will be displayed on the map. Refer to the trigger `severity` property for a list of supported trigger severities.
show_element_label	integer	How to display element labels by default. Possible values: 0 - always display; 1 - *(default)* auto-hide.
show_link_label	integer	How to display link labels by default. Possible values: 0 - always display; 1 - *(default)* auto-hide.
show_unack	integer	How problems should be displayed. Possible values: 0 - *(default)* display the count of all problems; 1 - display only the count of unacknowledged problems; 2 - display the count of acknowledged and unacknowledged problems separately.
userid	ID	ID of the user that is the owner of the map.

Property	Type	Description
private	integer	Type of map sharing. Possible values: 0 - public map; 1 - *(default)* private map.
show_suppressed	integer	Whether suppressed problems are shown. Possible values: 0 - *(default)* hide suppressed problems; 1 - show suppressed problems.

Map element

The map element object defines an object displayed on a map. It has the following properties.

Property	Type	Description
selementid	ID	ID of the map element. Property behavior: - *read-only*
elements	array	Element data object. Property behavior: - *required* if `elementtype` is set to ”host”, ”map”, ”trigger” or ”host group”
elementtype	integer	Type of map element. Possible values: 0 - host; 1 - map; 2 - trigger; 3 - host group; 4 - image. Property behavior: - *required*
iconid_off	ID	ID of the image used to display the element in default state. Property behavior: - *required*
areatype	integer	How separate host group hosts should be displayed. Possible values: 0 - *(default)* the host group element will take up the whole map; 1 - the host group element will have a fixed size.
elementsubtype	integer	How a host group element should be displayed on a map. Possible values: 0 - *(default)* display the host group as a single element; 1 - display each host in the group separately.
evaltype	integer	Map element tag filtering condition evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.
height	integer	Height of the fixed size host group element in pixels. Default: 200.

Property	Type	Description
iconid_disabled	ID	ID of the image used to display disabled map elements. Property behavior: - *supported* if `elementtype` is set to ”host”, ”map”, ”trigger”, or ”host group”
iconid_maintenance	ID	ID of the image used to display map elements in maintenance. Property behavior: - *supported* if `elementtype` is set to ”host”, ”map”, ”trigger”, or ”host group”
iconid_on	ID	ID of the image used to display map elements with problems. Property behavior: - *supported* if `elementtype` is set to ”host”, ”map”, ”trigger”, or ”host group”
label	string	Label of the element.
label_location	integer	Location of the map element label. Possible values: -1 - *(default)* default location; 0 - bottom; 1 - left; 2 - right; 3 - top.
permission	integer	Type of permission level. Possible values: -1 - none; 2 - read only; 3 - read-write.
show_label	integer	How to display the element label. Possible values: -1 - *(default)* map default; 0 - always display; 1 - auto-hide.
sysmapid	ID	ID of the map that the element belongs to. Property behavior: - *read-only*
urls	array	Map element URLs. The map element URL object is described in detail below.
use_iconmap	integer	Whether icon mapping must be used for host elements. Possible values: 0 - do not use icon mapping; 1 - *(default)* use icon mapping.
viewtype	integer	Host group element placing algorithm. Possible values: 0 - *(default)* grid.
width	integer	Width of the fixed size host group element in pixels. Default: 200.
x	integer	X-coordinates of the element in pixels. Default: 0.
y	integer	Y-coordinates of the element in pixels. Default: 0.

Property	Type	Description
zindex	integer	Value used to order map elements (z-index). Default: 0.

Map element Host

The map element Host object defines one host element.

Property	Type	Description
hostid	ID	ID of the host.

Map element Host group

The map element Host group object defines one host group element.

Property	Type	Description
groupid	ID	ID of the host group.

Map element Map

The map element Map object defines one map element.

Property	Type	Description
sysmapid	ID	ID of the map.

Map element Trigger

The map element Trigger object defines one or more trigger elements.

Property	Type	Description
triggerid	ID	ID of the trigger.

Map element Tag

The map element Tag object has the following properties.

Property	Type	Description
tag	string	Map element tag name. Property behavior: - *required*
operator	integer	Map element tag condition operator. Possible values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
value	string	Map element tag value.

Map element URL

The map element URL object defines a clickable link that will be available for a specific map element. It has the following properties:

Property	Type	Description
sysmapelementurlid	ID	ID of the map element URL. Property behavior: - *read-only*
name	string	Link caption. Property behavior: - *required*
url	string	Link URL. Property behavior: - *required*
selementid	ID	ID of the map element that the URL belongs to.

Map link

The map link object defines a link between two map elements. It has the following properties.

Property	Type	Description
linkid	ID	ID of the map link. Property behavior: - *read-only*
sysmapid	ID	ID of the map the link belongs to.
selementid1	ID	ID of the first map element linked on one end. Property behavior: - *required*
selementid2	ID	ID of the first map element linked on the other end. Property behavior: - *required*
drawtype	integer	Link line draw style. Possible values: 0 - *(default)* line; 2 - bold line; 3 - dotted line; 4 - dashed line.
color	string	Line color as a hexadecimal color code. Default: 000000.
label	string	Link label.
show_label	integer	How to display the link label. Possible values: -1 - *(default)* map default; 0 - always display; 1 - auto-hide.
indicator_type	integer	Select the link indicator type. Possible values: 0 - *(default)* static link; 1 - trigger; 2 - item value.

Property	Type	Description
linktriggers	array	Map link triggers to use as link status indicators. The map link trigger object is described in detail below. Property behavior: - *required* if `indicator_type` is set to ”trigger” (1).
itemid	ID	ID of the item. Property behavior: - *required* if `indicator_type` is set to ”item value” (2).
highlights	array	Map link highlights to use as link status indicators. The map link indicators object is described in detail below. Property behavior: - *required* if `indicator_type` is set to ”item value” (2).
thresholds	array	Map link thresholds to use as link status indicators. The map link indicators object is described in detail below. Property behavior: - *required* if `indicator_type` is set to ”item value” (2).
permission	integer	Type of permission level. Possible values: -1 - none; 2 - read only; 3 - read-write.

Map link trigger

The map link trigger object defines a map link status indicator based on the state of a trigger. It has the following properties:

Property	Type	Description
triggerid	ID	ID of the trigger used as a link indicator. Property behavior: - *required*
color	string	Indicator color as a hexadecimal color code. Default: `DD0000`.
drawtype	integer	Indicator draw style. Possible values: 0 - *(default)* line; 2 - bold line; 3 - dotted line; 4 - dashed line.

Map link indicators

The map link indicators object defines a map link status indicator based on the item value. It has the following properties:

Property	Type	Description
pattern	string	Regular expression to compare against. Available only for highlights.
sortorder	integer	Used for defining the sort order of highlights. Available only for highlights.
threshold	string	Numeric value to compare against. Available only for thresholds.

Property	Type	Description
drawtype	integer	Indicator draw style. Possible values: 0 - *(default)* line; 2 - bold line; 3 - dotted line; 4 - dashed line.
color	string	Indicator color as a hexadecimal color code. Default: DD0000. Property behavior: - *required*

Map URL

The map URL object defines a clickable link that will be available for all elements of a specific type on the map. It has the following properties:

Property	Type	Description
sysmapurlid	ID	ID of the map URL. Property behavior: - *read-only*
name	string	Link caption. Property behavior: - *required*
url	string	Link URL. Property behavior: - *required*
elementtype	integer	Type of map element for which the URL will be available. Refer to the map element `type` property for a list of supported types. Default: 0.
sysmapid	ID	ID of the map that the URL belongs to.

Map user

List of map permissions based on users. It has the following properties:

Property	Type	Description
sysmapuserid	ID	ID of the map user. Property behavior: - *read-only*
userid	ID	ID of the user. Property behavior: - *required*

Property	Type	Description
permission	integer	Type of permission level. Possible values: 2 - read only; 3 - read-write. Property behavior: - *required*

Map user group

List of map permissions based on user groups. It has the following properties:

Property	Type	Description
sysmapusrgrpid	ID	ID of the map user group. Property behavior: - *read-only*
usrgrpid	ID	ID of the user group. Property behavior: - *required*
permission	integer	Type of permission level. Possible values: 2 - read only; 3 - read-write. Property behavior: - *required*

Map shapes

The map shape object defines a geometric shape (with or without text) displayed on a map. It has the following properties:

Property	Type	Description
sysmap_shapeid	ID	ID of the map shape element. Property behavior: - *read-only*
type	integer	Type of map shape element. Possible values: 0 - rectangle; 1 - ellipse. Property is required when new shapes are created. Property behavior: - *required*
x	integer	X-coordinates of the shape in pixels. Default: 0.
y	integer	Y-coordinates of the shape in pixels. Default: 0.
width	integer	Width of the shape in pixels. Default: 200.

Property	Type	Description
height	integer	Height of the shape in pixels. Default: 200.
text	string	Text of the shape.
font	integer	Font of the text within shape. Possible values: 0 - Georgia, serif 1 - ”Palatino Linotype”, ”Book Antiqua”, Palatino, serif 2 - ”Times New Roman”, Times, serif 3 - Arial, Helvetica, sans-serif 4 - ”Arial Black”, Gadget, sans-serif 5 - ”Comic Sans MS”, cursive, sans-serif 6 - Impact, Charcoal, sans-serif 7 - ”Lucida Sans Unicode”, ”Lucida Grande”, sans-serif 8 - Tahoma, Geneva, sans-serif 9 - ”Trebuchet MS”, Helvetica, sans-serif 10 - Verdana, Geneva, sans-serif 11 - ”Courier New”, Courier, monospace 12 - ”Lucida Console”, Monaco, monospace Default: 9.
font_size	integer	Font size in pixels. Default: 11.
font_color	string	Font color. Default: 000000.
text_halign	integer	Horizontal alignment of text. Possible values: 0 - center; 1 - left; 2 - right. Default: 0.
text_valign	integer	Vertical alignment of text. Possible values: 0 - middle; 1 - top; 2 - bottom. Default: 0.
border_type	integer	Type of the border. Possible values: 0 - none; 1 - ——————; 2 - ····; 3 - – – –. Default: 0.
border_width	integer	Width of the border in pixels. Default: 0.
border_color	string	Border color. Default: 000000.
background_color	string	Background color (fill color). Default: (empty).

Property	Type	Description
zindex	integer	Value used to order all shapes and lines (z-index). Default: 0.

Map lines

The map line object defines a line displayed on a map. It has the following properties:

Property	Type	Description
sysmap_shapeid	ID	ID of the map shape element. Property behavior: - *read-only*
x1	integer	X-coordinates of the line point 1 in pixels. Default: 0.
y1	integer	Y-coordinates of the line point 1 in pixels. Default: 0.
x2	integer	X-coordinates of the line point 2 in pixels. Default: 200.
y2	integer	Y-coordinates of the line point 2 in pixels. Default: 200.
line_type	integer	Type of the lines. Possible values: 0 - none; 1 - ————; 2 - ┅; 3 - − − −. Default: 0.
line_width	integer	Width of the lines in pixels. Default: 0.
line_color	string	Line color. Default: 000000.
zindex	integer	Value used to order all shapes and lines (z-index). Default: 0.

map.create

Description

`object map.create(object/array maps)`

This method allows you to create new maps.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Maps to create.

Additionally to the standard map properties, the method accepts the following parameters.

Parameter	Type	Description
links	array	Map links to be created on the map.
selements	array	Map elements to be created on the map.
urls	array	Map URLs to be created on the map.
users	array	Map user shares to be created on the map.
userGroups	array	Map user group shares to be created on the map.
shapes	array	Map shapes to be created on the map.
lines	array	Map lines to be created on the map.

Note:
To create map links you'll need to set a map element `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. See example.

Return values

`(object)` Returns an object containing the IDs of the created maps under the `sysmapids` property. The order of the returned IDs matches the order of the passed maps.

Examples

Create an empty map

Create a map with no elements.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.create",
    "params": {
        "name": "Map",
        "width": 600,
        "height": 600
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "8"
        ]
    },
    "id": 1
}
```

Create a host map

Create a map with two host elements and a link between them. Note the use of temporary "selementid1" and "selementid2" values in the map link object to refer to map elements.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.create",
    "params": {
        "name": "Host map",
        "width": 600,
        "height": 600,
        "selements": [
            {
```

```
                "selementid": "1",
                "elements": [
                    {"hostid": "1033"}
                ],
                "elementtype": 0,
                "iconid_off": "2"
            },

            {
                "selementid": "2",
                "elements": [
                    {"hostid": "1037"}
                ],
                "elementtype": 0,
                "iconid_off": "2"
            }
        ],
        "links": [
            {
                "selementid1": "1",
                "selementid2": "2"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "9"
        ]
    },
    "id": 1
}
```

Create a trigger map

Create a map with trigger element, which contains two triggers.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.create",
    "params": {
        "name": "Trigger map",
        "width": 600,
        "height": 600,
        "selements": [
            {
                "elements": [
                    {"triggerid": "12345"},
                    {"triggerid": "67890"}
                ],
                "elementtype": 2,
                "iconid_off": "2"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "10"
        ]
    },
    "id": 1
}
```

Map sharing

Create a map with two types of sharing (user and user group).

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.create",
    "params": {
        "name": "Map sharing",
        "width": 600,
        "height": 600,
        "users": [
            {
                "userid": "4",
                "permission": "3"
            }
        ],
        "userGroups": [
            {
                "usrgrpid": "7",
                "permission": "2"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "9"
        ]
    },
    "id": 1
}
```

Map shapes

Create a map with map name title.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.create",
    "params": {
        "name": "Host map",
        "width": 600,
        "height": 600,
        "shapes": [
            {
```

```
                "type": 0,
                "x": 0,
                "y": 0,
                "width": 600,
                "height": 11,
                "text": "{MAP.NAME}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "10"
        ]
    },
    "id": 1
}
```

Map lines

Create a map line.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.create",
    "params": {
        "name": "Map API lines",
        "width": 500,
        "height": 500,
        "lines": [
            {
                "x1": 30,
                "y1": 10,
                "x2": 100,
                "y2": 50,
                "line_type": 1,
                "line_width": 10,
                "line_color": "009900"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "11"
        ]
    },
    "id": 1
}
```

map.delete

Description

`object map.delete(array mapIds)`

This method allows you to delete maps.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the maps to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted maps under the `sysmapids` property.

Examples

Delete multiple maps

Delete two maps.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.delete",
    "params": [
        "12",
        "34"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "12",
            "34"
        ]
    },
    "id": 1
}
```

map.get

Description

integer/array map.get(object parameters)

The method allows you to retrieve maps according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
sysmapids	ID/array	Returns only maps with the given IDs.
userids	ID/array	Returns only maps that belong to the given user IDs.
expandUrls	flag	Adds global map URLs to the corresponding map elements and expands macros in all map element URLs.
selectIconMap	query	Returns an `iconmap` property with the icon map used on the map.
selectLinks	query	Returns a `links` property with the map links between elements.
selectSelements	query	Returns a `selements` property with the map elements.
selectUrls	query	Returns a `urls` property with the map URLs.
selectUsers	query	Returns a `users` property with users that the map is shared with.
selectUserGroups	query	Returns a `userGroups` property with user groups that the map is shared with.
selectShapes	query	Returns a `shapes` property with the map shapes.
selectLines	query	Returns a `lines` property with the map lines.
sortfield	string/array	Sort the result by the given properties. Possible values: `name`, `width`, `height`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve a map

Retrieve all data about map "3".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.get",
    "params": {
        "output": "extend",
        "selectSelements": "extend",
        "selectLinks": "extend",
```

```
        "selectUsers": "extend",
        "selectUserGroups": "extend",
        "selectShapes": "extend",
        "selectLines": "extend",
        "sysmapids": "3"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "selements": [
                {
                    "selementid": "10",
                    "sysmapid": "3",
                    "elementtype": "4",
                    "evaltype": "0",
                    "iconid_off": "1",
                    "iconid_on": "0",
                    "label": "Zabbix server",
                    "label_location": "3",
                    "x": "11",
                    "y": "141",
                    "iconid_disabled": "0",
                    "iconid_maintenance": "0",
                    "elementsubtype": "0",
                    "areatype": "0",
                    "width": "200",

map.update

Description

`object map.update(object/array maps)`

This method allows you to update existing maps.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Map properties to be updated.

The `mapid` property must be defined for each map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard map properties, the method accepts the following parameters.

Parameter	Type	Description
links	array	Map links to replace the existing links.
selements	array	Map elements to replace the existing elements.
urls	array	Map URLs to replace the existing URLs.
users	array	Map user shares to replace the existing elements.
userGroups	array	Map user group shares to replace the existing elements.
shapes	array	Map shapes to replace the existing shapes.
lines	array	Map lines to replace the existing lines.

Note:
To create map links between new map elements you'll need to set an element's `selementid` to an arbitrary value and then use this value to reference this element in the links `selementid1` or `selementid2` properties. When the element is created, this value will be replaced with the correct ID generated by Zabbix. See example for map.create.

Return values

`(object)` Returns an object containing the IDs of the updated maps under the `sysmapids` property.

Examples

Resize a map

Change the size of the map to 1200x1200 pixels.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.update",
    "params": {
        "sysmapid": "8",
        "width": 1200,
        "height": 1200
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "8"
        ]
    },
    "id": 1
}
```

Change map owner

Available only for admins and super admins.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "map.update",
    "params": {
        "sysmapid": "9",
        "userid": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "sysmapids": [
            "9"
        ]
    },
    "id": 1
}
```

CMap::update() in *ui/include/classes/api/services/CMap.php*.

Media type

This class is designed to work with media types.

Object references:

- Media type
  - Webhook parameters
  - Script parameters
- Message template

Available methods:

- mediatype.create - create new media types
- mediatype.delete - delete media types
- mediatype.get - retrieve media types
- mediatype.update - update media types

Media type object

The following objects are directly related to the `mediatype` API.

Media type

The media type object has the following properties.

Property	Type	Description
mediatypeid	ID	ID of the media type. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the media type. Property behavior: - *required* for create operations
type	integer	Transport used by the media type. Possible values: 0 - Email; 1 - Script; 2 - SMS; 4 - Webhook; 5 - Push. Property behavior: - *required* for create operations
exec_path	string	Name of the script file (e.g., notification.sh) that is located in the directory specified in the AlertScriptsPath server configuration parameter. Property behavior: - *required* if `type` is set to ”Script”

Property	Type	Description
gsm_modem	string	Serial device name of the GSM modem. Property behavior: - *required* if `type` is set to ”SMS”
passwd	string	Authentication password. Property behavior: - *supported* if `smtp_authentication` is set to ”Normal password”
provider	integer	Email provider. Possible values: 0 - *(default)* Generic SMTP; 1 - Gmail; 2 - Gmail relay; 3 - Office365; 4 - Office365 relay.
smtp_email	string	Email address from which notifications will be sent. Property behavior: - *required* if `type` is set to ”Email”
smtp_helo	string	SMTP HELO. Property behavior: - *supported* if `type` is set to ”Email”
smtp_server	string	SMTP server. Property behavior: - *required* if `type` is set to ”Email”
smtp_port	integer	SMTP server port to connect to. Default: 25. Property behavior: - *supported* if `type` is set to ”Email”
smtp_security	integer	SMTP connection security level to use. Possible values: 0 - *(default)* None; 1 - STARTTLS; 2 - SSL/TLS. Property behavior: - *supported* if `type` is set to ”Email”
smtp_verify_host	integer	SSL verify host for SMTP. Possible values: 0 - *(default)* No; 1 - Yes. Property behavior: - *supported* if `smtp_security` is set to ”STARTTLS” or ”SSL/TLS”
smtp_verify_peer	integer	SSL verify peer for SMTP. Possible values: 0 - *(default)* No; 1 - Yes. Property behavior: - *supported* if `smtp_security` is set to ”STARTTLS” or ”SSL/TLS”

Property	Type	Description
smtp_authentication	integer	SMTP authentication method to use. Possible values: 0 - *(default)* None; 1 - Normal password; 2 - OAuth token. OAuth authentication is not allowed for *Office365 relay* email provider. Property behavior: - *supported* if `type` is set to ”Email”
redirection_url	string	Zabbix frontend URL to redirect back OAuth authorization. Default: Value of API settings property `url` with part `zabbix.php?action=oauth.authorize` Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
client_id	string	The client identifier registered within the OAuth authorization server. Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
client_secret	string	The client secret registered within the OAuth authorization server. Accessible only for user of type Super Admin. Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
authorization_url	string	OAuth URL, with parameters, to get access and refresh tokens. Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
token_url	string	OAuth URL to exchange authorization token to access and refresh tokens. This URL also is used by server to refresh invalid access token. Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
tokens_status	integer	Bit mask on tokens’ status. Possible values: 0 - (default) Both tokens contain invalid value 1 - Access token contains valid value 2 - Refresh token contains valid value 3 - Both tokens contain valid value. Property behavior: - *supported* if `smtp_authentication` is set to ”OAuth token”
access_token	string	OAuth access token value. Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
access_token_updated	timestamp	Timestamp of last modification of `access_token` done by server when refreshing with `refresh_token` or API on token changes. Property behavior: - *supported* if `smtp_authentication` is set to ”OAuth token”

Property	Type	Description
access_expires_in	integer	Time in seconds when `access_token` will become outdated and will require to make request to `refresh_url`. Is set by Zabbix server on `access_token` refresh or by API on token changes. Timestamp is calculated by adding value of `access_token_updated`. Property behavior: - *supported* if `smtp_authentication` is set to ”OAuth token”
refresh_token	string	OAuth refresh token value. Property behavior: - *required* if `smtp_authentication` is set to ”OAuth token”
status	integer	Whether the media type is enabled. Possible values: 0 - *(default)* Enabled; 1 - Disabled.
username	string	User name. Property behavior: - *supported* if `smtp_authentication` is set to ”Normal password”
maxsessions	integer	The maximum number of alerts that can be processed in parallel. Possible values if `type` is set to ”SMS”: 1. Possible values if `type` is set to ”Email”, ”Script”, or ”Webhook”: 0-100. Default: 1.
maxattempts	integer	The maximum number of attempts to send an alert. Possible values: 1-100. Default: 3.
attempt_interval	string	The interval between retry attempts. Accepts a number of seconds (e.g., 1, 30, 60), or a value with a time suffix (e.g., 30s, 1m, 1h). Possible values: 0-1h. Default: 10s.
message_format	integer	Message format. Possible values: 0 - Plain text; 1 - *(default)* HTML. Property behavior: - *supported* if `type` is set to ”Email”
script	text	Webhook script body (JavaScript). Property behavior: - *required* if `type` is set to ”Webhook”

Property	Type	Description
timeout	string	Webhook script timeout. Accepts a number of seconds (e.g., 1, 60), or a value with a time suffix (e.g., 30s, 1m) Possible values: 1-60s. Default: 30s. Property behavior: - *supported* if `type` is set to ”Webhook”
process_tags	integer	Process JSON property values in Webhook script response as tags. These tags are added to any existing problem tags. Possible values: 0 - *(default)* Ignore webhook script response; 1 - Process webhook script response as tags. Property behavior: - *supported* if `type` is set to ”Webhook”
show_event_menu	integer	Include an entry in the event menu that links to a custom URL. Also adds the `urls` property to the output of problem.get and event.get. Possible values: 0 - *(default)* Do not include event menu entry or `urls` property; 1 - Include event menu entry and `urls` property. Property behavior: - *supported* if `type` is set to ”Webhook”
event_menu_url	string	URL used in the event menu entry and in the `urls` property returned by problem.get and event.get. Property behavior: - *supported* if `show_event_menu` is set to ”Include event menu entry and `urls` property”
event_menu_name	string	Name used for the event menu entry and in the `urls` property returned by problem.get and event.get. Property behavior: - *supported* if `show_event_menu` is set to ”Include event menu entry and `urls` property”
parameters	array	Webhook or script parameters. Property behavior: - *supported* if `type` is set to ”Webhook” or ”Script”
description	text	Media type description.

Webhook parameters

Webhook parameters have the following properties.

Property	Type	Description
name	string	Parameter name. Property behavior: - *required*
value	string	Parameter value, supports macros. Supported macros are described on the Supported macros page.

Script parameters

Script parameters have the following properties.

Property	Type	Description
sortorder	integer	The order in which parameter values will be passed to the script as command-line arguments, starting with 0 as the first one. Property behavior: - *required*
value	string	Parameter value, supports macros. Supported macros are described on the Supported macros page.

Message template

The message template object defines a template that will be used as a default message for action operations to send a notification. It has the following properties.

Property	Type	Description
eventsource	integer	Event source. Possible values: 0 - Triggers; 1 - Discovery; 2 - Autoregistration; 3 - Internal; 4 - Services. Property behavior: - *required*
recovery	integer	Operation mode. Possible values: 0 - Operations; 1 - Recovery operations; 2 - Update operations. Property behavior: - *required*
subject	string	Message subject.
message	string	Message text.

mediatype.create

Description

`object mediatype.create(object/array mediaTypes)`

This method allows you to create new media types.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If delivery methods are specified in the `$ZBX_FEATURE_FLAGS['media_type_denylist']` feature flag in the frontend configuration file, the user is not allowed to call the method for the corresponding media types.

Parameters

`(object/array)` Media types to create.

Additionally to the standard media type properties, the method accepts the following parameters.

Parameter	Type	Description
message_templates	array	Message templates to be created for the media type.

Return values

(object) Returns an object containing the IDs of the created media types under the mediatypeids property. The order of the returned IDs matches the order of the passed media types.

Examples

Creating an email media type

Create a new email media type with a custom SMTP port and message templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.create",
    "params": {
        "type": "0",
        "name": "Email",
        "smtp_server": "mail.example.com",
        "smtp_helo": "example.com",
        "smtp_email": "zabbix@example.com",
        "smtp_port": "587",
        "message_format": "1",
        "message_templates": [
            {
                "eventsource": "0",
                "recovery": "0",
                "subject": "Problem: {EVENT.NAME}",
                "message": "Problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\" started at {EVENT.TIME}."
            },
            {
                "eventsource": "0",
                "recovery": "1",
                "subject": "Resolved in {EVENT.DURATION}: {EVENT.NAME}",
                "message": "Problem \"{EVENT.NAME}\" on host \"{HOST.NAME}\" has been resolved at {EVENT.R
            },
            {
                "eventsource": "0",
                "recovery": "2",
                "subject": "Updated problem in {EVENT.AGE}: {EVENT.NAME}",
                "message": "{USER.FULLNAME} {EVENT.UPDATE.ACTION} problem \"{EVENT.NAME}\" on host \"{HOST
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mediatypeids": [
            "7"
        ]
    },
    "id": 1
}
```

Creating a script media type

Create a new script media type with a custom value for the number of attempts and the interval between them.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.create",
    "params": {
        "type": "1",
        "name": "Push notifications",
        "exec_path": "push-notification.sh",
        "maxattempts": "5",
        "attempt_interval": "11s",
        "parameters": [
            {
                "sortorder": "0",
                "value": "{ALERT.SENDTO}"
            },
            {
                "sortorder": "1",
                "value": "{ALERT.SUBJECT}"
            },
            {
                "sortorder": "2",
                "value": "{ALERT.MESSAGE}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mediatypeids": [
            "8"
        ]
    },
    "id": 1
}
```

Creating a webhook media type

Create a new webhook media type.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.create",
    "params": {
        "type": "4",
        "name": "Webhook",
        "script": "var Webhook = {\r\n    token: null,\r\n    to: null,\r\n    subject: null,\r\n    messa
        "parameters": [
            {
                "name": "Message",
                "value": "{ALERT.MESSAGE}"
            },
            {
                "name": "Subject",
                "value": "{ALERT.SUBJECT}"
            },
            {
                "name": "To",
                "value": "{ALERT.SENDTO}"
```

```
            },
            {
                "name": "Token",
                "value": "<Token>"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mediatypeids": [
            "9"
        ]
    },
    "id": 1
}
```

Source

CMediaType::create() in *ui/include/classes/api/services/CMediaType.php*.

mediatype.delete

Description

`object mediatype.delete(array mediaTypeIds)`

This method allows you to delete media types.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If delivery methods are specified in the `$ZBX_FEATURE_FLAGS['media_type_denylist']` feature flag in the frontend configuration file, the user is not allowed to call the method for the corresponding media types.

Parameters

`(array)` IDs of the media types to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted media types under the `mediatypeids` property.

Examples

Deleting multiple media types

Delete two media types.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.delete",
    "params": [
        "3",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mediatypeids": [
            "3",
            "5"
        ]
    },
    "id": 1
}
```

Source

CMediaType::delete() in *ui/include/classes/api/services/CMediaType.php*.

mediatype.get

Description

`integer/array mediatype.get(object parameters)`

The method allows you to retrieve media types according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If delivery methods are specified in the `$ZBX_FEATURE_FLAGS['media_type_denylist']` feature flag in the frontend configuration file, the user is not allowed to call the method for the corresponding media types.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Note:
When requesting user-related information of media types, *Admin* and *User* type users may retrieve data only about their own user. For an example, see Retrieving media types as *Admin*.

Parameter	Type	Description
mediatypeids	ID/array	Return only media types with the given IDs.
mediaids	ID/array	Return only media types used by the given media.
userids	ID/array	Return only media types used by the given users.
selectActions	query	Return an `actions` property with the actions that use the media type.
selectMessageTemplates	query	Return a `message_templates` property with an array of media type messages. Parameter behavior: - *supported* for *Super admin* type users
selectUsers	query	Return a `users` property with the users that use the media type. See `user.get` for restrictions based on user type.
sortfield	string/array	Sort the result by the given properties. Possible values: `mediatypeid`.

Parameter	Type	Description
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Possible Media type object properties for *Admin* and *User* type users: `mediatypeid`, `name`, `type`, `status`, `maxattempts`.
output	query	Media type object properties to be returned. *Admin* and *User* type users may retrieve only the following properties: `mediatypeid`, `name`, `type`, `status`, `maxattempts`, `description`. For an example, see Retrieving media types as *Admin*. Default: `extend`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supports only properties of `string` and `text` data type. Possible Media type object properties for *Admin* and *User* type users: `name`, `description`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
preservekeys	boolean	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving media types

Retrieve all configured media types. The following example returns two media types:

- email media type;
- SMS media type.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.get",
    "params": {
        "output": "extend",
        "selectMessageTemplates": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "mediatypeid": "1",
            "type": "0",
            "name": "Email",
            "smtp_server": "mail.example.com",
            "smtp_helo": "example.com",
            "smtp_email": "zabbix@example.com",
            "exec_path": "",
            "gsm_modem": "",
            "username": "",
            "passwd": "",
            "status": "0",
            "smtp_port": "25",
            "smtp_security": "0",
            "smtp_verify_peer": "0",
            "smtp_verify_host": "0",
            "smtp_authentication": "0",
            "maxsessions": "1",
            "maxattempts": "3",
            "attempt_interval": "10s",
            "message_format": "0",
            "script": "",
            "timeout": "30s",
            "process_tags": "0",
            "show_event_menu": "1",
            "event_menu_url": "",
            "event_menu_name": "",
            "description": "",
            "provider": "0",

Retrieving media types as *Admin*

As an *Admin* type user, retrieve all media types that are enabled, with users that use these media types. The following example returns two media types:

- email media type with one user (only *Admin* type user's own user);
- SMS media type with no users.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.get",
    "params": {
        "output": "extend",
        "filter": {
            "status": 0
        },
        "selectUsers": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "mediatypeid": "1",
            "type": "0",
            "name": "Email",
            "status": "0",
            "description": "",
            "maxattempts": "3",
            "users": [
                {
                    "userid": "3",
                    "username": "database-admin",
                    "name": "John",
                    "surname": "Doe",
                    "url": "",
                    "autologin": "0",

            "users": []
        }
    ],
    "id": 1
}
```

Retrieve script and webhook media types

The following example returns three media types:

- script media type with parameters;
- script media type without parameters;
- webhook media type with parameters.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.get",
    "params": {
        "output": ["mediatypeid", "name", "parameters"],
        "filter": {
            "type": [1, 4]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "mediatypeid": "10",
            "name": "Script with parameters",
            "parameters": [
                {
                    "sortorder": "0",
                    "value": "{ALERT.SENDTO}"
                },
                {
                    "sortorder": "1",
                    "value": "{EVENT.NAME}"
                },
                {
                    "sortorder": "2",
                    "value": "{ALERT.MESSAGE}"
                },
                {
                    "sortorder": "3",
                    "value": "Zabbix alert"
                }
            ]
        },
        {
            "mediatypeid": "13",
            "name": "Script without parameters",
            "parameters": []
```

```
        },
        {
            "mediatypeid": "11",
            "name": "Webhook",
            "parameters": [
                {
                    "name": "alert_message",
                    "value": "{ALERT.MESSAGE}"
                },
                {
                    "name": "event_update_message",
                    "value": "{EVENT.UPDATE.MESSAGE}"
                },
                {
                    "name": "host_name",
                    "value": "{HOST.NAME}"
                },
                {
                    "name": "trigger_description",
                    "value": "{TRIGGER.DESCRIPTION}"
                },
                {
                    "name": "trigger_id",
                    "value": "{TRIGGER.ID}"
                },
                {
                    "name": "alert_source",
                    "value": "Zabbix"
                }
            ]
        }
    ],
    "id": 1
}
```

CMediaType::get() in *ui/include/classes/api/services/CMediaType.php*.

mediatype.update

Description

`object mediatype.update(object/array mediaTypes)`

This method allows you to update existing media types.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If delivery methods are specified in the `$ZBX_FEATURE_FLAGS['media_type_denylist']` feature flag in the frontend configuration file, the user is not allowed to call the method for the corresponding media types.

Parameters

`(object/array)` Media type properties to be updated.

The `mediatypeid` property must be defined for each media type, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard media type properties, the method accepts the following parameters.

Parameter	Type	Description
message_templates	array	Message templates to replace the current message templates.

Return values

(object) Returns an object containing the IDs of the updated media types under the mediatypeids property.

Examples

Enabling a media type

Enable a media type, that is, set its status to "0".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mediatype.update",
    "params": {
        "mediatypeid": "6",
        "status": "0"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mediatypeids": [
            "6"
        ]
    },
    "id": 1
}
```

MFA

This class is designed to work with MFA (Multi-Factor Authentication) methods.

Object references:

- MFA

Available methods:

- mfa.create - create new MFA methods
- mfa.delete - delete MFA methods
- mfa.get - retrieve MFA methods
- mfa.update - update MFA methods

MFA object

The following objects are directly related to the mfa API.

MFA

The MFA (Multi-Factor Authentication) object has the following properties.

Property	Type	Description
mfaid	ID	ID of the MFA method. Property behavior: - *read-only* - *required* for update operations
type	integer	Type of the MFA method. Possible values: 1 - TOTP (Time-based One-Time Passwords); 2 - Duo Universal Prompt.
name	string	Unique name of the MFA method. Property behavior: - *required* for create operations
hash_function	integer	Type of the hash function for generating TOTP codes. Possible values: 1 - SHA-1; 2 - SHA-256; 3 - SHA-512. Property behavior: - *required* if `type` is set to ”TOTP”
code_length	integer	Verification code length. Possible values: 6 - 6-digit long; 8 - 8-digit long. Property behavior: - *required* if `type` is set to ”TOTP”
api_hostname	string	API hostname provided by the Duo authentication service. Property behavior: - *required* if `type` is set to ”Duo Universal Prompt”
clientid	string	Client ID provided by the Duo authentication service. Property behavior: - *required* if `type` is set to ”Duo Universal Prompt”
client_secret	string	Client secret provided by the Duo authentication service. Property behavior: - *write-only* - *required* if `type` is set to ”Duo Universal Prompt”

mfa.create

Description

`object mfa.create(object/array MFA methods)`

This method allows you to create new MFA methods.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` MFA methods to create.

The method accepts MFA methods with the standard MFA method properties.

Return values

`(object)` Returns an object containing the IDs of the created MFA methods under the `mfaids` property. The order of the returned IDs matches the order of the passed items.

Examples

Creating MFA methods

Create a "Zabbix TOTP" MFA method utilizing time-based one-time passwords (TOTP), with the hash function for generating TOTP codes set to SHA-1 and the verification code length set to 6 digits.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mfa.create",
    "params": {
        "type": 1,
        "name": "Zabbix TOTP",
        "hash_function": 1,
        "code_length": 6
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mfaids": [
            "1"
        ]
    },
    "id": 1
}
```

Source

CMfa::create() in *ui/include/classes/api/services/CMfa.php*.

mfa.delete

Description

`object mfa.delete(array mfaids)`

This method allows you to delete MFA methods.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the MFA methods to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted MFA methods under the `mfaids` property.

Examples

Deleting MFA methods

Delete an MFA method.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mfa.delete",
    "params": [
        "2"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mfaids": [
            "2"
        ]
    },
    "id": 1
}
```

Source

CMfa::delete() in *ui/include/classes/api/services/CMfa.php*.

mfa.get

Description

`integer/array mfa.get(object parameters)`

The method allows you to retrieve MFA methods according to the given parameters.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
mfaids	ID/array	Return only MFA methods with the given IDs.
selectUsrgrps	query	Return a `usrgrps` property with user groups associated with MFA methods. Supports `count`.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supports properties: `mfaid` - ID of the MFA method; `type` - Type of the MFA method.
sortfield	string/array	Sort the result by the given properties. Possible values: `name`.

Parameter	Type	Description
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supported properties: `name`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Finding MFA methods by name

Retrieve all MFA methods with ”Zabbix” in their name.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mfa.get",
    "params": {
        "output": "extend",
        "search": {
            "name": "Zabbix"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "mfaid": "1",
            "type": "1",
            "name": "Zabbix TOTP 1",
            "hash_function": "1",
            "code_length": "6",
            "api_hostname": "",
            "clientid": ""
        },
        {
            "mfaid": "2",
            "type": "1",
            "name": "Zabbix TOTP 2",
            "hash_function": "3",
            "code_length": "8",
            "api_hostname": "",
```

```
            "clientid": ""
        }
    ],
    "id": 1
}
```

mfa.update

Description

`object mfa.update(object/array MFA methods)`

This method allows you to update existing MFA methods.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` MFA method properties to be updated.

The `mfaid` property must be defined for each item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts MFA methods with the standard MFA method properties.

Return values

`(object)` Returns an object containing the IDs of the updated MFA methods under the `mfaids` property.

Examples

Updating method properties

Update the hash function for generating TOTP codes and the verification code length for the "Zabbix TOTP" MFA method utilizing time-based one-time passwords (TOTP).

Request:

```
{
    "jsonrpc": "2.0",
    "method": "mfa.update",
    "params": {
        "mfaid": "1",
        "hash_function": 3,
        "code_length": 8
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "mfaids": [
            "1"
        ]
    },
    "id": 1
}
```

Module

This class is designed to work with frontend modules.

Object references:

- Module

Available methods:

- module.create - install new modules
- module.delete - uninstall modules
- module.get - retrieve modules
- module.update - update modules

Module object

The following objects are directly related to the `module` API.

Module

The module object has the following properties.

Property	Type	Description
moduleid	ID	ID of the module as stored in the database. Property behavior: - *read-only* - *required* for update operations
id	string	Unique module ID as defined by a developer in the `manifest.json` file of the module. Possible values for built-in modules: see property "type" description in Dashboard widget. Property behavior: - *required* for create operations
relative_path	string	Path to the directory of the module relative to the directory of the Zabbix frontend. Possible values: `widgets/*` - for built-in widget modules; `modules/*` - for third-party modules. Property behavior: - *required* for create operations
status	integer	Whether the module is enabled or disabled. Possible values: 0 - *(default)* Disabled; 1 - Enabled.
config	object	Module configuration.

module.create

Description

`object module.create(object/array modules)`

This method allows you to install new frontend modules.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If `$ZBX_FEATURE_FLAGS['modules_config_enabled']` is set to `false` in the frontend configuration file, the user will not be allowed to call this method.

Attention:
Module files must be unpacked manually in the correct subdirectories, matching the `relative_path` property of the modules.

Parameters

`(object/array)` Modules to create.

The method accepts modules with the standard module properties.

Return values

`(object)` Returns an object containing the IDs of the installed modules under the `moduleids` property. The order of the returned IDs matches the order of the passed modules.

Examples

Installing a module

Install a module with the status "Enabled".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "module.create",
    "params": {
        "id": "example_module",
        "relative_path": "modules/example_module",
        "status": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "moduleids": [
            "25"
        ]
    },
    "id": 1
}
```

See also

Source

CModule::create() in *ui/include/classes/api/services/CModule.php*.

module.delete

Description

`object module.delete(array moduleids)`

This method allows you to uninstall modules.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If `$ZBX_FEATURE_FLAGS['modules_config_enabled']` is set to `false` in the frontend configuration file, the user will not be allowed to call this method.

Attention:
Module files must be removed manually.

Parameters

`(array)` IDs of the modules to uninstall.

Return values

`(object)` Returns an object containing the IDs of the uninstalled modules under the `moduleids` property.

Examples

Uninstalling multiple modules

Uninstall modules "27" and "28".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "module.delete",
    "params": [
        "27",
        "28"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "moduleids": [
            "27",
            "28"
        ]
    },
    "id": 1
}
```

Source

CModule::delete() in *ui/include/classes/api/services/CModule.php*.

module.get

Description

`integer/array module.get(object parameters)`

The method allows you to retrieve modules according to the given parameters.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If `$ZBX_FEATURE_FLAGS['modules_config_enabled']` is set to `false` in the frontend configuration file, the user will not be allowed to call this method.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
moduleids	ID/array	Return only modules with the given IDs.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties. Possible values: `moduleid`, `relative_path`.
countOutput	boolean	These parameters are described in the Reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving a module by ID

Retrieve all data about modules "1", "2", and "25".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "module.get",
    "params": {
        "output": "extend",
        "moduleids": [
            "1",
            "2",
            "25"
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "moduleid": "1",
            "id": "actionlog",
            "relative_path": "widgets/actionlog",
            "status": "1",
            "config": []
        },
        {
            "moduleid": "2",
            "id": "clock",
            "relative_path": "widgets/clock",
            "status": "1",
            "config": []
        },
        {
            "moduleid": "25",
```

```
            "id": "example",
            "relative_path": "modules/example_module",
            "status": "1",
            "config": []
        }
    ],
    "id": 1
}
```

module.update

Description

`object module.update(object/array modules)`

This method allows you to update existing modules.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 If `$ZBX_FEATURE_FLAGS['modules_config_enabled']` is set to `false` in the frontend configuration file, the user will not be allowed to call this method.

Parameters

`(object/array)` Module properties to be updated.

The `moduleid` property must be defined for each module, all other properties are optional. Only the specified properties will be updated.

The method accepts modules with the standard module properties.

Return values

`(object)` Returns an object containing the IDs of the updated modules under the `moduleids` property.

Examples

Disabling a module

Disable module "25".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "module.update",
    "params": {
        "moduleid": "25",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "moduleids": [
            "25"
```

```
        ]
    },
    "id": 1
}
```

Problem

This class is designed to work with problems.

Object references:

- Problem
  - Media type URL
- Problem tag

Available methods:

- problem.get - retrieve problems

Problem object

The following objects are directly related to the `problem` API.

Problem

Note:
Problems are created by the Zabbix server and cannot be modified via the API.

The problem object has the following properties.

Property	Type	Description
eventid	ID	ID of the problem event.
source	integer	Type of the problem event. Possible values: 0 - event created by a trigger; 3 - internal event; 4 - event created on service status update.
object	integer	Type of object that is related to the problem event. Possible values if `source` is set to ”event created by a trigger”: 0 - trigger. Possible values if `source` is set to ”internal event”: 0 - trigger; 4 - item; 5 - LLD rule. Possible values if `source` is set to ”event created on service status update”: 6 - service.
objectid	ID	ID of the related object.
clock	timestamp	Time when the problem event was created.
ns	integer	Nanoseconds when the problem event was created.
r_eventid	ID	ID of the recovery event.
r_clock	timestamp	Time when the recovery event was created.

Property	Type	Description
r_ns	integer	Nanoseconds when the recovery event was created.
cause_eventid	ID	ID of the cause event.
correlationid	ID	ID of the correlation rule if this event was recovered by a global correlation rule.
userid	ID	ID of the user that closed the problem (if the problem was closed manually).
name	string	Resolved problem name.
acknowledged	integer	Acknowledge state for problem. Possible values: 0 - not acknowledged; 1 - acknowledged.
severity	integer	Problem current severity. Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.
suppressed	integer	Whether the problem is suppressed. Possible values: 0 - problem is in normal state; 1 - problem is suppressed.
opdata	string	Operational data with expanded macros.
urls	array	Active media type URLs.

Media type URL

The media type URL object has the following properties.

Property	Type	Description
name	string	Media type defined URL name.
url	string	Media type defined URL value.

Results will contain entries only for active media types with enabled event menu entry. Macro used in properties will be expanded, but if one of the properties contains an unexpanded macro, both properties will be excluded from results. For supported macros, see *Supported macros*.

Problem tag

The problem tag object has the following properties.

Property	Type	Description
tag	string	Problem tag name.
value	string	Problem tag value.

problem.get

Description

`integer/array problem.get(object parameters)`

The method allows you to retrieve problems according to the given parameters.

This method is for retrieving unresolved problems. It is also possible, if specified, to additionally retrieve recently resolved problems. The period that determines how old is "recently" is defined in *Administration* > *General*. Problems that were resolved prior to that period are not kept in the problem table. To retrieve problems that were resolved further back in the past, use the `event.get` method.

Attention:
This method may return problems of a deleted entity if these problems have not been removed by the housekeeper yet.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
eventids	ID/array	Return only problems with the given IDs.
groupids	ID/array	Return only problems created by objects that belong to the given host groups.
hostids	ID/array	Return only problems created by objects that belong to the given hosts.
objectids	ID/array	Return only problems created by the given objects.
source	integer	Return only problems with the given type. Refer to the problem event object page for a list of supported event types. Default: 0 - problem created by a trigger.
object	integer	Return only problems created by objects of the given type. Refer to the problem event object page for a list of supported object types. Default: 0 - trigger.
acknowledged	boolean	If set to `true` return only acknowledged problems.
action	integer	Return only problems for which the given event update actions have been performed. For multiple actions, use a sum of any acceptable bitmap values as bitmask (for example, 34 for acknowledge and suppress event).
action_userids	ID/array	Return only problems with the given IDs of users who performed the problem event update actions.
suppressed	boolean	If set to `true` return only suppressed problems.
symptom	boolean	If set to `true` return only symptom problem events.
severities	integer/array	Return only problems with given event severities. Applies only if object is trigger.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.
tags	array	Return only problems with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all problems. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
recent	boolean	If set to `true`, return recent problems, including those resolved within the `ok_period` and any unresolved problems. If set to `false`, return only unresolved problems.

Parameter	Type	Description
eventid_from	string	Return only problems with IDs greater or equal to the given ID.
eventid_till	string	Return only problems with IDs less or equal to the given ID.
time_from	timestamp	Return only problems that have been created after or at the given time.
time_till	timestamp	Return only problems that have been created before or at the given time.
selectAcknowledges	query	Return an `acknowledges` property with the problem updates. Problem updates are sorted in reverse chronological order. The problem update object has the following properties: `acknowledgeid` - `(ID)` ID of the update; `userid` - `(ID)` ID of the user that updated the event; `eventid` - `(ID)` ID of the updated event; `clock` - `(timestamp)` time when the event was updated; `message` - `(string)` text of the message; `action` - `(integer)`type of update action (see `event.acknowledge`); `old_severity` - `(integer)` event severity before this update action; `new_severity` - `(integer)` event severity after this update action; `suppress_until` - `(timestamp)` time till event will be suppressed; `taskid` - `(ID)` ID of the task if the current event is undergoing a rank change; `maintenanceid` - `(ID)` ID of the maintenance. Supports `count`.
selectTags	query	Return a `tags` property with the problem tags. Output format: `[{"tag": "<tag>", "value": "<value>"}, ...]`.
selectSuppressionData	query	Return a `suppression_data` property with the list of active maintenances and manual suppressions: `maintenanceid` - `(ID)` ID of the maintenance; `userid` - `(ID)` ID of user who suppressed the problem; `suppress_until` - `(integer)` time until the problem is suppressed.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type.
sortfield	string/array	Sort the result by the given properties. Possible values: `eventid`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving trigger problem events

Retrieve recent events from trigger "15112."

Request:

```
{
    "jsonrpc": "2.0",
    "method": "problem.get",
    "params": {
        "output": "extend",
        "selectAcknowledges": "extend",
        "selectTags": "extend",
        "selectSuppressionData": "extend",
        "objectids": "15112",
        "recent": true,
        "sortfield": ["eventid"],
        "sortorder": "DESC"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "eventid": "1245463",
            "source": "0",

                    "new_severity": "0",
                    "suppress_until": "1472511600",
                    "taskid": "0",
                    "maintenanceid": "0"
                }
            ],
            "opdata": "",
            "suppression_data": [
                {
                    "maintenanceid": "15",
                    "suppress_until": "1472511600",
                    "userid": "0"
                }
            ],
```

```
            "tags": [
                {
                    "tag": "test-tag",
                    "value": "test-value"
                }
            ],
            "urls": []
        }
    ],
    "id": 1
}
```

Retrieving problems acknowledged by specified user

Retrieving problems acknowledged by user with ID=10

Request:

```
{
    "jsonrpc": "2.0",
    "method": "problem.get",
    "params": {
        "output": "extend",
        "action": 2,
        "action_userids": [10],
        "selectAcknowledges": ["userid", "action"],
        "sortfield": ["eventid"],
        "sortorder": "DESC"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "eventid": "1248566",
            "source": "0",
            "object": "0",
            "objectid": "15142",
            "clock": "1472457242",
            "ns": "209442442",
            "r_eventid": "1245468",
            "r_clock": "1472457285",
            "r_ns": "125644870",
            "correlationid": "0",
            "userid": "10",

CEvent::get() in *ui/include/classes/api/services/CProblem.php*.

Proxy

This class is designed to work with proxies.

Object references:

- Proxy

Available methods:

- proxy.create - create new proxies
- proxy.delete - delete proxies
- proxy.get - retrieve proxies
- proxy.update - update proxies

Proxy object

The following objects are directly related to the `proxy` API.

Proxy

The proxy object has the following properties.

Property	Type	Description
proxyid	ID	ID of the proxy. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the proxy. Property behavior: - *required* for create operations
proxy_groupid	ID	ID of the proxy group. 0 - proxy is not assigned to any proxy group.
local_address	string	Address for active agents. IP address or DNS name to connect to. Property behavior: - *required* if `proxy_groupid` is not 0
local_port	string	Local proxy port number to connect to. User macros are supported. Default: 10051. Property behavior: - *supported* if `proxy_groupid` is not 0

Property	Type	Description
operating_mode	integer	Type of proxy. Possible values: 0 - active proxy; 1 - passive proxy. Property behavior: - *required* for create operations
description	text	Description of the proxy.
lastaccess	timestamp	Time when the proxy last connected to the server. Property behavior: - *read-only*
address	string	IP address or DNS name to connect to. User macros are supported. Property behavior: - *required* if the Zabbix proxy operating mode is passive
port	string	Port number to connect to. User macros are supported. Default: 10051. Property behavior: - *supported* if the Zabbix proxy operating mode is passive
allowed_addresses	string	Comma-delimited IP addresses or DNS names of active Zabbix proxy.
tls_connect	integer	Connections to proxy. Possible values: 1 - *(default)* No encryption; 2 - PSK; 4 - certificate.
tls_accept	integer	Connections from proxy. Possible bitmap values: 1 - *(default)* No encryption; 2 - PSK; 4 - certificate. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for PSK and certificate).
tls_issuer	string	Certificate issuer.
tls_subject	string	Certificate subject.
tls_psk_identity	string	PSK identity; must be paired with only one PSK (across autoregistration, hosts, and proxies). Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. Property behavior: - *write-only* - *required* if `tls_connect` is set to "PSK", or `tls_accept` contains the "PSK" bit
tls_psk	string	Pre-shared key (PSK); must be at least 32 hex digits. Property behavior: - *write-only* - *required* if `tls_connect` is set to "PSK", or `tls_accept` contains the "PSK" bit

Property	Type	Description
custom_timeouts	integer	Whether to override global item timeouts on the proxy level. Possible values: 0 - *(default)* use global settings; 1 - override timeouts.
timeout_zabbix_agent	string	Spend no more than `timeout_*` seconds on processing. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m). Also accepts user macros. Used only if `custom_timeouts` is set to ”override timeouts”; otherwise, the value is ignored. Possible values range: 1-600s. Property behavior: - *required* if `custom_timeouts` is set to ”override timeouts”
timeout_simple_check		
timeout_snmp_agent		
timeout_external_check		
timeout_db_monitor		
timeout_http_agent		
timeout_ssh_agent		
timeout_telnet_agent		
timeout_script		
timeout_browser		
timeout_telemetry_query		
version	integer	Version of proxy. Three-part Zabbix version number, where two decimal digits are used for each part, e.g., 60401 for version 6.4.1, 70002 for version 7.0.2, etc. 0 - Unknown proxy version. Property behavior: - *read-only*
compatibility	integer	Version of proxy compared to Zabbix server version. Possible values: 0 - Undefined; 1 - Current version (proxy and server have the same major version); 2 - Outdated version (proxy version is older than server version, but is partially supported); 3 - Unsupported version (proxy version is older than server previous LTS release version or server major version is older than proxy major version). Property behavior: - *read-only*
state	integer	State of the proxy. Possible values: 0 - Unknown; 1 - Offline; 2 - Online. Property behavior: - *read-only*

Application performance monitoring (APM)

The APM object has the following properties.

Property	Type	Description
data_collection_status	integer	Whether telemetry data collection is enabled on the proxy. Possible values: 0 - *(default)* Disabled; 1 - Enabled.
max_messages_per_second	integer	Maximum number of messages per second the proxy accepts. Possible values range: 0 (unlimited) – 2147483647. Default: 0. Property behavior: - *supported* if `data_collection_status` is set to ”Enabled”
additional_resource_attributes	array	Array of resource attributes to add to incoming telemetry data. Property behavior: - *supported* if `data_collection_status` is set to ”Enabled”

Resource attributes

The resource attributes object has the following properties.

Property	Type	Description
key	string	Resource attribute name. Must be unique for the specified `signal_type`. Property behavior: - *required*
value	string	Resource attribute value. Can be empty.
signal_type	integer	Type of telemetry data the attribute applies to. Possible values: 0 - Traces; 1 - Metrics; 2 - Logs. Property behavior: - *required*

proxy.create

Description

`object proxy.create(object/array proxies)`

This method allows you to create new proxies.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Proxies to create.

Additionally to the standard proxy properties, the method accepts the following parameters.

Parameter	Type	Description
hosts	array	Hosts to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy. The hosts must have only the `hostid` property defined.
apm	object	Application performance monitoring (APM) settings of the proxy.

Return values

`(object)` Returns an object containing the IDs of the created proxies under the `proxyids` property. The order of the returned IDs matches the order of the passed proxies.

Examples

Create an active proxy

Create an action proxy "Active proxy" and assign a host to be monitored by it.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "name": "Active proxy",
        "operating_mode": "0",
        "hosts": [
            {
                "hostid": "10279"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10280"
        ]
    },
    "id": 1
}
```

Create a passive proxy

Create a passive proxy "Passive proxy" and assign two hosts to be monitored by it.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "name": "Passive proxy",
        "operating_mode": "1",
        "address": "127.0.0.1",
        "port": "10051",
        "hosts": [
            {
                "hostid": "10192"
            },
            {
```

```
                "hostid": "10139"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10284"
        ]
    },
    "id": 1
}
```

Creating a proxy and adding it to a proxy group

Create an active proxy ”Active proxy” and add it to proxy group with ID ”1”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "name": "Active proxy",
        "proxy_groupid": "1",
        "operating_mode": "0"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "5"
        ]
    },
    "id": 1
}
```

Creating a proxy with certificate-based encryption

Create an active proxy with certificate-based encryption. The proxy is configured to monitor host ”10785”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "name": "Active proxy",
        "operating_mode": "0",
        "hosts": [
            {
                "hostid": "10785"
            }
        ],
        "tls_accept": "4",
        "tls_issuer": "CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com",
        "tls_subject": "CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com"
```

```
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "2"
        ]
    },
    "id": 1
}
```

Creating a proxy with APM enabled

Create an active proxy "Active proxy" with APM enabled. The proxy accepts up to 1000 messages per second, adds the `deployment.environment` resource attribute to traces, and adds the `cloud.region` resource attribute to metrics.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "name": "Active proxy",
        "operating_mode": "0",
        "apm": {
            "data_collection_status": "1",
            "max_messages_per_second": "1000",
            "additional_resource_attributes": [
                {
                    "key": "deployment.environment",
                    "value": "production",
                    "signal_type": "0"
                },
                {
                    "key": "cloud.region",
                    "value": "eu-central-1",
                    "signal_type": "1"
                }
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "3"
        ]
    },
    "id": 1
}
```

proxy.delete

Description

`object proxy.delete(array proxies)`

This method allows you to delete proxies.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of proxies to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted proxies under the `proxyids` property.

Examples

Delete multiple proxies

Delete two proxies.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.delete",
    "params": [
        "10286",
        "10285"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10286",
            "10285"
        ]
    },
    "id": 1
}
```

proxy.get

Description

`integer/array proxy.get(object parameters)`

The method allows you to retrieve proxies according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. SeeUser roles for more information.
 Only proxies allowed by the *Proxy access list* of the user's user groups are returned.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
proxyids	ID/array	Return only proxies with the given IDs.
proxy_groupids	ID/array	Return only proxies that belong to the given proxy groups.
selectApm	query	Return an `apm` property with the application performance monitoring (APM) settings of the proxy.
selectAssignedHosts	query	Return an `assignedHosts` property with the hosts assigned to the proxy. Supports `count`.
selectHosts	query	Return a `hosts` property with the hosts monitored by the proxy. Supports `count`.
selectProxyGroup	query	Return a `proxyGroup` property with the proxy group object.
sortfield	string/array	Sort the result by the given properties. Possible values: `proxyid`, `name`, `operating_mode`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all proxies

Retrieve all configured proxies and their interfaces.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "proxyid": "11",
            "name": "Active proxy",
```

proxy.update

Description

`object proxy.update(object/array proxies)`

This method allows you to update existing proxies.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Proxy properties to be updated.

The `proxyid` property must be defined for each proxy, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard proxy properties, the method accepts the following parameters.

Parameter	Type	Description
hosts	array	Hosts to be monitored by the proxy. If a host is already monitored by a different proxy, it will be reassigned to the current proxy. The hosts must have only the `hostid` property defined.
apm	object	Application performance monitoring (APM) settings of the proxy.

Return values

`(object)` Returns an object containing the IDs of the updated proxies under the `proxyids` property.

Examples

Change hosts monitored by a proxy

Update the proxy to monitor the two given hosts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.update",
    "params": {
        "proxyid": "10293",
        "hosts": [
            {
                "hostid": "10294"
            },
            {
                "hostid": "10295"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10293"
        ]
    },
    "id": 1
}
```

Change proxy status

Change the proxy to an active proxy and rename it to ”Active proxy”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.update",
    "params": {
        "proxyid": "10293",
        "name": "Active proxy",
        "operating_mode": "0"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "10293"
        ]
    },
    "id": 1
}
```

Add a proxy to a proxy group

Update proxy with ID ”5” and add it to proxy group with ID ”1”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxy.create",
    "params": {
        "proxyid": "5",
        "proxy_groupid": "1",
        "local_address": "127.0.0.1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxyids": [
            "5"
        ]
    },
    "id": 1
}
```

CProxy::update() in *ui/include/classes/api/services/CProxy.php*.

Proxy group

This class is designed to work with proxy groups.

Object references:

- Proxy group

Available methods:

- proxygroup.create - create new proxy groups
- proxygroup.delete - delete proxy groups
- proxygroup.get - retrieve proxy groups
- proxygroup.update - update proxy groups

Proxy group object

The following objects are directly related to the `proxygroup` API.

Proxy group

The proxy group object has the following properties.

Property	Type	Description
proxy_groupid	ID	ID of the proxy group. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the proxy group. Property behavior: - *required* for create operations
description	text	Description of the proxy group.
failover_delay	string	Period during which a proxy in the proxy group must communicate with Zabbix server to be considered online. Time suffixes are supported (e.g., `30s`, `1m`). User macros are supported. Possible values: 10s-15m. Default: 1m.
min_online	string	Minimum number of online proxies required to keep the proxy group online. User macros are supported. Possible values range: 1-1000. Default: 1.

Property	Type	Description
state	integer	State of the proxy group. Possible values: 0 - Unknown; 1 - Offline; 2 - Recovering; 3 - Online; 4 - Degrading. Property behavior: - *read-only*

proxygroup.create

Description

`object proxygroup.create(object/array proxyGroups)`

This method allows you to create new proxy groups.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Proxy groups to create.

The method accepts proxy groups with the standard proxy group properties.

Return values

`(object)` Returns an object containing the IDs of the created proxy groups under the `proxy_groupids` property. The order of the returned IDs matches the order of the passed proxy groups.

Examples

Create a proxy group

Create a proxy group with custom settings.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxygroup.create",
    "params": {
        "name": "Proxy group",
        "failover_delay": "5m",
        "min_online": "10"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxy_groupids": [
            "5"
        ]
    },
    "id": 1
}
```

Source

CProxyGroup::create() in *ui/include/classes/api/services/CProxyGroup.php*.

proxygroup.delete

Description

`object proxygroup.delete(array proxyGroupIds)`

This method allows you to delete proxy groups.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of proxy groups to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted proxy groups under the `proxy_groupids` property.

Examples

Delete multiple proxy groups

Delete two proxy groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxygroup.delete",
    "params": [
        "5",
        "10"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxy_groupids": [
            "5",
            "10"
        ]
    },
    "id": 1
}
```

Source

CProxyGroup::delete() in *ui/include/classes/api/services/CProxyGroup.php*.

proxygroup.get

Description

`integer/array proxygroup.get(object parameters)`

The method allows you to retrieve proxy groups according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information. Only proxy groups allowed by the *Proxy access list* of the user's user groups are returned.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
proxy_groupids	ID/array	Return only proxy groups with the given IDs.
proxyids	ID/array	Return only proxy groups that contain the given proxies.
selectProxies	query	Return a `proxies` property with the proxies that belong to the proxy group. Supports `count`.
sortfield	string/array	Sort the result by the given properties. Possible values: `proxy_groupid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all proxy groups

Retrieve all configured proxy groups with proxies.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxygroup.get",
    "params": {
        "output": "extend",
        "selectProxies": ["proxyid", "name"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "proxy_groupid": "1",
            "name": "Proxy group 1",
```

```
            "failover_delay": "1m",
            "min_online": "3",
            "description": "",
            "state": "1",
            "proxies": [
                {
                    "proxyid": "1",
                    "name": "proxy 1"
                },
                {
                    "proxyid": "2",
                    "name": "proxy 2"
                }
            ]
        },
        {
            "proxy_groupid": "2",
            "name": "Proxy group 2",
            "failover_delay": "10m",
            "min_online": "3",
            "description": "",
            "state": "3",
            "proxies": [
                {
                    "proxyid": "3",
                    "name": "proxy 3"
                },
                {
                    "proxyid": "4",
                    "name": "proxy 4"
                },
                {
                    "proxyid": "5",
                    "name": "proxy 5"
                }
            ]
        }
    ],
    "id": 1
}
```

proxygroup.update

Description

`object proxygroup.update(object/array proxyGroups)`

This method allows you to update existing proxy groups.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Proxy group properties to be updated.

The `proxy_groupid` property must be defined for each proxy group, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts proxy groups with the standard proxy group properties.

Return values

`(object)` Returns an object containing the IDs of the updated proxy groups under the `proxy_groupids` property.

Examples

Change minimum number of online proxies

Change minimum number of online proxies required for the group to be online.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "proxygroup.update",
    "params": {
        "proxy_groupid": "5",
        "min_online": "3"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "proxy_groupids": [
            "5"
        ]
    },
    "id": 1
}
```

Regular expression

This class is designed to work with global regular expressions.

Object references:

- Regular expression
- Expressions

Available methods:

- regexp.create - create new regular expressions
- regexp.delete - delete regular expressions
- regexp.get - retrieve regular expressions
- regexp.update - update regular expressions

Regular expression object

The following objects are directly related to the `regexp` API.

Regular expression

The global regular expression object has the following properties.

Property	Type	Description
regexpid	ID	ID of the regular expression. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the regular expression. Property behavior: - *required* for create operations
description	text	Description of the regular expression
test_string	string	Test string

Expressions

The expressions object has the following properties.

Property	Type	Description
expression	string	Regular expression. Property behavior: - *required*
expression_type	integer	Type of Regular expression. Possible values: 0 - Contains string; 1 - Contains any substring from list; 2 - Does not contain string; 3 - Matches regular expression; 4 - Does not match regular expression. Property behavior: - *required*
exp_delimiter	string	Expression delimiter. Default value: `","`. Possible values: `","` or `"."`, or `"/"`. Property behavior: - *supported* if `expression_type` is set to *Contains any substring from list*.
case_sensitive	integer	Case sensitivity. Default value: 0. Possible values: 0 - Case insensitive; 1 - Case sensitive.

regexp.create

Description

`object regexp.create(object/array regularExpressions)`

This method allows you to create new global regular expressions.

Note:
This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Regular expressions to create.

Additionally to the standard properties, the method accepts the following parameters.

Parameter	Type	Description
expressions	array	Expressions options. Parameter behavior: *- required*

Return values

`(object)` Returns an object containing the IDs of the created regular expressions under the `regexpids` property.

Examples

Creating a new global regular expression.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "regexp.create",
    "params": {
        "name": "Storage devices for SNMP discovery",
        "description": "Global regular expression used to discover and identify memory resources on the mo
        "test_string": "/boot",
        "expressions": [
            {
                "expression": "^(Physical memory|Virtual memory|Memory buffers|Cached memory|Swap space)$"
                "expression_type": "4",
                "case_sensitive": "1"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "regexpids": [
            "9"
        ]
    },
    "id": 1
}
```

Source

CRegexp::create() in *ui/include/classes/api/services/CRegexp.php*.

regexp.delete

Description

`object regexp.delete(array regexpids)`

This method allows you to delete global regular expressions.

> **Note:**
> This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the regular expressions to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted regular expressions under the `regexpids` property.

Examples

Deleting multiple global regular expressions.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "regexp.delete",
    "params": [
        "16",
        "17"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "regexpids": [
            "16",
            "17"
        ]
    },
    "id": 1
}
```

Source

CRegexp::delete() in *ui/include/classes/api/services/CRegexp.php*.

regexp.get

Description

`integer/array regexp.get(object parameters)`

The method allows you to retrieve global regular expressions according to the given parameters.

> **Note:**
> This method is available only to *Super Admin*. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
regexpids	ID/array	Return only regular expressions with the given IDs.
selectExpressions	query	Return an `expressions` property.
sortfield	string/array	Sort the result by the given properties. Possible values: `regexpid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	

Parameter	Type	Description
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving global regular expressions.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "regexp.get",
    "params": {
        "output": ["regexpid","name","description"],
        "selectExpressions": ["expression","expression_type"],
        "regexpids": [1,2],
        "preservekeys": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "1": {
            "regexpid": "1",
            "name": "File systems for discovery",
            "description": "",
            "expressions": [
                {
                    "expression": "^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|n
                    "expression_type": "3"
                }
            ]
        },
        "2": {
            "regexpid": "2",
            "name": "Network interfaces for discovery",
            "description": "",
            "expressions": [
                {
                    "expression": "^Software Loopback Interface",
                    "expression_type": "4"
                },
                {
                    "expression": "^(In)?[Ll]oop[Bb]ack[0-9._]*$",
                    "expression_type": "4"
                },
                {
```

```
                    "expression": "^NULL[0-9.]*$",
                    "expression_type": "4"
                },
                {
                    "expression": "^[Ll]o[0-9.]*$",
                    "expression_type": "4"
                },
                {
                    "expression": "^[Ss]ystem$",
                    "expression_type": "4"
                },
                {
                    "expression": "^Nu[0-9.]*$",
                    "expression_type": "4"
                }
            ]
        }
    },
    "id": 1
}
```

regexp.update

Description

`object regexp.update(object/array regularExpressions)`

This method allows you to update existing global regular expressions.

> **Note:**
> This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Regular expression properties to be updated.

The `regexpid` property must be defined for each object, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard properties, the method accepts the following parameters.

Parameter	Type	Description
expressions	array	Expressions options.

Return values

`(object)` Returns an object containing the IDs of the updated regular expressions under the `regexpids` property.

Examples

Updating global regular expression for file systems discovery.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "regexp.update",
    "params": {
        "regexpid": "1",
        "name": "File systems for discovery",
        "description": "Global regular expression used to discover and identify file systems on the monito
```

```
        "test_string": "",
        "expressions": [
            {
                "expression": "^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|zfs)$
                "expression_type": "3",
                "case_sensitive": "0"
            },
            {
                "expression": "^(ntfs|fat32|fat16)$",
                "expression_type": "3",
                "case_sensitive": "0"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "regexpids": [
            "1"
        ]
    },
    "id": 1
}
```

Report

This class is designed to work with scheduled reports.

Object references:

- Report
- Users
- User groups

Available methods:

- report.create - create new scheduled reports
- report.delete - delete scheduled reports
- report.get - retrieve scheduled reports
- report.update - update scheduled reports

Report object

The following objects are directly related to the `report` API.

Report

The report object has the following properties:

Property	Type	Description
reportid	ID	ID of the report. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
userid	ID	ID of the user who created the report. Property behavior: - *required* for create operations
name	string	Unique name of the report. Property behavior: - *required* for create operations
dashboardid	ID	ID of the dashboard that the report is based on. Property behavior: - *required* for create operations
period	integer	Period for which the report will be prepared. Possible values: 0 - *(default)* previous day; 1 - previous week; 2 - previous month; 3 - previous year.
cycle	integer	Period repeating schedule. Possible values: 0 - *(default)* daily; 1 - weekly; 2 - monthly; 3 - yearly.
start_time	integer	Time of the day, in seconds, when the report will be prepared for sending. Default: 0.
weekdays	integer	Days of the week for sending the report. Possible bitmap values: 1 - Monday; 2 - Tuesday; 4 - Wednesday; 8 - Thursday; 16 - Friday; 32 - Saturday; 64 - Sunday. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 21 for Monday, Wednesday, and Friday). Default: 0. Property behavior: - *required* if `cycle` is set to ”weekly”.
active_since	string	On which date to start. Possible values: empty string - *(default)* not specified (stored as 0); specific date in YYYY-MM-DD format (stored as a timestamp of the beginning of a day (00:00:00)).
active_till	string	On which date to end. Possible values: empty string - *(default)* not specified (stored as 0); specific date in YYYY-MM-DD format (stored as a timestamp of the end of a day (23:59:59)).
subject	string	Report message subject.

Property	Type	Description
message	string	Report message text.
status	integer	Whether the report is enabled or disabled. Possible values: 0 - *(default)* Enabled; 1 - Disabled.
description	text	Description of the report.
state	integer	State of the report. Possible values: 0 - *(default)* report was not yet processed; 1 - report was generated and successfully sent to all recipients; 2 - report generating failed; ”info” contains error information; 3 - report was generated, but sending to some (or all) recipients failed; ”info” contains error information. Property behavior: - *read-only*
lastsent	timestamp	Unix timestamp of the last successfully sent report. Property behavior: - *read-only*
info	string	Error description or additional information. Property behavior: - *read-only*

Users

The users object has the following properties:

Property	Type	Description
userid	ID	ID of user to send the report to. Property behavior: - *required*
access_userid	ID	ID of user on whose behalf the report will be generated. 0 - *(default)* Generate report by recipient.
exclude	integer	Whether to exclude the user from mailing list. Possible values: 0 - *(default)* Include; 1 - Exclude.

User groups

The user groups object has the following properties:

Property	Type	Description
usrgrpid	ID	ID of user group to send the report to. Property behavior: - *required*
access_userid	ID	ID of user on whose behalf the report will be generated. 0 - *(default)* Generate report by recipient.

report.create

Description

`object report.create(object/array reports)`

This method allows you to create new scheduled reports.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Scheduled reports to create.

Additionally to the standard scheduled report properties, the method accepts the following parameters.

Parameter	Type	Description
users	object/array	Users to send the report to. Parameter behavior: - *required* if `user_groups` is not set
user_groups	object/array	User groups to send the report to. Parameter behavior: - *required* if `users` is not set

Return values

`(object)` Returns an object containing the IDs of the created scheduled reports under the `reportids` property. The order of the returned IDs matches the order of the passed scheduled reports.

Examples

Creating a scheduled report

Create a weekly report that will be prepared for the previous week every Monday-Friday at 12:00 from 2021-04-01 to 2021-08-31.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "report.create",
    "params": {
        "userid": "1",
        "name": "Weekly report",
        "dashboardid": "1",
        "period": "1",
        "cycle": "1",
        "start_time": "43200",
        "weekdays": "31",
        "active_since": "2021-04-01",
        "active_till": "2021-08-31",
        "subject": "Weekly report",
        "message": "Report accompanying text",
        "status": "1",
        "description": "Report description",
        "users": [
            {
                "userid": "1",
                "access_userid": "1",
                "exclude": "0"
            },
            {
                "userid": "2",
```

```
                "access_userid": "0",
                "exclude": "1"
            }
        ],
        "user_groups": [
            {
                "usrgrpid": "7",
                "access_userid": "0"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "reportids": [
            "1"
        ]
    },
    "id": 1
}
```

report.delete

Description

`object report.delete(array reportids)`

This method allows you to delete scheduled reports.

> **Note:**
> This method is only available to *Admin* and *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the scheduled reports to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted scheduled reports under the `reportids` property.

Examples

Deleting multiple scheduled reports

Delete two scheduled reports.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "report.delete",
    "params": [
        "1",
        "2"
```

```
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "reportids": [
            "1",
            "2"
        ]
    },
    "id": 1
}
```

Source

CReport::delete() in *ui/include/classes/api/services/CReport.php*.

report.get

Description

`integer/array report.get(object parameters)`

The method allows you to retrieve scheduled reports according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
reportids	ID/array	Return only scheduled reports with the given report IDs.
expired	boolean	If set to `true` return only expired scheduled reports.
selectUsers	query	Return a `users` property with users the report is configured to be sent to.
selectUserGroups	query	Return a `user_groups` property with user groups the report is configured to be sent to.
sortfield	string/array	Sort the result by the given properties. Possible values: `reportid`, `name`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving report data

Request:

```
{
    "jsonrpc": "2.0",
    "method": "report.get",
    "params": {
        "output": "extend",
        "selectUsers": "extend",
        "selectUserGroups": "extend",
        "reportids": ["1", "2"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "reportid": "1",
            "userid": "1",

CReport::get() in *ui/include/classes/api/services/CReport.php*.

report.update

Description

`object report.update(object/array reports)`

This method allows you to update existing scheduled reports.

> **Note:**
> This method is only available to *Admin* and *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Scheduled report properties to be updated.

The `reportid` property must be defined for each scheduled report, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard scheduled report properties the method accepts the following parameters.

Parameter	Type	Description
users	object/array	Users to replace the current users assigned to the scheduled report. Parameter behavior: - *required* if `user_groups` is not set

Parameter	Type	Description
user_groups	object/array	User groups to replace the current user groups assigned to the scheduled report. Parameter behavior: - *required* if `users` is not set

Return values

(`object`) Returns an object containing the IDs of the updated scheduled reports under the `reportids` property.

Examples

Disabling scheduled report

Request:

```
{
    "jsonrpc": "2.0",
    "method": "report.update",
    "params": {
        "reportid": "1",
        "status": "0"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "reportids": [
            "1"
        ]
    },
    "id": 1
}
```

CReport::update() in *ui/include/classes/api/services/CReport.php*.

Role

This class is designed to work with user roles.

Object references:

- Role
- Role rules
  - UI element
  - Service
  - Service tag
  - Module
  - Action

Available methods:

- role.create - create new user roles
- role.delete - delete user roles
- role.get - retrieve user roles
- role.update - update user roles

Role object

The following objects are directly related to the `role` API.

Role

The role object has the following properties:

Property	Type	Description
roleid	ID	ID of the role. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the role. Property behavior: - *required* for create operations
type	integer	User type. Possible values: 1 - *(default)* User; 2 - Admin; 3 - Super admin. Property behavior: - *required* for create operations
readonly	integer	Whether the role is readonly. Possible values: 0 - *(default)* No; 1 - Yes. Property behavior: - *read-only*

Role rules

The role rules object has the following properties:

Property	Type	Description
ui	array	Array of the UI element objects.
ui.default_access	integer	Whether access to new UI elements is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.
profile.redirect.enforce	integer	Whether role-level redirect URL after authentication is enforced and cannot be overridden by the user. Possible values: 0 - *(default)* Disabled; 1 - Enabled.
profile.redirect.url	string	URL used for user redirection after authentication.
services.read.mode	integer	Read-only access to services. Possible values: 0 - Read-only access to the services, specified by the `services.read.list` or matched by the `services.read.tag` properties; 1 - *(default)* Read-only access to all services.

Property	Type	Description
services.read.list	array	Array of Service objects. The specified services, including child services, will be granted a read-only access to the user role. Read-only access will not override read-write access to the services. Property behavior: - *supported* if `services.read.mode` is set to "0".
services.read.tag	object	Array of Service tag objects. The tag matched services, including child services, will be granted a read-only access to the user role. Read-only access will not override read-write access to the services. Property behavior: - *supported* if `services.read.mode` is set to "0".
services.write.mode	integer	Read-write access to services. Possible values: 0 - *(default)* Read-write access to the services, specified by the `services.write.list` or matched by the `services.write.tag` properties; 1 - Read-write access to all services.
services.write.list	array	Array of Service objects. The specified services, including child services, will be granted a read-write access to the user role. Read-write access will override read-only access to the services. Property behavior: - *supported* if `services.write.mode` is set to "0".
services.write.tag	object	Array of Service tag objects. The tag matched services, including child services, will be granted a read-write access to the user role. Read-write access will override read-only access to the services. Property behavior: - *supported* if `services.write.mode` is set to "0".
modules	array	Array of the module objects.
modules.default_access	integer	Whether access to new modules is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.
api.access	integer	Whether access to API is enabled. Possible values: 0 - *(default)* Disabled; 1 - Enabled.
api.mode	integer	Mode for treating API methods listed in the `api` property. Possible values: 0 - *(default)* Deny list; 1 - Allow list. Property behavior: - *supported* if `api.access` is set to "1".

Property	Type	Description
api	array	Array of API methods. Wildcards are supported, for example: `*` (any method), `dashboard.*`, `*.export`. If no methods are specified, access to all API methods is denied if `api.mode` is set to "1" (Allow list), and allowed if `api.mode` is set to "0" (Deny list). Property behavior: - *supported* if `api.access` is set to "1".
actions	array	Array of the action objects.
actions.default_access	integer	Whether access to new actions is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.
devices.access	integer	Whether access to user's own mobile devices for use with Zabbix mobile app is enabled. Possible values: 0 - (*default for User and Admin*) Disabled; 1 - (*default for Super admin*) Enabled. Property behavior: - *supported* if `EnableMobileDevices` is enabled
devices.actions	array	Array of Device action objects. Property behavior: - *supported* if `devices.access` is set to "1"
devices.actions.default_access	integer	Whether access to new device actions is enabled. Possible values: 0 - (*default for User and Admin*) Disabled; 1 - (*default for Super admin*) Enabled. Property behavior: - *supported* if `EnableMobileDevices` is enabled

UI element

The UI element object has the following properties:

Property	Type	Description
name	string	Name of the UI element. Possible values if `type` of the Role object is set to ”User”, ”Admin”, or ”Super admin”: `monitoring.dashboard` - *Dashboards*; `monitoring.problems` - *Monitoring > Problems*; `monitoring.hosts` - *Monitoring > Hosts*; `monitoring.latest_data` - *Monitoring > Latest data*; `monitoring.maps` - *Monitoring > Maps*; `services.services` - *Services > Services*; `services.sla_report` - *Services > SLA report*; `inventory.overview` - *Inventory > Overview*; `inventory.hosts` - *Inventory > Hosts*; `reports.availability_report` - *Reports > Availability report*; `reports.top_triggers` - *Reports > Triggers top 100*. Possible values if `type` of the Role object is set to ”Admin” or ”Super admin”: `monitoring.discovery` - *Monitoring > Discovery*; `services.sla` - *Services > SLA*; `reports.scheduled_reports` - *Reports > Scheduled reports*; `reports.notifications` - *Reports > Notifications*; `configuration.template_groups` - *Data collection > Template groups*; `configuration.host_groups` - *Data collection > Host groups*; `configuration.templates` - *Data collection > Templates*; `configuration.hosts` - *Data collection > Hosts*; `configuration.maintenance` - *Data collection > Maintenance*; `configuration.discovery` - *Data collection > Discovery*; `configuration.trigger_actions` - *Alerts > Actions > Trigger actions*; `configuration.service_actions` - *Alerts > Actions > Service actions*; `configuration.discovery_actions` - *Alerts > Actions > Discovery actions*; `configuration.autoregistration_actions` - *Alerts > Actions > Autoregistration actions*; `configuration.internal_actions` - *Alerts > Actions > Internal actions*. Possible values if `type` of the Role object is set to ”Super admin”: `reports.system_info` - *Reports > System information*; `reports.audit` - *Reports > Audit log*; `reports.action_log` - *Reports > Action log*; `configuration.event_correlation` - *Data collection > Event correlation*; `administration.media_types` - *Alerts > Media types*; `administration.scripts` - *Alerts > Scripts*; `administration.user_groups` - *Users > User groups*; `administration.user_roles` - *Users > User roles*; `administration.users` - *Users > Users*; `administration.api_tokens` - *Users > API tokens*; `administration.authentication` - *Users > Authentication*; `administration.linked_devices` - *Users > Devices*; `administration.general` - *Administration > General*; `administration.audit_log` - *Administration > Audit log*; `administration.housekeeping` - *Administration > Housekeeping*; `administration.proxy_groups` - *Administration > Proxy groups*; `administration.proxies` - *Administration > Proxies*; `administration.macros` - *Administration > Macros*; `administration.queue` - *Administration > Queue*. Property behavior: - *required*

Property	Type	Description
status	integer	Whether access to the UI element is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.

Service

Property	Type	Description
serviceid	ID	ID of the Service. Property behavior: - *required*.

Service tag

Property	Type	Description
tag	string	Tag name. If empty string is specified, the service tag will not be used for service matching. Property behavior: - *required*.
value	string	Tag value. If no value or empty string is specified, only the tag name will be used for service matching.

Module

The module object has the following properties:

Property	Type	Description
moduleid	ID	ID of the module. Property behavior: - *required*.
status	integer	Whether access to the module is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.

Action

The action object has the following properties:

Property	Type	Description
name	string	Name of the action. Possible values if `type` of the Role object is set to ”User”, ”Admin”, or ”Super admin: `edit_dashboards` - Create and edit dashboards; `edit_maps` - Create and edit maps; `add_problem_comments` - Add problem comments; `change_severity` - Change problem severity; `acknowledge_problems` - Acknowledge problems; `suppress_problems` - Suppress problems; `close_problems` - Close problems; `execute_scripts` - Execute scripts; `manage_api_tokens` - Manage API tokens; `change_problem_ranking` - Change the problem ranking from cause to symptom, and vice versa; `edit_own_media` - Allow users to create and edit their own media. Possible values if `type` of the Role object is set to ”Admin” or ”Super admin”: `edit_maintenance` - Create and edit maintenances; `manage_scheduled_reports` - Manage scheduled reports, `manage_sla` - Manage SLA, `select_server_for_monitoring` - Allow users to create hosts monitored by the server and network discovery rules executed by the server. Possible values if `type` of the Role object is set to ”User” or ”Admin”: `invoke_execute_now` - allows users with only read permissions on a host to execute item checks. Possible values if `type` of the Role object is set to ”Super admin”: `edit_user_media` - Allow users to create and edit media for other users. Property behavior: - *required*.
status	integer	Whether access to perform the action is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.

Device action

The device action object has the following properties:

Property	Type	Description
name	string	Name of the device action. Possible values if `type` of the Role object is set to ”User”, ”Admin”, or ”Super admin: `manage_own` - Allow users to add or remove their own mobile devices. Possible values if `type` of the Role object is set to ”Super admin”: `manage_user` - Allow users to add or remove mobile devices for all users. Property behavior: - *required*

Property	Type	Description
status	integer	Whether access to perform the action is enabled. Possible values: 0 - Disabled; 1 - (*default*) Enabled.

role.create

Description

`object role.create(object/array roles)`

This method allows you to create new roles.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Roles to create.

Additionally to the standard role properties, the method accepts the following parameters.

Parameter	Type	Description
rules	array	Role rules to be created for the role.

Return values

`(object)` Returns an object containing the IDs of the created roles under the `roleids` property. The order of the returned IDs matches the order of the passed roles.

Examples

Creating a role

Create a role with type "User" and denied access to two UI elements.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "role.create",
    "params": {
        "name": "Operator",
        "type": "1",
        "rules": {
            "ui": [
                {
                    "name": "monitoring.hosts",
                    "status": "0"
                },
                {
                    "name": "monitoring.maps",
                    "status": "0"
                }
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "roleids": [
            "5"
        ]
    },
    "id": 1
}
```

Source

CRole::create() in *ui/include/classes/api/services/CRole.php*.

role.delete

Description

`object role.delete(array roleids)`

This method allows you to delete roles.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the roles to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted roles under the `roleids` property.

Examples

Deleting multiple user roles

Delete two user roles.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "role.delete",
    "params": [
        "4",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "roleids": [
            "4",
            "5"
        ]
    },
```

```
    "id": 1
}
```

Source

CRole::delete() in *ui/include/classes/api/services/CRole.php*.

role.get

Description

`integer/array role.get(object parameters)`

The method allows you to retrieve roles according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
roleids	ID/array	Return only roles with the given IDs.
current	boolean	If set to `true`, returns only the current user's role.
selectRules	query	Return a `rules` property with the role rules.
selectUsers	query	Return a `users` property with the users that the role is assigned to. See `user.get` for restrictions based on user type.
sortfield	string/array	Sort the result by the given properties. Possible values: `roleid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving role data

Retrieve "Super admin role" role data and its access rules.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "role.get",
    "params": {
```

```
        "output": "extend",
        "selectRules": "extend",
        "roleids": "3"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "roleid": "3",
            "name": "Super admin role",
            "type": "3",
            "readonly": "1",
            "rules": {
                "ui": [
                    {
                        "name": "monitoring.dashboard",
                        "status": "1"
                    },
                    {
                        "name": "monitoring.problems",
                        "status": "1"
                    },
                    {
                        "name": "monitoring.hosts",
                        "status": "1"
                    },
                    {
                        "name": "monitoring.latest_data",
                        "status": "1"
                    },
                    {
                        "name": "monitoring.maps",
                        "status": "1"
                    },
                    {
                        "name": "services.services",
                        "status": "1"
                    },
                    {
                        "name": "services.sla_report",
                        "status": "1"
                    },
                    {
                        "name": "inventory.overview",
                        "status": "1"
                    },
                    {
                        "name": "inventory.hosts",
                        "status": "1"
                    },
                    {
                        "name": "reports.availability_report",
                        "status": "1"
                    },
                    {
                        "name": "reports.top_triggers",
                        "status": "1"
                    },
```

```
                {
                    "name": "monitoring.discovery",
                    "status": "1"
                },
                {
                    "name": "services.sla",

role.update

Description

`object role.update(object/array roles)`

This method allows you to update existing roles.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Role properties to be updated.

The `roleid` property must be defined for each role, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard role properties the method accepts the following parameters.

Parameter	Type	Description
rules	array	Access rules to update for the role.

Return values

`(object)` Returns an object containing the IDs of the updated roles under the `roleids` property.

Examples

Disabling ability to execute scripts

Update role with ID "5", disable ability to execute scripts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "role.update",
    "params": [
        {
            "roleid": "5",
            "rules": {
                "actions": [
                    {
                        "name": "execute_scripts",
                        "status": "0"
                    }
                ]
            }
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "roleids": [
            "5"
        ]
    },
    "id": 1
}
```

Limiting access to API

Update role with ID "5", deny to call any "create", "update" or "delete" methods.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "role.update",
```

```
    "params": [
        {
            "roleid": "5",
            "rules": {
                "api.access": "1",
                "api.mode": "0",
                "api": ["*.create", "*.update", "*.delete"]
            }
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "roleids": [
            "5"
        ]
    },
    "id": 1
}
```

CRole::update() in *ui/include/classes/api/services/CRole.php*.

Script

This class is designed to work with scripts.

Object references:

- Script
  - Webhook parameters
- Debug
  - Log entry

Available methods:

- script.create - create new scripts
- script.delete - delete scripts
- script.execute - run scripts
- script.get - retrieve scripts
- script.getscriptsbyevents - retrieve scripts for events
- script.getscriptsbyhosts - retrieve scripts for hosts
- script.update - update scripts

Script object

The following objects are directly related to the `script` API.

Script

The script object has the following properties.

Property	Type	Description
scriptid	ID	ID of the script. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
name	string	Name of the script. Property behavior: - *required* for create operations
type	integer	Script type. Possible values if `scope` is set to ”action operation”: 0 - Script; 1 - IPMI; 2 - SSH; 3 - TELNET; 5 - Webhook. Possible values if `scope` is set to ”manual host action” or ”manual event action”: 6 - URL. Property behavior: - *required* for create operations
command	string	Command to run. Property behavior: - *required* if `type` is set to ”Script”, ”IPMI”, ”SSH”, ”TELNET”, or ”Webhook”
scope	integer	Script scope. Possible values: 1 - action operation; 2 - manual host action; 4 - manual event action. Property behavior: - *required* for create operations
execute_on	integer	Where to run the script. Possible values: 0 - run on Zabbix agent; 1 - run on Zabbix server. It is *supported* only if execution of global scripts is enabled on Zabbix server; 2 - *(default)* run on Zabbix server or proxy. Property behavior: - *supported* if `type` is set to ”Script”
menu_path	string	Folders separated by slash that form a menu like navigation in frontend when clicked on host or event. Property behavior: - *supported* if `scope` is set to ”manual host action” or ”manual event action”
authtype	integer	Authentication method used for SSH script type. Possible values: 0 - password; 1 - public key. Property behavior: - *supported* if `type` is set to ”SSH”
username	string	User name used for authentication. Property behavior: - *required* if `type` is set to ”SSH” or ”TELNET”

Property	Type	Description
password	string	Password used for SSH scripts with password authentication and TELNET scripts. Property behavior: - *supported* if `type` is set to ”SSH” and `authtype` is set to ”password”, or `type` is set to ”TELNET”
publickey	string	Name of the public key file used for SSH scripts with public key authentication. Property behavior: - *required* if `type` is set to ”SSH” and `authtype` is set to ”public key”
privatekey	string	Name of the private key file used for SSH scripts with public key authentication. Property behavior: - *required* if `type` is set to ”SSH” and `authtype` is set to ”public key”
port	string	Port number used for SSH and TELNET scripts. Property behavior: - *supported* if `type` is set to ”SSH” or ”TELNET”
groupid	ID	ID of the host group that the script can be run on. If set to ”0”, the script will be available on all host groups. Default: 0.
usrgrpid	ID	ID of the user group that will be allowed to run the script. If set to ”0”, the script will be available for all user groups. Default: 0. Property behavior: - *supported* if `scope` is set to ”manual host action” or ”manual event action”
host_access	integer	Host permissions needed to run the script. Possible values: 2 - *(default)* read; 3 - write. Property behavior: - *supported* if `scope` is set to ”manual host action” or ”manual event action”
confirmation	string	Confirmation pop up text. The pop up will appear when trying to run the script from the Zabbix frontend. Property behavior: - *supported* if `scope` is set to ”manual host action” or ”manual event action”
timeout	string	Webhook script execution timeout in seconds. Time suffixes are supported (e.g., `30s`, `1m`). Possible values: 1-60s. Default: 30s. Property behavior: - *required* if `type` is set to ”Webhook”

Property	Type	Description
parameters	array	Array of webhook input parameters. Property behavior: - *supported* if `type` is set to ”Webhook”
description	string	Description of the script.
url	string	User defined URL. Property behavior: - *required* if `type` is set to ”URL”
new_window	integer	Open URL in a new window. Possible values: 0 - No; 1 - *(default)* Yes. Property behavior: - *supported* if `type` is set to ”URL”
manualinput	integer	Indicates whether the script accepts user-provided input. Possible values: 0 - *(default)* Disabled; 1 - Enabled; Property behavior: - *supported* if `scope` is set to ”manual host action” or ”manual event action”
manualinput_prompt	string	Manual input prompt text. Property behavior: - *required* if `manualinput` is set to ”Enabled”
manualinput_validator	string	A character string field used to validate the user provided input. The string consists of either a regular expression or a set of values separated by commas. Property behavior: - *required* if `manualinput` is set to ”Enabled”
manualinput_validator_type	integer	Determines the type of user input expected. Possible values: 0 - *(default)* String. Indicates that manualinput_validator is to be treated as a regular expression; 1 - List. Indicates that manualinput_validator is to be treated as a comma-separated list of possible input values. Property behavior: - *supported* if `manualinput` is set to ”Enabled”
manualinput_default_value	string	Default value for auto-filling user input. Property behavior: - *supported* if `manualinput_validator_type` is set to ”String”

Webhook parameters

Parameters passed to webhook script when it is called have the following properties.

Property	Type	Description
name	string	Parameter name. Property behavior: - *required*
value	string	Parameter value. Supports macros.

Debug

Debug information of executed webhook script. The debug object has the following properties.

Property	Type	Description
logs	array	Array of log entries.
ms	string	Script execution duration in milliseconds.

Log entry

The log entry object has the following properties.

Property	Type	Description
level	integer	Log level.
ms	string	The time elapsed in milliseconds since the script was run before log entry was added.
message	string	Log message.

script.create

Description

`object script.create(object/array scripts)`

This method allows you to create new scripts.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Scripts to create.

The method accepts scripts with the standard script properties.

Return values

`(object)` Returns an object containing the IDs of the created scripts under the `scriptids` property. The order of the returned IDs matches the order of the passed scripts.

Examples

Create a webhook script

Create a webhook script that sends HTTP request to external service.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.create",
    "params": {

            },
            {
                "name": "v",
                "value": "2.2"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "3"
        ]
    },
    "id": 1
}
```

Create an SSH script

Create an SSH script with public key authentication that can be executed on a host and has a context menu.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.create",
    "params": {
        "name": "SSH script",
        "command": "my script command",
        "type": 2,
        "authtype": 1,
        "username": "John",
        "publickey": "pub.key",
        "privatekey": "priv.key",
        "password": "secret",
        "port": "12345",
        "scope": 2,
        "menu_path": "All scripts/SSH",
        "usrgrpid": "7",
        "groupid": "4"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "5"
        ]
    },
    "id": 1
}
```

Create a custom script

Create a custom script that will reboot a server. The script will require write access to the host and will prompt the user for manual input. Upon successful input submission, script will display confirmation message in the frontend.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.create",
    "params": {
        "name": "Reboot server",
        "command": "reboot server {MANUALINPUT}",
        "type": 0,
        "scope": 2,
        "confirmation": "Are you sure you would like to reboot the server {MANUALINPUT}?",
        "manualinput": 1,
        "manualinput_prompt": "Which server you want to reboot?",
        "manualinput_validator": "[1-9]",
        "manualinput_validator_type": 0,
        "manualinput_default_value": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "4"
        ]
    },
    "id": 1
}
```

Create a URL type script

Create a URL type script for host scope that remains in the same window and has confirmation text.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.create",
    "params": {
        "name": "URL script",
        "type": 6,
        "scope": 2,
        "url": "http://zabbix/ui/zabbix.php?action=host.edit&hostid={HOST.ID}",
        "confirmation": "Edit host {HOST.NAME}?",
        "new_window": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "56"
        ]
    },
    "id": 1
}
```

Create a URL type script with manual input

Create a URL type script for event scope that opens in a new window and has manual input.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.create",
    "params": {
        "name": "URL script with manual input",
        "type": 6,
        "scope": 4,
        "url": "http://zabbix/ui/zabbix.php?action={MANUALINPUT}",
        "new_window": 1,
        "manualinput": 1,
        "manualinput_prompt": "Select a page to open:",
        "manualinput_validator": "dashboard.view,script.list,actionlog.list",
        "manualinput_validator_type": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "57"
        ]
    },
    "id": 1
}
```

Source

CScript::create() in *ui/include/classes/api/services/CScript.php*.

script.delete

Description

`object script.delete(array scriptIds)`

This method allows you to delete scripts.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the scripts to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted scripts under the `scriptids` property.

Examples

Delete multiple scripts

Delete two scripts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.delete",
    "params": [
        "3",
        "4"
    ],
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "3",
            "4"
        ]
    },
    "id": 1
}
```

Source

CScript::delete() in *ui/include/classes/api/services/CScript.php*.

script.execute

Description

`object script.execute(object parameters)`

This method allows you to run a script on a host or event. Except for URL type scripts; those are not executable.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the ID of the script to run, either the ID of the host or the ID of the event and manualinput value.

Parameter	Type	Description
scriptid	ID	ID of the script to run. Parameter behavior: - *required*
hostid	ID	ID of the host to run the script on. Parameter behavior: - *required* if `eventid` is not set
eventid	ID	ID of the event to run the script on. Parameter behavior: - *required* if `hostid` is not set
manualinput	string	User-provided value to run the script with, substituting the {MANUALINPUT} macro.

Return values

`(object)` Returns the result of script execution.

Property	Type	Description
response	string	Whether the script was run successfully. Possible value - `success`.
value	string	Script output.
debug	object	Contains a debug object if a webhook script is executed. For other script types, it contains empty object.

Examples

Run a webhook script

Run a webhook script that sends HTTP request to external service.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.execute",
    "params": {
        "scriptid": "4",
        "hostid": "30079"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "response": "success",
        "value": "{\"status\":\"sent\",\"timestamp\":\"1611235391\"}",
        "debug": {
            "logs": [
                {
                    "level": 3,
                    "ms": 480,
                    "message": "[Webhook Script] HTTP status: 200."
                }
            ],
            "ms": 495
        }
    },
    "id": 1
}
```

Run a custom script

Run a ”ping” script on a host.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.execute",
    "params": {
        "scriptid": "1",
        "hostid": "30079"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "response": "success",
        "value": "PING 127.0.0.1 (127.0.0.1) 56(84) bytes of data.\n64 bytes from 127.0.0.1: icmp_req=1 tt
        "debug": []
    },
    "id": 1
}
```

Run a custom script with manual input

Run a ”ping” script with command ”ping -c {MANUALINPUT} {HOST.CONN}; case $? in [01]) true;; *) false;; esac” on a host.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.execute",
    "params": {
        "scriptid": "7",
        "hostid": "30079",
        "manualinput": "2"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "response": "success",
        "value": "PING 127.0.0.1 (127.0.0.1) 56(84) bytes of data.\n64 bytes from 127.0.0.1: icmp_seq=1 tt
        "debug": []
    },
    "id": 1
}
```

CScript::execute() in *ui/include/classes/api/services/CScript.php*.

script.get

Description

`integer/array script.get(object parameters)`

The method allows you to retrieve scripts according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	ID/array	Return only scripts that can be run on the given host groups.
hostids	ID/array	Return only scripts that can be run on the given hosts.
scriptids	ID/array	Return only scripts with the given IDs.
usrgrpids	ID/array	Return only scripts that can be run by users in the given user groups.
selectHostGroups	query	Return a `hostgroups` property with host groups that the script can be run on.
selectHosts	query	Return a `hosts` property with hosts that the script can be run on.
selectActions	query	Return an `actions` property with actions that the script is associated with.
sortfield	string/array	Sort the result by the given properties. Possible values: `scriptid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	

Parameter	Type	Description
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all scripts

Retrieve all configured scripts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

Source

CScript::get() in *ui/include/classes/api/services/CScript.php*.

script.getscriptsbyevents

Description

`object script.getscriptsbyevents(object parameters)`

This method allows you to retrieve all available scripts on the given event or specific script if script ID is provided. When manualinput is provided, it substitutes the `{MANUALINPUT}` macro with the specified value.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` The method accepts object or array of objects with the following parameters.

Parameter	Type	Description
eventid	ID	ID of event to return scripts for. Must be unique. Parameter behavior: - *required*
scriptid	ID	ID of script to return.
manualinput	string	Value of the user-provided {MANUALINPUT} macro value.

Return values

(object) Returns an object with event IDs as properties and arrays of available scripts as values. If script ID is provided, the associated value is an array containing the specific script.

Note:
The method will automatically expand macros in the `confirmation` text, `manualinput prompt` text and `url`.
If the manualinput parameter is provided, the {MANUALINPUT} macro will be resolved to the specified value.

Examples

Retrieve scripts by event IDs

Retrieve all scripts available to events ”632” and ”614”.

```

Retrieve specific script with manualinput value.

Retrieve script with ID ”4” on event ”632” with manualinput value ”dashboard.view”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.getscriptsbyevents",
    "params": [
      {
        "eventid":  "632",
        "scriptid": "4",
        "manualinput": "dashboard.view"
      }
  ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
      "632": [
        {
          "scriptid": "4",
          "name": "Open Zabbix page",
          "command": "",
          "host_access": "2",
          "usrgrpid": "0",

Source

CScript::getScriptsByEvents() in *ui/include/classes/api/services/CScript.php*.

script.getscriptsbyhosts

Description

`object script.getscriptsbyhosts(object parameters)`

This method allows you to retrieve all available scripts on the given host or specific script if script ID is provided. When manualinput is provided, it substitutes the `{MANUALINPUT}` macro with the specified value.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` The method accepts object or array of objects with the following parameters.

Parameter	Type	Description
hostid	ID	ID of host to return scripts for. Must be unique. Parameter behavior: - *required*
scriptid	ID	ID of script to return.
manualinput	string	Value of the user-provided {MANUALINPUT} macro value.

Return values

`(object)` Returns an object with host IDs as properties and arrays of available scripts as values. If script ID is provided, the associated value is an array containing the specific script.

Note:
The method will automatically expand macros in the `confirmation` text, `manualinput prompt` text and `url`.
If the manualinput parameter is provided, the {MANUALINPUT} macro will be resolved to the specified value.

Examples

Retrieve scripts by host IDs

Retrieve all scripts available on hosts ”30079” and ”30073”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.getscriptsbyhosts",
    "params": [
       {
          "hostid":  "30079"
       },
       {
          "hostid":  "30073"
       }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "30079": [
            {

```

Retrieve specific script with manualinput value.

Retrieve script with ID ”4” on host ”30079” with manualinput value ”dashboard.view”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.getscriptsbyhosts",
    "params": [
      {
        "hostid":  "30079",
        "scriptid": "4",
        "manualinput": "dashboard.view"
      }
  ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
      "30079": [
        {
          "scriptid": "4",
          "name": "Open Zabbix page",
          "command": "",
          "host_access": "2",

Source

CScript::getScriptsByHosts() in *ui/include/classes/api/services/CScript.php*.

script.update

Description

`object script.update(object/array scripts)`

This method allows you to update existing scripts.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Script properties to be updated.

The `scriptid` property must be defined for each script, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged. An exception is `type` property change from 5 (Webhook) to other: the `parameters` property will be cleaned.

Return values

`(object)` Returns an object containing the IDs of the updated scripts under the `scriptids` property.

Examples

Change script command

Change the command of the script to "/bin/ping -c 10 {HOST.CONN} 2>&1".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.update",
    "params": {
        "scriptid": "1",
        "command": "/bin/ping -c 10 {HOST.CONN} 2>&1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "1"
        ]
    },
```

```
    "id": 1
}
```

Change script command and add manual input

Change the command of the script to "/bin/ping -c {MANUALINPUT} {HOST.CONN} 2>&1".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "script.update",
    "params": {
      "scriptid": "1",
      "command": "/bin/ping -c {MANUALINPUT} {HOST.CONN} 2>&1",
      "manualinput": "1",
      "manualinput_prompt": "Specify the number of ICMP packets to send with the ping command",
      "manualinput_validator": "^(?:[1-9]|10)$",
      "manualinput_validator_type": "0",
      "manualinput_default_value": "10"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "scriptids": [
            "1"
        ]
    },
    "id": 1
}
```

Source

CScript::update() in *ui/include/classes/api/services/CScript.php*.

Server info

This class is designed to retrieve information about Zabbix server.

Available methods:

- serverinfo.get - retrieve the time of the last update from Zabbix server

serverinfo.get

This method allows you to retrieve the time of the last update from the given Zabbix server.

The method is available to *User*, *Admin*, *Super admin*, and unauthenticated users.

Method signature: `object serverinfo.get(object parameters)`

Method source: `CServerInfo::get()` in `ui/include/classes/api/services/CServerInfo.php`

Parameters

Parameter	Type	Description
serverid	ID	ID of the Zabbix server. Parameter behavior: - Required
output	query	This parameter is described in the reference commentary.

Return values

Property	Type	Description
serverid	ID	Zabbix server ID.
lastaccess	timestamp	Time of the last update from Zabbix server. For a high availability (HA) cluster, this shows the `lastaccess` value of the active node.

Examples

Retrieve server info

Retrieve information about the given Zabbix server.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "serverinfo.get",
    "params": {
        "serverid": "019fb1f9-22bd-74ea-bc03-51efb8b76aba",
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "serverid": "019fb1f9-22bd-74ea-bc03-51efb8b76aba",
        "lastaccess": 1785337245
    },
    "id": 1
}
```

Service

This class is designed to work with IT infrastructure/business services.

Object references:

- Service
- Status rule
- Service tag
- Service alarm
- Problem tag

Available methods:

- service.create - create new services
- service.delete - delete services
- service.get - retrieve services
- service.update - update services

Service object

The following objects are directly related to the `service` API.

Service

The service object has the following properties.

Property	Type	Description
serviceid	ID	ID of the service. Property behavior: - *read-only* - *required* for update operations
algorithm	integer	Status calculation rule. Only applicable if child services exist. Possible values: 0 - set status to OK; 1 - most critical if all children have problems; 2 - most critical of child services. Property behavior: - *required* for create operations
name	string	Name of the service. Property behavior: - *required* for create operations
sortorder	integer	Position of the service used for sorting. Possible values: 0-999. Property behavior: - *required* for create operations
weight	integer	Service weight. Possible values: 0-1000000. Default: 0.
propagation_rule	integer	Status propagation rule. Possible values: 0 - *(default)* propagate service status as is - without any changes; 1 - increase the propagated status by a given `propagation_value` (by 1 to 5 severities); 2 - decrease the propagated status by a given `propagation_value` (by 1 to 5 severities); 3 - ignore this service - the status is not propagated to the parent service at all; 4 - set fixed service status using a given `propagation_value`. Property behavior: - *required* if `propagation_value` is set

Property	Type	Description
propagation_value	integer	Status propagation value. Possible values if `propagation_rule` is set to "0" or "3": 0 - Not classified. Possible values if `propagation_rule` is set to "1" or "2": 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Possible values if `propagation_rule` is set to "4": -1 - OK; 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Property behavior: - *required* if `propagation_rule` is set
status	integer	Whether the service is in OK or problem state. If the service is in a problem state, `status` equals either the severity of the most critical problem or the highest status of a child service in a problem state. If the service is in OK state, `status` is equal to: -1. Property behavior: - *read-only*
description	string	Description of the service.
uuid	string	Universal unique identifier, used for linking imported services to already existing ones. Auto-generated, if not given.
created_at	integer	Unix timestamp when service was created.
readonly	integer	Access to the service. Possible values: 0 - Read-write; 1 - Read-only. Property behavior: - *read-only*

Status rule

The status rule object has the following properties.

Property	Type	Description
type	integer	Condition for setting (New status) status. Possible values: 0 - if at least (N) child services have (Status) status or above; 1 - if at least (N%) of child services have (Status) status or above; 2 - if less than (N) child services have (Status) status or below; 3 - if less than (N%) of child services have (Status) status or below; 4 - if weight of child services with (Status) status or above is at least (W); 5 - if weight of child services with (Status) status or above is at least (N%); 6 - if weight of child services with (Status) status or below is less than (W); 7 - if weight of child services with (Status) status or below is less than (N%). Where: - N (W) is `limit_value`; - (Status) is `limit_status`; - (New status) is `new_status`. Property behavior: - *required*
limit_value	integer	Limit value. Possible values: - for N and W: 1-100000; - for N%: 1-100. Property behavior: - *required*
limit_status	integer	Limit status. Possible values: -1 - OK; 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Property behavior: - *required*
new_status	integer	New status value. Possible values: 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Property behavior: - *required*

Service tag

The service tag object has the following properties.

Property	Type	Description
tag	string	Service tag name. Property behavior: - *required*
value	string	Service tag value.

Service alarm

Note:
Service alarms cannot be directly created, updated or deleted via the Zabbix API.

The service alarm objects represent a service's state change. It has the following properties.

Property	Type	Description
clock	timestamp	Time when the service state change has happened.
value	integer	Status of the service. Refer to the service `status` property for a list of possible values.

Problem tag

Problem tags allow linking services with problem events. The problem tag object has the following properties.

Property	Type	Description
tag	string	Problem tag name. Property behavior: - *required*
operator	integer	Mapping condition operator. Possible values: 0 - *(default)* Equals; 2 - Contains.
value	string	Problem tag value.

service.create

Description

`object service.create(object/array services)`

This method allows you to create new services.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` services to create.

Additionally to the standard service properties, the method accepts the following parameters.

Parameter	Type	Description
children	array	Child services to be linked to the service. The child services must have only the `serviceid` property defined.
parents	array	Parent services to be linked to the service. The parent services must have only the `serviceid` property defined.

Parameter	Type	Description
tags	array	Service tags to be created for the service.
problem_tags	array	Problem tags to be created for the service.
status_rules	array	Status rules to be created for the service.

Return values

(object) Returns an object containing the IDs of the created services under the serviceids property. The order of the returned IDs matches the order of the passed services.

Examples

Creating a service

Create a service that will be switched to problem state, if at least one child has a problem.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "service.create",
    "params": {
        "name": "Server 1",
        "algorithm": 1,
        "sortorder": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "serviceids": [
            "5"
        ]
    },
    "id": 1
}
```

Source

CService::create() in *ui/include/classes/api/services/CService.php*.

service.delete

Description

`object service.delete(array serviceIds)`

This method allows you to delete services.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(array) IDs of the services to delete.

Return values

(object) Returns an object containing the IDs of the deleted services under the serviceids property.

Examples

Deleting multiple services

Delete two services.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "service.delete",
    "params": [
        "4",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "serviceids": [
            "4",
            "5"
        ]
    },
    "id": 1
}
```

Source

CService::delete() in *ui/include/classes/api/services/CService.php*.

service.get

Description

`integer/array service.get(object parameters)`

The method allows you to retrieve services according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
serviceids	ID/array	Return only services with the given IDs.
parentids	ID/array	Return only services that are linked to the given parent services.
deep_parentids	flag	Return all direct and indirect child services. Used together with `parentids`.
childids	ID/array	Return only services that are linked to the given child services.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.

Parameter	Type	Description
tags	object/array	Return only services with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all services. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
problem_tags	object/array	Return only services with the given problem tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all services. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
without_problem_tags	flag	Return only services without problem tags.
slaids	ID/array	Return only services that are linked to the specific SLA(s).
selectChildren	query	Return a `children` property with the child services. Supports `count`.
selectParents	query	Return a `parents` property with the parent services. Supports `count`.
selectTags	query	Return a `tags` property with service tags. Supports `count`.
selectProblemEvents	query	Return a `problem_events` property with an array of problem event objects. The problem event object has the following properties: `eventid` - `(ID)` Event ID; `severity` - `(string)` Current event severity; `name` - `(string)` Resolved event name. Supports `count`.
selectProblemTags	query	Return a `problem_tags` property with problem tags. Supports `count`.
selectStatusRules	query	Return a `status_rules` property with status rules. Supports `count`.
selectStatusTimeline	object/array	Return a `status_timeline` property containing service state changes for given periods. Format `[{"period_from": "<period_from>", "period_to": "<period_to>"}, ...]` - `period_from` being a starting date (inclusive; integer timestamp) and `period_to` being an ending date (exclusive; integer timestamp) for the period you're interested in. Returns an array of entries containing a `start_value` property and an `alarms` array for the state changes within specified periods.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties. Possible values: `serviceid`, `name`, `status`, `sortorder`, `created_at`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving all services

Retrieve all data about all services and their dependencies.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "service.get",
    "params": {
        "output": "extend",
        "selectChildren": "extend",
        "selectParents": ["serviceid", "name"]
    },
    "id": 1
}
```

Response:

```

CService::get() in *ui/include/classes/api/services/CService.php*.

service.update

Description

`object service.update(object/array services)`

This method allows you to update existing services.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` service properties to be updated.

The `serviceid` property must be defined for each service, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard service properties, the method accepts the following parameters.

Parameter	Type	Description
children	array	Child services to replace the current child services. The child services must have only the `serviceid` property defined.
parents	array	Parent services to replace the current parent services. The parent services must have only the `serviceid` property defined.
tags	array	Service tags to replace the current service tags.
problem_tags	array	Problem tags to replace the current problem tags.
status_rules	array	Status rules to replace the current status rules.

Return values

`(object)` Returns an object containing the IDs of the updated services under the `serviceids` property.

Examples

Setting the parent for a service

Make service with ID "3" to be the parent for service with ID "5".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "service.update",
    "params": {
        "serviceid": "5",
        "parents": [
            {
```

```
                "serviceid": "3"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "serviceids": [
            "5"
        ]
    },
    "id": 1
}
```

Adding a scheduled downtime

Add a downtime for service with ID ”4” scheduled weekly from Monday 22:00 till Tuesday 10:00.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "service.update",
    "params": {
        "serviceid": "4",
        "times": [
            {
                "type": "1",
                "ts_from": "165600",
                "ts_to": "201600"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "serviceids": [
            "4"
        ]
    },
    "id": 1
}
```

CService::update() in *ui/include/classes/api/services/CService.php*.

Settings

This class is designed to work with common administration settings.

Object references:

- Settings

Available methods:

- settings.get - retrieve settings

- settings.update - update settings

Settings object

The following objects are directly related to the `settings` API.

Settings

The settings object has the following properties.

Property	Type	Description
default_lang	string	System language by default. Default: `en_US`.
default_timezone	string	System time zone by default. Default: `system` - system default. For the full list of supported time zones please refer to PHP documentation.
default_theme	string	Default theme. Possible values: `blue-theme` - *(default)* Blue; `blue-classic-theme` - Blue (classic); `dark-theme` - Dark; `dark-blue-theme` - Dark blue; `dark-classic-theme` - Dark (classic); `hc-light` - High-contrast light; `hc-dark` - High-contrast dark.
search_limit	integer	Limit for search and filter results. Default: 1000.
max_overview_table_size	integer	Max number of columns and rows in Data overview and Trigger overview dashboard widgets. Default: 50.
max_in_table	integer	Max count of elements to show inside table cell. Default: 50.
server_check_interval	integer	Show warning if Zabbix server is down. Possible values: 0 - Do not show warning; 10 - *(default)* Show warning.
work_period	string	Working time. Default: 1-5,09:00-18:00.
show_technical_errors	integer	Show technical errors (PHP/SQL) to non-Super admin users and to users that are not part of user groups with debug mode enabled. Possible values: 0 - *(default)* Do not technical errors; 1 - Show technical errors.
history_period	string	Max period to display history data in Latest data, Web, and Data overview dashboard widgets. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`). Default: 24h.

Property	Type	Description
period_default	string	Time filter default period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d, 1M, 1y), including support for months and years. Default: 1h.
max_period	string	Max period for time filter. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d, 1M, 1y), including support for months and years. Default: 2y.
severity_color_0	string	Color for ”Not classified” severity as a hexadecimal color code. Default: 97AAB3.
severity_color_1	string	Color for ”Information” severity as a hexadecimal color code. Default: 7499FF.
severity_color_2	string	Color for ”Warning” severity as a hexadecimal color code. Default: FFC859.
severity_color_3	string	Color for ”Average” severity as a hexadecimal color code. Default: FFA059.
severity_color_4	string	Color for ”High” severity as a hexadecimal color code. Default: E97659.
severity_color_5	string	Color for ”Disaster” severity as a hexadecimal color code. Default: E45959.
severity_name_0	string	Name for ”Not classified” severity. Default: Not classified.
severity_name_1	string	Name for ”Information” severity. Default: Information.
severity_name_2	string	Name for ”Warning” severity. Default: Warning.
severity_name_3	string	Name for ”Average” severity. Default: Average.
severity_name_4	string	Name for ”High” severity. Default: High.
severity_name_5	string	Name for ”Disaster” severity. Default: Disaster.
custom_color	integer	Use custom event status colors. Possible values: 0 - *(default)* Do not use custom event status colors; 1 - Use custom event status colors.
ok_period	string	Display OK triggers period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h). Default: 5m.

Property	Type	Description
blink_period	string	Blink period on change of trigger state. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h). Default: 2m.
problem_unack_color	string	Color for unacknowledged PROBLEM events as a hexadecimal color code. Default: CC0000.
problem_ack_color	string	Color for acknowledged PROBLEM events as a hexadecimal color code. Default: CC0000.
ok_unack_color	string	Color for unacknowledged RESOLVED events as a hexadecimal color code. Default: 009900.
ok_ack_color	string	Color for acknowledged RESOLVED events as a hexadecimal color code. Default: 009900.
problem_unack_style	integer	Blinking for unacknowledged PROBLEM events. Possible values: 0 - Do not show blinking; 1 - *(default)* Show blinking.
problem_ack_style	integer	Blinking for acknowledged PROBLEM events. Possible values: 0 - Do not show blinking; 1 - *(default)* Show blinking.
ok_unack_style	integer	Blinking for unacknowledged RESOLVED events. Possible values: 0 - Do not show blinking; 1 - *(default)* Show blinking.
ok_ack_style	integer	Blinking for acknowledged RESOLVED events. Possible values: 0 - Do not show blinking; 1 - *(default)* Show blinking.
url	string	Frontend URL.
discovery_groupid	ID	ID of the host group to which will be automatically placed discovered hosts.
default_inventory_mode	integer	Default host inventory mode. Possible values: -1 - *(default)* Disabled; 0 - Manual; 1 - Automatic.
alert_usrgrpid	ID	ID of the user group to which the database down alarm message will be sent. If set to ”0”, the alarm message will not be sent.
snmptrap_logging	integer	Log unmatched SNMP traps. Possible values: 0 - Do not log unmatched SNMP traps; 1 - *(default)* Log unmatched SNMP traps.
login_attempts	integer	Number of failed login attempts after which login form will be blocked. Default: 5.

Property	Type	Description
login_block	string	Time interval during which login form will be blocked if number of failed login attempts exceeds defined in login_attempts field. Accepts a number of seconds (e.g., 1, 60), or a value with a time suffix (e.g., 30s, 1m). Default: 30s.
validate_uri_schemes	integer	Validate URI schemes. Possible values: 0 - Do not validate; 1 - *(default)* Validate.
uri_valid_schemes	string	Valid URI schemes. Default: http,https,ftp,file,mailto,tel,ssh.
x_frame_options	string	X-Frame-Options HTTP header. Default: SAMEORIGIN.
iframe_sandboxing_enabled	integer	Use iframe sandboxing. Possible values: 0 - Do not use; 1 - *(default)* Use.
iframe_sandboxing_exceptions	string	Iframe sandboxing exceptions.
connect_timeout	string	Connection timeout with Zabbix server. Possible values range: 1-30s. Default: 3s. Property behavior: - *required*
socket_timeout	string	Network default timeout. Possible values range: 1-300s. Default: 3s. Property behavior: - *required*
media_type_test_timeout	string	Network timeout for media type test. Possible values range: 1-300s. Default: 65s. Property behavior: - *required*
item_test_timeout	string	Network timeout for item tests. Possible value range: 1-600s. Default: 60s. Property behavior: - *required*

Property	Type	Description
script_timeout	string	Network timeout for script execution. Possible values range: 1-300s. Default: 60s. Property behavior: - *required*
report_test_timeout	string	Network timeout for scheduled report test. Possible values range: 1-300s. Default: 60s. Property behavior: - *required*
device_link_timeout	string	Timeout for adding a mobile device for use with Zabbix mobile app; applies to communication between the Zabbix API and bridge adapter. Possible values range: 1-300s. Default: 60s. Property behavior: - *required*
auditlog_enabled	integer	Whether to enable audit logging. Possible values: 0 - Disable; 1 - *(default)* Enable.
auditlog_mode	integer	Whether to enable audit logging of low-level discovery, network discovery and autoregistration activities performed by the server (System user). Possible values: 0 - Disable; 1 - *(default)* Enable.
ha_failover_delay	string	Failover delay in seconds. Default: 1m. Property behavior: - *read-only*
geomaps_tile_provider	string	Geomap tile provider. Possible values: `OpenStreetMap.Mapnik` - *(default)* OpenStreetMap Mapnik; `OpenTopoMap` - OpenTopoMap; `Stamen.TonerLite` - Stamen Toner Lite; `Stamen.Terrain` - Stamen Terrain; `USGS.USTopo` - USGS US Topo; `USGS.USImagery` - USGS US Imagery. Supports empty string to specify custom values of `geomaps_tile_url`, `geomaps_max_zoom` and `geomaps_attribution`.
geomaps_tile_url	string	Geomap tile URL. Property behavior: - *supported* if `geomaps_tile_provider` is set to empty string

Property	Type	Description
geomaps_max_zoom	integer	Geomap max zoom level. Possible values: 0-30. Property behavior: - *supported* if `geomaps_tile_provider` is set to empty string
geomaps_attribution	string	Geomap attribution text. Property behavior: - *supported* if `geomaps_tile_provider` is set to empty string
vault_provider	integer	Vault provider. Possible values: 0 - *(default)* HashiCorp Vault; 1 - CyberArk Vault.
proxy_secrets_provider	integer	Resolve secret macro values by: Possible values: 0 - *(default)* server only; 1 - server and proxies independently.
timeout_zabbix_agent timeout_simple_check timeout_snmp_agent timeout_external_check timeout_db_monitor timeout_http_agent timeout_ssh_agent timeout_telnet_agent timeout_script timeout_browser timeout_telemetry_query	string	Spend no more than `timeout_*` seconds on processing. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m). Also accepts user macros. Possible values range: 1-600s. Default: 3s. Default for `timeout_browser`: 60s. Property behavior: - *required*
apm_global_db	object	Global data source configuration.

Global data source

The global data source object has the following properties:

Property	Type	Description
status	integer	Global data source status. Possible values: 0 - *(default)* not configured; 1 - configured.
url	string	URL used to connect to the data source. Property behavior: - *required* if user changes `status` to 1 (configured).

Property	Type	Description
authentication_type	integer	Type of authentication. Possible values: 0 - *(default)* using a username and password; 1 - no authentication used. Property behavior: - *required* if user changes `status` to 1 (configured).
username	string	Username used to log in to the data source. Property behavior: - *supported* if `status` is set to 1 (configured) and `authentication_type` is set to 0 (username and password). - *required* if user changes `authentication_type` to 0 (username and password).
password	string	Password used to log in to the data source. The value of this parameter can be empty. Property behavior: - *supported* if `status` is set to 1 (configured) and `authentication_type` is set to 0 (username and password).
db	string	Database name. The value of this parameter can be empty. Property behavior: - *supported* if `status` is set to 1 (configured).
ssl_verify_peer	integer	Verify server certificate. Possible values: 0 - *(default)* disabled; 1 - enabled. Property behavior: - *supported* if `status` is set to 1 (configured) and `url` uses the `https://` scheme.
ssl_verify_host	integer	Verify host. Possible values: 0 - disabled; 1 - *(default)* enabled. Property behavior: - *supported* if `status` is set to 1 (configured) and `url` uses the `https://` scheme.

settings.get

Description

`object settings.get(object parameters)`

The method allows you to retrieve settings object according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports only one parameter.

Parameter	Type	Description
output	query	This parameter is described in the reference commentary.

Return values

`(object)` Returns settings object.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "settings.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "alert_usrgrpid": "7",
        "apm_global_db": {
            "status": 1,
            "url": "https://localhost:8443",
            "authentication_type": 0,
            "username": "zabbix",

CSettings::get() in *ui/include/classes/api/services/CSettings.php*.

settings.update

Description

`object settings.update(object settings)`

This method allows you to update existing common settings.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Settings properties to be updated.

Return values

`(array)` Returns an array with the names of updated parameters.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "settings.update",
    "params": {
        "login_attempts": "1",
        "login_block": "1m"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        "login_attempts",
        "login_block"
    ],
    "id": 1
}
```

SLA

This class is designed to work with SLA (Service Level Agreement) objects used to estimate the performance of IT infrastructure and business services.

Object references:

- SLA
- SLA schedule
- SLA excluded downtime
- SLA service tag

Available methods:

- sla.create - create new SLAs
- sla.delete - delete SLAs
- sla.get - retrieve SLAs
- sla.getsli - retrieve Service Level Indicator (SLI) data for SLAs
- sla.update - update SLAs

SLA object

The following objects are directly related to the `sla` (Service Level Agreement) API.

SLA

The SLA object has the following properties.

Property	Type	Description
slaid	ID	ID of the SLA. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the SLA. Property behavior: - *required* for create operations
period	integer	Reporting period of the SLA. Possible values: 0 - daily; 1 - weekly; 2 - monthly; 3 - quarterly; 4 - annually. Property behavior: - *required* for create operations
slo	float	Minimum acceptable Service Level Objective expressed as a percent. If the Service Level Indicator (SLI) drops lower, the SLA is considered to be in problem/unfulfilled state. Possible values: 0-100 (up to 4 fractional digits). Property behavior: - *required* for create operations
effective_date	integer	Effective date of the SLA. Possible values: date timestamp in UTC.
timezone	string	Reporting time zone, for example: `Europe/London`, `UTC`. For the full list of supported time zones please refer to PHP documentation. Property behavior: - *required* for create operations
status	integer	Status of the SLA. Possible values: 0 - *(default)* disabled SLA; 1 - enabled SLA.
description	string	Description of the SLA.

SLA schedule

The SLA schedule object defines periods where the connected service(s) are scheduled to be in working order. It has the following properties.

Property	Type	Description
period_from	integer	Starting time of the recurrent weekly period of time (inclusive). Possible values: number of seconds (counting from Sunday). Property behavior: - *required*

Property	Type	Description
period_to	integer	Ending time of the recurrent weekly period of time (exclusive). Possible values: number of seconds (counting from Sunday). Property behavior: - *required*

SLA excluded downtime

The excluded downtime object defines periods where the connected service(s) are scheduled to be out of working order, without affecting SLI, e.g., undergoing planned maintenance. It has the following properties.

Property	Type	Description
name	string	Name of the excluded downtime. Property behavior: - *required*
period_from	integer	Starting time of the excluded downtime (inclusive). Possible values: timestamp. Property behavior: - *required*
period_to	integer	Ending time of the excluded downtime (exclusive). Possible values: timestamp. Property behavior: - *required*

SLA service tag

The SLA service tag object links services to include in the calculations for the SLA. It has the following properties.

Property	Type	Description
tag	string	SLA service tag name. Property behavior: - *required*
operator	integer	SLA service tag operator. Possible values: 0 - *(default)* Equals; 2 - Contains.
value	string	SLA service tag value.

sla.create

Description

`object sla.create(object/array SLAs)`

This method allows you to create new SLA objects.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object/array) SLA objects to create.

Additionally to the standard SLA properties, the method accepts the following parameters.

Parameter	Type	Description
service_tags	array	SLA service tags to be created for the SLA. Parameter behavior: - *required*
schedule	array	SLA schedule to be created for the SLA. Specifying an empty parameter will be interpreted as a 24x7 schedule. Default: 24x7 schedule.
excluded_downtimes	array	SLA excluded downtimes to be created for the SLA.

Return values

(object) Returns an object containing the IDs of the created SLAs under the slaids property. The order of the returned IDs matches the order of the passed SLAs.

Examples

Creating an SLA

Instruct to create an SLA entry for: * tracking uptime for SQL-engine related services; * custom schedule of all weekdays excluding last hour on Saturday; * an effective date of the last day of the year 2022; * with 1 hour and 15 minutes long planned downtime starting at midnight on the 4th of July; * SLA weekly report calculation will be on; * the minimum acceptable SLO will be 99.9995%.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.create",
    "params": [
        {
            "name": "Database Uptime",
            "slo": "99.9995",
            "period": "1",
            "timezone": "America/Toronto",
            "description": "Provide excellent uptime for main database engines.",
            "effective_date": 1672444800,
            "status": 1,
            "schedule": [
                {
                    "period_from": 0,
                    "period_to": 601200
                }
            ],
            "service_tags": [
                {
                    "tag": "database",
                    "operator": "0",
                    "value": "mysql"
                },
                {
                    "tag": "database",
                    "operator": "0",
                    "value": "postgresql"
                }
            ],
            "excluded_downtimes": [
                {
                    "name": "Software version upgrade rollout",
                    "period_from": "1648760400",
                    "period_to": "1648764900"
                }
```

```
            ]
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "slaids": [
            "5"
        ]
    },
    "id": 1
}
```

Source

CSla::create() in *ui/include/classes/api/services/CSla.php*.

sla.delete

Description

`object sla.delete(array slaids)`

This method allows you to delete SLA entries.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the SLAs to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted SLAs under the `slaids` property.

Examples

Deleting multiple SLAs

Delete two SLA entries.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.delete",
    "params": [
        "4",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "slaids": [
            "4",
            "5"
        ]
```

```
    },
    "id": 1
}
```

Source

CSla::delete() in *ui/include/classes/api/services/CSla.php*.

sla.get

Description

`integer/array sla.get(object parameters)`

The method allows you to retrieve SLA objects according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
slaids	ID/array	Return only SLAs with the given IDs.
serviceids	ID/array	Return only SLAs matching the specific services.
selectSchedule	query	Return a `schedule` property with SLA schedules. Supports `count`.
selectExcludedDowntimes	query	Return an `excluded_downtimes` property with SLA excluded downtimes. Supports `count`.
selectServiceTags	query	Return a `service_tags` property with SLA service tags. Supports `count`.
sortfield	string/array	Sort the result by the given properties. Possible values: `slaid`, `name`, `period`, `slo`, `effective_date`, `timezone`, `status`, `description`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving all SLAs

Retrieve all data about all SLAs and their properties.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.get",
    "params": {
        "output": "extend",
        "selectSchedule": ["period_from", "period_to"],
        "selectExcludedDowntimes": ["name", "period_from", "period_to"],
        "selectServiceTags": ["tag", "operator", "value"],
        "preservekeys": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "1": {
            "slaid": "1",
            "name": "Database Uptime",
            "period": "1",
            "slo": "99.9995",
            "effective_date": "1672444800",
            "timezone": "America/Toronto",
            "status": "1",
            "description": "Provide excellent uptime for main SQL database engines.",
            "service_tags": [
                {
                    "tag": "database",
                    "operator": "0",
                    "value": "mysql"
                },
                {
                    "tag": "database",
                    "operator": "0",
                    "value": "postgresql"
                }
            ],
            "schedule": [
                {
                    "period_from": "0",
                    "period_to": "601200"
                }
            ],
            "excluded_downtimes": [
                {
                    "name": "Software version upgrade rollout",
                    "period_from": "1648760400",
                    "period_to": "1648764900"
                }
            ]
        }
    },
    "id": 1
}
```

Source

CSla:get() in *ui/include/classes/api/services/CSla.php*.

sla.getsli

Description

`object sla.getsli(object parameters)`

This method allows you to calculate the Service Level Indicator (SLI) data for a Service Level Agreement (SLA).

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the SLA ID, reporting periods and, optionally, the IDs of the services - to calculate the SLI for.

Parameter	Type	Description
slaid	ID	ID of the SLA to return availability information for. Parameter behavior: *- required*
period_from	timestamp	Starting timestamp (inclusive) to report the SLI for. Possible values: Unix timestamp.
period_to	timestamp	Ending timestamp (inclusive) to report the SLI for. Possible values: Unix timestamp.
periods	integer	Number of periods to report. Possible values: 1-100
serviceids	ID/array	IDs of services to return the SLI for.

Partitioning of periods

The following table demonstrates the arrangement of returned period slices based on combinations of parameters.

Note:
Returned periods do not precede the first available period (based on the effective date of the SLA) and do not exceed the current period.

Parameters			Returned periods
period_from	**period_to**	**periods**	
-	-	-	Last 20 periods, including the current one.
-	-	N	Last N periods.
-	specified	-	Last 20 periods before `period_to`.
-	specified	N	Last N periods before `period_to`.
specified	-	-	First 20 periods starting with `period_from`.
specified	-	N	First N periods starting with `period_from`.
specified	specified	-	Up to 100 periods in the specified range.
specified	specified	N	N periods in the specified range.

Return values

`(object)` Returns the results of the calculation.

Property	Type	Description
periods	array	List of the reported periods. Each reported period is represented as an object consisting of: - `period_from` - `(timestamp)` Starting timestamp (inclusive) of the reported period. - `period_to` - `(timestamp)` Ending timestamp (exclusive) of the reported period. Periods are sorted by `period_from`, with earliest periods appearing first.
serviceids	array	List of service IDs in the reported periods. The sorting order of the list is not defined. Even if `serviceids` parameter was passed to the `sla.getsli` method.
sli	array	SLI data (as a **two-dimensional array**) for each reported period and service. The index of the `periods` property is used as the **first** dimension of the `sli` property. The index of the `serviceids` property is used as the **second** dimension of the `sli` property.

SLI data

The SLI data returned for each reported period and service consists of:

Property	Type	Description
uptime	integer	Amount of time service spent in an *OK* state during scheduled uptime, less the excluded downtimes.
downtime	integer	Amount of time service spent in a *not OK* state during scheduled uptime, less the excluded downtimes.
sli	float	SLI (per cent of total uptime), based on uptime and downtime.
error_budget	integer	Error budget (in seconds), based on the SLI and the SLO.
excluded_downtimes	array	Array of excluded downtimes in this reporting period. Each object will contain the following parameters: - `name` - `(string)` Name of the excluded downtime. - `period_from` - `(timestamp)` Starting timestamp (inclusive) of the excluded downtime. - `period_to` - `(timestamp)` Ending timestamp (exclusive) of the excluded downtime. Excluded downtimes are sorted by `period_from`, with earliest periods appearing first.

Examples

Calculating SLI for a daily SLA

Retrieve SLI data for services with IDs "1" and "4" that are linked to the SLA with ID "1". Retrieve data for a single period until "1761861599" (Oct 30 2025 23:59:59 GMT+0200). Since the reporting period of the SLA is daily, SLI data is retrieved from "1761775200" (Oct 30 2025 00:00:00 GMT+0200) to "1761861600" (Oct 31 2025 00:00:00 GMT+0200).

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.getsli",
    "params": {
        "slaid": "1",
        "serviceids": [
```

```
            1,
            4
        ],
        "periods": 1,
        "period_to": 1761861599
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "periods": [
            {
                "period_from": 1761775200,
                "period_to": 1761861600
            }
        ],
        "serviceids": [
            1,
            4
        ],
        "sli": [
            [
                {
                    "uptime": 43843,
                    "downtime": 0,
                    "sli": 100,
                    "error_budget": 0,
                    "excluded_downtimes": [
                        {
                            "name": "Maintenance OCT",
                            "period_from": 1761825600,
                            "period_to": 1761829200
                        }
                    ]
                },
                {
                    "uptime": 32225,
                    "downtime": 0,
                    "sli": 100,
                    "error_budget": 0,
                    "excluded_downtimes": []
                }
            ]
        ]
    },
    "id": 1
}
```

Calculating SLI for a monthly SLA

Retrieve SLI data on services with IDs ”50”, ”60” and ”70” that are linked to the SLA with ID ”5”. Retrieve data for three periods starting from ”1635724800” (Nov 01 2021 00:00:00 UTC). Since the reporting period of the SLA is monthly, SLI data is retrieved for the following three months:

- From ”1635724800” (Nov 01 2021 00:00:00 UTC) to ”1638316800” (Dec 01 2021 00:00:00 UTC)
- From ”1638316800” (Dec 01 2021 00:00:00 UTC) to ”1640995200” (Jan 01 2022 00:00:00 UTC)
- From ”1640995200” (Jan 01 2022 00:00:00 UTC) to ”1643673600” (Feb 01 2022 00:00:00 UTC)

Request:

```
{
    "jsonrpc": "2.0",
```

```
    "method": "sla.getsli",
    "params": {
        "slaid": "5",
        "serviceids": [
            50,
            60,
            70
        ],
        "periods": 3,
        "period_from": 1635724800
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "periods": [
            {
                "period_from": 1635724800,
                "period_to": 1638316800
            },
            {
                "period_from": 1638316800,
                "period_to": 1640995200
            },
            {
                "period_from": 1640995200,

CSla::getSli() in *ui/include/classes/api/services/CSla.php*

sla.update

Description

`object sla.update(object/array slaids)`

This method allows you to update existing SLA entries.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` SLA properties to be updated.

The `slaid` property must be defined for each SLA, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard SLA properties, the method accepts the following parameters.

Parameter	Type	Description
service_tags	array	SLA service tags to replace the current SLA service tags.
schedule	array	SLA schedule to replace the current one. Specifying parameter as empty will be interpreted as a 24x7 schedule.
excluded_downtimes	array	SLA excluded downtimes to replace the current ones.

Return values

`(object)` Returns an object containing the IDs of the updated SLAs under the `slaids` property.

Examples

Updating service tags

Make SLA with ID "5" to be calculated at monthly intervals for NoSQL related services, without changing its schedule or excluded downtimes; set SLO to 95%.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.update",
    "params": [
        {
            "slaid": "5",
            "name": "NoSQL Database engines",
            "slo": "95",
            "period": 2,
            "service_tags": [
                {
                    "tag": "database",
                    "operator": "0",
                    "value": "redis"
                },
                {
                    "tag": "database",
                    "operator": "0",
                    "value": "mongodb"
                }
            ]
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "slaids": [
            "5"
        ]
    },
    "id": 1
}
```

Changing the schedule of an SLA

Switch the SLA with ID ”5” to a 24x7 schedule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.update",
    "params": {
        "slaid": "5",
        "schedule": []
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "slaids": [
            "5"
        ]
    },
    "id": 1
}
```

Changing the excluded downtimes for an SLA

Add a planned 4 hour long RAM upgrade downtime on the 6th of April, 2022, while keeping (needs to be defined anew) a previously existing software upgrade planned on the 4th of July for the SLA with ID ”5”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "sla.update",
    "params": {
        "slaid": "5",
        "excluded_downtimes": [
            {
                "name": "Software version upgrade rollout",
                "period_from": "1648760400",
                "period_to": "1648764900"
            },
            {
                "name": "RAM upgrade",
                "period_from": "1649192400",
                "period_to": "1649206800"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "slaids": [
            "5"
        ]
    },
    "id": 1
}
```

Source

CSla::update() in *ui/include/classes/api/services/CSla.php*.

Task

This class is designed to work with tasks (such as checking items or low-level discovery rules without config reload).

Object references:

- Task
  - ’Execute now’ request object
  - ’Refresh proxy configuration’ request object
  - ’Diagnostic information’ request object
    - Statistic request object
    - Statistic result object

Available methods:

- task.create - create new tasks
- task.get - retrieve tasks

Task object

The following objects are directly related to the `task` API.

Task

The task object has the following properties:

Property	Type	Description
taskid	ID	ID of the task. Property behavior: - *read-only*
type	integer	Type of the task. Possible values: 1 - Diagnostic information; 2 - Refresh proxy configuration; 6 - Execute now. *Admin* and *User* type users may create only 'Execute now' tasks. Note that `task.get` always returns "7" (Task execution summary). Property behavior: - *required*
status	integer	Status of the task. Possible values: 1 - new task; 2 - task in progress; 3 - task is completed; 4 - task is expired. Property behavior: - *read-only*
clock	timestamp	Time when the task was created. Property behavior: - *read-only*
ttl	integer	The time in seconds after which task expires. Property behavior: - *read-only*
proxyid	ID	ID of the proxy about which diagnostic information statistic is collected. Property behavior: - *supported* if `type` is set to "Diagnostic information" or "Refresh proxy configuration"
request	object	Task request object according to the task type: Object of 'Execute now' task is described in detail below; Object of 'Refresh proxy configuration' task is described in detail below; Object of 'Diagnostic information' task is described in detail below. Property behavior: - *required*
result	object	Result object of the diagnostic information task. May contain NULL if result is not yet ready. Result object is described in detail below. Property behavior: - *read-only*

'Execute now' request object

The 'Execute now' task request object has the following properties.

Property	Type	Description
itemid	ID	ID of item and low-level discovery rules. *Admin* and *User* type users may 'Execute now' items on hosts for which they have *read-write* permission, or *read* permission and `invoke_execute_now` action enabled for their role. The same applies to *Admin* type users for low-level discovery (LLD) rules.

'Refresh proxy configuration' request object

The 'Refresh proxy configuration' task request object has the following properties.

Property	Type	Description
proxyids	array	Proxy IDs.

'Diagnostic information' request object

The diagnostic information task request object has the following properties. Statistic request object for all types of properties is described in detail below.

Property	Type	Description
historycache	object	History cache statistic request. Available on server and proxy.
valuecache	object	Items cache statistic request. Available on server.
preprocessing	object	Preprocessing manager statistic request. Available on server and proxy.
alerting	object	Alert manager statistic request. Available on server.
lld	object	LLD manager statistic request. Available on server.

Statistic request object

Statistic request object is used to define what type of information should be collected about server/proxy internal processes. It has the following properties.

Property	Type	Description
stats	query	Statistic object properties to be returned. The list of available fields for each type of diagnostic information statistic are described in detail below. Default: `extend` will return all available statistic fields.
top	object	Object to sort and limit returned statistic values. The list of available fields for each type of diagnostic information statistic are described in detail below. Example: { "source.alerts": 10 }

List of statistic fields available for each type of diagnostic information request

Following statistic fields can be requested for each type of diagnostic information request property.

Diagnostic type	Available fields	Description
historycache	items	Number of cached items.
	values	Number of cached values.
	memory	Shared memory statistics (free space, number of used chunks, number of free chunks, max size of free chunk).
	memory.data	History data cache shared memory statistics.
	memory.index	History index cache shared memory statistics.
valuecache	items	Number of cached items.
	values	Number of cached values.
	memory	Shared memory statistics (free space, number of used chunks, number of free chunks, max size of free chunk).

Diagnostic type	Available fields	Description
	mode	Value cache mode.
preprocessing	values	Number of queued values.
	preproc.values	Number of queued values with preprocessing steps.
alerting	alerts	Number of queued alerts.
lld	rules	Number of queued rules.
	values	Number of queued values.

List of sorting fields available for each type of diagnostic information request

Following statistic fields can be used to sort and limit requested information.

Diagnostic type	Available fields	Type
historycache	values	integer
valuecache	values	integer
	request.values	integer
preprocessing	values	integer
alerting	media.alerts	integer
	source.alerts	integer
lld	values	integer

Statistic result object

Statistic result object is retrieved in `result` field of task object.

Property	Type	Description
status	integer	Status of the task result. Possible values: -1 - error occurred during performing task; 0 - task result is created. Property behavior: - *read-only*
data	string/object	Results according the statistic request object of particular diagnostic information task. Contains error message string if error occurred during performing task.

task.create

Description

`object task.create(object/array tasks)`

This method allows you to create tasks.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` A task to create.

The method accepts tasks with the standard task properties.

Note that 'Execute now' tasks can be created only for the following types of items/discovery rules:

- Zabbix agent (passive)
- Simple check
- SNMP agent (v1/v2/v3)
- Zabbix internal

- External check
- Database monitor
- HTTP agent
- IPMI agent
- SSH agent
- TELNET agent
- JMX agent
- Calculated
- Dependent item
- Script
- Browser

If the item/discovery rule is of type ”Dependent item”, then its master item must also be one of the above types.

Return values

`(object)` Returns an object containing the IDs of the created tasks under the `taskids` property. One task is created for each item and low-level discovery rule. The order of the returned IDs matches the order of the passed `itemids`.

Examples

Creating a task

Create an ’Execute now’ task for an item and a low-level discovery rule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "task.create",
    "params": [
        {
            "type": 6,
            "request": {
                "itemid": "10092"
            }
        },
        {
            "type": 6,
            "request": {
                "itemid": "10093"
            }
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "taskids": [
            "1",
            "2"
        ]
    },
    "id": 1
}
```

Create a ’Refresh proxy configuration’ task for two proxies.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "task.create",
    "params": [
        {
```

```
            "type": 2,
            "request": {
                "proxyids": ["10459", "10460"]
            }
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "taskids": [
            "1"
        ]
    },
    "id": 1
}
```

Create a 'Diagnostic information' task.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "task.create",
    "params": [
        {
            "type": 1,
            "request": {
                "alerting": {
                    "stats": [
                        "alerts"
                    ],
                    "top": {
                        "media.alerts": 10
                    }
                },
                "lld": {
                    "stats": "extend",
                    "top": {
                        "values": 5
                    }
                }
            },
            "proxyid": 0
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "taskids": [
            "3"
        ]
    },
    "id": 1
}
```

Source

CTask::create() in *ui/include/classes/api/services/CTask.php*.

task.get

Description

`integer/array task.get(object parameters)`

The method allows you to retrieve tasks according to the given parameters.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
taskids	ID/array	Return only tasks with the given IDs.
output	query	These parameters are described in the reference commentary.
preservekeys	boolean	

Return values

`(integer/array)` Returns an array of objects.

Examples

Retrieve task by ID

Retrieve all the data about the task with the ID "1".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "task.get",
    "params": {
        "output": "extend",
        "taskids": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "taskid": "1",
            "type": "7",
            "status": "3",
            "clock": "1601039076",
            "ttl": "3600",
            "proxyid": null,
            "request": {
                "alerting": {
```

```
                    "stats": [
                        "alerts"
                    ],
                    "top": {
                        "media.alerts": 10
                    }
                },
                "lld": {
                    "stats": "extend",
                    "top": {
                        "values": 5
                    }
                }
            },
            "result": {
                "data": {
                    "alerting": {

Template

This class is designed to work with templates.

Object references:

- Template
- Template tag

Available methods:

- template.create - create new templates
- template.delete - delete templates
- template.get - retrieve templates
- template.massadd - add related objects to templates
- template.massremove - remove related objects from templates

- template.update - update templates

Template object

The following objects are directly related to the `template` API.

Template

The template object has the following properties.

Property	Type	Description
templateid	ID	ID of the template. Property behavior: - *read-only* - *required* for update operations
description	text	Description of the template.
host	string	Technical name of the template. Property behavior: - *required* for create operations
name	string	Visible name of the template. Default: `host` property value.
readme	text	Template-specific configuration instructions to display in the Host Wizard. Supports Markdown formatting.
uuid	string	Universal unique identifier, used for linking imported templates to already existing ones. Auto-generated, if not given.
vendor_name	string	Template vendor name. For create operations, both `vendor_name` and `vendor_version` should be either set or left empty. For update operations, `vendor_version` can be left empty if it has a value in the database.
vendor_version	string	Template vendor version. For create operations, both `vendor_name` and `vendor_version` should be either set or left empty. For update operations, `vendor_name` can be left empty if it has a value in the database.
wizard_ready	integer	Whether the template is available for selection in the Host Wizard. Possible values: 0 - *(default)* Not available. 1 - Available.

Template tag

The template tag object has the following properties.

Property	Type	Description
tag	string	Template tag name. Property behavior: - *required*
value	string	Template tag value. Property behavior: - *read-only*.

Property	Type	Description
object	integer	Type of object the tag was inherited from. Possible values: 0 - template. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

template.create

Description

`object template.create(object/array templates)`

This method allows you to create new templates.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Templates to create.

Additionally to the standard template properties, the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Template groups to add the template to. The template groups must have only the `groupid` property defined. Parameter behavior: - *required*
tags	object/array	Template tags.
templates	object/array	Templates to be linked to the template. The templates must have only the `templateid` property defined.
macros	object/array	User macros to be created for the template.

Return values

`(object)` Returns an object containing the IDs of the created templates under the `templateids` property. The order of the returned IDs matches the order of the passed templates.

Examples

Creating a template

Create a template with tags and link two templates to this template.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.create",
    "params": {
        "host": "Linux template",
        "groups": {
            "groupid": 1
```

```
        },
        "templates": [
            {
                "templateid": "11115"
            },
            {
                "templateid": "11116"
            }
        ],
        "tags": [
            {
                "tag": "host-name",
                "value": "{HOST.NAME}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "11117"
        ]
    },
    "id": 1
}
```

Source

CTemplate::create() in *ui/include/classes/api/services/CTemplate.php*.

template.delete

Description

`object template.delete(array templateIds)`

This method allows you to delete templates.

Deleting a template also removes all of its entities (items, triggers, graphs, etc.) from any hosts or templates it is linked to. To keep these entities, first unlink the template from the relevant hosts or templates using the `host.update`, `host.massremove`, `template.update`, or `template.massremove` methods.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the templates to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted templates under the `templateids` property.

Examples

Deleting multiple templates

Delete two templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.delete",
    "params": [
        "13",
        "32"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "13",
            "32"
        ]
    },
    "id": 1
}
```

Source

CTemplate::delete() in *ui/include/classes/api/services/CTemplate.php*.

template.get

Description

`integer/array template.get(object parameters)`

The method allows you to retrieve templates according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
templateids	ID/array	Return only templates with the given template IDs.
groupids	ID/array	Return only templates that belong to the given template groups.
parentTemplateids	ID/array	Return only templates that the given template is linked to.
hostids	ID/array	Return only templates that are linked to the given hosts/templates.
graphids	ID/array	Return only templates that contain the given graphs.
itemids	ID/array	Return only templates that contain the given items.
triggerids	ID/array	Return only templates that contain the given triggers.
with_items	flag	Return only templates that have items.
with_triggers	flag	Return only templates that have triggers.
with_graphs	flag	Return only templates that have graphs.
with_httptests	flag	Return only templates that have web scenarios.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.

Parameter	Type	Description
tags	object/array	Return only templates with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all templates. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
inheritedTags	boolean	Return templates that have given `tags` also in linked templates. Possible values: `true` - linked templates must also have given tags; `false` - *(default)* tags from linked templates are ignored.
selectInheritedTags	query	Return an `inheritedTags` property with tags that are on linked templates.
selectTags	query	Return template tags in the `tags` property.
selectDiscoveryRules	query	Return a `discoveryRules` property with template LLD rules. Supports `count`.
selectHosts	query	Return the hosts that are linked to the template in the `hosts` property. Supports `count`.
selectTemplateGroups	query	Return the template groups that the template belongs to in the `templategroups` property.
selectTemplates	query	Return templates to which the given template is linked in the `templates` property. Supports `count`.
selectParentTemplates	query	Return templates that are linked to the given template in the `parentTemplates` property. Supports `count`.
selectHttpTests	query	Return the web scenarios from the template in the `httpTests` property. Supports `count`.
selectItems	query	Return items from the template in the `items` property. Supports `count`.
selectTriggers	query	Return triggers from the template in the `triggers` property. Supports `count`.
selectGraphs	query	Return graphs from the template in the `graphs` property. Supports `count`.
selectMacros	query	Return the macros from the template in the `macros` property.
selectDashboards	query	Return dashboards from the template in the `dashboards` property. Supports `count`.
selectValueMaps	query	Return a `valuemaps` property with template value maps.

Parameter	Type	Description
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectTemplates` - results will be sorted by `name`; `selectHosts` - sorted by `host`; `selectParentTemplates` - sorted by `host`; `selectItems` - sorted by `name`; `selectDiscoveryRules` - sorted by `name`; `selectTriggers` - sorted by `description`; `selectGraphs` - sorted by `name`; `selectDashboards` - sorted by `name`.
sortfield	string/array	Sort the result by the given properties. Possible values: `hostid`, `host`, `name`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	
selectDiscoveries	query	Return low-level discoveries from the template in the `discoveries` property. Supports `count`. This query is **deprecated**, please use `selectDiscoveryRules` instead.

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving templates by name

Retrieve all data about two templates named ”Linux by Zabbix agent” and ”Windows by Zabbix agent”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": "extend",
        "filter": {
            "host": [
                "Linux by Zabbix agent",
                "Windows by Zabbix agent"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "proxyid": "0",
            "host": "Linux by Zabbix agent",
            "status": "3",
            "ipmi_authtype": "-1",
            "ipmi_privilege": "2",
            "ipmi_username": "",
            "ipmi_password": "",
            "maintenanceid": "0",
            "maintenance_status": "0",
            "maintenance_type": "0",
            "maintenance_from": "0",
            "name": "Linux by Zabbix agent",
            "flags": "0",
            "templateid": "10001",
            "description": "This is an official Linux template. It requires Zabbix agent 8.0 or newer.\r\n
            "tls_connect": "1",
            "tls_accept": "1",
            "tls_issuer": "",
            "tls_subject": "",
            "tls_psk_identity": "",
            "tls_psk": "",
            "custom_interfaces": "0",
            "uuid": "f8f7908280354f2abeed07dc788c3747",
            "vendor_name": "Zabbix",
            "vendor_version": "8.0-2",
            "proxy_groupid": "0",
            "monitored_by": "0",
            "wizard_ready": "1",
            "readme": "## Overview\r\n\r\nThis is an official Linux template. It requires Zabbix agent 8.0
        },
        {
            "proxyid": "0",
            "host": "Windows by Zabbix agent",
            "status": "3",
            "ipmi_authtype": "-1",
            "ipmi_privilege": "2",
            "ipmi_username": "",
            "ipmi_password": "",
            "maintenanceid": "0",
            "maintenance_status": "0",
            "maintenance_type": "0",
            "maintenance_from": "0",
            "name": "Windows by Zabbix agent",
            "flags": "0",
            "templateid": "10081",
            "description": "This is an official Windows template. It requires Zabbix agent 8.0 or newer.\r
            "tls_connect": "1",
            "tls_accept": "1",
            "tls_issuer": "",
            "tls_subject": "",
            "tls_psk_identity": "",
            "tls_psk": "",
            "custom_interfaces": "0",
            "uuid": "13b06904a6bf41cbb795e3193d896340",
            "vendor_name": "Zabbix",
            "vendor_version": "8.0-2",
            "proxy_groupid": "0",
            "monitored_by": "0",
```

```
            "wizard_ready": "1",
            "readme": "## Overview\r\n\r\nThis is an official Windows template. It requires Zabbix agent &
        }
    ],
    "id": 1
}
```

Retrieving template groups

Retrieve template groups that the template "Linux by Zabbix agent" is a member of.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": ["hostid"],
        "selectTemplateGroups": "extend",
        "filter": {
            "host": [
                "Linux by Zabbix agent"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "templateid": "10001",
            "templategroups": [
                {
                    "groupid": "10",
                    "name": "Templates/Operating systems",
                    "uuid": "846977d1dfed4968bc5f8bdb363285bc"
                }
            ]
        }
    ],
    "id": 1
}
```

Retrieving hosts by template

Retrieve hosts that have the "10001" (*Linux by Zabbix agent*) template linked to them.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": "templateid",
        "templateids": "10001",
        "selectHosts": ["hostid", "name"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
```

```
    "result": [
        {
            "templateid": "10001",
            "hosts": [
                {
                    "hostid": "10084",
                    "name": "Zabbix server"
                },
                {
                    "hostid": "10603",
                    "name": "Host 1"
                },
                {
                    "hostid": "10604",
                    "name": "Host 2"
                }
            ]
        }
    ],
    "id": 1
}
```

Searching by template tags

Retrieve templates that have tag "host-name" equal to "{HOST.NAME}".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.get",
    "params": {
        "output": ["hostid"],
        "selectTags": "extend",
        "evaltype": 0,
        "tags": [
            {
                "tag": "host-name",
                "value": "{HOST.NAME}",
                "operator": 1
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "templateid": "10402",
            "tags": [
                {
                    "tag": "host-name",
                    "value": "{HOST.NAME}"
                }
            ]
        }
    ],
    "id": 1
}
```

CTemplate::get() in *ui/include/classes/api/services/CTemplate.php*.

template.massadd

Description

`object template.massadd(object parameters)`

This method allows you to simultaneously add multiple related objects to the given templates.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the templates to update and the objects to add to the templates.

The method accepts the following parameters.

Parameter	Type	Description
templates	object/array	Templates to be updated. The templates must have only the `templateid` property defined. Parameter behavior: - *required*
groups	object/array	Template groups to add the given templates to. The template groups must have only the `groupid` property defined.
macros	object/array	User macros to be created for the given templates.
templates_link	object/array	Templates to link to the given templates. The templates must have only the `templateid` property defined.

Return values

`(object)` Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Link a group to templates

Add template group "2" to two templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.massadd",
    "params": {
        "templates": [
            {
                "templateid": "10085"
            },
            {
                "templateid": "10086"
            }
        ],
        "groups": [
```

```
            {
                "groupid": "2"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10085",
            "10086"
        ]
    },
    "id": 1
}
```

Link two templates to a template

Link templates ”10106” and ”10104” to template ”10073”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.massadd",
    "params": {
        "templates": [
            {
                "templateid": "10073"
            }
        ],
        "templates_link": [
            {
                "templateid": "10106"
            },
            {
                "templateid": "10104"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10073"
        ]
    },
    "id": 1
}
```

CTemplate::massAdd() in *ui/include/classes/api/services/CTemplate.php*.

template.massremove

Description

`object template.massremove(object parameters)`

This method allows you to remove related objects from multiple templates.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the templates to update and the objects that should be removed.

Parameter	Type	Description
templateids	ID/array	IDs of the templates to be updated. Parameter behavior: *- required*
groupids	ID/array	IDs of the template groups from which to remove the given templates.
macros	string/array	IDs of the user macros to delete from the given templates.
templateids_clear	ID/array	IDs of the templates to unlink and clear from the given templates (upstream).
templateids_link	ID/array	IDs of the templates to unlink from the given templates (upstream).

Return values

`(object)` Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Removing templates from a group

Remove two templates from group "2".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.massremove",
    "params": {
        "templateids": [
            "10085",
            "10086"
        ],
        "groupids": "2"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10085",
            "10086"
        ]
    },
```

```
    "id": 1
}
```

Unlinking templates from a host

Unlink templates ”10106” and ”10104” from template ”10085”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.massremove",
    "params": {
        "templateids": "10085",
        "templateids_link": [
            "10106",
            "10104"
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10085"
        ]
    },
    "id": 1
}
```

template.update

Description

`object template.update(object/array templates)`

This method allows you to update existing templates.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Template properties to be updated.

The `templateid` property must be defined for each template, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Additionally to the standard template properties, the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Template groups to replace the current template groups the templates belong to. The template groups must have only the `groupid` property defined.
tags	object/array	Template tags to replace the current template tags.
macros	object/array	User macros to replace the current user macros on the given templates.
templates	object/array	Templates to replace the currently linked templates. Templates that are not passed are only unlinked. The templates must have only the `templateid` property defined.
templates_clear	object/array	Templates to unlink and clear from the given templates. The templates must have only the `templateid` property defined.

Return values

`(object)` Returns an object containing the IDs of the updated templates under the `templateids` property.

Examples

Changing the standard template properties

Change the technical name of the template to ”Linux by Zabbix agent Custom”, the visible name to ”My template”, and update the template description.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": {
        "templateid": "10086",
        "host": "Linux by Zabbix agent Custom",
        "name": "My template",
        "description": "This is a custom Linux template."
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}
```

Updating template groups

Replace all template groups for the given template with a different one.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": {
        "templateid": "10086",
        "groups": [
            {
                "groupid": "24"
```

```
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}
```

Updating multiple template groups

Replace all template groups for multiple templates with different ones.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": [
        {
            "templateid": "10086",
            "groups": [
                {
                    "groupid": "24"
                }
            ]
        },
        {
            "templateid": "10087",
            "groups": [
                {
                    "groupid": "1"
                },
                {
                    "groupid": "12"
                }
            ]
        },
        {
            "templateid": "10088",
            "groups": [
                {
                    "groupid": "1"
                },
                {
                    "groupid": "12"
                }
            ]
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
```

```
    "result": {
        "templateids": [
            "10086",
            "10087",
            "10088"
        ]
    },
    "id": 1
}
```

Updating template tags

Replace all template tags with a different one.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": {
        "templateid": "10086",
        "tags": [
            {
                "tag": "host-name",
                "value": "{HOST.NAME}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}
```

Updating template macros

Replace all template macros with a different one.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": {
        "templateid": "10086",
        "macros": [
            {
                "macro": "{$MY_MACRO}",
                "value": "new_value"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
```

```
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}
```

Updating multiple template macros

Replace all user macros with the given user macro on multiple templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": [
            {
                "templateid": "10087",
                "macros": [
                    {
                        "macro": "{$AGENT.TIMEOUT}",
                        "value": "5m",
                        "description": "Timeout after which agent is considered unavailable. Works only fo
                    }
                ]
            },
            {
                "templateid": "10088",
                "macros": [
                    {
                        "macro": "{$AGENT.TIMEOUT}",
                        "value": "5m",
                        "description": "Timeout after which agent is considered unavailable. Works only fo
                    }
                ]
            }
        ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10087",
            "10088"
        ]
    },
    "id": 1
}
```

Updating template linked templates

Unlink (without clearing) all templates from the given template and link a different one to it.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": {
        "templateid": "10086",
        "templates": [
```

```
            {
                "templateid": "10001"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10086"
        ]
    },
    "id": 1
}
```

Clearing multiple template linked templates

Unlink and clear a specific linked template from the given templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "template.update",
    "params": [
        {
            "templateid": "10087",
            "templates_clear": [
                {
                    "templateid": "10001"
                }
            ]
        },
        {
            "templateid": "10088",
            "templates_clear": [
                {
                    "templateid": "10001"
                }
            ]
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "templateids": [
            "10087",
            "10088"
        ]
    },
    "id": 1
}
```

Source

CTemplate::update() in *ui/include/classes/api/services/CTemplate.php*.

Template dashboard

This class is designed to work with template dashboards.

Object references:

- Template dashboard
- Template dashboard page
  - Template dashboard widget
    - Template dashboard widget field

Available methods:

- templatedashboard.create - create new template dashboards
- templatedashboard.delete - delete template dashboards
- templatedashboard.get - retrieve template dashboards
- templatedashboard.update - update template dashboards

Template dashboard object

The following objects are directly related to the `templatedashboard` API.

Template dashboard

The template dashboard object has the following properties.

Property	Type	Description
dashboardid	ID	ID of the template dashboard. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the template dashboard. Property behavior: - *required* for create operations
templateid	ID	ID of the template the dashboard belongs to. Property behavior: - *constant* - *required* for create operations
display_period	integer	Default slideshow interval (in seconds). Possible values: 10, 30, 60, 120, 600, 1800, 3600. Default: 30.
auto_start	integer	Auto start slideshow. Possible values: 0 - do not auto start slideshow; 1 - *(default)* auto start slideshow.
uuid	string	Universal unique identifier, used for linking imported template dashboards to already existing ones. Auto-generated, if not given.

Template dashboard page

The template dashboard page object has the following properties.

Property	Type	Description
dashboard_pageid	ID	ID of the dashboard page. Property behavior: - *read-only*

Property	Type	Description
name	string	Dashboard page name. Default: empty string.
display_period	integer	Dashboard slideshow interval (in seconds). Possible values: 0, 10, 30, 60, 120, 600, 1800, 3600. Default: 0 (will use the default slideshow interval).
widgets	array	Array of the template dashboard widget objects.

Template dashboard widget

The template dashboard widget object has the following properties.

Property	Type	Description
widgetid	ID	ID of the dashboard widget. Property behavior: - *read-only*
type	string	Type of the dashboard widget. Possible values: actionlog - Action log; clock - Clock; discovery - Discovery status; favgraphs - Favorite graphs; favmaps - Favorite maps; gauge - Gauge; graph - Graph (classic); graphprototype - Graph prototype; honeycomb - Honeycomb; hostavail - Host availability; hostcard - Host card; hostnavigator - Host navigator; itemcard - Item card; itemnavigator - Item navigator; item - Item value; map - Map; navtree - Map Navigation Tree; piechart - Pie chart; plaintext - Plain text; problemhosts - Problem hosts; problems - Problems; problemsbysv - Problems by severity; scatterplot - Scatter plot; slareport - SLA report; svggraph - Graph; systeminfo - System information; tophosts - Top hosts; topitems - Top items; toptriggers - Top triggers; trigover - Trigger overview; url - URL; web - Web monitoring. Property behavior: - *required*
name	string	Custom widget name.

Property	Type	Description
x	integer	A horizontal position from the left side of the dashboard. Possible values range from 0 to 71.
y	integer	A vertical position from the top of the dashboard. Possible values range from 0 to 63.
width	integer	The widget width. Possible values range from 1 to 72.
height	integer	The widget height. Possible values range from 1 to 64.
view_mode	integer	The widget view mode. Possible values: 0 - *(default)* default widget view; 1 - with hidden header;
fields	array	Array of the template dashboard widget field objects.

Template dashboard widget field

The template dashboard widget field object has the following properties.

Property	Type	Description
type	integer	Type of the widget field. Possible values: 0 - Integer; 1 - String; 4 - Item; 5 - Item prototype; 6 - Graph; 7 - Graph prototype; 8 - Map; 9 - Service; 10 - SLA; 11 - User; 12 - Action; 13 - Media type. Property behavior: - *required*
name	string	Widget field name. Possible values: see Dashboard widget fields. Note that some host-related parameters (e.g., *Host groups*, *Exclude host groups* and *Hosts* in the *Problems* widget, *Host groups* in the *Host availability* widget, etc.) are not available when configuring the widget on a template dashboard. This is because template dashboards display data only from the host that the template is linked to. Property behavior: - *required*

Property	Type	Description
value	mixed	Widget field value depending on the type. Possible values: see Dashboard widget fields. Note that some host-related parameters (e.g., *Host groups*, *Exclude host groups* and *Hosts* in the *Problems* widget, *Host groups* in the *Host availability* widget, etc.) are not available when configuring the widget on a template dashboard. This is because template dashboards display data only from the host that the template is linked to. Property behavior: - *required*

templatedashboard.create

Description

`object templatedashboard.create(object/array templateDashboards)`

This method allows you to create new template dashboards.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Template dashboards to create.

Additionally to the standard template dashboard properties, the method accepts the following parameters.

Parameter	Type	Description
pages	array	Template dashboard pages to be created for the dashboard. Dashboard pages will be ordered in the same order as specified. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the created template dashboards under the `dashboardids` property. The order of the returned IDs matches the order of the passed template dashboards.

Examples

Creating a template dashboard

Create a template dashboard named “Graphs” with one Graph widget on a single dashboard page.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templatedashboard.create",
    "params": {
        "templateid": "10318",
        "name": "Graphs",
        "pages": [
            {
                "widgets": [
                    {
                        "type": "graph",
                        "x": 0,
                        "y": 0,
```

```
                        "width": 12,
                        "height": 5,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 6,
                                "name": "graphid",
                                "value": "1123"
                            }
                        ]
                    }
                ]

            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "32"
        ]
    },
    "id": 1
}
```

CTemplateDashboard::create() in *ui/include/classes/api/services/CTemplateDashboard.php*.

templatedashboard.delete

Description

`object templatedashboard.delete(array templateDashboardIds)`

This method allows you to delete template dashboards.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the template dashboards to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted template dashboards under the `dashboardids` property.

Examples

Deleting multiple template dashboards

Delete two template dashboards.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templatedashboard.delete",
    "params": [
        "45",
        "46"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "45",
            "46"
        ]
    },
    "id": 1
}
```

Source

CTemplateDashboard::delete() in *ui/include/classes/api/services/CTemplateDashboard.php*.

templatedashboard.get

Description

`integer/array templatedashboard.get(object parameters)`

The method allows you to retrieve template dashboards according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dashboardids	ID/array	Return only template dashboards with the given IDs.
templateids	ID/array	Return only template dashboards that belong to the given templates.
selectPages	query	Return a `pages` property with template dashboard pages, correctly ordered.
sortfield	string/array	Sort the result by the given properties. Possible values: `dashboardid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	

Parameter	Type	Description
startSearch	boolean	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving template dashboards

Retrieve all template dashboards with widgets for a specified template.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templatedashboard.get",
    "params": {
        "output": "extend",
        "selectPages": "extend",
        "templateids": "10001"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "dashboardid": "23",
            "name": "Docker overview",
            "templateid": "10001",
            "display_period": "30",
            "auto_start": "1",
            "uuid": "6dfcbe0bc5ad400ea9c1c2dd7649282f",
            "pages": [
                {
                    "dashboard_pageid": "1",
                    "name": "",
                    "display_period": "0",
                    "widgets": [
                        {
                            "widgetid": "220",
                            "type": "graph",
                            "name": "",
                            "x": "0",
                            "y": "0",
                            "width": "36",
                            "height": "5",
                            "view_mode": "0",
                            "fields": [
                                {
                                    "type": "6",

CTemplateDashboard::get() in *ui/include/classes/api/services/CTemplateDashboard.php*.

templatedashboard.update

Description

`object templatedashboard.update(object/array templateDashboards)`

This method allows you to update existing template dashboards.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Template dashboard properties to be updated.

The `dashboardid` property must be specified for each dashboard, all other properties are optional. Only the specified properties will be updated.

Additionally to the standard template dashboard properties, the method accepts the following parameters.

Parameter	Type	Description
pages	array	Template dashboard pages to replace the existing dashboard pages. Dashboard pages are updated by the `dashboard_pageid` property. New dashboard pages will be created for objects without `dashboard_pageid` property and the existing dashboard pages will be deleted if not reused. Dashboard pages will be ordered in the same order as specified. Only the specified properties of the dashboard pages will be updated. At least one dashboard page object is required for `pages` property.

Return values

`(object)` Returns an object containing the IDs of the updated template dashboards under the `dashboardids` property.

Examples

Renaming a template dashboard

Rename a template dashboard to ”Performance graphs”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templatedashboard.update",
    "params": {
        "dashboardid": "23",
        "name": "Performance graphs"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "23"
        ]
    },
    "id": 1
}
```

Updating template dashboard pages

Rename the first dashboard page, replace widgets on the second dashboard page and add a new page as the third one. Delete all other dashboard pages.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templatedashboard.update",
    "params": {
        "dashboardid": "2",
        "pages": [
            {
                "dashboard_pageid": 1,
                "name": "Renamed Page"
            },
            {
                "dashboard_pageid": 2,
                "widgets": [
                    {
                        "type": "clock",
                        "x": 0,
                        "y": 0,
                        "width": 12,
                        "height": 3
                    }
                ]
            },
            {
                "display_period": 60
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "2"
```

```
        ]
    },
    "id": 1
}
```

Template group

This class is designed to work with template groups.

Object references:

- Template group

Available methods:

- templategroup.create - create new template groups
- templategroup.delete - delete template groups
- templategroup.get - retrieve template groups
- templategroup.massadd - add related objects to template groups
- templategroup.massremove - remove related objects from template groups
- templategroup.propagate - propagate permissions to template groups' subgroups
- templategroup.update - update template groups

Template group object

The following objects are directly related to the `templategroup` API.

Template group

The template group object has the following properties.

Property	Type	Description
groupid	ID	ID of the template group. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the template group. Property behavior: - *required* for create operations
uuid	string	Universal unique identifier, used for linking imported template groups to already existing ones. Auto-generated, if not given.

templategroup.create

Description

`object templategroup.create(object/array templateGroups)`

This method allows you to create new template groups.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object/array) Template groups to create. The method accepts template groups with the standard template group properties.

Return values

(object) Returns an object containing the IDs of the created template groups under the groupids property. The order of the returned IDs matches the order of the passed template groups.

Examples

Creating a template group

Create a template group called "Templates/Databases".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.create",
    "params": {
        "name": "Templates/Databases"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "107820"
        ]
    },
    "id": 1
}
```

Source

CTemplateGroup::create() in *ui/include/classes/api/services/CTemplateGroup.php*.

templategroup.delete

Description

`object templategroup.delete(array templateGroupIds)`

This method allows you to delete template groups.

A template group cannot be deleted if it contains templates that belong to this group only.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(array) IDs of the template groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted template groups under the groupids property.

Examples

Deleting multiple template groups

Delete two template groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.delete",
    "params": [
        "107814",
        "107815"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "107814",
            "107815"
        ]
    },
    "id": 1
}
```

Source

CTemplateGroup::delete() in *ui/include/classes/api/services/CTemplateGroup.php*.

templategroup.get

Description

`integer/array templategroup.get(object parameters)`

The method allows you to retrieve template groups according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
graphids	ID/array	Return only template groups that contain templates with the given graphs.
groupids	ID/array	Return only template groups with the given template group IDs.
templateids	ID/array	Return only template groups that contain the given templates.
triggerids	ID/array	Return only template groups that contain templates with the given triggers.
with_graphs	boolean	Return only template groups that contain templates with graphs.
with_graph_prototypes	boolean	Return only template groups that contain templates with graph prototypes.
with_httptests	boolean	Return only template groups that contain templates with web checks.
with_items	boolean	Return only template groups that contain templates with items. Overrides the `with_simple_graph_items` parameters.
with_item_prototypes	boolean	Return only template groups that contain templates with item prototypes. Overrides the `with_simple_graph_item_prototypes` parameter.

Parameter	Type	Description
with_simple_graph_item_prototypes	boolean	Return only template groups that contain templates with item prototypes, which are enabled for creation and have numeric type of information.
with_simple_graph_items	boolean	Return only template groups that contain templates with numeric items.
with_templates	boolean	Return only template groups that contain templates.
with_triggers	boolean	Return only template groups that contain templates with triggers.
selectTemplates	query	Return a `templates` property with the templates that belong to the template group. Supports `count`.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectTemplates` - results will be sorted by `template`.
sortfield	string/array	Sort the result by the given properties. Possible values: `groupid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two template groups named ”Templates/Databases” and ”Templates/Modules”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.get",
    "params": {
        "output": "extend",
        "filter": {
            "name": [
                "Templates/Databases",
                "Templates/Modules"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
```

```
    "result": [
        {
            "groupid": "13",
            "name": "Templates/Databases",
            "uuid": "748ad4d098d447d492bb935c907f652f"
        },
        {
            "groupid": "8",
            "name": "Templates/Modules",
            "uuid": "57b7ae836ca64446ba2c296389c009b7"
        }
    ],
    "id": 1
}
```

templategroup.massadd

Description

`object templategroup.massadd(object parameters)`

This method allows you to simultaneously add multiple related objects to all the given template groups.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the template groups to update and the objects to add to all the template groups.

The method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Template groups to be updated. The template groups must have only the `groupid` property defined. Parameter behavior: - *required*
templates	object/array	Templates to add to all template groups. The templates must have only the `templateid` property defined. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the updated template groups under the `groupids` property.

Examples

Adding templates to template groups

Add two templates to template groups with IDs 12 and 13.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.massadd",
    "params": {
        "groups": [
            {
                "groupid": "12"
            },
            {
                "groupid": "13"
            }
        ],
        "templates": [
            {
                "templateid": "10486"
            },
            {
                "templateid": "10487"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "12",
            "13"
        ]
    },
    "id": 1
}
```

CTemplateGroup::massAdd() in *ui/include/classes/api/services/CTemplateGroup.php*.

templategroup.massremove

Description

`object templategroup.massremove(object parameters)`

This method allows you to remove related objects from multiple template groups.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the template groups to update and the objects that should be removed.

Parameter	Type	Description
groupids	ID/array	IDs of the template groups to be updated. Parameter behavior: - *required*
templateids	ID/array	IDs of the templates to remove from all template groups. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the updated template groups under the `groupids` property.

Examples

Removing templates from template groups

Remove two templates from the given template groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.massremove",
    "params": {
        "groupids": [
            "5",
            "6"
        ],
        "templateids": [
            "30050",
            "30001"
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "5",
            "6"
        ]
    },
    "id": 1
}
```

Source

CTemplateGroup::massRemove() in *ui/include/classes/api/services/CTemplateGroup.php*.

templategroup.propagate

Description

`object templategroup.propagate(object parameters)`

This method allows you to apply permissions to all template groups' subgroups.

Note:
This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groups	object/array	Template groups to propagate. The template groups must have only the `groupid` property defined. Parameter behavior: *- required*
permissions	boolean	Set `true` if need to propagate permissions. Parameter behavior: *- required*

Return values

`(object)` Returns an object containing the IDs of the propagated template groups under the `groupids` property.

Examples

Propagating template group permissions to its subgroups.

Propagate template group permissions to its subgroups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.propagate",
    "params": {
        "groups": [
            {
                "groupid": "15"
            }
        ],
        "permissions": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "15",
        ]
    },
    "id": 1
}
```

CTemplateGroup::propagate() in *ui/include/classes/api/services/CTemplateGroup.php*.

templategroup.update

Description

`object templategroup.update(object/array templateGroups)`

This method allows you to update existing template groups.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Template group properties to be updated.

The `groupid` property must be defined for each template group, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

`(object)` Returns an object containing the IDs of the updated template groups under the `groupids` property.

Examples

Renaming a template group

Rename a template group to "Templates/Databases"

Request:

```
{
    "jsonrpc": "2.0",
    "method": "templategroup.update",
    "params": {
        "groupid": "7",
        "name": "Templates/Databases"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "7"
        ]
    },
    "id": 1
}
```

Token

This class is designed to work with tokens.

Object references:

- Token

Available methods:

- token.create - create new tokens
- token.delete - delete tokens
- token.get - retrieve tokens
- token.update - update tokens

- token.generate - generate tokens

Token object

The following objects are directly related to the `token` API.

Token

The token object has the following properties.

Property	Type	Description
tokenid	ID	ID of the token. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the token. Property behavior: - *required* for create operations
description	text	Description of the token.
userid	ID	ID of the user that the token has been assigned to. Default: *current user*. Property behavior: - *constant*
lastaccess	timestamp	Most recent date and time the token was authenticated. "0" if the token has never been authenticated. Property behavior: - *read-only*
status	integer	Token status. Possible values: 0 - *(default)* enabled token; 1 - disabled token.
expires_at	timestamp	Token expiration date and time. "0" for never-expiring tokens.
created_at	timestamp	Token creation date and time. Property behavior: - *read-only*
creator_userid	ID	ID of the user that created the token. Property behavior: - *read-only*

token.create

Description

`object token.create(object/array tokens)`

This method allows you to create new tokens.

> **Note:**
> The *Manage API tokens* permission is required for the user role to manage tokens for other users.

Attention:
A token created by this method also has to be generated before it is usable.

Parameters

`(object/array)` Tokens to create.

The method accepts tokens with the standard token properties.

Return values

`(object)` Returns an object containing the IDs of the created tokens under the `tokenids` property. The order of the returned IDs matches the order of the passed tokens.

Examples

Create a token

Create an enabled token that never expires and authenticates user of ID 2.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "token.create",
    "params": {
        "name": "Your token",
        "userid": "2"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "tokenids": [
            "188"
        ]
    },
    "id": 1
}
```

Create a disabled token that expires at January 21st, 2021. This token will authenticate current user.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "token.create",
    "params": {
        "name": "Your token",
        "status": "1",
        "expires_at": "1611238072"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "tokenids": [
            "189"
        ]
    },
    "id": 1
}
```

Source

CToken::create() in *ui/include/classes/api/services/CToken.php*.

token.delete

Description

`object token.delete(array tokenids)`

This method allows you to delete tokens.

> **Note:**
> The *Manage API tokens* permission is required for the user role to manage tokens for other users.

Parameters

`(array)` IDs of the tokens to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted tokens under the `tokenids` property.

Examples

Delete multiple tokens

Delete two tokens.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "token.delete",
    "params": [
        "188",
        "192"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "tokenids": [
            "188",
            "192"
        ]
    },
    "id": 1
}
```

Source

CToken::delete() in *ui/include/classes/api/services/CToken.php*.

token.generate

Description

`object token.generate(array tokenids)`

This method allows you to generate tokens.

> **Note:**
> The *Manage API tokens* permission is required for the user role to manage tokens for other users.

Attention:
A token can be generated by this method only if it has been created.

Parameters

`(array)` IDs of the tokens to generate.

Return values

`(array)` Returns an array of objects containing the ID of the generated token under the `tokenid` property and generated authorization string under `token` property.

Property	Type	Description
tokenid	ID	ID of the token.
token	string	The generated authorization string for this token.

Examples

Generate multiple tokens

Generate two tokens.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "token.generate",
    "params": [
        "1",
        "2"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "tokenid": "1",
            "token": "bbcfce79a2d95037502f7e9a534906d3466c9a1484beb6ea0f4e7be28e8b8ce2"
        },
        {
            "tokenid": "2",
            "token": "fa1258a83d518eabd87698a96bd7f07e5a6ae8aeb8463cae33d50b91dd21bd6d"
        }
    ],
    "id": 1
}
```

Source

CToken::generate() in *ui/include/classes/api/services/CToken.php*.

token.get

Description

`integer/array token.get(object parameters)`

The method allows you to retrieve tokens according to the given parameters.

Note:
Only *Super admin* user type is allowed to view tokens for other users.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
tokenids	ID/array	Return only tokens with the given IDs.
userids	ID/array	Return only tokens created for the given users.
token	string	Return only tokens created for the given *Auth token*.
valid_at	timestamp	Return only tokens, which are valid (not expired) at the given date and time.
expired_at	timestamp	Return only tokens, which are expired (not valid) at the given date and time.
sortfield	string/array	Sort the result by the given properties. Possible values: `tokenid`, `name`, `lastaccess`, `status`, `expires_at`, `created_at`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve a token

Retrieve all data for the token with ID "2".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "token.get",
    "params": {
        "output": "extend",
        "tokenids": "2"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "tokenid": "1",
            "name": "The Token",
            "description": "",
            "userid": "1",
            "lastaccess": "0",
            "status": "0",
```

```
            "expires_at": "1609406220",
            "created_at": "1611239454",
            "creator_userid": "1"
        }
    ],
    "id": 1
}
```

Source

CToken::get() in *ui/include/classes/api/services/CToken.php*.

token.update

Description

`object token.update(object/array tokens)`

This method allows you to update existing tokens.

> **Note:**
> The *Manage API tokens* permission is required for the user role to manage tokens for other users.

Parameters

`(object/array)` Token properties to be updated.

The `tokenid` property must be defined for each token, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts tokens with the standard token properties.

Return values

`(object)` Returns an object containing the IDs of the updated tokens under the `tokenids` property.

Examples

Remove token expiry

Remove expiry date from token.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "token.update",
    "params": {
        "tokenid": "2",
        "expires_at": "0"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "tokenids": [
            "2"
        ]
    },
    "id": 1
}
```

Trend

This class is designed to work with trend data.

Object references:

- Float trend
- Integer trend

Available methods:

- trend.get - retrieve trends

Trend object

The following objects are directly related to the `trend` API.

Note:
Trend objects differ depending on the item's type of information. They are created by the Zabbix server and cannot be modified via the API.

Float trend

The float trend object has the following properties.

Property	Type	Description
clock	timestamp	Timestamp of an hour for which the value was calculated. For example, timestamp of "04:00:00" means values calculated for period "04:00:00-04:59:59".
itemid	ID	ID of the related item.
num	integer	Number of values that were available for the hour.
value_min	float	Hourly minimum value.
value_avg	float	Hourly average value.
value_max	float	Hourly maximum value.

Integer trend

The integer trend object has the following properties.

Property	Type	Description
clock	timestamp	Timestamp of an hour for which the value was calculated. For example, timestamp of "04:00:00" means values calculated for period "04:00:00-04:59:59".
itemid	ID	ID of the related item.
num	integer	Number of values that were available for the hour.
value_min	integer	Hourly minimum value.
value_avg	integer	Hourly average value.
value_max	integer	Hourly maximum value.

trend.get

Description

`integer/array trend.get(object parameters)`

The method allows you to retrieve trend data according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
itemids	ID/array	Return only trends with the given item IDs.
time_from	timestamp	Return only values that have been collected after or at the given time.
time_till	timestamp	Return only values that have been collected before or at the given time.
countOutput	boolean	Count the number of retrieved objects.
limit	integer	Limit the amount of retrieved objects.
output	query	Set Trend object properties to be returned.

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving item trend data

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trend.get",
    "params": {
        "output": [
            "itemid",
            "clock",
            "num",
            "value_min",
            "value_avg",
            "value_max"
        ],
        "itemids": [
            "23715"
        ],
        "limit": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "23715",
            "clock": "1446199200",
            "num": "60",
            "value_min": "0.165",
            "value_avg": "0.2168",
            "value_max": "0.35"
        }
    ],
    "id": 1
}
```

CTrend::get() in *ui/include/classes/api/services/CTrend.php*.

Trigger

This class is designed to work with triggers.

Object references:

- Trigger
- Trigger tag

Available methods:

- trigger.create - create new triggers
- trigger.delete - delete triggers
- trigger.get - retrieve triggers
- trigger.update - update triggers

Trigger object

The following objects are directly related to the `trigger` API.

Trigger

The trigger object has the following properties.

Property	Type	Description
triggerid	ID	ID of the trigger. Property behavior: - *read-only* - *required* for update operations
description	string	Name of the trigger. Property behavior: - *required* for create operations
expression	string	Trigger expression. Items with `value_type` set to 5 (binary) or 6 (JSON) cannot be used in trigger expressions. Property behavior: - *required* for create operations
event_name	string	Event name generated by the trigger.
opdata	string	Operational data.
comments	string	Additional description of the trigger.
error	string	Error text if there have been any problems when updating the state of the trigger. Property behavior: - *read-only*
flags	integer	Origin of the trigger. Possible values: 0 - *(default)* a plain trigger; 4 - a trigger converted from prototype. Property behavior: - *read-only*
lastchange	timestamp	Time when the trigger last changed its state. Property behavior: - *read-only*

Property	Type	Description
priority	integer	Severity of the trigger. Possible values: 0 - *(default)* not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.
state	integer	State of the trigger expression. Possible values: 0 - *(default)* trigger state is up to date; 1 - current trigger state is unknown. Property behavior: - *read-only*
status	integer	Whether the trigger is enabled or disabled. Possible values: 0 - *(default)* enabled; 1 - disabled.
templateid	ID	ID of the parent template trigger. Property behavior: - *read-only*
type	integer	Whether the trigger can generate multiple problem events. Possible values: 0 - *(default)* do not generate multiple events; 1 - generate multiple events.
url	string	URL associated with the trigger.
url_name	string	Label for the URL associated with the trigger.
value	integer	Whether the trigger is in OK or problem state. Possible values: 0 - *(default)* OK; 1 - problem. Property behavior: - *read-only*
recovery_mode	integer	OK event generation mode. Possible values: 0 - *(default)* Expression; 1 - Recovery expression; 2 - None.
recovery_expression	string	Trigger recovery expression. Items with `value_type` set to 5 (binary) or 6 (JSON) cannot be used in trigger recovery expressions.
correlation_mode	integer	OK event closes. Possible values: 0 - *(default)* All problems; 1 - All problems if tag values match.
correlation_tag	string	Tag for matching.
manual_close	integer	Allow manual close. Possible values: 0 - *(default)* No; 1 - Yes.

Property	Type	Description
uuid	string	Universal unique identifier, used for linking imported triggers to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the trigger belongs to a template

Trigger tag

The trigger tag object has the following properties.

Property	Type	Description
tag	string	Trigger tag name. Property behavior: - *required*
value	string	Trigger tag value. Property behavior: - *read-only*.
object	integer	Type of object the tag was inherited from. Possible values: 0 - template; 1 - host; 3 - item. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.
automatic	integer	Type of a trigger tag: Possible values: 0 - *(default)* tag created by user; 1 - tag created by LLD;Property behavior: - *read-only*.

trigger.create

Description

`object trigger.create(object/array triggers)`

This method allows you to create new triggers.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Triggers to create.

Additionally to the standard trigger properties the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Triggers that the trigger is dependent on. The triggers must have only the `triggerid` property defined.
tags	array	Trigger tags.

Return values

`(object)` Returns an object containing the IDs of the created triggers under the `triggerids` property. The order of the returned IDs matches the order of the passed triggers.

Examples

Creating a trigger

Create two triggers, each depending on one other trigger.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.create",
    "params": [
        {
            "description": "Processor load is too high on {HOST.NAME}",
            "expression": "last(/Linux server/system.cpu.load[percpu,avg1])>5",
            "dependencies": [
                {
                    "triggerid": "17367"
                }
            ]
        },
        {
            "description": "Service has stopped",
            "expression": "length(last(/Linux server/log[/var/log/system,Service .* has stopped]))<>0",
            "dependencies": [
                {
                    "triggerid": "17368"
                }
            ],
            "tags": [
                {
                    "tag": "service",
                    "value": "{{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")}"
                },
                {
                    "tag": "error",
                    "value": ""
                }
            ]
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "17369",
            "17370"
        ]
    },
```

```
    "id": 1
}
```

Source

CTrigger::create() in *ui/include/classes/api/services/CTrigger.php*.

trigger.delete

Description

`object trigger.delete(array triggerIds)`

This method allows you to delete triggers.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the triggers to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted triggers under the `triggerids` property.

Examples

Delete multiple triggers

Delete two triggers.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.delete",
    "params": [
        "12002",
        "12003"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "12002",
            "12003"
        ]
    },
    "id": 1
}
```

Source

CTrigger::delete() in *ui/include/classes/api/services/CTrigger.php*.

trigger.get

Description

`integer/array trigger.get(object parameters)`

The method allows you to retrieve triggers according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
triggerids	ID/array	Return only triggers with the given IDs.
groupids	ID/array	Return only triggers that belong to hosts or templates from the given host groups or template groups.
templateids	ID/array	Return only triggers that belong to the given templates.
hostids	ID/array	Return only triggers that belong to the given hosts.
itemids	ID/array	Return only triggers that contain the given items.
maintenanceids	ID/array	Return only triggers that are affected by the given maintenances.
functions	string/array	Return only triggers that use the given functions. Refer to the supported function page for a list of supported functions.
group	string	Return only triggers that belong to hosts or templates from the host group or template group with the given name.
host	string	Return only triggers that belong to host with the given technical name.
inherited	boolean	If set to `true` return only triggers inherited from a template.
templated	boolean	If set to `true` return only triggers that belong to templates.
dependent	boolean	If set to `true` return only triggers that have dependencies. If set to `false` return only triggers that do not have dependencies.
monitored	flag	Return only enabled triggers that belong to monitored hosts and contain only enabled items.
active	flag	Return only enabled triggers that belong to monitored hosts.
maintenance	boolean	If set to `true` return only enabled triggers that belong to hosts in maintenance.
withUnacknowledgedEvents	flag	Return only triggers that have unacknowledged events.
withAcknowledgedEvents	flag	Return only triggers with all events acknowledged.
withLastEventUnacknowledged	flag	Return only triggers with the last event unacknowledged.
skipDependent	flag	Skip triggers in a problem state that are dependent on other triggers. Note that the other triggers are ignored if disabled, have disabled items or disabled item hosts.
lastChangeSince	timestamp	Return only triggers that have changed their state after the given time.
lastChangeTill	timestamp	Return only triggers that have changed their state before the given time.
only_true	flag	Return only triggers that have been in a problem state recently (within the `ok_period`).
min_severity	integer	Return only triggers with severity greater or equal than the given severity.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.
tags	array	Return only triggers with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all triggers. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.

Parameter	Type	Description
expandComment	flag	Expand macros in the trigger description.
expandDescription	flag	Expand macros in the name of the trigger.
expandExpression	flag	Expand functions and macros in the trigger expression.
selectHostGroups	query	Return the host groups that the trigger belongs to in the `hostgroups` property.
selectHosts	query	Return the hosts that the trigger belongs to in the `hosts` property.
selectItems	query	Return items contained by the trigger in the `items` property.
selectFunctions	query	Return functions used in the trigger in the `functions` property. The function objects represent the functions used in the trigger expression and has the following properties: `functionid` - `(ID)` ID of the function; `itemid` - `(ID)` ID of the item used in the function; `function` - `(string)` name of the function; `parameter` - `(string)` parameter passed to the function. Query parameter is replaced by $ symbol in returned string.
selectDependencies	query	Return triggers that the trigger depends on in the `dependencies` property.
selectDiscoveryData	query	Return a `discoveryData` property with the trigger discovery object data. The trigger discovery object links a discovered trigger to a trigger prototype from which it was discovered. It has the following properties: `parent_triggerid` - `(ID)` ID of the trigger prototype from which the trigger has been created; `status` - `(int)` trigger discovery status: 0 - *(default)* trigger is discovered, 1 - trigger is not discovered anymore; `ts_delete` - `(timestamp)` time when a trigger that is no longer discovered will be deleted; `ts_disable` - `(timestamp)` time when a trigger that is no longer discovered will be disabled; `disable_source` - `(int)` indicator of whether trigger was disabled by an LLD rule or manually: 0 - *(default)* disabled automatically, 1 - disabled by an LLD rule.
selectDiscoveryRule	query	Return the low-level discovery rule that created the trigger in the `discoveryRule` property.
selectLastEvent	query	Return the last significant trigger event in the `lastEvent` property.
selectTags	query	Return the trigger tags in `tags` property.
inheritedTags	boolean	Return triggers that have given `tags` also in template/host/linked templates. Possible values: `true` - template/host/linked templates must also have given tags; `false` - *(default)* tags from template/host/linked templates are ignored.
selectInheritedTags	query	Return an `inheritedTags` property with tags inherited from templates, linked templates and hosts, and from items referenced in trigger or recovery expressions.
selectTemplateGroups	query	Return the template groups that the trigger belongs to in the `templategroups` property.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the trigger belongs to; `hostid` - ID of the host that the trigger belongs to.

Parameter	Type	Description
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectHosts` - results will be sorted by `host`.
sortfield	string/array	Sort the result by the given properties. Possible values: `triggerid`, `description`, `status`, `priority`, `lastchange`, `hostname`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	
selectTriggerDiscovery	query	Return the trigger discovery object in the `triggerDiscovery` property. The trigger discovery objects link the trigger to a trigger prototype from which it was created. This query is **deprecated**, please use `selectDiscoveryData` instead.

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by trigger ID

Retrieve all data and the functions used in trigger "14062".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.get",
    "params": {
        "triggerids": "14062",
        "output": "extend",
        "selectFunctions": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "14062",
            "expression": "{13513}<10m",

        }
    ],
    "id": 1
}
```

Retrieving triggers in problem state

Retrieve the ID, name and severity of all triggers in problem state and sort them by severity in descending order.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.get",
    "params": {
        "output": [
            "triggerid",
            "description",
            "priority"
        ],
        "filter": {
            "value": 1
        },
        "sortfield": "priority",
        "sortorder": "DESC"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "13907",
            "description": "Zabbix self-monitoring processes < 100% busy",
            "priority": "4"
        },
        {
```

```
            "triggerid": "13824",
            "description": "Zabbix discoverer processes more than 75% busy",
            "priority": "3"
        }
    ],
    "id": 1
}
```

Retrieving a specific trigger with tags

Retrieve a specific trigger with tags.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.get",
    "params": {
        "output": [
            "triggerid",
            "description"
        ],
        "selectTags": "extend",
        "triggerids": [
            "17578"
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "17370",
            "description": "Service status",
            "tags": [
                {
                    "tag": "service",
                    "value": "{{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")}",
                    "automatic": "1"
                },
                {
                    "tag": "error",
                    "value": "",
                    "automatic": "1"
                }
            ]
        }
    ],
    "id": 1
}
```

CTrigger::get() in *ui/include/classes/api/services/CTrigger.php*.

trigger.update

Description

`object trigger.update(object/array triggers)`

This method allows you to update existing triggers.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Trigger properties to be updated.

The `triggerid` property must be defined for each trigger, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard trigger properties the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Triggers that the trigger is dependent on. The triggers must have only the `triggerid` property defined.
tags	array	Trigger tags.

Return values

`(object)` Returns an object containing the IDs of the updated triggers under the `triggerids` property.

Examples

Enabling a trigger

Enable a trigger, that is, set its status to "0".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.update",
    "params": {
        "triggerid": "13938",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "13938"
        ]
    },
    "id": 1
}
```

Replacing triggers tags

Replace tags for trigger.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.update",
    "params": {
        "triggerid": "13938",
        "tags": [
            {
                "tag": "service",
                "value": "{{ITEM.VALUE}.regsub(\"Service (.*) has stopped\", \"\\1\")}"
            },
            {
                "tag": "error",
                "value": ""
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "13938"
        ]
    },
    "id": 1
}
```

Replacing dependencies

Replace dependencies for trigger.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "trigger.update",
    "params": {
        "triggerid": "22713",
        "dependencies": [
            {
                "triggerid": "22712"
            },
            {
                "triggerid": "22772"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "22713"
        ]
    },
    "id": 1
}
```

CTrigger::update() in *ui/include/classes/api/services/CTrigger.php*.

Trigger prototype

This class is designed to work with trigger prototypes.

Object references:

- Trigger prototype
- Trigger prototype tag

Available methods:

- triggerprototype.create - create new trigger prototypes
- triggerprototype.delete - delete trigger prototypes
- triggerprototype.get - retrieve trigger prototypes
- triggerprototype.update - update trigger prototypes

Trigger prototype object

The following objects are directly related to the `triggerprototype` API.

Trigger prototype

The trigger prototype object has the following properties.

Property	Type	Description
triggerid	ID	ID of the trigger prototype. Property behavior: - *read-only* - *required* for update operations
description	string	Name of the trigger prototype. Property behavior: - *required* for create operations
expression	string	Trigger expression. Must contain at least one item prototype. Item prototypes with `value_type` set to 5 (binary) or 6 (JSON) cannot be used in trigger expressions. Property behavior: - *required* for create operations
event_name	string	Event name generated by the trigger.
opdata	string	Operational data.
comments	string	Additional comments to the trigger prototype.
priority	integer	Severity of the trigger prototype. Possible values: 0 - *(default)* not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.
status	integer	Whether the trigger prototype is enabled or disabled. Possible values: 0 - *(default)* enabled; 1 - disabled.

Property	Type	Description
flags	integer	Origin of the trigger prototype. Possible values: 2 - a trigger prototype; 6 - a discovered trigger prototype. Property behavior: - *read-only*
templateid	ID	ID of the parent template trigger prototype. Property behavior: - *read-only*
type	integer	Whether the trigger prototype can generate multiple problem events. Possible values: 0 - *(default)* do not generate multiple events; 1 - generate multiple events.
url	string	URL associated with the trigger prototype.
url_name	string	Label for the URL associated with the trigger prototype.
recovery_mode	integer	OK event generation mode. Possible values: 0 - *(default)* Expression; 1 - Recovery expression; 2 - None.
recovery_expression	string	Trigger recovery expression. Must contain at least one item prototype. Item prototypes with `value_type` set to 5 (binary) or 6 (JSON) cannot be used in trigger recovery expressions.
correlation_mode	integer	OK event closes. Possible values: 0 - *(default)* All problems; 1 - All problems if tag values match.
correlation_tag	string	Tag for matching.
manual_close	integer	Allow manual close. Possible values: 0 - *(default)* No; 1 - Yes.
discover	integer	Trigger prototype discovery status. Possible values: 0 - *(default)* new triggers will be discovered; 1 - new triggers will not be discovered and existing triggers will be marked as lost.
uuid	string	Universal unique identifier, used for linking imported trigger prototypes to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the trigger prototype belongs to a template

Trigger prototype tag

The trigger prototype tag object has the following properties.

Property	Type	Description
tag	string	Trigger prototype tag name. Property behavior: - *required*
value	string	Trigger prototype tag value. Property behavior: - *read-only*.
object	integer	Type of object the tag was inherited from. Possible values: 0 - template; 1 - host; 3 - item; 4 - item prototype. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

triggerprototype.create

Description

`object triggerprototype.create(object/array triggerPrototypes)`

This method allows you to create new trigger prototypes.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Trigger prototypes to create.

Additionally to the standard trigger prototype properties the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Triggers and trigger prototypes that the trigger prototype is dependent on. The triggers must have only the `triggerid` property defined.
tags	array	Trigger prototype tags.

Return values

`(object)` Returns an object containing the IDs of the created trigger prototypes under the `triggerids` property. The order of the returned IDs matches the order of the passed trigger prototypes.

Examples

Creating a trigger prototype

Create a trigger prototype to detect when a file system has less than 20% free disk space.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "triggerprototype.create",
    "params": {
        "description": "Free disk space is less than 20% on volume {#FSNAME}",
        "expression": "last(/Zabbix server/vfs.fs.size[{#FSNAME},pfree])<20",
        "tags": [
            {
                "tag": "volume",
                "value": "{#FSNAME}"
            },
            {
                "tag": "type",
                "value": "{#FSTYPE}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "17372"
        ]
    },
    "id": 1
}
```

Source

CTriggerPrototype::create() in *ui/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.delete

Description

`object triggerprototype.delete(array triggerPrototypeIds)`

This method allows you to delete trigger prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the trigger prototypes to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted trigger prototypes under the `triggerids` property.

Examples

Deleting multiple trigger prototypes

Delete two trigger prototypes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "triggerprototype.delete",
    "params": [
```

```
        "12002",
        "12003"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "12002",
            "12003"
        ]
    },
    "id": 1
}
```

Source

CTriggerPrototype::delete() in *ui/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.get

Description

`integer/array triggerprototype.get(object parameters)`

The method allows you to retrieve trigger prototypes according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
active	flag	Return only enabled trigger prototypes that belong to monitored hosts.
discoveryids	ID/array	Return only trigger prototypes that belong to the given LLD rules.
functions	string/array	Return only triggers that use the given functions. Refer to the Supported functions page for a list of supported functions.
group	string	Return only trigger prototypes that belong to hosts or templates from the host groups or template groups with the given name.
groupids	ID/array	Return only trigger prototypes that belong to hosts or templates from the given host groups or template groups.
host	string	Return only trigger prototypes that belong to hosts with the given name.
hostids	ID/array	Return only trigger prototypes that belong to the given hosts.
inherited	boolean	If set to `true` return only trigger prototypes inherited from a template.
maintenance	boolean	If set to `true` return only enabled trigger prototypes that belong to hosts in maintenance.
min_severity	integer	Return only trigger prototypes with severity greater or equal than the given severity.
monitored	flag	Return only enabled trigger prototypes that belong to monitored hosts and contain only enabled items.
templated	boolean	If set to `true` return only trigger prototypes that belong to templates.
templateids	ID/array	Return only trigger prototypes that belong to the given templates.
triggerids	ID/array	Return only trigger prototypes with the given IDs.
expandExpression	flag	Expand functions and macros in the trigger expression.

Parameter	Type	Description
selectDependencies	query	Return trigger prototypes and triggers that the trigger prototype depends on in the `dependencies` property.
selectDiscoveryData	query	Return a `discoveryData` property with the trigger prototype discovery object data. The trigger prototype discovery object links a discovered trigger prototype to a trigger prototype from which it was discovered. It has the following properties: `parent_triggerid` - `(ID)` ID of the trigger prototype from which the trigger prototype has been created; `status` - `(int)` trigger prototype discovery status: 0 - *(default)* trigger prototype is discovered, 1 - trigger prototype is not discovered anymore; `ts_delete` - `(timestamp)` time when a trigger prototype that is no longer discovered will be deleted; `ts_disable` - `(timestamp)` time when a trigger prototype that is no longer discovered will be disabled; `disable_source` - `(int)` indicator of whether trigger prototype was disabled by an LLD rule or manually: 0 - *(default)* disabled automatically, 1 - disabled by an LLD rule.
selectDiscoveryRule	query	Return the LLD rule that the trigger prototype belongs to in the `discoveryRule` property.
selectDiscoveryRulePrototype	query	Return a `discoveryRulePrototype` property with the parent LLD rule prototype that the trigger prototype belongs to.
selectFunctions	query	Return functions used in the trigger prototype in the `functions` property. The function objects represent the functions used in the trigger expression and has the following properties: `functionid` - `(ID)` ID of the function; `itemid` - `(ID)` ID of the item used in the function; `function` - `(string)` name of the function; `parameter` - `(string)` parameter passed to the function. Query parameter is replaced by $ symbol in returned string.
selectHostGroups	query	Return the host groups that the trigger prototype belongs to in the `hostgroups` property.
selectHosts	query	Return the hosts that the trigger prototype belongs to in the `hosts` property.
selectInheritedTags	query	Return an `inheritedTags` property with tags inherited from templates, linked templates and hosts, and from item prototypes referenced in trigger or recovery expressions.
selectItems	query	Return items and item prototypes used the trigger prototype in the `items` property.
selectTags	query	Return the trigger prototype tags in `tags` property.
selectTemplateGroups	query	Return the template groups that the trigger prototype belongs to in the `templategroups` property.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the trigger prototype belongs to; `hostid` - ID of the host that the trigger prototype belongs to.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectHosts` - results will be sorted by `host`.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties. Possible values: `triggerid`, `description`, `status`, `priority`, `discovered`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve trigger prototypes from an LLD rule

Retrieve all trigger prototypes and their functions from an LLD rule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "triggerprototype.get",
    "params": {
        "output": "extend",
        "selectFunctions": "extend",
        "discoveryids": "22450"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "triggerid": "13272",
            "expression": "{12598}<20",

CTriggerPrototype::get() in *ui/include/classes/api/services/CTriggerPrototype.php*.

triggerprototype.update

Description

`object triggerprototype.update(object/array triggerPrototypes)`

This method allows you to update existing trigger prototypes.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Trigger prototype properties to be updated.

The `triggerid` property must be defined for each trigger prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard trigger prototype properties the method accepts the following parameters.

Parameter	Type	Description
dependencies	array	Triggers and trigger prototypes that the trigger prototype is dependent on. The triggers must have only the `triggerid` property defined.
tags	array	Trigger prototype tags.

Return values

`(object)` Returns an object containing the IDs of the updated trigger prototypes under the `triggerids` property.

Examples

Enabling a trigger prototype

Enable a trigger prototype, that is, set its status to "0".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "triggerprototype.update",
    "params": {
        "triggerid": "13938",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "13938"
        ]
    },
    "id": 1
}
```

Replacing trigger prototype tags

Replace tags for one trigger prototype.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "triggerprototype.update",
    "params": {
        "triggerid": "17373",
        "tags": [
            {
                "tag": "volume",
                "value": "{#FSNAME}"
            },
            {
                "tag": "type",
                "value": "{#FSTYPE}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "17373"
        ]
    },
    "id": 1
}
```

CTriggerPrototype::update() in *ui/include/classes/api/services/CTriggerPrototype.php*.

User

This class is designed to work with users.

Object references:

- User
- Media

Available methods:

- user.checkauthentication - check and prolong user sessions
- user.create - create new users
- user.delete - delete users
- user.get - retrieve users
- user.login - log in to the API
- user.logout - log out of the API
- user.provision - provision LDAP users
- user.resettotp - reset user TOTP secrets
- user.unblock - unblock users
- user.update - update users

User object

The following objects are directly related to the `user` API.

User

The user object has the following properties.

Property	Type	Description
userid	ID	ID of the user. Property behavior: - *read-only* - *required* for update operations
username	string	User's name. Property behavior: - *required* for create operations - *read-only* for provisioned users if the user is linked to a user directory (`userdirectoryid` is set to a valid value that is not "0"), and user directory provisioning status is enabled (`provision_status` of User directory object is set to "1"), and authentication status of all LDAP or SAML provisioning is enabled (`ldap_jit_status` of Authentication object is set to "Enabled for configured LDAP IdPs" or `saml_jit_status` of Authentication object is set to "Enabled for configured SAML IdPs")

Property	Type	Description
passwd	string	User's password. The value of this parameter can be an empty string if the user is linked to a user directory. Property behavior: - *write-only*
roleid	ID	ID of the role of the user. Note that users without a role can log into Zabbix only using LDAP or SAML authentication, provided their LDAP/SAML information matches the user group mappings configured in Zabbix.
attempt_clock	timestamp	Time of the last unsuccessful login attempt. Property behavior: - *read-only*
attempt_failed	integer	Recent failed login attempt count. Property behavior: - *read-only*
attempt_ip	string	IP address from where the last unsuccessful login attempt came from. Property behavior: - *read-only*
autologin	integer	Whether to enable auto-login. Possible values: 0 - *(default)* auto-login disabled; 1 - auto-login enabled.
autologout	string	User session life time. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h). If set to 0s, the session will never expire. Default: 15m.
default_maintenance_period	string	Default maintenance period for a maintenance created via shortcut. Accepts seconds or time unit with suffix (300s, 5m, 1h, 1d, 1w). The given value will be rounded down to whole minutes. Default: 1h.
lang	string	Language code of the user's language, for example, en_US. Default: default - system default.
name	string	Name of the user.
provisioned	integer	Whether the user has been provisioned. Possible values: 0 - not provisioned; 1 - provisioned. Property behavior: - *read-only*
refresh	string	Automatic refresh period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 1h). Default: 30s.
rows_per_page	integer	Amount of object rows to show per page. Default: 50.
surname	string	Surname of the user.

Property	Type	Description
theme	string	User's theme. Possible values: `default` - *(default)* system default; `blue-theme` - Blue; `blue-classic-theme` - Blue (classic); `dark-theme` - Dark; `dark-blue-theme` - Dark blue; `dark-classic-theme` - Dark (classic); `hc-light` - High-contrast light; `hc-dark` - High-contrast dark.
ts_provisioned	timestamp	Time when the latest provisioning operation was made. Property behavior: - *read-only* - *supported* for *Super admin* type users
url	string	URL of the page to redirect the user to after logging in.
userdirectoryid	ID	ID of the user directory that the user in linked to. Used for provisioning (creating or updating), as well as to login a user that is linked to a user directory. For login operations the value of this property will have priority over the `userdirectoryid` property of user groups that the user belongs to. Default: 0. Property behavior: - *read-only* - *supported* for *Super admin* type users
timezone	string	User's time zone, for example, `Europe/London`, `UTC`. Default: `default` - system default. For the full list of supported time zones please refer to PHP documentation.

Media

The media object has the following properties.

Property	Type	Description
mediaid	ID	ID of the user's media. Property behavior: - *read-only*
mediatypeid	ID	ID of the media type used by the user's media. Property behavior: - *required*

Property	Type	Description
sendto	string/array	Address, user name or other identifier of the recipient. If `type` of Media type is set to ”Email” or ”Push”, values are represented as array. For ”Push”, the array can contain either a wildcard (*), or one or more mobile device IDs. If `type` of Media type is set to ”Script”, ”SMS”, or ”Webhook”, value is represented as a string. Property behavior: - *required*
active	integer	Whether the media is enabled. Possible values: 0 - *(default)* enabled; 1 - disabled.
severity	integer	Trigger severities to send notifications about. Possible bitmap values: 1 - Not classified; 2 - Information; 4 - Warning; 8 - Average; 16 - High; 32 - Disaster. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 48 for Average, High, and Disaster). Default: 63.
period	string	Time when the notifications can be sent as a time period or user macros separated by a semicolon. Default: 1-7,00:00-24:00.
provisioned	integer	Whether the user has been provisioned. Possible values: 0 - not provisioned; 1 - provisioned.
userdirectory_mediaid	ID	User directory media mapping ID for provisioned media. Property behavior: - *read-only* - *supported* for *Super admin* type users

user.checkAuthentication

Description

`object user.checkAuthentication`

This method checks and prolongs the user session.

> **Attention:**
> Calling the `user.checkAuthentication` method using the parameter `sessionid` prolongs the user session by default.

Parameters

The method accepts the following parameters.

Parameter	Type	Description
extend	boolean	Whether to prolong the user session. Default value: "true". Setting the value to "false" allows you to check the user session without prolonging it.
sessionid	string	Parameter behavior: - *supported* if `sessionid` is set User authentication token. Parameter behavior: - *required* if `token` is not set
token	string	User API token. Parameter behavior: - *required* if `sessionid` is not set

Return values

`(object)` Returns an object containing information about the user.

Additionally to the standard user properties, the following information is returned.

Property	Type	Description
auth_type	integer	Default authentication for the user. Refer to the `authentication_type` property of the Authentication object for a list of possible values.
debug_mode	integer	Whether debug mode is enabled or disabled for the user. Refer to the `debug_mode` property of the User group object for a list of possible values.
deprovisioned	boolean	Whether the user belongs to a deprovisioned users group.
gui_access	string	User's authentication method to the frontend. Refer to the `gui_access` property of the User group object for a list of possible values.
secret	string	Random 32 characters string. Is generated on user login. Property `secret` is not returned if the user session is checked using an API token.
sessionid	string	Authentication token, which must be used in the following API requests. Property `sessionid` is not returned if the user session is checked using an API token.
type	integer	User type. Refer to the `type` property of the Role object for a list of possible values.
userip	string	IP address of the user.

Examples

Check authentication using authentication token

Check and prolong a user session using the user authentication token, and return additional information about the user.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.checkAuthentication",
```

```
    "params": {
        "sessionid": "673b8ba11562a35da902c66cf5c23fa2"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userid": "1",
        "username": "Admin",
        "name": "Zabbix",
        "surname": "Administrator",
        "url": "",
        "autologin": "1",
        "autologout": "0",
        "lang": "ru_RU",
        "refresh": "0",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "127.0.0.1",
        "attempt_clock": "1355919038",
        "rows_per_page": "50",
        "timezone": "Europe/Riga",
        "roleid": "3",
        "userdirectoryid": "0",
        "ts_provisioned": "0",
        "type": 3,
        "userip": "127.0.0.1",
        "debug_mode": 0,
        "gui_access": "0",
        "deprovisioned": false,
        "auth_type": 0,
        "sessionid": "673b8ba11562a35da902c66cf5c23fa2",
        "secret": "0e329b933e46984e49a5c1051ecd0751"
    },
    "id": 1
}
```

Check authentication using API token

Check a user session using the user API token, and return additional information about the user.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.checkAuthentication",
    "params": {
        "token": "00aff470e07c12d707e50d98cfe39edef9e6ec349c14728dbdfbc8ddc5ea3eae"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userid": "1",
        "username": "Admin",
        "name": "Zabbix",
        "surname": "Administrator",
        "url": "",
```

```
        "autologin": "1",
        "autologout": "0",
        "lang": "ru_RU",
        "refresh": "0",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "127.0.0.1",
        "attempt_clock": "1355919338",
        "rows_per_page": "50",
        "timezone": "Europe/Riga",
        "roleid": "3",
        "userdirectoryid": "0",
        "ts_provisioned": "0",
        "debug_mode": 0,
        "deprovisioned": false,
        "gui_access": "1",
        "mfaid": 0,
        "auth_type": 0,
        "type": 3,
        "userip": "127.0.0.1"
    },
    "id": 1
}
```

Source

CUser::checkAuthentication() in *ui/include/classes/api/services/CUser.php*.

user.create

Description

`object user.create(object/array users)`

This method allows you to create new users.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Note:
The strength of user password is validated according to the password policy rules defined by Authentication API. See authentication object for more information.

Parameters

`(object/array)` Users to create.

Additionally to the standard user properties, the method accepts the following parameters.

Parameter	Type	Description
usrgrps	array	User groups to add the user to. The user groups must have only the `usrgrpid` property defined.
medias	array	User media to be created.

Return values

`(object)` Returns an object containing the IDs of the created users under the `userids` property. The order of the returned IDs matches the order of the passed users.

Examples

Creating a user

Create a new user, add him to a user group and create a new media for him.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.create",
    "params": {
        "username": "John",
        "passwd": "Doe12345",
        "roleid": "5",
        "usrgrps": [
            {
                "usrgrpid": "7"
            }
        ],
        "medias": [
            {
                "mediatypeid": "1",
                "sendto": [
                    "support@company.com"
                ],
                "active": 0,
                "severity": 63,
                "period": "1-7,00:00-24:00"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "12"
        ]
    },
    "id": 1
}
```

user.delete

Description

`object user.delete(array users)`

This method allows you to delete users.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(array) IDs of users to delete.

Return values

(object) Returns an object containing the IDs of the deleted users under the userids property.

Examples

Deleting multiple users

Delete two users.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.delete",
    "params": [
        "1",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "1",
            "5"
        ]
    },
    "id": 1
}
```

Source

CUser::delete() in *ui/include/classes/api/services/CUser.php*.

user.get

Description

integer/array user.get(object parameters)

The method allows you to retrieve users according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

> **Note:**
> When requesting user media, permissions, or role information, *Admin* and *User* type users may retrieve data only about their own user. For an example, see Retrieving users as *Admin*.

Parameter	Type	Description
mediaids	ID/array	Return only users that use the given media.
mediatypeids	ID/array	Return only users that use the given media types.
userids	ID/array	Return only users with the given IDs.
usrgrpids	ID/array	Return only users that belong to the given user groups.

Parameter	Type	Description
getAccess	flag	Adds additional information about user permissions. Adds the following properties for each user: `gui_access` - `(integer)` user's frontend authentication method. Refer to the `gui_access` property of the user group object for a list of possible values. `debug_mode` - `(integer)` indicates whether debug is enabled for the user. Possible values: 0 - debug disabled, 1 - debug enabled. `users_status` - `(integer)` indicates whether the user is disabled. Possible values: 0 - user enabled, 1 - user disabled.
selectMedias	query	Return media used by the user in the `medias` property.
selectMediatypes	query	Return media types used by the user in the `mediatypes` property. See `mediatype.get` for restrictions based on user type.
selectUsrgrps	query	Return user groups that the user belongs to in the `usrgrps` property. See `usergroup.get` for restrictions based on user type.
selectRole	query	Return user role in the `role` property.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Possible User object properties for *Admin* and *User* type users when requesting data on users in their user group: `userid`, `name`, `surname`, `username`.
output	query	User object properties to be returned. *Admin* and *User* type users may retrieve only the following properties: - For their own user: `userid`, `attempt_clock`, `attempt_failed`, `attempt_ip`, `autologin`, `autologout`, `lang`, `name`, `provisioned`, `refresh`, `roleid`, `rows_per_page`, `surname`, `theme`, `timezone`, `url`, `username`. - For users in their user group: `userid`, `name`, `surname`, `username`. Default: `extend`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supports only properties of `string` and `text` data type. Possible User object properties for *Admin* and *User* type users when requesting data on users in their user group: `name`, `surname`, `username`.
sortfield	string/array	Sort the result by the given properties. Possible values: `userid`, `username`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
preservekeys	boolean	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving users

Retrieve all of the configured users.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "userid": "1",
            "username": "Admin",
            "name": "Zabbix",
            "surname": "Administrator",
            "url": "",
            "autologin": "1",
            "autologout": "0",
            "lang": "en_US",
            "default_maintenance_period": "1h",
            "refresh": "30s",
            "theme": "default",
            "attempt_failed": "0",
            "attempt_ip": "",
            "attempt_clock": "0",
            "rows_per_page": "50",
            "timezone": "default",
            "roleid": "3",
            "userdirectoryid": "0",
            "ts_provisioned": "0",
            "provisioned": "0"
        },
        {
            "userid": "2",
            "username": "guest",
            "name": "",
            "surname": "",
            "url": "",
            "autologin": "0",
            "autologout": "15m",
            "lang": "default",
            "default_maintenance_period": "1h",
            "refresh": "30s",
            "theme": "default",
            "attempt_failed": "0",
            "attempt_ip": "",
            "attempt_clock": "0",
            "rows_per_page": "50",
```

```
            "timezone": "default",
            "roleid": "4",
            "userdirectoryid": "0",
            "ts_provisioned": "0",
            "provisioned": "0"
        }
    ],
    "id": 1
}
```

Retrieving users as *Admin*

As an *Admin* type user, retrieve detailed data about your own user and limited data for users in your user group.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.get",
    "params": {
        "output": "extend",
        "getAccess": true,
        "selectMedias": "extend",
        "selectMediatypes": "extend",
        "selectUsrgrps": "extend",
        "selectRole": "extend"
    },
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "userid": "1",

CUser::get() in *ui/include/classes/api/services/CUser.php*.

user.login

Description

`string/object user.login(object parameters)`

This method allows you to log in to the API and generate an authentication token.

Warning:
When using this method, you also need to do user.logout to prevent the generation of a large number of open session records.

Attention:
This method is only available to unauthenticated users who do not belong to any user group with enabled multi-factor authentication.

Parameters

`(object)` Parameters containing the user name and password.

The method accepts the following parameters.

Parameter	Type	Description
password	string	User password. Parameter behavior: - *required*
username	string	User name. Parameter behavior: - *required*
userData	flag	Return information about the authenticated user.

Return values

`(string/object)` If the `userData` parameter is used, returns an object containing information about the authenticated user.

Additionally to the standard user properties, the following information is returned:

Property	Type	Description
auth_type	integer	Default authentication for the user. Refer to the `authentication_type` property of the Authentication object for a list of possible values.
debug_mode	integer	Whether debug mode is enabled or disabled for the user. Refer to the `debug_mode` property of the User group object for a list of possible values.
deprovisioned	boolean	Whether the user belongs to a deprovisioned users group.
gui_access	string	User's authentication method to the frontend. Refer to the `gui_access` property of the User group object for a list of possible values.
mfaid	integer	ID of the MFA method to use for the user during login. Returns "0" if MFA is disabled globally or for all user groups that the user belongs to.
secret	string	Random 32 characters string. Is generated on user login.
sessionid	string	Authentication token, which must be used in the following API requests.
type	integer	User type. Refer to the `type` property of the Role object for a list of possible values.
userip	string	IP address of the user.

Note:
If a user has been successfully authenticated after one or more failed attempts, the method will return the current values for the `attempt_clock`, `attempt_failed` and `attempt_ip` properties and then reset them.

If the `userData` parameter is not used, the method returns an authentication token that is required for authentication.

Examples

Authenticating a user

Authenticate a user.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.login",
    "params": {
        "username": "Admin",
        "password": "zabbix"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": "0424bd59b807674191e7d77572075f33",
    "id": 1
}
```

Requesting authenticated user's information

Authenticate and return additional information about the user.

Request:

```
{
    "jsonrpc": "2.0",
```

```
    "method": "user.login",
    "params": {
        "username": "Admin",
        "password": "zabbix",
        "userData": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userid": "1",
        "username": "Admin",
        "name": "Zabbix",
        "surname": "Administrator",
        "url": "",
        "autologin": "1",
        "autologout": "0",
        "lang": "ru_RU",
        "refresh": "0",
        "theme": "default",
        "attempt_failed": "0",
        "attempt_ip": "127.0.0.1",
        "attempt_clock": "1355919038",
        "rows_per_page": "50",
        "timezone": "Europe/Riga",
        "roleid": "3",
        "userdirectoryid": "0",
        "type": 3,
        "userip": "127.0.0.1",
        "debug_mode": 0,
        "gui_access": "0",
        "mfaid": "1",
        "deprovisioned": false,
        "auth_type": 0,
        "sessionid": "5b56eee8be445e98f0bd42b435736e42",
        "secret": "cd0ba923319741c6586f3d866423a8f4"
    },
    "id": 1
}
```

user.logout

Description

`string/object user.logout(array)`

This method allows you to log out of the API and invalidates the current authentication token.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(array) The method accepts an empty array.

Return values

(boolean) Returns true if the user has been logged out successfully.

Examples

Logging out

Log out from the API.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.logout",
    "params": [],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}
```

user.provision

Description

`object user.provision(object/array users)`

This method allows you to provision LDAP users.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(array) IDs of users to provision.

Return values

(object) Returns an object containing the IDs of the provisioned users under the userids property.

Examples

Provisioning multiple users

Provision two users.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.provision",
    "params": [
        "1",
        "5"
    ],
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "1",
            "5"
        ]
    },
    "id": 1
}
```

Source

CUser::provision() in *ui/include/classes/api/services/CUser.php*.

user.resettotp

Description

`object user.resettotp(object/array users)`

This method allows you to reset user TOTP secrets.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(`array`) IDs of users for which to reset TOTP secrets.

> **Note:**
> User sessions for the specified users will also be deleted (except for the user sending the request).

Return values

(`object`) Returns an object containing the IDs of the users for which TOTP secrets have been reset, under the `userids` property.

Examples

Resetting TOTP secrets for multiple users

Reset TOTP secrets for two users.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.resettotp",
    "params": [
        "1",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "1",
```

```
            "5"
        ]
    },
    "id": 1
}
```

- MFA object

Source

CUser::resettotp() in *ui/include/classes/api/services/CUser.php*.

user.unblock

Description

`object user.unblock(array userids)`

This method allows you to unblock users.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of users to unblock.

Return values

`(object)` Returns an object containing the IDs of the unblocked users under the `userids` property.

Examples

Unblocking multiple users

Unblock two users.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.unblock",
    "params": [
        "1",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "1",
            "5"
        ]
    },
    "id": 1
}
```

Source

CUser::unblock() in *ui/include/classes/api/services/CUser.php*.

user.update

Description

`object user.update(object/array users)`

This method allows you to update existing users.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

> **Note:**
> The strength of user password is validated according the password policy rules defined by Authentication API. See Authentication API for more information.

Parameters

`(object/array)` User properties to be updated.

The `userid` property must be defined for each user, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard user properties, the method accepts the following parameters.

Parameter	Type	Description
current_passwd	string	User's current password. The value of this parameter can be an empty string if the user is linked to a user directory. Parameter behavior: - *write-only* - *required* if `passwd` of User object is set and user changes own user password
usrgrps	array	User groups to replace existing user groups. The user groups must have only the `usrgrpid` property defined.
medias	array	User media to replace existing, non-provisioned media. Provisioned media can be omitted when updating media.

Return values

`(object)` Returns an object containing the IDs of the updated users under the `userids` property.

Examples

Renaming a user

Rename a user to John Doe.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.update",
    "params": {
        "userid": "1",
        "name": "John",
        "surname": "Doe"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "1"
        ]
    },
    "id": 1
}
```

Changing user role

Change a role of a user.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "user.update",
    "params": {
        "userid": "12",
        "roleid": "6"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userids": [
            "12"
        ]
    },
    "id": 1
}
```

User directory

This class is designed to work with user directories.

Object references:

- User directory
  - Media type mappings
  - Provisioning groups mappings

Available methods:

- userdirectory.create - create new user directory
- userdirectory.delete - delete user directory
- userdirectory.get - retrieve user directory
- userdirectory.update - update user directory
- userdirectory.test - test user directory connection

User directory object

The following objects are directly related to the `userdirectory` API.

User directory

The user directory object has the following properties.

Property	Type	Description
userdirectoryid	ID	ID of the user directory. If a user directory is deleted, the value of the User object property `userdirectoryid` is set to ”0” for all users that are linked to the deleted user directory. Property behavior: - *read-only* - *required* for update operations
idp_type	integer	Type of the authentication protocol used by the identity provider for the user directory. Note that only one user directory of type SAML can exist. Possible values: 1 - User directory of type LDAP; 2 - User directory of type SAML. Property behavior: - *required* for create operations
group_name	string	LDAP/SAML user directory attribute that contains the group name used to map groups between the LDAP/SAML user directory and Zabbix. Example: *cn* Property behavior: - *required* if `provision_status` is set to ”Enabled” and `saml_jit_status` of Authentication object is set to ”Enabled for configured SAML IdPs”
user_username	string	LDAP/SAML user directory attribute (also SCIM attribute if `scim_status` is set to ”SCIM provisioning is enabled”) that contains the user’s name which is used as the value for the User object property `name` when the user is provisioned. Examples: *cn*, *commonName*, *displayName*, *name*
user_lastname	string	LDAP/SAML user directory attribute (also SCIM attribute if `scim_status` is set to ”SCIM provisioning is enabled”) that contains the user’s last name which is used as the value for the User object property `surname` when the user is provisioned. Examples: *sn*, *surname*, *lastName*
provision_status	integer	Provisioning status of the user directory. Possible values: 0 - *(default)* Disabled (provisioning of users created by this user directory is disabled); 1 - Enabled (provisioning of users created by this user directory is enabled; additionally, the status of LDAP or SAML provisioning (`ldap_jit_status` or `saml_jit_status` of Authentication object) must be enabled).
provision_groups	array	Array of provisioning groups mappings objects for mapping LDAP/SAML user group pattern to Zabbix user group and user role. Property behavior: - *required* if `provision_status` is set to ”Enabled”
provision_media	array	Array of media type mappings objects for mapping user’s LDAP/SAML media attributes (e.g., email) to Zabbix user media for sending notifications.

Property	Type	Description
LDAP-specific properties:		
name	string	Unique name of the user directory. Property behavior: - *required* if `idp_type` is set to "User directory of type LDAP"
host	string	Host name, IP or URI of the LDAP server. URI must contain schema (`ldap://` or `ldaps://`), host, and port (optional). Examples: *host.example.com* *127.0.0.1* *ldap://ldap.example.com:389* Property behavior: - *required* if `idp_type` is set to "User directory of type LDAP"
port	integer	Port of the LDAP server. Property behavior: - *required* if `idp_type` is set to "User directory of type LDAP"
base_dn	string	LDAP user directory base path to user accounts. Examples: *ou=Users,dc=example,dc=org* *ou=Users,ou=system* (for OpenLDAP) *DC=company,DC=com* (for Microsoft Active Directory) *uid=%{user},dc=example,dc=com* (for direct user binding; placeholder "*%{user}*" is mandatory) Property behavior: - *required* if `idp_type` is set to "User directory of type LDAP"
search_attribute	string	LDAP user directory attribute by which to identify the user account from the information provided in the login request. Examples: *uid* (for OpenLDAP) *sAMAccountName* (for Microsoft Active Directory) Property behavior: - *required* if `idp_type` is set to "User directory of type LDAP"
bind_dn	string	LDAP server account for binding and searching over the LDAP server. For direct user binding and anonymous binding, `bind_dn` must be empty. Examples: *uid=ldap_search,ou=system* (for OpenLDAP) *CN=ldap_search,OU=user_group,DC=company,DC=com* (for Microsoft Active Directory) *CN=Admin,OU=Users,OU=Zabbix,DC=zbx,DC=local* Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
bind_password	string	LDAP password of the account for binding and searching over the LDAP server. For direct user binding and anonymous binding, `bind_password` must be empty. Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"

Property	Type	Description
description	string	Description of the user directory. Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
group_basedn	string	LDAP user directory base path to groups; used to configure a user membership check in the LDAP user directory. Ignored when provisioning a user if `group_membership` is set. Example: *ou=Groups,dc=example,dc=com* Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
group_filter	string	Filter string for retrieving LDAP user directory groups that the user is a member of; used to configure a user membership check in the LDAP user directory. Ignored when provisioning a user if `group_membership` is set. Supported `group_filter` placeholders: *%{attr}* - search attribute (replaced by the `search_attribute` property value); *%{groupattr}* - group attribute (replaced by the `group_member` property value); *%{host}* - host name, IP or URI of the LDAP server (replaced by the `host` property value); *%{user}* - Zabbix user username. Default: *(%{groupattr}=%{user})* Examples: - *(member=uid=%{ref},ou=Users,dc=example,dc=com)* will match "User1" if an LDAP group object contains the "*member*" attribute with the value "*uid=User1,ou=Users,dc=example,dc=com*", and will return the group that "User1" is a member of; - *(%{groupattr}=cn=%{ref},ou=Users,ou=Zabbix,DC=example,DC=com)* will match "User1" if an LDAP group object contains the attribute specified in the `group_member` property with the value "*cn=User1,ou=Users,ou=Zabbix,DC=example,DC=com*", and will return the group that "User1" is a member of. Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
group_member	string	LDAP user directory attribute that contains information about the group members; used to configure a user membership check in the LDAP user directory. Ignored when provisioning a user if `group_membership` is set. Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
group_membership	string	LDAP user directory attribute that contains information about the groups that a user belongs to. Example: *memberOf* Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"

Property	Type	Description
search_filter	string	Custom filter string used to locate and authenticate a user in an LDAP user directory based on the information provided in the login request. Supported `search_filter` placeholders: *%{attr}* - search attribute name (e.g., *uid*, *sAMAccountName*); *%{user}* - Zabbix user username. Default: *(%{attr}=%{user})* Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
start_tls	integer	LDAP server configuration option that allows the communication with the LDAP server to be secured using Transport Layer Security (TLS). Note that `start_tls` must be set to "Disabled" for hosts using the `ldaps://` protocol. Possible values: 0 - *(default)* Disabled; 1 - Enabled. Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
user_ref_attr	string	LDAP user directory attribute used to reference a user object. The value of `user_ref_attr` is used to get values from the specified attribute in the user directory and place them instead of the *%{ref}* placeholder in the `group_filter` string. Examples: *cn*, *uid*, *member*, *uniqueMember* Property behavior: - *supported* if `idp_type` is set to "User directory of type LDAP"
SAML-specific properties:		
idp_entityid	string	URI that identifies the identity provider and is used to communicate with the identity provider in SAML messages. Example: *https://idp.example.com/idp* Property behavior: - *required* if `idp_type` is set to "User directory of type SAML"
sp_entityid	string	URL or any string that identifies the identity provider's service provider. Examples: *https://idp.example.com/sp* *zabbix* Property behavior: - *required* if `idp_type` is set to "User directory of type SAML"
username_attribute	string	SAML user directory attribute (also SCIM attribute if `scim_status` is set to "SCIM provisioning is enabled") that contains the user's username which is compared with the value of the User object property `username` when authenticating. Examples: *uid*, *userprincipalname*, *samaccountname*, *username*, *userusername*, *urn:oid:0.9.2342.19200300.100.1.1*, *urn:oid:1.3.6.1.4.1.5923.1.1.1.13*, *urn:oid:0.9.2342.19200300.100.1.44* Property behavior: - *required* if `idp_type` is set to "User directory of type SAML"

Property	Type	Description
sso_url	string	URL of the identity provider's SAML single sign-on service, to which Zabbix will send the SAML authentication requests. Example: *http://idp.example.com/idp/sso/saml* Property behavior: - *required* if `idp_type` is set to "User directory of type SAML"
slo_url	string	URL of the identity provider's SAML single log-out service, to which Zabbix will send the SAML logout requests. Example: *https://idp.example.com/idp/slo/saml* Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
encrypt_nameid	integer	Whether the SAML name ID should be encrypted. Possible values: 0 - *(default)* Do not encrypt name ID; 1 - Encrypt name ID. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
encrypt_assertions	integer	Whether the SAML assertions should be encrypted. Possible values: 0 - *(default)* Do not encrypt assertions; 1 - Encrypt assertions. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
nameid_format	string	Name ID format of the SAML identity provider's service provider. Examples: *urn:oasis:names:tc:SAML:2.0:nameid-format:persistent* *urn:oasis:names:tc:SAML:2.0:nameid-format:transient* *urn:oasis:names:tc:SAML:2.0:nameid-format:kerberos* *urn:oasis:names:tc:SAML:2.0:nameid-format:entity* Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
scim_status	integer	Whether SCIM provisioning for SAML is enabled or disabled. Possible values: 0 - *(default)* SCIM provisioning is disabled; 1 - SCIM provisioning is enabled. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
sign_assertions	integer	Whether the SAML assertions should be signed with a SAML signature. Possible values: 0 - Do not sign assertions; 1 - *(default)* Sign assertions. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"

Property	Type	Description
sign_authn_requests	integer	Whether the SAML AuthN requests should be signed with a SAML signature. Possible values: 0 - Do not sign AuthN requests; 1 - *(default)* Sign AuthN requests. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
sign_messages	integer	Whether the SAML messages should be signed with a SAML signature. Possible values: 0 - Do not sign messages; 1 - *(default)* Sign messages. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
sign_logout_requests	integer	Whether the SAML logout requests should be signed with a SAML signature. Possible values: 0 - Do not sign logout requests; 1 - *(default)* Sign logout requests. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
sign_logout_responses	integer	Whether the SAML logout responses should be signed with a SAML signature. Possible values: 0 - Do not sign logout responses; 1 - *(default)* Sign logout responses. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML"
idp_certificate	string	Contents of the Service Provider (SP) certificate for SAML single sign-on (SSO) service setup. Examples: *-----BEGIN CERTIFICATE-----* * MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA7... ...more encoded data... -----END CERTIFICATE-----* Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML" and `$SSO['CERT_STORAGE']` is set to `database` in the frontend configuration file - *write-only*

Property	Type	Description
sp_private_key	string	Contents of the Service Provider (SP) Private Key for SAML single sign-on (SSO) service setup. Provides secure authentication and data exchange with the Identity Provider (IdP). Examples: *-----BEGIN CERTIFICATE----- MIIEvQIBADANBgkqhkiG9w0BA... ...more encoded data... -----END CERTIFICATE-----* Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML" and `$SSO['CERT_STORAGE']` is set to `database` in the frontend configuration file - *write-only*
sp_certificate	string	Contents of the Service Provider (SP) certificate for SAML single sign-on (SSO) service setup. Examples: *-----BEGIN CERTIFICATE----- MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA7... ...more encoded data... -----END CERTIFICATE-----* Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML" and `$SSO['CERT_STORAGE']` is set to `database` in the frontend configuration file - *write-only*
idp_certificate_hash	string	The md5 hash of idp_certificate value. Will return empty string for empty idp_certificate. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML" and `$SSO['CERT_STORAGE']` is set to `database` in the frontend configuration file - *read-only*
sp_private_key_hash	string	The md5 hash of sp_private_key value. Will return empty string for empty sp_private_key. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML" and `$SSO['CERT_STORAGE']` is set to `database` in the frontend configuration file - *read-only*
sp_certificate_hash	string	The md5 hash of sp_certificate value. Will return empty string for empty sp_certificate. Property behavior: - *supported* if `idp_type` is set to "User directory of type SAML" and `$SSO['CERT_STORAGE']` is set to `database` in the frontend configuration file - *read-only*

Media type mappings

The media type mappings object has the following properties.

Property	Type	Description
userdirectory_mediaid	ID	Media type mapping ID. Property behavior: - *read-only*
name	string	Visible name in the list of media type mappings. Property behavior: - *required*
mediatypeid	ID	ID of the media type to be created; used as the value for the Media object property `mediatypeid`. Property behavior: - *required*
attribute	string	LDAP/SAML user directory attribute (also SCIM attribute if `scim_status` is set to "SCIM provisioning is enabled") that contains the user's media (e.g., *user@example.com*) which is used as the value for the Media object property `sendto`. If present in data received from the LDAP/SAML identity provider, and the value is not empty, this will trigger media creation for the provisioned user. Property behavior: - *required*
active	integer	User media `active` property value when media is created for the provisioned user. Possible values: 0 - *(default)* enabled; 1 - disabled.
severity	integer	User media `severity` property value when media is created for the provisioned user. Default: 63.
period	string	User media `period` property value when media is created for the provisioned user. Default: 1-7,00:00-24:00.

Provisioning groups mappings

The provisioning groups mappings has the following properties.

Property	Type	Description
name	string	Full name of a group (e.g., *Zabbix administrators*) in LDAP/SAML user directory (also SCIM if `scim_status` is set to "SCIM provisioning is enabled"). Supports the wildcard character "*". Unique across all provisioning groups mappings. Property behavior: - *required*
roleid	ID	ID of the user role to assign to the user. If multiple provisioning groups mappings are matched, the role of the highest user type (*User*, *Admin*, or *Super admin*) is assigned to the user. If there are multiple roles with the same user type, the first role (sorted in alphabetical order) is assigned to the user. Property behavior: - *required*

Property	Type	Description
user_groups	array	Array of Zabbix user group ID objects. Each object has the following properties: `usrgrpid` - (`ID`) ID of Zabbix user group to assign to the user. If multiple provisioning groups mappings are matched, Zabbix user groups of all matched mappings is assigned to the user. Property behavior: *- required*

userdirectory.create

Description

`object userdirectory.create(object/array userDirectory)`

This method allows you to create new user directories.

> **Note:**
> This method is only available to *Super admin* user type.

Parameters

(`object/array`) User directories to create.

The method accepts user directories with the standard user directory properties.

Return values

(`object`) Returns an object containing the IDs of the created user directories under the `userdirectoryids` property. The order of the returned IDs matches the order of the passed user directories.

Examples

Creating a user directory

Create a user directory to authenticate users with StartTLS over LDAP. Note that to authenticate users over LDAP, LDAP authentication must be enabled.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.create",
    "params": {
        "idp_type": "1",
        "name": "LDAP API server #1",
        "host": "ldap://local.ldap",
        "port": "389",
        "base_dn": "ou=Users,dc=example,dc=org",
        "bind_dn": "cn=ldap_search,dc=example,dc=org",
        "bind_password": "ldapsecretpassword",
        "search_attribute": "uid",
        "start_tls": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "3"
        ]
    },
```

```
    "id": 1
}
```

Creating a user directory (JIT provisioning enabled)

Create a user directory to authenticate users over LDAP (with JIT provisioning enabled). Note that to authenticate users over LDAP, LDAP authentication must be enabled.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.create",
    "params": {
            "idp_type": "1",
            "name": "AD server",
            "provision_status": "1",
            "description": "",
            "host": "host.example.com",
            "port": "389",
            "base_dn": "DC=zbx,DC=local",
            "search_attribute": "sAMAccountName",
            "bind_dn": "CN=Admin,OU=Users,OU=Zabbix,DC=zbx,DC=local",
            "start_tls": "0",
            "search_filter": "",
            "group_basedn": "OU=Zabbix,DC=zbx,DC=local",
            "group_name": "CN",
            "group_member": "member",
            "group_filter": "(%{groupattr}=CN=%{ref},OU=Users,OU=Zabbix,DC=zbx,DC=local)",
            "group_membership": "",
            "user_username": "givenName",
            "user_lastname": "sn",
            "user_ref_attr": "CN",
            "provision_media": [
                {
                    "name": "example.com",
                    "mediatypeid": "1",
                    "attribute": "user@example.com"
                }
            ],
            "provision_groups": [
                {
                    "name": "*",
                    "roleid": "4",
                    "user_groups": [
                        {
                            "usrgrpid": "8"
                        }
                    ]
                },
                {
                    "name": "Zabbix administrators",
                    "roleid": "2",
                    "user_groups": [
                        {
                            "usrgrpid": "7"
                        },
                        {
                            "usrgrpid": "8"
                        }
                    ]
                }
            ]
        },
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "2"
        ]
    },
    "id": 1
}
```

Source

CUserDirectory::create() in *ui/include/classes/api/services/CUserDirectory.php*.

userdirectory.delete

Description

`object userdirectory.delete(array userDirectoryIds)`

This method allows you to delete user directories. User directory cannot be deleted when it is directly used for at least one user group.
 Default LDAP user directory cannot be deleted when `authentication.ldap_configured` is set to 1 or when there are more user directories left.

> **Note:**
> This method is only available to *Super admin* user type.

Parameters

`(array)` IDs of the user directories to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted user directories under the `userdirectoryids` property.

Examples

Deleting multiple user directories

Delete two user directories.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.delete",
    "params": [
        "2",
        "12"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "2",
            "12"
        ]
    },
```

```
    "id": 1
}
```

userdirectory.get

Description

`integer/array userdirectory.get(object parameters)`

The method allows you to retrieve user directories according to the given parameters.

> **Note:**
> This method is only available to *Super admin* user types.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
userdirectoryids	ID/array	Return only user directories with the given IDs.
selectUsrgrps	query	Return a `usrgrps` property with user groups associated with a user directory. Supports `count`.
selectProvisionMedia	query	Return a `provision_media` property with media type mappings associated with a user directory.
selectProvisionGroups	query	Return a `provision_groups` property with provisioning groups mappings associated with a user directory.
sortfield	string/array	Sort the result by the given properties. Possible values: `name`.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values. Supports properties: `userdirectoryid`, `idp_type`, `provision_status`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supported properties: `name`, `description`. User directory of type SAML will have an empty value for both `name` and `description` properties. Both properties can be changed with the `userdirectory.update` operation.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	

Parameter	Type	Description
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects
- the count of retrieved objects, if the `countOutput` parameter has been used

Examples

Retrieving user directories

Retrieve all user directories with additional properties that display media type mappings and provisioning groups mappings associated with each user directory.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.get",
    "params": {
        "output": "extend",
        "selectProvisionMedia": "extend",
        "selectProvisionGroups": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
       {
            "userdirectoryid": "1",
            "idp_type": "2",

CUserDirectory::get() in *ui/include/classes/api/services/CUserDirectory.php*.

userdirectory.test

Description

`object userdirectory.test(array userDirectory)`

This method allows you to test user directory connection settings.

Note:
This method also allows you to test what configured data matches the user directory settings for user provisioning (e.g., what user role, user groups, user medias will be assigned to the user). For this type of test the API request should be made for a user directory that has `provision_status` set to enabled.

Note:
This method is only available to *Super admin* user type.

Parameters

`(object)` User directory properties.

Since `userdirectory.get` API does not return `bind_password` field, `userdirectoryid` and/or `bind_password` should be supplied.
 Additionally to the standard user directory properties, the method accepts the following parameters.

Parameter	Type	Description
test_username	string	Username to test in user directory.
test_password	string	Username associated password to test in user directory.

Return values

`(bool)` Returns true on success.

Examples

Test user directory for existing user

Test user directory ”3” for ”user1”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.test",
    "params": {
        "userdirectoryid": "3",
        "host": "127.0.0.1",
        "port": "389",
        "base_dn": "ou=Users,dc=example,dc=org",
        "search_attribute": "uid",
        "bind_dn": "cn=ldap_search,dc=example,dc=org",
        "bind_password": "password",
        "test_username": "user1",
        "test_password": "password"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}
```

Test user directory for non-existing user

Test user directory ”3” for non-existing ”user2”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.test",
    "params": {
        "userdirectoryid": "3",
        "host": "127.0.0.1",
        "port": "389",
        "base_dn": "ou=Users,dc=example,dc=org",
        "search_attribute": "uid",
        "bind_dn": "cn=ldap_search,dc=example,dc=org",
        "test_username": "user2",
        "test_password": "password"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "error": {
        "code": -32500,
        "message": "Application error.",
        "data": "Incorrect user name or password or account is temporarily blocked."
    },
    "id": 1
}
```

Test user directory for user provisioning

Test userdirectory "3" for what configured data matches the user directory settings for "user3" provisioning (e.g., what user role, user groups, user medias will be assigned to the user).

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.test",
    "params": {
        "userdirectoryid": "2",
        "host": "host.example.com",
        "port": "389",
        "base_dn": "DC=zbx,DC=local",
        "search_attribute": "sAMAccountName",
        "bind_dn": "CN=Admin,OU=Users,OU=Zabbix,DC=zbx,DC=local",
        "test_username": "user3",
        "test_password": "password"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "username": "user3",
        "name": "John",
        "surname": "Doe",
        "medias": [],
        "usrgrps": [
            {
                "usrgrpid": "8"
            },
            {
                "usrgrpid": "7"
            }
        ],
        "roleid": "2",
        "userdirectoryid": "2"
    },
    "id": 1
}
```

CUserDirectory::test() in *ui/include/classes/api/services/CUserDirectory.php*.

userdirectory.update

Description

`object userdirectory.update(object/array userDirectory)`

This method allows you to update existing user directories.

> **Note:**
> This method is only available to *Super admin* user type.

Parameters

`(object/array)` User directory properties to be updated.

The `userdirectoryid` property must be defined for each user directory, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

`(object)` Returns an object containing the IDs of the updated user directories under the `userdirectoryids` property.

Examples

Update bind password for user directory

Set new bind password for a user directory.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.update",
    "params": {
        "userdirectoryid": "3",
        "bind_password": "newldappassword"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "3"
        ]
    },
    "id": 1
}
```

Update mappings for user directory

Update provisioning groups mappings and media type mappings for user directory "2".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "userdirectory.update",
    "params": {
        "userdirectoryid": "2",
        "provision_media": [
                {
                    "userdirectory_mediaid": "2"
                }
            ],
            "provision_groups": [
                {
                    "name": "Zabbix administrators",
                    "roleid": "2",
                    "user_groups": [
                        {
                            "usrgrpid": "7"
                        },
```

```
                        {
                            "usrgrpid": "8"
                        },
                        {
                            "usrgrpid": "11"
                        }
                    ]
                }
            ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "userdirectoryids": [
            "2"
        ]
    },
    "id": 1
}
```

CUserDirectory::update() in *ui/include/classes/api/services/CUserDirectory.php*.

User group

This class is designed to work with user groups.

Object references:

- User group
- Permission
- Tag-based permission

Available methods:

- usergroup.create - create new user groups
- usergroup.delete - delete user groups
- usergroup.get - retrieve user groups
- usergroup.update - update user groups

User group object

The following objects are directly related to the `usergroup` API.

User group

The user group object has the following properties.

Property	Type	Description
usrgrpid	ID	ID of the user group. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the user group. Property behavior: - *required* for create operations

Property	Type	Description
debug_mode	integer	Whether debug mode is enabled or disabled. Possible values: 0 - *(default)* disabled; 1 - enabled.
gui_access	integer	Frontend authentication method of the users in the group. Possible values: 0 - *(default)* use the system default authentication method; 1 - use internal authentication; 2 - use LDAP authentication; 3 - disable access to the frontend.
mfa_status	integer	Whether MFA is enabled or disabled for the users in the group. Possible values: 0 - disabled (for all configured MFA methods); 1 - enabled (for all configured MFA methods).
mfaid	ID	MFA method used for the users in the group. Property behavior: - *supported* for *Super admin* type users - *supported* if `mfa_status` of Authentication object is set to ”Enabled”
proxy_mode	integer	Mode for handling access to proxies that are not included in proxy groups. Possible values: 0 - Deny list; 1 - *(default)* Allow list. Property behavior: - *supported* for *Super admin* type users.
proxy_group_mode	integer	Mode for handling access to proxy groups (and their proxies). Possible values: 0 - Deny list; 1 - *(default)* Allow list. Property behavior: - *supported* for *Super admin* type users.
users_status	integer	Whether the user group is enabled or disabled. For deprovisioned users, the user group cannot be enabled. Possible values: 0 - *(default)* enabled; 1 - disabled.
userdirectoryid	ID	ID of the user directory used for authentication. Property behavior: - *supported* for *Super admin* type users - *supported* if `gui_access` is set to ”use the system default authentication method” or ”use LDAP authentication”

Permission

The permission object has the following properties.

Property	Type	Description
id	ID	ID of the host group or template group to add permission to. Property behavior: - *required*
permission	integer	Access level to the host group or template group. Possible values: 0 - access denied; 2 - read-only access; 3 - read-write access. Property behavior: - *required* for create operations

Tag-based permission

The tag-based permission object has the following properties.

Property	Type	Description
groupid	ID	ID of the host group to add permission to. Property behavior: - *required*
tag	string	Tag name.
value	string	Tag value.

usergroup.create

Description

`object usergroup.create(object/array userGroups)`

This method allows you to create new user groups.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` User groups to create.

Additionally to the standard user group properties, the method accepts the following parameters.

Parameter	Type	Description
hostgroup_rights	object/array	Host group permissions to assign to the user group.
proxies	object/array	Proxies to be linked to the user group. The proxies must have only the `proxyid` property defined.
proxy_groups	object/array	Proxy groups to be linked to the user group. The proxy groups must have only the `proxy_groupid` property defined.
templategroup_rights	object/array	Template group permissions to assign to the user group.
tag_filters	array	Tag-based permissions to assign to the user group.
users	object/array	Users to add to the user group. The user must have only the `userid` property defined.

Return values

(object) Returns an object containing the IDs of the created user groups under the usrgrpids property. The order of the returned IDs matches the order of the passed user groups.

Examples

Creating a user group

Create a user group *Operation managers* with denied access to host group "2", and add a user to it.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usergroup.create",
    "params": {
        "name": "Operation managers",
        "hostgroup_rights": {
            "id": "2",
            "permission": 0
        },
        "users": [
            {
                "userid": "12"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "usrgrpids": [
            "20"
        ]
    },
    "id": 1
}
```

See also

- Permission

Source

CUserGroup::create() in *ui/include/classes/api/services/CUserGroup.php*.

usergroup.delete

Description

`object usergroup.delete(array userGroupIds)`

This method allows you to delete user groups.

Attention:
Deprovisioned users group (the user group specified for `disabled_usrgrpid` in Authentication) cannot be deleted.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(array) IDs of the user groups to delete.

Return values

(object) Returns an object containing the IDs of the deleted user groups under the usrgrpids property.

Examples

Deleting multiple user groups

Delete two user groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usergroup.delete",
    "params": [
        "20",
        "21"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "usrgrpids": [
            "20",
            "21"
        ]
    },
    "id": 1
}
```

Source

CUserGroup::delete() in *ui/include/classes/api/services/CUserGroup.php*.

usergroup.get

Description

`integer/array usergroup.get(object parameters)`

The method allows you to retrieve user groups according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
mfaids	ID/array	Return only user groups with the given MFA methods. Parameter behavior: - *supported* for *Super admin* type users
mfa_status	integer	Return only user groups with the given MFA status. Refer to the user group page for a list of supported statuses.
proxyids	ID/array	Return only user groups that contain the given proxies. Parameter behavior: - *supported* for *Super admin* type users.

Parameter	Type	Description
proxy_groupids	ID/array	Return only user groups that contain the given proxy groups. Parameter behavior: - *supported* for *Super admin* type users.
selectProxies	ID/array	Return a `proxies` property with user group proxies. Parameter behavior: - *supported* for *Super admin* type users.
selectProxyGroups	ID/array	Return a `proxy_groups` property with user group proxy groups. Parameter behavior: - *supported* for *Super admin* type users.
status	integer	Return only user groups with the given status. Refer to the user group page for a list of supported statuses.
userids	ID/array	Return only user groups that contain the given users.
usrgrpids	ID/array	Return only user groups with the given IDs.
selectTagFilters	query	Return user group tag-based permissions in the `tag_filters` property.
selectUsers	query	Return the users from the user group in the `users` property. See `user.get` for restrictions based on user type.
selectHostGroupRights	query	Return user group host group permissions in the `hostgroup_rights` property. Refer to the user group page for a list of access levels to host groups.
selectTemplateGroupRights	query	Return user group template group permissions in the `templategroup_rights` property. Refer to the user group page for a list of access levels to template groups.
limitSelects	integer	Limits the number of records returned by subselects.
output	query	User group object properties to be returned. *Admin* and *User* type users may retrieve only the following properties: `usrgrpid`, `name`, `gui_access`, `users_status`, `debug_mode`, `mfa_status`. Default: `extend`.
sortfield	string/array	Sort the result by the given properties. Possible values: `usrgrpid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving enabled user groups

Retrieve all enabled user groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usergroup.get",
    "params": {
        "output": "extend",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "usrgrpid": "7",
            "name": "Zabbix administrators",
            "gui_access": "0",
            "users_status": "0",
            "debug_mode": "1",
            "userdirectoryid": "0",
            "mfa_status": "0",
            "mfaid": "0"
        },
        {
            "usrgrpid": "8",
            "name": "Guests",
            "gui_access": "0",
            "users_status": "0",
            "debug_mode": "0",
            "userdirectoryid": "0",
            "mfa_status": "0",
            "mfaid": "0"
        },
        {
            "usrgrpid": "11",
            "name": "Enabled debug mode",
            "gui_access": "0",
            "users_status": "0",
            "debug_mode": "1",
            "userdirectoryid": "0",
            "mfa_status": "0",
            "mfaid": "0"
        },
        {
            "usrgrpid": "12",
            "name": "No access to the frontend",
            "gui_access": "2",
            "users_status": "0",
            "debug_mode": "0",
            "userdirectoryid": "0",
            "mfa_status": "0",
            "mfaid": "0"
        },
        {
            "usrgrpid": "14",
            "name": "Read only",
            "gui_access": "0",
```

```
            "users_status": "0",
            "debug_mode": "0",
            "userdirectoryid": "0",
            "mfa_status": "0",
            "mfaid": "0"
        },
        {
            "usrgrpid": "18",
            "name": "Deny",
            "gui_access": "0",
            "users_status": "0",
            "debug_mode": "0",
            "userdirectoryid": "0",
            "mfa_status": "0",
            "mfaid": "0"
        }
    ],
    "id": 1
}
```

- User

Source

CUserGroup::get() in *ui/include/classes/api/services/CUserGroup.php*.

usergroup.update

Description

`object usergroup.update(object/array userGroups)`

This method allows you to update existing user groups.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` User group properties to be updated.

The `usrgrpid` property must be defined for each user group, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard user group properties, the method accepts the following parameters.

Parameter	Type	Description
hostgroup_rights	object/array	Host group permissions to replace the current permissions assigned to the user group.
proxies	object/array	Proxies to be linked to the user group. The proxies must have only the `proxyid` property defined.
proxy_groups	object/array	Proxy groups to be linked to the user group. The proxy groups must have only the `proxy_groupid` property defined.
templategroup_rights	object/array	Template group permissions to replace the current permissions assigned to the user group.
tag_filters	array	Tag-based permissions to replace the current permissions assigned to the user group.
users	object/array	Users to replace the current users assigned to the user group. The user must have only the `userid` property defined.

Return values

(object) Returns an object containing the IDs of the updated user groups under the usrgrpids property.

Examples

Enabling a user group and updating permissions

Enable a user group and provide read-write access for it to host groups ”2” and ”4”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usergroup.update",
    "params": {
        "usrgrpid": "17",
        "users_status": "0",
        "hostgroup_rights": [
            {
                "id": "2",
                "permission": 3
            },
            {
                "id": "4",
                "permission": 3
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "usrgrpids": [
            "17"
        ]
    },
    "id": 1
}
```

User macro

This class is designed to work with host-level and global user macros.

Object references:

- Global macro
- Host macro
  - Macro configuration

Available methods:

- usermacro.create - create new host macros
- usermacro.createglobal - create new global macros
- usermacro.delete - delete host macros
- usermacro.deleteglobal - delete global macros
- usermacro.get - retrieve host and global macros
- usermacro.update - update host macros

- usermacro.updateglobal - update global macros

User macro object

The following objects are directly related to the `usermacro` API.

Global macro

The global macro object has the following properties.

Property	Type	Description
globalmacroid	ID	ID of the global macro. Property behavior: - *read-only* - *required* for update operations
description	string	Description of the macro.
macro	string	Macro string. Property behavior: - *required* for create operations
type	integer	Type of macro. Possible values: 0 - *(default)* Text macro; 1 - Secret macro; 2 - Vault secret.
value	string	Value of the macro. Property behavior: - *write-only* if `type` is set to "Secret macro" - *required* for create operations

Host macro

The host macro object defines a macro available on a host, host prototype or template. It has the following properties.

Property	Type	Description
hostmacroid	ID	ID of the macro. Property behavior: - *read-only* - *required* for update operations
automatic	integer	Defines whether the macro is controlled by discovery rule. Possible values: 0 - *(default)* Macro is managed by user; 1 - Macro is managed by discovery rule. User is not allowed to create automatic macro. To update automatic macro, it must be converted to manual.
config	object/array	Macro configuration responsible for how the macro is displayed in the Host Wizard.
description	string	Description of the macro.
hostid	ID	ID of the host, host prototype, or template that the macro belongs to. Property behavior: - *constant* - *required* for create operations

Property	Type	Description
macro	string	Macro string. Property behavior: - *required* for create operations
type	integer	Type of macro. Possible values: 0 - *(default)* Text macro; 1 - Secret macro; 2 - Vault secret.
value	string	Value of the macro. Property behavior: - *write-only* if `type` is set to ”Secret macro” - *required* for create operations

Macro configuration

The macro configuration object defines how a macro is displayed in the Host Wizard.

Property	Type	Description
type	integer	Type of macro input field. Possible values: 0 - Macro is not used in Host Wizard; 1 - Textbox; 2 - List; 3 - Checkbox. Property behavior: - *required*
label	string	Label for macro input field. Property behavior: - *required* if `type` is set to ”Textbox”, ”List”, or ”Checkbox”
description	text	Help text displayed alongside macro input field. Supports Markdown formatting.
priority	integer	Macro input field position in the macro list. If `priority` is not set, the macro is added at the end of the ungrouped macro list.
required	integer	Marks the macro as mandatory. Possible values: 0 - Not mandatory; 1 - Mandatory. Property behavior: - *supported* if `type` is set to ”Textbox” or ”List”
regex	string	Regular expression to validate user input in a textbox field. Property behavior: - *supported* if `type` is set to ”Textbox”
section_name	string	Label of the collapsible section where the macro is grouped. If `section_name` is not set, the macro is ungrouped. Ungrouped macros are displayed first; grouped macros are displayed below, ordered by their `priority` within each collapsible section.

Property	Type	Description
options	text	JSON string defining list items or checkbox values. For lists: an array of objects with `value` and `text` properties. Example: `[{"value": "http", "text": "HTTP"}, {"value": "https", "text": "HTTPS"}]` For checkboxes: an object with `checked` and `unchecked` properties. Example: `{"checked": true, "unchecked": false}` Property behavior: - *required* if `type` is set to ”List” or ”Checkbox”

usermacro.create

Description

`object usermacro.create(object/array hostMacros)`

This method allows you to create new host macros.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Host macros to create.

The method accepts host macros with the standard host macro properties.

Return values

`(object)` Returns an object containing the IDs of the created host macros under the `hostmacroids` property. The order of the returned IDs matches the order of the passed host macros.

Examples

Creating a host macro

Create a host macro `{$SNMP_COMMUNITY}` with the value ”public” on host ”10198”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.create",
    "params": {
        "hostid": "10198",
        "macro": "{$SNMP_COMMUNITY}",
        "value": "public"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostmacroids": [
            "11"
        ]
    },
    "id": 1
}
```

Source

CUserMacro::create() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.createglobal

Description

`object usermacro.createglobal(object/array globalMacros)`

This method allows you to create new global macros.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Global macros to create.

The method accepts global macros with the standard global macro properties.

Return values

`(object)` Returns an object containing the IDs of the created global macros under the `globalmacroids` property. The order of the returned IDs matches the order of the passed global macros.

Examples

Creating a global macro

Create a global macro `{$SNMP_COMMUNITY}` with value "public".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.createglobal",
    "params":  {
        "macro": "{$SNMP_COMMUNITY}",
        "value": "public"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "globalmacroids": [
            "6"
        ]
    },
    "id": 1
}
```

Source

CUserMacro::createGlobal() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.delete

Description

`object usermacro.delete(array hostMacroIds)`

This method allows you to delete host macros.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the host macros to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted host macros under the `hostmacroids` property.

Examples

Deleting multiple host macros

Delete two host macros.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.delete",
    "params": [
        "32",
        "11"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostmacroids": [
            "32",
            "11"
        ]
    },
    "id": 1
}
```

Source

CUserMacro::delete() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.deleteglobal

Description

`object usermacro.deleteglobal(array globalMacroIds)`

This method allows you to delete global macros.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the global macros to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted global macros under the `globalmacroids` property.

Examples

Deleting multiple global macros

Delete two global macros.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.deleteglobal",
    "params": [
        "32",
        "11"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "globalmacroids": [
            "32",
            "11"
        ]
    },
    "id": 1
}
```

Source

CUserMacro::deleteGlobal() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.get

Description

`integer/array usermacro.get(object parameters)`

The method allows you to retrieve host and global macros according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
globalmacro	flag	Return global macros instead of host macros.
globalmacroids	ID/array	Return only global macros with the given IDs.
groupids	ID/array	Return only host macros that belong to hosts or templates from the given host groups or template groups.
hostids	ID/array	Return only macros that belong to the given hosts or templates.
hostmacroids	ID/array	Return only host macros with the given IDs.
inherited	boolean	If set to `true` return only host prototype user macros inherited from a template.
selectHostGroups	query	Return host groups that the host macro belongs to in the `hostgroups` property. Used only when retrieving host macros.
selectHosts	query	Return hosts that the host macro belongs to in the `hosts` property. Used only when retrieving host macros.

Parameter	Type	Description
selectTemplateGroups	query	Return template groups that the template macro belongs to in the `templategroups` property. Used only when retrieving template macros.
selectTemplates	query	Return templates that the host macro belongs to in the `templates` property. Used only when retrieving host macros.
sortfield	string/array	Sort the result by the given properties. Possible values: `macro`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving host macros for a host

Retrieve all host macros defined for host "10198".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.get",
    "params": {
        "output": "extend",
        "hostids": "10198"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostmacroid": "9",
            "hostid": "10198",
            "macro": "{$INTERFACE}",
            "value": "eth0",
            "description": "",
            "type": "0",
            "automatic": "0"
        },
        {
            "hostmacroid": "11",
```

```
            "hostid": "10198",
            "macro": "{$SNMP_COMMUNITY}",
            "value": "public",
            "description": "",
            "type": "0",
            "automatic": "0"
        }
    ],
    "id": 1
}
```

Retrieving host macros for a template

Retrieve host macros defined for template ”10265” that contain ”STATUS” in the macro name.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.get",
    "params": {
        "output": "extend",
        "hostids": "10265",
        "search": {
            "macro": "STATUS"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostmacroid": "6709",
            "hostid": "10265",
            "macro": "{$APACHE.STATUS.HOST}",
            "value": "",
            "description": "The hostname or IP address of the Apache status page host.",
            "type": "0",
            "automatic": "0",
            "config": {
                "type": "1",
                "priority": "1",
                "section_name": "",
                "label": "Apache status host",
                "description": "Hostname or IP address of the Apache status page host.",
                "required": "1",
                "regex": "",
                "options": []
            }
        },
        {
            "hostmacroid": "814",
            "hostid": "10265",
            "macro": "{$APACHE.STATUS.PATH}",
            "value": "server-status?auto",
            "description": "The URL path of the Apache status page.",
            "type": "0",
            "automatic": "0",
            "config": {
                "type": "1",
                "priority": "3",
```

```
                "section_name": "",
                "label": "Apache status page path",
                "description": "URL path of the Apache status page.",
                "required": "1",
                "regex": "",
                "options": []
            }
        },
        {
            "hostmacroid": "815",
            "hostid": "10265",
            "macro": "{$APACHE.STATUS.PORT}",
            "value": "80",
            "description": "The port of the Apache status page.",
            "type": "0",
            "automatic": "0",
            "config": {
                "type": "1",
                "priority": "2",
                "section_name": "",
                "label": "Apache status page port",
                "description": "In the range from 1 to 65535 inclusive.",
                "required": "1",
                "regex": "^-?([0-9]+|(([0-9]+)\\.([0-9]+)))$",
                "options": []
            }
        },
        {
            "hostmacroid": "816",
            "hostid": "10265",
            "macro": "{$APACHE.STATUS.SCHEME}",
            "value": "http",
            "description": "The request scheme, which may be either HTTP or HTTPS.",
            "type": "0",
            "automatic": "0",
            "config": {
                "type": "2",
                "priority": "4",
                "section_name": "",
                "label": "Request scheme",
                "description": "Request scheme, which may be either HTTP or HTTPS.",
                "required": "0",
                "regex": "",
                "options": [
                    {
                        "value": "http",
                        "text": "HTTP"
                    },
                    {
                        "value": "https",
                        "text": "HTTPS"
                    }
                ]
            }
        }
    ],
    "id": 1
}
```

Retrieving global macros

Retrieve all global macros.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.get",
    "params": {
        "output": "extend",
        "globalmacro": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "globalmacroid": "6",
            "macro": "{$SNMP_COMMUNITY}",
            "value": "public",
            "description": "",
            "type": "0"
        }
    ],
    "id": 1
}
```

Source

CUserMacro::get() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.update

Description

`object usermacro.update(object/array hostMacros)`

This method allows you to update existing host macros.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Host macro properties to be updated.

The `hostmacroid` property must be defined for each host macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

`(object)` Returns an object containing the IDs of the updated host macros under the `hostmacroids` property.

Examples

Changing the value of a host macro

Change the value of a host macro to ”public”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.update",
    "params": {
        "hostmacroid": "1",
        "value": "public"
    },
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostmacroids": [
            "1"
        ]
    },
    "id": 1
}
```

Change macro value that was created by discovery rule

Convert discovery rule created ”automatic” macro to ”manual” and change its value to ”new-value”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.update",
    "params": {
        "hostmacroid": "1",
        "value": "new-value",
        "automatic": "0"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostmacroids": [
            "1"
        ]
    },
    "id": 1
}
```

Source

CUserMacro::update() in *ui/include/classes/api/services/CUserMacro.php*.

usermacro.updateglobal

Description

`object usermacro.updateglobal(object/array globalMacros)`

This method allows you to update existing global macros.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Global macro properties to be updated.

The `globalmacroid` property must be defined for each global macro, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

(object) Returns an object containing the IDs of the updated global macros under the globalmacroids property.

Examples

Changing the value of a global macro

Change the value of a global macro to "public".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "usermacro.updateglobal",
    "params": {
        "globalmacroid": "1",
        "value": "public"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "globalmacroids": [
            "1"
        ]
    },
    "id": 1
}
```

CUserMacro::updateGlobal() in *ui/include/classes/api/services/CUserMacro.php*.

Value map

This class is designed to work with value maps.

Object references:

- Value map
  - Value mappings

Available methods:

- valuemap.create - create new value maps
- valuemap.delete - delete value maps
- valuemap.get - retrieve value maps
- valuemap.update - update value maps

Value map object

The following objects are directly related to the valuemap API.

Value map

The value map object has the following properties.

Property	Type	Description
valuemapid	ID	ID of the value map. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
hostid	ID	ID of the host or template that the value map belongs to. Property behavior: - *constant* - *required* for create operations
name	string	Name of the value map. Property behavior: - *required* for create operations
mappings	array	Value mappings for current value map. The mapping object is described in detail below. Property behavior: - *required* for create operations
uuid	string	Universal unique identifier, used for linking imported value maps to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the value map belongs to a template

Value mappings

The value mappings object defines value mappings of the value map. It has the following properties.

Property	Type	Description
type	integer	Mapping match type. Possible values: 0 - *(default)* mapping will be applied if value is equal; 1 - mapping will be applied if value is greater or equal[1]; 2 - mapping will be applied if value is less or equal[1]; 3 - mapping will be applied if value is in range (ranges are inclusive; multiple ranges, separated by comma character, can be defined)[1]; 4 - mapping will be applied if value matches a regular expression[2]; 5 - if no matches are found, mapping will not be applied, and the default value will be used. If `type` is set to ”0”, ”1”, ”2”, ”3”, ”4”, then `value` cannot be empty. If `type` is set to ”5”, then `value` must be empty.
value	string	Original value. Property behavior: - *required* if `type` is set to ”1”, ”2”, ”3”, ”4” - *supported* if `type` is set to ”5”
newvalue	string	Value to which the original value is mapped to. Property behavior: - *required*

[1] supported only for items having value type ”numeric unsigned”, ”numeric float”.
 [2] supported only for items having value type ”character”.

valuemap.create

Description

`object valuemap.create(object/array valuemaps)`

This method allows you to create new value maps.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Value maps to create.

The method accepts value maps with the standard value map properties.

Return values

`(object)` Returns an object containing the IDs of the created value maps the `valuemapids` property. The order of the returned IDs matches the order of the passed value maps.

Examples

Creating a value map

Create one value map with two mappings.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "valuemap.create",
    "params": {
        "hostid": "50009",
        "name": "Service state",
        "mappings": [
            {
                "type": "1",
                "value": "1",
                "newvalue": "Up"
            },
            {
                "type": "5",
                "newvalue": "Down"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "valuemapids": [
            "1"
        ]
    },
    "id": 1
}
```

Source

CValueMap::create() in *ui/include/classes/api/services/CValueMap.php*.

valuemap.delete

Description

`object valuemap.delete(array valuemapids)`

This method allows you to delete value maps.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the value maps to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted value maps under the `valuemapids` property.

Examples

Deleting multiple value maps

Delete two value maps.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "valuemap.delete",
    "params": [
        "1",
        "2"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "valuemapids": [
            "1",
            "2"
        ]

valuemap.get

Description

`integer/array valuemap.get(object parameters)`

The method allows you to retrieve value maps according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
valuemapids	ID/array	Return only value maps with the given IDs.

Parameter	Type	Description
selectMappings	query	Return the value mappings for current value map in the `mappings` property. Supports `count`.
sortfield	string/array	Sort the result by the given properties. Possible values: `valuemapid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving value maps

Retrieve all configured value maps.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "valuemap.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "valuemapid": "4",
            "name": "APC Battery Replacement Status"
        },
        {
            "valuemapid": "5",
            "name": "APC Battery Status"
        },
        {
            "valuemapid": "7",
            "name": "Dell Open Manage System Status"
        }
    ],
    "id": 1
}
```

Retrieve one value map with its mappings.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "valuemap.get",
    "params": {
        "output": "extend",
        "selectMappings": "extend",
        "valuemapids": ["4"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "valuemapid": "4",
            "name": "APC Battery Replacement Status",
            "mappings": [
                {
                    "type": "0",
                    "value": "1",
                    "newvalue": "unknown"
                },
                {
                    "type": "0",
                    "value": "2",
                    "newvalue": "notInstalled"
                },
                {
                    "type": "0",
                    "value": "3",
                    "newvalue": "ok"
                },
                {
                    "type": "0",
                    "value": "4",
                    "newvalue": "failed"
                },
                {
                    "type": "0",
                    "value": "5",
                    "newvalue": "highTemperature"
                },
                {
                    "type": "0",
                    "value": "6",
                    "newvalue": "replaceImmediately"
                },
                {
                    "type": "0",
                    "value": "7",
                    "newvalue": "lowCapacity"
                }
            ]
        }
    ],
    "id": 1
}
```

Source

CValueMap::get() in *ui/include/classes/api/services/CValueMap.php*.

valuemap.update

Description

`object valuemap.update(object/array valuemaps)`

This method allows you to update existing value maps.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Value map properties to be updated.

The `valuemapid` property must be defined for each value map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Return values

`(object)` Returns an object containing the IDs of the updated value maps under the `valuemapids` property.

Examples

Changing value map name

Change value map name to ”Device status”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "valuemap.update",
    "params": {
        "valuemapid": "2",
        "name": "Device status"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "valuemapids": [
            "2"
        ]
    },
    "id": 1
}
```

Changing mappings for one value map.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "valuemap.update",
    "params": {
        "valuemapid": "2",
        "mappings": [
            {
                "type": "0",
                "value": "0",
```

```
                "newvalue": "Online"
            },
            {
                "type": "0",
                "value": "1",
                "newvalue": "Offline"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "valuemapids": [
            "2"
        ]
    },
    "id": 1
}
```

CValueMap::update() in *ui/include/classes/api/services/CValueMap.php*.

Web scenario

This class is designed to work with web scenarios.

Object references:

- Web scenario
- Scenario step
  - HTTP field
- Web scenario tag

Available methods:

- httptest.create - create new web scenarios
- httptest.delete - delete web scenarios
- httptest.get - retrieve web scenarios
- httptest.update - update web scenarios

Web scenario object

The following objects are directly related to the `webcheck` API.

Web scenario

The web scenario object has the following properties.

Property	Type	Description
httptestid	ID	ID of the web scenario. Property behavior: - *read-only* - *required* for update operations
hostid	ID	ID of the host that the web scenario belongs to. Property behavior: - *constant* - *required* for create operations

Property	Type	Description
name	string	Name of the web scenario. Property behavior: - *required* for create operations
agent	string	User agent string that will be used by the web scenario. Default: Zabbix
authentication	integer	Authentication method that will be used by the web scenario. Possible values: 0 - *(default)* none; 1 - basic HTTP authentication; 2 - NTLM authentication; 3 - Kerberos authentication; 4 - Digest authentication.
delay	string	Execution interval of the web scenario. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or a user macro. Default: 1m.
headers	array	HTTP headers that will be sent when performing a request.
http_password	string	Password used for basic HTTP, NTLM, Kerberos, or Digest authentication.
http_proxy	string	Proxy that will be used by the web scenario given as *http://[username[:password]@]proxy.example.com[:port]*.
http_user	string	User name used for basic HTTP, NTLM, Kerberos, or Digest authentication.
retries	integer	Number of times a web scenario will try to execute each step before failing. Default: 1.
ssl_cert_file	string	Name of the SSL certificate file used for client authentication (must be in PEM format).
ssl_key_file	string	Name of the SSL private key file used for client authentication (must be in PEM format).
ssl_key_password	string	SSL private key password.
status	integer	Whether the web scenario is enabled. Possible values: 0 - *(default)* enabled; 1 - disabled.
templateid	ID	ID of the parent template web scenario. Property behavior: - *read-only*
variables	array	Web scenario variables.
verify_host	integer	Whether to validate that the host name for the connection matches the one in the host's certificate. Possible values: 0 - *(default)* skip host verification; 1 - verify host.
verify_peer	integer	Whether to validate that the host's certificate is authentic. Possible values: 0 - *(default)* skip peer verification; 1 - verify peer.

Property	Type	Description
uuid	string	Global unique identifier, used for linking imported web scenarios to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the web scenario belongs to a template

Scenario step

The scenario step object defines a specific web scenario check. It has the following properties.

Property	Type	Description
name	string	Name of the scenario step. Property behavior: - *required*
no	integer	Sequence number of the step in a web scenario. Property behavior: - *required*
url	string	URL to be checked. Property behavior: - *required*
follow_redirects	integer	Whether to follow HTTP redirects. Possible values: 0 - don't follow redirects; 1 - *(default)* follow redirects.
headers	array	HTTP headers that will be sent when performing a request. Scenario step headers will overwrite headers specified for the web scenario.
posts	string/array	HTTP POST variables as a string (raw post data) or as an array of HTTP fields (form field data).
required	string	Text that must be present in the response.
retrieve_mode	integer	Part of the HTTP response that the scenario step must retrieve. Possible values: 0 - *(default)* only body; 1 - only headers; 2 - headers and body.
status_codes	string	Ranges of required HTTP status codes, separated by commas.
timeout	string	Request timeout in seconds. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 1h), or a user macro. Default: 15s. Maximum: 1h. Minimum: 1s.
variables	array	Scenario step variables.
query_fields	array	Query fields - array of HTTP fields that will be added to URL when performing a request.

HTTP field

The HTTP field object defines the name and value that is used to specify the web scenario variables, HTTP headers, and POST fields or query fields. It has the following properties.

Property	Type	Description
name	string	Name of header/variable/POST or GET field. Property behavior: - *required*

Property	Type	Description
value	string	Value of header/variable/POST or GET field. Property behavior: - *required*

Web scenario tag

The web scenario tag object has the following properties.

Property	Type	Description
tag	string	Web scenario tag name. Property behavior: - *required*
value	string	Web scenario tag value. Property behavior: - *read-only*.
object	integer	Type of object the tag was inherited from. Possible values: 0 - template; 1 - host. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

httptest.create

Description

`object httptest.create(object/array webScenarios)`

This method allows you to create new web scenarios.

Note:
Creating a web scenario will automatically create a set of web monitoring items.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Web scenarios to create.

Additionally to the standard web scenario properties, the method accepts the following parameters.

Parameter	Type	Description
steps	array	Scenario steps. Parameter behavior: - *required*
tags	array	Web scenario tags.

Return values

(object) Returns an object containing the IDs of the created web scenarios under the httptestids property. The order of the returned IDs matches the order of the passed web scenarios.

Examples

Creating a web scenario

Create a web scenario to monitor the company home page. The scenario will have two steps, to check the home page and the "About" page and make sure they return the HTTP status code 200.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "httptest.create",
    "params": {
        "name": "Homepage check",
        "hostid": "10085",
        "steps": [
            {
                "name": "Homepage",
                "url": "http://example.com",
                "status_codes": "200",
                "no": 1
            },
            {
                "name": "Homepage / About",
                "url": "http://example.com/about",
                "status_codes": "200",
                "no": 2
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "httptestids": [
            "5"
        ]
    },
    "id": 1
}
```

See also

- Scenario step

Source

CHttpTest::create() in *ui/include/classes/api/services/CHttpTest.php*.

httptest.delete

Description

`object httptest.delete(array webScenarioIds)`

This method allows you to delete web scenarios.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the web scenarios to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted web scenarios under the `httptestids` property.

Examples

Deleting multiple web scenarios

Delete two web scenarios.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "httptest.delete",
    "params": [
        "2",
        "3"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "httptestids": [
            "2",
            "3"
        ]
    },
    "id": 1
}
```

Source

CHttpTest::delete() in *ui/include/classes/api/services/CHttpTest.php*.

httptest.get

Description

`integer/array httptest.get(object parameters)`

The method allows you to retrieve web scenarios according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	ID/array	Return only web scenarios that belong to the given host groups.
hostids	ID/array	Return only web scenarios that belong to the given hosts.
httptestids	ID/array	Return only web scenarios with the given IDs.
inherited	boolean	If set to `true` return only web scenarios inherited from a template.

Parameter	Type	Description
inheritedTags	boolean	Return web scenarios that have given `tags` also in template/host/linked templates. Possible values: `true` - template/host/linked templates must also have given tags; `false` - *(default)* tags from template/host/linked templates are ignored.
monitored	boolean	If set to `true` return only enabled web scenarios that belong to monitored hosts.
selectInheritedTags	query	Return an `inheritedTags` property with tags that are on template/host/linked templates.
templated	boolean	If set to `true` return only web scenarios that belong to templates.
templateids	ID/array	Return only web scenarios that belong to the given templates.
expandName	flag	Expand macros in the name of the web scenario.
expandStepName	flag	Expand macros in the names of scenario steps.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.
tags	array	Return only web scenarios with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all web scenarios. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
selectHosts	query	Return the hosts that the web scenario belongs to as an array in the `hosts` property.
selectSteps	query	Return web scenario steps in the `steps` property. Supports `count`.
selectTags	query	Return web scenario tags in the `tags` property.
sortfield	string/array	Sort the result by the given properties. Possible values: `httptestid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving a web scenario

Retrieve all data about web scenario "9".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "httptest.get",
    "params": {
        "output": "extend",
        "selectSteps": "extend",
        "httptestids": "9"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "httptestid": "9",
            "name": "Homepage check",

httptest.update

Description

`object httptest.update(object/array webScenarios)`

This method allows you to update existing web scenarios.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Web scenario properties to be updated.

The `httptestid` property must be defined for each web scenario, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard web scenario properties, the method accepts the following parameters.

Parameter	Type	Description
steps	array	Scenario steps to replace existing steps.
tags	array	Web scenario tags.

Return values

`(object)` Returns an object containing the IDs of the updated web scenarios under the `httptestid` property.

Examples

Enabling a web scenario

Enable a web scenario, that is, set its status to ”0”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "httptest.update",
    "params": {
        "httptestid": "5",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "httptestids": [
            "5"
        ]
    },
    "id": 1
}
```

Source

CHttpTest::update() in *ui/include/classes/api/services/CHttpTest.php*.

Appendix 1. Reference commentary

Notation Method signature

Each API method page contains the method signature.

Example: `object action.create(object/array actions)`

Signature	Description
`object`	The type of data the method returns.
`action.create`	The full name of the method.
`object/array`	The type of data the method accepts.
`actions`	A short summary of what the method accepts.

Data types

The Zabbix API supports the following data types as input:

Type	Description
ID	A unique identifier used to reference an entity.
boolean	A boolean value (either `true` or `false`).
flag	A value that is considered to be `true` if passed and not equal to `null`; otherwise, the value is considered to be `false`.
integer	A whole number.
float	A floating point number.
string	A text string.
text	A longer text string.
timestamp	A Unix timestamp.
array	An ordered sequence of values (a plain array).
object	An associative array.

Type	Description
query	A value that defines the data to be returned. The value can be defined as an array of property names (to return only specific properties), or as one of the predefined values: `extend` - returns all object properties; `count` - returns the number of retrieved records, supported only by certain subselects.

Attention:
Zabbix API always returns values as strings or arrays only.

Property behavior

Some of the object properties are marked with short labels to describe their behavior. The following labels are used:

- ***read-only*** - the value of the property is set automatically and cannot be defined or changed by the user, even in some specific conditions (e.g., *read-only* for inherited objects or discovered objects);
- ***write-only*** - the value of the property can be set, but cannot be accessed after;
- ***constant*** - the value of the property can be set when creating an object, but cannot be changed after;
- ***supported*** - the value of the property is not required to be set, but is allowed to be set in some specific conditions (e.g., *supported* if `type` is set to "Simple check", "External check", "SSH agent", "TELNET agent", or "HTTP agent"); note, however, that *supported* properties may still be set to their default values regardless of conditions;
- ***required*** - the value of the property is required to be set for all operations (except get operations) or in some specific conditions (e.g., *required* for create operations; *required* if `operationtype` is set to "global script" and `opcommand_hst` is not set).

Note:
For update operations, a property is considered as "set" when setting it during the update operation.

Properties that are not marked with labels are optional.

Parameter behavior

Some of the operation parameters are marked with short labels to describe their behavior for the operation. The following labels are used:

- ***read-only*** - the value of the parameter is set automatically and cannot be defined or changed by the user, even in some specific conditions (e.g., *read-only* for inherited objects or discovered objects);
- ***write-only*** - the value of the parameter can be set, but cannot be accessed after;
- ***supported*** - the value of the parameter is not required to be set, but is allowed to be set in some specific conditions (e.g., *supported* if `operating_mode` of Proxy object is set to "passive proxy"); note, however, that *supported* parameters may still be set to their default values regardless of conditions;
- ***required*** - the value of the parameter is required to be set.

Parameters that are not marked with labels are optional.

Reserved ID value "0" Reserved ID value "0" can be used to filter elements and to remove referenced objects. For example, to remove a referenced proxy from a host, proxyid should be set to 0 ("proxyid": "0") or to filter hosts monitored by server option proxyids should be set to 0 ("proxyids": "0").

Common "get" method parameters The following parameters are supported by all `get` methods:

Parameter	Type	Description
countOutput	boolean	Return the number of records in the result instead of the actual data.
editable	boolean	If set to `true`, return only objects that the user has write permissions to. Default: `false`.
excludeSearch	boolean	Return results that do not match the criteria given in the `search` parameter.

Parameter	Type	Description
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names (e.g., Host object properties in `host.get`, Item object properties in `item.get`, etc.), and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Note that some methods have specific functionality for this parameter, which is described on the method page (e.g., the `filter` parameter in host.get also supports Host interface properties).
limit	integer	Limit the number of records returned.
output	query	Object properties to be returned. Note that the object ID (i.e., `hostid`, `itemid`, etc.) is always included in the response, even if it is not specified in the `output` parameter. Default: `extend`.
preservekeys	boolean	Use IDs as keys in the resulting array.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names (e.g., Host object properties in `host.get`, Item object properties in `item.get`, etc.), and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supports only properties of `string` and `text` data type. Note that some methods have specific functionality for this parameter, which is described on the method page (e.g., the `search` parameter in host.get also supports Host interface properties).
searchByAny	boolean	If set to `true`, return results that match any of the criteria given in the `filter` or `search` parameter instead of all of them. Default: `false`.
searchWildcardsEnabled	boolean	If set to `true`, enables the use of "*" as a wildcard character in the `search` parameter. Default: `false`.
sortfield	string/array	Sort the result by the given properties. Refer to a specific API get method description for a list of properties that can be used for sorting. Macros are not expanded before sorting. If no value is specified, data will be returned unsorted.
sortorder	string/array	Order of sorting. If an array is passed, each value will be matched to the corresponding property given in the `sortfield` parameter. Possible values: `ASC` - *(default)* ascending; `DESC` - descending.
startSearch	boolean	The `search` parameter will compare the beginning of fields, that is, perform a `LIKE "…%"` search instead. Ignored if `searchWildcardsEnabled` is set to `true`.

Entity origin flags Get methods return a `flags` property for entities related to low-level discovery (LLD rule/LLD rule prototype, item/item prototype, etc). This property is useful to denote if the entity has been discovered or not, since editing for discovered entities is limited.

The `flags` property returns a result based on a combination ("+" operation) of these values:

Value	Description
0	Base entity (item, trigger, graph, host)

Value	Description
1	Low-level discovery rule
2	Any prototype (item prototype, trigger prototype, LLD rule prototype, etc)
4	Discovered entity (discovered item, trigger, graph, host, LLD rule)

The **combined** value returned by the `flags` property may be:

Value	Combination of	Description
0	0	Plain entity (item, trigger, graph, host).
2	2	Entity prototype (item prototype, trigger prototype, etc).
6	2+4	Discovered item, trigger, graph, host (converted from prototype).
1	1	Low-level discovery rule.
3	1+2	Low-level discovery rule prototype.
5	1+4	Discovered low-level discovery rule (converted from prototype).
7	1+2+4	Discovered low-level discovery rule prototype.

Examples User permission check

Does the user have permission to write to hosts whose names begin with ”MySQL” or ”Linux” ?

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "countOutput": true,
        "search": {
            "host": ["MySQL", "Linux"]
        },
        "editable": true,
        "startSearch": true,
        "searchByAny": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": "0",
    "id": 1
}
```

Note:
Zero result means no hosts with read/write permissions.

Mismatch counting

Count the number of hosts whose names do not contain the substring ”ubuntu”

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "countOutput": true,
        "search": {
            "host": "ubuntu"
        },
        "excludeSearch": true
    },
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": "44",
    "id": 1
}
```

Searching for hosts using wildcards

Find hosts whose name contains word ”server” and have interface ports ”10050” or ”10071”. Sort the result by host name in descending order and limit it to 5 hosts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid", "host"],
        "selectInterfaces": ["port"],
        "filter": {
            "port": ["10050", "10071"]
        },
        "search": {
            "host": "*server*"
        },
        "searchWildcardsEnabled": true,
        "searchByAny": true,
        "sortfield": "host",
        "sortorder": "DESC",
        "limit": 5
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "50003",
            "host": "WebServer-Tomcat02",
            "interfaces": [
                {
                    "port": "10071"
                }
            ]
        },
        {
            "hostid": "50005",
            "host": "WebServer-Tomcat01",
            "interfaces": [
                {
                    "port": "10071"
                }
            ]
        },
        {
            "hostid": "50004",
            "host": "WebServer-Nginx",
            "interfaces": [
```

```
                {
                    "port": "10071"
                }
            ]
        },
        {
            "hostid": "99032",
            "host": "MySQL server 01",
            "interfaces": [
                {
                    "port": "10050"
                }
            ]
        },
        {
            "hostid": "99061",
            "host": "Linux server 01",
            "interfaces": [
                {
                    "port": "10050"
                }
            ]
        }
    ],
    "id": 1
}
```

Searching for hosts using wildcards with ”preservekeys”

If you add the parameter ”preservekeys” to the previous request, the result is returned as an associative array, where the keys are the id of the objects.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid", "host"],
        "selectInterfaces": ["port"],
        "filter": {
            "port": ["10050", "10071"]
        },
        "search": {
            "host": "*server*"
        },
        "searchWildcardsEnabled": true,
        "searchByAny": true,
        "sortfield": "host",
        "sortorder": "DESC",
        "limit": 5,
        "preservekeys": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "50003": {
            "hostid": "50003",
            "host": "WebServer-Tomcat02",
            "interfaces": [
```

```
                {
                    "port": "10071"
                }
            ]
        },
        "50005": {
            "hostid": "50005",
            "host": "WebServer-Tomcat01",
            "interfaces": [
                {
                    "port": "10071"
                }
            ]
        },
        "50004": {
            "hostid": "50004",
            "host": "WebServer-Nginx",
            "interfaces": [
                {
                    "port": "10071"
                }
            ]
        },
        "99032": {
            "hostid": "99032",
            "host": "MySQL server 01",
            "interfaces": [
                {
                    "port": "10050"
                }
            ]
        },
        "99061": {
            "hostid": "99061",
            "host": "Linux server 01",
            "interfaces": [
                {
                    "port": "10050"
                }
            ]
        }
    },
    "id": 1
}
```

Appendix 2. Changes from 7.4 to 8.0

Breaking changes history

ZBXNEXT-10069 Added new parameter `maxValueSize` to the history.get method. If you are requesting data for items with a binary value (`history=5`), set `maxValueSize` to `null`; otherwise, `history.get` will return the item value truncated to 64KiB.

host

ZBXNEXT-9185 Added property behavior description for the `monitored_by` property of the host object. ZBXNEXT-10387 `host.massupdate`: Removed method. Please use `host.update` instead.

hostgroup

ZBXNEXT-10387 `hostgroup.massupdate`: Removed method. Please use `hostgroup.update`, `hostgroup.massadd`, or `hostgroup.massremove` instead.

hostinterface

ZBXNEXT-10814 hostinterface.create, hostinterface.update, hostinterface.delete, hostinterface.massadd, and hostinterface.massremove methods have been removed from the hostinterface API. Please use methods of the host object instead.

role

ZBXNEXT-9185 Added new select_server_for_monitoring value for the name property of the role's action object.

template

ZBXNEXT-10387 template.massupdate: Removed method. Please use template.update, template.massadd, or template_massremove instead.

templategroup

ZBXNEXT-10387 templategroup.massupdate: Removed method. Please use templategroup.update, templategroup.massadd, or templategroup.massremove instead.

usergroup

ZBXNEXT-9185 Added new parameters proxies and proxy_groups to the usergroup.create and usergroup.update methods.
 Added new parameters proxyids, proxy_groupids, selectProxies, and selectProxyGroups to the usergroup.get method.
 Added new properties proxy_mode and proxy_group_mode to the user group object.

Other changes and bug fixes action

ZBXNEXT-9399 Added new value 29 (proxy group) to the conditiontype action filter parameter if event source is discovery/autoregistration.

apmlog

ZBXNEXT-10083 Added new APM log API.

apmmetric

ZBXNEXT-10083 Added new APM metric API.

apmspan

ZBXNEXT-10083 Added new APM span API.

apmtrace

ZBXNEXT-10083 Added new APM trace API.

configuration

ZBXNEXT-5419 Added new parameter returnMissingObjects to the configuration.importcompare method.
 ZBXNEXT-5419 Added new parameter dashboards to the rules object (configuration.importcompare method).
 ZBXNEXT-5419 Added new parameter returnMissingObjects to the configuration.import method.
 ZBXNEXT-5419 Added new parameter dashboards to the rules object (configuration.import method). ZBXNEXT-10390 Added a new global_regexes parameter to the options object of the configuration.export method. ZBXNEXT-10390 Added a new global_regexes parameter to the rules object of the configuration.importcompare and configuration.import methods.

connector

ZBXNEXT-10069 Added new item_value_type value (64 - JSON) to the connector object.

dashboard

ZBXNEXT-4769 Added new dashboard widget field show_hostnames to the graph widget.
 ZBXNEXT-9546 Added new dashboard widget fields ds.0.item_tags_evaltype, ds.0.item_tags.0.tag, ds.0.item_tags.0.operator and ds.0.item_tags.0.value to svggraph and piechart widgets.
 ZBXNEXT-10158 Added new dashboard widget fields columns.0.aggregate_columns, columns.0.combined_column_name and columns.0.column_aggregate_function to the topitems widget.
 ZBXNEXT-9424, ZBXNEXT-4769 Added new dashboard widget type scatterplot.
 ZBXNEXT-8160 Added new dashboard widget fields clustering_mode and clustering_zoom_level to the geomap widget.
 ZBXNEXT-943 Added new dashboard widget field ds.0.invert_values to the graph widget.
 ZBXNEXT-10657 Added default values for the new "dark-blue-theme" theme to the Color and Background color parameters of the honeycomb widget.

drule

ZBXNEXT-9185 Updated property behavior for the timeout property of the discovery rule object.

device

ZBXNEXT-10357 Added new Device API with methods device.get and device.offboard.

event

ZBXNEXT-1150 Added a property `maintenanceid` to the `selectAcknowledges` parameter of the event.get method.

history

ZBXNEXT-10069 Added new `history` value (6 - JSON) to the history.get method.
 ZBXNEXT-10069 Added new `JSON history` object.

hostprototype

ZBXNEXT-9546 Added new parameter `selectInheritedTags` to the hostprototype.get method.

httptest

ZBXNEXT-9546 Added new parameters `inheritedTags` and `selectInheritedTags` to the httptest.get method.

item

ZBXNEXT-10249 Added new `type` value (24 - Telemetry query) to the item object.
 ZBXNEXT-10249 Added new properties `query`, `time_shift`, `lookback_limit`, and `granularity` to the item object.
 ZBXNEXT-9185 Updated property behavior for the `timeout` property of the item object.
 ZBXNEXT-10069 Added new `value_type` value (6 - JSON) to the item object.
 ZBXNEXT-9546 Added new parameters `inheritedTags` and `selectInheritedTags` to the item.get method.

itemprototype

ZBXNEXT-10249 Added new `type` value (24 - Telemetry query) to the item prototype object.
 ZBXNEXT-10249 Added new properties `query`, `time_shift`, `lookback_limit`, and `granularity` to the item prototype object.
 ZBXNEXT-10069 Added new `value_type` value (6 - JSON) to the itemprototype object.
 ZBXNEXT-9546 Added new parameter `selectInheritedTags` to the itemprototype.get method.

maintenance

ZBXNEXT-8339 Added `triggers` and `event_names` properties to the maintenance.create and maintenance.update methods. The `problem_tags` property gained "Does not equal" and "Does not contain" operators.
 ZBXNEXT-8339 Added `triggerids`, `selectTriggers`, and `selectEventNames` parameters to the maintenance.get method.

mediatype

ZBXNEXT-10357 Added new `type` value (5 - Push) to the media type object.

problem

ZBXNEXT-1150 Added a property `maintenanceid` to the `selectAcknowledges` parameter of the problem.get method.

proxy

ZBXNEXT-10084 Added new parameter `selectApm` to the proxy.get method.
 ZBXNEXT-10084 Added new parameter `apm` to the proxy.create and proxy.update methods.
 ZBXNEXT-10084 Added new Application performance monitoring (APM) object.
 ZBXNEXT-10249 Added new property `timeout_telemetry_query` to the proxy object.

regexp

ZBXNEXT-10390 Added a new `description` property to the regular expression object.

role

ZBXNEXT-10334 Changed the behavior of the `api` property in the role rules object. If `api.mode` is set to 1 (allow list) and `api` is empty, access to all API methods is now denied.
 ZBXNEXT-10469 Changed the default value of the `api.access` property in the role rules object. The default value is now 0 (disabled).
 ZBXNEXT-10357 Added new properties `devices.access`, `devices.actions`, and `devices.actions.default_access` to the role rules object.
 ZBXNEXT-10357 Added new `name` value (administration.linked_devices - *Users* > *Devices*) to the UI element object.
 ZBXNEXT-10357 Added new parameter `current` to the role.get method.

serverinfo

ZBXNEXT-10357 Added new Server info API with method `serverinfo.get`.

settings

ZBXNEXT-10249 Added new property `timeout_telemetry_query` to the settings object.
 ZBXNEXT-10680 Added new property `apm_global_db` to the settings object.
 ZBXNEXT-10357 Added new property `device_link_timeout` to the settings object.
 ZBXNEXT-10657 Added the `dark-blue-theme` value to the `default_theme` property of the settings object.

template

ZBXNEXT-9546 Added new parameters `inheritedTags` and `selectInheritedTags` to the template.get method.

templatedashboard

ZBXNEXT-9424 Added new template dashboard widget type scatterplot.

trigger

ZBXNEXT-9546 Added new parameters `inheritedTags` and `selectInheritedTags` to the trigger.get method.
 ZBXNEXT-8339 Added new property `maintenanceids` to the trigger.get method.
 ZBXNEXT-5467 Added property `automatic` to trigger tag object.

triggerprototype

ZBXNEXT-9546 Added new parameter `selectInheritedTags` to the triggerprototype.get method.

user

ZBXNEXT-10657 Added the `dark-blue-theme` value to the `theme` property of the user object.
 ZBXNEXT-8339 Added new property `default_maintenance_period` to the user.create, user.get, and user.update methods.

userdirectory

ZBXNEXT-9834 Added properties `idp_certificate`, `sp_private_key`, `sp_certificate`, `idp_certificate_hash`, `sp_private_key_hash`, and `sp_certificate_hash` to user directory object.
 DEV-5022 Changed the default value of the `sign_assertions`, `sign_authn_requests`, `sign_messages`, `sign_logout_requests`, `sign_logout_responses` properties in the user directory object. The default value is now 1 (enabled).

Appendix 3. Changes in 8.0

8.0.1 This version is not released yet.

Extensions

Overview Although Zabbix offers a multiplicity of features, there is always room for additional functionality. Extensions are a convenient way of modifying and enhancing the monitoring capabilities of Zabbix without changing its source code.

You can extend Zabbix functionality either by using built-in extension options (trapper items, user parameters, etc.) or by using or creating custom extensions (loadable modules, plugins, etc.).

This section provides an overview with references to all the options for extending Zabbix.

Data collection with custom commands Trapper items

Trapper items are items that accept incoming data instead of querying for it. Trapper items are useful for sending specific data to Zabbix server or proxy, for example, periodic availability and performance data in the case of long-running user scripts. Sending data to Zabbix server or proxy is possible using the Zabbix sender utility or Zabbix sender protocol. Sending data to Zabbix server is also possible using the `history.push` API method.

External checks

An external check is an item for executing checks by running an executable, for example, a shell script or a binary.

External checks are executed by Zabbix server or proxy (when host is monitored by proxy), and do not require an agent running on the host being monitored.

User parameters

A user parameter is a user-defined command (associated with a user-defined key) that, when executed, can retrieve the data you need from the host where Zabbix agent is running. User parameters are useful for configuring agent or agent 2 items that are not predefined in Zabbix.

`system.run[]` Zabbix agent items

`system.run[]` Zabbix agent item is an item for a user-defined command (associated with a predefined key `system.run[]`, for example, `system.run[myscript.sh]`) that can be executed on the host where Zabbix agent is running.

Note:
`system.run[]` items are disabled by default and, if used, must be enabled (allowed) and defined in the Zabbix agent or Zabbix agent 2 configuration file (`AllowKey` or `AllowKeyRegexp` configuration parameter).

Attention:
User-defined commands in items such as external checks, user parameters and `system.run[]` Zabbix agent items are executed from the OS user that is used to run Zabbix components. To execute these commands, this user must have the necessary permissions.

HTTP agent items

HTTP agent item is an item for executing data requests over HTTP/HTTPS. HTTP agent items are useful for sending requests to HTTP endpoints to retrieve data from services such as *Elasticsearch* and *OpenWeatherMap*, for checking the status of Zabbix API or the status of Apache or NGINX web server, etc. HTTP agent items (with trapping enabled) can also function as trapper items.

Script items

A script item is an item for executing user-defined JavaScript code that retrieves data over HTTP/HTTPS. Script items are useful when the functionality provided by HTTP agent items is not enough. For example, in demanding data collection scenarios that require multiple steps or complex logic, a script item can be configured to make an HTTP call, then process the data received, and then pass the transformed value to a second HTTP call.

Note:
HTTP agent items and script items are supported by Zabbix server and proxy, and do not require an agent running on the host being monitored.

Advanced extensions Loadable modules

Loadable modules, written in C, are a versatile and performance-minded option for extending the functionality of Zabbix components (server, proxy, agent) on UNIX platforms. A loadable module is basically a shared library used by Zabbix daemon and loaded on startup. The library should contain certain functions, so that a Zabbix process may detect that the file is indeed a module it can load and work with.

Loadable modules have a number of benefits, including the ability to add new metrics or implement any other logic (for example, Zabbix history data export), great performance, and the option to develop, use and share the functionality they provide. It contributes to trouble-free maintenance and helps to deliver new functionality easier and independently of the Zabbix core code base.

Loadable modules are especially useful in a complex monitoring setup. When monitoring embedded systems, having a large number of monitored parameters or heavy scripts with complex logic or long startup time, extensions such as user parameters, `system.run[]` Zabbix agent items, and external checks will have an impact on performance. Loadable modules offer a way of extending Zabbix functionality without sacrificing performance.

Plugins

Plugins extend the monitoring capabilities of Zabbix agent 2. Written in the Go programming language, they provide an alternative to loadable modules (written in C).

It is possible to develop your own plugin (independent data collector) for Zabbix agent 2. See Developer center.

Alert customization Webhooks

A webhook is a Zabbix media type that provides an option to extend Zabbix alerting capabilities to external software such as helpdesk systems, chats, or messengers. Similarly to script items, webhooks are useful for making HTTP calls using custom JavaScript code, for example, to push notifications to different platforms such as Microsoft Teams, Discord, and Jira. It is also possible to return some data (for example, about created helpdesk tickets) that is then displayed in Zabbix.

Existing webhooks are available in the Zabbix Git repository. For custom webhook development, see Webhook development guidelines.

Alert scripts

An alert script is a Zabbix media type that provides an option to create an alternative way (script) to handle Zabbix alerts. Alert scripts are useful if you are not satisfied with the existing media types for sending alerts in Zabbix.

Frontend customization Custom themes

It is possible to change Zabbix frontend visual appearance by using custom themes. See the instructions on creating and applying your own themes.

Frontend modules

Frontend modules provide an option to extend Zabbix frontend functionality by adding third-party modules or by developing your own. With frontend modules you can add new menu items, their respective views, actions, etc.

Global scripts A global script is a user-defined set of commands that can be executed on a monitoring target (by shell (/bin/sh) interpreter), depending on the configured scope and user permissions. Global scripts can be configured for the following actions:

- Action operation
- Manual host action
- Manual event action

Global scripts are useful in many cases. For example, if configured for action operations or manual host actions, you can use global scripts to automatically or manually execute remote commands such as restarting an application (web server, middleware, CRM, etc.) or freeing disk space (removing older files, cleaning `/tmp`, etc). Or, another example, if configured for manual event actions, you can use global scripts to manage problem tickets in external systems.

Global scripts can be executed by Zabbix server, proxy or agent.

> **Attention:**
> User-defined commands are executed from the OS user that is used to run Zabbix components. To execute these commands, this user must have the necessary permissions.

Zabbix API Zabbix API is an HTTP-based API that is part of Zabbix frontend. With Zabbix API, you can do any of the following operations:

- Programmatically retrieve and modify the configuration of Zabbix.
- Import and export Zabbix configuration.
- Access Zabbix historical and trend data.
- Configure applications to work with Zabbix.
- Integrate Zabbix with third-party software.
- Automate routine tasks.

Zabbix API consists of a multiplicity of methods that are nominally grouped into separate APIs. Each method performs a specific task. For the available methods, as well as an overview of the functions provided by Zabbix API, see Zabbix API Method reference.

Loadable modules

Overview

Loadable modules offer a performance-minded option for extending Zabbix functionality.

You can extend Zabbix functionality in many ways, for example, with user parameters, external checks, and system.run Zabbix agent items. These work very well, but have one major drawback, namely fork(). Zabbix has to fork a new process every time it handles a user metric, which is not good for performance. It is not a big deal normally, however it could be a serious issue when monitoring embedded systems, having a large number of monitored parameters or heavy scripts with complex logic or long startup time.

Support of loadable modules offers ways for extending Zabbix agent, server and proxy without sacrificing performance.

A loadable module is basically a shared library used by Zabbix daemon and loaded on startup. The library should contain certain functions, so that a Zabbix process may detect that the file is indeed a module it can load and work with.

Loadable modules have a number of benefits. Great performance and ability to implement any logic are very important, but perhaps the most important advantage is the ability to develop, use and share Zabbix modules. It contributes to trouble-free maintenance and helps to deliver new functionality easier and independently of the Zabbix core code base.

Module licensing and distribution in binary form is governed by the AGPL-3.0 license (modules are linking with Zabbix in runtime and are using Zabbix headers; the whole Zabbix code is licensed under AGPL-3.0 license since Zabbix 7.0). Binary compatibility is not guaranteed by Zabbix.

Module API stability is guaranteed during one Zabbix LTS (Long Term Support) release cycle. Stability of Zabbix API is not guaranteed (technically it is possible to call Zabbix internal functions from a module, but there is no guarantee that such modules will work).

Module API

In order for a shared library to be treated as a Zabbix module, it should implement and export several functions. There are currently six functions in the Zabbix module API, only one of which is mandatory and the other five are optional.

Mandatory interface

The only mandatory function is zbx_module_api_version():

```
int zbx_module_api_version(void);
```

This function should return the API version implemented by this module and in order for the module to be loaded this version must match module API version supported by Zabbix. Version of module API supported by Zabbix is ZBX_MODULE_API_VERSION. So this function should return this constant. Old constant ZBX_MODULE_API_VERSION_ONE used for this purpose is now defined to equal ZBX_MODULE_API_VERSION to preserve source compatibility, but it's usage is not recommended.

Optional interface

The optional functions are zbx_module_init(), zbx_module_item_list(), zbx_module_item_timeout(), zbx_module_history_w and zbx_module_uninit():

```
int zbx_module_init(void);
```

This function should perform the necessary initialization for the module (if any). If successful, it should return ZBX_MODULE_OK. Otherwise, it should return ZBX_MODULE_FAIL. In the latter case Zabbix will not start.

```
ZBX_METRIC  *zbx_module_item_list(void);
```

This function should return a list of items supported by the module. Each item is defined in a ZBX_METRIC structure, see the section below for details. The list is terminated by a ZBX_METRIC structure with "key" field of NULL.

```
void    zbx_module_item_timeout(int timeout);
```

If module exports zbx_module_item_list() then this function is used by Zabbix to specify the timeout settings in Zabbix configuration file that the item checks implemented by the module should obey. Here, the "timeout" parameter is in seconds.

```
ZBX_HISTORY_WRITE_CBS   zbx_module_history_write_cbs(void);
```

This function should return callback functions Zabbix server will use to export history of different data types. Callback functions are provided as fields of ZBX_HISTORY_WRITE_CBS structure, fields can be NULL if module is not interested in the history of certain type.

```
int zbx_module_uninit(void);
```

This function should perform the necessary uninitialization (if any) like freeing allocated resources, closing file descriptors, etc.

All functions are called once on Zabbix startup when the module is loaded, with the exception of zbx_module_uninit(), which is called once on Zabbix shutdown when the module is unloaded.

Defining items

Each item is defined in a ZBX_METRIC structure:

```
typedef struct
{
    char        *key;
    unsigned    flags;
    int     (*function)();
    char        *test_param;
}
ZBX_METRIC;
```

Here, **key** is the item key (e.g., "dummy.random"), **flags** is either CF_HAVEPARAMS or 0 (depending on whether the item accepts parameters or not), **function** is a C function that implements the item (e.g., zbx_module_dummy_random), and **test_param** is the parameter list to be used when Zabbix agent is started with the -p flag (e.g., "1,1000", can be NULL). An example definition may look like this:

```
static ZBX_METRIC keys[] =
{
    { "dummy.random", CF_HAVEPARAMS, zbx_module_dummy_random, "1,1000" },
```

```
    { NULL }
}
```

Each function that implements an item should accept two pointer parameters, the first one of type AGENT_REQUEST and the second one of type AGENT_RESULT:

```
int zbx_module_dummy_random(AGENT_REQUEST *request, AGENT_RESULT *result)
{
    ...

    SET_UI64_RESULT(result, from + rand() % (to - from + 1));

    return SYSINFO_RET_OK;
}
```

These functions should return SYSINFO_RET_OK, if the item value was successfully obtained. Otherwise, they should return SYSINFO_RET_FAIL. See example "dummy" module below for details on how to obtain information from AGENT_REQUEST and how to set information in AGENT_RESULT.

Providing history export callbacks

Attention:
History export via module is no longer supported by Zabbix proxy.

Module can specify functions to export history data by type: Numeric (float), Numeric (unsigned), Character, Text and Log:

```
typedef struct
{
    void    (*history_float_cb)(const ZBX_HISTORY_FLOAT *history, int history_num);
    void    (*history_integer_cb)(const ZBX_HISTORY_INTEGER *history, int history_num);
    void    (*history_string_cb)(const ZBX_HISTORY_STRING *history, int history_num);
    void    (*history_text_cb)(const ZBX_HISTORY_TEXT *history, int history_num);
    void    (*history_log_cb)(const ZBX_HISTORY_LOG *history, int history_num);
}
ZBX_HISTORY_WRITE_CBS;
```

Each of them should take history array of history_num elements as arguments. Depending on history data type to be exported, history is an array of the following structures, respectively:

```
typedef struct
{
    zbx_uint64_t    itemid;
    int     clock;
    int     ns;
    double      value;
}
ZBX_HISTORY_FLOAT;

typedef struct
{
    zbx_uint64_t    itemid;
    int     clock;
    int     ns;
    zbx_uint64_t    value;
}
ZBX_HISTORY_INTEGER;

typedef struct
{
    zbx_uint64_t    itemid;
    int     clock;
    int     ns;
    const char  *value;
}
ZBX_HISTORY_STRING;
```

```
typedef struct
{
    zbx_uint64_t    itemid;
    int     clock;
    int     ns;
    const char  *value;
}
ZBX_HISTORY_TEXT;

typedef struct
{
    zbx_uint64_t    itemid;
    int     clock;
    int     ns;
    const char  *value;
    const char  *source;
    int     timestamp;
    int     logeventid;
    int     severity;
}
ZBX_HISTORY_LOG;
```

Callbacks will be used by Zabbix server history syncer processes in the end of history sync procedure after data is written into Zabbix database and saved in value cache.

Attention:
In case of internal error in history export module, it is recommended that module is written in such a way that it does not block whole monitoring until it recovers but discards data instead and allows Zabbix server to continue running.

Building modules

Modules are currently meant to be built inside Zabbix source tree, because the module API depends on some data structures that are defined in Zabbix headers.

The most important header for loadable modules is `include/module.h`, which defines these data structures. Other necessary system headers that help `include/module.h` to work properly are `stdlib.h` and `stdint.h`.

With this information in mind, everything is ready for the module to be built. The module should include `stdlib.h`, `stdint.h` and `module.h`, and the build script should make sure that these files are in the include path. See example "dummy" module below for details.

Another useful header is `include/zbxcommon.h`, which defines `zabbix_log()` function, which can be used for logging and debugging purposes.

Configuration parameters

Zabbix agent, server and proxy support two parameters to deal with modules:

- `LoadModulePath` - full path to the location of loadable modules
- `LoadModule` - module(s) to load at startup.

The modules must be located in a directory specified by `LoadModulePath` or the path must precede the module name. If the preceding path is absolute (starts with /) then `LoadModulePath` is ignored. Multiple `LoadModule` parameters are allowed.

For example, to extend Zabbix agent we could add the following parameters:

```
LoadModulePath=/usr/local/lib/zabbix/agent/
LoadModule=mariadb.so
LoadModule=apache.so
LoadModule=kernel.so
LoadModule=/usr/local/lib/zabbix/dummy.so
```

Upon agent startup it will load the mariadb.so, apache.so and kernel.so modules from the `/usr/local/lib/zabbix/agent` directory while dummy.so will be loaded from `/usr/local/lib/zabbix`. The agent will fail to start if a module is missing, in case of bad permissions or if a shared library is not a Zabbix module.

Frontend configuration

Loadable modules are supported by Zabbix agent, server and proxy. Therefore, item type in Zabbix frontend depends on where the module is loaded. If the module is loaded into the agent, then the item type should be "Zabbix agent" or "Zabbix agent (active)". If the module is loaded into server or proxy, then the item type should be "Simple check".

History export through Zabbix modules does not need any frontend configuration. If the module is successfully loaded by server and provides `zbx_module_history_write_cbs()` function which returns at least one non-NULL callback function then history export will be enabled automatically.

Dummy module

Zabbix includes a sample module written in C language. The module is located under `src/modules/dummy`:

```
alex@alex:~trunk/src/modules/dummy$ ls -l
-rw-rw-r-- 1 alex alex 9019 Apr 24 17:54 dummy.c
-rw-rw-r-- 1 alex alex   67 Apr 24 17:54 Makefile
-rw-rw-r-- 1 alex alex  245 Apr 24 17:54 README
```

The module is well documented, it can be used as a template for your own modules.

After `./configure` has been run in the root of Zabbix source tree as described above, just run `make` in order to build `dummy.so`.

 * Purpose: returns a set of module functions Zabbix will call to export      *
 *          different types of historical data                                *
 *                                                                            *
 * Return value: structure with callback function pointers (can be NULL if    *
 *               module is not interested in data of certain types)           *
 *                                                                            *
 ******************************************************************************/
ZBX_HISTORY_WRITE_CBS   zbx_module_history_write_cbs(void)
{
    static ZBX_HISTORY_WRITE_CBS    dummy_callbacks =
    {
        dummy_history_float_cb,
        dummy_history_integer_cb,
        dummy_history_string_cb,
        dummy_history_text_cb,
        dummy_history_log_cb,
    };
```

```
    return dummy_callbacks;
}
```

The module exports three new items:

- `dummy.ping` - always returns '1'
- `dummy.echo[param1]` - returns the first parameter as it is, for example, `dummy.echo[ABC]` will return ABC
- `dummy.random[param1, param2]` - returns a random number within the range of param1-param2, for example, `dummy.random[1,1000000]`

Limitations

Support of loadable modules is implemented for the Unix platform only. It means that it does not work for Windows agents.

In some cases, a module may need to read module-related configuration parameters from `zabbix_agentd.conf`. It is not supported currently. If you need your module to use some configuration parameters you should probably implement parsing of a module-specific configuration file.

Frontend modules

Overview

It is possible to enhance Zabbix frontend functionality by adding third-party modules or by developing your own modules without the need to change the source code of Zabbix.

Note that the module code will run with the same privileges as Zabbix source code. This means:

- Third-party modules can be harmful. You must trust the modules you are installing.
- Errors in a third-party module code may crash the frontend. If this happens, just remove the module code from the frontend. As soon as you reload Zabbix frontend, you'll see a note saying that some modules are absent. Go to Module administration (in *Administration* > *General* > *Modules*) and click *Scan directory* again to remove non-existent modules from the database.

Installation

Please always read the installation manual for a particular module. It is recommended to install new modules one by one to catch failures easily.

Just before you install a module:

- Make sure you have downloaded the module from a trusted source. Installation of harmful code may lead to consequences, such as data loss.
- Different versions of the same module (same ID) can be installed in parallel, but only a single version can be enabled at once.

Steps to install a module:

- Unpack your module into its own folder in the `modules` directory of the Zabbix frontend installation (for example, `zabbix/ui/modules`).
- Ensure that your module folder contains at least the `manifest.json` file.
- Navigate to Module administration and click the *Scan directory* button.
- New module will appear in the list along with its version, author, description and status.
- Enable module by clicking its status.

Troubleshooting:

Problem	Solution
Module did not appear in the list	If your module didn't appear in the list, make sure `manifest.json` exists in `modules/your-module/`. If it doesn't, you might have unpacked the module to the wrong directory. If it does, the module might not be compatible with your Zabbix version. Also, check that the web server user has at least read and search access (`r-x`) to the module folder and all subdirectories, and read access (`r--`) to all files inside.

Problem	Solution
Frontend crashed	The module code is not compatible with the current Zabbix version or server configuration. Please delete module files and reload the frontend. You'll see a notice that some modules are absent. Go to Module administration and click *Scan directory* again to remove non-existent modules from the database.
Error message about identical namespace, ID or actions appears	New module tried to register a namespace, ID or actions which are already registered by other enabled modules. Disable the conflicting module (mentioned in error message) prior to enabling the new one.
Technical error messages appear	Report errors to the developer of the module.

Developing modules

For information about developing custom modules, see Developer center.

Appendixes

Overview This section contains reference materials, configuration parameters, technical specifications, and procedural guides that support the main manual.

Essential reference

- Installation and setup - database creation, server and agent installation and configuration.
- Process configuration - configuration parameters for Zabbix server, proxy, agent, and more.
- Items - item key reference and supported data types.
- Macros - built-in and user macro syntax and usage.

Installation and setup

This section covers database creation, security configuration, platform-specific setup procedures, and feature configuration.

Please use the sidebar to find the procedure relevant to your environment.

Database creation

Overview

A Zabbix database must be created during the installation of Zabbix server or proxy.

This section provides instructions for creating a Zabbix database. A separate set of instructions is available for each supported database.

> **Note:**
> To improve database security by creating database roles/users with minimal privileges, see database creation best practices for each supported database:

> - MySQL/MariaDB
> - PostgreSQL/TimescaleDB
>
> For configuring secure TLS connections, see Secure connection to the database.

UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings. For switching to UTF-8, see Repairing Zabbix database character set and collation. See also Limits of filtering with utf8mb4 collations.

> **Note:**
> If installing from Zabbix Git repository, you need to run the following command prior to proceeding to the next steps:

 `make dbschema`

MySQL/MariaDB

The utf8mb4 character set with the utf8mb4_bin collation is supported for Zabbix server/proxy to work properly with MySQL/MariaDB databases.
 To avoid future problems, it is strongly recommended to use the utf8mb4 character set with the utf8mb4_bin collation for both new and existing installations. To convert databases using the utf8mb3 character set and utf8mb3_bin collation to utf8mb4 character set and utf8mb4_bin collation, follow the instructions in Repairing Zabbix database character set and collation.

Deterministic triggers need to be created during the import of schema. On MySQL and MariaDB, this requires `GLOBAL log_bin_trust_function_creators = 1` to be set if binary logging is enabled and there is no superuser privileges and `log_bin_trust_function_creators = 1` is not set in MySQL configuration file.

If you are installing Zabbix from packages or containers, see the respective instructions.

If you are installing Zabbix from sources:

- Create and configure a database and a user. For security reasons, use a strong, unique password for the Zabbix database user.

```
mysql -uroot -p<password>

mysql> create database zabbix character set utf8mb4 collate utf8mb4_bin;
mysql> create user 'zabbix'@'localhost' identified by '<password>';
mysql> grant all privileges on zabbix.* to 'zabbix'@'localhost';
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
mysql> quit;
```

- Import the data into the database and set utf8mb4 character set as default (assuming you are in the root directory of Zabbix sources). For a Zabbix proxy database, only `schema.sql` should be imported (no images.sql nor data.sql).

```
cd database/mysql
mysql -uzabbix -p<password> zabbix < schema.sql
#### stop here if you are creating database for Zabbix proxy
mysql -uzabbix -p<password> zabbix < images.sql
mysql -uzabbix -p<password> --default-character-set=utf8mb4 zabbix < data.sql
```

`log_bin_trust_function_creators` can be disabled after the schema has been successfully imported:

```
mysql -uroot -p<password>

mysql> SET GLOBAL log_bin_trust_function_creators = 0;
mysql> quit;
```

PostgreSQL

You need to have database user with permissions to create database objects.

If you are installing Zabbix from packages or containers, see the respective instructions.

If you are installing Zabbix from sources:

- Create a database user.

The following shell command will create user `zabbix`. Specify a password when prompted and repeat the password (note, you may first be asked for sudo password):

```
sudo -u postgres createuser --pwprompt zabbix
```

- Create a database.

The following shell command will create the database `zabbix` (last parameter) with the previously created user as the owner (`-O zabbix`).

```
sudo -u postgres createdb -O zabbix -E Unicode -T template0 zabbix
```

- Import the initial schema and data (assuming you are in the root directory of Zabbix sources). For a Zabbix proxy database, only `schema.sql` should be imported (no images.sql nor data.sql).

```
cd database/postgresql
cat schema.sql | sudo -u zabbix psql zabbix
#### stop here if you are creating database for Zabbix proxy
cat images.sql | sudo -u zabbix psql zabbix
cat data.sql | sudo -u zabbix psql zabbix
```

Attention:
The above commands are provided as an example that will work in most of GNU/Linux installations. You can use different commands depending on how your system/database is configured, for example:

 `psql -U <username>`

 If you have any trouble setting up the database, please consult your Database administrator.

TimescaleDB

Instructions for creating and configuring TimescaleDB are provided in a separate section.

Elasticsearch and ClickHouse

Zabbix can also store history data in Elasticsearch or ClickHouse. For setup instructions, see the linked pages.

SQLite

Using SQLite is supported for **Zabbix proxy** only!

The database will be automatically created if it does not exist.

Return to the installation section.

Repairing Zabbix database character set and collation

MySQL/MariaDB

Historically, MySQL and derivatives used 'utf8' as an alias for utf8mb3 - MySQL's own 3-byte implementation of the standard UTF8, which is 4-byte. Starting from MySQL 8.0.28 and MariaDB 10.6.1, the 'utf8mb3' character set is deprecated and at some point its support will be dropped while 'utf8' will become a reference to 'utf8mb4'. Since Zabbix 6.0, 'utf8mb4' is supported. To avoid future problems, it is highly recommended to use 'utf8mb4'. Another advantage of switching to 'utf8mb4' is support of supplementary Unicode characters.

Warning:
As versions before Zabbix 6.0 are not aware of utf8mb4, make sure to first upgrade Zabbix server and DB schema to 6.0.x or later before executing utf8mb4 conversion.

1. Check the database character set and collation.

For example:

```
mysql> SELECT @@character_set_database, @@collation_database;
+--------------------------+----------------------+
| @@character_set_database | @@collation_database |
+--------------------------+----------------------+
| latin2                   | latin2_general_ci    |
+--------------------------+----------------------+
```

Or:

```
mysql> SELECT @@character_set_database, @@collation_database;
+--------------------------+----------------------+
| @@character_set_database | @@collation_database |
+--------------------------+----------------------+
| utf8                     | utf8_bin             |
+--------------------------+----------------------+
```

As we see, the character set here is not 'utf8mb4' and collation is not 'utf8mb4_bin', so we need to fix them.

2. Stop Zabbix.

3. Create a backup copy of the database!

4. Fix the character set and collation on database level:

```
alter database <your DB name> character set utf8mb4 collate utf8mb4_bin;
```

Fixed values:

```
mysql> SELECT @@character_set_database, @@collation_database;
+--------------------------+----------------------+
| @@character_set_database | @@collation_database |
+--------------------------+----------------------+
```

```
| utf8mb4                    | utf8mb4_bin          |
+----------------------------+----------------------+
```

5. Load the script to fix character set and collation on table and column level:

```
mysql <your DB name> < utf8mb4_convert.sql
```

6. Execute the script:

```
                SET @ZABBIX_DATABASE = '<your DB name>';
If MariaDB →    set innodb_strict_mode = OFF;
                CALL zbx_convert_utf8();
If MariaDB →    set innodb_strict_mode = ON;
                drop procedure zbx_convert_utf8;
```

Please note that 'utf8mb4' is expected to consume slightly more disk space.

7. If no errors - you may want to create a database backup copy with the fixed database.

8. Start Zabbix.

Database upgrade to primary keys

Overview

This section provides instructions for manually upgrading tables in existing installations to primary keys.

Upgrading to primary keys optimizes how data is indexed and accessed, which may speed up queries and save space. It also improves data management and synchronization in clustered setups, helping with scaling and ensuring the system remains reliable even if some servers fail.

> **Attention:**
> The instructions provided on this page are designed for advanced users and may need to be adjusted for your specific configuration. Upgrading to primary keys can be time-consuming and resource-intensive. Ensure that enough free disk space is available; depending on your database size and stored data, the process may require up to 2.5 times the space currently used by history tables.

Primary keys are used for all tables in new installations since Zabbix 6.0.

There is no automatic database upgrade to primary keys; however, existing installations may be upgraded manually **after** upgrading Zabbix server to 6.0 or newer.

> **Attention:**
> Since Zabbix 7.0, upgrading tables to primary keys also upgrades tables to use double precision data types.

 If you have Zabbix 7.0 (or later), tables already use double precision. However, the instructions on this page can still be followed to upgrade tables to primary keys without affecting tables that already use double precision.

 If you have Zabbix 6.4 (or earlier), consider upgrading tables to double precision first. For more information, see Upgrading to numeric values of extended range in Zabbix 7.0 documentation.

Instructions are available for:

- MariaDB/MySQL
- PostgreSQL
- TimescaleDB

Important notes

To perform the database upgrade:

1. Stop Zabbix server.

Stopping Zabbix server for the time of the upgrade is strongly recommended. However, if absolutely necessary, you can perform the upgrade while the server is running (only for MySQL, MariaDB, and PostgreSQL without TimescaleDB).

2. Back up your database.
3. Install the latest zabbix-sql-scripts package compatible with your Zabbix version (e.g., for RHEL: `dnf install zabbix-sql-scripts`).
4. Run the scripts for your database.
5. Start Zabbix server.

Warning:
Run the scripts for the server database only. The proxy will not benefit from this upgrade.

If the database uses partitions, contact the DB administrator or Zabbix Support for help.

CSV files can be removed after a successful upgrade to primary keys.

Optionally, Zabbix frontend may be switched to maintenance mode.

MariaDB/MySQL

Export and import must be performed in tmux/screen to ensure that the session isn't dropped.

See also: Important notes

MySQL 8.4+ with mysqlsh

This method can be used with a running Zabbix server, but it is recommended to stop the server for the time of the upgrade. The MySQL Shell (*mysqlsh*) must be installed and able to connect to the DB.

- Log in to MySQL console as root (recommended) or as any user with FILE privileges.
- Start MySQL with the local_infile variable enabled.
- Rename old tables and create new tables by running `history_upgrade_prepare.sql`.

```
mysql -uzabbix -p<password> zabbix < /usr/share/zabbix/sql-scripts/mysql/option-patches/history_upgrade_pr
```

- Export and import data.

Connect via mysqlsh. If using a socket connection, specifying the path might be required.

```
sudo mysqlsh -uroot -S /run/mysqld/mysqld.sock --no-password -Dzabbix
```

Switch into JavaScript mode using:

```
\js
```

Then run the code below (CSVPATH can be changed as needed):

```
CSVPATH="/var/lib/mysql-files";

util.exportTable("history_old", CSVPATH + "/history.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history.csv", {"dialect": "csv", "table": "history" });

util.exportTable("history_uint_old", CSVPATH + "/history_uint.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_uint.csv", {"dialect": "csv", "table": "history_uint" });

util.exportTable("history_str_old", CSVPATH + "/history_str.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_str.csv", {"dialect": "csv", "table": "history_str" });

util.exportTable("history_log_old", CSVPATH + "/history_log.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_log.csv", {"dialect": "csv", "table": "history_log" });

util.exportTable("history_text_old", CSVPATH + "/history_text.csv", { dialect: "csv" });
util.importTable(CSVPATH + "/history_text.csv", {"dialect": "csv", "table": "history_text" });
```

If you receive the message "JavaScript is not supported", your MySQL Shell installation lacks JS support. In that case, install the official MySQL Shell package from Oracle (or build it from source) so that JavaScript mode is enabled.

- Follow post-migration instructions to drop the old tables.

MariaDB/MySQL 8.4+ without mysqlsh

This upgrade method takes more time and should be used only if an upgrade with *mysqlsh* is not possible.

Table upgrade

- Log in to MySQL console as root (recommended) or any user with FILE privileges.
- If performing migration with a running Zabbix server, start MySQL with the local_infile variable enabled.
- Rename old tables and create new tables by running `history_upgrade_prepare.sql`:

```
mysql -uzabbix -p<password> zabbix < /usr/share/zabbix/sql-scripts/mysql/option-patches/history_upgrade_pr
```

Migration with stopped server

`max_execution_time` (in MySQL) or `max_statement_time` (in MariaDB) must be disabled before migrating data to avoid time-out during migration.

For MySQL:

```
SET @@max_execution_time=0;
```

For MariaDB:

```
SET @@max_statement_time=0;
```

```
INSERT IGNORE INTO history SELECT * FROM history_old;
INSERT IGNORE INTO history_uint SELECT * FROM history_uint_old;
INSERT IGNORE INTO history_str SELECT * FROM history_str_old;
INSERT IGNORE INTO history_log SELECT * FROM history_log_old;
INSERT IGNORE INTO history_text SELECT * FROM history_text_old;
```

Follow post-migration instructions to drop the old tables.

Migration with running server

Check for which paths import/export is enabled:

```
mysql> SELECT @@secure_file_priv;
+-----------------------+
| @@secure_file_priv    |
+-----------------------+
| /var/lib/mysql-files/ |
+-----------------------+
```

If *secure_file_priv* value is a path to a directory, export/import will be performed for files in that directory. In this case, edit paths to files in queries accordingly or set the *secure_file_priv* value to an empty string for the upgrade time.

If *secure_file_priv* value is empty, export/import can be performed from any location.

If *secure_file_priv* value is NULL, set it to the path that contains exported table data ('/var/lib/mysql-files/' in the example above).

For more information, see MySQL documentation or MariaDB documentation.

`max_execution_time` (in MySQL) or `max_statement_time` (in MariaDB) must be disabled before exporting data to avoid time-out during export.

For MySQL:

```
SET @@max_execution_time=0;
```

For MariaDB:

```
SET @@max_statement_time=0;
```

```
SELECT * INTO OUTFILE '/var/lib/mysql-files/history.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES TER
LOAD DATA INFILE '/var/lib/mysql-files/history.csv' IGNORE INTO TABLE history FIELDS TERMINATED BY ',' ESC

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_uint.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINE
LOAD DATA INFILE '/var/lib/mysql-files/history_uint.csv' IGNORE INTO TABLE history_uint FIELDS TERMINATED

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_str.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES
LOAD DATA INFILE '/var/lib/mysql-files/history_str.csv' IGNORE INTO TABLE history_str FIELDS TERMINATED BY

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_log.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINES
LOAD DATA INFILE '/var/lib/mysql-files/history_log.csv' IGNORE INTO TABLE history_log FIELDS TERMINATED BY

SELECT * INTO OUTFILE '/var/lib/mysql-files/history_text.csv' FIELDS TERMINATED BY ',' ESCAPED BY '"' LINE
LOAD DATA INFILE '/var/lib/mysql-files/history_text.csv' IGNORE INTO TABLE history_text FIELDS TERMINATED
```

Follow post-migration instructions to drop the old tables.

PostgreSQL

Export and import must be performed in tmux/screen to ensure that the session isn't dropped. For installations with TimescaleDB, skip this section and proceed to PostgreSQL + TimescaleDB.

See also: Important notes

Table upgrade

- Rename tables using `history_upgrade_prepare.sql`:

```
sudo -u zabbix psql zabbix < /usr/share/zabbix/sql-scripts/postgresql/option-patches/history_upgrade_prepa
```

Migration with stopped server

- Export current history, import it to the temp table, then insert the data into new tables while ignoring duplicates:

```
INSERT INTO history SELECT * FROM history_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_uint SELECT * FROM history_uint_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_str SELECT * FROM history_str_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_log SELECT * FROM history_log_old ON CONFLICT (itemid,clock,ns) DO NOTHING;

INSERT INTO history_text SELECT * FROM history_text_old ON CONFLICT (itemid,clock,ns) DO NOTHING;
```

See tips for improving INSERT performance: PostgreSQL: Bulk Loading Huge Amounts of Data, Checkpoint Distance and Amount of WAL.

- Follow post-migration instructions to drop the old tables.

Migration with running server

- Export current history, import it to the temp table, then insert the data into new tables while ignoring duplicates:

```
\copy history_old TO '/tmp/history.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history (
    itemid                   bigint                                  NOT NULL,
    clock                    integer         DEFAULT '0'             NOT NULL,
    value                    DOUBLE PRECISION DEFAULT '0.0000'        NOT NULL,
    ns                       integer         DEFAULT '0'             NOT NULL
);
\copy temp_history FROM '/tmp/history.csv' DELIMITER ',' CSV
INSERT INTO history SELECT * FROM temp_history ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_uint_old TO '/tmp/history_uint.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_uint (
    itemid                   bigint                                  NOT NULL,
    clock                    integer         DEFAULT '0'             NOT NULL,
    value                    numeric(20)     DEFAULT '0'             NOT NULL,
    ns                       integer         DEFAULT '0'             NOT NULL
);
\copy temp_history_uint FROM '/tmp/history_uint.csv' DELIMITER ',' CSV
INSERT INTO history_uint SELECT * FROM temp_history_uint ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_str_old TO '/tmp/history_str.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_str (
    itemid                   bigint                                  NOT NULL,
    clock                    integer         DEFAULT '0'             NOT NULL,
    value                    varchar(255)    DEFAULT ''              NOT NULL,
    ns                       integer         DEFAULT '0'             NOT NULL
);
\copy temp_history_str FROM '/tmp/history_str.csv' DELIMITER ',' CSV
INSERT INTO history_str (itemid,clock,value,ns) SELECT * FROM temp_history_str ON CONFLICT (itemid,clock,n

\copy history_log_old TO '/tmp/history_log.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_log (
    itemid                   bigint                                  NOT NULL,
    clock                    integer         DEFAULT '0'             NOT NULL,
```

```
    timestamp                integer         DEFAULT '0'               NOT NULL,
    source                   varchar(64)     DEFAULT ''                NOT NULL,
    severity                 integer         DEFAULT '0'               NOT NULL,
    value                    text            DEFAULT ''                NOT NULL,
    logeventid               integer         DEFAULT '0'               NOT NULL,
    ns                       integer         DEFAULT '0'               NOT NULL
);
\copy temp_history_log FROM '/tmp/history_log.csv' DELIMITER ',' CSV
INSERT INTO history_log SELECT * FROM temp_history_log ON CONFLICT (itemid,clock,ns) DO NOTHING;

\copy history_text_old TO '/tmp/history_text.csv' DELIMITER ',' CSV
CREATE TEMP TABLE temp_history_text (
    itemid                   bigint                                    NOT NULL,
    clock                    integer         DEFAULT '0'               NOT NULL,
    value                    text            DEFAULT ''                NOT NULL,
    ns                       integer         DEFAULT '0'               NOT NULL
);
\copy temp_history_text FROM '/tmp/history_text.csv' DELIMITER ',' CSV
INSERT INTO history_text SELECT * FROM temp_history_text ON CONFLICT (itemid,clock,ns) DO NOTHING;
```

- Follow post-migration instructions to drop the old tables.

PostgreSQL + TimescaleDB

Export and import must be performed in tmux/screen to ensure that the session isn't dropped. Zabbix server should be down during the upgrade.

See also: Important notes

- Rename tables using `history_upgrade_prepare.sql`.
  - If compression is enabled (on default installation), run the script from /usr/share/zabbix/sql-scripts/postgresql/times

    ```
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_
    ```

  - If compression is disabled, run the script from /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-pat

    ```
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/histo
    ```

- Run TimescaleDB hypertable migration scripts based on compression settings:
  - If compression is enabled (on default installation), run scripts from /usr/share/zabbix/sql-scripts/postgresql/timesca

    ```
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/history_
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/with-compression/trends_u
    ```

  - If compression is disabled, run scripts from /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patch

    ```
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/histo
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/histo
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/histo
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/histo
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/histo
    cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/option-patches/without-compression/trend
    ```

See also: Tips for improving INSERT performance.

- Follow post-migration instructions to drop the old tables.

Post-migration

For all databases, once the migration is completed, do the following:

- Verify that everything works as expected.
- Drop old tables:

```
DROP TABLE history_old;
DROP TABLE history_uint_old;
DROP TABLE history_str_old;
```

```
DROP TABLE history_log_old;
DROP TABLE history_text_old;
```

- For TimescaleDB, also drop the following old table:

```
DROP TABLE trends_old;
```

See also

- Preparing auditlog table for partitioning

Preparing auditlog table for partitioning

Overview

Some databases (for example, MySQL) require the partitioning column to be part of the table's unique constraint. Therefore, to partition the `auditlog` table by time, the primary key must be changed from `auditid` to a composite key `auditid` + `clock`.

This section provides instructions for altering the primary key of the `auditlog` table.

> **Attention:**
> The instructions provided on this page are designed for advanced users. Note that these instructions might need to be adjusted for your specific configuration. Altering the primary key can also be incompatible with future upgrade patches, so manually handling future upgrades may be necessary.

 Altering the primary key can be a resource-intensive operation that takes a lot of time depending on the `auditlog` table size. Stopping Zabbix server and switching Zabbix frontend to maintenance mode for the time of the alteration is recommended. However, if absolutely necessary, there is a way to alter the primary key without downtime (see below).

Partitioning the `auditlog` table can improve, for example, housekeeping in large setups. Although Zabbix housekeeping currently cannot take advantage of partitioned tables (except for TimescaleDB), you can disable Zabbix housekeeping and delete partitions using scripts.

Since Zabbix 7.0, the `auditlog` table for TimescaleDB has been converted to a hypertable, which allows the housekeeper to drop data by chunks. To upgrade the existing `auditlog` table to a hypertable, see Upgrading TimescaleDB schema.

MySQL

Important notes on rebuilding indexes

MySQL automatically rebuilds indexes for the primary key during the `ALTER TABLE` operation. However, it is highly recommended to also manually rebuild indexes with the `OPTIMIZE TABLE` statement to ensure optimal database performance.

Rebuilding indexes may temporarily require as much additional disk space as the table itself uses. To obtain the current size of data and indexes, you can execute the following statements:

```
ANALYZE TABLE auditlog;
SHOW TABLE STATUS LIKE 'auditlog';
```

If the available disk space is a concern, follow the Altering primary key without downtime instructions. Other options are also available:

- Increasing the `sort_buffer_size` MySQL parameter may help to reduce disk space usage when manually rebuilding indexes. However, modifying this variable may impact overall memory usage of the database.
- Consider freeing up space by deleting potentially unnecessary data.
- Consider decreasing the *Data storage period* housekeeper parameter before executing the housekeeper.

Altering primary key with downtime

1. Drop the current `auditlog` table primary key and add the new primary key.

```
ALTER TABLE auditlog DROP PRIMARY KEY, ADD PRIMARY KEY (auditid, clock);
```

2. Rebuild indexes (optional but highly recommended, see Important notes on rebuilding indexes).

```
OPTIMIZE TABLE auditlog;
```

Altering primary key without downtime

Manual method of altering the primary key is described here. Alternatively, you can use the pt-online-schema-change toolkit from Percona. This toolkit performs the following actions automatically, while also minimizing the space used for altering the `auditlog` table.

1. Create a new table with the new primary key and create indexes.

```
CREATE TABLE `auditlog_new` (
  `auditid`            varchar(25)                             NOT NULL,
  `userid`             bigint unsigned                         NULL,
  `username`           varchar(100)    DEFAULT ''              NOT NULL,
  `clock`              integer         DEFAULT '0'             NOT NULL,
  `ip`                 varchar(39)     DEFAULT ''              NOT NULL,
  `action`             integer         DEFAULT '0'             NOT NULL,
  `resourcetype`       integer         DEFAULT '0'             NOT NULL,
  `resourceid`         bigint unsigned                         NULL,
  `resource_cuid`      varchar(25)                             NULL,
  `resourcename`       varchar(255)    DEFAULT ''              NOT NULL,
  `recordsetid`        varchar(25)                             NOT NULL,
  `details`            longtext                                NOT NULL,
  PRIMARY KEY (auditid,clock)
) ENGINE=InnoDB;
CREATE INDEX `auditlog_1` ON `auditlog_new` (`userid`,`clock`);
CREATE INDEX `auditlog_2` ON `auditlog_new` (`clock`);
CREATE INDEX `auditlog_3` ON `auditlog_new` (`resourcetype`,`resourceid`);
```

2. Swap tables.

```
RENAME TABLE auditlog TO auditlog_old, auditlog_new TO auditlog;
```

3. Copy data from the old table to the new table.

```
INSERT INTO auditlog SELECT * FROM auditlog_old;
```

This can be done in chunks (multiple `INSERT INTO` statements with `WHERE clock` clauses as needed) to avoid excessive resource usage.

4. Drop the old table.

```
DROP TABLE auditlog_old;
```

PostgreSQL

Important notes on rebuilding indexes

PostgreSQL automatically rebuilds indexes for the primary key during the `ALTER TABLE` operation. However, it is highly recommended to also manually rebuild indexes with the `REINDEX TABLE CONCURRENTLY` statement to ensure optimal database performance.

Rebuilding indexes may temporarily require up to three times of disk space currently used by indexes. To obtain the current size of indexes, you can execute the following query:

```
SELECT pg_size_pretty(pg_indexes_size('auditlog'));
```

If the available disk space is a concern, follow the Altering primary key without downtime instructions. Other options are also available:

- Increasing the `maintenance_work_mem` PostgreSQL parameter may help to reduce disk space usage when manually rebuilding indexes. However, modifying this variable may impact overall memory usage of the database.
- If you have another disk or tablespace with more available space, you might consider changing the temporary storage location for the index rebuild. You can set the `temp_tablespaces` PostgreSQL parameter to specify a different tablespace for temporary objects.
- Consider freeing up space by deleting potentially unnecessary data.
- Consider decreasing the *Data storage period* housekeeper parameter before executing the housekeeper.

Altering primary key with downtime

1. Drop the current `auditlog` table primary key and add the new primary key.

```
ALTER TABLE auditlog DROP CONSTRAINT auditlog_pkey;
ALTER TABLE auditlog ADD PRIMARY KEY (auditid,clock);
```

2. Rebuild indexes (optional but highly recommended, see Important notes on rebuilding indexes).

```
REINDEX TABLE CONCURRENTLY auditlog;
```

Altering primary key without downtime

Manual method of altering the primary key is described here. Alternatively, the `pg_repack` extension can be considered for creating a new table, copying data, and swapping tables.

1. Create a new table with the new primary key and create indexes.

```
CREATE TABLE auditlog_new (
  auditid               varchar(25)                             NOT NULL,
  userid                bigint                                  NULL,
  username              varchar(100)    DEFAULT ''              NOT NULL,
  clock                 integer         DEFAULT '0'             NOT NULL,
  ip                    varchar(39)     DEFAULT ''              NOT NULL,
  action                integer         DEFAULT '0'             NOT NULL,
  resourcetype          integer         DEFAULT '0'             NOT NULL,
  resourceid            bigint                                  NULL,
  resource_cuid         varchar(25)                             NULL,
  resourcename          varchar(255)    DEFAULT ''              NOT NULL,
  recordsetid           varchar(25)                             NOT NULL,
  details               text            DEFAULT ''              NOT NULL,
  PRIMARY KEY (auditid,clock)
);
CREATE INDEX auditlog_new_1 ON auditlog_new (userid,clock);
CREATE INDEX auditlog_new_2 ON auditlog_new (clock);
CREATE INDEX auditlog_new_3 ON auditlog_new (resourcetype,resourceid);
```

2. Swap tables.

```
ALTER TABLE auditlog RENAME TO auditlog_old;
ALTER TABLE auditlog_new RENAME TO auditlog;
```

3. Copy data from the old table to the new table.

```
INSERT INTO auditlog SELECT * FROM auditlog_old;
```

This can be done in chunks (multiple `INSERT INTO` statements with `WHERE clock` clauses as needed) to avoid excessive resource usage.

4. Drop the old table.

```
DROP TABLE auditlog_old;
```

- Database upgrade to primary keys

TimescaleDB setup

Overview

Zabbix supports TimescaleDB, a PostgreSQL-based database solution of automatically partitioning data into time-based chunks to support faster performance at scale.

> **Warning:**
> Currently, TimescaleDB is not supported by Zabbix proxy.

Instructions on this page can be used for the following scenarios:

- Creating a TimescaleDB database or migrating from existing PostgreSQL tables to TimescaleDB (see Configuration).
- Upgrading an existing TimescaleDB database schema when upgrading Zabbix (see Upgrading TimescaleDB schema).

Configuration

Pre-requisites: TimescaleDB extension of a supported version installed on the database server. For installation instructions, see TimescaleDB documentation.

> **Warning:**
> Before installing TimescaleDB, install a supported PostgreSQL release from the official PostgreSQL repository.

Enable TimescaleDB extension for the specific database by executing:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb CASCADE;" | sudo -u postgres psql zabbix
```

Running this command requires database administrator privileges.

Note:
If you use a database schema other than 'public' you need to add a SCHEMA clause to the command above. E.g.:
 echo "CREATE EXTENSION IF NOT EXISTS timescaledb SCHEMA yourschema CASCADE;" | sudo -u postgres psql zabbix

Then run the `postgresql/timescaledb/schema.sql` script. For new installations, the script must be run after the regular PostgreSQL database has been created with initial schema/data (see database creation).

```
cat /usr/share/zabbix/sql-scripts/postgresql/timescaledb/schema.sql | sudo -u zabbix psql zabbix
```

Attention:
Please ignore warning messages informing that the best practices are not followed while running `schema.sql` script on TimescaleDB version 2.9.0 and higher. Regardless of this warning, the configuration will be completed successfully.

The migration of existing history, trends and audit log data may take a lot of time. Zabbix server and frontend must be down for the period of migration.

The `schema.sql` script sets the following housekeeping parameters:

- Override item history period
- Override item trend period

In order to use partitioned housekeeping for history and trends, both these options must be enabled. It is also possible to enable override individually either for history only or trends only.

For PostgreSQL and TimescaleDB, the `postgresql/timescaledb/schema.sql` script sets two additional parameters:

- Enable compression
- Compress records older than 7 days

To successfully remove compressed data by housekeeper, both *Override item history period* and *Override item trend period* options must be enabled. If override is disabled and tables have compressed chunks, the housekeeper will not remove data from these tables, and warnings about incorrect configuration will be displayed in the *Housekeeping* and *System information* sections.

All of these parameters can be changed in *Administration* > *Housekeeping* after the installation.

Note:
You may want to run the timescaledb-tune tool provided by TimescaleDB to optimize PostgreSQL configuration parameters in your `postgresql.conf`.

Upgrading TimescaleDB schema

When upgrading Zabbix to a version that contains new TimescaleDB hypertables, Zabbix server does not automatically configure those hypertables (for example, when upgrading from Zabbix 6.4 to 8.0, as versions 7.0.0 and 7.0.2 have introduced new hypertables).

To configure new TimescaleDB hypertables, follow these steps:

1. Start Zabbix server; this upgrades the existing database.
2. Check the server log file that the database upgrade is completed; when completed, stop Zabbix server. Note that the server logs a warning if it attempts to enable compression for a table that is not a hypertable.
3. Run the `postgresql/timescaledb/schema.sql` script; this configures the new TimescaleDB hypertables. Note that, since Zabbix 7.0.0, the script's location and name have changed from `postgresql/timescaledb.sql` to `postgresql/timescaledb/schema.sql`.

Attention:
Please ignore warning messages informing that the best practices are not followed while running `schema.sql` script on TimescaleDB version 2.9.0 and higher. Regardless of this warning, the configuration will be completed successfully.

TimescaleDB compression

Native TimescaleDB compression is supported for all Zabbix tables that are TimescaleDB hypertables. During the upgrade or migration to TimescaleDB, initial compression of the large tables may take a lot of time.

Note that compression is supported under the "timescale" Timescale Community license and it is not supported under "apache" Apache 2.0 license. If Zabbix detects that compression is not supported a warning message is written into the Zabbix server log and users cannot enable compression in the frontend.

Note:
Users are encouraged to get familiar with compression in TimescaleDB documentation before using compression.

Note that there are certain limitations imposed by compression, specifically:

- Compressed chunk modifications (inserts, deletes, updates) are not allowed
- Schema changes for compressed tables are not allowed.

Compression settings can be changed in the *History, trends and audit log compression* block in *Administration > Housekeeping* section of Zabbix frontend.

Parameter	Default	Comments
Enable compression	Enabled	Checking or unchecking the checkbox does not activate/deactivate compression immediately. Because compression is handled by the Housekeeper, the changes will take effect in up to 2 times `HousekeepingFrequency` hours (set in `zabbix_server.conf`) After disabling compression, new chunks that fall into the compression period will not be compressed. However, all previously compressed data will stay compressed. To uncompress previously compressed chunks, follow the instructions in TimescaleDB documentation. When upgrading from older versions of Zabbix with TimescaleDB support, compression will not be enabled by default.
Compress records older than	7d	This parameter cannot be less than 7 days. Due to immutability of compressed chunks all late data (e.g., data delayed by a proxy) that is older than this value will be discarded.

For better trend update performance, you may want to lower the "chunk_time_interval" for `trends` and `trends_uint` tables from 30 days to 7 days or less depending on how many items use trends. The purpose of this setting is to adhere to TimescaleDB's best practices and to ensure that the chunk size remains within the system's available resources.

Elasticsearch setup

Zabbix can store history data in Elasticsearch as an alternative to a relational database.

Attention:
The support of Elasticsearch is currently experimental.

This guide covers the setup for the supported versions of Elasticsearch. If you're using a different version, some functionality may not work as intended.

Elasticsearch can store the following value types:

Item value type	Database table	Elasticsearch type
Numeric (unsigned)	history_uint	uint
Numeric (float)	history	dbl
Character	history_str	str
Log	history_log	log
Text	history_text	text
Binary	history_bin	not supported by Zabbix
JSON	history_json	json

Note:
Elasticsearch does not accept JSON arrays. A JSON value must be either a single object, or a set of objects.

Important notes

- Elasticsearch requires libcurl. See requirements for details.
- The housekeeper does not delete data from Elasticsearch. To control how long data is kept, see Index Lifecycle Management.
- Zabbix does **not** calculate or store trends in Elasticsearch. Consider extending the history storage period to preserve older data.
- When Elasticsearch is used, range queries retrieving values from the database are limited by the timestamp of the data storage period.
- Elasticsearch is not supported for Zabbix proxies.

If Elasticsearch isn't installed yet, refer to the official installation guide before proceeding.

Configuring Elasticsearch

To store history data in Elasticsearch, you need to:

- Create an index for each value type you want to store—this is where Elasticsearch stores the data, similar to a table in a relational database.
- Define a mapping for each index—this defines the structure of the data, similar to a table schema.
- Set up an ingest pipeline to process values before storage (required for JSON values and date-based indices).

Elasticsearch can store data in a single index per value type, or across multiple date-based indices. Both approaches are described below.

Storing history in a single index

In this approach, all history data for a given value type is written to a single index (e.g., `uint` or `text`).

To create an index for the *Numeric (unsigned)* value type, send the following request (with `/uint` in the URL) to your Elasticsearch instance:

```
curl -X PUT \
 http://localhost:9200/uint \
 -H 'content-type:application/json' \
 -d '{
     "settings": {
      "index": {
         "number_of_replicas": 1,
         "number_of_shards": 5
      }
   },
   "mappings": {
      "properties": {
         "itemid": { "type": "long" },
         "clock": { "format": "epoch_second", "type": "date" },
         "value": { "type": "long" }
      }
   }
}'
```

Elasticsearch will respond with a confirmation that the index was created:

```
{"acknowledged": true, "shards_acknowledged": true, "index": "uint"}
```

Similar requests must be sent for each additional value type you want to store in Elasticsearch.

> **Note:**
> Mappings for all value types are available in the Zabbix source repository.

For example, to create an index for the *Text* value type:

```
curl -X PUT \
 http://localhost:9200/text \
 -H 'content-type:application/json' \
 -d '{
   "settings": {
      "index": {
         "number_of_replicas": 1,
         "number_of_shards": 5
```

```
      }
   },
   "mappings": {
      "properties": {
         "itemid": { "type": "long" },
         "clock": { "format": "epoch_second", "type": "date" },
         "value": {
            "fields": {
               "analyzed": { "index": true, "type": "text", "analyzer": "standard" }
            },
            "index": false,
            "type": "text"
         }
      }
   }
}'
```

JSON value type

Unlike other value types, JSON values require additional processing before storage.

The index below uses separate fields for parsed and raw values, so an ingest pipeline is needed to parse each value as JSON and store it in the correct field.

To create an index for the *JSON* value type, send the following request (with `/json` in the URL) to your Elasticsearch instance.

```
curl -X PUT \
 http://localhost:9200/json \
 -H 'content-type:application/json' \
 -d '{
   "settings": {
      "number_of_shards": 5,
      "number_of_replicas": 1
   },
   "mappings": {
      "dynamic": false,
      "properties": {
         "itemid": { "type": "long" },
         "clock": { "type": "date", "format": "epoch_second" },
         "ns": { "type": "long" },
         "value_parsed": { "type": "flattened" },
         "value_raw": { "type": "keyword", "ignore_above": 1000000 }
    }
  }
}'
```

Then, create the ingest pipeline:

```
curl -X PUT \
 http://localhost:9200/_ingest/pipeline/json \
 -H 'content-type:application/json' \
 -d '{
   "processors": [
      {
         "json": {
            "field": "value",
            "target_field": "value_parsed",
            "ignore_failure": true
         }
      },
      {
         "set": {
            "if": "ctx.value_parsed == null",
            "field": "value_raw",
            "value": "{{{ value }}}"
         }
```

```
      }
   ],
   "on_failure": [
      {
         "set": {
            "field": "value_raw",
            "value": "{{{ value }}}"
         }
      }
   ]
}'
```

Elasticsearch will respond with a confirmation that the ingest pipeline was created:

```
{"acknowledged": true}
```

Storing history in date-based indices

Instead of writing all history data to a single index (e.g., `uint`), Elasticsearch can distribute this data across multiple date-based indices (e.g., `uint-2026-01-01`, `uint-2026-01-02`). This makes it easier to manage data volume and retention over time.

To enable this, you need to:

- Create an index template for each value type you want to store—this tells Elasticsearch what mapping to apply when it automatically creates a new date-based index.
- Create an ingest pipeline for each value type—it processes each incoming value and routes it to the correct date-based index.

Index templates

To create a template for the `text` index, send a request with the following details:

- Use `_template/text_template` in the URL of your Elasticsearch instance.
- Use `"text*"` in the `"index_patterns"` field to match the index name.
- Use a mapping for the `text` value type (see mappings in the Zabbix source repository).

```
curl -X PUT \
 http://localhost:9200/_template/text_template \
 -H 'content-type:application/json' \
 -d '{
   "index_patterns": [ "text*" ],
   "settings": {
      "index": {
         "number_of_replicas": 1,
         "number_of_shards": 5
      }
   },
   "mappings": {
      "properties": {
         "itemid": { "type": "long" },
         "clock": { "format": "epoch_second", "type": "date" },
         "value": {
            "fields": {
               "analyzed": { "index": true, "type": "text", "analyzer": "standard" }
            },
            "index": false,
            "type": "text"
         }
      }
   }
}'
```

Template for the `json` index:

```
curl -X PUT \
 http://localhost:9200/_template/json_template \
 -H 'content-type:application/json' \
 -d '{
```

```
   "index_patterns": [ "json*" ],
   "settings": {
      "number_of_shards": 5,
      "number_of_replicas": 1
   },
   "mappings": {
      "dynamic": false,
      "properties": {
         "itemid": { "type": "long" },
         "clock": { "type": "date", "format": "epoch_second" },
         "ns": { "type": "long" },
         "value_parsed": { "type": "flattened" },
         "value_raw": { "type": "keyword", "ignore_above": 1000000 }
      }
   }
}'
```

Ingest pipelines

To create an ingest pipeline for the `text` index:

- Use `_ingest/pipeline/text-pipeline` in the URL of your Elasticsearch instance.
- Include a `date_index_name` processor to route each value to the correct date-based index based on its timestamp.

```
curl -X PUT \
 http://localhost:9200/_ingest/pipeline/text-pipeline \
 -H 'content-type:application/json' \
 -d '{
   "description": "daily text index naming",
   "processors": [
      {
         "date_index_name": {
            "field": "clock",
            "date_formats": ["UNIX"],
            "index_name_prefix": "text-",
            "date_rounding": "d"
         }
      }
   ]
}'
```

For the `json` index, the pipeline also needs to parse the JSON value before routing it to the correct index:

```
curl -X PUT \
 http://localhost:9200/_ingest/pipeline/json-pipeline \
 -H 'content-type:application/json' \
 -d '{
   "description": "daily json index naming",
   "processors": [
      {
         "json": {
            "field": "value",
            "target_field": "value_parsed",
            "ignore_failure": true
         }
      },
      {
         "script": {
            "source": "if (ctx.value_parsed == null || !(ctx.value_parsed instanceof Map)) { ctx.value_raw
         }
      },
      {
         "date_index_name": {
            "field": "clock",
            "date_formats": [ "UNIX" ],
```

```
            "index_name_prefix": "json-",
            "date_rounding": "d"
         }
      }
   ]
}'
```

Configuring Zabbix server

In your Zabbix server configuration file (`zabbix_server.conf`), set the `HistoryProvider` parameter.

For example, to store *Character*, *Log*, *Text*, and *JSON* type values in Elasticsearch (while keeping *Numeric* values in a database):

```
HistoryProvider=elasticsearch;value_types="str,log,text,json",url=http://localhost:9200
```

If you're using date-based indices, add `date_index=1` to the parameter:

```
HistoryProvider=elasticsearch;value_types="str,log,text,json",url=http://localhost:9200,date_index=1
```

After making changes, restart Zabbix server:

```
systemctl restart zabbix-server
```

Configuring Zabbix frontend

In your Zabbix frontend configuration file (`zabbix.conf.php`), set the `$HISTORY_PROVIDERS` variable to match the server configuration:

```
$HISTORY_PROVIDERS[] = [
  'types' => ['str','log','text','json'],
  'provider' => 'elasticsearch',
  'url' => 'http://localhost:9200'
];
```

Troubleshooting

The following steps may help you troubleshoot problems with your Elasticsearch setup:

1. Check Elasticsearch or Zabbix server logs for errors.
2. To identify slow queries, use the `log_slow_queries` option in the `HistoryProvider` Zabbix server configuration parameter.
3. Verify that Elasticsearch allows access from Zabbix server and Zabbix frontend.
4. Verify that `auto_create_index` is enabled:

```
curl -X GET \
 "http://localhost:9200/_cluster/settings?include_defaults=true&filter_path=**.auto_create_index"

#### {"defaults": {"action": {"auto_create_index": "false"} } }
```

To enable it, send the following request:

```
curl -X PUT \
 http://localhost:9200/_cluster/settings \
 -H 'content-type:application/json' \
 -d '{
   "persistent": {
      "action.auto_create_index": "true"
   }
}'

#### {"acknowledged": true, "persistent": {"action": {"auto_create_index": "true"} }, "transient": {} }
```

5. Verify that mappings, templates, and ingest pipelines are correct by sending `GET` requests to their respective URLs:

```
curl -X GET http://localhost:9200/json
curl -X GET http://localhost:9200/_template/json*
curl -X GET http://localhost:9200/_ingest/pipeline/json*
```

You can compare received responses with expected responses in the Elasticsearch API documentation.

6. Check if any shards are in a failed state; restarting Elasticsearch may resolve this.
7. Query Elasticsearch to see if the data collected by Zabbix is stored, for example:

```
curl 'http://localhost:9200/json/_search' \
 -H 'Content-Type: application/json' \
 -d '{
   "query": {
     "term": {
       "itemid": 42269
     }
   }
 }'
```

8. If you need to reset your Elasticsearch setup and start over, you can delete all indices, templates, and ingest pipelines:

```
curl -X DELETE "http://localhost:9200/_all"
curl -X DELETE "http://localhost:9200/_template/*"
curl -X DELETE "http://localhost:9200/_ingest/pipeline/*"
```

ClickHouse setup

Zabbix can store history data in ClickHouse as an alternative to a relational database.

Note:
ClickHouse can also be used as a telemetry data source for application performance monitoring (APM); for details, see *Administration* > *Data source*.

This guide covers the setup for the supported versions of ClickHouse. If you're using a different version, some functionality may not work as intended.

ClickHouse can store the following value types:

Item value type	Database table	ClickHouse type
Numeric (unsigned)	history_uint	uint
Numeric (float)	history	dbl
Character	history_str	str
Log	history_log	log
Text	history_text	text
Binary	history_bin	not supported by Zabbix
JSON	history_json	json

Note:
ClickHouse does not accept JSON arrays. A JSON value must be either a single object, or a set of objects. Additionally, ClickHouse handles JSON keys with NULL the same as missing keys.

Important notes

- The housekeeper does not delete data from ClickHouse. To control how long data is kept, configure ClickHouse data storage period in ClickHouse.
- Zabbix does **not** calculate or store trends in ClickHouse. Consider extending the history storage period to preserve older data.
- If you want to migrate your history data from an existing Zabbix database (MySQL or PostgreSQL) to ClickHouse, see the ClickHouse schema and history migration scripts.
- ClickHouse is not supported as history storage for Zabbix proxies, but can be used as a telemetry data source for Zabbix proxy with APM enabled.
- If you have a ClickHouse cluster, see Configuring ClickHouse clusters.

Configuring ClickHouse

You need to create and configure a Zabbix database and user, and import the database schema.

This guide gives instructions for Docker or package installations of ClickHouse.

Docker

1. Create and configure the Zabbix database and user when running the ClickHouse container:

```
sudo docker run -d \
  --name clickhouse \
  -e CLICKHOUSE_DB=zabbix \
  -e CLICKHOUSE_USER=zabbix \
  -e CLICKHOUSE_DEFAULT_ACCESS_MANAGEMENT=1 \
  -e CLICKHOUSE_PASSWORD=<password> \
  -p 8123:8123/tcp \
  -p 9000:9000/tcp \
  --cap-add=SYS_NICE \
  --cap-add=NET_ADMIN \
  --cap-add=IPC_LOCK \
  --ulimit nofile=262144:262144 \
  -v clickhouse_data:/var/lib/clickhouse \
  clickhouse/clickhouse-server:26.4
```

2. Confirm that ClickHouse is working and you can connect to it:

```
sudo docker exec -it clickhouse \
  clickhouse-client \
  --query "SELECT version()"

#### 26.4.4.38
```

3. Import the database schema using the history_all.sh script from your Zabbix directory:

```
./usr/share/zabbix/sql-scripts/clickhouse/history_all.sh \
  --user zabbix \
  --password <password> \
  --db zabbix \
  --server http://localhost:8123
```

Note:
The data storage period (Time-To-Live, or TTL) for ClickHouse is, by default, 31 days. To change it, use the `--ttl` option when importing the database schema (e.g., `--ttl 604800` for 7 days), or configure it later.

4. Verify that tables were created:

```
sudo docker exec -it clickhouse \
  clickhouse-client \
  --user zabbix \
  --password <password> \
  --query "SHOW TABLES FROM zabbix"

#### history
#### history_json
#### history_log
#### history_str
#### history_text
#### history_uint
```

Packages

1. Start ClickHouse:

```
sudo service clickhouse-server start
```

2. Create and configure the Zabbix database and user:

```
clickhouse-client --user default

localhost :) CREATE DATABASE IF NOT EXISTS zabbix
localhost :) CREATE USER IF NOT EXISTS zabbix IDENTIFIED WITH sha256_password BY '<password>'
localhost :) GRANT CREATE, ALTER, DROP, INSERT, SELECT, UPDATE, OPTIMIZE ON zabbix.* TO zabbix
localhost :) quit
```

3. Import the database schema using the history_all.sh script from your Zabbix directory:

```
./usr/share/zabbix/sql-scripts/clickhouse/history_all.sh \
  --user zabbix \
  --password <password> \
  --db zabbix \
  --server http://localhost:8123
```

Note:
The data storage period (Time-To-Live, or TTL) for ClickHouse is, by default, 31 days. To change it, use the `--ttl` option when importing the database schema (e.g., `--ttl 604800` for 7 days), or configure it later.

4. Verify that tables were created:

```
clickhouse-client \
  --user zabbix \
  --password <password> \
  --query "SHOW TABLES FROM zabbix"

#### history
#### history_json
#### history_log
#### history_str
#### history_text
#### history_uint
```

Configuring Zabbix server

In your Zabbix server configuration file (`zabbix_server.conf`), set the `HistoryProvider` parameter.

For example, to store all supported types of values in ClickHouse:

```
HistoryProvider=clickhouse;value_types="uint,dbl,str,log,text,json",url=http://localhost:8123,db=zabbix,us
```

After making changes, restart Zabbix server:

```
systemctl restart zabbix-server
```

Configuring Zabbix frontend

In your Zabbix frontend configuration file (`zabbix.conf.php`), set the `$HISTORY_PROVIDERS` variable to match the server configuration:

```
$HISTORY_PROVIDERS[] = [
  'types' => ['uint','dbl','str','log','text','json'],
  'provider' => 'clickhouse',
  'url' => 'http://localhost:8123',
  'db' => 'zabbix',
  'username' => 'zabbix',
  'password' => '<password>'
];
```

Additional configuration

The steps below are optional. You do not need them for a basic setup.

Configuring ClickHouse data storage period

The data storage period (Time-To-Live, or TTL) for ClickHouse is, by default, 31 days. To change it, run the commands below.

The examples below use Docker. If you installed ClickHouse using packages, run the queries in the ClickHouse client directly.

1. Alter the table (replace `history_json` and 3600 with the values you need):

```
sudo docker exec -it clickhouse \
  clickhouse-client \
  --user zabbix \
  --password <password> \
  --query "ALTER TABLE zabbix.history_json MODIFY TTL clock_ns + toIntervalSecond(3600)"
```

2. Apply the changes immediately:

```
sudo docker exec -it clickhouse \
  clickhouse-client \
  --user zabbix \
  --password <password> \
  --query "OPTIMIZE TABLE zabbix.history_json MATERIALIZE TTL"
```

3. Verify that the data storage period changed:

```
sudo docker exec -it clickhouse \
  clickhouse-client \
  --user zabbix \
  --password <password> \
  --query "SHOW CREATE TABLE zabbix.history_json"

#### CREATE TABLE zabbix.history_json
#### (
####     `itemid` UInt64,
####     `clock_ns` DateTime64(9),
####     `value` JSON,
####     `value_str` String
#### )
#### ENGINE = MergeTree
#### PARTITION BY toDate(clock_ns)
#### PRIMARY KEY (itemid, clock_ns)
#### ORDER BY (itemid, clock_ns)
#### TTL clock_ns + toIntervalSecond(3600)
#### SETTINGS index_granularity = 8192
```

4. Restart Zabbix server to refresh the data storage period in *Administration* > *Housekeeping*:

```
systemctl restart zabbix-server
```

Configuring ClickHouse clusters

This section provides configuration steps for ClickHouse clusters with replication and sharding.

The steps below use Docker and the ClickHouse `cluster_2S_2R` from ClickHouse documentation (running ClickHouse 26.4.4.38 with ClickHouse Keeper).

Before you start, it is recommended to put a load balancer in front of your ClickHouse cluster for Zabbix. Zabbix server and frontend configuration supports only a single ClickHouse URL, so it can only point to one node. If that node goes down, a load balancer will redirect Zabbix to a healthy node instead, through that same URL.

1. Create the Zabbix database:

```
sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "CREATE DATABASE IF NOT EXISTS zabbix ON CLUSTER cluster_2S_2R ENGINE = Replicated('/clickhouse/
```

Attention:
The `ON CLUSTER` clause reaches only nodes that are part of the cluster when you run the command. If you add nodes to your cluster later, run this command again.

2. Create and configure the Zabbix user:

```
sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "CREATE USER IF NOT EXISTS zabbix ON CLUSTER cluster_2S_2R IDENTIFIED WITH sha256_password BY '<

sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "GRANT ON CLUSTER cluster_2S_2R CREATE, ALTER, DROP, INSERT, SELECT, UPDATE, OPTIMIZE ON zabbix.
```

3. Import the database schema using the `history_all.sh` script from your Zabbix directory:

```
./usr/share/zabbix/sql-scripts/clickhouse/history_all.sh \
  --user zabbix \
  --password <password> \
  --db zabbix \
  --server http://localhost:8123 \
  --engine "ReplicatedMergeTree()"
```

Note:
The data storage period (Time-To-Live, or TTL) for ClickHouse is, by default, 31 days. To change it, use the `--ttl` option when importing the database schema (e.g., `--ttl 604800` for 7 days), or configure it later.

Note:
If your ClickHouse cluster requires explicit replica paths (for example, if your ClickHouse server configuration does not set default paths for replicated tables), run the schema scripts (`history_schema.sh`, `history_uint_schema.sh`, etc.) individually and set a different path for each table:

```
./usr/share/zabbix/sql-scripts/clickhouse/history_schema.sh \
  --user zabbix \
  --password <password> \
  --db zabbix \
  --server http://localhost:8123 \
  --engine "ReplicatedMergeTree('/clickhouse/tables/{shard}/history', '{replica}')"
```

For more details on ClickHouse replication, see Replicating data and Replicated* table engines in ClickHouse documentation.

4. Configure sharding for each table type. Rename the tables and create a `Distributed` table with the original name, pointing to the renamed table. This `Distributed` table is what Zabbix actually reads from and writes to; the table splits data across shards automatically. For example, for the `history` table:

```
sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "RENAME TABLE zabbix.history TO zabbix.history_local"

sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "CREATE TABLE zabbix.history AS zabbix.history_local ENGINE = Distributed('cluster_2S_2R', 'zabb
```

Note:
For more details on ClickHouse sharding, see Distributed table engine in ClickHouse documentation.

5. Configure Zabbix server.

6. Configure Zabbix frontend.

7. Verify that Zabbix data is spread across shards. The row count from `zabbix.history_local` may change between repeated checks, since Zabbix server continuously inserts new data. Run this command on each node:

```
sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "SELECT count(*) FROM zabbix.history_local"

#### 2446 (clickhouse-01)
#### 2471 (clickhouse-02)
#### 2494 (clickhouse-03)
```

8. Check that replication is in sync (`active_replicas` should match `total_replicas`):

```
sudo docker exec -it clickhouse-01 \
  clickhouse-client \
  --user default \
  --query "SELECT database, table, is_leader, total_replicas, active_replicas FROM system.replicas WHERE d
```

```
#### zabbix  history_json_local  1 2 2
#### zabbix  history_local       1 2 2
#### zabbix  history_log_local   1 2 2
#### zabbix  history_str_local   1 2 2
#### zabbix  history_text_local  1 2 2
#### zabbix  history_uint_local  1 2 2
```

Troubleshooting

The following steps may help you troubleshoot problems with your ClickHouse setup:

1. Check ClickHouse or Zabbix server logs for errors.
2. To identify slow queries, use the `log_slow_queries` option in the `HistoryProvider` Zabbix server configuration parameter.
3. Verify that ClickHouse allows access from Zabbix server and Zabbix frontend.
4. Query ClickHouse to see if the data collected by Zabbix is stored, for example:

```
sudo docker exec -it clickhouse \
  clickhouse-client \
  --user zabbix \
  --password <password> \
  --query "SELECT * FROM zabbix.history_uint WHERE itemid = 42269"
```

Distribution-specific notes on setting up NGINX for Zabbix

RHEL

On RHEL 8, 9, and 10, NGINX is included in AppStream—no extra repos needed. Simply enable and install with:

```
dnf module list nginx
dnf -y install nginx
```

On RHEL 7, NGINX can be installed from the CentOS 7 Extras repository (if using CentOS) via:

```
yum -y install nginx
```

If you prefer the very latest upstream builds, configure the official NGINX repository at `/etc/yum.repos.d/nginx.repo`:

```
cat > /etc/yum.repos.d/nginx.repo << 'EOF'
[nginx-stable]
name=nginx stable repo
baseurl=https://nginx.org/packages/rhel/$releasever/$basearch/
gpgcheck=1
enabled=1
gpgkey=https://nginx.org/keys/nginx_signing.key
EOF
dnf -y install nginx
```

SLES 15

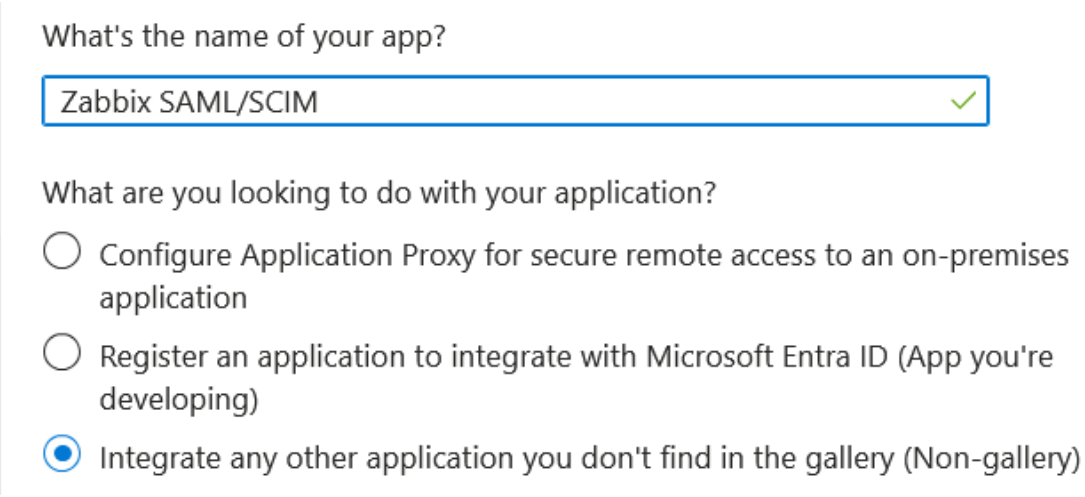
In SUSE Linux Enterprise Server 15 you need to configure `php-fpm` (the path to configuration file may vary slightly depending on the service pack):

```
cp /etc/php8/fpm/php-fpm.conf{.default,}
cp /etc/php8/fpm/php-fpm.d/www.conf{.default,}
sed -i 's/user = nobody/user = wwwrun/; s/group = nobody/group = www/' /etc/php8/fpm/php-fpm.d/www.conf
```

SAML setup with Microsoft Entra ID

Overview

This section provides guidelines for configuring single sign-on and user provisioning into Zabbix from Microsoft Entra ID (formerly Microsoft Azure Active Directory) using SAML 2.0 authentication.



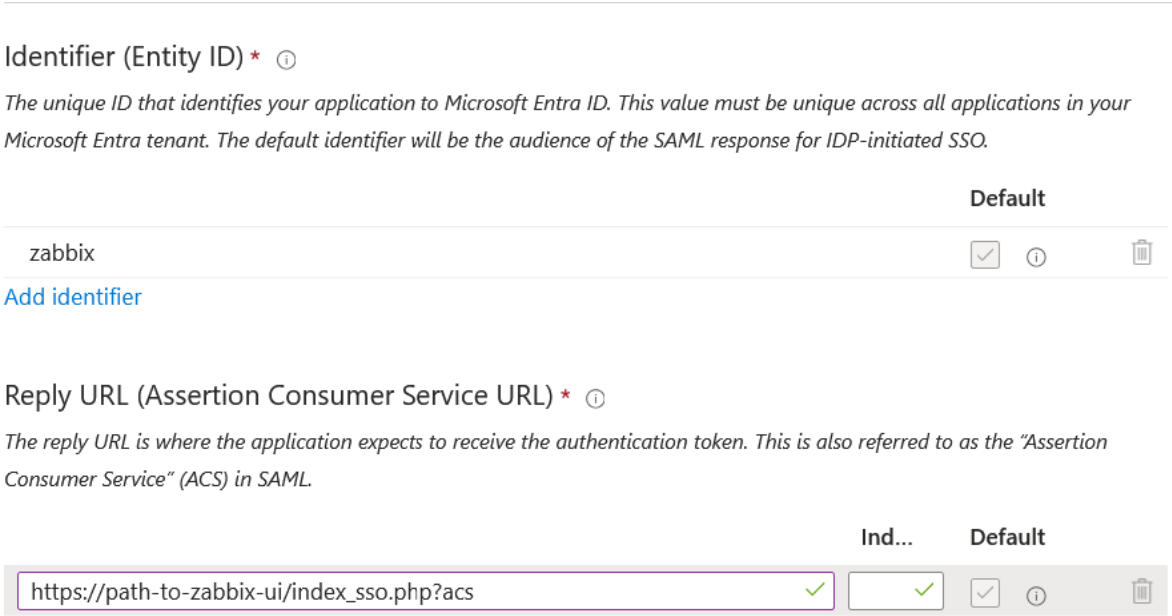
Microsoft Entra ID configuration

Creating application

1. Log into Microsoft Entra admin center at Microsoft Entra ID. For testing purposes, you may create a free trial account in Microsoft Entra ID.

2. In Microsoft Entra admin center select *Applications* > *Enterprise applications* > *New application* > *Create your own application*.

3. Add the name of your app and select the *Integrate any other application...* option. After that, click *Create*.

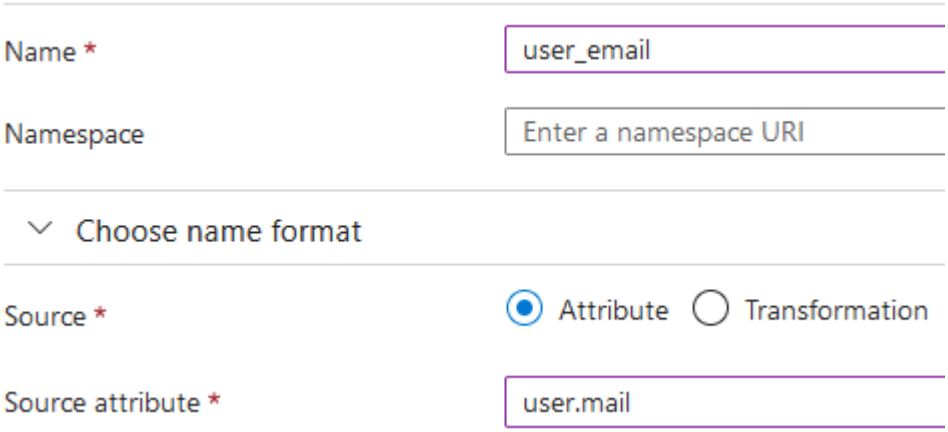


Setting up single sign-on

1. In your application page, go to *Set up single sign on* and click *Get started*. Then select *SAML*.

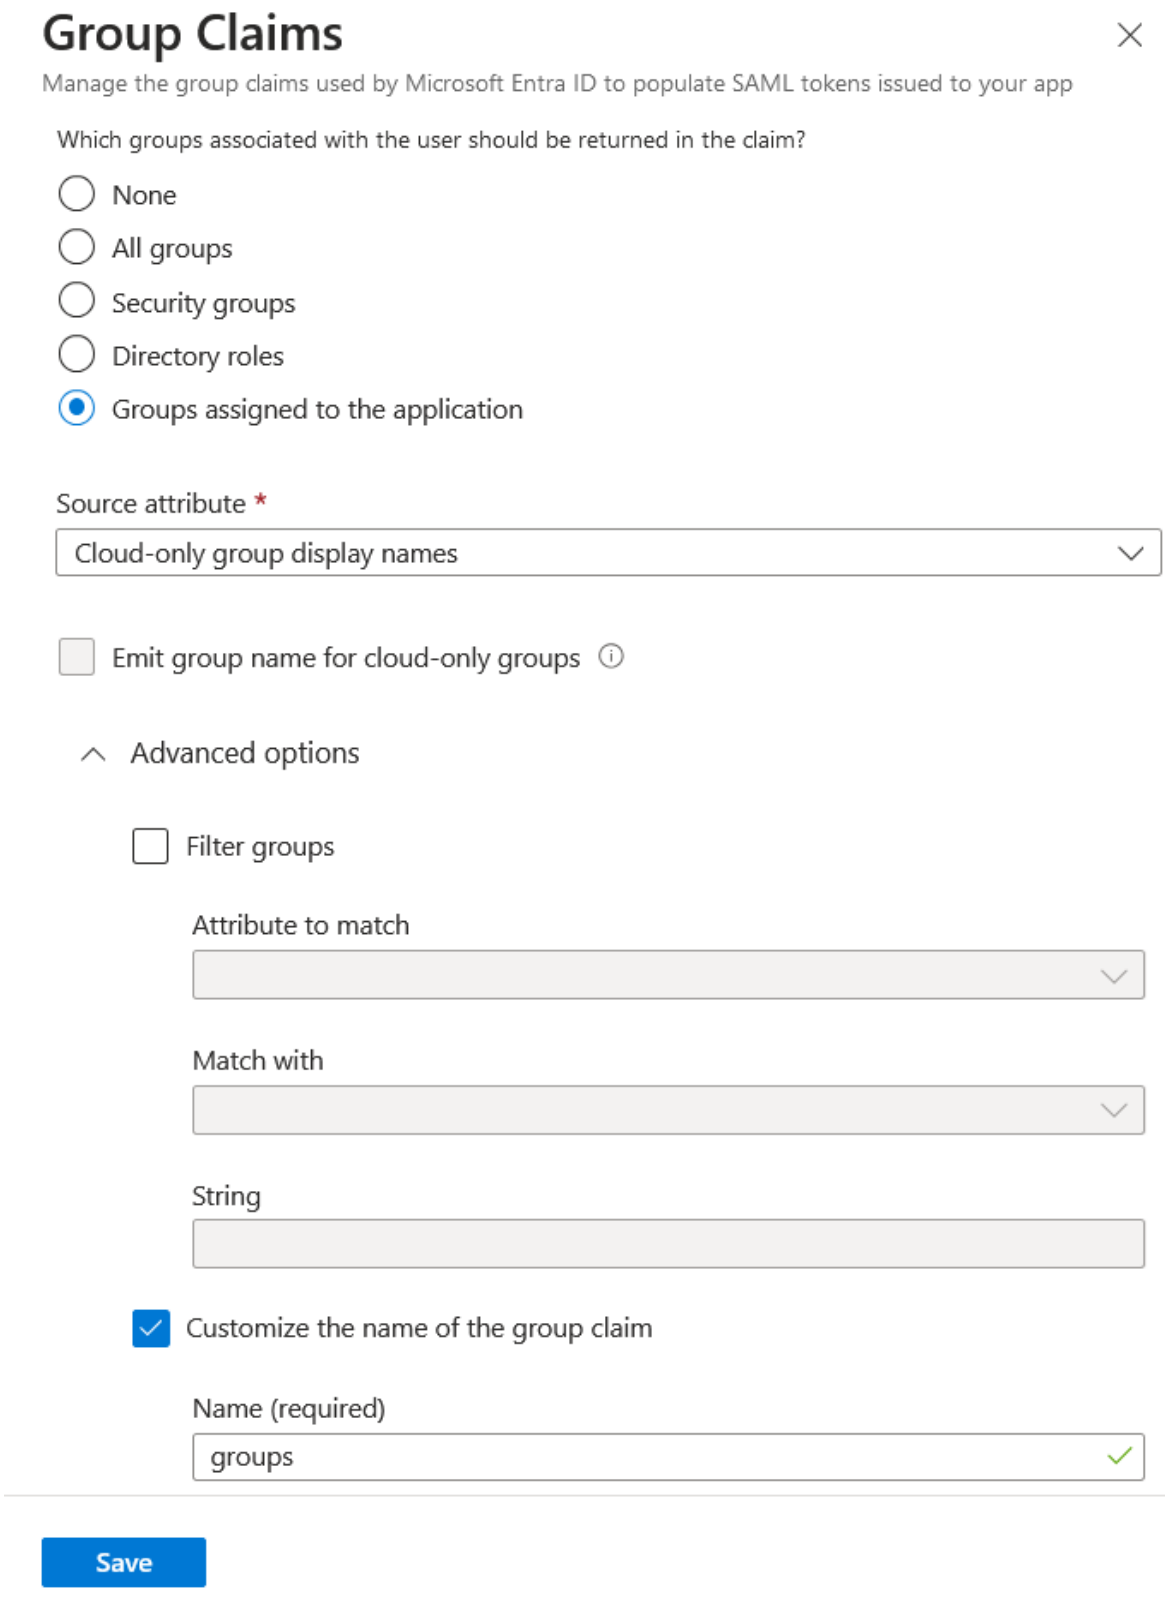
2. Edit *Basic SAML Configuration*:

- In *Identifier (Entity ID)* set a unique name to identify your app to Microsoft Entra ID, for example, `zabbix`;
- In *Reply URL (Assertion Consumer Service URL)* set the Zabbix single sign-on endpoint: `https://<path-to-zabbix-ui>/index_sso`



Note that `https` is required. To use this with Zabbix, add the following line to the frontend configuration file:

```
$SSO['SETTINGS'] = ['use_proxy_headers' => true];
```

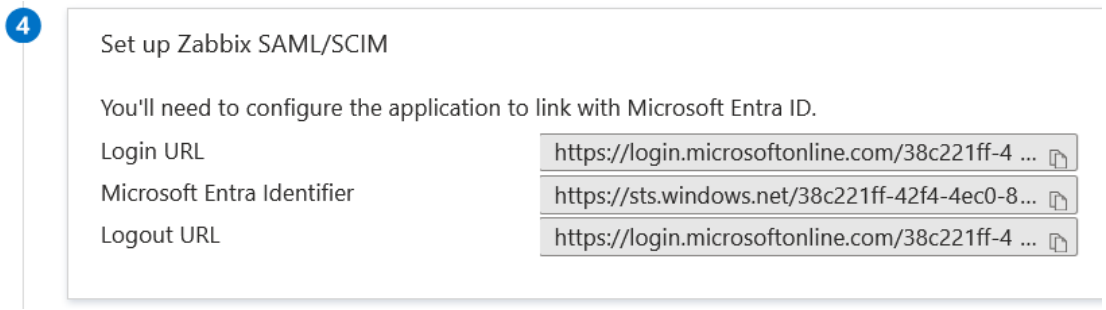


3. Edit *Attributes & Claims*. You must add all attributes that you want to pass to Zabbix (user_name, user_lastname, user_email, user_mobile, groups).

The attribute names are arbitrary. Different attribute names may be used, however, it is required that they match the respective field value in Zabbix SAML settings.

- Click *Add new claim* to add an attribute:

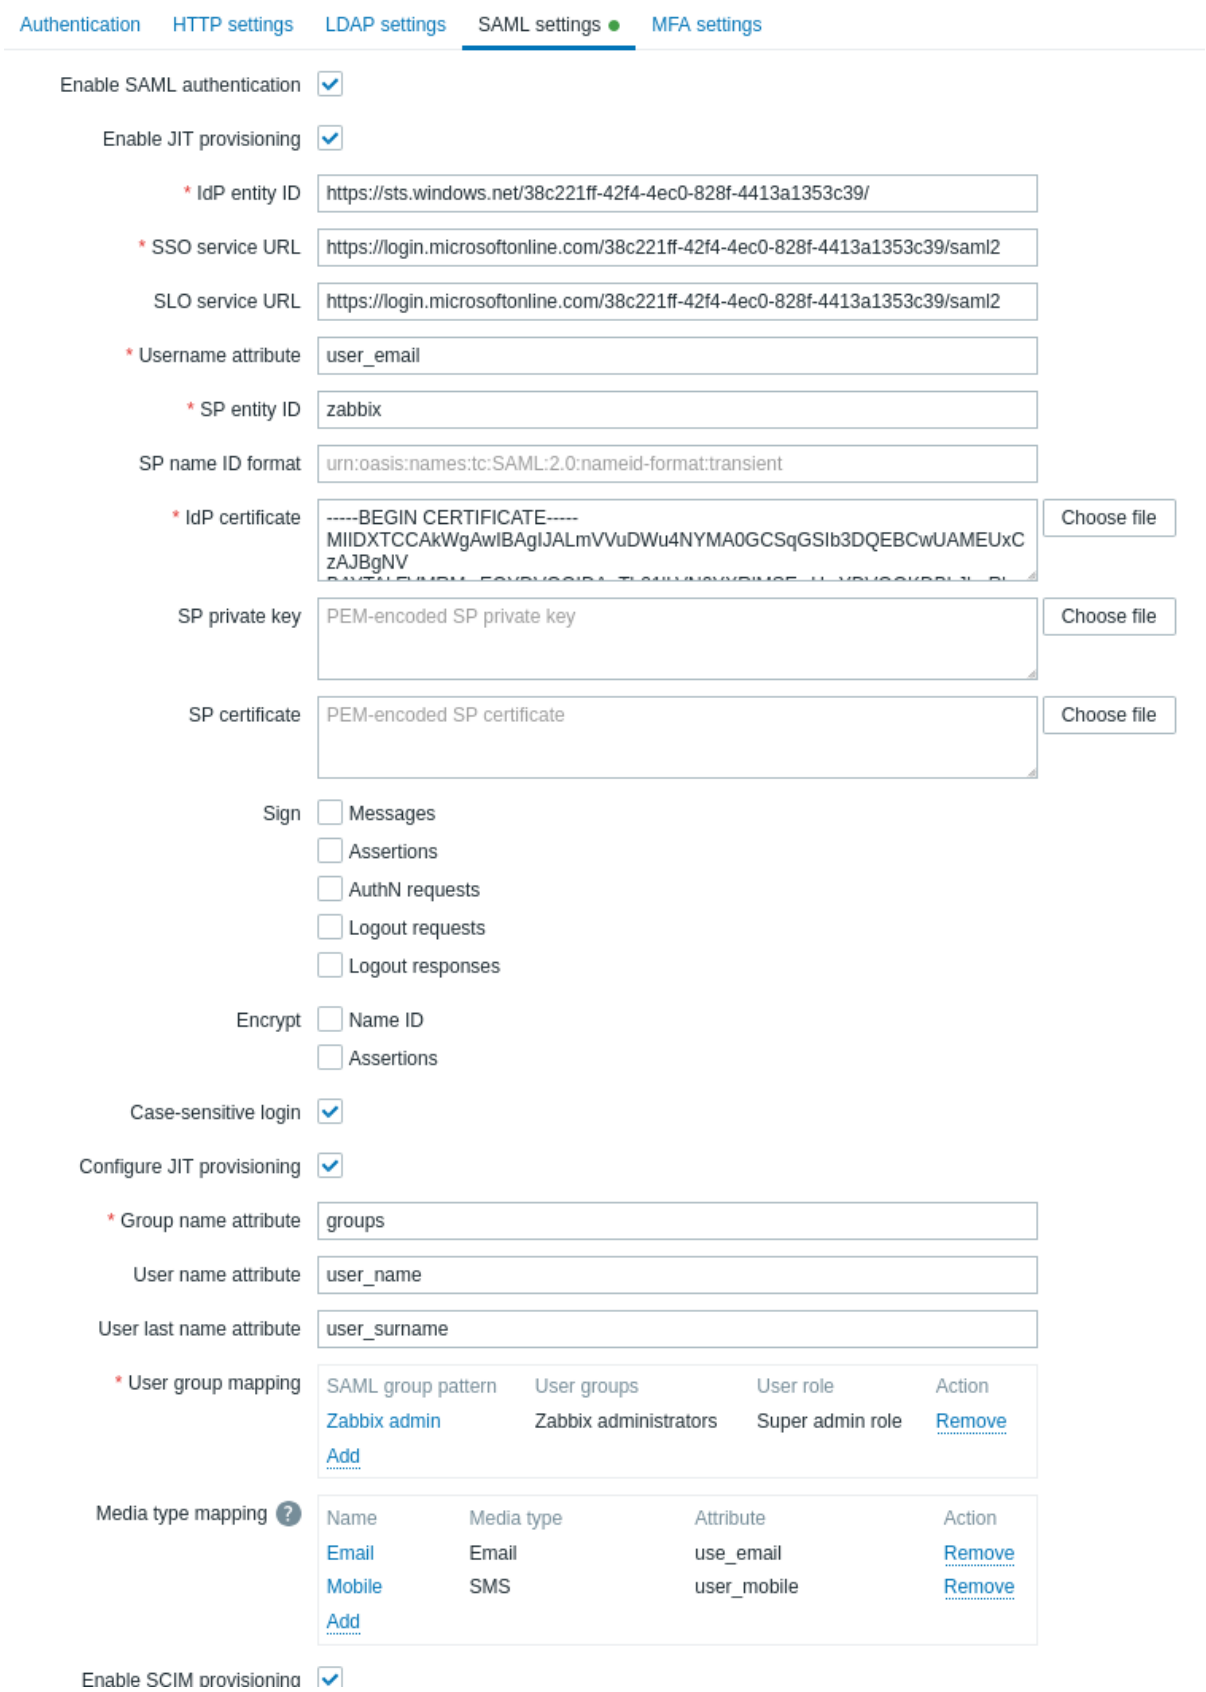
- Click *Add a group claim* to add an attribute for passing groups to Zabbix:



It is important in this claim that the group names (rather than group IDs) are passed to Zabbix by the selected *Source attribute*. Otherwise, JIT user provisioning will not work properly.

4. In *SAML Certificates* download the Base64 certificate provided by Entra ID and place it into `conf/certs` of the Zabbix frontend installation (the location may differ based on OS/source of your Zabbix installation).

Set 644 permissions to it by running:



```
chmod 644 entra.cer
```

5. Use the values from *Set up <your app name>* in Entra ID to configure Zabbix SAML authentication (see next section):

Zabbix configuration

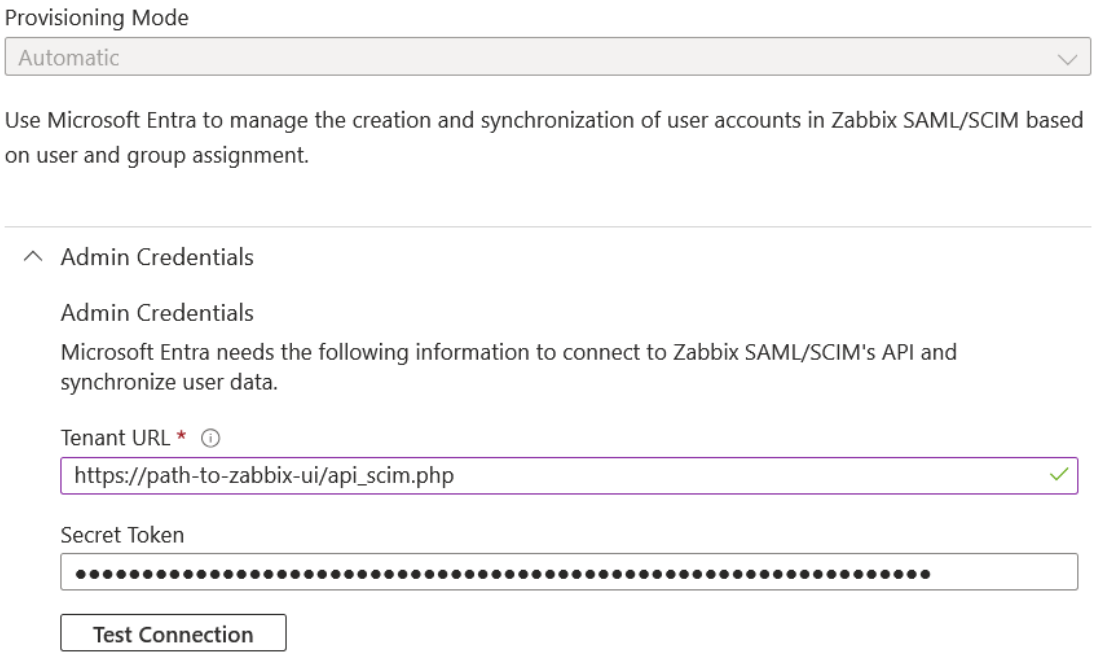
1. In Zabbix, go to the SAML settings and fill the configuration options based on the Entra ID configuration:

Zabbix field	Setup field in Entra ID	Sample value
IdP entity ID	Microsoft Entra identifier	
SSO service URL	Login URL	
SLO service URL	Logout URL	
SP entity ID	Identifier (Entity ID)	
Username attribute	Custom attribute (claim)	`user_email`
Group name attribute	Custom attribute (claim)	`groups`
User name attribute	Custom attribute (claim)	`user_name`

Zabbix field	Setup field in Entra ID	Sample value
User last name attribute	Custom attribute (claim)	`user_lastname`

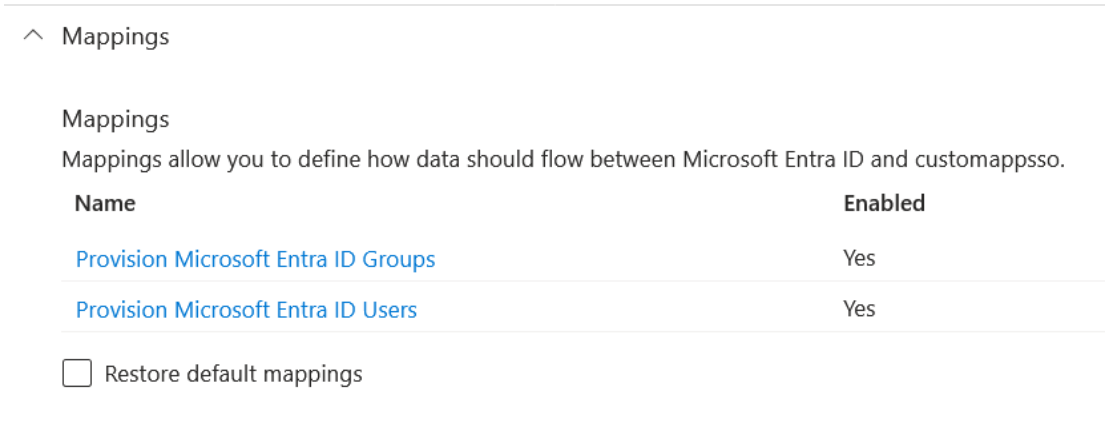
2.Add the Base64 certificate provided by Entra ID.

If `$SSO['CERT_STORAGE'] = 'database'` is set in the frontend configuration file (`zabbix.conf.php`), you can paste the certificate text or upload the certificate file in the frontend during SAML configuration—no files are required on the filesystem.



If `$SSO['CERT_STORAGE'] = 'file'` is set in the configuration file, the certificate must be made available on the filesystem (by default in `ui/conf/certs` or the path configured in the configuration file) and the frontend will not store certificates in the database. Note that if `$SSO['CERT_STORAGE']` is not set or is commented out, file storage is assumed and certificates are read from `ui/conf/certs`.

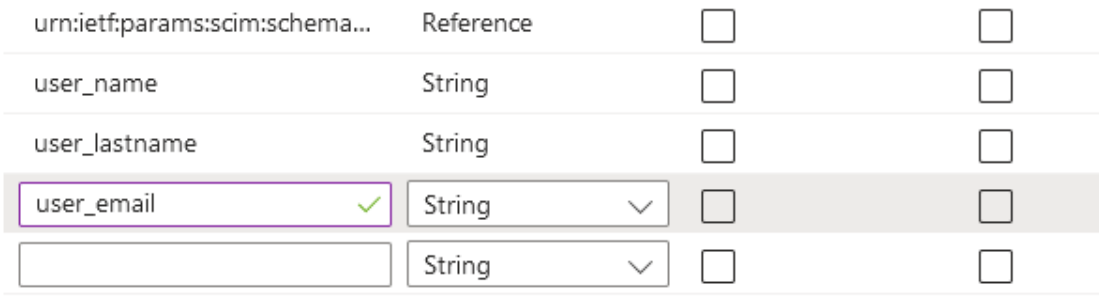
It is also required to configure user group mapping. Media mapping is optional.



3. Click the *Update* button to save these settings.

SCIM user provisioning

1. In your Entra ID application page, from the main menu open the Provisioning page. Click *Get started* and then select Automatic provisioning mode: - In *Tenant URL*, set the following value: `https://<path-to-zabbix-ui>/api_scim.php` - In *Secret token*, enter a Zabbix API token with Super admin permissions. - Click *Test connection* to see if the connection is established.



2. Now you can add all the attributes that will be passed with SCIM to Zabbix. To do that, click *Mappings* and then on *Provision Microsoft Entra ID Users*.

At the bottom of the Attribute Mapping list, enable *Show advanced options*, and then click *Edit attribute list for customappsso*.

At the bottom of the attribute list, add your own attributes with type 'String':

Save the list.

3. Now you can add mappings for the added attributes. At the bottom of the Attribute Mapping list, click *Add New Mapping* and create mappings as shown below:

When all mappings are added, save the list of mappings.

4. As a prerequisite of user provisioning into Zabbix, you must have users and groups configured in Entra ID.

To do that, go to *Microsoft Entra admin center* and then add users/groups in the respective Users and Groups pages.

5. When users and groups have been created in Entra ID, you can go to the *Users and groups* menu of your application and add them to the app.

6. Go to the *Provisioning* menu of your app, and click *Start provisioning* to have users provisioned to Zabbix.

Note that the Users PATCH request in Entra ID does not support changes in media.

Authentication request signing

It is possible to configure Entra ID to validate the signature of signed authentication requests.

To make this work, create public/private keys:

```
openssl req -x509 -newkey rsa:4096 -keyout /usr/share/zabbix/conf/certs/request-sign.key -out /usr/share/z
```

Assign permissions:

```
chown apache /usr/share/zabbix/conf/certs/request-sign.key
chmod 400 /usr/share/zabbix/conf/certs/request-sign.key
```

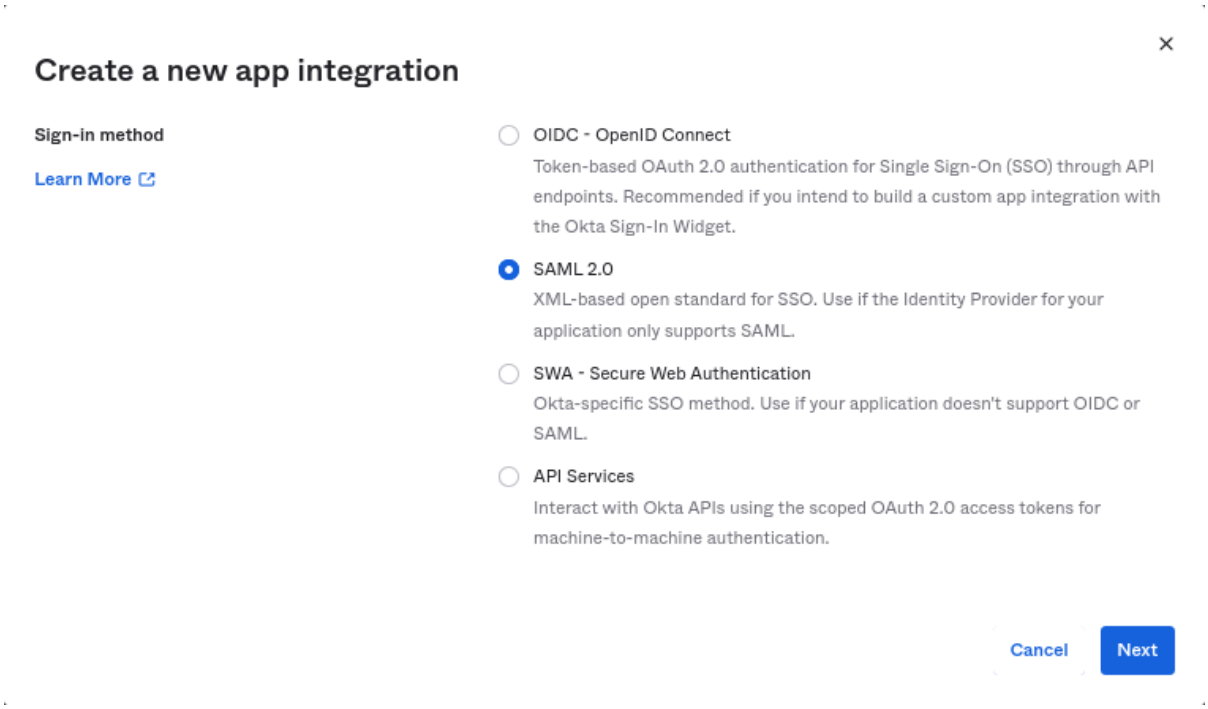
Update the Zabbix frontend configuration by adding:

```
$SSO['SP_KEY'] = 'conf/certs/request-sign.key';
$SSO['SP_CERT'] = 'conf/certs/request-sign.crt';
```

Troubleshooting

Authentication issues may occur with MicroSoft Edge browsers when a user, trying to login to Zabbix via SAML, is already logged in with the MicroSoft Edge profile. As a sign of such issue the user may be able to log in to Zabbix using MicroSoft Edge in private mode.

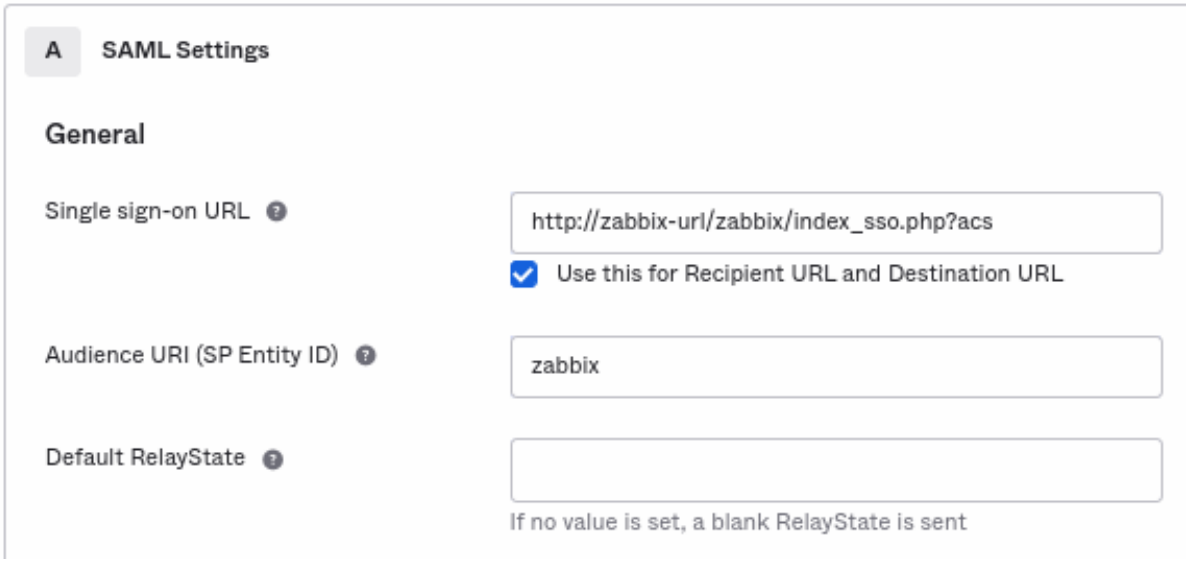
To avoid authentication issues in this case it may be necessary to set `requestedAuthnContext` to `false` in the Zabbix frontend configuration file.



```
$SSO['SETTINGS'] = [
    'security' => [
        'requestedAuthnContext' => false
    ]
];
```

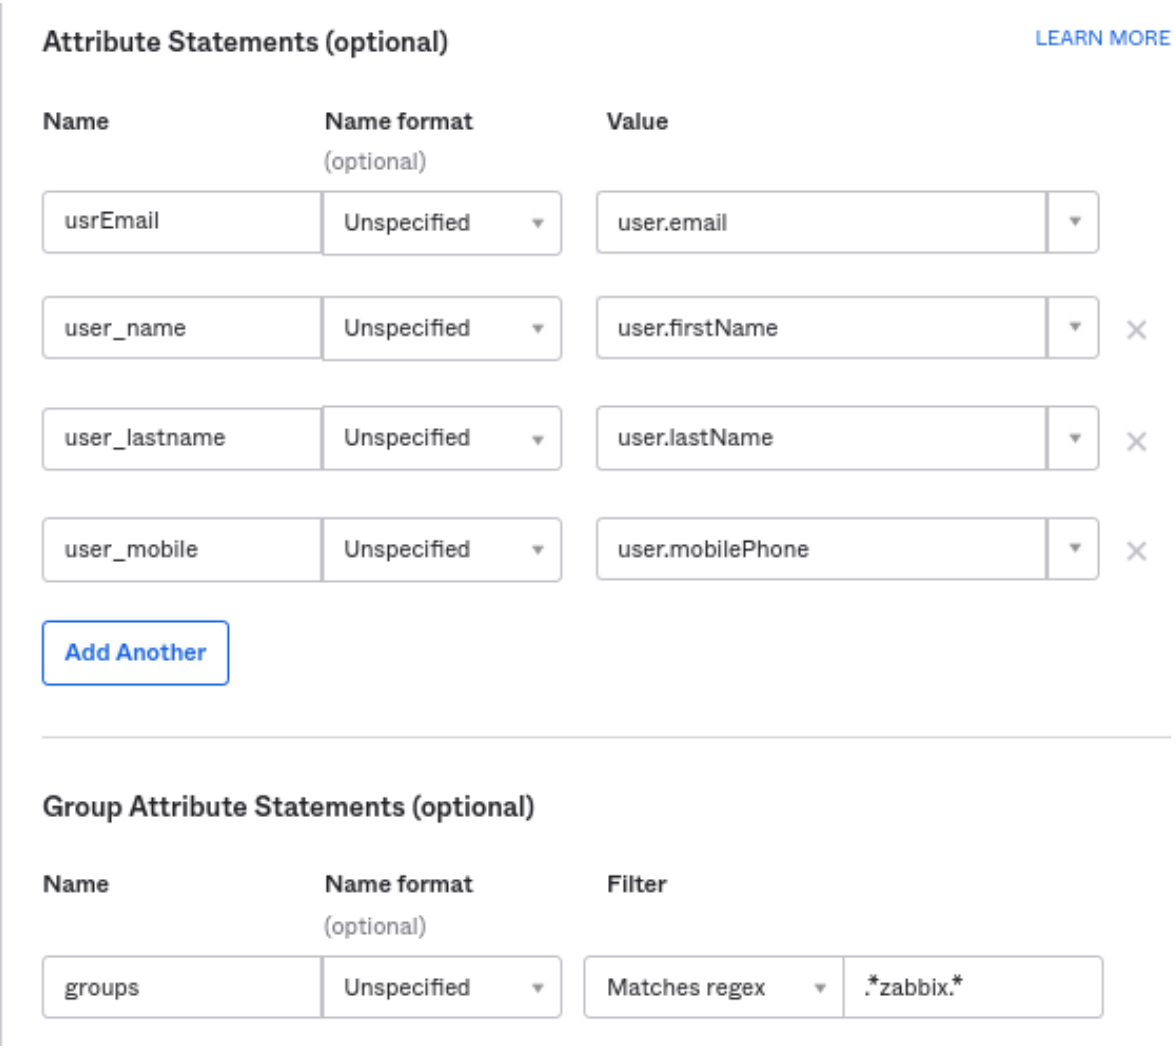
SAML setup with Okta

This section provides guidelines for configuring Okta to enable SAML 2.0 authentication and user provisioning for Zabbix.



Okta configuration

1. Go to https://developer.okta.com/signup/ and register/sign into your account.
2. In the Okta web interface navigate to *Applications* > *Applications*.
3. Click *Create App Integration*.

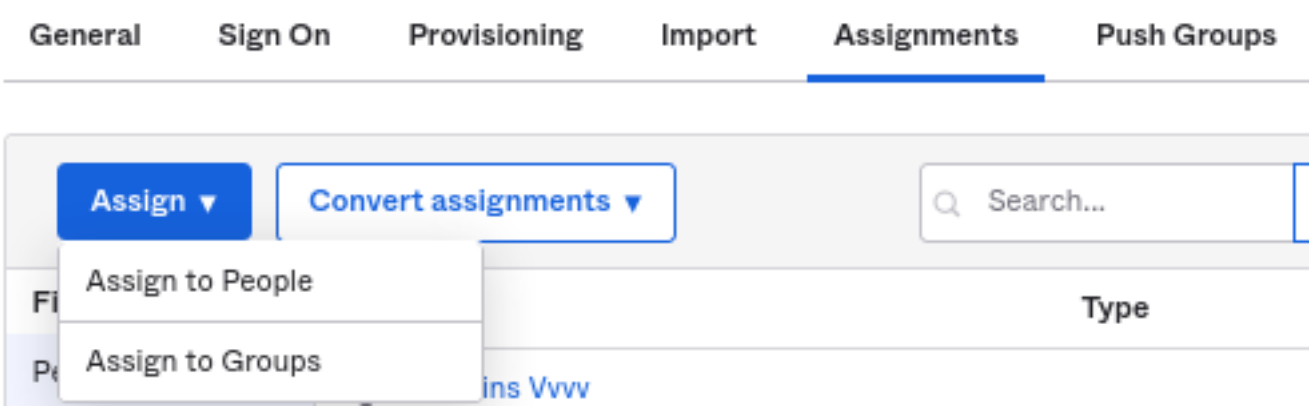


Select "SAML 2.0" as the sign-in method and click *Next*.

4. In general settings, fill in the app name and click *Next*.
5. In SAML configuration, enter the values provided below, then click *Next*.

- In **General** add:
  - *Single sign-on URL*: `http://<your-zabbix-url>/zabbix/index_sso.php?acs<br>` Note the use of "http", and not "https", so that the `acs` parameter is not cut out in the request. The *Use this for Recipient URL and Destination URL* checkbox should also be marked.
  - *Audience URI (SP Entity ID)*: `zabbix<br>` Note that this value will be used within the SAML assertion as a unique service provider identifier (if not matching, the operation will be rejected). It is possible to specify a URL or any string of data in this field.
  - *Default RelayState*:
 Leave this field blank; if a custom redirect is required, it can be added in Zabbix in the *Users* > *Users* settings.
  - Fill in other fields according to your preferences.
- In **Attribute Statements/Group Attribute Statements** add:

These attribute statements are inserted into the SAML assertions shared with Zabbix.



The attribute names used here are arbitrary examples. You may use different attribute names, however, it is required that they match the respective field value in Zabbix SAML settings.

If you want to configure SAML sign-in into Zabbix *without* JIT user provisioning, then only the email attribute is required.

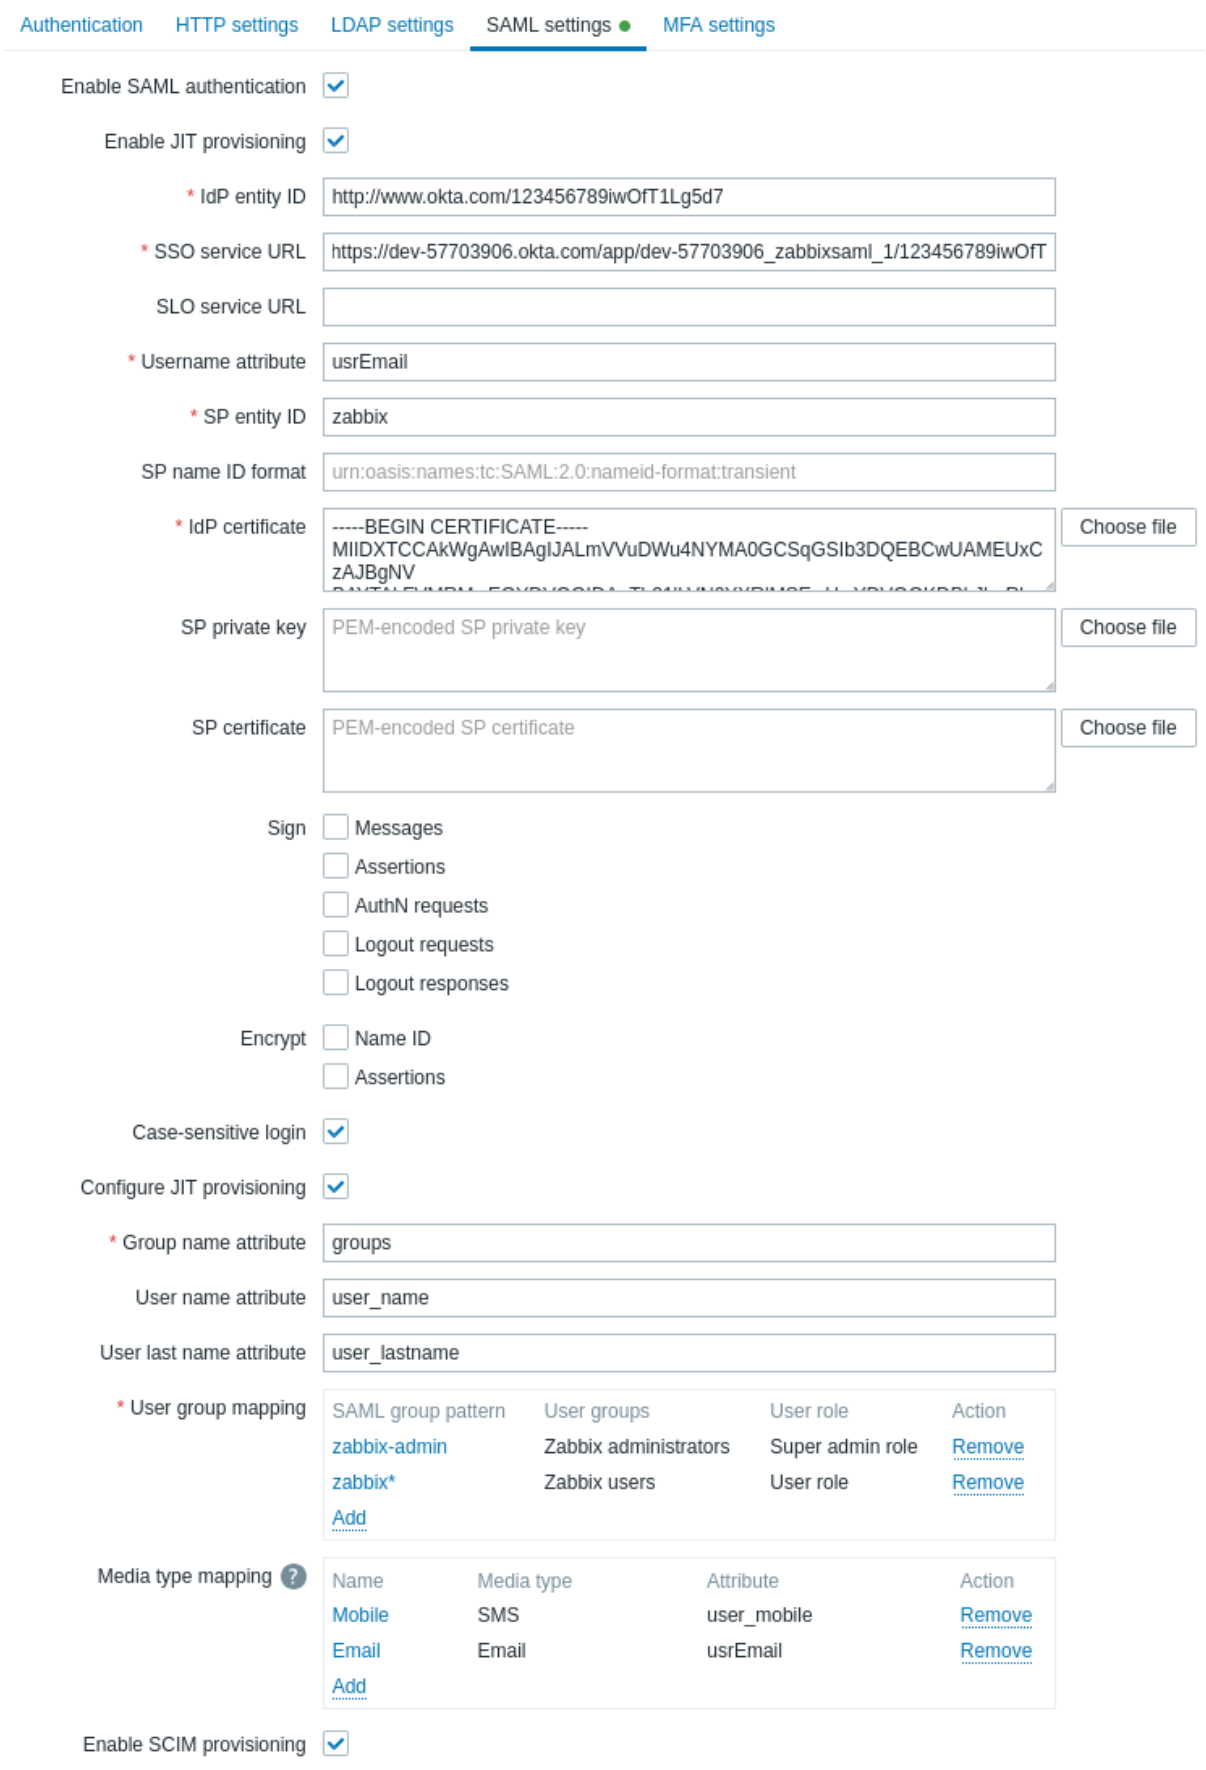
Note:
If planning to use an encrypted connection, generate the private and public encryption certificates, then upload the public certificate to Okta. The certificate upload form appears when *Assertion Encryption* is set to "Encrypted" (click *Show Advanced Settings* to find this parameter).

6. In the next tab, select "I'm a software vendor. I'd like to integrate my app with Okta" and click *Finish*.

7. Navigate to the "Assignments" tab of the newly-created application and click the *Assign* button, then select "Assign to People" from the drop-down.

8. In a popup that appears, assign the app to people that will use SAML 2.0 to authenticate with Zabbix, then click *Save and go back*.

9. Download the IdP certificate. Set 644 permissions to it by running:



```
chmod 644 idp.crt
```

10. Navigate to the "Sign On" tab and click the *View Setup Instructions* button.

Setup **instructions** will be opened in a new tab; keep this tab open while configuring Zabbix.

Zabbix configuration

1. In Zabbix, go to the SAML settings and fill the configuration options based on setup instructions from Okta:

Zabbix field	Setup field in Okta	Sample value
IdP entity ID	Identity Provider Issuer	
SSO service URL	Identity Provider Single Sign-On URL	
Username attribute	Attribute name	`usrEmail`
SP entity ID	Audience URI	`zabbix`
Group name attribute	Attribute name	`groups`

Zabbix field	Setup field in Okta	Sample value
User name attribute	Attribute name	`user_name`
User last name attribute	Attribute name	`user_lastname`

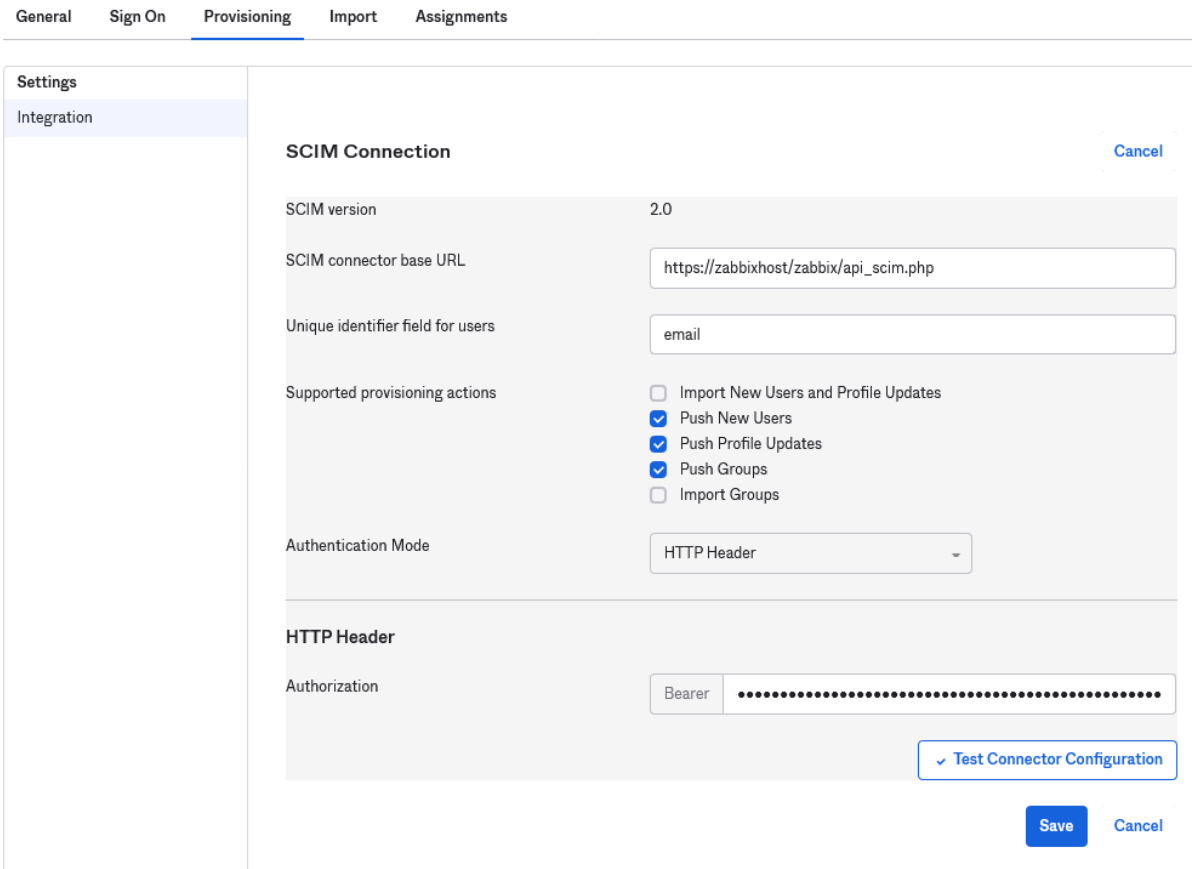
It is also required to configure user group and media mapping.

2. Add the Base64 certificate provided in the Okta SAML setup instructions.

If `$SSO['CERT_STORAGE'] = 'database'` is set in the frontend configuration file (`zabbix.conf.php`), you can paste the certificate text or upload the certificate file in the frontend during SAML configuration—no files are required on the filesystem.

If `$SSO['CERT_STORAGE'] = 'file'` is set in the configuration file, the certificate must be made available on the filesystem (by default in `ui/conf/certs` or the path configured in the configuration file) and the frontend will not store certificates in the database. Note that if `$SSO['CERT_STORAGE']` is not set or is commented out, file storage is assumed and certificates are read from `ui/conf/certs`.

3. If *Assertion Encryption* has been set to "Encrypted" in Okta, the "Assertions" checkbox of the *Encrypt* parameter should be marked in Zabbix as well.



4. Click the *Update* button to save these settings.

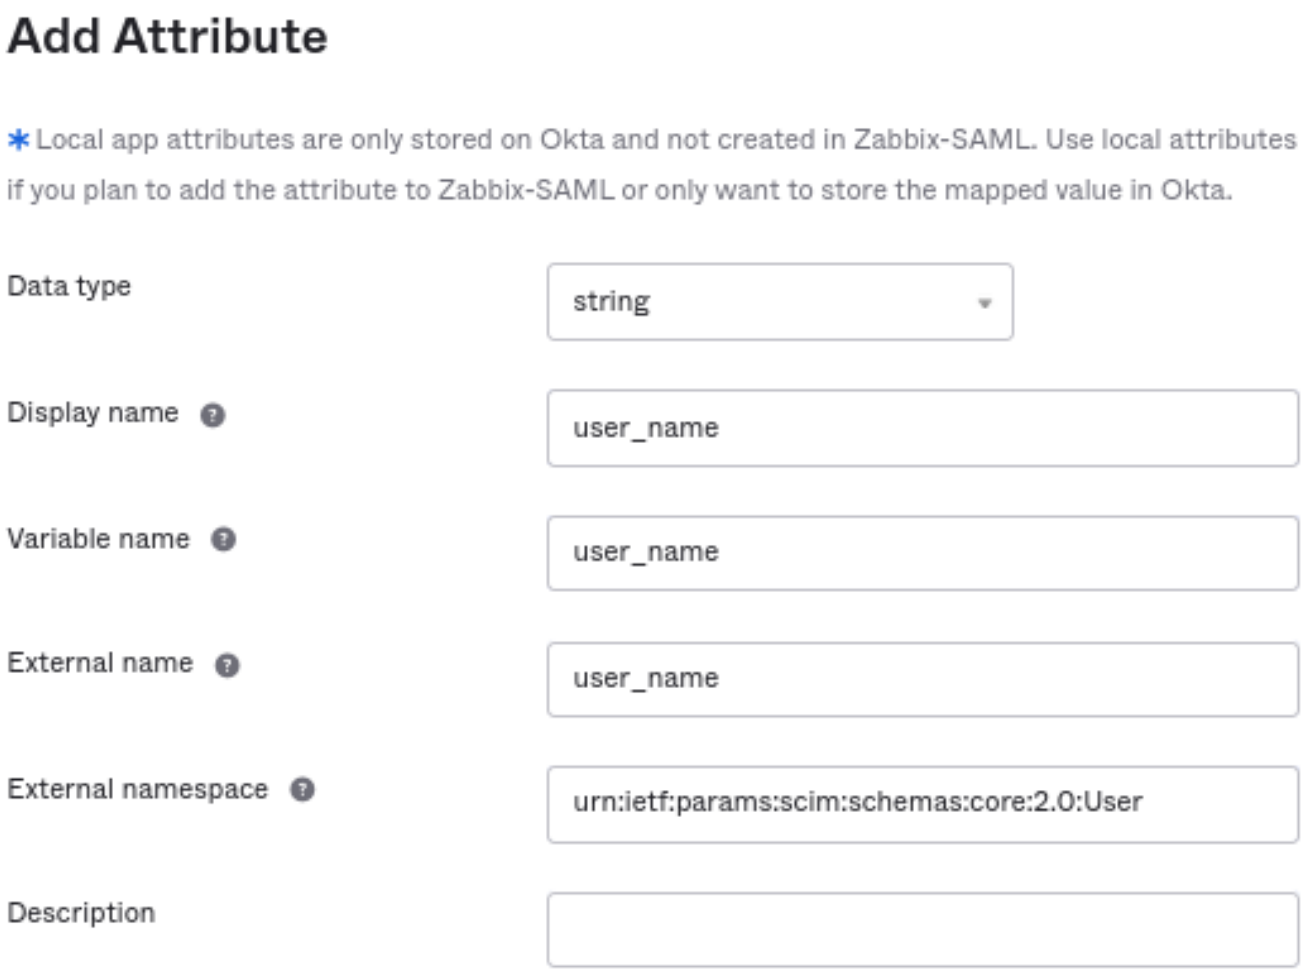
SCIM provisioning

1. To turn on SCIM provisioning, go to *General* > *App Settings* of the application in Okta.

Mark the *Enable SCIM provisioning* checkbox. As a result, a new *Provisioning* tab appears.

2. Go to the "Provisioning" tab to set up a SCIM connection: - In *SCIM connector base URL*, specify the path to the Zabbix frontend and append `api_scim.php` to it, i.e.:
 `https://<your-zabbix-url>/zabbix/api_scim.php` - *Unique identifier field for users*: `email` - *Authentication mode*: `HTTP header` - In *Authorization*, enter a valid API token with Super admin rights.

Attention:
If you are experiencing authentication issues, see Authorization header forwarding.

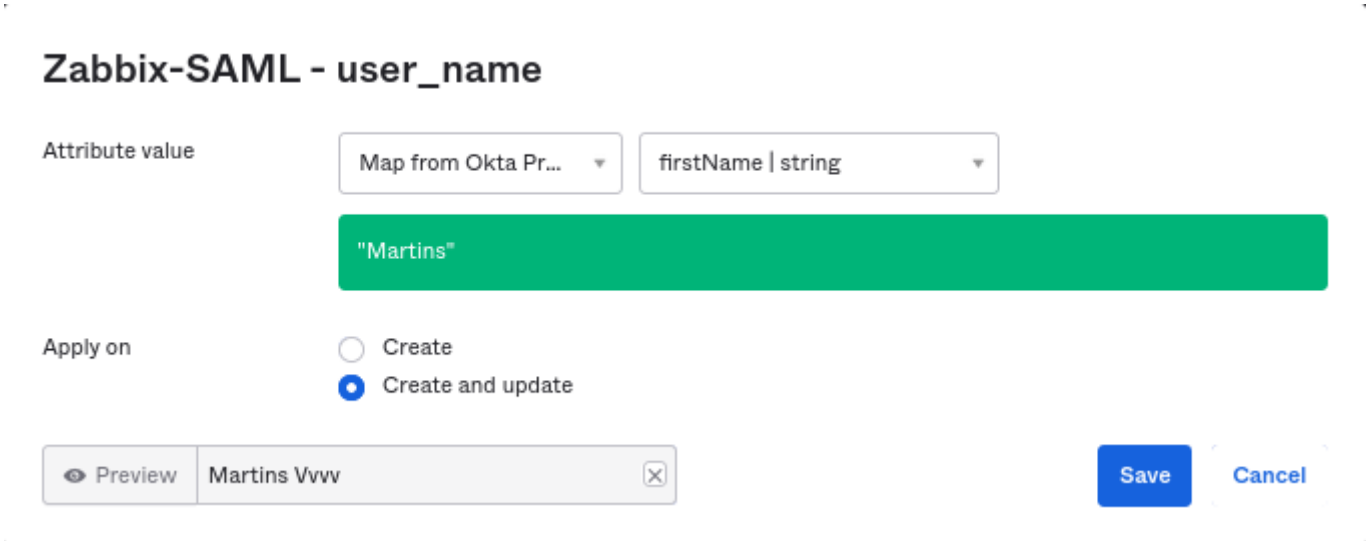


3. Click *Test Connector Configuration* to test the connection. If all is correct a success message will be displayed.

4. In *Provisioning* > *To App*, make sure to mark the following checkboxes: - Create Users - Update User Attributes - Deactivate Users

This will make sure that these request types will be sent to Zabbix.

5. Make sure that all attributes defined in SAML are defined in SCIM. You can access the profile editor for your app in *Provisioning* > *To App*, by clicking *Go to Profile Editor*.



Click *Add Attribute*. Fill the values for *Display name*, *Variable name*, *External name* with the SAML attribute name, for example, `user_name`.

External namespace should be the same as user schema: `urn:ietf:params:scim:schemas:core:2.0:User`

6. Go to *Provisioning* > *To App* > *Attribute Mappings* of your application. Click *Show Unmapped Attributes* at the bottom. Newly added attributes appear.

7. Map each added attribute.

8. Add users in the ”Assignments” tab. The users previously need to be added in *Directory* > *People*. All these assignments will

be sent as requests to Zabbix.

9. Add groups in the "Push Groups" tab. The user group mapping pattern in Zabbix SAML settings must match a group specified here. If there is no match, the user cannot be created in Zabbix.

Information about group members is sent every time when some change is made.

SAML setup with OneLogin

Overview

This section provides guidelines for configuring single sign-on and user provisioning into Zabbix from OneLogin using SAML 2.0 authentication.

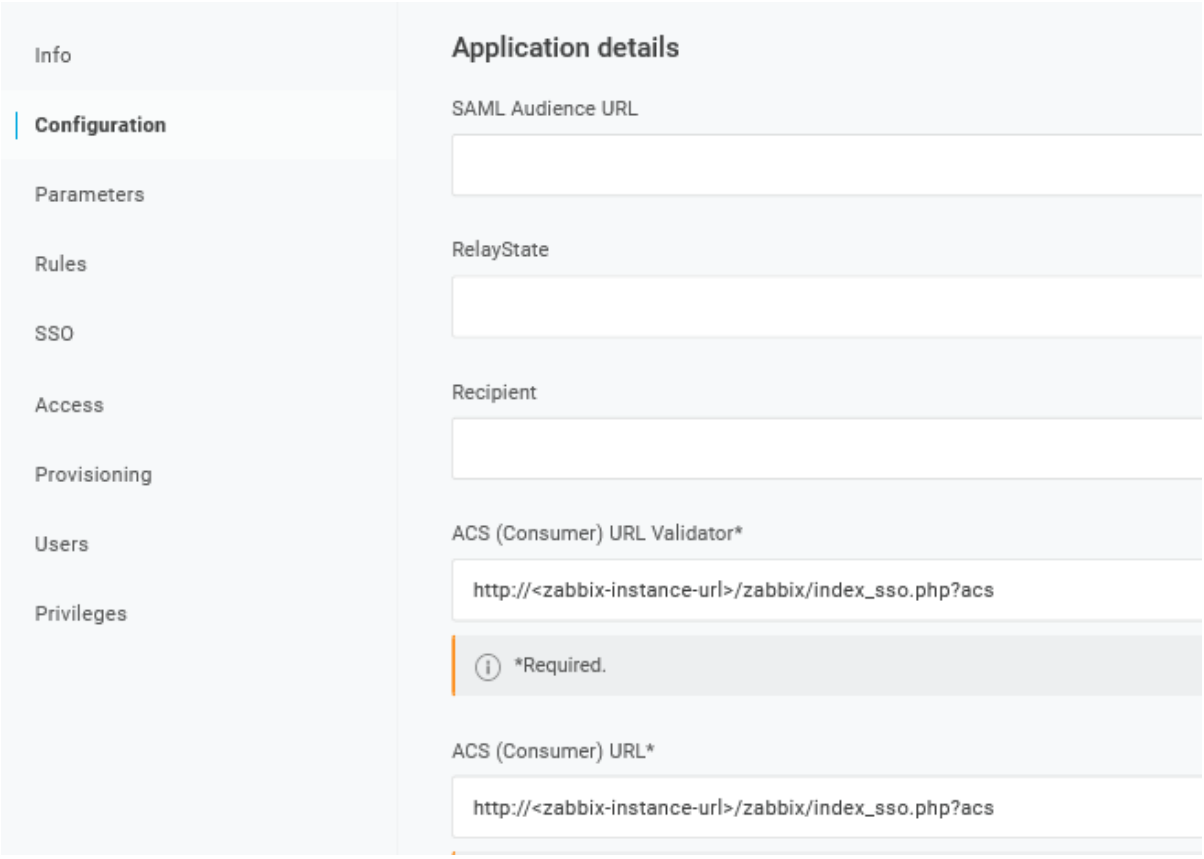
OneLogin configuration

Creating application

1. Log into your account at OneLogin. For testing purposes, you may create a free developer account in OneLogin.

2. In the OneLogin web interface navigate to *Applications* > *Applications*.

3. Click "Add App" and search for the appropriate app. The guidelines in this page are based on the *SCIM Provisioner with SAML (SCIM v2 Enterprise, full SAML)* app example.



4. To begin with, you may want to customize the display name of your app. You may also want to add the icon and app details. After that, click *Save*.

Setting up SSO/SCIM provisioning

1. In *Configuration* > *Application details*, set the Zabbix single sign-on endpoint `http://<zabbix-instance-url>/zabbix/index_sso.p` as the value of these fields:

- *ACS (Consumer) URL Validator*
- *ACS (Consumer) URL*

Note the use of "http", and not "https", so that the `acs` parameter is not cut out in the request.

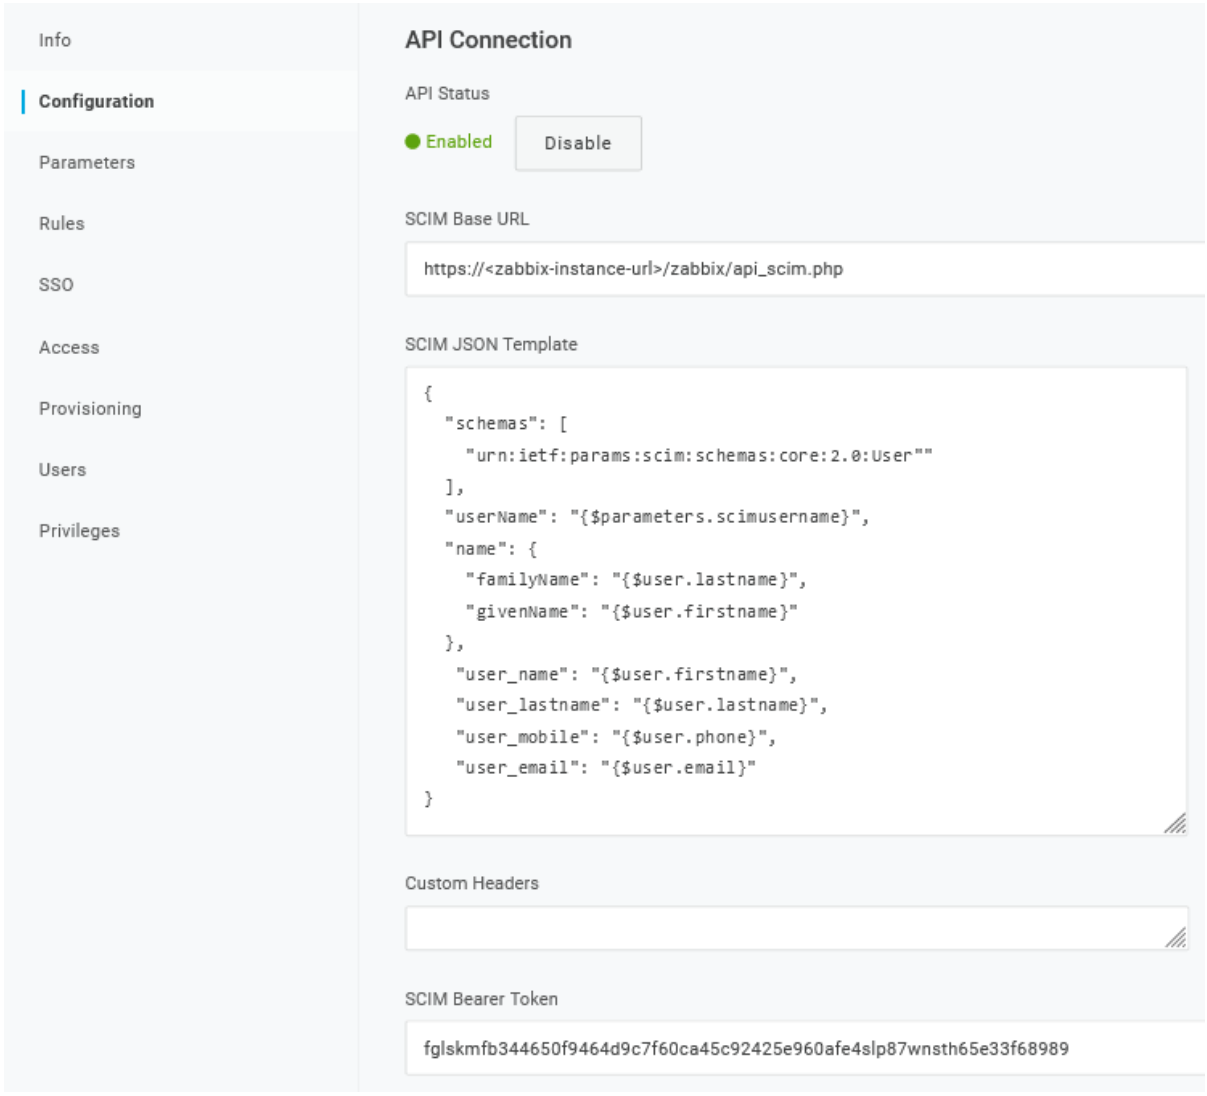
It is also possible to use "https". To use this with Zabbix, add the following line to the frontend configuration file (`zabbix.conf.php`):

```
$SSO['SETTINGS'] = ['use_proxy_headers' => true];
```

Leave other options with their default values.

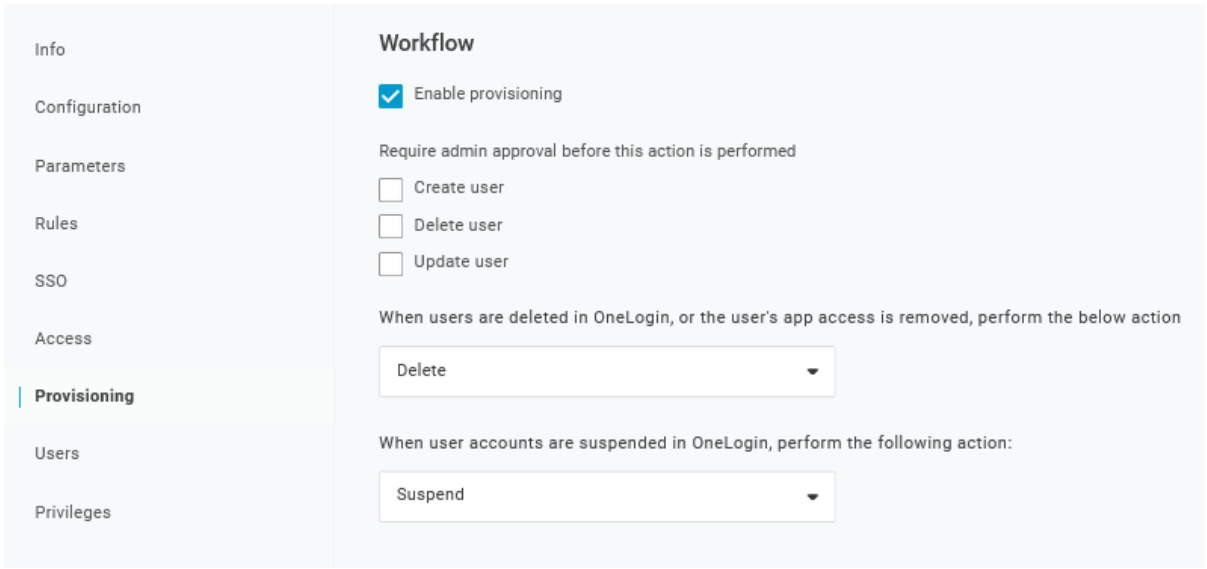
2. In *Configuration* > *API connection*, set the following values:

- *SCIM Base URL*: `https://<zabbix-instance-url>/zabbix/api_scim.php`
- *SCIM JSON Template*: should contain all custom attributes that you would like to pass to Zabbix via SCIM such as `user_name`, `user_lastname`, `user_email`, and `user_mobile`:



```
{
  "schemas": [
    "urn:ietf:params:scim:schemas:core:2.0:User"
  ],
  "userName": "{$parameters.scimusername}",
  "name": {
    "familyName": "{$user.lastname}",
    "givenName": "{$user.firstname}"
  },
   "user_name": "{$user.firstname}",
   "user_lastname": "{$user.lastname}",
   "user_mobile": "{$user.phone}",
   "user_email": "{$user.email}"
}
```

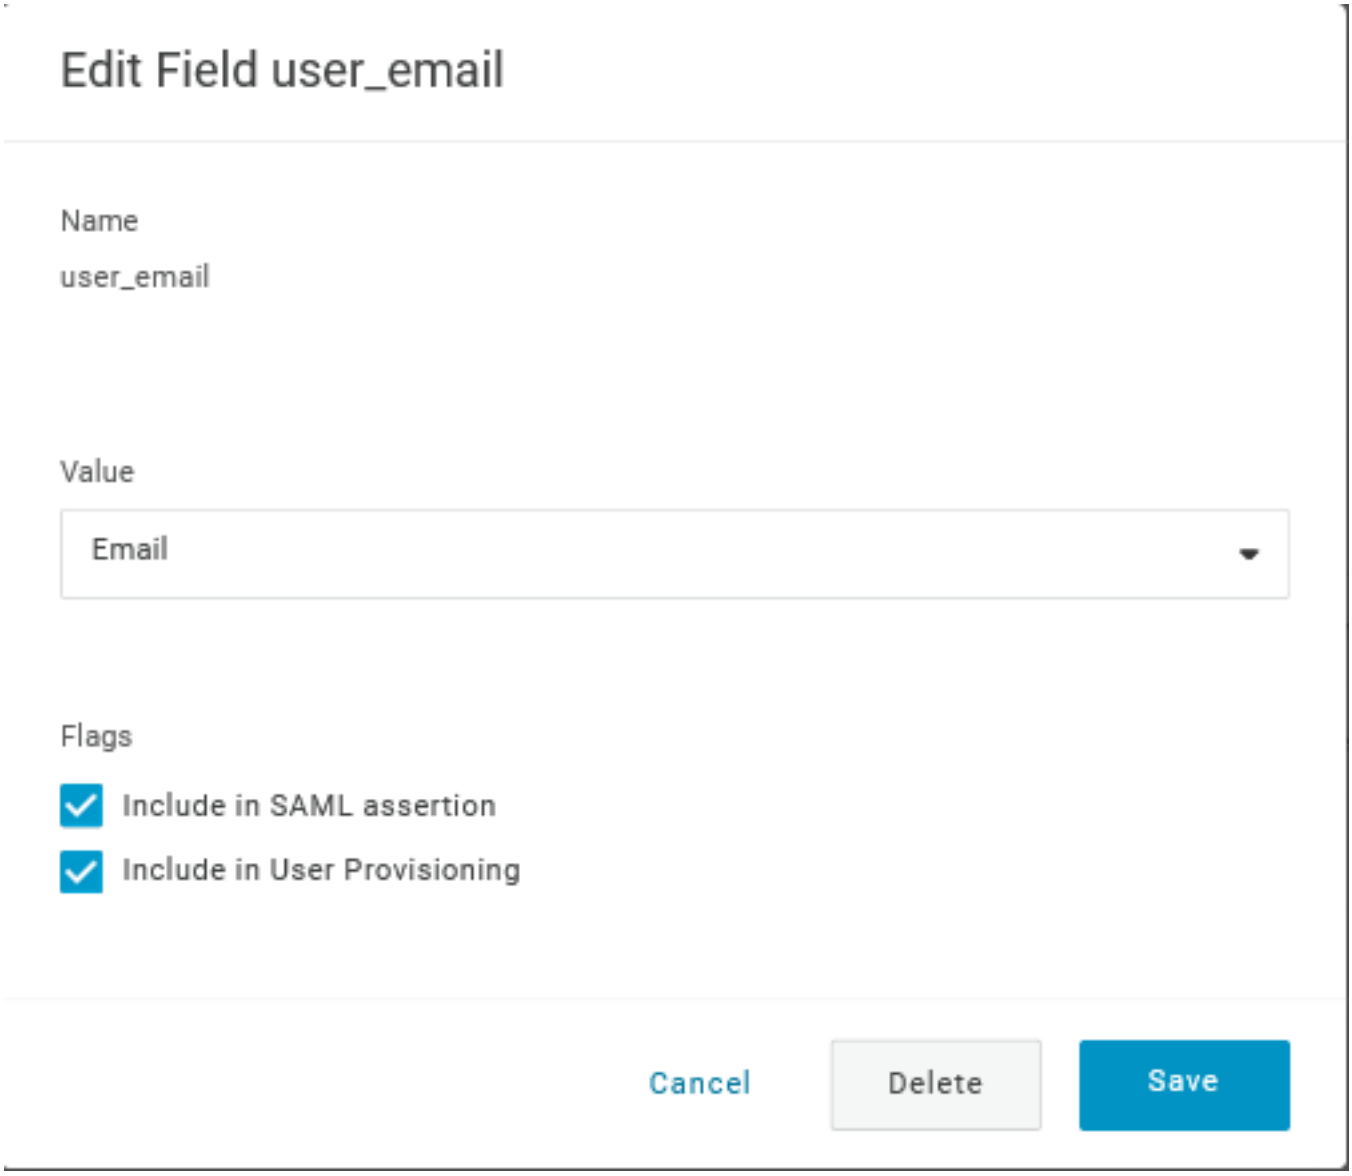
The attribute names are arbitrary. Different attribute names may be used, however, it is required that they match the respective field value in Zabbix SAML settings.



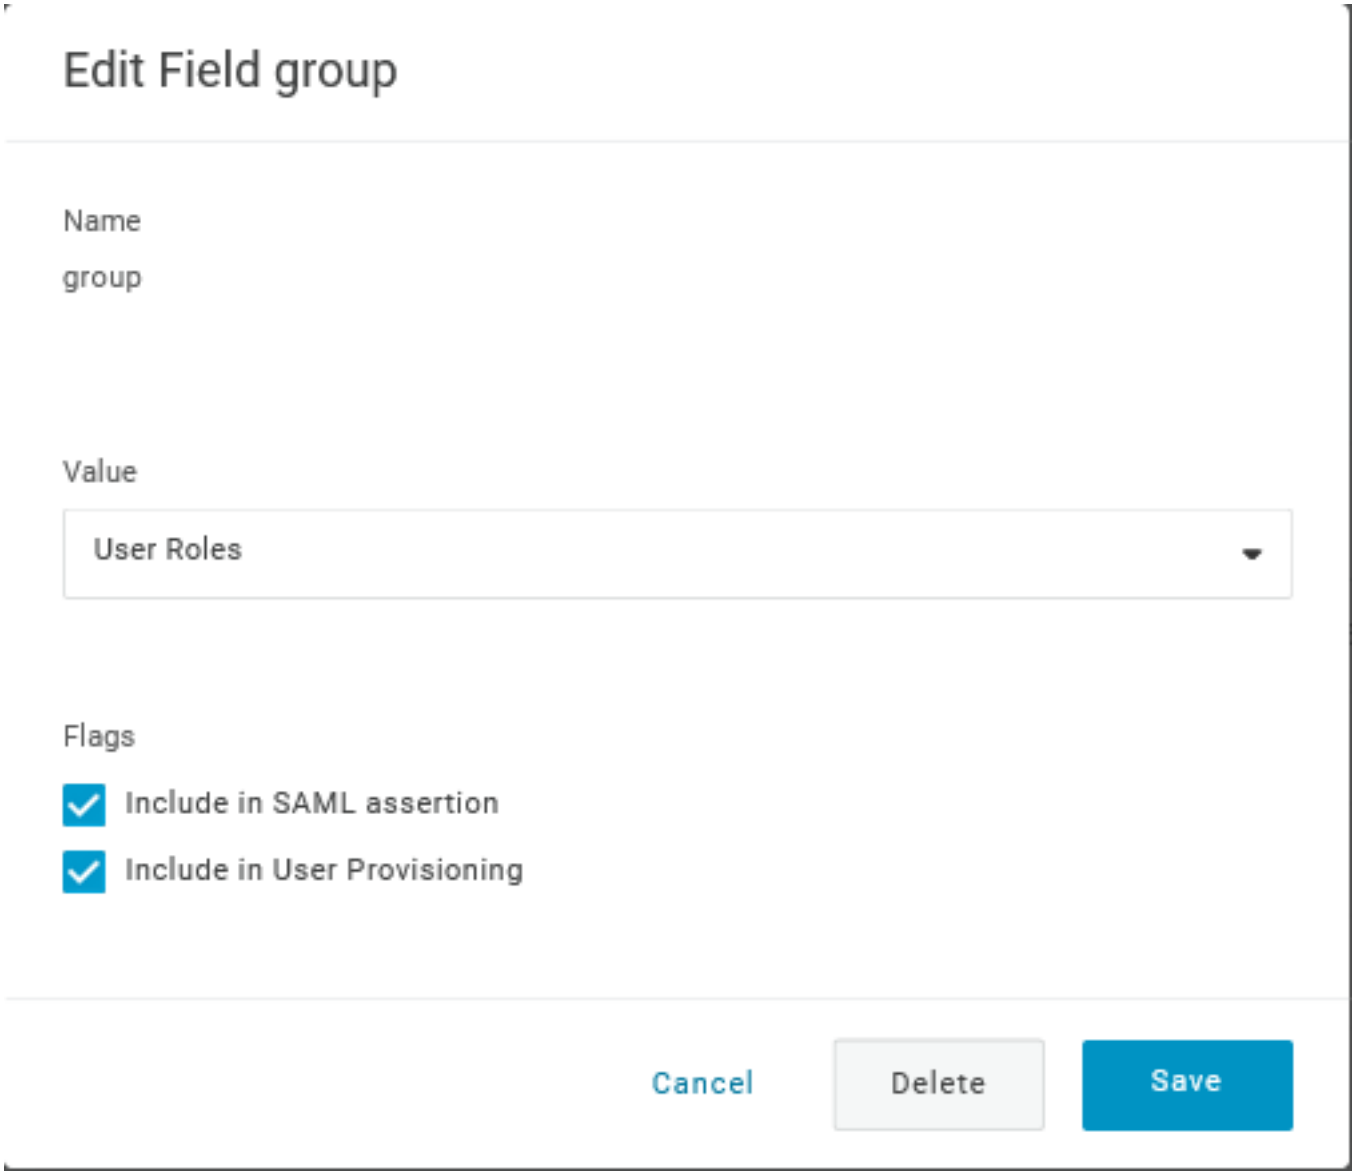
Note that for user provisioning to work, OneLogin needs to receive in response a 'name' attribute with 'givenName' and 'familyName', even if it was not required by the service provider. Thus it is necessary to specify this in the schema in the application configuration part.

- *SCIM Bearer Token*: enter a Zabbix API token with Super admin permissions.

Click *Enable* to activate the connection.

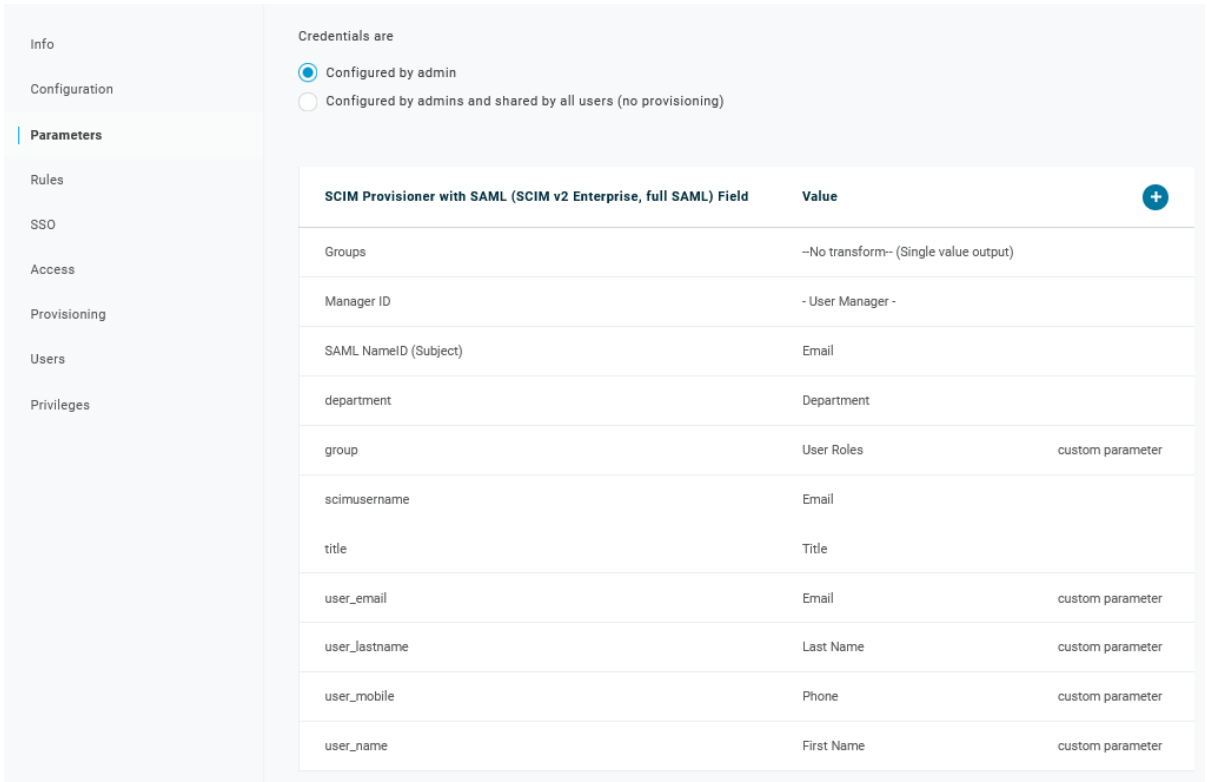


3. In the *Provisioning* page, enable the Provisioning option:

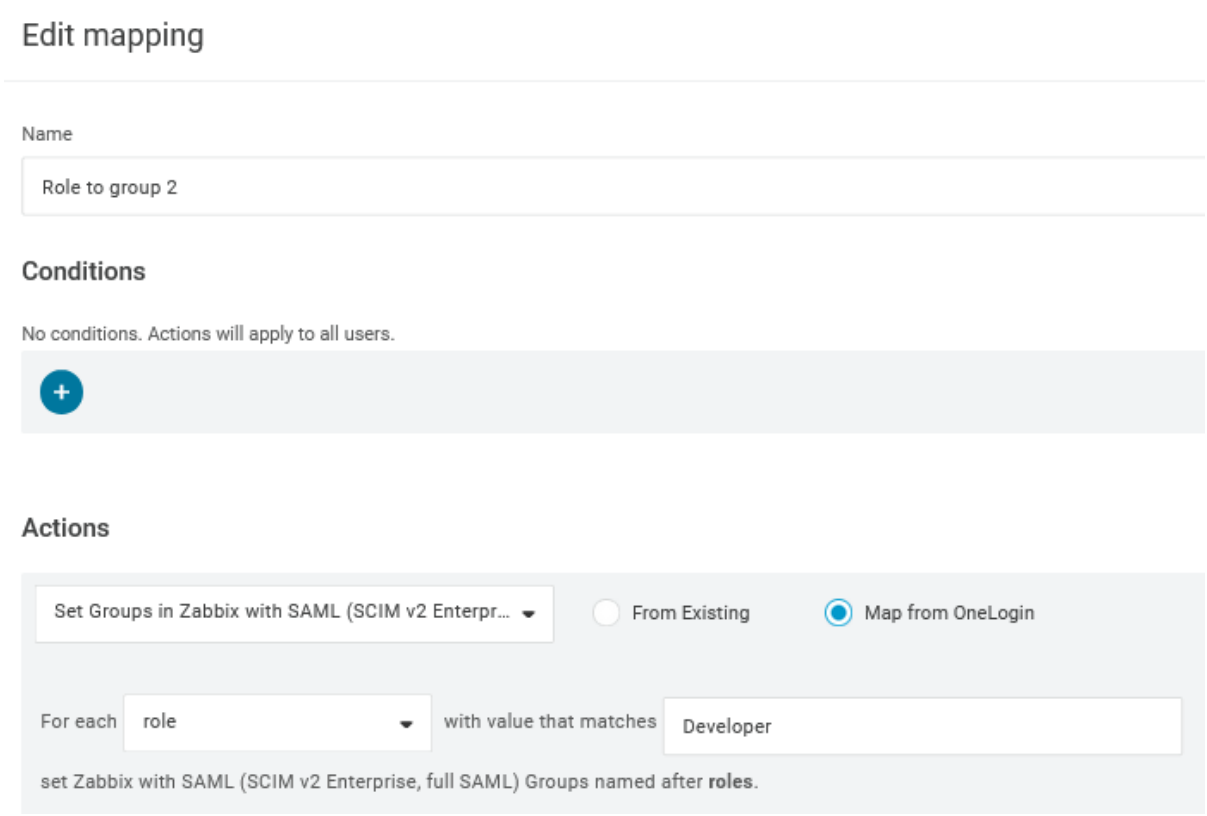


4. The *Parameters* page contains a list of default parameters:

- Make sure that the 'scimusername' matches the user login value in OneLogin (e.g., email);
- Mark the *Include in User Provisioning* option for the 'Groups' parameter;
- Click "+" to create the custom parameters that are required for SAML assertions and user provisioning such as `user_name`, `user_lastname`, `user_email`, and `user_mobile`:



When adding a parameter, make sure to mark both the *Include in SAML assertion* and *Include in User Provisioning* options.



- Add a 'group' parameter that matches user roles in OneLogin. User roles will be passed as a string, separated by a semicolon `;`. The OneLogin user roles will be the used for creating user groups in Zabbix:

Verify the list of parameters:

5. In the *Rules* page, create user role mappings to the default Groups parameter.

You may use a regular expression to pass specific roles as groups. The role names should not contain ; as OneLogin uses it as a separator when sending an attribute with several roles.

6. Download the IdP certificate. Set 644 permissions to it by running:

```
chmod 644 idp.crt
```

Zabbix configuration

1. In Zabbix, go to the SAML settings and fill the configuration options based on the OneLogin configuration:

Zabbix field	Setup field in OneLogin	Sample value
IdP entity ID	Issuer URL (see SSO tab of your application in OneLogin)	
SSO service URL	SAML 2.0 Endpoint (HTTP) (see SSO tab of your application in OneLogin)	

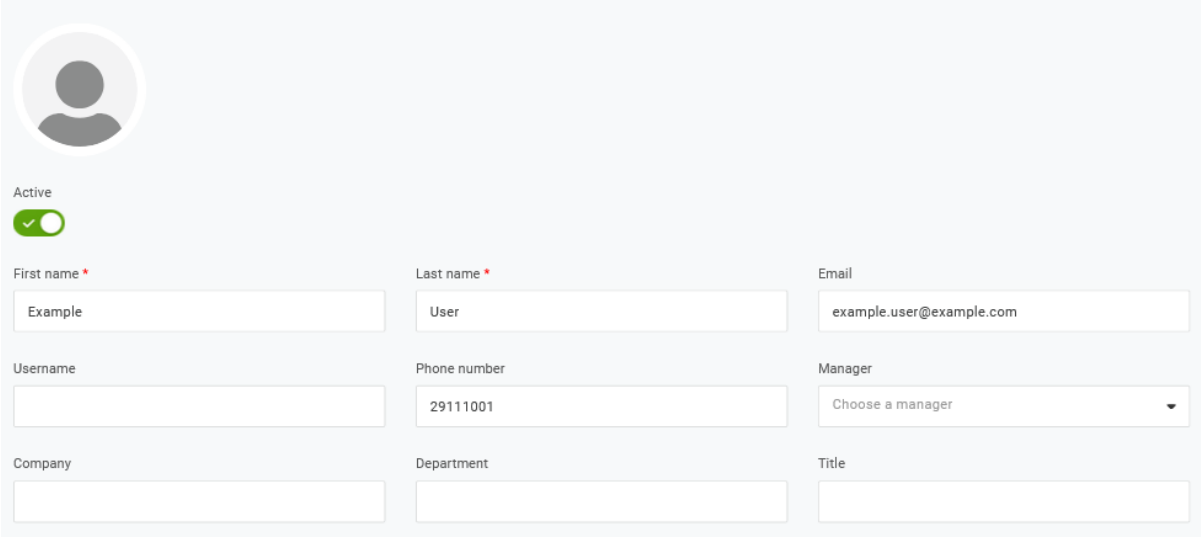
Zabbix field	Setup field in OneLogin	Sample value
SLO service URL	SLO Endpoint (HTTP) (see SSO tab of your application in OneLogin)	
Username attribute	Custom parameter	`user_email`
Group name attribute	Custom parameter	`group`
User name attribute	Custom parameter	`user_name`
User last name attribute	Custom parameter	`user_lastname`

It is also required to configure user group mapping. Media mapping is optional. Click *Update* to save these settings.

2. Add the Base64 certificate provided by OneLogin.

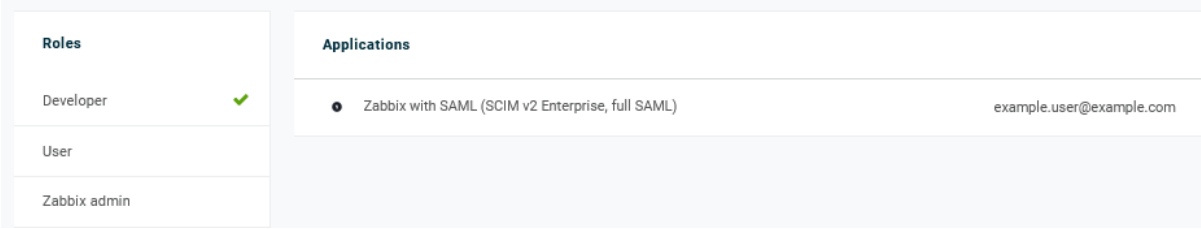
If `$SSO['CERT_STORAGE'] = 'database'` is set in the frontend configuration file (`zabbix.conf.php`), you can paste the certificate text or upload the certificate file in the frontend during SAML configuration—no files are required on the filesystem.

If `$SSO['CERT_STORAGE'] = 'file'` is set in the configuration file, the certificate must be made available on the filesystem (by default in `ui/conf/certs` or the path configured in the configuration file) and the frontend will not store certificates in the database. Note that if `$SSO['CERT_STORAGE']` is not set or is commented out, file storage is assumed and certificates are read from `ui/conf/certs`.



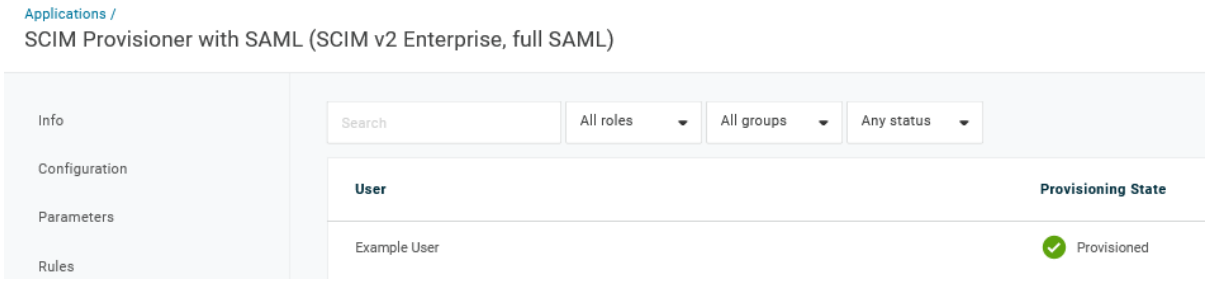
You can access the certificate download in OneLogin in *Applications* > *SSO* > click *View details* under the current certificate.

3. Click the *Update* button to save these settings.

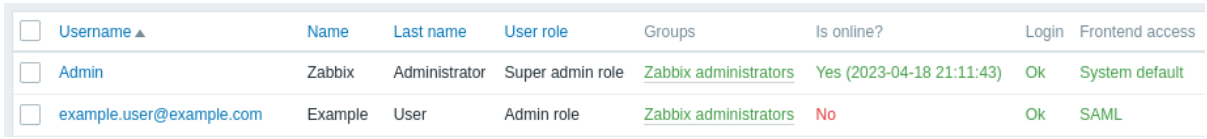


SCIM user provisioning

With user provisioning enabled, it is now possible to add/update users and their roles in OneLogin and have them immediately provisioned to Zabbix.



For example, you may create a new user:



Add it to a user role and the application that will provision the user:

When saving the user, it will be provisioned to Zabbix. In *Application* > *Users* you can check the provisioning status of current application users:

If successfully provisioned, the user can be seen in the Zabbix user list.

Username	Name	Last name	User role	Groups	Is online?	Login	Frontend access
Admin	Zabbix	Administrator	Super admin role	Zabbix administrators	Yes (2023-04-18 21:11:43)	Ok	System default
example.user@example.com	Example	User	Admin role	Zabbix administrators	No	Ok	SAML

Setting up scheduled reports

Overview

This section provides instructions on installing Zabbix web service and configuring Zabbix to enable generation of scheduled reports.

Installation

A new Zabbix web service process and Google Chrome browser should be installed to enable generation of scheduled reports. The web service may be installed on the same machine where the Zabbix server is installed or on a different machine. Google Chrome browser should be installed on the same machine, where the web service is installed.

The official zabbix-web-service package is available in the Zabbix repository. Google Chrome browser is not included into these packages and has to be installed separately.

To compile Zabbix web service from sources, see Installing Zabbix web service.

After the installation, run `zabbix_web_service` on the machine, where the web service is installed:

```
zabbix_web_service
```

Configuration

To ensure proper communication between all elements involved make sure the server configuration and frontend configuration parameters are properly configured.

Zabbix server

The following parameters in Zabbix server configuration file need to be updated: `WebServiceURL` and `StartReportWriters`.

WebServiceURL

This parameter is required to enable communication with the web service. The URL should be in the format `http[s]://host:port/report`.

- By default, the web service listens on port 10053. A different port can be specified in the web service configuration file.
- Specifying the `/report` path is mandatory (the path is hardcoded and cannot be changed).

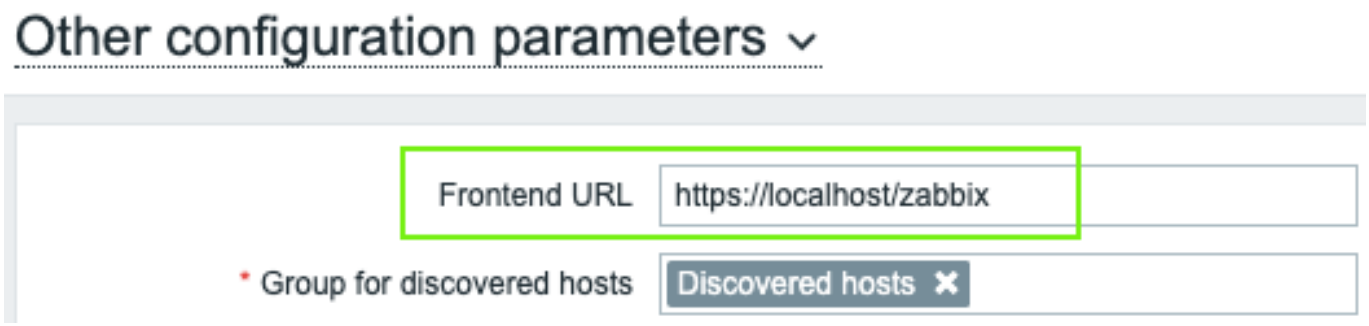
Example:

```
WebServiceURL=http://localhost:10053/report
```

Attention:
It is strongly recommended to set up encryption between Zabbix server and Zabbix web service using certificates. By default, data transmitted between Zabbix server and Zabbix web service is not encrypted, which can lead to unauthorized access.

StartReportWriters

This parameter determines how many report writer processes should be started. If it is not set or equals 0, report generation is disabled. Based on the number and frequency of reports required, it is possible to enable from 1 to 100 report writer processes.



Example:

```
StartReportWriters=3
```

Zabbix frontend

A *Frontend URL* parameter should be set to enable communication between Zabbix frontend and Zabbix web service:

- Proceed to the *Administration* > *General* > *Other* frontend menu section
- Specify the full URL of the Zabbix web interface in the *Frontend URL* parameter

Note:
Once the setup procedure is completed, you may want to configure and send a test report to make sure everything works correctly.

Items

This section contains reference information and technical notes about items, including parameter details for specific item keys, platform-specific details, and notes on special item configurations.

Please use the sidebar to find information relevant to your use case.

vm.memory.size parameters

Overview

This section provides some parameter details for the vm.memory.size[<mode>] agent item.

Parameters

The following parameters are available for this item:

- **active** - memory currently in use or very recently used, and so it is in RAM
- **anon** - memory not associated with a file (cannot be re-read from it)
- **available** - available memory, calculated differently depending on the platform (see the table below)
- **buffers** - cache for things like file system metadata
- **cached** - cache for various things
- **exec** - executable code, typically from a (program) file
- **file** - cache for contents of recently accessed files
- **free** - memory that is readily available to any entity requesting memory
- **inactive** - memory that is marked as not used
- **pavailable** - 'available' memory as percentage of 'total' (calculated as `available/total*100`)
- **pinned** - same as 'wired'
- **pused** - 'used' memory as percentage of 'total' (calculated as `used/total*100`)
- **shared** - memory that may be simultaneously accessed by multiple processes
- **slab** - total amount of memory used by the kernel to cache data structures for its own use
- **total** - total physical memory available
- **used** - used memory, calculated differently depending on the platform (see the table below)
- **wired** - memory that is marked to always stay in RAM. It is never moved to disk.

Warning:
Some of these parameters are platform-specific and might not be available on your platform. See Zabbix agent items for details.

Platform-specific calculation of **available** and **used**:

Platform	**”available”**	**”used”**
AIX	free + cached	real memory in use
FreeBSD	inactive + cached + free	active + wired + cached
HP UX	free	total - free
Linux<3.14	free + buffers + cached	total - free
Linux 3.14+ (also backported to 3.10 on RHEL 7)	/proc/meminfo, see ”MemAvailable” in Linux kernel documentation for details. Note that free + buffers + cached is no longer equal to ’available’ due to not all the page cache can be freed and low watermark being used in calculation.	total - free
NetBSD	inactive + execpages + file + free	total - free
OpenBSD	inactive + free + cached	active + wired
OSX	inactive + free	active + wired
Solaris	free	total - free
Win32	free	total - free

Attention:
The sum of *vm.memory.size[used]* and *vm.memory.size[available]* does not necessarily equal total. For instance, on FreeBSD:
 * Active, inactive, wired, cached memories are considered used, because they store some useful information.
 * At the same time inactive, cached, free memories are considered available, because these kinds of memories can be given instantly to processes that request more memory.
So inactive memory is both used and available simultaneously. Because of this, the *vm.memory.size[used]* item is designed for informational purposes only, while *vm.memory.size[available]* is designed to be used in triggers.

Minimum permission level for Windows agent items

Overview

When monitoring systems using an agent, a good practice is to obtain metrics from the host on which the agent is installed. To use the principle of least privilege, it is necessary to determine what metrics are obtained from the agent.

The table in this document allows you to select the minimum rights for guaranteed correct operation of Zabbix agent.

If a different user is selected for the agent to work, rather than ’LocalSystem’, then for the operation of agent as a Windows service, the new user must have the rights ”Log on as a service” from ”Local Policy→User Rights Assignment” and the right to create, write and delete the Zabbix agent log file. An Active Directory user must be added to the *Performance Monitor Users* group.

Note:
When working with the rights of an agent based on the ”minimum technically acceptable” group, prior provision of rights to objects for monitoring is required.

Common agent items supported on Windows

Item key	User group	
	Recommended	Minimum technically acceptable (functionality is limited)
agent.hostname	Guests	Guests
agent.ping	Guests	Guests
agent.variant	Guests	Guests
agent.version	Guests	Guests
log	Administrators	Guests
log.count	Administrators	Guests
logrt	Administrators	Guests
logrt.count	Administrators	Guests
net.dns	Guests	Guests
net.dns.perf	Guests	Guests

Item key	User group	
net.dns.record	Guests	Guests
net.if.discovery	Guests	Guests
net.if.in	Guests	Guests
net.if.out	Guests	Guests
net.if.total	Guests	Guests
net.tcp.listen	Guests	Guests
net.tcp.port	Guests	Guests
net.tcp.service	Guests	Guests
net.tcp.service.perf	Guests	Guests
net.udp.service	Guests	Guests
net.udp.service.perf	Guests	Guests
proc.num	Administrators	Guests
system.cpu.discovery	Performance Monitor Users	Performance Monitor Users
system.cpu.load	Performance Monitor Users	Performance Monitor Users
system.cpu.num	Guests	Guests
system.cpu.util	Performance Monitor Users	Performance Monitor Users
system.hostname	Guests	Guests
system.localtime	Guests	Guests
system.run	Administrators	Guests
system.sw.arch	Guests	Guests
system.swap.size	Guests	Guests
system.uname	Guests	Guests
system.uptime	Performance Monitor Users	Performance Monitor Users
vfs.dir.count	Administrators	Guests
vfs.dir.get	Administrators	Guests
vfs.dir.size	Administrators	Guests
vfs.file.cksum	Administrators	Guests
vfs.file.contents	Administrators	Guests
vfs.file.exists	Administrators	Guests
vfs.file.md5sum	Administrators	Guests
vfs.file.regexp	Administrators	Guests
vfs.file.regmatch	Administrators	Guests
vfs.file.size	Administrators	Guests
vfs.file.time	Administrators	Guests
vfs.fs.discovery	Administrators	Guests
vfs.fs.size	Administrators	Guests
vfs.fs.get	Administrators	Guests
vm.memory.size	Guests	Guests
web.page.get	Guests	Guests
web.page.perf	Guests	Guests
web.page.regexp	Guests	Guests
zabbix.stats	Guests	Guests

Windows-specific item keys

Item key	User group	
	Recommended	Minimum technically acceptable (functionality is limited)
eventlog	Event Log Readers	Guests
net.if.list	Guests	Guests
perf_counter	Performance Monitor Users	Performance Monitor Users
proc_info	Administrators	Guests
service.discovery	Guests	Guests
service.info	Guests	Guests
services	Guests	Guests
wmi.get	Administrators	Guests
vm.vmemory.size	Guests	Guests

Encoding of returned values

Zabbix server expects every returned text value in the UTF8 encoding. This is related to any type of checks: Zabbix agent, SSH, Telnet, etc.

Different monitored systems/devices and checks can return non-ASCII characters in the value. For such cases, almost all possible **zabbix** keys contain an additional item key parameter - **<encoding>**. This key parameter is optional but it should be specified if the returned value is not in the UTF8 encoding and it contains non-ASCII characters. Otherwise, the result can be unexpected and unpredictable.

A description of behavior with different database backends in such cases follows.

MySQL

If a value contains a non-ASCII character in non UTF8 encoding - this character and the following will be discarded when the database stores this value. No warning messages will be written to the zabbix_server.log.
 Relevant for at least MySQL version 5.1.61.

PostgreSQL

If a value contains a non-ASCII character in non UTF8 encoding - this will lead to a failed SQL query (PGRES_FATAL_ERROR:ERROR invalid byte sequence for encoding) and data will not be stored. An appropriate warning message will be written to the zabbix_server.log.
 Relevant for at least PostgreSQL version 9.1.3.

Large file support

Large file support, often abbreviated to LFS, is the term applied to the ability to work with files larger than 2 GB on 32-bit operating systems. Support for large files affects at least log file monitoring and all vfs.file.* items. Large file support depends on the capabilities of a system at Zabbix compilation time, but is completely disabled on a 32-bit Solaris due to its incompatibility with procfs and swapctl.

Sensor

Overview

Each sensor chip gets its own directory in the sysfs /sys/devices tree. To find all sensor chips, it is easier to follow the device symlinks from /sys/class/hwmon/hwmon*, where * is a real number (0,1,2,...).

The sensor readings are located either in /sys/class/hwmon/hwmon*/ directory for virtual devices, or in /sys/class/hwmon/hwmon*/dev directory for non-virtual devices. A file, named name, located inside hwmon* or hwmon*/device directories contains the name of the chip, which corresponds to the name of the kernel driver used by the sensor chip.

There is only one sensor reading value per file. The common scheme for naming the files that contain sensor readings inside any of the directories mentioned above is: <type><number>_<item>, where

- **type** - for sensor chips is "in" (voltage), "temp" (temperature), "fan" (fan), etc.
- **item** - "input" (measured value), "max" (high threshold), "min" (low threshold), etc.
- **number** - always used for elements that can be present more than once (usually starts from 1, except for voltages which start from 0). If files do not refer to a specific element they have a simple name with no number.

The information regarding sensors available on the host can be acquired using **sensors-detect** and **sensors** tools (lm-sensors package). **Sensors-detect** helps to determine which modules are necessary for available sensors. When modules are loaded the **sensors** program can be used to show the readings of all sensor chips. The labeling of sensor readings, used by this program, can be different from the common naming scheme (<type><number>_<item>):

- if there is a file called <type><number>_label, then the label inside this file will be used instead of <type><number><item> name;
- if there is no <type><number>_label file, then the program searches inside the /etc/sensors.conf (could be also /etc/sensors3.conf, or different) for the name substitution.

This labeling allows user to determine what kind of hardware is used. If there is neither <type><number>_label file nor label inside the configuration file the type of hardware can be determined by the name attribute (hwmon*/device/name). The actual names of sensors, which zabbix_agent accepts, can be obtained by running **sensors** program with -u parameter (sensors -u).

In the **sensors** program the available sensors are separated by the bus type (ISA adapter, PCI adapter, SPI adapter, Virtual device, ACPI interface, HID adapter).

Obtaining sensor identifiers

Sensor labels, as printed by the sensors command, cannot always be used directly because labeling varies between chip vendors. For example, sensors output might contain the following lines:

```
sensors
in0:          +2.24 V  (min =  +0.00 V, max =  +3.32 V)
Vcore:        +1.15 V  (min =  +0.00 V, max =  +2.99 V)
+3.3V:        +3.30 V  (min =  +2.97 V, max =  +3.63 V)
+12V:        +13.00 V  (min =  +0.00 V, max = +15.94 V)
M/B Temp:     +30.0°C  (low  = -127.0°C, high = +127.0°C)
```

Out of these, only one display name corresponds directly to an internal identifier:

```
zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in0]
2.240000
```

Attempting to use other display labels (like `Vcore` or `+12V`) will not work:

```
zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,Vcore]
ZBX_NOTSUPPORTED
```

To find the internal sensor identifier that Zabbix accepts, run `sensors -u`. In the output, the following may be observed:

```
sensors -u
...
Vcore:
  in1_input: 1.15
  in1_min: 0.00
  in1_max: 2.99
  in1_alarm: 0.00
...
+12V:
  in4_input: 13.00
  in4_min: 0.00
  in4_max: 15.94
  in4_alarm: 0.00
...
```

So the `Vcore` label corresponds to identifier `in1`, and `+12V` corresponds to `in4`. According to the kernel hwmon sysfs specification, these are voltages on chip pins and generally speaking may need scaling.

```
zabbix_get -s 127.0.0.1 -k sensor[lm85-i2c-0-2e,in1]
1.301000
```

Not only voltage (`in`), but also current (`curr`), temperature (`temp`) and fan speed (`fan`) readings can be retrieved by Zabbix.

Compatibility

Legacy distributions

Sensor readings are obtained from `/proc/sys/dev/sensors` directory:

- **device** - device name (if <mode> is used, it is a regular expression)
- **sensor** - sensor name (if <mode> is used, it is a regular expression)
- **mode** - possible values: `avg`, `max`, `min` (if this parameter is omitted, device and sensor are treated verbatim)

Example key: `sensor[w83781d-i2c-0-2d,temp1]`.

Current distributions

Sensor readings are obtained from `/sys/class/hwmon` directory:

- **device** - device name (non-regular expression). The device name could be the actual name of the device (e.g `0000:00:18.3`) or the name acquired using sensors program (e.g., `k8temp-pci-00c3`). It is up to the user to choose which name to use.
- **sensor** - sensor name (non-regular expression).
- **mode** - possible values: `avg`, `max`, `min` (if this parameter is omitted, device and sensor are treated verbatim).

Example keys:

`sensor[k8temp-pci-00c3,temp,max]` or `sensor[0000:00:18.3,temp1]`.

`sensor[smsc47b397-isa-0880,in,avg]` or `sensor[smsc47b397.2176,in1]`.

Notes on memtype parameter in proc.mem items

Overview

The **memtype** parameter is supported on Linux, AIX, FreeBSD, and Solaris platforms.

Three common values of memtype are supported on all of these platforms: pmem, rss and vsize. Additionally, platform-specific memtype values are supported on some platforms.

AIX

See values supported for memtype parameter on AIX in the table.

Supported value	Description	Source in procentry64 structure	Tries to be compatible with
vsize [1]	Virtual memory size	pi_size	
pmem	Percentage of real memory	pi_prm	ps -o pmem
rss	Resident set size	pi_trss + pi_drss	ps -o rssize
size	Size of process (code + data)	pi_dvm	ps gvw SIZE column
dsize	Data size	pi_dsize	
tsize	Text (code) size	pi_tsize	ps gvw TSIZ column
sdsize	Data size from shared library	pi_sdsize	
drss	Data resident set size	pi_drss	
trss	Text resident set size	pi_trss	

Notes for AIX:

1. When choosing parameters for proc.mem[] item key on AIX, try to specify narrow process selection criteria. Otherwise, there is a risk of getting unwanted processes counted into proc.mem[] result.

Example:

```
$ zabbix_agentd -t proc.mem[,,,NonExistingProcess,rss]
proc.mem[,,,NonExistingProcess,rss]           [u|2879488]
```

This example shows that specifying only the command line (regular expression to match) parameter results in Zabbix agent self-accounting, which is probably not what you want.

2. Do not use ps -ef to browse processes — it shows only non-kernel processes. Use ps -Af to see all processes which will be seen by Zabbix agent.
3. Let's go through example of topasrec how Zabbix agent proc.mem[] selects processes.

```
$ ps -Af | grep topasrec
root 10747984        1   0   Mar 16      -  0:00 /usr/bin/topasrec  -L -s 300 -R 1 -r 6 -o /var/perf daily
```

proc.mem[] has arguments:

proc.mem[<name>,<user>,<mode>,<cmdline>,<memtype>]

where: - The first criterion is a process name (argument <name>). In our example Zabbix agent will see it as topasrec. In order to match, you need to either specify topasrec or to leave it empty. - The second criterion is a user name (argument <user>). To match, you need to either specify root or to leave it empty. - The third criterion used in process selection is an argument <cmdline>. Zabbix agent will see its value as /usr/bin/topasrec -L -s 300 -R 1 -r 6 -o /var/perf/daily/ -ypersistent=1 -O type=bin -ystart_time=04:08:54,Mar16,2023. To match, you need to either specify a regular expression which matches this string or to leave it empty.

Arguments <mode> and <memtype> are applied after using the three criteria mentioned above.

FreeBSD

See values supported for memtype parameter on FreeBSD in the table.

Supported value	Description	Source in kinfo_proc structure	Tries to be compatible with
vsize	Virtual memory size	kp_eproc.e_vm.vm_map.size or ki_size	ps -o vsz
pmem	Percentage of real memory	calculated from rss	ps -o pmem
rss	Resident set size	kp_eproc.e_vm.vm_rssize or ki_rssize	ps -o rss
size [1]	Size of process (code + data + stack)	tsize + dsize + ssize	
tsize	Text (code) size	kp_eproc.e_vm.vm_tsize or ki_tsize	ps -o tsiz
dsize	Data size	kp_eproc.e_vm.vm_dsize or ki_dsize	ps -o dsiz
ssize	Stack size	kp_eproc.e_vm.vm_ssize or ki_ssize	ps -o ssiz

Linux

See values supported for memtype parameter on Linux in the table.

Supported value	Description	Source in /proc/<pid>/status file
vsize [1]	Virtual memory size	VmSize
pmem	Percentage of real memory	(VmRSS/total_memory) * 100
rss	Resident set size	VmRSS
data	Size of data segment	VmData
exe	Size of code segment	VmExe
hwm	Peak resident set size	VmHWM
lck	Size of locked memory	VmLck
lib	Size of shared libraries	VmLib
peak	Peak virtual memory size	VmPeak
pin	Size of pinned pages	VmPin
pte	Size of page table entries	VmPTE
size	Size of process code + data + stack segments	VmExe + VmData + VmStk
stk	Size of stack segment	VmStk
swap	Size of swap space used	VmSwap

Notes for Linux:

1. Not all memtype values are supported by older Linux kernels. For example, Linux 2.4 kernels do not support hwm, pin, peak, pte and swap values.
2. We have noticed that self-monitoring of the Zabbix agent active check process with proc.mem[...,...,...,...,data] shows a value that is 4 kB larger than reported by VmData line in the agent's /proc/<pid>/status file. At the time of self-measurement the agent's data segment increases by 4 kB and then returns to the previous size.

Solaris

See values supported for memtype parameter on Solaris in the table.

Supported value	Description	Source in psinfo structure	Tries to be compatible with
vsize [1]	Size of process image	pr_size	ps -o vsz
pmem	Percentage of real memory	pr_pctmem	ps -o pmem
rss	Resident set size It may be underestimated (see rss description in man ps).	pr_rssize	ps -o rss

Footnotes

[1] Default value.

Notes on selecting processes in proc.mem and proc.num items

Processes modifying their commandline

Some programs use modifying their commandline as a method for displaying their current activity. A user can see the activity by running ps and top commands. Examples of such programs include *PostgreSQL*, *Sendmail*, *Zabbix*.

Let's see an example from Linux. Let's assume we want to monitor a number of Zabbix agent processes.

ps command shows processes of interest as

```
$ ps -fu zabbix
UID        PID  PPID  C STIME TTY          TIME CMD
...
zabbix    6318     1  0 12:01 ?        00:00:00 sbin/zabbix_agentd -c /home/zabbix/zabbix_agentd.conf
zabbix    6319  6318  0 12:01 ?        00:00:01 sbin/zabbix_agentd: collector [idle 1 sec]
zabbix    6320  6318  0 12:01 ?        00:00:00 sbin/zabbix_agentd: listener #1 [waiting for connection]
zabbix    6321  6318  0 12:01 ?        00:00:00 sbin/zabbix_agentd: listener #2 [waiting for connection]
zabbix    6322  6318  0 12:01 ?        00:00:00 sbin/zabbix_agentd: listener #3 [waiting for connection]
zabbix    6323  6318  0 12:01 ?        00:00:00 sbin/zabbix_agentd: active checks #1 [idle 1 sec]
...
```

Selecting processes by name and user does the job:

```
$ zabbix_get -s localhost -k 'proc.num[zabbix_agentd,zabbix]'
6
```

Now let's rename zabbix_agentd executable to zabbix_agentd_30 and restart it.

ps now shows

```
$ ps -fu zabbix
UID        PID  PPID  C STIME TTY          TIME CMD
...
zabbix    6715     1  0 12:53 ?        00:00:00 sbin/zabbix_agentd_30 -c /home/zabbix/zabbix_agentd.conf
zabbix    6716  6715  0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: collector [idle 1 sec]
zabbix    6717  6715  0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: listener #1 [waiting for connection
zabbix    6718  6715  0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: listener #2 [waiting for connection
zabbix    6719  6715  0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: listener #3 [waiting for connection
zabbix    6720  6715  0 12:53 ?        00:00:00 sbin/zabbix_agentd_30: active checks #1 [idle 1 sec]
...
```

Now selecting processes by name and user produces an incorrect result:

```
$ zabbix_get -s localhost -k 'proc.num[zabbix_agentd_30,zabbix]'
1
```

Why a simple renaming of executable to a longer name lead to quite different result ?

Zabbix agent starts with checking the process name. /proc/<pid>/status file is opened and the line Name is checked. In our case the Name lines are:

```
$ grep Name /proc/{6715,6716,6717,6718,6719,6720}/status
/proc/6715/status:Name:   zabbix_agentd_3
/proc/6716/status:Name:   zabbix_agentd_3
/proc/6717/status:Name:   zabbix_agentd_3
/proc/6718/status:Name:   zabbix_agentd_3
/proc/6719/status:Name:   zabbix_agentd_3
/proc/6720/status:Name:   zabbix_agentd_3
```

The process name in status file is truncated to 15 characters.

A similar result can be seen with ps command:

```
$ ps -u zabbix
  PID TTY          TIME CMD
...
 6715 ?        00:00:00 zabbix_agentd_3
 6716 ?        00:00:01 zabbix_agentd_3
 6717 ?        00:00:00 zabbix_agentd_3
 6718 ?        00:00:00 zabbix_agentd_3
```

```
 6719 ?        00:00:00 zabbix_agentd_3
 6720 ?        00:00:00 zabbix_agentd_3
 ...
```

Obviously, that is not equal to our `proc.num[]` `name` parameter value `zabbix_agentd_30`. Having failed to match the process name from `status` file the Zabbix agent turns to `/proc/<pid>/cmdline` file.

How the agent sees the "cmdline" file can be illustrated with running a command

```
$ for i in 6715 6716 6717 6718 6719 6720; do cat /proc/$i/cmdline | awk '{gsub(/\x0/,"<NUL>"); print};'; d
sbin/zabbix_agentd_30<NUL>-c<NUL>/home/zabbix/zabbix_agentd.conf<NUL>
sbin/zabbix_agentd_30: collector [idle 1 sec]<NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><
sbin/zabbix_agentd_30: listener #1 [waiting for connection]<NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><N
sbin/zabbix_agentd_30: listener #2 [waiting for connection]<NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><N
sbin/zabbix_agentd_30: listener #3 [waiting for connection]<NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><N
sbin/zabbix_agentd_30: active checks #1 [idle 1 sec]<NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL><NUL
```

`/proc/<pid>/cmdline` files in our case contain invisible, non-printable null bytes, used to terminate strings in *C* language. The null bytes are shown as "<NUL>" in this example.

Zabbix agent checks "cmdline" for the main process and takes a `zabbix_agentd_30`, which matches our `name` parameter value `zabbix_agentd_30`. So, the main process is counted by item `proc.num[zabbix_agentd_30,zabbix]`.

When checking the next process, the agent takes `zabbix_agentd_30: collector [idle 1 sec]` from the `cmdline` file and it does not meet our `name` parameter `zabbix_agentd_30`. So, only the main process which does not modify its commandline, gets counted. Other agent processes modify their command line and are ignored.

This example shows that the `name` parameter cannot be used in `proc.mem[]` and `proc.num[]` for selecting processes in this case.

Note:
For `proc.get[]` item, when Zabbix agent checks "cmdline" for the process name, it will only use part of the name starting from the last slash and until the first space or colon sign. Process name received from cmdline file will only be used if its beginning completely matches the shortened process name in the `status` file. The algorithm is the same for both process name in the filter and in the JSON output.

Using `cmdline` parameter with a proper regular expression produces a correct result:

```
$ zabbix_get -s localhost -k 'proc.num[,zabbix,,zabbix_agentd_30[ :]]'
6
```

Be careful when using `proc.get[]`, `proc.mem[]` and `proc.num[]` items for monitoring programs which modify their command lines.

Before putting `name` and `cmdline` parameters into `proc.get[]`, `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

Linux kernel threads

Threads cannot be selected with `cmdline` parameter in `proc.get[]`, `proc.mem[]` and `proc.num[]` items

Let's take as an example one of kernel threads:

```
$ ps -ef| grep kthreadd
root         2     0  0 09:33 ?        00:00:00 [kthreadd]
```

It can be selected with process `name` parameter:

```
$ zabbix_get -s localhost -k 'proc.num[kthreadd,root]'
1
```

But selection by process `cmdline` parameter does not work:

```
$ zabbix_get -s localhost -k 'proc.num[,root,,kthreadd]'
0
```

The reason is that Zabbix agent takes the regular expression specified in `cmdline` parameter and applies it to contents of process `/proc/<pid>/cmdline`. For kernel threads their `/proc/<pid>/cmdline` files are empty. So, `cmdline` parameter never matches.

Counting of threads in `proc.mem[]` and `proc.num[]` items

Linux kernel threads are counted by `proc.num[]` item but do not report memory in `proc.mem[]` item. For example:

```
$ ps -ef | grep kthreadd
root         2     0  0 09:51 ?        00:00:00 [kthreadd]

$ zabbix_get -s localhost -k 'proc.num[kthreadd]'
1

$ zabbix_get -s localhost -k 'proc.mem[kthreadd]'
ZBX_NOTSUPPORTED: Cannot get amount of "VmSize" memory.
```

But what happens if there is a user process with the same name as a kernel thread ? Then it could look like this:

```
$ ps -ef | grep kthreadd
root         2     0  0 09:51 ?        00:00:00 [kthreadd]
zabbix    9611  6133  0 17:58 pts/1    00:00:00 ./kthreadd

$ zabbix_get -s localhost -k 'proc.num[kthreadd]'
2

$ zabbix_get -s localhost -k 'proc.mem[kthreadd]'
4157440
```

`proc.num[]` counted both the kernel thread and the user process. `proc.mem[]` reports memory for the user process only and counts the kernel thread memory as if it was 0. This is different from the case above when ZBX_NOTSUPPORTED was reported.

Be careful when using `proc.mem[]` and `proc.num[]` items if the program name happens to match one of the thread.

Before putting parameters into `proc.mem[]` and `proc.num[]` items, you may want to test the parameters using `proc.num[]` item and `ps` command.

Implementation details of net.tcp.service and net.udp.service checks

Implementation of net.tcp.service and net.udp.service checks is detailed on this page for various services specified in the service parameter.

Item net.tcp.service parameters

ftp

Creates a TCP connection and expects the first 4 characters of the response to be "220 ", then sends "QUIT\r\n". Default port 21 is used if not specified.

http

Creates a TCP connection without expecting and sending anything. Default port 80 is used if not specified.

https

Uses (and only works with) libcurl, does not verify the authenticity of the certificate, does not verify the host name in the SSL certificate, only fetches the response header (HEAD request). Default port 443 is used if not specified.

imap

Creates a TCP connection and expects the first 4 characters of the response to be "* OK", then sends "a1 LOGOUT\r\n". Default port 143 is used if not specified.

ldap

Opens a connection to an LDAP server and performs an LDAP search operation with filter set to (objectClass=*). Expects successful retrieval of the first attribute of the first entry. Default port 389 is used if not specified.

nntp

Creates a TCP connection and expects the first 3 characters of the response to be "200" or "201", then sends "QUIT\r\n". Default port 119 is used if not specified.

pop

Creates a TCP connection and expects the first 3 characters of the response to be "+OK", then sends "QUIT\r\n". Default port 110 is used if not specified.

smtp

Creates a TCP connection and expects the first 3 characters of the response to be ”220”, followed by a space, the line ending or a dash. The lines containing a dash belong to a multiline response and the response will be re-read until a line without the dash is received. Then sends ”QUIT\r\n”. Default port 25 is used if not specified.

ssh

Creates a TCP connection. If the connection has been established, both sides exchange an identification string (SSH-major.minor-XXXX), where major and minor are protocol versions and XXXX is a string. Zabbix checks if the string matching the specification is found and then sends back the string ”SSH-major.minor-zabbix_agent\r\n” or ”0\n” on mismatch. Default port 22 is used if not specified.

tcp

Creates a TCP connection without expecting and sending anything. Unlike the other checks requires the port parameter to be specified.

telnet

Creates a TCP connection and expects a login prompt (’:’ at the end). Default port 23 is used if not specified.

Item net.udp.service parameters

ntp

Sends an SNTP packet over UDP and validates the response according to RFC 4330, section 5. Default port 123 is used if not specified.

proc.get parameters

Overview

The item **proc.get**[<name>,<user>,<cmdline>,<mode>] is supported on Linux, Windows, FreeBSD, OpenBSD, and NetBSD.

List of process parameters returned by the item varies depending on the operating system and ’mode’ argument value.

Linux

The following process parameters are returned on Linux for each mode:

mode=process	mode=thread	mode=summary
pid: PID	pid: PID	name: process name
ppid: parent PID	ppid: parent PID	processes: number of processes
name: process name	name: process name	vsize: virtual memory size
cmdline: command with arguments	user: user (real) the process runs under	pmem: percentage of real memory
user: user (real) the process runs under	group: group (real) the process runs under	rss: resident set size
group: group (real) the process runs under	uid: user ID	data: size of data segment
uid: user ID	gid: ID of the group the process runs under	exe: size of code segment
gid: ID of the group the process runs under	tid: thread ID	lib: size of shared libraries
vsize: virtual memory size	tname: thread name	lck: size of locked memory
pmem: percentage of real memory	cputime_user: total CPU time spent in user mode (value expressed in clock ticks—divide by `getconf CLK_TCK` or `sysconf(_SC_CLK_TCK)` to obtain seconds)	pin: size of pinned pages
rss: resident set size	cputime_system: total CPU time spent in system mode (value expressed in clock ticks—divide by `getconf CLK_TCK` or `sysconf(_SC_CLK_TCK)` to obtain seconds)	pte: size of page table entries
data: size of data segment	state: thread state	size: size of process code + data + stack segments

mode=process	mode=thread	mode=summary
exe: size of code segment	ctx_switches: number of context switches	stk: size of stack segment
hwm: peak resident set size	page_faults: number of page faults	swap: size of swap space used
lck: size of locked memory		cputime_user: total CPU time spent in user mode (value expressed in clock ticks—divide by `getconf CLK_TCK` or `sysconf(_SC_CLK_TCK)` to obtain seconds)
lib: size of shared libraries		cputime_system: total CPU time spent in system mode (value expressed in clock ticks—divide by `getconf CLK_TCK` or `sysconf(_SC_CLK_TCK)` to obtain seconds)
peak: peak virtual memory size		ctx_switches: number of context switches
pin: size of pinned pages		threads: number of threads
pte: size of page table entries		page_faults: number of page faults
size: size of process code + data + stack segments		pss: proportional set size memory
stk: size of stack segment		
swap: size of swap space used		
cputime_user: total CPU time spent in user mode (value expressed in clock ticks—divide by `getconf CLK_TCK` or `sysconf(_SC_CLK_TCK)` to obtain seconds)		
cputime_system: total CPU time spent in system mode (value expressed in clock ticks—divide by `getconf CLK_TCK` or `sysconf(_SC_CLK_TCK)` to obtain seconds)		
state: process state (transparently retrieved from procfs, long form)		
ctx_switches: number of context switches		
threads: number of threads		
page_faults: number of page faults		
pss: proportional set size memory		

BSD-based OS

The following process parameters are returned on FreeBSD, OpenBSD, and NetBSD for each mode:

mode=process	mode=thread	mode=summary
pid: PID	pid: PID	name: process name
ppid: parent PID	ppid: parent PID	processes: number of processes

cputime_system: total CPU time spent in system mode (reported in milliseconds)		handles: number of handles
threads: number of threads		io_read_b: IO bytes read
page_faults: number of page faults		io_write_b: IO bytes written
handles: number of handles		io_read_op: IO read operations
io_read_b: IO bytes read		io_write_op: IO write operations

mode=process	mode=thread	mode=summary
io_write_b: IO bytes written io_read_op: IO read operations io_write_op: IO write operations io_other_b: IO bytes transferred, other than read and write operations io_other_op: IO operations, other than read and write operations		io_other_b: IO bytes transferred, other than read and write operations io_other_op: IO operations, other than read and write operations

Unreachable/unavailable host interface settings

Overview

Several configuration parameters define how Zabbix server should behave when an agent check (Zabbix, SNMP, IPMI, JMX) fails and a host interface becomes unreachable.

Unreachable interface

A host interface is treated as unreachable after a failed check (network error, timeout) by Zabbix, SNMP, IPMI or JMX agents. Since Zabbix 6.2.0, active Zabbix agent checks also affect interface availability. When active checks become unavailable, they contribute to the overall availability status of the agent interface.

From the moment an interface becomes unreachable, **UnreachableDelay** defines how often it is rechecked using one of the items (including LLD rules). These rechecks are performed by unreachable pollers (or IPMI pollers for IPMI checks). By default, the interval between consecutive reachability checks is 15 seconds.

Attention:
Checks performed by asynchronous pollers are not moved to unreachable pollers.

In the Zabbix server log unreachability is indicated by messages like:

```
Zabbix agent item "system.cpu.load[percpu,avg1]" on host "New host" failed: first network error, wait for
Zabbix agent item "system.cpu.load[percpu,avg15]" on host "New host" failed: another network error, wait f
```

The log messages specify the exact item that failed and its type (Zabbix agent).

Note:
The *Timeout* parameter will also affect how early an interface is rechecked during unreachability. If Timeout is set to 20 seconds and UnreachableDelay to 30 seconds, the next check will be in 50 seconds after the first attempt.

The **UnreachablePeriod** parameter defines the total duration of the unreachability period. By default, UnreachablePeriod is 45 seconds. This value should be several times larger than UnreachableDelay to ensure that an interface is rechecked multiple times before being marked as unavailable.

An internal item, zabbix[host,active_agent,available], allows monitoring the availability of active checks in unreachable scenarios.

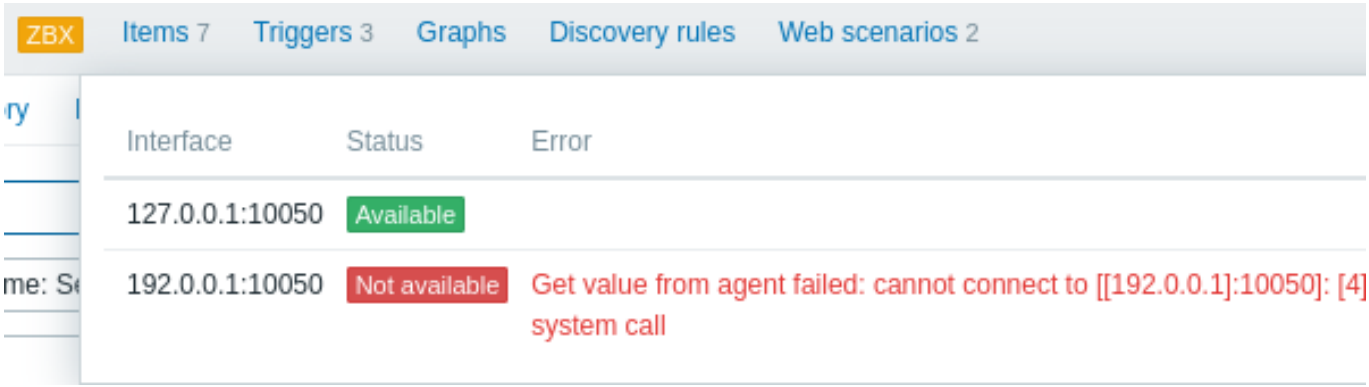
Switching interface back to available

When the unreachability period is over, the interface is polled again, decreasing priority for item that turned the interface into unreachable state. If the unreachable interface reappears, the monitoring returns to normal automatically:

```
resuming Zabbix agent checks on host "New host": connection restored
```

Note:
Once interface becomes available, the host does not poll all its items immediately for two reasons:
- It might overload the host.
- The interface restore time is not always matching planned item polling schedule time.

So, after the interface becomes available, items are not polled immediately, but they are getting rescheduled to their next polling round.



Unavailable interface

After the UnreachablePeriod ends and the interface has not reappeared, the interface is treated as unavailable.

In the server log it is indicated by messages like these:

```
temporarily disabling Zabbix agent checks on host "New host": interface unavailable
```

and in the frontend the host availability icon goes from green/gray to yellow/red (the unavailable interface details can be seen in the hint box that is displayed when a mouse is positioned on the host availability icon):

The **UnavailableDelay** parameter defines how often an interface is checked during interface unavailability.

By default, it is 60 seconds (so in this case "temporarily disabling", from the log message above, will mean disabling checks for one minute).

When the connection to the interface is restored, the monitoring returns to normal automatically, too:

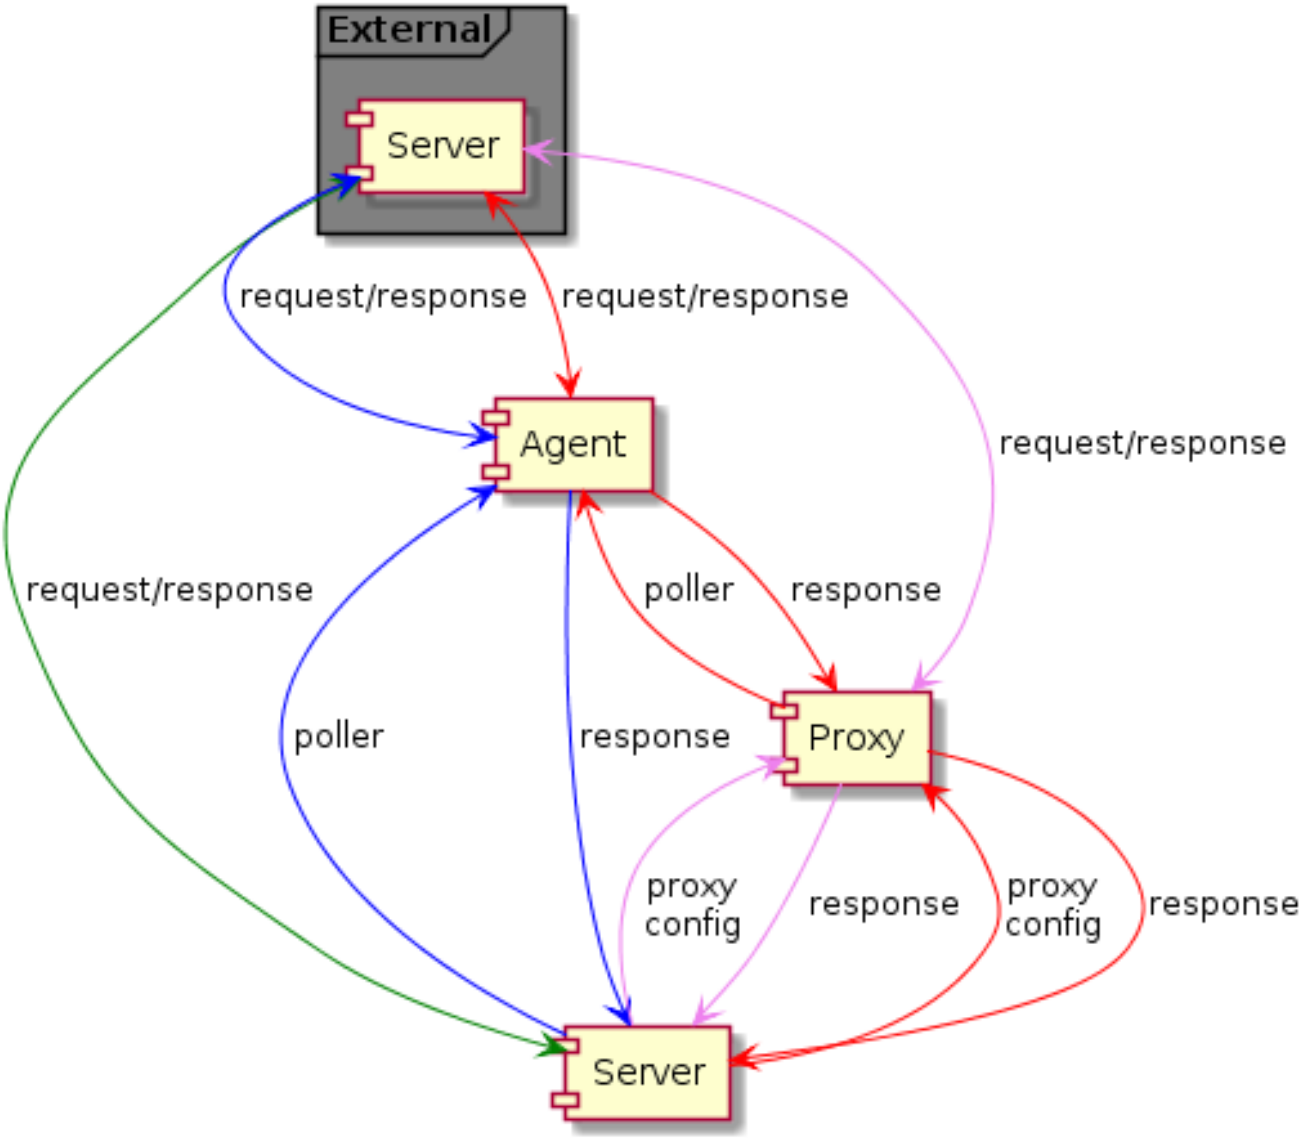
```
enabling Zabbix agent checks on host "New host": interface became available
```

Remote monitoring of Zabbix stats

Overview

It is possible to make some internal metrics of Zabbix server and proxy accessible remotely by another Zabbix instance or a third-party tool. This can be useful so that supporters/service providers can monitor their client Zabbix servers/proxies remotely or, in organizations where Zabbix is not the main monitoring tool, that Zabbix internal metrics can be monitored by a third-party system in an umbrella-monitoring setup.

Zabbix internal stats are exposed to a configurable set of addresses listed in the new 'StatsAllowedIP' server/proxy parameter. Requests will be accepted only from these addresses.



Items

To configure querying of internal stats on another Zabbix instance, you may use two items:

- `zabbix[stats,<ip>,<port>]` internal item - for direct remote queries of Zabbix server/proxy. <ip> and <port> are used to identify the target instance.
- `zabbix.stats[<ip>,<port>]` agent item - for agent-based remote queries of Zabbix server/proxy. <ip> and <port> are used to identify the target instance.

See also: Internal items, Zabbix agent items

The following diagram illustrates the use of either item depending on the context.

- - Server → external Zabbix instance (`zabbix[stats,<ip>,<port>]`)
- - Server → proxy → external Zabbix instance (`zabbix[stats,<ip>,<port>]`)
- - Server → agent → external Zabbix instance (`zabbix.stats[<ip>,<port>]`)
- - Server → proxy → agent → external Zabbix instance (`zabbix.stats[<ip>,<port>]`)

To make sure that the target instance allows querying it by the external instance, list the address of the external instance in the 'StatsAllowedIP' parameter on the target instance.

Exposed metrics

The stats items gather the statistics in bulk and return a JSON, which is the basis for dependent items to get their data from. The following internal metrics are returned by either of the two items:

- `zabbix[boottime]`
- `zabbix[hosts]`
- `zabbix[items]`
- `zabbix[items_unsupported]`
- `zabbix[preprocessing]` (server only)
- `zabbix[preprocessing_queue]` (server only)
- `zabbix[process,<type>,<mode>,<state>]` (only process type based statistics)
- `zabbix[rcache,<cache>,<mode>]`
- `zabbix[requiredperformance]`
- `zabbix[triggers]` (server only)
- `zabbix[uptime]`
- `zabbix[vcache,buffer,<mode>]` (server only)

- zabbix[vcache,cache,<parameter>]
- zabbix[version]
- zabbix[vmware,buffer,<mode>]
- zabbix[wcache,<cache>,<mode>] ('trends' cache type server only)

Templates

Templates are available for remote monitoring of Zabbix server or proxy internal metrics from an external instance:

- Remote Zabbix server health
- Remote Zabbix proxy health

Note that in order to use a template for remote monitoring of multiple external instances, a separate host is required for each external instance monitoring.

Trapper process

Receiving internal metric requests from an external Zabbix instance is handled by the trapper process that validates the request, gathers the metrics, creates the JSON data buffer and sends the prepared JSON back, for example, from server:

```
{
  "response": "success",
  "data": {
    "boottime": N,
    "uptime": N,
    "hosts": N,
    "items": N,
    "items_unsupported": N,
    "preprocessing": {
        "queued": {
          "count": N,
          "size": N
        },
        "direct": {
          "count": N,
          "size": N
        },
        "queue": N
    },
    "preprocessing_queue": N,
    "process": {
      "alert manager": {
        "busy": {
          "avg": N,
          "max": N,
          "min": N
        },
        "idle": {
          "avg": N,
          "max": N,
          "min": N
        },
        "count": N
      },
...
    },
    "queue": N,
    "rcache": {
      "total": N,
      "free": N,
      "pfree": N,
      "used": N,
      "pused": N
    },
    "requiredperformance": N,
    "triggers": N,
```

```
    "uptime": N,
    "vcache": {
      "buffer": {
        "total": N,
        "free": N,
        "pfree": N,
        "used": N,
        "pused": N
      },
      "cache": {
        "requests": N,
        "hits": N,
        "misses": N,
        "mode": N
      }
    },
    "vmware": {
      "total": N,
      "free": N,
      "pfree": N,
      "used": N,
      "pused": N
    },
    "version": "N",
    "wcache": {
      "values": {
        "all": N,
        "float": N,
        "uint": N,
        "str": N,
        "log": N,
        "text": N,
        "not supported": N
      },
      "history": {
        "pfree": N,
        "free": N,
        "total": N,
        "used": N,
        "pused": N
      },
      "index": {
        "pfree": N,
        "free": N,
        "total": N,
        "used": N,
        "pused": N
      },
      "trend": {
        "pfree": N,
        "free": N,
        "total": N,
        "used": N,
        "pused": N
      }
    }
  }
}
```

Internal queue items

There are also two other items that specifically allow remote querying of internal queue statistics on another Zabbix instance:

- `zabbix[stats,<ip>,<port>,queue,<from>,<to>]` internal item - for direct internal queue queries to remote Zabbix

server/proxy
- `zabbix.stats[<ip>,<port>,queue,<from>,<to>]` agent item - for agent-based internal queue queries to remote Zabbix server/proxy

See also: Internal items, Zabbix agent items

Configuring Kerberos with Zabbix

Overview

Kerberos authentication can be used in web monitoring and HTTP items in Zabbix.

This page describes an example of configuring Kerberos for Zabbix server to perform web monitoring of `www.example.com` with a Kerberos principal for Zabbix process on Debian/Ubuntu.

Configuration

1. Install KDC and client utilities:

```
sudo apt update
sudo apt install krb5-kdc krb5-admin-server krb5-user
```

During package setup answer the prompts, e.g.:

```
Default Kerberos version 5 realm: EXAMPLE.COM
Kerberos servers for your realm: localhost (or your FQDN)
Administrative server for your Kerberos realm: localhost (or your FQDN)
```

2. Map a friendly hostname (optional, for local testing).

Edit /etc/hosts and add an entry for your DC and webserver if you don't have DNS:

```
sudo vi /etc/hosts
```

Example line you might add:

```
192.168.1.100  dc01.example.com dc01
```

3. Configure the Kerberos client and KDC realm:

```
sudo vi /etc/krb5.conf
```

Example settings:

```
[libdefaults]
    default_realm = EXAMPLE.COM
    dns_lookup_realm = false
    dns_lookup_kdc = false
    rdns = false
    ticket_lifetime = 24h
    renew_lifetime = 7d
    forwardable = true

[realms]
    EXAMPLE.COM = {
        kdc = dc01.example.com
        admin_server = dc01.example.com
    }

[domain_realm]
    .example.com = EXAMPLE.COM
    example.com = EXAMPLE.COM
```

If you plan to use `.localdomain` or other non-public names, add explicit domain→realm mappings so hostname→realm mapping works. Mismatches here cause `Server not found in Kerberos database` errors.

4. Initialize the Kerberos database (one-time, KDC host). Set a secure master password when prompted:

```
sudo krb5_newrealm
```

5. Create the `HTTP/host.fqdn@REALM` principal using the exact hostname clients will use; prefer lowercase (e.g., `HTTP/web.example.com@`
A case/name mismatch causes `Server not found in Kerberos database`.

```
sudo kadmin.local
```

Inside `kadmin.local`:

```
addprinc kerb-admin@EXAMPLE.COM      # administrative principal
addprinc -randkey HTTP/dc01.example.com@EXAMPLE.COM
ktadd -k /etc/apache2/http.keytab HTTP/dc01.example.com@EXAMPLE.COM
quit
```

Move the keytab to the web host (or keep local if same machine) and set permissions usable by Apache:

```
chown www-data:www-data /etc/apache2/http.keytab
chmod 600 /etc/apache2/http.keytab
#### verify
sudo -u www-data -k /etc/apache2/http.keytab
```

6. Install and enable Apache GSSAPI module:

```
sudo apt install libapache2-mod-auth-gssapi
sudo a2enmod auth_gssapi
sudo a2enmod headers
sudo systemctl restart apache2
```

> **Attention:**
> Not all mod_auth_gssapi versions support every `Gssapi*` directive. If Apache fails with `Invalid command 'GssapiCredStore'` remove the unsupported directive or upgrade the module.

7. Configure a VirtualHost (adjust `DocumentRoot` / path to your Zabbix UI):

```
sudo vi /etc/apache2/sites-available/zabbix.conf
```

Inside `zabbix.conf`:

```
<VirtualHost *:80>
    ServerName dc01.example.com
    DocumentRoot /usr/share/zabbix/ui
    <Directory /usr/share/zabbix/ui>
        Options FollowSymLinks
        AllowOverride None
        Require all granted
        AuthType GSSAPI
        AuthName "Kerberos Login"
        GssapiCredStore keytab:/etc/apache2/http.keytab
        GssapiLocalName On
        Require valid-user
    </Directory>
    RequestHeader set X-Remote-User %{REMOTE_USER}s env=REMOTE_USER
    RequestHeader unset Authorization
</VirtualHost>
```

Restart Apache:

```
sudo systemctl restart apache2
```

8. Enable/start KDC services and verify listening ports (KDC host):

```
sudo systemctl enable --now krb5-kdc krb5-admin-server
ss -tnlp | grep :80    # or: sudo netstat -tnlp | grep :80
```

9. Obtain a TGT for testing (run as the user that will use the ticket).

Expect to see `krbtgt/EXAMPLE.COM@EXAMPLE.COM` in the ticket list. Run `kinit` as the same OS user that needs the ticket (e.g., `zabbix` for web checks or `www-data`/Apache for interactive browser SSO tests). Tickets issued to a different OS user won't be visible unless `KRB5CCNAME` and permissions are adjusted.

```
kinit kerb-admin@EXAMPLE.COM
klist
```

10. Test SPNEGO exchange with curl (from a client with a valid TGT). A `200 OK` (or redirect to app) indicates SPNEGO succeeded:

```
curl -v --negotiate -u : http://dc01.example.com/
```

11. Optionally, if Zabbix UI should accept HTTP-authenticated logins, enable HTTP authentication in the Zabbix frontend.

In the frontend configuration file (`zabbix.conf.php`) set:

```
$ZBX_FEATURE_FLAGS['http_auth_enabled'] = true;
```

Then configure HTTP authentication in the web interface.

12. Browser configuration (Firefox is used as an example): set `network.negotiate-auth.trusted-uris` to the host(s) performing Negotiate (`dc01.example.com`) so the browser will send Kerberos tokens automatically.

Inside `about:config`:

```
network.negotiate-auth.trusted-uris = dc01.example.com
```

Now visiting `http://dc01.example.com` should log you straight into Zabbix without the form.

13. Keep keys/tickets fresh. Default Kerberos ticket lifetime is approximately 10 hours. Add a cron/systemd timer to avoid expirations:

```
####for the web service
kinit -kt /etc/apache2/http.keytab HTTP/dc01.example.com@EXAMPLE.COM
####for the monitoring user
kinit -kt /var/lib/zabbix/kerb.keytab kerb-admin@EXAMPLE.COM
```

14. Housekeeping checks:

- `klist -k /etc/apache2/http.keytab` - verify service principal present in keytab.
- `sudo tail -f /var/log/apache2/error.log` - watch for GSSAPI errors (`gss_acquire_cred[_from]() failed to get server creds` means keytab/permissions or missing principal).
- `curl --negotiate` returning 401/403 often means wrong principal, no ticket, host header mismatch, or filesystem permission issue; check logs and `/etc/krb5.conf` domain mappings.

Security and file-permission notes

Keytab files must be readable only by the account that needs them. Example permissions: `0400` owned by `zabbix:zabbix` for a zabbix user keytab, or `0440` and `root:www-data` for an Apache keytab.

Avoid storing long-lived plaintext passwords on the host. Use keytabs or domain-joined machine principals where possible.

When running tests or scripts that set `KRB5CCNAME` or copy keytabs, double-check ownership and permissions after the operation—a webserver rejecting credentials is commonly a file-permission problem.

modbus.get parameters

Overview

The table below presents details of the `modbus.get` item parameters.

Parameters

Parameter	Description	Defaults	Example
endpoint	Protocol and address of the endpoint, defined as `protocol://connection_string` Possible protocol values: *rtu*, *ascii* (Agent 2 only), *tcp* Connection string format: with *tcp* - `address:port` with serial line: *rtu*, *ascii* - `port_name:speed:params` where 'speed' - 1200, 9600 etc 'params' - data bits (5,6,7 or 8), parity (n,e or o for none/even/odd), stop bits (1 or 2)	protocol: none *rtu/ascii* protocol: port_name: none speed: 115200 params: 8n1 *tcp* protocol: address: none port: 502	tcp://192.168.6.1:511 tcp://192.168.6.2 tcp://[::1]:511 tcp://::1 tcp://localhost:511 tcp://localhost rtu://COM1:9600:8n ascii://COM2:1200:7o2 rtu://ttyS0:9600 ascii://ttyS1

Parameter	Description	Defaults	Example
slave id	Modbus address of the device it is intended for (1 to 247), see MODBUS Messaging Implementation Guide (page 23) tcp device (not GW) will ignore the field	serial: 1 tcp: 255 (0xFF)	2
function	Empty or value of a supported function: 1 - Read Coil, 2 - Read Discrete Input, 3 - Read Holding Registers, 4 - Read Input Registers	empty	3
address	Address of the first registry, coil or input. If 'function' is empty, then 'address' should be in range for: Coil - 00001 - 09999 Discrete input - 10001 - 19999 Input register - 30001 - 39999 Holding register - 40001 - 49999 If 'function' is not empty, the 'address' field will be from 0 till 65535 and used without modification (PDU)	empty function: 00001 non-empty function: 0	9999
count	Count of sequenced 'type' which will be read from device, where: for Coil or Discrete input the 'type' = 1 bit for other cases: (count*sizeof(type))/2 = real count of registers for reading If 'offset' is not 0, the value will be added to 'real count' Acceptable range for 'real count' is 1:65535	1	2
type	Data type: for Read Coil and Read Discrete Input - *bit* for Read Holding Registers and Read Input Registers: *int8* - 8bit *uint8* - 8bit (unsigned) *int16* - 16bit *uint16* - 16bit (unsigned) *int32* - 32bit *uint32* - 32bit (unsigned) *float* - 32bit *uint64* - 64bit (unsigned) *double* - 64bit	bit uint16	uint64
endianness	Endianness type: *be* - Big Endian *le* - Little Endian *mbe* - Mid-Big Endian *mle* - Mid-Little Endian Limitations: for 1 bit - be for 8 bits - be,le for 16 bits - be,le	be	le

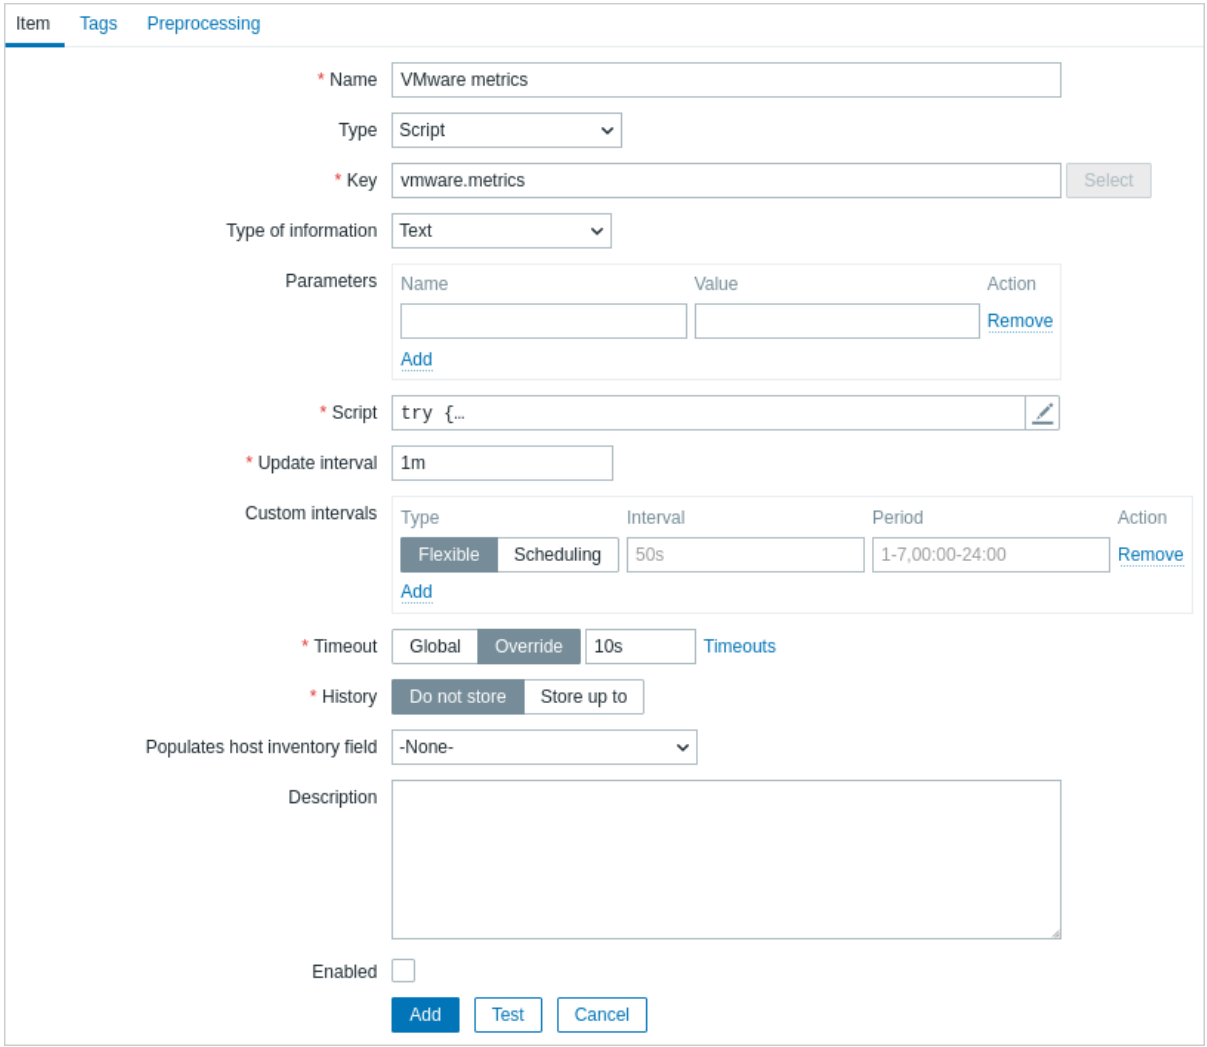
Parameter	Description	Defaults	Example
offset	Number of registers, starting from 'address', the result of which will be discarded. The size of each register is 16bit (needed to support equipment that does not support random read access).	0	4

Creating custom performance counter names for VMware

Overview

The VMware performance counter path has the `group/counter[rollup]` format where:

- `group` - the performance counter group, for example, *cpu*
- `counter` - the performance counter name, for example, *usagemhz*
- `rollup` - the performance counter rollup type, for example, *average*



So the above example would give the following counter path: `cpu/usagemhz[average]`

The performance counter group descriptions, counter names and rollup types can be found in VMware documentation.

It is possible to obtain internal names and create custom performance counter names by using script item in Zabbix.

Configuration

1. Create disabled Script item on the main VMware host (where the **eventlog[]** item is present) with the following parameters:

- *Name*: VMware metrics
- *Type*: Script
- *Key*: vmware.metrics
- *Type of information*: Text

- *Script*: copy and paste the script provided below
- *Timeout*: 10
- *History*: Do not store
- *Enabled*: unmarked

Script

```
try {
    Zabbix.log(4, 'vmware metrics script');

    var result, resp,
    req = new HttpRequest();
    req.addHeader('Content-Type: application/xml');
    req.addHeader('SOAPAction: "urn:vim25/6.0"');

    login = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:vi
    <soapenv:Header/>\
    <soapenv:Body>\
        <urn:Login>\
            <urn:_this type="SessionManager">SessionManager</urn:_this>\
            <urn:userName>{$VMWARE.USERNAME}</urn:userName>\
            <urn:password>{$VMWARE.PASSWORD}</urn:password>\
        </urn:Login>\
    </soapenv:Body>\
</soapenv:Envelope>'
    resp = req.post("{$VMWARE.URL}", login);
    if (req.getStatus() != 200) {
        throw 'Response code: '+req.getStatus();
    }

    query = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:vi
<soapenv:Header/>\
    <soapenv:Body>\
        <urn:RetrieveProperties>\
            <urn:_this type="PropertyCollector">propertyCollector</urn:_this>\
            <urn:specSet>\
                <urn:propSet>\
                   <urn:type>PerformanceManager</urn:type>\
                   <urn:pathSet>perfCounter</urn:pathSet>\
                </urn:propSet>\
                <urn:objectSet>\
                   <urn:obj type="PerformanceManager">PerfMgr</urn:obj>\
                </urn:objectSet>\
            </urn:specSet>\
        </urn:RetrieveProperties>\
    </soapenv:Body>\
</soapenv:Envelope>'
    resp = req.post("{$VMWARE.URL}", query);
    if (req.getStatus() != 200) {
        throw 'Response code: '+req.getStatus();
    }
    Zabbix.log(4, 'vmware metrics=' + resp);
    result = resp;

    logout = '<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:v
    <soapenv:Header/>\
    <soapenv:Body>\
        <urn:Logout>\
            <urn:_this type="SessionManager">SessionManager</urn:_this>\
        </urn:Logout>\
    </soapenv:Body>\
</soapenv:Envelope>'

    resp = req.post("{$VMWARE.URL}",logout);
```

```
    if (req.getStatus() != 200) {
        throw 'Response code: '+req.getStatus();
    }

} catch (error) {
    Zabbix.log(4, 'vmware call failed : '+error);
    result = {};
}

return result;
```

Once the item is configured, click the *Test* button, then *Get value*.

Copy received XML to any XML formatter and find the desired metric.

An example of XML for one metric:

```
<PerfCounterInfo xsi:type="PerfCounterInfo">
    <key>6</key>
    <nameInfo>
        <label>Usage in MHz</label>
        <summary>CPU usage in megahertz during the interval</summary>
        <key>usagemhz</key>
    </nameInfo>
    <groupInfo>
        <label>CPU</label>
        <summary>CPU</summary>
        <key>cpu</key>
    </groupInfo>
    <unitInfo>
        <label>MHz</label>
        <summary>Megahertz</summary>
        <key>megaHertz</key>
    </unitInfo>
    <rollupType>average</rollupType>
    <statsType>rate</statsType>
    <level>1</level>
    <perDeviceLevel>3</perDeviceLevel>
</PerfCounterInfo>
```

Use XPath to extract the counter path from received XML. For the example above, the XPath will be:

field	xPath	value
group	//groupInfo[../key=6]/key	cpu
counter	//nameInfo[../key=6]/key	usagemhz
rollup	//rollupType[../key=6]	average

Resulting performance counter path in this case is: `cpu/usagemhz[average]`

Return values for system.sw.packages.get

Overview

This section provides return value details for the `system.sw.packages.get` Zabbix agent item.

Details

The output of this item is an array of objects each containing the following properties:

- **name** - package name
- **manager** - package manager that reported this data (`rpm`, `dpkg`, `pacman`, `pkgtool`, or `portage`)
- **version** - package version
- **size** - uncompressed package size in bytes (if not available, set to 0)
- **arch** - package architecture
- **buildtime** - an object with 2 entries:
  - **timestamp** - UNIX timestamp when the package was built (if not available, set to 0)
  - **value** - human readable date and time when the package was built (if not available, set to empty string)
- **installtime** - an object with 2 entries:
  - **timestamp** - UNIX timestamp when the package was installed (if not available, set to 0)
  - **value** - human readable date and time when the package was installed (if not available, set to empty string)

Example:

```
[
    {
        "name": "util-linux-core",
        "manager": "rpm",
        "version": "2.37.4-3.el9",
        "size": 1296335,
        "arch": "x86_64",
        "buildtime": {
            "timestamp" : 1653552239,
            "value" : "Sep 20 01:39:40 2021 UTC"
        },
        "installtime": {
            "timestamp" : 1660780885,
            "value" : "Aug 18 00:01:25 2022 UTC"
        }
    },
    {
        "name": "xfonts-base",
        "manager": "dpkg",
        "version": "1:1.0.5",
        "size": 7337984,
        "arch": "all",
        "buildtime": {
            "timestamp": 0,
            "value": ""
        },
        "installtime": {
            "timestamp": 0,
            "value": ""
        }
    }
]
```

Return values for net.dns.get

Overview

This section provides return value details for the `net.dns.get` Zabbix agent 2 item.

Details

The output of this item is an object containing DNS record information based on the parameters provided in the item key.

For example, the `net.dns.get[,example.com]` item may return the following JSON of a refused query:

```
{
    "flags": [
        "RA"
    ],
```

```
    "query_time": "0.019030",
    "question_section": [
        {
            "qclass": "IN",
            "qname": "example.com.",
            "qtype": "SOA"
        }
    ],
    "response_code": "REFUSED",
    "zbx_error_code": 0
}
```

By specifying the IP address of the DNS server, the `net.dns.get[192.0.2.1,example.com]` item may return the following JSON:

```
{
    "answer_section": [
        {
            "class": "IN",
            "name": "example.com.",
            "rdata": {
                "expire": 1209600,
                "mbox": "noc.dns.example.org.",
                "minttl": 3600,
                "ns": "ns.example.org.",
                "refresh": 7200,
                "retry": 3600,
                "serial": 2022091378
            },
            "rdlength": 44,
            "ttl": 1205,
            "type": "SOA"
        }
    ],
    "flags": [
        "RA"
    ],
    "query_time": "0.029556",
    "question_section": [
        {
            "qclass": "IN",
            "qname": "example.com.",
            "qtype": "SOA"
        }
    ],
    "response_code": "NOERROR",
    "zbx_error_code": 0
}
```

If there is a connection problem, the `net.dns.get[192.0.2.1,example.com]` item may an error:

```
{
    "zbx_error_code": -1,
    "zbx_error_msg": "Communication error: read udp 192.0.2.1:12345->192.0.2.1:53: i/o timeout"
}
```

The following types of error codes are possible:

Scenario	"zbx_error_code"	"zbx_error_msg"
No errors and the DNS response was received and parsed.	0	
DNS is down.	-1	"Communication error"
Error occurs during JSON parsing	-2	"Received unexpected response"

With additional parameters, the `net.dns.get[192.0.2.1,example.com,ANY,5,5,tcp,"cdflag,rdflag,dnssec,nsid,edns0,aaf`

item may return the following JSON:

```
{
    "additional_section": [
        {
            "extended_rcode": 32768,
            "name": ".",
            "rdata": {
                "options": [
                {
                    "code": 0,
                    "nsid": "67 70 64 6e 73 2d 6c 70 70"
                }
                ]
        },
            "rdlength": 13,
            "type": "OPT",
            "udp_payload": 512
        }
    ],
    "answer_section": [
        {
            "class": "IN",
            "name": "example.com.",
            "rdata": {
                "a": "192.0.2.1"
            },
            "rdlength": 4,
            "ttl": 19308,
            "type": "A"
        },
        {
            "class": "IN",
            "name": "example.com.",
            "rdata": {
                "algorithm": 13,

Return values for net.if.get

Overview

This section provides return value details for the `net.if.get` item. The item is supported on Linux by Zabbix agent and Zabbix agent 2.

Details

This item returns detailed information on network interfaces whose names match the given regular expression. The output is structured as a JSON object containing `config` and `values` arrays.

The output contains the following properties:

- **name** - interface name, read from `/proc/net/dev`;
- **ifalias** - interface alias, read from `/sys/class/net/<name>/ifalias`;
- **mac** - interface MAC address, read from `/sys/class/net/<name>/address`;
- **type** - interface type (`physical`, `virtual`, `loopback`);
- **speed** - the link speed in Mbits/sec, Ethernet-specific, read from `/sys/class/net/<name>/speed`;
- **duplex** - interface latest or current duplex value (`half`, `full`), Ethernet-specific, read from `/sys/class/net/<name>/duplex`;
- **administrative_state** - configured state (`down`, `up`), read from `/sys/class/net/<name>/flags`;
- **operational_state** - interface RFC2863 operational state (`unknown`, `notpresent`, `down`, `lowerlayerdown`, `testing`, `dormant`, `up`), read from `sys/class/net/<name>/operstate`;
- **carrier** - physical link presence (0 - physical link is down, 1 - physical link is up), read from `/sys/class/net/<name>/carrier`;
- **carrier_changes** - total number of times link state changed from up to down and vice versa, read from `/sys/class/net/<name>/car`
- **carrier_up_count** - number of times link has become up, read from `/sys/class/net/<name>/carrier_up_count`;
- **carrier_down_count** - number of times link has become down, read from `/sys/class/net/<name>/carrier_down_count`;
- **in** - incoming traffic, read from `/proc/net/dev`. Contains interface counters:
  - **bytes** - number of good bytes;
  - **packets** - number of good packets;
  - **errors** - total number of bad packets;
  - **dropped** - number of packets received but not processed + count of packets missed by the host;
  - **overruns** - number of overflow events;
  - **frame** - number of packets with framing errors;
  - **compressed** - number of correctly received compressed packets;
  - **multicast** - multicast packets received.
- **out** - outgoing traffic, read from `/proc/net/dev`. Contains interface counters:
  - **bytes** - number of good bytes;
  - **packets** - number of good packets;
  - **errors** - total number of bad packets;
  - **dropped** - number of packets received but not processed + count of packets missed by the host;
  - **overruns** - number of overflow events;
  - **collisions** - number of collisions during packet transmissions;
  - **carrier** - number of frame transmission errors due to loss of carrier during transmission;
  - **compressed** - number of transmitted compressed packets.

Unavailable metrics are excluded from the JSON output. In the following example, no alias is configured for the "lo" interface, so the `ifalias` property is excluded.

Example:

```
{
    "config": [
        {
            "name": "lo",
```

```
            "mac": "00:00:00:00:00:00",
            "type": "loopback",
            "administrative_state": "up",
            "operational_state": "unknown",
            "carrier": 1
        },
        {
            "name": "enp3s0",
            "ifalias": "Wired Ethernet connection",
            "mac": "8c:16:45:e3:1d:58",
            "type": "physical",
            "duplex": "unknown",
            "administrative_state": "up",
            "operational_state": "down",
            "carrier": 0
        },
        {
            "name": "wlp5s0",
            "ifalias": "Wi-Fi network adapter",
            "mac": "34:e1:2d:72:67:c6",
            "type": "physical",
            "administrative_state": "up",
            "operational_state": "up",
            "carrier": 1
        }
    ],
    "values": [
        {
            "name": "lo",
            "mac": "00:00:00:00:00:00",
            "carrier": 1,
            "carrier_changes": 0,
            "carrier_up_count": 0,
            "carrier_down_count": 0,
            "in": {
                "bytes": 1040047,
                "packets": 10784,
                "errors": 0,
                "dropped": 0,
                "overruns": 0,
                "frame": 0,
                "compressed": 0,
                "multicast": 0
            },
            "out": {
                "bytes": 1040047,
                "packets": 10784,
                "errors": 0,
                "dropped": 0,
                "overruns": 0,
                "collisions": 0,
                "carrier": 0,
                "compressed": 0
            }
        },
        {
            "name": "enp3s0",
            "ifalias": "Wired Ethernet connection",
            "mac": "8c:16:45:e3:1d:58",
            "carrier": 0,
            "carrier_changes": 1,

Return values for vfs.dev.get

Overview

This section provides return value details for the `vfs.dev.get` item. The item is supported on Linux by Zabbix agent and Zabbix agent 2, and on AIX by Zabbix agent.

Details

This item returns detailed information on block devices whose names match the given regular expression.

The output is structured as a JSON object containing `config` and, depending on the <mode> parameter, `values` arrays.

The `config` array contains the properties that are available for the selected mode. The `values` array is returned only for modes that provide block device statistics.

Unavailable metrics are excluded from the JSON output.

The following sections describe the properties returned for each mode.

disks mode

`vfs.dev.get[disks,.*]` returns block device configuration data.

Properties:

- **name** - block device name;
- **devid** - block device identifier, for example, a WWN-based or kernel-generated device ID;
- **type** - block device type (`disk`, `partition`, `rom`);
- **path** - path to the block device node;
- **model** - device model;
- **serial** - device serial number;
- **wwn** - device World Wide Name (WWN);
- **size_bytes** - device size in bytes;
- **logical_block_size** - logical block size in bytes;
- **physical_block_size** - physical block size in bytes.

Example for Linux:

```
{
  "config": [
    {
      "name": "sda",
      "devid": "ata-ST2000LM015-2E8174_ZDZ3YHZY",
      "type": "disk",
      "path": "/dev/sda",
      "model": " ST2000LM015-2E81",
      "wwn": "naa.5000c500b2791423",
      "size_bytes": 2000398934016,
      "logical_block_size": 512,
      "physical_block_size": 4096
    },
    {
      "name": "sdb",
      "devid": "usb-Kingston_DataTraveler_3.0_E0D55E6C382C15A158991CBD-0:0",
      "type": "disk",
      "path": "/dev/sdb",
      "model": "DataTraveler 3.0",
      "size_bytes": 61991813632,
      "logical_block_size": 512,
      "physical_block_size": 512
    },
    {
      "name": "nvme0n1",
      "devid": "nvme-SAMSUNG_MZVLW256HEHP-000L7_S35ENX1K753633",
      "type": "disk",
      "path": "/dev/nvme0n1",
      "model": "SAMSUNG MZVLW256HEHP-000L7",
      "serial": "S35ENX1K753633",
      "wwn": "eui.002538b781b7dc55",
      "size_bytes": 256060514304,
      "logical_block_size": 512,
      "physical_block_size": 512
```

```
    }
  ]
}
```

Example for AIX:

```
{
  "config": [
    {
      "name": "cd0",
      "type": "disk",
      "path": "/dev/cd0",
      "size_bytes": 0,
      "logical_block_size": 512
    },
    {
      "name": "hdisk1",
      "type": "disk",
      "devid": "48333321360050768OC818022F000000000015EA404214503IBMfcp05VDASD03AIXvscsi",
      "path": "/dev/hdisk1",
      "size_bytes": 51136000000,
      "logical_block_size": 512
    },
    {
      "name": "hdisk0",
      "type": "disk",
      "devid": "48333321360050768OC818022F000000000015EA304214503IBMfcp05VDASD03AIXvscsi",
      "path": "/dev/hdisk0",
      "size_bytes": 0,
      "logical_block_size": 512
    }
  ]
}
```

devices mode

`vfs.dev.get[devices,.*]` returns block device configuration data, including partitions.

Properties:

- **name** - block device name.
- **devid** - block device identifier.
- **type** - block device type (`disk`, `partition`, `rom`).
- **partitions** - partitions on the device. Contains partition names and their sizes in bytes.

Example for Linux:

```
{
  "config": [
    {
      "name": "sda",
      "devid": "ata-ST2000LM015-2E8174_ZDZ3YHZY",
      "type": "disk",
      "partitions": {
        "sda1": 16759808,
        "sda2": 2000381018112
      }
    },
    {
      "name": "sdb",
      "devid": "usb-Kingston_DataTraveler_3.0_E0D55E6C382C15A158991CBD-0:0",
      "type": "disk",
      "partitions": {
        "sdb1": 27631878144,
        "sdb2": 34359768576,
        "sdb3": 32256
```

```
      }
    },
    {
      "name": "nvme0n1",
      "devid": "nvme-SAMSUNG_MZVLW256HEHP-000L7_S35ENX1K753633",
      "type": "disk",
      "partitions": {
        "nvme0n1p1": 209715200,
        "nvme0n1p2": 16777216,
        "nvme0n1p3": 255060869120,
        "nvme0n1p4": 770703360
      }
    }
  ]
}
```

disk_stats mode

`vfs.dev.get[disk_stats,.*]` returns block device configuration data and disk statistics.

Properties:

- **name** - block device name.
- **devid** - block device identifier.
- **type** - block device type (`disk`, `partition`, `rom`).
- **size_bytes** - device size in bytes.
- **logical_block_size** - logical block size in bytes.
- **stats** - block device I/O statistics. Contains:
  - **reads_completed** - number of completed read operations;
  - **writes_completed** - number of completed write operations;
  - **bytes_read** - number of bytes read;
  - **bytes_written** - number of bytes written;
  - **io_time_ms** - total time spent doing I/O, in milliseconds.

Example for Linux

```
{
  "config": [
    {
      "name": "sda",
      "devid": "ata-ST2000LM015-2E8174_ZDZ3YHZY",
      "type": "disk",
      "size_bytes": 61991813632
    },
    {
      "name": "sdb",
      "devid": "usb-Kingston_DataTraveler_3.0_E0D55E6C382C15A158991CBD-0:0",
      "type": "disk",
      "size_bytes": 61991813632
    },
    {
      "name": "nvme0n1",
      "devid": "nvme-SAMSUNG_MZVLW256HEHP-000L7_S35ENX1K753633",
      "type": "disk",
      "size_bytes": 256060514304
    }
  ],
  "values": [
    {
      "name": "sda",
      "stats": {
        "reads_completed": 871,
        "writes_completed": 0,
        "bytes_read": 13045760,
        "bytes_written": 0,
```

```
        "io_time_ms": 1256
      }
    },
    {
      "name": "sdb",
      "stats": {
        "reads_completed": 51017,
        "writes_completed": 10682,
        "bytes_read": 10514627,
        "bytes_written": 1530472,
        "io_time_ms": 284988
      }
    },
    {
      "name": "nvme0n1",
      "stats": {
        "reads_completed": 1259,
        "writes_completed": 7,
        "bytes_read": 49698,
        "bytes_written": 6,
        "io_time_ms": 243
      }
    }
  ]
}
```

Example for AIX:

```
{
  "config": [
    {
      "name": "cd0",
      "type": "disk",
      "path": "/dev/cd0",
      "size_bytes": 0,
      "logical_block_size": 2048
    },
    {
      "name": "hdisk1",
      "type": "disk",
      "devid": "48333321360050768 0C818022F000000000015EA404214503IBMfcp05VDASD03AIXvscsi",
      "path": "/dev/hdisk1",
      "size_bytes": 51136000000,
      "logical_block_size": 512
    },
    {
      "name": "hdisk0",
      "type": "disk",
      "devid": "48333321360050768 0C818022F000000000015EA304214503IBMfcp05VDASD03AIXvscsi",
      "path": "/dev/hdisk0",
      "size_bytes": 0,
      "logical_block_size": 512
    }
  ],
  "values": [
    {
      "name": "cd0",
      "stats": {
        "reads_completed": 21,
        "writes_completed": 0,

```

Notes on system.cpu.util items on Windows

system.cpu.util item provides the CPU utilization percentage.

When a collector process is started on Zabbix agent for Windows, a buffer for N items for N logical processors (threads) is initialized. Values are periodically updated in the buffer using Windows performance counters. These values are reported when `system.cpu.util[n]` is requested, where 0 <= n < N.

One more item in the buffer is used for `system.cpu.util[total]`.

Zabbix automatically selects different performance counters to support both NUMA systems and older Windows versions with no processor group support.

If logical processor (thread) count is less or equal than 64 and number of processor groups is equal to 1, then:

```
N is logical processor (thread) count.

\Processor(_Total)\% Processor Time
\Processor(0)\% Processor Time
\Processor(1)\% Processor Time
\Processor(2)\% Processor Time
...
\Processor(N-1)\% Processor Time
```

Else:

```
G is processor group count and N is logical processor (thread) count in group.

\Processor Information(_Total)\% Processor Time
\Processor Information(0,0)\% Processor Time
\Processor Information(0,1)\% Processor Time
\Processor Information(0,2)\% Processor Time
...
\Processor Information(0,N-1)\% Processor Time
...
\Processor Information(G-1,0)\% Processor Time
\Processor Information(G-1,1)\% Processor Time
\Processor Information(G-1,2)\% Processor Time
...
\Processor Information(G-1,N-1)\% Processor Time
```

Large JSON value support

To ensure reliable handling of large values with the JSON data type (1MiB or more), review and apply the following configuration changes as needed:

1. If you're using MySQL or MariaDB, increase the maximum allowed packet size in `/etc/mysql/my.cnf` (it may default to 1MB on some systems):

```
[mysqld]
max_allowed_packet=128M

[mysqldump]
max_allowed_packet=1G
```

2. Adjust additional MySQL/MariaDB server system variables and InnoDB system variables as needed. For example:

```
innodb_io_capacity=1900
connect_timeout=600
wait_timeout=57600
interactive_timeout=57600
net_read_timeout=7200
net_write_timeout=7200
net-buffer-length=32704
```

3. Increase `HistoryCacheSize` to 2G in the Zabbix server configuration file.

4. If you're using Zabbix proxy, increase `HistoryCacheSize` to 2G and `ProxyMemoryBufferSize` to 2G in the proxy configuration file.

5. If you're using Zabbix agent, increase communication timeouts between Zabbix server/proxy and agent (e.g., item timeouts or the `Timeout` parameter value in the Zabbix server/proxy and agent configuration files). Otherwise, messages between them may not complete, and you may see errors such as *"message length does not match expected length"*. Also, review other timeouts as needed, such as the script timeout or item test timeout.

Supported functions

See Trigger expression and functions.

Macros

It is possible to use out-of-the-box Supported macros and User macros supported by location.

Macros supported by location

Overview

The macros supported by location table contains reference of all macros (built-in, expression, and user-definable) that are supported in the specific location.

If all macros from a related group are supported, then only the group name is given. Click each macro name or group name to see full details of the macros.

The macro details list contains a detailed list of all **built-in** macros, grouped by application area. Note that to customize macro values (for example, shorten or extract specific substrings), you can use macro functions.

Macros supported by location

Location	Supported macros	Comments
Action		
Time period condition, Default operation step duration, Step duration	User-definable macros (global only)	A single macro has to fill the whole field; multiple macros/mix with text are not supported
Notifications and commands		
Trigger-based	Action macros Date/time macros {ESC.HISTORY} Event macros, Cause/symptom event macros Event update macros: {EVENT.UPDATE.HISTORY}, {EVENT.UPDATE.STATUS} Expression macro: {?EXPRESSION} {FUNCTION.VALUE} Host macros: {HOST.CONN}, {HOST.DESCRIPTION}, {HOST.DNS}, {HOST.HOST}, {HOST.ID}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} Target host macros (commands only) Host inventory macros Item macros (except {ITEM.STATE}, {ITEM.STATE.ERROR}) Proxy macros Trigger macros: {TRIGGER.DESCRIPTION}, {TRIGGER.EVENTS.*}, {TRIGGER.EXPRESSION}, {TRIGGER.EXPRESSION.EXPLAIN}, {TRIGGER.EXPRESSION.RECOVERY}, {TRIGGER.ID}, {TRIGGER.HOSTGROUP.NAME}, {TRIGGER.NAME}, {TRIGGER.NAME.ORIG}, {TRIGGER.NSEVERITY}, {TRIGGER.SEVERITY}, {TRIGGER.STATUS}, {TRIGGER.TEMPLATE.NAME}, {TRIGGER.URL}, {TRIGGER.URL.NAME}, {TRIGGER.VALUE} User-definable macros	See also: Using macros in messages

Location	Supported macros	Comments
Problem update	Action macros Date/time macros {ESC.HISTORY} Event macros, Cause/symptom event macros, Recovery event macros Event update macros: all (except {EVENT.UPDATE.NSEVERITY}, {EVENT.UPDATE.SEVERITY}) Expression macro: {?EXPRESSION} Function macros Host macros: {HOST.CONN}, {HOST.DESCRIPTION}, {HOST.DNS}, {HOST.HOST}, {HOST.ID}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} Target host macros (commands only) Host inventory macros Item macros (except {ITEM.STATE}, {ITEM.STATE.ERROR}) Proxy macros Trigger macros: {TRIGGER.DESCRIPTION}, {TRIGGER.EVENTS.*}, {TRIGGER.EXPRESSION}, {TRIGGER.EXPRESSION.EXPLAIN}, {TRIGGER.EXPRESSION.RECOVERY}, {TRIGGER.ID}, {TRIGGER.HOSTGROUP.NAME}, {TRIGGER.NAME}, {TRIGGER.NAME.ORIG}, {TRIGGER.NSEVERITY}, {TRIGGER.SEVERITY}, {TRIGGER.STATUS}, {TRIGGER.TEMPLATE.NAME}, {TRIGGER.URL}, {TRIGGER.URL.NAME}, {TRIGGER.VALUE} {USER.FULLNAME} User-definable macros

Discovery	Action macros Date/time macros Discovery macros Event macros: {EVENT.AGE}, {EVENT.DATE}, {EVENT.ID}, {EVENT.OBJECT}, {EVENT.SOURCE}, {EVENT.TIME}, {EVENT.TIMESTAMP} Target host macros (commands only) Proxy macros	
Autoregistration	Action macros Date/time macros Event macros: {EVENT.AGE}, {EVENT.DATE}, {EVENT.ID}, {EVENT.OBJECT}, {EVENT.SOURCE}, {EVENT.TIME}, {EVENT.TIMESTAMP} Host macros: {HOST.HOST}, {HOST.IP}, {HOST.PORT}, {HOST.METADATA} Target host macros (commands only) Proxy macros	
Service-based	Action macros Date/time macros {ESC.HISTORY} Event macros: all except {EVENT.ACK.STATUS}, {EVENT.OPDATA} Service macros User-definable macros	
Service recovery	Event macros (except {EVENT.ACK.STATUS}, {EVENT.OPDATA}), Recovery event macros	

Location	Supported macros	Comments
Service update	Action macros Date/time macros {ESC.HISTORY} Event macros (except {EVENT.ACK.STATUS}, {EVENT.OPDATA}) Event update macros: {EVENT.UPDATE.DATE}, {EVENT.UPDATE.NSEVERITY}, {EVENT.UPDATE.SEVERITY}, {EVENT.UPDATE.STATUS}, {EVENT.UPDATE.TIME}, {EVENT.UPDATE.TIMESTAMP} Service macros User-definable macros	
Internal notifications	Action macros Date/time macros {ESC.HISTORY} Event macros (except {EVENT.NSEVERITY}, {EVENT.SEVERITY}), Recovery event macros Host macros: {HOST.CONN}, {HOST.DESCRIPTION}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} Host inventory macros Item macros: {ITEM.DESCRIPTION}, {ITEM.DESCRIPTION.ORIG}, {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG}, {ITEM.NAME}, {ITEM.NAME.ORIG}, {ITEM.VALUETYPE} Proxy macros	
Item-based	Item macros: {ITEM.STATE}, {ITEM.STATE.ERROR}	
LLD rule-based	Low-level discovery notification macros	
Trigger-based	Trigger macros: {TRIGGER.DESCRIPTION}, {TRIGGER.EXPRESSION}, {TRIGGER.EXPRESSION.RECOVERY}, {TRIGGER.HOSTGROUP.NAME}, {TRIGGER.ID}, {TRIGGER.NAME}, {TRIGGER.NAME.ORIG}, {TRIGGER.NSEVERITY}, {TRIGGER.SEVERITY}, {TRIGGER.STATE}, {TRIGGER.STATE.ERROR}, {TRIGGER.TEMPLATE.NAME}, {TRIGGER.URL}, {TRIGGER.URL.NAME} User-definable macros	
Alert script parameters	Alert macros User-definable macros (global only)	
Connector		
URL, Username, Password, Bearer token, HTTP proxy, SSL certificate, SSL key file, SSL key password field	User-definable macros (global only)	
Timeout field	User-definable macros (global only)	A single macro has to fill the whole field; multiple macros/mix with text are not supported.

Location	Supported macros	Comments
Graph name	Expression macro: {?EXPRESSION}	Only a single **avg**, **last**, **max**, **min** function with seconds as parameter (time suffixes can be used) is supported in this macro in this location. The {HOST.HOST<1-9>} macro can be used as host within the macro (see also indexed macros). Example usage: {?avg(/{HOST.HOST}/item.key,1h)} Unsupported usage: {?last(/host/item1)/last(/host/item2)} {?last(/host/item1)*10} {?count(/host/item1,5m)}
Host, host prototype		
Interface IP/DNS	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME} User-definable macros [1]	[1] For IP address, a single macro has to fill the whole field; multiple macros/mix with text are not supported
Interface port	User-definable macros	A single macro has to fill the whole field; multiple macros/mix with text are not supported
SNMP community *SNMPv3 Context name, Security name, Authentication passphrase, Privacy passphrase* *IPMI username, password*	User-definable macros	
Item, item prototype, LLD rule		
Name	User-definable macros	Not supported in LLD rule names.
Description	User-definable macros	

Location	Supported macros	Comments
Key parameters	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} User-definable macros	The supported {HOST.*} macros will resolve to the interface that is selected for the item. When used in items without interfaces they will resolve to either the Zabbix agent, SNMP, JMX or IPMI interface of the host in this order of priority or to 'UNKNOWN' if the host does not have any interface. Macros are not supported in the item key of Zabbix trapper items.
Update interval, *Custom intervals*, *Timeout (available for supported item types)*, *Store up to (for history/trends)* fields	User-definable macros	A single macro has to fill the whole field; multiple macros/mix with text are not supported.
Delete lost resources, *Disable lost resources* fields	User-definable macros	These fields are supported for LLD rules only. A single macro has to fill the whole field; multiple macros/mix with text are not supported.
Preprocessing step parameters (including custom scripts), *custom error-handling parameters* (*Set value to* and *Set error to* fields)	User-definable macros	
Filter regular expressions	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} User-definable macros	These fields are supported for LLD rules only.
Override filter regular expressions	User-definable macros	These fields are supported for LLD rules only.
Override operations: *Update interval*, *History storage period*, *Trend storage period* (for item prototypes)	User-definable macros	These fields are supported for LLD rules only. A single macro has to fill the whole field; multiple macros/mix with text are not supported.
Item types		

Location	Supported macros	Comments
Browser item *parameter names and values*	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} Host inventory macros Item macros: {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG} User-definable macros	
Script item *parameter names and values*		
Calculated/aggregate item formula (*expression constants*, *function parameters*, *item key parameters*, (aggregate item only) *filter conditions* (host group name and tag name))	User-definable macros	
Database monitor item *Username, Password, SQL query* fields	User-definable macros	
HTTP agent item *URL, Query fields, Request body, Headers (names and values), SSL certificate file, SSL key file* fields	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} Item macros: {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG} User-definable macros	URLs that contain a secret macro will not work, as the macro in them will be resolved as "******"
HTTP agent item *HTTP Proxy* field	Item macros: {ITEM.ID}, {ITEM.KEY}, {ITEM.KEY.ORIG} User-definable macros	
HTTP agent item *Required status codes, HTTP authentication username/password, SSL key password* fields	User-definable macros	
HTTP agent item *Allowed hosts* field	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME} User-definable macros	
JMX agent item *Endpoint* field	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.PORT} User-definable macros	
Trapper item *Allowed hosts* field	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP} User-definable macros	
SNMP agent item *SNMP OID* field	User-definable macros	
SSH and Telnet item *script*	Host macros: {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.IP}, {HOST.NAME}, {HOST.PORT} User-definable macros	
SSH agent item *Username, Public key file, Private key file, Password* fields	User-definable macros	
Telnet agent item *Username, Password* fields	User-definable macros	
Map		

Location	Supported macros	Comments

Macro details

This list contains details for each built-in macro grouped by application area:

- Action macros
- Alert macros
- Date/time macros
- Discovery macros
- Event macros
  - Event update macros
  - Cause/symptom event macros
  - Recovery event macros
- Escalation macros
- Function macros
- Host macros
  - Target host macros
- Host group macros
- Host inventory macros
- Item macros
- Low-level discovery notification macros
- Map macros
- Proxy macros
- Script macros
- Service macros
- Trigger macros
- Username macros

Action macros

{ACTION.ID}

The numeric ID of the triggered action.

{ACTION.NAME}

The name of the triggered action.

Alert macros

{ALERT.MESSAGE}

The *Default message* value from action configuration.

{ALERT.SENDTO}

The *Send to* value from user media configuration.

{ALERT.SUBJECT}

The *Default subject* value from action configuration.

Date and time macros

{DATE}

The current date in `yyyy.mm.dd` format.

{TIME}

The current time in `hh:mm:ss` format.

{TIMESTAMP}

The current time in UNIX timestamp format.

Discovery macros

{DISCOVERY.DEVICE.IPADDRESS}

The IP address of the discovered device.
 Available always, does not depend on host being added.

{DISCOVERY.DEVICE.DNS}

The DNS name of the discovered device.
 Available always, does not depend on host being added.

{DISCOVERY.DEVICE.STATUS}

The status of the discovered device (UP/DOWN).

{DISCOVERY.DEVICE.UPTIME}

The time since the last change of discovery status for a particular device.
 For example: 1h 29m 01s.
 For devices with status DOWN, this is the period of their downtime.

{DISCOVERY.RULE.NAME}

The name of the discovery rule that discovered the presence or absence of device/service.

{DISCOVERY.SERVICE.NAME}

The name of the discovered service.
 For example: HTTP.

{DISCOVERY.SERVICE.PORT}

The port of the discovered service.
 For example: 80.

{DISCOVERY.SERVICE.STATUS}

The status of the discovered service (UP/DOWN).

{DISCOVERY.SERVICE.UPTIME}

The time since the last change of discovery status for a particular service.
 For example: 1h 29m 01s.
 For services with status DOWN, this is the period of their downtime.

Escalation macros

{ESC.HISTORY}

The log of previously sent notifications, their escalation step and status (*sent*, *in progress* or *failed*).

Event macros

{EVENT.ACK.STATUS}

The acknowledgment status of the event (Yes/No).

{EVENT.AGE}

The age of the event that triggered an action, with precision down to a second.
 Useful in escalated messages. For example: 9m 13s.

{EVENT.DATE}

The date of the event that triggered an action in `yyyy.mm.dd` format.
 For example: 2025.04.14.

{EVENT.DURATION}

The duration of the event (time difference between problem and recovery events), with precision down to a second.
 Useful in problem recovery messages.

{EVENT.ID}

The numeric ID of the event that triggered an action.

{EVENT.NAME}

The name of the event that triggered an action.

{EVENT.NSEVERITY}

The numeric value of the event severity.
 Possible values: *0* - Not classified, *1* - Information, *2* - Warning, *3* - Average, *4* - High, *5* - Disaster.

{EVENT.OBJECT}

The numeric value of the event object.
 Possible values: *0* - Trigger, *1* - Discovered host, *2* - Discovered service, *3* - Autoregistration, *4* - Item, *5* - Low-level discovery rule.

{EVENT.OPDATA}

The operational data of the underlying trigger of the problem.

{EVENT.SEVERITY}

The name of the event severity.

{EVENT.SOURCE}

The numeric value of the event source.
 Possible values: *0* - Trigger, *1* - Discovery, *2* - Autoregistration, *3* - Internal, *4* - Service.

{EVENT.STATUS}

The verbal value of the event that triggered an action.

{EVENT.TAGS}

A comma-separated list of event tags.
Expanded to an empty string if no tags exist.

{EVENT.TAGSJSON}

A JSON array containing event tag objects.
Expanded to an empty array if no tags exist.

{EVENT.TAGS.<tag name>}

The event tag value referenced by the tag name.
 A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) must be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash.

{EVENT.TIME}

The time of the event that triggered an action in `hh:mm:ss` format.
 For example: 12:57:53.

{EVENT.TIMESTAMP}

The UNIX timestamp of the event that triggered an action.

{EVENT.VALUE}

The numeric value of the event that triggered an action.
 Possible values: *1* - problem, *0* - recovering.

Cause/symptom event macros

{EVENT.CAUSE.ACK.STATUS}

The acknowledgment status of the cause event (Yes/No).
 Used in the context of a symptom event.

{EVENT.CAUSE.AGE}

The age of the cause event, with precision down to a second.
 Useful in escalated messages.
 Used in the context of a symptom event.

{EVENT.CAUSE.DATE}

The date of the cause event in `yyyy.mm.dd` format.
 Used in the context of a symptom event.

{EVENT.CAUSE.DURATION}

The duration of the cause event (time difference between problem and recovery events), with precision down to a second.
 Useful in problem recovery messages.
 Used in the context of a symptom event.

{EVENT.CAUSE.ID}

The numeric ID of the cause event.
 Used in the context of a symptom event.

{EVENT.CAUSE.NAME}

The name of the cause event.
 Used in the context of a symptom event.

{EVENT.CAUSE.NSEVERITY}

The numeric value of the cause event severity.
 Possible values: *0* - Not classified, *1* - Information, *2* - Warning, *3* - Average, *4* - High, *5* - Disaster.
 Used in the context of a symptom event.

{EVENT.CAUSE.OBJECT}

The numeric value of the cause event object.
 Possible values: *0* - Trigger, *1* - Discovered host, *2* - Discovered service, *3* - Autoregistration, *4* - Item, *5* - Low-level discovery rule.
 Used in the context of a symptom event.

{EVENT.CAUSE.OPDATA}

The operational data of the underlying trigger of the cause problem.
 Used in the context of a symptom event.

{EVENT.CAUSE.SEVERITY}

The name of the cause event severity.
 Possible values: *Not classified*, *Information*, *Warning*, *Average*, *High*, *Disaster*.
 Used in the context of a symptom event.

{EVENT.CAUSE.SOURCE}

The numeric value of the cause event source.
 Possible values: *0* - Trigger, *1* - Discovery, *2* - Autoregistration, *3* - Internal.
 Used in the context of a symptom event.

{EVENT.CAUSE.STATUS}

The verbal value of the cause event.
 Used in the context of a symptom event.

{EVENT.CAUSE.TAGS}

A comma-separated list of cause event tags.
Expanded to an empty string if no tags exist.
 Used in the context of a symptom event.

{EVENT.CAUSE.TAGSJSON}

A JSON array containing cause event tag objects.
Expanded to an empty array if no tags exist.
 Used in the context of a symptom event.

{EVENT.CAUSE.TAGS.<tag name>}

The cause event tag value referenced by the tag name.
 A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) must be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash.
 Used in the context of a symptom event.

{EVENT.CAUSE.TIME}

The time of the cause event in `hh:mm:ss` format.
 Used in the context of a symptom event.

{EVENT.CAUSE.TIMESTAMP}

The UNIX timestamp of the cause event.
 Used in the context of a symptom event.

{EVENT.CAUSE.UPDATE.HISTORY}

The log of cause problem updates (acknowledgments, etc).
 Used in the context of a symptom event.

{EVENT.CAUSE.VALUE}

The numeric value of the cause event.
 Possible values: *1* - Problem, *0* - Recovering.
 Used in the context of a symptom event.

{EVENT.SYMPTOMS}

The list of symptom events. Includes the following details: host name, event name, severity, age, service tags and values.
 This macro is used in the context of the cause event and returns information about symptom events.

Recovery event macros

{EVENT.RECOVERY.DATE}

The date of the recovery event in `yyyy.mm.dd` format.

{EVENT.RECOVERY.ID}

The numeric ID of the recovery event.

{EVENT.RECOVERY.NAME}

The name of the recovery event.

{EVENT.RECOVERY.STATUS}

The verbal value of the recovery event.

{EVENT.RECOVERY.TAGS}

A comma-separated list of recovery event tags. Expanded to an empty string if no tags exist.

{EVENT.RECOVERY.TAGSJSON}

A JSON array containing recovery event tag objects. Expanded to an empty array if no tags exist.

{EVENT.RECOVERY.TIME}

The time of the recovery event in `hh:mm:ss` format.

{EVENT.RECOVERY.TIMESTAMP}

The UNIX timestamp of the recovery event.

{EVENT.RECOVERY.VALUE}

The numeric value of the recovery event.

Event update macros

{EVENT.UPDATE.ACTION}

Human-readable name of the action(s) performed during problem update.
 Resolves to the following values: *acknowledged*, *unacknowledged*, *commented*, *changed severity from (original severity) to (updated severity)* and *closed* (depending on how many actions are performed in one update).

{EVENT.UPDATE.ACTIONJSON}

A JSON array containing details of the action(s) performed during problem update.
 Possible JSON property values:
- true (for `acknowledge`, `unacknowledge`, `close`, `unsuppress`, `cause`, and `symptom` properties);
- <message string> (for `message` property);
- timestamp (for `suppress_until` and `timestamp` properties) or 0 (for `suppress_until` property if suppressed indefinitely);
- 0, 1, 2, 3, 4, 5 (for `old` and `new` severity properties).

 For example: `{"acknowledge":true,"message":"Monthly maintenance.","severity":{"old":2,"new":1},"suppress_until":1730851`

{EVENT.UPDATE.DATE}

The date of the event update (acknowledgment, etc) in `yyyy.mm.dd` format.

{EVENT.UPDATE.HISTORY}

The log of problem updates (acknowledgments, etc).

{EVENT.UPDATE.MESSAGE}

The problem update message.

{EVENT.UPDATE.NSEVERITY}

The numeric value of the new event severity set during problem update operation.

{EVENT.UPDATE.SEVERITY}

The name of the new event severity set during problem update operation.

{EVENT.UPDATE.STATUS}

The Numeric value of the problem update status.
 Possible values: *0* - Webhook was called because of problem/recovery event, *1* - Update operation.

{EVENT.UPDATE.TIME}

The time of the event update (acknowledgment, etc) in `hh:mm:ss` format.

{EVENT.UPDATE.TIMESTAMP}

The UNIX timestamp of the event update (acknowledgment, etc).

Function macros

{FUNCTION.VALUE}

The value of the Nth item-based function in the trigger expression at the time of the event.
 Only functions with `/host/key` as the first parameter are counted.

 This macro may be used with a numeric index, e.g., {FUNCTION.VALUE<1-9>} to point to the first, second, third, etc. function in a trigger expression. See indexed macros.

{FUNCTION.RECOVERY.VALUE}

The value of the Nth item-based function in the recovery expression at the time of the event.*
 Only functions with `/host/keys` as the first parameter are counted.

 This macro may be used with a numeric index, e.g., {FUNCTION.RECOVERY.VALUE<1-9>} to point to the first, second, third, etc. function in a trigger expression. See indexed macros.

Host macros

{HOST.CONN}

The host IP address or DNS name, depending on host settings.
 In global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface. If an agent interface is not defined, the main SNMP interface will be used. If an SNMP interface is also not defined, the main JMX interface will be used. If a JMX interface is not defined either, the main IPMI interface will be used. If the host does not have any interface, the macro resolves to 'UNKNOWN'.

 This macro may be used with a numeric index as {HOST.CONN<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.DESCRIPTION}

The host description.

 This macro may be used with a numeric index as {HOST.DESCRIPTION<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.DNS}

The host DNS name.
 In global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface. If an agent interface is not defined, the main SNMP interface will be used. If an SNMP interface is also not defined, the main JMX interface will be used. If a JMX interface is not defined either, the main IPMI interface will be used. If the host does not have any interface, the macro resolves to 'UNKNOWN'.

 This macro may be used with a numeric index as {HOST.DNS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.HOST}

The technical host name.
 Macro functions are not supported for this macro if it is used as a placeholder in the first parameter of a history function, for example, `last(/{HOST.HOST}/{ITEM.KEY})`.

 This macro may be used with a numeric index as {HOST.HOST<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.ID}

The host ID.

 This macro may be used with a numeric index as {HOST.ID<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.IP}

The host IP address.
 In global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface. If an agent interface is not defined, the main SNMP interface will be used. If an SNMP interface is also not defined, the main JMX interface will be used. If a JMX interface is not defined either, the main IPMI interface will be used. If the host does not have any interface, the macro resolves to 'UNKNOWN'.

 This macro may be used with a numeric index as {HOST.IP<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.METADATA}

The host metadata.

 Used only for active agent autoregistration.

{HOST.NAME}

The visible host name.

 This macro may be used with a numeric index as {HOST.NAME<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{HOST.PORT}

The host (agent) port.
 In global scripts, interface IP/DNS fields and web scenarios the macro will resolve to the main agent interface. If an agent interface is not defined, the main SNMP interface will be used. If an SNMP interface is also not defined, the main JMX interface will be used. If a JMX interface is not defined either, the main IPMI interface will be used. If the host does not have

any interface, the macro resolves to 'UNKNOWN'.

 This macro may be used with a numeric index as {HOST.PORT<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

Target host macros

{HOST.TARGET.CONN}

The IP address or DNS name of the target host.

{HOST.TARGET.DNS}

The DNS name of the target host.

{HOST.TARGET.HOST}

The technical name of the target host.

{HOST.TARGET.IP}

The IP address of the target host.

{HOST.TARGET.NAME}

The visible name of the target host.

Host group macros

{HOSTGROUP.ID}

The host group ID.

Host inventory macros

{INVENTORY.ALIAS}

The *Alias* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.ALIAS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.ASSET.TAG}

The *Asset tag* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.ASSET.TAG<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.CHASSIS}

The *Chassis* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.CHASSIS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.CONTACT}

The *Contact* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.CONTACT<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.CONTRACT.NUMBER}

The *Contract number* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.CONTRACT.NUMBER<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.DEPLOYMENT.STATUS}

The *Deployment status* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.DEPLOYMENT.STATUS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HARDWARE}

The *Hardware* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HARDWARE<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HARDWARE.FULL}

The *Hardware (Full details)* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HARDWARE.FULL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HOST.NETMASK}

The *Host subnet mask* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HOST.NETMASK<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HOST.NETWORKS}

The *Host networks* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HOST.NETWORKS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HOST.ROUTER}

The *Host router* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HOST.ROUTER<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HW.ARCH}

The *Hardware architecture* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HW.ARCH<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HW.DATE.DECOMM}

The *Date hardware decommissioned* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HW.DATE.DECOMM<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HW.DATE.EXPIRY}

The *Date hardware maintenance expires* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HW.DATE.EXPIRY<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HW.DATE.INSTALL}

The *Date hardware installed* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HW.DATE.INSTALL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.HW.DATE.PURCHASE}

The *Date hardware purchased* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.HW.DATE.PURCHASE<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.INSTALLER.NAME}

The *Installer name* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.INSTALLER.NAME<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.LOCATION}

The *Location* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.LOCATION<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.LOCATION.LAT}

The *Location latitude* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.LOCATION.LAT<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.LOCATION.LON}

The *Location longitude* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.LOCATION.LON<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.MACADDRESS.A}

The *MAC address A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.MACADDRESS.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.MACADDRESS.B}

The *MAC address B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.MACADDRESS.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.MODEL}

The *Model* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.MODEL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.NAME}

The *Name* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.NAME<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.NOTES}

The *Notes* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.NOTES<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.OOB.IP}

The *OOB IP address* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.OOB.IP<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.OOB.NETMASK}

The *OOB subnet mask* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.OOB.NETMASK<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.OOB.ROUTER}

The *OOB router* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.OOB.ROUTER<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.OS}

The *OS* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.OS<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.OS.FULL}

The *OS (Full details)* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.OS.FULL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.OS.SHORT}

The *OS (Short)* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.OS.SHORT<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.CELL}

The *Primary POC cell* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.CELL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.EMAIL}

The *Primary POC email* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.EMAIL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.NAME}

The *Primary POC name* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.NAME<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.NOTES}

The *Primary POC notes* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.NOTES<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.PHONE.A}

The *Primary POC phone A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.PHONE.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.PHONE.B}

The *Primary POC phone B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.PHONE.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.PRIMARY.SCREEN}

The *Primary POC screen name* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.PRIMARY.SCREEN<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.CELL}

The *Secondary POC cell* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.CELL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.EMAIL}

The *Secondary POC email* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.EMAIL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.NAME}

The *Secondary POC name* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.NAME<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.NOTES}

The *Secondary POC notes* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.NOTES<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.PHONE.A}

The *Secondary POC phone A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.PHONE.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.PHONE.B}

The *Secondary POC phone B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.PHONE.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.POC.SECONDARY.SCREEN}

The *Secondary POC screen name* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.POC.SECONDARY.SCREEN<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SERIALNO.A}

The *Serial number A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SERIALNO.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SERIALNO.B}

The *Serial number B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SERIALNO.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.ADDRESS.A}

The *Site address A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.ADDRESS.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.ADDRESS.B}

The *Site address B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.ADDRESS.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.ADDRESS.C}

The *Site address C* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.ADDRESS.C<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.CITY}

The *Site city* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.CITY<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.COUNTRY}

The *Site country* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.COUNTRY<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.NOTES}

The *Site notes* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.NOTES<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.RACK}

The *Site rack location* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.RACK<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.STATE}

The *Site state/province* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.STATE<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SITE.ZIP}

The *Site ZIP/postal* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SITE.ZIP<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE}

The *Software* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE.APP.A}

The *Software application A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE.APP.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE.APP.B}

The *Software application B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE.APP.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE.APP.C}

The *Software application C* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE.APP.C<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE.APP.D}

The *Software application D* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE.APP.D<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE.APP.E}

The *Software application E* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE.APP.E<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.SOFTWARE.FULL}

The *Software (Full details)* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.SOFTWARE.FULL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.TAG}

The *Tag* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.TAG<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.TYPE}

The *Type* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.TYPE<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.TYPE.FULL}

The *Type (Full details)* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.TYPE.FULL<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.URL.A}

The *URL A* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.URL.A<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.URL.B}

The *URL B* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.URL.B<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.URL.C}

The *URL C* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.URL.C<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{INVENTORY.VENDOR}

The *Vendor* field in host inventory.

 This macro may be used with a numeric index, e.g., {INVENTORY.VENDOR<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

Item macros

{ITEM.DESCRIPTION}

The description of the Nth item in the trigger expression that caused a notification.

 This macro may be used with a numeric index as {ITEM.DESCRIPTION<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{ITEM.DESCRIPTION.ORIG}

The original description (with macros unresolved) of the Nth item in the trigger expression that caused a notification.

 This macro may be used with a numeric index as {ITEM.DESCRIPTION.ORIG<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{ITEM.ID}

The numeric ID of the Nth item in the trigger expression that caused a notification.

 This macro may be used with a numeric index as {ITEM.ID<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{ITEM.KEY}

The key of the Nth item in the trigger expression that caused a notification.
 Macro functions are not supported for this macro if it is used as a placeholder in the first parameter of a history function, for example, `last(/{HOST.HOST}/{ITEM.KEY})`.

 This macro may be used with a numeric index as {ITEM.KEY<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{ITEM.KEY.ORIG}

The original key (with macros unresolved) of the Nth item in the trigger expression that caused a notification.

 This macro may be used with a numeric index as {ITEM.KEY.ORIG<1-9>} to point to the first, second, third, etc. host in a trigger expression. See indexed macros.

{ITEM.LASTVALUE}

The latest value of the Nth item in the trigger expression that caused a notification.
 It will resolve to *UNKNOWN* in the frontend if the latest history value has been collected more than the *Max history display period* time ago (set in the *Administration > General* menu section).
 When used in the problem name, the macro will not resolve to the latest item value when viewing problem events; instead, it will keep the item value from the time when the problem happened.
When used in notifications, in some cases the macro might not resolve to the latest item value at the moment the trigger fired. For example, if an item quickly receives two values, ”A” and ”B”, and the trigger fires for ”A”, notifications might show ”B” as the latest value due to a slight processing delay - the latest item value changed between the time the trigger fired and when the notification was created. To avoid this, you can use the {ITEM.VALUE} macro, which resolves to the value at the moment the trigger fires, ensuring the correct value is used in the notification.
 It is alias to `last(/{HOST.HOST}/{ITEM.KEY})`.
 The resolved value for text/log items is truncated to 20 characters by the frontend in the following locations:
- Operational data;
- Trigger description;
- Trigger URLs;
- Trigger URL labels;
- Description of the item value widget.
To resolve to a full value, you may use macro functions, as no values are truncated by the server. For example: `{{ITEM.LASTVALUE}.regsub("(.*)", \1)}`.

 This macro may be used with a numeric index, e.g., {ITEM.LASTVALUE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LASTVALUE.AGE}

The time that elapsed between the latest item value collection and macro evaluation.
 Displayed in a human-readable format (e.g., 1m 45s).

 This macro may be used with a numeric index, e.g., {ITEM.LASTVALUE.AGE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LASTVALUE.DATE}

The date when the latest item value was collected.
 Displayed in a `YYYYMMDD` format.
 Server time zone is used in trigger names (in *Monitoring* > *Problems* list), event names, and tag names and values. In all other cases user time zone is used.

 This macro may be used with a numeric index, e.g., {ITEM.LASTVALUE.DATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LASTVALUE.TIME}

The time when the latest item value was collected.
 Displayed in an `HHMMSS` format.
 Server time zone is used in trigger names (in *Monitoring* > *Problems* list), event names, and tag names and values. In all other cases user time zone is used.

 This macro may be used with a numeric index, e.g., {ITEM.LASTVALUE.TIME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LASTVALUE.TIMESTAMP}

The UNIX timestamp when the latest item value was collected.

 This macro may be used with a numeric index, e.g., {ITEM.LASTVALUE.TIMESTAMP<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.AGE}

The age of the log event.
With precision down to a second.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.AGE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.DATE}

The date when the log entry was written to the log.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.DATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.EVENTID}

The ID of the event in the event log.
 For Windows event log monitoring only.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.EVENTID<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.NSEVERITY}

The numeric severity of the event in the event log.
 For Windows event log monitoring only.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.NSEVERITY<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.SEVERITY}

The verbal severity of the event in the event log.
 For Windows event log monitoring only.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.SEVERITY<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.SOURCE}

The source of the event in the event log.
 For Windows event log monitoring only.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.SOURCE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.TIME}

The time when the log entry was written to the log.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.TIME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.LOG.TIMESTAMP}

The UNIX timestamp when the log entry was written to the log.

 This macro may be used with a numeric index, e.g., {ITEM.LOG.TIMESTAMP<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.NAME}

The name of the item with all macros resolved.

 This macro may be used with a numeric index, e.g., {ITEM.NAME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.NAME.ORIG}

The original name (with macros unresolved) of the item.

 This macro may be used with a numeric index, e.g., {ITEM.NAME.ORIG<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.STATE}

The latest state of the Nth item in the trigger expression that caused a notification.
 Possible values: *Not supported*, *Normal*.

 This macro may be used with a numeric index, e.g., {ITEM.STATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.STATE.ERROR}

The error message with details why an item became unsupported.
 If an item goes into the unsupported state and then immediately gets supported again the error field can be empty.

{ITEM.VALUE}

Resolved to either:

- The historical (at-the-time-of-event) value of the Nth item in the trigger expression, if used in the context of change of trigger state, for example, when displaying events or sending notifications;
- The latest value of the Nth item in the trigger expression, if used without the context of trigger state change, for example, when displaying a list of triggers in a pop-up selection window. In this case works the same as {ITEM.LASTVALUE}.

In the first case it will resolve to *UNKNOWN* if the history value has already been deleted or has never been stored.
In the second case, and in the frontend only, it will resolve to *UNKNOWN* if the latest history value has been collected more than the *Max history display period* time ago (set in the *Administration > General* menu section).
The resolved value for text/log items is truncated to 20 characters by the frontend in the following locations:
- Operational data;
- Trigger description;
- Trigger URLs;
- Trigger URL labels;
- Description of the item value widget.
To resolve to a full value, you may use macro functions, as no values are truncated by the server. For example: `{{ITEM.VALUE}.regsub("(.*)", \1)}`.

This macro may be used with a numeric index, e.g., {ITEM.VALUE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.VALUE.AGE}

The time that elapsed between the item value collection and macro evaluation.
 Displayed in a human-readable format (e.g., 1m 45s).

 This macro may be used with a numeric index, e.g., {ITEM.VALUE.AGE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.VALUE.DATE}

The date when the item value was collected.
 Displayed in a `YYYYMMDD` format.
 The server time zone is used in trigger names (in *Monitoring* > *Problems* list), event names, and tag names and values. In all other cases user time zone is used.

This macro may be used with a numeric index, e.g., {ITEM.VALUE.DATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.VALUE.TIME}

The time when the item value was collected.
 Displayed in an `HHMMSS` format.
 The server time zone is used in trigger names (in *Monitoring* > *Problems* list), event names, and tag names and values. In all other cases user time zone is used.

This macro may be used with a numeric index, e.g., {ITEM.VALUE.TIME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.VALUE.TIMESTAMP}

The UNIX timestamp when the item value was collected.

 This macro may be used with a numeric index, e.g., {ITEM.VALUE.TIMESTAMP<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{ITEM.VALUETYPE}

The value type of the Nth item in the trigger expression that caused a notification.
 Possible values: *0* - Numeric float, *1* - Character, *2* - Log, *3* - Numeric unsigned, *4* - Text.

 This macro may be used with a numeric index, e.g., {ITEM.VALUETYPE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

Low-level discovery notification macros

{LLDRULE.DESCRIPTION}

The description of the low-level discovery rule that caused a notification.

{LLDRULE.DESCRIPTION.ORIG}

The original description (with macros unresolved) of the low-level discovery rule that caused a notification.

{LLDRULE.ID}

The numeric ID of the low-level discovery rule that caused a notification.

{LLDRULE.KEY}

The key of the low-level discovery rule that caused a notification.

{LLDRULE.KEY.ORIG}

The original key (with macros unresolved) of the low-level discovery rule that caused a notification.

{LLDRULE.NAME}

The name of the low-level discovery rule that caused a notification.

{LLDRULE.NAME.ORIG}

The original name (with macros unresolved) of the low-level discovery rule that caused a notification.

{LLDRULE.STATE}

The latest state of the low-level discovery rule.
 Possible values: *Not supported*, *Normal*.

 This macro may be used with a numeric index, e.g., {LLDRULE.STATE<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{LLDRULE.STATE.ERROR}

The error message with details why the low-level discovery rule became unsupported.
 If a low-level discovery rule goes into the unsupported state and then immediately gets supported again the error field can be empty.

Map macros

{MAP.ID}

The network map ID.

{MAP.NAME}

The network map name.

Proxy macros

{PROXY.DESCRIPTION}

The proxy description.
 Resolves to either:

- Proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use indexed macros here;
- Proxy, which executed discovery (in discovery notifications). Use {PROXY.DESCRIPTION} here, without indexing;
- Proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.DESCRIPTION} here, without indexing.

This macro may be used with a numeric index, e.g., {PROXY.DESCRIPTION<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

{PROXY.NAME}

The proxy name.
 Resolves to either:

- Proxy of the Nth item in the trigger expression (in trigger-based notifications). You may use indexed macros here;
- Proxy, which executed discovery (in discovery notifications). Use {PROXY.NAME} here, without indexing;
- Proxy to which an active agent registered (in autoregistration notifications). Use {PROXY.NAME} here, without indexing.

This macro may be used with a numeric index, e.g., {PROXY.NAME<1-9>} to point to the first, second, third, etc. item in a trigger expression. See indexed macros.

Script macros

{MANUALINPUT}

The manual input value specified by user at script execution time.

Service macros

{SERVICE.DESCRIPTION}

The service description with macros resolved.

{SERVICE.ID}

The numeric ID of the service that triggered an action.

{SERVICE.NAME}

The service name with macros resolved.

{SERVICE.ROOTCAUSE}

The list of trigger problem events that caused a service to fail, sorted by severity and host name.
 Includes the following details: host name, event name, severity, age, service tags and values.

{SERVICE.TAGS}

A comma-separated list of service event tags.
 Service event tags can be defined in the service configuration tags section. Expanded to an empty string if no tags exist.

{SERVICE.TAGSJSON}

A JSON array containing service event tag objects.
 Service event tags can be defined in the service configuration tags section. Expanded to an empty array if no tags exist.

{SERVICE.TAGS.<tag name>}

The service event tag value referenced by the tag name.
 The service event tags can be defined in the service configuration tags section.
 A tag name containing non-alphanumeric characters (including non-English multibyte-UTF characters) must be double quoted. Quotes and backslashes inside a quoted tag name must be escaped with a backslash.

Trigger macros

{TRIGGER.DESCRIPTION}

The trigger description.
 All macros supported in a trigger description will be expanded if `{TRIGGER.DESCRIPTION}` is used in notification text.

{TRIGGER.EVENTS.ACK}

The number of acknowledged events for a map element in maps, or for the trigger which generated current event in notifications.

{TRIGGER.EVENTS.PROBLEM.ACK}

The number of acknowledged problem events for all triggers disregarding their state.

{TRIGGER.EVENTS.PROBLEM.UNACK}

The number of unacknowledged problem events for all triggers disregarding their state.

{TRIGGER.EVENTS.UNACK}

The number of unacknowledged events for a map element in maps, or for the trigger which generated current event in notifications.

{TRIGGER.EXPRESSION}

The trigger expression.

{TRIGGER.EXPRESSION.EXPLAIN}

A partially-evaluated trigger expression.
 Item-based functions are evaluated and replaced by the results at the time of event generation whereas all other functions are displayed as written in the expression. Can be used for debugging trigger expressions.

{TRIGGER.EXPRESSION.RECOVERY}

The trigger recovery expression if *OK event generation* in trigger configuration is set to "Recovery expression"; otherwise, an empty string is returned.

{TRIGGER.EXPRESSION.RECOVERY.EXPLAIN}

A partially-evaluated trigger recovery expression.
 Item-based functions are evaluated and replaced by the results at the time of event generation whereas all other functions are displayed as written in the expression. Can be used for debugging trigger recovery expressions.

{TRIGGER.HOSTGROUP.NAME}

A sorted (by SQL query), comma-space separated list of host groups in which the trigger is defined.

{TRIGGER.ID}

The numeric trigger ID which triggered this action.

{TRIGGER.NAME}

The trigger name with macros resolved.
 Note that `{EVENT.NAME}` can be used in actions to display the triggered event/problem name with macros resolved.

{TRIGGER.NAME.ORIG}

The original trigger name (with macros unresolved).

{TRIGGER.NSEVERITY}

The numerical trigger severity.
 Possible values: *0* - Not classified, *1* - Information, *2* - Warning, *3* - Average, *4* - High, *5* - Disaster.

{TRIGGER.PROBLEM.EVENTS.PROBLEM.ACK}

The number of acknowledged problem events for triggers in problem state.

{TRIGGER.PROBLEM.EVENTS.PROBLEM.UNACK}

The number of unacknowledged problem events for triggers in problem state.

{TRIGGER.SEVERITY}

The trigger severity name.
 Can be defined in *Administration > General > Trigger displaying options*.

{TRIGGER.STATE}

The latest state of the trigger expression.
 Possible values: *Unknown*, *Normal*.

{TRIGGER.STATE.ERROR}

The error message with details why a trigger became unsupported.
 If a trigger goes into the unsupported state and then immediately gets supported again the error field can be empty.

{TRIGGER.STATUS}

The trigger value at the time of operation step execution.
 Possible values: *Problem*, *OK*.

{TRIGGER.TEMPLATE.NAME}

A sorted (by SQL query), comma-space separated list of templates in which the trigger is defined, or *UNKNOWN* if the trigger is defined in a host.

{TRIGGER.URL}

The trigger URL.

{TRIGGER.URL.NAME}

The label for the trigger URL.

{TRIGGER.VALUE}

The current numeric trigger value.
 Possible values: *0* - trigger is in OK state, *1* - trigger is in Problem state.

{TRIGGERS.ACK}

The number of acknowledged triggers for a map element, disregarding trigger state.
 A trigger is considered to be acknowledged if all of its problem events are acknowledged.

{TRIGGERS.PROBLEM.ACK}

The number of acknowledged problem triggers for a map element.
 A trigger is considered to be acknowledged if all of its problem events are acknowledged.

{TRIGGERS.PROBLEM.UNACK}

The number of unacknowledged problem triggers for a map element.
 A trigger is considered to be unacknowledged if at least one of its problem events is unacknowledged.

{TRIGGERS.UNACK}

The number of unacknowledged triggers for a map element, disregarding trigger state.
 A trigger is considered to be unacknowledged if at least one of its problem events is unacknowledged.

Username macros

{USER.FULLNAME}

The name, surname and username of the user who added event acknowledgment or started the script.

{USER.NAME}

The name of the user who started the script.

{USER.SURNAME}

The surname of the user who started the script.

{USER.USERNAME}

The username of the user who started the script.

Indexed macros

The indexed macro syntax **{MACRO<1-9>}** can only reference the N-th item, function, or host in a trigger's *Expression* field:

- **{HOST.IP1}, {HOST.IP2}, {HOST.IP3}** resolve to the IP addresses of the first, second, and third hosts in the trigger expression (if present).
- **{ITEM.VALUE1}, {ITEM.VALUE2}, {ITEM.VALUE3}** resolve to the values of the first, second, and third items in the trigger expression at the time of the event (if present).
- **{FUNCTION.VALUE1}, {FUNCTION.VALUE2}, {FUNCTION.VALUE3}** resolve to the values of the first, second, and third item-based functions at the time of the event (if present).

In the context of triggers, indexed macros always refer to the *Expression* field of the trigger configuration, not the *Recovery expression*. For example, in a recovery event, **{ITEM.VALUE2}** will resolve to the value of the second item from the problem expression at the time of recovery.

The **{HOST.HOST<1-9>}** macro is also supported within the `{?func(/host/key,param)}` expression macro in **graph names**. For example, `{?func(/{HOST.HOST2}/key,param)}` in a graph name will resolve to the host of the second item in the graph.

Warning:
Indexed macros will not resolve in any other context beyond the cases mentioned here. For other contexts, use macros without an index (**{HOST.HOST}, {HOST.IP}**, etc.).

User macros supported by location

Overview

This section contains a list of locations, where user-definable macros are supported.

Note:
Only global-level user macros are supported for *Actions*, *Network discovery*, *Proxies* and all locations listed under *Other locations* section of this page. In the mentioned locations, host-level and template-level macros will not be resolved.

Note:
To customize macro values (for example, shorten or extract specific substrings), you can use macro functions.

Actions

In actions, user macros can be used in the following fields:

Location		Multiple macros/mix with text[1]
Trigger-based notifications and commands		yes
Trigger-based internal notifications		yes
Problem update notifications		yes
Service-based notifications and commands		yes
Service update notifications		yes
Time period condition		no
Operations		
	Default operation step duration	no
	Step duration	no

Hosts/host prototypes

In a host and host prototype configuration, user macros can be used in the following fields:

Location		Multiple macros/mix with text[1]
Interface IP/DNS		DNS only
Interface port		no
SNMP v1, v2		
	SNMP community	yes
SNMP v3		
	Context name	yes
	Security name	yes
	Authentication passphrase	yes
	Privacy passphrase	yes
IPMI		
	Username	yes
	Password	yes
Tags[2]		
	Tag names	yes
	Tag values	yes

Items / item prototypes

In an item or an item prototype configuration, user macros can be used in the following fields:

Location	Multiple macros/mix with text[1]
Item name	yes

Location	Multiple macros/mix with text[1]
Item key parameters	yes[4]
Update interval	no
Custom intervals	no
Timeout (available for supported item types)	no
Store up to (for history and trends)	no
Description	yes
Calculated/aggregate item	
Formula (expression constants and function parameters; item key parameters; (*aggregate item only*) filter conditions (host group name and tag name))	yes
Database monitor	
Username	yes
Password	yes
SQL query	yes
HTTP agent	
URL[3]	yes
Query fields	yes
Request body	yes
Headers (names and values)	yes
Required status codes	yes
HTTP proxy	yes
HTTP authentication username	yes
HTTP authentication password	yes
SSl certificate file	yes
SSl key file	yes
SSl key password	yes
Allowed hosts	yes
JMX agent	
JMX endpoint	yes
Script item	

Location	Multiple macros/mix with text[1]
Parameter names and values	yes
Browser item	
Parameter names and values	yes
Telemetry query item	
Time shift	no
Lookback limit	no
Granularity	no
SNMP agent	
SNMP OID	yes
SSH agent	
Username	yes
Public key file	yes
Private key file	yes
Password	yes
Script	yes
TELNET agent	
Username	yes
Password	yes
Script	yes
Zabbix trapper	
Allowed hosts	yes
Tags[2]	
Tag names	yes
Tag values	yes
Preprocessing steps	
Parameters (including custom scripts)	yes
Custom error-handling parameters (*Set value to* and *Set error to* fields)	yes

Low-level discovery

In a low-level discovery rule, user macros can be used in the following fields:

Location		Multiple macros/mix with text[1]
Key parameters		yes
Update interval		no
Custom interval		no
Timeout (available for supported item types)		no
Delete lost resources		no
Disable lost resources		no
Description		yes
SNMP agent		
	SNMP OID	yes
SSH agent		
	Username	yes
	Public key file	yes
	Private key file	yes
	Password	yes
	Script	yes
TELNET agent		
	Username	yes
	Password	yes

Location		Multiple macros/mix with text[1]
	Script	yes
Zabbix trapper		
	Allowed hosts	yes
Database monitor		
	Username	yes
	Password	yes
	SQL query	yes
JMX agent		
	JMX endpoint	yes
HTTP agent		
	URL[3]	yes
	Query fields	yes
	Request body	yes
	Headers (names and values)	yes
	Required status codes	yes
	HTTP authentication username	yes
	HTTP authentication password	yes
Filters		
	Regular expression	yes
Overrides		
	Filters: regular expression	yes
	Operations: update interval (for item prototypes)	no
	Operations: history storage period (for item prototypes)	no
	Operations: trend storage period (for item prototypes)	no

Network discovery

In a network discovery rule, user macros can be used in the following fields:

Location		Multiple macros/mix with text[1]
Update interval		no
SNMP v1, v2		
	SNMP community	yes
	SNMP OID	yes
SNMP v3		
	Context name	yes
	Security name	yes
	Authentication passphrase	yes
	Privacy passphrase	yes
	SNMP OID	yes

Proxies

In a proxy configuration, user macros can be used in the following fields:

Location	Multiple macros/mix with text[1]
Address for active agents > *Port* (if the proxy belongs to a group)	no
Interface address and port (for passive proxy)	no
Timeouts for item types	no

Proxy groups

In a proxy group configuration, user macros can be used in the following fields:

Location	Multiple macros/mix with text[1]
Failover period	no
Minimum number of proxies	no

Templates

In a template configuration, user macros can be used in the following fields:

Location		Multiple macros/mix with text[1]
Tags[2]		
	Tag names	yes
	Tag values	yes

Triggers

In a trigger configuration, user macros can be used in the following fields:

Location	Multiple macros/mix with text[1]
Name	yes
Operational data	yes
Expression (only in constants and function parameters; secret macros are not supported)	yes
Tag for matching	yes
Menu entry name	yes
Menu entry URL[3]	yes
Description	yes
Tags[2]	
Tag names	yes
Tag values	yes

Web scenario

In a web scenario configuration, user macros can be used in the following fields:

Location	Multiple macros/mix with text[1]
Name	yes
Update interval	no

Location		Multiple macros/mix with text[1]
Agent		yes
HTTP proxy		yes
Variables (values only)		yes
Headers (names and values)		yes
Steps		
	Name	yes
	URL[3]	yes
	Variables (values only)	yes
	Headers (names and values)	yes
	Timeout	no
	Required string	yes
	Required status codes	no
Authentication		
	User	yes
	Password	yes
	SSL certificate	yes
	SSL key file	yes
	SSL key password	yes
Tags[2]		
	Tag names	yes
	Tag values	yes

Other locations

In addition to the locations listed here, user macros can be used in the following fields:

Location	Multiple macros/mix with text[1]
Global scripts (URL, script, SSH, Telnet, IPMI), including confirmation text	yes
Webhooks	
JavaScript script	no
JavaScript script parameter name	no
JavaScript script parameter value	yes
Dashboards	
Column of data type *Text* in *Top hosts* dashboard widget	yes
Description parameter in *Item value* and *Gauge* dashboard widget	yes
Primary/Secondary label *Text* parameter in *Honeycomb* dashboard widget	yes
URL[3] parameter in *URL* dashboard widget	yes
Monitoring > *Problems*, *Hosts*, *Latest data*	

Location	Multiple macros/mix with text[1]
Custom text column *Data collection* > *Templates*, *Hosts*	yes
Custom text column *Alerts* > *Media types* > *Message templates*	yes
Subject	yes
Message *Alerts* > *Media types* > *Script*	yes
Script parameters *Alerts* > *Media types* > *Media type*	yes
Username and *Password* fields for the *Email* media type (when *Authentication* is set to "Username and password"; secret macros recommended) *Users* > *Users* > *Media*	yes
When active *Administration* > *General* > *GUI*	yes
Working time	no

Location	Multiple macros/mix with text[1]
Administration > General > Timeouts	
Timeouts for item types	no
Administration > General > Connectors	
URL	yes
Username	yes
Password	yes
Bearer token	yes
Timeout	no
HTTP proxy	yes
SSL certificate file	yes
SSL key file	yes
SSL key password	yes

For a complete list of all macros supported in Zabbix, see supported macros.

Footnotes

[1] If multiple macros in a field or macros mixed with text are not supported for the location, a single macro has to fill the whole field.

[2] Macros used in tag names and values are resolved only during event generation process.

[3] URLs that contain a secret macro will not work, as the macro in them will be resolved as "******".

[4] Macros are not supported in the item key of Zabbix trapper items.

Version compatibility

Supported agents

To be compatible with Zabbix 8.0, Zabbix agent must not be older than version 1.6 and must not be newer than 8.0.

You may need to review the configuration of older agents as some parameters have changed, for example, parameters related to logging for versions before 3.0.

To take full advantage of the latest functionality, metrics, improved performance and reduced memory usage, use the latest supported agent.

Notes for Windows XP

- On 32-bit Windows XP, do not use Zabbix agents newer than 6.0.x;
- On Windows XP/Server 2003, do not use agent templates that are newer than Zabbix 4.0.x. The newer templates use English performance counters, which are only supported since Windows Vista/Server 2008.

Supported agents 2

Older Zabbix agents 2 from version 4.4 onwards are compatible with Zabbix 8.0; Zabbix agent 2 must not be newer than 8.0.

Note that when using Zabbix agent 2 versions 4.4 and 5.0, the default interval of 10 minutes is used for refreshing unsupported items.

To take full advantage of the latest functionality, metrics, improved performance and reduced memory usage, use the latest supported agent 2.

Supported Zabbix proxies

For full compatibility with Zabbix 8.0, proxies must match the server's major version. Only Zabbix 8.0.x proxies are fully compatible with a Zabbix 8.0.x server.

Outdated proxies are partially supported: they can still collect data and execute scripts but cannot receive configuration updates, such as new items.

In relation to Zabbix server, proxies can be:

- *Current* (proxy and server have the same major version);
- *Outdated* (proxy version is older than server version, but is partially supported);
- *Unsupported* (proxy version is older than server previous LTS release version *or* proxy version is newer than server major version).

Examples:

Server version	*Current* proxy version	*Outdated* proxy version	*Unsupported* proxy version
6.4	6.4	6.0, 6.2	Older than 6.0; newer than 6.4
7.0	7.0	6.0, 6.2, 6.4	Older than 6.0; newer than 7.0
7.2	7.2	7.0	Older than 7.0; newer than 7.2
7.4	7.4	7.0	Older than 7.0; newer than 7.4
8.0	8.0	7.0, 7.2, 7.4	Older than 7.0; newer than 8.0

Functionality supported by proxies:

Proxy version	Data update	Configuration update	Tasks
Current	Yes	Yes	Yes
Outdated	Yes	No	Remote commands (e.g., shell scripts); Immediate item value checks (i.e., *Execute now*); Note: Preprocessing tests with a real value are not supported.
Unsupported	No	No	No

Warnings about using incompatible Zabbix daemon versions are logged.

Supported XML files

XML files not older than version 1.8 are supported for import in Zabbix 8.0.

Attention:
In the XML export format, trigger dependencies are stored by name only. If there are several triggers with the same name (for example, having different severities and expressions) that have a dependency defined between them, it is not possible to import them. Such dependencies must be manually removed from the XML file and re-added after import.

Time period syntax

Overview

To set a time period, the following format has to be used:

`d-d,hh:mm-hh:mm`

where the symbols stand for the following:

Symbol	Description
d	Day of the week: 1 - Monday, 2 - Tuesday ,... , 7 - Sunday
hh	Hours: 00-24
mm	Minutes: 00-59

You can specify more than one time period using a semicolon (;) separator:

`d-d,hh:mm-hh:mm;d-d,hh:mm-hh:mm...`

Leaving the time period empty equals 1-7,00:00-24:00, which is the default value.

> **Attention:**
> The upper limit of a time period is not included. Thus, if you specify 09:00-18:00 the last second included in the time period is 17:59:59.

Examples

Working hours. Monday - Friday from 9:00 till 18:00:

`1-5,09:00-18:00`

Working hours plus weekend. Monday - Friday from 9:00 till 18:00 and Saturday, Sunday from 10:00 till 16:00:

`1-5,09:00-18:00;6-7,10:00-16:00`

Unit symbols

Overview

Working with large values such as 86400, 104857600, or 1000000 can be challenging and can lead to errors. To simplify configuration and improve readability, Zabbix supports unit symbols (suffixes) that function as value multipliers.

Trigger expressions without suffixes:

```
last(/host/system.uptime)<86400
avg(/host/system.cpu.load,600s)<10
last(/host/vm.memory.size[available])<20971520
```

Trigger expressions with suffixes:

```
last(/host/system.uptime)<1d
avg(/host/system.cpu.load,10m)<10
last(/host/vm.memory.size[available])<20M
```

Suffixes can also simplify the configuration of other entities, such as items, widgets, etc., and help display item values in a human-readable format.

> **Note:**
> To see if an entity configuration field supports suffixes, always see the relevant page for the entity being configured.

Time suffixes

Zabbix frontend supports the following time suffixes in entity configuration:
 s - seconds *(when used, works the same as the raw value)*;
 m - minutes;
 h - hours;
 d - days;
 w - weeks;
 M - months *(trend functions only)*;
 y - years *(trend functions only)*.

Time suffixes are supported only with integer numbers. For example, 1h is supported, but 1,5h or 1.5h is not supported; use 90m instead.

Memory size suffixes

Zabbix supports the following memory size suffixes:
 K - kilobytes
 M - megabytes
 G - gigabytes
 T - terabytes

Item value suffixes

Suffixes can also be used to display numeric item values in a human-readable format.

To enable this, use one of the following suffixes in the *Units* field when configuring an item:
 B - bytes;
 Bps - bytes per second;
 s - seconds, displayed using up to three largest non-zero time units;
 uptime - elapsed time in hh:mm:ss or N days, hh:mm:ss;
 unixtime - Unix timestamp, formatted as yyyy.mm.dd hh:mm:ss.

The following additional rules apply to how these suffixes are interpreted and displayed:

- For B and Bps, Zabbix uses base-2 conversion (1K = 1024B), following the JEDEC standard.
- For other units (such as Hz, W, etc.), Zabbix uses base-10 conversion (1K = 1000).
- For s (seconds):

- The format includes yyy mmm ddd hhh mmm sss ms; only up to three largest non-zero time units are displayed (e.g., 1M 10d 4h).
- If a unit is zero and between two non-zero units, it is omitted (e.g., 10d 56m instead of 10d 0h 56m).

When *Units* are used, the following multiplier suffixes are automatically applied to item values:
 K, **M**, **G**, **T** - kilo, mega, giga, tera;
 P, **E**, **Z**, **Y** - peta, exa, zetta, yotta *(these are applied in frontend only).*

To prevent unit conversion, use the `!` prefix (e.g., !B or !s).

The following examples show how received item values are converted based on the specified units:

```
1 B → 1 B
1024 B → 1 KB
1536 B → 1.5 KB
881764 B → 881.76 KB
881764 !B → 881764 B

0.0000155 s → 0.016ms
3470400 s → 1M 10d 4h
2606400 s → 1M 4h
2592000 s → 1M
2592001 s → 1M
2592001 !s → 2592001 s

17764 uptime → 04:56:04
86400 uptime → 1 day, 00:00:00
881764 uptime → 10 days, 04:56:04
32417764 uptime → 375 days, 04:56:04
32417764 !uptime → 32417764 uptime

881764 unixtime → 1970-01-11 04:56:04 AM

17764 Hz → 17.76 KHz
86400 Hz → 86.4 KHz
881764 Hz → 881.76 KHz
32417764 Hz → 32.42 MHz

0 ! → 0
0 !! → 0 !
```

Note:
Before Zabbix 4.0, there was a hardcoded unit stoplist consisting of `ms`, `rpm`, `RPM`, `%`. This stoplist has been deprecated, thus the correct way to prevent converting such units is `!ms`, `!rpm`, `!RPM`, `!%`.

Command execution

Zabbix uses common functionality for external checks, user parameters, system.run items, custom alert scripts, remote commands and global scripts.

Execution steps

Note:
By default, all scripts in Zabbix are executed using the *sh* shell, and it is not possible to modify the default shell. To utilize a different shell, you can employ a workaround: create a script file and invoke that script during command execution.

The command/script is executed similarly on both Unix and Windows platforms:

1. Zabbix (the parent process) creates a pipe for communication
2. Zabbix sets the pipe as the output for the to-be-created child process
3. Zabbix creates the child process (runs the command/script)
4. A new process group (in Unix) or a job (in Windows) is created for the child process
5. Zabbix reads from the pipe until timeout occurs or no one is writing to the other end (ALL handles/file descriptors have been closed). Note that the child process can create more processes and exit before they exit or close the handle/file descriptor.

6. If the timeout has not been reached, Zabbix waits until the initial child process exits or timeout occurs
7. If the initial child process exited and the timeout has not been reached, Zabbix checks exit code of the initial child process and compares it to 0 (non-zero value is considered as execution failure, only for custom alert scripts, remote commands and user scripts executed on Zabbix server and Zabbix proxy)
8. At this point it is assumed that everything is done and the whole process tree (i.e. the process group or the job) is terminated

Attention:
Zabbix assumes that a command/script has done processing when the initial child process has exited AND no other process is still keeping the output handle/file descriptor open. When processing is done, ALL created processes are terminated.

All double quotes and backslashes in the command are escaped with backslashes and the command is enclosed in double quotes.

Exit code checking

Exit code are checked with the following conditions:

- Only for custom alert scripts, remote commands and user scripts executed on Zabbix server and Zabbix proxy.
- Any exit code that is different from 0 is considered as execution failure.
- Contents of standard error and standard output for failed executions are collected and available in frontend (where execution result is displayed).
- Additional log entry may be created for remote commands executed on Zabbix agent/proxy by enabling the LogRemoteCommands parameter on agent/proxy.

Possible frontend messages and log entries for failed commands/scripts:

- Contents of standard error and standard output for failed executions (if any).
- "Process exited with code: N." (for empty output, and exit code not equal to 0).
- "Process killed by signal: N." (for process terminated by a signal, on Linux only).
- "Process terminated unexpectedly." (for process terminated for unknown reasons).

- system.run items
- Custom alert scripts
- Remote commands
- Global scripts

Escaping examples

Overview

This page provides examples of using correct escaping when using regular expressions in various contexts.

Note:
When using the trigger expression constructor, correct escaping in regular expressions is added automatically.

Examples

User macro with context

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{$MACRO:regex:"\.+\\"[a-z]+"}`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

Macro function inside item key parameter

Regular expression: `.+:(\d+)$<br>` Item key: `net.tcp.service[tcp,,"{{$ENDPOINT}.regsub(\".+:(\d+)$\",\1)}"]`

Notice:

- regular expression inside the `regsub` macro function is double-quoted (because of contains closing parenthesis);
- quotation marks around the regular expression are escaped (because the whole third item parameter is double-quoted);
- third item key parameter is double-quoted because it contains a comma.

LLD macro function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{{#MACRO}.iregsub("\.+\\"([a-z]+)", \1)}`

Notice:

- backslashes are not escaped;
- quotation marks are escaped.

LLD macro function inside user macro context

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{{#MACRO}.iregsub("\.+\\"([a-z]+)", \1)}<br>` User macro with context: `{$MACRO:"{{#MACRO}.iregsub(\"\.+\\\"[a-z]+\", \1)}"}`

Notice:

- backslash escaping for LLD does not change;
- upon inserting the LLD macro into user macro context, we need to put it into string:

1. Quotation marks are added around the macro expression;
2. Quotation marks get escaped; in total, 3 new backslashes are introduced.

String parameter of function (any)

`concat` is used as example.

String content: `\.+\"[a-z]+<br>` Expression: `concat("abc", "\\.\\\"[a-z]+")`

Notice:

- String parameters require escaping both for backslashes and quotation marks.

LLD macro function inside string parameter of function

Regular expression: `\.+\"([a-z]+)<br>` LLD macro: `{{#MACRO}.iregsub("\.+\\"([a-z]+)", \1)}<br>` Expression: `concat("abc, "{{#MACRO}.iregsub(\"\\.+\\\\\"([a-z]+)\", \\1)}")`

Notice:

- String parameters require escaping both for backslashes and quotation marks;
- Another layer of escaping is added, because the macro will be resolved only after string is unquoted;

User macro with context inside string parameter of function

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{$MACRO:regex:"\.+\\"[a-z]+"}<br>` Expression: `concat("abc, "{$MACRO:regex:\"\\.+\\\\\"[a-z]+\"}")`

Notice:

- Same as in the previous example an additional layer of escaping is needed;
- Backslashes and quotation marks are escaped only for the top-level escaping (by virtue of it being a string parameter).

LLD macro function inside user macro context inside function

Regular expression: `\.+\"([a-z])+<br>` LLD macro: `{{#MACRO}.iregsub("\.+\\"([a-z]+)", \1)}<br>` User macro with context: `{$MACRO:"{{#MACRO}.iregsub(\"\.+\\\"([a-z]+)\", \1)}"}<br>` Expression: `concat("abc, "{$MACRO:\"{{#MACRO}.iregsub(\\\"\.+\\\\\\\"([a-z]+)\\\", \\1)}\"}")`

Notice the three layers of escaping:

1. For LLD macro function, without escaping of backslashes;
2. For User macro with context, without escaping of backslashes;
3. For the string parameter of a function, with escaping of backslashes.

User macro with context just inside string

Regular expression: `\.+\"[a-z]+<br>` User macro with context: `{$MACRO:regex:"\.+\\"[a-z]+"}<br>` Inside string of some expression, for example: `func(arg1, arg2, arg3)="{$MACRO:regex:\"\\.+\\\\\"[a-z]+\"}"`

Notice:

- Strings also require backslash escaping;
- Strings also require quotation mark escaping;
- Again a case with 2 levels of escaping:

1. Escaping for user macro context without backslash escaping;
2. Escaping for it being a string with backslash escaping.

What is Zabbix

Zabbix was created by Alexei Vladishev, and currently is actively developed and supported by Zabbix SIA.

Zabbix is an enterprise-class open source distributed monitoring solution.

Zabbix is a software that monitors numerous parameters of a network and the health and integrity of servers, virtual machines, applications, services, databases, websites, the cloud and more. Zabbix uses a flexible notification mechanism that allows users to configure email-based alerts for virtually any event. This allows a fast reaction to server problems. Zabbix offers excellent reporting and data visualization features based on the stored data. This makes Zabbix ideal for capacity planning.

Zabbix supports both polling and trapping. All Zabbix reports and statistics, as well as configuration parameters, are accessed through a web-based frontend. A web-based frontend ensures that the status of your network and the health of your servers can be assessed from any location. Properly configured, Zabbix can play an important role in monitoring IT infrastructure. This is equally true for small organizations with a few servers and for large companies with a multitude of servers.

Zabbix is available at no cost. Zabbix is written and distributed under the AGPL-3.0 license. It means that its source code is freely distributed and available for the general public.

Commercial support is available and provided by Zabbix Company and its partners around the world.

Learn more about Zabbix features.

Users of Zabbix Many organizations of different size around the world rely on Zabbix as a primary monitoring platform.

Architecture Zabbix consists of several major software components. Their responsibilities are outlined below.

Server

Zabbix server is the central component to which agents report availability and integrity information and statistics. The server is the central repository in which all configuration, statistical and operational data is stored.

Database storage

All configuration information as well as the data gathered by Zabbix is stored in a database.

Web interface

For an easy access to Zabbix from anywhere and from any platform, the web-based interface is provided. The interface is part of Zabbix server, and usually (but not necessarily) runs on the same physical machine as the one running the server.

Proxy

Zabbix proxy can collect performance and availability data on behalf of Zabbix server. A proxy is an optional part of Zabbix deployment; however, it may be very beneficial to distribute the load of a single Zabbix server.

Agent

Zabbix agents are deployed on monitoring targets to actively monitor local resources and applications and report the gathered data to Zabbix server. Since Zabbix 4.4, there are two types of agents available: the Zabbix agent (lightweight, supported on many platforms, written in C) and the Zabbix agent 2 (extra-flexible, easily extendable with plugins, written in Go).

Data flow In addition it is important to take a step back and have a look at the overall data flow within Zabbix. In order to create an item that gathers data you must first create a host. Moving to the other end of the Zabbix spectrum you must first have an item to create a trigger. You must have a trigger to create an action. Thus if you want to receive an alert that your CPU load is too high on *Server X* you must first create a host entry for *Server X* followed by an item for monitoring its CPU, then a trigger which activates if the CPU is too high, followed by an action which sends you an email. While that may seem like a lot of steps, with the use of templating it really isn't. However, due to this design it is possible to create a very flexible setup.

Features Zabbix is a highly integrated network monitoring solution, offering a multiplicity of features in a single package.

Data gathering

- availability and performance checks
- support for SNMP (both trapping and polling), IPMI, JMX, VMware monitoring
- custom checks
- gathering desired data at custom intervals
- performed by server/proxy and by agents

Flexible threshold definitions

- you can define very flexible problem thresholds, called triggers, referencing values from the backend database

Highly configurable alerting

- sending notifications can be customized for the escalation schedule, recipient, media type
- notifications can be made meaningful and helpful using macro variables
- automatic actions include remote commands

Real-time graphing

- monitored items are immediately graphed using the built-in graphing functionality

Web monitoring capabilities

- Zabbix can follow a path of simulated mouse clicks on a web site and check for functionality and response time

Extensive visualization options

- ability to create custom graphs that can combine multiple items into a single view
- network maps
- slideshows in a dashboard-style overview
- reports
- high-level (business) view of monitored resources

Historical data storage

- data stored in a database
- configurable history
- built-in housekeeping procedure

Easy configuration

- add monitored devices as hosts
- hosts are picked up for monitoring, once in the database
- apply templates to monitored devices

Use of templates

- grouping checks in templates
- templates can inherit other templates

Network discovery

- automatic discovery of network devices
- agent autoregistration
- discovery of file systems, network interfaces and SNMP OIDs

Fast web interface

- a web-based frontend in PHP
- accessible from anywhere
- you can click your way through
- audit log

Zabbix API

- Zabbix API provides programmable interface to Zabbix for mass manipulations, third-party software integration and other purposes.

Permissions system

- secure user authentication
- certain users can be limited to certain views

Full featured and easily extensible agent

- deployed on monitoring targets
- can be deployed on both Linux and Windows

Binary daemons

- written in C, for performance and small memory footprint
- easily portable

Ready for complex environments

- remote monitoring made easy by using a Zabbix proxy

Glossary In this section you can learn the meaning of some terms commonly used in Zabbix.

host

- *any physical or virtual device, application, service, or any other logically-related collection of monitored parameters.*

host group

- *a logical grouping of hosts. Host groups are used when assigning access rights to hosts for different user groups.*

item

- *a particular piece of data that you want to receive from a host, a metric of data.*

value preprocessing

- *a transformation of received metric value* before saving it to the database.

trigger

- *a logical expression that defines a problem threshold and is used to "evaluate" data received in items.*

When received data is above the threshold, triggers go from *Ok* into a *Problem* state. When received data is below the threshold, triggers stay in/return to an *Ok* state.

template

- *a set of entities (items, triggers, graphs, low-level discovery rules, web scenarios) ready to be applied to one or several hosts.*

The job of templates is to speed up the deployment of monitoring tasks on a host; also to make it easier to apply mass changes to monitoring tasks. Templates are linked directly to individual hosts.

template group

- *a logical grouping of templates. Template groups are used when assigning access rights to templates for different user groups.*

event

- *a single occurrence of something that deserves attention such as a trigger changing state or a discovery/agent autoregistration taking place.*

event tag

- *a pre-defined marker for the event.* It may be used in event correlation, permission granulation, etc.

event correlation

- *a method of correlating problems to their resolution flexibly and precisely.*

For example, you may define that a problem reported by one trigger may be resolved by another trigger, which may even use a different data collection method.

problem

- *a trigger that is in "Problem" state.*

problem update

- *problem management options provided by Zabbix, such as adding comment, acknowledging, changing severity or closing manually.*

action

- *a predefined means of reacting to an event.*

An action consists of operations (e.g., sending a notification) and conditions (*when* the operation is carried out)

escalation

- *a custom scenario for executing operations within an action; a sequence of sending notifications/executing remote commands.*

macro

- *a variable placeholder that resolves to a specific value depending on the context.*

media

- *a means of delivering notifications; delivery channel.*

notification

- *a message about some event sent to a user via the chosen media channel.*

remote command

- a pre-defined command that is automatically executed on a monitored host upon some condition.

web scenario

- one or several HTTP requests to check the availability of a web site.

frontend

- the web interface provided with Zabbix.

dashboard

- customizable section of the web interface displaying summaries and visualizations of important information in visual units called widgets.

widget

- visual unit displaying information of a certain kind and source (a summary, a map, a graph, the clock, etc.), used in the dashboard.

Zabbix API

- Zabbix API allows you to use the JSON RPC protocol to create, update and fetch Zabbix objects (like hosts, items, graphs and others) or perform any other custom tasks.

Zabbix server

- a central process of Zabbix software that performs monitoring, interacts with Zabbix proxies and agents, calculates triggers, sends notifications; a central repository of data.

Zabbix proxy

- a process that may collect data on behalf of Zabbix server, taking some processing load from the server.

Zabbix agent

- a process deployed on monitoring targets to actively monitor local resources and applications.

Zabbix agent 2

- a new generation of Zabbix agent for actively monitoring local resources and applications, allowing the use of custom plugins for monitoring.

> **Attention:**
> Because Zabbix agent 2 shares much functionality with Zabbix agent, the term "Zabbix agent" in documentation stands for both - Zabbix agent and Zabbix agent 2, if the functional behavior is the same. Zabbix agent 2 is only specifically named where its functionality differs.

encryption

- support of encrypted communications between Zabbix components (server, proxy, agent, zabbix_sender and zabbix_get utilities) using Transport Layer Security (TLS) protocol.

agent autoregistration

- automated process whereby a Zabbix agent itself is registered as a host and started to monitor.

network discovery

- automated discovery of network devices.

low-level discovery

- automated discovery of low-level entities on a particular device (e.g., file systems, network interfaces, etc).

low-level discovery rule

- set of definitions for automated discovery of low-level entities on a device.

item prototype

- a metric with certain parameters as variables, ready for low-level discovery. After low-level discovery the variables are automatically substituted with the real discovered parameters and the metric automatically starts gathering data.

trigger prototype

- a trigger with certain parameters as variables, ready for low-level discovery. After low-level discovery the variables are automatically substituted with the real discovered parameters and the trigger automatically starts evaluating data.

Prototypes of some other Zabbix entities are also in use in low-level discovery - graph prototypes, host prototypes, host group prototypes.

Zabbix Cloud

Zabbix Cloud

Discover the available configuration options and access controls for organizations and nodes in Zabbix Cloud.

Please note that Zabbix Cloud nodes currently run **Zabbix 7.0**.
 For in-depth information on Zabbix 7.0, see official documentation.

Set up and manage Zabbix Cloud

Start using Zabbix Cloud Guided instructions to get your Zabbix Cloud instance up and running quickly, including initial configuration and connecting your monitored devices.

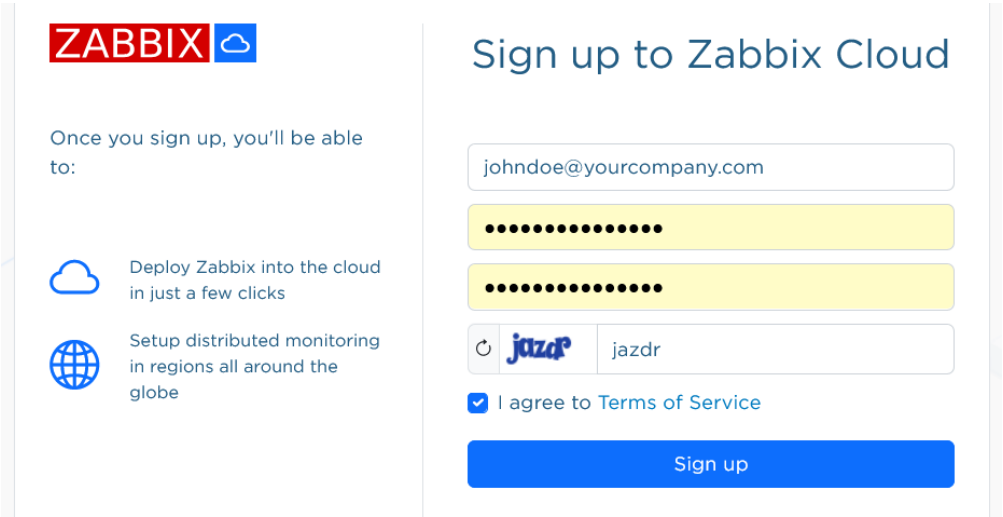
Node configuration Learn how to set up your Zabbix Cloud node, focusing on access, data handling, and resource settings.

Adding users Find out how to add and assign roles to users within a Zabbix Cloud organization and its nodes.

Learn about Zabbix Cloud

Zabbix Cloud vs. on-premises Compare the differences in management, scalability, and maintenance between the two deployments, and learn which can support your workflow most seamlessly.

Explore Zabbix Cloud Get an overview of Zabbix Cloud, including its key features, perks, and what comes with a subscription. For common questions on setup and usage, see the FAQ.



Deploy Zabbix in the cloud

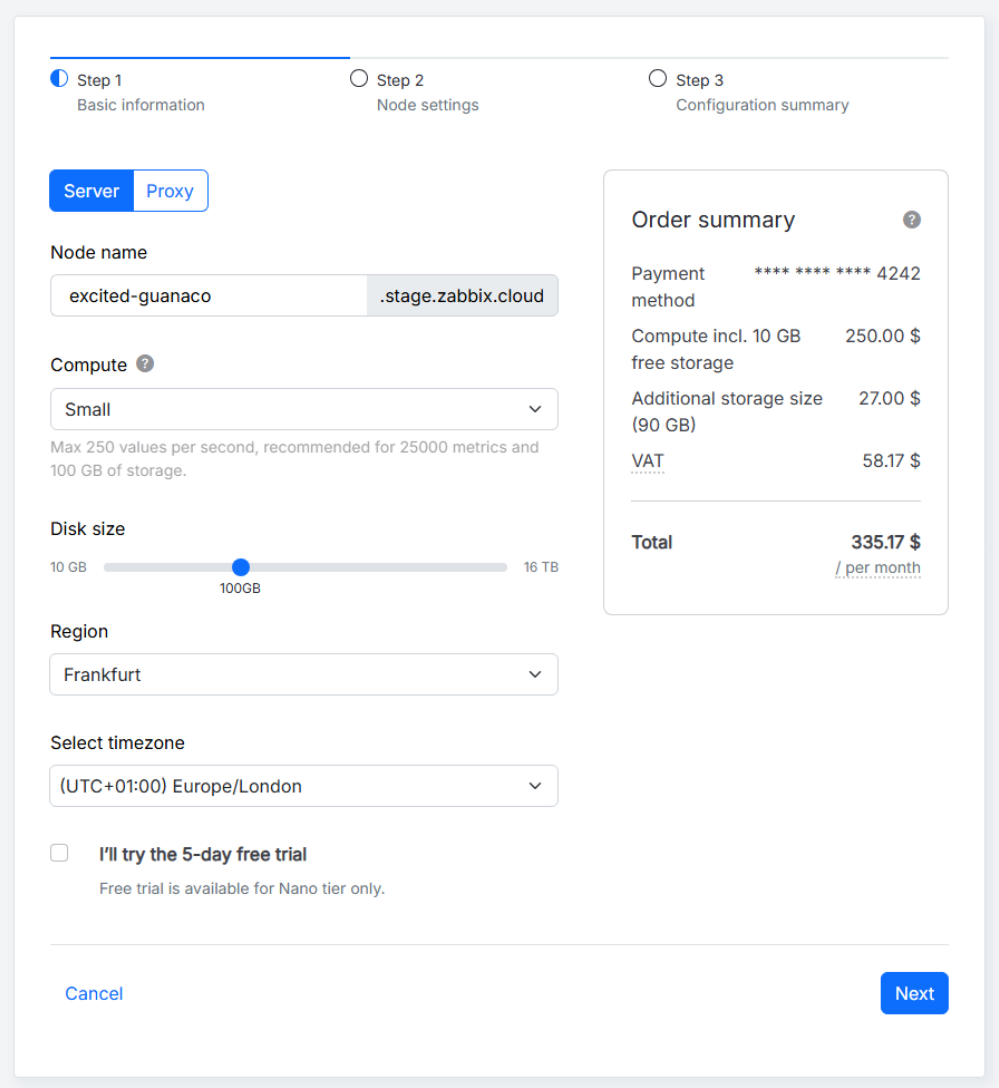
To start Zabbix in the cloud, follow this process:

1. Log in or sign up at cloud.zabbix.com.
2. Create a cloud node.
3. Start using Zabbix in the cloud.

Log in or sign up You can log in at cloud.zabbix.com with an existing Google, GitHub, or Microsoft account.

Alternatively, go to the sign up page to register.

After signing up, you will receive a confirmation of your new account in the email.



Go to cloud.zabbix.com to log in. You will be asked for a one-time password when logging in. This password will be sent to you in the email.

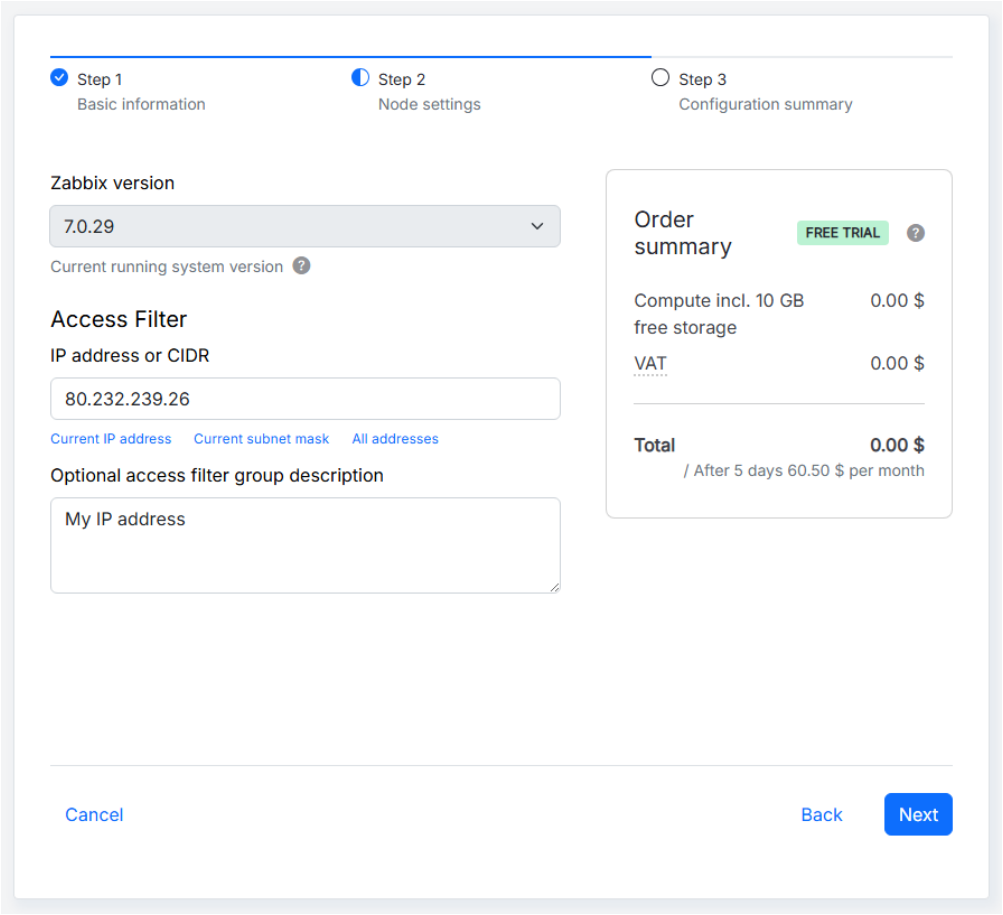
Create cloud node A cloud node is a Zabbix instance deployed in Zabbix Cloud. It can be deployed as a server node or proxy node.

When logged in, you will see that a *Private* organization already exists for your account by default. You can rename the default organization later.

Click *Create New Node*. A three-step node configuration form will open.

In the first step you will select basic information.

Parameter	Description
Server/Proxy	Select whether to deploy a Zabbix server instance or a Zabbix proxy instance.
Node name	The node name forms a unique subdomain in the format `<your-name>.zabbix.cloud`, which is used to access the node's services.
Compute	Select the computing power for the node. To determine what level of resources you need, see pricing details. You can always upgrade later if you need more power. A billing method will be required before creating a non-trial node. Add billing information via the *Billing* menu. A 5-day **free trial** is available for trying a *Nano* tier node. You will not be charged during the trial period, but once it ends, your node will be removed if not converted to a paid node.
Disk size	The slider defaults to a recommended minimum based on tier. Increase it if you store large volumes of history or trends. Be aware that larger disks incur higher monthly costs and that you cannot shrink a disk yourself—you'd need to contact support to reduce it.
Region	Select the region where the node will be deployed.
Select timezone	Select the timezone of the Zabbix server. This timezone is used by the Zabbix server and is independent of the maintenance and user profile timezones.

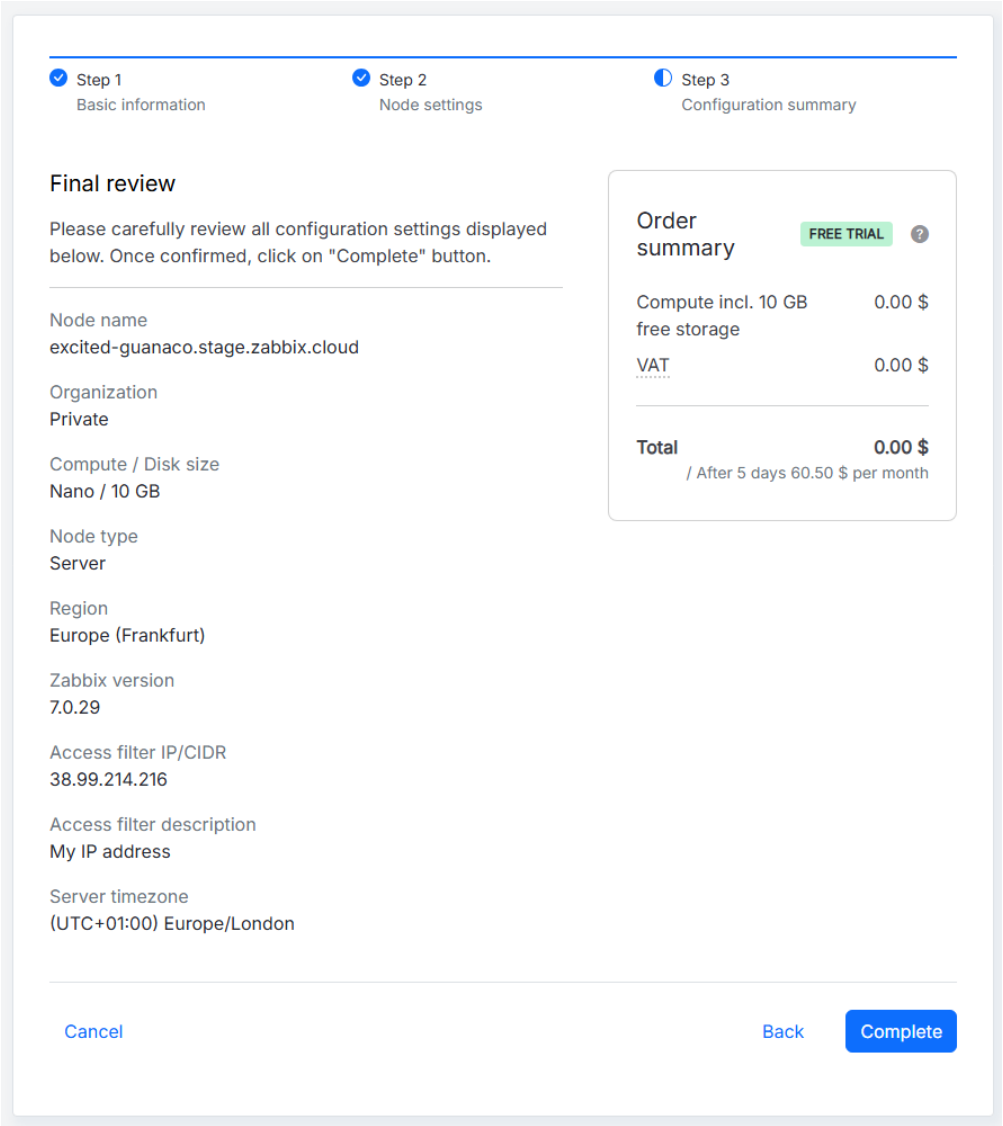


After completing the configuration, click *Next*.

In the second step you will select the node settings.

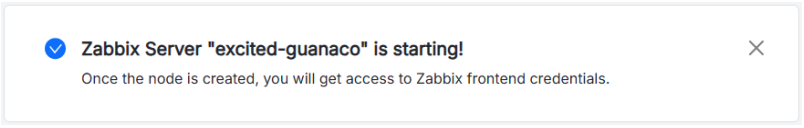
The configuration options in the second step depend on whether you are creating a server or proxy node.

Configure a server node

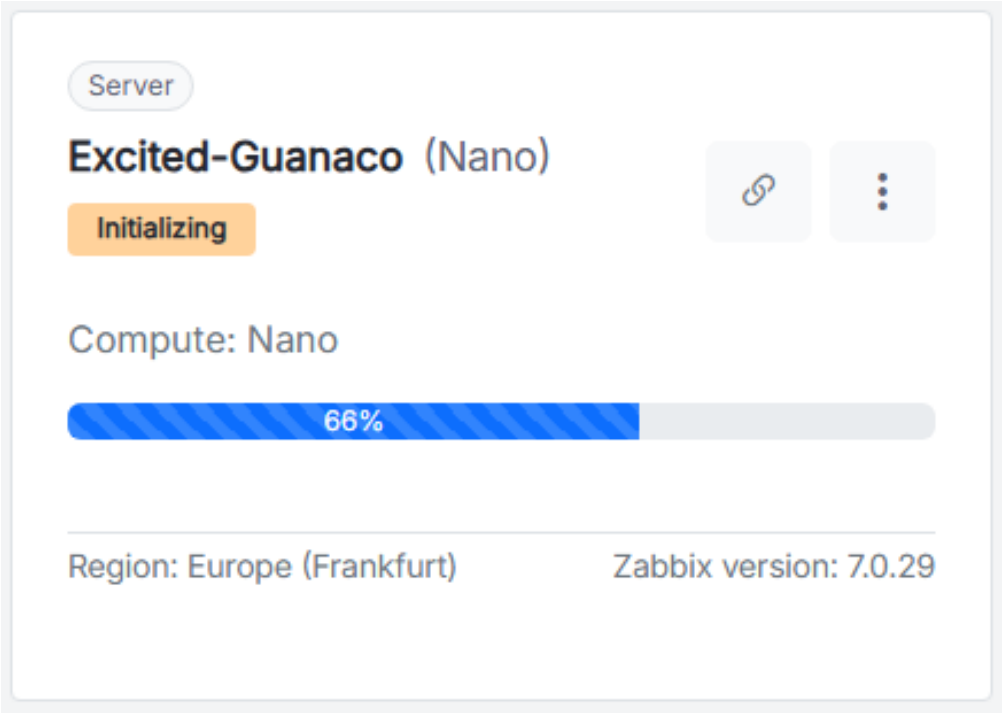


During server node creation, the following parameters are available:

Parameter	Description
Zabbix version	Select the Zabbix version. Zabbix Cloud supports the latest LTS version and automatically applies minor version updates.
IP address or CIDR	Specify the initial access filter for the node. Enter the IP address or CIDR manually, or complete the field automatically by selecting the relevant option. For server nodes, this filter applies to connections to the server, API, and frontend. The filter can be changed later in the Access filters tab.
Optional access filter group description	Add an optional description for the access filter group, which can contain multiple IP addresses or CIDRs.

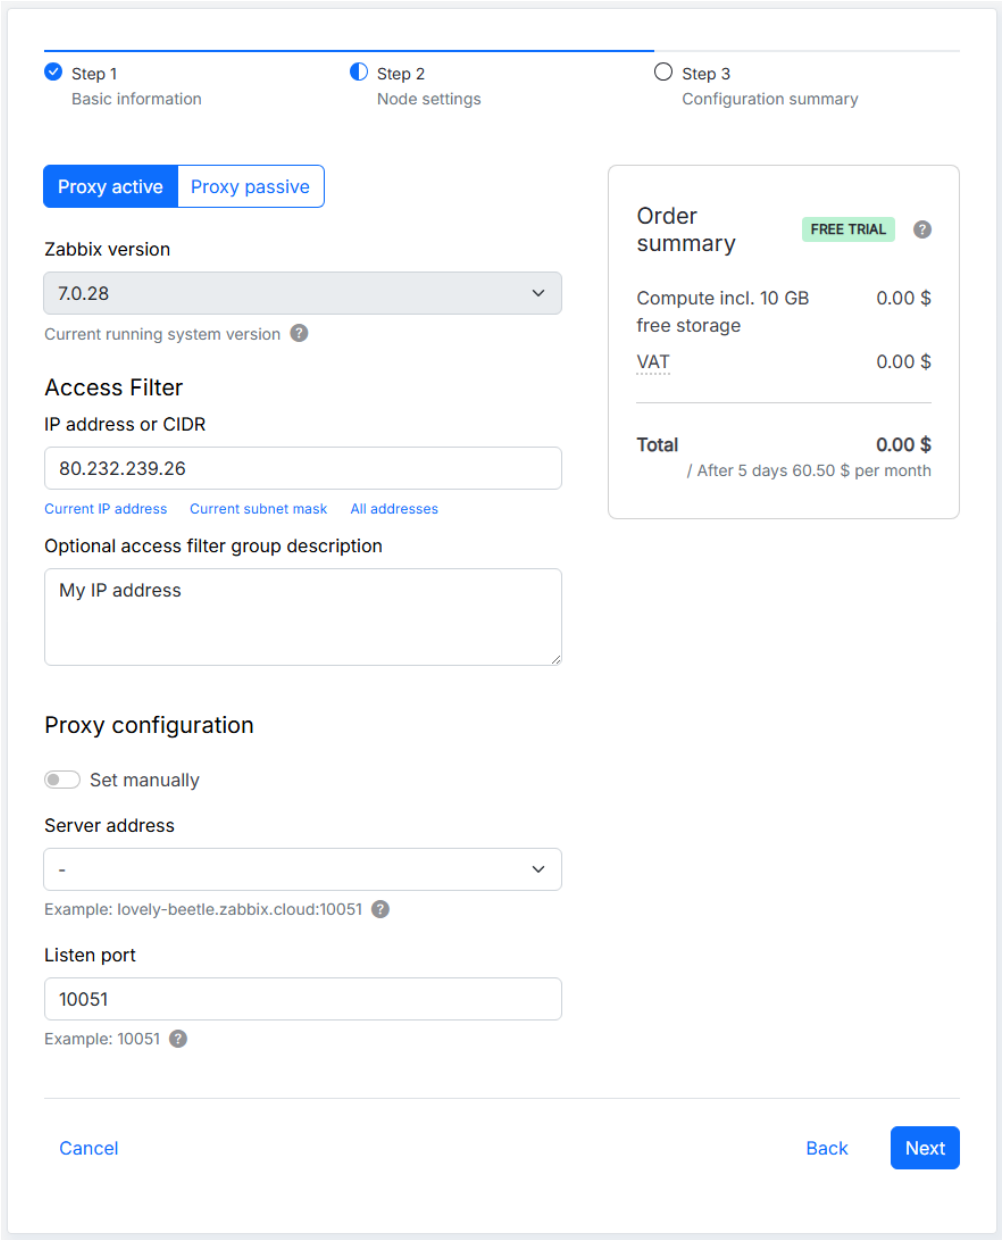


Warning:
During node creation, the *IP address or CIDR* field is prefilled with the IP address used to access Zabbix Cloud. You can change this value to specify a different initial access filter. After the node is created, you can add, edit, or delete access filters from the *Access filters* tab.

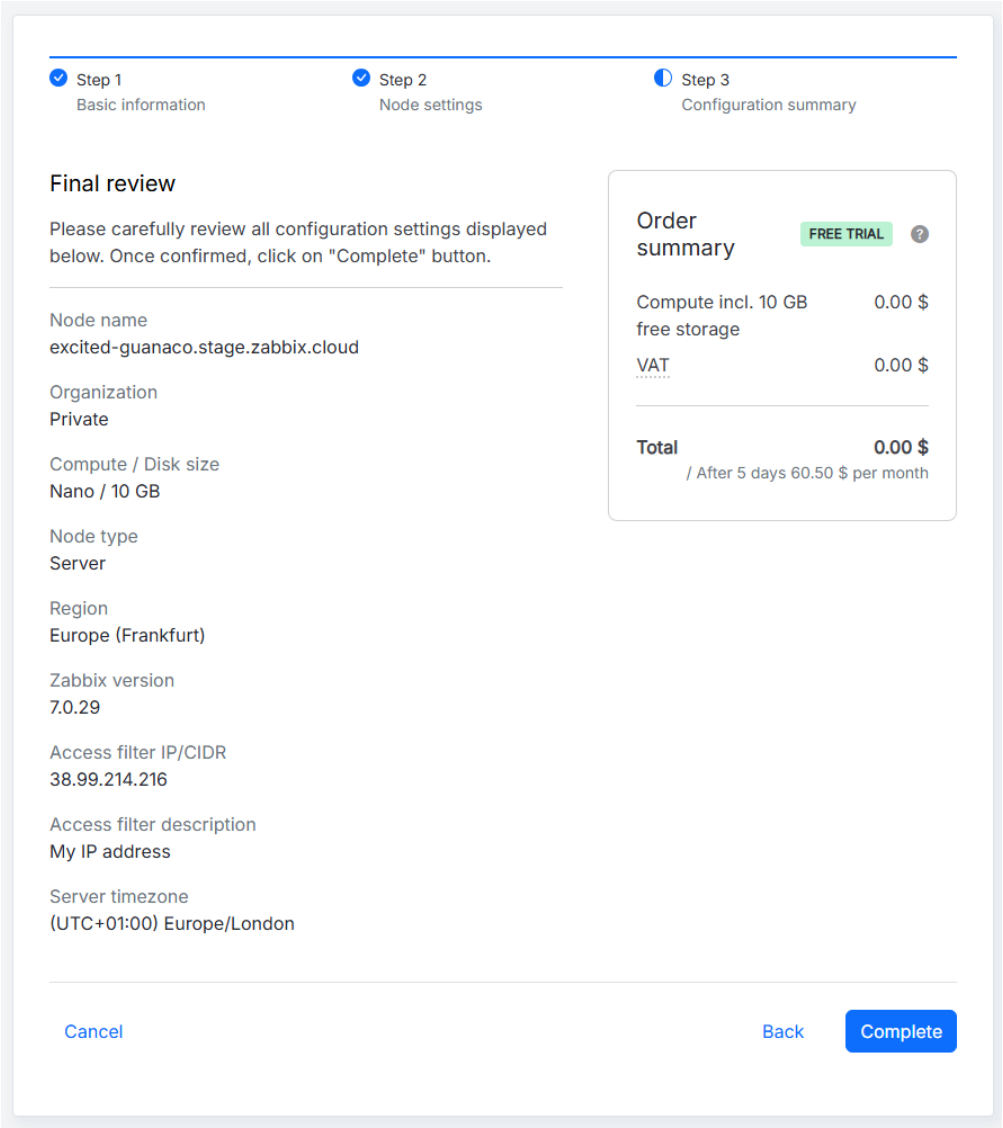


The third step displays a configuration summary for the node.

After reviewing configuration settings, and confirming everything is correct, click *Complete* for a trial node or *Proceed to payment* for a paid node. Otherwise, return to a previous step by clicking the *Back* button, or *Cancel* to start from beginning.

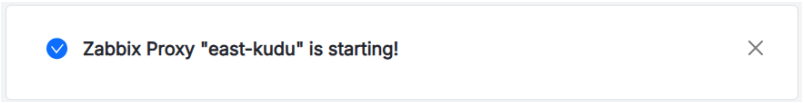


As the node is being initialized, a corresponding message is displayed and the node already appears under *Organizations*.

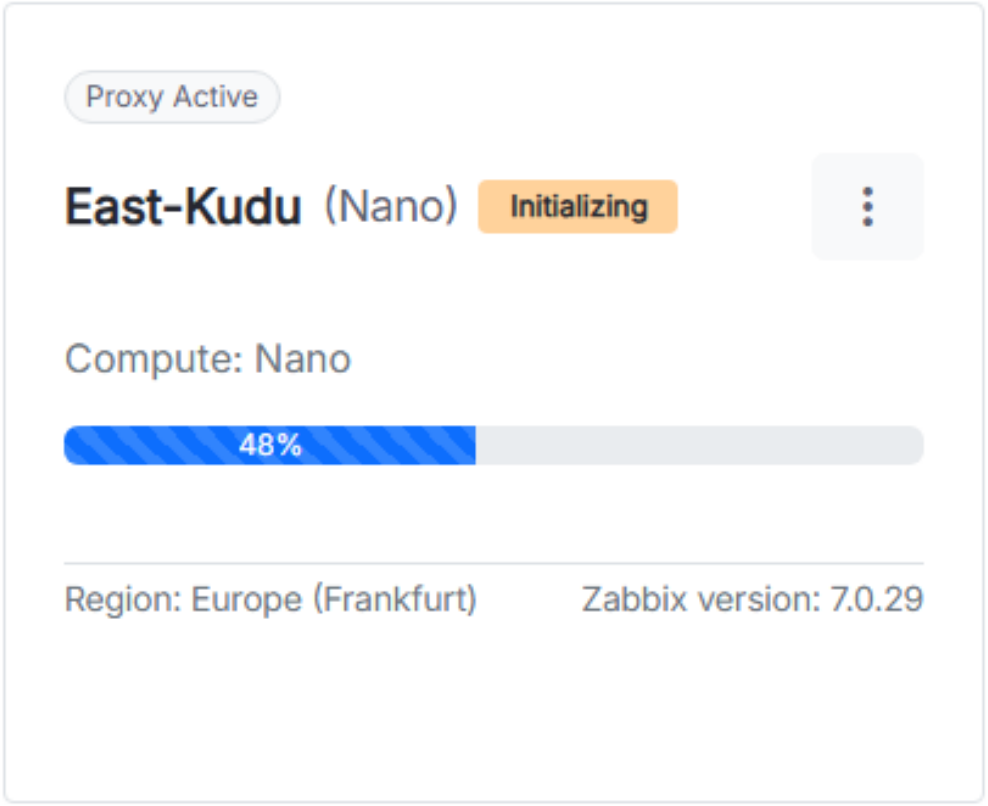


Configure a proxy node

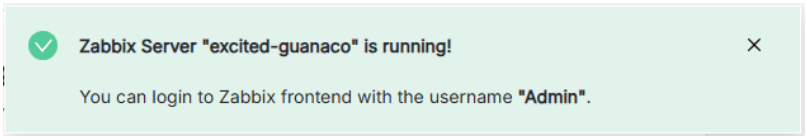
During the proxy node creation the following parameters are available:



Parameter	Description
Proxy active/Proxy passive	Select the proxy mode. In active mode, the proxy initiates connections to Zabbix server; in passive mode, Zabbix server initiates connections to the proxy.
Zabbix version	Select the Zabbix version. Zabbix Cloud supports the latest LTS version and automatically applies minor version updates.
IP address or CIDR	Specify the initial inbound IP access filter for the proxy. Enter the IP address or CIDR manually, or complete the field automatically by selecting the relevant option. The filter defines which network requests are allowed to reach the proxy and can be changed later in the Access filters tab.
Optional access filter group description	Add an optional description for the access filter group, which can contain multiple IP addresses or CIDRs.
Set manually	Select how to specify the Zabbix server. When disabled, select a server node from the list of server nodes available to you. When enabled, specify server addresses manually.
Server address	Specify the Zabbix server address. When *Set manually* is disabled, select a server node from the list. When enabled, specify up to 10 server addresses. For an active proxy, specify the IP address or DNS name of the Zabbix server. For a passive proxy, specify the IP address, DNS name, or CIDR of the Zabbix server. Access filters are configured separately and are not updated automatically when a server address is specified.
Listen port	Specify the port on which the proxy listens for incoming connections. The default port is 10051. The listen port cannot be changed after node creation.



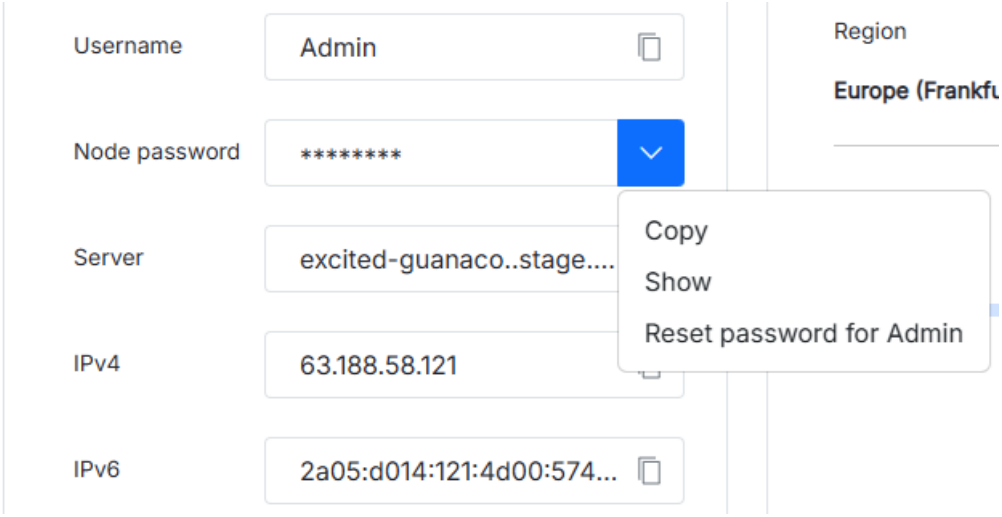
In the third step you will see the configuration summary for the node.



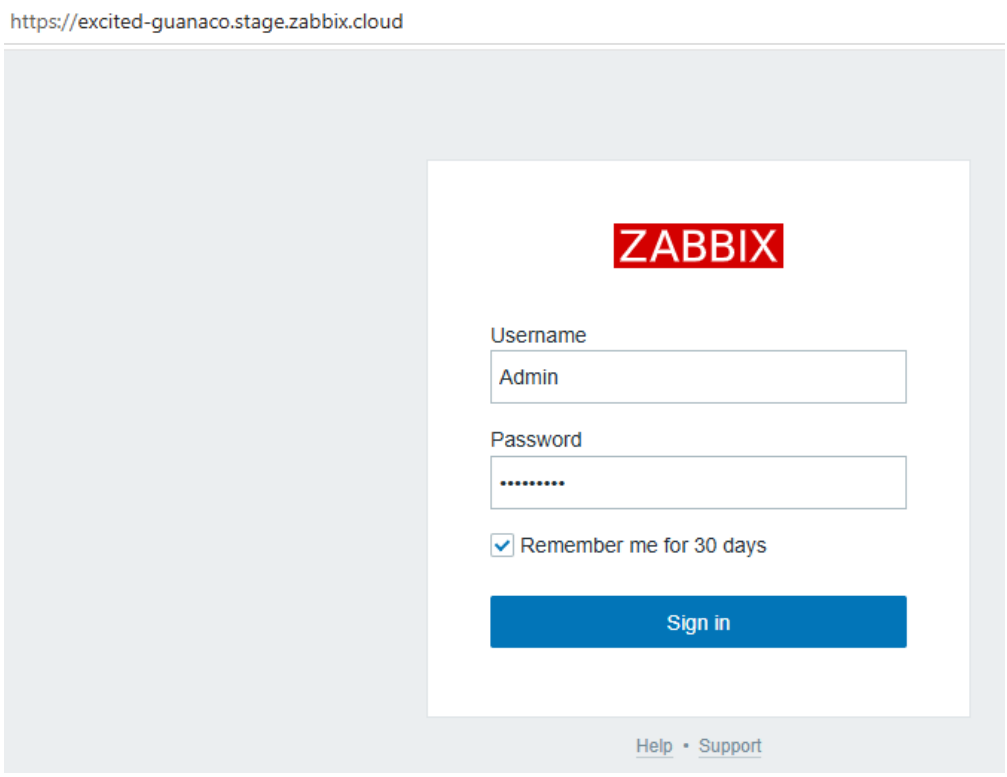
After reviewing the configuration settings and confirming that everything is correct, click *Complete* for a trial node or *Proceed to payment* for a paid node. Otherwise return to previous steps by clicking the *Back* button, or *Cancel* to start from beginning.

As the node is being initialized, a corresponding message is displayed and the node already appears under *Organizations*.

To configure a Zabbix Cloud proxy, see Set up a Zabbix Cloud proxy.



Start using Zabbix



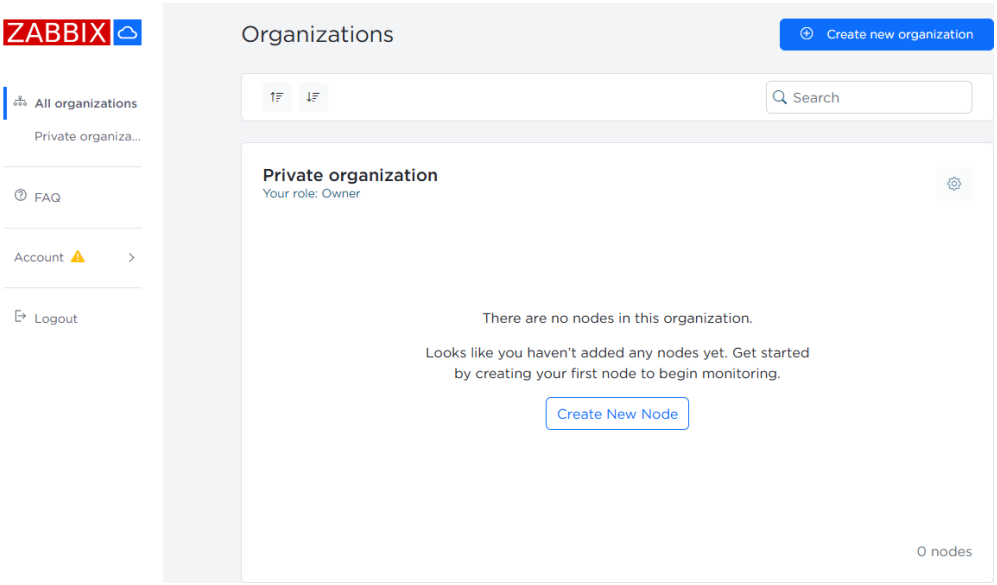
When the server node status changes from *Initializing* to *Running*, you can log in to the Zabbix frontend.

To access the initial frontend password, click the created node.

You will be taken to node settings (overview, access filters, encryption, backups, etc.). In **Connection info**, locate *Node password* field and select *Reset password for Admin* from the dropdown. After the password is reset, click the same dropdown and select *Copy*.

Click the frontend URL to open Zabbix frontend (`excited-guanaco.zabbix.cloud`).

Log in using the following credentials:



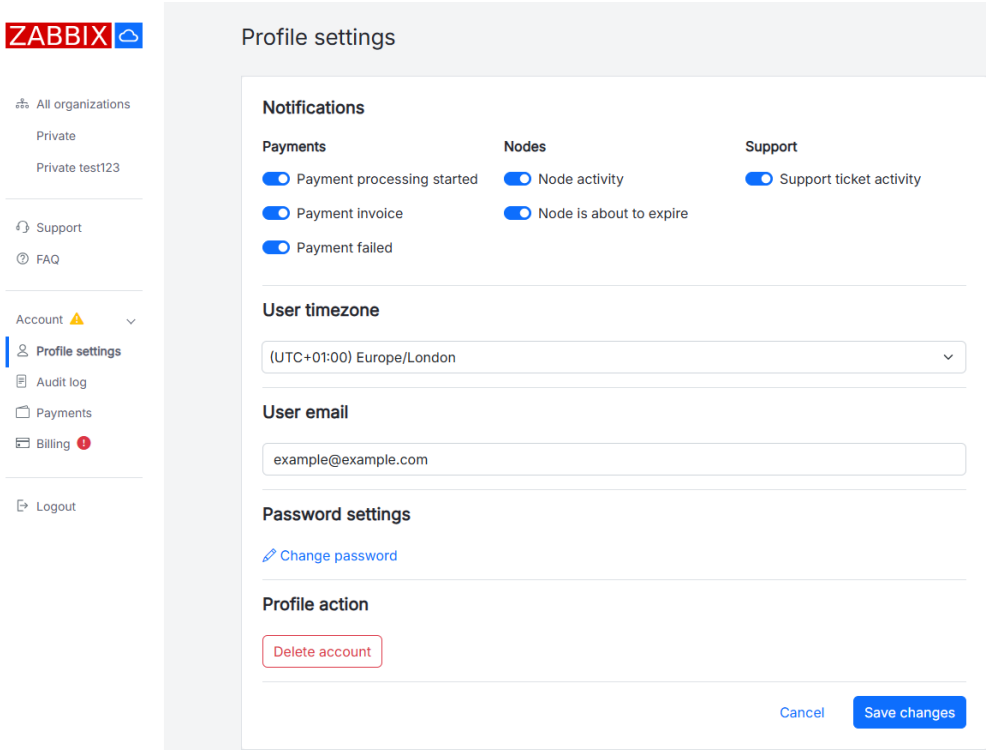
- *Username* - `Admin`
- *Password* - provide the copied password

To start monitoring, you need to define access filters - IP address or addresses that are allowed to connect to the Zabbix Cloud server. At least one must be defined.

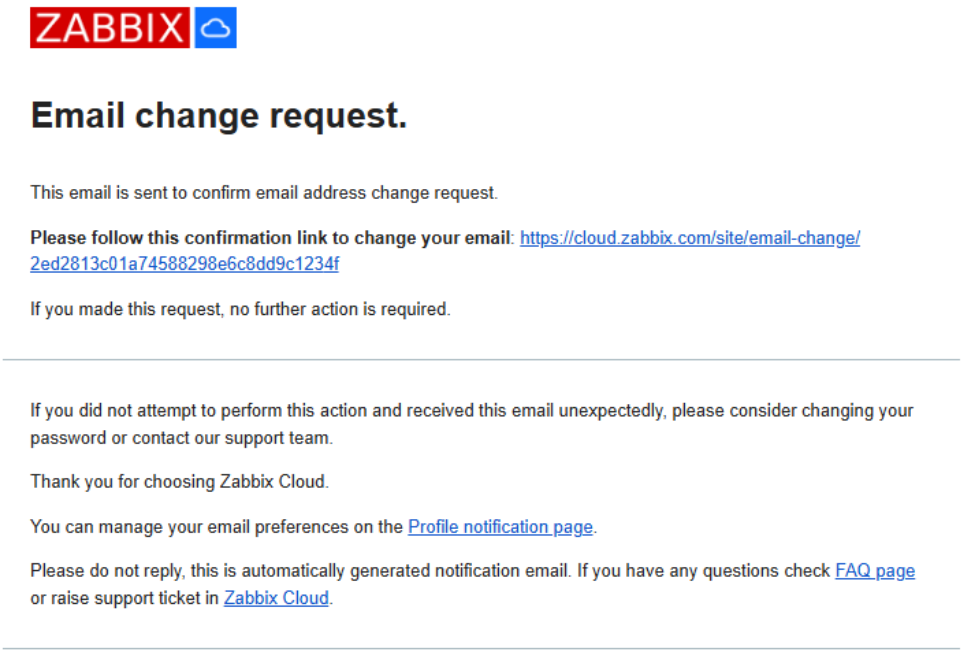
Organization management An organization is a container for one or more nodes. Organizations also help you structure your resources and delegate responsibilities, such as:

- Node management
- Billing

When you log in to Zabbix Cloud, the *All organizations* page is displayed. By default, a private organization is created for your account.



As the owner of this organization, you can manage users, admins, nodes, and the organization name. Click the  settings button to access management options.



Account management Changing the account email address

To change the account email address, navigate to *Account* > *Profile settings*.

In the *User email* field, enter the new email address and click *Save changes*.

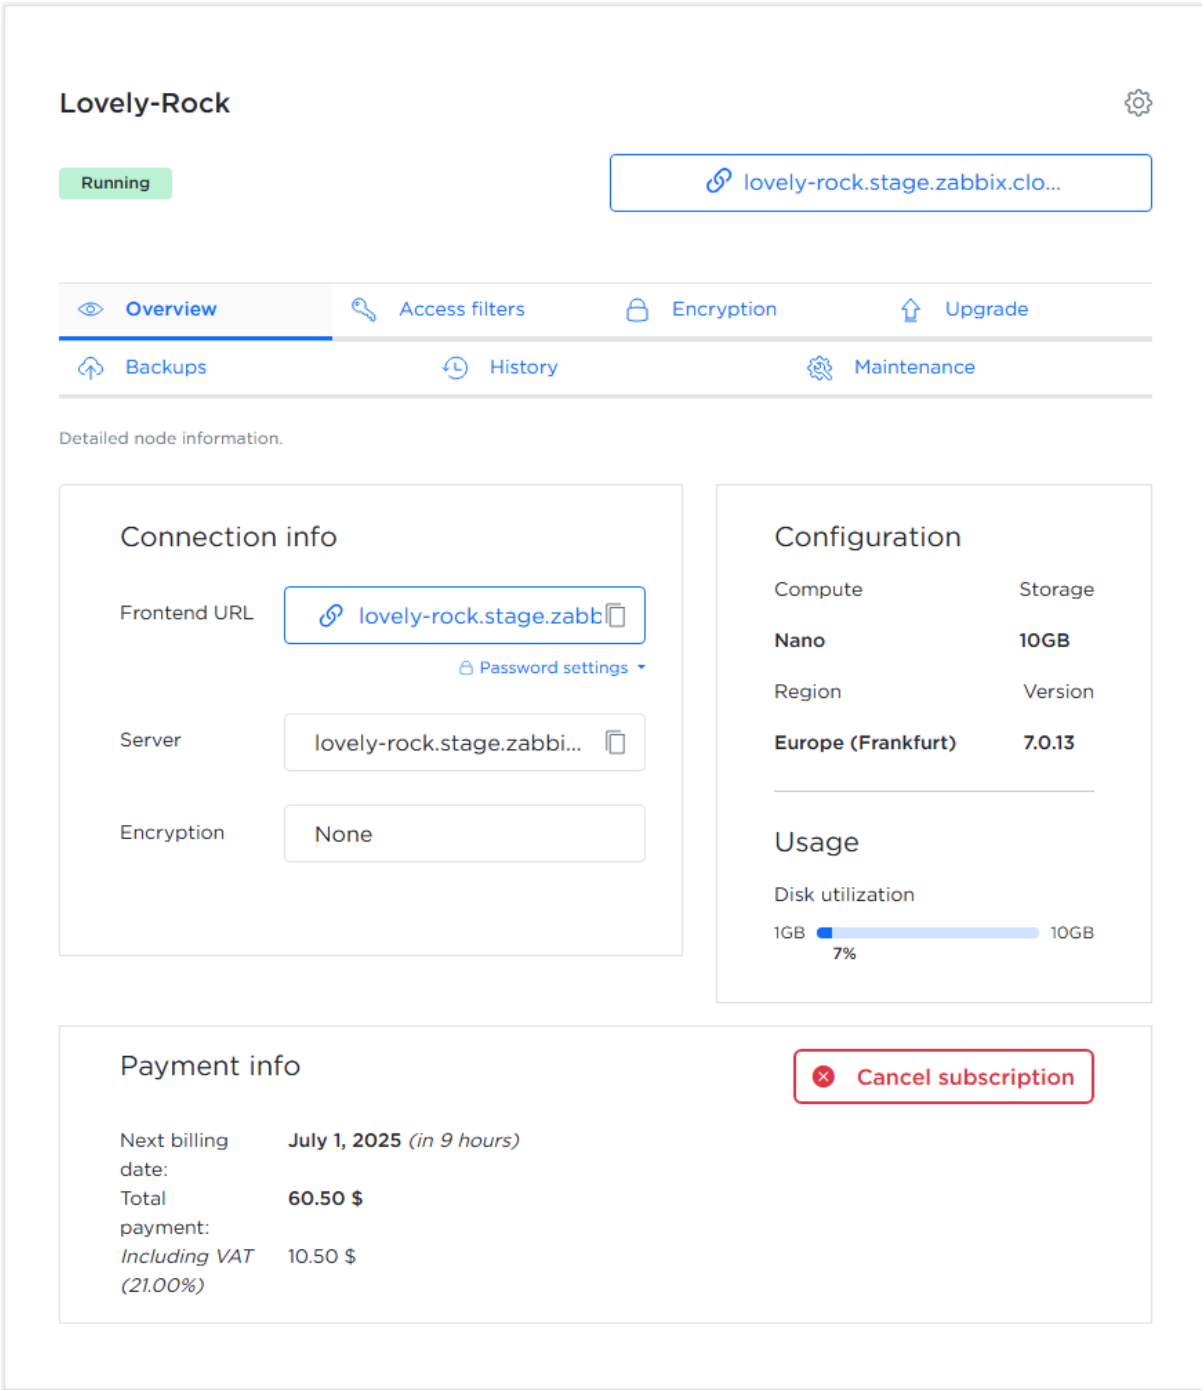
A confirmation message is sent to the new email address. Follow the link in the message to confirm the email address change.

The confirmation link opens the *Profile settings* page with a confirmation message and the updated email address in the User email field.

After the change is confirmed, an email confirming the change is sent to both the new and previous email addresses. The message sent to the previous address includes the previous and new email addresses.

Node configuration

Overview



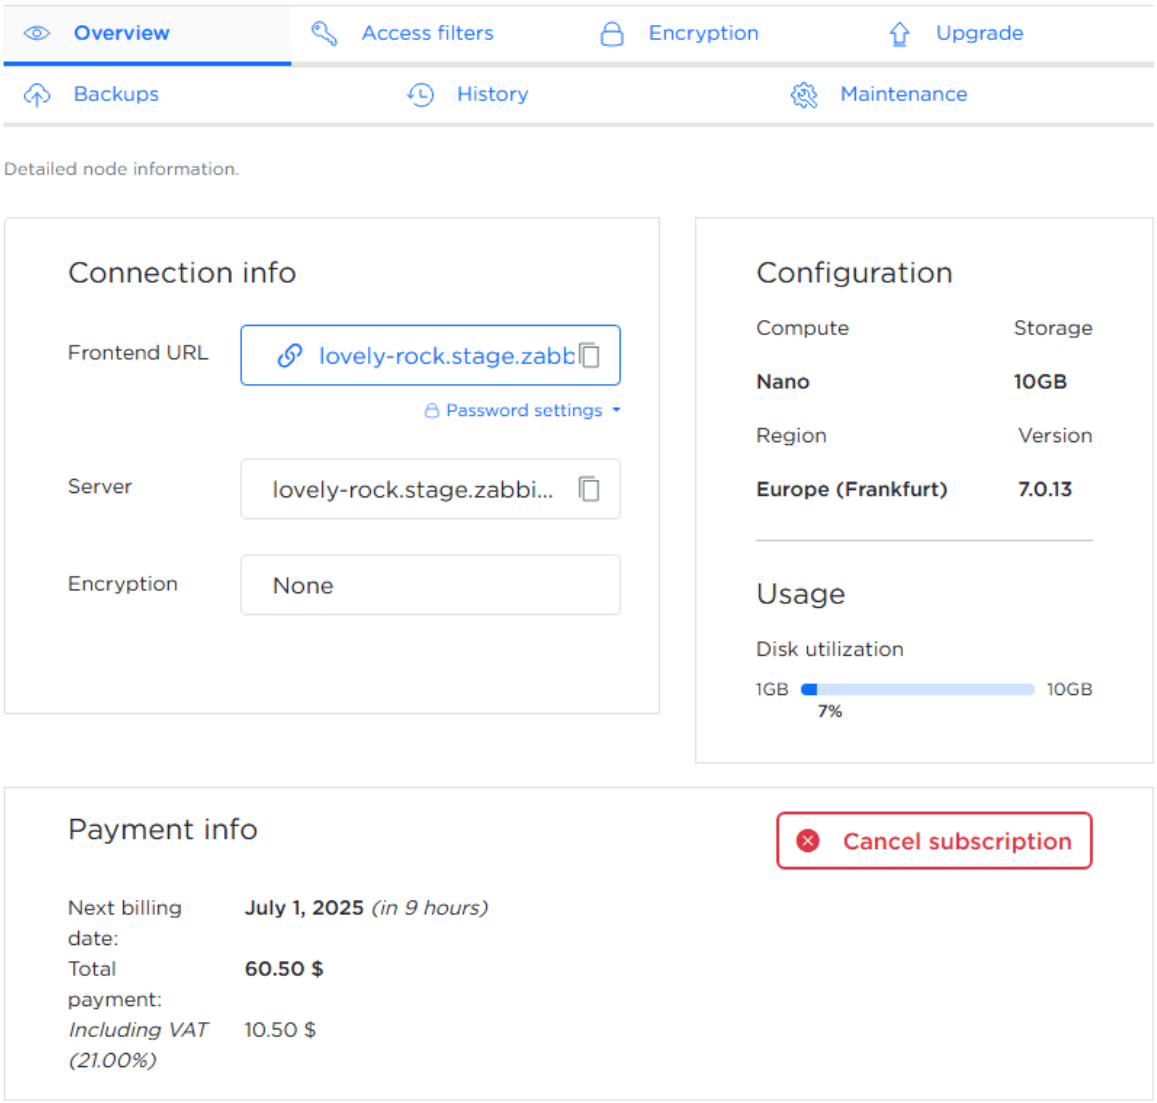
A **cloud node** is a Zabbix component deployed in the cloud. Server nodes include the Zabbix server, database, and web frontend, while proxy nodes include the Zabbix proxy and database. A cloud node has dedicated computing resources (CPU, memory) and disk storage.

Users may create one or more cloud nodes. Cloud nodes can be grouped into **organizations** (structural, regional, etc), creating a distributed monitoring setup.

Cloud nodes and organizations are created using the Zabbix Cloud user interface. To access the node configuration page, click the node from *All organizations*, your organization menu, or the *Node configuration page* link shown after the node is launched.

In the node configuration view, each tab lets you manage a specific aspect of your node:

- Overview - view node details, open its frontend, and manage node users.
- Access filters - control access by IP address or subnet.
- Encryption - configure TLS by uploading certificates, keys, and optional CRLs.
- Backups - create, restore, and delete node snapshots; view the next scheduled backup.
- History - set retention periods for audit logs, history, and trends, with preset units and a 3x/day update limit.
- Maintenance - define weekly maintenance windows by time zone, day, and hour.
- Upgrade - scale compute/storage resources or manage your trial/payment status.



Note:
Some tabs may be unavailable depending on the node type (server or proxy), type of user who views the page and node status (trial/non-trial).

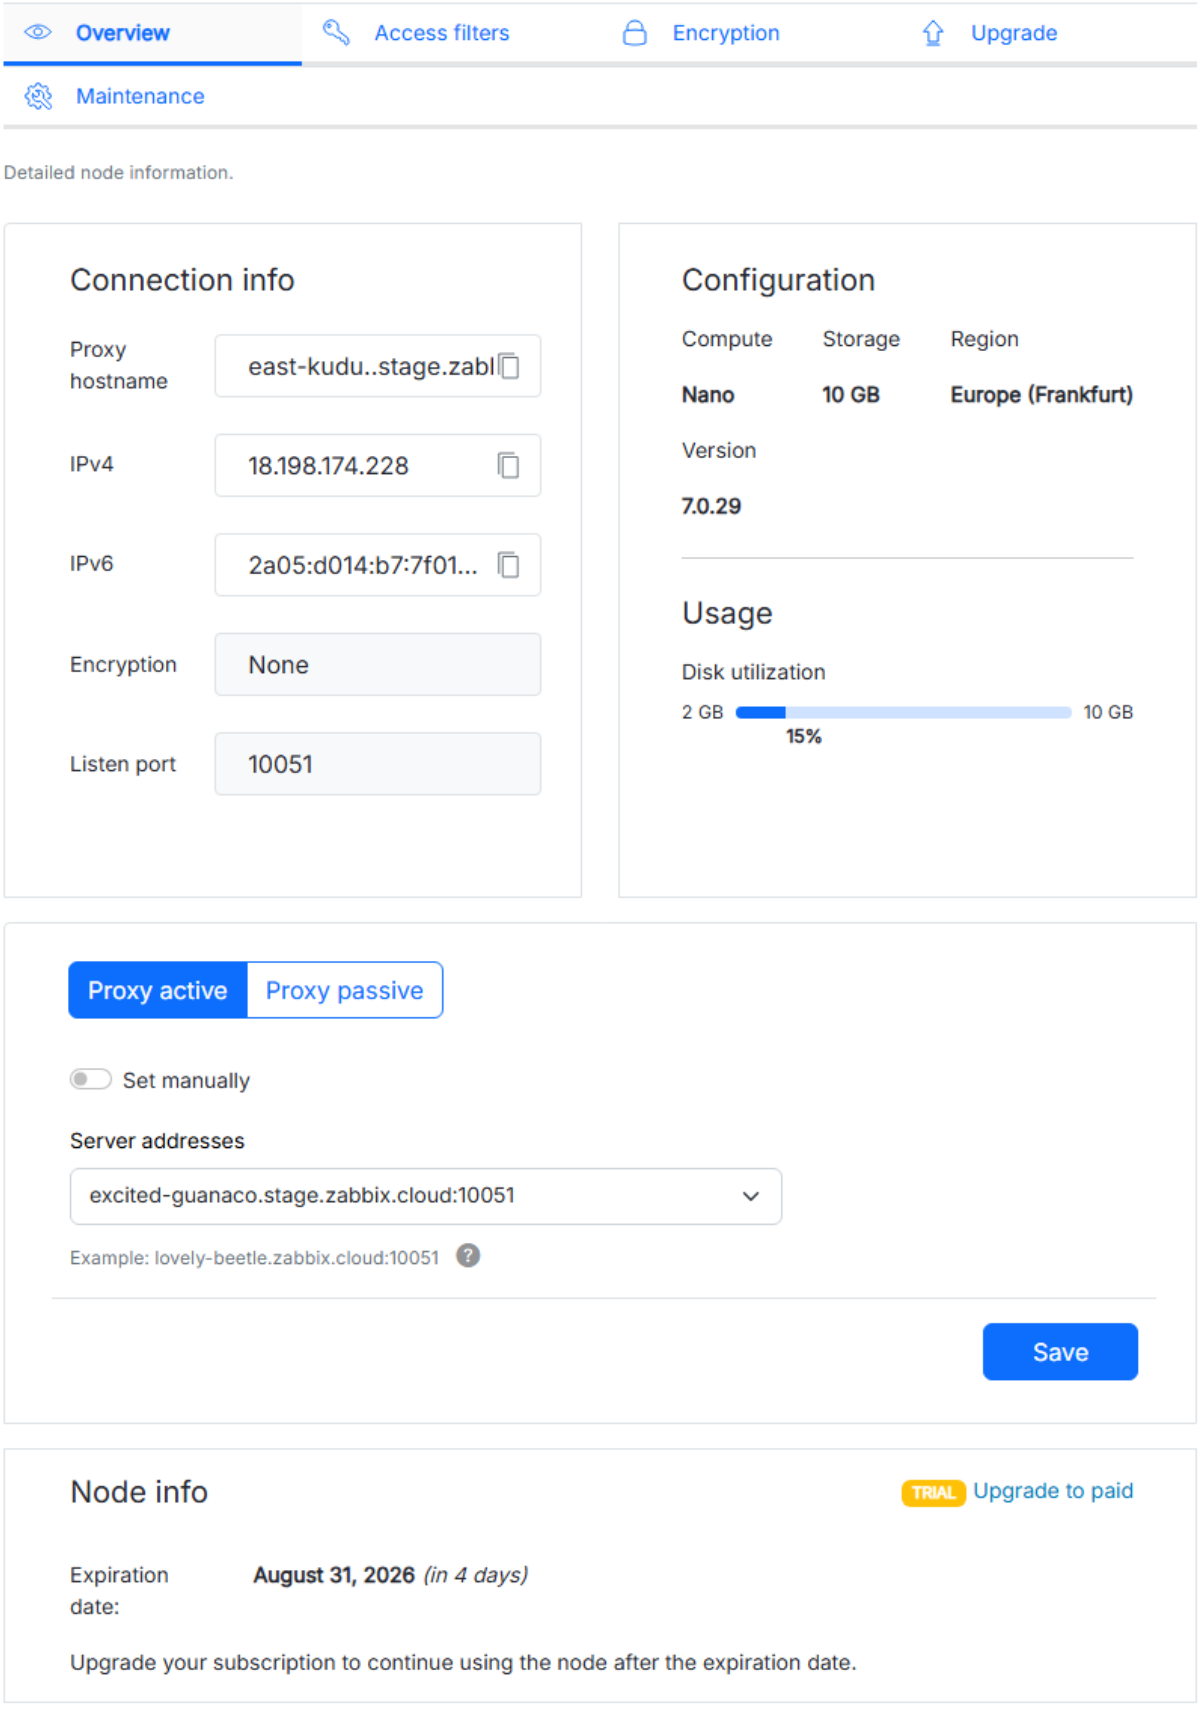
Overview tab

The *Overview* tab provides detailed information about the node. The information displayed depends on whether the node is a server or proxy.

Server node The *Overview* tab for the server node contains the following sections:

Connection info:

- Clickable frontend URL with a copy-to-clipboard option
- Username
- Node password and its settings
- Server hostname with a copy-to-clipboard option
- IPv4 address with a copy-to-clipboard option
- IPv6 address with a copy-to-clipboard option
- Current encryption method



Configuration and usage:

- Compute tier, maximum storage, region
- Zabbix components version
- Disk utilization

Node info/Payment Info:

- Expiration date (for trial and prepaid nodes)
- A context-specific button is shown depending on the node type after the node completes initialization: - *Upgrade to paid* - available for nodes on a free trial - *Cancel subscription* - available for paid nodes with an active subscription - *Resubscribe to paid* - shown if a subscription has been canceled - No action button is displayed for prepaid nodes, which have long validity and cannot be canceled

Proxy node The *Overview* tab for the proxy node contains the following sections:

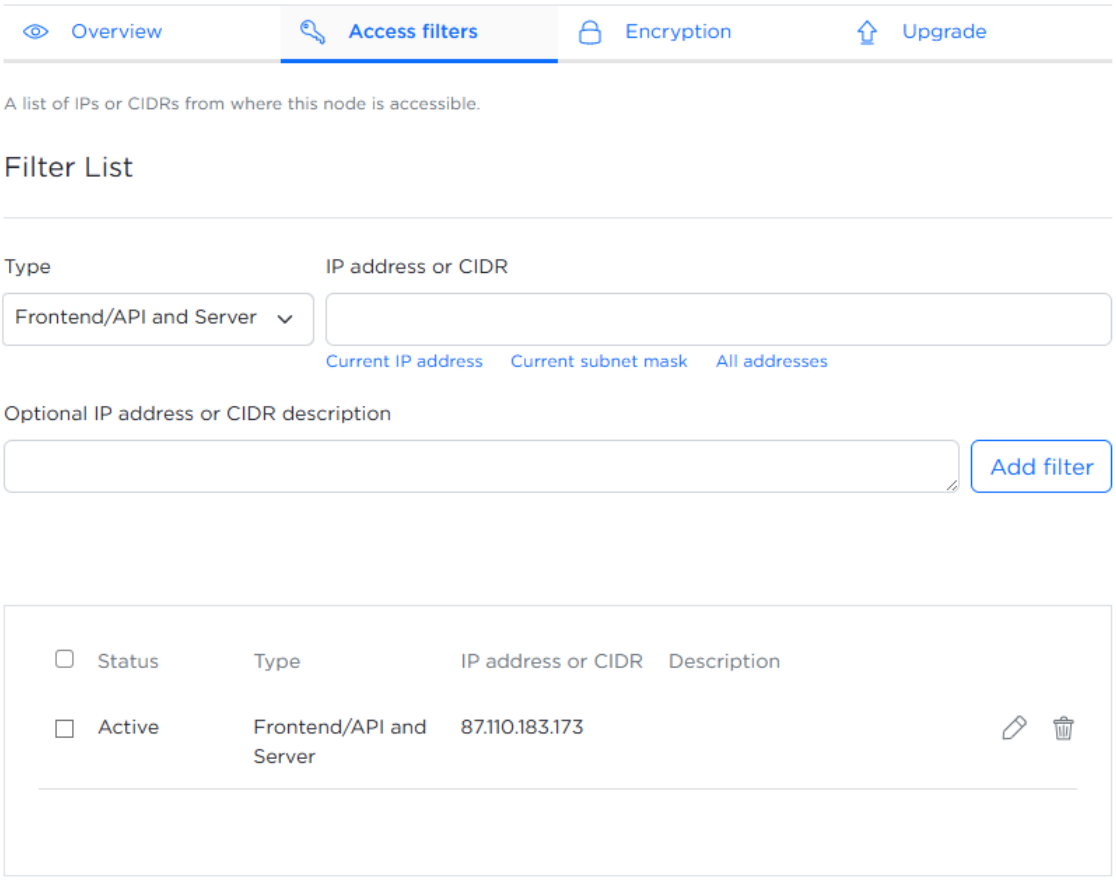
Connection info:

- Proxy hostname with a copy-to-clipboard option
- IPv4 address with a copy-to-clipboard option
- IPv6 address with a copy-to-clipboard option
- Current encryption method
- Current listen port

Configuration and usage:

- Compute tier, maximum storage, region
- Zabbix components version
- Disk utilization

Proxy mode:



- Switch between active and passive proxy modes
- Select the server address from the *Server addresses* dropdown, or enable *Set manually* to enter the server address manually

Node info/Payment Info:

- Expiration date (for trial and prepaid nodes)
- A context-specific button is shown depending on the node type after the node completes initialization: - *Upgrade to paid* - available for nodes on a free trial - *Cancel subscription* - available for paid nodes with an active subscription - *Resubscribe to paid* - shown if a subscription has been canceled - No action button is displayed for prepaid nodes, which have long validity and cannot be canceled

Access filters tab

The *Access filters* tab lets you restrict access to your Zabbix node by IP address or subnet.

To configure an access filter, complete the following fields:

- *Type* - for server nodes, use the dropdown to choose which Zabbix component to limit: frontend/API only, server only, or both. For proxy nodes, only *Inbound IP* is available. It defines which incoming network requests are allowed to reach the proxy.
- *IP address or CIDR* - enter the IP address or CIDR manually, or complete the field automatically by selecting the relevant option.
- *Optional IP address or CIDR description* - add an optional description for each IP or subnet.

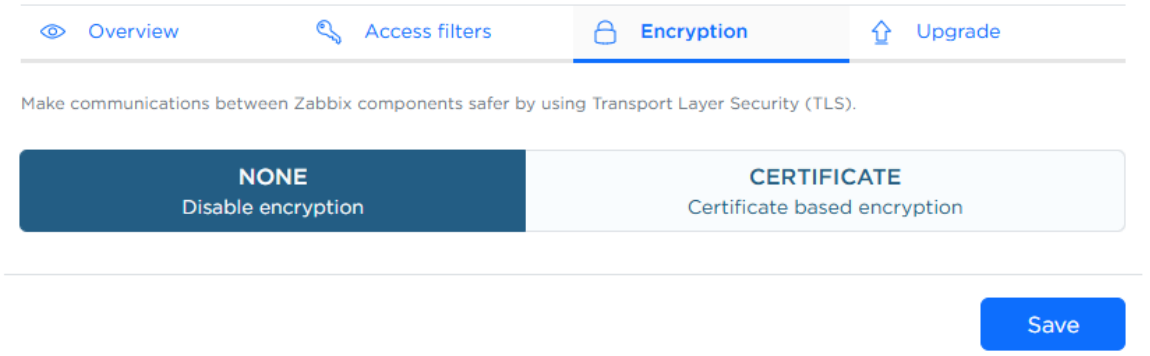
After completing the fields, click *Add filter*. Added filters appear in the table below, showing status, type, IP address or subnet, and description.

Warning:
During node initialization, an access filter is automatically created for the IP address you used. If you later connect from a different IP or network, you must add that address here or you will be blocked.

You can:

-  - edit a filter.
-  - delete a filter or multiple filters using the checkboxes.

Encryption tab

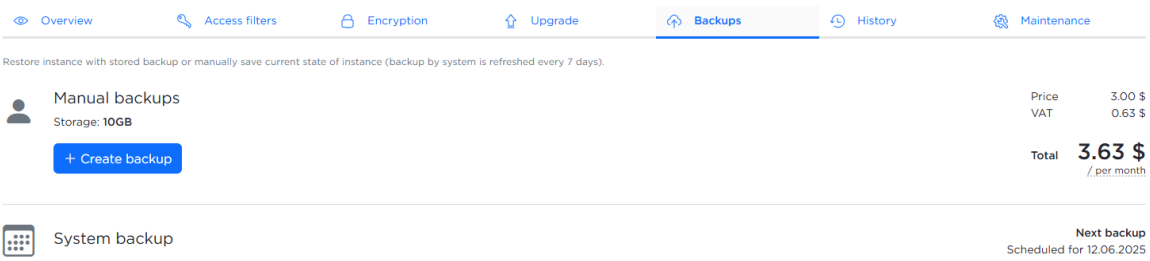


The *Encryption* tab lets you configure TLS encryption for communication between Zabbix components by uploading the required certificate files.

To enable secure communication using certificates, select *CERTIFICATE* and upload the following files from your computer:

- *Root CA certificates* - trusted CA certificates used to verify peer certificates. Click *Choose file* and select the file containing trusted Root CA certificates (typically a `.crt` or `.pem` file, PEM-encoded).
- *Certificate chain* - represents the chain of trust for your own certificate. Click *Choose file* and select the PEM-encoded file (e.g., `.crt` or `.pem`) that includes your certificate and any intermediate CA certificates.

- *Private key* - the private key corresponding to your certificate. Click *Choose file* and select the PEM-encoded `.key` file.
- *Revoked certificates* (optional) - if you maintain a Certificate Revocation List (CRL), click *Choose file* and select the CRL file to specify certificates that should no longer be trusted.

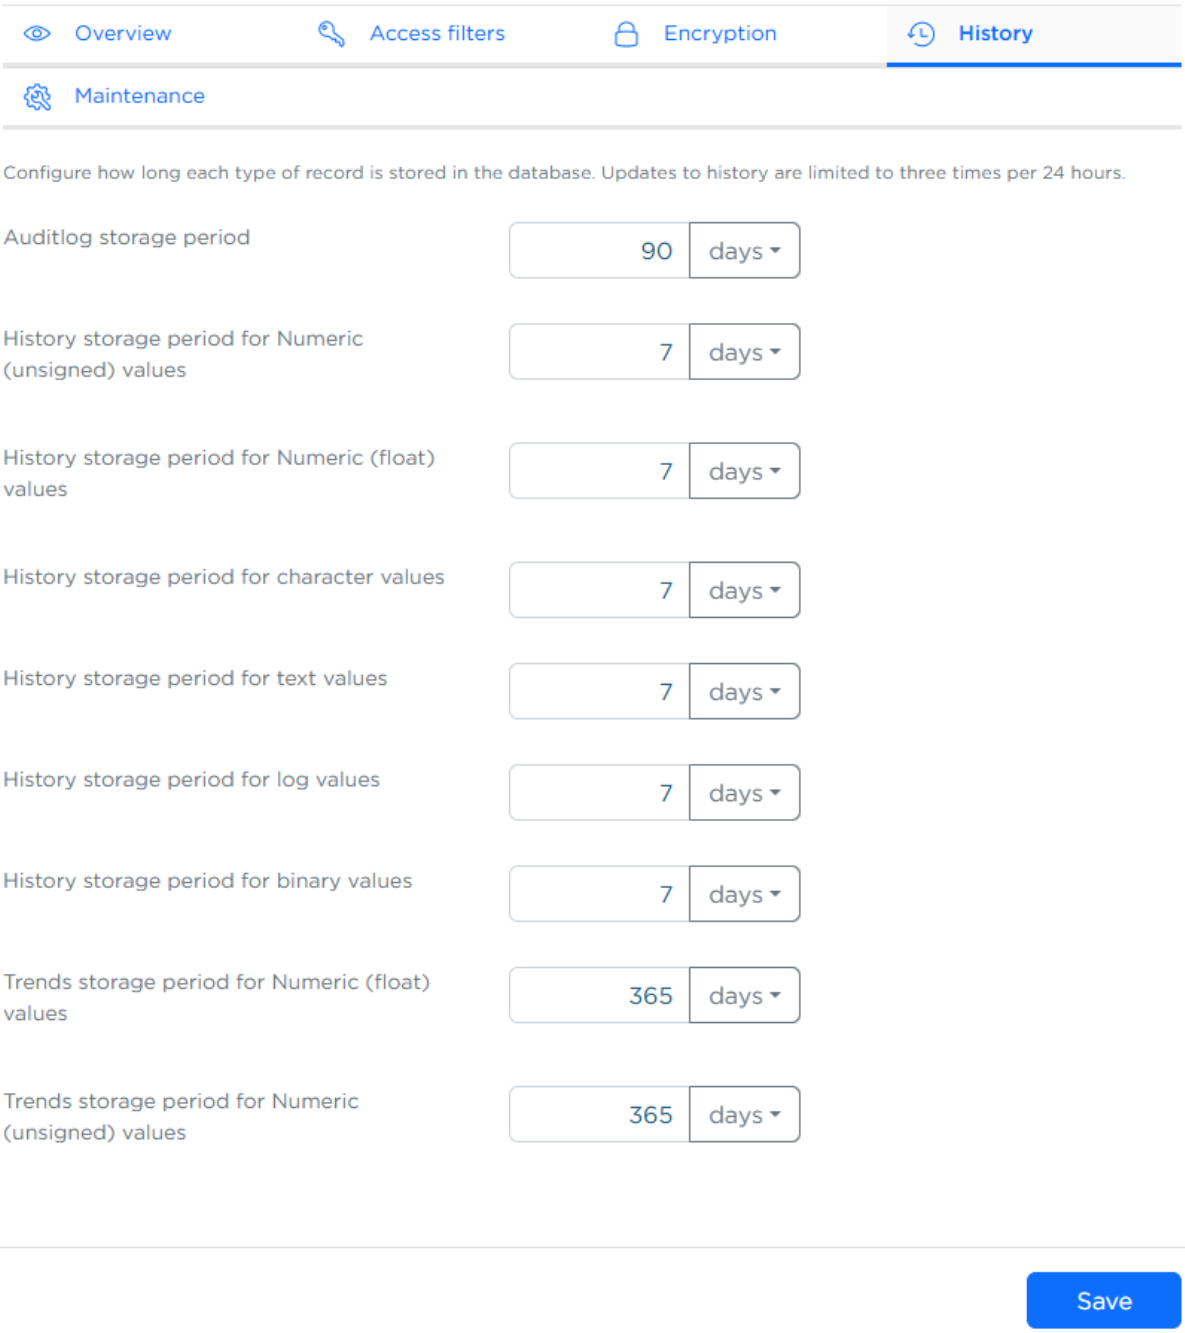


After selecting the files, click *Save*. The files will be uploaded, validated, and applied to configure TLS encryption between Zabbix components.

Backups tab

The *Backups* tab lets you view, create, restore, and delete backups of your Zabbix node.

You can restore your instance from any saved backup or create a new manual backup at any time. The tab also shows the date of the next scheduled backup.



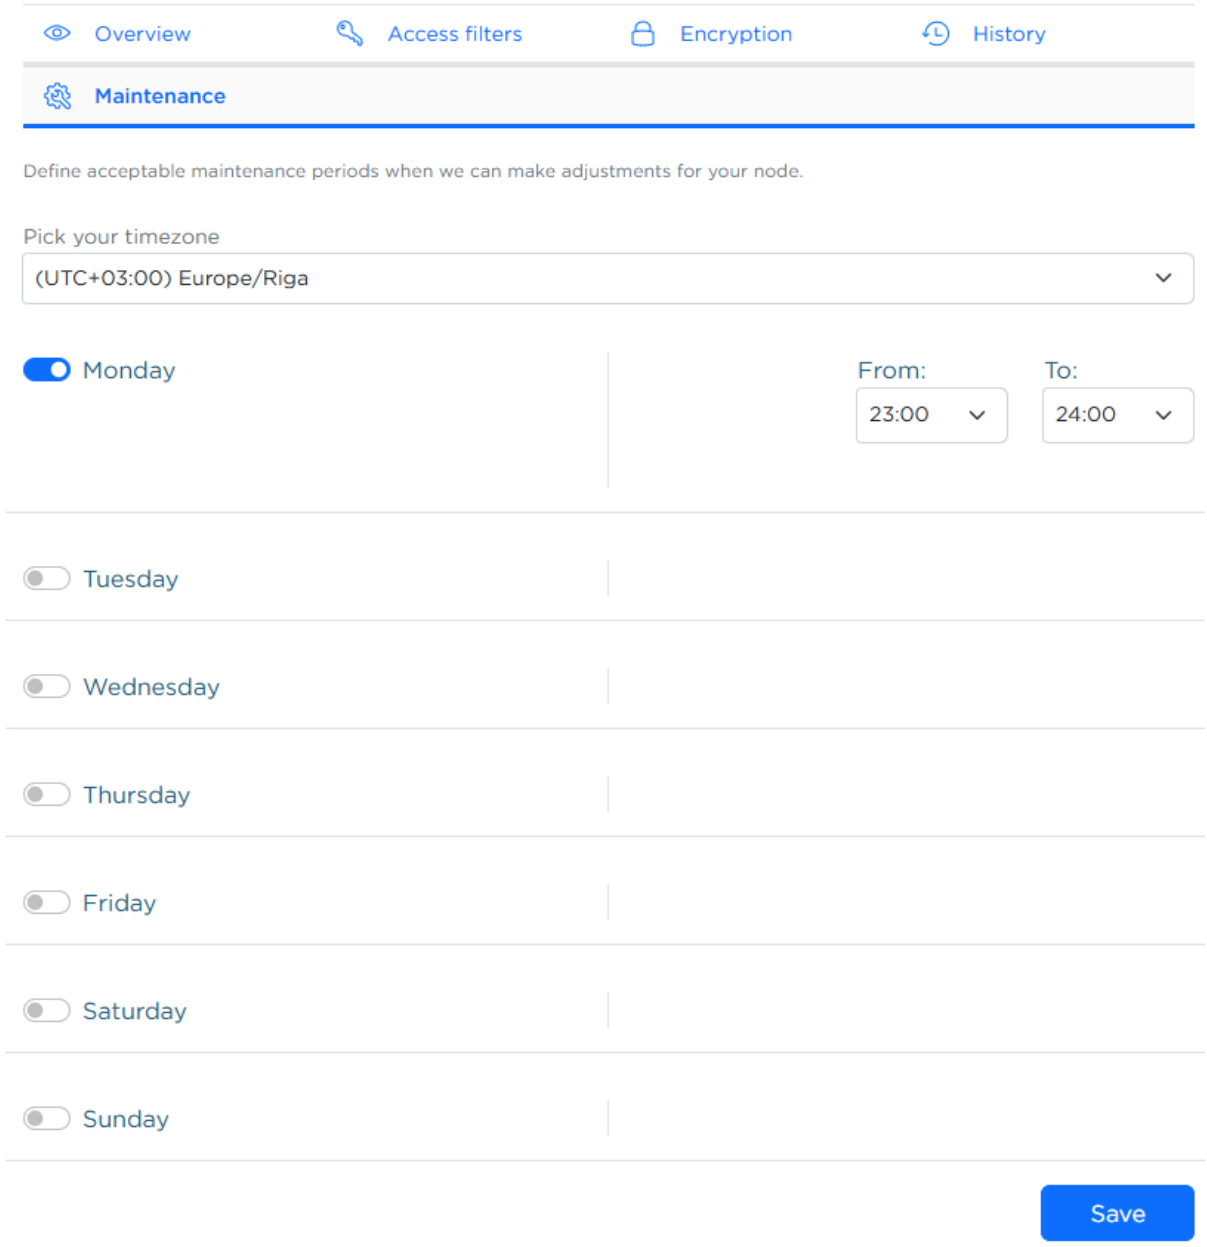
To create a backup:

1. Click *Create backup* button.
2. Enter an optional description in the popup window.
3. Click *Create* to confirm.

Warning:
Additional backups are charged monthly based on storage usage.

History tab

The *History* tab lets you configure how long different types of historical data are stored.



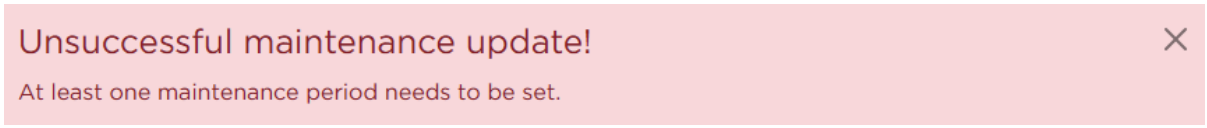
You can set the storage period for each data type (e.g., numeric, text, logs) and choose the unit (days, months, years). Changes can be made up to three times every 24 hours.

After updating the values, click *Save* to apply the changes.

Warning:
Longer retention periods can increase disk usage and may impact performance. It is recommended to configure retention periods based on your actual data and analysis needs.
 Zabbix Cloud uses database partitioning to manage data storage instead of traditional Zabbix housekeeping. This enables faster performance and more predictable retention handling.

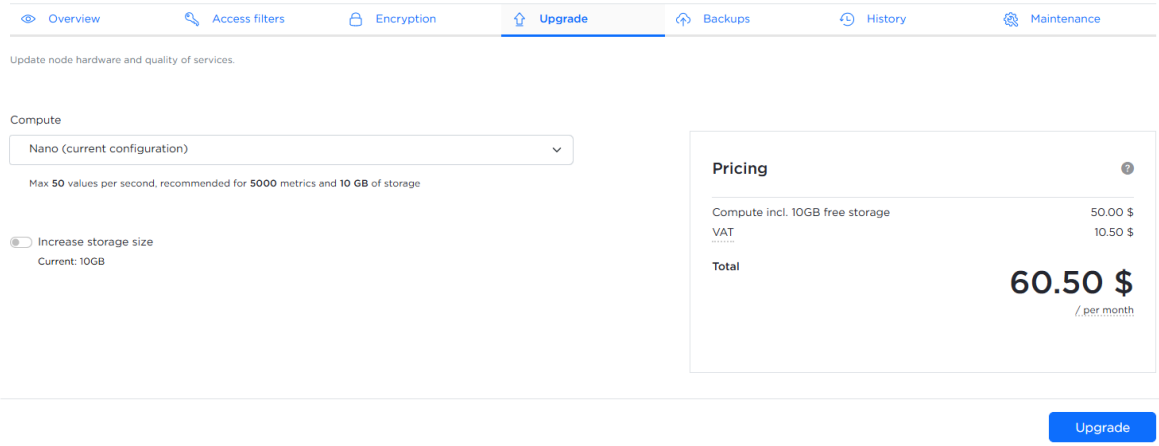
Maintenance tab

The *Maintenance* tab lets you define acceptable maintenance windows when updates or adjustments can be performed on your node.



You must:

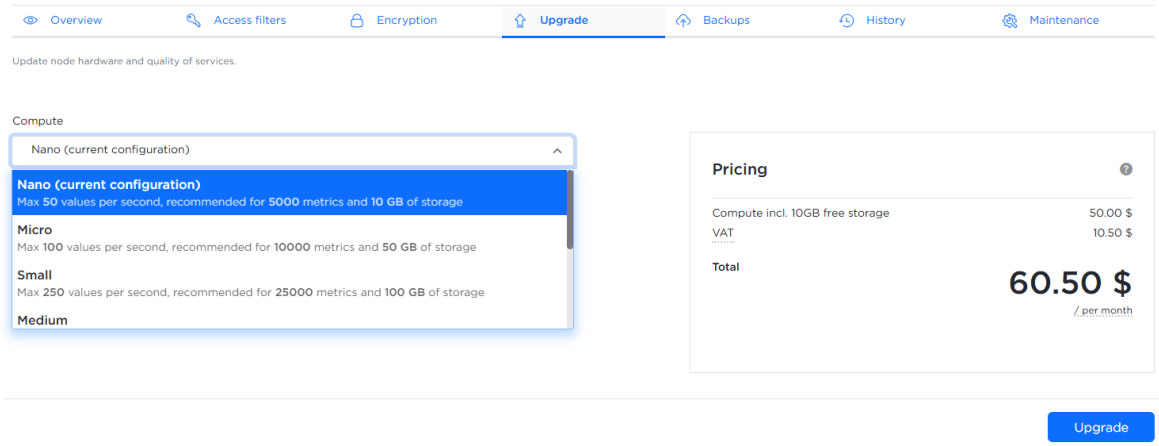
- Select your time zone from the dropdown.
- Choose at least one day and one hourly window for maintenance.



Click *Save* to apply changes.

If no day or time window is selected, an error will be displayed.

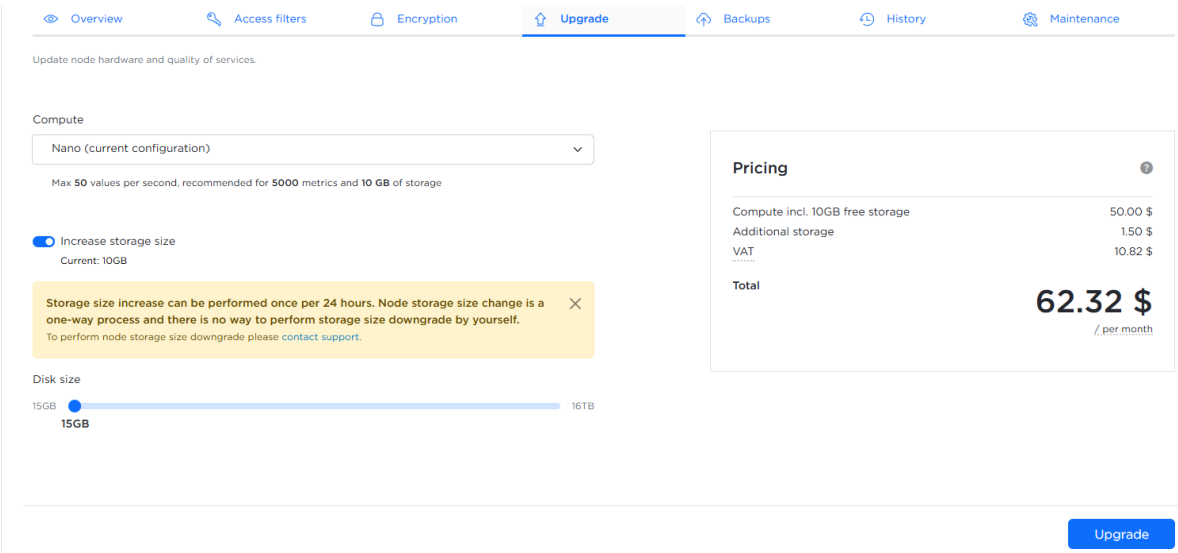
Upgrade tab



The *Upgrade* tab lets you scale your node's resources or manage its subscription.

You may increase the compute tier or disk size. Note that disk size can only be increased once every 24 hours and cannot be reduced via the UI (contact Zabbix support for any shrink requests). Free-trial nodes can be converted to paid subscriptions.

To increase compute tier:



1. Click the *Compute* dropdown.

2. Select desired configuration tier.
3. Click *Upgrade* button.

To increase disk size:

1. Click *Increase storage size* radiobutton.
2. Adjust the *Disk size* slider to the desired value.

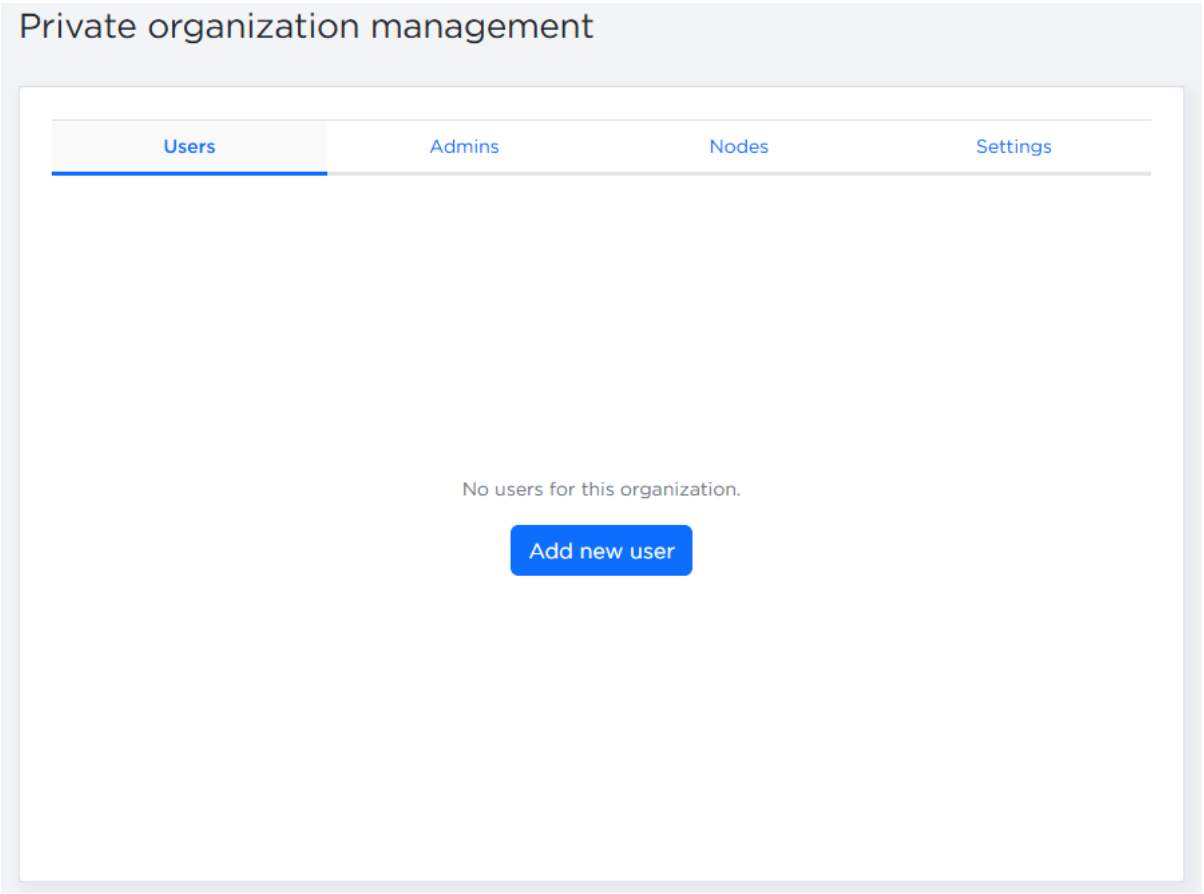
3. Click *Upgrade*.

Note:
The updated total monthly price is shown in the *Pricing* table before confirming changes.

Adding users

Introduction

The following examples describe how to add users to your organization and nodes.



Note:
Copying, clearing, and resetting frontend password can be only performed by the owner.

Adding users to organizations

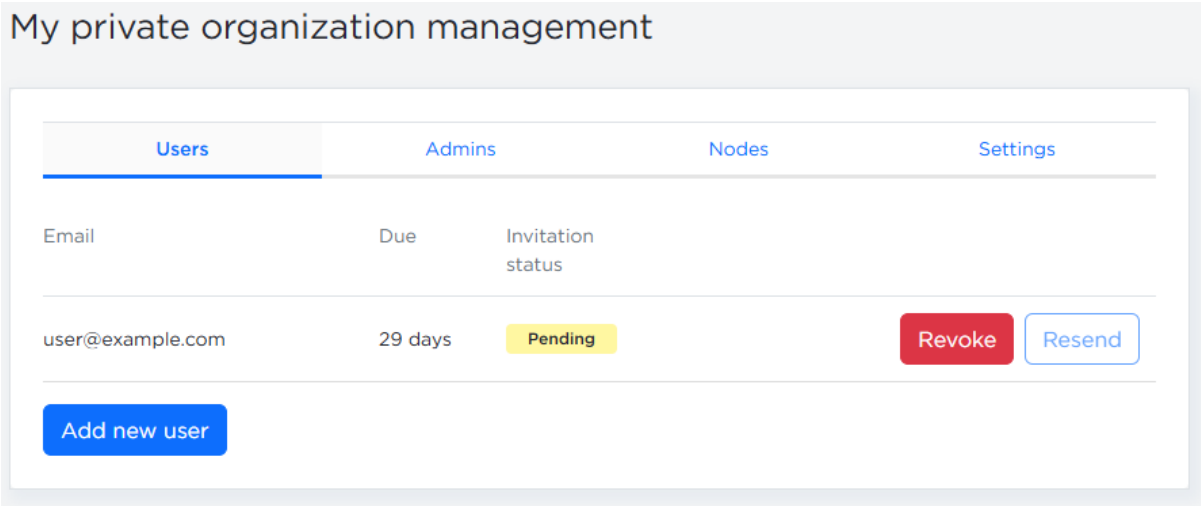
Similar to users in Zabbix, you can create users in Zabbix Cloud and assign them roles to control what they can do within an organization and its nodes.

To add users to your organization:

1. Open the *All organizations* page.
2. Click the settings button of the particular organization to enter its management menu.

3. In the *Users* or *Admins* tab, click *Add new user*.
4. Enter the user's email and select a role: *Administrator* or *User*.

Note that selecting the *User* role adds the user to the organization, but does not grant access to any nodes.

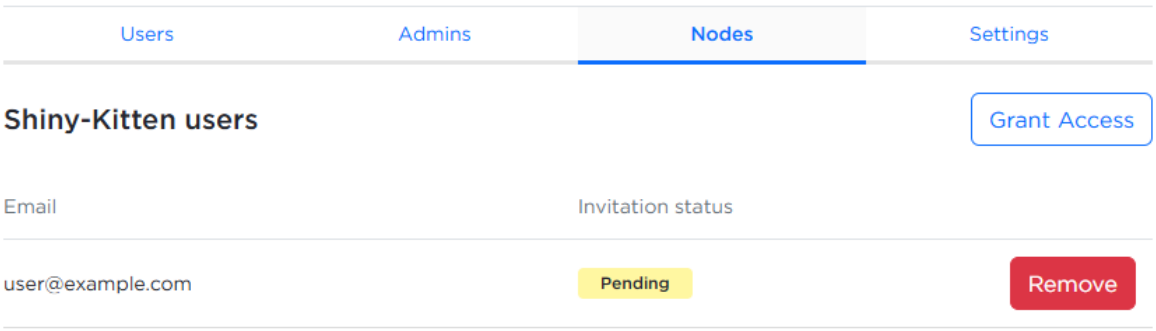


Each role grants a different level of access:

- **User** - can access nodes they're assigned to and can perform configuration tasks that do not generate charges, for example:
  - Manage access filters

  - Configure encryption
  - Set history/trend retention periods
  - Schedule maintenance
- **Administrator** - has all User permissions and can also perform actions that may generate charges, for example:
  - Create and restore backups
  - Upgrade or downgrade node resources (compute tier and disk size)
  - Cancel subscriptions
- **Owner** - has full control over the organization. In addition to all Administrator permissions, the Owner can:
  - Create and destroy nodes
  - Add or remove Users and Administrators
  - Rename or delete the organization
  - Manage billing details

> **Attention:**
> The Owner's payment method is charged for all services. If bank confirmation is required, the Owner must authorize the transaction, even if it was initiated by an Administrator.



The invited user will be added with a *Pending* status. You can revoke the invite or resend it (resending is available once every 10 minutes—the button will be disabled if this limit is reached).

Adding users to nodes

To add the user to the node:

1. Go to the *Nodes* tab.
2. Click *Grant Access*.
3. Select a user added to the organization from the dropdown.
4. Click *Grant access*.

Alternatively, you can grant access from the *Node configuration* window:

1. Click the  settings button.

2. Select *Add user*.
3. Choose a user and click *Grant access*.

Invited users must accept the invitation by creating a Zabbix Cloud account using the same email address where the invitation was sent. If the user already has a Zabbix Cloud account under that email, they must sign in and confirm the invitation. Invitations are tied to a specific email address and cannot be accepted from a different account.

Key differences of Zabbix Cloud

Introduction

Zabbix Cloud is a cloud-based platform allowing its users to run self-contained Zabbix instances in the cloud (cloud nodes).

Compared to a regular, on-premise Zabbix deployment:

- No installation or maintenance is required.
- Cloud nodes are fully managed by Zabbix.
- Cloud nodes can be started within minutes.

This service is offered on a pay-as-you-go basis (a **free trial** is available).

Comparison table While most of the functionality overlaps between on-premise Zabbix installations and cloud nodes, there are also differences. A summary comparison table is provided below. Subsequent sections describe selected items in detail.

Feature / Aspect	Zabbix Cloud	Zabbix on-premises
Release cycle	In step with LTS releases	You choose your Zabbix version (stable, beta, custom builds)
Ease of use	Ready-to-use platform, fully managed by Zabbix	Requires installation, configuration and maintenance
Vulnerability patching	Automatic OS/Zabbix patching	Manual patching by user
HTTPS certificate	Valid certificate out-of-the-box (no Let's Encrypt)	Self-signed by default (Let's Encrypt or other CA can be configured)
DB performance (INSERT/UPDATE/SELECT)	Auto-partitioning for max speed; no long-running DELETEs	Manual partitioning & cleanup (long DELETE transactions possible)
Performance tuning	Pre-tuned by Zabbix Cloud team (no changelogs)	Full visibility & control over tuning parameters
Firewall control	Managed by Zabbix Cloud team; GUI/trapper ports not exposed publicly	Full control of firewall rules and port exposure
Outbound traffic on port 25	Blocked by default to prevent spam and abuse; use SMTP port 587 or 465 instead	Not restricted by Zabbix; depends on your network and hosting provider
DB isolation & protection	Highly isolated, no direct DB/SSH access	Depends on your network and host security
High availability (HA)	Runs on a highly-available cloud platform, Zabbix proxies can be used for higher data-collection resilience	User-managed HA
SNMP traps	Only via dedicated proxy (no HA/load-balanced trap receiver)	Direct or via proxy, HA/load-balance possible
SNMP polling	Hard without proxies (each device needs NAT/custom port)	Native SNMP polling; proxy optional
Retention settings	History/Trends/Audit only via UI (no API or configuration file)	Configurable in Zabbix server configuration file or via API
Custom scripts	`AlertScriptsPath`, `ExternalScripts`, frontend & community modules not supported	Fully supported (scripts path, modules, integrations)
ODBC monitoring	Only PostgreSQL (driver `{postgresql}`); MariaDB plugin present as a placeholder	ODBC for PostgreSQL, MySQL, Oracle, etc. - fully configurable
Limiting ODBC calls	Not possible (`StartODBCPollers=1`) only; heavy sync queries block other work)	Fully tunable poller count & scheduling
SAML certificate upload	Not supported	Supported via UI or API
Scheduled reports	Must create own Email media (script media unsupported)	Supports both script and Email media out-of-the-box

Feature / Aspect	Zabbix Cloud	Zabbix on-premises
Host interface for active checks	Platform-issued IP address (created automatically)	Interfaces managed by you; IPs under your control

Feature differences SNMP traps

SNMP traps are only supported through a dedicated Zabbix proxy. If SNMP trap monitoring is required, automated load balancing or high availability for the proxy cannot be used because SNMP traps must be sent to a single IP address.

SNMP polling

Without proxies, SNMP polling requires each device to be exposed via NAT and custom ports.

Retention settings

History, trend, and audit log retention periods can be configured only via the web interface in the cloud. These settings cannot be configured through `zabbix_server.conf` or the API.

Manual per-item history overrides are not supported (partitioning is controlled globally). Cloud node URLs do not accept the same query parameters as an on-premise installations.

Custom scripts

The following custom script types are not supported by Zabbix Cloud:

- Alert scripts (`AlertScriptsPath`)
- External scripts (`ExternalScripts`)
- Frontend scripts on Zabbix Server

Community-developed frontend modules cannot be installed.

ODBC monitoring

Zabbix Cloud supports ODBC monitoring only for PostgreSQL. Use the official Zabbix ODBC template and define the connection string in the template using:

```
Driver={postgresql}
```

A MariaDB plugin is also installed but currently not functional. If used, define:

```
Driver={mysql}
```

> **Attention:**
> There is no known working configuration for Oracle MySQL 8.0 in Zabbix Cloud. While simple queries (such as `SELECT 1`) may succeed, more complex queries return `SQL_ERROR`.

 It is not possible to limit ODBC calls (`StartODBCPollers=1` only). Heavy synchronous reporting may impact performance, and only a single `SELECT` can run at a time.

Infrastructure access

Zabbix Cloud does not provide SSH access to the underlying nodes, nor does it permit direct database connections (for example, to port 3306). All configuration, monitoring, and troubleshooting activities must be carried out via the cloud UI or API, ensuring that the OS and database layers remain isolated and secured.

Outbound traffic on port 25

To prevent spam and abuse, outbound connections from Zabbix Cloud nodes to TCP port 25 are blocked by default. This affects:

- Email media types that send through an SMTP server on port 25. Since 25 is the default *SMTP server port* for a new Email media type, change it to 587 (with *Connection security* set to STARTTLS) or 465 (SSL/TLS), depending on what your SMTP server supports. The *Office365 relay* email provider cannot be used, as it connects to Microsoft's relay endpoint on port 25.
- Scheduled reports, which require an Email media type.
- Checks that the cloud node itself performs against port 25, such as `net.tcp.service[smtp]` simple checks or SMTP checks in network discovery rules. These report the SMTP service as down even when it is running; perform such checks through a Zabbix proxy or Zabbix agent in your own network instead.

The default *Cloud Email* media type is not affected.

Active check interface

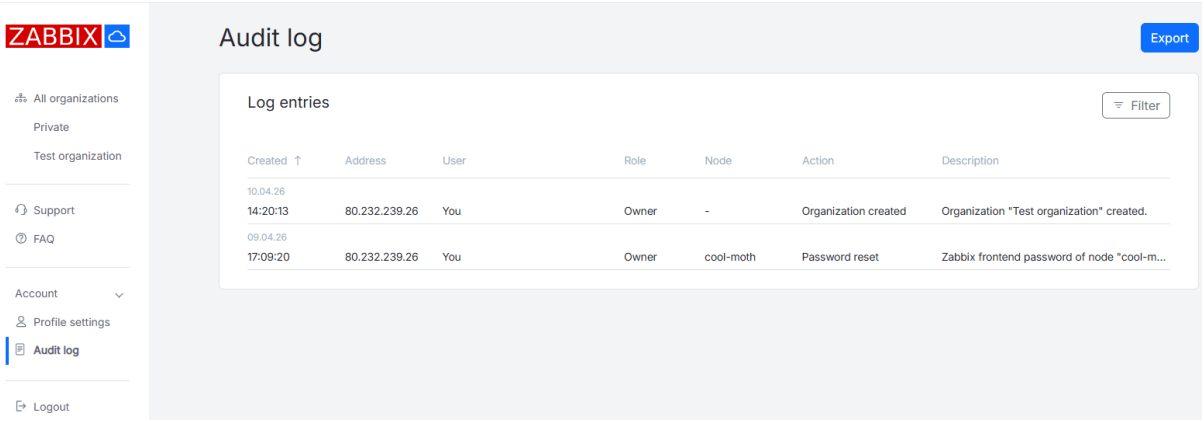
Active checks in the cloud automatically create a host interface with an IP unrelated to your on-premise network. By default, this IP may be external. To maintain consistency, you can manually delete or adjust the host interface after creation.

SAML certificate upload

SAML authentication is not supported because few providers accept unencrypted or unsigned SAML messages.

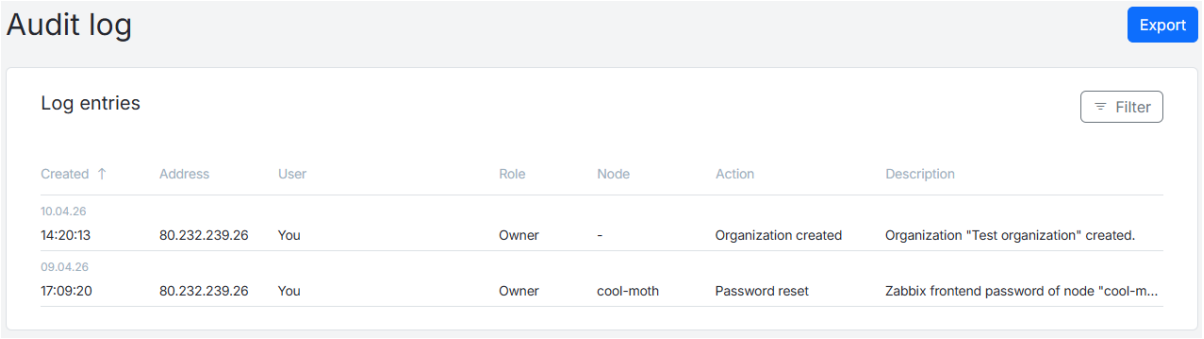
Scheduled reports

The default *Cloud Email* media type uses a script transport and cannot be used for scheduled reports. To send reports by email:



1. Create a new Email media type.
2. Assign the email media to your user in *User settings* > *Media*.
3. Select that media type when configuring scheduled reports.

Attention:
Do not use port 25 as the *SMTP server port* for this media type; see Outbound traffic on port 25.



Audit log

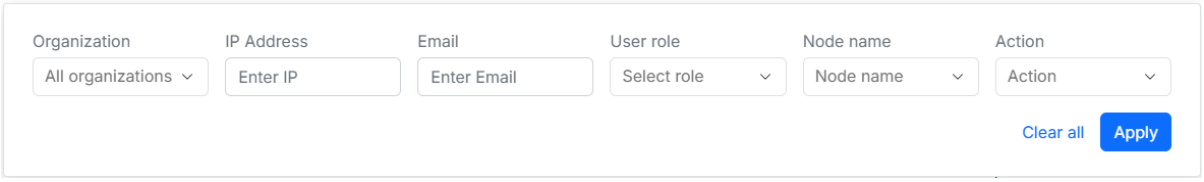
Overview In Zabbix Cloud, the Audit log records user and system activity.

After logging in to a Zabbix Cloud account, go to *Account* > *Audit log* to view audit log records. The audit log entries available to a user depend on the user's organization role.

Viewing audit log records Audit log records are displayed in a table.

The table contains the following information:

Column	Description
Created	Date and time when the log entry was created. The displayed time corresponds to the user's timezone selected in the *User timezone* dropdown in *Account* > *Profile settings*.
User	Name of the organization user who performed the action.
Role	The role of the user who performed the action.
Node	Name of the node related to the action.
Action	Name of the performed action.
Description	Description of the performed action.



Column names can be clicked to sort records in ascending or descending order.

Filtered audit log records can be exported in `.csv` format using the *Export* button.

Using filters

Use the *Filter* button to open the filter.

To display the filtered results, click *Apply* after selecting one or more filtering parameters. To clear the filter, click *Clear all*.

It is possible to filter records by one or more parameters. The following filtering parameters are available:

Parameter	Description
Organization	Select all organizations or a specific one.
IP Address	Specify an IP address.
Email	Specify an email address attached to the user.
User role	Select all roles or a specific one: Owner, Admin, or User.
Node name	Select all nodes or a specific one.
Action	Select a specific action type.

Audit log tracks the following actions:

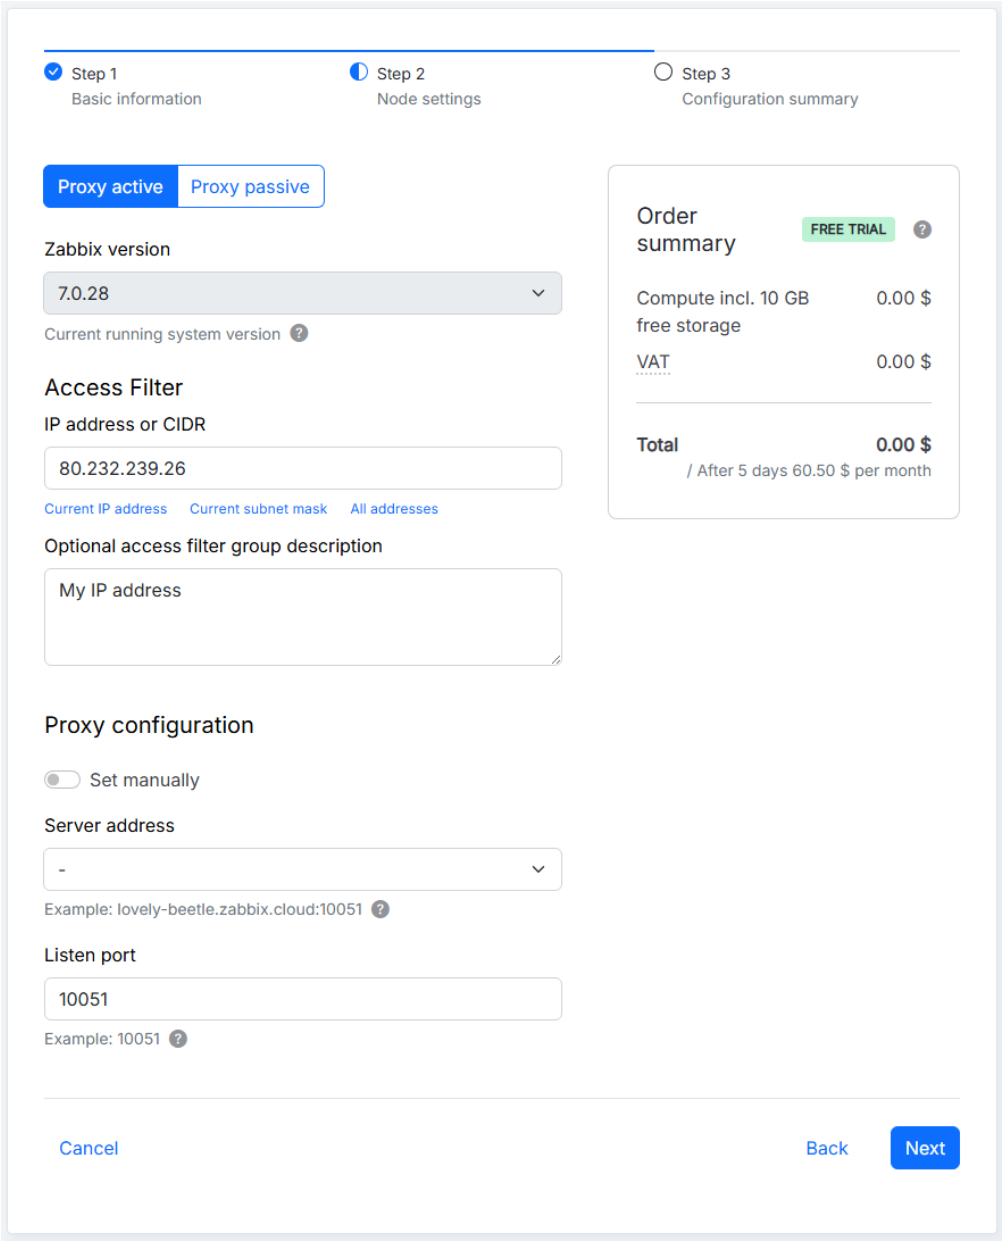
- *Node created*
- *Node deleted*
- *Node upgraded*
- *Node version updated*
- *Password reset*
- *Maintenance updated*
- *History setting updated*
- *Node expiration date extended*
- *Proxy configuration updated*
- *Backup created*
- *Backup deleted*
- *Backup restored*
- *Backup updated*
- *Access filter added*
- *Access filter updated*
- *Access filter deleted*
- *Encryption enabled*
- *Encryption disabled*
- *Subscription cancelled*
- *Subscription renewed*
- *Subscription payment failed*
- *Payment requires confirmation*
- *Organization created*
- *Organization deleted*
- *Admin invited*
- *User invited*
- *Admin joined*
- *User joined*
- *Admin removed from organization*
- *User removed from organization*
- *Node added to organization*
- *Node removed from organization*
- *Node access granted*
- *Node access revoked*
- *User settings updated*
- *Payment created*

- *Payment completed*
- *Payment failed*
- *VAT charge applied*
- *VAT validation failed*
- *Billing info updated*
- *Payment method updated*
- *Payment method removed*
- *Prepaid node created*
- *Prepaid node updated*
- *Incident started*
- *Incident ended*

Set up a Zabbix Cloud proxy

Overview This page describes how to configure a Zabbix proxy deployed on Zabbix Cloud to collect monitoring data from hosts in a remote environment.

The procedure is primarily intended for a Zabbix server and proxy created on Zabbix Cloud.



The procedure also describes the configuration required when the Zabbix server is not hosted on Zabbix Cloud.

Prerequisites A Zabbix server is installed, configured, and running, or a Zabbix server node is running on Zabbix Cloud.

Create a proxy node Create a Zabbix Cloud proxy node.

During node creation:

1. Select *Proxy*.
2. Select *Proxy active* or *Proxy passive* depending on how the proxy should communicate with the Zabbix server.
3. Configure the node's IP address or CIDR access filters (can be done after node creation).
4. Specify the Zabbix server to which the proxy will connect.

5. Complete the node creation process.

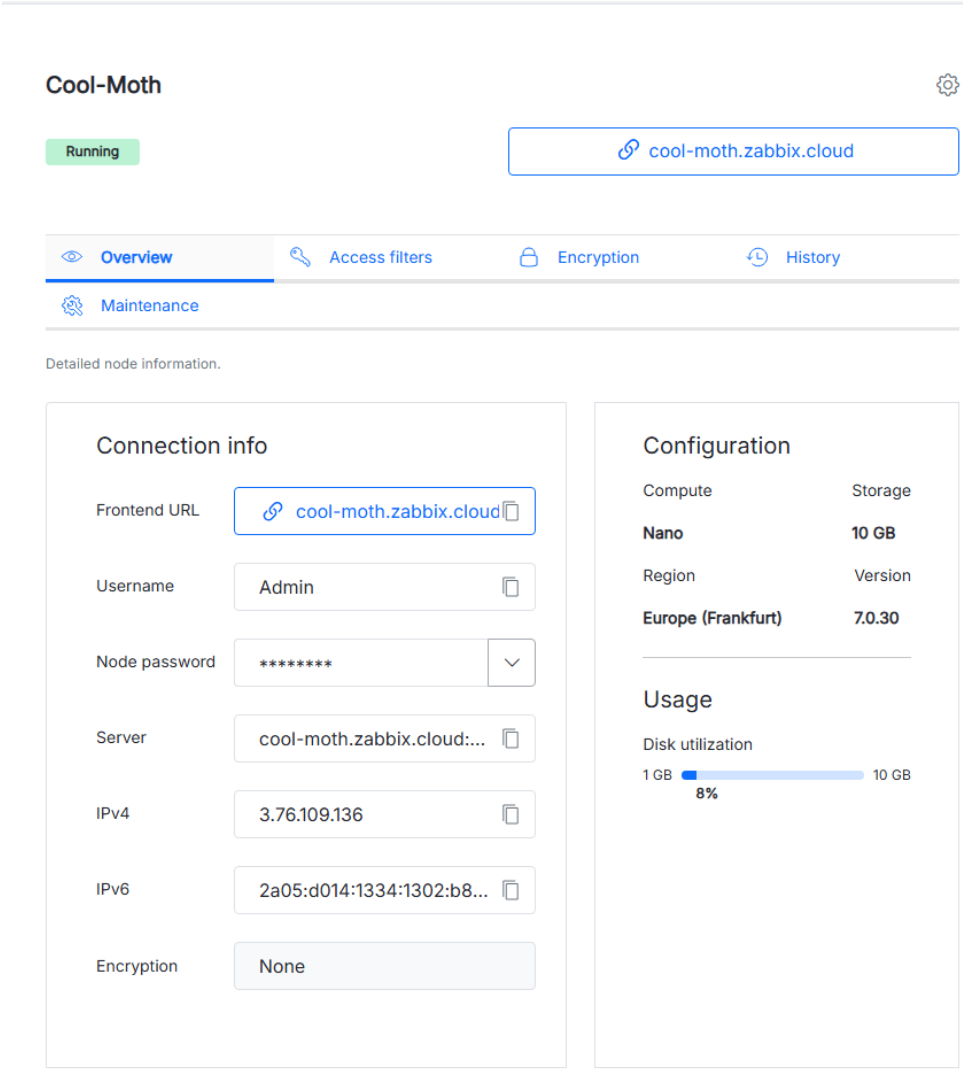
For more information about creating a proxy node, see Deploy Zabbix in the cloud.

Configure access filters Zabbix Cloud uses access filters to control which IP addresses or subnets can connect to a cloud node.

During node initialization, an access filter is automatically created for the IP address used to access the node. This does not necessarily include the addresses of monitored hosts or other Zabbix components. Add the required addresses manually.

See Node configuration — Access filters for more information.

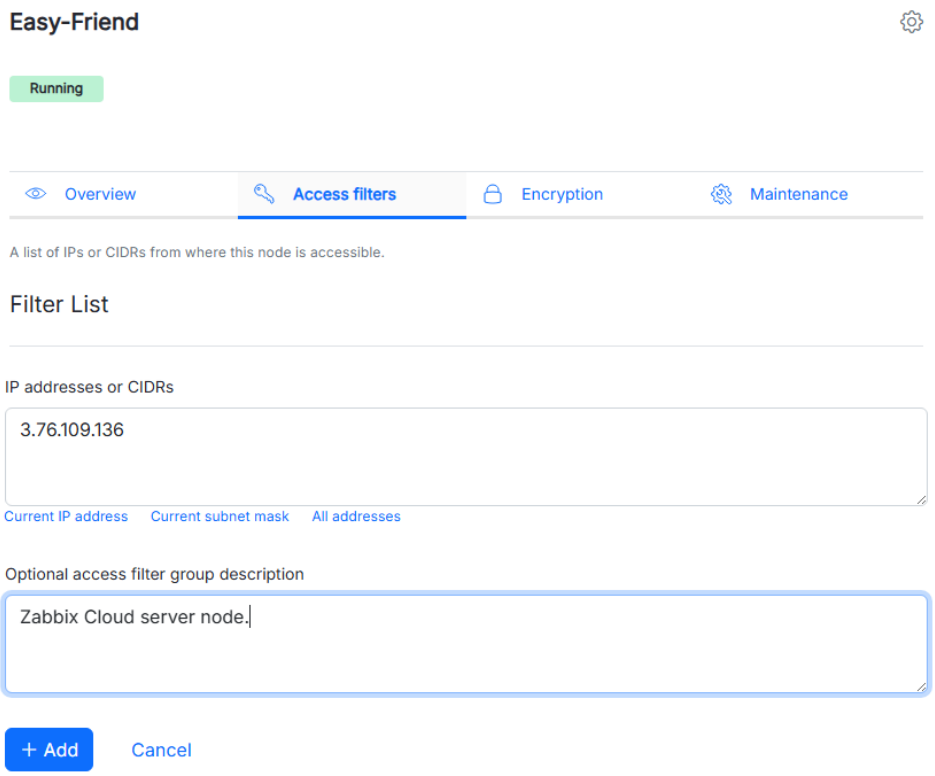
Proxy node



Add the IP addresses or subnets from which connections to the proxy are expected.

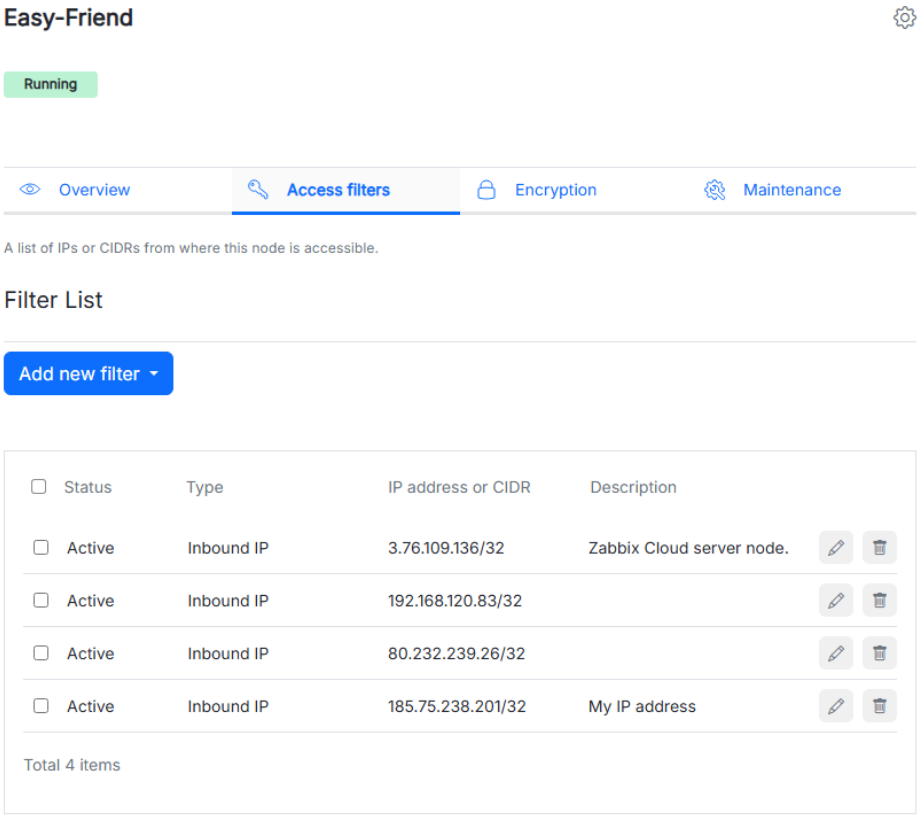
If monitored hosts use active agent checks, the agents initiate connections to the proxy, so the IP address or subnet of the monitored hosts must be allowed by the proxy node's access filters.

If *Proxy Passive* was set as a proxy mode, the Zabbix server connects to the proxy, so the IP address or subnet of the Zabbix server must be allowed by the proxy node's access filters.



If *Proxy passive* was selected and a server node is used:

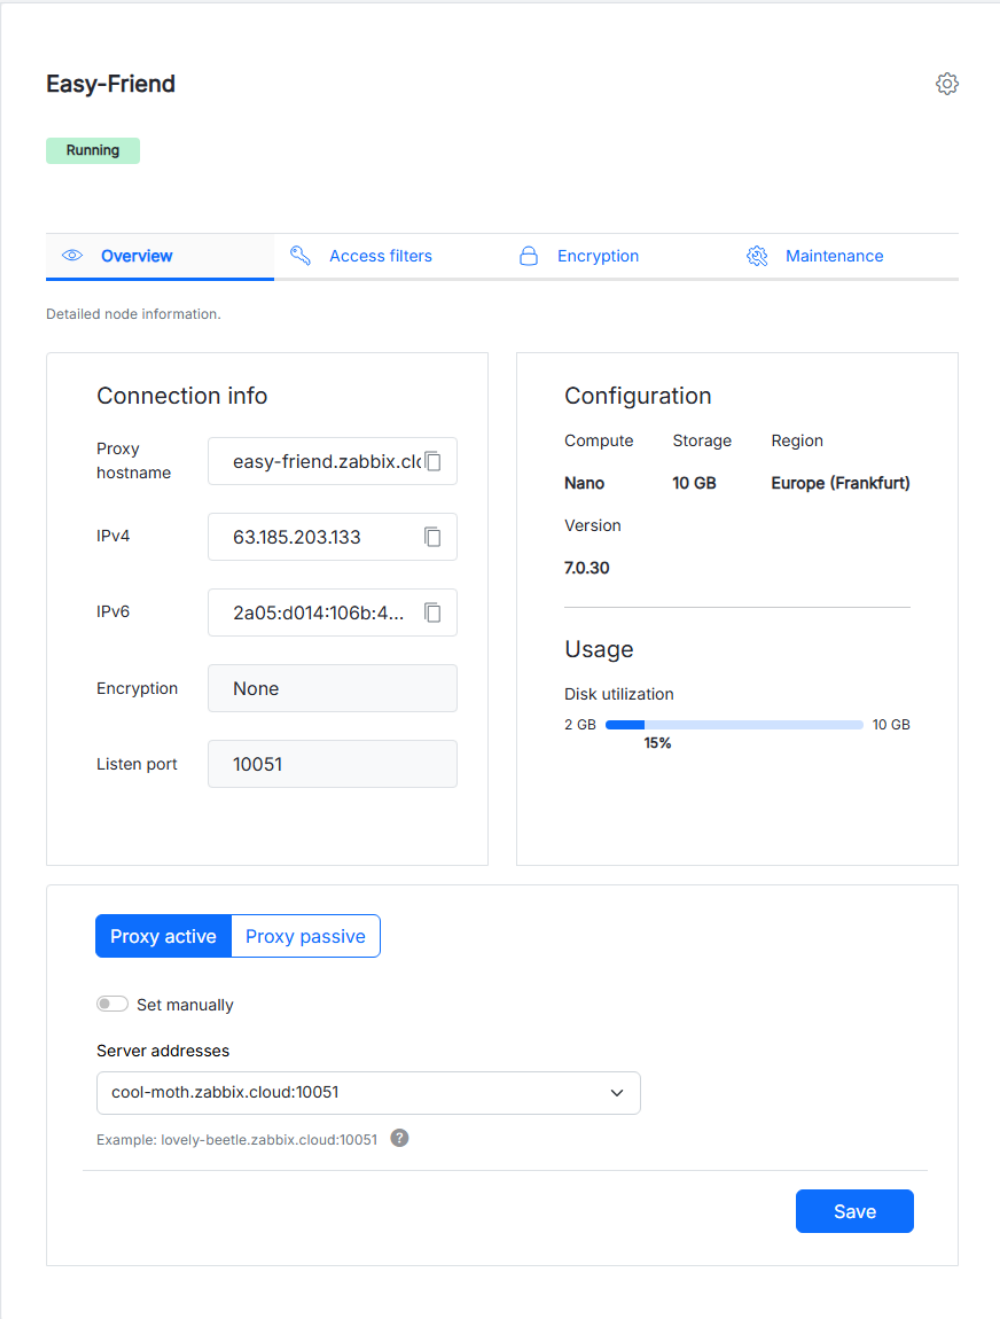
1. Navigate to the *Overview* tab of your server node, and copy the IPv4 or IPv6 address of the node.



2. Navigate to the *Access filters* tab of your proxy node, click *Add new filter* > *Add*.

3. Paste the copied address to the *IP addresses or CIDRs* field, and add description to the *Optional access filter group description* field.

4. Click *Add*.

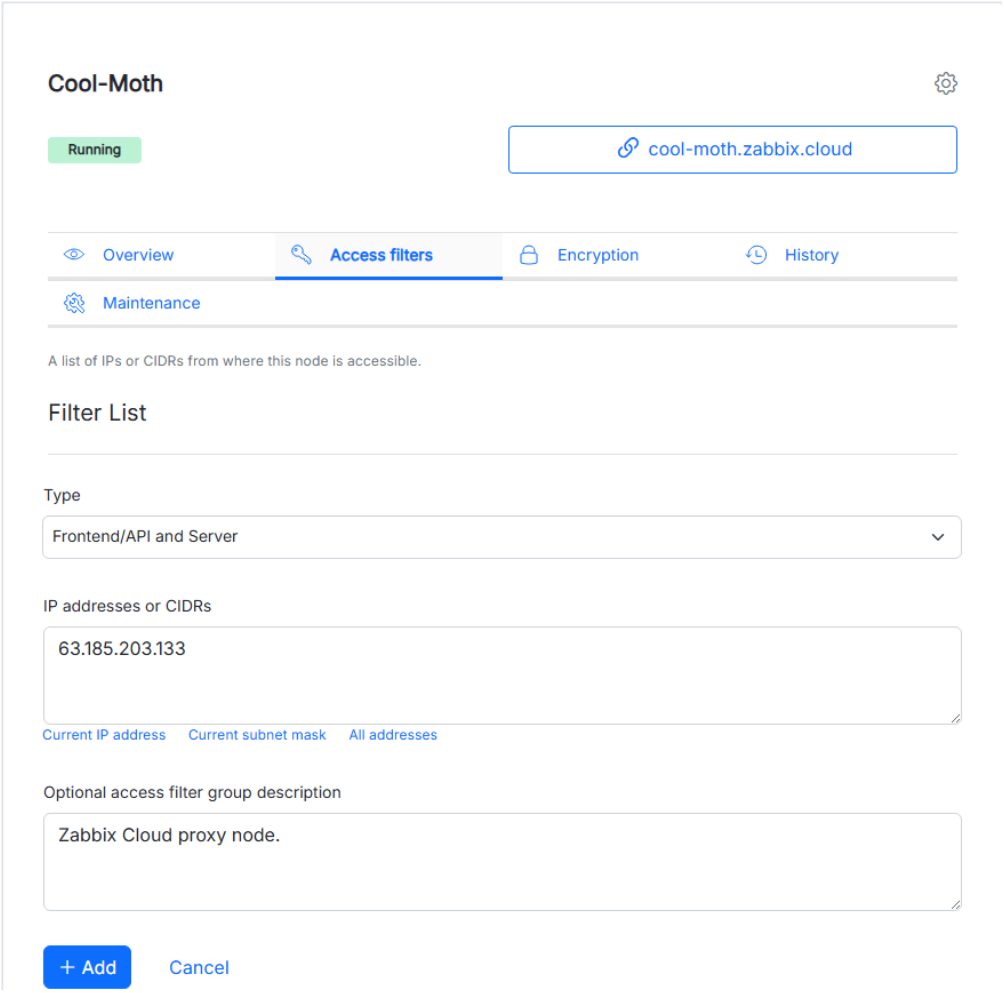


Do steps 2-4 for the IP address of a Zabbix agent using active checks.

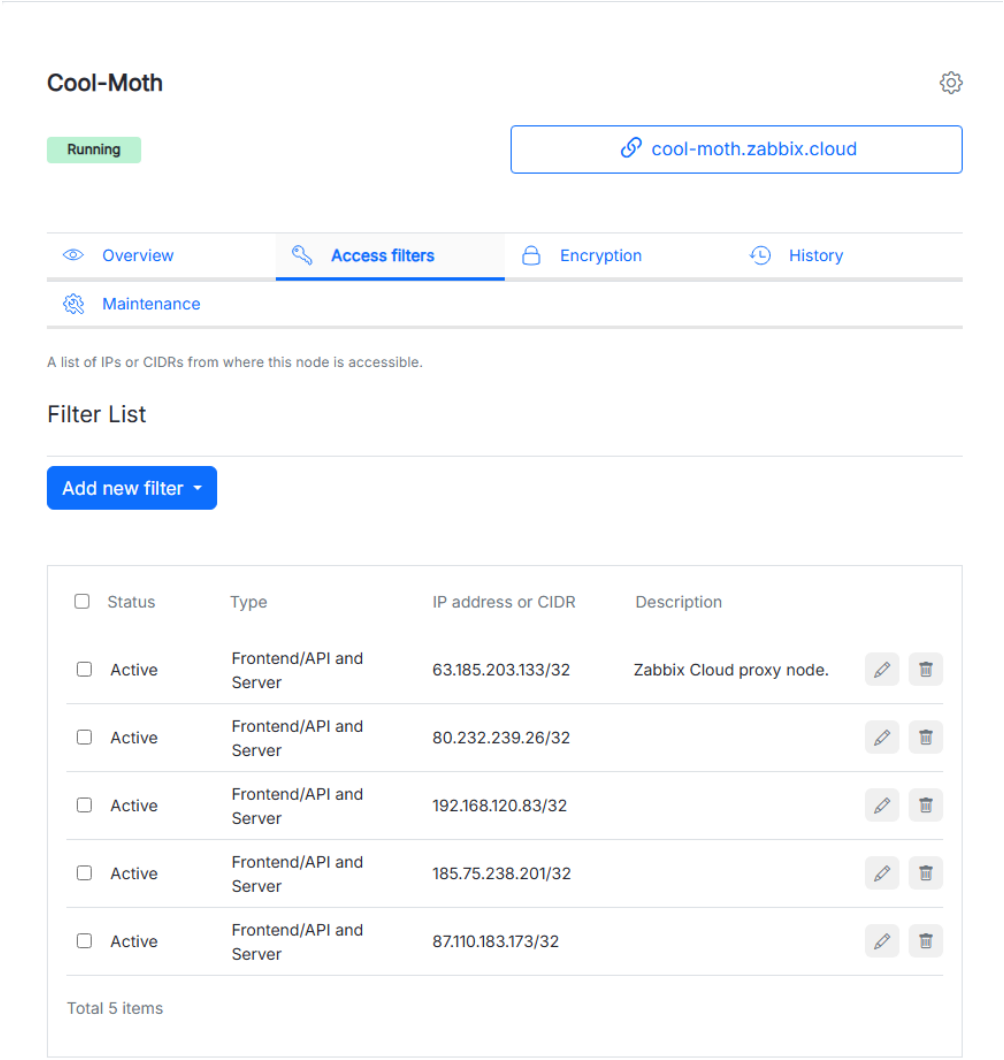
Server node

If the Zabbix server is hosted on Zabbix Cloud, configure access filters on the server node as well.

For a proxy in the active mode, add the IP address or CIDR of the proxy node to the server node's access filters, because the proxy initiates the connection to the server.



1. Navigate to the *Overview* tab of your proxy node, and copy the IPv4 or IPv6 address of the node.



2. Navigate to the *Access filters* tab of your server node, click *Add new filter* > *Add*.

3. Paste the copied address to the *IP addresses or CIDRs* field, and add description to the *Optional access filter group description* field.

4. Select the appropriate filter type.

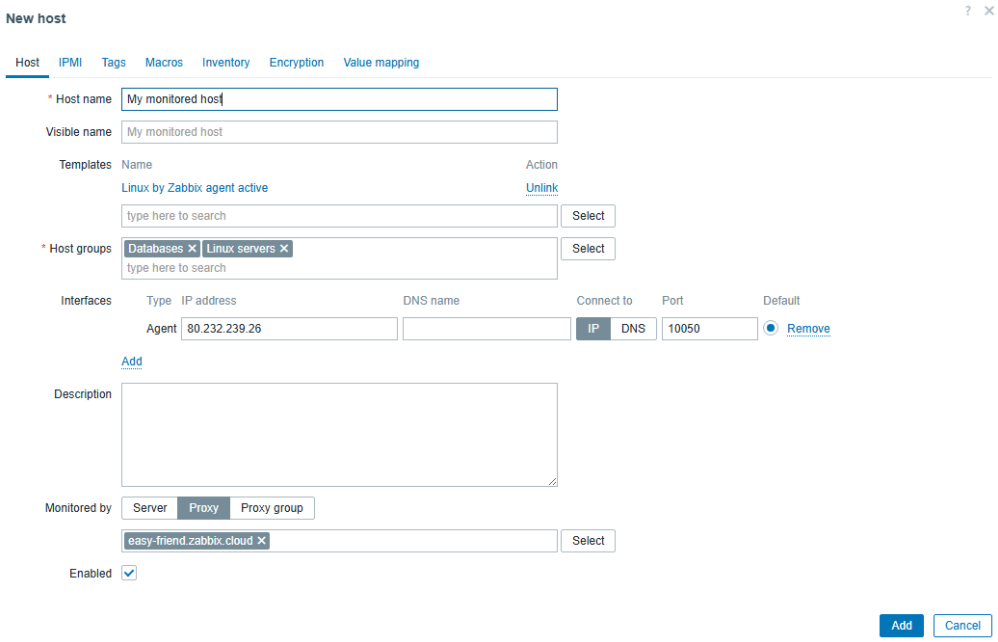
5. Click *Add*.

Configure the proxy The proxy must be configured on the Zabbix frontend to communicate with the Zabbix server.

Open *Administration* > *Proxies* in the Zabbix frontend, click *Create proxy*, and configure the proxy as required:



1. Add the proxy name to the *Proxy name* field. It must match the proxy hostname configured for the proxy. Type it in, or copy it from the *Overview* tab of your proxy.
2. Select the Proxy mode corresponding to the one selected during proxy creation.
3. For an active proxy, enter the IP address or DNS name of the proxy.
4. Click *Add*.

For more information, see Distributed monitoring using proxies.

Configure monitored hosts Add the hosts that should be monitored through the proxy.

1. Go to *Data collection* > *Hosts*.
2. Create a host or open an existing host.
3. In *Monitored by*, select the *Proxy* and either type in the proxy name to search and select, or press the *Select* button to open a list of proxies to select from.
4. Configure the host interface and other parameters.
5. Click *Add* or *Update*.

A host configured to be monitored by a proxy sends or receives monitoring data through that proxy, depending on the item type and agent mode.

Configure Zabbix agent When a monitored host uses Zabbix agent or Zabbix agent 2, configure the agent to communicate with the appropriate Zabbix component.

The configuration depends on whether the agent uses *passive* or *active* checks.

Passive agent checks

With passive checks, the Zabbix proxy initiates connections to the agent and requests monitoring data.

Open the Zabbix agent configuration file and update the `Server` parameter to allow connections from the IP address of the Zabbix Cloud proxy.

For example:

```
Server=<proxy_IP>
```

Make sure that the monitored host allows incoming TCP connections from the proxy on the agent port, which is 10050 by default.

The proxy must be able to reach the monitored host over the network.

Active agent checks

With active checks, the agent initiates connections to the Zabbix proxy and sends collected monitoring data.

Open the Zabbix agent configuration file and update the `ServerActive` parameter with the address of the Zabbix Cloud proxy.

For example:

`ServerActive=<proxy_IP>:<proxy_listen_port>`

Replace `<proxy_IP>` with the IP address of the Zabbix Cloud proxy and `<proxy_listen_port>` with the listen port configured when the proxy node was created. The default listen port is 10051.

If a proxy is specified in `ServerActive`, the agent obtains its active-check configuration from the proxy rather than directly from the Zabbix server.

Make sure that the monitored host can establish an outgoing TCP connection to the proxy on the configured listen port.

For more information about passive and active agent checks, see Passive and active agent checks.

External Zabbix server A Zabbix Cloud proxy can also communicate with a Zabbix server deployed outside Zabbix Cloud.

In this case, the external Zabbix server must be able to communicate with the cloud proxy according to the selected proxy mode.

For a proxy in the active mode, the proxy initiates the connection to the external Zabbix server. Configure the external Zabbix server to accept connections from the proxy and make sure that the proxy can reach the server over the network.

For a passive proxy, the Zabbix server initiates the connection to the proxy. Add the IP address or subnet of the external Zabbix server to the proxy node's access filters and make sure that the server can reach the proxy over the network.

The external Zabbix server does not use Zabbix Cloud access filters. Instead, configure the required firewall and network rules on the external environment.

The monitored hosts can be located in the same environment as the external Zabbix server, in another network, or in a network accessible by the proxy.

When agents use active checks, configure their `ServerActive` parameter to point to the Zabbix Cloud proxy. When agents use passive checks, configure their `Server` parameter to allow connections from the proxy.

Verify the configuration After configuring the proxy, agents, access filters, and network connectivity, verify that the proxy is communicating with the Zabbix server.

1. Go to *Administration* > *Proxies*.
2. Check the proxy *State*.
3. Go to *Monitoring* > *Latest data* and check that recent item values are available.

If the proxy is not communicating with the server, verify:

- the proxy mode;
- the server address and port;
- proxy access filters;
- server access filters, when the server is hosted on Zabbix Cloud;
- agent configuration;
- firewall and routing rules;
- the address configured in `Server` or `ServerActive`.

Mobile app

Mobile app

Zabbix mobile app lets you monitor your Zabbix environment from your mobile device. View problems, check their details, update problems, and get push notifications when something needs attention.

Get the app (coming soon)

Set up Zabbix for the app

Set up Zabbix bridge adapter Install Zabbix bridge adapter to let mobile devices connect to Zabbix.

Add devices Add your mobile device in the Zabbix web interface to connect it to your Zabbix server.

Set up push notifications Get alerts on your mobile device when a problem occurs.

Learn about the app

App overview Learn the basics of using Zabbix mobile app.

Secure mobile access Secure the app, your mobile devices, and Zabbix bridge adapter, or revoke access from lost or compromised devices.

Set up Zabbix for the app

To use Zabbix mobile app (coming soon), you must first:

1. Set up Zabbix bridge adapter.
2. Set up push notifications.
3. Add your mobile device in the Zabbix web interface.

The sections below cover each step.

After setting up, see Secure mobile access to keep the app and Zabbix bridge adapter secure.

Set up Zabbix bridge adapter To allow your Zabbix server to communicate with the mobile app, you must set up Zabbix bridge adapter.

The bridge adapter can be installed on the same system as your Zabbix server, or on a different system, using packages:

> **Attention:**
> The steps below are for Ubuntu 24.04. For other operating systems, take the repository and package installation commands (e.g., `wget`, `dpkg`, `apt`) from the Get Zabbix page for your OS, and use them to install the `zabbix-bridge-adapter` package.

1. Start a new shell session with root privileges:

```
sudo -s
```

2. Install the Zabbix repository:

```
wget https://repo.zabbix.com/zabbix/8.0/release/ubuntu/pool/main/z/zabbix-release/zabbix-release_latest_8.
dpkg -i zabbix-release_latest_8.0+ubuntu24.04_all.deb
apt update
```

3. Install Zabbix bridge adapter:

```
apt install zabbix-bridge-adapter
```

4. Edit the Zabbix server configuration file:

```
EnableMobileDevices=1
BridgeAdapterURL=https://bridge-adapter.example.com:10054/rpc
```

5. Restart Zabbix server, for example (see other options):

```
systemctl restart zabbix-server
```

6. Copy the Zabbix server ID from *Reports* > *System information*; you will use it in the next step.

7. Edit the Zabbix bridge adapter configuration file:

```
ZabbixAPIURL=https://example.com/zabbix/api_jsonrpc.php
ServerId=019fb1f9-22bd-74ea-bc03-51efb8b76aba
DataDir=/var/lib/zabbix-bridge-adapter
```

> **Attention:**
> The directory specified in `DataDir` must have 0700 permissions, and all files stored in it must have 0600 permissions.

8. Review and accept the end-user license agreement (EULA) of Zabbix bridge adapter:

```
zabbix_bridge_adapter license show
sudo -u zabbix-bridge-adapter zabbix_bridge_adapter -c /etc/zabbix/zabbix_bridge_adapter.conf license acce
```

9. Start Zabbix bridge adapter:

```
systemctl start zabbix-bridge-adapter
```

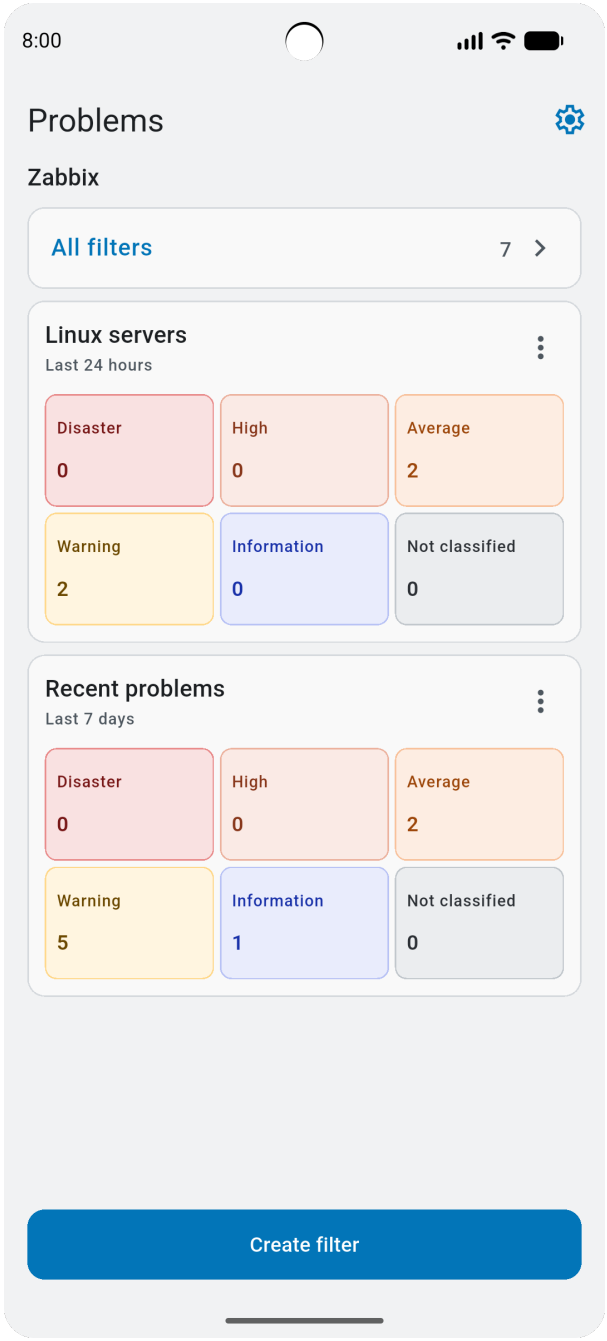
Attention:
When started, Zabbix bridge adapter uses the server ID to enroll your Zabbix server with the centrally hosted Zabbix Bridge. The enrollment state is stored in a state file in `DataDir`. If you reinstall the bridge adapter and the state file is lost, enrolling the same Zabbix server may fail. To avoid this, back up the state file before you reinstall the bridge adapter and restore it afterwards.

Set up push notifications To get alerts on your mobile device when something needs attention in your monitored environment:

1. Create a push notification media type (or enable the default one).
2. Create an action (or enable the default *Report problems to Zabbix administrators* trigger action).
3. Add a device to automatically add the media type to your user (or add user media manually).

Add devices To use Zabbix mobile app on your device, you must add that device in the Zabbix web interface. For instructions, see:

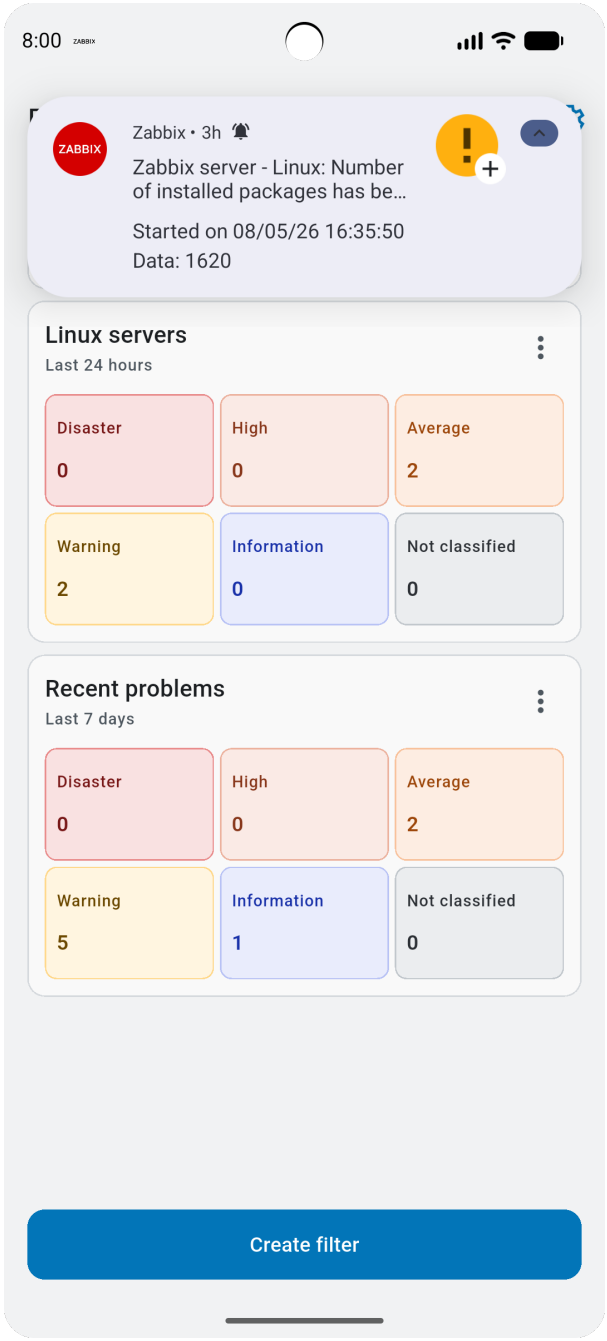
- *Users* > *Devices* (as *Super admin*, add your own or other user mobile devices)
- *User settings* > *Devices* (as any user, add your own mobile devices)



App overview

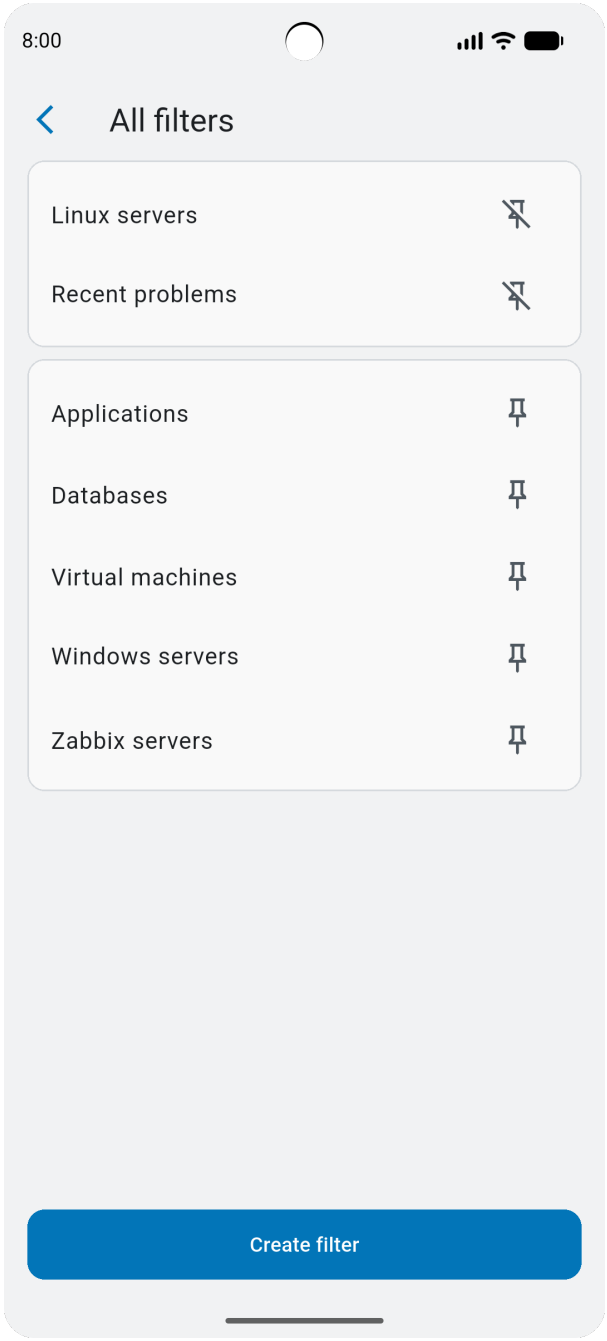
Zabbix mobile app (coming soon) lets you monitor your Zabbix environment from your mobile device. View problems, check their details, update problems, and get push notifications when something needs attention.

This page gives you an overview of the mobile app and how to use it.



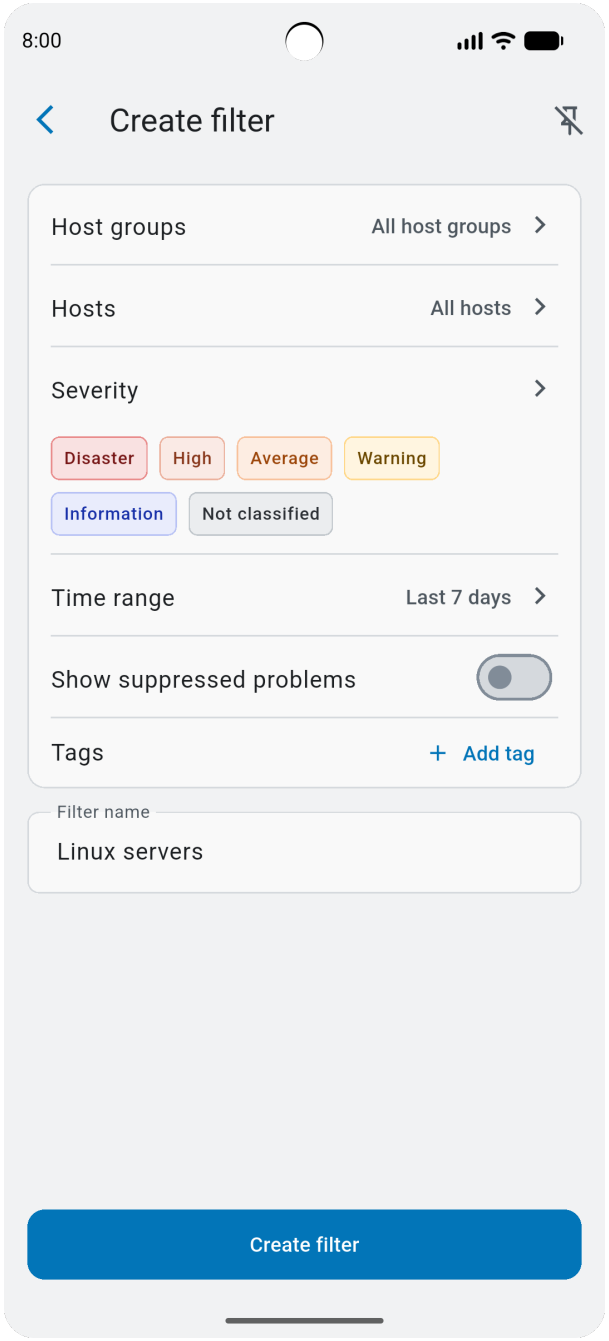
Problems The *Problems* screen shows you an overview of problems based on your pinned filters. It contains:

- *Settings* icon - tap to see app settings.
- *All filters* - tap to see and manage filters.
- Zabbix server name (or *Zabbix*, if not configured when installing the Zabbix web interface).
- Pinned filters - tap their name or a severity to open the *Problem list* screen. Tap the three-dot menu to manage the filter: edit, duplicate, unpin, or delete it. Note that pinned filters are ordered alphabetically, and the *Recent problems* filter cannot be edited and removed.
- *Create filter* - tap to create a new filter.



Notifications When Zabbix server detects a problem, it can send a notification to your mobile device. The notification contains the problem host, name, and a message generated from the message templates configured for the push notification media type.

Tap the notification to open the *Problem details* screen.



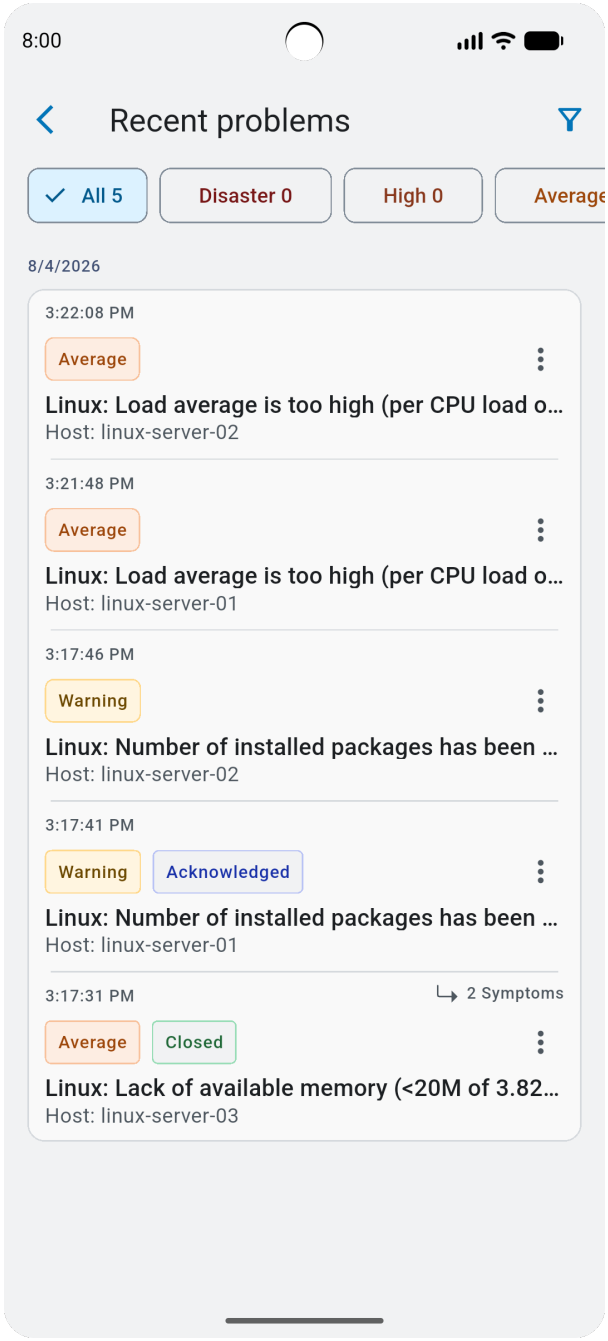
All filters The *All filters* screen lets you manage filters. It contains:

- Filter names - tap to edit the filter.
- Pin icons - tap to pin or unpin the filter to the *Problems* screen.
- *Create filter* - tap to create a new filter.

Create filter The *Create filter* screen lets you create a filter, with options similar to those in *Monitoring* > *Problems* (see details). You can also set a *Time range* for how long to show unresolved problems.

Tap *Create filter* to save the filter. New filters are pinned to the *Problems* screen; tap the pin icon to change this.

Problem list The *Problem list* screen shows problems that match the filter (e.g., *Recent problems*).

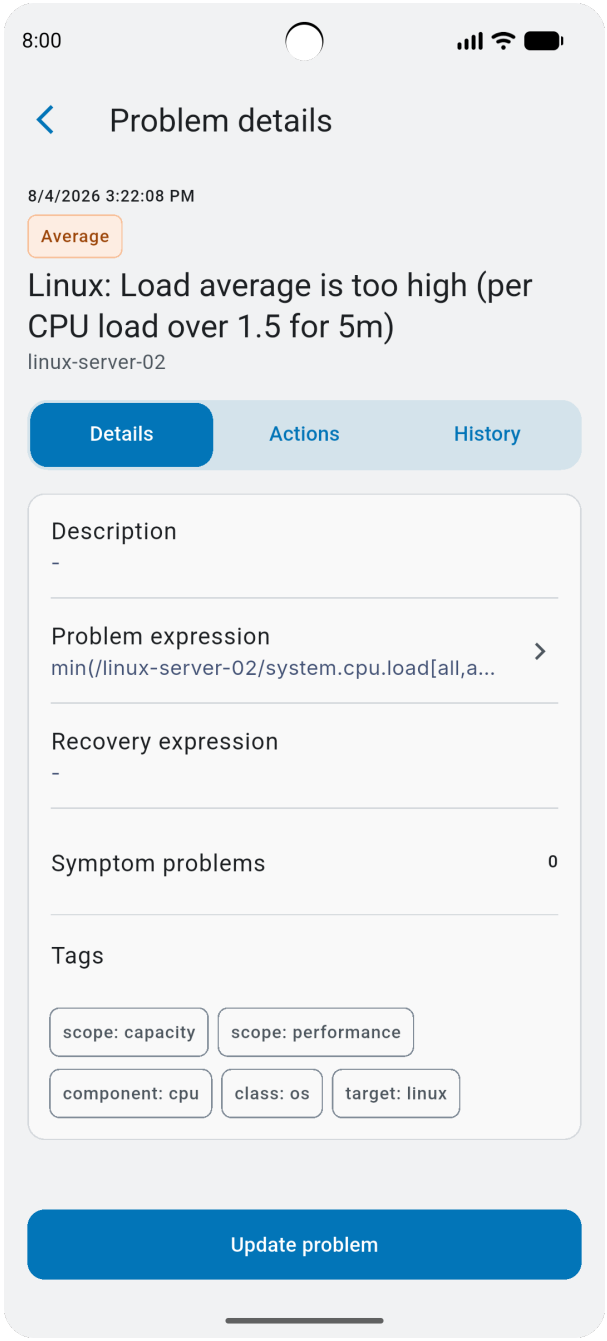


Tap the filter icon or a problem severity to narrow the list further.

For each problem, you can see:

- Start time and date.
- Severity, name, and host.
- Whether it was acknowledged or recently closed (resolved automatically or closed manually).
- Whether it has symptoms - tap to see the symptom problem list.

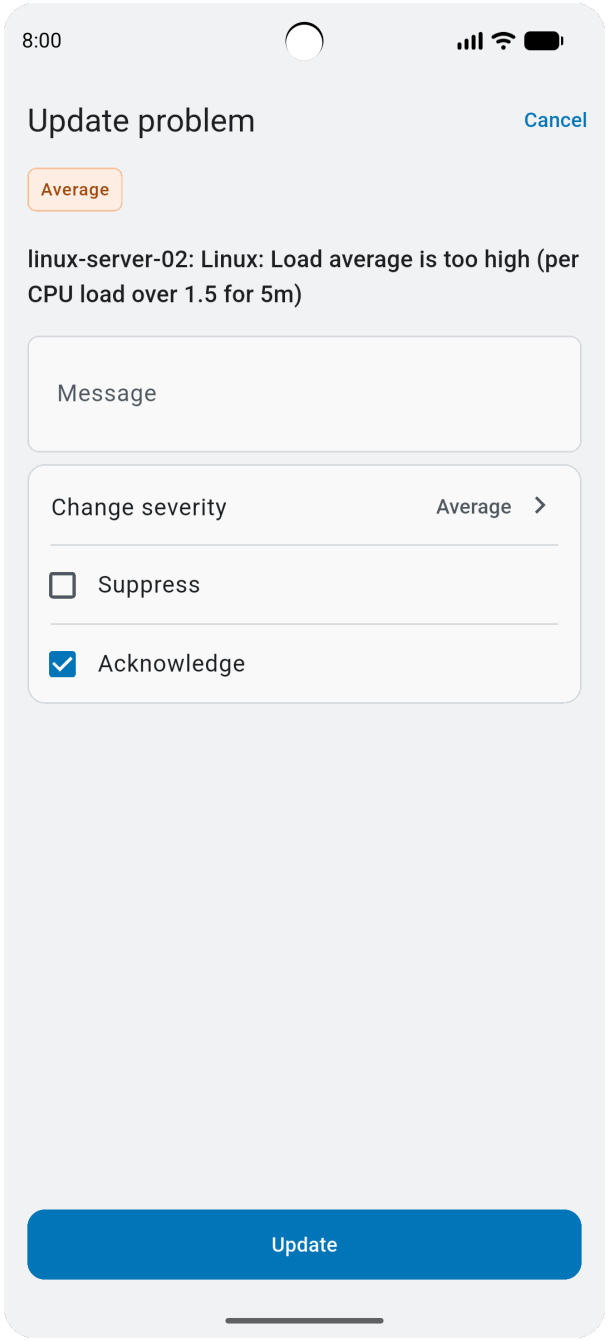
Tap a problem to open the *Problem details* screen.



Tap the three-dot menu to quickly acknowledge the problem, or suppress it for a time you choose.

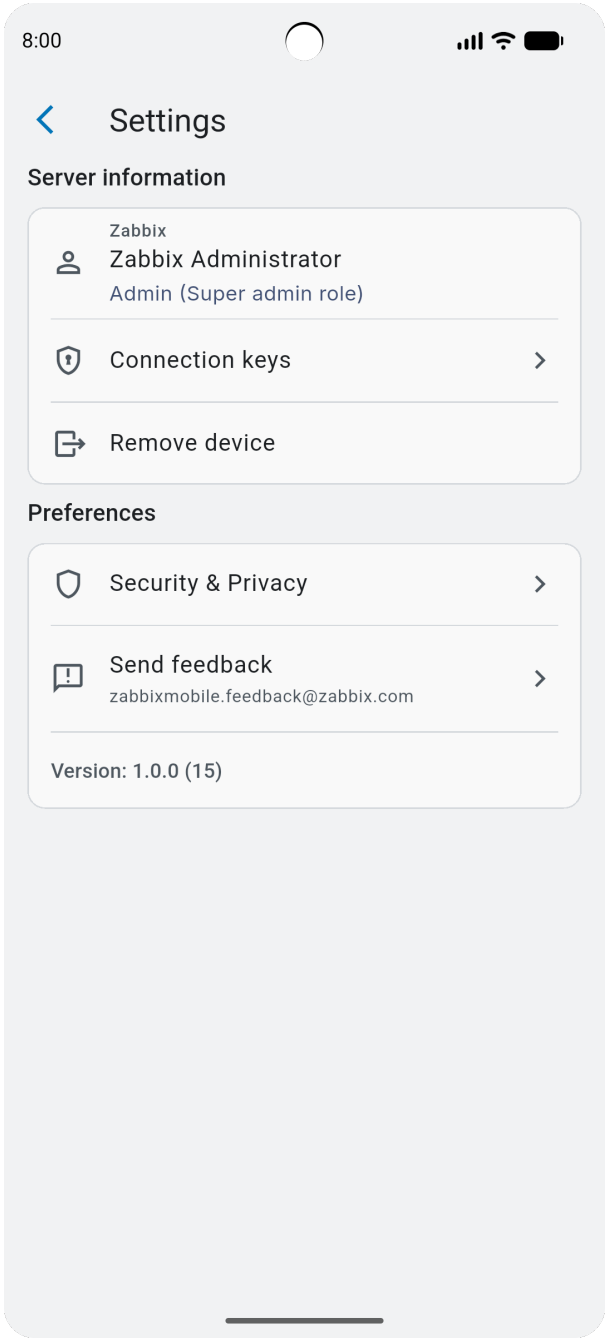
Problem details The *Problem details* screen shows you problem details, actions, and history.

- *Details* tab - shows the problem description, expressions, symptom problems (tap to see the problem list), and tags.
- *Actions* tab - shows the problem timeline: when it started or was acknowledged, whether a notification was sent, and other actions.
- *History* tab - shows the problem age, duration, and recovery time (or – if the problem is still ongoing).



Tap *Update problem* to update the problem.

Update problem The *Update problem* screen lets you update a problem:



- Add a message.
- Change the problem severity.
- Suppress the problem for a time you choose.
- Acknowledge or unacknowledge the problem.
- Close the problem.

Tap *Update* to save your changes.

Settings The *Settings* screen lets you access app settings. It contains:

- Zabbix server name (or *Zabbix*, if not configured when installing the Zabbix web interface).
- Name, type, and role of the user the mobile device is added to.
- *Connection keys* - open to see and copy the server ID, device ID, and other details.
- *Remove device* - tap to remove the mobile device from Zabbix.
- *Security & Privacy* - open to enable app lock and manage diagnostic data sharing.
- *Send feedback* - open to send feedback to Zabbix.
- App version.

Secure mobile access

This page contains best practices for keeping Zabbix mobile app and Zabbix bridge adapter secure.

Protect mobile devices To prevent other people from opening the app on your mobile device, enable app lock in the app *Settings*.

If a device has been lost or compromised, remove it in the Zabbix web interface. This revokes and removes its access credentials, so the device can no longer access Zabbix. Depending on your user role permissions, you can remove devices in the following sections:

- *User settings > Devices* - any user can remove their own devices (requires the *Manage own devices* permission).
- *Users > Devices* - *Super admin* can remove any user's devices (requires the *Manage user devices* permission).

You can also limit which parts of Zabbix can be accessed from a mobile device. To do this, assign users a user role that grants only the permissions the app requires. The minimal permissions are as follows:

Section	Configuration
Access to UI elements	Clear all checkboxes.
Access to services	Set *Read-write access to services* and *Read-only access to services* to `None`.
Access to modules	Clear all checkboxes.
Access to API	Clear the *Enabled* checkbox.
Access to actions	Clear all checkboxes. To let users update problems in the app, also mark the actions they need: - *Add problem comments* - *Change severity* - *Acknowledge problems* - *Suppress problems* - *Close problems* - *Create and edit own media*
Devices	Note that the problems that users can see in the app also depend on their access to hosts. Mark the *Enabled* checkbox. To let users add and remove their own mobile devices, also mark the *Manage own devices* checkbox; otherwise, a *Super admin* must manage their devices in *Users > Devices*.

Protect Zabbix bridge adapter Zabbix bridge adapter stores its data (state file and encryption keys) in the directory specified in the `DataDir` parameter of Zabbix bridge adapter configuration file. Make sure that the directory has 0700 permissions, and all files stored in it have 0600 permissions.

Zabbix bridge adapter passes requests from mobile devices to Zabbix API. To restrict which API methods can be called through Zabbix bridge adapter, use its `AllowedAPIMethods` parameter. For example, allow only the minimal set of methods that the mobile app requires, or even fewer, if you do not want some mobile app features to be used (e.g., do not allow `event.acknowledge` if mobile app users should not update problems).

Developer center

Developer center

Start developing custom extensions for Zabbix with guidance on plugins, modules, and widgets.

Build on Zabbix

Plugins An overview on how to develop and manage Zabbix plugins to extend functionality or integrate with external systems.

Python library for Zabbix Resources for using the official `zabbix_utils` library to interact with the Zabbix API and build integrations.

Frontend modules Guides and references for building custom modules that extend or modify the Zabbix frontend to suit specific use cases.

Widgets A breakdown of widget structure and logic, with instructions for creating custom dashboard elements tailored to your needs.

Creating a plugin

This page is intended for those who are interested in developing their own plugin (independent data collector) for Zabbix agent 2.

A custom plugin extends Zabbix agent 2 functionality beyond the provided built-in plugins and loadable plugins.

Each plugin is a *Go* package that defines the structure and implements one or several interfaces (*Exporter*, *Configurator*, *Runner*). For more information, see Plugin interfaces and Connection diagram.

This guide will help you create a custom loadable plugin.

For additional guidance, see also the repository of:

- Example plugin
- Existing loadable plugins

What you'll create This is ste-by-step tutorial for creating a simple loadable plugin named **MyIP**. This plugin will implement a single item key (`myip`) returning the external IP address of the Zabbix agent host.

Step 1: Setup

1. A plugin is a standard Go module. Start by initializing the `go.mod` file in the plugin directory to track plugin dependencies:

```
cd path/to/plugins/myip # Switch to your plugin directory
go mod init myip
```

2. Install the mandatory dependency Zabbix Go SDK (`golang.zabbix.com/sdk`):

```
go get golang.zabbix.com/sdk@$LATEST_COMMIT_HASH
```

Replace `$LATEST_COMMIT_HASH` with the latest `HEAD` commit hash from the `golang.zabbix.com/sdk` repository in the appropriate release branch. For example:

```
go get golang.zabbix.com/sdk@af85407
```

Note that `golang.zabbix.com/sdk` versioning is currently not supported, but this may change in the future.

Additional dependencies can be installed as needed using `go get`.

3. Create an empty `main.go` file for the plugin source code:

```
touch main.go
```

Now the initial setup is complete, and the plugin is ready for development.

Step 2: Plugin structure The `golang.zabbix.com/sdk` module, installed in the previous step, provides the necessary framework for plugin development and ensures all plugins have a consistent structure.

1. Set up basic execution flow.

Start by defining the main execution flow of the plugin. Add the following code to `main.go`:

```
package main

func main() {
    err := run()
    if err != nil {
        panic(err)
    }
}

func run() error {
    return nil
}
```

This establishes the basic execution flow for the plugin. The run function will later contain the core logic of the plugin.

2. Explore the plugin interfaces.

A Zabbix agent 2 plugin shall be represented by a struct that implements interfaces from the `golang.zabbix.com/sdk/plugin` package:

- *Accessor* - defines essential methods all plugins must implement, such as setting the plugin name and handling item key timeouts.
- One or more of the following functional plugin interfaces:
  - *Exporter* - performs a poll and returns a value (or values), nothing, or an error; often used alongside the *Collector* interface.
  - *Collector* - manages the periodic collection of data.
  - *Runner* - defines plugin startup and shutdown procedures.
  - *Watcher* - enables independent metric polling, bypassing the agent's internal scheduler; useful for trap-based or event-driven monitoring.
  - *Configurator* - defines how the plugin reads and applies its configuration settings.

You can either implement these interfaces yourself or use the default ones provided by the Zabbix Go SDK, modifying them as needed. This tutorial uses the default implementations.

3. Create the plugin struct.

Now, import the *plugin* package and create a `myIP` struct that embeds the `plugin.Base` struct:

```
import "golang.zabbix.com/sdk/plugin"

type myIP struct {
    plugin.Base
}
```

The myIP struct currently satisfies the Accessor interface. A method for implementing one of the functional plugin interfaces, the `Exporter`, will be added later in the tutorial.

Step 3: Define item keys Your plugin needs the item keys to collect data and provide it to Zabbix server or proxy.

1. Import *errs* package for error handling:

```
import "golang.zabbix.com/sdk/errs"
```

2. Register item keys using the `plugin.RegisterMetrics()` function within the `run()` function:

```
func run() error {
    p := &myIP{}

    // Register the `myip` item key.
    err := plugin.RegisterMetrics(
        p,
        "MyIP",                          // Plugin name
        "myip",                          // Item key name
        "Returns the host's IP address.", // Item key description
    )
    if err != nil {
        return errs.Wrap(err, "failed to register metrics")
    }

    return nil
}
```

To register several item keys, repeat the parameters *metric name* and *description* for each metric. For example:

```
plugin.RegisterMetrics(&impl, "Myip", "metric.one", "Metric one description.", "metric.two", "Metric two d
```

Step 4: Set up the handler The handler facilitates communication between the agent and the plugin.

1. Import the *container* package:

```
import "golang.zabbix.com/sdk/plugin/container"
```

2. Indise the `run()` function add code to create and set up a handler:

```
func run() error {
    p := &myIP{}

    // Register the `myip` item key.
    err := plugin.RegisterMetrics(
        p,
        "MyIP",                          // Plugin name
        "myip",                          // Item key name
        "Returns the host's IP address.", // Item key description
    )
    if err != nil {
        return errs.Wrap(err, "failed to register metrics")
    }

    // Create a new handler.
    h, err := container.NewHandler("MyIP") // Plugin name
```

```
    if err != nil {
        return errs.Wrap(err, "failed to create new handler")
    }

    // Setup logging to forward logs from the plugin to the agent.
    // Available via p.Logger.Infof, p.Logger.Debugf, etc.
    p.Logger = h

    // Start plugin execution.
    // Blocks until a termination request is received from the agent.
    err = h.Execute()
    if err != nil {
        return errs.Wrap(err, "failed to execute plugin handler")
    }

    return nil
}
```

Step 5: Implement data collection Data collection is done via the Exporter interface, which describes the `Export` method:

```
func Export(
  key string,             // The item key to collect.
  params []string,        // Arguments passed to the item key (`myip[arg1, arg2]`).
  context ContextProvider // Metadata about the item key data collection.
) (any, error)
```

1. Import the required packages for HTTP requests and response reading:

```
import (
    "io"
    "net/http"
)
```

2. Implement the `Export` method for the `myIP` struct:

```
func (p *myIP) Export(
    key string, params []string, context plugin.ContextProvider,
) (any, error) {
    // The plugin can use different data collection logic based on the `key` parameter.
    // This implementation only verifies that the provided `key` is supported.
    if key != "myip" {
        return nil, errs.Errorf("unknown item key %q", key)
    }

    // The log will get forwarded to the agent 2 log.
    p.Infof(
        "received request to handle %q key with %d parameters",
        key,
        len(params),
    )

    // Collect the data and return it.

    resp, err := http.Get("https://api.ipify.org")
    if err != nil {
        return nil, errs.Wrap(err, "failed to get IP address")
    }

    defer resp.Body.Close()

    body, err := io.ReadAll(resp.Body)
    if err != nil {
        return nil, errs.Wrap(err, "failed to read response body")
    }
```

```
    return string(body), nil
}
```

Step 6: Build and configure the plugin

1. To build the plugin, run:

```
go mod tidy
go build
```

This should create an executable `myip` in the current directory.

2. Configure Zabbix agent 2 to use the plugin:

```
echo "Plugins.MyIP.System.Path=$PATH_TO_THE_MYIP_PLUGIN_EXECUTABLE" > /etc/zabbix/zabbix_agent2.d/plugins.
```

Replace `$PATH_TO_THE_MYIP_PLUGIN_EXECUTABLE` with the path to the `myip` created in step 5.

The plugin name in the configuration parameter name (*MyIP* in this tutorial) must match the plugin name defined in the *plugin.RegisterMetrics()* function.

3. To test the plugin and its `myip` item, run:

```
zabbix_agent2 -c /etc/zabbix/zabbix_agent2.conf -t myip
```

The output should contain an external IP address of your host and look similar to this:

```
myip                                          [s|192.0.2.1]
```

With that, you have created a simple loadable plugin for Zabbix agent 2. Congrats!

```
package main

import (
    "io"
    "net/http"

    "golang.zabbix.com/sdk/errs"
    "golang.zabbix.com/sdk/plugin"
    "golang.zabbix.com/sdk/plugin/container"
)

var _ plugin.Exporter = (*myIP)(nil)

type myIP struct {
    plugin.Base
}

func main() {
    err := run()
    if err != nil {
        panic(err)
    }
}

func run() error {
    p := &myIP{}

    // Register the `myip` item key.
    err := plugin.RegisterMetrics(
        p,
        "MyIP",                             // Plugin name
        "myip",                             // Item key name
        "Returns the host's IP address.", // Item key description
    )
    if err != nil {
```

```
        return errs.Wrap(err, "failed to register metrics")
    }

    // Create a new handler.
    h, err := container.NewHandler("MyIP") // Plugin name
    if err != nil {
        return errs.Wrap(err, "failed to create new handler")
    }

    // Setup logging to forward logs from the plugin to the agent.
    // Available via p.Logger.Infof, p.Logger.Debugf, etc.
    p.Logger = h

    // Start plugin execution.
    // Blocks until a termination request from the agent is received.
    err = h.Execute()
    if err != nil {
        return errs.Wrap(err, "failed to execute plugin handler")
    }

    return nil
}

func (p *myIP) Export(
    key string, params []string, context plugin.ContextProvider,
) (any, error) {
    // The plugin can use different data collection logic based on the `key` parameter.
    // This implementation only verifies that the provided `key` is supported.
    if key != "myip" {
        return nil, errs.Errorf("unknown item key %q", key)
    }

    // The log will get forwarded to the agent 2 log.
    p.Infof(
        "received request to handle %q key with %d parameters",
        key,
        len(params),
    )

    // Collect the data and return it.

    resp, err := http.Get("https://api.ipify.org")
    if err != nil {
        return nil, errs.Wrap(err, "failed to get IP address")
    }

    defer resp.Body.Close()

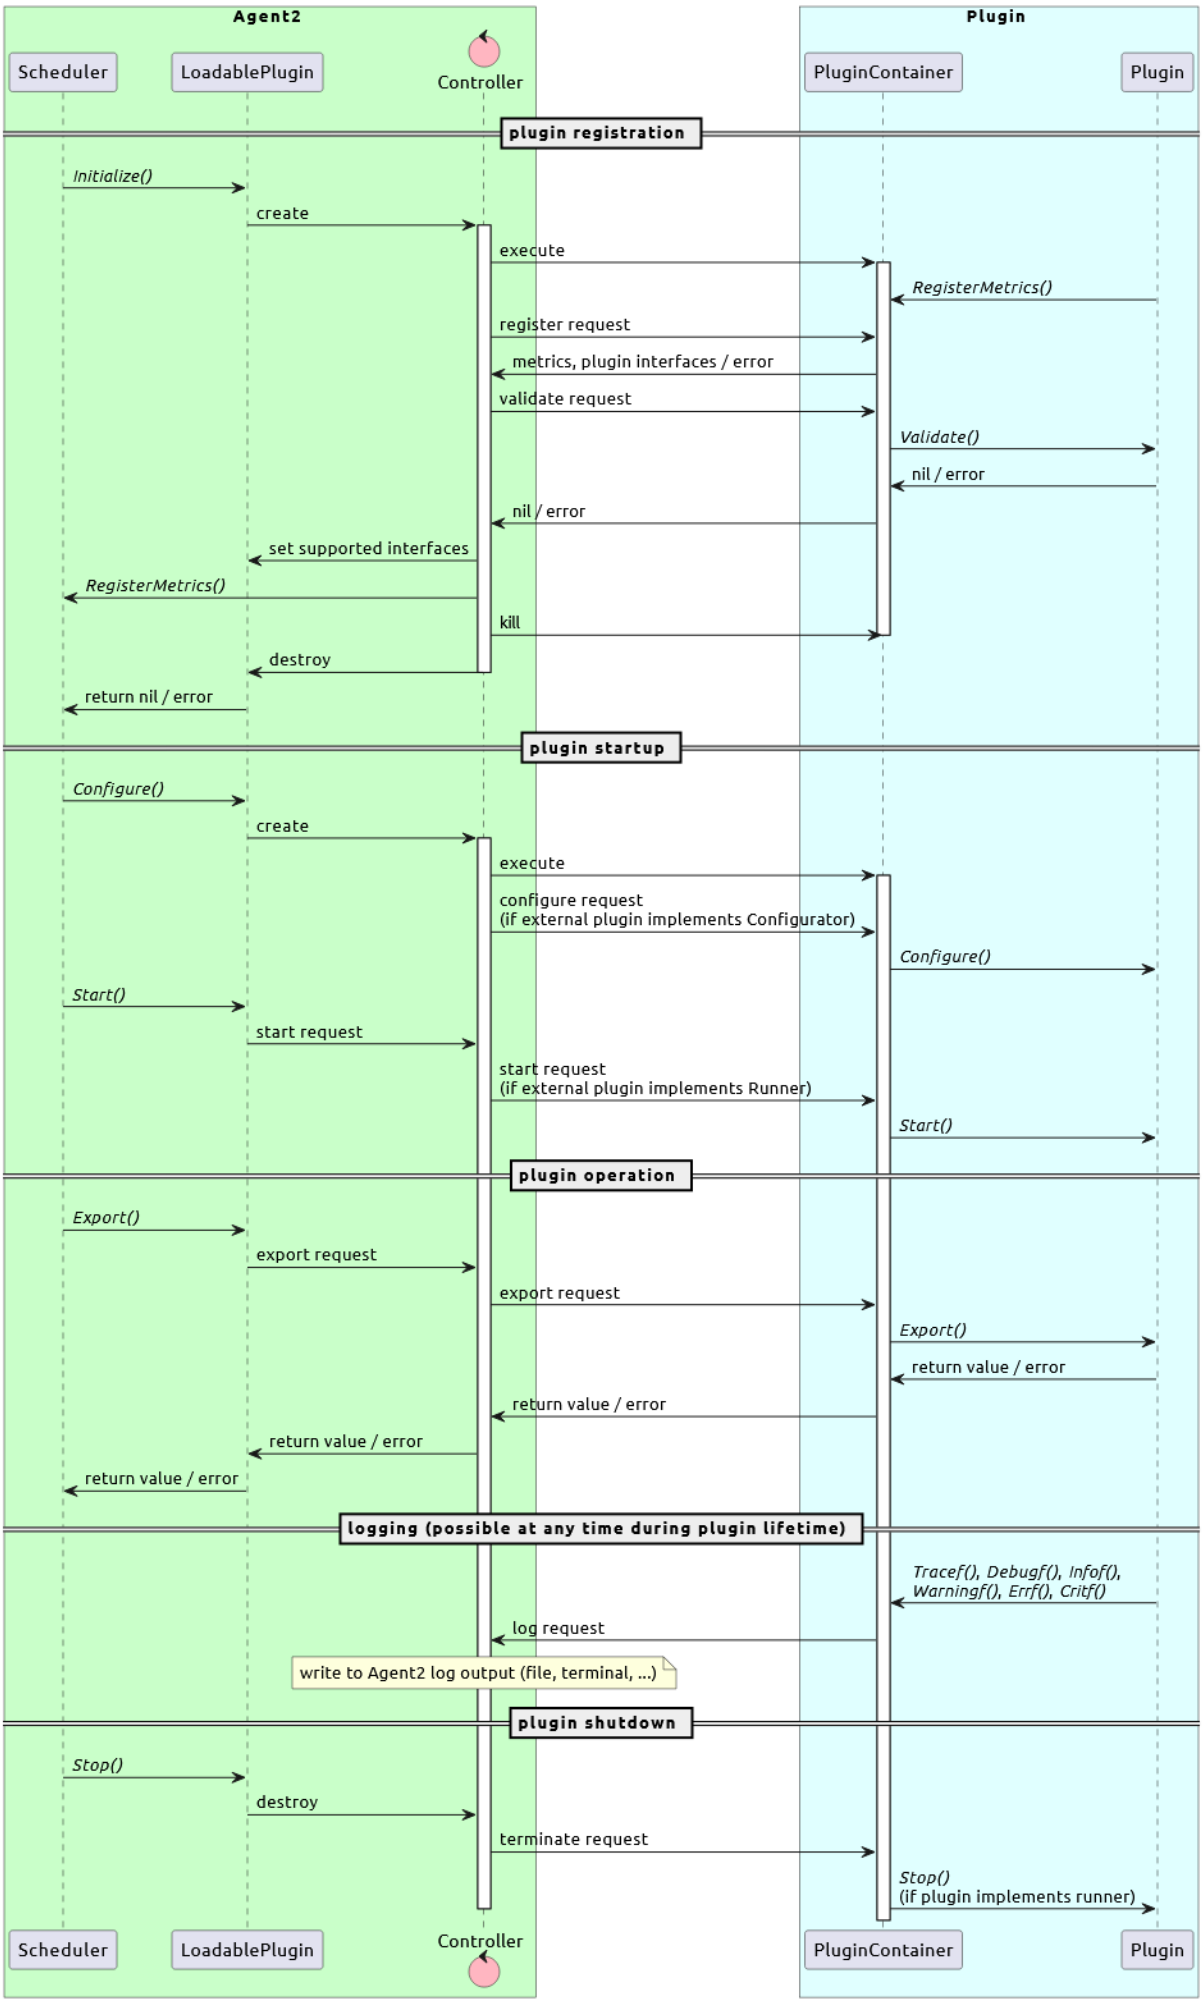
    body, err := io.ReadAll(resp.Body)
    if err != nil {
        return nil, errs.Wrap(err, "failed to read response body")
    }

    return string(body), nil
}
```

Complete source code

Plugin interfaces

This section describes available plugin interfaces.



plugin.Exporter *Exporter* is the simplest interface that performs a poll and returns a value (values), nothing, or error. It accepts a preparsed item key, parameters, and context. Access to all other plugin interfaces is exclusive and no method can be called if a plugin is already performing a task. Also, there is a limit of 100 maximum concurrent *Export()* calls per plugin, which can be reduced according to the requirements for each plugin.

plugin.Configurator *Configurator* interface provides plugin configuration parameters from Zabbix agent 2 configuration files.

plugin.Runner *Runner* interface provides the means for performing initialization when a plugin is started (activated) and deinitialization when a plugin is stopped (deactivated). For example, a plugin can start/stop some background *goroutine* by implementing the Runner interface.

Connection diagram Zabbix agent 2 connects bidirectionally to the plugins using UNIX sockets on Linux and Named Pipes on Windows.

The connection diagram below illustrates the communication process between Zabbix agent 2 and a loadable plugin and the metrics collection process.

Python library for Zabbix

zabbix_utils is the official Python library for Zabbix.

With zabbix_utils you can:

- Use Zabbix API to manage Zabbix objects (create hosts, update items, get events, etc.).
- Collect data from Zabbix agent (similarly to Zabbix get).
- Send data to Zabbix server or proxy (similarly to Zabbix sender).

The library supports both synchronous and asynchronous script execution, allowing it to handle both simple workflows and large-scale parallel operations such as mass data collection, bulk exports, alert processing, and efficient system scaling.

The library is compatible with supported Zabbix server versions and modern Python releases.

To get started, install the library and then follow the quickstart guide.

Installation

zabbix_utils can be installed using any of the methods described below.

Requirements:

- Zabbix 6.0 or later (tested on 6.0, 7.0, 7.2, 7.4)
- Python 3.8 or later (tested on 3.8–3.13)
- aiohttp async HTTP framework (required only for asynchronous mode)

Python Package Index (PyPI)

This is the most common method for most environments:

```
pip install zabbix_utils
pip install zabbix_utils[async] # Only for async support
```

Zabbix repository

Use this method if you prefer managing dependencies through your system's package manager.

Download Zabbix packages for your Linux distribution and then run the following commands.

On RHEL and derivatives:

```
dnf install python3-zabbix-utils
dnf install epel-release # Only for async support
dnf install python3-aiohttp # Only for async support
```

On Debian/Ubuntu and derivatives:

```
apt install python3-zabbix-utils
apt install python3-aiohttp # Only for async support
```

Source (GitHub)

Use this method if you prefer the latest development version:

```
git clone https://github.com/zabbix/python-zabbix-utils
cd python-zabbix-utils/
pip install -r requirements.txt # Only for async support
python3 setup.py install
```

To install dependencies required for asynchronous mode, you can also use one of the methods described above.

Quickstart guide

After you have installed zabbix_utils, you can use it in your script.

This quickstart guide shows you how to:

- Retrieve the hostname from Zabbix agent.
- Create a host and a trapper item using Zabbix API.
- Send a value to the item.

The guide presents the script step by step, explaining each part as it is introduced. The complete script is provided at the end of the page.

The guide also assumes your Zabbix server, agent, and API are running locally.

Retrieve hostname from Zabbix agent

Start by retrieving the hostname of the system where Zabbix agent is running. You will need this hostname to create a host using Zabbix API.

1. Import the `Getter` class from zabbix_utils. This class works like Zabbix get and lets you request data from Zabbix agent.

2. Create a `Getter` instance that connects to the local Zabbix agent at `127.0.0.1` on port `10050`.

3. Call the `get()` method on the `Getter` instance to request the hostname from Zabbix agent.

- The `get()` method takes an item key as its parameter and sends a request to Zabbix agent for that item.
- The `get()` method returns an object, and the hostname is stored inside the `value` attribute of that object.
- `system.hostname` is a built-in Zabbix agent key that returns the host's name.

```
from zabbix_utils import Getter

agent = Getter(host='127.0.0.1', port=10050)
hostname = agent.get('system.hostname').value
```

Connect and log in to Zabbix API

Next, connect to the Zabbix API. This lets your script manage Zabbix objects such as hosts and items.

1. Import the `ZabbixAPI` class from zabbix_utils.

2. Create a `ZabbixAPI` instance and provide the URL of your Zabbix web interface.

3. Call the `login()` method on the `ZabbixAPI` instance and provide your username and password. The account must have permission to access Zabbix API.

4. Call the `logout()` method to close the session after API operations.

```
from zabbix_utils import ZabbixAPI

api = ZabbixAPI(url='127.0.0.1/zabbix')
api.login(user='Admin', password='zabbix')

### API operations go here

api.logout()
```

Create host in Zabbix

Now that you have the hostname from Zabbix agent and you're connected to Zabbix API, you can create a new host in Zabbix.

1. Call the `host.create()` API method on the `ZabbixAPI` instance and provide the host details:

- `host` - set to the `hostname` variable containing the hostname you retrieved from Zabbix agent.
- `interfaces` - contains connection details for Zabbix agent that's running on the host.
- `groups` - contains at least one host group the host should belong to.

2. Since Zabbix API returns the ID of the newly created host, save this ID in the `host_id` variable for later use.

3. Print a message to confirm the host was created.

```
api.host.create(
    host=hostname,
    interfaces=[{
        'type': 1,
        'main': 1,
        'useip': 1,
        'ip': '127.0.0.1',
        'dns': '',
        'port': '10050',
```

```
    }],
    groups=[{'groupid': '2'}]
)

host_id = host['hostids'][0]

print(f"Host '{hostname}' created with ID {host_id}")
```

Create new item in Zabbix

After creating a host, you can add an item to it.

1. Define a unique key for the item to be created.

2. Call the `item.create()` method on the `ZabbixAPI` instance and provide the item details:

   - `hostid` - set to the `host_id` variable containing the ID of the host you just created.
   - `name` - a name for the item.
   - `key_` - set to the `item_key` variable you just defined.
   - `type` - set to 2 (trapper item), required to receive values sent from your script in the following steps.
   - `value_type` - set to 3 (numeric unsigned), the type of data this item stores.

3. Since Zabbix API returns the ID of the newly created item, save this ID in the `item_id` variable for later use.

4. Print a message to confirm the item was created.

```
item_key = 'app.myservice.heartbeat'

item = api.item.create(
    hostid=host_id,
    name='App heartbeat',
    key_=item_key,
    type=2,
    value_type=3,
)

item_id = item['itemids'][0]

print(f"Item '{item_key}' created with ID {item_id}")
```

Send value to host

Now that you've created your host and item, you can send data to it.

1. Import the `time` class and wait a few seconds before sending the data. This ensures Zabbix has fully processed your new host and item.

2. Import the `Sender` class from zabbix_utils. This class works like Zabbix sender and lets your script send data to Zabbix.

3. Create a `Sender` instance that connects to the local Zabbix server at `127.0.0.1` on port `10051`.

4. Call the `send_value()` method on the `Sender` instance to send a value to your host's item and provide these details:

   - `hostname` - set to the `hostname` variable containing the hostname you retrieved from Zabbix agent.
   - `item_key` - set to the `item_key` variable you just defined earlier in your script.
   - `1` - the value to send.

4. Print a message to confirm the value was sent.

```
import time
time.sleep(10)

from zabbix_utils import Sender

sender = Sender(server='127.0.0.1', port=10051)

response = sender.send_value(hostname, item_key, 1)

print(f"Sender response: {response}")
```

After this code runs successfully, you should see a success message indicating Zabbix received your value:

```
Sender response: {"processed": 1, "failed": 0, "total": 1, "time": "0.000151", "chunk": 1}
```

Now you can also check your Zabbix web interface (*Monitoring* > *Latest data*) to see the value.

Complete script

Below is the complete script that combines all the steps: retrieving the hostname, creating the host and item using Zabbix API, and sending data to Zabbix.

```
import time
from zabbix_utils import Getter, ZabbixAPI, Sender

### Retrieve host name from Zabbix agent
agent = Getter(host='127.0.0.1', port=10050)
hostname = agent.get('system.hostname').value

### Connect and log in to Zabbix API
api = ZabbixAPI(url='127.0.0.1/zabbix')
api.login(user='Admin', password='zabbix')

### Create host in Zabbix
host = api.host.create(
    host=hostname,
    interfaces=[{
        'type': 1,
        'main': 1,
        'useip': 1,
        'ip': '127.0.0.1',
        'dns': '',
        'port': '10050',
    }],
    groups=[{'groupid': '2'}]
)

host_id = host['hostids'][0]

print(f"Host '{hostname}' created with ID {host_id}")

### Create item in Zabbix
item_key = 'app.myservice.heartbeat'

item = api.item.create(
    hostid=host_id,
    name='App heartbeat',
    key_=item_key,
    type=2,
    value_type=3
)

item_id = item['itemids'][0]

print(f"Item '{item_key}' created with ID {item_id}")

### Log out from API
api.logout()

### Wait for Zabbix to process new host
time.sleep(10)

### Send value to host
sender = Sender(server='127.0.0.1', port=10051)
response = sender.send_value(hostname, item_key, 1)

print(f"Sender response: {response}")
```

Use Zabbix API

zabbix_utils lets you use Zabbix API to manage Zabbix objects, including creating hosts, updating items, retrieving events, and more.

API requests can be made in synchronous or asynchronous mode:

- In synchronous mode, your Python script sends a request and waits for a response before continuing, which is suitable for simple, sequential, and predictable operations.
- In asynchronous mode, the script sends requests without waiting for each response, allowing other operations to proceed in parallel; this is more efficient for slow requests or large batches of data.

The examples on this page focus on synchronous mode, though asynchronous mode follows similar patterns. Additional examples are available in the zabbix_utils GitHub repository.

Import

To use zabbix_utils for working with Zabbix API, import the `ZabbixAPI` class in your script:

```
from zabbix_utils import ZabbixAPI
```

> **Note:**
> If you already use a community Python library, you can usually replace that import with `ZabbixAPI` from zabbix_utils.

Log in

Before making API requests, you must create a `ZabbixAPI` instance and log in to Zabbix API.

Choose the method that best fits how you manage credentials. You can use your username and password or API tokens.

During initialization

When creating a `ZabbixAPI` instance, you can provide the Zabbix web interface URL and your credentials all at once:

```
### Username and password:
api = ZabbixAPI(url="127.0.0.1/zabbix", user="Admin", password="zabbix")

### API token:
api = ZabbixAPI(url="127.0.0.1/zabbix", token="your_api_token")
```

If you prefer to group connection parameters, you can pass them as a Python dictionary and unpack it using Python's keyword argument syntax:

```
ZABBIX_AUTH = {
    "url": "127.0.0.1/zabbix",
    "user": "Admin",
    "password": "zabbix"
}

api = ZabbixAPI(**ZABBIX_AUTH)
```

Using `login()`

You can first create a `ZabbixAPI` instance with just the Zabbix web interface URL, and later use the `login()` method with your credentials:

```
### Username and password:
api = ZabbixAPI(url="127.0.0.1/zabbix")
api.login(user="Admin", password="zabbix")

### API token:
api = ZabbixAPI(url="127.0.0.1/zabbix")
api.login(token="your_api_token")
```

Using environment variables

You can first store your credentials as environment variables, for example, by using a terminal:

```
### Username and password:
export ZABBIX_USER="Admin"
export ZABBIX_PASSWORD="zabbix"

### Token:
export ZABBIX_TOKEN="your_api_token"
```

Then, if you start your script from the same terminal session, the `ZabbixAPI` instance in the script requires only the Zabbix web interface URL:

```
api = ZabbixAPI(url="127.0.0.1/zabbix")
```

You can also store the URL in an environment variable:

```
### Username and password:
export ZABBIX_USER="Admin"
export ZABBIX_PASSWORD="zabbix"
export ZABBIX_URL="https://127.0.0.1/zabbix"

### Token:
export ZABBIX_TOKEN="your_api_token"
export ZABBIX_URL="https://127.0.0.1/zabbix"
```

When the URL and credentials are all set as environment variables, the `ZabbixAPI` instance in the script does not require any arguments at all:

```
api = ZabbixAPI()
```

Log out

If you logged in using a username and password, call the `logout()` method after completing your API operations:

```
from zabbix_utils import ZabbixAPI

api = ZabbixAPI(url="127.0.0.1/zabbix")
api.login(user="Admin", password="zabbix")

### API actions go here

api.logout()
```

> **Note:**
> Calling the `logout()` method is not required when using API tokens.

API requests

After you've logged in, you can make any API requests by calling methods described in the Zabbix API method reference.

API methods are called using the following format:

```
api_instance.zabbix_object.method(parameters)
```

> **Note:**
> Some Zabbix API method or object names use words that are reserved keywords in Python (e.g., `import`). To avoid Python errors, add an underscore to the method or object name when using it in Python (e.g., `api.configuration.import_`).

For example, to see a list of hosts with `host.get`:

```
### 1. Import ZabbixAPI from zabbix_utils:
from zabbix_utils import ZabbixAPI

### 2. Create the ZabbixAPI instance and log in:
api = ZabbixAPI(url="127.0.0.1/zabbix")
api.login(user="Admin", password="zabbix")

### 3. Retrieve hosts matching a filter:
hosts = api.host.get(
```

```
    filter={
        "host": [
            "Zabbix server",
            "Linux server"
        ]
    }
)

### 4. Iterate over returned hosts and print each host's details:
for host in hosts:
    print(host)

### 5. Log out from the API to close the session:
api.logout()
```

Asynchronous mode

Asynchronous mode lets your script send API requests without waiting for each one to finish. This can make your script more efficient when it needs to perform many API requests or when some requests take a long time.

When using asynchronous mode, there are important differences compared to synchronous mode:

- Import Python's `asyncio` module (you must first install the required dependencies).
- Import `AsyncZabbixAPI` instead of `ZabbixAPI`.
- Write your code inside an `async` function.
- Use `await` when calling API methods, including `login()` and `logout()`.

> **Attention:**
> When creating an `AsyncZabbixAPI` instance, you cannot log in during initialization.

For example, to see a list of hosts with `host.get` in asynchronous mode:

```
### 1. Import asyncio for asynchronous mode, and AsyncZabbixAPI from zabbix_utils:
import asyncio
from zabbix_utils import AsyncZabbixAPI

### 2. Define the main async function where all API operations will run:
async def main():

    # 3. Create an AsyncZabbixAPI instance and log in (must await):
    api = AsyncZabbixAPI(url="127.0.0.1")
    await api.login(user="User", password="zabbix")

    # 4. Retrieve hosts matching a filter (must await):
    hosts = await api.host.get(
        filter={
            "host": [
                "Zabbix server",
                "Linux server"
            ]
        }
    )

    # 5. Iterate over returned hosts and print each host's details:
    for host in hosts:
        print(host)

    # 6. Log out from the API to close the session (must await):
    await api.logout()

### 7. Run the async main() function using asyncio's event loop:
asyncio.run(main())
```

Examples

The following examples show common Zabbix API tasks using the zabbix_utils library.

Additional examples are available in the `examples` directory of the zabbix_utils GitHub repository.

Collect data from Zabbix agent

Overview

zabbix_utils lets you collect data from Zabbix agent (similarly to Zabbix get).

Data can be collected in synchronous or asynchronous mode:

- In synchronous mode, your Python script requests and waits for data before continuing, which is suitable for simple, sequential, and predictable operations.
- In asynchronous mode, the script requests data without waiting for each response, allowing other operations to proceed in parallel; this is more efficient for slow requests or large batches of data.

The examples on this page focus on synchronous mode, though asynchronous mode follows similar patterns. Additional examples are available in the zabbix_utils GitHub repository.

Import

To use zabbix_utils for collecting item values, import the `Getter` class in your Python script:

```
from zabbix_utils import Getter
```

Request data

To request an item value:

1. Create a `Getter` instance, specifying the IP address and port of your Zabbix agent.
2. Call the `get()` method on the `Getter` instance, specifying the key of the item you want to retrieve.

For example, to request data for the `system.uname` item:

```
agent = Getter(host='192.0.2.1', port=10050)
response = agent.get('system.uname')
```

Using non-default IP

If the server running your script has multiple IP addresses, you can specify a `source_ip` for the `Getter` to use when connecting to Zabbix agent:

```
agent = Getter(
    host='192.0.2.1',
    port=10050,
    source_ip='10.10.7.1'
)
```

Using timeout

You can set a response `timeout` for the `Getter` to control how long your script should wait for a response from Zabbix agent before giving up:

```
agent = Getter(
    host='192.0.2.1',
    port=10050,
    timeout=30
)
```

Using encryption

The `Getter` does not include built-in encryption support, but you can provide it by creating a wrapper using third-party libraries:

```
def psk_wrapper(sock, tls):
    # ...
    # Implementation of TLS PSK wrapper for the socket
    # ...

agent = Getter(
    host='192.0.2.1',
```

```
    port=10050,
    socket_wrapper=psk_wrapper
)
```

Response

The response from Zabbix agent is processed by the library and returned as an `AgentResponse` object:

```
print(response)
### {
###     "error": null,
###     "raw": "Linux zabbix_server 5.15.0-3.60.5.1.el9uek.x86_64",
###     "value": "Linux zabbix_server 5.15.0-3.60.5.1.el9uek.x86_64"
### }

print(response.value)
### Linux zabbix_server 5.15.0-3.60.5.1.el9uek.x86_64

print(response.error)
### None
```

Asynchronous mode

Asynchronous mode lets your script collect values without waiting for each one to arrive. This can make your script more efficient when it needs to collect many values or when some values take a long time to be collected.

When using asynchronous mode, there are important differences compared to synchronous mode:

- Import Python's `asyncio` module (you must first install the required dependencies).
- Import `AsyncGetter` instead of `Getter`.
- Write your code inside an `async` function.
- Use `await` when calling the `get()` method.

For example, to collect a single value using asynchronous mode:

```
### 1. Import asyncio for asynchronous mode, and AsyncGetter from zabbix_utils:
import asyncio
from zabbix_utils import AsyncGetter

### 2. Define the main async function where all data requests will be executed:
async def main():
    agent = AsyncGetter(host='192.0.2.1', port=10050)

    # 3. Fetch the system.uname value from Zabbix agent (must await):
    response = await agent.get('system.uname')

    # 4. Print the value returned by Zabbix agent:
    print(response.value)

### 5. Run the async main() function using asyncio's event loop:
asyncio.run(main())
```

Send data to Zabbix server or proxy

zabbix_utils lets you send item values to a trapper item on Zabbix server or proxy (similarly to Zabbix sender).

You can send a single value, multiple values, or even target multiple Zabbix clusters.

Data can be sent in synchronous or asynchronous mode:

- In synchronous mode, your Python script sends values and waits for a response before continuing; this is suitable for simple, sequential, and predictable operations.
- In asynchronous mode, the script sends values without waiting for each response, allowing other operations to proceed in parallel; this is more efficient for slow requests or large batches of data.

The examples on this page focus on synchronous mode, though asynchronous mode follows similar patterns. Additional examples are available in the zabbix_utils GitHub repository.

Import

To use zabbix_utils for sending item values, import the Sender class in your script:

```
from zabbix_utils import Sender
```

For sending multiple values, you may also import the ItemValue class:

```
from zabbix_utils import Sender, ItemValue
```

Send single value

To send an item value:

1. Create a Sender instance, specifying the IP address and port of your Zabbix server or proxy.
2. Call the send_value() method on the Sender instance using the following format:

```
sender_instance.send_value('host', 'item.key', 'value', optional_timestamp, optional_nanoseconds)
```

For example, to send 1 to the service.status trapper item on the Linux server host:

```
sender = Sender(server='127.0.0.1', port=10051)
response = sender.send_value('Linux server', 'service.status', 1)
```

Using non-default IP

If the server running your script has multiple IP addresses, you can specify a source_ip for the Sender to use when sending values to Zabbix server or proxy:

```
sender = Sender(
    server='127.0.0.1',
    port=10051,
    source_ip='10.10.7.1'
)
```

Using timeout

You can set a response timeout for the Sender to control how long your script should wait for a response from Zabbix server or proxy before giving up:

```
sender = Sender(
    server='127.0.0.1',
    port=10051,
    timeout=30
)
```

Using agent configuration file

You can let zabbix_utils read the Server or ServerActive parameters from a local Zabbix agent or agent 2 configuration file. In such cases, you don't need to specify connection parameters when creating a Sender instance:

```
sender = Sender(
    use_config=True,
    config_path='/etc/zabbix/zabbix_agent2.conf'
)
```

> **Attention:**
> If ServerActive contains one or more Zabbix clusters with multiple server instances, Sender sends data to the first available server in each cluster. If ServerActive is not set, the address from Server with the default port (10051) is used.

Using encryption

The Sender does not include built-in encryption support, but you can provide it by creating a wrapper using third-party libraries:

```
def psk_wrapper(sock, tls):
    # ...
    # Implementation of TLS PSK wrapper for the socket
    # ...
```

```
sender = Sender(
    server='127.0.0.1',
    port=10051,
    socket_wrapper=psk_wrapper
)
```

Response for single value

The response returned by Zabbix server or proxy is processed by the library and returned as a `TrapperResponse` object:

```
print(response)
### {"processed": 1, "failed": 0, "total": 1, "time": "0.000123", "chunk": 1}

print(response.processed)
### 1

print(response.failed)
### 0

print(response.total)
### 1
```

Asynchronous mode

Asynchronous mode lets your Python script send values without waiting for a response from Zabbix server or proxy. This can make your script more efficient when it needs to send many values or when some values take a long time send.

When using asynchronous mode, there are a few important differences compared to synchronous mode:

- Import Python's `asyncio` module (you must first install the required dependencies).
- Import `AsyncSender` instead of `Sender`.
- Write your code inside an `async` function.
- Use `await` when calling the `send_value()` method.

For example, to send a single value using asynchronous mode:

```
### 1. Import asyncio for asynchronous mode, and AsyncSender from zabbix_utils:
import asyncio
from zabbix_utils import AsyncSender

### 2. Define the main async function where all data sending operations (must await) will be executed:
async def main():
    sender = AsyncSender(server='127.0.0.1', port=10051)
    response = await sender.send_value('Linux server', 'service.status', 1)

    # 3. Print the response returned by Zabbix server or proxy:
    print(response)

### 4. Run the async main() function using asyncio's event loop:
asyncio.run(main())
```

Send multiple values

To send multiple values:

1. Prepare an array of `ItemValue` objects, each using the same format as the `send_value()` method.
2. Create a `Sender` instance, specifying the IP address and port of your Zabbix server or proxy.
3. Call the `send()` method (instead of `send_value()`) on the `Sender` instance, specifying the array of objects with values to send.

For example, to send five values to different hosts:

```
items = [
    ItemValue('server-de', 'service.status', 'up', 1770887205, 100),
    ItemValue('server-fr', 'service.status', 'up', 1770887205, 100),
    ItemValue('server-uk', 'service.status', 'up', 1770887205, 100),
    ItemValue('server-nl', 'service.status', 'up', 1770887205, 100),
    ItemValue('server-pl', 'service.status', 'up', 1770887205, 100),
]
```

```
sender = Sender(server='127.0.0.1', port=10051)
response = sender.send(items)
```

Using custom chunk size

If you need to send more values than a trapper item can accept in a single request, you can split them into chunks.

By default, the chunk size is 250 values. You can change it by setting the `chunk_size` parameter when creating a `Sender` instance.

For example, to send five values in three chunks (2-2-1), set the `chunk_size` parameter to 2:

```
items = [
    ItemValue('server-de', 'service.status', 'up'),
    ItemValue('server-fr', 'service.status', 'up'),
    ItemValue('server-uk', 'service.status', 'up'),
    ItemValue('server-nl', 'service.status', 'up'),
    ItemValue('server-pl', 'service.status', 'up'),
]

sender = Sender(server='127.0.0.1', port=10051, chunk_size=2)
response = sender.send(items)
```

Send values to multiple Zabbix clusters

To send values to multiple Zabbix clusters:

1. Prepare an array of Zabbix clusters. If a cluster has multiple nodes, the value will be sent to the first **available** node of each cluster.
2. Create a `Sender`, specifying your array of Zabbix clusters.
3. Call the `send_value()` method on the `Sender` instance using the same format as the `send_value()` method.

For example, to send a value to the first available node in each cluster:

```
zabbix_clusters = [
    ['zabbix.cluster1.node1', 'zabbix.cluster1.node2:10051'],
    ['zabbix.cluster2.node1:10051', 'zabbix.cluster2.node2', 'zabbix.cluster2.node3']
]

sender = Sender(clusters=zabbix_clusters)
response = sender.send_value('Linux server', 'service.status', 1)
```

Response for multiple values

By default, `Sender` returns an aggregated result of sending values across all hosts or clusters:

```
print(response)
### {"processed": 2, "failed": 0, "total": 2, "time": "0.000108", "chunk": 2}
```

If you need more detailed information, you can inspect the results for each cluster and each chunk using the `response.details` attribute:

```
print(response)
### {"processed": 2, "failed": 0, "total": 2, "time": "0.000108", "chunk": 2}

if response.failed == 0:
    print(f"Value sent successfully in {response.time}")
else:
    print(response.details)
    # {
    #     127.0.0.1:10051: [
    #         {
    #             "processed": 1,
    #             "failed": 0,
    #             "total": 1,
    #             "time": "0.000051",
    #             "chunk": 1
    #         }
```

```
    #     ],
    #     zabbix.example.local:10051: [
    #         {
    #             "processed": 1,
    #             "failed": 0,
    #             "total": 1,
    #             "time": "0.000057",
    #             "chunk": 1
    #         }
    #     ]
    # }

    for node, chunks in response.details.items():
        for resp in chunks:
            print(f"Processed {resp.processed} of {resp.total} at {node.address}:{node.port}")
            # Processed 1 of 1 at 127.0.0.1:10051
            # Processed 1 of 1 at zabbix.example.local:10051
```

Debug logging

To troubleshoot issues when working with Zabbix API, collecting data from Zabbix agent, or sending data to Zabbix server or proxy, you can enable debug logging.

The zabbix_utils library uses Python's standard `logging` module.

To see detailed debug messages from the library:

1. Import Python's `logging` module in your script.
2. Configure the logging system to output messages in a readable format and set the logging level to DEBUG.

```
import logging
from zabbix_utils import Getter

logging.basicConfig(
    format=u'[%(asctime)s] %(levelname)s %(message)s',
    level=logging.DEBUG
)

agent = Getter(host='127.0.0.1', port=10050)
resp = agent.get('system.uname')

print(resp.value)
```

With debug logging enabled, detailed information about requests and responses is printed, for example:

```
[2023-10-01 12:00:01,587] DEBUG Content of the packet: b'ZBXD\x01\x0c\x00\x00\x00\x00\x00\x00\x00system.un
[2023-10-01 12:00:01,722] DEBUG Zabbix response header: b'ZBXD\x01C\x00\x00\x00C\x00\x00\x00'
[2023-10-01 12:00:01,723] DEBUG Zabbix response body: Linux test_server 5.15.0-3.60.5.1.el9uek.x86_64
[2023-10-01 12:00:01,724] DEBUG Response from [127.0.0.1:10050]: Linux test_server 5.15.0-3.60.5.1.el9uek.
Linux test_server 5.15.0-3.60.5.1.el9uek.x86_64
```

Modules

What is a PHP frontend module?

- A module is an entity with a unique ID, name, description, author, and other fields defined in it's manifest file, along with PHP, Javascript and other files located in a single directory inside the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
- A module should conform to simple rules to guarantee correct operation.
- A module must be installed (unpacked) and enabled in the frontend by the administrator.

What a module can be used for

- Adding new functionality via custom frontend sections;
- Creating custom dashboard widget types (see widget modules);
- Overriding or extending the existing functionality.

What a module cannot be used for

- Registering a new API method or modifying an existing one.

How modules work

- An enabled module is launched on each HTTP request, before executing the action code.
- The module will register new actions or redefine the existing ones.
- The module will add new frontend sections and remove or redefine the existing ones.
- The module will hook to frontend events like onBeforeAction and onTerminate, if needed.
- The requested action is finally executed by running the action code - either the default one, or module-defined.

Where to go next Whether you prefer to learn by doing or read the guidelines first, these pages contain the information and steps required to build your own modules:

- Step-by-step tutorials for writing your first module
- Module file structure
- Widget module specifics
- Module examples to reuse

Module file structure

All code related to a module is stored in a single directory inside the **modules** directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).

```
example_module_directory/          (required)
   manifest.json                   (required)  Metadata and action definition.
   Module.php                                  Module initialization and event handling.
   actions/                                    Action controller files.
       SomethingView.php
       SomethingCreate.php
       SomethingDelete.php
       data_export/
           ExportAsXml.php
           ExportAsExcel.php
   views/                                      View files.
       example.something.view.php
       example.something.delete.php
   assets/                                     Any additional files to be used in views. Must be specified
       js/                                     JavaScript files used in views.
           example.something.view.js.php
       css/                                    CSS files used in views.
           example.something.css
        image.png                              Images used in views.
        example.something.file                 Any file for using in views.
```

Module file tree

Writing a module A sample module writing process consists of the following steps (where available, click the file or folder name to view additional details about the step):

1. Create a new directory for the module inside **zabbix/ui/modules/**.
2. Add manifest.json file with module metadata.
3. Create *views* folder and define a module view(s).
4. Create *actions* folder and define a module action(s).
5. Create Module.php (or Widget.php for dashboard widgets) file and define initialization and event handling rules.

6. Create *assets* folder for JavaScript files (place into *assets/js*), CSS styles (place into *assets/css*), or any other additional files.
7. Make sure to specify required views, actions and asset files in the manifest.json.
8. Register the module in Zabbix frontend and start using it.

Note:
You can register and enable a module as soon as you create manifest.json file. Once the module is enabled, you can preview all changes made to module files immediately by refreshing Zabbix frontend.

manifest.json

Any module needs the manifest.json file. The file must be located in the module's primary directory (for example, *zabbix/ui/modules/module_name/manifest.json*).

As a bare minimum, manifest.json should specify these fields:

```
{
    "manifest_version": 2.0,
    "id": "my_ip_address",
    "name": "My IP Address",
    "namespace": "MyIPAddress",
    "version": "1.0"
}
```

Parameters supported in **manifest.json** (click the parameter name for a detailed description):

Parameter	Description	Required
manifest_version	Manifest version of the module.	Yes
id	Unique module ID.	
name	Module name that will be displayed in the Administration section.	
namespace	PHP namespace for module classes.	
version	Module version.	
type	Type of the module. For widget must be set to *widget*	Yes for widgets, otherwise no
widget	Widget configuration. Used for widgets only.	
actions	Actions to register with the module.	
assets	CSS styles and JavaScript files to include.	No
author	Module author.	
config	Default values for custom module options.	
description	Module description.	
url	A link to the module description.	

manifest_version

Manifest version of the module. Currently, supported version is **2.0**.

Type: Double

Example:

```
"manifest_version": 2.0
```

id

Module ID. Must be unique. To avoid future naming conflicts, it is recommended to use prefix for modules (author or company name, or any other). For example, if a module is an example for lessons and the module name is "My module", then the ID will be "example_my_module".

Type: String

Example:

```
"id": "example_my_module"
```

name

Module name that will be displayed in the Administration section.

Type: String

Example:

```
"name": "My module"
```

namespace

PHP namespace for module classes.

Type: String

Example:

```
"namespace": "ClockWidget"
```

version

Module version. The version will be displayed in the Administration section.

Type: String

Example:

```
"version": "1.0"
```

type

Type of the module. Required for widgets and must equal "widget".

Type: String

Default: "module"

Example:

```
"type": "widget"
```

actions

Actions to register with the module. Defining *class* object key for each action is required, other action keys are optional.

Type: Object

Supported object keys if *type* is *module*:

- **write.your.action.name** (object) - action name, should be written in lowercase [a-z], separating words with dots. Supports the keys:
  - **class** (string; required) - action class name.
  - **layout** (string) - action layout. Supported values: *layout.json*, *layout.htmlpage* (default), *null*.
  - **view** (string) - action view.

Example:

```
"actions": {
    "module.example.list": {
        "class": "ExampleList",
        "view": "example.list",
        "layout": "layout.htmlpage"
        }
    }
```

Supported object keys if *type* is *widget*:

- **widget.{id}.view** (object) - file and class name for widget view. Replace **{id}** with the widget's id value (for example, *widget.example_clock.view*). Supports the keys:
  - **class** (string; required) - action class name for widget view mode to extend the default CControllerDashboardWidgetView class. The class source file must be located in the *actions* directory.
  - **view** (string) - widget view. Must be located in the *views* directory. If the view file is *widget.view.php*, which is expected by default, this parameter maybe omitted. If using a different name, specify it here.
- **widget.{id}.edit** (object) - file name for widget configuration view. Replace **{id}** with the widget's id value (for example, *widget.example_clock.edit*). Supports the keys:
  - **class** (string; required) - action class name for widget configuration view mode. The class source file must be located in the *actions* directory.
  - **view** (string) - widget configuration view. Must be located in the *views* directory. If the view file is *widget.edit.php*, which is expected by default, this parameter maybe omitted. If using a different name, specify it here.

Example:

```
"actions": {
    "widget.tophosts.view": {
        "class": "WidgetView"
    },
    "widget.tophosts.column.edit": {
        "class": "ColumnEdit",
        "view": "column.edit",
        "layout": "layout.json"
    }
}
```

assets

CSS styles and JavaScript files to include.

Type: Object

Supported object keys:

- **css** (array) - CSS files to include. The files must be located in the *assets/css*.
- **js** (array) - JavaScript files to include. The files must be located in the *assets/js*.

Example:

```
"assets": {
    "css": ["widget.css"],
    "js": ["class.widget.js"]
}
```

author

Module author. The author will be displayed in the Administration section.

Type: String

Example:

```
"author": "John Smith"
```

config

Default values for the module options. The object may contain any custom keys. If specified, these values will be written into the database during module registration. New variables added later will be written upon the first call. Afterwards, the variable values can only be changed directly in the database.

Type: Object

Example:

```
"config": {
    "username": "Admin",
    "password": "",
    "auth_url": "https://example.com/auth"
}
```

description

Module description.

Type: String

Example:

```
"description": "This is a clock widget."
```

widget

Widget configuration. Used, if *type* is set to *widget*.

Type: Object

Supported object keys:

- **name** (string) - used in the widget list and as default header. If empty, ”name” parameter from the module will be used.

- **size** (object) - default widget dimensions. Supports keys:
  - *width* (integer) - default widget width.
  - *height* (integer) - default widget height.
- **form_class** (string) - class with widget fields form. Must be located in the *includes* directory. If the class is *WidgetForm.php*, which is expected by default, this parameter maybe omitted. If using a different name, specify it here.
- **js_class** (string) - name of a JavaScript class for widget view mode to extend the default CWidget class. The class will be loaded with the dashboard. The class source file must be located in the assets/js directory. See also: assets.
- **use_time_selector** (boolean) - determines whether the widget requires dashboard time selector. Supported values: *true*, *false* (default).
- **refresh_rate** (integer) - widget refresh rate in seconds (default: 60).

Example:

```
"widget": {
    "name": "",
    "size": {
        "width": 12,
        "height": 5
    },
    "form_class": "WidgetForm",
    "js_class": "CWidget",
    "use_time_selector": false,
    "refresh_rate": 60
}
```

url

A link to the module description. For widgets, this link will be opened when clicking the help icon in the *Add widget* or *Edit widget* window. If **url** is not specified, clicking the help icon will open the general Dashboard widgets page.

Type: String

Example:

```
"url": "http://example.com"
```

Actions

Actions are responsible for 'business logic' of the module. An action usually consists of a controller and an action view.

A module can:

- Call actions that are already defined in Zabbix frontend.
- Override default actions with custom actions.
- Define completely new actions.

To override a default action behavior with some custom behavior, define an action with the same name in the module configuration. When the action is called, the module action will be executed instead of the default Zabbix action.

Action files should be stored in the *actions* folder. The actions need to be specified in the manifest.json.

Controller

Action controller workflow:

1. Check that all parameters passed in an HTTP request are valid:
   - Call the controller's *checkInput()* method;
   - Use validation rules defined in CNewValidator.php;
   - Call *validateInput()* method.
2. Check user permissions.
3. Prepare the data according to passed parameters: if *checkInput()* returns true, Zabbix calls the controller's *doAction()* method.
4. Prepare the **$data** array for the view. Use *CControllerResponseData* and *setResponse()* method to store response in the **$data** array.

Example:

```
/**
 * Validate input parameters.
 *
 * @return bool
 */
protected function checkInput(): bool {
    $ret = $this->validateInput([
        'status' => 'in '.implode(',', [HOST_STATUS_MONITORED, HOST_STATUS_NOT_MONITORED])
    ]);

    if (!$ret) {
        $this->setResponse(new CControllerResponseFatal());
    }

    return $ret;
}

/**
 * Check user permissions.
 *
 * @return bool
 */
protected function checkPermissions() {
    return $this->getUserType() >= USER_TYPE_ZABBIX_ADMIN;
}

/**
 * Execute action and generate response object.
 */
protected function do Action(): void {
    $data = [
        'hosts_count' => API::Host()->get([
            'countOutput' => true,
            'filter' => [
                'status' => $this->getInput('status')
            ]
        ])
    ];

    $this->setResponse(new CControllerResponseData($data));
}
```

Note:
You can view the full list of available controller classes in Zabbix source code.

Views

View file receives the data from a controller and then prepares the HTML look of it.

Note:
Defining view(s) for a frontend module is optional, unless the module is a widget.
 Dashboard widgets need at least two views: one for edit mode and one for view mode (should be stored in the *views* directory).

It is possible to use pre-defined Zabbix HTML classes (from the */zabbix/ui/include/classes/html*) in the view as well as add new HTML and CSS classes. New classes should be stored in the module's *assets* folder.

Example:

```
...
(new CColHeader(_('Name')))
```

This will add a new column name *Name* and style the top table row as on other Zabbix pages.

Action view

This is a reference file for defining an action view.

```
<?php declare(strict_types = 1);

/**
* @var CView $this
*/

$this->includeJsFile('example.something.view.js.php');

(new CWidget())
    ->setTitle(_('Something view'))
    ->addItem(new CDiv($data['name']))
    ->addItem(new CPartial('module.example.something.reusable', [
        'contacts' => $data['contacts']
    ])
    ->show();
```

Assets

The folder *assets* may contain any files and subfolders that do not belong to other directories. You can use it for:

- JavaScript styles (must be inside *assets/js*);
- CSS styles (must be inside *assets/css*);
- Images;
- Fonts;
- Anything else you need to include.

assets/js

assets/js directory is reserved and should only contain JavaScript files. To be used by the widget, specify these files in the *manifest.json*.

For example:

```
"assets": {
    "js": ["class.widget.js"]
}
```

assets/css

assets/css is reserved and should only contain CSS style files. To be used by the widget, specify these files in the *manifest.json*.

For example:

```
"assets": {
    "css": ["mywidget.css"]
}
```

CSS styles

CSS files may contain a custom attribute `theme` to define different style for a specific frontend themes.

Available themes and their attribute values:

- **Blue** - [theme='blue-theme']
- **Blue (classic)** - [theme='blue-classic-theme']
- **Dark** - [theme='dark-theme']
- **Dark blue** - [theme='dark-blue-theme']
- **Dark (classic)** - [theme='dark-classic-theme']
- **High-contrast light** - [theme='hc-light']
- **High-contrast dark** - [theme='hc-dark']

Example:

```
.widget {
    background-color: red;
}

[theme='dark-theme'] .widget {
    background-color: green;
}
```

Register a new module

This section explains how to add a new module to Zabbix frontend.

Pre-requisites Before proceeding make sure, that:

- The module is located inside the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
- The module has at least a basic version of manifest.json file.
- You have access to the Administration menu section in Zabbix (requires Super admin user role type).

> **Note:**
> The frontend will not install or even recognize incompatible modules.

Adding a module Open *Administration* > *General* > *Modules* page and click *Scan directory*.

Locate your module in the list and activate it.

To activate a module, click the *Disabled* hyperlink - the module's state will change to *Enabled*.

Click the module name to view additional information about the module, such as author, version, or short description (if defined in the manifest).

Widget preview Widget modules, once added, become immediately visible in the dashboard widget list.

You can open a dashboard, switch to edit mode and add the widget to the dashboard as usual.

When you make some changes to the widget, refresh the dashboard to view how the widget looks with the most recent updates.

Widgets

Widgets are Zabbix frontend modules used for the dashboards. Unless otherwise noted, all module guidelines are also applicable to widgets.

However, a widget is notably different from a module. To build a widget:

- specify the type "widget" in the manifest.json file ("type": "widget");
- include at least two views: one for the widget presentation mode and one for the widget configuration mode (example.widget.view.php and example.widget.edit.php);
- and a controller for widget presentation (WidgetView.php);
- use and extend default widget classes.

Configuration

This page describes classes that can be used to create a widget configuration view with custom configuration fields. The widget configuration view is the part of the widget that allows the user to configure widget parameters for presentation.

Widget

Primary widget class, extends the base class of all dashboard widgets - *CWidget*. Required for overriding the default widget behavior.

The *Widget* class should be located in the root directory of the widget (for example, *zabbix/ui/modules/my_custom_widget*).

Widget.php example

```
<?php

namespace Modules\MyCustomWidget;

use Zabbix\Core\CWidget;

class Widget extends CWidget {

    public const MY_CONSTANT = 0;

    public function getTranslationStrings(): array {
        return [
            'class.widget.js' => [
                'No data' => _('No data')
            ]
        ];
    }
}
```

WidgetForm

The *WidgetForm* class extends the default class *CWidgetForm* and contains a set of *CWidgetField* fields that are required for defining widget configuration storage structure in the database and handling input validation.

The *WidgetForm* class should be located in the *includes* directory. If the class has a different name, the name should be specified in the *widget/form_class* parameter in the *manifest.json* file.

includes/WidgetForm.php example

```
<?php

namespace Modules\MyCustomWidget\Includes;

use Modules\MyCustomWidget\Widget;

use Zabbix\Widgets\{
    CWidgetField,
    CWidgetForm
};

use Zabbix\Widgets\Fields\{
    CWidgetFieldMultiSelectItem,
    CWidgetFieldTextBox,
    CWidgetFieldColor
};

class WidgetForm extends CWidgetForm {

    public const DEFAULT_COLOR_PALETTE = [
        'FF465C', 'B0AF07', '0EC9AC', '524BBC', 'ED1248', 'D1E754', '2AB5FF', '385CC7', 'EC1594', 'BAE37D'
        '6AC8FF', 'EE2B29', '3CA20D', '6F4BBC', '00A1FF', 'F3601B', '1CAE59', '45CFDB', '894BBC', '6D6D6D'
    ];

    public function addFields(): self {
        return $this
            ->addField(
                (new CWidgetFieldMultiSelectItem('itemid', _('Item')))
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
                    ->setMultiple(false)
            )
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            )
```

```
            ->addField(
                (new CWidgetFieldColor('chart_color', _('Color')))->setDefault('FF0000')
            );
    }
}
```

CWidgetFormView

The *CWidgetFormView* class is required for specifying the presentation logic of the fields defined in the *WidgetForm* class, determining their appearance and behavior when rendered in the configuration view.

The *CWidgetFormView* class supports the following methods:

- *addField()* - receives an instance of the *CWidgetFieldView* class as a parameter; each *CWidgetField* class, has a respective *CWidgetFieldView* class for using in the widget configuration view.
- *addFieldset()* - receives an instance of the *CWidgetFieldsGroupView* class that combines fields into a collapsible container.
- *addFieldsGroup()* - receives an instance of *CWidgetFormFieldsetCollapsibleView* that visually (with a border) combines fields into a group.
- *includeJsFile()* - allows adding a JavaScript file to the widget configuration view.
- *addJavaScript()* - allows adding inline JavaScript that will be executed as soon as the widget configuration view is loaded.

The *CWidgetFormView* class should be located in the *views* directory.

views/widget.edit.php example

```
<?php

/**
 * My custom widget form view.
 *
 * @var CView $this
 * @var array $data
 */

use Modules\MyCustomWidget\Includes\WidgetForm;

(new CWidgetFormView($data))
    ->addField(
        (new CWidgetFieldMultiSelectItemView($data['fields']['itemid']))->setPopupParameter('numeric', tru
    )
    ->addFieldset(
        (new CWidgetFormFieldsetCollapsibleView(_('Advanced configuration')))
            ->addField(
                new CWidgetFieldTextBoxView($data['fields']['description'])
            )
            ->addField(
                new CWidgetFieldColorView($data['fields']['chart_color'])
            )
    )
    ->includeJsFile('widget.edit.js.php')
    ->addJavaScript('my_custom_widget_form.init('.json_encode([
        'color_palette' => WidgetForm::DEFAULT_COLOR_PALETTE
    ]).');')
    ->show();
```

JavaScript

A JavaScript class can be used to add dynamic behavior and interactivity to the widget configuration view. For example, you can initialize a color picker, defined in the *CWidgetFormView* class.

The JavaScript class should be loaded with the form, therefore it should be referenced in the *CWidgetFormView* class by using the methods *includeJsFile()* and *addJavaScript()*.

In the example below, a singleton class instance is immediately created and stored under the *window.my_custom_widget_form* name. Thus, opening the form for the second time will re-create the instance.

The JavaScript class should be located in the *views* directory.

views/widget.edit.js.php example

```
<?php

use Modules\MyCustomWidget\Widget;

?>

window.my_custom_widget_form = new class {

    init({color_palette}) {
        colorPalette.setThemeColors(color_palette);

        for (const colorpicker of jQuery('.<?= ZBX_STYLE_COLOR_PICKER ?> input')) {
            jQuery(colorpicker).colorpicker();
        }

        const overlay = overlays_stack.getById('widget_properties');

        for (const event of ['overlay.reload', 'overlay.close']) {
            overlay.$dialogue[0].addEventListener(event, () => { jQuery.colorpicker('hide'); });
        }
    }
};
```

CWidgetField

The *CWidgetField* class is a base class from which all form field classes (*CWidgetFieldCheckBox*, *CWidgetFieldTextArea*, *CWidgetFieldRadioButtonList*, etc.) are inherited. Classes extending *CWidgetField* are responsible for receiving, saving, and validating widget configuration values.

The following *CWidgetField* classes are available.

CWidgetField class	Database field type	Description
CWidgetFieldCheckBox	int32	Single checkbox.
CWidgetFieldCheckBoxList	array of int32	Multiple checkboxes under a single configuration field.
CWidgetFieldColor	string	Color selection field.
CWidgetFieldDatePicker	string	Date selection field.
CWidgetFieldIntegerBox	int32	Field to enter an integer. Can be used to configure minimum and maximum values.
CWidgetFieldLatLng	string	Text box for entering comma-separated latitude, longitude, and map zoom level.
CWidgetFieldMultiSelect	-	Base class for multiselect fields, extended by all `CWidgetFieldMultiSelect*` classes.
CWidgetFieldMultiSelectAction	ID	Multiselect field for selecting actions from the list of actions defined in *Alerts* > *Actions*.
CWidgetFieldMultiSelectGraph	ID	Multiselect field for selecting custom graphs.
CWidgetFieldMultiSelectGraphPrototype	ID	Multiselect field for selecting custom graph prototypes.
CWidgetFieldMultiSelectGroup	ID	Multiselect field for selecting host groups.
CWidgetFieldMultiSelectHost	ID	Multiselect field for selecting hosts.
CWidgetFieldMultiSelectHostInventory	array of int32	Multiselect field for selecting host inventory fields.
CWidgetFieldMultiSelectItem	ID	Multiselect field for selecting items.
CWidgetFieldMultiSelectItemPrototype	ID	Multiselect field for selecting item prototypes.
CWidgetFieldMultiSelectMap	ID	Multiselect field for selecting maps.
CWidgetFieldMultiSelectMediaType	ID	Multiselect field for selecting media types.
CWidgetFieldMultiSelectOverrideHost	ID	Multiselect field for selecting a data source for hosts from a dashboard or another widget.
CWidgetFieldMultiSelectService	ID	Multiselect field for selecting services.
CWidgetFieldMultiSelectSla	ID	Multiselect field for selecting SLAs.
CWidgetFieldMultiSelectUser	ID	Multiselect field for selecting users.
CWidgetFieldNavTree	array of (multiple mixed)	Stores a navigation tree structure of maps for use in the *Map navigation tree* widget.
CWidgetFieldNumericBox	string	Field to enter a float number.
CWidgetFieldPatternSelect	-	Base class for pattern select fields, extended by all `CWidgetPatternSelect*` classes.

CWidgetField class	Database field type	Description
CWidgetFieldPatternSelectHost	string	Multiselect field for selecting hosts. Supports host name patterns.
CWidgetFieldPatternSelectItem	string	Multiselect field for selecting items. Supports item name patterns.
CWidgetFieldRadioButtonList	int32	Radio box group that consists of one or more radio boxes.
CWidgetFieldRangeControl	int32	Slider to select an integer type value.
CWidgetFieldReference	string	Stores a unique identifier for this widget on the dashboard; used for widget communication.
CWidgetFieldSelect	int32	Dropdown select box.
CWidgetFieldSeverities	array of int32	*CWidgetFieldCheckBoxList* preset with trigger severities.
CWidgetFieldSparkline	array of (multiple mixed)	Allows configuring a sparkline chart.
CWidgetFieldTags	array of (string, int32, string)	Allows configuring one or more tag filter rows.
CWidgetFieldTextArea	string	Text area for entering multi-line text.
CWidgetFieldTextBox	string	Text box for entering single-line text.
CWidgetFieldThresholds	array of (string, string)	Allows configuring color and number pairs.
CWidgetFieldTimePeriod	array of string	Time period selecting field.
CWidgetFieldTimeZone	string	Dropdown with timezones.
CWidgetFieldUrl	string	Text box for entering URLs.

Note:
The maximum length for `int32` fields is 10 characters, `ID` fields 20 characters, and `string` fields 65535 characters. For composite types (e.g., `array of (string, int32, string)`), the limit applies to each element individually. Field-specific length restrictions can be set using methods such as `setMaxLength()`.

Presentation

This page describes the components that can be used to create a widget presentation view. The widget presentation view is the part of the widget that receives the data according to its configuration and displays it on the dashboard in a container.

The presentation view consists of three parts:

- Widget action
- Widget view
- JavaScript

Widget action

The widget action class (*WidgetView*) contains methods for operations with widgets in the presentation view mode. The majority of widget actions use and/or extend the default controller class *CControllerDashboardWidgetView*.

The widget action class should be located in the *actions* directory and specified in the *actions* parameter (*actions/widget.{id}.view/class*) in the *manifest.json* file.

actions/WidgetView.php example (implemented in the Zabbix-native *System information* widget)

```
class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $this->setResponse(new CControllerResponseData([
            'name' => $this->getInput('name', $this->widget->getDefaultName()),
            'system_info' => CSystemInfoHelper::getData(),
            'info_type' => $this->fields_values['info_type'],
            'user_type' => CWebUser::getType(),
            'user' => [
                'debug_mode' => $this->getDebugMode()
            ]
        ]));
    }
}
```

Widget view

The widget view class (*CWidgetView*) is responsible for building the widget presentation view.

The widget view class should be located in the *views* directory. If the file containing the widget view class has a different name than the default (*widget.view.php*), then it must be specified in the *manifest.json* file *actions* parameter (*actions/widget.{id}.view/view*).

views/widget.view.php example

```
<?php

/**
 * My custom widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem(
        new CTag('h1', true, $data['name'])
    )
    ->show();
```

JavaScript

The JavaScript class is responsible for determining widget behavior, such as updating widget data, resizing the widget, displaying widget elements, etc.

All JavaScript operations use and/or extend the base JavaScript class of all dashboard widgets - *CWidget*. The *CWidget* class contains a set of methods with the default implementation for widget behavior. Depending on widget complexity, these methods can be utilized as is or extended.

The *CWidget* class contains the following methods:

- Methods that define widget lifecycle: *onInitialize()*, *onStart()*, *onActivate()*, *onDeactivate()*, *onDestroy()*, *onEdit()*.
- Methods that handle updating and displaying widget data: *promiseUpdate()*, *getUpdateRequestData()*, *processUpdateResponse(response)*, *processUpdateErrorResponse(error)*, *setContents(response)*.
- Methods that modify widget appearance: *onResize()*, *hasPadding()*.

The JavaScript class should be located in the *assets/js* directory and specified in the *assets* (*assets/js*) parameter in the *manifest.json* file.

Lifecycle methods

The widget lifecycle methods are invoked by the dashboard, and at different stages of the widget's lifecycle during its existence within the dashboard.

The ***onInitialize()*** method defines the initial state and/or values of the widget, without performing any HTML or data manipulation. This method is invoked when a widget is created (a widget object is instantiated), typically by adding the widget to a dashboard page or loading the dashboard page.

Example:

```
onInitialize() {
    this._time_offset = 0;
    this._interval_id = null;
    this._clock_type = CWidgetClock.TYPE_ANALOG;
    this._time_zone = null;
    this._show_seconds = true;
    this._time_format = 0;
    this._tzone_format = 0;
    this._show = [];
    this._has_contents = false;
    this._is_enabled = true;
}
```

The ***onStart()*** method defines the HTML structure of the widget, without performing any data manipulation. This method is invoked before the first activation of the dashboard page, that is, before the dashboard and its widgets are fully displayed to the user.

Example:

```
onStart() {
    this._events.resize = () => {
        const padding = 25;
```

```
        const header_height = this._view_mode === ZBX_WIDGET_VIEW_MODE_HIDDEN_HEADER
            ? 0
            : this._header.offsetHeight;

        this._target.style.setProperty(
            '--content-height',
            `${this._cell_height * this._pos.height - padding * 2 - header_height}px`
        );
    }
}
```

The ***onActivate()*** method makes the widget active and interactive by enabling custom event listeners (for responding to user actions) and initiating the widget update cycle (for keeping its content up-to-date). This method is invoked when the dashboard page is activated, that is, when it becomes fully displayed in the user interface.

Note that before the *onActivate()* method is invoked, the widget is in the inactive state (`WIDGET_STATE_INACTIVE`). After successful invocation, the widget transitions to the active state (`WIDGET_STATE_ACTIVE`). In the active state, the widget is responsive, listens to events, updates its content periodically, and can interact with other widgets.

Example:

```
onActivate() {
    this._startClock();

    this._resize_observer = new ResizeObserver(this._events.resize);
    this._resize_observer.observe(this._target);
}
```

The ***onDeactivate()*** method stops any activity and interactivity of the widget by deactivating custom event listeners and stopping the widget update cycle. This method is invoked when the dashboard page is deactivated, that is, switched away or deleted, or when the widget is deleted from the dashboard page.

Note that before the *onDeactivate()* method is invoked, the widget is in the active state (`WIDGET_STATE_ACTIVE`). After successful invocation, the widget transitions to the inactive state (`WIDGET_STATE_INACTIVE`).

Example:

```
onDeactivate() {
    this._stopClock();
    this._resize_observer.disconnect();
}
```

The ***onDestroy()*** method performs cleanup tasks before the widget is deleted from the dashboard, which can include closing a database connection that was established during widget initialization, cleaning up temporary data to free up system memory and avoid resource leaks, unregistering event listeners related to resize events or button clicks to prevent unnecessary event handling and memory leaks, etc. This method is invoked when the widget or the dashboard page that contains it is deleted.

Note that before the *onDestroy()* method is invoked, a widget in an active state (`WIDGET_STATE_ACTIVE`) is always deactivated with the invocation of the *onDeactivate()* method.

Example:

```
onDestroy() {
    if (this._filter_widget) {
        this._filter_widget.off(CWidgetMap.WIDGET_NAVTREE_EVENT_MARK, this._events.mark);
        this._filter_widget.off(CWidgetMap.WIDGET_NAVTREE_EVENT_SELECT, this._events.select);
    }
}
```

The ***onEdit()*** method defines the appearance and behavior of the widget when the dashboard transitions into edit mode. This method is invoked when the dashboard transitions into edit mode, typically when a user interacts with the widget's *Edit* button or the dashboard's *Edit dashboard* button.

Example:

```
onEdit() {
    this._deactivateGraph();
}
```

Update process methods

The widget update process methods are responsible for retrieving updated data from Zabbix server or any other data source and displaying it in the widget.

The ***promiseUpdate()*** method initiates the data update process by retrieving data, typically using web requests or API calls. This method is invoked when a dashboard page is displayed and periodically after, until the dashboard page is switched to another dashboard page.

The following is an example of the default implementation of the *promiseUpdate()* method used by most Zabbix-native widgets. In the default implementation, the *promiseUpdate()* method follows a general pattern for retrieving data from the server. It creates a new `Curl` object with the appropriate URL and request parameters, sends a `POST` request using the *fetch()* method with the data object constructed by the *getUpdateRequestData()* method, and processes the response (or an error response) with the *processUpdateResponse(response)* or *processUpdateErrorResponse(error)* accordingly. This implementation is suitable for most widgets as they typically retrieve data in a JSON format and handle it in a consistent manner.

```
promiseUpdate() {
    const curl = new Curl('zabbix.php');

    curl.setArgument('action', `widget.${this._type}.view`);

    return fetch(curl.getUrl(), {
        method: 'POST',
        headers: {'Content-Type': 'application/json'},
        body: JSON.stringify(this.getUpdateRequestData()),
        signal: this._update_abort_controller.signal
    })
        .then((response) => response.json())
        .then((response) => {
            if ('error' in response) {
                this.processUpdateErrorResponse(response.error);

                return;
            }

            this.processUpdateResponse(response);
        });
    }
```

The ***getUpdateRequestData()*** method prepares the server request data for updating the widget by gathering various properties and their corresponding values (widget identifiers, filter settings, time ranges, etc.) from the widget's state and configuration, and constructing a data object that represents the necessary information to be sent to the server in the update request. This method is invoked only as part of the default *promiseUpdate()* method, that is, during the widget update process.

Default implementation:

```
getUpdateRequestData() {
    return {
        templateid: this._dashboard.templateid ?? undefined,
        dashboardid: this._dashboard.dashboardid ?? undefined,
        widgetid: this._widgetid ?? undefined,
        name: this._name !== '' ? this._name : undefined,
        fields: Object.keys(this._fields).length > 0 ? this._fields : undefined,
        view_mode: this._view_mode,
        edit_mode: this._is_edit_mode ? 1 : 0,
        dynamic_hostid: this._dashboard.templateid !== null || this.supportsDynamicHosts()
            ? (this._dynamic_hostid ?? undefined)
            : undefined,
        ...this._contents_size
    };
}
```

The ***processUpdateResponse(response)*** method handles the response received from the server after the update request, and, if the update process has been successful and without errors, clears widget data and displays new contents with the *setContents()* method. This method is invoked only as part of the default *promiseUpdate()* method, that is, during the widget update process.

Default implementation:

```
processUpdateResponse(response) {
    this._setHeaderName(response.name);

    this._updateMessages(response.messages);
    this._updateInfo(response.info);
    this._updateDebug(response.debug);

    this.setContents(response);
}
```

The ***processUpdateErrorResponse(error)*** method handles the response received from the server after the update request if the response is an error, and displays the error message/-s. This method is invoked only as part of the default *promiseUpdate()* method, that is, during the widget update process.

Default implementation:

```
processUpdateErrorResponse(error) {
    this._updateMessages(error.messages, error.title);
}
```

The ***setContents(response)*** method displays widget contents if the widget update process has been successful and without errors, which can include manipulating DOM elements, updating UI components, applying styles or formatting, etc. This method is invoked only as part of the default *processUpdateResponse(response)* method, that is, during the process of handling the response received from the server after the update request.

Default implementation:

```
setContents(response) {
    this._body.innerHTML = response.body ?? '';
}
```

Presentation modification methods

The widget presentation modification methods are responsible for modifying widget appearance.

The ***onResize()*** method is responsible for adjusting widget's visual elements to accommodate the new widget size, which can include rearranging elements, adjusting element dimensions, text truncation, implementing lazy loading to improve responsiveness during resizing, etc. This method is invoked when the widget is resized, for example, when the user manually resizes the widget or when the browser window is resized.

Example:

```
onResize() {
    if (this.getState() === WIDGET_STATE_ACTIVE) {
        this._startUpdating();
    }
}
```

The ***hasPadding()*** method is responsible for applying an 8px vertical padding at the bottom of the widget when it is configured to show its header. This method is invoked when the dashboard page is activated, that is, when it becomes the displayed page in the user interface.

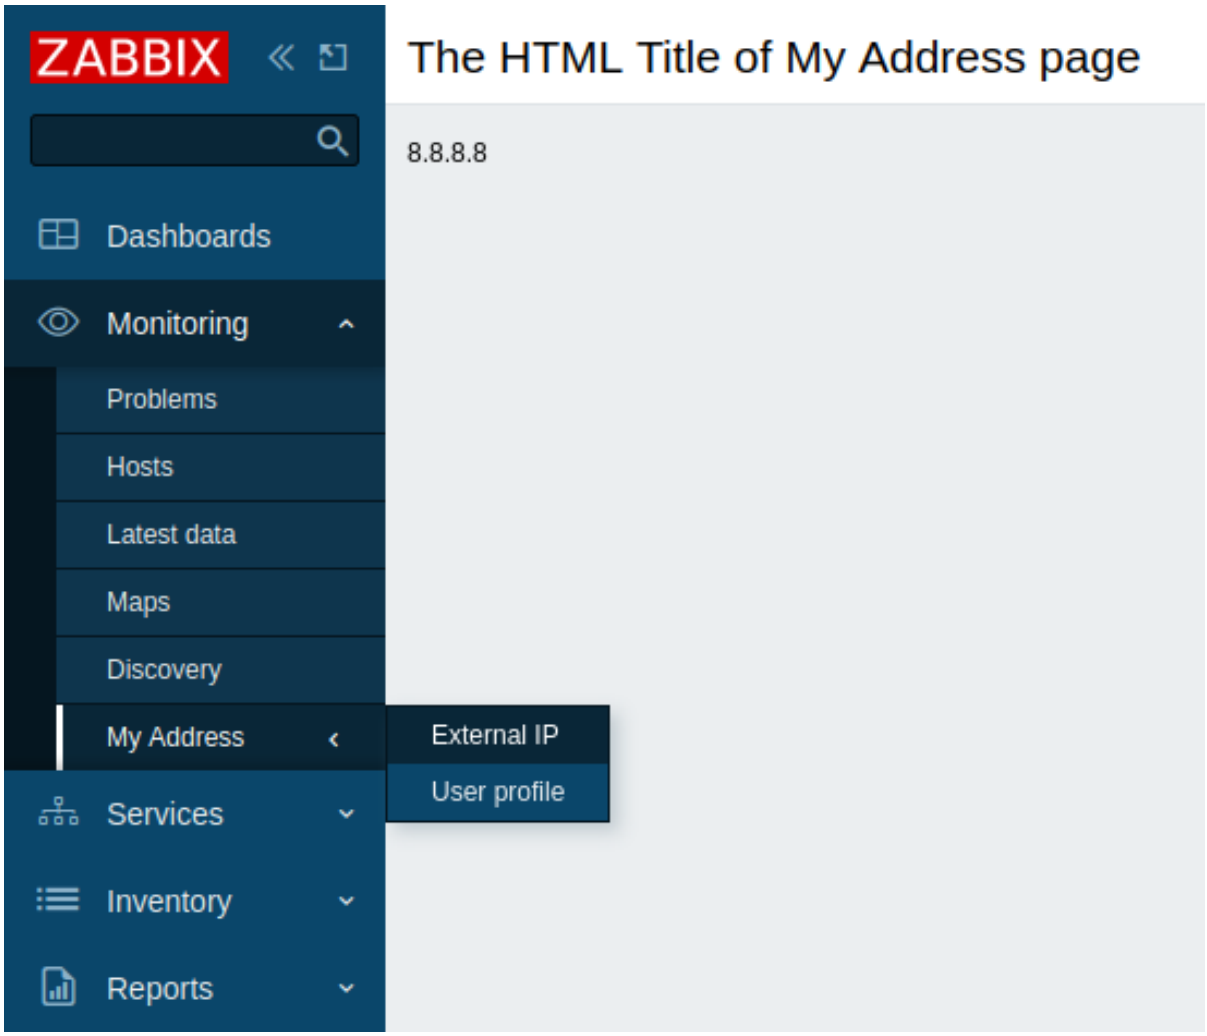
Default implementation:

```
hasPadding() {
    return this.getViewMode() !== ZBX_WIDGET_VIEW_MODE_HIDDEN_HEADER;
}
```

For some widgets it is necessary to use all of the available widget space to configure, for example, a custom background color. The following is an example of the implementation of the *hasPadding()* method used in the Zabbix-native *Item value* widget.

```
hasPadding() {
    return false;
}
```

Tutorials



This section contains practical step-by-step tutorials to illustrate how to build a custom module and a widget in Zabbix.

Create a module (tutorial)

This is a step-by-step tutorial that shows how to create a simple Zabbix frontend module. You can download all files of this module as a ZIP archive: MyAddress.zip.

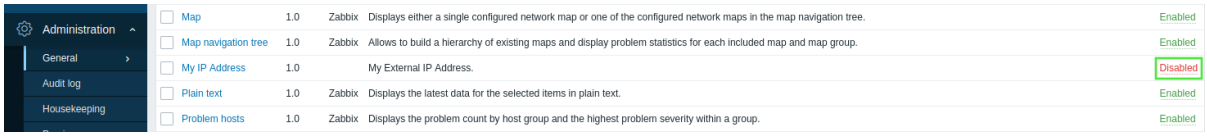
What you'll build

During this tutorial, you will first build a frontend module that adds a new *My Address* menu section and then convert it into a more advanced frontend module that makes an HTTP request to *https://api.seeip.org* and displays the response - the IP address of your computer - on a new page in the newly created *My Address* menu section. Here's how the finished module will look like:

Part I - New menu section

Add a blank module to Zabbix frontend

1. Create a directory *MyAddress* in the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
2. Create a *manifest.json* file with basic module metadata (see the description of supported parameters).



ui/modules/MyAddress/manifest.json

```
{
    "manifest_version": 2.0,
    "id": "my-address",
    "name": "My IP Address",
    "version": "1.0",
    "namespace": "MyAddress",
    "description": "My External IP Address."
}
```

3. In Zabbix frontend, go to *Administration* > *General* > *Modules* section and click the *Scan directory* button.

Scan directory

4. Locate the new module *My IP Address* in the list and click the "Disabled" hyperlink to change the module's status from "Disabled" to "Enabled" (if the module is not listed, see troubleshooting section).

The module is now registered in the frontend. However, it is not visible yet, because you still need to define the module functionality. Once you add content to the module directory, you will immediately see the changes in Zabbix frontend upon refreshing the page.

Create a menu section

1. Create a *Module.php* file in the *MyAddress* directory.

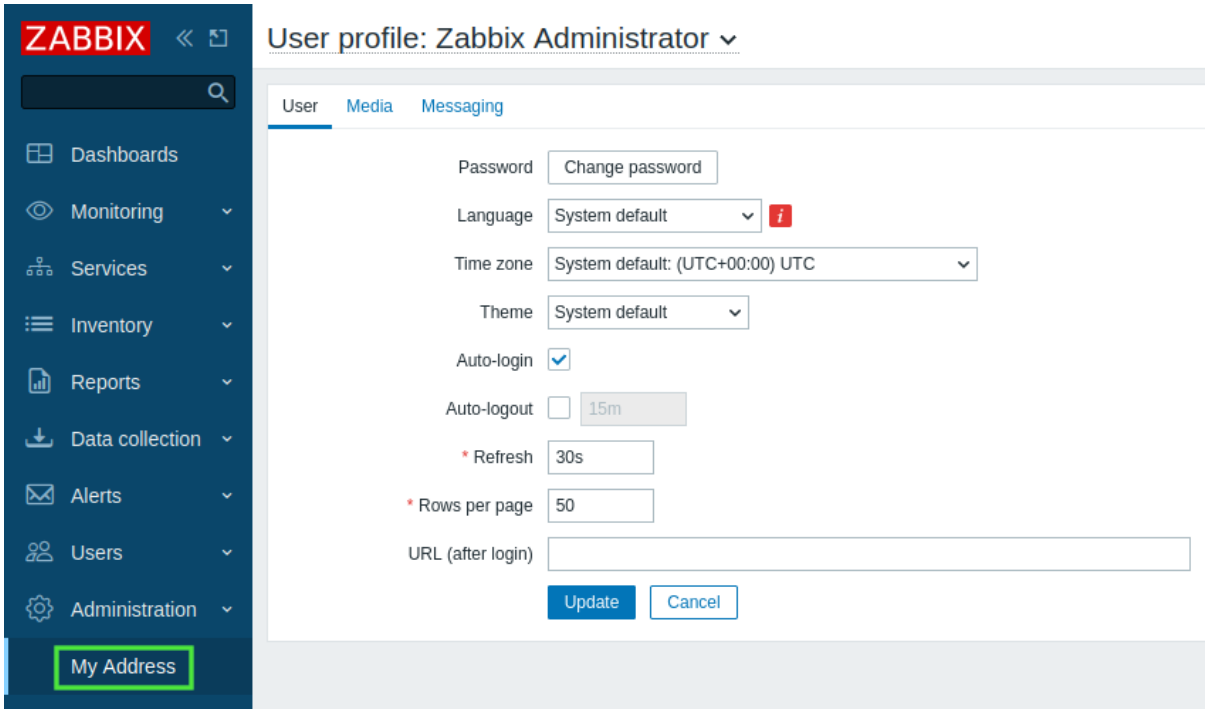
This file implements a new *Module* class that extends the default *CModule* class. The *Module* class will insert a new *My Address* menu section into the main menu.

The *setAction()* method specifies an action to be executed upon clicking the menu section. To start with, you can use the predefined action *userprofile.edit*, which will open the *User profile* page. In part III of this tutorial, you will learn how to create a custom action.

ui/modules/MyAddress/Module.php

```
<?php

namespace Modules\MyAddress;



use Zabbix\Core\CModule,
    APP,
    CMenuItem;

class Module extends CModule {

    public function init(): void {
        APP::Component()->get('menu.main')
            ->add((new CMenuItem(_('My Address')))
            ->setAction('userprofile.edit'));
    }
}
```

Note:
You can replace `'userprofile.edit'` with other actions, for example, `'charts.view'` (opens custom graphs), `'problems.view'` (opens *Monitoring* > *Problems*), or `'report.status'` (opens *System information* report).

3. Refresh Zabbix frontend. There is now a new *My Address* section at the bottom of the Zabbix main menu. Click *My Address* to open the *User profile* page.

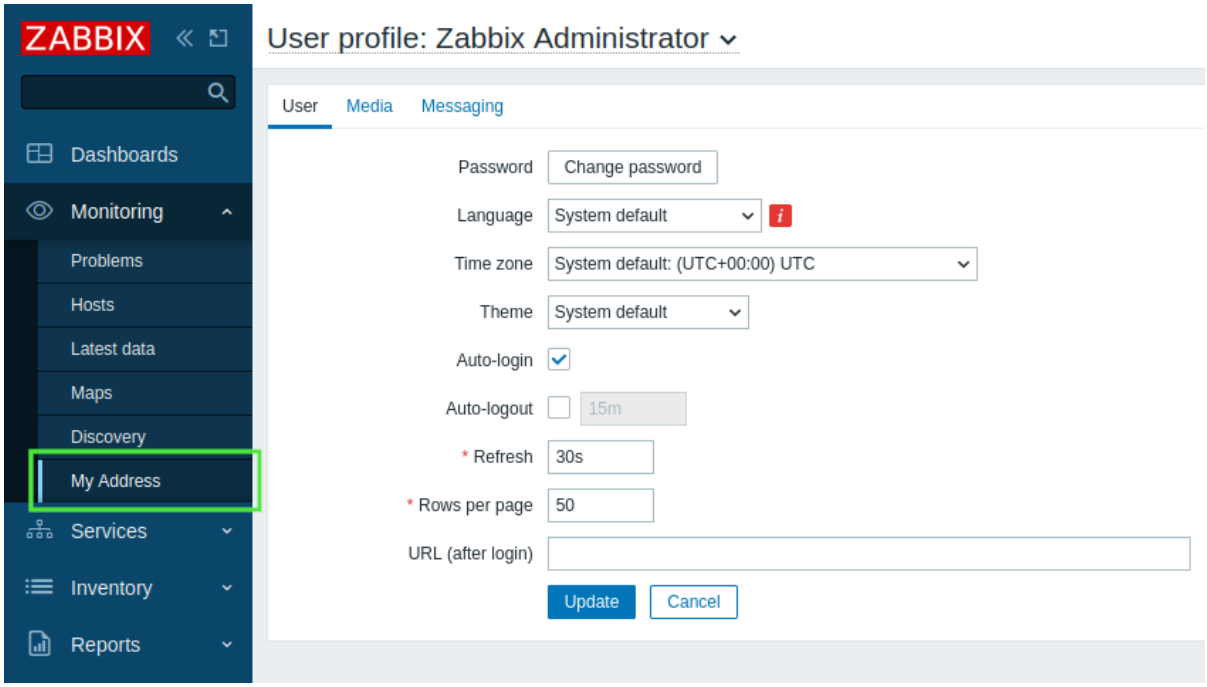
Part II - Menu section location change

In this part, you will move the *My Address* menu section to the *Monitoring* section and then add a nested menu to it. As a result, users will be able to access two sub-menu pages from the *Monitoring* > *My Address* menu section.

1. Open and edit the *Module.php* file.

ui/modules/MyAddress/Module.php

```
<?php



namespace Modules\MyAddress;

use Zabbix\Core\CModule,
    APP,
    CMenuItem;

class Module extends CModule {

    public function init(): void {
        APP::Component()->get('menu.main')
            ->findOrAdd(_('Monitoring'))
            ->getSubmenu()
            ->insertAfter(_('Discovery'),
                (new CMenuItem(_('My Address')))->setAction('userprofile.edit')
            );
    }
}
```

2. Refresh Zabbix frontend. Expand the *Monitoring* menu section and observe that the *My address* section is now located below the *Discovery* section.

3. To add nested pages to the *My Address* menu section, open and edit the *Module.php* file again.

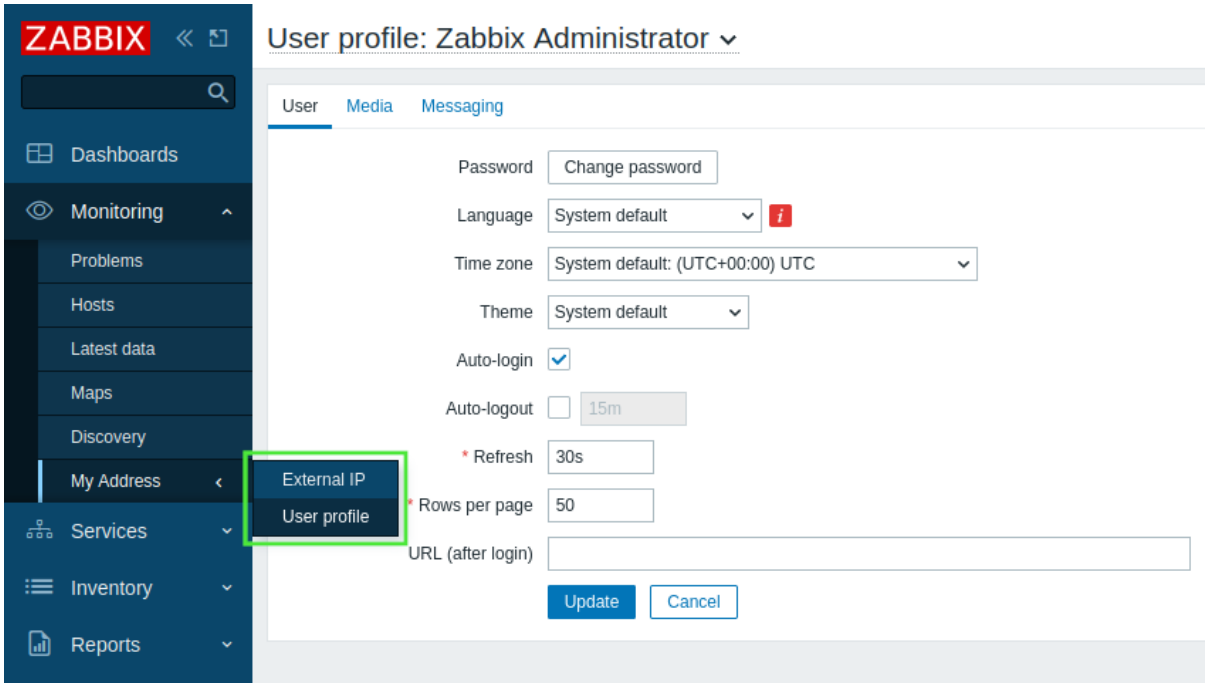
This step creates two subsections:

- *External IP* that executes a new 'my.address' action that will be defined in the next steps;
- *User profile* that executes the predefined 'userprofile.edit' action to open the *User profile* page.

Note that for the nested menu, you need to use the *CMenu* class in addition to the classes used in the previous steps.

ui/modules/MyAddress/Module.php

```
<?php



namespace Modules\MyAddress;

use Zabbix\Core\CModule,
    APP,
    CMenu,
    CMenuItem;

class Module extends CModule {

    public function init(): void {
        APP::Component()->get('menu.main')
            ->findOrAdd(_('Monitoring'))
            ->getSubmenu()
            ->insertAfter(_('Discovery'),
                (new CMenuItem(_('My Address')))->setSubMenu(
                    new CMenu([
                        (new CMenuItem(_('External IP')))->setAction('my.address'),
                        (new CMenuItem(_('User profile')))->setAction('userprofile.edit')
                    ])
                )
            );
    }
}
```

4. Refresh Zabbix frontend. Observe that the *My address* menu section now contains a third-level menu with two pages - *External IP* and *User profile*.

Part III - Module action

An action is implemented in two files - *actions/MyAddress.php* and *views/my.address.php*. The ***actions/MyAddress.php*** file takes care of the business logic implementation, while the ***views/my.address.php*** file is responsible for the view.

1. Create a directory *actions* in the *MyAddress* directory.
2. Create a *MyAddress.php* file in the *actions* directory.

The action logic will be defined in the *MyAddress* class. This action class will implement four functions: *init()*, *checkInput()*, *checkPermissions()*, and *doAction()*. Zabbix frontend calls the *doAction()* function when the action is requested. This function is responsible for the business logic of the module.

Attention:
The data must be organized as an associative array. The array can be multidimensional and may contain any data expected by the view.

ui/modules/MyAddress/actions/MyAddress.php

```
<?php

namespace Modules\MyAddress\Actions;

use CController,
    CControllerResponseData;

class MyAddress extends CController {

    public function init(): void {
        $this->disableCsrfValidation();
    }

    protected function checkInput(): bool {
        return true;
    }

    protected function checkPermissions(): bool {
        return true;
    }

    protected function doAction(): void {
        $data = ['my-ip' => file_get_contents("https://api.seeip.org")];
        $response = new CControllerResponseData($data);
```

```
        $this->setResponse($response);
    }
}
```

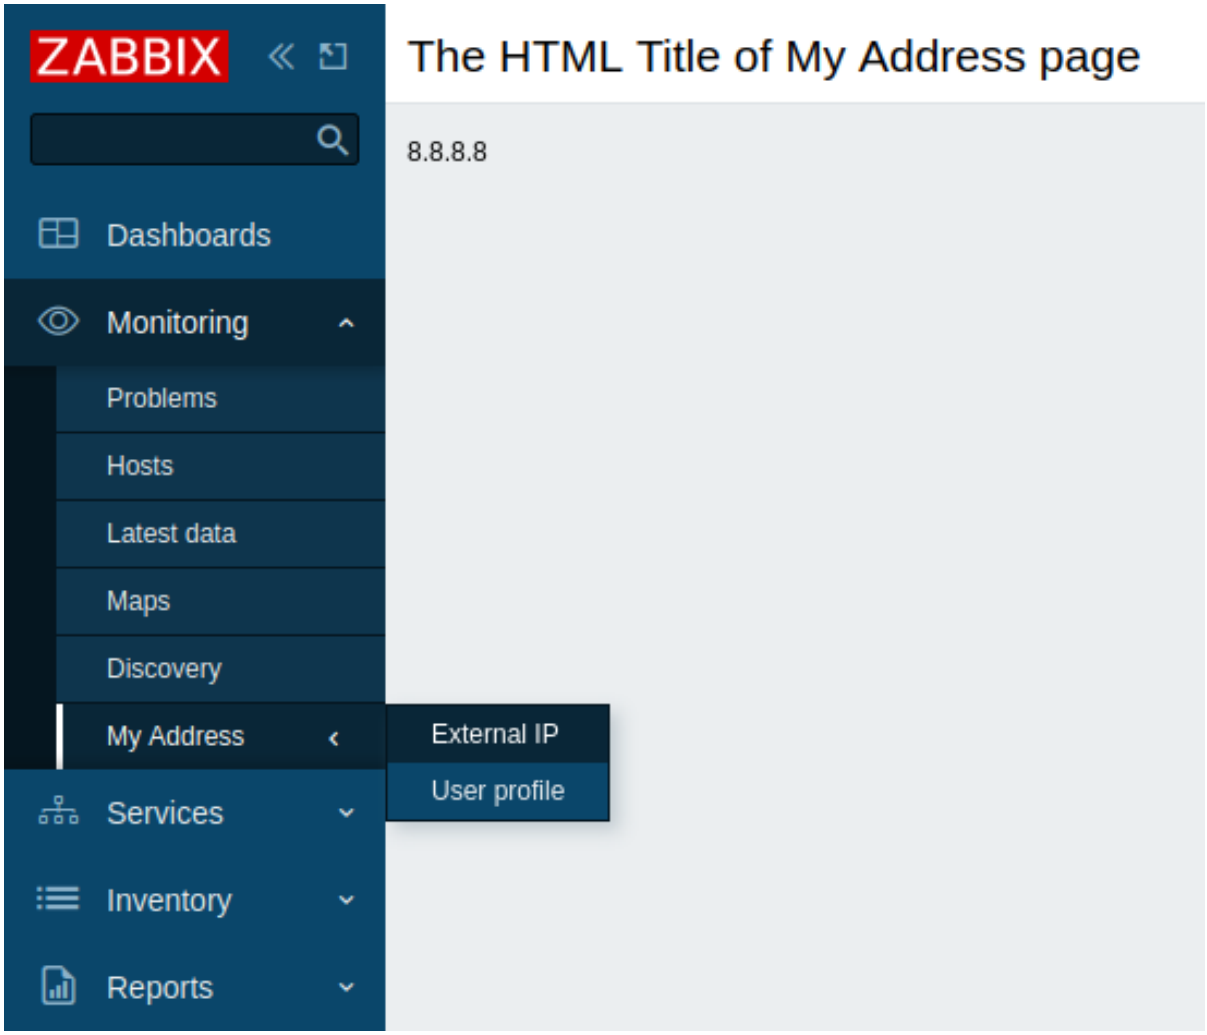
3. Create a new directory *views* in the *MyAddress* directory.
4. Create a *my.address.php* file in the *views* directory and define the module view.

Note that the variable `$data` is available in the view without specifically defining it. The framework automatically passes the associative array to the view.

ui/modules/MyAddress/views/my.address.php

```
<?php

(new CHtmlPage())
    ->setTitle(_('The HTML Title of My Address Page'))
    ->addItem(new CDiv($data['my-ip']))
    ->show();
```

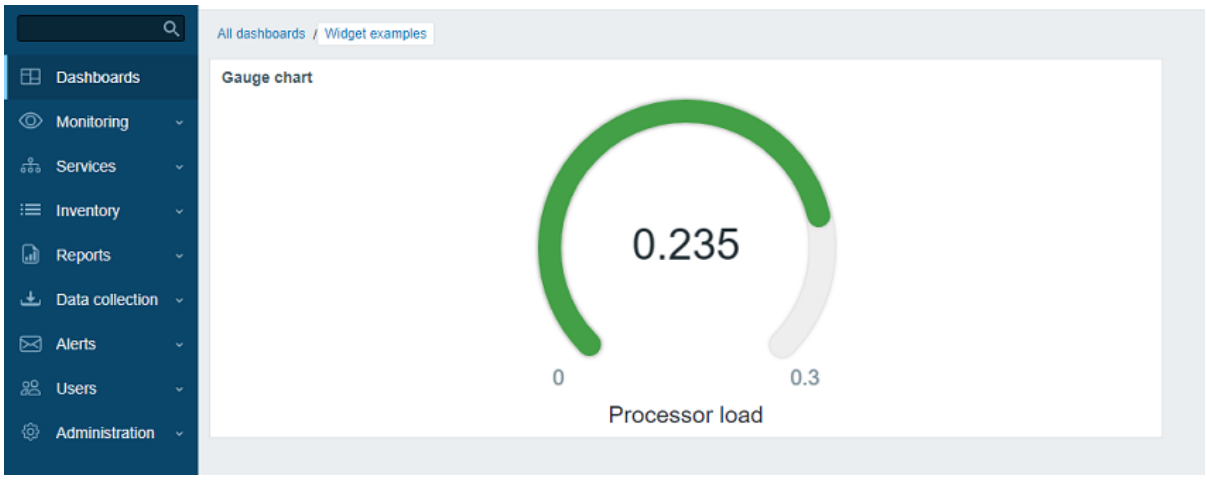


5. The module action has to be registered in the *manifest.json* file. Open *manifest.json* and add a new object `actions` that contains:

- the action key with the action name written in lowercase (a-z) and with words separated by dots (for example, `my.address`);
- the action class name (`MyAddress`) as a value for the `class` key of the `my.address` object;
- the action view name (`my.address`) as a value for the `view` key of the `my.address` object.

ui/modules/MyAddress/manifest.json

```
{
    "manifest_version": 2.0,
    "id": "my-address",
    "name": "My IP Address",
    "version": "1.0",
    "namespace": "MyAddress",
    "description": "My External IP Address.",
    "actions": {
        "my.address": {
            "class": "MyAddress",
            "view": "my.address"
        }
    }
}
```



6. Refresh Zabbix frontend. Click *My address* > *External IP* to see the IP address of your computer.

Create a widget (tutorial)

This is a step-by-step tutorial that shows how to create a simple dashboard widget. You can download all files of this widget as a ZIP archive: lesson_gauge_chart.zip.

What you'll build During this tutorial, you will first build a basic "Hello, world!" widget and then convert it into a more advanced widget that displays an item value as a gauge chart. Here's how the finished widget will look like:

Part I - "Hello, world!" In this section you will learn how to create the minimum required widget elements and add a new widget to Zabbix frontend.

Add a blank widget to Zabbix frontend

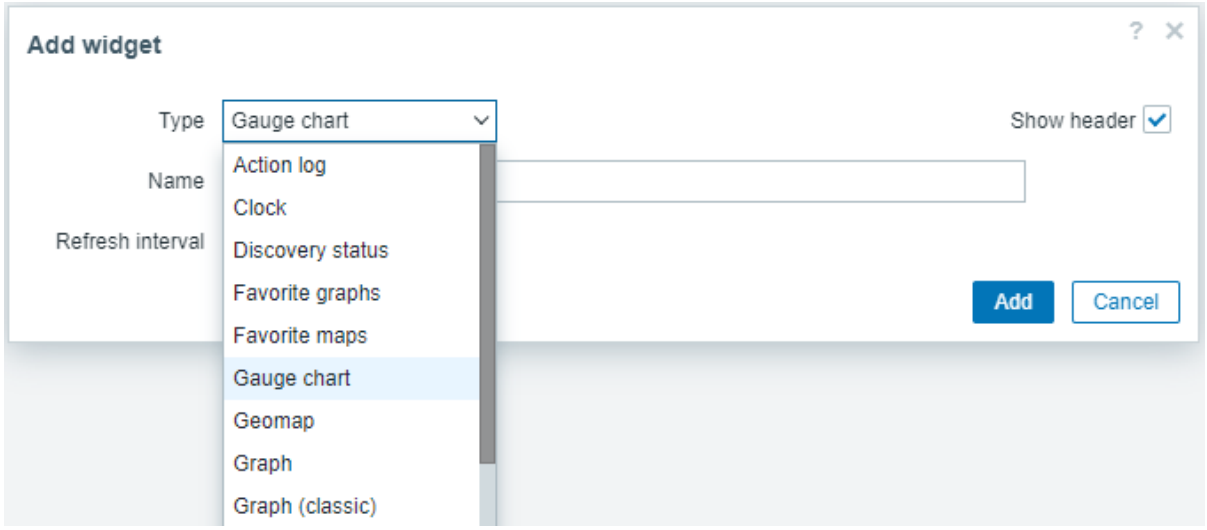
1. Create a directory `lesson_gauge_chart` in the `modules` directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).

> **Note:**
> All custom widgets are treated as external modules and must be added to the `modules` directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*). The directory `zabbix/ui/widgets` is reserved for Zabbix built-in widgets and gets updated along with Zabbix UI.

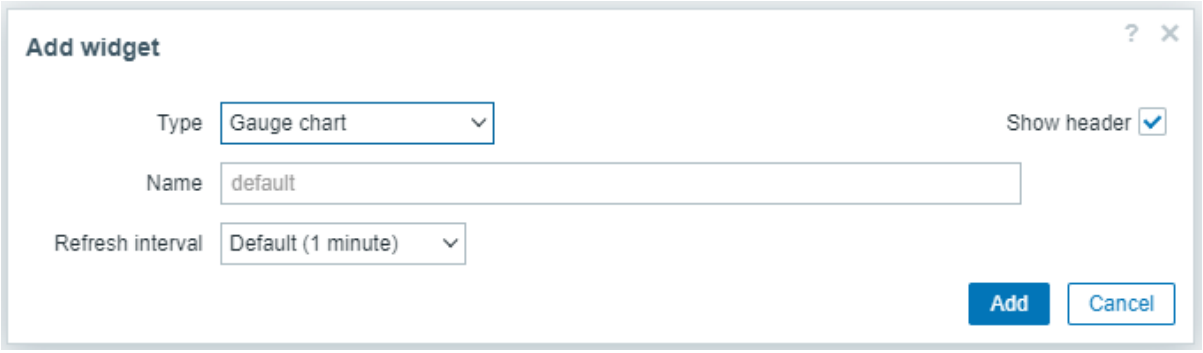
2. Create a `manifest.json` file with basic widget metadata (see the description of supported parameters).

ui/modules/lesson_gauge_chart/manifest.json

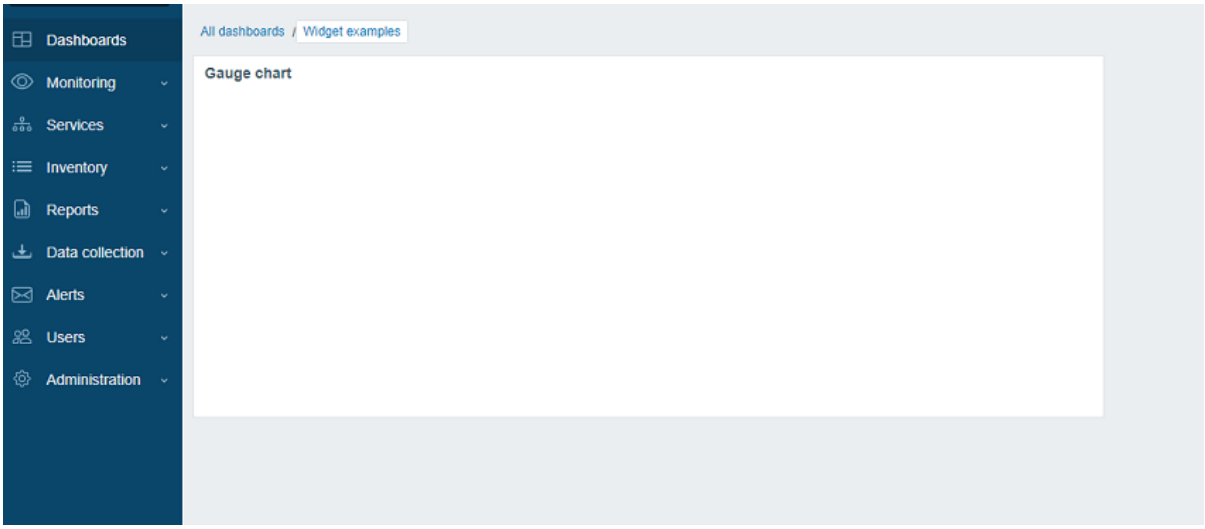
```
{
    "manifest_version": 2.0,
    "id": "lesson_gauge_chart",
    "type": "widget",
    "name": "Gauge chart",
    "namespace": "LessonGaugeChart",
    "version": "1.1",
    "author": "Zabbix"
}
```



3. In Zabbix frontend, go to *Administration* > *General* > *Modules* section and click the *Scan directory* button.



4. Locate the new module *Gauge chart* in the list and click the "Disabled" hyperlink to change the module's status from "Disabled" to "Enabled" (if the module is not listed, see troubleshooting section).



5. Open a dashboard, switch it to edit mode and add a new widget. In the *Type* field, select "Gauge chart".

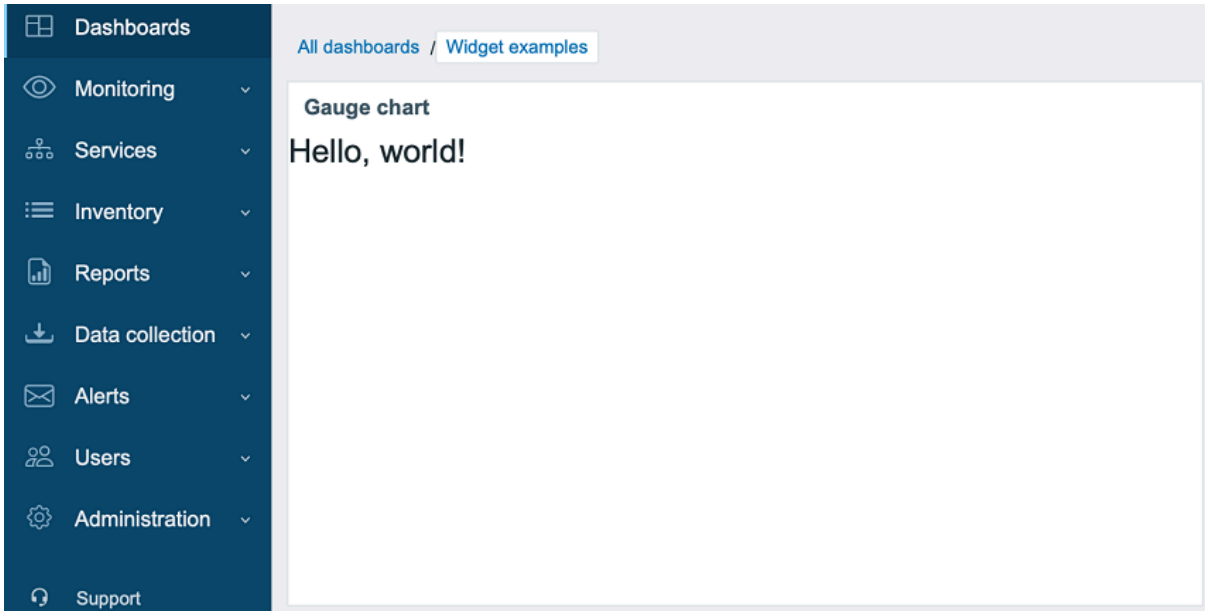
6. At this point, the *Gauge chart* widget configuration contains only common widget fields *Name* and *Refresh interval*. Click *Add* to add the widget to the dashboard.

7. A blank widget should appear on the dashboard. Click *Save changes* in the upper-right corner to save the dashboard.

Add a widget view

Note:
The widget's **view** file should be located in the `views` directory (for this tutorial, `ui/modules/lesson_gauge_chart/views/`). If the file has the default name `widget.view.php`, you do not need to register it in the `manifest.json` file. If the file has a different name, specify it in the `actions/widget.lesson_gauge_chart.view` section of the `manifest.json` file.

1. Create a directory `views` in the `lesson_gauge_chart` directory.
2. Create a `widget.view.php` file in the `views` directory.



`ui/modules/lesson_gauge_chart/views/widget.view.php`

```
<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem(
        new CTag('h1', true, 'Hello, world!')
    )
    ->show();
```

3. Refresh the dashboard. The *Gauge chart* widget now displays "Hello, world!".

Part II - Gauge chart Add settings to a configuration view and use them in a widget view

In this section, you will learn how to add a widget configuration field and show the entered value in the widget view as text.

The widget configuration consists of a form (`Zabbix\Widgets\CWidgetForm`) and a widget form view (`widget.edit.php`). To add fields (`Zabbix\Widgets\CWidgetField`), you need to create a `WidgetForm` class, which will extend `Zabbix\Widgets\CWidgetForm`.

The form contains the set of fields (`Zabbix\Widgets\CWidgetField`) of various types, which are used to validate user-entered values. The form field (`Zabbix\Widgets\CWidgetField`) for each input element type converts the value into a single format to store it in the database.

> **Note:**
> The widget's **form** file should be located in the `includes` directory (for this tutorial, `ui/modules/lesson_gauge_chart/includes/`). If the file has the default name `WidgetForm.php`, you do not need to register it in the `manifest.json` file. If the file has a different name, specify it in the `widget/form_class` section of the `manifest.json` file.

1. Create a new directory `includes` in the `lesson_gauge_chart` directory.
2. Create a `WidgetForm.php` file in the `includes` directory.

`ui/modules/lesson_gauge_chart/includes/WidgetForm.php`

```
<?php

namespace Modules\LessonGaugeChart\Includes;

use Zabbix\Widgets\CWidgetForm;

class WidgetForm extends CWidgetForm {
}
```

3. Add a *Description* field to widget configuration form. This is a regular text field, where a user can enter any character set. You can use the `CWidgetFieldTextBox` class for it.

`ui/modules/lesson_gauge_chart/includes/WidgetForm.php`

```
<?php

namespace Modules\LessonGaugeChart\Includes;

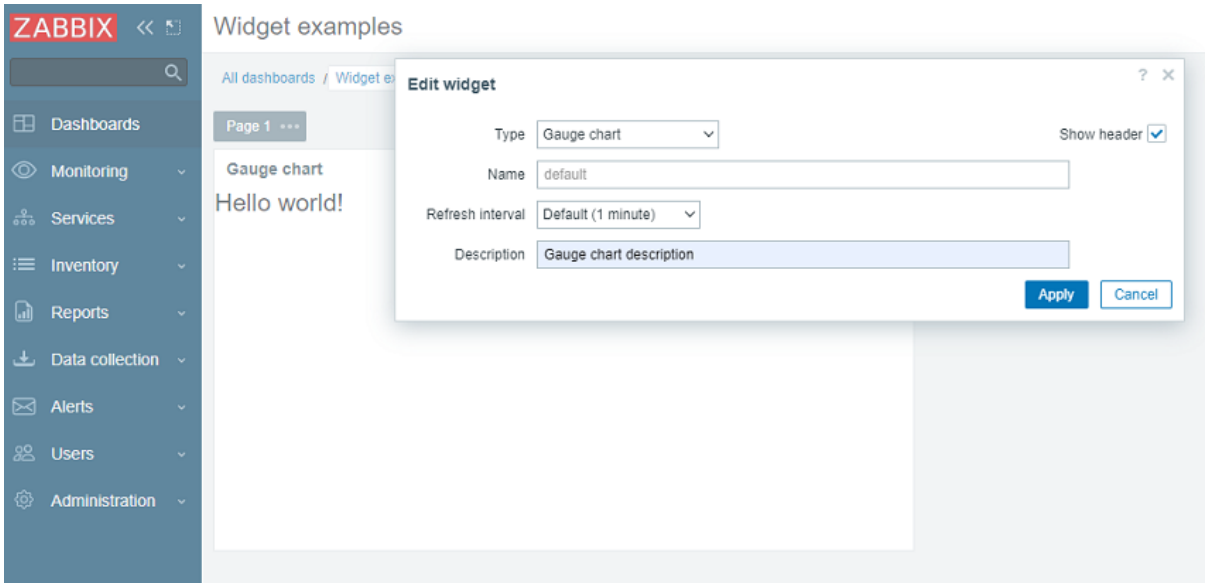
use Zabbix\Widgets\CWidgetForm;

use Zabbix\Widgets\Fields\CWidgetFieldTextBox;

class WidgetForm extends CWidgetForm {
```

```
    public function addFields(): self {
        return $this
            ->addField(
               new CWidgetFieldTextBox('description', _('Description'))
            );
    }
}
```

4. In the `views` directory, create a widget configuration view file `widget.edit.php` and add a view for the new *Description* field. For the `CWidgetFieldTextBox` field class, the view is `CWidgetFieldTextBoxView`.



`ui/modules/lesson_gauge_chart/views/widget.edit.php`

```
<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetFormView($data))
    ->addField(
        new CWidgetFieldTextBoxView($data['fields']['description'])
    )
    ->show();
```

5. Go to the dashboard and click the gear icon in the widget to open the widget configuration form.
6. The widget configuration form now contains a new *Description* text field. Enter any value, for example, *Gauge chart description*.

7. Click *Apply* in the widget configuration form. Then click *Save changes* in the upper-right corner to save the dashboard. Note that the new description is not visible anywhere, and the widget still displays "Hello, world!".

For the new description to appear in the widget, the *Description* field value needs to be retrieved from the database and passed to the widget view. For that, you need to create an action class.

8. Create a new directory `actions` in the `lesson_gauge_chart` directory.
9. Create a `WidgetView.php` file in the `actions` directory. The `WidgetView` action class will extend the `CControllerDashboardWidge` class.

Values of the widget configuration fields are stored in the `$fields_values` property of the action class.

`ui/modules/lesson_gauge_chart/actions/WidgetView.php`

```php
<?php

namespace Modules\LessonGaugeChart\Actions;

use CControllerDashboardWidgetView,
    CControllerResponseData;

class WidgetView extends CControllerDashboardWidgetView {

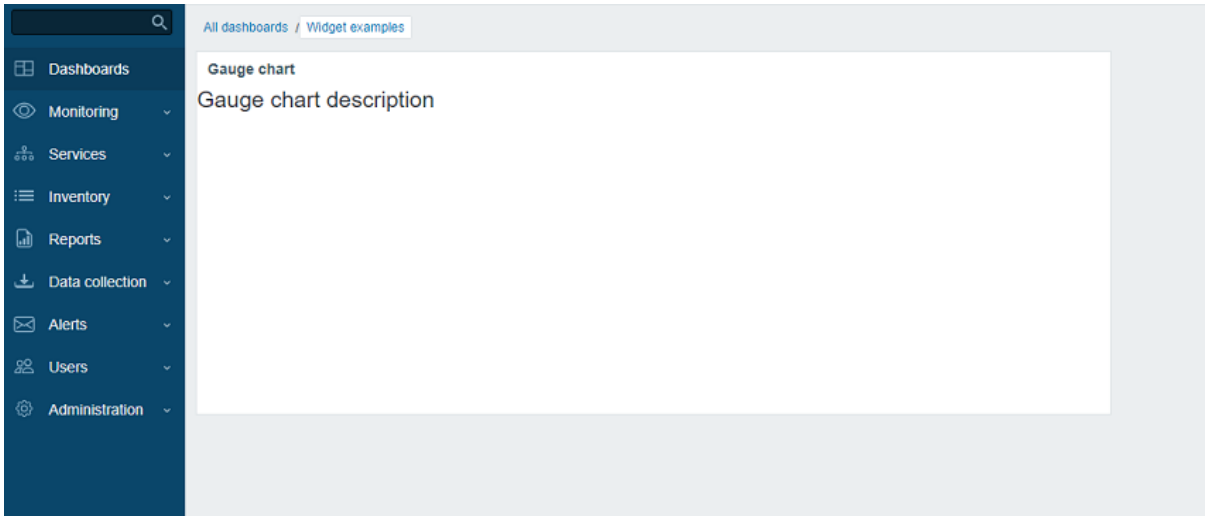
    protected function doAction(): void {
        $this->setResponse(new CControllerResponseData([
            'name' => $this->getInput('name', $this->widget->getName()),
            'description' => $this->fields_values['description'],
            'user' => [
                'debug_mode' => $this->getDebugMode()
            ]
        ]));
    }
}
```

10. Open `manifest.json` and register `WidgetView` as an action class in the `actions/widget.lesson_gauge_chart.view` section.

`ui/modules/lesson_gauge_chart/manifest.json`

```
{
    "manifest_version": 2.0,
    "id": "lesson_gauge_chart",
    "type": "widget",
    "name": "Gauge chart",
    "namespace": "LessonGaugeChart",
    "version": "1.0",
    "author": "Zabbix",
    "actions": {
        "widget.lesson_gauge_chart.view": {
            "class": "WidgetView"
        }
    }
}
```

11. Now you can use the value of the description field, contained in `$data['description']`, in the widget view. Open `views/widget.view.php` and replace the static text "Hello, world!" with `$data['description']`.



`ui/modules/lesson_gauge_chart/views/widget.view.php`

```php
<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem(
        new CTag('h1', true, $data['description'])
    )
    ->show();
```

12. Refresh the dashboard page. You should now see the widget description text instead of "Hello, world!".

Retrieve an item value via API

The widget should show the last value of an item of user's choice. For that, you need to add the ability to select items in the widget configuration.

In this section, you will learn how to add an item selection field to the widget form and how to add the visual part of this field to the configuration view. Then, the widget controller will be able to retrieve item data and its value via an API request. Once received, the value can be displayed in the widget view.

1. Open `includes/WidgetForm.php` and add the `CWidgetFieldMultiSelectItem` field. This will allow selecting an item in the configuration form.

`ui/modules/lesson_gauge_chart/includes/WidgetForm.php`

```
<?php

namespace Modules\LessonGaugeChart\Includes;

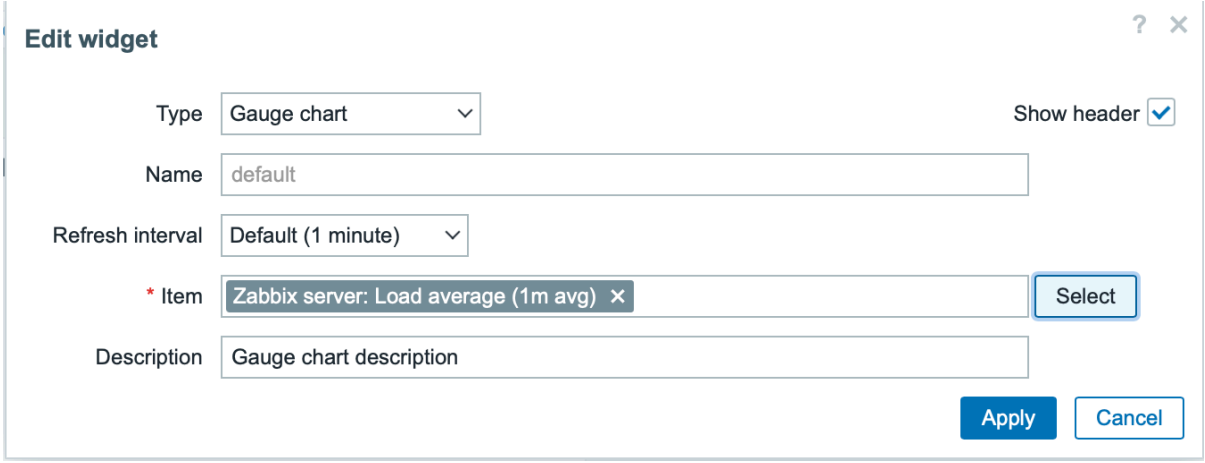
use Zabbix\Widgets\{
    CWidgetField,
    CWidgetForm
};

use Zabbix\Widgets\Fields\{
    CWidgetFieldMultiSelectItem,
    CWidgetFieldTextBox
};

/**
 * Gauge chart widget form.
 */
class WidgetForm extends CWidgetForm {

    public function addFields(): self {
        return $this
            ->addField(
                (new CWidgetFieldMultiSelectItem('itemid', _('Item')))
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
                    ->setMultiple(false)
            )
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            );
    }
}
```

2. Open `views/widget.edit.php` and add the field visual component to the configuration view.



`ui/modules/lesson_gauge_chart/views/widget.edit.php`

```php
<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetFormView($data))
    ->addField(
        new CWidgetFieldMultiSelectItemView($data['fields']['itemid'])
    )
    ->addField(
        new CWidgetFieldTextBoxView($data['fields']['description'])
    )
    ->show();
```

3. Return to the dashboard and click the gear icon in the widget to open the widget configuration form.
4. The widget configuration form now contains a new input field *Item*. Select the host "Zabbix server" and the item "Load average (1m avg)".

5. Click *Apply* in the widget configuration form. Then click *Save changes* in the upper-right corner to save the dashboard.
6. Open and modify `actions/WidgetView.php`.

From now on, the item ID will be available in the widget controller in `$this->fields_values['itemid']`. The `doAction()` controller method collects the item data (name, value type, units) using the API method `item.get` and the item last value using the API method `history.get`.

ui/modules/lesson_gauge_chart/actions/WidgetView.php

```php
<?php

namespace Modules\LessonGaugeChart\Actions;

use API,
    CControllerDashboardWidgetView,
    CControllerResponseData;

class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $db_items = API::Item()->get([
            'output' => ['itemid', 'value_type', 'name', 'units'],
            'itemids' => $this->fields_values['itemid'],
            'webitems' => true,
            'filter' => [
                'value_type' => [ITEM_VALUE_TYPE_UINT64, ITEM_VALUE_TYPE_FLOAT]
            ]
```

```
        ]);

        $value = null;

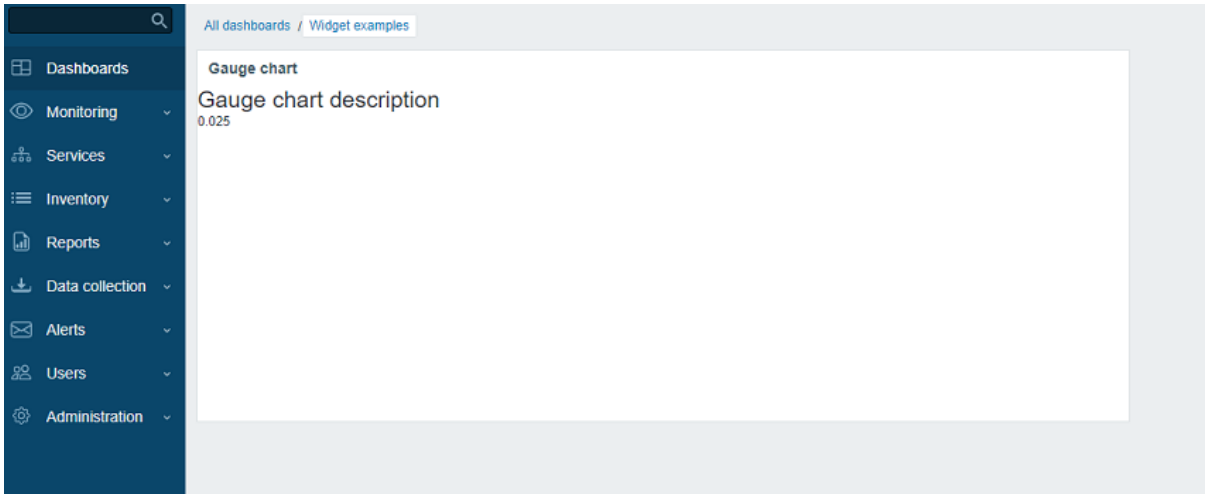
        if ($db_items) {
            $item = $db_items[0];

            $history = API::History()->get([
                'output' => API_OUTPUT_EXTEND,
                'itemids' => $item['itemid'],
                'history' => $item['value_type'],
                'sortfield' => 'clock',
                'sortorder' => ZBX_SORT_DOWN,
                'limit' => 1
            ]);

            if ($history) {
                $value = convertUnitsRaw([
                    'value' => $history[0]['value'],
                    'units' => $item['units']
                ]);
            }
        }

        $this->setResponse(new CControllerResponseData([
            'name' => $this->getInput('name', $this->widget->getName()),
            'value' => $value,
            'description' => $this->fields_values['description'],
            'user' => [
                'debug_mode' => $this->getDebugMode()
            ]
        ]));
    }
}
```

7. Open `views/widget.view.php` and add the item value to the widget view.



`ui/modules/lesson_gauge_chart/views/widget.view.php`

```
<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem([
        new CTag('h1', true, $data['description']),
        new CDiv($data['value'] !== null ? $data['value']['value'] : _('No data'))
    ])
    ->show();
```

8. Refresh the dashboard page. The widget will display the latest item value.

Add advanced configuration settings to a configuration view

In this section, you will learn how to add an expandable/collapsible *Advanced configuration* section with optional parameters, such as color, minimum and maximum values, units and the *Description* field created earlier.

1. Create a `Widget.php` file in the main widget directory `lesson_gauge_chart` to create a new class `Widget`.

The `Widget` class will extend the `CWidget` base class to add/override the default widget settings (in this case - translations). JavaScript, provided below, displays the string "No data" in case of missing data. The "No data" string is present in the Zabbix UI translation files.

If there are any widget constants, it is recommended to also specify them in the `Widget` class.

`ui/modules/lesson_gauge_chart/Widget.php`

```
<?php

namespace Modules\LessonGaugeChart;

use Zabbix\Core\CWidget;

class Widget extends CWidget {

    public const UNIT_AUTO = 0;
    public const UNIT_STATIC = 1;

    public function getTranslationStrings(): array {
        return [
            'class.widget.js' => [
                'No data' => _('No data')
            ]
        ];
    }
}
```

2. Open `includes/WidgetForm.php` and add the new fields *Color* (color picker), *Min* (numeric field), *Max* (numeric field), and *Units* (select), and define the default color palette for the color picker, so that it can be used in the next steps.

`ui/modules/lesson_gauge_chart/includes/WidgetForm.php`

```
<?php

namespace Modules\LessonGaugeChart\Includes;

use Modules\LessonGaugeChart\Widget;

use Zabbix\Widgets\{
    CWidgetField,
    CWidgetForm
};
```

```
use Zabbix\Widgets\Fields\{
    CWidgetFieldColor,
    CWidgetFieldMultiSelectItem,
    CWidgetFieldNumericBox,
    CWidgetFieldSelect,
    CWidgetFieldTextBox
};

/**
 * Gauge chart widget form.
 */
class WidgetForm extends CWidgetForm {

    public const DEFAULT_COLOR_PALETTE = [
        'FF465C', 'B0AF07', '0EC9AC', '524BBC', 'ED1248', 'D1E754', '2AB5FF', '385CC7', 'EC1594', 'BAE37D',
        '6AC8FF', 'EE2B29', '3CA20D', '6F4BBC', '00A1FF', 'F3601B', '1CAE59', '45CFDB', '894BBC', '6D6D6D'
    ];

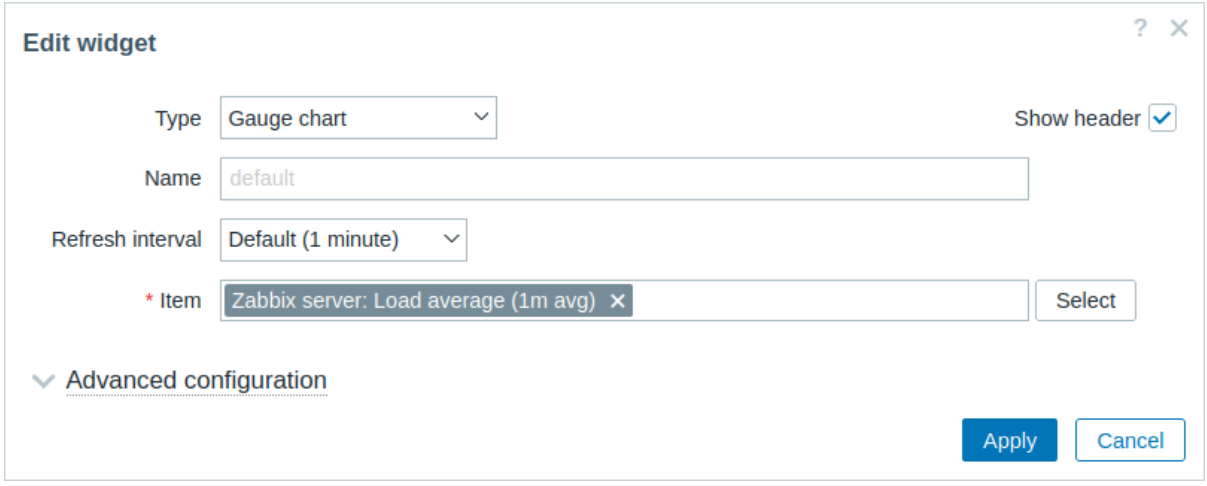
    public function addFields(): self {
        return $this
            ->addField(
                (new CWidgetFieldMultiSelectItem('itemid', _('Item')))
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
                    ->setMultiple(false)
            )
            ->addField(
                (new CWidgetFieldColor('chart_color', _('Color')))->setDefault('FF0000')
            )
            ->addField(
                (new CWidgetFieldNumericBox('value_min', _('Min')))
                    ->setDefault(0)
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
            )
            ->addField(
                (new CWidgetFieldNumericBox('value_max', _('Max')))
                    ->setDefault(100)
                    ->setFlags(CWidgetField::FLAG_NOT_EMPTY | CWidgetField::FLAG_LABEL_ASTERISK)
            )
            ->addField(
                (new CWidgetFieldSelect('value_units', _('Units'), [
                    Widget::UNIT_AUTO => _x('Auto', 'history source selection method'),
                    Widget::UNIT_STATIC => _x('Static', 'history source selection method')
                ]))->setDefault(Widget::UNIT_AUTO)
            )
            ->addField(
                (new CWidgetFieldTextBox('value_static_units'))
            )
            ->addField(
                new CWidgetFieldTextBox('description', _('Description'))
            );
    }
}
```

3. Open `views/widget.edit.php` and add the field visual components to the configuration view.

`ui/modules/lesson_gauge_chart/views/widget.edit.php`

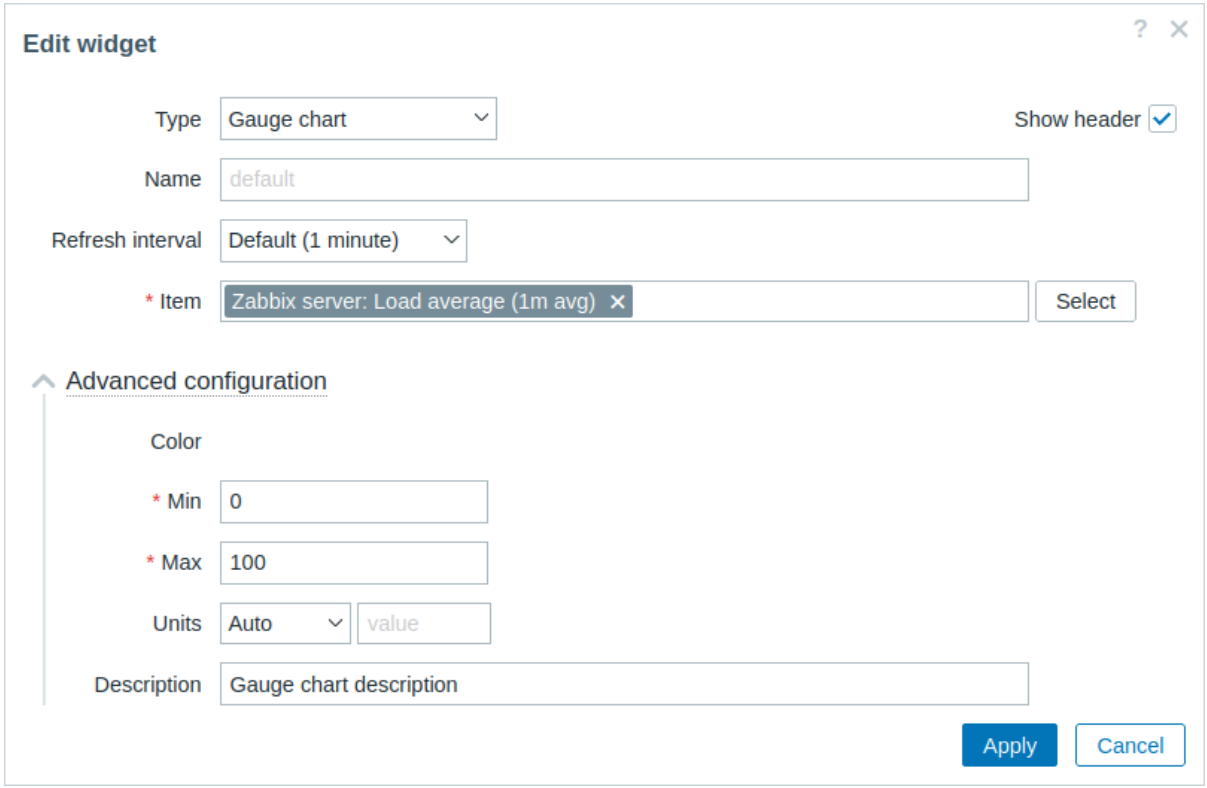
```
<?php

/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
```



```
 */

$lefty_units = new CWidgetFieldSelectView($data['fields']['value_units']);
$lefty_static_units = (new CWidgetFieldTextBoxView($data['fields']['value_static_units']))
    ->setPlaceholder(_('value'))
    ->setWidth(ZBX_TEXTAREA_TINY_WIDTH);



(new CWidgetFormView($data))
    ->addField(
        (new CWidgetFieldMultiSelectItemView($data['fields']['itemid']))
            ->setPopupParameter('numeric', true)
    )
    ->addFieldset(
        (new CWidgetFormFieldsetCollapsibleView(_('Advanced configuration')))
            ->addField(
                new CWidgetFieldColorView($data['fields']['chart_color'])
            )
            ->addField(
                new CWidgetFieldNumericBoxView($data['fields']['value_min'])
            )
            ->addField(
                new CWidgetFieldNumericBoxView($data['fields']['value_max'])
            )
            ->addItem([
                $lefty_units->getLabel(),
                (new CFormField([
                    $lefty_units->getView()->addClass(ZBX_STYLE_FORM_INPUT_MARGIN),
                    $lefty_static_units->getView()
                ]))
            ])
            ->addField(
                new CWidgetFieldTextBoxView($data['fields']['description'])
            )
    )
    ->show();
```

Note:
The `addField()` method of the `CWidgetFormView` class takes a CSS class string as the second parameter.

4. Return to the dashboard, switch to edit mode and click the gear icon in the widget to open the widget configuration form. The widget configuration form now contains a new expandable/collapsible section *Advanced configuration*.

5. Expand the *Advanced configuration* section to see additional widget configuration fields. Note that the field *Color* has no color picker yet. This is because the color picker must be initialized with JavaScript, which will be added in the next section - *Add JavaScript to the widget*.

Add JavaScript to the widget

In this section, you will learn how to add a gauge chart - made using JavaScript - that shows if the latest value is normal or too high/too low.

1. Create a `widget.edit.js.php` file in the `views` directory.

JavaScript will be responsible for initializing the color picker in the configuration view.

`ui/modules/lesson_gauge_chart/views/widget.edit.js.php`

```
<?php

use Modules\LessonGaugeChart\Widget;

?>

window.widget_lesson_gauge_chart_form = new class {

    init({color_palette}) {
        this._unit_select = document.getElementById('value_units');
        this._unit_value = document.getElementById('value_static_units');

        this._unit_select.addEventListener('change', () => this.updateForm());

        colorPalette.setThemeColors(color_palette);

        for (const colorpicker of jQuery('.<?= ZBX_STYLE_COLOR_PICKER ?> input')) {
            jQuery(colorpicker).colorpicker();
        }

        const overlay = overlays_stack.getById('widget_properties');

        for (const event of ['overlay.reload', 'overlay.close']) {
            overlay.$dialogue[0].addEventListener(event, () => { jQuery.colorpicker('hide'); });
        }

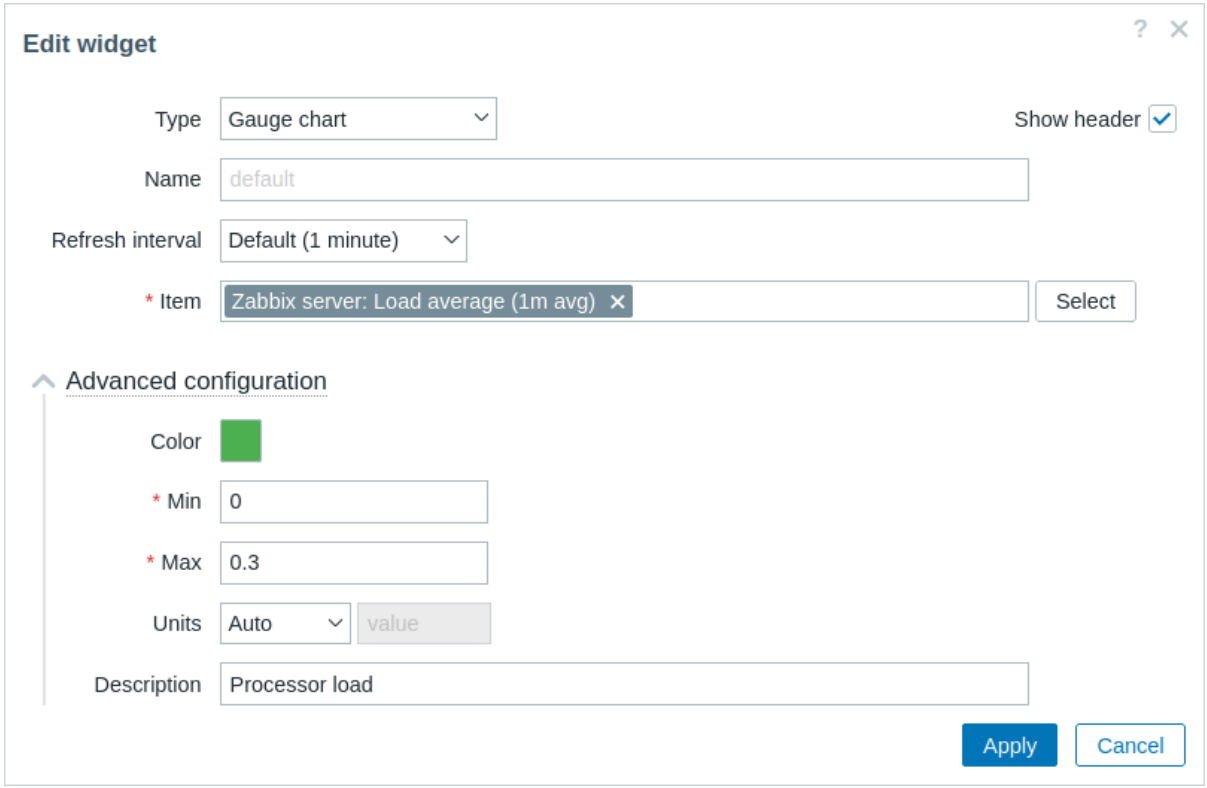
        this.updateForm();
    }
```

```
    updateForm() {
        this._unit_value.disabled = this._unit_select.value == <?= Widget::UNIT_AUTO ?>;
    }
};
```

2. Open `views/widget.edit.php` and add the `widget.edit.js.php` file with the JavaScript to the configuration view. To do this, use the `includeJsFile()` method. To add inline JavaScript, use the `addJavaScript()` method.

ui/modules/lesson_gauge_chart/views/widget.edit.php

```
<?php



/**
 * Gauge chart widget form view.
 *
 * @var CView $this
 * @var array $data
 */

use Modules\LessonGaugeChart\Includes\WidgetForm;

$lefty_units = new CWidgetFieldSelectView($data['fields']['value_units']);
$lefty_static_units = (new CWidgetFieldTextBoxView($data['fields']['value_static_units']))
    ->setPlaceholder(_('value'))
    ->setWidth(ZBX_TEXTAREA_TINY_WIDTH);

(new CWidgetFormView($data))
    ->addField(
        (new CWidgetFieldMultiSelectItemView($data['fields']['itemid']))
            ->setPopupParameter('numeric', true)
    )
    ->addFieldset(
        (new CWidgetFormFieldsetCollapsibleView(_('Advanced configuration')))
            ->addField(
                new CWidgetFieldColorView($data['fields']['chart_color'])
            )
            ->addField(
                new CWidgetFieldNumericBoxView($data['fields']['value_min'])
            )
            ->addField(
                new CWidgetFieldNumericBoxView($data['fields']['value_max'])
            )
            ->addItem([
                $lefty_units->getLabel(),
                (new CFormField([
                    $lefty_units->getView()->addClass(ZBX_STYLE_FORM_INPUT_MARGIN),
                    $lefty_static_units->getView()
                ]))
            ])
            ->addField(
                new CWidgetFieldTextBoxView($data['fields']['description'])
            )
    )
    ->includeJsFile('widget.edit.js.php')
    ->addJavaScript('widget_lesson_gauge_chart_form.init('.json_encode([
        'color_palette' => WidgetForm::DEFAULT_COLOR_PALETTE
    ], JSON_THROW_ON_ERROR).');')
    ->show();
```

3. Return to the dashboard, click the gear icon in the widget to open the widget configuration form. Now, expand the *Advanced configuration* section to see the initialized color picker. Fill in the fields with values and select a color for the gauge chart.

4. Click *Apply* in the widget configuration form. Then click *Save changes* in the upper-right corner to save the dashboard.
5. Open `actions/WidgetView.php` and update the controller.

The `$this->fields_values` property now contains the values of all the *Advanced configuration* fields. Finalize the controller to enable passing the configuration and selected item value to the widget view.

`ui/modules/lesson_gauge_chart/actions/WidgetView.php`

```
<?php

namespace Modules\LessonGaugeChart\Actions;

use API,
    CControllerDashboardWidgetView,
    CControllerResponseData;

class WidgetView extends CControllerDashboardWidgetView {

    protected function doAction(): void {
        $db_items = API::Item()->get([
            'output' => ['itemid', 'value_type', 'name', 'units'],
            'itemids' => $this->fields_values['itemid'],
            'webitems' => true,
            'filter' => [
                'value_type' => [ITEM_VALUE_TYPE_UINT64, ITEM_VALUE_TYPE_FLOAT]
            ]
        ]);

        $history_value = null;

        if ($db_items) {
            $item = $db_items[0];

            $history = API::History()->get([
                'output' => API_OUTPUT_EXTEND,
                'itemids' => $item['itemid'],
                'history' => $item['value_type'],
                'sortfield' => 'clock',
                'sortorder' => ZBX_SORT_DOWN,
```

```
                'limit' => 1
            ]);

            if ($history) {
                $history_value = convertUnitsRaw([
                    'value' => $history[0]['value'],
                    'units' => $item['units']
                ]);
            }
        }

        $this->setResponse(new CControllerResponseData([
            'name' => $this->getInput('name', $this->widget->getName()),
            'history' => $history_value,
            'fields_values' => $this->fields_values,
            'user' => [
                'debug_mode' => $this->getDebugMode()
            ]
        ]));
    }
}
```

6. Open and modify `views/widget.view.php`.

You need to create a container for the gauge chart, which you will draw in the next steps, and a container for the description.

To pass values to JavaScript as a JSON object, use the `setVar()` method.

`ui/modules/lesson_gauge_chart/views/widget.view.php`

```
<?php

/**
 * Gauge chart widget view.
 *
 * @var CView $this
 * @var array $data
 */

(new CWidgetView($data))
    ->addItem([
        (new CDiv())->addClass('chart'),
        $data['fields_values']['description']
            ? (new CDiv($data['fields_values']['description']))->addClass('description')
            : null
    ])
    ->setVar('history', $data['history'])
    ->setVar('fields_values', $data['fields_values'])
    ->show();
```

7. Create a new directory `assets` in the `lesson_gauge_chart` directory. This directory will be used for storing JavaScript, CSS, and potentially any other assets, such as fonts or images.
8. For widget view JavaScript, create a directory `js` in the `assets` directory.
9. Create a `class.widget.js` file in the `assets/js` directory.

This JavaScript widget class will extend the base JavaScript class of all dashboard widgets - `CWidget`.

The dashboard relies on a correct implementation of a widget and communicates any relevant information to the widget through calling the respective JavaScript methods. The dashboard also expects the widget to generate events when some interaction occurs. Thus, the `CWidget` class contains a set of methods with the default implementation of widget behavior, which can be customized by extending the class.

In this case, some customization is necessary, therefore custom logic will be implemented for the following widget behavior:

- widget initialization that is responsible for defining the initial state of the widget (see the `onInitialize()` method);

- displaying widget contents (that is, drawing the gauge chart) if the widget update process has been successful and without errors (see the `processUpdateResponse(response)` method and the related `_resizeChart()` and `_updatedChart()` methods)
- resizing the widget (see the `onResize()` method and the related `_resizeChart()` method)

For other aspects of the gauge chart widget, the default implementation for widget behavior will be used. To learn more about the JavaScript methods of the `CWidget` class, see: JavaScript.

Since this JavaScript is required for the widget view, it should be loaded with the dashboard page. To enable JavaScript loading, you will need to update the `assets/js` and `js_class` parameters in the `manifest.json` file as shown in step 10.

`ui/modules/lesson_gauge_chart/assets/js/class.widget.js`

```
class WidgetLessonGaugeChart extends CWidget {

    static UNIT_AUTO = 0;
    static UNIT_STATIC = 1;

    onInitialize() {
        super.onInitialize();

        this._refresh_frame = null;
        this._chart_container = null;
        this._canvas = null;
        this._chart_color = null;
        this._min = null;
        this._max = null;
        this._value = null;
        this._last_value = null;
        this._units = '';
    }

    processUpdateResponse(response) {
        if (response.history === null) {
            this._value = null;
            this._units = '';
        }
        else {
            this._value = Number(response.history.value);
            this._units = response.fields_values.value_units == WidgetLessonGaugeChart.UNIT_AUTO
                ? response.history.units
                : response.fields_values.value_static_units;
        }

        this._chart_color = response.fields_values.chart_color;
        this._min = Number(response.fields_values.value_min);
        this._max = Number(response.fields_values.value_max);

        super.processUpdateResponse(response);
    }

    setContents(response) {
        if (this._canvas === null) {
            super.setContents(response);

            this._chart_container = this._body.querySelector('.chart');
            this._chart_container.style.height =
                `${this._getContentsSize().height - this._body.querySelector('.description').clientHeight}
            this._canvas = document.createElement('canvas');

            this._chart_container.appendChild(this._canvas);

            this._resizeChart();
        }
```

```
        this._updatedChart();
    }

    onResize() {
        super.onResize();

        if (this._state === WIDGET_STATE_ACTIVE) {
            this._resizeChart();
        }
    }

    _resizeChart() {
        const ctx = this._canvas.getContext('2d');
        const dpr = window.devicePixelRatio;

        this._canvas.style.display = 'none';
        const size = Math.min(this._chart_container.offsetWidth, this._chart_container.offsetHeight);
        this._canvas.style.display = '';

        this._canvas.width = size * dpr;
        this._canvas.height = size * dpr;

        ctx.scale(dpr, dpr);

        this._canvas.style.width = `${size}px`;
        this._canvas.style.height = `${size}px`;

        this._refresh_frame = null;

        this._updatedChart();
    }

    _updatedChart() {
        if (this._last_value === null) {
            this._last_value = this._min;
        }

        const start_time = Date.now();
        const end_time = start_time + 400;

        const animate = () => {
            const time = Date.now();

            if (time <= end_time) {
                const progress = (time - start_time) / (end_time - start_time);
                const smooth_progress = 0.5 + Math.sin(Math.PI * (progress - 0.5)) / 2;
                let value = this._value !== null ? this._value : this._min;
                value = (this._last_value + (value - this._last_value) * smooth_progress - this._min) / (t

                const ctx = this._canvas.getContext('2d');
                const size = this._canvas.width;
                const char_weight = size / 12;
                const char_shadow = 3;
                const char_x = size / 2;
                const char_y = size / 2;
                const char_radius = (size - char_weight) / 2 - char_shadow;

                const font_ratio = 32 / 100;

                ctx.clearRect(0, 0, size, size);

                ctx.beginPath();
```

```
                ctx.shadowBlur = char_shadow;
                ctx.shadowColor = '#bbb';
                ctx.strokeStyle = '#eee';
                ctx.lineWidth = char_weight;
                ctx.lineCap = 'round';
                ctx.arc(char_x, char_y, char_radius, Math.PI * 0.749, Math.PI * 2.251, false);
                ctx.stroke();

                ctx.beginPath();
                ctx.strokeStyle = `#${this._chart_color}`;
                ctx.lineWidth = char_weight - 2;
                ctx.lineCap = 'round';
                ctx.arc(char_x, char_y, char_radius, Math.PI * 0.75,
                    Math.PI * (0.75 + (1.5 * Math.min(1, Math.max(0, value)))), false
                    );
                ctx.stroke();

                ctx.shadowBlur = 2;
                ctx.fillStyle = '#1f2c33';
                ctx.font = `${(char_radius * font_ratio)|0}px Arial`;
                ctx.textAlign = 'center';
                ctx.textBaseline = 'middle';
                ctx.fillText(`${this._value !== null ? this._value : t('No data')}${this._units}`,
                    char_x, char_y, size - char_shadow * 4 - char_weight * 2
                );

                ctx.fillStyle = '#768d99';
                ctx.font = `${(char_radius * font_ratio * .5)|0}px Arial`;
                ctx.textBaseline = 'top';

                ctx.textAlign = 'left';
                ctx.fillText(`${this._min}${this._min != '' ? this._units : ''}`,
                    char_weight * .75, size - char_weight * 1.25, size / 2 - char_weight
                );

                ctx.textAlign = 'right';
                ctx.fillText(`${this._max}${this._max != '' ? this._units : ''}`,
                    size - char_weight * .75, size - char_weight * 1.25, size / 2 - char_weight
                );

                requestAnimationFrame(animate);
            }
            else {
                this._last_value = this._value;
            }
        };

        requestAnimationFrame(animate);
    }
}
```

10. Open `manifest.json` and add:

- file name (`class.widget.js`) to the array in the `assets/js` section;
- class name (`WidgetLessonGaugeChart`) to the `js_class` parameter in the `widget` section.

The `WidgetLessonGaugeChart` class will now be automatically loaded with the dashboard.

`ui/modules/lesson_gauge_chart/manifest.json`

```
{
    "manifest_version": 2.0,
    "id": "lesson_gauge_chart",
    "type": "widget",
    "name": "Gauge chart",
```

```
    "namespace": "LessonGaugeChart",
    "version": "1.0",
    "author": "Zabbix",
    "actions": {
        "widget.lesson_gauge_chart.view": {
            "class": "WidgetView"
        }
    },
    "widget": {
        "js_class": "WidgetLessonGaugeChart"
    },
    "assets": {
        "js": ["class.widget.js"]
    }
}
```

Add CSS styles to the widget

In this section you will learn how to add custom CSS styles to make the widget look more appealing.

1. For widget styles, create a new directory `css` in the `assets` directory.
2. Create a `widget.css` file in the `assets/css` directory. To style widget elements, use the selector `div.dashboard-widget-{widget id}`. To configure CSS for the whole widget, use the selector `form.dashboard-widget-{widget id}`

`ui/modules/lesson_gauge_chart/assets/css/widget.css`

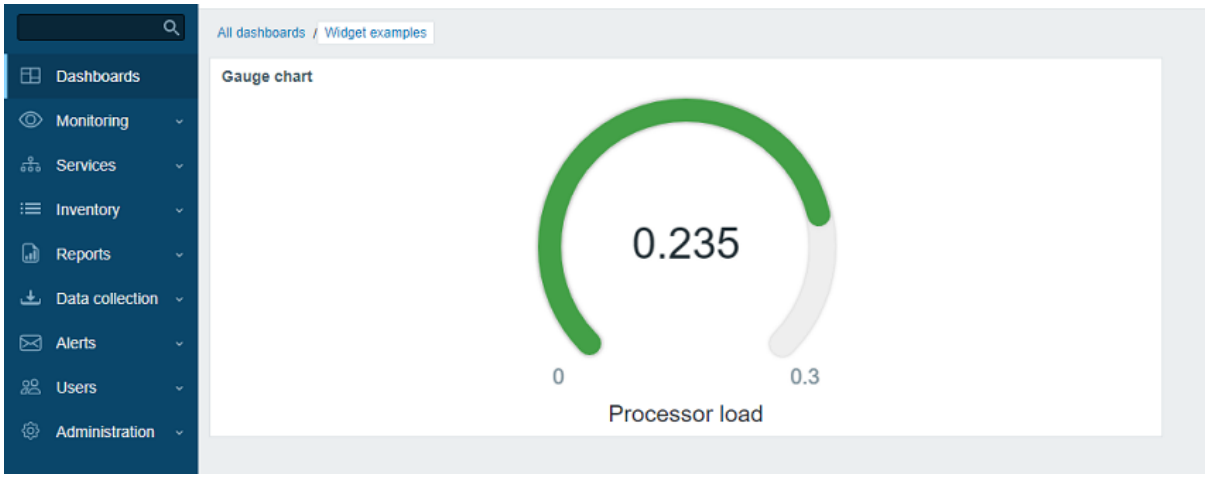
```
div.dashboard-widget-lesson_gauge_chart {
    display: grid;
    grid-template-rows: 1fr;
    padding: 0;
}

div.dashboard-widget-lesson_gauge_chart .chart {
    display: grid;
    align-items: center;
    justify-items: center;
}

div.dashboard-widget-lesson_gauge_chart .chart canvas {
    background: white;
}

div.dashboard-widget-lesson_gauge_chart .description {
    padding-bottom: 8px;
    font-size: 1.750em;
    line-height: 1.2;
    text-align: center;
}

.dashboard-grid-widget-hidden-header div.dashboard-widget-lesson_gauge_chart .chart {
    margin-top: 8px;
}
```



3. Open `manifest.json` and add the CSS file name (`widget.css`) to the array in the `assets/css` section. This will allow the CSS styles defined in `widget.css` to load with the dashboard page.

`ui/modules/lesson_gauge_chart/manifest.json`

```
{
    "manifest_version": 2.0,
    "id": "lesson_gauge_chart",
    "type": "widget",
    "name": "Gauge chart",
    "namespace": "LessonGaugeChart",
    "version": "1.0",
    "author": "Zabbix",
```

```
    "actions": {
        "widget.lesson_gauge_chart.view": {
            "class": "WidgetView"
        }
    },
    "widget": {
        "js_class": "WidgetLessonGaugeChart"
    },
    "assets": {
        "css": ["widget.css"],
        "js": ["class.widget.js"]
    }
}
```

4. Refresh the dashboard page to see the finished version of the widget.

Examples

This section provides files of sample modules and widgets, which you can use as a base for your custom modules.

To use a module:

1. Download the ZIP archive.
2. Unpack the content into a separate directory inside the *modules* directory of your Zabbix frontend installation (for example, *zabbix/ui/modules*).
3. Register the module in Zabbix frontend.

Module example

- When creating a host group, grant read permissions to configured user groups - hg_auto_perm.zip

Widget examples

- Minimal widget - widget_min.zip
- ”Hello, world” widget using CSS only - hello_world_css.zip
- ”Hello, world” widget using JavaScript only - hello_world_js.zip
- ”Hello, world” widget using PHP - hello_world_php.zip

Note:
You can also use Zabbix native widgets as examples.

Changes to extension development

Changes from 7.4 to 8.0 ZBXNEXT-10445 The maximum length of `string` widget fields has been increased from 2048 to 65535 characters. Specific `string` fields in Zabbix native widgets now also have their own length restrictions (e.g., set via the `setMaxLength()` function).

Zabbix manpages

Reference documentation for Zabbix command-line tools and services, listing available commands, options, and usage examples.

zabbix_agent2

```
ZABBIX_AGENT2(8)            System Manager's Manual           ZABBIX_AGENT2(8)

NAME
       zabbix_agent2 - Zabbix agent 2

SYNOPSIS
       zabbix_agent2 [-c config-file]
       zabbix_agent2 [-c config-file] [-v] -p
       zabbix_agent2 [-c config-file] [-v] -t item-key
       zabbix_agent2 [-c config-file] -R runtime-option
       zabbix_agent2 [-c config-file] -T
       zabbix_agent2 -h
       zabbix_agent2 -V

DESCRIPTION
       zabbix_agent2  is  an  application for monitoring parameters of various
       services.

OPTIONS
       -c, --config config-file
              Use the alternate config-file instead of the default one.

       -R, --runtime-control runtime-option
              Perform administrative functions according to runtime-option.

           Runtime control options
               userparameter_reload
                   Reload user parameters from the configuration file

               log_level_increase
                   Increase log level

               log_level_decrease
                   Decrease log level

               help
                   List available runtime control options

               metrics
                   List available metrics

               version
                   Display version

       -p, --print
              Print known items and exit.  For each item  either  generic  de-
              faults  are used, or specific defaults for testing are supplied.
              These defaults are listed in square brackets as item key parame-
              ters.  Returned values are enclosed in square brackets and  pre-
              fixed  with  the type of the returned value, separated by a pipe
```

```
              character.  For user parameters type is always t, as  the  agent
              can  not determine all possible return values.  Items, displayed
              as working, are not guaranteed to work from the Zabbix server or
              zabbix_get when querying a running agent daemon  as  permissions
              or environment may be different.  Returned value types are:

           d   Number with a decimal part.

           m   Not  supported.   This could be caused by querying an item that
               only works in the active mode like a log monitoring item or  an
               item  that  requires multiple collected values.  Permission is-
               sues or incorrect user parameters could also result in the  not
               supported state.

           s   Text.  Maximum length not limited.

           t   Text.  Same as s.

           u   Unsigned integer.

       -t, --test item-key
              Test single item and exit.  See --print for output description.

       -v, --verbose
              Enable verbose output when test item or print known items.

       -T, --test-config
              Validate configuration file and exit.

       -h, --help
              Display this help and exit.

       -V, --version
              Output version information and exit.

FILES
       /usr/local/etc/zabbix_agent2.conf
              Default  location  of  Zabbix agent 2 configuration file (if not
              modified during compile time).

```
ZABBIX_AGENTD(8)            System Manager's Manual           ZABBIX_AGENTD(8)

NAME
       zabbix_agentd - Zabbix agent daemon

SYNOPSIS
       zabbix_agentd [-c config-file]
       zabbix_agentd [-c config-file] -p
       zabbix_agentd [-c config-file] -t item-key
       zabbix_agentd [-c config-file] -R runtime-option
       zabbix_agentd [-c config-file] -T
```

```
       zabbix_agentd -h
       zabbix_agentd -V

DESCRIPTION
       zabbix_agentd is a daemon for monitoring various server parameters.

OPTIONS
       -c, --config config-file
              Use the alternate config-file instead of the default one.

       -f, --foreground
              Run Zabbix agent in foreground.

       -R, --runtime-control runtime-option
              Perform administrative functions according to runtime-option.

           Runtime control options
               userparameter_reload
                   Reload user parameters from the configuration file

               log_level_increase[=target]
                   Increase  log level, affects all processes if target is not
                   specified

               log_level_decrease[=target]
                   Decrease log level, affects all processes if target is  not
                   specified

           Log level control targets
               process-type
                   All  processes of specified type (active checks, collector,
                   listener)

               process-type,N
                   Process type and number (e.g., listener,3)

               pid Process identifier, up to 65535. For larger values  specify
                   target as "process-type,N"

       -p, --print
              Print  known  items  and exit.  For each item either generic de-
              faults are used, or specific defaults for testing are  supplied.
              These defaults are listed in square brackets as item key parame-
              ters.   Returned values are enclosed in square brackets and pre-
              fixed with the type of the returned value, separated by  a  pipe
              character.   For  user parameters type is always t, as the agent
              can not determine all possible return values.  Items,  displayed
              as working, are not guaranteed to work from the Zabbix server or
              zabbix_get  when  querying a running agent daemon as permissions
              or environment may be different.  Returned value types are:

           d   Number with a decimal part.

           m   Not supported.  This could be caused by querying an  item  that
               only  works in the active mode like a log monitoring item or an
               item that requires multiple collected values.   Permission  is-
               sues  or incorrect user parameters could also result in the not
               supported state.

           s   Text.  Maximum length not limited.

           t   Text.  Same as s.
```

```
           u   Unsigned integer.

       -t, --test item-key
              Test single item and exit.  See --print for output description.

       -T, --test-config
              Validate configuration file and exit.

       -h, --help
              Display this help and exit.

       -V, --version
              Output version information and exit.

FILES
       /usr/local/etc/zabbix_agentd.conf
              Default location of Zabbix agent configuration file (if not mod-
              ified during compile time).

zabbix_get

```
ZABBIX_GET(1)               General Commands Manual              ZABBIX_GET(1)

NAME
       zabbix_get - Zabbix get utility

SYNOPSIS
       zabbix_get  -s  host-name-or-IP  [-p  port-number]  [-I IP-address] [-t
       timeout] -k item-key
       zabbix_get -s host-name-or-IP  [-p  port-number]  [-I  IP-address]  [-t
       timeout]   --tls-connect  cert  --tls-ca-file  CA-file  [--tls-crl-file
       CRL-file] [--tls-agent-cert-issuer cert-issuer]  [--tls-agent-cert-sub-
       ject  cert-subject]  --tls-cert-file  cert-file --tls-key-file key-file
       [--tls-cipher13 cipher-string] [--tls-cipher cipher-string] -k item-key
       zabbix_get -s host-name-or-IP  [-p  port-number]  [-I  IP-address]  [-t
       timeout]     --tls-connect    psk    --tls-psk-identity    PSK-identity
       --tls-psk-file PSK-file  [--tls-cipher13  cipher-string]  [--tls-cipher
       cipher-string] -k item-key
       zabbix_get -h
       zabbix_get -V

DESCRIPTION
       zabbix_get  is  a  command  line  utility  for getting data from Zabbix
       agent.

OPTIONS
       -s, --host host-name-or-IP
              Specify host name or IP address of a host.

       -p, --port port-number
              Specify port number of agent running on the  host.   Default  is
              10050.
```

```
-I, --source-address IP-address
       Specify source IP address.

-t, --timeout seconds
       Specify timeout. Valid range: 1-600 seconds (default: 30)

-k, --key item-key
       Specify key of item to retrieve value for.

-P, --protocol value
       Protocol used to communicate with agent. Values:

            auto        connect using JSON protocol, fallback and retry
                        with plaintext protocol (default)

            json        connect using JSON protocol

            plaintext   connect  using  plaintext  protocol  where just
                        item key is sent (6.4.x and older releases)

--tls-connect value
       How to connect to agent. Values:

            unencrypted
                        connect without encryption (default)

            psk         connect using TLS and a pre-shared key

            cert        connect using TLS and a certificate

--tls-ca-file CA-file
       Full pathname of a file containing the top-level CA(s)  certifi-
       cates for peer certificate verification.

--tls-crl-file CRL-file
       Full pathname of a file containing revoked certificates.

--tls-agent-cert-issuer cert-issuer
       Allowed agent certificate issuer.

--tls-agent-cert-subject cert-subject
       Allowed agent certificate subject.

--tls-cert-file cert-file
       Full  pathname  of a file containing the certificate or certifi-
       cate chain.

--tls-key-file key-file
       Full pathname of a file containing the private key.

--tls-psk-identity PSK-identity
       PSK-identity string.

--tls-psk-file PSK-file
       Full pathname of a file containing the pre-shared key.

--tls-cipher13 cipher-string
       Cipher string for OpenSSL 1.1.1 or newer for TLS  1.3.  Override
       the  default  ciphersuite selection criteria. This option is not
       available if OpenSSL version is less than 1.1.1.

--tls-cipher cipher-string
       GnuTLS priority string (for TLS 1.2 and up)  or  OpenSSL  cipher
```

```
              string  (only for TLS 1.2). Override the default ciphersuite se-
              lection criteria.

       -h, --help
              Display this help and exit.

       -V, --version
              Output version information and exit.

EXIT STATUS
       The exit status is 0 if zabbix_get successfully retrieves a value  from
       the Zabbix agent. If value retrieval failed, the exit status is 1.

EXAMPLES
       zabbix_get -s 127.0.0.1 -p 10050 -k "system.cpu.load[all,avg1]"
       zabbix_get   -s   127.0.0.1  -p  10050  -k  "system.cpu.load[all,avg1]"
       --tls-connect    cert     --tls-ca-file     /home/zabbix/zabbix_ca_file
       --tls-agent-cert-issuer   "CN=Signing   CA,OU=IT   operations,O=Example
       Corp,DC=example,DC=com" --tls-agent-cert-subject "CN=server1,OU=IT  op-
       erations,O=Example  Corp,DC=example,DC=com"  --tls-cert-file /home/zab-
       bix/zabbix_get.crt --tls-key-file /home/zabbix/zabbix_get.key
       zabbix_get  -s  127.0.0.1  -p  10050   -k   "system.cpu.load[all,avg1]"
       --tls-connect   psk   --tls-psk-identity   "PSK   ID   Zabbix   agentd"
       --tls-psk-file /home/zabbix/zabbix_agentd.psk

Zabbix                            2022-01-06                      ZABBIX_GET(1)
```

zabbix_js

```
ZABBIX_JS(1)                General Commands Manual                ZABBIX_JS(1)

NAME
       zabbix_js - Zabbix JS utility

SYNOPSIS
       zabbix_js -s script-file -p input-param [-l log-level] [-t timeout]
       zabbix_js -s script-file -i input-file [-l log-level] [-t timeout]
       zabbix_js -h
       zabbix_js -V

DESCRIPTION
       zabbix_js  is  a  command  line  utility  that can be used for embedded
       script testing.

OPTIONS
       -s, --script script-file
              Specify the file name of the script to execute. If '-' is speci-
              fied as file name, the script will be read from stdin.

       -p, --param input-param
              Specify the input parameter passed to the script.  Parameter  is
              passed  verbatim  as a string and is available in the script via
              the 'value' variable. Mutually exclusive with -i.

       -i, --input input-file
```

```
              Specify a file containing the  input  parameter  passed  to  the
              script.  The  file  contents are passed verbatim as a string and
              are available in the script via the 'value' variable. If '-'  is
              specified as file name, the input will be read from stdin. Mutu-
              ally exclusive with -p.

       -w, --webdriver url
              Specify the webdriver URL.

       -l, --loglevel log-level
              Specify log level (Range: 0-5).

       -t, --timeout timeout
              Specify  the timeout in seconds. Valid range: 1-600 seconds (de-
              fault: 10)

       -h, --help
              Display this help and exit.

       -V, --version
              Output version information and exit.

EXAMPLES
       zabbix_js -s script-file.js -p example

ZABBIX_PROXY(8)             System Manager's Manual            ZABBIX_PROXY(8)

NAME
       zabbix_proxy - Zabbix proxy daemon

SYNOPSIS
       zabbix_proxy [-c config-file]
       zabbix_proxy [-c config-file] -R runtime-option
       zabbix_proxy [-c config-file] -T
       zabbix_proxy -h
       zabbix_proxy -V

DESCRIPTION
       zabbix_proxy is a daemon that collects monitoring data from devices and
       sends it to Zabbix server.

OPTIONS
       -c, --config config-file
              Use the alternate config-file instead of the default one.

       -f, --foreground
              Run Zabbix proxy in foreground.

       -R, --runtime-control runtime-option
              Perform administrative functions according to runtime-option.
```

```
Runtime control options
    config_cache_reload
        Reload configuration cache.  Ignored if cache is being cur-
        rently  loaded.   Active  Zabbix  proxy will connect to the
        Zabbix server and request configuration data.  Default con-
        figuration file (unless -c option  is  specified)  will  be
        used  to  find PID file and signal will be sent to process,
        listed in PID file.

    snmp_cache_reload
        Reload SNMP cache.

    housekeeper_execute
        Execute the housekeeper.  Ignored if housekeeper  is  being
        currently executed.

    diaginfo[=section]
        Log  internal  diagnostic information of the specified sec-
        tion. Section can be  historycache,  preprocessing,  locks.
        By  default  diagnostic  information  of  all  sections  is
        logged.

    prof_enable[=target]
        Enable profiling, affects all processes if  target  is  not
        specified

    prof_disable[=target]
        Disable  profiling,  affects all processes if target is not
        specified

    log_level_increase[=target]
        Increase log level, affects all processes if target is  not
        specified.

    log_level_decrease[=target]
        Decrease  log level, affects all processes if target is not
        specified.

Log level control targets
    process-type
        All  processes  of  specified  type  (availability manager,
        browser poller,  configuration syncer, data sender, discov-
        ery manager, history syncer, housekeeper, http poller,  ic-
        mp pinger, internal poller, ipmi manager, ipmi poller, java
        poller,     odbc poller,     poller, agent poller, http ag-
        ent poller,  snmp poller,  preprocessing manager,     prep-
        rocessing worker,     self-monitoring, snmp trapper, super-
        visor,  task manager,  trapper,  unreachable poller, vmware
        collector)

    process-type,N
        Process type and number (e.g., poller,3)

    pid Process identifier

Profiling control targets
    process-type
        All  processes  of  specified  type  (availability manager,
        browser poller, configuration syncer, data sender,  discov-
        ery manager, history syncer, housekeeper, http poller,  ic-
        mp pinger, internal poller, ipmi manager, ipmi poller, java
        poller, odbc poller, poller, agent poller, http agent poll-
        er,  snmp  poller,  preprocessing manager, self-monitoring,
```

```
                snmp trapper,  task manager,  trapper,  unreachable poller,
                vmware collector)

             process-type,N
                Process type and number (e.g., history syncer,1)

             pid Process identifier

             scope
                (rwlock, mutex, processing) can be used  with  process-type
                (e.g., history syncer,1,processing)

       -T, --test-config
              Validate configuration file and exit.

       -h, --help
              Display this help and exit.

       -V, --version
              Output version information and exit.

FILES
       /usr/local/etc/zabbix_proxy.conf
              Default location of Zabbix proxy configuration file (if not mod-
              ified during compile time).

DESCRIPTION

zabbix_sender is a command line utility for sending monitoring data to Zabbix server or proxy. On the Zabbix server an item of type Zabbix trapper should be created with corresponding key. Note that incoming values will only be accepted from hosts specified in Allowed hosts field for this item.

OPTIONS

-c, --config config-file

Use config-file. Zabbix sender reads server details from the agentd configuration file. By default, Zabbix sender does not read any configuration file. Only parameters Hostname, ServerActive, SourceIP, TLSConnect, TLSCAFile, TLSCRLFile, TLSServerCertIssuer, TLSServerCertSubject, TLSCertFile, TLSKeyFile, TLSPSKIdentity and TLSPSKFile are supported. Hostname defined through HostnameItem parameter will not be picked up, in this case the hostname should be specified via command line (see -s option). All addresses defined in the agent ServerActive configuration parameter are used for sending data. If sending of batch data fails to one address, the following batches are not sent to this address.

-z, --zabbix-server server

Hostname or IP address of Zabbix server. If a host is monitored by a proxy, proxy hostname or IP address should be used instead. When used together with --config, overrides the entries of ServerActive parameter specified in agentd configuration file.

-p, --port port

Specify port number of Zabbix server trapper running on the server. Default is 10051. When used together with --config,

overrides the port entries of ServerActive parameter specified in agentd configuration file.

-I, --source-address IP-address
Specify source IP address. When used together with --config, overrides SourceIP parameter specified in agentd configuration file.

-t, --timeout seconds
Specify timeout. Valid range: 1-300 seconds (default: 60)

-s, --host host
Specify host name the item belongs to (as registered in Zabbix frontend). Host IP address and DNS name will not work. When used together with --config, overrides Hostname parameter specified in agentd configuration file.

-k, --key key
Specify item key to send value to.

-o, --value value
Specify item value.

-i, --input-file input-file
Load values from input file. Specify - as <input-file> to read values from standard input. Each line of file contains whitespace delimited: <hostname> <key> <value>. Each value must be specified on its own line. Each line must contain 3 whitespace delimited entries: <hostname> <key> <value>, where "hostname" is the name of monitored host as registered in Zabbix frontend, "key" is target item key and "value" - the value to send. Specify - as <hostname> to use hostname from agent configuration file or from --host argument.

An example of a line of an input file:

"Linux DB3" db.connections 43

The value type must be correctly set in item configuration of Zabbix frontend. Zabbix sender will send up to 250 values in one connection. Contents of the input file must be in the UTF-8 encoding. All values from the input file are sent in a sequential order top-down. Entries must be formatted using the following rules:

- Quoted and non-quoted entries are supported.
- Double-quote is the quoting character.
- Entries with whitespace must be quoted.
- Double-quote and backslash characters inside quoted entry must be escaped with a backslash.
- Escaping is not supported in non-quoted entries.
- Linefeed escape sequences (\n) are supported in quoted strings.
- Linefeed escape sequences are trimmed from the end of an entry.

-T, --with-timestamps

This option can be only used with --input-file option.

Each line of the input file must contain 4 whitespace delimited entries: <hostname> <key> <timestamp> <value>. Timestamp should be specified in Unix timestamp format. If target item has triggers referencing it, all timestamps must be in an increasing order, otherwise event calculation will not be correct.

An example of a line of the input file:

"Linux DB3" db.connections 1429533600 43

For more details please see option --input-file.

If a timestamped value is sent for a host that is in a “no data” maintenance type then this value will be dropped; however, it is possible to send a timestamped value in for an expired maintenance period and it will be accepted.

-N, --with-ns
This option can be only used with --with-timestamps option.

Each line of the input file must contain 5 whitespace delimited entries: <hostname> <key> <timestamp> <ns> <value>.

An example of a line of the input file:

"Linux DB3" db.connections 1429533600 7402561 43

For more details please see option --input-file.

-r, --real-time
Send values one by one as soon as they are received. This can be used when reading from standard input.

--tls-connect value
How to connect to server or proxy. Values:

unencrypted
connect without encryption (default)

psk connect using TLS and a pre-shared key

cert connect using TLS and a certificate

--tls-ca-file CA-file
Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification.

--tls-crl-file CRL-file
Full pathname of a file containing revoked certificates.

--tls-server-cert-issuer cert-issuer
Allowed server certificate issuer.

--tls-server-cert-subject cert-subject
Allowed server certificate subject.

--tls-cert-file cert-file
Full pathname of a file containing the certificate or certificate chain.

--tls-key-file key-file

Full pathname of a file containing the private key.

--tls-psk-identity PSK-identity
Full pathname of a file containing the pre-shared key.

--tls-psk-file PSK-file
PSK-identity string.

--tls-cipher13 cipher-string
Cipher string for OpenSSL 1.1.1 or newer for TLS 1.3. Override the default ciphersuite selection criteria. This option is not available if OpenSSL version is less than 1.1.1.

--tls-cipher cipher-string
GnuTLS priority string (for TLS 1.2 and up) or OpenSSL cipher string (only for TLS 1.2). Override the default ciphersuite selection criteria.

-v, --verbose
Verbose mode, -vv for more details.

-h, --help
Display this help and exit.

-V, --version
Output version information and exit.

EXIT STATUS
The exit status is 0 if the values were sent and all of them were successfully processed by server. If data was sent, but processing of at least one of the values failed, the exit status is 2. If data sending failed, the exit status is 1.

EXAMPLES
zabbix_sender -c /etc/zabbix/zabbix_agentd.conf -k mysql.queries -o 342.45
Send 342.45 as the value for mysql.queries item of monitored host. Use monitored host and Zabbix server defined in agent configuration file.

zabbix_sender -c /etc/zabbix/zabbix_agentd.conf -s "Monitored Host" -k mysql.queries -o 342.45
Send 342.45 as the value for mysql.queries item of Monitored Host host using Zabbix server defined in agent configuration file.

zabbix_sender -z 192.168.1.113 -i data_values.txt
Send values from file data_values.txt to Zabbix server with IP 192.168.1.113. Host names and keys are defined in the file.

echo "- hw.serial.number 1287872261 SQ4321ASDF" | zabbix_sender -c /usr/local/etc/zabbix_agentd.conf -T -i -
Send a timestamped value from the commandline to Zabbix server, specified in the agent configuration file. Dash in the input data indicates that hostname also should be used from the same configuration file.

echo '"Zabbix server" trapper.item ""' | zabbix_sender -z 192.168.1.113 -p 10000 -i -
Send empty value of an item to the Zabbix server with IP address 192.168.1.113 on port 10000 from the commandline. Empty values must be indicated by empty double quotes.

```
       zabbix_sender -z 192.168.1.113  -s "Monitored Host" -k mysql.queries -o
       342.45  --tls-connect  cert  --tls-ca-file  /home/zabbix/zabbix_ca_file
       --tls-cert-file      /home/zabbix/zabbix_agentd.crt      --tls-key-file
       /home/zabbix/zabbix_agentd.key
              Send  342.45  as  the  value for mysql.queries item in Monitored
              Host host to server with IP 192.168.1.113 using  TLS  with  cer-
              tificate.

       zabbix_sender -z 192.168.1.113  -s "Monitored Host" -k mysql.queries -o
       342.45  --tls-connect  psk  --tls-psk-identity  "PSK  ID Zabbix agentd"
       --tls-psk-file /home/zabbix/zabbix_agentd.psk
              Send 342.45 as the value for  mysql.queries  item  in  Monitored
              Host  host  to  server with IP 192.168.1.113 using TLS with pre-
              shared key (PSK).

ZABBIX_SERVER(8)            System Manager's Manual           ZABBIX_SERVER(8)

NAME
       zabbix_server - Zabbix server daemon

SYNOPSIS
       zabbix_server [-c config-file]
       zabbix_server [-c config-file] -R runtime-option
       zabbix_server [-c config-file] -T
       zabbix_server -h
       zabbix_server -V

DESCRIPTION
       zabbix_server is the core daemon of Zabbix software.

OPTIONS
       -c, --config config-file
              Use the alternate config-file instead of the default one.

       -f, --foreground
              Run Zabbix server in foreground.

       -R, --runtime-control runtime-option
              Perform administrative functions according to runtime-option.

           Runtime control options
               config_cache_reload
                   Reload configuration cache.  Ignored if cache is being cur-
                   rently  loaded.   Default configuration file (unless -c op-
                   tion is specified) will be used to find PID file and signal
                   will be sent to process, listed in PID file.

               snmp_cache_reload
                   Reload SNMP cache.

               housekeeper_execute
```

Execute the housekeeper. Ignored if housekeeper is being currently executed.

trigger_housekeeper_execute
Execute the trigger housekeeper (remove problems for deleted triggers). Ignored if trigger housekeeper is being currently executed.

secrets_reload
Reload secrets from Vault. Ignored if configuration cache or secrets are being currently loaded.

diaginfo[=section]
Log internal diagnostic information of the specified section. Section can be historycache, preprocessing, alerting, lld, valuecache, locks, and connector. By default, diagnostic information of all sections is logged.

prof_enable[=target]
Enable profiling, affects all processes if target is not specified

prof_disable[=target]
Disable profiling, affects all processes if target is not specified

ha_status
Display high availability cluster status. Can be performed only on active node.

ha_remove_node
ha_remove_node[=name|ID] Remove high availability node by its name or ID listed in ha_status. Can be performed only on active node.

ha_set_failover_delay[=delay]
Set high availability failover delay. The delay can be specified using time suffixes. Can be performed only on active node.

log_level_increase[=target]
Increase log level, affects all processes if target is not specified

log_level_decrease[=target]
Decrease log level, affects all processes if target is not specified

Log level control targets
process-type
All processes of specified type (alerter, alert manager, alert syncer, availability manager, browser poller, configuration syncer, configuration syncer worker, connector manager, connector worker, discovery manager, escalator, ha manager, history poller, history syncer, housekeeper, http poller, http agent poller, icmp pinger, internal poller, ipmi manager, ipmi poller, java poller, lld manager, lld worker, odbc poller, poller, agent poller, preprocessing manager, preprocessing worker, proxy poller, proxy group manager, report manager, report writer, self-monitoring, service manager, snmp poller, snmp trapper, supervisor, task manager, timer, trapper, trigger housekeeper, unreachable poller, vmware collector)

```
                process-type,N
                    Process type and number (e.g., poller,3)

                pid Process identifier

            Profiling control targets
                process-type
                    All  processes  of  specified type (alerter, alert manager,
                    alert syncer, availability manager, browser poller, config-
                    uration syncer, configuration syncer worker, connector man-
                    ager,    connector worker,    discovery manager, escalator,
                    ha manager,  history poller,  history syncer,  housekeeper,
                    http poller,  http agent poller, icmp pinger,  internal po-
                    ller,  ipmi manager, ipmi poller, java poller, lld manager,
                    lld worker,  odbc poller,  poller,  agent poller,  preproc-
                    essing manager, proxy poller,  proxy group manager,   repo-
                    rt manager,   report writer, self-monitoring, service mana-
                    ger, snmp poller, snmp trapper,  task manager, timer, trap-
                    per, trigger housekeeper, unreachable poller, vmware colle-
                    ctor)

                process-type,N
                    Process type and number (e.g., history syncer,1)

                pid Process identifier

                scope
                    (rwlock, mutex, processing) can be used  with  process-type
                    (e.g., history syncer,1,processing)

        -T, --test-config
               Validate configuration file and exit.

        -h, --help
               Display this help and exit.

        -V, --version
               Output version information and exit.

FILES
        /usr/local/etc/zabbix_server.conf
               Default  location  of  Zabbix  server configuration file (if not
               modified during compile time).

ZABBIX_WEB_SERVICE(8)       System Manager's Manual      ZABBIX_WEB_SERVICE(8)

NAME
        zabbix_web_service - Zabbix web service

SYNOPSIS
```

```
       zabbix_web_service [-c config-file]
       zabbix_web_service [-c config-file] -T
       zabbix_web_service -h
       zabbix_web_service -V

DESCRIPTION
       zabbix_web_service is an application for providing web services to Zab-
       bix components.

OPTIONS
       -c, --config config-file
              Use the alternate config-file instead of the default one.

       -T, --test-config
              Validate configuration file and exit.

       -h, --help
              Display this help and exit.

       -V, --version
              Output version information and exit.

FILES
       /usr/local/etc/zabbix_web_service.conf
              Default  location  of  Zabbix web service configuration file (if
              not modified during compile time).
